The instruction is executed when a positive signal edge is detected at the REQ parameter. The BUSY parameter then has the signal state "1". If a negative signal edge is detected at the BUSY parameter, the instruction is terminated and the value at the VALUE parameter is written to the data block. The DONE parameter then has the signal state "1" for one program cycle.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

---

#### Note

The array DB must be located in a data block with the block property "Optimized".

---

## Syntax

The following syntax is used for the "Write to ARRAY data block in load memory" instruction:

### SCL

```
"Instance DB" (REQ := <Operand>,
  DB := <Operand>,
  INDEX := <Operand>,
  VALUE := <Operand>,
  BUSY => <Operand>,
  DONE => <Operand>,
  ERROR => <Operand>)
```

## Parameter

The following table shows the parameters of the "Write to the array data block in load memory" instruction:

Parameter	Declaration	Data type	Description
REQ	Input	BOOL	REQ = "1": Start writing to the array DB
DB	Input	DB_ANY	Data block to which data is written
INDEX	Input	DINT	Element in the DB to which data is written
VALUE	Input	VARIANT	Value to be written
BUSY	Output	BOOL	BUSY = "1": The array DB is still being written
DONE	Output	BOOL	DONE = "1": The instruction was executed successfully
ERROR	Output	INT	Error information: If an error occurs during the execution of the instruction, an error code is output on the ERROR parameter.

For additional information on valid data types, refer to "See also".

**ERROR parameter**

The following table shows the meaning of the values of the ERROR parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
80B5	Copying process was interrupted
80C3	Too many concurrent calls
8132	The data block does not exist or is too short
8133	The data block is not located in the load memory
8134	The data block is write protected
8135	The DB is not an array data block.
8282	The value of the INDEX parameter is outside the limits of the array.
8350	The VARIANT data type contains no value
8352	Code generation error
8353	Code generation error
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

You can find descriptions of the error codes triggered by the instructions "READ\_DBL: Read from data block in load memory" and "WRIT\_DBL: Write to data block in load memory" under "See also".

**Example**

The following example shows how the instruction works:

**SCL**

```
"WriteToArrayDBL_DB"(REQ := "TagReg",
    DB := "ArrayDB",
    INDEX := "ArrayDB"."THIS"[2],
    VALUE := "SourceTargetField[1]".Data1[6],
    BUSY => "TagBusy",
    DONE => "TagDone",
    ERROR => "TagError");
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
REQ	TagReq	BOOL
DB	ArrayDB	The data type of the "ArrayDB" operand is Array [0 to 10] of INT.
INDEX	ArrayDB."THIS"[2]	Third element of the "ArrayDB"
VALUE	SourceTargetField[1].Data1[6]	The data type of the "SourceTargetField" operand is Array [0 to 10] of "MOVE_UDT".
BUSY	TagBusy	BOOL
DONE	TagDone	BOOL

If a positive edge is detected at the "TagReq" operand, the "Write to ARRAY data block in load memory" instruction is executed. As soon as a negative signal edge is detected at the "TagBusy" operand, the instruction is terminated and the value at the VALUE parameter is written in the third element in the "ArrayDB". After the instruction has been processed, the "TagDone" operand the signal state "1".

### Read/write access

### PEEK: Read memory address

### Description

The "Read memory address" instruction is used to read a memory address from a memory area without specifying a data type.

If you specify the 16#84 area at the AREA parameter for a data block, you can only access data blocks with the "Standard" block property.

### Syntax

The following syntax is used for the "Read memory address" instruction:

#### SCL

```
PEEK (AREA:= <Operand>,
      DBNUMBER := <Operand>,
      BYTEOFFSET:= <Operand>)
```

**SCL**

```
PEEK_<Data type>(AREA := <Operand>,
                 DBNUMBER := <Operand>,
                 BYTEOFFSET:= <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
AREA	Input	BYTE	The following areas can be selected: <ul style="list-style-type: none"> <li>• 16#81: Input</li> <li>• 16#82: Output</li> <li>• 16#83: Bit memory</li> <li>• 16#84: DB</li> <li>• 16#1: Peripheral input (S7-1500 only)</li> </ul>
DBNUMBER	Input	DINT, DB_ANY	Number of the data block if AREA = DB, otherwise "0"
BYTEOFFSET	Input	DINT	Address to read from Only the 16 least significant bits are used.
_<Data type>		Bit strings default: BYTE	Data type of the function value: <ul style="list-style-type: none"> <li>• You do not need to specify the data type if using the default.</li> <li>• Any other valid data type you may use must be declared explicitly.</li> </ul>
Function value		Bit strings	Result of the instruction

For additional information on valid data types, refer to "See also".

**Note**

If you read the memory address of the input, output or bit memory areas, you will need to set the "DBNUMBER" parameter with the value "0", as the instruction is faulty otherwise.

**Example**

The following example shows how the instruction works:

**SCL**

```
"Tag_Result1" := PEEK(AREA := "Tag_Area",
                     DBNUMBER := "Tag_DBNumber",
```

**SCL**

```
BYTEOFFSET := "Tag_Byte");
```

**SCL**

```
"Tag_Result2" := PEEK_WORD(AREA := "Tag_Area",
                           DBNUMBER := "Tag_DBNumber",
                           BYTEOFFSET := "Tag_Byte");
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
AREA	Tag_Area	16#84
DBNUMBER	Tag_DBNumber	5
BYTEOFFSET	Tag_Byte	20
Function value	Tag_Result1	Byte value "20"
Function value	Tag_Result2	Word value "20"

The instruction reads the value of address "20" from the "Tag\_Byte" operand at data block "5" and returns the result as a function value at the "Tag\_Result" operand.

**See also**

Overview of the valid data types (Page 1262)

**PEEK\_BOOL: Read memory bit****Description**

The "Read memory bit" instruction is used to read a memory bit from a memory area without specifying a data type.

If you specify the 16#84 area at the AREA parameter for a data block, you can only access data blocks with the "Standard" block property.

**Note**

The instruction can only be used to access "Standard" memory areas.

**Syntax**

The following syntax is used for the "Read memory bit" instruction:

**SCL**

```
PEEK_BOOL(AREA := <Operand>,
          DBNumber := <Operand>);
```

**SCL**

```

BYTEOFFSET := <Operand>,
BITOFFSET := <Operand>
    
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
AREA	Input	BYTE	The following areas can be selected: <ul style="list-style-type: none"> <li>• 16#81: Input</li> <li>• 16#82: Output</li> <li>• 16#83: Bit memory</li> <li>• 16#84: DB</li> <li>• 16#1: Peripheral input (S7-1500 only)</li> </ul>
DBNUMBER	Input	DINT, DB_ANY	Number of the data block if AREA = DB, otherwise "0"
BYTEOFFSET	Input	DINT	Address to read from Only the 16 least significant bits are used.
BITOFFSET	Input	INT	Bit to be read from
Function value		BOOL	Result of the instruction

For additional information on valid data types, refer to "See also".

**Note**

If you read the memory bit from the input, output or bit memory areas, you will need to set the "DBNUMBER" parameter with the value "0", as the instruction is faulty otherwise.

**Example**

The following example shows how the instruction works:

**SCL**

```

"Tag_Result" := PEEK_BOOL(AREA := "Tag_Area",
                        DBNUMBER := "Tag_DBNumber",
                        BYTEOFFSET := "Tag_Byte",
                        BITOFFSET := "Tag_Bit");
    
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
AREA	Tag_Area	16#84
DBNUMBER	Tag_DBNumber	5
BYTEOFFSET	Tag_Byte	20

Parameter	Operand	Value
BITOFFSET	Tag_Bit	3
Function value	Tag_Result	3

The instruction reads the value of memory bit "3" from the "Tag\_Bit" operand at byte "20" of data block "5" and returns the result at the "Tag\_Result" operand as function value.

## POKE: Write memory address

### Description

The "Write memory address" instruction is used to write a memory address to a memory area without specifying a data type.

If you specify the 16#84 area at the AREA parameter for a data block, you can only access data blocks with the "Standard" block property.

---

### Note

The instruction can only be used to access "Standard" memory areas.

---

### Syntax

The following syntax is used for the "Write memory address" instruction:

```
SCL  
POKE (AREA := <Operand>,  
      DBNUMBER := <Operand>,  
      BYTEOFFSET := <Operand>,  
      VALUE := <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
AREA	Input	BYTE	The following areas can be selected: <ul style="list-style-type: none"> <li>• 16#81: Input</li> <li>• 16#82: Output</li> <li>• 16#83: Bit memory</li> <li>• 16#84: DB</li> <li>• 16#2: Peripheral output (S7-1500 only)</li> </ul>
DBNUMBER	Input	DINT, DB_ANY	Number of the data block if AREA = DB, otherwise "0"
BYTEOFFSET	Input	DINT	Address to be written Only the 16 least significant bits are used.
VALUE	Input	Bit strings	Value to be written

For additional information on valid data types, refer to "See also".

**Note**

If you write the memory address in the input, output or bit memory areas, you will need to set the "DBNUMBER" parameter with the value "0", as the instruction is faulty otherwise.

**Example**

The following example shows how the instruction works:

```

SCI
POKE (AREA := "Tag_Area",
      DBNUMBER := "Tag_DBNumber",
      BYTEOFFSET := "Tag_Byte"),
VALUE := "Tag_Value";
    
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
AREA	Tag_Area	16#84
DBNUMBER	Tag_DBNumber	5
BYTEOFFSET	Tag_Byte	20
VALUE	Tag_Value	16#11

The instruction overwrites the memory address "20" in the data block "5" with value "16#11".

**See also**

Overview of the valid data types (Page 1262)

**POKE\_BOOL: Write memory bit****Description**

The "Write memory bit" instruction is used to write a memory bit to a memory area without specifying a data type.

If you specify the 16#84 area at the AREA parameter for a data block, you can only access data blocks with the "Standard" block property.

**Note**

The instruction can only be used to access "Standard" memory areas.

**Syntax**

The following syntax is used for the "Write memory bit" instruction:

**SCL**

```
POKE_BOOL (AREA := <Operand>,
           DBNUMBER := <Operand>,
           BYTEOFFSET := <Operand>,
           BITOFFSET := <Operand>,
           VALUE := <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
AREA	Input	BYTE	The following areas can be selected: <ul style="list-style-type: none"> <li>• 16#81: Input</li> <li>• 16#82: Output</li> <li>• 16#83: Bit memory</li> <li>• 16#84: DB</li> <li>• 16#2: Peripheral output (S7-1500 only)</li> </ul>
DBNUMBER	Input	DINT, DB_ANY	Number of the data block if AREA = DB, otherwise "0"
BYTEOFFSET	Input	DINT	Address to be written Only the 16 least significant bits are used.
BITOFFSET	Input	INT	Bit to be written
VALUE	Input	BOOL	Value to be written

For additional information on valid data types, refer to "See also".

---

**Note**

If you write the memory bit in the input, output or bit memory areas, you need to set the "DBNUMBER" parameter with the value "0", as the instruction is faulty otherwise.

---

**Example**

The following example shows how the instruction works:

```
SCI  
POKE_BOOL (AREA := "Tag_Area",  
           DBNUMBER := "Tag_DBNumber",  
           BYTEOFFSET := "Tag_Byte",  
           BITOFFSET := "Tag_Bit",  
           VALUE := "Tag_Value");
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
AREA	Tag_Area	16#84
DBNUMBER	Tag_DBNumber	5
BYTEOFFSET	Tag_Byte	20
BITOFFSET	Tag_Bit	3
VALUE	Tag_Value	M0.0

The instruction overwrites the memory bit "3" in data block "5" in byte "20" with the value "M0.0".

**See also**

Overview of the valid data types (Page 1262)

**POKE\_BLK: Write memory area**

**Description**

The "Write memory area" instruction copies the content a memory area to a different memory area without specifying a data type.

If you specify the 16#84 area at the AREA parameter for a data block, you can only access data blocks with the "Standard" block property.

---

**Note**

The instruction can only be used to access "Standard" memory areas.

---

## Syntax

The following syntax is used for the "Write memory area" instruction:

### SCL

```
POKE_BLK (AREA_SRC:= <Operand>,
          DBNUMBER_SRC:= <Operand>,
          BYTEOFFSET_SRC:= <Operand>,
          AREA_DEST:= <Operand>,
          DBNUMBER_DEST:= <Operand>,
          BYTEOFFSET_DEST:= <Operand>,
          COUNT:= <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
AREA_SRC	Input	BYTE	The following areas can be selected in the source memory area: <ul style="list-style-type: none"> <li>• 16#81: Input</li> <li>• 16#82: Output</li> <li>• 16#83: Bit memory</li> <li>• 16#84: DB</li> </ul>
DBNUMBER_SRC	Input	DINT, DB_ANY	Number of the data block in the source memory area, if AREA = DB, otherwise "0"
BYTEOFFSET_SRC	Input	DINT	Address in the source memory area to be written Only the 16 least significant bits are used.
AREA_DEST	Input	BYTE	The following areas can be selected in the destination memory area: <ul style="list-style-type: none"> <li>• 16#81: Input</li> <li>• 16#82: Output</li> <li>• 16#83: Bit memory</li> <li>• 16#84: DB</li> </ul>
DBNUMBER_DEST	Input	DINT, DB_ANY	Number of the data block in the destination memory area, if AREA = DB, otherwise "0"
BYTEOFFSET_DEST	Input	DINT	Address in the destination memory area to be written Only the 16 least significant bits are used.
COUNT	Input	DINT	Number of bytes which are copied

For additional information on valid data types, refer to "See also".

**Note**

If you write the memory address in the input, output or bit memory areas, you will need to set the "DBNUMBER" parameter with the value "0", as the instruction is faulty otherwise.

**Example**

The following example shows how the instruction works:

**SCL**

```
POKE_BLK(AREA_SRC := "Tag_Source_Area",
         DBNUMBER_SRC := "Tag_Source_DBNumber",
         BYTEOFFSET_SRC := "Tag_Source_Byte"),
        AREA_DEST := "Tag_Destination_Area",
        DBNUMBER_DEST := "Tag_Destination_DBNumber",
        BYTEOFFSET_DEST := "Tag_Destination_Byte",
        COUNT := "Tag_Count");
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
AREA_SRC	Tag_Source_Area	16#84
DBNUMBER_SRC	Tag_Source_DBNumber	5
BYTEOFFSET_SRC	Tag_Source_Byte	20
AREA_DEST	Tag_Destination_Area	16#83
DBNUMBER_DEST	Tag_Destination_DBNumber	0
BYTEOFFSET_DEST	Tag_Destination_Byte	30
COUNT	Tag_Count	100

The instruction writes 100 byte from data block "5" starting with address "20" in the memory area of the bit memory starting at address "30".

**See also**

Overview of the valid data types (Page 1262)

**READ\_LITTLE: Read data in little endian format**

**Description**

You use the "Read data in little endian format" instruction to read the data to a single tag in the little endian byte sequence. With the little endian format, the byte with the least significant bits is saved first, which means at the lowest memory address. The memory area that is read from must have the data type ARRAY of BYTE.

The operand at the DEST\_VARIABLE parameter must have an elementary data type. The operand at the POS parameter determines the position at which the reading starts.

---

### Note

#### Reading tag of data type VARIANT or BOOL

If you want to read a tag to which a VARIANT points, use the "Serialize" or "Deserialize" instructions.

If you want to read a tag of the data type BOOL, use a "Slice access".

---

## Syntax

Use the following syntax for the "Read data in little endian format" instruction:

### SCL

```
READ_LITTLE(SRC_ARRAY := <Operand>,
            DEST_VARIABLE => <Operand>,
            POS := <Operand>)
```

## Parameter

The following table shows the parameters of the "Read data in little endian format" instruction:

Parameter	Declaration	Data type	Description
SRC_ARRAY	Input	ARRAY of BYTE	Memory area from which is read
DEST_VARIABLE	Output	Bit strings, integers, floating-point numbers, timers, LDT, TOD, LTOD, DATE, CHAR, WCHAR	Read value
POS	InOut	DINT	Determines the position at which the reading starts. The POS parameter is calculated zero-based.
Function value		INT	Error information

## Example

The following example shows how the instruction works:

### SCL

```
#TagResult := READ_LITTLE(SRC_ARRAY := #SourceField,
                        DEST_VARIABLE => #DINTVariable,
                        POS := #TagPos);
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
SRC_ARRAY	#SourceField	ARRAY[0..3] of BYTE := 16#1A, 16#2B, 16#3C, 16#4D
DEST_VARIABLE	#DINTVariable	1295788826 16#4D3C2B1A
POS	#TagPos	0 => 4

The "Read data in little endian format" instruction reads the integer 1\_295\_788\_826 from the memory area "#SourceField" and writes it to the "#DINTVariable" operand in little endian format. The data type at the DEST\_VARIABLE parameter specifies how many bytes are read. The quantity 4 is saved at the "#TagPos" operand.

**See also**

- Overview of the valid data types (Page 1262)

- Serialize: Serialization (Page 2427)
- Addressing areas of a tag with slice access (Page 1250)

**WRITE\_LITTLE: Write data in little endian format**

**Description**

You use the "Write data in little endian format" instruction to write the data of a single tag in the little endian byte sequence to a memory area. With the little endian format, the byte with the least significant bits is saved first, which means at the lowest memory address. The memory area written to must have the data type ARRAY of BYTE.

The operand at the SRC\_VARIABLE parameter must have an elementary data type. The operand at the POS parameter determines the position at which the writing starts.

---

**Note**

**Writing tag of data type VARIANT or BOOL**

If you want to write a tag to which a VARIANT points, use the "Serialize" or "Deserialize" instructions.

If you want to write a tag of the data type BOOL, use a "Slice access".

---

**Syntax**

Use the following syntax for the "Write data in little endian format" instruction:

**SCL**

```
WRITE_LITTLE(SRC_VARIABLE := <Operand>,
             DEST_ARRAY := <Operand>,
```

**SCL**

```
POS := <Operand>
```

**Parameter**

The following table shows the parameters of the "Write data in little endian format" instruction:

Parameter	Declaration	Data type	Description
SRC_VARIABLE	Input	Bit strings, integers, floating-point numbers, timers, LDT, TOD, LTOD, DATE, CHAR, WCHAR	Tag whose data are written
DEST_ARRAY	InOut	ARRAY of BYTE	Memory area to which the data are written
POS	InOut	DINT	Determines the position at which the writing starts. The POS parameter is calculated zero-based.
Function value		INT	Error information

**Example**

The following example shows how the instruction works:

**SCL**

```
#TagResult := WRITE_LITTLE(SRC_VARIABLE := #DINTVariable,
                            DEST_ARRAY := #TargetField,
                            POS := #TagPos);
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
SRC_VARIABLE	#DINTVariable	1295788826 16#4D3C2B1A
DEST_ARRAY	#TargetField	ARRAY[0..10] of BYTE = 16#1A, 16#2B, 16#3C, 16#4D
POS	#TagPos	0 => 4

The "Write data in little endian format" instruction writes the integer 1\_295\_788\_826 from the "#DINTVariable" operand to the "#TargetField" memory area in little endian format. The data type at the SRC\_VARIABLE parameter specifies how many bytes are written. The quantity 4 is saved at the "#TagPos" operand.

**See also**

Serialize: Serialization (Page 2427)

Addressing areas of a tag with slice access (Page 1250)

## READ\_BIG: Read data in big endian format

### Description

You use the "Read data in big endian format" instruction to read the data to a single tag in the big endian byte sequence. With the big endian format, the byte with the most significant bits is saved first, which means at the lowest memory address. The memory area that is read from must have the data type ARRAY of BYTE.

The operand at the DEST\_VARIABLE parameter must have an elementary data type. The operand at the POS parameter determines the position at which the reading starts.

---

#### Note

##### Reading tag of data type VARIANT or BOOL

If you want to read a tag to which a VARIANT points, use the "Serialize" or "Deserialize" instructions.

If you want to read a tag of the data type BOOL, use a "Slice access".

---

### Syntax

Use the following syntax for the "Read data in big endian format" instruction:

#### SCL

```
READ_BIG(SRC_ARRAY := <Operand>,
         DEST_VARIABLE => <Operand>,
         POS := <Operand>)
```

### Parameter

The following table shows the parameters of the "Read data in big endian format" instruction:

Parameter	Declaration	Data type	Description
SRC_ARRAY	Input	ARRAY of BYTE	Memory area from which is read
DEST_VARIABLE	Output	Bit strings, integers, floating-point numbers, timers, LDT, TOD, LTOD, DATE, CHAR, WCHAR	Read value

Parameter	Declaration	Data type	Description
POS	InOut	DINT	Determines the position at which the reading starts. The POS parameter is calculated zero-based.
Function value		INT	Error information

## Example

The following example shows how the instruction works:

### SCL

```
#TagResult := READ_BIG(SRC_ARRAY := #SourceField,
                      DEST_VARIABLE => #DINTVariable,
                      POS := #TagPos);
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
SRC_ARRAY	#SourceField	ARRAY[0..10] of BYTE := 16#1A, 16#2B, 16#3C, 16#4D
DEST_VARIABLE	#DINTVariable	439041101 16#1A2B3C4D
POS	#TagPos	0 => 4

The "Read data in big endian format" instruction reads the integer 439\_041\_101 from the memory area "#SourceField" and writes it to the "#DINTVariable" operand in big endian format. The data type at the DEST\_VARIABLE parameter specifies how many bytes are read. The quantity 4 is saved at the "#TagPos" operand.

Addressing areas of a tag with slice access (Page 1250)

## WRITE\_BIG: Write data in big endian format

### Description

You use the "Write data in big endian format" instruction to write the data of a single tag in the big endian byte sequence to a memory area. With the big endian format, the byte with the most significant bits is saved first, which means at the lowest memory address. The memory area written to must have the data type ARRAY of BYTE.

The operand at the SRC\_VARIABLE parameter must have an elementary data type. The operand at the POS parameter determines the position at which the writing starts.

**Note**

**Writing tag of data type VARIANT or BOOL**

If you want to write a tag to which a VARIANT points, use the "Serialize" or "Deserialize" instructions.

If you want to write a tag of the data type BOOL, use a "Slice access".

**Syntax**

Use the following syntax for the "Write data in big endian format" instruction:

**SCL**

```
WRITE_BIG(SRC_VARIABLE := <Operand>,
          DEST_ARRAY := <Operand>,
          POS := <Operand>)
```

**Parameter**

The following table shows the parameters of the "Write data in big endian format" instruction:

Parameter	Declaration	Data type	Description
SRC_VARIABLE	Input	Bit strings, integers, floating-point numbers, timers, LDT, TOD, LTOD, DATE, CHAR, WCHAR	Tag whose data are written
DEST_ARRAY	InOut	ARRAY of BYTE	Memory area to which the data are written
POS	InOut	DINT	Determines the position at which the writing starts. The POS parameter is calculated zero-based.
Function value		INT	Error information

**Example**

The following example shows how the instruction works:

**SCL**

```
#TagResult := WRITE_BIG(SRC_VARIABLE := #DINTVariable,
                       DEST_ARRAY := #TargetField,
                       POS := #TagPos);
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
SRC_VARIABLE	#DINTVariable	439041101 16#1A2B3C4D
DEST_ARRAY	#TargetField	ARRAY[0..10] of BYTE = 16#1A, 16#2B, 16#3C, 16#4D
POS	#TagPos	0 => 4

The "Write data in big endian format" instruction writes the integer 439\_041\_101 from the "#DINTVariable" operand to the "#TargetField" memory area in big endian format. The data type at the SRC\_VARIABLE parameter specifies how many bytes are written. The quantity 4 is saved at the "#TagPos" operand.

Addressing areas of a tag with slice access (Page 1250)

## VARIANT instructions

### VariantGet: Read out VARIANT tag value

#### Description

You can use the "Read out VARIANT tag value" instruction to read the value of the tag to which the VARIANT at the SRC parameter points and write it in the tag at the DST parameter.

The SRC parameter must have the VARIANT data type. Any data type except for VARIANT can be specified at the DST parameter.

The data type of the tag at the DST parameter must match the data type to which the VARIANT points.

---

#### Note

The tag to which the VARIANT at parameter SRC points must be a PLC data type.

To copy structures and ARRAYS, you can use the "MOVE\_BLK\_VARIANT: Move block" instruction. For additional information, refer to "See also".

---

### Syntax

The following syntax is used for the "Read out VARIANT tag value" instruction:

#### SCL

```
VariantGet(SRC := <Operand>,  
           DST => <Operand>)
```

### Parameter

The following table shows the parameters of the "Read out VARIANT tag value" instruction:

Parameter	Declaration	Data type	Description
SRC	Input	VARIANT	Tag to be read
DST	Output	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY, structures	Result of the instruction

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

#### SCL

```
VariantGet(SRC := #TagIn_Source,  
           DST => "TagOut_Dest");
```

The value of the tag to which the VARIANT at the "#TagIn\_Source" operand points is read and written to the "TagOut\_Dest" operand.

### See also

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)
- VARIANT (Page 1303)
- MOVE\_BLK\_VARIANT: Move block (Page 2432)

### VariantPut: Write VARIANT tag value

#### Description

You can use the "Write VARIANT tag value" instruction to write the value of the tag at the SRC parameter to the tag at the DST parameter to which the VARIANT points.

The DST parameter must have the VARIANT data type. Any data type except for VARIANT can be specified at the SRC parameter.

The data type of the tag at the SRC parameter must match the data type to which the VARIANT points.

---

#### Note

The tag to which the VARIANT at parameter DST points must be a PLC data type.

---

## Syntax

The following syntax is used for the "Write VARIANT tag value" instruction:

### SCL

```
VariantPut (SRC := <Operand>,
           DST := <Operand>)
```

## Parameter

The following table shows the parameters of the "Write VARIANT tag value" instruction:

Parameter	Declaration	Data type	Description
SRC	Input	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY	Tag to be read
DST	Input	VARIANT	Result of the instruction

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

### SCL

```
VariantPut (SRC := "TagIn_Source",
           DST => "#TagIn_Dest");
```

The value of the "TagIn\_Source" operand is written to the tag to which the VARIANT at the "#TagIn\_Dest" operand points.

## See also

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

VARIANT (Page 1303)

### CountOfElements: Get number of ARRAY elements

#### Description

You can use the "Get number of ARRAY elements" instruction to query how many ARRAY elements a tag to which VARIANT is pointing has.

If it is a one-dimensional ARRAY, the difference between the high and low limit +1 is output as a result. If it is a multi-dimensional ARRAY, the product of all dimensions is output as the result.

The <Operand> must have the VARIANT data type.

The result is "0" if the VARIANT tag is not an ARRAY.

If the VARIANT points to an ARRAY of BOOL, the fill elements are included in the count. (For example, 8 is returned for an ARRAY[0..1] of BOOL)

#### Syntax

The following syntax is used for the "Get number of ARRAY elements" instruction:

##### SCL

```
CountOfElements (<Operand>)
```

#### Parameter

The following table shows the parameters of the "Get number of ARRAY elements" instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	VARIANT	Tag to be queried
Function value		UDINT	Result of the instruction

For additional information on valid data types, refer to "See also".

#### Example

The following example shows how the instruction works:

##### SCL

```
IF IS_ARRAY(#Tag_VARIANTToArray) THEN  
"Tag_Result" := CountOfElements(#Tag_VARIANT);  
END_IF;
```

If the tag to which the VARIANT points is an ARRAY, the number of ARRAY elements is output.

 VARIANT (Page 1303)

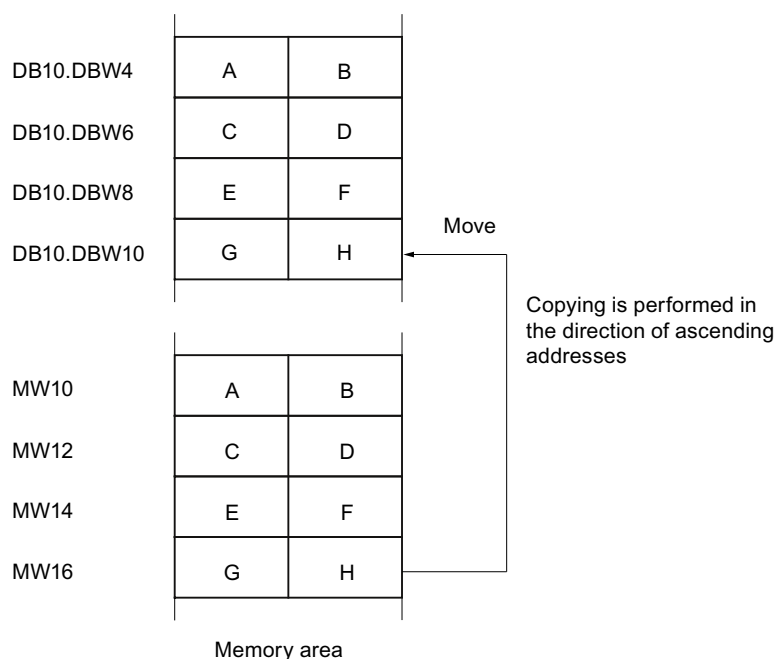

**Other****BLKMOV: Move block****Description**

The instruction "Move block" copies the contents of a memory area (source area) to another memory area (destination area). The move operation takes place in the direction of ascending addresses. You use VARIANT to define the source and destination areas.

**Note**

The tags of the instruction can only be used in data blocks in which the attribute "Optimized block access" is not set. If the tag with the retentive setting "Set in IDB" has been declared, you can also use the tags "with optimized access".

The following figure shows the principle of the move operation:

### Consistency of source data and destination data

Note that while the instruction "Move block" is being executed, the source data remains unchanged; otherwise the consistency of the destination data cannot be guaranteed.

### Interruptibility

There is no limit to the nesting depth.

### Memory areas

The instruction "Move block" moves the following memory areas:

- Areas of a data block
- Bit memory
- Process image of the inputs
- Process image of the outputs

### General rules for moving

The source and destination areas must not overlap. If the source and destination area have different lengths, only the length of the smaller area will be moved.

If the source area is smaller than the destination area, the entire source area will be written to the destination area. The remaining bytes of the destination area remain unchanged.

If the destination area is smaller than the source area, the entire destination area will be written. The remaining bytes of the source area are ignored.

If a block of data type BOOL is moved, the tag must be addressed absolutely and the specified length of the area must be divisible by 8, otherwise the instruction cannot be executed.

### Rules for moving character strings

You can use the "Move block" instruction to move source and destination areas of the STRING data type. If only the source area is of data type STRING, the characters will be moved that are actually contained in the character string. Information on the actual and maximum length is also written to the destination area. If the source and destination area are both STRING data type, the current length of the character string in the destination area is set to the number of characters actually moved.

If you want to move the information on the maximum and actual length of a character string, specify the areas in bytes in the SRCBLK and DSTBLK parameters.

### Syntax

The following syntax is used for the "Move block" instruction:

```
SCL  
BLKMOV (SRCBLK:= <Operand>,  
        DSTBLK => <Operand>)
```

## Parameter

The following table shows the parameters of the "Move block" instruction:

Parameter	Declaration	Data type	Description
SRCBLK	Input	VARIANT	Specifies the memory area to be moved (source area).
DSTBLK	Output	VARIANT	Specifies the memory area to which the block is to be moved (destination area).
Function value (RET_VAL)		INT	Error information

For additional information on valid data types, refer to "See also".

## RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
8152	The data types WSTRING, WCHAR and BOOL are not supported.
8092	The source or target area is only available in the load memory.
General error information	See also: "GET_ERR_ID: Get error ID locally"
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

## See also

Overview of the valid data types (Page 1262)

GET\_ERR\_ID: Get error ID locally (Page 2520)

## UBLKMOV: Move block uninterruptible

### Description

The instruction "Move block uninterruptible" copies the contents of a memory area (source area) to another memory area (destination area). The move operation takes place in the direction of ascending addresses. You use VARIANT to define the source and destination areas.

The move operation cannot be interrupted by other operating system activities. As a result the interrupt reaction time of the CPU can increase during the execution of the instruction "Move block uninterruptible".

---

**Note**

The tags of the instruction can only be used in data blocks in which the attribute "Optimized block access" is not set. If the tag with the retentive setting "Set in IDB" has been declared, you can also use the tags "with optimized access".

---

## Memory areas

The instruction "Move block uninterruptible" copies the following memory areas:

- Areas of a data block
- Bit memory
- Process image of the inputs
- Process image of the outputs

## General rules for moving

The source and destination area must not overlap during the execution of the instruction "Move block uninterruptible". If the source area is smaller than the destination area, the entire source area will be written to the destination area. The remaining bytes of the destination area remain unchanged.

If the destination area is smaller than the source area, the entire destination area will be written. The remaining bytes of the source area are ignored.

If a source or destination area defined as a formal parameter is less than a destination or source area specified at the SRCBLK or DSTBLK parameter, no data is transferred.

If a block of data type BOOL is moved, the tag must be addressed absolutely and the specified length of the area must be divisible by 8, otherwise the instruction cannot be executed.

You can use the "Move block uninterruptible" instruction to move a maximum of 16 KB. Note the CPU-specific restrictions for this.

## Rules for moving character strings

The instruction "Move block uninterruptible" copies source and destination areas of the data type STRING. If only the source area is of data type STRING, the characters will be moved that are actually contained in the character string. Information on the actual and maximum length are not written in the destination area. If the source and destination area are both STRING data type, the current length of the character string in the destination area is set to the number of characters actually moved. If areas of the STRING data type are moved, specify "1" as the area length.

## Syntax

The following syntax is used for the "Move block uninterruptible" instruction:

```
SCL
UBLKMOV (SRCBLK:= <Operand>,
        DSTBLK => <Operand>)
```

## Parameter

The following table shows the parameters of the "Move block uninterruptible" instruction:

Parameter	Declaration	Data type	Description
SRCBLK	Input	VARIANT	Specifies the memory area to be moved (source area).
DSTBLK	Output	ANY	Specifies the memory area to which the block is to be moved (destination area).
Function value (RET_VAL)		VARIANT	Error information

For additional information on valid data types, refer to "See also".

## RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code (W#16#...)	Explanation
0000	No error
8152	The data types WSTRING, WCHAR and BOOL are not supported.
8091	The source area is in a data block that is not relevant for program execution.
General error information	See also: "GET_ERR_ID: Get error ID locally"

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

## See also

Overview of the valid data types (Page 1262)

**FILL: Fill block**

**Description**

The instruction "Fill block" fills a memory area (destination area) with the content of another memory area (source area). The instruction "Fill block" moves the content of the source area to the destination area until the destination area is completely written. The move operation takes place in the direction of ascending addresses.

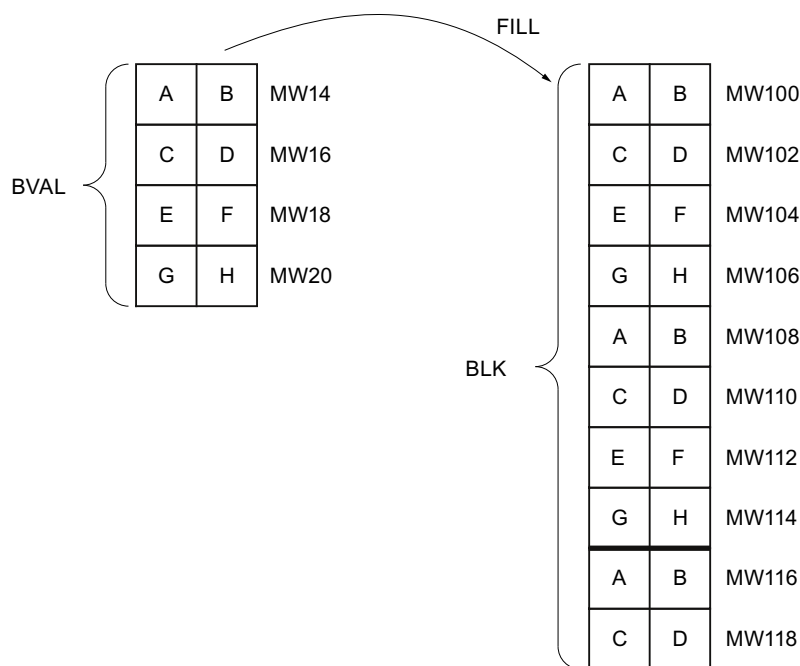

You use VARIANT to define the source and destination areas.

**Note**

The tags of the instruction can only be used in data blocks in which the attribute "Optimized block access" is not set. If the tag with the retentive setting "Set in IDB" has been declared, you can also use the tags "with optimized access".

For blocks with the "Optimized block access" attribute, you can use the "FILL\_BLK: Fill block" instruction.

The following figure shows the principle of the move operation:

Example: The contents of the range MW100 to MW118 are to be preassigned with the contents of the memory words MW14 to MW20.

**Consistency of source data and destination data**

Note that while the instruction "Fill block" is being executed, the source data remains unchanged; otherwise the consistency of the destination data cannot be guaranteed.

## Memory areas

The instruction "Fill block" copies the following memory areas:

- Areas of a data block
- Bit memory
- Process image of the inputs
- Process image of the outputs

The instruction "Fill block" copies the following memory areas:

- Instructions, system data blocks
- Counters
- Timers
- Memory areas of the I/O area

## General rules for moving

The source and destination areas must not overlap. If the destination area to be preset is not an integer multiple of the length of the input parameter BVAL, the destination area is nevertheless written up to the last byte.

If the destination area to be preset is smaller than the source area, the function only copies as much data as can be written to the destination area.

If the destination or source block actually present is smaller than the assigned memory area for the source or destination area (BVAL, BLK parameters), no data will be transferred.

If the ANY pointer (source or destination) is of the data type BOOL, it must be addressed absolutely and the length specified must be divisible by 8; otherwise the instruction is not executed.

If the destination area is STRING data type, the instruction writes the entire string including the administration information.

## Syntax

The following syntax is used for the instruction "Fill block":

```
SCL  
FILL(BVAL:= <Operand>,  
      BLK => <Operand>)
```

**Parameter**

The following table shows the parameters of the "Fill block" instruction:

Parameter	Declaration	Data type	Description
BVAL	Input	VARIANT	Specification of the memory area (source area) with whose content the destination area on the BLK parameter will be filled.
BLK	Output	VARIANT	Specification of the memory area that will be filled with the content of the source area.
Function value (RET_VAL)		INT	Error information

For additional information on valid data types, refer to "See also".

**BVAL Parameter**

When you transfer a structure as an input parameter, remember that the length of a structure is always based on an even number of bytes. The structure will need one byte of additional memory space if you declare a structure with an odd number of bytes.

**RET\_VAL parameter**

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code (W#16#...)	Explanation
0000	No error
8152	The data types WSTRING, WCHAR and BOOL are not supported.
General error information	See also: "GET_ERR_ID: Get error ID locally"
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

**See also**

- Overview of the valid data types (Page 1262)
- GET\_ERR\_ID: Get error ID locally (Page 2520)

## Conversion operations

### CONVERT: Convert value

#### Description

Use the "Convert value" instruction to program explicit conversions. You determine the data types to be converted in a dialogue box with opens automatically when you insert the instruction. When executed, the instruction reads the source value and converts it into the specified target value.

For information on possible conversions, refer to section "Explicit conversion" under "See also".

#### Note

For S7-1500 CPU: You can select the data types DWORD and LWORD if REAL or LREAL were selected as IN data type.

#### Syntax

The following syntax is used for the "Convert value" instruction:

#### SCL

```
<Target_value> := <Conversion_function>(<Source_value>);
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
<Source_value>	Input, constant	Bit strings, integers, floating-point numbers, TIME, DATE, TOD, DTL, strings	Bit strings, integers, floating-point numbers, TIME, LTIME, DATE, TOD, LTOD, DTL, strings	Value to be converted.
<Conversion_function>	-	-	-	Function that specifies the data type to be converted .
<Target_value>	Output	Bit strings, integers, floating-point numbers, TIME, DATE, TOD, DTL, strings	Bit strings, integers, floating-point numbers, TIME, LTIME, DATE, TOD, LTOD, DTL, strings	Result of the conversion

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

```
SCL
"Tag_INT" := REAL_TO_INT("Tag_REAL");
```

The following table shows how the instruction works using specific operand values:

Operand	Data type	Value
Tag_REAL	REAL	20.56
Tag_INT	INT	21

During the conversion, the value of the "Tag\_REAL" operand will be rounded to the nearest integer and saved in the "Tag\_INT" operand.

**See also**

- Overview of the valid data types (Page 1262)
- Operators and operator precedence (Page 1544)

**ROUND: Round numerical value**

**Description**

The "Round numerical value" instruction is used to round the value at input IN to the nearest integer. The instruction interprets the value at input IN as a floating-point number and converts it into an integer or floating-point number. If the input value is exactly between an even and odd number, the even number is selected.

**Syntax**

The following syntax is used for the "Round numerical value" instruction:

```
SCL
ROUND(<Expression>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Input value to be rounded.
Function value		Integers, floating-point numbers	Result of the rounding

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL
"Tag_Result" := ROUND("Tag_Value");
```

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value	
Tag_Value	1.50000000	-1.50000000
Tag_Result	2	-2

## See also

Overview of the valid data types (Page 1262)

Operators and operator precedence (Page 1544)

## CEIL: Generate next higher integer from floating-point number

### Description

Use the "Generate next higher integer from floating-point number" instruction to round the value to the nearest integer. The instruction interprets the input value as floating-point number and converts it to the next higher integer. The function value can be greater than or equal to the input value.

### Syntax

The following syntax is used for the "Generate next higher integer from floating-point number" instruction:

```
SCL
CEIL(<Expression>)
CEIL_<Data type>(<Expression>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Input value
_<Data type>		Integers, floating-point numbers. Default: DINT	Data type of the function value: <ul style="list-style-type: none"> <li>You do not need to specify the data type if using the default.</li> <li>Any other valid data type you may use must be declared explicitly.</li> </ul>
Function value		Integers, floating-point numbers	Input value rounded up

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```

SCL
"Tag_Result1" := CEIL("Tag_Value");
"Tag_Result2" := CEIL_REAL("Tag_Value");
    
```

The following table shows how the instruction works using specific operand values:

Operand	Value	
Tag_Value	0.5	-0.5
Tag_Result1	1	0
Tag_Result2	1.0	0.0

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

### See also

- Overview of the valid data types (Page 1262)
- Expressions (Page 1538)
- Operators and operator precedence (Page 1544)

## FLOOR: Generate next lower integer from floating-point number

### Description

Use the "Generate next lower integer from floating-point number" instruction to round the value of a floating point number to the next lower integer. The instruction interprets the input value as floating-point number and converts it to the next lower integer. The function value can be equal or less than the input value.

## Syntax

Use the following syntax for the "Generate next lower integer from floating-point number" instruction:

```
SCL
FLOOR(<Expression>)
FLOOR_<data type>(<expression>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Input value
_<Data type>		Integers, floating-point numbers. Default: DINT	Data type of the function value: <ul style="list-style-type: none"> <li>You do not need to specify the data type if using the default.</li> <li>Any other valid data type you may use must be declared explicitly.</li> </ul>
Function value		Integers, floating-point numbers	Input value rounded

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL
"Tag_Result1" := FLOOR("Tag_Value");
"Tag_Result2" := FLOOR_REAL("Tag_Value");
```

The following table shows how the instruction works using specific operand values:

Operand	Value	
Tag_Value	0.5	-0.5
Tag_Result1	0	-1
Tag_Result2	0.0	-1.0

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

## See also

Overview of the valid data types (Page 1262)

Expressions (Page 1538)

Operators and operator precedence (Page 1544)

## TRUNC: Truncate numerical value

### Description

The "Truncate numerical value" instruction is used to generate an integer from the input value without rounding. The instruction selects only the integer part of the input value and returns this part without decimal places as the function value.

### Syntax

The following syntax is used for the "Truncate numerical value" instruction:

**SCL**

TRUNC (<Expression>)

TRUNC\_<Data type> (<Expression>)

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Input value
_<Data type>		Integers, floating-point numbers Default: DINT	Data type of the function value: <ul style="list-style-type: none"> <li>You do not need to specify the data type if using the default.</li> <li>Any other valid data type you may use must be declared explicitly.</li> </ul>
Function value		Integers, floating-point numbers	Integer component of the input value

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

**SCL**

"Tag\_Result1" := TRUNC ("Tag\_Value1");

"Tag\_Result2" := TRUNC ("Tag\_Value2"+"Tag\_Value3");

"Tag\_Result3" := TRUNC\_SINT ("Tag\_Value4");

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Value1	-1.5
Tag_Result1	-1
Tag_Value2	2.1

Operand	Value
Tag_Value3	3.2
Tag_Result2	5
Tag_Result3	2
Tag_Value4	2.4

## See also

Overview of the valid data types (Page 1262)

Operators and operator precedence (Page 1544)

## SCALE\_X: Scale

### Description

Use the "Scale" instruction to scale a floating-point number by mapping it to a specific value range. You specify the value range with the MIN and MAX parameters. The result of the scaling is an integer.

The following figure shows an example of how values can be scaled:

The instruction "Scale" works with the following equation:

$$\text{OUT} = [\text{VALUE} * (\text{MAX} - \text{MIN})] + \text{MIN}$$

### Note

For more information on the conversion of analog values, refer to the respective manual.

**Syntax**

The following syntax is used for the "Scale" instruction:

```

SCL
SCALE_X(MIN := <Operand>,
        VALUE := <Operand>,
        MAX := <Operand>)
SCALE_X_<Data type>(MIN := <Operand>,
                    VALUE := <Operand>,
                    MAX := <Operand>)
    
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
MIN	Input	Integers, floating-point numbers	Low limit of the value range
VALUE	Input	Floating-point numbers	Value to be scaled. If you enter a constant, you must declare it.
MAX	Input	Integers, floating-point numbers	High limit of the value range
_<Data type>		Integers, floating-point numbers Default: INT	Data type of the function value: <ul style="list-style-type: none"> <li>You do not need to specify the data type if using the default.</li> <li>Any other valid data type you may use must be declared explicitly.</li> </ul>
Function value		Integers, floating-point numbers	Result of scaling

For additional information on valid data types, refer to "See also".

For additional information on declaring constants, refer to "See also".

**Example**

The following example shows how the instruction works:

```

SCL
"Tag_Result1" := SCALE_X(MIN := "Tag_Value1",
                        VALUE := "Tag_Real",
                        MAX := "Tag_Value2");
"Tag_Result2" := SCALE_X_REAL(MIN := "Tag_Value1",
                              VALUE := "Tag_Real",
                              MAX := "Tag_Value2");
    
```

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Real	0.5
Tag_Value1	10
Tag_Value2	30
Tag_Result1	20
Tag_Result2	20.0

## See also

Overview of the valid data types (Page 1262)

Operators and operator precedence (Page 1544)

Declaring global constants (Page 1378)

## NORM\_X: Normalize

### Description

You can use the instruction "Normalize" to normalize the value of the tag at the VALUE input by mapping it to a linear scale. You can use the MIN and MAX parameters to define the limits of a value range that is applied to the scale. Depending on the location of the normalized value in this value range, the result at output OUT is calculated and stored as a floating-point number. If the value to be normalized equals the value at input MIN, the instruction returns the result "0.0". If the value to be normalized equals the value at input MAX, the instruction returns the result "1.0".

The following figure shows an example of how values can be normalized:

The "Normalize" instruction works with the following equation:

$$OUT = (VALUE - MIN) / (MAX - MIN)$$

**Note**

For more information on the conversion of analog values, refer to the respective manual.

**Syntax**

The following syntax is used for the "Normalize" instruction:

```

SCI
NORM_X(MIN := <Operand>,
        VALUE := <Operand>,
        MAX := <Operand>)
NORM_X_<Data type>(MIN := <Operand>,
                    VALUE := <Operand>,
                    MAX := <Operand>)
    
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
MIN <sup>1)</sup>	Input	Integers, floating-point numbers	Low limit of the value range
VALUE <sup>1)</sup>	Input	Integers, floating-point numbers	Value to be normalized.
MAX <sup>1)</sup>	Input	Integers, floating-point numbers	High limit of the value range
_<Data type>		Floating-point numbers Default: REAL	Data type of the function value: <ul style="list-style-type: none"> <li>You do not need to specify the data type if using the default.</li> <li>Any other valid data type you may use must be declared explicitly.</li> </ul>
Function value		Floating-point numbers	Result of the normalization
<sup>1)</sup> If you use constants in these three parameters, you only need to declare one of them.			

For additional information on valid data types, refer to "See also".

For additional information on declaring constants, refer to "See also".

## Example

The following example shows how the instruction works:

```

SCL
"Tag_Result1" := NORM_X(MIN := "Tag_Value1",
                        VALUE := "Tag_InputValue",
                        MAX := "Tag_Value2");
"Tag_Result2" := NORM_X_LREAL(MIN := "Tag_Value1",
                              VALUE := "Tag_InputValue",
                              MAX := "Tag_Value2");

```

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_InputValue	20
Tag_Value1	10
Tag_Value2	30
Tag_Result1	0.5
Tag_Result2	0.5

## VARIANT instructions

### VARIANT\_TO\_DB\_ANY: Convert VARIANT to DB\_ANY

#### Description

The instruction "Convert VARIANT to DB\_ANY" is used to read the number of the data block from a VARIANT and convert it to the data type DB\_ANY.

**Requirements**

If the conditions are met, the instruction is executed. If the conditions are not met, "0" is output as data block number.

The output tag...	homed...	Conversion options
VARIANT	...a data block which is an instance data block of an UDT or SDT	The output tag can be converted to a data block number.
VARIANT	...an Array DB	The output tag can be converted to a data block number.
VARIANT	...an object with an elementary data type	It is not possible to convert the output tag to a database number because a data block can never comprise only one elementary data type.
VARIANT	...a structure within a data block	It is not possible to convert the output tags to a database number because it is only a part within the data block.

**Syntax**

The following syntax is used for the "Convert VARIANT To DB\_ANY" instruction:

```

SCL
VARIANT_TO_DB_ANY(IN := <Operand>,
                  ERR => <Operand>)
    
```

**Parameter**

The following table shows the parameters of the "Convert VARIANT to DB\_ANY" instruction:

Parameter	Declaration	Data type	Description
IN	Input	VARIANT	Tag to be read
ERR	Output	INT	Error information
Function value		DB_ANY	Result: Number of the DB

For additional information on valid data types, refer to "See also".

**ERR parameter**

The following table shows the meaning of the values of the ERR parameter:

Error code* (W#16#...)	Explanation
0000	No error
252C	The VARIANT data type has the value "0"
8130	The number of the data block is "0"

Error code* (W#16#...)	Explanation
8131	The data block does not exist
8132	The data block is too short
8134	The data block is write protected
8150	The VARIANT data type has the value "0"
8154	The data type is not correctly declared
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

## Example

The following example shows how the instruction works:

### SCL

```
"Tag_Result" := VARIANT_TO_DB_ANY(IN := "Tag_In",
                                ERR := "Tag_Err");
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_In	The data type of the Tag_In operand is VARIANT. The value is read.
<Function value>	Tag_Result	Number of the block is output.

The third element is read from "Tag\_In" operand and written to the "Tag\_Result" operand.

## DB\_ANY\_TO\_VARIANT: Convert DB\_ANY to VARIANT

### Description

The instruction "Convert DB\_ANY to VARIANT" is used to read the number of the data block from a DB\_ANY and convert it to the data type VARIANT.

### Requirements

If the conditions are met, the instruction is executed. If the conditions are not met or the data block does not exist, the value "0" is output. All additional accesses to this value "0" fail.

The output tag...	homed...	Conversion options
DB_ANY	...a data block which is an instance data block of an UDT or SDT	It is possible to convert the output tag to the VARIANT data type.
DB_ANY	...a DB which is an ARRAY DB	It is possible to convert the output tag to the VARIANT data type.
DB_ANY	...a data block which is an instance data block of a function block or a global data block	It is not possible to convert the output tags to the VARIANT data type.

### Syntax

The following syntax is used for the "Convert DB\_ANY to VARIANT" instruction:

#### SCL

```
DB_ANY_TO_VARIANT(IN := <Operand>,
                  ERR => <Operand>)
```

### Parameter

The following table shows the parameters of the "Convert DB\_ANY to VARIANT" instruction:

Parameter	Declaration	Data type	Description
IN	Input	DB_ANY	Tag to be read
ERR	Output	INT	Error information
Function value		VARIANT	Result

For additional information on valid data types, refer to "See also".

### ERR parameter

The following table shows the meaning of the values of the ERR parameter:

Error code* (W#16#...)	Explanation
0000	No error
8130	The number of the data block is "0"
8131	The data block does not exist
8132	The data block is too short
8134	The data block is write protected

Error code* (W#16#...)	Explanation
8154	The data type is not correctly declared
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

## Example

The following example shows how the instruction works:

### SCL

```
"Tag_Result" := DB_ANY_TO_VARIANT(IN := "Tag_In",
                                   ERR := "Tag_Err");
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_In	The data type of the Tag_In operand is DB_ANY. The value is read.
<Function value>	Tag_Result	Number of the block is converted and output to the VARIANT data type.

The third element is read from "Tag\_In" operand and written to the "Tag\_Result" operand.

Overview of the valid data types (Page 1262)

Operators and operator precedence (Page 1544)

## Other

## SCALE: Scale

### Description

The instruction "Scale" converts the integer on the parameter IN into a floating-point number, which can be scaled in physical units between a low and a high limit. You can use the LO\_LIM and HI\_LIM parameters to specify the low limit and high limit of the value range to which the input value is scaled. The result of the instruction is output on the OUT parameter.

The instruction "Scale" works with the following equation:

$$\text{OUT} = [((\text{FLOAT}(\text{IN}) - \text{K1}) / (\text{K2} - \text{K1})) * (\text{HI\_LIM} - \text{LO\_LIM})] + \text{LO\_LIM}$$

The values of the "K1" and "K2" constants are determined by the signal state on the BIPOLAR parameter. The following signal states are possible on the BIPOLAR parameter:

- Signal state "1": It is assumed that the value at the IN parameter is bipolar and in a value range between -27648 and 27648. In this case the "K1" constant has the value "-27648.0" and the "K2" constant the value "+27648.0".
- Signal state "0": It is assumed that the value at the IN parameter is unipolar and in a value range between 0 and 27648. In this case the "K1" constant has the value "0.0" and the "K2" constant the value "+27648.0".

When the value at the IN parameter is greater than the value of the "K2" constant, the result of the instruction is set to the value of the high limit (HI\_LIM) and an error is output.

When the value at the IN parameter is less than the value of the "K1" constant, the result of the instruction is set to the value of the low limit value (LO\_LIM) and an error is output.

When the indicated low limit is greater than the high limit (LO\_LIM > HI\_LIM), the result is scaled in reverse proportion to the input value.

## Syntax

The following syntax is used for the "Scale" instruction:

```

SCL
SCALE (IN:= <Expression>,
      HI_LIM := <Operand>,
      LO_LIM := <Operand>,
      BIPOLAR := <Operand>,
      OUT => <Operand>)
    
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
IN	Input	INT	Input value to be scaled.
HI_LIM	Input	REAL	High limit
LO_LIM	Input	REAL	Low limit
BIPOLAR	Input	BOOL	Indicates if the value at the IN parameter is to be interpreted as bipolar or unipolar. The parameter can assume the following values: 1: Bipolar 0: Unipolar
OUT	Output	REAL	Result of the instruction
Function value (RET_VAL)		WORD	Error information

For additional information on valid data types, refer to "See also".

## RET\_VAL Parameter

The following table shows the meaning of the values of the parameter RET\_VAL:

Error code (W#16#...)	Explanation
0000	No error
0008	The value of the parameter IN is greater than 27 648 or is less than 0 (unipolar) or -27 648 (bipolar).
General error information	See also: "GET_ERR_ID: Get error ID locally"
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

## Example

The following example shows how the instruction works:

```
"Tag_ErrorCode" := SCALE(IN := "Tag_InputValue",
    HI_LIM := "Tag_HighLimit"
    LO_LIM := "Tag_LowLimit"
    BIPOLAR := "Tag_Bipolar",
    OUT => "Tag_Result");
```

The error information is returned in the operand "Tag\_ErrorCode" as a function value.

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_InputValue	22
HI_LIM	Tag_HighLimit	100.0
LO_LIM	Tag_LowLimit	0.0
BIPOLAR	Tag_Bipolar	1
OUT	Tag_Result	50.03978588
RET_VAL	Tag_ErrorCode	W#16#0000

## See also

Expressions (Page 1538)

Operators and operator precedence (Page 1544)

GET\_ERR\_ID: Get error ID locally (Page 2520)

## UNSCALE: Unscale

### Description

The instruction "Unscale" unscales the floating-point number on the IN parameter in physical units between a low and a high limit and converts them into an integer. You can use the LO\_LIM and HI\_LIM parameters to specify the low limit and high limit of the value range to which the input value is unscaled. The result of the instruction is output on the OUT parameter.

The instruction "Unscale" works with the following equation:

$$OUT = [((IN-LO\_LIM)/(HI\_LIM-LO\_LIM)) * (K2-K1)] + K1$$

The values of the "K1" and "K2" constants are determined by the signal state on the BIPOLAR parameter. The following signal states are possible on the BIPOLAR parameter:

- Signal state "1": It is assumed that the value at the IN parameter is bipolar and in a value range between -27648 and 27648. In this case the "K1" constant has the value "-27648.0" and the "K2" constant the value "+27648.0".
- Signal state "0": It is assumed that the value at the IN parameter is unipolar and in a value range between 0 and 27648. In this case the "K1" constant has the value "0.0" and the "K2" constant the value "+27648.0".

When the value at the IN parameter is greater than the value of the "HI\_LIM" constant, the result of the instruction is set to the value of the constant (K2) and an error is output.

When the value at the IN parameter is less than the value of the constant of the low limit (LO\_LIM), the result of the instruction is set to the value of the constant (K1) and an error is output.

### Syntax

The following syntax is used for the instruction "Unscale":

```

SCL
UNSCALE (IN := <Expression>,
         HI_LIM := <Operand>,
         LO_LIM := <Operand>,
         BIPOLAR := <Operand>,
         OUT => <Operand>)
    
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
IN	Input	REAL	Input value to be unscaled to an integer value.
HI_LIM	Input	REAL	High limit
LO_LIM	Input	REAL	Low limit

Parameter	Declaration	Data type	Description
BIPOLAR	Input	BOOL	Indicates if the value at the IN parameter is to be interpreted as bipolar or unipolar. The parameter can assume the following values: 1: Bipolar 0: Unipolar
OUT	Output	INT	Result of the instruction
Function value (RET_VAL)		WORD	Error information

For additional information on valid data types, refer to "See also".

### RET\_VAL Parameter

The following table shows the meaning of the values of the parameter RET\_VAL:

Error code (W#16#...)	Explanation
0000	No error
0008	The value of the IN parameter is greater than the value of the high limit (HI_LIM) or less than the value of the low limit (LO_LIM).
General error information	See also: "GET_ERR_ID: Get error ID locally"

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

### Example

The following example shows how the instruction works:

```

SCI
"Tag_ErrorCode" := UNSCALE(IN := "Tag_InputValue",
                           HI_LIM := "Tag_HighLimit"
                           LO_LIM := "Tag_LowLimit"
                           BIPOLAR := "Tag_Bipolar",
                           OUT => "Tag_Result");

```

The error information is returned in the operand "Tag\_ErrorCode" as a function value.

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_InputValue	50.03978588
HI_LIM	Tag_HighLimit	100.0
LO_LIM	Tag_LowLimit	0.0
BIPOLAR	Tag_Bipolar	1

Parameter	Operand	Value
OUT	Tag_Result	22
RET_VAL	Tag_ErrorCode	W#16#0000

**Program control operations**

**IF: Run conditionally**

**Description**

The instruction "Run conditionally" branches the program flow depending on a condition. The condition is an expression with Boolean value (TRUE or FALSE). Logical expression or comparative expressions can be stated as conditions.

When the instruction is executed, the stated expressions are evaluated. If the value of an expression is TRUE, the condition is fulfilled; if the value is FALSE, it is not fulfilled.

**Syntax**

Depending on the type of branch, you can program the following forms of the instruction:

- Branch through IF:

**SCL**

```
IF <Condition> THEN <Instructions>  
END_IF;
```

If the condition is satisfied, the instructions programmed after the THEN are executed. If the condition is not satisfied, the execution of the program continues with the next instruction after the END\_IF.

- Branch through IF and ELSE:

**SCL**

```
IF <Condition> THEN <Instructions1>  
ELSE <Instructions0>;  
END_IF;
```

If the condition is satisfied, the instructions programmed after the THEN are executed. If the condition is not satisfied, the instructions programmed after the ELSE are executed. Then the execution of the program continues with the next instruction after the END\_IF.

- Branch through IF, ELSIF and ELSE:

**SCL**

```
IF <Condition1> THEN <Instructions1>
ELSIF <Condition2> THEN <Instruction2>
ELSE <Instructions0>;
END_IF;
```

If the first condition (<Condition1>) is satisfied, the instructions (<Instructions1>) after the THEN are executed. After execution of the instructions, the execution of the program continues after the END\_IF.

If the first condition is not satisfied, the second condition (<Condition2>) is checked. If the second condition (<Condition2>) is fulfilled, the instructions (<Instructions2>) after the THEN are executed. After execution of the instructions, the execution of the program continues after the END\_IF.

If none of the conditions are fulfilled, the instructions (<Instructions0>) after ELSE are executed followed by the execution of the program after END\_IF.

You can nest as many combinations of ELSIF and THEN as you like within the IF instruction. The programming of an ELSE branch is optional.

The syntax of the IF instruction consists of the following parts:

Parameter	Data type	Description
<Condition>	BOOL	Expression to be evaluated
<Instructions>	-	Instructions to be executed with satisfied condition. An exception are instructions programmed after the ELSE. These are executed if no condition within the program loop is satisfied.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

**SCL**

```
IF "Tag_1" = 1
THEN "Tag_Value" := 10;
ELSIF "Tag_2" = 1
THEN "Tag_Value" := 20;
ELSIF "Tag_3" = 1
THEN "Tag_Value" := 30;
ELSE "Tag_Value" := 0;
END_IF;
```

The following table shows how the instruction works using specific operand values:

Operand	Value			
	1	0	0	0
Tag_1	1	0	0	0
Tag_2	0	1	0	0

Operand	Value			
Tag_3	0	0	1	0
Tag_Value	10	20	30	0

**See also**

Operators and operator precedence (Page 1544)

Overview of the valid data types (Page 1262)

**CASE: Create multiway branch**

**Description**

The instruction "Create multiway branch" executes one of several instruction sequences depending on the value of a numerical expression.

The value of the expression must be an integer. When the instruction is executed, the value of the expression is compared with the values of several constants. If the value of the expression agrees with the value of a constant, the instructions programmed directly after this constant are executed. The constants can assume the following values:

- An integer (for example, 5)
- A range of integers (for example, 15..20)
- An enumeration consisting of integers and ranges (for example, 10, 11, 15..20)

**Syntax**

The following syntax is used for the "Create multiway branch" instruction:

```
SCL  
CASE <expression> OF  
<Constant1>: <Instructions1>  
<Constant2>: <Instructions2>  
<ConstantX>: <InstructionsX>; // X >=3  
ELSE <Instructions0>;  
END_CASE;
```

The syntax of the instruction consists of the following parts:

Parameter	Data type	Description
<expression>	Integers	Value which is compared to the programmed constant values.
<Constant>	Integers	Constant values which form the condition for the execution of an instruction sequence. The constants can assume the following values: <ul style="list-style-type: none"> <li>• An integer (for example, 5)</li> <li>• A range of integers (for example, 15..20)</li> <li>• An enumeration consisting of integers and ranges (for example, 10, 11, 15..20)</li> </ul>
<Instruction>	-	Any instructions which are executed if the value of the expression agrees with the value of a constant. An exception are instructions programmed after the ELSE. These instructions are executed if the values do not agree.

For additional information on valid data types, refer to "See also".

If the value of the expression agrees with the value of the first constant (<Constant1>), the instructions (<Instructions1>) which are programmed directly after the first constant are executed. Program execution subsequently resumes after the END\_CASE.

If the value of the expression does not agree with the value of the first constant (<Constant1>), this value is compared to the value of the constant which is programmed next. In this way, the CASE instruction is executed until the values agree. If the value of the expression does not correspond to any of the programmed constant values, the instructions (<Instructions0>) which are programmed after the ELSE are executed. ELSE is an optional part of the syntax and can be omitted.

The CASE instruction can also be nested by replacing an instruction block with CASE. END\_CASE represents the end of the CASE instruction.

## Example

The following example shows how the instruction works:

```

SCL
CASE "Tag_Value" OF
  0 :
    "Tag_1" := 1;
  1, 3, 5 :
    "Tag_2" := 1;
  6..10 :
    "Tag_3" := 1;
  16, 17, 20..25 :
    "Tag_4" := 1;
ELSE "Tag_5" := 1;
END_CASE;

```

The following table shows how the instruction works using specific operand values:

Operand	Values				
Tag_Value	0	1, 3, 5	6, 7, 8, 9, 10	16,17, 20, 21, 22, 23, 24, 25	2
Tag_1	1	-	-	-	-
Tag_2	-	1	-	-	-
Tag_3	-	-	1	-	-
Tag_4	-	-	-	1	-
Tag_5	-	-	-	-	1
1: The operand is set to the signal state "1". -: The signal state of the operand remains unaltered.

- CONTINUE: Recheck loop condition (Page 2507)
- Overview of the valid data types (Page 1262)
- Operators and operator precedence (Page 1544)
- EXIT: Exit loop immediately (Page 2508)

**FOR: Run in counting loop**

**Description**

The instruction "Run in counting loop" causes repeated execution of a program loop until a loop variable lies within a specified value range.

Program loops can also be nested. Within a program loop, you can program additional program loops with other loop variables.

The current continuous run of a program loop can be ended by the instruction "Recheck loop condition" (CONTINUE). The instruction "Exit loop immediately" (EXIT) ends the entire loop execution. For additional information on this topic, refer to "See also".

**Limits for FOR statements**

To program "safe" FOR statements that do not run endlessly, observe the following rules and limits:

**Rule**

FOR ii := Start TO End BY Step DO

If ...	... then	Note
start < end	end < (PMAX step)	Run tag ii runs in a positive direction
start > end AND step < 0	end > (NMAX step)	Run tag ii runs in a negative direction

## Limits

Different limits apply to the possible data types:

Data type	PMAX	NMAX
ii of type SINT	127	-128
ii of type INT	32767	-32768
ii of type DINT	2147483647	-2147483648
ii of type LINT	9223372036854775807	-9223372036854775808

## Syntax

The following syntax is used for the "Run in counting loop" instruction:

### SCL

```
FOR<Run_tag> := <Start_value> TO<End_value> BY<Increment> DO<Instructions>
END_FOR;
```

## Parameter

The following table shows the parameters of the "Run in counting loop" instruction:

Parameter	Data type		Description
	S7-1200	S7-1500	
<Run tag>	SINT, INT, DINT	SINT, INT, DINT, LINT	Operand whose value is evaluated with the loop execution. The data type of the loop variable determines the data type of the other parameters.
<Start value>	SINT, INT, DINT	SINT, INT, DINT, LINT	Expression whose value is allocated at the start of the loop execution of the loop variables.
<End value>	SINT, INT, DINT	SINT, INT, DINT, LINT	Expression whose value defines the last run of the program loop. The value of the loop variable is checked before each loop: <ul style="list-style-type: none"> <li>End value not reached: The instructions according to DO are executed</li> <li>End value is reached: The FOR loop is executed one last time</li> <li>End value exceeded: The FOR loop is completed</li> </ul> An alteration to the end value is not permitted during execution of the instruction.

Parameter	Data type		Description
	S7-1200	S7-1500	
<Increment>	SINT, INT, DINT	SINT, INT, DINT, LINT	Expression by whose value the loop variable is increased (positive increment) or decreased (negative increment) after each loop. Specification of the increment is optional. If no increment is given, the value of the loop variable is increased by 1 after each loop. An alteration of the increment is not permitted during execution of the instruction.
<Instructions>	-	-	Instructions which are carried out with each loop, as long as the value of the loop variable lies within the value range. The value range is defined by the start and end values.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```

SCL
FOR i := 2 TO 8 BY 2
    DO "a_array[i] := "Tag_Value"*"b_array[i]";
END_FOR;
    
```

The operand "Tag\_Value" is multiplied with the elements (2, 4, 6, 8) of the ARRAY tag "b\_array". The result is read in to the elements (2, 4, 6, 8) of the ARRAY tag "a\_array".

### See also

- CONTINUE: Recheck loop condition (Page 2507)
- EXIT: Exit loop immediately (Page 2508)
- Overview of the valid data types (Page 1262)
- Operators and operator precedence (Page 1544)

### WHILE: Run if condition is met

#### Description

The instruction "Run if condition is met" causes a program loop to be repeatedly executed until the implementation condition is satisfied. The condition is an expression with Boolean value (TRUE or FALSE). Logical expression or comparative expressions can be stated as conditions.

When the instruction is executed, the stated expressions are evaluated. If the value of an expression is TRUE, the condition is fulfilled; if the value is FALSE, it is not fulfilled.

Program loops can also be nested. Within a program loop, you can program additional program loops with other loop variables.

The current continuous run of a program loop can be ended by the instruction "Recheck loop condition" (CONTINUE). The instruction "Exit loop immediately" (EXIT) ends the entire loop execution. For additional information on this topic, refer to "See also".

## Syntax

The following syntax is used for the "Run if condition is met" instruction:

```
SCL
WHILE <Condition> DO <Instructions>
END_WHILE;
```

The syntax of the WHILE instruction consists of the following parts:

Parameter	Data type	Description
<Condition>	BOOL	Expression which is evaluated before each loop.
<Instructions>	-	Instructions to be executed with satisfied condition. If the condition has not been satisfied, program execution continues after END_WHILE.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL
WHILE
  "Tag_Value1" <> "Tag_Value2"
  DO "Tag_Result"
    := "Tag_Input";
END_WHILE;
```

As long as the values of the operands "Tag\_Value1" and "Tag\_Value2" do not match, the value of the operand "Tag\_Input" is allocated to the operand "Tag\_Result".

## REPEAT: Run if condition is not met

### Description

The instruction "Run if condition is not met" causes a program loop to be repeatedly executed until a termination condition is met. The condition is an expression with Boolean value (TRUE or FALSE). Logical expression or comparative expressions can be stated as conditions.

When the instruction is executed, the stated expressions are evaluated. If the value of an expression is TRUE, the condition is fulfilled; if the value is FALSE, it is not fulfilled.

The instructions are executed once, even if the termination condition is fulfilled.

Program loops can also be nested. Within a program loop, you can program additional program loops with other loop variables.

The current continuous run of a program loop can be ended by the instruction "Recheck loop condition" (CONTINUE). The instruction "Exit loop immediately" (EXIT) ends the entire loop execution. For additional information on this topic, refer to "See also".

### Syntax

The following syntax is used for the "Run if condition is not met" instruction:

```
SCL
REPEAT <Instructions>
UNTIL <Condition>END_REPEAT;
```

The syntax of the REPEAT instruction consists of the following parts:

Parameter	Data type	Description
<Instructions>	-	Instructions that are executed as long as the programmed condition has the value FALSE. The instructions are executed once, even if the termination condition is fulfilled.
<Condition>	BOOL	Expression which is evaluated after each loop. If the expression has the value FALSE, the program loop is executed once again. If the expression has the value TRUE, the program loop continues after END_REPEAT.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```
SCL
REPEAT "Tag_Result"
      := "Tag_Value";
UNTIL "Tag_Error"
END_REPEAT;
```

As long as the value of the operand "Tag\_Error" has the signal state "0", the value of the operand "Tag\_Value" is allocated to the operand "Tag\_Result".

Overview of the valid data types (Page 1262)

## CONTINUE: Recheck loop condition

### Description

The "Recheck loop condition" instruction ends the current program run of a FOR, WHILE or REPEAT loop.

After execution of the instruction, the conditions for the continuation of the program loop are evaluated again. The instruction affects the program loop which directly contains the instruction.

### Syntax

The following syntax is used for the "Recheck loop condition" instruction:

```
SCL
CONTINUE;
```

### Example

The following example shows how the instruction works:

```
SCL
FOR i
    := 1 TO 15 BY 2 DO
    IF (i < 5) THEN
        CONTINUE;
    END_IF;
    "DB10".Test[i] := 1;
END_FOR;
```

For additional information on valid data types, refer to "See also".

If the condition  $i < 5$  is satisfied, then the subsequent value allocation ("DB10".Test[i] := 1) will not be executed. The run variable (i) is increased by the increment of "2" and checked to see whether its current value lies in the programmed value range. If the run variable lies in the value range, the IF condition is evaluated again.

If the condition  $i < 5$  is not satisfied, then the subsequent value allocation ("DB10".Test[i] := 1) will be executed and a new loop started. In this case, the run variable is also increased by the increment "2" and checked.

### See also

Operators and operator precedence (Page 1544)

EXIT: Exit loop immediately (Page 2508)

Overview of the valid data types (Page 1262)

## EXIT: Exit loop immediately

### Description

The instruction "Exit loop immediately" cancels the execution of a FOR, WHILE or REPEAT loop at any point regardless of conditions. The execution of the program is continued after the end of the loop (END\_FOR, END\_WHILE, END\_REPEAT).

The instruction affects the program loop which directly contains the instruction.

### Syntax

The following syntax is used for the "Exit loop immediately" instruction:

```
SCL
EXIT;
```

### Example

The following example shows how the instruction works:

```
SCL
FOR i := 15 TO 1 BY -2 DO
IF (i < 5)
THEN EXIT;
END_IF;
"DB10".Test[i] := 1;
END_FOR;
```

For additional information on valid data types, refer to "See also".

If the condition  $i < 5$  is satisfied, then the execution of the loop will be cancelled. Program execution resumes after the END\_FOR.

If the condition  $i < 5$  is not satisfied, then the subsequent value allocation ("DB10".Test[i] := 1) will be executed and a new loop started. The run tag (i) is decreased by the increment of "-2" and it is checked whether its current value lies in the programmed value range. If the (i) run variable lies within the value range, the IF condition is evaluated again.

**GOTO: Jump****Description**

Use the instruction "Jump" to resume the execution of a program at a given point marked with a jump label.

The jump labels and the instruction "Jump" must be in the same block. The name of a jump label can only be assigned once within a block. Each jump label can be the target of several jump instructions.

A jump from the "outside" into a program loop is not permitted, but a jump from a loop to the "outside" is possible.

**Syntax**

Use the following syntax for the "Jump" instruction:

```
SCL
-----
GOTO <Jump label>
...
<Jump label>: <Instructions>
```

The syntax of the GOTO instruction consists of the following parts:

Parameter	Data type	Description
<jump label>	-	Jump label to be jumped to
<Instructions>	-	Instructions which are executed after the jump.

**Example**

The following example shows how the instruction works:

```
SCL
-----
CASE "Tag_Value" OF
1 : GOTO MyLABEL1;
2 : GOTO MyLABEL2;
3 : GOTO MyLABEL3;
ELSE GOTO MyLABEL4;
END_CASE;
MyLABEL1: "Tag_1" := 1;
```

### 9.7 References

```
SCL
MyLABEL2: "Tag_2" := 1;
MyLABEL3: "Tag_3" := 1;
MyLABEL4: "Tag_4" := 1;
```

Depending on the value of the "Tag\_Value" operand, the execution of the program will resume at the point identified by the corresponding jump label. If the operand "Tag\_Value" has the value 2, for example, program execution will resume at the jump label "MyLABEL2". The program line identified by the jump label "MyLABEL1" will be skipped in this case.

### RETURN: Exit block

#### Description

The instruction "Exit block" exits the program execution in the currently edited block and continues in the calling block.

The instruction can be omitted at the end of the block.

#### Syntax

The following syntax is used for the "Exit block" instruction:

```
SCL
RETURN;
```

#### Example

The following example shows how the instruction works:

```
SCL
IF "Tag_Error" <>0 THEN RETURN;
END_IF;
```

If the signal state of the "Tag\_Error" operand is not zero, execution of the program ends in the block currently being processed.

## (\*...\*): Inserting a comment section

### Description

You can use the "Insert comment section" instruction to add a comment section. The text within the parenthesis "(\*...\*)" is handled as a comment.

### Syntax

The following syntax is used for the "Insert comment section" instruction:

```
SCL  
|  
| (*...*)
```

### Example

The following example shows how the instruction works:

```
SCL  
|  
| (*This is a comment section.*)
```

## ENDIS\_PW: Limit and enable password legitimation

### Description

You use the "Limit and enable password legitimation" instruction to specify whether passwords configured for the CPU are legitimized or not. In this way, you can prevent legitimized connections, even if the correct password is known.

When you call the instruction and the REQ parameter has the signal state "0", the currently set state is displayed at the output parameters. If changes have been made to the input parameters, these are not transferred to the output parameters.

When you call the instruction and the REQ parameter has the signal state "1", the signal state is taken from the input parameters (F\_PWD, FULL\_PWD, R\_PWD, HMI\_PWD). FALSE means that legitimation per password is not permitted; TRUE means the password can be used.

Disable or enabling of the passwords can be allowed or prohibited individually. For example, all passwords can be prohibited except the fail-safe password. You can thus limit access options to a small user group. The output parameters (F\_PWD\_ON, FULL\_PWD\_ON,

R\_PWD\_ON, HMI\_PWD\_ON) always show the current status of the password use, regardless of the REQ parameter.

Passwords that are not configured must have the signal state TRUE at the input and return the signal state TRUE at the output. The fail-safe password can only be configured for an F-CPU and must therefore always be interconnected with the signal state TRUE in a standard CPU. If the instruction returns an error, the call has no effect and the previous lock is still in effect.

Disabled passwords can be enabled again under the following conditions:

- The CPU is reset to its factory settings.
- The front panel of the S7-1500 CPU supports a dialog that allows you to navigate to the appropriate menu in which the passwords can be enabled again.
- When you call the "Limit and enable password legitimation" instruction, the input parameter of the desired password has the signal state "1".
- Set the mode selector to STOP. The restriction to password legitimation is re-established as soon as the switch is set back to RUN.
- Plugging an empty memory card (transfer module or program card) into an S7-1200 CPU.
- The transition from POWER OFF to POWER ON disables the protection in the S7-1200 CPU. The "Limit and enable password legitimation" instruction must be called once again in the program (e.g. in the startup OB).

---

**Note**

The "Limit and enable password legitimation" instruction blocks access from HMI systems if the HMI password has not been enabled.

---

**Note**

Existing legitimized connections retain their access rights and you cannot use the "Limit and enable password legitimation" instruction to restrict them.

---

### Preventing accidental lockout of an S7-1500 CPU

The settings can be made on the front panel of the CPU and the CPU saves the most recent setting.

To prevent accidental lockout, the protection can be disabled by setting the mode switch to STOP with an S7-1500 CPU. The protection is automatically enabled again by setting mode selector to RUN without having to call the "Limit and enable password legitimation" instruction again or taking additional actions on the front panel.

### Preventing accidental lockout of an S7-1200 CPU

Because the S7-1200 CPU does not have a mode switch, protection is disabled with POWER OFF - POWER ON. This means that it is possible and advisable to prevent accidental lockout with the help of specific program sequences within your program.

To do so, program a time control either by means of a cyclic interrupt OB or a timer in the Main OB (OB 1). This gives you the option of calling the "Limit and enable password legitimation" instruction in the respective OB (e.g., OB 1 or OB 35) relatively quickly after a transition from POWER OFF to POWER ON and the associated disabling of the protection. Call the instruction in the startup OB (OB 100) to keep the time window in which the instruction is inactive and there are no limitations for password legitimation relatively small. This procedure will give you the best possible protection from unauthorized access.

If there has been an accidental lockout, you can skip the call in the startup OB (by querying an input parameter, for example) and you have the set time (for example, 10 seconds up to 1 minute) to establish a connection to the CPU before the lock becomes active once again.

If there is no timer in your program code and a lockout has occurred, insert an empty transfer card or an empty program card into the CPU. The empty transfer card or program card deletes the internal load memory of the CPU. You must then download the user program once again from STEP 7 to the CPU.

### Procedure for lost passwords with an S7-1200 CPU

If you have lost the password for a password-protected S7-1200 CPU, delete the password-protected program with an empty transfer card or program card. The empty transfer card or program card deletes the internal load memory of the CPU. You can then load a new user program from STEP 7 Basic in the CPU.

#### WARNING

##### Inserting an empty transfer card

When you insert a transfer card in a CPU during runtime, the CPU goes to STOP mode. If operating states are unstable, controllers may fail and thus cause the uncontrolled operation of the controlled devices. This leads to an unforeseen operation of the automation system which can cause deadly or serious injuries and/or damage to property.

Once you have pulled the transfer card, the content of the transfer card is available in the internal load memory. Make sure that the card does not include a program at this point.

#### WARNING

##### Inserting an empty program card

When you insert a program card in a CPU during runtime, the CPU goes to STOP mode. If operating states are unstable, controllers may fail and thus cause the uncontrolled operation of the controlled devices. This leads to an unforeseen operation of the automation system which can cause deadly or serious injuries and/or damage to property.

Make sure that the program card is empty. The internal load memory is copied to the empty program card. Once you have pulled the previously empty program card, the internal load memory is empty.

You must remove the transfer card or program card before you put the CPU into RUN mode.

**Effects of password use on the operating modes**

The following table shows what effects the password use by means of the "Limit and enable password legitimization" instruction has on the operating modes and the corresponding user actions.

Action	Password protection by means of the instruction
Basic state after <ul style="list-style-type: none"> <li>• Operating mode switch to STOP</li> <li>• Reset memory manually (PG, switch, change of MC (Motion Control))</li> <li>• Reset to factory setting</li> </ul>	Not activated (no restrictions)
Basic state after POWER ON	<ul style="list-style-type: none"> <li>• S7-1200 CPU: The lock is disabled and the instruction must be called once again in the program (e.g., in the startup OB).</li> <li>• S7-1500 CPU: Enabled (if a lock was activated before POWER OFF). The option of not allowing passwords is retentive.</li> </ul>
Operating mode transition RUN/STARTUP/HOLD -> STOP (by terminating the instruction, an error or communication) or STOP -> STARTUP/RUN/HOLD	Activated Passwords still cannot be used.

**Syntax**

The following syntax is used for the "Limit and enable password legitimization" instruction:

**SCL**

```

ENDIS_PW (REQ := <Operand>,
          F_PWD := <Operand>,
          FULL_PWD := <Operand>,
          R_PWD := <Operand>,
          HMI_PWD := <Operand>,
          F_PWD_ON => <Operand>,
          FULL_PWD_ON => <Operand>,
          R_PWD_ON => <Operand>,
          HMI_PWD_ON => <Operand>,
          RET_VAL => <Operand>)
    
```

## Parameter

The following table shows the parameters of the "Limit and enable password legitimation" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L	When the REQ parameter has the signal state "0", the currently set signal state of the passwords is queried.
F_PWD	Input	BOOL	I, Q, M, D, L	Read/write access including fail-safe <ul style="list-style-type: none"> <li>F_PWD = "0": Do not allow password</li> <li>F_PWD = "1": Allow password</li> </ul>
FULL_PWD	Input	BOOL	I, Q, M, D, L	Read/write access <ul style="list-style-type: none"> <li>FULL_PWD = "0": Do not allow password</li> <li>FULL_PWD = "1": Allow password</li> </ul>
R_PWD	Input	BOOL	I, Q, M, D, L	Read access <ul style="list-style-type: none"> <li>R_PWD = "0": Do not allow password</li> <li>R_PWD = "1": Allow password</li> </ul>
HMI_PWD	Input	BOOL	I, Q, M, D, L	HMI access <ul style="list-style-type: none"> <li>HMI_PWD = "0": Do not allow password</li> <li>HMI_PWD = "1": Allow password</li> </ul>
F_PWD_ON	Output	BOOL	I, Q, M, D, L	Read/write access including fail-safe <ul style="list-style-type: none"> <li>F_PWD_ON = "0": Password not allowed</li> <li>F_PWD_ON = "1": Password allowed</li> </ul>
FULL_PWD_ON	Output	BOOL	I, Q, M, D, L	Read/write access status <ul style="list-style-type: none"> <li>FULL_PWD_ON = "0": Password not allowed</li> <li>FULL_PWD_ON = "1": Password allowed</li> </ul>
R_PWD_ON	Output	BOOL	I, Q, M, D, L	Read-access status <ul style="list-style-type: none"> <li>R_PWD_ON = "0": Password not allowed</li> <li>R_PWD_ON = "1": Password allowed</li> </ul>
HMI_PWD_ON	Output	BOOL	I, Q, M, D, L	HMI-access status <ul style="list-style-type: none"> <li>HMI_PWD_ON = "0": Password not allowed</li> <li>HMI_PWD_ON = "1": Password allowed</li> </ul>
RET_VAL	Output	WORD	I, Q, M, D, L	Error information

For additional information on valid data types, refer to "See also".

## RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
8090	The "Limit and enable password legitimation" instruction is not supported

Error code* (W#16#...)	Explanation
80D0	The password for fail-safe is not configured. The signal state must be TRUE for standard CPUs.
80D1	The read/write access is not configured
80D2	The read access is not configured
80D3	The HMI access is not configured
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

### RE\_TRIGR: Restart cycle monitoring time

#### Description

The instruction "Restart cycle monitoring time" restarts the cycle monitoring of the CPU. The cycle time monitoring then restarts with the time you have set in the CPU configuration.

The instruction "Restart cycle monitoring time" can be called, regardless of the priority, in all blocks.

If the instruction is called in a block with a higher priority, such as a hardware interrupt, diagnostic interrupt, or cyclic interrupt, the instruction is not executed and the ENO enable output is set to signal state "0".

The instruction "Restart cycle monitoring time" can be called a maximum of 10 times in a program cycle.

---

#### Note

If the instruction "Restart cycle monitoring time" is started more than 30 times within a LOOP instruction, the CPU switches to STOP because of a runtime error.

---

#### Syntax

The following syntax is used for the "Restart cycle monitoring time" instruction:

```
SCL  
RE_TRIGR()
```

### STP: Exit program

#### Description

The "Exit program" instruction is used to set the CPU to STOP mode and therefore to terminate the execution of the program. The effects of changing from RUN to STOP depend on the CPU configuration.

## Syntax

The following syntax is used for the instruction "Exit program":

---

```
SCL
STP()
```

---

## GET\_ERROR: Get error locally

### Description

The "Get error locally" instruction is used to query the occurrence of errors within a block. This is usually to access error. If the system reports an error during the processing of the block, detailed information is generated for the first error to occur during the execution of the block since the last execution of the instruction.

The error information can only be saved in operands of the "ErrorStruct" system data type. The "ErrorStruct" system data type specifies the exact structure in which the information about the error is stored. Using additional instructions, you can evaluate this structure and program an appropriate response. If several errors occur in the block, the error information about the next error to occur in the instruction is output only after the first error that occurred has been remedied.

---

#### Note

The <Operand> is only changed if error information is present. To set the operand back to "0" after handling the error, you have the following options:

- Declare the operand in the "Temp" section of the block interface.
  - Reset the operand to "0" before calling the instruction.
- 

You can find an example of how you can implement the instruction in combination with other troubleshooting options under "See also".

---

#### Note

The "Get error locally" instruction enables local error handling within a block. If "Get error locally" is inserted in the program code of a block, any predefined system reactions are ignored if errors occur.

---

## Syntax

The following syntax is used for the "Get error locally" instruction:

```
SCL
GET_ERROR (<Operand>)
```

**Parameter**

The following table shows the parameters of the "Get error locally" instruction:

Parameter	Data type	Description
<Operand>	ErrorStruct	Information about errors that have occurred

**Data type "ErrorStruct"**

The following table shows the structure of the "ErrorStruct" data type:

Structure component	Data type	Description
ERROR_ID	WORD	Error ID
FLAGS	BYTE	Shows if an error occurred during a block call. 16#01: Error during a block call 16#00: No error during a block call
REACTION	BYTE	Default reaction: 0: Ignore (write error), 1: Continue with substitute value "0" (read error), 2: Skip instruction (system error)
CODE_ADDRESS	CREF	Information about the address and type of block
BLOCK_TYPE	BYTE	Type of block where the error occurred: 1: OB 2: FC 3: FB
CB_NUMBER	UINT	Number of the code block
OFFSET	UDINT	Reference to the internal memory
MODE	BYTE	Information about the address of an operand
OPERAND_NUMBER	UINT	Operand number of the machine command
POINTER_NUMBER_LOCATION	UINT	(A) Internal pointer
SLOT_NUMBER_SCOPE	UINT	(B) Storage area in internal memory
DATA_ADDRESS	NREF	Information about the address of an operand

Structure component		Data type	Description
	AREA	BYTE	(C) Memory area: L: 16#40 – 4E, 86, 87, 8E, 8F, C0 – CE I: 16#81 Q: 16#82 M: 16#83 DB: 16#84, 85, 8A, 8B Range violations for a directly editable tag of data type DINT: 16#04
	DB_NUMBER	UINT	(D) Number of the data block
	OFFSET	UDINT	(E) Relative address of the operand

### Structure component "ERROR\_ID"

The following table shows the values that can be output at the structure component "ERROR\_ID":

ID* (hexadecimal)	ID* (decimal)	Description
0	0	No error
2503	9475	Invalid pointer
2520	9504	Invalid STRING
2522	9506	Read error: Operand outside the valid range
2523	9507	Write error: Operand outside the valid range
2524	9508	Read error: Invalid operand
2525	9509	Write error: Invalid operand
2528	9512	Read error: Data alignment
2529	9513	Write error: Data alignment
252C	9516	Invalid pointer
2530	9520	Write error: Data block
2533	9523	Invalid pointer used
2538	9528	Access error: DB does not exist
2539	9529	Access error: Wrong DB used
253A	9530	Global data block does not exist
253C	9532	Faulty information or the function does not exist
253D	9533	System function does not exist
253E	9534	Faulty information or the function block does not exist
253F	9535	System block does not exist
2550	9552	Access error: DB does not exist
2551	9553	Access error: Wrong DB used
2575	9589	Error in the program nesting depth
2576	9590	Error in the local data distribution
2577	9591	The block property "Parameter passing via registers" is not selected.

ID* (hexadecimal)	ID* (decimal)	Description
25A0	9632	Internal error in TP
25A1	9633	Tag is write-protected
25A2	9634	Invalid numerical value of tag
2942	10562	Read error: Input
2943	10563	Write error: Output
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".		

### Example

The following example shows how the instruction works:

#### SCL

```

LABEL: #TagOut := #Field[#index] * REAL#40.5;

GET_ERROR(#Error);

IF #Error.REACTION = 1 THEN
    GOTO LABEL;
;
END_IF;
    
```

An error occurred accessing the "#Field[#index]" tag. The "#TagOut" operand returns the signal state "1" despite the read/access error and the multiplication is performed with the value "0.0". If this error scenario occurs, we recommend that you program the "Get error locally" instruction after the multiplication to get the error. The error information supplied by the "Get error locally" instruction is evaluated with a comparison. If the "#Error.REACTION" structure component has the value "1", there is a read/access error and the program execution begins again at the jump label LABEL.

### See also

Querying and fixing errors in the program code (Page 227)

### GET\_ERR\_ID: Get error ID locally

#### Description

The "Get error ID locally" instruction is used to query the occurrence of errors within a block. This is usually to access error. If the system reports during the block processing errors within the block execution since the last execution of the instruction, the instruction outputs the error ID of the first error that occurred.

The error ID can only be saved in operands of the WORD data type. If several errors occur in the block, the error ID of the next error to occur in the instruction is output only after the first error that occurred has been remedied.

---

#### Note

The <Operand> is only changed if error information is present. To set the operand back to "0" after handling the error, you have the following options:

- Declare the operand in the "Temp" section of the block interface.
  - Reset the operand to "0" before calling the instruction.
- 

The output of the "Get error ID locally" instruction is only set if error information is present. If one of these conditions is not fulfilled, the remaining program execution is not affected by the "Get error ID locally" instruction.

You can find an example of how you can implement the instruction in combination with other troubleshooting options under "See also".

---

#### Note

The "Get error ID locally" instruction enables local error handling within a block. If the "Get error ID locally" instruction is inserted in the program code of a block, any predefined system reactions are ignored if errors occur.

---

## Syntax

The following syntax is used for the "Get error ID locally" instruction:

#### SCL

```
GET_ERR_ID()
```

## Parameter

The following table shows the parameters of the "Get error ID locally" instruction:

Parameter	Data type	Description
Function value	WORD	Error ID

## Error ID

The following table shows the values that can be output:

ID* (hexadecimal)	ID* (decimal)	Description
0	0	No error
2503	9475	Invalid pointer

ID* (hexadecimal)	ID* (decimal)	Description
2520	9504	Invalid STRING
2522	9506	Read error: Operand outside the valid range
2523	9507	Write error: Operand outside the valid range
2524	9508	Read error: Invalid operand
2525	9509	Write error: Invalid operand
2528	9512	Read error: Data alignment
2529	9513	Write error: Data alignment
252C	9516	Invalid pointer
2530	9520	Write error: Data block
2533	9523	Invalid pointer used
2538	9528	Access error: DB does not exist
2539	9529	Access error: Wrong DB used
253A	9530	Global data block does not exist
253C	9532	Faulty information or the function does not exist
253D	9533	System function does not exist
253E	9534	Faulty information or the function block does not exist
253F	9535	System block does not exist
2550	9552	Access error: DB does not exist
2551	9553	Access error: Wrong DB used
2575	9589	Error in the program nesting depth
2576	9590	Error in the local data distribution
2577	9591	The block property "Parameter passing via registers" is not selected.
25A0	9632	Internal error in TP
25A1	9633	Tag is write-protected
25A2	9634	Invalid numerical value of tag
2942	10562	Read error: Input
2943	10563	Write error: Output
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".		

**Example**

The following example shows how the instruction works:

**SCL**

```
#TagOut := #Field[#index] * REAL#40.5;

#TagID := GET_ERR_ID();

IF #TagID = 16#2522 THEN
    MOVE_BLK(IN := #TagArrayIn[0],
            COUNT := 1,
```

**SCL**

```

OUT => #TagArrayOut[1]);
END_IF;

```

An error occurred accessing the "#Field[#index]" tag. The "#TagOut" operand returns the signal state "1" despite the read/access error and the multiplication is performed with the value "0.0". If this error scenario occurs, we recommend that you program the "Get error ID locally" instruction after the multiplication to get the error. The error ID supplied by the "Get error ID locally" instruction is evaluated with a comparison. If the "#TagID" operand returns ID 16#2522, there is a read/access error and the value "100.0" of the "#TagArrayIn[0]" operand is written to the "#TagArrayOut[1]" operand.

**INIT\_RD: Initialize all retain data****Description**

The "Initialize all retain data" instruction is used to reset the retentive data of all data blocks, bit memories and SIMATIC timers and counters at the same time. The instruction can only be executed within a startup OB because the execution exceeds the program cycle duration.

**Syntax**

Use the following syntax for the "Initialize all retain data" instruction:

**SCL**

```

INIT_RD(REQ := <Operand>
        RET_VAL := <Operand>)

```

**Parameter**

The following table shows the parameters of the "Initialize all retain data" instruction:

Parameter	Declaration	Data type	Description
REQ	Input	BOOL	If the input "REQ" has the signal state "1", all retentive data are reset.
RET_VAL	Output	INT	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.

For additional information on valid data types, refer to "See also".

### RET\_VAL Parameter

The following table shows the meaning of the values of the parameter RET\_VAL:

Error code* (W#16#...)	Explanation
0000	No error
80B5	The instruction cannot be executed because it was not programmed within a startup OB.
General error information	See also: "GET_ERR_ID: Get error ID locally"

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

### Example

The following example shows how the instruction works:

#### SCL

```
INIT_RD (REQ := "Tag_REQ",  
         RET_VAL := "Tag_Result");
```

If the operand "Tag\_REQ" has the signal state "1", the instruction is executed. All retentive data of all data blocks, bit memories and SIMATIC timers and counters are reset.

### WAIT: Configure time delay

#### Description

The instruction "Configure time delay" pauses the program execution for a specific period of time. You indicate the period of time in microseconds on the WT parameter of the instruction.

You can configure time delays of up to 32 767 microseconds (µs). The shortest possible time delay depends on the respective CPU and corresponds to the execution time of the instruction "Configure time delay".

The execution of the instruction can be interrupted by higher priority events.

The instruction "Configure time delay" supplies no error information.

## Syntax

The following syntax is used for the instruction "Configure time delay":

```
SCL
WAIT(WT:= <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
WT	Input	INT	Time delay in microseconds (µs)

## See also

Overview of the valid data types (Page 1262)

## RUNTIME: Measure program runtime

### Description

The "Measure program runtime" instruction is used to measure the runtime of the entire program, individual blocks or command sequences.

If you want to measure the runtime of your entire program, call the instruction "Measure program runtime" in OB1. Measurement of the runtime is started with the first call and the output RET\_VAL returns the runtime of the program after the second call. The measured runtime includes all CPU processes that can occur during the program execution, for example, interruptions caused by higher-level events or communication. The instruction "Measure program runtime" reads an internal counter of the CPU and writes the value to the in/out parameter. The instruction calculates the current program runtime according to the internal counter frequency and writes it to output RET\_VAL.

If you want to measure the runtime of individual blocks or individual command sequences, you need three separate networks. Call the instruction "Measure program runtime" in an individual network within your program. You set the starting point of the runtime measurement with this first call of the instruction. Then you call the required program block or the command sequence in the next network. In another network, call the "Measure program runtime" instruction a second time and assign the same memory to the in/out parameter as you did during the first call of the instruction. The "Measure program runtime" instruction in the third network reads an internal CPU counter and calculates the current runtime of the program block or the command sequence according to the internal counter frequency and writes it to the output RET\_VAL.

The "Measure program runtime" instruction uses an internal high-frequency counter to calculate the time. If the counter overruns, the instruction returns values  $\leq 0.0$ . Ignore these runtime values.

**Note**

The runtime of a command sequence cannot be determined exactly, because the sequence of instructions within a command sequence is changed during optimized compilation of the program.

**Syntax**

The following syntax is used for the "Measure program runtime" instruction:

**SCL**

```
RUNTIME (<Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Operand>	InOut	LREAL	Saves the starting point of the runtime measurement.
Function value		LREAL	Returns the measured runtime in seconds

For additional information on valid data types, refer to "See also".

**Example**

The following example shows the how the instruction works based on the runtime calculation of a program block:

**SCL**

```
"Tag_Result" := RUNTIME("Tag_Memory");

"Best_before_date_DB" ();

"Tag_Result" := RUNTIME("Tag_Memory");
```

The starting point for the runtime measurement is set with the first call of the instruction and buffered as reference for the second call of the instruction in the "TagMemory" operand.

The "Best\_before\_date" program block FB1 is called.

When the program block FB1 has been processed, the instruction is executed a second time. The second call of the instruction calculates the runtime of the program block and writes the result to the output "Tag\_Result".

**See also**

Overview of the valid data types (Page 1262)

**Word logic operations****DECO: Decode****Description**

The instruction "Decode" sets a bit specified by the input value in the output value.

The instruction "Decode" reads the value of the parameter IN and sets the bit in the output value, whose bit position corresponds to the read value. The other bits in the output value are filled with zeroes. If the value of the IN parameter is greater than 31, a modulo 32 instruction is executed.

**Syntax**

The following syntax is used for the instruction "Decode":

**SCL**

```
DECO(IN := <Expression>)
```

```
DECO_WORD(IN := <Expression>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
IN	Input	UINT	Position of the bit in the output value which is set.
_<Data type>		Bit strings default: DWORD	Data type of the function value: <ul style="list-style-type: none"> <li>You do not need to specify the data type if using the default.</li> <li>Any other valid data type you may use must be declared explicitly.</li> </ul>
Function value		Bit strings	Current output value

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

```

SCL
"Tag_Result" := DECO(IN := "Tag_Value");
"Tag_Result2" := DECO_BYTE(IN := "Tag_Value2");
    
```

The following figure shows how the instruction works using specific operand values:

The instruction reads the number "3" from the value of the operand "Tag\_Value" and sets the third bit to the value of the operand "Tag\_Result".

**See also**

- Overview of the valid data types (Page 1262)
- Operators and operator precedence (Page 1544)

**ENCO: Encode**

**Description**

The instruction "Encode" reads the bit number of the lowest-value bit set in the input value and issues this as a result.

**Syntax**

The following syntax is used for the instruction "Encode":

```

SCL
ENCO(IN := <Expression>)
    
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
IN	Input	Bit strings	Input value
Function value		INT	Bit number of the bit in the input value that is read out.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

### SCL

```
"Tag_Result" := ENCO(IN := "Tag_Value");
```

The following figure shows how the instruction works using specific operand values:

The instruction reads the lowest-value set bit of the operand "Tag\_Value" and writes the bit position "3" in the operand "Tag\_Result".

## SEL: Select

### Description

The instruction "Select" selects one of the parameters IN0 or IN1 depending on a switch (G parameter) and issues its content as a result. When the parameter G has the signal status "0", the value at parameter IN0 is moved. When the parameter G has the signal status "1", the value at parameter IN1 is moved and returned as a function value.

The instruction is only executed if the tags of all parameters have the same data type class.

### Syntax

The following syntax is used for the instruction "Select":

#### SCL

```
SEL(G:= <Expression>,
    IN0 := <Expression>,
    IN1 := <Expression>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
G	Input	BOOL	BOOL	Switch
IN0	Input	Bit strings, integers, floating-point numbers, TIME, TOD, DATE, CHAR, DT	Bit strings, integers, floating-point numbers, CHAR, timers, DATE, TOD, LTOD, DT, LDT	First input value
IN1	Input	Bit strings, integers, floating-point numbers, TIME, TOD, DATE, CHAR, DT	Bit strings, integers, floating-point numbers, CHAR, timers, DATE, TOD, LTOD, DT, LDT	Second input value
Function value		Bit strings, integers, floating-point numbers, TIME, TOD, DATE, CHAR, DT	Bit strings, integers, floating-point numbers, CHAR, timers, DATE, TOD, LTOD, DT, LDT	Result of the instruction

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```

SCL
"Tag_Result" := SEL(G := "Tag_Value",
                   IN0 := "Tag_0",
                   IN1 := "Tag_1");
    
```

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value	
Tag_Value	0	1
Tag_0	W#16#0000	W#16#4C
Tag_1	W#16#FFFF	D#16#5E
Tag_Result	W#16#0000	D#16#5E

## MUX: Multiplex

### Description

The "Multiplex" instruction copies the value of a selected input parameter and issues it. You can use the parameter K to determine the number of the input parameter whose value will be moved. Numbering starts at IN0 and is incremented continuously with each new input. You can declare a maximum of 32 inputs.

If the value of the K parameter is greater than the number of inputs and the INELSE parameter is not set, the instruction function value is invalid and the ENO enable output is set to 0.

Numerical data types and time data types are permitted at the inputs. All tags with assigned parameters must be of the same data type.

The function value is invalid if any of the following conditions are met:

- The value of the parameter K is greater than the number of available inputs.
- Errors occurred during the execution of the instruction.

### Syntax

The following syntax is used for the "Multiplex" instruction:

```

SCL
MUX(K := <Expression>,
    IN0 := <Expression>,
    IN1 := <Expression>,
    INELSE := <Expression>)

```

### Parameter

The following table shows the parameters of the "Multiplex" instruction:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
K	Input	Integers	Integers	Specifies the parameter whose content is to be transferred. <ul style="list-style-type: none"> <li>• If K = 0 =&gt; Parameter IN0</li> <li>• If K = 1 =&gt; Parameter IN1, etc.</li> </ul>
IN0	Input	Binary numbers, integers, floating-point numbers, strings, TOD, DATE, TIME, DT	Binary numbers, integers, floating-point numbers, strings, TOD, LTOD, DATE, timers, DT, LDT	First input value

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN1	Input	Binary numbers, integers, floating-point numbers, strings, TOD, DATE, TIME, DT	Binary numbers, integers, floating-point numbers, strings, TOD, LTOD, DATE, timers, DT, LDT	Second input value
INn	Input	Binary numbers, integers, floating-point numbers, strings, TOD, DATE, TIME, DT	Binary numbers, integers, floating-point numbers, strings, TOD, LTOD, DATE, timers, DT, LDT	Optional input values
INELSE	Input	Binary numbers, integers, floating-point numbers, strings, TOD, DATE, TIME, DT	Binary numbers, integers, floating-point numbers, strings, TOD, LTOD, DATE, timers, DT, LDT	Specifies the value to be copied when K <> n.
Function value		Binary numbers, integers, floating-point numbers, strings, TOD, DATE, TIME, DT	Binary numbers, integers, floating-point numbers, strings, TOD, LTOD, DATE, timers, DT, LDT	Result of the instruction

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```

SCI
"Tag_Result" := MUX(K := "Tag_Number",
    IN0 := "Tag_1",
    IN1 := "Tag_2",
    INELSE := "Tag_3");
    
```

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value	
Tag_Number	1	4
Tag_1	DW#16#00000000	DW#16#00000000
Tag_2	DW#16#003E4A7D	DW#16#003E4A7D
Tag_3	DW#16#FFFF0000	DW#16#FFFF0000
Tag_Result	DW#16#003E4A7D	DW#16#FFFF0000

## DEMUX: Demultiplex

### Description

The "Demultiplex" instruction transfers the value of the input parameter IN to a selected output parameter. The selection of the input parameter takes place independent of the parameter value K. The K parameter specifies the output parameter number to which the value of the input parameter IN is transferred. The other output parameters are not changed. Numbering starts at OUT0 and continues consecutively with each new output. You can declare a maximum of 32 output parameters.

If the value of the K parameter is greater than the number of output parameters, the value of the ENO enable output is set to "0" and the value is transferred to the input parameter IN and the output parameter OUTELSE.

The function value is invalid if any of the following conditions are met:

- The value of the K parameter is greater than the number of available outputs.
- Errors occurred during execution of the instruction.

### Syntax

The following syntax is used for the instruction "Demultiplex":

```
SCL  
DEMUX(K := <Expression>,  
      IN := <Expression>,  
      OUT0 := <Operand>,  
      OUT1 := <Operand>,  
      OUTELSE := <Operand>)
```

**Parameter**

The following table shows the parameters of the instruction "Demultiplex":

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
K	Input	Integers	Integers	Specifies the output to which the input value (IN) will be copied. <ul style="list-style-type: none"> <li>• If K = 0 =&gt; Parameter OUT0</li> <li>• If K = 1 =&gt; Parameter OUT1, etc.</li> </ul>
IN	Input	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE, DT	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, DT, LDT	Input value
OUT0	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE, DT	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, DT, LDT	First output
OUT1	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE, DT	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, DT, LDT	Second output
OUTn	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE, DT	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, DT, LDT	Optional outputs
OUTELSE	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE, DT	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, DT, LDT	Output to which the value at input IN is copied if K > n.

For additional information on available data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL
DEMUX(K := "Tag_Number",
      IN := "Tag_Value",
      OUT0 := "Tag_1",
      OUT1 := "Tag_2",
      OUTELSE := "Tag_3");
```

The following tables show how the instruction works using specific operand values:

Input values of the "Demultiplex" instruction before the network execution

Parameter	Operand	Values	
K	Tag_Number	2	4
IN	Tag_Value	DW#16#FFFFFFFF	DW#16#003E4A7D

Output values of the "Demultiplex" instruction after the network execution

Parameter	Operand	Values	
OUT0	Tag_1	Unchanged	Unchanged
OUT1	Tag_2	DW#16#FFFFFFFF	Unchanged
OUTELSE	Tag_3	Unchanged	DW#16#003E4A7D

## Shift and rotate

### SHR: Shift right

#### Description

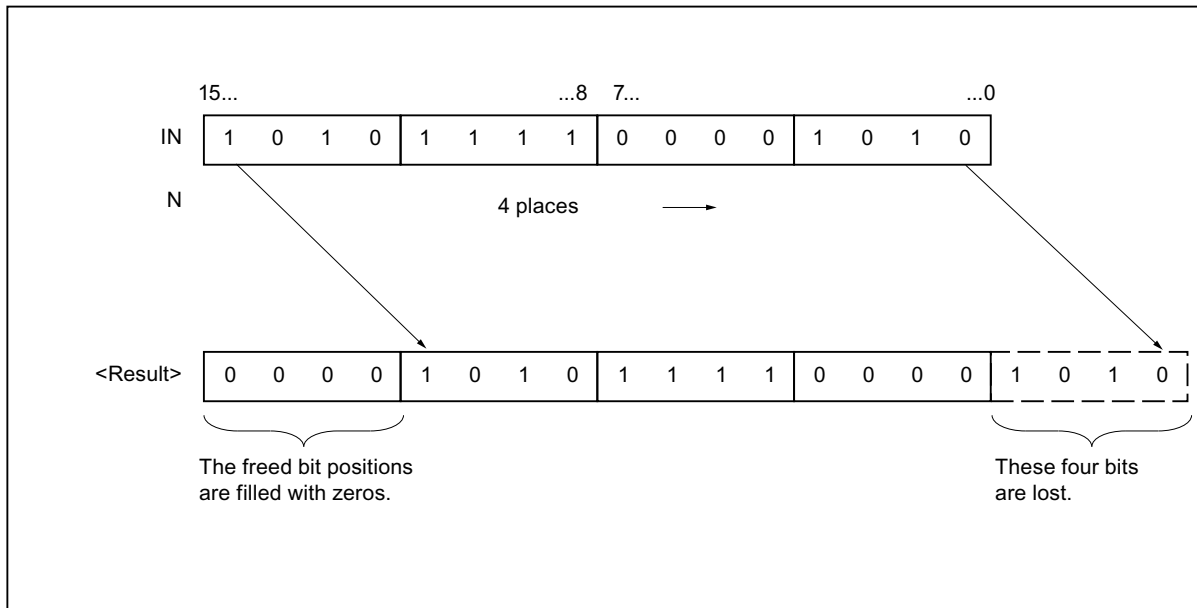

The "Shift right" instruction shifts the contents of the IN parameter bit-by-bit to the right and returns it as a function value. The parameter N is used to specify the number of bit positions by which the specified value should be shifted.

If the value of the N parameter is "0", the value of the IN parameter is given as a result.

If the value of the N parameter is greater than the number of available bit positions, then the value of the IN parameter is shifted to the right by the available number of bit positions.

The bit positions that are freed by shifting in the left operand area are filled with zeros.

The following figure shows how the content of an integer data type operand is shifted by four bit positions to the right:

### Syntax

The following syntax is used for the instruction "Shift right":

```

SCL
SHR(IN := <Operand>,
     N := <Operand>)
    
```

### Parameter

The following table shows the parameters of the "Shift right" instruction:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN	Input	Bit strings, integers	Bit strings, integers	Value to be shifted
N	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	Number of bits by which the value (IN) is shifted
Function value		Bit strings, integers	Bit strings, integers	Result of the instruction

For more information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL
"Tag_Result" := SHR(IN := "Tag_Value",
                    N := "Tag_Number");
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_Value	0011 1111 1010 1111
N	Tag_Number	3
Function value	Tag_Result	0000 0111 1111 010 1

The content of the "Tag\_Value" operand is shifted by three bit positions to the right. The result of the instruction is returned in the operand "Tag\_Result" as a function value.

## See also

Overview of the valid data types (Page 1262)

Operators and operator precedence (Page 1544)

## SHL: Shift left

### Description

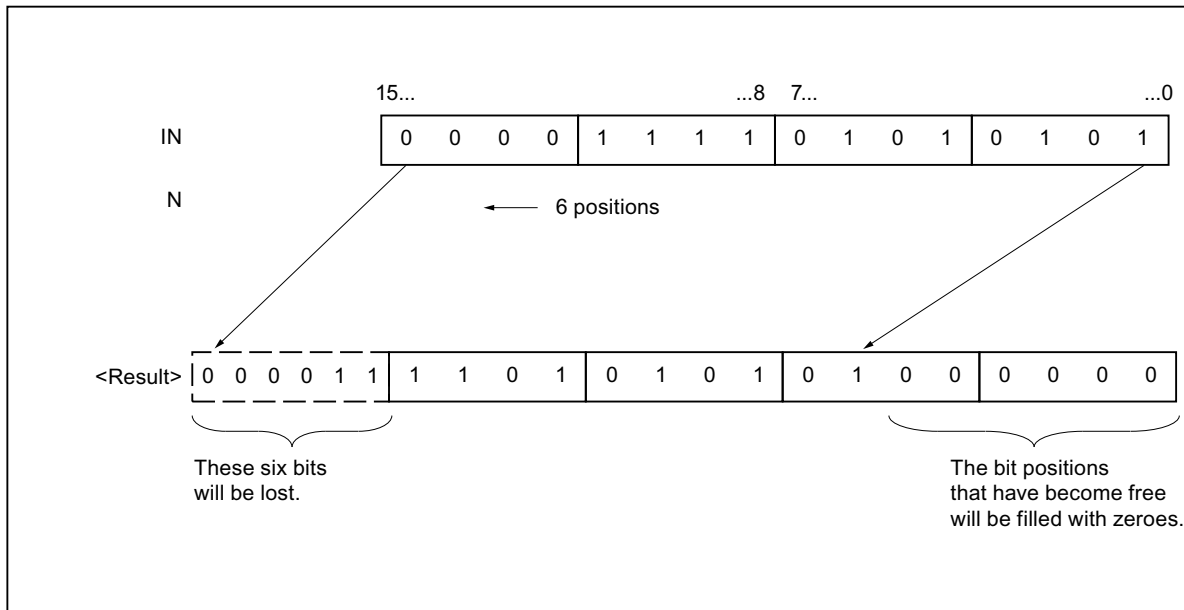

The "Shift left" instruction shifts the contents of the IN parameter bit-by-bit to the left and returns it as a function value. The parameter N is used to specify the number of bit positions by which the specified value should be shifted.

If the value of the N parameter is "0", the value of the IN parameter is given as a result.

If the value of the N parameter is greater than the number of bit positions, the value of the IN parameter is shifted to the left by the available number of bit positions.

The bit positions freed by the shift are filled with zeros in the result value.

The following figure shows how the content of an operand of the WORD data type is shifted six bit positions to the left:

**Syntax**

The following syntax is used for the instruction "Shift left":

```

SCL
SHL(IN := <Operand>,
     N := <Operand>)
    
```

**Parameter**

The following table shows the parameters of the "Shift left" instruction:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN	Input	Bit strings, integers	Bit strings, integers	Value to be shifted
N	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	Number of bits by which the value (IN) is shifted
Function value		Bit strings, integers	Bit strings, integers	Result of the instruction

For more information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL
"Tag_Result" := SHL(IN := "Tag_Value",
                    N := "Tag_Number");
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_Value	0011 1111 1010 1111
N	Tag_Number	4
Function value	Tag_Result	1111 1010 1111 0000

The value of the "Tag\_Value" operand is shifted by four bit positions to the left. The result of the instruction is returned in the operand "Tag\_Result" as a function value.

## ROR: Rotate right

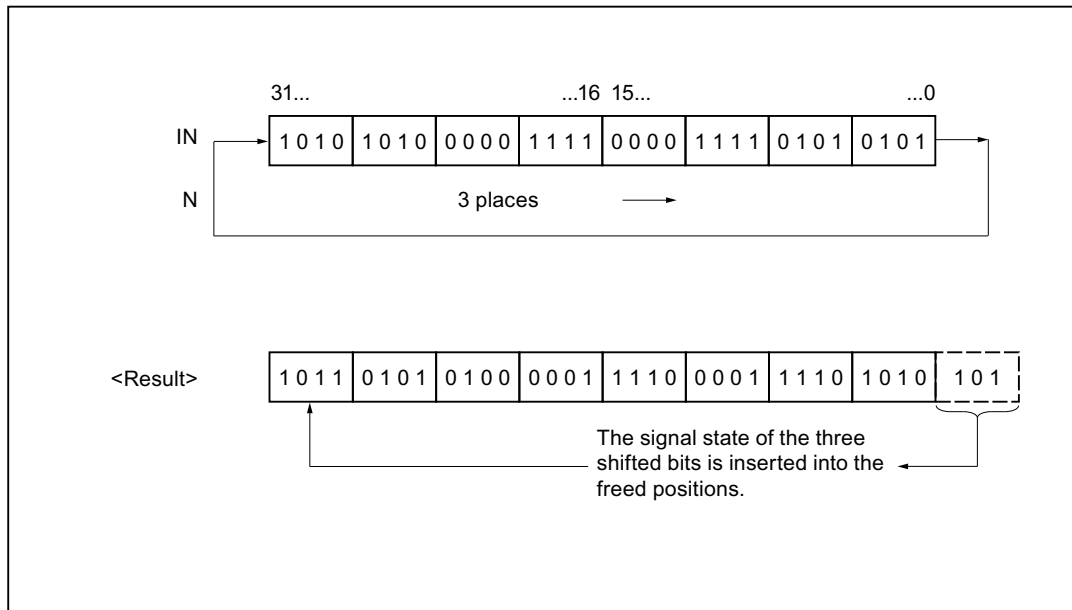

### Description

The "Rotate right" instruction rotates the content of the IN parameter bit-by-bit to the right and assigns the result to the specified operand. The parameter N is used to specify the number of bit positions by which the specified value should be rotated. The bit positions freed by rotating are filled with the bit positions that are pushed out.

If the value of the N parameter is "0", the value at input IN is given as a result.

If the value at the N parameter is greater than the number of available bit positions, the operand value at the IN input is still rotated by the specified number of bit positions.

The following figure shows how the content of an operand of the DWORD data type is rotated three bit positions to the right:

### Syntax

The following syntax is used for the instruction "Rotate right":

```

SCL
ROR(IN := <Operand>,
     N := <Operand>)
    
```

### Parameter

The following table shows the parameters of the "Rotate right" instruction:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN	Input	Bit strings, integers	Bit strings, integers	Value to be rotated
N	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	Number of bit positions by which the value (IN) is rotated
Function value		Bit strings, integers	Bit strings, integers	Result of the instruction

For more information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL
"Tag_Result" := ROR(IN := "Tag_Value",
                    N := "Tag_Number");
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_Value	0000 1111 1001 0101
N	Tag_Number	5
Function value	Tag_Result	1010 1000 0111 1100

The content of the "Tag\_Value" operand is rotated by five bit positions to the right. The result of the instruction is returned in the operand "Tag\_Result" as a function value.

## See also

Overview of the valid data types (Page 1262)

Operators and operator precedence (Page 1544)

## ROL: Rotate left

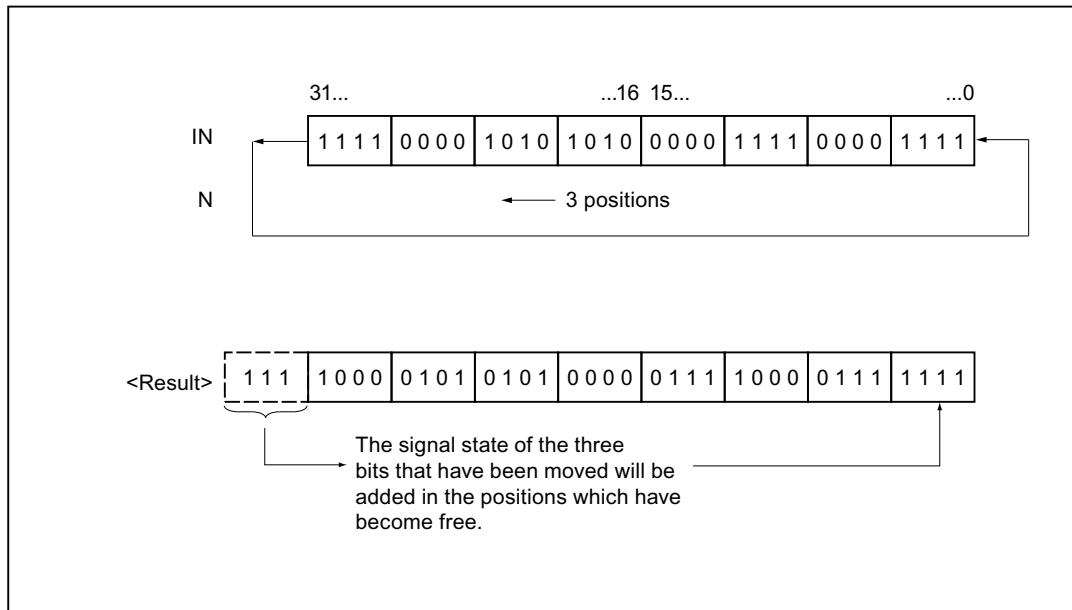

### Description

The "Rotate left" instruction rotates the contents of the IN parameter bit-by-bit to the left and returns it as a function value. The parameter N is used to specify the number of bit positions by which the specified value should be rotated. The bit positions freed by rotating are filled with the bit positions that are pushed out.

If the value of the N parameter is "0", the value at input IN is given as a result.

If the value at the N parameter is greater than the number of available bit positions, the operand value at the IN input is still rotated by the specified number of bit positions.

The following figure shows how the content of an operand of the DWORD data type is rotated three bit positions to the left:

**Syntax**

The following syntax is used for the "Rotate left" instruction:

```

SCL
ROL(IN := <Operand>,
    N := <Operand>)
    
```

**Parameter**

The following table shows the parameters of the "Rotate left" instruction:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN	Input	Bit strings, integers	Bit strings, integers	Value to be rotated
N	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	Number of bit positions by which the value (IN) is rotated
Function value		Bit strings, integers	Bit strings, integers	Result of the instruction

For more information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```

SCI
"Tag_Result" := ROL(IN := "Tag_Value",
                   N := "Tag_Number");

```

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	1010 1000 1111 0110
N	Tag_Number	5
Function value	Tag_Result	0001 1110 1101 0101

The content of the operand "Tag\_Value" is rotated five bit positions to the left. The result of the instruction is returned in the operand "Tag\_Result" as a function value.

## Additional instructions

### DRUM: Implement sequencer

#### Description

The "Implement sequencer" instruction is used to assign the programmed values of the OUT\_VAL parameter of the corresponding step to the programmed output bits (OUT1 to OUT16) and the output word (OUT\_WORD). The specific step must thereby satisfy the conditions of the programmed enable mask on the S\_MASK parameter while the instruction remains at this step. The instruction advances to the next step if the event for the step is true and the programmed time for the current step elapses, or if the value at the JOG parameter changes from "0" to "1". The instruction is reset if the signal state on the RESET parameter changes to "1". The current step is hereby equated to the preset step (DSP).

The amount of time spent on a step is determined by the product of the preset timebase (DTBP) and the preset counter value (S\_PRESET) for each step. At the start of a new step, this calculated value is loaded into the DCC parameter, which contains the time remaining for the current step. If, for example the value at the DTBP parameter is "2" and the preset value for the first step is "100" (100 ms), the DCC parameter has the value "200" (200 ms).

A step can be programmed with a time value, an event, or both. Steps that have an event bit and the time value "0" advance to the next step as soon as the signal state of the event bit is "1". Steps that are programmed only with a time value start the time immediately. Steps that are programmed with an event bit and a time value greater than "0" start the time when the signal state of the event bit is "1". The event bits are initialized with a signal state of "1".

When the sequencer is on the last programmed step (LST\_STEP) and the time for this step has expired, the signal state on the Q parameter is set to "1"; otherwise it is set to "0". When the parameter Q is set, the instruction remains on the step until it is reset.

In the configurable mask (S\_MASK) you can selected the separate bits in the output word (OUT\_WORD) and set or reset the output bits (OUT1 to OUT16) by means of the output values (OUT\_VAL). If a bit of the configurable mask is in the signal state "1", the value OUT\_VAL sets or resets the corresponding bit. If the signal state of a bit of the configurable mask is "0", the corresponding bit is left unchanged. All the bits of the configurable mask for all 16 steps are initialized with a signal state of "1".

The output bit on the OUT1 parameter corresponds to the least significant bit of the output word (OUT\_WORD). The output bit on the OUT16 parameter corresponds to the most significant bit of the output word (OUT\_WORD).

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For more information on this topic, refer to "See also".

### Syntax

The following syntax is used for the "Implement sequencer" instruction:

```

SCL
<Instance>RESET:= <Operand>,
    JOG := <Operand>,
    DRUM_EN := <Operand>,
    LST_STEP := <Operand>,
    EVENT1 - 16 := <Operand>,
    OUT1 - 16 => <Operand>,
    Q => <Operand>,
    OUT_WORD => <Operand>,
    ERR_CODE => <Operand>
    
```

### Parameter

The following table shows the parameters of the "Implement sequencer" instruction:

Parameter	Declaration	Data type	Description
RESET	Input	BOOL	A signal state of "1" indicates a reset condition.
JOG	Input	BOOL	When the signal state changes from "0" to "1", the instruction advances to the next step.

Parameter	Declaration	Data type	Description
DRUM_EN	Input	BOOL	A signal state of "1" allows the sequencer to advance based on the event and time criteria.
LST_STEP	Input	BYTE	Step number of the last step programmed.
EVENT(i), 1 ≤ i ≤ 16	Input	BOOL	Event bit (i); Initial signal state is "1".
OUT(j), 1 ≤ j ≤ 16	Output	BOOL	Output bit (j)
Q	Output	BOOL	A signal state of "1" indicates that the time for the last step has elapsed.
OUT_WORD	Output	WORD	Word address to which the sequencer writes the output values.
ERR_CODE	Output	WORD	Error information
JOG_HIS	Static	BOOL	JOG parameter history bit
EOD	Static	BOOL	A signal state of "1" indicates that the time for the last step has elapsed.
DSP	Static	BYTE	Preset step of the sequencer
DSC	Static	BYTE	Current step of the sequencer
DCC	Static	DWORD	Current numerical value of the sequencer
DTBP	Static	WORD	Preset timebase of the sequencer
PREV_TIME	Static	DWORD	Previous system time
S_PRESET	Static	ARRAY of WORD	Count preset for each step [1 to 16] where 1 count = 1 ms.
OUT_VAL	Static	ARRAY of BOOL	Output values for each step [1 to 16, 0 to 15].
S_MASK	Static	ARRAY of BOOL	Configurable mask for each step [1 to 16, 0 to 15]. Initial signal states are "1".

For more information on valid data types, refer to "See also".

The static parameters are not visible when calling the instruction in the program. These are saved in the instance of the instruction.

### ERR\_CODE Parameter

The following table shows the meaning of the values of the parameter ERR\_CODE:

ERR_CODE*	Explanation
W#16#0000	No error
W#16#000B	The value at the LST_STEP parameter is less than 1 or greater than 16.
W#16#000C	The value at the DSC parameter is less than 1 or greater than the value at the LST_STEP parameter.
W#16#000D	The value at the DSP parameter is less than 1 or greater than the value at the LST_STEP parameter.

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For more information on toggling display formats, refer to "See also".

### DCAT: Discrete control-timer alarm

#### Description

The "Discrete control-timer alarm" instruction is used to accumulate the time from the point at which the CMD parameter issues the command to open or close. The time is accumulated until the preset time (PT) is exceeded or the information is received that the device was opened or closed (O\_FB or C\_FB) within the specified time. If the preset time is exceeded before the information on the opening or closing of the device is received, the corresponding alarm is activated. If the signal state on the command input changes state before the preset time, the time is restarted.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For more information on this topic, refer to "See also".

The "Discrete control-timer alarm" instruction has the following reactions to the input conditions:

- When the signal state of the CMD parameter changes from "0" to "1", the signal states of the parameters Q, CMD\_HIS, ET (only if ET < PT), OA and CA are influenced as follows:
  - The parameters Q and CMD\_HIS are set to "1".
  - The parameters ET, OA and CA are reset to "0".
- When the signal state on the parameter CMD changes from "1" to "0", the parameters Q, ET (only if ET < PT), OA, CA and CMD\_HIS are reset to "0".

- When the signal state of the parameters CMD and CMD\_HIS is "1" and the parameter O\_FB is set to "0", the time difference (ms) since the last execution of the instruction is added to the value at the parameter ET. If the value of the parameter ET exceeds the value of the parameter PT, the signal state on the parameter OA is set to "1". If the value of the parameter ET does not exceed the value of the parameter PT, the signal state on the parameter OA is reset to "0". The value at the parameter CMD\_HIS is set to the value of the parameter CMD.
- If the signal state of the parameters CMD, CMD\_HIS and O\_FB are set to "1" and the parameter C\_FB has the value "0", the signal state of the parameter OA is set to "0". The value of parameter ET is set to the value of parameter PT. If the signal state of the parameter O\_FB changes to "0", the alarm is set the next time the instruction is executed. The value of parameter CMD\_HIS is set to the value of parameter CMD.
- If the parameters CMD, CMD\_HIS and C\_FB have the value "0", the time difference (ms) since the last execution of the instruction is added to the value of the parameter ET. If the value of the parameter ET exceeds the value of the parameter PT, the signal state of the parameter CA is set to "1". If the value at the parameter PT is not exceeded, the parameter CA has the signal state "0". The value of parameter CMD\_HIS is set to the value of parameter CMD.
- If the parameters CMD, CMD\_HIS and O\_FB have the signal state "0" and the parameter C\_FB is set to "1", the parameter CA is set to "0". The value of parameter ET is set to the value of parameter PT. If the signal state of the parameter C\_FB changes to "0", the alarm is set the next time the instruction is executed. The value of parameter CMD\_HIS is set to the value of parameter CMD.
- If the parameters O\_FB and C\_FB simultaneously have the signal state "1", the signal states of both alarm outputs are set to "1".

The "Discrete control-timer alarm" instruction has no error information.

## Syntax

The following syntax is used for the "Discrete control-timer alarm" instruction:

```
SCL  
<Instance>CMD:= <Operand>,  
    O_FB := <Operand>,  
    C_FB := <Operand>,  
    Q => <Operand>,  
    OA => <Operand>,  
    CA => <Operand>
```

**Parameter**

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CMD	Input	BOOL	A signal state of "0" indicates a "close" command. A signal state of "1" indicates an "open" command.
O_FB	Input	BOOL	Feedback input when opening
C_FB	Input	BOOL	Feedback input when closing
Q	Output	BOOL	Shows the status of the parameter CMD
OA	Output	BOOL	Alarm output when opening
CA	Output	BOOL	Alarm output when closing
ET	Static	DINT	Currently elapsed time, where one count = 1 ms.
PT	Static	DINT	Preset time value, where one count = 1 ms.
PREV_TIME	Static	DWORD	Previous system time
CMD_HIS	Static	BOOL	CMD history bit

For more information on valid data types, refer to "See also".

The static parameters are not visible when calling the instruction in the program. These are saved in the instance of the instruction.

**Example**

In the following example the parameter CMD changes from "0" to "1". After the execution of the instruction the parameter Q is set to "1" and the two alarm outputs OA and CA have the signal state "0". The parameter CMD\_HIS of the instance data block is set to the signal state "1" and the parameter ET is reset to "0".

**Note**

You can initialize static parameters in the data block.

**SCL**

```
"DCAT_DB" (CMD := "Tag_Input_CMD",
           O_FB := "Tag_Input_O_FB",
           C_FB := "Tag_Input_C_FB",
           Q => "Tag_Output_Q",
           OA => "Tag_Output_OA",
           CA => "Tag_Output_CA");
```

The following tables show how the instruction works using specific values:

**Before processing**

In this example the following values are used for the input and output parameters:

Parameter	Operand	Value
CMD	Tag_Input_CMD	TRUE
O_FB	Tag_Input_O_FB	FALSE
C_FB	Tag_Input_C_FB	FALSE
Q	Tag_Output_Q	FALSE
OA	Tag_Output_OA	FALSE
CA	Tag_Output_CA	FALSE

The following values are saved in the instance data block "DCAT\_DB" of the instruction:

Parameter	Address	Value
ET	DBD4	L#12
PT	DBD8	L#222
CMD_HIS	DBX16.0	FALSE

#### After processing

The following values are written to the output parameters after the instruction has been executed:

Parameter	Operand	Value
Q	Tag_Output_Q	TRUE
OA	Tag_Output_OA	FALSE
CA	Tag_Output_CA	FALSE

The following values are saved in the instance data block "DCAT\_DB" of the instruction:

Parameter	Address	Value
ET	DBD4	L#0
CMD_HIS	DBX16.0	TRUE

Overview of the valid data types (Page 1262)

### MCAT: Motor control-timer alarm

#### Description

The "Motor control-timer alarm" instruction is used to accumulate the time from the point at which one of the command inputs (opening or closing) is switched on. The time is accumulated until the preset time is exceeded or the relevant feedback input indicates that the device has executed the requested operation within the specified time. If the preset time is exceeded before the feedback is received, the corresponding alarm is triggered.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single

9.7 References

instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

Execution of the "Motor control-timer alarm" instruction

The following table shows the reactions of the "Motor control-timer alarm" instruction to the various input conditions:

Input parameters								Output parameters								
ET	O_H IS	C_H IS	O_C MD	C_C MD	S_C MD	O_F B	C_F B	OO	CO	OA	CA	ET	O_H IS	C_H IS	Q	State
X	1	1	X	X	X	X	X	0	0	1	1	PT	0	0	0	Alarm
X	X	X	X	X	X	1	1	0	0	1	1	PT	0	0	0	Alarm
X	X	X	X	X	1	X	X	0	0	0	0	X	0	0	1	Stop
X	X	X	1	1	X	X	X	0	0	0	0	X	0	0	1	Stop
X	0	X	1	0	0	X	X	1	0	0	0	0	1	0	1	Start opening
<PT	1	0	X	0	0	0	X	1	0	0	0	INC	1	0	1	Open
X	1	0	X	0	0	1	0	0	0	0	0	PT	1	0	1	Opened
>=PT	1	0	X	0	0	0	X	0	0	1	0	PT	1	0	0	Opening alarm
X	X	0	0	1	0	X	X	0	1	0	0	0	0	1	1	Start closing
<PT	0	1	0	X	0	X	0	0	1	0	0	INC	0	1	1	Close
X	0	1	0	X	0	0	1	0	0	0	0	PT	0	1	1	Closed
>=PT	0	1	0	X	0	X	0	0	0	0	1	PT	0	1	0	Closing alarm
X	0	0	0	0	0	X	X	0	0	0	0	X	0	0	1	Stopped
Legend:																
INC	Add the time difference (ms) since the last processing of the FB to ET															
PT	PT is set to the same value as ET															
X	Cannot be used															
<PT	ET < PT															
>=PT	ET >= PT															
If the input parameters O_HIS and C_HIS both have the signal state "1", they are immediately set to the signal state "0". In this case, the last row in the table (X) mentioned above is valid. Because it is therefore not possible to check whether the input parameters O_HIS and C_HIS have the signal state "1", the output parameters are set as follows in this case: OO = FALSE CO = FALSE OA = FALSE CA = FALSE ET = PT Q = TRUE																

## Syntax

The following syntax is used for the "Motor control-timer alarm" instruction:

```

SCL
<Instance>O_CMD:= <Operand>,
      C_CMD := <Operand>,
      S_CMD := <Operand>,
      O_FB := <Operand>,
      C_FB := <Operand>,
      OO => <Operand>,
      CO => <Operand>,
      OA => <Operand>,
      CA => <Operand>,
      Q => <Operand>

```

## Parameter

The following table shows the parameters of the "Motor control-timer alarm" instruction:

Parameter	Declaration	Data type	Description
O_CMD	Input	BOOL	"Open" command input
C_CMD	Input	BOOL	"Close" command input
S_CMD	Input	BOOL	"Stop" command input
O_FB	Input	BOOL	Feedback input when opening
C_FB	Input	BOOL	Feedback input when closing
OO	Output	BOOL	"Open" output
CO	Output	BOOL	"Close" output
OA	Output	BOOL	Alarm output when opening
CA	Output	BOOL	Alarm output when closing
Q	Output	BOOL	A signal state of "0" indicates an error condition.
ET	Static	DINT	Currently elapsed time, where one count = 1 ms
PT	Static	DINT	Preset time value, where one count = 1 ms
PREV_TIME	Static	DWORD	Previous system time
O_HIS	Static	BOOL	"Open" history bit
C_HIS	Static	BOOL	"Close" history bit

For additional information on valid data types, refer to "See also".

The static parameters are not visible when calling the instruction in the program. These are saved in the instance of the instruction.

**Example**

The following example shows how the instruction works:

**Note**

You can initialize static parameters in the data block.

**SCL**

```
"MCAT_DB" (O_CMD := "Tag_Iput_O_CMD",
           C_CMD := "Tag_Input_C_CMD",
           S_CMD := "Tag_Input_S_CMD",
           O_FB := "Tag_Input_O_FB",
           C_FB := "Tag_Input_C_FB",
           OO => "Tag_OutputOpen",
           CO => "Tag_OutputClosed",
           OA => "Tag_Output_OA",
           CA => "Tag_Output_CA",
           Q => "Tag_Output_Q");
```

The following tables show how the instruction works using specific values:

**Before processing**

In this example the following values are used for the input and output parameters:

Parameter	Operand	Value
O_CMD	Tag_Input_O_CMD	TRUE
C_CMD	Tag_Input_C_CMD	FALSE
S_CMD	Tag_Input_S_CMD	FALSE
O_FB	Tag_Input_O_FB	FALSE
C_FB	Tag_Input_C_FB	FALSE
OO	Tag_OutputOpen	FALSE
CO	Tag_OutputClosed	FALSE
OA	Tag_Output_OA	FALSE
CA	Tag_Output_CA	FALSE
Q	Tag_Output_Q	FALSE

The following values are saved in the instance data block "MCAT\_DB" of the instruction:

Parameter	Address	Value
ET	DBD4	L#2
PT	DBD8	L#22
O_HIS	DBX16.0	TRUE
C_HIS	DBX16.1	FALSE

**After processing**

The following values are written to the output parameters after the instruction has been executed:

Parameter	Operand	Value
OO	Tag_OutputOpen	TRUE
CO	Tag_OutputClosed	FALSE
OA	Tag_Output_OA	FALSE
CA	Tag_Output_CA	FALSE
Q	Tag_Output_Q	TRUE

The following values are saved in the instance data block "MCAT\_DB" of the instruction:

Parameter	Address	Value
ET	DBD4	L#0
O_HIS	DBX16.0	TRUE
CMD_HIS	DBX16.1	FALSE

## IMC: Compare input bits with the bits of a mask

### Description

The "Compare input bits with the bits of a mask" instruction is used to compare the signal state of up to 16 programmed input bits (IN\_BIT0 to IN\_BIT15) with the corresponding bit of a mask. Up to 16 steps with masks can be programmed. The value of the IN\_BIT0 parameter is compared with the value of the mask CMP\_VAL[x,0], with "x" indicating the step number. On the CMP\_STEP parameter, you specify the step number of the mask that is used for the comparison. All programmed values are compared in the same manner. Unprogrammed input bits or unprogrammed bits of the mask have a default signal state FALSE.

If a match is found in the comparison, the signal state of the OUT parameter is set to "1". Otherwise the OUT parameter is set to "0".

If the value of CMP\_STEP parameter is greater than 15, the instruction is not executed. An error message is output at the ERR\_CODE parameter.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For more information on this topic, refer to "See also".

### Syntax

The following syntax is used for the "Compare input bits with the bits of a mask" instruction:

```
SCL
<Instance>(IN_BIT0 - 15 := <Operand>,
          CMP_STEP := <Operand>,
```

**SCL**

```
OUT => <Operand>,
ERR_CODE => <Operand>
```

**Parameters**

The following table shows the parameters of the "Compare input bits with the bits of a mask" instruction:

Parameter	Declaration	Data type	Description
IN_BIT0	Input	BOOL	Input bit 0 is compared with bit 0 of the mask.
IN_BIT1	Input	BOOL	Input bit 1 is compared with bit 1 of the mask.
IN_BIT2	Input	BOOL	Input bit 2 is compared with bit 2 of the mask.
IN_BIT3	Input	BOOL	Input bit 3 is compared with bit 3 of the mask.
IN_BIT4	Input	BOOL	Input bit 4 is compared with bit 4 of the mask.
IN_BIT5	Input	BOOL	Input bit 5 is compared with bit 5 of the mask.
IN_BIT6	Input	BOOL	Input bit 6 is compared with bit 6 of the mask.
IN_BIT7	Input	BOOL	Input bit 7 is compared with bit 7 of the mask.
IN_BIT8	Input	BOOL	Input bit 8 is compared with bit 8 of the mask.
IN_BIT9	Input	BOOL	Input bit 9 is compared with bit 9 of the mask.
IN_BIT10	Input	BOOL	Input bit 10 is compared with bit 10 of the mask.
IN_BIT11	Input	BOOL	Input bit 11 is compared with bit 11 of the mask.
IN_BIT12	Input	BOOL	Input bit 12 is compared with bit 12 of the mask.
IN_BIT13	Input	BOOL	Input bit 13 is compared with bit 13 of the mask.
IN_BIT14	Input	BOOL	Input bit 14 is compared with bit 14 of the mask.
IN_BIT15	Input	BOOL	Input bit 15 is compared with bit 15 of the mask.
CMP_STEP	Input	BYTE	The step number of the mask used for the comparison.
OUT	Output	BOOL	A signal state of "1" indicates that a match was found. A signal state of "0" indicates that no match was found.
ERR_CODE	Output	WORD	Error information
CMP_VAL	Static	ARRAY OF WORD	Comparison masks [0 to 15, 0 to 15]: The first number of the index is the step number and the second number is the bit number of the mask.

For more information on valid data types, refer to "See also".

The static parameters are not visible when calling the instruction in the program. These are saved in the instance of the instruction.

## ERR\_CODE Parameter

The following table shows the meaning of the values of the ERR\_CODE parameter:

Error code* (W#16#...)	Explanation
0000	No error
000A	The value at the CMP_STEP parameter is greater than 15.
*The error codes can be displayed as integer or hexadecimal value in the program editor. For more information on toggling display formats, refer to "See also".	

## See also

## SMC: Compare scan matrix

### Description

You can use the "Compare scan matrix" instruction to compare the signal state of up to 16 programmed input bits (IN\_BIT0 to IN\_BIT15) with the corresponding bit of the comparison masks for each step. Processing starts at step 1 and is continued until the last programmed step (LAST) or until a match is found. The input bit of the IN\_BIT0 parameter is compared with the value of the mask CMP\_VAL[x,0], with "x" indicating the step number. All programmed values are compared in the same manner. If a match is found the signal state of the OUT parameter is set to "1" and the step number with the matching mask is written in the OUT\_STEP parameter. Unprogrammed input bits or unprogrammed bits of the mask have a default signal state FALSE. If more than one step has a matching mask, only the first one found is indicated in the OUT\_STEP parameter. If no match is found, the signal state of the OUT parameter is set to "0". In this case the value at the OUT\_STEP parameter is greater by "1" than the value at the LAST parameter.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For more information on this topic, refer to "See also".

### Syntax

The following syntax is used for the "Compare scan matrix" instruction:

```
SCL
<Instance>(IN_BIT0 - 15 := <Operand>,
          OUT => <Operand>,
          OUT_STEP => <Operand>,
          ERR_CODE => <Operand>)
```

**Syntax**

The following table shows the parameters of the "Compare scan matrix" instruction:

Parameter	Declaration	Data type	Description
IN_BIT0	Input	BOOL	Input bit 0 is compared with bit 0 of the mask.
IN_BIT1	Input	BOOL	Input bit 1 is compared with bit 1 of the mask.
IN_BIT2	Input	BOOL	Input bit 2 is compared with bit 2 of the mask.
IN_BIT3	Input	BOOL	Input bit 3 is compared with bit 3 of the mask.
IN_BIT4	Input	BOOL	Input bit 4 is compared with bit 4 of the mask.
IN_BIT5	Input	BOOL	Input bit 5 is compared with bit 5 of the mask.
IN_BIT6	Input	BOOL	Input bit 6 is compared with bit 6 of the mask.
IN_BIT7	Input	BOOL	Input bit 7 is compared with bit 7 of the mask.
IN_BIT8	Input	BOOL	Input bit 8 is compared with bit 8 of the mask.
IN_BIT9	Input	BOOL	Input bit 9 is compared with bit 9 of the mask.
IN_BIT10	Input	BOOL	Input bit 10 is compared with bit 10 of the mask.
IN_BIT11	Input	BOOL	Input bit 11 is compared with bit 11 of the mask.
IN_BIT12	Input	BOOL	Input bit 12 is compared with bit 12 of the mask.
IN_BIT13	Input	BOOL	Input bit 13 is compared with bit 13 of the mask.
IN_BIT14	Input	BOOL	Input bit 14 is compared with bit 14 of the mask.
IN_BIT15	Input	BOOL	Input bit 15 is compared with bit 15 of the mask.
OUT	Output	BOOL	A signal state of "1" indicates that a match was found. A signal state of "0" indicates that no match was found.
OUT_STEP	Output	BYTE	Contains the step number with the matching mask, or the step number which is greater by "1" than the value at the LAST parameter, provided no match is found.
ERR_CODE	Output	WORD	Error information
LAST	Static	BYTE	Specifies the step number of the last step to be scanned for a matching mask.
CMP_VAL	Static	ARRAY OF WORD	Comparison masks [0 to 15, 0 to 15]: The first number of the index is the step number and the second number is the bit number of the mask.

For more information on valid data types, refer to "See also".

The static parameters are not visible when calling the instruction in the program. These are saved in the instance of the instruction.

## ERR\_CODE Parameter

The following table shows the meaning of the values of the parameter ERR\_CODE:

Error code* (W#16#...)	Explanation
0000	No error
000E	The value at the LAST parameter is greater than 15.

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For more information on toggling display formats, refer to "See also".

Overview of the valid data types (Page 1262)

## LEAD\_LAG: Lead and lag algorithm

### Description

Use the "Lead and lag algorithm" instruction to process signals with an analog tag. The gain value at the GAIN parameter must be greater than zero. The result of the "Lead and lag algorithm" instruction is calculated using the following equation:

$$\text{OUT} = \left[ \frac{\text{LG\_TIME}}{\text{LG\_TIME} + \text{SAMPLE\_T}} \right] \text{PREV\_OUT} + \text{GAIN} \left[ \frac{\text{LD\_TIME} + \text{SAMPLE\_T}}{\text{LG\_TIME} + \text{SAMPLE\_T}} \right] \text{IN} - \text{GAIN} \left[ \frac{\text{LD\_TIME}}{\text{LG\_TIME} + \text{SAMPLE\_T}} \right] * \text{PREV\_IN}$$

The instruction "Lead and lag algorithm" supplies plausible results only when processing is in fixed program cycles. The same units must be specified at the parameters LD\_TIME, LG\_TIME and SAMPLE\_T. At LG\_TIME > 4 + SAMPLE\_T, the instruction approaches the following function:

$$\text{OUT} = \text{GAIN} * ((1 + \text{LD\_TIME} * s) / (1 + \text{LG\_TIME} * s)) * \text{IN}$$

When the value of the GAIN parameter is less than or equal to zero, the calculation is not performed and an error information is output on the ERR\_CODE parameter.

You can use the "Lead and lag algorithm" instruction in conjunction with loops as a compensator in dynamic feed-forward control. The instruction consists of two operations. The "Lead" operation shifts the phase of output OUT so that the output leads the input. The "Lag" operation, on the other hand, shifts the output so that the output lags behind the input. Because the "Lag" operation is equivalent to an integration, it can be used as a noise suppressor or as a low-pass filter. The "Lead" operation is equivalent to a differentiation and can therefore be used as a high-pass filter. The two instructions together (Lead and Lag) result in the output phase lagging behind the the input at lower frequencies and leading it at higher frequencies. This means that the "Lead and lag algorithm" instruction can be used as a band pass filter.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For more information on this topic, refer to "See also".

**Syntax**

The following syntax is used for the "Lead and lag algorithm" instruction:

```

SCL
<Instance>(IN:= <Operand>,
           SAMPLE_T := <Operand>,
           OUT => <Operand>,
           ERR_CODE => <Operand>)
    
```

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	REAL	The input value of the current sample time (cycle time) to be processed. Constants can also be specified on the IN parameter.
SAMPLE_T	Input	INT	Sample time Constants can also be specified on the SAMPLE_T parameter.
OUT	Output	REAL	Result of the instruction
ERR_CODE	Output	WORD	Error information
LD_TIME	Static	REAL	Lead time in the same unit as sample time.
LG_TIME	Static	REAL	Lag time in the same unit as sample time
GAIN	Static	REAL	Gain as % / % (the ratio of the change in output to a change in input as a steady state).
PREV_IN	Static	REAL	Previous input
PREV_OUT	Static	REAL	Previous output

For more information on valid data types, refer to "See also".

The static parameters are not visible when calling the instruction in the program. These are saved in the instance of the instruction.

## ERR\_CODE Parameter

The following table shows the meaning of the values of the parameter ERR\_CODE:

Error code* (W#16#...)	Explanation
0000	No error
0009	The value at the GAIN parameter is less than or equal to zero.

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For more information on toggling display formats, refer to "See also".

## Example

The following example shows how the instruction works:

### Note

You can initialize static parameters in the data block.

### SCL

```
"LEAD_LAG_DB" (IN := "Tag_Input",
                SAMPLE_T := "Tag_Input_SAMPLE_T",
                OUT => "Tag_Output_Result",
                ERR_CODE => "Tag_ErrorCode");
```

The following tables show how the instruction works using specific values:

### Before processing

In this example the following values are used for the input parameters:

Parameter	Operand	Value
IN	Tag_Input	2.0
SAMPLE_T	Tag_Input_SAMPLE_T	10

The following values are saved in the instance data block "LEAD\_LAG\_DB" of the instruction:

Parameter	Address	Value
LD_TIME	DBD12	2.0
LG_TIME	DBD16	2.0
GAIN	DBD20	1.0
PREV_IN	DBD24	6.0
PREV_OUT	DBD28	6.0

### After processing

The following values are written to the output parameters after the instruction has been executed:

Parameter	Operand	Value
OUT	Tag_Output_Result	2.0

The following values are saved in the instance data block "LEAD\_LAD\_DB" of the instruction:

Parameter	Operand	Value
PREV_IN	DBD24	2.0
PREV_OUT	DBD28	2.0

Overview of the valid data types (Page 1262)

**SEG: Create bit pattern for seven-segment display**

**Description**

The "Create bit pattern for seven-segment display" instruction is used to convert each of the four hexadecimal digits of the specified source word (IN) into an equivalent bit pattern for a 7-segment display. The result of the instruction is output in the double word on the OUT parameter.

The following relation exists between the hexadecimal digits and the assignment of the 7 segments (a, b, c, d, e, f, g):

Input digit (Binary)	Assignment of the segments - g f e d c b a	Display (Hexadecimal)	Seven-segment display
0000	00111111	0	
0001	00000110	1	
0010	01011011	2	
0011	01001111	3	
0100	01100110	4	
0101	01101101	5	
0110	01111101	6	
0111	00000111	7	
1000	01111111	8	
1001	01100111	9	
1010	01110111	A	
1011	01111100	B	
1100	00111001	C	
1101	01011110	D	
1110	01111001	E	
1111	01110001	F	

## Syntax

Use the following syntax for the "Create bit pattern for seven-segment display" instruction:

```
SCL
SEG(IN := <Operand>,
    OUT => <Operand>)
```

## Parameter

The following table shows the parameters of the "Create bit pattern for seven-segment display" instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	Source word with four hexadecimal digits
OUT	Output	DWORD	Bit pattern for the seven-segment display
Function value		VOID	Empty function value

## Example

The following example shows how the instruction works:

```
SCL
SEG(IN := "Tag_Input",
    OUT => "Tag_Output");
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value	
		Hexadecimal	Binary
IN	Tag_Input	W#16#1234	0001 0010 0011 0100
OUT	Tag_Output	DW16#065B4F66	00000110 01011011 01001111 01100110 Display: 1234

## BCDCPL: Create tens complement

### Description

The "Create tens complement" instruction is used to create the tens complement of a seven-digit BCD number specified by the operand. This instruction uses the following mathematical formula to calculate:

10000000 (as BCD)

– 7-digit BCD value

-----

Tens complement (as BCD)

### Syntax

The following syntax is used for the "Create tens complement" instruction:

```
SCL
BCDCPL (<Operand>)
```

### Parameter

The following table shows the parameters of the "Create tens complement" instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	Bit strings	7-digit BCD number
Function value		DWORD	Result of the instruction

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```
SCL
"Tag_Result" := BCDCPL("Tag_Input");
```

The following table shows how the instruction functions using specific values:

Operand	Value*
Tag_Input	DW#16#01234567
Tag_Result	DW#16#08765433

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

**See also**

Overview of the valid data types (Page 1262)

**BITSUM: Count number of set bits****Description**

The "Count number of set bits" instruction is used to count the number of bits of an operand that are set to the signal state "1".

**Syntax**

The following syntax is used for the "Count number of set bits" instruction:

```
SCL
BITSUM(<Operand>)
```

**Parameter**

The following table shows the parameters of the "Count number of set bits" instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	DWORD	Operand whose set bits are counted
Function value		INT	Result of the instruction

**Example**

The following example shows how the instruction works:

```
SCL
"Tag_Result" := BITSUM("Tag_Input");
```

The following table shows how the instruction functions using specific values:

Operand	Value*
Tag_Input	DW#16#12345678
Tag_Result	W#16#000D (13 bits)
*The error codes can be displayed as integer or hexadecimal value in the program editor. For more information on toggling display formats, refer to "See also".

### 9.7.3 Extended instructions

#### 9.7.3.1 Date and time-of-day

#### T\_COMP: Compare time tags

##### Description

This instruction is used to compare the contents of two tags of the data types "Timers" or "Date and time".

The instruction supports comparisons of the following data types: DATE, TIME, LTIME, TOD (TIME\_OF\_DAY), LTOD (LTIME\_OF\_DAY), DT (DATE\_AND\_TIME), LDT (DATE\_AND\_LTIME), DTL, S5Time.

The data types must be the same length and format to carry out the comparison.

The comparison result is output at the OUT parameter as a return value. For this purpose, the parameter OUT is set to "1" if the condition used for the comparison is satisfied.

The following comparison options can be used:

Symbol	Description
EQ	The return value has the signal state "1" if the time is the same at the parameter IN1 and IN2.
NE	The return value has the signal state "1" if the time at parameters IN1 and IN2 is not identical.
GE	The return value has the signal state "1" if the time at parameter IN1 is greater (more recent) than or equal to the time at parameter IN2 .
LE	The return value has the signal state "1" if the time at parameter IN1 is less (less recent) than or equal to the time at parameter IN2.
GT	The return value has the signal state "1" if the time at parameter IN1 is greater (more recent) than the time at parameter IN2.
LT	The return value has the signal state "1" if the time at parameter IN1 is less (less recent) than the time at parameter IN2 .

##### Parameters

The following table shows the parameters of the instruction "T\_COMP":

Parameter	Declaration	Data type	Memory area	Description
IN1	Input	DATE, TIME, LTIME, TOD, LTOD, DT, LDT, DTL	I, Q, M, D, L, P or constant	First value to be compared.
IN2	Input	DATE, TIME, LTIME, TOD, LTOD, DT, LDT, DTL	I, Q, M, D, L, P or constant	Second value to be compared.
OUT	Output	BOOL	I, Q, M, D, L, P	Return value

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

## T\_CONV: Convert times and extract

### Description

You use the instruction "T\_CONV" to convert the data type of the IN input parameter to the data type that is output at the OUT output. You select the data formats for the conversion from the instruction boxes of the input and output.

### Parameters

The following table shows the parameters of the instruction "T\_CONV". If an input and output parameter of the same data type is used, the instruction copies the corresponding value.

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN	Input	Integers, TIME, date and time*	WORD, integers, timers, date and time*	I, Q, M, D, L, P or constant	Value to be converted
OUT	Return	Integers, TIME, date and time*	WORD, integers, timers, date and time*	I, Q, M, D, L, P	Result of the conversion

\* The range of supported data types depends on the CPU. Please refer to the overviews of valid data types for information on the data types supported by the S7-1200 and S7-1500 modules.

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

## T\_ADD: Add times

### Description

You use this instruction to add the time information in the IN1 input to the time information in the IN2 input. You can query the result in the OUT output parameter. You can add the following formats:

- Addition of a time period to another time period.  
Example: Addition of a TIME data type to another TIME data type.
- Addition of a time period to a time.  
Example: Addition of a TIME data type to the DTL data type.

The data type for the value at input parameter IN1 and output parameter OUT is defined by the selection in the instruction boxes of the input and output. You can only specify time information in TIME format in the IN2 input parameter (for S7-1500 modules also LTIME).

**Parameters**

The following tables show the parameters of the "T\_ADD" instruction, according to the possible conversions:

Table 9-34 Addition of a time period to another time period

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	TIME	TIME, LTIME	I, Q, M, D, L, P or constant	First number to be added
IN2	Input	TIME	TIME, LTIME	I, Q, M, D, L, P or constant	Second number to be added
OUT	Return	DINT, DWORD, TIME, TOD	TIME, LTIME,	I, Q, M, D, L, P	Result of addition The data type selection depends on the data types selected for the IN1 and IN2 input parameters.

Table 9-35 Addition of a time period to a time

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	DTL, TOD	DT, TOD, LTOD, LDT, DTL	I, Q, M, D, L, P or constant	First number to be added
IN2	Input	TIME	TIME, LTIME	I, Q, M, D, L, P or constant	Second number to be added
OUT	Return	DINT, DWORD, TIME, TOD, UDINT, DTL	DT, DTL, LDT, TOD, LTOD	I, Q, M, D, L, P	Result of addition The data type selection depends on the data types selected for the IN1 and IN2 input parameters.

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

**T\_SUB: Subtract times**

**Description**

You use this instruction to subtract the time information in the IN2 input parameter from the time information in the IN1 input parameter. You can query the difference in the OUT output parameter. You can subtract the following formats:

- Subtraction of a time period from another time period  
Example: Subtraction of a time period of the data type TIME from another time period of the data type TIME. The result can be output to a tag with the TIME format.
- Subtraction of a time period from a time  
Example: Subtraction of a time period of the data type TIME from a time of the data type DTL. The result can be output to a tag with the DTL format.

You decide the formats of the values in the IN1 input parameter and the OUT output parameter by selecting the data types for the input and output parameters of the instruction.

## Parameters

The following tables show the parameters of the "T\_SUB" instruction, according to the possible conversions:

Table 9-36 Subtraction of a time period from another time period

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	TIME	TIME, LTIME	I, Q, M, D, L, P or constant	Minuend
IN2	Input	TIME	TIME, LTIME	I, Q, M, D, L, P or constant	Subtrahend
OUT	Return	DINT, DWORD, TIME, TOD, UDINT	TIME, LTIME	I, Q, M, D, L, P	Result of subtraction

Table 9-37 Subtraction of a time period from a time

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	DTL, TOD	TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	Minuend
IN2	Input	TIME	TIME, LTIME	I, Q, M, D, L, P or constant	Subtrahend
OUT	Return	DTL, DINT, DWORD, TIME, TOD, UDINT	TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P	Result of subtraction

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

## T\_DIFF: Time difference

### Description

You use this instruction to subtract the time information in the IN2 input parameter from the time information in the IN1 input parameter. The result is sent at output parameter OUT.

- If the time information at the IN2 input parameter is greater than the time information at the IN1 input parameter, the result is output as a negative value at the OUT output parameter.
- If the result of the subtraction is outside the TIME range, the result is set to "0" (0:00) and the enable output ENO = "0".

**Parameters**

The following table shows the parameters of the "T\_DIFF" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	DTL, DATE, TOD	DTL, DATE, DT, TOD, LTOD, LDT	I, Q, M, D, L, P or constant	Minuend
IN2	Input	DTL, DATE, TOD	DTL, DATE, DT, TOD, LTOD, LDT	I, Q, M, D, L, P or constant	Subtrahend
OUT	Return	TIME, INT	TIME, LTIME, INT	I, Q, M, D, L, P	Difference of input parameters

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

**T\_COMBINE: Combine times**

**Description**

The instruction combines the value of a date with the value of a time and converts this into a combined date and time value.

- The date is output at the input parameter IN1. A value of between 1990-01-01 and 2089-12-31 must be used for the data type DATE (this is not checked).
- The time is input at the IN2 input value (TOD/LTOD data type).
- The combined data type for the date and time value is output at the OUT output value.

**Parameters**

The following table shows the parameters of the instruction "T\_COMBINE":

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	DATE	DATE	I, Q, M, D, L, P or constant	Input tag of the date
IN2	Input	TOD	TOD, LTOD	I, Q, M, D, L, P or constant	Input tag of the time
OUT	Return	DTL	DT, DTL, LDT	I, Q, M, D, L, P	Return value of the date and time

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## Time-of-day functions

### WR\_SYS\_T: Set time-of-day

#### Description

You use this instruction to set the date and time-of-day of the CPU clock. Enter the date and time-of-day at the input parameter IN . The value must be in the following range:

- With DT: min. DT#1990-01-01-0:0:0, max. DT#2200-12-31-23:59:59.999
- With LDT: min. LDT#1970-1-1-0:0:0.000000000, max. LDT#2200-12-31-23:59:59.999999999
- With DTL: min. DTL#1970-01-01-00:00:00.0, max. DTL#2200-12-31-23:59:59.999999999

You can query whether errors have occurred during execution of the instruction in the RET\_VAL output parameter.

The "WR\_SYS\_T" instruction cannot be used to pass information about the local time zone or daylight saving time.

#### Parameters

The following table shows the parameters of the "WR\_SYS\_T" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN	Input	DTL	DT, DTL, LDT	I, Q, M, D, L, P or constant *	Date and time
RET_VAL	Return	INT	INT	I, Q, M, D, L, P	Status of the instruction

\* The data types DT and DTL cannot be used for the following memory areas: import, output and bit memory.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

#### Parameter RET\_VAL

Error code* (W#16#...)	Description
0000	No error
8080	Error in date
8081	Error in time
8082	Month invalid
8083	Day invalid
8084	Hour information invalid
8085	Minute information invalid
8086	Second information invalid

Error code* (W#16#...)	Description
8087	Nanosecond information invalid
80B0	The real-time clock has failed
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

### RD\_SYS\_T: Read time-of-day

#### Description

You use this instruction to read out the current date and current time-of-day of the CPU clock.

The read out dates are output at the OUT output parameter of the instruction. The provided value does not include information about the local time zone or daylight saving time.

You can query whether errors have occurred during execution of the instruction in the RET\_VAL output.

#### Parameters

The following table shows the parameters of the "RD\_SYS\_T" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
RET_VAL	Return	INT	INT	I, Q, M, D, L, P	Status of the instruction
OUT	Output	DTL	DT, DTL, LDT	I, Q, M, D, L, P	Date and time of CPU

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

#### Parameter RET\_VAL

Error code* (W#16#....)	Description
0000	No error
8081	Time value specified at the OUT parameter is outside the valid value range: <ul style="list-style-type: none"> <li>• With DT: min. DT#1990-01-01-0:0:0, max. DT#2200-12-31-23:59:59.999</li> <li>• With LDT: min. LDT#1970-1-1-0:0:0.000000000, max. LDT#2200-12-31-23:59:59.999999999</li> <li>• With DTL: min. DTL#1970-01-01-00:00:00.0, max. DTL#2200-12-31-23:59:59.999999999</li> </ul>
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## RD\_LOC\_T: Read local time

### Description

You use this instruction to read the current local time from the CPU clock and output this at the OUT output. Information on the time zone and the start of daylight saving time and standard time, which you have set in the configuration of the CPU clock, is used to output the local time.

### Parameter

The following table shows the parameters of the "RD\_LOC\_T" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
RET_VAL	Return	INT	INT	I, Q, M, D, L, P	Status of the instruction
OUT	Output	DTL	DT, LDT, DTL	I, Q, M, D, L, P	Local time

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### RET\_VAL parameter

Error code* (W#16#...)	Description
0000	No error
0001	No error. Local time is output as daylight saving time.
8080	Local time cannot be read.
8081	Time value specified at the OUT parameter is outside the valid value range: <ul style="list-style-type: none"> <li>• With DT: min. DT#1990-01-01-0:0:0, max. DT#2089-12-31-23:59:59.999</li> <li>• With LDT: min. LDT#1970-1-1-0:0:0.000000000, max. LDT#2200-12-31-23:59:59.999999999</li> <li>• With DTL: min. DTL#1970-01-01-00:00:00.0, max. DTL#2200-12-31-23:59:59.999999999</li> </ul>
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## WR\_LOC\_T: Write local time

### Description

The instruction "WR\_LOC\_T" is used to set the date and time of the CPU clock. Enter the date and time-of-day as local time at the input parameter LOCTIME.

The value must be in the following range:

### 9.7 References

- With DT: min. DT#1990-01-01-00:00:00, max. DT#2089-12-31-23:59:59.999
- With DTL: min. DTL#1970-01-01-00:00:00.0, max. DTL#2200-12-31-23:59:59.999999999
- With LDT: min. LDT#1970-1-1-0:0:0.000000000, max. LDT#2200-12-31-23:59:59.999999999

The granularity of the time information for local time and system time is product-specific and is at least one millisecond. Input values at the LOCTIME parameter which are less than those supported by the CPU are rounded up during system time calculation.

You can query whether errors have occurred during execution of the instruction in the RET\_VAL output parameter.

#### Use of WR\_LOC\_T during the time change to daylight savings or standard time

- Changeover from standard to daylight saving time  
In the following it is assumed that the time of the changeover is 2:00 am, and that the time is moved forward by one hour. This means there is no hour between 02:00:00:000000000 AM and 02:59:59:999999999 AM.  
When you specify a corresponding time for LOCTIME, the error code W#16#8089 is generated.  
DST is irrelevant.
- Changeover from daylight saving to standard time  
In the following it is assumed that the time of the changeover is 3:00 am, and that the time is moved back by one hour. This means there are two hours between 02:00:00:000000000 AM and 02:59:59:999999999 AM.  
For all times for LOCTIME that are between 02:00:00:000000000 AM and 02:59:59:999999999 AM, you therefore need to declare whether the time is before or after the time changeover. The DST parameter is used for this:
  - With DST=TRUE, the time is in the first of the two hours, i.e. still in daylight savings time.
  - With DST=FALSE, the time is in the second of the two hours, i.e. in standard time.

For all times for LOCTIME that are outside the double hour, DST is irrelevant.

## Parameters

The following table shows the parameters of the "WR\_LOC\_T" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
LOCTIME	Input	DTL	DT, DTL, LDT	D, L, P or constant	Local time
DST	Input	BOOL	BOOL	I, Q, M, D, L, P, T, C or constant	<b>Daylight Saving Time</b> Is only evaluated during the "double hour" at changeover to standard time. <ul style="list-style-type: none"> <li>• TRUE = daylight saving time (first hour)</li> <li>• FALSE = standard time (second hour)</li> </ul>
RET_VAL	Return	INT	INT	I, Q, M, D, L, P	Error message (see "RET_VAL parameter")

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## RET\_VAL parameter

Error code* (W#16#....)	Description
0000	No error.
8080	The LOCTIME parameter has an invalid value.
8081	Time value specified at the LOCTIME parameter is outside the valid value range: <ul style="list-style-type: none"> <li>• With DT: min. DT#1990-01-01-00:00:00, max. DT#2089-12-31-23:59:59.999</li> <li>• With DTL: min. DTL#1970-01-01-00:00:00.0, max. DTL#2200-12-31-23:59:59.999999999</li> <li>• With LDT: min. LDT#1970-1-1-0:0:0.000000000, max. LDT#2200-12-31-23:59:59.999999999</li> </ul>
8082**	Invalid value specified for the month (byte 2 in DTL format).
8083**	Invalid value specified for the day (byte 3 in DTL format).
8084**	Invalid value specified for the hour (byte 5 in DTL format).
8085**	Invalid value specified for the minute (byte 6 in format DTL).
8086**	Invalid value specified for the second (byte 7 in DTL format).
8087**	Invalid value specified for the nanosecond (byte 8 to 11 in DTL format).
8089	Time value does not exist (hour already passed upon changeover to daylight saving time).
80B0	The real-time clock has failed.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	
** Only for local time information at the LOCTIME parameter in DTL format.	

## SET\_TIMEZONE: Set time zone

### Description

Use the instruction "SET\_TIMEZONE" to set the parameter for the local time zone and the daylight saving / standard time changeover.

The settings which are carried out with the instruction "SET\_TIMEZONE" correspond with the settings for the time-of-day in the properties of the CPU. Define the corresponding parameters in the system data type TimeTransformationRule for execution of the instruction "SET\_TIMEZONE".

The local time is calculated based on the system time using the settings for the time zone and the daylight saving / standard time changeover. The system time of the CPU is the UTC time. The system time is used exclusively for communication within the system.

### Parameters

The following table shows the parameters of the "SET\_TIMEZONE" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L, P or constant	Setting the parameters which are stored at the parameter TimeZone.
TimeZone	Input	Time Transformation Rule (Page 2575)	D, L	Store the parameters for the local time zone and the daylight saving / standard time changeover in the system data type TimeTransformationRule.
DONE	Output	BOOL	I, Q, M, D, L, P	Status parameter: <ul style="list-style-type: none"> <li>0: Job not yet started or is still executing</li> <li>1: Job completed error-free</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L, P	Status parameter: <ul style="list-style-type: none"> <li>0: Job not yet started or already completed</li> <li>1: Job not yet completed. A new job cannot be started.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L, P	Status parameter: <ul style="list-style-type: none"> <li>0: No error</li> <li>1: Error occurred</li> </ul>
STATUS	Output	DINT, DWORD, UDINT, WORD	I, Q, M, D, L, P	Detailed error and status information is output at the parameter STATUS. The parameter is only set for the duration of one call. To display the status, you should therefore copy the STATUS parameter to a free data area.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter STATUS

Error code* (W#16#...)	Description
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
7002	Intermediate call (REQ irrelevant): Instruction already active; BUSY has the value "1".
808x	Incorrect input at the xth parameter of the system data type TimeTransformationRule. Example: Error code 8084 corresponds with an incorrect input at the 4th parameter (DaylightStartWeek). Only the values 1 to 5 are valid here.
80C3	Temporary resource error: The CPU is currently processing the maximum possible number of simultaneous block calls. "SET_TIMEZONE" cannot be executed unless at least one of the block calls is finished.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## TimeTransformationRule

### Description

The times for changeover to daylight saving time and standard time are defined with the system data type TimeTransformationRule.

The following options are available for creating the structure TimeTransformationRule:

- Create a new data block and select as the type TimeTransformationRule.
- Enter TimeTransformationRule as the Data type in an existing data block or a local interface of a function block.

The structure is as follows:

Name	Data type	Description
TimeTransformationRule	STRUCT	
Bias	INT	Time difference between the local time and the system time (UTC) in minutes.
DaylightBias	INT	The time difference between standard and daylight saving time in minutes.
Time specification for change to daylight saving time. The following times always refer to the local time.		
DaylightStartMonth	USINT	Month in which change is made to daylight saving time: 1 = January 2 = February 3 = March ... 12 = December

Name	Data type	Description
DaylightStartWeek	USINT	Week in which change is made to daylight saving time. 1 = First occurrence of the weekday in the month ... 5 = Last occurrence of the weekday in the month
DaylightStartWeekday	USINT	Weekday on which change is made to daylight saving time: 1 = Sunday
DaylightStartHour	USINT	Hour in which change is made to daylight saving time
DaylightStartMinute	USINT	Minute in which change is made to daylight saving time
Time when change is made to standard time, the following times always refer to the local time.		
StandardStartMonth	USINT	Month in which change is made to standard time: 1 = January 2 = February 3 = March ... 12 = December
StandardStartWeek	USINT	Week in which change is made to standard time: 1 = First occurrence of the weekday in the month ... 5 = Last occurrence of the weekday in the month
StandardStartWeekday	USINT	Weekday on which change is made to standard time: 1 = Sunday
StandardStartHour	USINT	Hour in which change is made to standard time
StandardStartMinute	USINT	Minute in which change is made to standard time
TimeZoneName	STRING[80]	Name of the time zone, for example: "(GMT+01:00) Amsterdam, Berlin, Bern, Rome, Stockholm, Vienna"

**SNC\_RTCB: Synchronize slave clocks**

**Definition: Synchronization of slave clocks**

The synchronization of clock slaves refers to the transfer of the date and time-of-day from the clock master of a bus segment to all clock slaves of this bus segment.

**Description**

You use this instruction to synchronize all slave clocks present on a bus segment independent of the assigned synchronization interval. Successful synchronization is only possible if "SNC\_RTCB" is called on a CPU whose real-time clock was assigned as the master clock for at least one bus segment.

## Parameters

The following table shows the parameters of the "SNC\_RTCB" instruction:

Parameter	Declaration	Data type	Memory area	Description
RET_VAL	Output	INT	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter RET\_VAL

Error code* (W#16#...)	Explanation
0000	No error occurred during synchronization.
0001	The existing clock was not assigned the master clock function for any of the bus segments.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## TIME\_TCK: Read system time

### Description

With the "TIME\_TCK" instruction, you read the system time of the CPU. The system time is a time counter that counts from 0 to a maximum of 2147483647 ms. In case of an overflow, the system time is counted again starting with "0". The time scale and the accuracy of the system time is 1 ms. The system time is only influenced by the operating modes of the CPU. You can use the system time, for example, to measure the duration of processes by comparing the results of two "TIME\_TCK" calls. The instruction does not provide any error information.

The following table provides an overview of how the system time changes depending on the operating modes of the CPU.

Mode	System time ...
Startup	... is constantly updated
RUN	
STOP	... is stopped and retains the current value
Warm restart	... is deleted and restarts with "0"

**Parameter**

The following table shows the parameters of the instruction "TIME\_TCK":

Parameters	Declaration	Data type	Memory area	Description
RET_VAL	Return	TIME	I, Q, M, D, L	The RET_VAL parameter contains the read system time in the range from 0 to 2 <sup>31</sup> -1 ms.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**RTM: Runtime meters**

**Description**

You can use this instruction to set, start, stop, and read out a 32-bit runtime meter of your CPU. Ensure that the runtime meter can also be stopped or restarted during execution of the user program, which may render the saved values incorrect.

**Parameters**

The following table shows the parameters of the "RTM" instruction:

Parameter	Declaration	Data type	Memory area	Description
NR	Input	RTM	I, Q, M, D, L or constant	Number of the runtime meter Numbering starts with 0. For information on the number of runtime meters of your CPU, refer to the technical data.
MODE	Input	BYTE	I, Q, M, D, L or constant	Job ID: <ul style="list-style-type: none"> <li>• 0: Read out (the status is then written to CQ and the current value to CV). After the runtime meter has reached (2E31) -1 hours, it stops at the highest value that can be displayed and outputs an "Overflow" error message.</li> <li>• 1: start (at the last counter value)</li> <li>• 2: stop</li> <li>• 4: set (to the value specified in PV)</li> <li>• 5: set (to the value specified in PV) and then start</li> <li>• 6: set (to the value specified in PV) and then stop</li> </ul>
PV	Input	DINT	I, Q, M, D, L or constant	New value for the runtime meter

Parameter	Declaration	Data type	Memory area	Description
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code.
CQ	Output	BOOL	I, Q, M, D, L	Status of the runtime meter (1: running)
CV	Output	DINT	I, Q, M, D, L	Current value of the runtime meter

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter RET\_VAL

Error code (W#16#...)	Explanation
0000	No error
8080	Wrong number for the runtime meter
8081	A negative value was passed to the PV parameter.
8082	Overflow of the runtime meter
8091	The MODE input parameter contains an invalid value.
General error information	See also: Evaluating errors with GET_ERR_ID (Page 2520)

### 9.7.3.2 String + Char

#### S\_MOVE: Move character string

##### Description

You can use this instruction to move the content of a string (W)STRING. The string in the IN input parameter is copied to the OUT output parameter.

The tags at the input parameter IN and the output OUT must have the same data type.

You can use the "MOVE\_BLK" and "UMOVE\_BLK" instructions to copy tags of data type ARRAY.

##### Parameters

The following table shows the parameters of the "S\_MOVE" instruction:

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN	Input	STRING	STRING, WSTRING	D, L or constant	Source string
OUT	Output	STRING	STRING, WSTRING	D, L or constant	Destination string

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## S\_COMP: Compare character strings

### Description

The instruction compares the contents of two tags in the STRING format and outputs the result of the comparison as a return value. The tags that are to be compared will be interconnected at the IN1 and IN2 inputs. You can only assign a symbolically defined tag for the input parameters.

Use the instruction box to select the comparison condition. If the comparison condition (for example, greater than or equal to) is satisfied, the signal state is set to "1" at the output parameter OUT .

The following comparison options can be used:

Symbol	Description
EQ	The return value has the signal state "1" if the string at the IN1 parameter is the same as the string at the IN2 parameter.
NE	The return value has the signal state "1" if the string at the IN1 parameter is not equal to the string at the IN2 parameter.
GT <sup>(1)</sup>	The return value has the signal state "1" if the string at the IN1 parameter is greater than the string at the IN2 parameter.
LT <sup>(1)</sup>	The return value has the signal state "1" if the string at the IN1 parameter is less than the string at the IN2 parameter.
GE <sup>(1)</sup>	The return value has the signal state "1" if the string at the IN1 parameter is greater than or equal to the string at the IN2 parameter.
LE <sup>(1)</sup>	The return value has the signal state "1" if the string at the IN1 parameter is less than or equal to the string at the IN2 parameter.
<sup>(1)</sup> The characters are compared by their ASCII code (for example, 'a' is greater than 'A'), starting from the left. The first character to be different decides the result of the comparison. If the first characters are the same, the longer string is greater.	

### Parameters

The following table shows the parameters of the "S\_COMP" instruction:

Parameters	Declaration	Data type	Memory area	Description
IN1	Input	STRING*	D, L or constant	Input tag in the STRING format.
IN2	Input	STRING*	D, L or constant	Input tag in the STRING format.
OUT	Output	BOOL	I, Q, M, D, L	Result of comparison
* Define the maximum length of the character string if you use the data type STRING in the interface declaration for a temporary tag (you will find further information in the description of the data type).				

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## S\_CONV: Convert character string

### Description

You use this instruction to convert the value at the IN input to the data format you have specified in the OUT output. You decide the output format of the conversion by selecting a data type for the OUT output parameter.

The following conversions are possible:

- Conversion of a character string (STRING) to:
  - Numerical value (integer or floating-point number)  
The conversion is performed for all characters of the character string specified in the IN input parameter. Permitted characters are the digits "0" to "9", the decimal point, and the plus and minus signs. The first character of the string may be a valid number or a sign. Leading spaces and exponential notations are ignored.
  - A character (CHAR)  
The first character of the character string is transferred to the parameter OUT when a character string is converted to a character (CHAR).
- Conversion of a numerical value or character to a character string (STRING):
  - You decide the format of the numeric value to be converted by selecting a data type for the IN input. A valid tag of the STRING data type must be specified in the OUT output. The length of the character string after conversion depends on the value at the IN input.
  - The conversion result is saved as a string starting at the third byte. The first byte of the string records the maximum length and the second byte the actual length of the character string. Positive numeric value are output without a sign.
  - When you convert zero (e.g. INT\_TO\_STRING(0)), the string will be 6 characters long.
  - The first character of the character string is filled with spaces when converting to a numerical value. The number of spaces depends on the length of the numerical value.
  - The character is written at the first position in the character string when converting to a character (CHAR).

---

#### Note

##### Exponential notation during conversion from floating-point numbers

Do not use exponential notation ("e" or "E") for the conversion from floating-point numbers with the instruction "S\_CONV". Instead, use the instruction "STRG\_VAL (Page 2582)" for the conversion of floating-point numbers with exponential notation. You can use the FORMAT parameter of the instruction to select exponential notation as input format.

---

**Parameters**

The following tables show the parameters of the "S\_CONV" instruction, according to the possible conversions:

Table 9-38 Parameters for converting a character string to a numeric value:

Parameters	Declaration	Data type	Memory area	Description
IN	Input	STRING	D, L or constant	Value to be converted
OUT	Output	CHAR, USINT, UINT, UDINT, ULINT, SINT, INT, DINT, LINT, REAL, LREAL	I, Q, M, D, L	Result of the conversion

Table 9-39 Parameter when converting a numerical value or character to a character string:

Parameter	Declaration	Data type	Memory area	Description
IN	Input	CHAR, USINT, UINT, UDINT, ULINT, SINT, INT, DINT, LINT, REAL, LREAL	I, Q, M, D, L or constant	Value to be converted
OUT	Output	STRING	D, L	Result of the conversion

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**STRG\_VAL: Convert character string to numerical value**

**Description**

The instruction "STRG\_VAL" converts a character string to an integer or a floating-point number:

- You specify the character string to be converted in the IN input parameter.
- You define the format of the output value by selecting a data type for the OUT output parameter.

Permitted characters for the conversion are the digits "0" to "9", the decimal point, the decimal comma, notations "E" and "e", and the plus and minus characters. The conversion can be interrupted by invalid characters.

The "STRG\_VAL" instruction is not supported by the SCL programming language.

## Parameters

The following table shows the parameters of the "STRG\_VAL" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN	Input	STRING	STRING, WSTRING	D, L or constant	Numeric character string to be converted
FORMAT	Input	WORD	WORD	I, Q, M, D, L, P or constant	Output format of the characters
P	Input	UINT	UINT	I, Q, M, D, L, P or constant	Reference to the first character to be converted (first character = 1, the value "0" or a value > length of the string is invalid)
OUT	Output	USINT, SINT, UINT, INT, UDINT, DINT, REAL, LREAL	USINT, SINT, UINT, INT, UDINT, DINT, ULINT, LINT, REAL, LREAL	I, Q, M, D, L, P	Result of the conversion

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## FORMAT parameter

You use the FORMAT parameter to specify how the characters of a character string are to be interpreted. Exponential values can also be converted and represented with the "STRG\_VAL" instruction.

The following table shows the possible values of the FORMAT parameter and their meaning:

Value (W#16#....)	Notation	Decimal representation
0000	Decimal fraction	"."
0001		","
0002	Exponential	"."
0003		","
0004 to FFFF	Invalid values	

## P parameter

The conversion starts at the character whose position you specified in the P parameter. If, for example, the value "1" is specified in the P parameter, the conversion starts at the first character of the specified character string.

**Example**

The following table shows examples of the conversion of a character string to a numeric value:

IN (STRING)	FORMAT (W#16#....)	OUT (data type)	OUT (value)	ENO status
'123'	0000	INT/DINT	123	1
'-00456'	0000	INT/DINT	-456	1
'123.45'	0000	INT/DINT	123	1
'+2345'	0000	INT/DINT	2345	1
'00123AB'	0000	INT/DINT	123	1
'123'	0000	REAL	123.0	1
'-00456'	0001	REAL	-456.0	1
'+00456'	0001	REAL	456.0	1
'123.45'	0000	REAL	123.45	1
'123.45'	0001	REAL	12345.0	1
'123,45'	0000	REAL	12345.0	1
'123,45'	0001	REAL	123.45	1
'.00123AB'	0001	REAL	123.0	1
'1.23e-4'	0000	REAL	1.23	1
'1.23E-4'	0000	REAL	1.23	1
'1.23E-4'	0002	REAL	1.23E-4	1
'12,345.67'	0000	REAL	12345.67	1
'12,345.67'	0001	REAL	12.345	1
'3.4e39'	0002	REAL	W#16#7F800000	1
'-3.4e39'	0002	REAL	W#16#FF800000	1
'1.1754943e-38'	0002	REAL	0.0	1
'12345'	-/-	SINT	0	0
'A123'	-/-	-/-	0	0
'	-/-	-/-	0	0
'++123'	-/-	-/-	0	0
'+-123'	-/-	-/-	0	0

**VAL\_STRG: Convert numerical value to character string**

**Description**

The "VAL\_STRG" instruction is used to convert a numerical value into a character string.

- You specify the value to be converted in the IN input parameter. You decide the format of the numeric value by selecting a data type.
- You query the result of the conversion in the OUT output parameter.

Permitted characters for the conversion are the digits "0" to "9", the decimal point, the decimal comma, notations "E" and "e", and the plus and minus characters. The conversion can be interrupted by invalid characters.

The "VAL\_STRG" instruction is not supported by the SCL programming language.

## Parameters

The following table shows the parameters of the "VAL\_STRG" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN	Input	USINT, SINT, UINT, INT, UDINT, DINT, REAL, LREAL	USINT, SINT, UINT, INT, UDINT, DINT, ULINT, LINT, REAL, LREAL	I, Q, M, D, L, P or constant	Value to be converted
SIZE	Input	USINT	USINT	I, Q, M, D, L, P or constant	Number of character positions
PREC	Input	USINT	USINT	I, Q, M, D, L, P or constant	Number of decimal places
FORMAT	Input	WORD	WORD	I, Q, M, D, L, P or constant	Output format of the characters
P	InOut	UINT	UINT	I, Q, M, D, L, P or constant	Character starting at which the result is written.
OUT	Output	STRING	STRING, WSTRING	D, L	Result of the conversion

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## P parameter

With the P parameter, you specify the character in the string starting at which the result is written. If, for example, the value "2" is specified in the P parameter, the converted value is saved starting at the second character of the string.

## SIZE and P parameters

Use the SIZE parameter to specify how many characters of the character string will be written. This is counted starting from the character specified in the P parameter. If the output value is shorter than the specified length, the result is written to the character string right-justified. The empty character positions are filled with blanks.

## FORMAT parameter

Use the FORMAT parameter to specify how the numerical value is interpreted during conversion and written to the character string. You can specify only tags of the FORMAT data type in the USINT parameter.

The following table shows the possible values of the FORMAT parameter and their meaning:

9.7 References

Value (W#16#...)	Notation	Sign	Decimal representation
0000	Decimal fraction	"-"	"."
0001			"."
0002	Exponential		"."
0003			"."
0004	Decimal fraction	"+" and "-"	"."
0005			"."
0006	Exponential		"."
0007			"."
0008 to FFFF	Invalid values		

**PREC parameter**

Use the PREC parameter to define the number of decimal places when converting floating-point numbers. A maximum precision of seven numbers is supported for numerical values of the REAL data type. If the value to be converted is an integer, you use the PREC parameter to specify the position where the decimal point will be placed.

**Example**

The following table shows examples of the conversion of numeric values to a character string.

IN (value)	IN (data type)	P	SIZE	FORMAT (W#16#...)	PREC	OUT (STRING)	ENO status
123	UINT	16	10	0000	0	xxxxxxxx123 C	1
0	UINT	16	10	0000	2	xxxxxx0.00 C	1
12345678	UDINT	16	10	0000	3	x12345.678 C	1
12345678	UDINT	16	10	0001	3	x12345.678 C	1
123	INT	16	10	0004	0	xxxxxx+123 C	1
-123	INT	16	10	0004	0	xxxxxx-123 C	1
-0.00123	REAL	16	10	0004	4	xxx-0.0012 C	1
-0.00123	REAL	16	10	0006	4	-1.2300E-3 C	1
-Inf <sup>1)</sup>	REAL	16	10	-/-	4	xxxxxx-INF C	0
+Inf <sup>2)</sup>	REAL	16	10	-/-	4	xxxxxx+INF C	0
NaN <sup>3)</sup>	REAL	16	10	-/-	4	xxxxxxNaN C	0
12345678	UDINT	16	6	-/-	3	xxxxxxxxxx C	0

"x" represents blanks

<sup>1)</sup>-Inf: Floating-point number representing a negative infinite value.

<sup>2)</sup>+Inf: Floating-point number representing a positive infinite value.

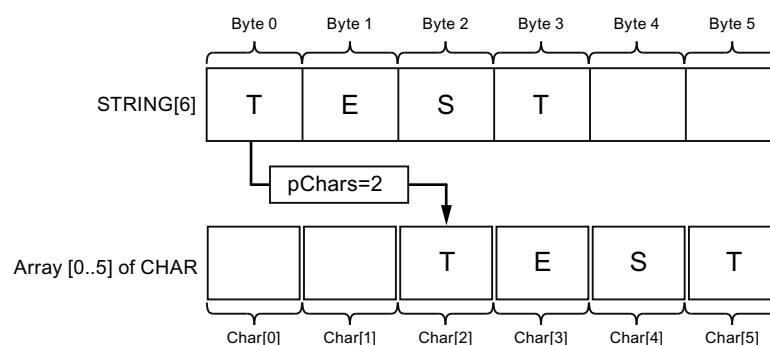

<sup>3)</sup>NaN: Value returned as the result of invalid math operations.

## Strg\_TO\_Chars: Convert character string to Array of CHAR

### Description

Use the instruction to copy a character string (W)STRING into a structure of the data type Array of CHAR or Array of BYTE. Only ASCII characters are valid for the copy process.

- Specify the character string at the input parameter STRG.
- The characters are written to a data type Array of CHAR / BYTE at the parameter CHARS.
  - The number of characters in the structure Array of CHAR / BYTE should be at least the same number as were copied from the character string STRING.
  - If the structure Array of CHAR / BYTE contains less characters than in the character string then the characters are written up to the maximum length of the Array of CHAR / BYTE.
  - If the character string contains a character "\$00" then the copy process is only carried out up to the corresponding position.
  - The number of copied characters is output at the parameter CNT.
- Use the parameter PCHARS to define the character in the structure after which Array of CHAR / BYTE should be written.
  - Example: Use the value "2" at the parameter PCHARS if writing should take place after the third character:

- The lower index limit of the array is used as the standard ("0") (e.g. CHAR[0] at an Array [0..5] of CHAR).

### Note

#### Use of the instruction with S7-1200 V2.0

S7-1200 up to Version 2.0 only supports Array [0 .. n] of CHAR / BYTE. Negative index limits (e.g. Array [-3..2] of CHAR) are not permissible. This restriction is not checked by the software.

**Parameters**

The following table shows the parameters of the instruction "Strg\_TO\_Chars":

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
STRG	Input	STRING	STRING, WSTRING	D, L or constant	The copy source Character string with a maximum length of 254 characters.
PCHARS	Input	DINT	DINT	I, Q, M, D, L, P or constant	Position in the structure Array of (W)CHAR / BYTE after which the characters in the character string are written.
CHARS	InOut	VARIANT	VARIANT	D, L	The copy target The characters can be copied to a structure of the data type Array of (W)CHAR or Array of BYTE.
CNT	Output	UINT	UINT	I, Q, M, D, L, P	Number of copied characters.

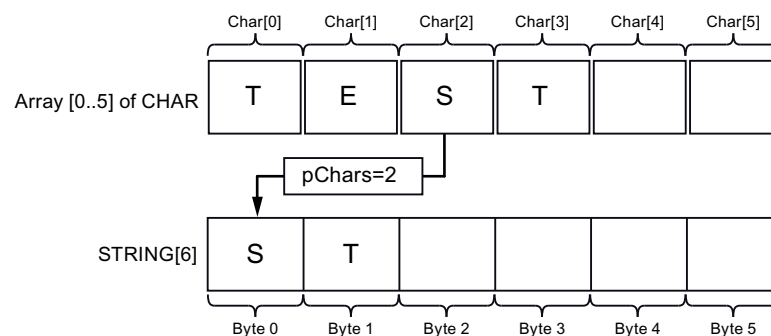

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## Chars\_TO\_Strg: Convert Array of CHAR to character string

### Description

Use the instruction "Chars\_TO\_Strg" to copy the character from a structure of a data type Array of CHAR or Array of BYTE to a character string STRING. Only ASCII characters are valid for the copy process.

- At the input parameter CHARS, enter the characters of the structure Array of (W)CHAR / BYTE which are to be copied to a character string.
- The characters are written to a data type STRING at the parameter STRG.
  - The number of characters in the character string STRING should be at least the same number as were copied from the field Array of CHAR.
  - If the character string is shorter than the number of characters in the structure Array of CHAR / BYTE, the maximum length of characters is written in the character string.
  - If the structure Array of CHAR / BYTE contains a character "\$00" then the copy process is only carried out up to the corresponding position.
- Use the parameter PCHARS to define the position in the structure Array of CHAR / BYTE after which the character it to be copied.
  - Example: Use the value "2" at the parameter PCHARS if copying is to take place after the third character in the structure:

- The lower index limit of the array is used as the standard ("0") (e.g. CHAR[0] at Array [0..5] of CHAR).
- If an index is specified at parameter PCHARS and the index is not contained in the copy source (e.g. "7" at Array [0..5] of CHAR) then the instruction is not executed.

### Note

#### Use of the instruction with S7-1200 V2.0

S7-1200 up to Version 2.0 only supports Array [0 .. n] of CHAR / BYTE. Negative index limits (e.g. Array [-3..2] of CHAR) are not permissible. This restriction is not checked by the software.

**Parameters**

The following table shows the parameters of the instruction "Chars\_TO\_Strg":

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
CHARS	Input	VARIANT	VARIANT	D, L	The copy source Structure Array of CHAR / BYTE from which the character is copied.
PCHARS	Input	DINT	DINT	I, Q, M, D, L, P or constant	Position in the structure Array of (W)CHAR / Array of BYTE after which the characters are copied.
CNT	Output	UINT	UINT	I, Q, M, D, L, P	Number of characters to be copied. All characters were copied at "0".
STRG	Output	STRING	STRING, WSTRING	D, L	The copy target Character string

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

**MAX\_LEN: Determine the length of a character string**

**Description**

A tag of the STRING data type contains two lengths: the maximum length and the current length (this is the number of currently valid characters).

- The maximum length of the character string is specified for each tag in the STRING keyword in square brackets. The number of bytes occupied by a string is 2 greater than the maximum length.
- The current length represents the number of the character places actually used. The current length must be less than or equal to the maximum length.

You use the "MAX\_LEN" instruction to query the maximum length of the character string specified at the IN input parameter and output this information as a numerical value at the OUT output parameter.

If errors occur during processing of the instruction, then an empty string will be output.

---

**Note**

**Reading out the current length**

You can also use the LEN (Page 2601) instruction to read out the current length of a string.

---

## Parameter

The following table shows the parameters of the "MAX\_LEN" instruction:

Parameter	Declaration	Data type	Memory area	Description
IN	Input	STRING	D, L or constant	Character string
OUT	Return	INT	I, Q, M, D, L, P	Maximum number of characters

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## Join: Join multiple strings

### Description

The "JOIN" instruction connects multiple strings into an array.

To convert multiple strings into a single one, the instruction provides the following functions:

- **Format selection**

You use the first bit in the Mode parameter to select whether you want to use CSV or FSR as the format for the array.

- With CSV (Comma Separated Values), the contents of the source strings are written consecutively and separated with a delimiter. Example:

```
1963,Miller,John,CitynameA,Roadname
```

```
1974,Jackson,Peter,CitynameB,VeryLongRoadname
```

- With FSR (Fixed Size Records), a certain number of characters is defined for each value (each source character string). If fewer characters are required, the characters are padded with delimiters. If more characters are required, the text is truncated. Example:

```
1963Miller,,,,,,,,John,,,,,,,,CitynameA,,,,Roadname,,,,,,,,
```

```
1974Jackson,,,,,,,,Peter,,,,,CitynameB,,,,,VeryLongRoadna
```

- **Selection of the delimiter for the source strings**

You can use the RecSeparator parameter to select the delimiter to be used for each string. You should select a character based on the content of the input strings at the SrcStruct parameter. If the input strings contain a comma within a string, for example, the comma should not be used as a delimiter. The data type that you use for the delimiter must correspond to the destination array at the DstArray parameter in order for the delimiter to be included in what is written in the array.

- **Selection of the delimiter for the end of all source strings**

You can use the third bit of the Mode parameter to specify whether an additional character should be written as a delimiter at the end of the copied characters in the destination array (DstArray parameter). Specify the character to be used as a delimiter at the EndSeparator parameter. Make sure to use a character other than the one set for the RecSeparator parameter (delimiter for individual strings). If the two delimiters are indistinguishable, you will obtain unexpected results if you reverse the conversion using the "SPLIT" instruction.

- **Selection of the source strings**  
 You specify the source strings at the SrcStruct parameter. For the data type, you can use Array of STRING or Array of WSTRING or structures which only contain the STRING or WSTRING data type. This also applies to user data types or nested structures. You can use these as long as they exclusively contain the data type STRING or WSTRING respectively.
- **Specification of the number of joined strings**  
 If you use an Array of STRING or Array of WSTRING at the SrcStruct parameter (source string) (no nested structures), you can use the Count parameter to specify the number of source strings that have been joined to form a single string. If you use a data type other than Array of (W)STRING at the SrcStruct parameter, the Count parameter is ignored. This makes it possible to connect only a part of a large array.
- **Selection of a destination area for writing the array**  
 You use the Array of (W)CHAR data type at the DstArray parameter. It is not possible to use the STRING or WSTRING data types here, because the length is limited to 256 characters for STRING.
- **Index of the position in the array (DestArray target parameter)**  
 The conversion starts at this position and the instruction reads the Position parameter to determine the position at which the conversion is completed. This enables follow-up calls of the instruction for filling the array.

**Parameters**

The following table shows the parameters of the instruction "JOIN":

Parameter	Declaration	Data type	Memory area	Description
Mode	Input	DWORD	I, Q, M, D, L or constant	Specifies how the merger to string is performed (see Mode" parameter).
RecSeparator	Input	VARIANT	I, Q, M, D, L	Delimiter for the source strings <ul style="list-style-type: none"> <li>• With CSV: Character that is used as a delimiter for the individual strings.</li> <li>• With FSR: Character that is used as a fill character for the individual strings.</li> </ul>
EndSeparator	Input	VARIANT	I, Q, M, D, L	Delimiter for the end of the conversion Delimiter that is written at the end of the characters if bit 3 = 1 has been set for the Mode parameter.
SrcStruct	Input	VARIANT	I, Q, M, D, L	Pointer to the source strings.
Count	Input	UDINT	I, Q, M, D, L	Number of strings that were joined. The Count parameter can only be used when an Array of (W)STRING has been used at the SrcStruct parameter.
DestArray	InOut	VARIANT	I, Q, M, D, L	Area in which the characters are written after the conversion. Use the Array [0 .. x] of CHAR/WCHAR data type at the DestArray parameter. You can set the length (x) of the array based on the length of the source strings at the SrcStruct parameter.

Parameter	Declaration	Data type	Memory area	Description
Position	InOut	UDINT	I, Q, M, D, L	Index the position in the total string
Ret_Val	Return	UINT	I, Q, M, D, L	Status of instruction (see table "RET_VAL parameter").

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### Mode parameter

Bit	Bit value "0"	Bit value "1"	Description
0	CSV format (Comma Separated Values)	FSR format (Fixed Size Record)	Selection of the format: <ul style="list-style-type: none"> <li>With CSV, the source strings are separated by a delimiter in the destination array.</li> <li>With FSR, the source strings are written into the destination array with the fill characters defined at the RecSeparator parameter.</li> </ul>
1	-	-	Irrelevant for the "JOIN" instruction.
2	-	-	Reserved (irrelevant for bit value)
3	Write no additional delimiters.	Write character defined by the EndSeparator parameter at the end of the read characters.	Select whether an additional character is to be written as a delimiter at the end of the characters in the array (DestArray parameter).
4	-	-	Irrelevant for the "JOIN" instruction.

### RET\_VAL parameter

Error code* (W#16#...)	Explanation
0000	No error.
0001	Additional characters are ignored.
8190	Selection at the Mode parameter is not supported.
8x20	Source strings invalid.
8x50	VARIANT points to empty content.
8x52	VARIANT points to a block that has not been created with optimized access.
8x53	VARIANT points to data structure that is too short.
8x54	Invalid data type
8882	The value at the Position parameter is outside the source string.
8x84	Found additional characters.
80B4	Different data types at parameters SrcStruct (source) and DestArray (destination) or at separators (parameters RecSeparator and EndSeparator).
80B5	Buffer overflow with the instruction. The characters were not fully generated at the DestArray parameter.

Error code* (W#16#...)	Explanation
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
<p>* Note the following for the error codes:</p> <ul style="list-style-type: none"> <li>• The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".</li> <li>• The "x" in the second position of the listed error codes stands for the parameter that caused the error. Example: Error code 8352 hex = error occurred at 3rd parameter (EndSeparator), see Parameter table.</li> <li>• If the error cannot be clearly assigned to a specific parameter, "0" is output. Example: The CHAR data type is used for the delimiter (RecSeparator parameter). WCHAR is used as data type for the array at the DestArray parameter. Error code 80B4 is output in this case.</li> </ul>	

### Split: Splitting an array of characters into multiple strings

#### Description

The "SPLIT" instruction converts an array (Array of CHAR / WCHAR) into several separate strings (Array of STRING / WSTRING or structure).

To convert the array into several strings, specify the following information:

- **Selection of array to be read**  
You specify the array to be read at the SrcArray parameter. Make sure that the data types used for the input and output parameters match any other parameters used. If you use an array with the CHAR data type at the SrcArray parameter, for example, you must use the CHAR data type for the delimiter (Rec/EndSeparator) and the structure must only contain strings with the STRING data type at the DestStruct parameter.
- **Selection of the format for the array to be read**  
You use the first bit of the Mode parameter to specify whether the array to be read has the CSV or FSR format (for a definition, see the "JOIN (Page 2591)" instruction).
- **Delimiter used for the array to be read**
  - If the array to be read has CSV format, specify which delimiter was used at the RecSeparator parameter.
  - If the array to be read has FSR format, specify which fill character was used at the RecSeparator parameter.
- **Selection of the delimiter for the end of the total string**  
Specify the delimiter after which the reading of the array should stop at the EndSeparator parameter. The "SPLIT" instruction stops at this position and outputs the string that has been found. It should be noted, that the EndSeparator delimiter is evaluated with higher priority than the RecSeparator delimiter. If the delimiter at the EndSeparator parameter is used in a string to be read (between two RecSeparator delimiters), all content after the EndSeparator delimiter is ignored.

- **Specification of the position starting at which the array is read**  
The conversion starts at this position in the array and the instruction reads the Position parameter to determine the position at which the conversion is completed. This enables follow-up calls of the instruction for filling the various strings at the DestStruct parameter.
- **Outputting the number of read strings**  
If you use an Array of STRING at the DestStruct parameter, you can use the Count parameter to output the number of read strings. Only strings with content are counted. If you use a data type other than Array of STRING at the DestStruct parameter, "0" is output at the Count parameter.

## Parameters

The following table shows the parameters of the "SPLIT" instruction:

Parameter	Declaration	Data type	Memory area	Description
Mode	Input	DWord	I, Q, M, D, L or constant	Specifies how the split into multiple strings is performed (see "Mode" parameter).
RecSeparator	Input	Variant	I, Q, M, D, L	Delimiter or fill character <ul style="list-style-type: none"> <li>• With CSV: Character that was used in the array to be read to identify the individual strings.</li> <li>• With FSR: Character that has been used as a fill character in the array to be read.</li> </ul>
EndSeparator	Input	Variant	I, Q, M, D, L	Delimiter used to define the end of the total string in the array to be read.
SrcArray	Input	Variant	I, Q, M, D, L	Pointer to the array to be read (Array of CHAR/WCHAR)
DestStruct	InOut	Variant	I, Q, M, D, L	Structure which includes the converted strings (Array of STRING / WSTRING).
Position	InOut	UDInt	I, Q, M, D, L	Position from which the array is to be read at the SrcArray parameter.
Ret_Val	Return	Int	I, Q, M, D, L	Result of instruction execution / error code (see table "Ret_Val parameter")
Count	Output	UDInt	I, Q, M, D, L	Number of strings that were found.

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

**Mode parameter**

Bit	Bit value "0"	Bit value "1"	Description
0	CSV format (Comma Separated Values)	FSR format (Fixed Size Record)	Basic mode: Selection of CSV or FSR
1	<ul style="list-style-type: none"> <li>With CSV: Additional characters are written to the following string.</li> <li>With FSR: Fill characters remain in string.</li> </ul>	<ul style="list-style-type: none"> <li>With CSV: Additional characters are removed.</li> <li>With FSR: Fill characters are removed.</li> </ul>	Use bit 1 to specify how you want to deal with additional characters: <ul style="list-style-type: none"> <li>With CSV:                             <ul style="list-style-type: none"> <li>If the bit is set, additional characters that do not fit in the destination string are ignored. Example: The instruction writes to a string with a length of 16 characters (STRING[16] data type). No delimiter is contained in the source after the first 16 characters. If bit 1 is set, the extra characters are ignored and the instruction continues to read the array.</li> <li>If the bit is not set, the instruction stops in such a case and generates an error message at the Ret_Val parameter.</li> </ul> </li> <li>With FSR:                             <ul style="list-style-type: none"> <li>If the bit is set, the fill characters used are not written to the destination string.</li> <li>If the bit is not set, the fill characters are written to the destination string.</li> </ul> </li> </ul>
2	-	-	Reserved for use in future versions.
3	Separator is retained.	Separator is removed.	Specification of whether the delimiter is removed at the end of the total string.
4	Leave unwritten strings (STRING) at length.	Set unwritten strings (STRING) to length "0".	Specification of whether unused strings (STRING) at the DestStruct parameter are to be set to the length "0".

**RET\_VAL parameter**

Error code* (W#16#...)	Explanation
0000	No error.
0001	Additional characters are ignored.
8190	Selection at the Mode parameter is not supported.
8x20	Source strings invalid.
8x50	VARIANT points to empty content.
8x52	VARIANT points to a block that has not been created with optimized access.
8x53	VARIANT points to data structure that is too short.
8x54	Invalid data type
8882	The value at the Position parameter is outside the source string.
8x84	Found additional characters.
80B4	Different data types at parameters SrcStruct (source) and DestArray (destination) or at separators (parameters RecSeparator and EndSeparator).
80B5	Buffer overflow with the instruction. The strings were not fully generated at the DestArray parameter.

Error code* (W#16#...)	Explanation
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
<p>* Note the following for the error codes:</p> <ul style="list-style-type: none"> <li>The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".</li> <li>The "x" in the second position of the listed error codes stands for the parameter that caused the error. Example: Error code 8352 hex = error occurred at 3rd parameter (EndSeparator), see Parameter table.</li> <li>If the error cannot be clearly assigned to a specific parameter, "0" is output. Example: The CHAR data type is used for the delimiter (RecSeparator parameter). WCHAR is used as data type for the array at the DestArray parameter. Error code 80B4 is output in this case.</li> </ul>	

## ATH: Convert ASCII string to hexadecimal number

### Description

You use the instruction "ATH" to convert the ASCII character string specified at the IN input parameter into a hexadecimal number. The result of the conversion is output to the OUT output parameter.

- You can reference the following data types using the pointer in the IN parameter (ASCII): STRING, Array of CHAR, Array of BYTE, WSTRING, Array of WCHAR.
- You can reference the following data types using the pointer in the OUT parameter (hexadecimal): Bit strings, integers, STRING, Array of CHAR, Array of BYTE, WSTRING, Array of WCHAR.

With the N parameter, you specify the number of ASCII characters to be converted. A maximum of 32767 valid ASCII characters can be converted. Only digits "0" to "9", upper case letters "A" to "F", and lower case letters "a" to "f" can be interpreted. All other characters are converted to zeros.

Since 8 bits are required for the ASCII character and only 4 bits for the hexadecimal digit, the output word length is only half of the input word length. The ASCII characters are converted and positioned in the output in the same order as they are read in. If there is an odd number of ASCII characters, the hexadecimal number is padded with zeros in the nibble to the right of the last converted hexadecimal number.

### Parameters

The following table shows the parameters of the "ATH" instruction:

Parameter	Declaration	Data type	Memory area	Description
IN	Input	VARIANT	I, Q, D, L	Pointer to ASCII character string
N	Input	INT	I, Q, M, D, L or constant	Number of ASCII characters to be converted
RET_VAL	Return	WORD	I, Q, M, D, L	Status of the instruction
OUT	Output	VARIANT	I, Q, M, D, L	Hexadecimal number

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

**RET\_VAL parameter**

Error code (W#16#...)*	Description
0000	No error
0007	Invalid character. Only the following ASCII characters may be used: Digits "0" to "9", upper case letters "A" to "F", lower case letters "a" to "f".
8101	Invalid pointer in the IN parameter, e.g., because a non-existing data block is referenced.
8182	Input buffer is too small for data in the N parameter.
8120	Invalid format in the IN parameter.
8151	Non-supported data type in the IN parameter.
8401	Invalid pointer in the OUT parameter, e.g., because a non-existing data block is referenced.
8482	Output buffer is too small for data in the N parameter.
8420	Invalid format in the OUT parameter.
8451	Non-supported data type in the OUT parameter.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**ASCII characters and hexadecimal values**

The following table shows the ASCII characters and the corresponding hexadecimal values:

ASCII character	ASCII-coded hexadecimal value	Hexadecimal digit
"0"	30	0
"1"	31	1
"2"	32	2
"3"	33	3
"4"	34	4
"5"	35	5
"6"	36	6
"7"	37	7
"8"	38	8
"9"	39	9
"A"	41	A
"B"	42	B
"C"	43	C
"D"	44	D
"E"	45	E
"F"	46	F

## Example

The following table shows examples of the conversion of ASCII character strings to hexadecimal numbers:

IN	N	OUT	ENO status
'0123'	4	16#0123	1
'123AFx1a23'	10	16#123AF01a23	0

## HTA: Convert hexadecimal number to ASCII string

### Description

You use the instruction "HTA" to convert the hexadecimal number specified at the IN input into an ASCII character string. The result of the conversion is stored at the address specified in the OUT parameter.

- You can reference the following data types using the pointer in the IN parameter (hexadecimal): Bit strings, integers, STRING, Array of CHAR, Array of BYTE, WSTRING, Array of WCHAR.
- You can reference the following data types using the pointer in the OUT parameter (ASCII): STRING, Array of CHAR, Array of BYTE, WSTRING, Array of WCHAR.

With the N parameter, you specify the number of hexadecimal bytes to be converted. Since 8 bits are required for the ASCII character and only 4 bits for the hexadecimal digit, the output value is twice as long as the input value. Each nibble of the hexadecimal number is converted to a character while maintaining the original order.

A maximum of 32767 characters can be written to the ASCII character string. The result of the conversion is represented by the digits "0" to "9" and upper-case letters "A" to "F".

If the complete result of the conversion cannot be displayed in the OUT parameter, the result is will only be partially written to the parameter.

### Parameters

The following table shows the parameters of the "HTA" instruction:

Parameter	Declaration	Data type	Memory area	Description
IN	Input	VARIANT	I, Q, M, D, L	Start address of the hexadecimal digits
N	Input	INT	I, Q, M, D, L or constant	Number of hexadecimal bytes to be converted
RET_VAL	Return	WORD	I, Q, M, D, L	Error message
OUT	Output	VARIANT	I, Q, D, L	Address at which the result is stored.

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

**RET\_VAL parameter**

Error code* (W#16#...)	Description
0000	No error
8101	Invalid pointer at the IN parameter, e.g., because a non-existing data block is referenced.
8182	Input buffer is too small for data in the N parameter.
8120	Invalid format in the IN parameter.
8151	Non-supported data type in the IN parameter.
8401	Invalid pointer in the OUT parameter, e.g., because a non-existing data block is referenced.
8482	Output buffer is too small for data in the N parameter.
8420	Invalid format in the OUT parameter.
8451	Non-supported data type in the OUT parameter.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

**ASCII characters and hexadecimal values**

The following table shows the ASCII characters and the corresponding hexadecimal values:

Hexadecimal digit	ASCII-coded hexadecimal value	ASCII character
0	30	"0"
1	31	"1"
2	32	"2"
3	33	"3"
4	34	"4"
5	35	"5"
6	36	"6"
7	37	"7"
8	38	"8"
9	39	"9"
A	41	"A"
B	42	"B"
C	43	"C"
D	44	"D"
E	45	"E"
F	46	"F"

## Example

The following table shows examples of the conversion of hexadecimal numbers to ASCII character strings:

IN	N	OUT	ENO status
W#16#0123	2	'0123'	1
16#123AF01023	4	'123AF010'	0

## Other instructions

### LEN: Determine the length of a character string

#### Description

A tag of the STRING data type contains two lengths: the maximum length and the current length (this is the number of currently valid characters).

- The maximum length of the character string is specified for each tag in the STRING keyword in square brackets. The number of bytes occupied by a string is 2 greater than the maximum length.
- The current length represents the number of the character places actually used. The current length must be less than or equal to the maximum length.

You use the instruction "LEN" to query the current length of the character string specified at the IN input parameter and output this information as a numerical value at the OUT output parameter. An empty string ("") has the length zero.

If errors occur during processing of the instruction, then an empty string will be output.

#### Note

##### Reading out the maximum length

You can also use the MAX\_LEN (Page 2590) instruction to read out the current length of a string.

## Parameters

The following table shows the parameters of the "LEN" instruction:

Parameter	Declaration	Data type	Memory area	Description
IN	Input	STRING	D, L or constant	Character string
OUT	Return	INT, DINT, REAL, LREAL	I, Q, M, D, L	Number of valid characters

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## CONCAT: Combine character strings

### Description

You use the instruction "CONCAT" to combine the character string at the IN1 input parameter with the character string at the IN2 input parameter. The result is output in the OUT output parameter with the STRING format. If the resulting character string is longer than the tag specified in the OUT output parameter, then the resulting character string will be limited to the available length.

If errors occur during processing of the instruction and the OUT output parameter can be written, an empty string will be output.

### Parameters

The following table shows the parameters of the "CONCAT" instruction:

Parameter	Declaration	Data type	Memory area	Description
IN1	Input	STRING	D, L or constant	Character string
IN2	Input	STRING	D, L or constant	Character string
OUT	Return	STRING	D, L	Resulting character string

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## LEFT: Read the left character of a character string

### Description

You use the instruction "LEFT" to extract a partial string beginning with the first character of the string at the IN input parameter. You specify the number of characters to be extracted in the L parameter. The extracted characters are output in the OUT output parameter with STRING format.

If the number of characters to be extracted is greater than the current length of the character string, the OUT output parameter returns the input character string as a result. If the L parameter contains the value "0" or the input value is an empty string, an empty string will be returned. If the value in the L parameter is negative, an empty string will be output.

If errors occur during processing of the instruction and the OUT output parameter can be written, an empty string will be output.

## Parameters

The following table shows the parameters of the "LEFT" instruction:

Parameter	Declaration	Data type	Memory area	Description
IN	Input	STRING	D, L or constant	Character string
L	Input	BYTE, INT, SINT, USINT	I, Q, M, D, L or constant	Number of characters to be extracted
OUT	Return	STRING	D, L	Extracted partial string

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## RIGHT: Read the right characters of a character string

### Description

You use this instruction to extract the last L character in a character string in the input parameter IN. You specify the number of characters to be extracted in the L parameter. The extracted characters are output in the OUT output parameter with STRING format.

If the number of characters to be extracted is greater than the current length of the character string, the OUT output parameter returns the input character string as a result. If the L parameter contains the value "0" or the input value is an empty string, an empty string will be returned. If the value in the L parameter is negative, an empty string will be output.

If errors occur during processing of the instruction and the OUT output parameter can be written, an empty string will be output.

## Parameters

The following table shows the parameters of the "RIGHT" instruction:

Parameter	Declaration	Data type	Memory area	Description
IN	Input	STRING	D, L or constant	Character string
L	Input	BYTE, INT, SINT, USINT	I, Q, M, D, L or constant	Number of characters to be extracted
OUT	Return	STRING	D, L	Extracted partial string

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## MID: Read middle characters of a character string

### Description

You use this instruction to extract a portion of the character string in the IN input parameter. With the P parameter, you specify the position of the first character to be extracted. With the

L parameter, you define the length of the character string to be extracted. The extracted partial character string is output to the OUT output parameter.

The following rules must be observed when executing the instruction:

- If the number of characters to be extracted exceeds the current length of the character string in the IN input parameter, a partial character string will be output, starting from character position P and continuing to the end of the character string.
- If the character position specified in the P parameter falls outside the current character string length in the IN input parameter, an empty character string will be output in the OUT output parameter.
- If the value of the P or L parameter equals zero or is negative, an empty character string will be output in the OUT output parameter.

If errors occur during processing of the instruction and the OUT output parameter can be written, an empty string will be output.

### Parameters

The following table shows the parameters of the "MID" instruction:

Parameter	Declaration	Data type	Memory area	Description
IN	Input	STRING	D, L or constant	Character string
L	Input	BYTE, INT, SINT, USINT	I, Q, M, D, L or constant	Length of the string to be extracted
P	Input	BYTE, INT, SINT, USINT	I, Q, M, D, L or constant	Position of the first character to be extracted (first character = 1)
OUT	Return	STRING	D, L	Extracted partial string

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### DELETE: Delete characters in a character string

#### Description

You use this instruction to delete a portion of the character string in the IN input parameter. With the P parameter, you specify the position of the first character to be deleted. You specify the number of characters to be deleted in the L parameter. The remaining partial character string is output to the OUT output parameter with STRING format.

The following rules must be observed when executing the instruction:

- If the value in the P parameter is less than or equals zero, an empty character string will be output in the OUT output parameter.
- If the value in the P parameter is greater than the current length of the character string in the IN input, the input character string will be returned in the OUT output parameter.

- If the value in the L parameter equals zero, the input character string will be returned in the OUT output parameter.
- If the number of characters to be deleted at the L parameter is greater than the length of the character string in the IN parameter, an empty character string will be output.
- If the value in the L parameter is negative, an empty character string will be output.

If errors occur during processing of the instruction and the OUT output parameter can be written, an empty string will be output.

## Parameter

The following table shows the parameters of the "DELETE" instruction:

Parameter	Declaration	Data type	Memory area	Description
IN	Input	STRING	D, L or constant	Character string
L	Input	BYTE, INT, SINT, USINT	I, Q, M, D, L or constant	Number of characters to be deleted
P	Input	BYTE, INT, SINT, USINT	I, Q, M, D, L or constant	Position of first character to be deleted
OUT	Return	STRING	D, L	Resulting character string

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## INSERT: Insert characters in a character string

### Description

You use this instruction to insert the character string in the IN2 input parameter to the character string in the IN1 input parameter. With the P parameter, you specify the position of the character starting at which the characters are inserted. The result is output in the OUT output parameter with the STRING format.

The following rules must be observed when executing the instruction:

- If the value in the P parameter exceeds the current length of the character string in the IN1 input parameter, the character string of the IN2 input parameter will be appended to the character string of the IN1 input parameter.
- If the value at the P parameter is zero, the character string at the IN2 parameter followed by the character string at the IN1 parameter will be output in the OUT output parameter.
- If the value in the P parameter is negative, an empty character string will be output in the OUT output parameter.
- If the resulting character string is longer than the tag specified in the OUT output parameter, the resulting character string will be limited to the available length.

**Parameter**

The following table shows the parameters of the "INSERT" instruction:

Parameter	Declaration	Data type	Memory area	Description
IN1	Input	STRING	D, L or constant	Character string
IN2	Input	STRING	D, L or constant	String to insert
P	Input	BYTE, INT, SINT, USINT	I, Q, M, D, L or constant	Insert position
OUT	Return	STRING	D, L	Resulting character string

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**REPLACE: Replace characters in a character string**

**Description**

You use this instruction to replace a portion of the character string in the IN1 input with the character string in the IN2 input. You specify the position of the first character to be replaced in the P parameter. You specify the number of characters to be replaced in the L parameter. The result is output in the OUT output parameter with the STRING format.

The following rules must be observed when executing the instruction:

- If the value in the P parameter is less than or equals zero, an empty character string will be output in the OUT output parameter.
- If the value in the L parameter is less than zero, an empty character string will be output in the OUT output parameter.
- If P equals one, the character string in the IN1 input will be replaced beginning with (and including) the first character.
- If the value in the P parameter exceeds the current length of the character string in the IN1 input parameter, the character string of the IN2 input parameter will be appended to the character string of the IN1 input parameter.
- If the resulting character string is longer than the tag specified in the OUT output parameter, the resulting character string will be limited to the available length.
- If the value at parameter L is zero, characters are not replaced but inserted. The same conditions apply as with the instruction INSERT. See also: INSERT: Insert characters in a character string (Page 2605)

## Parameters

The following table shows the parameters of the "REPLACE" instruction:

Parameter	Declaration	Data type	Memory area	Description
IN1	Input	STRING	D, L or constant	String with characters to be replaced.
IN2	Input	STRING	D, L or constant	String with characters to be inserted.
L	Input	BYTE, INT, SINT, USINT	I, Q, M, D, L or constant	Number of characters to be replaced
P	Input	BYTE, INT, SINT, USINT	I, Q, M, D, L or constant	Position of first character to be replaced
OUT	Return	STRING	D, L	Resulting character string

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## FIND: Find characters in a character string

### Description

You can use this instruction to search through the character string in the IN1 input parameter for a specific character or a specific sequence of characters.

- You specify the value to be searched for in the IN2 input parameter. The search is made from left to right.
- The position of the first occurrence is output in the OUT output parameter. If the search returns no match, the value "0" will be output in the OUT output parameter.

If an invalid character is specified at the IN2 parameter or if an error occurs during processing, the value "0" is output at the OUT parameter.

### Parameters

The following table shows the parameters of the "FIND" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	STRING	STRING, WSTRING	D, L or constant	String searched through
IN2	Input	STRING, CHAR	STRING, WSTRING, CHAR, WCHAR	D, L or constant (For (W)CHAR also I, Q, M)	Characters to search for
OUT	Return	INT	INT	I, Q, M, D, L	Character position

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## Runtime information

### GetSymbolName: Read out a tag on the input parameter

#### Description

The "GetSymbolName" instruction is used to read the name of a tag interconnected at the parameter via the input parameter of a block.

If a block is used multiple times in the project and called each time by a different tag, you can use the "GetSymbolName" instruction to evaluate the name of the calling tag. The process value of the tag is irrelevant in this case.

- You specify the input parameters of the block interface at the VARIABLE parameter. Use only an interface parameter for this parameter and no PLC or data block tags.
- You can limit the length of the read tag name using the SIZE parameter. If the name has been truncated, this is indicated by the characters "..." (Unicode character 16#2026) appears at the end of the name. Note that the "..." character itself has a length of 1. If you enter 6 as the maximum length at the SIZE parameter, for example, and read the tag name "MyPLCTag" via the block interface, the following is output: "MyPLC...".
- The name read is output at the OUT parameter.

#### Parameters

The following table shows the parameters of the "GetSymbolName" instruction:

Parameter	Declaration	Data type	Memory area	Description
VARIABLE	Input	PARAMETER	L	Input parameters of the block interface
SIZE	Input	UINT	I, Q, M, D, L	Length limit for the read names
OUT	Return	WSTRING	I, Q, M, D, L	Name of the tag that was read via the block interface

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### GetInstanceName: Read out name of the read instance

#### Description

You can use the "GetInstanceName" instruction to read the name of the instance data block within a function block.

- You can specify how many characters of the instance name should be read out using the SIZE parameter. If you use the "0" value for SIZE, the entire name is read.
- The name of the instance data block is written to the OUT parameter. If the name of the instance data block is longer than the maximum length of WSTRING (254 characters), the name is truncated.

## Parameters

The following table shows the parameters of the "GetInstanceName" instruction:

Parameter	Declaration	Data type	Memory area	Description
SIZE	Input	DINT	I, Q, M, D, L or constant	Number of characters up to which the name of the instance data block is to be read
OUT	Output	WSTRING	I, Q, M, D, L	Read name of the instance data block

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## GetBlockName: Read out name of the block

### Description

You can use the "GetBlockName" instruction to read the name of the block in which the instruction is called.

- You can specify how many characters of the block name should be read using the SIZE parameter. If you use the "0" value for SIZE, the entire name is read.
- The name of the block is written at the OUT parameter. If the name of the block is longer than the maximum length of WSTRING (254 characters), the name is truncated.

### Parameter

The following table shows the parameters of the "GetBlockName" instruction:

Parameter	Declaration	Data type	Memory area	Description
SIZE	Input	UINT	I, Q, M, D, L or constant	Number of characters up to which the name of the instance data block is to be read.
RET_VAL	Output	WSTRING	I, Q, M, D, L	Read name of the instance data block

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### 9.7.3.3 Process image

#### UPDAT\_PI: Update the process image inputs

### Description

With the instruction, you update the OB 1 process image (=process image partition 0) of the inputs or a process image partition of the inputs of the inputs defined by configuration.

If you have configured repeated signaling of I/O access errors for the system-side process image update, then the selected process image will be updated constantly.

Otherwise, this update will only be performed if the selected process image partition is not updated by the system, in other words:

- If you have not assigned this process image partition to an interrupt OB or
- If you selected process image partition 0 and have disabled updating of the OB 1 process image partition during configuration.

**Note**

Each logical address that you have assigned to a process image partition of the inputs per configuration no longer belongs to the OB 1 process image of the inputs.

When you update a process image partition with "UPDAT\_PI", you must not perform a simultaneous update with the "SYNC\_PI (Page 2613)" instruction.

System-side updating of the OB 1 process image of the inputs and the process image partitions of inputs that you have assigned to an interrupt OB takes place independently of "UPDAT\_PI" calls.

**Parameters**

The following table shows the parameters of the "UPDAT\_PI" instruction:

Parameter	Declaration	Data type	Memory area	Description
PART	Input	PIP	I, Q, M, D, L or constant	Number of the process image partition of the inputs to be updated. Maximum value range (depending on the CPU): 0 to 31 (0 means OB 1 process image, n where 1 <= n <= 31 means process image partition n).
RET_VAL	Return	INT	I, Q, M, D, L, P	Error information
FLADDR	Output	WORD	I, Q, M, D, L, P	Address of the first byte to cause an error if an access error has occurred.

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

**RET\_VAL parameter**

Error code* (W#16#...)	Explanation
0000	No error occurred.
8090	Illegal value for PART parameter
8091	The specified process image partition was not yet defined or is not located in the permitted process image area on the CPU.
8092	The process image partition is being updated by the system and cannot be used for the PART parameter.

Error code* (W#16#...)	Explanation
8093	The process image partition update is being processed in another OB.
80A0	An access error was detected when accessing the I/O.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**Note**

If you use the instruction for process image partitions of DP standard slaves for which you have defined a consistency area greater than 32 bytes, the error codes of the "DPRD\_DAT (Page 2659)" instruction are also possible.

**UPDAT\_PO: Update the process image outputs****Description**

You use the instruction to transfer the signal states of the OB 1 process image (= process image partition 0) of the outputs or a process image partition of the outputs defined per configuration to the output modules.

If you have specified a consistency range for the selected process image partition, corresponding data is transferred as consistent data to the respective I/O module.

**Note**

Each logical address you have assigned to a process image partition of the outputs during configuration no longer belongs to the OB 1 process image of the outputs.

Outputs that you update with "UPDAT\_PO" must not be updated simultaneously with the "SYNC\_PO (Page 2614)" instruction.

The OB 1 process image of the outputs and the process image partitions of the outputs that you have assigned to an interrupt OB are transferred by the system to the output modules independently of "UPDAT\_PO" calls.

**Parameters**

The following table shows the parameters of the "UPDAT\_PO" instruction:

Parameter	Declaration	Data type	Memory area	Description
PART	Input	PIP	I, Q, M, D, L or constant	Number of the process image partition of the outputs to be transferred. Maximum value range (depending on the CPU): 0 to 31. (0 means OB 1 process image, n where 1 <= n <= 31 means process image partition n)
RET_VAL	Return	INT	I, Q, M, D, L, P	Error information
FLADDR	Output	WORD	I, Q, M, D, L, P	Address of the first byte to cause an error if an access error has occurred.

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

**RET\_VAL parameter**

Error code* (W#16#...)	Explanation
0000	No error occurred.
8090	Illegal value for PART parameter
8091	The specified process image partition was not yet defined or is not located in the permitted process image area on the CPU.
8092	The process image partition is being updated by the system and cannot be used for the PART parameter.
8093	The process image partition update is being processed in another OB.
80A0	An access error was detected when accessing the I/O.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

**Note**

If you use the instruction for process image partitions of DP standard slaves for which you have defined a consistency area greater than 32 bytes, the error codes of the "DPWR\_DAT (Page 2661)" instruction are also possible.

## SYNC\_PI: Synchronize the process image inputs

### Description

The "SYNC\_PI" is used to update the process image partition of inputs in isochronous mode. A user program linked to a DP cycle or PN send cycle can use this instruction to update input data acquired in a process image partition of the inputs isochronously and consistently.

### Call

"SYNC\_PI" is interruptible and can only be called in OBs 61, 62, 63 and 64.

#### Note

A call of the "SYNC\_PI" instruction in OBs 61 to 64 is only permitted if you have assigned the affected process image partition to the associated OB in the HW configuration.

A process image partition that you update with "SYNC\_PI" must not be updated simultaneously with the "UPDAT\_PI (Page 2609)" instruction.

### Parameters

The following table shows the parameters of the "SYNC\_PI" instruction:

Parameter	Declaration	Data type	Memory area	Range of values	Description
PART	Input	PIP	I, Q, M, D, L or constant	1 to 31	Number of the process image partition of the inputs to be updated isochronously.
RET_VAL	Return	INT	I, Q, M, D, L, P	-	Error information
FLADDR	Output	WORD	I, Q, M, D, L, P		Address of the first byte to cause an error if an access error has occurred.

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

### RET\_VAL parameter

Error code (W#16#...)*	Explanation
0000	No error occurred.
0001	Consistency warning. The update of the process image partition was distributed over two DP or PN cycles. However, the data in one slave or IO device were consistently transferred.
8090	Illegal value on PART parameter or updating the specified process image partition of the inputs is not permitted in this OB. The process image partition of the inputs was not updated.
8091	The specified process image partition was not yet defined or is not located in the permitted process image area on the CPU. The process image partition of the inputs was not updated.
8092	The process image partition is being updated by the system and cannot be used for the PART parameter.
8093	The process image partition update is being processed in another OB.

Error code (W#16#...)*	Explanation
80A0	During updating an access error was detected. The affected inputs were set to "0".
80A1	The update time is after the permitted access window. The process image partition of the inputs was not updated. The DP or PN cycle is too short to ensure enough time for processing the instruction. You must therefore increase the TDP (also known as T_DC), Ti and To timers.
80A2	Access error with consistency warning In the case of update of the specified process image partition an access error with simultaneous consistency warning was detected. <ul style="list-style-type: none"> <li>The data of the incorrect inputs was not read by the I/O. In the process image partition of the inputs the involved inputs are set to zero.</li> <li>The update of the process image partition of the not involved by an access error input data was distributed over two DP and PN cycles.</li> </ul>
80C1	The update time is before the permitted access window. The process image partition of the inputs was not updated.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**Note**

If you use the "SYNC\_PI" instruction for process image partitions of DP standard slaves for which you have defined a consistency area greater than 32 bytes, the error codes of the "DPRD\_DAT (Page 2659)" instruction are also possible.

**SYNC\_PO: Synchronize the process image outputs**

**Description**

The instruction "SYNC\_PO" is used to update a process image partition of outputs in isochronous mode. An application program linked to a DP cycle or a PN send cycle can use this instruction for the consistent isochronous transfer of the computed output data of a process image partition from outputs to the I/O devices.

## Call

"SYNC\_PO" is interruptible and can only be called in OBs 61, 62, 63 and 64.

### Note

A call of the "SYNC\_PO" instruction in OBs 61 to 64 is only permitted if you have assigned the affected process image partition to the associated OB in the HW configuration.

A process image partition that you update with "SYNC\_PO" must not be updated simultaneously with the "UPDAT\_PO (Page 2611)" instruction.

## Parameters

The following table shows the parameters of the "SYNC\_PO" instruction:

Parameter	Declaration	Data type	Memory area	Range of values	Description
PART	Input	PIP	I, Q, M, D, L or constant	1 to 31	Number of the process image partition of the outputs to be updated isochronously.
RET_VAL	Return	INT	I, Q, M, D, P	-	If an error occurs while the instruction is being executed, the return value contains an error code.
FLADDR	Output	WORD	I, Q, M, D, L, P	-	Address of the first byte that has caused the error.

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

## RET\_VAL parameter

Error code (W#16#...)*	Explanation
0000	No error occurred.
0001	Consistency warning. The update of the process image partition was distributed over two DP or PN cycles. However, the data in one slave or IO device were consistently transferred.
8090	Illegal value in PART parameter, or updating the specified process image partition of the outputs is not permitted in this OB. Outputs were not transferred to the I/O. The process image partition of the outputs remains unchanged.
8091	The specified process image partition was not yet defined or is not located in the permitted process image area on the CPU. Outputs were not transferred to the I/O. The process image partition of the outputs remains unchanged.
8092	The process image partition is being updated by the system and cannot be used for the PART parameter.
8093	The process image partition update is being processed in another OB.
80A0	In the case of update of the specified process image partition of the outputs an access error was detected. Incorrect outputs were not transferred to the I/O. During process image partition of the outputs, these outputs remain unchanged.

Error code (W#16#...)*	Explanation
80A1	<p>Access error with consistency warning</p> <p>In the case of update of the specified process image partition of the outputs an access error with simultaneous consistency warning was detected.</p> <ul style="list-style-type: none"> <li>• The data of the incorrect outputs were not transferred to the I/O. During process image partition of the outputs, the involved outputs remain unchanged.</li> <li>• The update of the process image partition of the not involved by an access error input data was distributed over two DP and PN cycles.</li> </ul>
80A2	The update time is after the permitted access window. Outputs were not transferred to the I/O. The process image partition of the outputs remains unchanged.
80C1	The update time is before the permitted access window. Outputs were not transferred to the I/O. The process image partition of the outputs remains unchanged.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**Note**

If you use the "SYNC\_PO" instruction for process image partitions of DP standard slaves for which you have defined a consistency area greater than 32 bytes, the error codes of the "DPWR\_DAT (Page 2661)" instruction are also possible.

**9.7.3.4 Distributed I/O**

**RDREC: Read data record**

**Description**

You use the instruction "RDREC" to read the data record with the number INDEX from the module addressed using the ID. This may be a module in a central rack or a distributed module (PROFIBUS DP or PROFINET IO).

- Use the parameter ID to select from which module a data record is to be read. Use only the hardware identifier of the module for the "ID" parameter.
- Use the INDEX parameter to select the information to be read from the module. Which data records can be read with which data record number depends on the module. For additional information, see the manual to the specific module.
- The data records readable via "RDREC" have a different length. Use MLEN to specify the maximum number of data record bytes you want to read. If length "0" is selected at the parameter MLEN, the complete data record is written at the parameter RECORD.
- The target range RECORD should have at least the length of MLEN bytes. If you read out the full data record with MLEN=0, use the maximum length of the data record for RECORD. The structure (configuration, data types and length) that you use at the parameter RECORD, also depends on which data record is read out by which module.

- The value TRUE for the output parameter VALID indicates that the data record was successfully transferred to the target range RECORD. In this case, the LEN output parameter contains the length of the read data in bytes.
- If an error has occurred during transfer of the data record, this is indicated by the output parameter ERROR. In this case, the output parameter STATUS contains the error information.

---

#### Note

The interface of the "RDREC" instruction is identical to the "RDREC" FB defined in "PROFIBUS Guideline PROFIBUS Communication and Proxy Function Blocks according to IEC 61131-3".

---

### Functional description

"RDREC" is an instruction that works asynchronously, which means its execution extends over multiple calls. You start the data record transfer by calling "RDREC" with REQ= 1.

The job status is displayed via the output parameter BUSY and the two central bytes of output parameter STATUS. The two central bytes of STATUS correspond to the RET\_VAL output parameter of the instructions that operate asynchronously.

See also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794).

The transfer of the data record is complete when the output parameter BUSY has the value FALSE .

### Parameter

The following table shows the parameters of the "RDREC" instruction:

Parameter	Declaration	Data type*	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L, T, C or constant	REQ = 1: Transfer data record
ID	Input	HW_IO	I, Q, M, L or constant	Hardware identifier of the hardware module (DP/PROFINET IO) The number is assigned automatically and is stored in the properties of the module or of the interface in the hardware configuration.
INDEX	Input	BYTE, DINT, INT, SINT, UINT, USINT, WORD	I, Q, M, D, L or constant	Data record number
MLEN	Input	BYTE, UINT, USINT	I, Q, M, D, L or constant	Maximum length in bytes of the data record information to be read
VALID	Output	BOOL	I, Q, M, D, L	New data record was received and is valid.
BUSY	Output	BOOL	I, Q, M, D, L	BUSY = 1: The reading process is not yet complete.

Parameter	Declaration	Data type*	Memory area	Description
ERROR	Output	BOOL	I, Q, M, D, L	ERROR = 1: An error occurred during the reading process.
STATUS	Output	DWORD	I, Q, M, D, L	Block status or error information
LEN	Output	UINT	I, Q, M, D, L	Length of the read data record information
RECORD	InOut	VARIANT	I, Q, M, D, L	Target range for the data record read.

\* There is no implicit conversion in STL, which is why the range of valid data types may be limited. During programming in STL, please note the valid data types. These are displayed in the parameter tooltip.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**Note**

If you use "RDREC" to read a data record for PROFINET IO, then negative values in the INDEX, MLEN, and LEN parameters will be interpreted as an unsigned 16-bit integer.

**Parameter STATUS**

For interpretation of the STATUS parameter, see Parameter STATUS (Page 2626).

**See also**

Basics of block access (Page 1209)

**WRREC: Write data record**

**Description**

The instruction "WRREC" is used to transfer the RECORD data record to the component addressed using ID. This may be a module in a central rack or a distributed component (PROFIBUS DP or PROFINET IO).

- Use LEN to specify the length of the data record to be transmitted in bytes. The selected length of the source range RECORD should have at least the length of LEN bytes.
- The value TRUE at output parameter DONE indicates that the data record has been successfully transferred.
- If an error has occurred during transfer of the data record, this is indicated by the output parameter ERROR. In this case, the output parameter STATUS contains the error information.

**Note**

The interface of the "WRREC" instruction is identical to the "WRREC" FB defined in "PROFIBUS Guideline PROFIBUS Communication and Proxy Function Blocks according to IEC 61131-3".

## Functional description

"The WRREC" instruction works asynchronously, that is, its execution extends over multiple calls. You start the data record transfer by calling "WRREC" with REQ = 1.

The job status is displayed via the output parameter BUSY and the two central bytes of output parameter STATUS. The two central bytes of STATUS correspond to the RET\_VAL output parameter of the instructions that operate asynchronously.

See also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794).

Note that you must assign the same value to the actual parameter of RECORD for all "WRREC" calls that belong to one and the same job. The same applies to the actual parameters of LEN.

The transfer of the data record is complete when the output parameter BUSY has the value FALSE.

## Parameter

The following table shows the parameters of the instruction "WRREC":

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L, T, C or constant	REQ= 1: Transfer data record
ID	Input	HW_IO	I, Q, M, L or constant	ID number of the hardware component (DP/ PROFINET IO) The number is assigned automatically and is stored in the properties of the component or of the interface in the hardware configuration.
INDEX	Input	DINT	I, Q, M, D, L or constant	Data record number
LEN	Input	BYTE, UINT, USINT	I, Q, M, D, L or constant	(hidden) Maximum length of the data record to be transferred in bytes
DONE	Output	BOOL	I, Q, M, D, L	Data record was transferred
BUSY	Output	BOOL	I, Q, M, D, L	BUSY= 1: The writing process is not yet complete.
ERROR	Output	BOOL	I, Q, M, D, L	ERROR = 1: An error occurred during the writing process.
STATUS	Output	DWORD	I, Q, M, D, L	Block status or error information For interpretation of the STATUS parameter, see Parameter STATUS (Page 2626).
RECORD	InOut	VARIANT	I, Q, M, D, L	Data record

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**Note**

If you use "WRREC" to write a data record for PROFINET IO, negative values in the INDEX and LEN parameters will be interpreted as an unsigned 16-bit integer.

**STATUS parameter**

For interpretation of the STATUS parameter, see Parameter STATUS (Page 2626).

**GETIO: Read process image**

**Description**

You use the instruction "GETIO" to consistently read out all inputs of a DP standard slave/ PROFINET IO device. The instruction "GETIO" calls the instruction "DPRD\_DAT (Page 2659)". If there was no error during the data transmission, the data that have been read are entered in the target range indicated by INPUTS .

The target range must have the same length that you configured for the selected component.

If you read from a DP standard slave with a modular configuration or with several DP identifiers, you can only access the data of one component/DP identifier at the configured start address with a "GETIO" call.

**Parameter**

The following table shows the parameters of the instruction "GETIO":

Parameter	Declaration	Data type	Memory area	Description
ID	Input	HW_SUBMOD ULE	I, Q, M, D, L or constant	Hardware ID of the DP standard slave / PROFINET IO device.
STATUS	Output	DWORD	I, Q, M, D, L	Contains the error information of "DPRD_DAT (Page 2659)" in the form DW#16#40xxx00.
LEN	Output	INT	I, Q, M, D, L	Amount of data read in bytes
INPUTS	InOut	VARIANT	I, Q, M, D	Target range for the read data. It must have the same length as the range that you configured for the selected DP standard slave / PROFINET IO device. Only the BYTE data type is permitted.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**STATUS parameter**

See also: DPRD\_DAT: Read consistent data of a DP standard slave (Page 2659).

**SETIO: Transfer process image****Description**

You use the instruction "SETIO" to consistently transfer data from the source range defined by the parameter OUTPUTS to the addressed DP standard slave / PROFINET IO device, and, if necessary, to the process image (if you have configured the relevant address area of the DP standard slave / PROFINET IO device as a consistent range in a process image). "SETIO" calls the instruction "DPWR\_DAT (Page 2661)".

The source range must have the same length that you configured for the selected component.

In the case of a DP standard slave / PROFINET IO device with modular configuration or with several DP identifiers, you can only access one DP identifier / component per "SETIO" call.

**Parameters**

The following table shows the parameters of the "SETIO" instruction:

Parameter	Declaration	Data type	Memory area	Description
ID	Input	HW_SUBMODU LE	I, Q, M, D, L or constant	Hardware ID of the DP standard slave / PROFINET IO device.
STATUS	Output	DWORD	I, Q, M, D, L	Contains the error information of "DPWR_DAT (Page 2661)" in the form DW#16#40xxx00.
OUTPUTS	InOut	VARIANT	I, Q, M, D	Source range for the data to be written. It must have the same length as the range that you configured for the selected DP standard slave / PROFINET IO device. Only the BYTE data type is permitted.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**Parameter STATUS**

See also: DPWR\_DAT: Write consistent data of a DP standard slave (Page 2661).

**GETIO\_PART: Read process image area****Description**

You use the instruction "GETIO\_PART" to consistently read out a related part of the inputs of an IO module. "GETIO\_PART" calls the instruction "DPWR\_DAT (Page 2659)".

Use the ID input parameter to select the IO module by means of the hardware ID.

You use the OFFSET and LEN parameters to specify the portion of the process image area to be read. If the input area spanned by OFFSET and LEN is not completely covered by the module, the block returns the error code DW#16#4080B700.

The length of the target range must be larger than or equal to the amount of bytes to be read:

- If there was no error during the data transmission, ERROR receives the value FALSE. The data that are read are written to the target range defined at the INPUTS parameter.
- If there was no error during the data transmission, ERROR receives the value TRUE. The STATUS parameter receives the error information from "DPRD\_DAT".
- If the target range is greater than LEN, then the first LEN bytes of the target range will be written. ERROR receives the value FALSE.

### Parameters

The following table shows the parameters of the "GETIO\_PART" instruction:

Parameter	Declaration	Data type	Memory area	Description
ID	Input	HW_SUBMODULE	I, Q, M, D, L or constant	Hardware identifier of the module
OFFSET	Input	INT	I, Q, M, D, L or constant	Number of the first byte to be read in the process image for the component (smallest possible value: 0).
LEN	Input	INT	I, Q, M, D, L or constant	Number of bytes to be read.
STATUS	Output	DWORD	I, Q, M, D, L	Contains the error information of "DPRD_DAT" in the form DW#16#40xxx00, if ERROR = TRUE.
ERROR	Output	BOOL	I, Q, M, D, L	Error display: ERROR = TRUE if an error occurs when "DPRD_DAT" is called.
INPUTS	InOut	VARIANT	I, Q, M, D	Target range for read data: If the target range is greater than LEN, the first LEN bytes of the target range are written.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameter STATUS

See "RET\_VAL" parameter of the "DPRD\_DAT (Page 2659)" instruction.

### SETIO\_PART: Transfer process image area

#### Description

You can use the "SETIO\_PART" instruction to consistently write data from the source area spanned by OUTPUTS to the outputs of an IO module. "SETIO\_PART" calls the instruction "DPWR\_DAT (Page 2661)".

Use the ID input parameter to select the IO module by means of the hardware ID. You use the OFFSET and LEN parameters to specify the portion of the process image area to be written for the components addressed by means of ID. If the output area spanned by OFFSET and LEN is not completely covered by the module, the block returns the error code DW#16#4080B700.

The length of the source range must be greater than or equal to the number of bytes to be written:

- If there was no error during the data transmission, ERROR receives the value FALSE.
- If there was an error during the data transmission, ERROR receives the value TRUE, and STATUS receives the error information of "DPWR\_DAT".
- If the source range is greater than LEN, the first LEN bytes from OUTPUTS are transferred. ERROR receives the value FALSE.

## Parameter

The following table shows the parameters of the instruction "SETIO\_PART":

Parameter	Declaration	Data type	Memory area	Description
ID	Input	HW_SUBMODULE	I, Q, M, D, L or constant	Hardware identifier of the IO module.
OFFSET	Input	INT	I, Q, M, D, L or constant	Number of the first byte to be written in the process image for the component (smallest possible value: 0).
LEN	Input	INT	I, Q, M, D, L or constant	Number of bytes to be written.
STATUS	Output	DWORD	I, Q, M, D, L	Contains the error information of "DPWR_DAT" in the form DW#16#40xxxx00, if ERROR = TRUE.
ERROR	Output	BOOL	I, Q, M, D, L	Error display: ERROR = TRUE if an error occurs when "DPWR_DAT" is called.
OUTPUTS	InOut	VARIANT	I, Q, M, D	Source range for the data to be written: If the source range is greater than LEN, the first LEN bytes are transferred from OUTPUTS.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## Parameters STATUS and ERROR

See instruction "DPWR\_DAT (Page 2661)".

## RALRM: Receive interrupt

### Description RALRM

#### Description

The instruction receives an interrupt with all corresponding information from an I/O module (centralized configuration) or from a module of a DP slave or PROFINET IO device and supplies this information to its output parameters.

The information in the output parameters contains the start information of the called OB as well as information of the interrupt source.

For a central configuration, the configuration of the data structure of the target range AINFO corresponds to the data structure of PROFINET IO.

Call "RALRM" only within the interrupt OB started by the CPU operating system as a result of the I/O interrupt that is to be examined.

---

#### Note

If you call "RALRM" in an OB whose start event is not an I/O interrupt, the instruction will provide correspondingly reduced information in its outputs.

Make sure to use different instance DBs when you call "RALRM" in different OBs. If you evaluate data resulting from an "RALRM" call outside of the associated interrupt OB, you should moreover use a separate instance DB per OB start event.

---

#### Note

The interface of the "RALRM" instruction is identical to the "RALRM" FB defined in "PROFIBUS Guideline PROFIBUS Communication and Proxy Function Blocks according to IEC 61131-3".

---

### Calling RALRM

"RALRM" can be called in three operating modes (MODE parameter). These are explained in the table below.

MODE	RALRM ...
0	... shows the component that triggered the interrupt in the ID output parameter and writes TRUE in the NEW output parameter.
1	... writes all output parameters, independent of the interrupt triggering component.
2	... checks whether the component specified in the F_ID input parameter has triggered the interrupt. <ul style="list-style-type: none"><li>• If not, NEW = FALSE</li><li>• If yes, NEW = TRUE and all other output parameters are written.</li></ul>

## Parameters

The following table shows the parameters of the "RALRM" instruction:

Parameter	Declaration	Data type	Memory area	Description
MODE	Input	INT	I, Q, M, D, L or constant	Mode
F_ID	Input	HW_IO	D, L or constant	Hardware identifier of the module. The number is assigned automatically and is stored in the hardware configuration properties of the component or interface.
MLEN	Input	UINT	I, Q, M, D, L or constant	Maximum length of the interrupt information to be received in bytes. With MLEN = 0, all data specified at the AINFO parameter are read.
NEW	Output	BOOL	I, Q, M, D, L	A new interrupt was received.
STATUS (Page 2626)	Output	DWORD	I, Q, M, D, L	Error code
ID	Output	HW_IO	I, Q, M, D, L	Hardware identifier of the module from which the interrupt was received.
LEN	Output	UINT	I, Q, M, D, L	Length of the received interrupt information
TINFO (Page 2629)	InOut	VARIANT	I, Q, M, D, L	Destination area for OB start and management information
AINFO (Page 2642)	InOut	VARIANT	I, Q, M, D, L	Destination area for header information and additional interrupt information For AINFO , you should provide a length of at least MLEN bytes.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

---

### Note

If you select a target range (Page 2648) TINFO or AINFO that is too short, RALRM cannot enter the full information.

---

## Parameter STATUS

### Description

The STATUS output parameter contains error information. If it is interpreted as ARRAY[1...4] of BYTE, the error information has the following structure:

Field element	Name	Meaning
STATUS[1]	Function_Num	<ul style="list-style-type: none"> <li>B#16#00, if no error</li> <li>Function ID from DPV1-PDU: In the event of an error, B#16#80 is output (in the event of an error reading a data record B#16#DE and writing a data record B#16#DF). If no DPV1 protocol element is used, then B#16#C0 will be output.</li> </ul>
STATUS[2]	Error Decode	Location of the error ID
STATUS[3]	Error_Code_1	Error ID
STATUS[4]	Error_Code_2	Manufacturer-specific error ID extension

### Field element STATUS[2]

STATUS[2] can have the following values:

Error Decode (B#16#...)	Source	Meaning
00 to 7F	CPU	No error or no warning
80	DPV1	Error according to IEC 61158-6
81 to 8F	CPU	B#16#8x shows an error in the xth call parameter of the instruction.
FE, FF	DP profile	Profile-specific error

### Field element STATUS[3]

STATUS[3] can have the following values:

Error Decode (B#16#...)	Error_Code_1 (B#16#...)	Explanation according to DVP1	Meaning
00	00		No error, no warning
70	00	reserved, reject	Initial call; no active data record transfer
	01	reserved, reject	Initial call; data record transfer has started
	02	reserved, reject	Intermediate call; data record transfer already active
80	81		The system data type at parameter TINFO does not match the call environment of the instruction. The used system data type must match the organization block in the user program (example: for a time-delay interrupt OB you need the system data type TI_Delay).
	90	reserved, pass	Invalid logical start address

Error Decode (B#16#...)	Error_Code_1 (B#16#...)	Explanation according to DVP1	Meaning
	92	reserved, pass	Illegal type for VARIANT pointer
	93	reserved, pass	The DP component addressed via ID or F_ID is not configured.
	96		The "RALRM (Page 2624)" cannot supply the OB start information, management information, header information, or additional interrupt information. For OBs 4x, 55, 56, 57, 82 and 83, you can use the "DPNRM_DG (Page 2674)" instruction to read the current diagnostic frame of the relevant DP slave asynchronously (address information from OB start information).
	A0	read error	Negative acknowledgment while reading the module
	A1	write error	Negative acknowledgment when writing to the module
	A2	module failure	DP protocol error at layer 2 (e.g., slave failure or bus problems)
	A3	reserved, pass	<ul style="list-style-type: none"> <li>PROFIBUS DP: DP protocol error with Direct-Data-Link-Mapper or User-Interface/User</li> <li>PROFINET IO: General CM error</li> </ul>
	A4	reserved, pass	Communication on PBUS+ disrupted
	A5	reserved, pass	–
	A7	reserved, pass	DP slave or module is occupied (temporary error)
	A8	version conflict	DP slave or module reports non-compatible versions
	A9	feature not supported	Function is not supported by DP slave or module
	AA to AF	user specific	DP slave or module reports a manufacturer-specific error in its application. Please check the documentation from the manufacturer of the DP slave or module.
	B0	invalid index	Data record not known in module  Illegal data record number $\geq 256$
	B1	write length error	Error at length specification: <ul style="list-style-type: none"> <li>With "RALRM (Page 2624)": length error in AINFO (Page 2642)</li> <li>With "RDREC (Page 2616)": length error in MLEN</li> <li>With "WRREC (Page 2618)": length error in LEN</li> </ul>
	B2	invalid slot	The configured slot is not assigned.
	B3	type conflict	Actual module type does not match specified module type
	B4	invalid area	DP slave or module reports access to an invalid area
	B5	state conflict	DP slave or module not ready
	B6	access denied	DP slave or module denies access
	B7	invalid range	DP slave or module reports an invalid range for a parameter or value
	B8	invalid parameter	DP slave or module reports an invalid parameter

9.7 References

Error_Decode (B#16#...)	Error_Code_1 (B#16#...)	Explanation according to DVP1	Meaning
	B9	invalid type	DP slave or module reports an invalid type With "RDREC (Page 2616)": buffer too small (subsets cannot be read) With "WRREC (Page 2618)": buffer too small (subsets cannot be written)
	BA to BF	user specific	DP slave or module reports a manufacturer-specific error when accessing. Please check the documentation from the manufacturer of the DP slave or module.
	C0	read constrain conflict	With "WRREC (Page 2618)": the data can only be written when the CPU is in STOP mode. Note: this means that writing by the user program is not possible. You can only write the data online with PG/PC. With "RDREC (Page 2616)": the module routes the data record, but either no data is present or the data can only be read when the CPU is in STOP mode. Note: if data can only be read when the CPU is in STOP mode, then an evaluation by the user program is not possible. In this case, you can only read the data online with PG/PC.
	C1	write constrain conflict	The data of the previous write job on the module for the same data record have not yet been processed by the module.
	C2	resource busy	The module is currently processing the maximum possible number of jobs for a CPU.
	C3	resource unavailable	The required operating resources are currently occupied.
	C4		Internal temporary error. Job could not be executed. Repeat the job. If this error occurs often, check your installation for sources of electrical interference.
	C5		DP slave or module not available.
	C6		Data record transfer was canceled due to priority class cancellation
	C7		Job aborted due to warm or cold restart on the DP master
	C8 to CF		DP slave or module reports a manufacturer-specific resource error. Please check the documentation from the manufacturer of the DP slave or module.
	Dx	user specific	DP slave specific. Refer to the description of the DP slave.
81	00 to FF		Error in the initial call parameter (with "RALRM (Page 2624)": MODE)
	00		Illegal operating mode
82	00 to FF		Error in the second call parameter
:	:		:
88	00 to FF		Error in the eighth call parameter (with "RALRM (Page 2624)": TINFO (Page 2629))
	01		Wrong syntax ID
	23		Quantity structure exceeded or target range too small
	24		Wrong range ID

Error Decode (B#16#...)	Error_Code_1 (B#16#...)	Explanation according to DVP1	Meaning
	32		DB/DI no. out of user range
	3A		DB/DI no. is NULL for area ID DB/DI or specified DB/DI does not exist
89	00 to FF		Error in the ninth call parameter (with "RALRM (Page 2624)": AINFO (Page 2642))
	01		Wrong syntax ID
	23		Quantity structure exceeded or target range too small
	24		Wrong range ID
	32		DB/DI no. out of user range
	3A		DB/DI no. is NULL for area ID DB/DI or specified DB/DI does not exist
8A	00 to FF		Error in the 10th call parameter
:	:		:
8F	00 to FF		Error in the 15th call parameter
FE, FF	00 to FF		Profile-specific error

### Field element STATUS[4]

With DPV1 errors, the DP master passes on STATUS[4] to the CPU and the instruction. Without DPV1 error, this value is set to 0, with the following exceptions for "RDREC":

- STATUS[4] contains the target range length from RECORD, if MLEN > the target range length from RECORD
- STATUS[4]=MLEN, if the actual data record length < MLEN < the target range length from RECORD
- STATUS[4]=0, if STATUS[4]> 255 would have to be set

In PROFINET IO, STATUS[4] has the value "0".

### Parameter TINFO

#### Data structure of the destination area TINFO

The data structure of the destination area TINFO contains the start information of the organization block in which "RALRM" is currently being called.

The TINFO destination area can contain the start information with standard access or optimized access. The format of the start information in the TINFO destination area must always match the start information of the corresponding organization block.

9.7 References

- The start information of an OB with standard access is always stored in the first 20 bytes of the "Temp" section in the block interface. Use the "TI\_Classic" data structure for this.
- The start information of an OB with optimized access is always written to the "Input" section. Use a data structure for the specific OB type for these OBs.

Changing the block access (standard/optimized) also changes the block interface.

The following table provides an overview of the data structures that are used depending on the organization block at the TINFO parameter.

Name of the data structure	S7-1200 CPUs as of version	S7-1500 CPUs as of version	Data structure used for:
Data structure for organization blocks with standard access			
TI_Classic	-	V1	Organization blocks without optimized block access.
Data structure for organization blocks with optimized block access			
TI_ProgramCycle	V2	V1	Cycle OB (program cycle)
TI_Startup	V2	V1	Startup OB (startup)
TI_Delay	V2	V1	Time delay interrupt
TI_Cyclic	V2	V1	Cyclic interrupt OB
TI_HWInterrupt	V2	V1	Hardware interrupt OB
TI_TimeError	V2	V1	Time error OB
TI_DiagnosticInterrupt	V2	V1	Diagnostic error interrupt OB
TI_PlugPullModule	V2	V1	Pull/plug of modules OB
TI_StationFailure	V2	V1	Rack or station failure OB
TI_ProgIOAccessError	V2	V1	<ul style="list-style-type: none"> <li>• Programming error OB</li> <li>• I/O access error OB</li> </ul>
TI_TimeOfDay	V2	V1	Time-of-day interrupt OB
TI_SynchCycle	-	V1	Synchronous cycle interrupt OB
TI_Submodule	V2	V1	<ul style="list-style-type: none"> <li>• Status interrupt OB</li> <li>• Update interrupt OB</li> <li>• OB for manufacturer or profile-specific interrupt</li> </ul>

Data structure for organization blocks with standard access

The following shows the TI\_Classic data structure:

Parameter	Data type	Byte	Description
TI_Classic	Data structure for organization blocks with optimized block access.		
Bytes 0 to 19: Start information of the OB in which "RALRM" is currently being called.*			
EV_CLASS	BYTE	0	Event class Example OB1: <ul style="list-style-type: none"> <li>• Bits 0-3: ID of the event (1 = incoming event)</li> <li>• Bits 4-7: Event class (1 = Event class 1)</li> </ul>

Parameter	Data type	Byte	Description
EV_NUM	BYTE	1	Event number (depending on OB type) Example OB1 (SCAN_1): <ul style="list-style-type: none"> <li>• SCAN_1 = 1 for first call</li> <li>• SCAN_1 = 3 for all additional calls</li> </ul>
PRIORITY	BYTE	2	Priority class
NUM	BYTE	3	OB number
TYP2_3	BYTE	4	Additional information Different information is stored in the BYTES "TYP2_3" and "TYPE 1" depending on the OB type used. What these are is described in the documentation for the organization blocks. Example (OB1): <ul style="list-style-type: none"> <li>• TYP2_3: OB1_RESERVED_1 (reserved)</li> <li>• TYP1: OB1_RESERVED_2 (reserved)</li> </ul>
TYP1	BYTE	5	
ZI1	WORD	6 to 7	Additional information Different information is stored in "ZI1" depending on the OB type used. What these are is described in the documentation for the organization blocks. Example (OB1): <ul style="list-style-type: none"> <li>• ZI1: OB1_PREV_CYCLE (runtime of previous cycle in ms)</li> </ul>
ZI2_3	DWORD	8 to 11	Additional information Different information is stored in "ZI2_3" depending on the OB type used. What these are is described in the documentation for the organization blocks. Example (OB1): <ul style="list-style-type: none"> <li>• ZI2: OB1_MIN_CYCLE (minimum cycle time (ms) since the last startup)</li> <li>• ZI3: OB1_MAX_CYCLE (maximum cycle time (ms) since the last startup)</li> </ul>
OB_DATE_ TIME	DATE_AND_TIME (DT)	12 to 19	Date and time-of-day when the OB was called.
Bytes 20 and 21: Address information			

Parameter	Data type	Byte	Description
address	WORD	20 and 21	<p>Address information like S7-300/400 CPUs:</p> <ul style="list-style-type: none"> <li>In a central configuration, the rack number (0-31):</li> </ul>  <ul style="list-style-type: none"> <li>For a distributed configuration with PROFIBUS DP: <ul style="list-style-type: none"> <li>DP master system ID (1-31)</li> <li>Station number (0-127).</li> </ul> </li> </ul>  <ul style="list-style-type: none"> <li>In a distributed configuration with PROFINET IO: <ul style="list-style-type: none"> <li>The last two positions in the PROFINET IO system ID (0-15). To obtain the complete PROFINET IO system ID, you must add 100 (decimal) to it.</li> <li>Station number (0-2047).</li> </ul> </li> </ul> 
Bytes 22 to 31: Management information			
slv_prfl	BYTE	22	<p>Slave profile like S7-300/400 CPUs:</p> <ul style="list-style-type: none"> <li>In a central configuration: 0 (data record 0 or data record 1)</li> <li>In a distributed configuration: <ul style="list-style-type: none"> <li>Bit 0 to 3: Slave type <ul style="list-style-type: none"> <li>0000: DP (structure data record 0)</li> <li>0001: DPS7 (structure data record 0 or data record 1)</li> <li>0010: DPS7 V1 (structure data record 0 or data record 1)</li> <li>0011: DPV1 (structure according to PROFIBUS DP standard)</li> <li>0100 – 0111: Reserved</li> <li>1000: PROFINET IO (structure according to PROFINET IO standard)</li> <li>from 1001: Reserved</li> </ul> </li> <li>Bit 4 to 7: Profile type (reserved)</li> </ul> </li> </ul>

Parameter	Data type	Byte	Description
intr_type	BYTE	23	Interrupt info type like S7-300/400 CPUs: <ul style="list-style-type: none"> <li>• In a central configuration: 0</li> <li>• In a distributed configuration: <ul style="list-style-type: none"> <li>– Bit 0 to 3: Interrupt info type <ul style="list-style-type: none"> <li>- 0000: Interrupt comes from a configured remote module</li> <li>- 0001: Interrupt comes from a non-DPV1 slav / non IO device or a slot that is not configured</li> <li>- 0010: Interrupt generated in the CPU</li> <li>- from 0011: Reserved</li> </ul> </li> <li>– Bit 4 to 7: Structure version <ul style="list-style-type: none"> <li>- 0000: Initial</li> <li>- from 0001: Reserved</li> </ul> </li> </ul> </li> </ul>
flags1	BYTE	24	Flags of the PROFIBUS DP master interface module / PROFINET IO controller interface module like S7-300/400 CPUs: <ul style="list-style-type: none"> <li>• In a central configuration: 0</li> <li>• In a distributed configuration: <ul style="list-style-type: none"> <li>– Bit 0 = 0: Interrupt originating from an integrated interface module (PROFINET IO or PROFIBUS DP)</li> <li>– Bit 0 = 1: Interrupt originating from an external interface module (PROFINET IO or PROFIBUS DP)</li> <li>– Bit 1 to 7: Reserved</li> </ul> </li> </ul>
flags2	BYTE	25	Flags of the PROFIBUS DP master interface module / PROFINET IO controller interface module like S7-300/400 CPUs: <ul style="list-style-type: none"> <li>• In a central configuration: 0</li> <li>• For a distributed configuration with PROFIBUS DP: <ul style="list-style-type: none"> <li>– Bit 0: EXT_DIAG_FLAG from the diagnostics message frame, or 0 if this bit does not exist in the interrupt The bit is 1 if the DP slave is faulty.</li> <li>– Bit 1 to 7: Reserved</li> </ul> </li> <li>• In a distributed configuration with PROFINET IO: <ul style="list-style-type: none"> <li>– Bit 0: ARDiagnosisState or 0 if there is no information in the interrupt. The bit is 1 if the IO device is faulty.</li> <li>– Bit 1 to 7: Reserved</li> </ul> </li> </ul>
id	UINT	26 and 27	Management information <ul style="list-style-type: none"> <li>• In a central configuration: 0</li> <li>• For a distributed configuration with PROFIBUS DP: PROFIBUS ID number as unique identifier of the PROFIBUS DP slave</li> <li>• In a distributed configuration with PROFINET IO: PROFINET IO device ID number as unique identifier of the PROFINET IO device</li> </ul>
manufacturer	UINT	28 and 29	Manufacturer ID (only in a distributed configuration with PROFINET IO).
instance	UINT	30 and 31	Ident number of the instance (only in a distributed configuration with PROFINET IO).

\*The start information depends on the OB used. You can find the start information of each OB type at the interface or in the documentation of the OB.

**Data structures for organization blocks with optimized block access**

The data structures for organization blocks with optimized block access have the following format:

- Bytes 0 to 3: Format of the start information, class and number of the called OB (same structure for all data structures).
- Bytes 4 to 19: Optimized start information (structure depends on the OB type). The data in bytes 4 to 19 correspond to the structure and content of the corresponding OB interface.
- Bytes 20 to 31: In addition, the address and management information for certain OBs. The data in bytes 20 to 31 correspond to the data of 20 to 31 bytes of the TI\_Classic data structure.

The format of the data structures is described in the following tables.

Table 9-40 Cycle OB: Data structure TI\_ProgramCycle

Parameter	Data type	Byte	Description
TI_ProgramCycle			Data structure for cycle OB
SI_Format	USINT	0	Format of the start information: <ul style="list-style-type: none"> <li>• 16#FF: None</li> <li>• 16#FE: Optimized start information</li> </ul>
OB_Class	USINT	1	OB class (=1)
OB_Nr	UINT	2	OB number (1...32767).
Initial_Call	BOOL	4	= TRUE in the first call of this OB: <ul style="list-style-type: none"> <li>• Transition from STOP or HOLD to RUN</li> <li>• After reloading</li> </ul>
Remanence	BOOL	5	= TRUE, if retentive data are available.

Table 9-41 Startup OB: Data structure TI\_Startup

Parameter	Data type	Byte	Description
TI_Startup			Data structure for startup OB
SI_Format	USINT	0	Format of the start information: <ul style="list-style-type: none"> <li>• 16#FF: None</li> <li>• 16#FE: Optimized start information</li> </ul>
OB_Class	USINT	1	OB class (=100)
OB_Nr	UINT	2	OB number (1...32767).
LostRetentive	BOOL	4	=TRUE, if the contents of retentive data areas have been lost.
LostRTC	BOOL	5	=TRUE, if the time-of-day of the real-time clock has been lost.

Table 9-42 Time delay interrupt OB: Data structure TI\_Delay

Parameter	Data type	Byte	Description
TI_Delay			Data structure for time delay interrupt OB
SI_Format	USINT	0	Format of the start information: <ul style="list-style-type: none"> <li>• 16#FF: None</li> <li>• 16#FE: Optimized start information</li> </ul>

Parameter	Data type	Byte	Description
OB_Class	USINT	1	OB class (=20)
OB_Nr	UINT	2	OB number (1...32767).
Sign	WORD	4	User ID: Input parameter SIGN from the call of the "SRT_DINT (Page 2765)" instruction.

Table 9-43 Cyclic interrupt OB: Data structure TI\_Cyclic

Parameter	Data type	Byte	Description
TI_Cyclic			Data structure for cyclic interrupt OB
SI_Format	USINT	0	Format of the start information: <ul style="list-style-type: none"> <li>• 16#FF: None</li> <li>• 16#FE: Optimized start information</li> </ul>
OB_Class	USINT	1	OB class (=30)
OB_Nr	UINT	2	OB number (1...32767).
Initial_Call	BOOL	4	= TRUE in the first call of this OB <ul style="list-style-type: none"> <li>• At the transition from STOP or HOLD to RUN</li> <li>• After reloading</li> </ul>
Event_Count	INT	6	Number of discarded start events since the last start of this OB.

Table 9-44 Hardware interrupt OB: Data structure TI\_HWInterrupt

Parameter	Data type	Byte	Description
TI_HWInterrupt			Data structure for hardware interrupt OB
SI_Format	USINT	0	Format of the start information: <ul style="list-style-type: none"> <li>• 16#FF: None</li> <li>• 16#FE: Optimized start information</li> </ul>
OB_Class	USINT	1	OB class (=40)
OB_Nr	UINT	2	OB number (1...32767).
LADDR	HW_IO	4	Hardware identifier of the module that triggers the hardware interrupt.
USI	WORD	6	Identifier for future extensions (not user-relevant).
IChannel	USINT	8	Number of the channel that triggered the hardware interrupt.
EventType	BYTE	9	Identifier for the event type associated with the event triggering the interrupt (e.g., rising edge). You can find this ID in the description of the respective module.
address	WORD	20	See "address" parameter for the TI_Cassic. data structure
slv_prfl	BYTE	22	See "slv_prfl" parameter for the TI_Cassic data structure.
intr_type	BYTE	23	See "intr_type" parameter for the TI_Cassic data structure.
flags1	BYTE	24	See "flags1" parameter for the TI_Cassic data structure.
flags2	BYTE	25	See "flags2" parameter for the TI_Cassic data structure.
id	UNIT	26	See "id" parameter for the TI_Cassic data structure.
manufacturer	UNIT	28	See "manufacturer" parameter for the TI_Cassic data structure.
instance	UNIT	30	See "instance" parameter for the TI_Cassic data structure.

Table 9-45 Time error OB: Data structure TI\_TimeError

Parameter	Data type	Byte	Description
TI_TimeError			Data structure for time error OB
SI_Format	USINT	0	Format of the start information: <ul style="list-style-type: none"> <li>• 16#FF: None</li> <li>• 16#FE: Optimized start information</li> </ul>
OB_Class	USINT	1	OB class (=80)
OB_Nr	UINT	2	OB number (1...32767).
Csg_OBnr	OB_ANY	4	Number of the OB that was being executed when the time error occurred.
Fault_ID	BYTE	7	Error code. Possible values: <ul style="list-style-type: none"> <li>• B#16#01: Cycle time exceeded</li> <li>• B#16#02: The requested OB is still being processed.</li> <li>• B#16#05: Expired time-of-day interrupt due to time jump.</li> <li>• B#16#06: Expired time-of-day interrupt upon re-entry into RUN after HOLD.</li> <li>• B#16#07: Overflow of the OB request buffer for the current priority class.</li> <li>• B#16#08: Isochronous mode interrupt - time error.</li> <li>• B#16#09: Interrupt loss due to high interrupt load</li> <li>• B#16#0B: Technology synchronization interrupt - time error</li> </ul>
Csg_Prio	UNIT	8	Priority of the OB that was being executed when the time error occurred.

Table 9-46 Diagnostic interrupt OB: Data structure TI\_DiagnosticInterrupt

Parameter	Data type	Byte	Description
TI_DiagnosticInterrupt			Data structure for diagnostic interrupt OB
SI_Format	USINT	0	Format of the start information: <ul style="list-style-type: none"> <li>• 16#FF: None</li> <li>• 16#FE: Optimized start information</li> </ul>
OB_Class	USINT	1	OB class (=82)
OB_Nr	UINT	2	OB number (1...32767).
LADDR	HW_ANY	4	Hardware identifier of the hardware object that triggered the diagnostic interrupt.
IO_State	WORD	6	Status of the hardware object: <ul style="list-style-type: none"> <li>• Bit 0: Good</li> <li>• Bit 1: Disabled</li> <li>• Bit 2: Maintenance required</li> <li>• Bit 3: Maintenance demanded</li> <li>• Bit 4: Error</li> <li>• Bit 5: Not accessible</li> <li>• Bit 6: Qualified</li> <li>• Bit 7: Not available</li> </ul>
Channel	UINT	8	Channel number
MultiError	BOOL	10	=TRUE, if there is more than one error.
address	WORD	20	See "address" parameter for the TI_Cassic. data structure
slv_prfl	BYTE	22	See "slv_prfl" parameter for the TI_Cassic data structure.
intr_type	BYTE	23	See "intr_type" parameter for the TI_Cassic data structure.

Parameter	Data type	Byte	Description
flags1	BYTE	24	See "flags1" parameter for the TI_Cassic data structure.
flags2	BYTE	25	See "flags2" parameter for the TI_Cassic data structure.
id	UINT	26	See "id" parameter for the TI_Cassic data structure.
manufacturer	UINT	28	See "manufacturer" parameter for the TI_Cassic data structure.
instance	UINT	30	See "instance" parameter for the TI_Cassic data structure.

Table 9-47 Pull/plug interrupt OB: Data structure TI\_PlugPullModule

Parameter	Data type	Byte	Description
TI_PlugPullModule			Data structure for pull/plug interrupt OB
SI_Format	USINT	0	Format of the start information: <ul style="list-style-type: none"> <li>• 16#FF: None</li> <li>• 16#FE: Optimized start information</li> </ul>
OB_Class	USINT	1	OB class (=83)
OB_Nr	UINT	2	OB number (1...32767).
LADDR	HW_IO	4	Hardware identifier of the affected module or submodule
Event_Class	BYTE	6	<ul style="list-style-type: none"> <li>• B#16#38: (Sub)module plugged</li> <li>• B#16#39: (Sub)module pulled or not responding</li> </ul>
Fault_ID	BYTE	7	<p>Error code</p> <p>The following table shows the events that cause the start of the pull/plug interrupt OB.</p> <ul style="list-style-type: none"> <li>• With Event_Class = B#16#38 - (sub-)module plugged: <ul style="list-style-type: none"> <li>– B#16#54: PROFINET IO submodule inserted and matches configured submodule</li> <li>– B#16#55: PROFINET IO submodule inserted, but does not match configured submodule</li> <li>– B#16#56: PROFINET IO submodule inserted; but error in module parameter assignment</li> <li>– B#16#57: PROFINET IO submodule or module inserted, but with a problem or maintenance</li> <li>– B#16#58: PROFINET IO submodule, access error corrected</li> </ul> </li> <li>• With Event_Class = B#16#39 - (sub-)module pulled or cannot be reached: <ul style="list-style-type: none"> <li>– B#16#51: PROFINET IO module removed</li> <li>– B#16#54: PROFINET IO submodule removed</li> </ul> </li> </ul>
address	WORD	20	See "address" parameter for the TI_Cassic. data structure
slv_prfl	BYTE	22	See "slv_prfl" parameter for the TI_Cassic data structure.
intr_type	BYTE	23	See "intr_type" parameter for the TI_Cassic data structure.
flags1	BYTE	24	See "flags1" parameter for the TI_Cassic data structure.
flags2	BYTE	25	See "flags2" parameter for the TI_Cassic data structure.
id	UINT	26	See "id" parameter for the TI_Cassic data structure.
manufacturer	UINT	28	See "manufacturer" parameter for the TI_Cassic data structure.
instance	UINT	30	See "instance" parameter for the TI_Cassic data structure.

Table 9-48 Rack error OB: Data structure TI\_StationFailure

Parameter	Data type	Byte	Description
<b>TI_StationFailure</b>			Data structure for rack error OB
SI_Format	USINT	0	Format of the start information: <ul style="list-style-type: none"> <li>• 16#FF: None</li> <li>• 16#FE: Optimized start information</li> </ul>
OB_Class	USINT	1	OB class (=86)
OB_Nr	UINT	2	OB number (1...32767).
LADDR	HW_Device	4	Hardware identifier of the defective hardware object.
Event_Class	BYTE	6	<ul style="list-style-type: none"> <li>• B#16#38: (Sub)module plugged</li> <li>• B#16#39: (Sub)module pulled or not responding</li> </ul>
Fault_ID	BYTE	7	Error code The following table shows the events that cause the start of the pull/plug interrupt OB. <ul style="list-style-type: none"> <li>• With Event_Class = B#16#38 - (sub-)module plugged:                             <ul style="list-style-type: none"> <li>– B#16#54: PROFINET IO submodule inserted and matches configured submodule</li> <li>– B#16#55: PROFINET IO submodule inserted, but does not match configured submodule</li> <li>– B#16#56: PROFINET IO submodule inserted; but error in module parameter assignment</li> <li>– B#16#57: PROFINET IO submodule or module inserted, but with a problem or maintenance</li> <li>– B#16#58: PROFINET IO submodule, access error corrected</li> </ul> </li> <li>• With Event_Class = B#16#39 - (sub-)module pulled or cannot be reached:                             <ul style="list-style-type: none"> <li>– B#16#51: PROFINET IO module removed</li> <li>– B#16#54: PROFINET IO submodule removed</li> </ul> </li> </ul>
address	WORD	20	See "address" parameter for the TI_Cassic. data structure
slv_prfl	BYTE	22	See "slv_prfl" parameter for the TI_Cassic data structure.
intr_type	BYTE	23	See "intr_type" parameter for the TI_Cassic data structure.
flags1	BYTE	24	See "flags1" parameter for the TI_Cassic data structure.
flags2	BYTE	25	See "flags2" parameter for the TI_Cassic data structure.
id	UINT	26	See "id" parameter for the TI_Cassic data structure.
manufacturer	UINT	28	See "manufacturer" parameter for the TI_Cassic data structure.
instance	UINT	30	See "instance" parameter for the TI_Cassic data structure.

Table 9-49 Programming error OB / I/O access error OB: Data structure TI\_ProgIOAccessError

Parameter	Data type	Byte	Description*
<b>TI_ProgIOAccessError</b>			Data structure for programming error OB and I/O access error OB
SI_Format	USINT	0	Format of the start information: <ul style="list-style-type: none"> <li>• 16#FF: None</li> <li>• 16#FE: Optimized start information</li> </ul>

Parameter	Data type	Byte	Description*
OB_Class	USINT	1	OB class: <ul style="list-style-type: none"> <li>• =121 for programming error OB</li> <li>• =122 for I/O access error OB</li> </ul>
OB_Nr	UINT	2	OB number (1...32767).
BlockNr	UINT	4	Number of the block in which the programming error occurred.
Reaction	USINT	6	<ul style="list-style-type: none"> <li>• 0: Ignore error</li> <li>• 1: Substitute bad value</li> <li>• 2: Skip command</li> </ul>
Fault_ID	BYTE	7	Error code <ul style="list-style-type: none"> <li>• B#16#21: BCD conversion error</li> <li>• B#16#22: Area length error when reading</li> <li>• B#16#23: Area length error when writing</li> <li>• B#16#24: Range error when reading</li> <li>• B#16#25: Range error when writing</li> <li>• B#16#26: Error in timer no.</li> <li>• B#16#27: Error in counter no.</li> <li>• B#16#28: Read access to a byte, word or double word with a pointer whose bit address is not zero</li> <li>• B#16#29: Write access to a byte, word or double word with a pointer whose bit address is not zero</li> <li>• B#16#30: Write access to a write-protected global DB</li> <li>• B#16#31: Write access to a write-protected instance DB</li> <li>• B#16#32: DB number error when accessing a global DB</li> <li>• B#16#33: DB number error when accessing an instance DB</li> <li>• B#16#34: Number error during FC call</li> <li>• B#16#35: Number error during FB call</li> <li>• B#16#42: I/O access error, reading</li> <li>• B#16#43: I/O access error, writing</li> <li>• B#16#3A: Access to a DB that is not loaded; the DB number is located in the permitted area</li> <li>• B#16#3C: Access to an FC that is not loaded; the FC number is within the permissible range</li> <li>• B#16#3D: Access to an instruction (SFC) that is not loaded; the SFC number is within the permissible range</li> <li>• B#16#3E: Access to an FB that is not loaded; the FB number is within the permissible range</li> <li>• B#16#3F: Access to an SFB that is not available; the SFB number is within the permissible range</li> </ul>
BlockType	USINT	8	Type of block in which the error has occurred: <ul style="list-style-type: none"> <li>• OB: B#16#88</li> <li>• FC: B#16#8C</li> <li>• FB: B#16#8E</li> </ul>

9.7 References

Parameter	Data type	Byte	Description*
Area	USINT	9	Memory area in which the incorrect access occurred: <ul style="list-style-type: none"> <li>Local data: B#16#40 to 4E, 86, 87, 8E, 8F, C0 to CE</li> <li>Process image input: B#16#01</li> <li>Process image output: B#16#02</li> <li>Technology DB: B#16#04</li> <li>I: B#16#81</li> <li>Q: B#16#82</li> <li>M: B#16#83</li> <li>DB: B#16#84, 85, 8A, 8B</li> </ul>
DBNr	DB_ANY	10	DB no. if AREA = DB (global DB or instance DB) Only relevant for programming error OB.
Csg_OBNr	OB_ANY	12	OB number: <ul style="list-style-type: none"> <li>121: Programming error OB</li> <li>122: I/O access error OB</li> </ul>
Csg_Prio	USINT	14	OB priority
Width	USINT	15	Type of access during which the error occurred: <ul style="list-style-type: none"> <li>Bit: B#16#00</li> <li>Byte: B#16#01</li> <li>Word: B#16#02</li> <li>DWord: B#16#03</li> <li>LWord: B#16#04</li> </ul>

\* Only certain output values are possible depending on the OB (I/O access error OB or programming error OB) from which information is read.

Table 9-50 Time-of-day interrupt OB: Data structure TI\_TimeOfDay

Parameter	Data type	Byte	Description
TI_TimeOfDay			Data structure for time-of-day interrupt OB
SI_Format	USINT	0	Format of the start information: <ul style="list-style-type: none"> <li>16#FF: None</li> <li>16#FE: Optimized start information</li> </ul>
OB_Class	USINT	1	OB class (=10)
OB_Nr	UINT	2	OB number (1...32767).
CaughtUp	BOOL	4	=TRUE if an OB call was executed subsequently because time was adjusted ahead
SecondTime	BOOL	5	=TRUE if an OB was called a second time because time was adjusted back. Note: SecondTime is set only once in situations in which the time is set back.

Table 9-51 Isochronous mode interrupt OB: Data structure TI\_SynchCycle

Parameter	Data type	Byte	Description
TI_SynchCycle			Data structure for isochronous mode interrupt OB
SI_Format	USINT	0	Format of the start information: <ul style="list-style-type: none"> <li>16#FF: None</li> <li>16#FE: Optimized start information</li> </ul>

Parameter	Data type	Byte	Description
OB_Class	USINT	1	OB class (=61)
OB_Nr	UINT	2	OB number (1...32767).
Initial_Call	BOOL	4	= TRUE in the first call of this OB: <ul style="list-style-type: none"> <li>• Transition from STOP or HOLD to RUN</li> <li>• After reloading</li> </ul>
IO_System	USINT	5	Number of the distributed I/O system triggering the interrupt
Event_Count	INT	6	<ul style="list-style-type: none"> <li>• = n: Number of lost cycles</li> <li>• = -1: An unknown number of cycles has been lost (e.g., because cycle has changed).</li> </ul>
PIP_Input	BOOL	10	=TRUE: The associated process image of the inputs is up-to-date
PIP_Output	BOOL	11	=TRUE: The associated process image of the outputs was transferred to the outputs in good time after the last cycle
SyncCycleTime	LTIME	16	Calculated cycle time

Table 9-52 Status interrupt OB / update interrupt OB for manufacturer or profile-specific interrupt: Data structure TI\_Submodule

Parameter	Data type	Byte	Description
TI_Submodule			Data structure for status interrupt OB / update interrupt OB for manufacturer or profile-specific interrupt
SI_Format	USINT	0	Format of the start information: <ul style="list-style-type: none"> <li>• 16#FF: None</li> <li>• 16#FE: Optimized start information</li> </ul>
OB_Class	USINT	1	OB class <ul style="list-style-type: none"> <li>• =55 for status interrupt OB</li> <li>• =56 for update interrupt OB</li> <li>• =57 for manufacturer or profile-specific interrupt OB</li> </ul>
OB_Nr	UINT	2	OB number (1...32767).
LADDR	HW_IO	4	Hardware address of the component triggering the interrupt
Slot	UINT	6	Slot number of the component triggering the interrupt
Specifier	WORD	8	Interrupt specifier from the interrupt frame
address	WORD	20	See "address" parameter for the TI_Cassic. data structure
slv_prfl	BYTE	22	See "slv_prfl" parameter for the TI_Cassic data structure.
intr_type	BYTE	23	See "intr_type" parameter for the TI_Cassic data structure.
flags1	BYTE	24	See "flags1" parameter for the TI_Cassic data structure.
flags2	BYTE	25	See "flags2" parameter for the TI_Cassic data structure.
id	UINT	26	See "id" parameter for the TI_Cassic data structure.
manufacturer	UINT	28	See "manufacturer" parameter for the TI_Cassic data structure.
instance	UINT	30	See "instance" parameter for the TI_Cassic data structure.

Parameter AINFO

Data structure of the destination area AINFO with interrupts from PROFIBUS DP

Byte	Meaning
0 to 3	Header information, for exact description, see below
4 to 63	Additional interrupt information: data for the respective interrupt:
	distributed: ARRAY[0] to ARRAY[59]

Structure of the header information with interrupts from PROFIBUS DP

Byte	Data type	Meaning
0	BYTE	Length of the received interrupt information in bytes
		central: 4 to 224
		distributed: 4 to 63
1	BYTE	central: Reserved
		distributed: ID for the interrupt type
		1: Diagnostics interrupt
		2: Process interrupt
		3: Pull interrupt
4: Plug interrupt		
5: Status interrupt		
6: Update interrupt		
31: Failure of an expansion device, DP master system or DP station		
32 to 126: Manufacturer-specific interrupt		
2	BYTE	Slot number of the component that triggered the interrupt
3	BYTE	central: Reserved
		distributed: Specifier
		Bits 0 and 1: 0: No further information; 1: Incoming event, fault at slot
		2: Outgoing event, fault at slot cleared
		3: Outgoing event, slot still faulty
Bit 2: Add_Ack		
Bits 3 to 7: Sequence number		

**Data structure of the destination area AINFO with interrupts from PROFINET IO or central I/O devices**

Byte	Meaning
0 to 25	Header information, for exact description, see below
26 to 1431	Additional interrupt information: Standardized diagnostic data for the respective interrupt: ARRAY[0] to ARRAY[1405] Note: The additional interrupt information may also be omitted.

**Structure of the header information with interrupts from PROFINET IO or central I/O devices**

Byte	Data type	Meaning
0 and 1	WORD	<ul style="list-style-type: none"> <li>• Bits 0 to 7: Block type</li> <li>• Bits 8 to 15: Reserved</li> </ul>
2 and 3	WORD	Block length
4 and 5	WORD	Version: <ul style="list-style-type: none"> <li>• Bits 0 to 7: low byte</li> <li>• Bits 8 to 15: high byte</li> </ul>
6 and 7	WORD	ID for interrupt type: <ul style="list-style-type: none"> <li>• 1: Diagnostics interrupt (incoming)</li> <li>• 2: Process interrupt</li> <li>• 3: Remove module interrupt</li> <li>• 4: Insert module interrupt</li> <li>• 5: Status interrupt</li> <li>• 6: Update interrupt</li> <li>• 7: Redundancy interrupt</li> <li>• 8: Controlled by supervisor</li> <li>• 9: Released by supervisor</li> <li>• 10: Configured module not inserted</li> <li>• 11: Return of the sub-module</li> <li>• 12: Diagnostics interrupt (outgoing)</li> <li>• 13: Slave-to-slave connection alarm</li> <li>• 14: Neighborhood change alarm</li> <li>• 15: Clock synchronization message (bus end)</li> <li>• 16: Clock synchronization alarm (device end)</li> <li>• 17: Network component alarm</li> <li>• 18: Time synchronization alarm (bus end)</li> <li>• 19 to 31: Reserved</li> <li>• 32 to 127: Manufacturer-specific interrupt</li> <li>• 128 to 65535: Reserved</li> </ul>
8 to 11	DWORD	API (Application Process Identifier)
12 to 13	WORD	Slot number of the component triggering the interrupt (value range 0 to 65535)
14 to 15	WORD	Submodule slot number of the component triggering the interrupt (value range 0 to 65535)
16 to 19	DWORD	Module identification; specific information on the source of the interrupt

Byte	Data type	Meaning
20 to 23	DWORD	Submodule identification; specific information on the source of the interrupt
24 to 25	WORD	Interrupt specifier: <ul style="list-style-type: none"> <li>• Bits 0 to 10: Sequence number (value range 0 to 2047)</li> <li>• Bit 11: Channel diagnostics:                             <ul style="list-style-type: none"> <li>0: No channel diagnostics available</li> <li>1: Channel diagnostic information exists</li> </ul> </li> <li>• Bit 12: Status of manufacturer-specific diagnostics:                             <ul style="list-style-type: none"> <li>0: No manufacturer-specific status information available</li> <li>1: Manufacturer-specific status information available</li> </ul> </li> <li>• Bit 13: Status of diagnostics for sub-module:                             <ul style="list-style-type: none"> <li>0: No status information available, all errors have been corrected</li> <li>1: At least one item of channel diagnostics and/or status information is available</li> </ul> </li> <li>• Bit 14: Reserved</li> <li>• Bit 15: Application relationship diagnosis state:                             <ul style="list-style-type: none"> <li>– 0: None of the modules configured within this application relationship reports diagnostic information</li> <li>– 1: At least one of the modules configured in this AR is reporting diagnostic information</li> </ul> </li> </ul>

**Structure of the additional interrupt information for interrupts from PROFINET IO or central I/O**

The additional interrupt information for PROFINET IO depends on the format identifier. It can comprise multiple data blocks with the same or different format identifier. The following format identifiers are available:

- W#16#0000 to W#16#7FFF: Manufacturer-specific diagnostics

Byte	Data type	Meaning
0 to 1	WORD	Format identifier for the structure of the following data serving as additional interrupt information W#16#0000 to W#16#7FFF: Manufacturer-specific diagnostics
2 to n	BYTE	See manufacturer's manual.

- W#16#8000: Channel diagnostics

Channel diagnostics is output in blocks of 6 bytes each. The additional interrupt information (without format identifier) is only output for disrupted channels.

Byte	Data type	Meaning
0 to 1	WORD	Format identifier for the structure of the following data serving as additional interrupt information W#16#8000: Channel diagnostics
2 to 3	WORD	Channel number of the component triggering the interrupt (value range: 0 to 65535): <ul style="list-style-type: none"> <li>• W#16#0000 to W#16#7FFF: Channel number of the interface module/sub-module</li> <li>• W#16#8000: The generic substitute for the entire sub-module</li> <li>• W#16#8001 to W#16#FFFF: Reserved</li> </ul>
4	BYTE	Bits 0 to 2: Reserved
		Bits 3 to 4: Type of error: <ul style="list-style-type: none"> <li>• 0: Reserved</li> <li>• 1: Incoming error</li> <li>• 2: Outgoing error</li> <li>• 3: Outgoing error, other errors present</li> </ul>
		Bits 5 to 7: Type of channel: <ul style="list-style-type: none"> <li>• 0: Reserved</li> <li>• 1: Input channel</li> <li>• 2: Output channel</li> <li>• 3: Input/output channel</li> </ul>

Byte	Data type	Meaning
5	BYTE	Data format: <ul style="list-style-type: none"> <li>• B#16#00: Free data format</li> <li>• B#16#01: Bit</li> <li>• B#16#02: 2 bits</li> <li>• B#16#03: 4 bits</li> <li>• B#16#04: Byte</li> <li>• B#16#05: Word</li> <li>• B#16#06: Double word</li> <li>• B#16#07: 2 double words</li> <li>• B#16#08 to B#16#FF: Reserved</li> </ul>
6 to 7	WORD	Type of error: <ul style="list-style-type: none"> <li>• W#16#0000: Reserved</li> <li>• W#16#0001: Short circuit</li> <li>• W#16#0002: Undervoltage</li> <li>• W#16#0003: Overvoltage</li> <li>• W#16#0004: Overload</li> <li>• W#16#0005: Overtemperature</li> <li>• W#16#0006: Wire break</li> <li>• W#16#0007: High limit exceeded</li> <li>• W#16#0008: Low limit exceeded</li> <li>• W#16#0009: Error</li> <li>• W#16#000A to W#16#000F: Reserved</li> <li>• W#16#0010 to W#16#001F: Manufacturer-specific</li> <li>• W#16#0020 to W#16#00FF: Reserved</li> <li>• W#16#0100 to w#16#7FFF: Manufacturer-specific</li> <li>• W#16#8000: Device diagnostics available</li> <li>• W#16#8001 to W#16#FFFF: Reserved</li> </ul> Not all channels support every error type. For detailed information, refer to the description of the diagnostic data for the specific device.

**Note**

The section from "channel number" to "type of error" can occur from 0 to n times.

- W#16#8001: MULTIPLE (different types of diagnostic information are transmitted). In this case, the additional interrupt information is transmitted as blocks of variable length.

Byte	Data type	Meaning
0 to 1	WORD	Format identifier for the structure of the following data serving as additional interrupt information W#16#8001: Manufacturer-specific diagnostics and/or channel diagnostics
2 to 3	WORD	Block type
4 to 5	WORD	Block length
6	BYTE	Version: high byte
7	BYTE	Version: low byte
8 to 11	DWORD	API (only if low byte of version = 1)
12 to 13	WORD	Slot number
14 to 15	WORD	Subslot number
16 to 17	WORD	Channel number
18 to 19	WORD	Channel properties
20 to 21	WORD	Format identifier: <ul style="list-style-type: none"> <li>• W#16#0000 to W#16#7FFF: Manufacturer-specific diagnostics</li> <li>• W#16#8000: Channel diagnostics</li> <li>• W#16#8002: Extended channel diagnostics</li> <li>• W#16#8003: Stepped extended channel diagnostics</li> <li>• W#16#8004 to W#16#80FF: Reserved</li> </ul>
22 to n	BYTE	Data depend on the format identifier

---

**Note**

The section starting from "block type" can occur from 1 to n times.

---

- W#16#8002: Extended channel diagnostics

Byte	Meaning
0 to 1	Format identifier W#16#8002
2 to 3	Channel number
4 to 5	Channel properties
6 to 7	Error type
8 to 9	Additional error value
10 to 13	Additional error information

- W#16#8003: Stepped extended channel diagnostics

Byte	Meaning
0 to 1	Format identifier W#16#8003
2 to 3	Channel number
4 to 5	Channel properties
6 to 7	Error type
8 to 9	Additional error value
10 to 13	Additional error information
14 to 17	Qualified channel qualifier

- W#16#8100: Maintenance information

Byte	Meaning
0 to 1	Format identifier W#16#8100
2 to 3	Block type
4 to 5	Block length
6 to 7	Block version
8 to 9	Reserved
10 to 13	Maintenance status

**Note**

You can find more detailed information about the structure of the additional alarm information in the *Programming Manual SIMATIC PROFINET IO from PROFIBUS DP to PROFINET IO* and the current version of IEC 61158-6-10-1.

**Destination area TINFO and AINFO**

**Destination area TINFO and AINFO**

Depending on the respective OB in which "RALRM (Page 2624)" is called, the destination areas TINFO and AINFO are only partially written. Refer to the table below to find out which information is entered respectively.

Interrupt type	OB class	TINFO OB start information	TINFO Management information	AINFO Header information	AINFO Additional interrupt information	
Process interrupt	4x	Yes	Yes	Yes	central:	No
					distributed:	as supplied by PROFIBUS DP slave/ PROFINET IO device
Status interrupt	55	Yes	Yes	Yes	Yes	Yes
Update interrupt	56	Yes	Yes	Yes	Yes	Yes
Manufacturer-specific interrupt	57	Yes	Yes	Yes	Yes	Yes

Interrupt type	OB class	TINFO OB start information	TINFO Management information	AINFO Header information	AINFO Additional interrupt information	
I/O redundancy error	70	Yes	Yes	No	No	No
Diagnostics interrupt	82	Yes	Yes	Yes	central:	Structure according to PROFINET IO standard
					distributed:	as supplied by PROFIBUS DP slave/ PROFINET IO device
Insert/remove interrupt	83	Yes	Yes	Yes	central:	No
					distributed:	as supplied by PROFIBUS DP slave/ PROFINET IO device
Special form of the remove module interrupt: Controlled by supervisor	83	Yes	Yes	Yes	PROFINET IO only	
Special form of the insert module interrupt: Enabled by supervisor	83	Yes	Yes	Yes	PROFINET IO only	
Unconfigured module inserted	83	Yes	Yes	Yes	PROFINET IO only	
Rack failure/ station failure	86	Yes	Yes	No	No	
... all other OBs		Yes	No	No	No	

## D\_ACT\_DP: Enable/disable DP slaves

### Description

Use the "D\_ACT\_DP" instruction to specifically deactivate and reactivate configured DP slaves/PROFINET IO devices. In addition, you can determine whether each assigned DP slave or PROFINET IO device is currently activated or deactivated.

If you use the instruction to deactivate an IE/PB Link PN IO type of gateway, then all connected PROFIBUS DP slaves will also cease to function. These failures will be reported.

The instruction cannot be used on PROFIBUS PA field devices that are connected by a DP/PA link to a DP master system.

---

**Note**

As long as one or more "D\_ACT\_DP" jobs are active, you cannot load a changed configuration from the programming device to the CPU (within the scope of CiR).

If a changed configuration is being loaded from the programming device to the CPU during ongoing operation (CiR), the CPU will reject activation of a "D\_ACT\_DP" job.

Several runs through the cycle control point are required to perform the disabling or enabling job. Therefore, you cannot wait for the end of such a job in a programmed loop.

---

### Functional description

"D\_ACT\_DP" is an instruction that works asynchronously, which means its execution extends over multiple calls. You start the job by calling D\_ACT\_DP with REQ = 1.

The output parameters RET\_VAL and BUSY indicate the status of the job.

See also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794).

### Application

If you configure DP slaves/PROFINET IO devices in a CPU which are not actually present or not currently required, the CPU will nevertheless continue to access these DP slaves/PROFINET IO devices at regular intervals. After the slaves are deactivated, further CPU accessing will stop. With PROFIBUS DP, the fastest possible DP bus cycle can be achieved in this manner and the corresponding error events no longer occur.

### Examples

From a machine OEM's point of view, there are numerous device options possible in series production of machines. However, each delivered machine includes only one combination of selected options.

Every one of these possible machine options is configured as a DP slave/PROFINET IO device by the manufacturer in order to create and maintain a common user program having all possible options. Use "D\_ACT\_DP" to deactivate all DP slaves/PROFINET IO devices not present at machine startup.

A similar situation exists for machine tools having numerous tooling options available but actually using only a few of them at any given time. These tools are implemented as DP slaves/PROFINET IO devices. With "D\_ACT\_DP", the user program activates the tools currently needed and deactivates those required later.

### Identification of a job

If you have started a deactivation or activation job and you call "D\_ACT\_DP" again before the job is complete, the behavior of the instruction depends on whether or not the new call involves

the same job. If the input parameter LADDR matches, then the call will be interpreted as a follow-on call.

### Deactivating DP slaves/PROFINET IO devices

When you deactivate a DP slave/PROFINET IO device with "D\_ACT\_DP", its process outputs are set to the configured substitute values or to 0 (safe state). The assigned DP master/PROFINET IO controller does not continue to address this component. Deactivated DP slaves/PROFINET IO devices are not identified as faulty or missing by the error LEDs on the DP master/PROFINET IO controller or CPU.

The process image of the inputs of deactivated DP slaves/PROFINET IO devices is updated with 0, that is, it is handled just as it is for failed DP slaves/PROFINET IO devices.

If you are using your program to directly access the user data of a previously deactivated DP slave/PROFINET IO device, the I/O access error OB is called and the corresponding start event is entered in the diagnostics buffer. If you attempt to access a deactivated DP slave/PROFINET IO device via an instruction (such as "RD\_REC (Page 2654)"), you will receive the same error information in RET\_VAL as for an unavailable DP slave/PROFINET IO device.

Deactivating a DP slave/PROFINET IO device does not start the program error OB, even if its inputs or outputs belong to the system-side process image to be updated. Also there is no entry in the diagnostics buffer.

If a DP station/PNIO station fails after you have deactivated it with "D\_ACT\_DP", the operating system does not detect the failure.

Applies to PROFIBUS DP: If you wish to deactivate DP slaves functioning as transmitters in slave-to-slave communication, we recommend that you first deactivate the receivers (listeners) that detect which input data the transmitter is transferring to its DP master. Deactivate the transmitter only after you have performed this step.

### Activating DP slaves/PROFINET IO devices

When you reactivate a DP slave/PROFINET IO device with "D\_ACT\_DP", this component is configured and assigned parameters by the associated DP master/PROFINET IO controller (as with the return of a failed DP station/PROFINET IO station). This activation is complete when the component is able to transfer user data.

Activating a DP slave/PROFINET IO device does not start the program error OB, even if its inputs or outputs belong to the system-side process image to be updated. Also there is no entry in the diagnostics buffer.

If you try to activate a DP slave/PROFINET IO device with "D\_ACT\_DP" that cannot be accessed (for example, because it was physically separated from the bus), the instruction returns the error code W#16#80A7 after expiration of the configured parameter assignment time for distributed I/O. The DP slave/PROFINET IO device is activated and the fact that the activated DP slave/PROFINET IO device cannot be accessed results in a corresponding display in the system diagnostics.

If the DP slave/PROFINET IO device is accessible again afterwards, this results in standard system behavior (for example, a call of the OB configured for this purpose).

**Note**

Activating a DP slave/PROFINET IO device may be time-consuming. If you wish to cancel a current activation job, start "D\_ACT\_DP" again with the same value for LADDR and MODE = 2. Repeat the call of "D\_ACT\_DP" with MODE = 2 until successful cancellation of the activation job is indicated by RET\_VAL = 0.

If you wish to activate DP slaves which take part in the slave-to-slave communication, we recommend that you first activate the transmitters and then the receivers (listeners).

**Parameters**

The following table shows the parameters of the "D\_ACT\_DP" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Level-triggered control parameter REQ=1: Execute activation or deactivation
MODE	Input	USINT	I, Q, M, D, L or constant	Job identifier Possible values: <ul style="list-style-type: none"> <li>• 0: Request information on whether the addressed component is activated or deactivated (output via RET_VAL parameter)</li> <li>• 1: Activate the DP slave/PROFINET IO device</li> <li>• 2: Deactivate the DP slave/PROFINET IO device</li> </ul>
LADDR	Input	HW_DEVICE	I, Q, M, D, L or constant	Hardware identifier of the DP slave (HW_DPSlave)/PROFINET IO device (HW_Device)  The number can be taken from the properties of the DP slave / PROFINET IO device in the Network view or from the "System constants" tab of the standard tag table.  If both the identifier for the device diagnostics as well as the ID for operating state transitions are both specified there, you must use the code for the device diagnostics.
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code.
BUSY	Output	BOOL	I, Q, M, D, L	Active code: <ul style="list-style-type: none"> <li>• BUSY = 1: The job is still active.</li> <li>• BUSY = 0: The job was terminated.</li> </ul>

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

## RET\_VAL parameter

Error code* (W#16#...)	Explanation
0000	Job completed without error.
0001	The DP slave/PROFINET IO device is active (this error code is possible only with MODE = 0.)
0002	The DP slave/PROFINET IO device is deactivated (this error code is possible only with MODE = 0.)
7000	First call with REQ=0. The job specified with LADDR is not active; BUSY has the value "0".
7001	First call with REQ=1. The job specified with LADDR was initiated. BUSY has the value "1".
7002	Intermediate call (REQ irrelevant). The activated job is still active; BUSY has the value "1".
8090	<ul style="list-style-type: none"> <li>You have not configured a module with the address specified in LADDR.</li> <li>You operate your CPU as I-Slave and you have specified in LADDR an address of this I-Slave.</li> </ul>
8092	The deactivation of the currently addressed DP slave/PROFINET IO device (MODE=2) cannot be canceled by being activated (MODE=1). Activate the component at a later time.
8093	No DP slave / PROFINET IO device that can be activated or deactivated is assigned to the address specified in LADDR.
8094	You have attempted to activate a device which is potential partner for a tool change port. However, another device is already activated on this tool change port at this time. The activated device will remain activated.
80A0	Error during the communication between the CPU and the IO controller.
80A1	Parameters could not be assigned for the addressed component. (This error code is only available when MODE = 1.) Note: "D_ACT_DP" returns this error information only if the activated slaves/devices of this component fails again during parameter assignment. If the parameter assignment of a single module was unsuccessful, "D_ACT_DP" returns the error information W#16#0000.
80A2	The addressed DP slave does not return an acknowledgment. (This error information is not available with PROFINET IO devices. The process is not time-monitored by PROFINET.)
80A3	The DP master/PROFINET IO controller concerned does not support this function.
80A4	The CPU does not support this function for external DP masters/PROFINET IO controller.
80A6	Slot error in the DP slave/PROFINET IO device; not all user data can be accessed (this error code is only available when MODE=1). Note: "D_ACT_DP" returns this error information only if the activated component fails again after parameter assignment and before the end of "D_ACT_DP". If only a single module is unavailable, "D_ACT_DP" returns the error information W#16#0000.
80A7	Activation of a non-accessible device.
80AA	Activation with errors in the DP slave/PROFINET IO device: Differences in the configuration
80AB	Activation with errors in the DP slave/PROFINET IO device: Parameter assignment error
80AC	Activation with errors in the DP slave/PROFINET IO device: Maintenance required
80C1	"D_ACT_DP" has been started and is being continued with another address (this error code is possible when MODE=1 and MODE=2).
80C3	<ul style="list-style-type: none"> <li>Temporary resource error: The CPU is currently processing the maximum possible activation and deactivation jobs. (This error code is available only when MODE = 1 and MODE = 2.)</li> <li>The CPU is busy receiving a modified configuration. Currently you can not enable/disable DP slaves/PROFINET IO devices.</li> </ul>
80C5	DP: Jobs not collected by the user are discarded at restart.
80C6	PROFINET: Jobs not collected by the user are discarded at restart.

Error code* (W#16#...)	Explanation
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

Others

**RD\_REC: Read data record from I/O**

**Description**

Use the instruction to read the data record with the number RECNUM from the addressed module. You start the read process by assigning the value "1" to the input parameter REQ during the call. If the read process could be executed immediately, the instruction returns the value "0" at the output parameter BUSY . If BUSY has the value "1", reading is not yet complete.

See also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794). The data record read is entered in the target range spanned by the RECORD parameter, providing the data transfer was free of errors.

**Note**

When you read out a data record with a number greater than one from an FM or a CP you have purchased prior to February 1997 (below referred to as "old modules"), "RD\_REC" responds differently than it does in new modules. This special situation is covered in the section "Using old S7-300 FMs and CPs with data record numbers >1" (see below).

If a DPV1 slave is configured via GSD file (GSD rev. 3 and higher) and the DP interface of the DP master is set to "S7 compatible", then you may not read any data records from the I/O modules in the user program with "RD\_REC". In this case, the DP master addresses the wrong slot (configured slot + 3).

Remedy: Set the interface of the DP master to "DPV1".

**Parameters**

The following table shows the parameters of the "RD\_REC" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ = 1: Read request
LADDR	Input	HW_IO	I, Q, M, D, L or constant	Hardware identifier of the module.
RECNUM	Input	BYTE	I, Q, M, D, L or constant	Data record number (permitted values: 0 to 240)

Parameter	Declaration	Data type	Memory area	Description
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code. In addition: the length of the data record actually transferred in bytes (possible values: +1 to +240), if the target range is greater than the transferred data record and if no error occurred during the transfer.
BUSY	Output	BOOL	I, Q, M, D, L	BUSY = 1: The reading process is not yet complete.
RECORD	Output	ANY	I, Q, M, D, L	Target range for the data record read. With asynchronous execution of "RD_REC", make sure that the actual parameters of RECORD have the same length information for all calls. Only the BYTE data type is permitted. Note: Note that for S7-300 CPUs the parameter RECORD always requires the full specification of the DB parameters (for example, P#DB13.DBX0.0 byte 100). The omission of an explicit DB number is only permitted for S7-300 CPUs and leads to an error message in the user program.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter RECORD

### Note

If you want to ensure that the entire data record is always read, select a target range with a length of 241 bytes. If the data transfer is without error, RET\_VAL contains the actual data record length.

## Using old S7-300 FMs and CPs with data record numbers > 1

If you want to use the instruction "RD\_REC" to read out a data record with a number greater than one from an old S7-300 FM or old S7-300 CP, remember the following points:

- If the target range is greater than the actual length of the required data record, no data is entered in RECORD . RET\_VAL is written with W#16#80B1.
- If the target range is smaller than the actual length of the required data record, the CPU reads as many bytes beginning at the start of the record as are specified in the length information of RECORD and enters this number of bytes in RECORD . RET\_VAL has the value "0".
- If the length specified in RECORD is the same as the actual length of the required data record, the CPU reads the data record and enters it in RECORD . RET\_VAL is written with "0".

**RET\_VAL parameter**

- If an error has occurred while the function was being executed, the return value contains an error code.
- If no error occurred during the transfer, RET\_VAL contains the following:
  - 0, if the entire target range was filled with data from the selected data record (the data record can also be incomplete).
  - The length of the data record actually transferred in bytes (possible values: +1 to +240) if the target range is greater than the transferred data record.

**Note**

If the general error W#16#8745 occurs, this only indicates that access to at least one byte of the process image was blocked. The data record was read by the module correctly and written to the I/O memory area.

When looking at the "real" error information (error codes W#16#8xyz) in the following table, we distinguish between two cases:

- Temporary errors (error codes W#16#80A2 to 80A3, 80Cx):  
This type of error can possibly be eliminated without user action, meaning it is helpful to call the instruction again (multiple calls, if necessary).  
Example of a temporary error: Resources required are currently in use (W#16#80C3).
- Permanent errors (error codes W#16#809x, 80A0, 80A1, 80Bx):  
This type of error does not correct itself. A new call of the instruction will not be successful until you have eliminated the error. Example of a permanent error: Wrong length specification in RECORD (W#16#80B1).

**Note**

If you transfer data records to a DPV1 slave with "WR\_REC (Page 2658)" or if you read data records from a DPV1 slave with RD\_REC and if this DPV1 slave operates in DPV1 mode, the DP master evaluates the error information it received from the slave as follows:

If the error information lies within the range from W#16#8000 to W#16#80FF or W#16#F000 to W#16#FFFF, the DP master passes the error information to the instruction. If the error information is outside this range, the DP master passes the value W#16#80A2 to the instruction and suspends the slave.

For a description of the error information originating from DPV1 slaves, refer to STATUS[3] Parameter STATUS (Page 2626).

**Parameter RET\_VAL for WR\_REC and RD\_REC**

Error code* (W#16#...)	Explanation	Restriction
0000	No error	-
7000	First call with REQ=0: No data transfer active; BUSY has the value 0.	-
7001	First call with REQ=1: Data transfer started; BUSY has the value 1.	Distributed I/O

Error code* (W#16#...)	Explanation	Restriction
7002	Intermediate call (REQ irrelevant): Data transfer already active; BUSY has the value 1.	Distributed I/O
8090	Address specified at parameter ADDR is invalid.	-
8092	A type other than BYTE is specified in the ANY reference.	-
8093	This instruction is not permitted for the module selected by means of LADDR and IOID .	-
80A0	Negative acknowledgment when reading from the module: Module was removed during the reading process or is defective	With "RD_REC" only
80A1	Negative acknowledgment when writing to the module: Module was removed during the writing process or is defective	With "WR_REC (Page 2658)" only
80A2	<ul style="list-style-type: none"> <li>DP protocol error at layer 2 (for example, slave failure or bus problems)</li> <li>For ET200S, data record cannot be read in DPV0 mode.</li> </ul>	Distributed I/O
80A3	DP protocol error with user interface/user	Distributed I/O
80A4	Communication on PBUS+ disrupted	-
80B0	<ul style="list-style-type: none"> <li>Instruction not possible for module type.</li> <li>The module does not recognize the data record.</li> <li>Data record number 241 not permitted.</li> <li>With "WR_REC (Page 2658)", data records 0 and 1 are not permitted.</li> </ul>	-
80B1	The length specified in parameter RECORD is incorrect.	<ul style="list-style-type: none"> <li>With "WR_REC (Page 2658)": Length incorrect</li> <li>With "RD_REC" (only when using old S7-300 FMs and S7-300 CPs): specified length &gt; data record length</li> <li>With DPNRM_DG: specified length &lt; data record length</li> </ul>
80B2	The configured slot is not assigned.	-
80B3	Actual module type does not match specified module type	-
80B7	DP slave or module reports an invalid range for a parameter or value.	With "RD_REC" only
80C0	<p>With "WR_REC (Page 2658)": the data can only be written when the CPU is in STOP mode. Note: this means that writing by the user program is not possible. You can only write the data online with PG/PC.</p> <p>With "RD_REC": the module routes the data record, but either no data is present or the data can only be read when the CPU is in STOP mode. Note: if data can only be read when the CPU is in STOP mode, then an evaluation by the user program is not possible. In this case, you can only read the data online with PG/PC.</p> <p>With "DPNRM_DG (Page 2674)": There are no diagnostic data available.</p>	With "WR_REC (Page 2658)" or "RD_REC" or "DPNRM_DG (Page 2674)"

Error code* (W#16#...)	Explanation	Restriction
80C1	The data of the previous write job on the module for the same data record have not yet been processed by the module.	-
80C2	The module is currently processing the maximum possible number of jobs for a CPU.	-
80C3	The required resources (memory, etc.) are currently occupied.	-
80C4	Internal temporary error. Job could not be executed. Repeat the job. If this error occurs often, check your installation for sources of electrical interference.	-
80C5	Distributed I/O not available.	Distributed I/O
80C6	Data record transfer stopped due to priority class abort (restart or background)	Distributed I/O
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)	-

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## WR\_REC: Write data record to I/O

### Description

Use the instruction "WR\_REC" to transfer the data record RECORD to the addressed module.

The data to be transferred are read from the RECORD parameter during the first call. If the transfer of the data record takes longer than the duration of one call, the contents of the RECORD parameter are no longer relevant for the subsequent instruction calls (for the same job).

You start the writing process by assigning the value "1" to the input parameter REQ during the call. If the writing process could be executed immediately, the instruction returns the value "0" at the output parameter BUSY. If BUSY has the value "1", writing is not yet complete.

### Parameters

The following table shows the parameters of the instruction "WR\_REC":

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L, T, C or constant	REQ = 1: Write request
LADDR	Input	HW_IO	I, Q, M, D, L or constant	Hardware identifier of the module.
RECNUM	Input	BYTE	I, Q, M, D, L or constant	Data record number
RECORD	Input	VARIANT	I, Q, M, D, L	Data record

Parameter	Declaration	Data type	Memory area	Description
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code.
BUSY	Output	BOOL	I, Q, M, D, L	BUSY = 1: The writing process is not yet completed.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

### Parameter RET\_VAL

See also: RD\_REC: Read data record from I/O (Page 2654)

---

#### Note

If the general error W#16#8544 occurs, it only indicates that access to at least one byte of the I/O memory area containing the data record was denied. The data transfer was continued.

---

### DPRD\_DAT: Read consistent data of a DP standard slave

#### Description

Use the instruction "DPRD\_DAT" to read out consistent data from an I/O module.

The instruction can be used for the central modules as well as for the DP standard slaves and PROFINET IO devices.

You require "DPRD\_DAT" because you can only read out a maximum of four continuous bytes using the load commands that access the I/O or the process image input table. If required, you can also read consistent data via the process image of the inputs. Refer to the related documentation to find out if your CPU supports this functionality. For additional information on consistent data of a DP standard slave/PROFINET IO device, refer to Section "Data consistency (Page 3132)".

If necessary, the instruction "DPRD\_DAT" can also be used for a data area of 1 byte or larger. For information on the maximum length of the data, refer to the documentation of your CPU (e.g. 64 bytes for an S7-1214).

9.7 References

- Use the parameter LADDR to select the module of the DP normslave/PROFINET IO device. If an access error occurs, the error code W#16#8090 is output.
- Use the RECORD parameter to define the target range of the read data:
  - The target range has to be at least as long as the inputs of the selected module. Only the inputs are transferred, the other bytes are not considered. If you read from a DP standard slave with a modular configuration or with several DP identifiers, you can only access the data of a module of the configured hardware identifier per "DPRD\_DAT" call. If you select a target range that is too small, the error code 80B1 is output at the RET\_VAL parameter.
  - All bit strings and all integers can be used as data type. It is also possible to use these data types in a data structure of the ARRAY type . The data type STRING is not supported.
- If there was no error during the data transmission, the data that have been read are entered in the target range defined at the RECORD parameter.

Parameters

The following table shows the parameters of the instruction "DPRD\_DAT":

Parameter	Declaration	Data type	Memory area	Description
LADDR	Input	HW_IO	I, Q, M, L or constant	Hardware ID of the module from which the data is to be read. The hardware ID can be found in the properties of the module in the device view or system constants.
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code.
RECORD	Output	VARIANT	I, Q, M, D, L	Destination area for the user data that were read.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

RET\_VAL parameter

Error code* (W#16#...)	Explanation
0000	No error occurred.
8090	<ul style="list-style-type: none"> <li>• You have not configured a module for the specified hardware identifier or</li> <li>• You have ignored the restriction concerning the length of consistent data, or</li> <li>• you have not specified a hardware identifier as an address at parameter LADDR .</li> </ul>
8092	A data type other than (Array of) bit string or integer was specified at the RECORD parameter.
8093	No DP module/PROFINET IO device from which you can read consistent data exists for the hardware identifier specified in LADDR . This error code also occurs if the module addressed by means of LADDR does not have inputs.
80A0	An access error was detected when accessing the I/O.

Error code* (W#16#...)	Explanation
80B1	The length of the specified target range at parameter RECORD is shorter than the configured user data length.
80C0	The data have not been read yet.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

Parameter STATUS (Page 2626)

## DPWR\_DAT: Write consistent data of a DP standard slave

### Description

Use the instruction "DPWR\_DAT" to transfer the data at the parameters RECORD consistently to the addressed module of the central module or of the DP standard slave/PROFINET IO device and if necessary to the process image (i.e. if the affected address range of the DP standard slaves is projected as consistency range in a process image).

You require "DPWR\_DAT" because you can only write a maximum of four continuous bytes using the transfer commands that access the I/O or process image output. If required, you can also write consistent data via the process image outputs. Refer to the related documentation to find out if your CPU supports this functionality. Do not use both possibilities concurrently when writing consistent data: Either use "DPWR\_DAT" or write via the process image output table. For additional information on consistent data of a DP standard slave/PROFINET IO device, refer to Section "Data consistency (Page 3132)". If the DP standard slave has a modular design, you can only access one module of the DP slave.

### CAUTION

#### I/O access

When using "DPWR\_DAT", avoid accessing I/O areas that have process image partitions with OB6x connections (isochronous mode interrupts) assigned to them.

If necessary, the instruction "DPRD\_DAT" can also be used for a data area of 1 byte or larger. For information on the maximum length of the data, refer to the documentation of your CPU (e.g. 64 bytes for an S7-1214).

- Use the LADDR parameter to select the DP standard slave / PROFINET IO device. If an access error occurs on the addressed module, the error code 8090 is output.
- Use the RECORD parameter to define the source range of the data to be written:
  - The source range has to be at least as long as the outputs of the selected module. Only the outputs are transferred, the other bytes are not considered. If the source range at parameter RECORD is longer than the outputs of the configured module, only the data up to the maximum length of the outputs is transferred. If the source range at parameter RECORD is shorter than the outputs of the configured module, the error code 80B1 is output.
  - The following data types can be used: Byte, Char, Word, LWord, DWord, Int, UInt, USInt, Sint, LInt, UInt, DInt, UDInt. The use of these data types in a data structure of the type ARRAY or STRUCT is also permissible.
  - The data type STRING is not supported.

The data is transferred synchronously, that is, the write process is completed when the instruction is completed.

### Parameters

The following table shows the parameters of the instruction "DPWR\_DAT":

Parameter	Declaration	Data type	Memory area	Description
LADDR	Input	HW_IO	I, Q, M, L or constant	Hardware ID of the module to which the data is to be written. The hardware ID can be found in the properties of the module in the device view or system constants.
RECORD	Input	VARIANT	I, Q, M, D, L	Source area for the user data to be written.
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### RET\_VAL parameter

Error code* (W#16#...)	Explanation
0000	No error occurred.
8090	<ul style="list-style-type: none"> <li>• You have not configured a module for the specified hardware identifier or</li> <li>• You have ignored the restriction concerning the length of consistent data, or</li> <li>• you have not specified a hardware identifier at parameter LADDR .</li> </ul>
8092	A data type other than (Array of) bit string or integer was specified at the RECORD parameter.

Error code* (W#16#...)	Explanation
8093	No DP module /PROFINET IO device to which you can write consistent data exists at the HW ID specified in LADDR . This error code also occurs if the DP standard slave / PROFINET IO device addressed via LADDR does not have outputs.
80A1	Access error detected while I/O devices were being accessed.
80B1	The length of the specified source range at the RECORD parameter is shorter than the outputs of the configured DP standard slave / PROFINET IO device.
80C1	The data of the previous write job have not yet been processed by the DP standard slave / PROFINET IO device.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

Parameter STATUS (Page 2626)

**iDevice / iSlave****RCVREC: Receive data record****Description**

An I-device can receive a data record from a superordinate controller. The receipt takes place in the user program with the instruction "RCVREC" (receive record).

The instruction has the following operating modes:

- Check whether the I-device has a request for a data record receipt.
- Make the data record available to the output parameters.
- Send an answer to the superordinate controller.

You can determine the operating mode executed by the instruction using the input parameter MODE (see below).

The I-device must be in the RUN or STARTUP mode.

With MLEN, you specify the maximum number of bytes you want to receive. The selected length of the target range RECORD should have at least the length of MLEN bytes.

If a data record was received (MODE=1 or MODE=2), the output parameter NEW will indicate that the data record was stored in RECORD. Note that RECORD has a sufficient length. The output parameter LEN contains the actual length of the data record received in bytes.

Set CODE1 and CODE2 to zero for the positive answer to the superordinate controller. If the received data record is to be rejected, enter the negative answer to the superordinate controller in Error Code 1 of the CODE1 and in Error Code 2 of the CODE2.

**Note**

If the I-device has received a request for a data record receipt, you must recognize the delivery of this request within a certain duration. After recognition, you must send an answer to the superordinate controller within this time period. Otherwise the I-device will experience a timeout error which causes the operating system of the I-device to send a negative answer to the superordinate controller. For information on the value for the time period, refer to the specifications of your CPU.

The output parameter STATUS receives the error information after the occurrence of an error.

**Operating modes**

You can determine the operating mode of the instruction "RCVREC" with the input parameter MODE. This step will be explained in the following table.

MODE	Meaning
0	Check whether a request for a data record receipt exists If a data record from a higher-level controller exists on the I-device, the instruction will only write the output parameters NEW, SLOT, SUBSLOT, INDEX and LEN. If you call the instruction several times with MODE=0, then the output parameter will only refer to one and the same request.
1	Receiving a data record for any subplot of the I-device If a data record from a superordinate controller exists on the I-device for any subplot of the I-device, the instruction will write the output parameter and transfer the data record to the parameter RECORD.
2	Receiving a data record for a specific subplot of the I-device If a data record from a superordinate controller exists on the I-device for a specific subplot of the I-device, the instruction will write the output parameter and transfer the data record to the parameter RECORD.
3	Sending a positive answer to the superordinate controller The instruction checks the request of the superordinate controller to receive a data record, accepts the existing data record and sends a positive acknowledgment to the superordinate controller.
4	Sending a negative answer to the superordinate controller The instruction checks the request of the superordinate controller to receive a data record, rejects the existing data record and sends a negative acknowledgment to the superordinate controller. Enter the reason for the rejection in the input parameters CODE1 and CODE2.

**Note**

After the receipt of a data record (NEW=1) you must call "RCVREC" twice to ensure complete processing. You must do this in the following order:

- First call with MODE=1 or MODE=2
- Second call with MODE=3 or MODE=4

## Parameters

The following table shows the parameters of the "RCVREC" instruction:

Parameter	Declaration	Data type	Memory area	Description
MODE	Input	INT	I, Q, M, D, L or constant	Mode
F_ID	Input	HW_SUBMO DULE	I, Q, M, D, L or constant	Subslot in the transfer area of the I-device for the data record to be received (only relevant for MODE=2). The high word is always set to zero.
MLEN	Input	INT*	I, Q, M, D, L or constant	Maximum length of the data record to be received in bytes
CODE1	Input	BYTE	I, Q, M, D, L or constant	Zero (for MODE=3) and/or Error Code 1 (forMODE=4)
CODE2	Input	BYTE	I, Q, M, D, L or constant	Zero (for MODE=3) and/or Error Code 2 (forMODE=4)
NEW	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• MODE = 0: New data record was received</li> <li>• MODE=1 or 2: Data record was transferred to RECORD</li> </ul>
STATUS	Output	DWORD	I, Q, M, D, L	Error information
SLOT	Output	HW_SUBMO DULE	I, Q, M, D, L	Identical to F_ID
SUBSLOT	Output	HW_SUBMO DULE	I, Q, M, D, L	Identical to F_ID
INDEX	Output	UINT	I, Q, M, D, L	Number of the data record received
LEN	Output	UINT	I, Q, M, D, L	Length of the data record received
RECORD	InOut	VARIANT	I, Q, M, D, L	Target range for the data record received. Note: Note that for S7-300 CPUs the parameter RECORD always requires the full specification of the DB parameters (for example, P#DB13.DBX0.0 Byte 100). The omission of an explicit DB number is not permitted for S7-300 CPUs and results in an error message in the user program.

\* Use the data type UINT in the STL programming language.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter STATUS

For interpretation of the parameter STATUS refer to section: Parameter STATUS (Page 2626)

## PRVREC: Make data record available

### Description

An I-device can receive a request from a superordinate controller to make a data record available. The I-device makes the data record available in the user program with the instruction "PRVREC" (provide record).

The instruction has the following operating modes:

- Check whether the I-device has a request for making a data record available.
- Transfer the requested data record to the superordinate controller.
- Sending an answer to the superordinate controller.

You can determine the operating mode executed by the instruction using the input parameter MODE (see below).

The I-device must be in the RUN or STARTUP mode.

Enter the maximum number of bytes the data record to be sent should have with LEN. The selected length of the target range RECORD should have at least the length of LEN bytes.

If a request to make a data record available exists, (MODE=0), the output parameter NEW will be set to TRUE.

If the request for making a data record available is accepted, write RECORD for the positive answer to the superordinate controller with the requested data record and write zero for CODE1 and CODE2. If the request for making a data record available is to be rejected, enter the negative answer to the superordinate controller in Error Code 1 of the CODE1 and in Error Code 2 of the CODE2.

---

### Note

If the I-device has received a request for making a data record available, you must recognize the delivery of this request within a certain time period. After recognition, you must send an answer to the superordinate controller within this time period. Otherwise the I-device will experience a timeout error which causes the operating system of the I-device to send a negative answer to the superordinate controller. For information on the value for the time period, refer to the specifications of your CPU.

---

The output parameter STATUS receives the error information after the occurrence of an error.

## Operating modes

You can determine the operating mode of the instruction "PRVREC" with the input parameter MODE. This step will be explained in the following table.

MODE	Meaning
0	Check whether a request for making a data record available exists If a request from a higher-level controller for making a data record available exists on the I-device, the instruction will only write the output parameters NEW, SLOT, SUBSLOT, INDEX and RLEN. If you call the instruction several times with MODE=0, then the output parameter will only refer to one and the same request.
1	Receiving a request for making a data record available for any subslot of the I-device If such a request from a superordinate controller for any subslot of the I-device exists on the I-device, the instruction will write the output parameter.
2	Receiving a request for making a data record available for a specific subslot of the I-device If such a request from a superordinate controller for a specific subslot of the I-device exists on the I-device, the instruction will write the output parameter.
3	Make the data record available and send a positive answer to the superordinate controller The instruction checks the request of the superordinate controller to make a data record available, makes the request data record available to RECORD and sends a positive acknowledgement to the superordinate controller.
4	Sending a negative answer to the superordinate controller The instruction checks the request of the superordinate controller to make a data record available, rejects this request and sends a negative acknowledgement to the superordinate controller. Enter the reason for the rejection in the input parameters CODE1 and CODE2.

### Note

After the receipt of a request (NEW=1) you must call the instruction twice to ensure complete processing. You must do this in the following order:

- First call with MODE=1 or MODE=2
- Second call with MODE=3 or MODE=4

## Parameters

The following table shows the parameters of the "PRVREC" instruction:

Parameter	Declaration	Data type	Memory area	Description
MODE	Input	INT	I, Q, M, D, L or constant	Mode
F_ID	Input	HW_SUBMO DULE	I, Q, M, D, L or constant	Subslot in the transfer area of the I-device for the data record to be sent (only relevant for MODE=2). The high word is always set to zero.
CODE1	Input	BYTE	I, Q, M, D, L or constant	Zero (for MODE=3) and/or Error Code 1 (for MODE=4)
CODE2	Input	BYTE	I, Q, M, D, L or constant	Zero (for MODE=3) and/or Error Code 2 (for MODE=4)
LEN	Input	UINT	I, Q, M, D, L or constant	Maximum length of the data record to be sent in bytes

Parameter	Declaration	Data type	Memory area	Description
NEW	Output	BOOL	I, Q, M, D, L	The new data record was requested by the superordinate controller.
STATUS	Output	DWORD	I, Q, M, D, L	Error information
SLOT	Output	HW_SUBMODULE	I, Q, M, D, L	Identical to F_ID
SUBSLOT	Output	HW_SUBMODULE	I, Q, M, D, L	Identical to F_ID
INDEX	Output	UINT	I, Q, M, D, L	Number of the data record to be sent
RLEN	Output	UINT	I, Q, M, D, L	Length of the data record to be sent
RECORD	InOut	VARIANT	I, Q, M, D, L	Data record made available Note: Note that for S7-300 CPUs the parameter RECORD always requires the full specification of the DB parameters (for example, P#DB13.DBX0.0 Byte 100). The omission of an explicit DB number is not permitted for S7-300 CPUs and results in an error message in the user program.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameter STATUS

For interpretation of the parameter STATUS refer to section: Parameter STATUS (Page 2626)

### PROFIBUS

#### DPSYC\_FR: Synchronize DP slaves / Freeze inputs

#### Description

You use the instruction to synchronize one or more groups of DP slaves.

The function involves sending one of the control commands below, or a combination of them, to the relevant groups:

- SYNC (simultaneous output and freezing of output states on the DP slaves)
- UNSYNC (cancels the SYNC control command)
- FREEZE (freeze the input states on the DP slaves and read in the frozen inputs)
- UNFREEZE (cancels the FREEZE control command)

Before you send the control commands listed above, you must assign the DP slaves to groups per configuration. You must know which DP slave is assigned to which group, with which number and know the reactions of the various groups to SYNC/FREEZE.

---

**Note**

Note that the control commands SYNC and FREEZE also remain valid when you perform a warm/cold restart.

Please note also that you may initiate only one SYNC/UNSYNC job or only one FREEZE/UNFREEZE job at a time.

---

### Functional description

"DPSYC\_FR" works asynchronously, that is, its execution extends over multiple calls. You start the job by calling "DPSYC\_FR" with REQ=1.

The output parameters RET\_VAL and BUSY indicate the status of the job.

See also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794).

### Identification of a job

If you have triggered a SYNC/FREEZE job and called "DPSYC\_FR" again before the first job was completed, the response of the instruction depends on whether the new call is for the same job. If the input parameters LADDR, GROUP and MODE match, the call is interpreted as a follow-on call.

### Writing outputs of DP modules

The writing of outputs of DP modules is triggered as follows:

- By transfer commands to the DP I/O
- By writing the process image of the outputs to the modules (by the operating system at the end of OB 1 or by calling the instruction "UPDAT\_PO (Page 2611)")
- Calling the "DPWR\_DAT (Page 2661)" instruction.

In normal operation, the DP master transfers the output bytes cyclically (within the cycle of the PROFIBUS DP bus) to the outputs of the DP slaves.

If you want to have certain output data (possibly distributed on several slaves) applied to the outputs to the process at exactly the same time, you can send the SYNC control command to the relevant DP master using the "DPSYC\_FR" instruction.

### What are the effects of SYNC?

With the SYNC control command, the DP slaves of the selected groups are switched to Sync mode. In other words, the DP master transfers the current output data and instructs the DP slaves involved to freeze their outputs. With the following output message frames, the DP

slaves enter the output data in an internal buffer and the state of the outputs remains unchanged.

Following each SYNC control command, the DP slaves of the selected groups apply the output data of their internal buffer to the outputs on the process.

The outputs are only updated cyclically again when you send the UNSYNC control command using the "DPSYC\_FR" instruction.

---

**Note**

If the DP slaves of the selected group(s) are not currently connected to the network or have failed when the control command was sent, they will not be switched to SYNC mode. This information will not be communicated in the return value of the instruction.

---

### Reading input data of DP modules

The input data of the DP modules are read as follows:

- Using load commands to the DP I/O
- When the process image of the inputs is updated (by the operating system at the start of OB 1 or by calling the "UPDAT\_PI (Page 2609)" instruction)
- By calling the "DPRD\_DAT (Page 2659)" instruction.

In normal operation, the DP master receives this input data cyclically (within the cycle of the PROFIBUS DP bus) from its DP slaves and makes them available to the CPU.

If you want to have certain input data (possibly distributed on several slaves) to be read from the process at exactly the same time, send the FREEZE control command to the relevant DP master using the "DPSYC\_FR" instruction.

### What are the effects of FREEZE?

With the FREEZE control command, the DP slaves involved are switched to Freeze mode, in other words the DP master instructs the DP slaves to freeze the current state of the inputs. It then transfers the frozen data to the input area of the CPU.

Following each FREEZE control command, the DP slaves freeze the state of their inputs again.

The DP master only receives the current state of the inputs cyclically again after you have sent the UNFREEZE control command with the "DPSYC\_FR" instruction.

---

**Note**

If the DP slaves of the selected group(s) are not currently connected to the network or have failed when the control command has been sent, they will not be switched to FREEZE mode. This information will not be communicated in the return value of the instruction.

---

## Data consistency

Because the DPSYC\_FR functions are asynchronous and can be interrupted by higher priority classes, you should make sure that the process images are consistent with the actual inputs and outputs of the I/O when using the "DPSYC\_FR" instruction.

This is guaranteed if you comply with the following consistency rules:

- Define suitable process image partitions for the "SYNC outputs" and the "FREEZE inputs" (only possible on the S7-400). Call the "UPDAT\_PO (Page 2611)" instruction immediately before each first call of a SYNC job. Call the "UPDAT\_PI (Page 2609)" instruction immediately after the respective last call of a FREEZE job.
- As an alternative: Use only direct I/O access for outputs involved in a SYNC job and for inputs involved in a FREEZE job. Do not write to these outputs when a SYNC job is active and do not read in these inputs when a FREEZE job is active.

## Use of DPWR\_DAT and DPRD\_DAT

If you use the "DPWR\_DAT (Page 2661)" instruction, it must be complete before you send a SYNC job for the outputs involved.

If you use the "DPRD\_DAT (Page 2659)" instruction, it must be complete before you send a FREEZE job for the inputs involved.

## Startup and "DPSYC\_FR"

The user alone must take responsibility for sending the SYNC and FREEZE control commands in the startup OBs.

If you want the outputs of one or more groups to be in SYNC mode when the user program starts, you must initialize these outputs during startup and completely execute the "DPSYC\_FR" instruction with the SYNC control command.

If you want the inputs of one or more groups to be in FREEZE mode when the user program starts, you must execute the "DPSYC\_FR" instruction with the FREEZE control command completely for these inputs during startup.

## Parameters

The following table shows the parameters of the "DPSYC\_FR" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Level-triggered control parameter REQ = 1: Triggering of the SYNC/FREEZE job
LADDR	Input	HW_DPMASTER	I, Q, M, D, L or constant	Hardware identifier of the DP master interface The number can be taken from the properties of the DP master interface in the Network view or from the "System constants" tab of the standard tag table.

Parameter	Declaration	Data type	Memory area	Description
GROUP	Input	BYTE	I, Q, M, D, L or constant	Group selection Bit 0 = 1: group 1 selected Bit 1 = 1: group 2 selected : Bit 7 = 1: group 8 selected You can select several groups per job. The value B#16#0 is invalid.
MODE	Input	BYTE	I, Q, M, D, L or constant	Job ID (coding complies with EN 50 170 Volume 2, PROFIBUS) Bit 0: reserved (value 0) Bit 1: reserved (value 0) Bit 2: <ul style="list-style-type: none"> <li>• = 1: UNFREEZE will be executed</li> <li>• = 0: no meaning</li> </ul> Bit 3: <ul style="list-style-type: none"> <li>• = 1: FREEZE will be executed</li> <li>• = 0: no meaning</li> </ul> Bit 4: <ul style="list-style-type: none"> <li>• = 1: UNSYNC will be executed</li> <li>• = 0: no meaning</li> </ul> Bit 5: <ul style="list-style-type: none"> <li>• = 1: SYNC will be executed</li> <li>• = 0: no meaning</li> </ul> Bit 6: reserved (value 0) Bit 7: reserved (value 0)  Possible values: <ul style="list-style-type: none"> <li>• with exactly one ID per job:                             <ul style="list-style-type: none"> <li>- B#16#04 (UNFREEZE)</li> <li>- B#16#08 (FREEZE)</li> <li>- B#16#10 (UNSYNC)</li> <li>- B#16#20 (SYNC)</li> </ul> </li> <li>• with more than one ID per job:                             <ul style="list-style-type: none"> <li>- B#16#14 (UNSYNC, UNFREEZE)</li> <li>- B#16#18 (UNSYNC, FREEZE)</li> <li>- B#16#24 (SYNC, UNFREEZE)</li> <li>- B#16#28 (SYNC, FREEZE)</li> </ul> </li> </ul>
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code. Make sure that you evaluate RET_VAL each time the block has been executed.
BUSY	Output	BOOL	I, Q, M, D, L	BUSY=1: The SYNC/FREEZE job is not yet complete.

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

## RET\_VAL parameter

### Note

If you access DPV1 slaves, error information of these slaves can be forwarded from the DP master to the instruction. For a description of this error information, refer to STATUS[3], STATUS (Page 2626) parameter.

Error code* (W#16#...)	Explanation
0000	Job completed without error.
7000	First call with REQ=0. The job specified with LADDR, GROUP and MODE is not active; BUSY has the value 0.
7001	First call with REQ=1. The job specified with LADDR, GROUP and MODE was triggered; BUSY has the value 1.
7002	Intermediate call (REQ irrelevant). The activated SYNC/FREEZE job is still running; BUSY has the value 1.
8090	The module selected with LADDR is not a DP master.
8093	This instruction is not permitted for the module selected with LADDR (configuration or version of the DP master).
8094	GROUP parameter is incorrect
8095	MODE parameter is incorrect
80B0	The group selected with GROUP is not configured.
80B1	The group selected with GROUP is not assigned to this CPU.
80B2	The SYNC job specified with MODE is not permitted on the group selected with GROUP.
80B3	The FREEZE job specified with MODE is not permitted on the group selected with GROUP.
80C2	Temporary shortage of resources on the DP master: The DP master is currently processing the maximum number of jobs for a CPU.
80C3	This SYNC/UNSYNC job cannot be activated at present because only one SYNC/UNSYNC job can be triggered at a time. Check your user program.
80C4	This FREEZE/UNFREEZE job cannot be activated at present because only one FREEZE/UNFREEZE job can be triggered at a time. Check your user program.
80C5	Short circuit directly at DP interface
80C6	Job aborted due to I/O disconnection by CPU
80C7	Job aborted due to warm or cold restart on the DP master
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**DPNRM\_DG: Read diagnostics data from a DP slave**

**Description**

You use the "DPNRM\_DG" instruction to read the current diagnostic data of a DP slave in the form specified in EN 50 170 Volume 2, PROFIBUS.

Refer to the following table for the basic structure of the slave diagnostic data and to the manuals of the DP slaves for further information.

Byte	Meaning
0	Station status 1
1	Station status 2
2	Station status 3
3	Master station number
4	Vendor ID (high byte)
5	Vendor ID (low byte)
6 ...	Additional slave-specific diagnostic information

The data that has been read is entered in the target range indicated by RECORD following without error data transfer. You start the read process by assigning the value "1" to the REQ input parameter when the "DPNRM\_DG" instruction is called.

**Functional description**

The reading process is executed asynchronously, in other words, it can extend over several calls. The output parameters RET\_VAL and BUSY indicate the status of the job.

See also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794).

**Parameters**

The following table shows the parameters of the "DPNRM\_DG" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ = 1: Read request
LADDR	Input	HW_DPSLAVE	I, Q, M, D, L or constant	Configured diagnostic address of the DP slave Note: Address must be specified in hexadecimal form, for example, diagnostic address 1022 means: LADDR:=W#16#3FE.
RET_VAL	Return	DINT, INT, LREAL, REAL	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code. If no error has occurred, the length of the data actually transferred is entered in RET_VAL.

Parameter	Declaration	Data type	Memory area	Description
RECORD	Output	VARIANT	I, Q, M, D, L	Destination area for the diagnostic data that were read. Only the BYTE data type is permitted. The minimum length of the data record to be read or the target range is 6. The maximum length of the data record to be sent is 240. Standard slaves can provide more than 240 bytes of diagnostic data up to a maximum of 244 bytes. In this case, the first 240 bytes are transferred to the target range and the overflow bit is set in the data.
BUSY	Output	BOOL	I, Q, M, D, L	BUSY = 1: The reading process is not yet complete.

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

You can find information on data type conversion in the different programming languages under "Auto-Hotspot".

### RECORD parameter

The CPU evaluates the actual length of the read diagnostic data:

If the length specified for RECORD

- is less than the number of data bytes supplied, the data is discarded and a corresponding error code is entered in RET\_VAL.
- is greater than or equal to the number of data bytes supplied, the data is accepted in the destination area and the actual length is entered in RET\_VAL as a positive value.

---

#### Note

You must ensure that the actual parameters of RECORD correspond in all calls belonging to a job.

A job is uniquely identified by the LADDR input parameter.

---

### Standard slaves with more than 240 bytes of diagnostic data

With standard slaves on which the number of standard diagnostic data is between 241 and 244 bytes, note the following points:

If the length specified for RECORD

- is less than 240 bytes, the data is discarded and a corresponding error code is entered in RET\_VAL.
- If the length specified for RECORD is greater than or equal to 240 bytes, the first 240 bytes of the standard diagnostic data is transferred to the target range and the overflow bit is set in the data.

**RET\_VAL parameter**

- If an error occurs while the function is being executed, the return value contains an error code.
- If no errors have occurred during data transfer, RET\_VAL contains the length of the data read in bytes as a positive number.

**Note**

The amount of data read in a DP slave depends on its diagnostics status.

For the evaluation of the error information of the RET\_VAL parameter, refer to the following table.

Error code (W#16#...)	Explanation	Restriction
7000	First call with REQ = 0: No data transfer active; BUSY has the value "0".	-
7001	First call with REQ = 1: Data transfer triggered; BUSY has the value "1".	Distributed I/O
7002	Intermediate call (REQ irrelevant): Data transfer already active; BUSY has the value "1".	Distributed I/O
8090	Address specified at parameter LADDR is invalid.	-
8093	This instruction is not permitted for the module selected by means of LADDR and IOID.	-
80A2	<ul style="list-style-type: none"> <li>• DP protocol error at layer 2 (for example, slave failure or bus problems)</li> <li>• For ET200S, data record cannot be read in DPV0 mode.</li> </ul>	Distributed I/O
80A3	DP protocol error with user interface/user	Distributed I/O
80A4	Communication on PBUS+ disrupted	Distributed I/O
80B0	<ul style="list-style-type: none"> <li>• Instruction not possible for module type.</li> <li>• The module does not recognize the data record.</li> <li>• Data record number 241 not permitted.</li> <li>• With "WR_REC (Page 2618)", data records 0 and 1 are not permitted.</li> </ul>	-
80B1	The length specified in parameter RECORD is incorrect.	specified length < data record length
80B2	The configured slot is not assigned.	-
80B3	Actual module type does not match specified module type	-
80C0	There are no diagnostic data available.	-
80C1	The data of the previous write job on the module for the same data record have not yet been processed by the module.	-
80C2	The module is currently processing the maximum possible number of jobs for a CPU.	-
80C3	The required resources (memory, etc.) are currently occupied.	-

Error code (W#16#...)	Explanation	Restriction
80C4	Internal temporary error. Job could not be executed. Repeat the job. If this error occurs often, check your installation for sources of electrical interference.	-
80C5	Distributed I/O not available.	Distributed I/O
80C6	Data record transfer stopped due to priority class abort (restart or background)	Distributed I/O
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)	-
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

## DP\_TOPOL: Determine topology for DP master system

### Description

You use the instruction to trigger the topology determination for a selected DP master system. Calling the instruction will address all diagnostics repeaters on a DP master system.

---

#### Note

The topology can only be determined for one DP master system at a time.

---

Topology determination is the prerequisite for the detailed display of the error location if line errors occur. After configuration and after every change to the physical configuration of a DP master system, you must repeat the topology determination with "DP\_TOPOL".

Changes to the physical configuration are:

- Changes in line lengths
- Adding or removing stations or components with repeater function
- Changing station addresses

If an error is reported by a diagnostics repeater, "DP\_TOPOL" writes the DPR and DPRI outputs for the duration of one "DP\_TOPOL" pass. If errors are reported by multiple diagnostics repeaters of the selected DP master system, "DP\_TOPOL" writes DPR and DPRI with information regarding the first diagnostics repeater reporting the error. You can read out the entire diagnostic information on the programming device or using the "DPNRM\_DG (Page 2674)" instruction. If no diagnostics repeater reports an error, the DPR and DPRI outputs have the value NULL.

If you want to repeat a topology determination after an error occurs, you must first reset "DP\_TOPOL". This is done by calling "DP\_TOPOL" with REQ=0 and R=1.

### Functional description

"DP\_TOPOL" works asynchronously, that is, its execution extends over multiple calls. You start determining the bus topology by calling "DP\_TOPOL" with REQ=1. If you want to cancel the process, call "DP\_TOPOL" with R=1.

The output parameters RET\_VAL and BUSY indicate the status of the job.

See also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794).

**Note**

Determining the topology may take several minutes.

**Identification of a job**

The input parameter DP\_ID uniquely specifies a job.

If you have called "DP\_TOPOL" and you call this instruction again before the topology is re-determined, the manner in which the instruction reacts depends on whether the new call involves the same job: If the DP\_ID parameter matches a job that has not yet been completed, then the call is interpreted as a follow-up call and the value W#16#7002 will be entered in RET\_VAL. On the other hand, if another job is involved, the CPU rejects it.

**Parameters**

The following table shows the parameters of the "DP\_TOPOL" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ=1: Trigger topology determination
R	Input	BOOL	I, Q, M, D, L or constant	R=1: Cancel topology determination
DP_ID	Input	HW_IOSYST EM	I, Q, M, D, L or constant	DP master system ID of those master systems for which the topology will be determined
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code.
BUSY	Output	BOOL	I, Q, M, D, L	BUSY=1: Topology determination is not yet complete.
DPR	Output	BYTE	I, Q, M, D, L	PROFIBUS address of the diagnostics repeater reporting the error.
DPRI	Output	BYTE	I, Q, M, D, L	Measuring segment diagnostics repeater reporting the error: <ul style="list-style-type: none"> <li>• Bit 0 = 1: Temporary faults on segment DP2</li> <li>• Bit 1 = 1: Permanent faults on segment DP2</li> <li>• Bit 4 = 1: Temporary faults on segment DP3</li> <li>• Bit 5 = 1: Permanent faults on segment DP3</li> </ul>

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter RET\_VAL

When looking at the "real" error information (error codes W#16#8xyz) in the following table, we distinguish between two cases:

- Temporary errors (error codes W#16#80A2 to 80A4, 80C3, 80C5):  
It is possible to eliminate this type of error without user action; in other words, it is advisable to call "DP\_TOPOL" again (multiple calls, if necessary).  
Example of a temporary error: Resources required are currently in use (W#16#80C3).
- Permanent errors (error codes W#16#8082, 80B0, 80B2):  
This type of error does not correct itself. A new call of "DP\_TOPOL" is only advisable after you have eliminated the error. Example of a permanent error: The DP master/CPU does not support this service. (W#16#80B0).

Error code* (W#16#...)	Explanation
0000	Job completed without error.
7000	First call with REQ=0. Topology determination is not triggered. BUSY has the value "0".
7001	First call with REQ=1. The request to execute topology determination was sent. BUSY has the value "1".
7002	Intermediate call (REQ irrelevant): Topology determination is not yet complete. BUSY has the value "1".
7010	You have attempted to cancel topology identification. But there is no running job with the specified DP_ID. BUSY has the value "0".
7011	First call with R=1. The cancellation of the topology determination was triggered. BUSY has the value "1".
7012	Intermediate call: The cancellation of the topology determination is not yet complete. BUSY has the value "1".
7013	Final call: The topology determination was cancelled. BUSY has the value "0".
8082	No DP master system is configured with the specified DP_ID.
80A2	Error during topology determination; for more detailed information, refer to output parameters DPR and DPRI.
80A3	Error during topology determination: Monitoring time has elapsed (timeout).
80A4	Communication on PBUS+ disrupted
80B0	The DP master/CPU does not support this service.
80B2	Error during topology determination: No diagnostics repeater was found at the selected DP master system.
80C3	Resources required are currently in use. Possible cause: You have initiated a second topology determination (only one topology determination is permitted at one time).
80C5	The DP master system is currently not available.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## ASi

### ASI\_CTRL: Controlling ASi master behavior

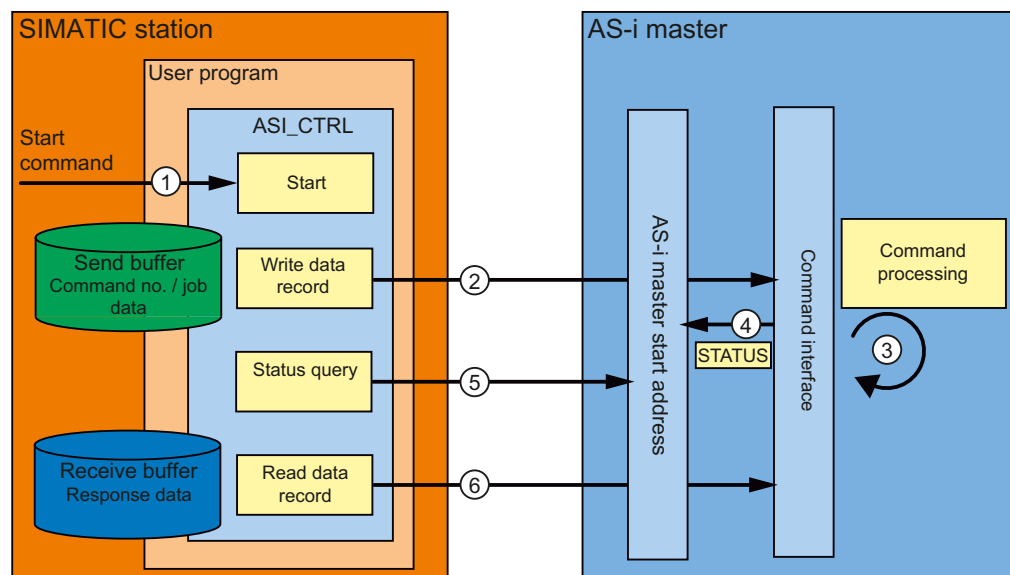

#### Description of ASI\_CTRL

#### Description

Using the instruction "ASI\_CTRL", you can control the behavior of the AS-i master from the user program of the PLC. The instruction processes the command protocol automatically. It also enables parameter assignment on SIMATIC AS-i masters and reading out information data. The functions and operation of the command interface are detailed in the manual for the AS-i master.

Both centrally inserted AS-i masters and distributed AS-i masters via PROFIBUS DP are supported. Combinations with PROFINET IO (e.g. IE/PB Link PN IO) are also possible.

The schematic diagram below shows the functions of the "ASI\_CTRL" instruction:

- ① Start of processing at the REQ parameter.
- ② The program sends the required command to the AS-i master via the instruction "RDREC".
- ③ The AS-i master processes the command.
- ④ The current status of the AS-i master is stored in the input area of the binary data (logical start address).
- ⑤ The instruction "ASI\_CTRL" cyclically queries and evaluates the 4 status bits.
- ⑥ Once command processing is complete, the command job is completed with "RDREC". Depending on the command, the data field of "RDREC" may contain the response data for the command or additional status information.

## Differences in the command call between IE/ AS-i Link and DP/AS-i Links

There are significant differences in how a controller exchanges commands with an AS-i master.

- **IE/AS-i Link** (PROFINET) used the data record interface. The different commands are called with either "Write data record" ("WRREC" instruction) or "Read data record" ("RDREC" instruction) by various data record numbers.
- **DP/AS-i Links** (PROFIBUS) use the command interface. All commands are called by data record number 2 with "Write data record" ("WRREC" instruction) plus "Read data record" ("RDREC" instruction). The type of command is defined by the data content in the write job.

## Changes compared to the instruction "ASi\_3422".

The instruction "ASI\_CTRL" is a revised version of the instruction "ASi\_3422" (S7-300/400) and provides improved functionality and compatibility. The specific changes are as follows:

- For writing and reading diagnostic data records, the instructions "WR\_REC (Page 2658)" and "RD\_REC (Page 2654)" have been replaced by the instructions "RDREC (Page 2616)" and "WRREC (Page 2618)". Their function is identical; however, they support data transfer via PROFINET IO.
- The block type of the instruction has been changed from a function (FC) to a function block (FB). "ASI\_CTRL" has an instance data block and is multi-instance-capable.
- The designation of the formal parameters of "ASI\_CTRL" complies with the SIMATIC system blocks. There is no STARTUP input parameter. The definition of the STATUS parameter is based on the instructions "RDREC (Page 2616)" and "WRREC (Page 2618)". The status identifiers for the parameter DONE and the new parameter BUSY have also been adjusted.

## Operation of the "ASI\_CTRL" instruction

The instruction "ASI\_CTRL" is an asynchronous function block; in other words, its processing extends over multiple calls.

- A job is started with REQ = TRUE.
- The job status is displayed via the BUSY output parameters and the two central bytes of the output parameter STATUS.
- The BUSY parameter is set during job processing. Upon the first call, STATUS is assigned the value 00700100<sub>H</sub>. Upon all subsequent calls for this job, it is assigned the value 00700200<sub>H</sub>. When the job is complete, the result is output at the parameters DONE or ERROR.
  - If no errors have occurred, DONE is set. For jobs with response data from the AS-i master, this data is provided in the specified receive buffer. In such cases, the STATUS parameter also displays the volume of data supplied in bytes. For jobs without response data, the value 00000000<sub>H</sub> is entered in STATUS.
  - If an error occurs during job processing, ERROR is set. The content of the receive buffer is invalid in such a case. An error code is entered in the STATUS parameter for a more detailed description of the error which has occurred.

**Number of command calls**

If you use the instruction "ASI\_CTRL" to send commands, you may not simultaneously send other commands to the same AS-i master with "RDREC (Page 2616)" or "WRREC (Page 2618)". This also applies to multiple calls of the instruction for the same AS-i master.

The instruction "ASI\_CTRL" cannot be run with interruptions. Calls therefore cannot be programmed in program priority classes which interrupt each other (for example with calls in OB 1 and in OB 35).

**Parameter**

The following table shows the parameters of the instruction "ASI\_CTRL":

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L, constant	REQ = TRUE starts a new job unless a job is already in progress. No edge evaluation takes place.
LADDR	Input	WORD	I, Q, M, D, L, constant	Start address of the AS-i master in the S7 address space (logical base address). The start address is defined in the hardware configuration when the master is configured.
SD	Input	VARIANT	I, Q, M, D, L	Send buffer The parameter refers to a memory area in which the command is to be specified (see "ASi commands (Page 2683)"). Example: P#DB101.DBX 0.0 BYTE 223
RD	Input	VARIANT	I, Q, M, D, L	Receive buffer This buffer is only relevant for commands which deliver answer data. The parameter refers to a memory area in which a command response is stored (see "ASi commands (Page 2683)"). Example: P#DB102.DBX 224.0 BYTE 221
DONE	Output	BOOL	Q, M, D, L	DONE = TRUE: Job completed without errors.
BUSY	Output	BOOL	Q, M, D, L	BUSY = TRUE: Job in progress.
ERROR	Output	BOOL	Q, M, D, L	ERROR = TRUE: Job aborted with error.
STATUS	Output	DWORD	M, D	Job status / error code See the "STATUS parameter" description.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**Note**

**Parameters LADDR, SD, and RD**

The parameters LADDR, SD, and RD must not be changed in any block cycle when a job is in progress: they must remain constant.

**STATUS parameter**

The following table shows the possible STATUS displays dependent upon DONE and ERROR.

DONE	ERROR	STATUS	Meaning
0	0	00700000 <sub>H</sub>	First call with REQ = FALSE; no active job.
0	0	00700100 <sub>H</sub>	First call with REQ = TRUE; job has started.
0	0	00700200 <sub>H</sub>	Subsequent call (REQ irrelevant); job is still in progress.
1	0	00000000 <sub>H</sub>	Job completed without errors. No response data.
1	0	0000xx00 <sub>H</sub>	Job completed without errors. Number of xx bytes of response data.
0	1	C0818400 <sub>H</sub>	Data type of formal operand RD invalid.
0	1	C0818500 <sub>H</sub>	Error in communication with AS-i master (incorrect address configured at the LADDR parameter).
0	1	C0838100 <sub>H</sub>	Incorrect AS-i slave address.
0	1	C0838200 <sub>H</sub>	AS-i slave is not enabled (not in LAS).
0	1	C0838300 <sub>H</sub>	Error at the AS interface (the SD parameter may have been set too small).
0	1	C0838400 <sub>H</sub>	The command is not valid with the current AS-i master status.
0	1	C0838500 <sub>H</sub>	There is no AS-i slave with the address "0".
0	1	C0838600 <sub>H</sub>	The AS-i slave has invalid configuration data (I/O or ID codes).
0	1	C083A100 <sub>H</sub>	The AS-i slave addressed has not been found at the AS interface.
0	1	C083A200 <sub>H</sub>	There is no AS-i slave with the address "0".
0	1	C083A300 <sub>H</sub>	There is already an AS-i slave with the new address at the AS interface.
0	1	C083A400 <sub>H</sub>	The AS-i slave address cannot be deleted.
0	1	C083A500 <sub>H</sub>	The AS-i slave address cannot be set.
0	1	C083A600 <sub>H</sub>	The AS-i slave address cannot be permanently saved.
0	1	C083A700 <sub>H</sub>	Error during reading of the extended ID1 code.
0	1	C083A800 <sub>H</sub>	The target address is not plausible (e.g. a B slave address has been used for a standard slave).
0	1	C083B100 <sub>H</sub>	A length error has occurred during string transfer.
0	1	C083B200 <sub>H</sub>	A protocol error has occurred during string transfer.
0	1	C083F800 <sub>H</sub>	Unknown job number or job parameter.
0	1	C083F900 <sub>H</sub>	The AS-i master has detected an EEPROM error.

**ASi commands****Description**

The command interface allows the controller and AS-i master to exchange parameter assignment and information data.

These commands

- provide the complete functionality of the M4 master profile of the AS-i master specifications.
- enable the AS-i master to be completely configured from the controller.

**Note**

**AS-i commands supported**

Please see the manual of the relevant AS-i master for the AS-i commands supported and a detailed description.

**General structure of the send buffer**

The general structure of the send buffer for commands and job data is set out in the table below. The area for the command number must always be filled. The number of bytes for the job data can be found in the description of the command (see AS-i master documentation). "q" is the start address of the send buffer.

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
	<b>Meaning</b>							
q + 0	Command number							
q + 1	Job data							
q + 2	Job data							
q + ...	Job data							

**General structure of the receive buffer**

The general structure of the receive buffer for the command response data is set out in the table below. The number of bytes for the response data depends on the command. Some commands do not return response data, and therefore only require the definition of a virtual receive buffer which is not filled with data. "n" is the start address of the receive buffer.

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
	<b>Meaning</b>							
n + 0	Command number (echo)							
n + 1	Response data							
n + 2	Response data							
n + ...	Response data							

**CAUTION****Memory areas can be overwritten**

If the receive buffer of the "ASI\_CTRL" instruction is too short, neighboring memory areas may be overwritten. The length specified in the ANY pointer of the RD parameter when the instruction "ASI\_CTRL" is called is irrelevant. The required length for the receive buffer can be found in the description of the command.

The following applies for command numbers 39<sub>H</sub>, 41<sub>H</sub>, 42<sub>H</sub>, 43<sub>H</sub> and 44<sub>H</sub>:

The receive buffer must be 221 bytes long (bytes 0 to 220), even if the command returns less data. Depending on the command, the highest bytes in the receive buffer may be overwritten with zero values by the AS-i master.

**AS-i commands**

A selection of possible AS-i commands is set out in the table below.

Name	Parameter	Return	Coding
Set_permanent_parameter (Set_Permanent_Parameter)	Slave address, parameter		00 <sub>H</sub>
Get_permanent_parameter (Get_Permanent_Parameter)	Slave address	Parameter	01 <sub>H</sub>
Write_parameter (Write_Parameter)	Slave address, parameter	Parameter echo	02 <sub>H</sub>
Read_parameter (Read_Parameter)	Slave address	Parameter value	03 <sub>H</sub>
Store_actual_parameters (Store_Actual_Parameters)			04 <sub>H</sub>
Set_configuration_data	Slave address, configuration		25 <sub>H</sub>
Get_configuration_data	Slave address	set configuration data	26 <sub>H</sub>
Store_actual_configuration (Store_Actual_Configuration)			07 <sub>H</sub>
Get_actual_configuration	Slave address	Actual configuration data	28 <sub>H</sub>
Configure_LPS	LPS		29 <sub>H</sub>
Set_offline_mode	Mode		0A <sub>H</sub>
Select_auto-program	Mode		0B <sub>H</sub>
Set_mode	Mode		0C <sub>H</sub>
Change_AS-iSlave_address (Change_AS-iSlave_Address)	Address1, Address2		0D <sub>H</sub>
Get_AS-iSlave_status	Slave address	Error record of the AS-i slave	0F <sub>H</sub>
Read_lists_and_flags		LDS, LAS, LPS, flags	30 <sub>H</sub>

Name	Parameter	Return	Coding
Get_overall_configuration		Actual configuration data, current parameters, LAS, flags	39 <sub>H</sub>
Set_overall_configuration	Overall configuration		3A <sub>H</sub>
Write_parameter_list	Parameter list		3C <sub>H</sub>
Read_parameter_echo_list		Parameter echo list	33 <sub>H</sub>
Write_CTT2_request	Slave address CTT2 string	CTT2 string	44 <sub>H</sub>
Read_version_identifier		Version string	14 <sub>H</sub>
Read_AS-i_slave	Slave address	ID code	17 <sub>H</sub>
Read_AS-i_slave_extended_ID1	Slave address	Extended ID1 code	37 <sub>H</sub>
Write_AS-iSlave_extended_ID1	Extended ID1 code		3F <sub>H</sub>
Read_AS-iSlave_extended_ID2	Slave address	Extended ID2 code	38 <sub>H</sub>
Read_AS-iSlave_IO	Slave address	I/O configuration	18 <sub>H</sub>
Read_I/O_error_list		LPF	3E <sub>H</sub>
Write_AS-i-slave_parameter_string	Slave address, parameter string		40 <sub>H</sub>
Read_AS-iSlave_parameter_string	Slave address	Parameter string	41 <sub>H</sub>
Read_AS-iSlave_ID_string	Slave address	ID string	42 <sub>H</sub>
Read_AS-iSlave_diagnostic_string	Slave address	Diagnostic string	43 <sub>H</sub>
Read_AS-i_line_error_counter			4A <sub>H</sub>
Read_and_clear_AS-i_line_error_counter			4B <sub>H</sub>
Read_AS-iSlave_error_counter	Slave address		4C <sub>H</sub>
Read_and_clear_AS-iSlave_error_counter	Slave address		4D <sub>H</sub>
Additional command for DP/ AS-i F-Link:			
AS-i_status/diag_of_F_slaves		Status/diagnostics of all AS-i safe slaves	51 <sub>H</sub>

**Note**

**Re-initializing the AS-i master command interface**

Another command which is not mentioned in the table is command 77<sub>H</sub>. This call re-initializes the command interface of the AS-i master. Any command which the AS-i master specified is currently processing will be terminated.

As of version V2.1.20 of DP/AS-i LINK Advanced, command 0E<sub>H</sub> is also available. This call enables you to release and block the ground fault monitoring function for a line.

### 9.7.3.5 PROFlenergy

#### Description of PROFlenergy

#### PROFlenergy

PROFlenergy is a manufacturer- and device-neutral profile for energy management with PROFINET. PROFlenergy enables central, coordinated device shutdown to reduce electricity consumption during breaks in production and unplanned interruptions.

The PROFINET devices/power modules are switched off via special commands in the user program of the PROFINET IO controller. No additional hardware is required. The PROFINET devices interpret the PROFlenergy commands directly.

#### PROFlenergy controller (PE controller)

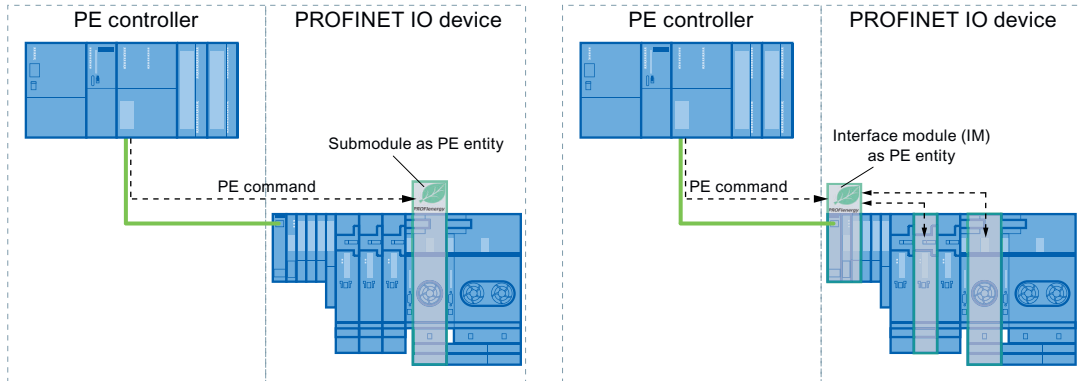

The PE controller is a PLC which enables/disables the idle state in lower-level devices. Individual production components and entire production lines are switched off and reactivated from the user program. Commands (e.g. "Start\_Pause" and "End\_Pause") are sent to the lower-level device using corresponding instructions (function blocks). The commands are sent via the PROFINET communication protocol.

#### PROFlenergy entity (PE entity)

The PE entity receives the PROFlenergy commands of the PE controller and executes these accordingly (for example, by returning a measured value or activating an energy saving mode). Implementation of the PE entity in a PROFlenergy-capable device is device- and manufacturer-specific.

The PE entity can, for example, be executed:

- Within the proxy of a submodule: The PE commands are valid for the addressed submodule and any existing lower-level submodules.
- Within the proxy of a module: The PE commands are valid for different submodules within the module.

- For networked submodules without a proxy function: The PE commands in this case are only valid for the respective submodule.

## PROFenergy instructions

- Instructions for IO controller
  - The "PE\_START\_END (Page 2689)" instruction represents the simplest way to activate or deactivate the idle state of the PROFINET devices (PROFenergy commands "Start\_Pause" and "End\_Pause"). This is done using a positive and negative signal edge in the instruction.
  - The "PE\_CMD (Page 2693)" instruction allows you to transmit all PROFenergy commands, including "Start\_Pause" and "End\_Pause". With other commands, you can query the current status of the PROFINET devices or the behavior during breaks, for example.
  - The instruction "PE\_DS3\_Write\_ET200S (Page 2699)" is used to define the switching characteristic of up to 8 slots of ET 200S. The instruction is not a PROFenergy instruction; however, it supplements the PROFenergy functions for an ET 200S.
- Instruction for iDevices
 

The "PE\_I\_DEV (Page 2723)" instruction allows you to implement PROFenergy on iDevices as well. The instruction receives PROFenergy commands on the iDevice and forwards these to the user program for processing. After processing the command, the user program calls the "PE\_I\_DEV (Page 2723)" instruction again in order to send the acknowledgement to the IO controller. For these replies, each command offers you a corresponding auxiliary block that supplies the response data to the instruction "PE\_I\_DEV (Page 2723)".

## PROFenergy commands (PE commands)

The PE controller transmits PE commands to the PE entity. The PE command can be either a control command to switch a PE entity to the energy-saving mode, or a command to read a status or measured value:

- PI commands for control  
PROFenergy supports two control commands that can be executed using either the "PE\_Start\_End (Page 2689)" instruction or the "PE\_CMD (Page 2693)" instruction:
  - Start\_Pause: Starting a suitable energy-saving mode (PE Energy-saving mode)
  - End\_Pause: Exiting the energy-saving mode (switch to PE\_ready\_to\_operate mode)
- PI commands for reading a status or measured value  
Certain condition information can be read by the control system using the following status commands with the instruction "PE\_CMD (Page 2693)":
  - PE\_Identify: Read out which PE commands are supported by the PE entity.
  - PEM\_Status: Read out the currently active mode of a PE entity (e. g. PE\_ready\_to\_operate).
  - Query\_Modes: Output an overview of all supported energy-saving modes, including the time and energy information
  - Query\_Measurement: Output the measured values of a PE entity

## Example applications

Examples for use of PROFenergy instructions can be found in the Industry Online Support in the entry "PROFenergy - Saving Energy with SIMATIC S7 (<http://support.automation.siemens.com/WW/view/en/41986454>)".

## IO controller

### PE\_START\_END: Start and exit energy-saving mode

#### Description

The instruction "PE\_START\_END" is used to start and exit the energy-saving mode of a specified PE entity (e.g. ET 200S).

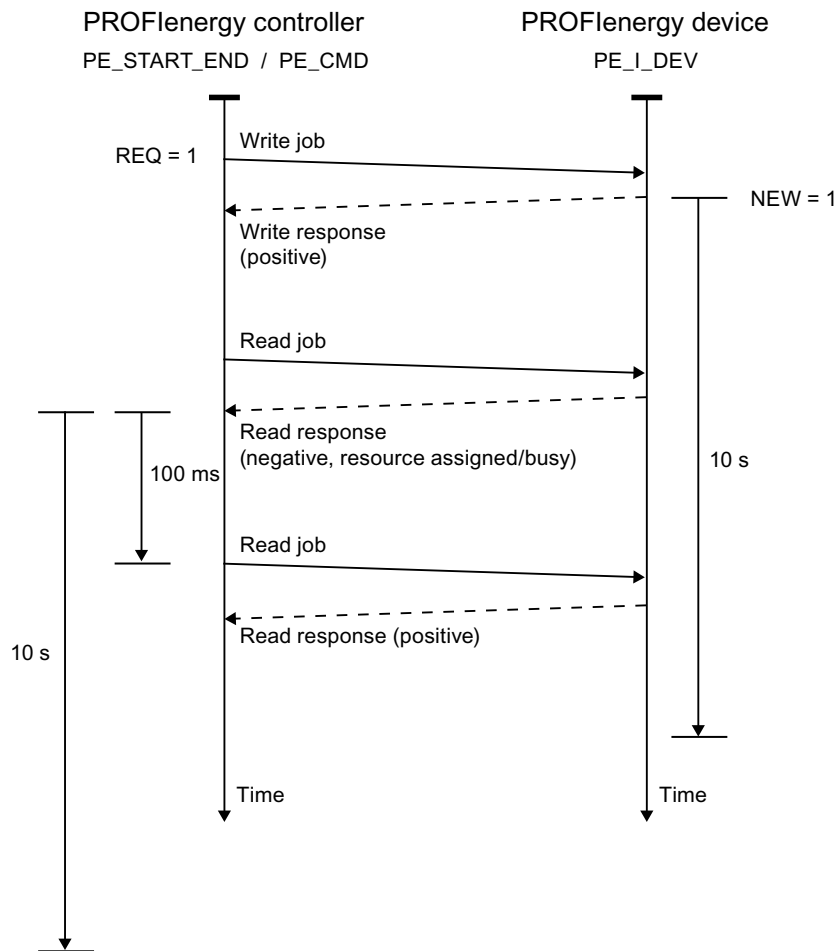

The instruction "PE\_START\_END" is used in the PE controller, preferably when only field devices from which energy data does not need to be read out are connected to the corresponding PE devices. Alternatively, the instruction "PE\_CMD (Page 2693)" can be used to read energy data.

The energy-saving modes are configured in the user program of the PE controller. On completion of the "PE\_START\_END" instruction, the PE entity reports its current energy-saving mode and outputs this data at parameter PE\_MODE\_ID.

**Write and read jobs of the "PE\_START\_END" instruction.**

The instruction "PE\_START\_END" sends a PROFlenergy command internally as a write job to the PE entity using "WRREC (Page 2618)". "PE\_START\_END" then waits for acknowledgment from the PE entity. The acknowledgment data record is read with the instruction "RDREC (Page 2616)" every 100 milliseconds. Until acknowledgment is received from the PE entity, the function repeats the read job for 10 seconds at intervals of 100 milliseconds. The response data of the PE entity is also read with the instruction "RDREC (Page 2616)".

Below is a flowchart of the write and read jobs:

## Parameter

The following table shows the parameters of the instruction "PE\_START\_END":

Parameter	Declaration	Data type	Memory area	Description
START	Input	BOOL	I, Q, M, D, L or constant	Transmitting the PE command "Start_Pause" to the PE entity with the address set at parameter ID.
END	Input	BOOL	I, Q, M, D, L or constant	Transmitting the PE command "End_Pause" to the PE entity with the address set at parameter ID.
ID	Input	HW_SUBMODULE	I, Q, M, D, L or constant	Address of the PE entity Use the hardware ID of the head module for a PROFINET IO device. Refer to the system constants of the assigned IO controller for the hardware ID. The name of the head module is composed of the name of the IO device and the suffix [Head] (example: "IO_Device_1[Head]").
PAUSE_TIME	Input	TIME	I, Q, M, D, L, P or constant	Planned pause duration. <ul style="list-style-type: none"> <li>• Range: T#1MS to T#24D20H31M23S647MS</li> <li>• Start value: T#0MS</li> </ul>
VALID	Output	BOOL	I, Q, M, D, L	PE command successfully sent.
BUSY	Output	BOOL	I, Q, M, D, L	PE command still being processed.
ERROR	Output	BOOL	I, Q, M, D, L	Error occurred during processing. The error message is output at the STATUS parameter.
STATUS	Output	DWORD	I, Q, M, D, L, P	Block status / error number (see "STATUS parameter")
PE_MODE_ID	Output	BYTE	I, Q, M, D, L, P	Identification number of energy-saving mode (energy-saving level for the duration of the pause).

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### PAUSE\_TIME parameter

The parameter PAUSE\_TIME is used to set the default duration of the energy-saving period at the PE entity. The PE entity checks whether the pause period is of sufficient length and whether it can be implemented. The minimum pause duration (Time\_min\_Pause) must be

greater than the sum of the times the device needs to switch to energy-saving mode (Time\_to\_Pause) and to switch back to operating mode (Time\_to\_Operate).

ET 200S checks whether the scheduled pause duration is greater than or equal to the minimum pause duration (PM-E\_Pause\_Min) saved on the ET 200S. This is fixed at 10 seconds. If a shorter pause is used, the power modules (PM-E) of the ET 200S will remain on.

The module does not switch back on automatically at the end of the pause; it remains in OFF mode until the "END" command is sent. This prevents uncoordinated switch-on, which can cause undesired peak loads.

### STATUS parameter

Error information is output at the STATUS output parameter. If it is interpreted as ARRAY[1...4] of BYTE, the error information has the following structure:

Field element	Name	Meaning
STATUS[1]	Function_Num	Cause of the error <ul style="list-style-type: none"> <li>• B#16#00: No error</li> <li>• B#16#DE: Error during reading of data record</li> <li>• B#16#DF: Error during writing of data record</li> <li>• B#16#C0: Error message from the instruction or from the communication instructions "RDREC (Page 2616)" and "WRREC (Page 2618)" used internally.</li> </ul>
STATUS[2]	Error Decode	Location of the error ID <ul style="list-style-type: none"> <li>• 80: DPV1 error as defined in IEC 61158-6 or application-specific</li> <li>• FE: DP/PNIO profiles - PROFIenergy-specific error</li> </ul>

Field element	Name	Meaning
STATUS[3]	Error_Code_1	Error ID <ul style="list-style-type: none"> <li>• When Error_Decode = <b>80</b>:               <ul style="list-style-type: none"> <li>– <b>80</b>: Simultaneous positive edge at the input parameters START and END.</li> <li>– <b>81</b>: Length conflict at the CMD_PARAM and CMD_PARAM_LEN parameters.</li> <li>– <b>82-8F</b>: Other error messages (reserved)</li> </ul> </li> <li>• When Error_Decode = <b>FE</b>:               <ul style="list-style-type: none"> <li>– <b>01</b>: "Service Request ID" invalid</li> <li>– <b>02</b>: Incorrect "Request_Reference"</li> <li>– <b>03</b>: "Modifier" invalid</li> <li>– <b>04</b>: "Data Structure Identifier RQ" invalid</li> <li>– <b>05</b>: "Data Structure Identifier RS" invalid</li> <li>– <b>06</b>: "PE energy-saving modes" are not supported</li> <li>– <b>07</b>: "Response" is too long (maximum transmissible length exceeded)</li> <li>– <b>08</b>: "Count" invalid</li> <li>– <b>50</b>: No suitable "energy mode" is available.</li> <li>– <b>51</b>: Time value specified is not supported.</li> <li>– <b>52</b>: "PE_Mode_ID" invalid</li> </ul> </li> </ul>
STATUS[4]	Error_Code_2	Manufacturer-specific error ID extension

**Note****Error messages of the instructions RDREC and WRREC**

The instruction "PE\_START\_END" uses the instructions "WRREC (Page 2618)" and "RDREC (Page 2616)" for communication. Error messages for these instructions are output in the field elements STATUS[1] to STATUS[4].

Please see the description of the corresponding STATUS (Page 2626) parameter for an explanation of the error codes of the "WRREC (Page 2618)" and "RDREC (Page 2616)" instructions.

**See also**

Description of PROFlenergy (Page 2687)

**PE\_CMD: Start and exit energy-saving mode / Read out status information****Description**

The instruction "PE\_CMD" is used in the PE controller to start or terminate a pause in the energy-saving mode in the PE entity. Additional information and energy measurements can also be read out from a PE entity using "PE\_CMD".

The instruction is best used with PE controllers to which assigned PE devices are connected from which energy measurements are to be read out. If this is not the case, the instruction "PE\_START\_END (Page 2689)" can also be used to start and end the pauses.

### Transfer of the PROFlenergy commands (PE commands)

The instruction "PE\_CMD" transfers a PROFlenergy command to a PE entity.

The instruction can also be used if additional commands are to be added to the PROFlenergy profile in future. The commands which can be used with the current PROFlenergy profile are listed in the description of the CMD and CMD\_MODIFIER parameters (see the "CMD and CMD\_MODIFIER parameters" table).

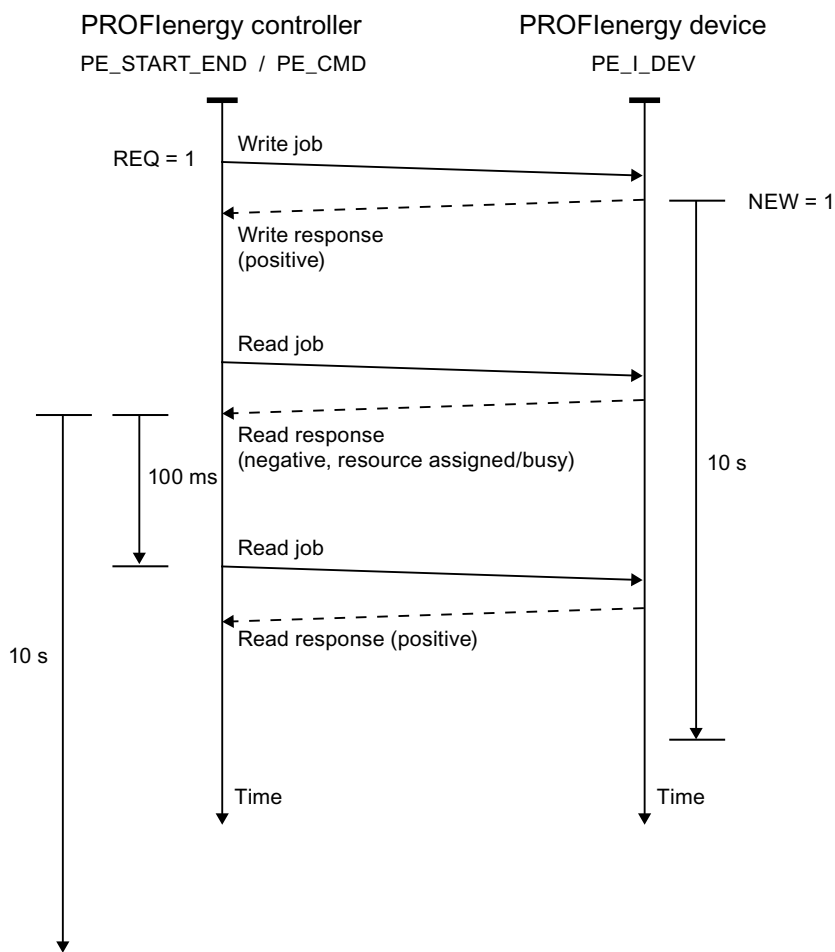

- The individual PE commands which are transferred to the PE entity using the instruction are assigned defined "Service\_Request\_IDs". The Service\_Request\_IDs 01 to 05 and 16 are assigned at the CMD parameter.
- The two PE commands 04 (Query\_Modes) and 16 (Query\_Measurement) are defined in more detail with the CMD\_MODIFIER parameter.
- Additional values are transferred at the CMD\_PARA parameter for individual PE commands (see the description of the individual PE commands). The parameter CMD\_PARA\_LEN defines the length of the data at the parameter CMD\_PARA.

The commands are transferred without plausibility test. The response data of the PE entity is saved to the RESPONSE\_DATA data area that is addressed by VARIANT pointer (for information about the response frame contents, refer to the description of the respective PE command).

### Write and read jobs of the "PE\_CMD" instruction.

The instruction "PE\_CMD" uses "WRREC (Page 2618)" internally to transmit a PROFlenergy command as a write job to the PE entity. "PE\_CMD" then waits for the acknowledgment from the PE entity. The acknowledgment data record is read with the instruction "RDREC (Page 2616)" every 100 milliseconds. Until acknowledgment is received from the PE entity, the function repeats the read job for 10 seconds at intervals of 100 milliseconds. The response data of the PE entity is also read with the instruction "RDREC (Page 2616)".

Below is a flowchart of the write and read jobs:

**Parameter**

The following table shows the parameters of the instruction "PE\_CMD":

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Starts transferring the PE command upon a positive edge.
ID	Input	HW_SUBMODULE	I, Q, M, D, L or constant	Address of the PE entity Use the hardware ID of the head module for a PROFINET IO device. Refer to the system constants of the assigned IO controller for the hardware ID. The name of the head module is composed of the name of the IO device and the suffix [Head] (example: "IO_Device_1[Head]").

Parameter	Declaration	Data type	Memory area	Description
CMD	Input	BYTE	I, Q, M, D, L, P or constant	Service-Request-ID of the PROFlenergy command in accordance with the PROFlenergy profile (see "CMD and CMD_MODIFIER parameters"). Further service request IDs are possible following extensions of the PROFlenergy profile.
CMD_MODIFIER	Input	BYTE	I, Q, M, D, L, P or constant	PROFlenergy sub-command (only when CMD=3 or CMD=16, see "CMD and CMD_MODIFIER parameters") Further sub-commands are possible following extensions of the PROFlenergy profile.
CMD_PARA	Input	VARIANT	I, Q, M, D, L	Parameters for the PE commands: <ul style="list-style-type: none"> <li>Get mode: PE_mode_ID</li> <li>Get measurement values: List of Measurement_Ids</li> </ul> The complete Service Data Request is entered.
CMD_PARA_LEN	Input	INT	I, Q, M, D, L, P or constant	The actual length of the command parameters (<= length defined in CMD_PARA; is verified by the instruction).
RESPONSE_DATA	InOut	VARIANT	I, Q, M, D, L	PROFlenergy information May be complete response frame including block header, depending on the command. Note: If the buffer is too small, only the number of bytes which is specified in the VARIANT pointer will be entered.
VALID	Output	BOOL	I, Q, M, D, L	Command successfully sent.
BUSY	Output	BOOL	I, Q, M, D, L	Command still being processed.
ERROR	Output	BOOL	I, Q, M, D, L	Error occurred during processing.
STATUS	Output	DWORD	I, Q, M, D, L	Block status / error number (see "STATUS parameter"):

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameters CMD and CMD\_MODIFIER

CMD	CMD_MODIFIER	PROFlenergy command	Description
01	0	Start_Pause (Page 2713)	Start energy-saving mode or switch to a different energy-saving mode.
02	0	End_Pause (Page 2713)	End energy-saving mode.
03	1	Query_Modes - List of energy-saving modes (Page 2714)	Output the energy-saving modes supported.

CMD	CMD_MODIFIER	PROFenergy command	Description
	2	Query_Modes - Get mode (Page 2715)	Output attributes of the energy-saving mode currently enabled.
04	0	PEM_Status (Page 2717)	Query status of energy-saving mode.
05	0	PE_Identify (Page 2718)	Read out the number and description of PE commands supported.
16	1	Query_Measurement - Get_Measurement_List (Page 2719)	List of measured values supported by the PE entity.
	2	Query_Measurement - Get_Measurement_Values (Page 2721)	Output the measured values of the PE entity.

### STATUS parameter

Error information is output at the STATUS output parameter. If it is interpreted as ARRAY[1...4] of BYTE, the error information has the following structure:

Field element	Name	Meaning
STATUS[1]	Function_Num	Cause of the error <ul style="list-style-type: none"> <li>• B#16#00: No error</li> <li>• B#16#DE: Error during reading of data record</li> <li>• B#16#DF: Error during writing of data record</li> <li>• B#16#C0: Error message from the internal communication instructions "RDREC (Page 2616)" and "WRREC (Page 2618)".</li> </ul>
STATUS[2]	Error Decode	Location of the error ID <ul style="list-style-type: none"> <li>• <b>80</b>: DPV1 error as defined in IEC 61158-6 or application-specific</li> <li>• <b>FE</b>: DP/PNIO profiles - PROFenergy-specific error</li> </ul>

Field element	Name	Meaning
STATUS[3]	Error_Code_1	<p>Error ID</p> <ul style="list-style-type: none"> <li>• When Error_Decode = <b>80</b>:                             <ul style="list-style-type: none"> <li>– <b>81</b>: Length conflict at the CMD_PARA and CMD_PARA_LEN parameters, or maximum data record length (4095 bytes) exceeded.</li> <li>– <b>82-8F</b>: Other error messages (reserved)</li> </ul> </li> <li>• When Error_Decode = <b>FE</b>:                             <ul style="list-style-type: none"> <li>– <b>01</b>: "Service Request ID" invalid</li> <li>– <b>02</b>: Incorrect "Request_Reference"</li> <li>– <b>03</b>: "Modifier" invalid</li> <li>– <b>04</b>: "Data Structure Identifier RQ" invalid</li> <li>– <b>05</b>: "Data Structure Identifier RS" invalid</li> <li>– <b>06</b>: "PE energy-saving modes" are not supported</li> <li>– <b>07</b>: "Response" is too long (maximum transmissible length exceeded)</li> <li>– <b>08</b>: "Count" invalid</li> <li>– <b>50</b>: No suitable energy-saving mode (energy mode) is available.</li> <li>– <b>51</b>: Time value specified is not supported.</li> <li>– <b>52</b>: "PE_Mode_ID" invalid</li> </ul> </li> </ul>
STATUS[4]	Error_Code_2	Manufacturer-specific error ID extension

**Note**

**Error messages of the instructions RDREC and WRREC**

The instruction "PE\_CMD" uses the instructions "WRREC (Page 2618)" and "RDREC (Page 2616)" for communication. Error messages for these instructions are output in the field elements STATUS[1] to STATUS[4].

Please see the description of the corresponding STATUS (Page 2626) parameter for an explanation of the error codes of the "WRREC (Page 2618)" and "RDREC (Page 2616)" instructions.

**See also**

Description of PROFlenergy (Page 2687)

**PE\_DS3\_Write\_ET200S: Set power module switching behavior****Description**

The instruction "PE\_DS3\_Write\_ET200S" sends basic settings for power module switching behavior to the ET 200S. The switching behavior of up to 8 slots in the ET 200S (e.g. for power modules) can be defined with the instruction "PE\_DS3\_Write\_ET200S".

**Note**

This instruction is not part of the PROEnergy profile but instead supplements SIMATIC-specific functions.

**Parameter**

The following table shows the parameters of the instruction "PE\_DS3\_Write\_ET200S":

Parameter	Declaration	Data type	Memory area	Description
ENABLE	Input	BOOL	I, Q, M, D, L or constant	A positive edge triggers the transfer of the data record. The data record must be transferred again after voltage OFF/ON.
ID	Input	HW_SUBMODULE	I, Q, M, D, L or constant	Address of the ET 200S The address may be taken from the hardware configuration.
SLOT_NO_X	Input	INT	I, Q, M, D, L, P or constant	Slot number of switchable power module X.
FUNC_X	Input	INT	I, Q, M, D, L, P or constant	Function of the module in this slot. Use the parameter FUNC_X to define the switching behavior of the PM-E (power module of the ET 200S): <ul style="list-style-type: none"> <li>• FALSE: <ul style="list-style-type: none"> <li>- With "PAUSE_START": <ul style="list-style-type: none"> <li>-No effect on PM-E</li> <li>-PM-E remains on</li> </ul> </li> <li>- With "PAUSE_STOP": <ul style="list-style-type: none"> <li>-Switches PM_E back on</li> </ul> </li> </ul> </li> <li>• TRUE: <ul style="list-style-type: none"> <li>- With "PAUSE_START": <ul style="list-style-type: none"> <li>-Switches PM_E off</li> </ul> </li> <li>- With "PAUSE_STOP": <ul style="list-style-type: none"> <li>-Switches PM-E back on</li> </ul> </li> </ul> </li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	Transfer not yet complete.
DONE	Output	BOOL	I, Q, M, D, L	Transfer completed without errors.
ERROR	Output	BOOL	I, Q, M, D, L	Transfer completed with error.
STATUS	Output	DWORD	I, Q, M, D, L, P	Error number (see STATUS parameter of the instruction "PE_Start_End (Page 2689)")

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

Description of PROFINergy (Page 2687)

## PE\_WOL: Starting and stopping energy-saving mode via WakeOnLan

### Description PE\_WOL

#### Description

The "PE\_WOL" instruction sends the PROFINergy commands "Start\_Pause" and "End\_Pause" to multiple PROFINergy-enabled devices in the PROFINET I/O systems.

Multiple PE devices can be coordinated via the instruction provided that the PE devices support the "Wake on LAN" function over a UDP connection.

The "PE\_WOL" instruction can only be executed on a CPU with an integrated Ethernet interface. This CPU should be able to load blocks with a size of about 400 KB. You cannot use the block with PROFINET I/O systems that are connected via an Ethernet CP.

The instruction "PE\_WOL" is executed asynchronously.

#### Definition: Wake on LAN

The Wake on LAN function allows data processing equipment to resume working from a state near total shutdown when a special Ethernet packet is received.

For this procedure to work, the data processing equipment must have a network controller that is capable of receiving such a packet.

This packet (Magic Packet™) has a special format. It contains the MAC address of the network adapter 15 times.

#### Selection of devices

The devices are selected using the user data block at the parameter PENERGY (Type: "PE\_PLUS"). The user DB represents the database for processing multiple devices.

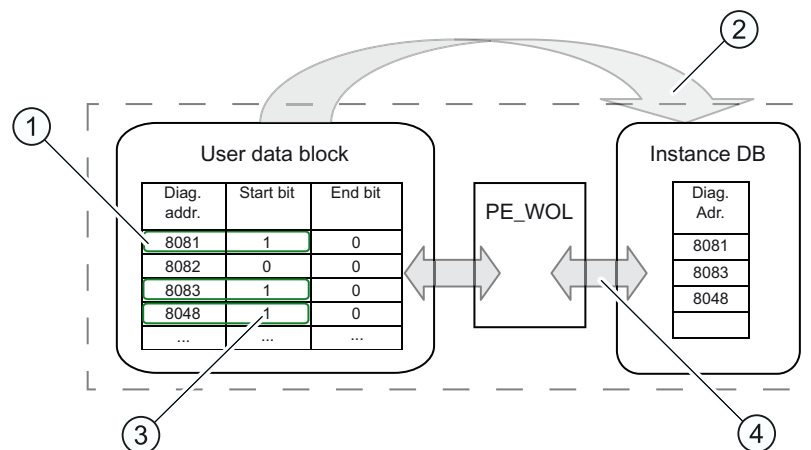

Prior to initialization of "PE\_WOL", you must store at least the following information in the user DB:

- ID of the PROFINET I/O system
- Data of the connection which is used for "Wake On LAN".

- Port number which is used for "Wake On LAN".
- For each device
  - Pause time (PauseTime)
  - Switching of the device to the PE\_SLEEP\_MODE (EnableSleep)

You initialize the "PE\_WOL" instruction with the COM\_RST parameter. The jobs stored in the user DB are processed one after the other after initialization.

The graphic below illustrates how the PE command "Start\_Pause" is transmitted to several devices:

- (1) Step 1: The bit "CmdStartPause" of the devices to be shut down is set to "1" by the user.
- (2) Step 2: The diagnostic addresses of the devices to be shut down (CmdStartPause = "1") are linked to the queue.
- (3) Step 3: The bit "CmdStartPause" is reset automatically once the jobs have been linked.
- (4) Step 4: The instruction "PE\_WOL" processes the jobs as soon as they are linked.

A PROFINET command "CmdStartPause" or "CmdEndPause" can be sent for all recognized devices in the PROFINET IO system via the START and END parameters.

The status of the job processing as well as possible errors during processing are output by the STATUS parameter.

### Operation of the instruction using the user DB

The operation of the instruction "PE\_WOL" can only take place via the user DB. A basic procedure applies in this case:

1. Selection of the command to be executed for a device:
  - START\_PAUSE ("CmdStartPause" in user DB)
  - ENDE\_PAUSE ("CmdEndPause" in user DB)
  - UPDATE\_STATUS ("CmdUpdateStatus" in user DB)
2. Setting the bit for updating ("Update" in the header of the user DB)  
At least one CPU cycle should pass with an "Update" = False between two updates; otherwise, edge detection cannot be guaranteed.

### Prioritizing the PE commands

The graphic below shows the chronological sequence of three possible commands.

These are processed one after the other, regardless of whether the previous command call was successful or completed with an error.

Only one command is executed if you set two commands, such as "CmdEndPause" and "CmdUpdateStatus" simultaneously. A prioritization is present within the block:

- The command "CmdStartPause" has the highest priority and is therefore always executed if selected.
- The command "CmdEndPause" has the second highest priority.
- The command "CmdUpdateStatus" has the lowest priority.

If all three commands are set at the same time, the commands that are not executed remain preselected. In this case, the next rising edge executes the next command.

### Parameters

The following table shows the parameters of the "PE\_WOL" instruction:

Parameter	Declaration	Data type	Memory area	Description
COM_RST (Page 2703)	Input	BOOL	I, Q, M, D, L	Resets the block and performs a re-initialization. As long as True is set here, the initialization is started but not yet fully completed. Only the falling edge continues the initialization and switches to the normal operating mode after initialization.
START (Page 2704)	Input	BOOL	I, Q, M, D, L	A rising edge performs a "CmdStartPause" PROFlenergy command for all detected devices that support this function.
END (Page 2705)	Input	BOOL	I, Q, M, D, L	A rising edge performs a "CmdEndPause" PROFlenergy command for all detected devices that support this function.

Parameter	Declaration	Data type	Memory area	Description
PENERGY (Page 2705)	InOut	PE_PLUS	D	Pointer to the user DB that contains the database for processing multiple devices.
STATUS (Page 2709)	Output	DWORD	I, Q, M, D, L	Status/error number for the current status of the instruction (see "STATUS parameter").

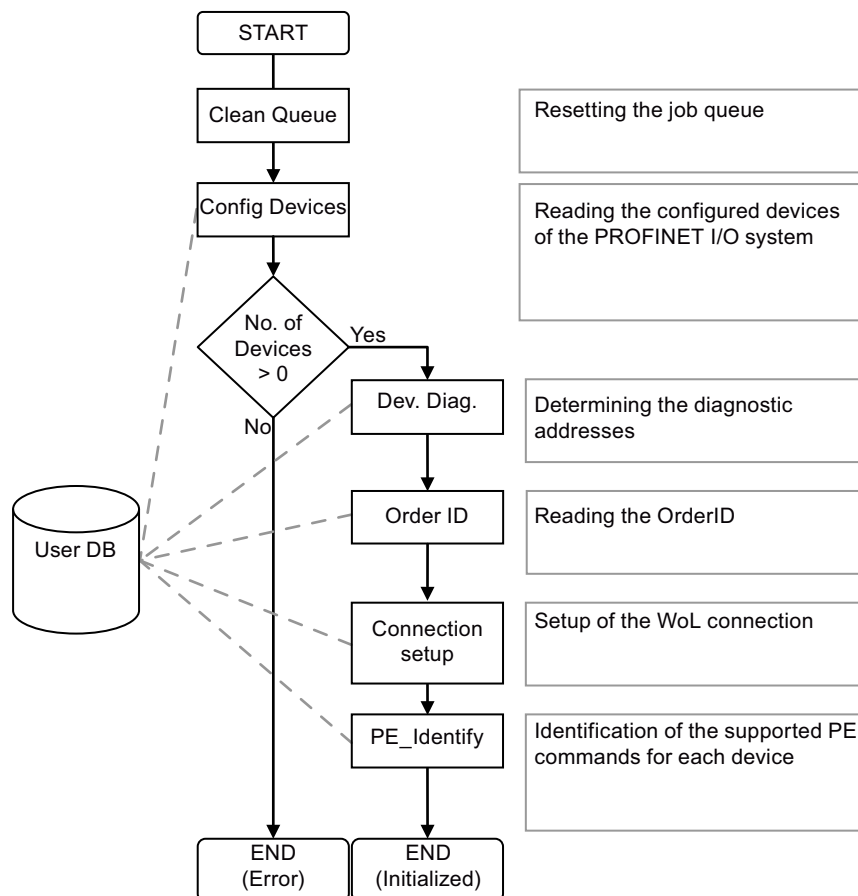

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameter COM\_RST

#### Sequence of the initialization routine

You start the initialization of the "PE\_WOL" instruction with the COM\_RST parameter.

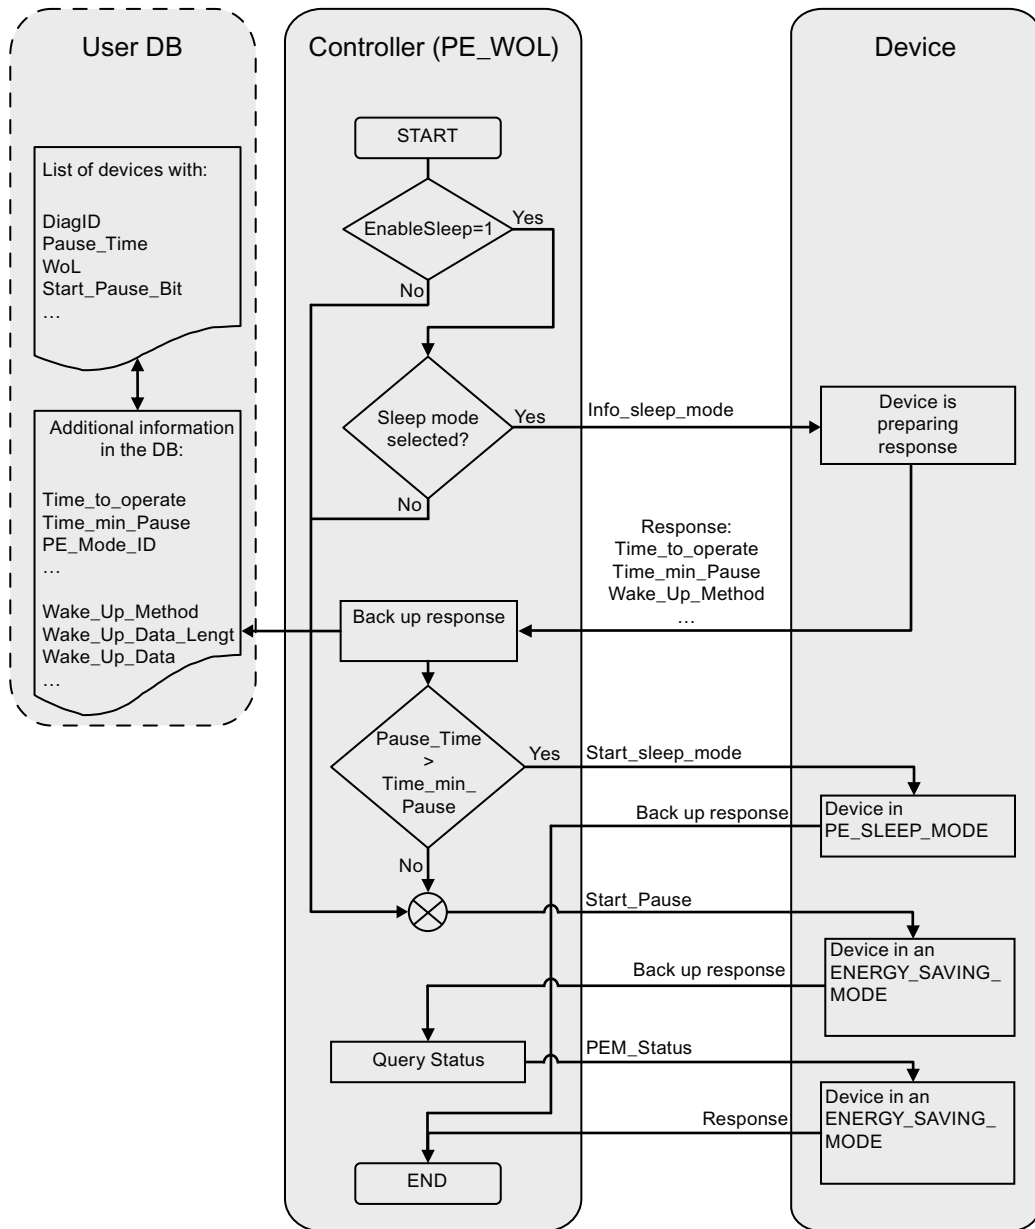

The following flow diagram shows the initialization routine.

Parameter START

Sequence of the CmdStartPause command

The flow diagram shows the internally used functions and interaction with a device when executing the CmdStartPause command.

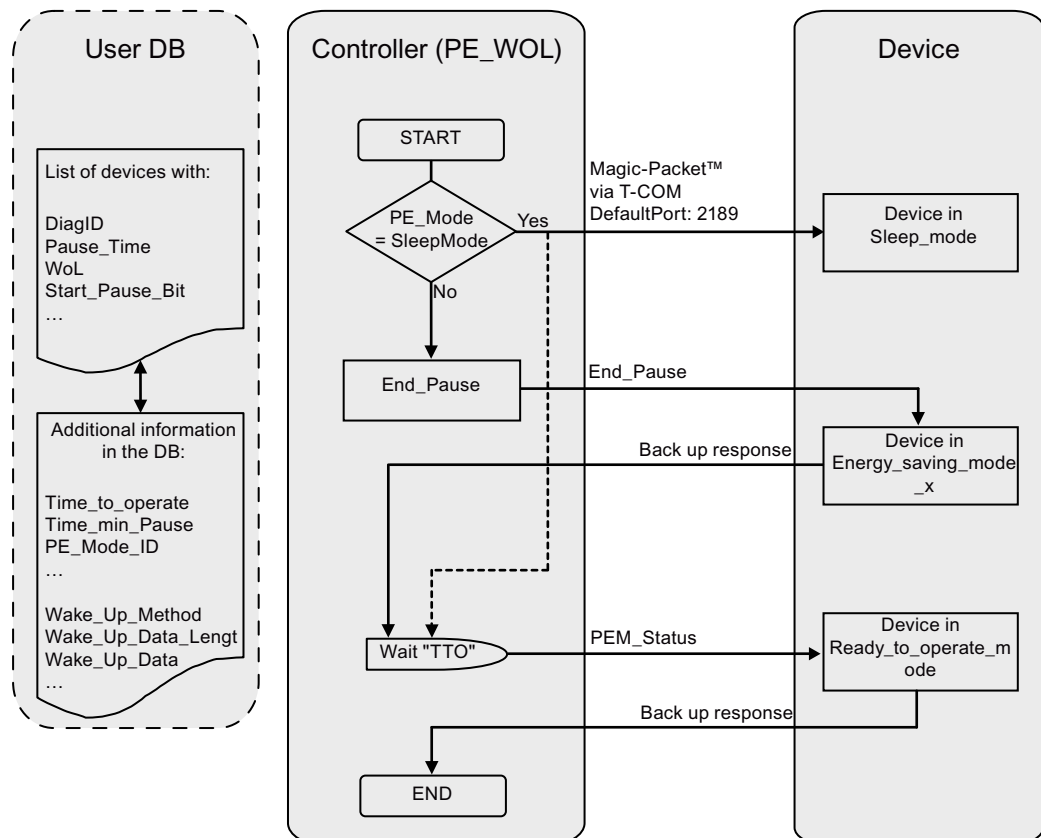

## Parameter END

### Sequence of the CmdEndPause command

The flow diagram shows the internally used functions and interaction with a device when executing the CmdEndPause command.

## PENERGY parameter

### Data block at the PENERGY parameter

The user DB for the "PE\_WOL" PROFenergy instruction represents a data base for processing multiple devices.

The data block is usually divided into two parts. These are:

- Header 110 bytes
- Device section for a maximum of 256 devices each with 100 bytes (Device). These include:
  - Device-specific data (Device)
  - PROFIenergy-specific data (PE)
  - Data for the job processing (Task)
  - User data (UserData)

The data block operates with optimized access.

### Connection parameter "Connection"

The "PE\_WOL" instruction reserves a connection resource in the area of "Open User Communication". This is used as a UDP connection. The following parameters must be defined in the data block for this:

- Connection ID ("Connection.id" parameter)  
The connection ID is an integer within the range of 1 to 32. The default setting is 31. It is used to identify the communication resources allocated by the firmware, for example the send and receive buffers.  
The connection ID must be unique throughout the CPU.
- Port number that is used for the "Wake on LAN" function ("Header.PortNo" parameter)  
Number of the UDP port via which a "Wake On LAN" packet is sent. These port numbers are part of the communication resources, which are identified and provided by the firmware through the connection ID. The default setting for port 2189 used here is currently not assigned by IANA. The port number is transferred to the connection configuration. This affects the "Connection.local\_tsap\_id[1]" and "Connection.rem\_tsap\_id[1]" parameters.
- Interface ID ("Connection.local\_device\_id" parameter)  
The interface ID is also part of the connection description. This ID identifies the CPU interface to use for this connection. There are several possible valid values.  
However, these need to be adapted to the employed CPU and interface:
  - B#16#01 for ET200S CPU or WinAC RTX with Ethernet interface in subslot IF1
  - B#16#02 for CPU 315(F)-2PN/DP or CPU 317(F)-2PN/DP
  - B#16#03 for CPU 319(F)-2PN/DP
  - B#16#05 for CPU 41x(F)-3PN/DP
  - B#16#06 for WinAC RTX with Ethernet interface in subslot IF2
  - B#16#0B for WinAC RTX with Ethernet interface in subslot IF3
  - B#16#0F for WinAC RTX with Ethernet interface in subslot IF4

## Structure of the data block

The data block has the following structure:

Name	Data type	Offset	Comment
Header	PE_HEADER	-	Header information
Update <sup>(1)</sup>	BOOL	-	Signal for indicating a change in the data area. <ul style="list-style-type: none"> <li>• True= indicates a change by the user.</li> <li>• False = indicates the application of changes.</li> </ul>
Initialized	BOOL	-	Signal indicating the completed initialization. <ul style="list-style-type: none"> <li>• True=Initialization finished.</li> <li>• False= indicates that the block is not initialized.</li> </ul>
LinkUp	BOOL	-	Indicates successful configuration of the Ethernet interface. <ul style="list-style-type: none"> <li>• True=interface ready for use.</li> <li>• False=interface not yet configured.</li> </ul>
LinkDown	BOOL	-	Indicates an unconfigured interface. <ul style="list-style-type: none"> <li>• True=interface is not yet configured.</li> <li>• False=interface is currently being configured or is now configured.</li> </ul>
PROFINET_ID <sup>(1)</sup>	INT	-	ID of the PROFINET I/O system
Reserved	ARRAY [1..37] OF BYTE	-	Reserved
LastDeviceID	INT	-	Contains the highest Device-ID in this PROFINET I/O system.
PortNo <sup>(1)</sup>	WORD	-	Port number that is used for the "Wake on LAN" function (default= 2189).
Connection	TCON_Param	-	Contains the connection configuration of the "Wake on LAN" connection.
BLOCK_LENGTH	UInt	-	Length of the structure (always B#16#40).
ID <sup>(1)</sup>	CONN_OUC	-	Connection ID
CONNECTION_TYPE <sup>(1)</sup>	USINT	-	Connection type (UDP = B#16#13)
ACTIVE_EST <sup>(1)</sup>	BOOL	-	Active connection establishment (always passive for UDP)
LOCAL_DEVICE_ID <sup>(1)</sup>	USINT	-	Contains the interface ID (CPU dependent)
LOCAL_TSAP_ID_LEN <sup>(1)</sup>	USINT	-	Contains the length in bytes of the own/local UDP port
REM_SUBNET_ID_LEN <sup>(1)</sup>	USINT	-	Unused (always B#16#00)
REM_STADDR_LEN <sup>(1)</sup>	USINT	-	Contains the length of the remote IP address or B#16#00.
REM_TSAP_ID_LEN <sup>(1)</sup>	USINT	-	Contains the length in bytes of the remote UDP port.
NEXT_STADDR_LEN <sup>(1)</sup>	USINT	-	Contains the length of the default router address (not relevant).
LOCAL_TSAP_ID <sup>(1)</sup>	ARRAY[1..16] OF BYTE	-	Contains the own/local port number.
REM_SUBNET_ID <sup>(1)</sup>	ARRAY[1..6] OF USINT	-	Unused (always B#16#00)
REM_STADDR <sup>(1)</sup>	ARRAY[1..6] OF USINT	-	Contains the remote IP address.

9.7 References

Name	Data type	Offset	Comment
REM_TSAP_ID <sup>(1)</sup>	ARRAY[1..16] OF BYTE	-	Contains the remote UDP port number.
NEXT_STADDR <sup>(1)</sup>	ARRAY[1..6] OF BYTE	-	irrelevant
SPARE <sup>(1)</sup>	WORD	-	
Device	ARRAY[1..256] OF PE_DEVICE	-	Array of devices
Device	PE_DEV	-	Contains data for each device
DiagID	HW_IO	-	Diagnostic address of the device. Assigned by the hardware configuration.
InterfacelD	WORD	-	Diagnostic address of the device interface. Assigned by the hardware configuration.
MACAdr	ARRAY[1..6] OF BYTE	-	Contains the MAC address of the device.
IPAdr	ARRAY[1..4] OF BYTE	-	Contains the IP address of the device.
OrderID_MxLen	Byte	-	Contains the maximum length of the OrderID.
OrderId_ActLen	Byte	-	Contains the actual length of the OrderID.
OrderID_Data	ARRAY[1..20] OF CHAR	-	Contains the OrderID of the device.
PE	PE_PE	-	PROFInergy-specific data.
ModelID	BYTE	-	PE_MODE_ID according to Profienergy specification.
Result	BYTE	-	PE ErrorCode according to Profienergy specification.
PauseTime <sup>(1)</sup>	TIME	-	Contains the idle time in ms.
TimeToPause	TIME	-	Contains the time it takes for the device to go into Pause mode.
TimeToOperate	TIME	-	Contains the time it takes for the device to go into operating mode.
MinSleepTime	TIME	-	Contains the minimum time of the device in PE_SLEEP_MODE.
SleepToOperate	TIME	-	Contains the time it takes for the device to go from PE_SLEEP_MODE into operating mode.
StatusOperate	BOOL	-	Indicates the operating mode of the device.
StatusPause	BOOL	-	Indicates the device is in Pause mode.
StatusSleep	BOOL	-	Indicates the PE_SLEEP_MODE of the device.
StatusTransitOK	BOOL	-	Indicates the transition from one energy state to another.
StatusInTransit	BOOL	-	Indicates a current state transition.
StatusTransitNOK	BOOL	-	Indicates that the state change was not successful.
StatusError	BOOL	-	Indicates an error with the device.
StatusRetryEx	BOOL	-	Indicates an unsuccessful execution of a command. No more attempts will be made to execute this command.
CmdStartPause <sup>(1)</sup>	BOOL	-	Places a START_PAUSE command for this device in the queue.
CmdEndPause <sup>(1)</sup>	BOOL	-	Places a END_PAUSE command for this device in the queue.

Name	Data type	Offset	Comment
CmdUpdateStatus <sup>(1)</sup>	BOOL	-	Places a PEM_STATUS command for this device in the queue.
EnableSleep <sup>(1)</sup>	BOOL	-	Allows PE_SLEEP_MODE for this device. <ul style="list-style-type: none"> <li>• True= device should go to PE_SLEEP_MODE if idle time is sufficient</li> <li>• False=device may not go into PE_SLEEP_MODE.</li> </ul>
Services	WORD	-	Shows all supported PROFINergy services.
UserData <sup>(2)</sup>	ARRAY[1..24] OF BYTE	-	User-defined data
Task	PE_TASK	-	Job processing
Cmd	BYTE	-	Internal bits for job processing
CmdJ	BYTE	-	Internal bits for job processing
TimeStart	BOOL	-	Starts a delay time.
TimeStarted	BOOL	-	The delay time has just started.
TimeDone	BOOL	-	Shows the expiration of the delay time.
Done	BOOL	-	Indicates that this job has been completed.
DelayedCmd	BOOL	-	Indicates that a delayed command is still pending.
IsV1_0	BOOL	-	Indicates that this device is a Spec. V1.0 device.
IsWakeOnLAN	BOOL	-	Indicates that this device is woken up by "Wake On LAN".
RetryCount	BYTE	-	Repetition counter for PE_COMMANDS
Duration	TIME	-	Contains the value for the delay in ms.
StartTime	TIME	-	Contains the start time for the delay time.
MachineState	INT	-	Contains the internal status of the job.
<sup>(1)</sup> To be filled in by the user.			
<sup>(2)</sup> Available for use by the user.			

## Parameter STATUS

### Parameter STATUS

The output value at the STATUS parameter is divided into three areas:

- Bits 31 to 24: MESSAGE
- Bit 23 to 16: LOCATION
- Bit 15 to 0: INFORMATION

You can learn the meaning of each error code for the three areas in the following tables:

Table 9-53 Possible values for MESSAGE

Error code (W#16#...)	Description
00	No error.
50	Instruction initialized.

9.7 References

Error code (W#16#...)	Description
51	Determining configuration of the PROFINET I/O system.
52	The instruction could not determine any configured devices in the PROFINET I/O system.
53	Determining the logical addresses of configured devices.
54	Reading interface information out of the devices.
55	Determining I&M data (data record 0 only) of the configured devices.
56	Configuring PROFINET interface for sending the "Wake on LAN" MagicPaket™ via UDP.
57	Determining PROFINET capabilities of the connected devices.
62	Invalid PROFINET I/O system ID detected. The causative number is displayed in the INFORMATION field.
70	The instruction is initiated and processing jobs. The value in the INFORMATION field contains the number of currently active jobs.
80	The instruction has lost the initialization during processing of jobs. This generally occurs when either the instance DB or the user DB has been reloaded.
FF	Unknown error has occurred.

Table 9-54 Possible values for LOCATION

Error code (W#16#...)	Description
00	The instruction is either not initialized or it is idle.
70	The instruction is waiting for jobs.
71	The instruction has appended a job to the job list.
72	The instruction is preparing to send a job.
73	The instruction is sending a job to a device.
74	The instruction is waiting for a response from the device.
75	The instruction is evaluating the response of the device.
76	The instruction is removing the job from the job list.
FF	Unknown error has occurred.

Table 9-55 Possible values for INFORMATION

Error code (W#16#...)	Description
0000	No additional information available and no jobs active.
0001 -00FF	1 – 255 jobs are currently being processed.
8001	Error at parameter 1
8002	Error at parameter 2
8003	Error at parameter 3
8004	Error at parameter 4

Error code (W#16#...)	Description
8005	<p>Error at parameter 5. This error is reported if there is no interconnection or an invalid interconnection to the user DB.</p> <p>Possible causes:</p> <ul style="list-style-type: none"> <li>• The user DB is too small.</li> <li>• The user DB is write-protected.</li> <li>• There is no user DB in the RAM.</li> <li>• The user DB is invalid for the employed CPU.</li> </ul>
8100	An attempt has been made to place more than the maximum of 256 possible jobs. This is a temporary error, which is resolved by completing a few jobs. The placed jobs are not accepted and must be placed again.
8200	An attempt has been made to send an invalid or an unsupported PROFIenergy command (PE_COMMAND).
84xx	A communication error has occurred. The number of the device that generated the error is output to "xx".
85xx	An error has been returned from device xx. The number of the device that generated the error is output to "xx".
8600	The requested wake-up method is currently not supported.
FFFF	Unknown error has occurred.

## PROFIenergy commands

### Structure of the message frames

#### Structure of the response frame in accordance with the PROFIenergy profile

The table below shows the basic structure of the response frame in accordance with the PROFIenergy profile. The response frame consists of a general section (Header) and a specific section (Service Data Response). The contents of the specific section of the response frame can be found in the description of the relevant PROFIenergy command.

Block definition	Attributes	Value	Data type	Description
BlockHeader	BlockType	801 <sub>hex</sub>	WORD	
	BlockLength		WORD	Number of bytes without consideration of the fields BlockType and BlockLength.
	BlockVersionHigh	1 <sub>hex</sub>	BYTE	
	BlockVersionLow	0 <sub>hex</sub>	BYTE	

9.7 References

Block definition	Attributes	Value	Data type	Description
Response Header	Service_Request_ID	1 <sub>hex</sub> to FF <sub>hex</sub>	BYTE	ID of the PI command executed. The ID of the PE command processed by the PE entity is returned in the response frame: <ul style="list-style-type: none"> <li>• 01: Start_Pause</li> <li>• 02: End_Pause</li> <li>• 03: Query_Modes</li> <li>• 04: PEM_Status</li> <li>• 05: PE_Identify</li> <li>• 06 to 09: Reserved</li> <li>• 16: Query_Measurement</li> <li>• 11 to CF: Reserved</li> <li>• D0 to FF: Manufacturer-specific</li> </ul>
	Request_Reference	1 <sub>hex</sub> to FF <sub>hex</sub>	BYTE	Unique number to identify the query/response pair (returned by the server in the response).
Service Header Response	Status	1 <sub>hex</sub> to FF <sub>hex</sub>	BYTE	Information whether or not the PI command was executed: <ul style="list-style-type: none"> <li>• 00: Reserved</li> <li>• 01: Completed</li> <li>• 02: Completed with error</li> <li>• 03: Data incomplete</li> <li>• 04 to CF: Reserved</li> <li>• D0 to FF: Depends on the Service_Request_ID</li> </ul>
	Data_Structure_Identifier_RS	1 <sub>hex</sub> to FF <sub>hex</sub>	BYTE	<ul style="list-style-type: none"> <li>• 00: Reserved</li> <li>• 01 to FF: Data structure depends on the Service_Request_ID</li> <li>• 0xFF - Error</li> </ul>
Service Data Response				Depends on the Service-Request-ID: <ul style="list-style-type: none"> <li>• For the service request IDs, see the CMD and CMD_MODIFIER parameters of the instruction "PE_CMD (Page 2693)".</li> <li>• The specific contents of the response frame can be found in the description of the PE command (see for example the "Start_Pause (Page 2713)" command).</li> </ul>

## PI Command "Start\_Pause"

### Description

Use the PE command "Start\_Pause" to start the energy-saving mode. The command Start\_Pause can be used to:

- Switch the PE from "ready" state (PE\_ready\_to\_operate) to an energy-saving mode (PE\_energy\_saving\_mode).
- The PE entity can automatically switch between the energy-saving modes. Energy consumption can increase or decrease when you switch energy-saving mode.

### Calling the PI command "Start\_Pause"

The command "Start\_Pause" is called with the instruction "PE\_CMD (Page 2693)" with the following parameters:

Parameter	Value	Description
CMD	1	Call of PE command "Start_Pause".
CMD_MODIFIER	0	There are no additional specifications of the command call for command "Start_Pause".
CMD_PARA_LEN	4	Length of the CMD_PARA parameter of 4 bytes.
CMD_PARA	VARIANT	VARIANT pointer to the value for "Pause_Time" (TIME).

### Response frame (Service Data Response)

The following response frame data of the PE entity is written to the data block that is referenced at parameter RESPONSE\_DATA (see instruction "PE\_CMD (Page 2693)"):

Attribute	Value	Data type	Description
PE_Mode_ID	1 to 255	BYTE	Identification number of the energy-saving mode
Reserved	0	BYTE	-

## PI Command "End\_Pause"

### Description

The PE command "End\_Pause" is used to end the energy-saving mode of the PE entity.

### Calling the PE command "End\_Pause"

The command "End\_Pause" is called with the instruction "PE\_CMD (Page 2693)" with the following parameters:

Parameter	Value	Description
CMD	2	Call of PE command "End_Pause".
CMD_MODIFIER	0	There are no additional specifications of the command call for command "End_Pause".
CMD_PARA_LEN	0	Length of the CMD_PARA parameter of 0 bytes.
CMD_PARA	irrelevant	-

### Response frame (Service Data Response)

The following data of the PE entity response frame is written to the data block referenced at the RESPONSE\_DATA parameter (see "PE\_CMD (Page 2693)"):

Attribute	Value	Data type	Description
Time_to_operate	-	DWORD	Expected time it takes to switch to the "PE_ready_to_operate" mode.

### PI command "Query\_modes" - "List\_Energy\_Saving\_Modes"

#### Description

Use PE command "Query\_modes" and sub-command (modifier) "List\_Energy\_Saving\_Modes" to output all energy-saving modes (PE\_Mode\_ID) supported by the PE entity.

The query result is written in the form of a response frame to the data block referenced by the RESPONSE\_DATA parameter.

### Calling the PE command "Query\_modes" - "List\_Energy\_Saving\_Modes"

The command "List\_Energy\_Saving\_Modes" is called with the instruction "PE\_CMD (Page 2693)" with the following parameters:

Parameter	Value	Description
CMD	3	Call of PE command "Query_modes".
CMD_MODIFIER	1	Specification of the command call: Select the sub-command "List_Energy_Saving_Modes" to output the number and types of energy-saving modes supported.
CMD_PARA_LEN	0	Length of the CMD_PARA parameter of 0 bytes.
CMD_PARA	irrelevant	-

### Response frame (Service Data Response)

The following data of the PE entity response frame is written to the data block referenced at the RESPONSE\_DATA parameter (see "PE\_CMD (Page 2693)"):

Attribute	Value	Data type	Description
Number_of_PE_Mode_IDs	1	BYTE	The number of energy-saving modes.
PE_Mode_IDs	-	Array [...] of BYTE	Array with the IDs of the supported energy-saving modes. The meaning of the individual IDs depends on the PE entity.

### PI command "Query\_modes" - "Get\_Mode"

#### Description

You use the PE command "Query\_modes" and the sub-command (modifier) "Get\_Mode" to output the attributes of the energy-saving mode which is currently enabled.

### Calling the PE command "Query\_modes" - "Get\_Mode"

The call of the command with the instruction "PE\_CMD" occurs with the following parameters:

Parameter	Value	Description
CMD	3	Call of the PE command "Query_modes"
CMD_MODIFIER	2	Specification of the command call: Select the sub-command "Get_Mode" to output the status of the mode which is currently enabled.
CMD_PARA_LEN	1	Length of the CMD_PARA parameter of 1 byte.
CMD_PARA	VARIANT	VARIANT pointer to the value for PE_MODE_ID.

**Response frame (Service Data Response)**

The following data of the PE entity response frame is written to the data block referenced at the RESPONSE\_DATA parameter (see "PE\_CMD (Page 2693)"):

Attribute	Value	Data type	Description
PE_Mode_ID	<ul style="list-style-type: none"> <li>• 0 "PE_power_off" mode</li> <li>• 1...254 Energy-saving mode of the PE entity (manufacturer-specific)</li> <li>• 255 "PE_ready_to_operate" mode</li> </ul>	BYTE	ID of the energy-saving mode currently enabled.
PE_Mode_Attributes	Bit 0: <ul style="list-style-type: none"> <li>• = 0: Only static energy consumer and time values are available.</li> <li>• = 1: Dynamic energy consumer and time values are available.</li> </ul> Bit 1 to 7: <ul style="list-style-type: none"> <li>• Reserved</li> </ul>	BYTE	
Time_min_Pause <sup>1</sup>	Time difference without date	DWORD	Minimum pause time for the PI mode. The minimum pause time is the sum of the values of the following attributes: <ul style="list-style-type: none"> <li>• Time_to_Pause</li> <li>• Time_to_operate</li> <li>• Time_min_length_of_stay</li> </ul> See the description "PAUSE_TIME parameter" of the instruction "PE_START_END: Start and exit energy-saving mode (Page 2689)".
Time_to_Pause <sup>1</sup>	Time difference without date	DWORD	Switch off time: Duration from call of energy-saving mode to start of energy-saving mode (transition duration of PE_ready_to_operate to PE_energy_saving_mode). The switch-off time depends on the PE entity.
Time_to_operate <sup>1</sup>	Time difference without date	DWORD	Switch-on time: Duration of the transition from energy-saving mode (PE_energy_saving_mode) to ready to operate mode (PE_ready_to_operate). The PE entity calculates the duration dynamically in the output operation.
Time_min_length_of_stay <sup>1</sup>		DWORD	Minimum active period of the energy-saving mode on the PE entity.
Time_max_length_of_stay <sup>1</sup>		DWORD	Maximum active period of the energy-saving mode on the PE entity.
Mode_Power_Consumption <sup>2</sup>		REAL	Power consumption of the PE entity in active energy-saving mode. Unit: kW

Attribute	Value	Data type	Description
Energy_Consumption_to_pause <sup>2</sup>		REAL	Energy consumption of the PE entity during transition from ready-to-operate mode (PE_ready_to_operate) to energy-saving mode (PE_energy_saving_mode) Unit: kWh
Energy_Consumption_to_operate <sup>2</sup>		REAL	Energy consumption of the PE entity during transition from energy-saving mode (PE_energy_saving_mode) to ready-to-operate mode (PE_ready_to_operate) Unit: kWh

<sup>1</sup> If the duration is infinite, 0xFFFFFFFF will be output. If the duration is zero, "0" will be output.

<sup>2</sup> If the data for energy and power consumption is not defined by the PE entity, "0.0" will be output as the value.

## PI command "PEM\_Status"

### Description

The PE command "PEM\_Status" is used to query the status of a PE entity energy-saving mode that is currently enabled.

### Calling the PE command "PEM\_Status"

The command "PEM\_Status" is called with the instruction "PE\_CMD" with the following parameters:

Parameter	Value	Description
CMD	4	Call of PE command "PEM_Status".
CMD_MODIFIER	0	There are no other specifications of the command call for command "PEM_Status".
CMD_PARA_LEN	0	Length of the CMD_PARA parameter of 0 bytes.
CMD_PARA	irrelevant	-

**Response frame (Service Data Response)**

The following data of the PE entity response frame is written to the data block referenced at the RESPONSE\_DATA parameter (see "PE\_CMD (Page 2693)"):

Attribute	Value	Data type	Description
PE_Mode_ID_Source	<ul style="list-style-type: none"> <li>• 0 "PE_power_off" mode</li> <li>• 1 to 254 Energy-saving mode of the PE entity (manufacturer-specific)</li> <li>• 255 "PE_ready_to_operate" mode</li> </ul>	BYTE	Mode of the PE entity before a PE command is sent.
PE_Mode_ID_Destination	<ul style="list-style-type: none"> <li>• 0 "PE_power_off" mode</li> <li>• 1 to 254 Energy-saving mode of the PE entity (manufacturer-specific)</li> <li>• 255 "PE_ready_to_operate" mode</li> </ul>	BYTE	Mode of the PE entity after a PE command is executed.
Time_to_operate	Time difference without date	DWORD	Switch-on time: Duration of the transition from energy-saving mode (PE_energy_saving_mode) to ready to operate mode (PE_ready_to_operate). The PE entity calculates the duration dynamically during output.
Remaining_time_to_destination	Time difference without date	DWORD	Remaining time to switch to another mode.
Mode_Power_Consumption		REAL	Power consumption of the PE entity in active energy-saving mode. Unit: kW
Energy_Consumption_to_Destination		REAL	Energy consumption for the current PI transition Unit: kWh
Energy_Consumption_to_operate		REAL	Energy consumption of the PE entity during transition from energy-saving mode (PE_energy-saving mode) to ready-to-operate mode (PE_ready_to_operate) Unit: kWh

**PI command "PE\_Identify"**

**Description**

The PE command "PE\_Identify" is used to read out the number and description of PE commands supported by the PE entity. The number of specific commands supported depends on the PE entity. As PE\_Identify is itself a PE command, at least three supported PE commands will be output upon a positive response: Start\_Pause, End\_Pause and PE\_Identify.

## Calling the PE command "PE\_Identify"

The command "PE\_Identify" is called with the instruction "PE\_CMD (Page 2693)" with the following parameters:

Parameter	Value	Description
CMD	5	Call of the command "PE_Identify".
CMD_MODIFIER	0	There are no other specifications of the command call for command "PE_Identify".
CMD_PARA_LEN	0	Length of the CMD_PARA parameter of 0 bytes.
CMD_PARA	irrelevant	-

## Response frame (Service Data Response)

The following data of the PE entity response frame is written to the data block referenced at the RESPONSE\_DATA parameter (see "PE\_CMD (Page 2693)"):

Attribute	Value	Data type	Description
Count <sup>1</sup>	6	BYTE	Number of supported PROFINergy commands
Start_Pause	1	BYTE	First PE command supported (Service_Request_ID)
End_Pause	2	BYTE	...
Query_Modes	3	BYTE	...
PEM_Status	4	BYTE	...
PE_Identify	5	BYTE	...
Query_Measurement	16	BYTE	Last PE command supported (Service_Request_ID)

<sup>1</sup> The number of commands supported is manufacturer-specific and depends on the PE entity used. The values given are an example of a response frame where all 6 PE commands are supported.

## PI Command "Query\_Measurement" - "Get\_Measurement\_list"

### Description

Use the PE command "Query\_Measurement" and sub-command (modifier) "Get\_measurement\_list" to query the specific measured values supported by the PE entity. The supported measured values are output as a list in the data block referenced by the RESPONSE\_DATA parameter.

### Calling the PE command "Query\_Measurement" - "Get\_Measurement\_list"

The command is called with the instruction "PE\_CMD (Page 2693)" with the following parameters:

Parameter	Value	Description
CMD	16	Call of the command "Query_Measurement".
CMD_MODIFIER	1	Specification of the command call: Select the sub-command "Get_Measurement_List" to output a list of supported measured values.
CMD_PARA_LEN	0	Length of the CMD_PARA parameter of 0 bytes.
CMD_PARA	irrelevant	-

### Response frame (Service Data Response)

The following data of the PE entity response frame is written to the data block referenced at the RESPONSE\_DATA parameter (see "PE\_CMD (Page 2693)"):

Attribute	Value	Data type	Description
Count	-	BYTE	Number of measurement IDs
reserved	-	BYTE	
...			
Measurement_ID	-	WORD	First supported Measurement_ID The Measurement_ID is manufacturer-specific. For more information, refer to the manual of the respective PE entity.
Accuracy_Domain	-	BYTE	See "accuracy domain" table.
Accuracy_Class	-	BYTE	See "accuracy classes" table.
Range	-	REAL	Specifies the scale end value of the measured value (only for accuracy domain 1). The attribute range uses the same unit as defined using attribute Measurement_ID (only one unit is used for each Measurement_ID).
...			
Measurement_ID	-	WORD	Last supported Measurement_ID
Accuracy_Domain	-	BYTE	See "accuracy domain" table.
Accuracy_Class	-	BYTE	See "accuracy classes" table.
Range	-	REAL	Specifies the scale end value of the measurement value (only for accuracy domain 1). The attribute range uses the same unit as defined using attribute Measurement_ID (only one unit is used for each Measurement_ID).

### Accuracy domains

Accuracy domain	Description
0	Reserved
1	The accuracy deviation is output in percentages of the scale end value. The percentage of the possible deviation is divided into accuracy classes (see table: Accuracy classes of the accuracy domains 1 and 2).

Accuracy domain	Description
2	The accuracy deviation is output in percentages of the current measurement value. The percentage of the possible deviation is divided into accuracy classes (see table: Accuracy classes of the accuracy domains 1 and 2).
3	The measuring accuracy adheres to the standard IEC 61557-12. The function performance classes for performance measurement and monitoring devices (PMD) without external sensors, and the system performance classes for PMD with external sensors, are coded as set out in the "Accuracy classes of accuracy domain 3" table.
4	The entry of the accuracy adheres to the standard EN 50470-3, chapter 8 (see also table: Accuracy classes of accuracy domain 4).

## Accuracy classes

Table 9-56 Accuracy classes of the accuracy domains 1 and 2

Accuracy class	0	1	2	3	4	5	6	7	8
Meaning	Reserved	0.01%	0.02%	0.05%	0.1%	0.2%	0.5%	1%	1.5%

Accuracy class	9	10	11	12	13	14	15	>15
Meaning	2%	2.5%	3%	5%	10%	20%	>20%	Not defined

Table 9-57 Accuracy classes of accuracy domain 3

Accuracy class	0	1	2	3	4	5	6	7	8
Meaning	Reserved	0,02	0,05	0,1	0,2	0,5	1	1,5	2

Accuracy class	9	10	11	12	13	14	>13
Meaning	2,5	3	5	10	20	20%	Not defined

Table 9-58 Accuracy classes of accuracy domain 4

Accuracy class	0	1	2	3	4	5	6	>7
Meaning	Reserved	0,5	1,0	1,5	2,0	2,5	3,0	Not defined

## PI Command "Query\_Measurement" - "Get\_Measurement\_values"

### Description

Use the PE command "Query\_Measurement" and sub-command (modifier) "Get\_measurement\_values" to output a list of measured values supported by the PE entity. The measured values are output as a list in the data block referenced by the RESPONSE\_DATA parameter.

**Calling the PE command "Query\_Measurement" - "Get\_Measurement\_values"**

The command is called with the instruction "PE\_CMD (Page 2693)" with the following parameters:

Parameter	Value	Description
CMD	16	Call of the command "Query_Measurement".
CMD_MODIFIER	2	Specification of the command call: Select the command "Get_Measurement_Values" to output a list of supported measurement values.
CMD_PARA_LEN	0	Depends on the number of measurement values. The length of the parameters results from the attribute count and the sum of the lengths of the attributes for the transferred measurement values.
CMD_PARA	VARIANT	VARIANT pointer to data structure with list of measured values to be queried (see "CMD_PARA parameter").

**Parameter CMD\_PARA**

The structure specified with the VARIANT pointer at the CMD\_PARA parameter must have the following setup:

Attribute	Value	Data type	Description
Count	-	BYTE	Number of measured values (Measurement-IDs)
reserved	0	BYTE	Not used
Measurement_ID	-	WORD	First measured value queried
...			
Measurement_ID	-	WORD	Last measured value queried

**Response frame (Service Data Response)**

The following response frame data of the PE entity is written to the data block that is referenced at parameter RESPONSE\_DATA (see "PE\_CMD (Page 2693)"):

Attribute	Value	Data type	Description
Count <sup>1</sup>	-	BYTE	Number of measured values (Measurement-IDs)
reserved	0	BYTE	Not used
Length_of_Structure	2 to 65535	WORD	Length of the structure in bytes
Measurement_Data_Structure_ID	1 = simple value	BYTE	Defines the following structure.
Measurement_ID	0 to 65535	WORD	ID of the supported measurement value.
Status_of_Measurement_Value	1 to 3	BYTE	Status of the measurement value: <ul style="list-style-type: none"> <li>• 1: Valid</li> <li>• 2: Not supported</li> <li>• 3: Invalid</li> </ul>
Transmission_Data_Type	-	REAL	

Attribute	Value	Data type	Description
End_of_demand	-	TOD	Optional time stamping with data type TimeOfDay.
...			
Length_of_Structure	-	WORD	Length of the structure in bytes
Measurement_Data_Structure_ID	-	BYTE	Defines the following structure.
Measurement_ID	-	WORD	ID of the supported measurement value.
Status_of_Measurement_Value	-	BYTE	Status of the measurement value: <ul style="list-style-type: none"> <li>• 1: Valid</li> <li>• 2: Not supported</li> <li>• 3: Invalid</li> </ul>
Transmission_Data_Type	-	REAL	
End_of_demand	-	TOD	Optional time stamping with data type TimeOfDay.

<sup>1</sup> If the data length of the measurement values queried exceeds the size of the PDU (Protocol Data Unit) of the protocol layer, the data will not be completely transferred and only the supported measurement values will be output.

## iDevice / iSlave

### PE\_I\_DEV: Control PROFIenergy commands in the I-Device

#### Description

The instruction "PE\_I\_DEV" is used to process the PROFIenergy profile in the intelligent IO device (iDevice). The functions which are executed by the firmware in standard PROFIenergy-compatible IO devices, such as the ET 200S, are implemented in the iDevice by the instruction "PE\_I\_DEV" and the corresponding auxiliary blocks:

- The instruction "PE\_I\_DEV" is called cyclically by the user program of the iDevice and receives all PROFIenergy commands.
- The PROFIenergy response is generated by configuring an auxiliary block. The response in the pause is fully programmable. The response data must be provided within 10 seconds; otherwise, "State conflict 0x80B5" will occur at the STATUS parameter of the instruction in the IO controller.

No specific knowledge of the PROFIenergy standard is required to use the instruction.

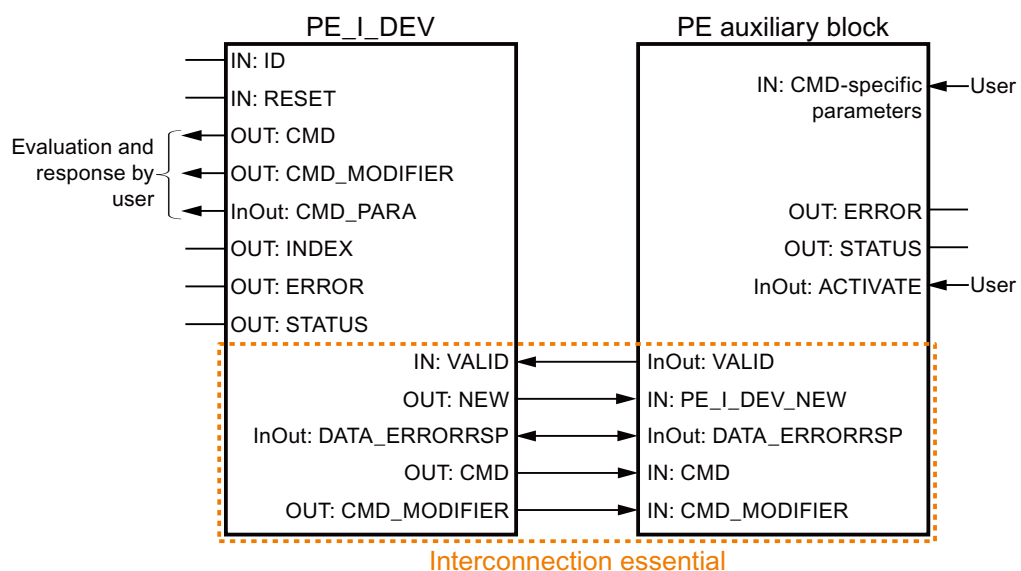

### PROFenergy auxiliary blocks (PE auxiliary blocks)

The PE auxiliary blocks are used to generate the response frame. Enter the response data (in plain text) at the input parameters of the relevant block.

- For each PROFenergy command, there is a corresponding auxiliary block for a positive response:
  - PE command "Start\_Pause": PE\_Start\_RSP (Page 2728)
  - PE command "End\_Pause": PE\_End\_RSP (Page 2730)
  - PE command "Query\_modes" - "List\_Energy\_Saving\_Modes": PE\_List\_Modes\_RSP (Page 2731)
  - PE command "Query\_modes" - "Get\_Mode": PE\_Get\_Mode\_RSP (Page 2732)
  - PE command "PEM\_Status": PE\_PEM\_Status\_RSP (Page 2734)
  - PE command "PE\_Identify": PE\_Identify\_RSP (Page 2736)
  - PE command "Query\_Measurement" - "Get\_Measurement\_list": PE\_Measurement\_List\_RSP (Page 2737)
  - PE command "Query\_Measurement" - "Get\_Measurement\_values": PE\_Measurement\_Value\_RSP (Page 2739)
- Irrespective of the PROFenergy command, there is an additional shared auxiliary block for a negative response (see PE\_Error\_RSP (Page 2727)).

### Interconnection of the auxiliary blocks

The instruction "PE\_I\_DEV" and the auxiliary blocks are coordinated. Some of the parameters are simply interconnected. The diagram below shows which of the parameters need to be interconnected.

## Parameters

The following table shows the parameters of the instruction "PE\_I\_DEV":

Parameter	Declaration	Data type	Memory area	Description
RESET	Input	BOOL	I, Q, M, D, L or constant	Resets the instruction.
ID	Input	HW_SUBMODULE	I, Q, M, D, L or constant	Address of the iDevice The address may be taken from the hardware configuration.
VALID	Input	BOOL	I, Q, M, D, L or constant	The response data for the PROFinergy controller is ready and can be sent.
CMD_PARA	Output	VARIANT	I, Q, M, D, L	Parameters for: <ul style="list-style-type: none"> <li>Get mode: PE_mode_ID</li> <li>Get measurement values: List of Measurement_IDs (list of IDs of the tags to be read; either one tag or multiple tags may be read at any given time).</li> </ul> Maximum length: 234 bytes
DATA_ERROR_RSP	InOut	VARIANT	I, Q, M, D, L	Pointer to the data area containing the acknowledgment data for the PROFinergy controller. This must correspond to the pointer which is also used with the auxiliary blocks.
INDEX	Output	INT	I, Q, M, D, L	Data record number of the PROFinergy record (set at 0x80A0)
CMD	Output	INT	I, Q, M, D, L	Service-Request-ID of the PROFinergy command in accordance with the PROFinergy profile (see "CMD and CMD_MODIFIER parameters"). Further PE commands (Service-Request-IDs) are possible following extensions of the PROFinergy profile.
CMD_MODIFIER	Output	INT	I, Q, M, D, L	PROFinergy sub-command: <ul style="list-style-type: none"> <li>Only when CMD=3 or CMD=16; see "CMD and CMD_MODIFIER parameters".</li> <li>For all other commands: "0".</li> </ul> Further sub-commands are possible following extensions of the PROFinergy profile.
NEW	Output	BOOL	I, Q, M, D, L	New data available from the PROFinergy controller.
ERROR	Output	BOOL	I, Q, M, D, L	Command completed with error.
STATUS	Output	DWORD	I, Q, M, D, L	Error information (see "STATUS parameter").

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

Parameters CMD and CMD\_MODIFIER

CMD	CMD_MODIFIER	PROFenergy command	Description
01	0	Start_Pause	Start energy-saving mode or switch to a different energy-saving mode.
02	0	End_Pause	End energy-saving mode.
03	1	Query_Modes - List energy saving Modes	Output the energy-saving modes supported.
	2	Query_Modes - Get Mode	Output attributes of the energy-saving mode currently enabled.
04	0	PEM_Status	Query status of energy-saving mode.
05	0	PE_Identify	Read out the number and description of PE commands supported.
16	1	Query_Measurement - Get_Measurement_List	List of measured values supported by the PE entity.
	2	Query_Measurement - Get_Measurement_Values	Output of the measured values of the PE entity.

STATUS parameter

Error information is output at the STATUS output parameter. If it is interpreted as ARRAY[1...4] of BYTE, the error information has the following structure:

Field element	Name	Meaning
STATUS[1]	Function_Num	Cause of the error <ul style="list-style-type: none"> <li>• B#16#00: No error</li> <li>• B#16#DE: Error during reading of data record</li> <li>• B#16#DF: Error during writing of data record</li> <li>• B#16#C0: Error message from the instruction "PE_I_DEV" or from the internal communication instructions "RDREC (Page 2616)" and "WRREC (Page 2618)".</li> </ul>
STATUS[2]	Error Decode	Location of the error ID <ul style="list-style-type: none"> <li>• 80: DPV1 error as defined in IEC 61158-6 or application-specific</li> </ul>
STATUS[3]	Error_Code_1	Error ID (when Error Decode = 80): <ul style="list-style-type: none"> <li>• B1: Write length error (error in write length or insufficient length information with the data type VARIANT).</li> </ul>
STATUS[4]	Error_Code_2	For PROFINET errors: Output of IO controller error message If no PROFINET error has occurred, the value in STATUS[4] = "0".

**Note****Error messages of the instructions RDREC and WRREC**

The instruction "PE\_I\_DEV" uses the instructions "WRREC (Page 2618)" and "RDREC (Page 2616)" for communication. Error messages for these instructions are output in the field elements STATUS[1] to STATUS[4].

Please see the description of the corresponding STATUS (Page 2626) parameter for an explanation of the error codes of the "WRREC (Page 2618)" and "RDREC (Page 2616)" instructions.

**See also**

Description of PROFIenergy (Page 2687)

**Auxiliary blocks of the instruction PE\_I\_DEV****PE\_Error\_RSP: Generate negative answer to command****Description**

The auxiliary block "PE\_Error\_RSP" (Response with failure) generates a negative response if the command requested is not supported (either in general or temporarily). Response generation does not depend on the command requested.

**Parameter**

The following table shows the parameters of the "PE\_Error\_RSP" auxiliary block:

Parameter	Declaration	Data type	Memory area	Description
PE_I_DEV_NEW	Input	BOOL	I, Q, M, D, L or constant	The parameter must be interconnected with the NEW output parameter of the "PE_I_DEV (Page 2723)" instruction. The auxiliary block is only processed if the parameter value is set to "1".
ERROR_CODE	Input	BYTE	I, Q, M, D, L or constant	Error number
ACTIVATE	InOut	BOOL	I, Q, M, D, L	The instruction copies the input parameters to the DATA_ERROR_RSP data area at a rising edge at input ACTIVATE. The parameter is then reset by the instruction.  The parameter must be set within 10 seconds after a rising edge is detected at parameter NEW of the "PE_I_DEV (Page 2723)" instruction.

Parameter	Declaration	Data type	Memory area	Description
VALID	InOut	BOOL	I, Q, M, D, L	The parameter must be interconnected with the VALID input of the "PE_I_DEV (Page 2723)" instruction. The auxiliary block sets the parameter as soon as the response data for the PROFIenergy controller is available and ready for transmission.
DATA_ERRORRRSP	InOut	VARIANT	D	Pointer on the data area in which the response data is stored. The parameter is identical to the pointer for DATA_ERRORRRSP of the "PE_I_DEV (Page 2723)" instruction. The addressed data area contains the complete PROFIenergy frame. Minimum length: 244 bytes
ERROR	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>"0": No error</li> <li>"1": Error occurred.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	<ul style="list-style-type: none"> <li>"0": No error</li> <li>"0x80B1": Error in VARIANT setting, e.g. incorrect range</li> </ul>

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### PE\_Start\_RSP: Generate answer to command at start of pause

#### Description

The auxiliary block "PE\_Start\_RSP" (Start Pause) generates the response to the PE command Start\_Pause (Page 2713). The instruction returns the energy-saving mode to which the device has switched (PE\_MODE\_ID parameter).

If the response differs depending on the length of the pause, you can return this fact in the feedback on the energy-saving mode (PE\_Mode\_ID = 1 for a brief pause, PE\_Mode\_ID = 2 for a longer pause, etc.).

## Parameter

The following table shows the parameters of the "PE\_Start\_RSP" auxiliary block:

Parameter	Declaration	Data type	Memory area	Description
PE_I_DEV_NEW	Input	BOOL	I, Q, M, D, L or constant	The parameter must be interconnected with the NEW output parameter of the "PE_I_DEV (Page 2723)" instruction. The auxiliary block is only processed if the parameter value is set to "1".
CMD	Input	INT	I, Q, M, D, L or constant	Service-Request-ID of the PROFinergy command The parameter must be interconnected with the CMD output parameter of the "PE_I_DEV (Page 2723)" instruction.
PE_MODE_ID	Input	BYTE	I, Q, M, D, L or constant	PE mode that the process assumes
ACTIVATE	InOut	BOOL	I, Q, M, D, L	The instruction copies the input parameters to the DATA_ERROR_RSP data area at a rising edge at input ACTIVATE. The parameter is then reset by the instruction. The parameter must be set within 10 seconds after a rising edge is detected at parameter NEW of the "PE_I_DEV (Page 2723)" instruction.
VALID	InOut	BOOL	I, Q, M, D, L	The parameter must be interconnected with the VALID input of the "PE_I_DEV (Page 2723)" instruction. The auxiliary block sets the parameter as soon as the response data for the PROFinergy controller is available and ready for transmission.
DATA_ERROR_RSP	InOut	VARIANT	D	Pointer on the data area in which the response data is stored. The parameter is identical to the pointer for DATA_ERROR_RSP of the "PE_I_DEV (Page 2723)" instruction. The addressed data area contains the complete PROFinergy frame. Minimum length: 244 bytes
ERROR	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>"0": No error</li> <li>"1": Error occurred.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	<ul style="list-style-type: none"> <li>"0": No error</li> <li>"0x80B1": Error in VARIANT setting, e.g. incorrect range</li> </ul>

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

**PE\_End\_RSP: Generate answer to command at end of pause**

**Description**

The auxiliary block "PE\_End\_RSP" generates the response to the PE command End\_Pause (Page 2713). The response returned is the time required to switch from the current mode to "Ready\_To\_Operate" mode.

**Parameter**

The following table shows the parameters of the "PE\_End\_RSP" auxiliary block:

Parameter	Declaration	Data type	Memory area	Description
PE_I_DEV_NEW	Input	BOOL	I, Q, M, D, L or constant	The parameter must be interconnected with the NEW output parameter of the "PE_I_DEV (Page 2723)" instruction. The auxiliary block is only processed if the parameter value is set to "1".
CMD	Input	INT	I, Q, M, D, L or constant	Service-Request-ID of the PROFIenergy command The parameter must be interconnected with the CMD output parameter of the "PE_I_DEV (Page 2723)" instruction.
Time_to_Operate	Input	DWORD	I, Q, M, D, L or constant	Time required to switch from the current mode to "Ready_To_Operate".
ACTIVATE	InOut	BOOL	I, Q, M, D, L	The instruction copies the input parameters to the DATA_ERROR_RSP data area at a rising edge at input ACTIVATE. The parameter is then reset by the instruction. The parameter must be set within 10 seconds after a rising edge is detected at parameter NEW of the "PE_I_DEV (Page 2723)" instruction.
VALID	InOut	BOOL	I, Q, M, D, L	The parameter must be interconnected with the VALID input of the "PE_I_DEV (Page 2723)" instruction. The auxiliary block sets the parameter as soon as the response data for the PROFIenergy controller is available and ready for transmission.
DATA_ERROR_RSP	InOut	VARIANT	D	Pointer on the data area in which the response data is stored. The parameter is identical to the pointer for DATA_ERROR_RSP of the "PE_I_DEV (Page 2723)" instruction. The addressed data area contains the complete PROFIenergy frame. Minimum length: 244 bytes

Parameter	Declaration	Data type	Memory area	Description
ERROR	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>"0": No error</li> <li>"1": Error occurred.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	<ul style="list-style-type: none"> <li>"0": No error</li> <li>"0x80B1": Error in VARIANT setting, e.g. incorrect range</li> </ul>

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## PE\_List\_Modes\_RSP: Generate queried energy savings modes as answer

### Description

The auxiliary block "PE\_List\_Modes\_RSP" generates the response to the PE command List\_Energy\_Saving\_Modes (Page 2714). The response generated includes the number and the IDs of energy-saving modes supported.

### Parameter

The following table shows the parameters of the "PE\_List\_Modes\_RSP" auxiliary block:

Parameter	Declaration	Data type	Memory area	Description
PE_I_DEV_NEW	Input	BOOL	I, Q, M, D, L or constant	The parameter must be interconnected with the NEW output parameter of the "PE_I_DEV (Page 2723)" instruction. The auxiliary block is only processed if the parameter value is set to "1".
CMD	Input	INT	I, Q, M, D, L or constant	Service-Request-ID of the PROFlenergy command The parameter must be interconnected with the CMD output parameter of the "PE_I_DEV (Page 2723)" instruction.
CMD_MODIFIER	Input	INT	I, Q, M, D, L or constant	PROFlenergy sub-command (evaluated only if CMD=3, or CMD=16). The parameter must be interconnected with the CMD_MODIFIER output parameter of the "PE_I_DEV" instruction.
Number_of_PE_Mode_IDs	Input	BYTE	I, Q, M, D, L or constant	Number of energy-saving modes supported. Permitted values: 1 to 254
PE_MODE_ID	Input	VARIANT	I, Q, M, D, L	Points to the area in which the IDs of the energy-saving modes supported (PE_Mode_ID) are stored. Valid range: 1 to 254.

Parameter	Declaration	Data type	Memory area	Description
ACTIVATE	InOut	BOOL	I, Q, M, D, L	The instruction copies the input parameters to the DATA_ERROR_RSP data area at a rising edge at input ACTIVATE. The parameter is then reset by the instruction.  The parameter must be set within 10 seconds after a rising edge is detected at parameter NEW of the "PE_I_DEV (Page 2723)" instruction.
VALID	InOut	BOOL	I, Q, M, D, L	The parameter must be interconnected with the VALID input of the "PE_I_DEV (Page 2723)" instruction.  The auxiliary block sets the parameter as soon as the response data for the PROFIenergy controller is available and ready for transmission.
DATA_ERRORRRSP	InOut	VARIANT	D	Pointer on the data area in which the response data is stored. The parameter is identical to the pointer for DATA_ERRORRRSP of the "PE_I_DEV (Page 2723)" instruction. The addressed data area contains the complete PROFIenergy frame.  Minimum length: 244 bytes
ERROR	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• "0": No error</li> <li>• "1": Error occurred.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• "0": No error</li> <li>• "0x80B1": Error in VARIANT setting, e.g. incorrect range</li> </ul>

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### PE\_Get\_Mode\_RSP: Generate queried energy data as answer

#### Description

The auxiliary block "PE\_Get\_Mode\_RSP" generates the response to the command Get\_Mode (Page 2715). The response frame contains the time, performance, or energy data of an energy-saving mode.

## Parameter

The following table shows the parameters of the "PE\_Get\_Mode\_RSP" auxiliary block:

Parameter	Declaration	Data type	Memory area	Description
PE_I_DEV_NEW	Input	BOOL	I, Q, M, D, L or constant	The parameter must be interconnected with the NEW output parameter of the "PE_I_DEV (Page 2723)" instruction. The auxiliary block is only processed if the parameter value is set to "1".
CMD	Input	INT	I, Q, M, D, L or constant	Service-Request-ID of the PROFlenergy command  The parameter must be interconnected with the CMD output parameter of the "PE_I_DEV (Page 2723)" instruction.
CMD_MODIFIER	Input	INT	I, Q, M, D, L or constant	PROFlenergy sub-command (evaluated only if CMD=3, or CMD=16). The parameter must be interconnected with the CMD_MODIFIER output parameter of the "PE_I_DEV" instruction.
PE_Mode_ID	Input	BYTE	I, Q, M, D, L or constant	ID of the energy-saving mode currently enabled.
Time_min_Pause	Input	DWORD	I, Q, M, D, L or constant	Minimum pause duration for this PE energy-saving mode.  This is the sum of the following three parameters: <ul style="list-style-type: none"> <li>• Time_to_Pause</li> <li>• Time_to_operate</li> <li>• Time_min_length_of_stay</li> </ul>
Time_to_Pause	Input	DWORD	I, Q, M, D, L or constant	Time between the edge at the START parameter (see "PE_I_DEV (Page 2723)") and the requested PE energy-saving mode being reached.
Time_to_Operate	Input	DWORD	I, Q, M, D, L or constant	Maximum switch-on time to "PE_ready_to_operate". The "Time_to_operate" parameter can be used directly for the relevant calculations. The value may be a static maximum, or be calculated dynamically by the PE entity.
Time_min_Lenght_of_stay	Input	DWORD	I, Q, M, D, L or constant	Minimum dwell time of the PE entity in this PE mode.
Time_max_Lenght_of_stay	Input	DWORD	I, Q, M, D, L or constant	Maximum dwell time of the PE entity in this PE mode.
Mode_Power_Consumption	Input	DWORD	I, Q, M, D, L or constant	Energy consumption in the current PE mode in [kW].
Energy_Consum_to_Pause	Input	DWORD	I, Q, M, D, L or constant	Energy consumption from "PE_ready_to_operate" to the current PE mode in [kWh].
Energy_Consum_to_operate	Input	DWORD	I, Q, M, D, L or constant	Energy consumption from the current PE mode to "PE_ready_to_operate" in [kWh].

Parameter	Declaration	Data type	Memory area	Description
ACTIVATE	InOut	BOOL	I, Q, M, D, L	The instruction copies the input parameters to the DATA_ERROR_RSP data area at a rising edge at input ACTIVATE. The parameter is then reset by the instruction.  The parameter must be set within 10 seconds after a rising edge is detected at parameter NEW of the "PE_I_DEV (Page 2723)" instruction.
VALID	InOut	BOOL	I, Q, M, D, L	The parameter must be interconnected with the VALID input of the "PE_I_DEV (Page 2723)" instruction.  The auxiliary block sets the parameter as soon as the response data for the PROFlenergy controller is available and ready for transmission.
DATA_ERROR_RSP	InOut	VARIANT	D	Pointer on the data area in which the response data is stored. The parameter is identical to the pointer for DATA_ERROR_RSP of the "PE_I_DEV (Page 2723)" instruction. The addressed data area contains the complete PROFlenergy frame.  Minimum length: 244 bytes
ERROR	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>"0": No error</li> <li>"1": Error occurred.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	<ul style="list-style-type: none"> <li>"0": No error</li> <li>"0x80B1": Error in VARIANT setting, e.g. incorrect range</li> </ul>

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### PE\_PEM\_Status\_RSP: Generate PEM status as answer

#### Description

The auxiliary block "PE\_PEM\_Status\_RSP" generates the response to the command PEM\_Status (Page 2717).

## Parameter

The following table shows the parameters of the "PE\_PEM\_Status\_RSP" auxiliary block:

Parameter	Declaration	Data type	Memory area	Description
PE_I_DEV_NEW	Input	BOOL	I, Q, M, D, L or constant	The parameter must be interconnected with the NEW output parameter of the "PE_I_DEV (Page 2723)" instruction. The auxiliary block is only processed if the parameter value is set to "1".
CMD	Input	INT	I, Q, M, D, L or constant	Service-Request-ID of the PROFIenergy command The parameter must be interconnected with the CMD output parameter of the "PE_I_DEV (Page 2723)" instruction.
PE_MODE_ID_Source	Input	BYTE	I, Q, M, D, L or constant	Source and Destination for PEM_STATUS. Values: <ul style="list-style-type: none"> <li>• 0x00: PE_POWER_OFF</li> <li>• 0x01 – 0xFE: manufacturer-specific</li> <li>• 0xFF: PE_READY_TO_OPERATE</li> </ul>
PE_MODE_ID_Destination	Input	BYTE	I, Q, M, D, L or constant	
Time_to_Operate <sup>1</sup>	Input	DWORD	I, Q, M, D, L or constant	Maximum switch-on time to "PE_ready_to_operate". "Time_to_operate" can be used directly for the relevant calculations. The value may be a static maximum, or be calculated dynamically by the PE entity.
Remaining_time_to_destination <sup>1</sup>	Input	DWORD	I, Q, M, D, L or constant	Optional: Time remaining until the requested PE mode. Dynamic value or static maximum value
Mode_Power_Consumption <sup>2</sup>	Input	DWORD	I, Q, M, D, L or constant	Energy consumption in the current PE mode in [kW].
Energy_Consumption_to_Destination <sup>2</sup>	Input	DWORD	I, Q, M, D, L or constant	Energy consumption in the time until the requested PE mode in [kW].
Energy_Consumption_to_operate <sup>2</sup>	Input	DWORD	I, Q, M, D, L or constant	Energy consumption from the current PE mode to "PE_ready_to_operate" in [kWh].
ACTIVATE	InOut	BOOL	I, Q, M, D, L	The instruction copies the input parameters to the DATA_ERROR_RSP data area at a rising edge at input ACTIVATE. The parameter is then reset by the instruction. The parameter must be set within 10 seconds after a rising edge is detected at parameter NEW of the "PE_I_DEV (Page 2723)" instruction.
VALID	InOut	BOOL	I, Q, M, D, L	The parameter must be interconnected with the VALID input of the "PE_I_DEV (Page 2723)" instruction. The auxiliary block sets the parameter as soon as the response data for the PROFIenergy controller is available and ready for transmission.

9.7 References

Parameter	Declaration	Data type	Memory area	Description
DATA_ERRORRSP	InOut	VARIANT	D	Pointer on the data area in which the response data is stored. The parameter is identical to the pointer for DATA_ERRORRSP of the "PE_I_DEV (Page 2723)" instruction. The addressed data area contains the complete PROFinergy frame. Minimum length: 244 bytes
ERROR	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>"0": No error</li> <li>"1": Error occurred.</li> </ul>

**PE\_Identify\_RSP: Generate supported PROFinergy commands as answer**

**Description**

The auxiliary block "PE\_Identify\_RSP" generates the response to the command PE\_Identify (Page 2718). In the response to the command, specify which PROFinergy commands are supported. Please note that PE\_IDENTIFY is itself a PE command and has to be included in the response.

**Parameter**

The following table shows the parameters of the "PE\_Identify\_RSP" auxiliary block:

Parameter	Declaration	Data type	Memory area	Description
PE_I_DEV_NEW	Input	BOOL	I, Q, M, D, L or constant	The parameter must be interconnected with the NEW output parameter of the "PE_I_DEV (Page 2723)" instruction. The auxiliary block is only processed if the parameter value is set to "1".
CMD	Input	INT	I, Q, M, D, L or constant	Service-Request-ID of the PROFinergy command The parameter must be interconnected with the CMD output parameter of the "PE_I_DEV (Page 2723)" instruction.
Start_Pause	Input	BOOL	I, Q, M, D, L or constant	One parameter for each of the relevant PROFinergy commands:
End_Pause	Input	BOOL	I, Q, M, D, L or constant	<ul style="list-style-type: none"> <li>0: PE command is not supported</li> <li>1: PE command is supported</li> </ul>

Parameter	Declaration	Data type	Memory area	Description
Query_Modes	Input	BOOL	I, Q, M, D, L or constant	
PEM_Status	Input	BOOL	I, Q, M, D, L or constant	
PE_Identify	Input	BOOL	I, Q, M, D, L or constant	
Query_Measurement	Input	BOOL	I, Q, M, D, L or constant	
ACTIVATE	InOut	BOOL	I, Q, M, D, L	<p>The instruction copies the input parameters to the DATA_ERROR_RSP data area at a rising edge at input ACTIVATE. The parameter is then reset by the instruction.</p> <p>The parameter must be set within 10 seconds after a rising edge is detected at parameter NEW of the "PE_I_DEV (Page 2723)" instruction.</p>

DATA_ERROR_RSP	InOut	VARIANT	D	<p>Pointer on the data area in which the response data is stored. The parameter is identical to the pointer for DATA_ERROR_RSP of the "PE_I_DEV (Page 2723)" instruction. The addressed data area contains the complete PROFlenergy frame.</p> <p>Minimum length: 244 bytes</p>
ERROR	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>"0": No error</li> <li>"1": Error occurred.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	<ul style="list-style-type: none"> <li>"0": No error</li> <li>"0x80B1": Error in VARIANT setting, e.g. incorrect range</li> </ul>

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## PE\_Measurement\_List\_RSP: Generate list of supported measured values as answer

### Description

The auxiliary block "PE\_Measurement\_List\_RSP" generates the response to the command Get\_measurement\_list (Page 2719). In the response, specify which measured values (Measurement-IDs) are supported.

**Parameter**

The following table shows the parameters of the "PE\_Measurement\_List\_RSP" auxiliary block:

Parameter	Declaration	Data type	Memory area	Description
PE_I_DEV_NEW	Input	BOOL	I, Q, M, D, L or constant	The parameter must be interconnected with the NEW output parameter of the "PE_I_DEV (Page 2723)" instruction. The auxiliary block is only processed if the parameter value is set to "1".
CMD	Input	INT	I, Q, M, D, L or constant	Service-Request-ID of the PROFIenergy command  The parameter must be interconnected with the CMD output parameter of the "PE_I_DEV (Page 2723)" instruction.
CMD_MODIFIER	Input	INT	I, Q, M, D, L or constant	PROFIenergy sub-command (evaluated only if CMD=3, or CMD=16). The parameter must be interconnected with the CMD_MODIFIER output parameter of the "PE_I_DEV" instruction.
Count	Input	BYTE	I, Q, M, D, L or constant	Number of measured values supported (measurement IDs)
Measurement_List	Input	VARIANT	D	Pointer to the array with the Measurement_IDs supported.  For information on the structure of the array in accordance with the PROFIenergy profile, see: PI Command "Query_Measurement" - "Get_Measurement_list" (Page 2719)
ACTIVATE	InOut	BOOL	I, Q, M, D, L	The instruction copies the input parameters to the DATA_ERROR_RSP data area at a rising edge at input ACTIVATE. The parameter is then reset by the instruction.  The parameter must be set within 10 seconds after a rising edge is detected at parameter NEW of the "PE_I_DEV (Page 2723)" instruction.
VALID	InOut	BOOL	I, Q, M, D, L	The parameter must be interconnected with the VALID input of the "PE_I_DEV (Page 2723)" instruction.  The auxiliary block sets the parameter as soon as the response data for the PROFIenergy controller is available and ready for transmission.
DATA_ERROR_RSP	InOut	VARIANT	D	Pointer on the data area in which the response data is stored. The parameter is identical to the pointer for DATA_ERROR_RSP of the "PE_I_DEV (Page 2723)" instruction. The addressed data area contains the complete PROFIenergy frame.  Minimum length: 244 bytes

Parameter	Declaration	Data type	Memory area	Description
ERROR	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>"0": No error</li> <li>"1": Error occurred.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	<ul style="list-style-type: none"> <li>"0": No error</li> <li>"0x80B1": Error in VARIANT setting, e.g. incorrect range</li> </ul>

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## PE\_Measurement\_Value\_RSP: Generate queried measured values as answer

### Description

The auxiliary block "PE\_Measurement\_Value\_RSP" generates the response to the command Get\_measurement\_values (Page 2721). In the response, return the values of the requested measurements.

### Parameter

The following table shows the parameters of the "PE\_Measurement\_Value\_RSP" auxiliary block:

Parameter	Declaration	Data type	Memory area	Description
PE_I_DEV_NEW	Input	BOOL	I, Q, M, D, L or constant	The parameter must be interconnected with the NEW output parameter of the "PE_I_DEV (Page 2723)" instruction. The auxiliary block is only processed if the parameter value is set to "1".
CMD	Input	INT	I, Q, M, D, L or constant	Service-Request-ID of the PROFinergy command The parameter must be interconnected with the CMD output parameter of the "PE_I_DEV (Page 2723)" instruction.
CMD_MODIFIER	Input	INT	I, Q, M, D, L or constant	PROFinergy sub-command (evaluated only if CMD=3, or CMD=16). The parameter must be interconnected with the CMD_MODIFIER output parameter of the "PE_I_DEV" instruction.
Count	Input	BYTE	I, Q, M, D, L or constant	Number of measured values (Measurement_Values).
Measurement_Values	Input	VARIANT	D	Pointer to the array with the measured values (Measurement_IDs). For information on the structure of the array in accordance with the PROFinergy profile, see PI Command "Query_Measurement" - "Get_Measurement_values" (Page 2721)

Parameter	Declaration	Data type	Memory area	Description
ACTIVATE	InOut	BOOL	I, Q, M, D, L	The instruction copies the input parameters to the DATA_ERROR_RSP data area at a rising edge at input ACTIVATE. The parameter is then reset by the instruction.  The parameter must be set within 10 seconds after a rising edge is detected at parameter NEW of the "PE_I_DEV (Page 2723)" instruction.
VALID	InOut	BOOL	I, Q, M, D, L	The parameter must be interconnected with the VALID input of the "PE_I_DEV (Page 2723)" instruction.  The auxiliary block sets the parameter as soon as the response data for the PROFlenergy controller is available and ready for transmission.
DATA_ERRORRRSP	InOut	VARIANT	D	Pointer on the data area in which the response data is stored. The parameter is identical to the pointer for DATA_ERRORRRSP of the "PE_I_DEV (Page 2723)" instruction. The addressed data area contains the complete PROFlenergy frame.  Minimum length: 244 bytes
ERROR	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• "0": No error</li> <li>• "1": Error occurred.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• "0": No error</li> <li>• "0x80B1": Error in VARIANT setting, e.g. incorrect range</li> </ul>

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### 9.7.3.6 Module parameter assignment

#### Writing and reading data records

##### Principle

Some modules have a write-only system data area to which your program can transfer data records. This area contains data records with numbers from 0 to a maximum of 240. Not every module contains all of the data records (see following table).

Modules can also have a read-only system data area in which your program can read data records. This area contains data records with numbers from 0 to a maximum of 240. Not every module contains all of the data records (see following table).

---

##### Note

There are modules that have both system data areas. These are physically separate areas and the only thing they have in common is their logical structure.

---

### Write-only system data area

The following table shows the structure of the write-only system data area. This table also shows how the permitted size of the individual data records and which instructions can be used to write them.

Data record number	Contents	Size	Can be written with instruction
0	Parameter	-	WR_DPARM (Page 2748)
1	Parameter	-	WR_DPARM (Page 2748)
2 to 127	User data	Each ≤ 240 bytes	WR_DPARM (Page 2748) WR_REC (Page 2658)
128 to 240	Parameter	Each ≤ 240 bytes	WR_DPARM (Page 2748) WR_REC (Page 2658)

### Read-only system data area

The following table shows the structure of the read-only system data area. This table also shows the permitted size of the individual data records and which instructions can be used to read them.

Data record number	Contents	Size	Can be read with instruction
0	Module-specific diagnostics data (set as standard for the entire system)	4 bytes	RD_REC (Page 2654)
1	Channel-specific diagnostics data (incl. data record 0)	4 to 220 Bytes	RD_REC (Page 2654)
2 to 127	User data	Each ≤ 240 bytes	RD_REC (Page 2654)
128 to 240	Diagnostics data	Each ≤ 240 bytes	RD_REC (Page 2654)

### System resources

If you start several asynchronous data record transfers one after the other with only short intervals between them, the allocation of system resources by the operating system ensures that all the jobs are executed and that they do not interfere with each other.

If the limits of the system resources are reached, this is indicated in RET\_VAL. You can remedy this temporary error situation by simply repeating the job.

The maximum number of "simultaneously" active jobs of a single instruction type depends on the CPU.

## RD\_DPAR: Read module data record

### Description

You use the instruction to read the data record with the number INDEX of the addressed component from the configured system data. This may be a module in a central rack or a distributed component (PROFIBUS DP or PROFINET IO).

The value TRUE for the output parameter VALID indicates that the data record was successfully transferred to the target range RECORD. In this case, the LEN output parameter contains the length of the read data in bytes.

If an error has occurred during transfer of the data record, this is indicated by the output parameter ERROR. In this case, the output parameter STATUS contains the error information.

### Functional description

The "RD\_DPAR" instruction works asynchronously, that is, its execution extends over multiple calls. You start the data record transfer by calling "RD\_DPAR" with REQ = 1.

The output parameter BUSY and bytes 2 and 3 of the output parameter STATUS show the status of the job. Bytes 2 and 3 of STATUS match the output parameter RET\_VAL of the instructions that operate asynchronously.

See also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794).

The transfer of the data record is complete when the output parameter BUSY has the value FALSE.

### Parameter

The following table shows the parameters of the instruction "RD\_DPAR":

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ = 1: Read request
LADDR	Input	HW_IO	I, Q, M, D, L or constant	Identification number of the CPU or the interface. The number is assigned automatically and is stored in the properties of the CPU or of the interface of the hardware configuration.
INDEX	Input	INT	I, Q, M, D, L or constant	Data record number
RECORD	InOut	VARIANT	I, Q, M, D, L	Target range for the read data record
VALID	Output	BOOL	I, Q, M, D, L	New data record was received and is valid
BUSY	Output	BOOL	I, Q, M, D, L	BUSY = 1: The job is not yet completed.
ERROR	Output	BOOL	I, Q, M, D, L	ERROR = 1: An error occurred during the reading process.

Parameter	Declaration	Data type	Memory area	Description
STATUS	Output	DWORD	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• Call ID (bytes 2 and 3) or error code</li> <li>• Byte 1: B#16#00, if no error. Otherwise function ID from DPV1-PDU: In the case of error for data record reading B#16#DE, in the case of error for data record writing B#16#DF. If no DPV1 protocol element is used: B#16#C0.</li> <li>• Byte 4: Manufacturer-specific error ID extension</li> </ul>
LEN	Output	INT	I, Q, M, D, L	Length of the read data record information

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### STATUS parameter

Error code* (W#16#...)	Explanation	Restriction
0000	No error	-
7000	First call with REQ=0: No data transfer active; BUSY has the value "0".	-
7001	First call with REQ=1: Data transfer triggered; BUSY has the value "1".	Distributed I/O
7002	Intermediate call (REQ irrelevant): Data transfer already active; BUSY has the value "1".	Distributed I/O
8090	Address specified at parameter LADDR is invalid.	-
8092	A data type other than (Array of) bit string or integer was specified at the RECORD parameter.	-
8093	This instruction is not valid for the module selected with LADDR.	-
80A1	Negative acknowledgment during sending of data record to module (module defective or unplugged during sending).	-
80A2	DP protocol error at layer 2, possible hardware/interface error in DP slave.	Distributed I/O
80A3	DP protocol error at user interface/user.	Distributed I/O
80A4	Communication problem on com bus.	Error occurs between CPU and external DP interface module
80B0	Instruction for module type not possible, or module does not recognize the data record.	-
80B1	The length of the data record to be sent is incorrect.	-
80B2	The configured slot is not assigned.	-
80B3	Actual module type does not correspond to specified module type.	-
80C1	The data of the previous write job on the module for the same data record have not yet been processed by the module.	-

9.7 References

Error code* (W#16#...)	Explanation	Restriction
80C2	The module is currently processing the maximum possible number of jobs for a CPU.	-
80C3	The required resources (memory, etc.) are currently occupied.	
80C4	Internal temporary error. Job could not be executed. Repeat the job. If this error occurs often, check your installation for sources of electrical interference.	-
80C5	Distributed I/O not available or deactivated.	Distributed I/O
80C6	Data record transfer cancelled due to priority class abort (restart or background).	Distributed I/O
80D0	There is no entry for the module.	-
80D1	The data record number is not configured for the module (data record numbers > 241 are rejected).	-
80D2	The module cannot be assigned parameters according to its type identifier.	-
80D5	The data record is static.	-
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)	-

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

**See also**

RD\_DPARM: Read data record from configured system data (Page 2746)

**RD\_DPARA: Read module data record asynchronously**

**Description**

You use the instruction to read the data record with the number RECNUM of a selected module from the configured system data. The read data record is entered in the target range defined by the parameter RECORD .

**Functional description**

The "RD\_DPARA" instruction works asynchronously, that is, its execution extends over multiple calls. You start the reading process by calling the instruction with REQ = 1.

The output parameters RET\_VAL and BUSY indicate the status of the job.

See also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794).

## Parameters

The following table shows the parameters of the instruction "RD\_DPARA":

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ = 1: Read request
LADDR	Input	HW_IO	I, Q, M, D, L or constant	Identification number of the CPU or the interface. The number is assigned automatically and is stored in the properties of the CPU or of the interface of the hardware configuration.
RECNUM	Input	BYTE	I, Q, M, D, L or constant	Data record number (permitted values: 0 to 240)
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code.  If no error occurred during the transmission, the following cases are distinguished: <ul style="list-style-type: none"> <li>RET_VAL contains the length of the actually read data record in bytes if the target range is larger than the read data record.</li> <li>RET_VAL contains "0" if the length of the read data record is equal to the length of the target range.</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	BUSY = 1: The job is not yet completed.
RECORD	Output	VARIANT	I, Q, M, D, L	Target range for the data record read.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## RET\_VAL parameter

Error code* (W#16#...)	Explanation	Restriction
0000	No error	-
7000	First call with REQ=0: No data transfer active; BUSY has the value 0.	-
7001	First call with REQ=1: Data transfer triggered; BUSY has the value "1".	Distributed I/O
7002	Intermediate call (REQ irrelevant): Data transfer already active; BUSY has the value "1".	Distributed I/O
8090	Specified logical base address invalid.	-
8092	A data type other than (Array of) bit string or integer was specified at the RECORD parameter.	-
8093	This instruction is not valid for the module selected with LADDR.	-
80A1	Negative acknowledgment during sending of data record to module (module defective or unplugged during sending).	-
80A2	DP protocol error at layer 2, possible hardware/interface error in DP slave.	Distributed I/O

9.7 References

Error code* (W#16#...)	Explanation	Restriction
80A3	DP protocol error at user interface/user.	Distributed I/O
80A4	Communication on PBUS+ disrupted	-
80B0	Instruction for module type not possible, or module does not recognize the data record.	-
80B1	The length of the data record to be sent is incorrect. With RD_DPARM (Page 2746): The target range spanned by RECORD is too short.	-
80B2	The configured slot is not assigned.	-
80B3	Actual module type does not correspond to specified module type.	-
80C1	The data of the previous write job on the module for the same data record have not yet been processed by the module.	-
80C2	The module is currently processing the maximum possible number of jobs for a CPU.	-
80C3	The required resources (memory, etc.) are currently occupied.	-
80C4	Internal temporary error. Job could not be executed. Repeat the job. If this error occurs often, check your installation for sources of electrical interference.	-
80C5	Distributed I/O not available or deactivated.	Distributed I/O
80C6	Data record transfer cancelled due to priority class abort (restart or background).	Distributed I/O
80D0	There is no entry for the module.	-
80D1	The data record number is not configured for the module (data record numbers > 241 are rejected).	-
80D2	The module cannot be assigned parameters according to its type identifier.	-
80D5	The data record is static.	-
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)	-

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

**RD\_DPARM: Read data record from configured system data**

**Description**

You use instruction to read the data record with the number RECNUM of the addressed module from the configured system data. The read data record is entered into the target range spanned by the RECORD parameter.

## Parameters

The following table shows the parameters of the instruction "RD\_DPARM":

Parameter	Declaration	Data type	Memory area	Description
IOID	Input	BYTE	I, Q, M, D, L or constant	Address area identifier: <ul style="list-style-type: none"> <li>• B#16#54 = Peripheral input (PI)</li> <li>• B#16#55 = Peripheral output (PQ)</li> </ul> If the module is a mixed module, the area identifier of the lower address must be specified. If the addresses are identical, specify B#16#54.
LADDR	Input	HW_IO	I, Q, M, D, L or constant	Hardware ID of the CPU or the interface. The number is assigned automatically and is stored in the properties of the CPU or of the interface in the hardware configuration.
RECNUM	Input	BYTE	I, Q, M, D, L or constant	Data record number (permitted values: 0 to 240)
RET_VAL	Return	INT	I, Q, M, D, L	Length of the data record read in bytes if the read data record fits in the target range and no error occurred in the transfer.  If an error occurs while the instruction is being executed, the return value contains an error code.
RECORD	Output	VARIANT	I, Q, M, D, L	Target range for the data record read.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## RET\_VAL parameter

Error code* (W#16#...)	Explanation	Restriction
0000	No error	-
7000	First call with REQ=0: No data transfer active; BUSY has the value "0".	-
7001	First call with REQ=1: Data transfer triggered; BUSY has the value "1".	Distributed I/O
7002	Intermediate call (REQ irrelevant): Data transfer already active; BUSY has the value "1".	Distributed I/O
8090	Specified logical base address invalid.	-
8092	A type other than BYTE is specified in the VARIANT reference at the RECORD parameter.	-
8093	This instruction is not valid for the module selected with LADDR.	-
80B1	The target range spanned by RECORD is too short.	-
80C3	The required resources (memory, etc.) are currently occupied.	-
80D0	There is no entry for the module.	-

Error code* (W#16#...)	Explanation	Restriction
80D1	The data record number is not configured for the module (data record numbers > 241 are rejected).	-
80D2	The module cannot be assigned parameters according to its type identifier.	-
80D5	The data record is static.	-
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)	-

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### WR\_DPARM: Transfer data record

#### Description

You use the instruction "WR\_DPARM" to transfer the data record with the number RECNUM from the configuration data to the addressed module. With this instruction, it is irrelevant whether the data record is static or dynamic.

#### Parameters

The following table shows the parameters of the instruction "WR\_DPARM":

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L	REQ = 1: Write request
LADDR	Input	HW_IO	I, Q, M, D, L or constant	Hardware ID of the CPU or of the interface. The number is assigned automatically and is stored in the properties of the CPU or of the interface in the hardware configuration.
RECNUM	Input	BYTE	I, Q, M, D, L or constant	Data record number
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code.
BUSY	Output	BOOL	I, Q, M, D, L	BUSY = 1: The writing process is not yet completed.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## RET\_VAL parameter

Error code* (W#16#...)	Explanation	Restriction
0000	No error	-
7000	First call with REQ=0: No data transfer active; BUSY has the value 0.	-
7001	First call with REQ=1: Data transfer triggered; BUSY has the value "1".	Distributed I/O
7002	Intermediate call (REQ irrelevant): Data transfer already active; BUSY has the value "1".	Distributed I/O
8090	Address specified at parameter LADDR is invalid.	-
8093	This instruction is not valid for the module selected with LADDR.	-
80A1	Negative acknowledgment during sending of data record to module (module defective or unplugged during sending).	-
80A2	DP protocol error at layer 2, possible hardware/interface error in DP slave.	Distributed I/O
80A3	DP protocol error at user interface/user.	Distributed I/O
80A4	Communication on PBUS+ disrupted	-
80B0	Instruction for module type not possible, or module does not recognize the data record.	-
80B1	The length of the data record to be sent is incorrect.	-
80B2	The configured slot is not assigned.	-
80B3	Actual module type does not correspond to specified module type.	-
80C1	The data of the previous write job on the module for the same data record have not yet been processed by the module.	-
80C2	The module is currently processing the maximum possible number of jobs for a CPU.	-
80C3	The required resources (memory, etc.) are currently occupied.	-
80C4	Internal temporary error. Job could not be executed. Repeat the job. If this error occurs often, check your installation for sources of electrical interference.	-
80C5	Distributed I/O not available or deactivated.	Distributed I/O
80C6	Data record transfer cancelled due to priority class abort (restart or background).	Distributed I/O
80D0	There is no entry for the module.	-
80D1	The data record number is not configured for the module (data record numbers > 241 are rejected).	-
80D2	The module cannot be assigned parameters according to its type identifier.	-
80D5	The data record is static.	-

Error code* (W#16#...)	Explanation	Restriction
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)	-
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

### 9.7.3.7 Interrupts

#### ATTACH: Attach an OB to an interrupt event

##### Description

You use the instruction "ATTACH" to assign an organization block (OB) to an event.

You enter the symbolic or numeric name of the organization block in the OB\_NR parameter. This will then be assigned to the event specified in the EVENT parameter.

If the event in the EVENT parameter occurs following error-free execution of the "ATTACH" instruction, the organization block in the OB\_NR parameter will be called and its program executed.

With the ADD parameter, you specify whether previous assignments of the organization block to other events should be canceled or retained. If the ADD parameter has the value "0", the existing assignments will be replaced by the current assignment.

##### Parameters

The following table shows the parameters of the "ATTACH" instruction:

Parameter	Declaration	Data type	Memory area	Description
OB_NR	Input	OB_ATT	I, Q, M, D, L or constant	Organization block (numbers up to 32767 are supported.)
EVENT	Input	EVENT_ATT	D, L or constant	Event, e.g., creation of a process event (failure of a hardware module; read hardware ID (16#C0xyzz) and query at block)
ADD	Input	BOOL	I, Q, M, D, L or constant	Effects on previous assignments: <ul style="list-style-type: none"> <li>• ADD=0 (default): This event replaces all previous event assignments for this OB.</li> <li>• ADD=1: This event is added to the previous event assignments for this OB.</li> </ul>
RET_VAL	Return	INT	I, Q, M, D, L	Status of the instruction

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter RET\_VAL

Error code* (W#16#...)	Description
0	No error
8090	OB does not exist
8091	OB is incorrect type
8093	Event does not exist
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## DETACH: Detach an OB from an interrupt event

### Description

You use this instruction to cancel the existing assignment of an organization block to one or more events during runtime.

- If you have selected a single event, the assignment of the OB to this event will be cancelled. All other currently existing assignments remain active. You can select an individual event using the drop-down list of the operand placeholder at the EVENT parameter.
- If you have not selected an event, all currently existing assignments of the organization block to events will be canceled.

You enter the symbolic or numeric name of the organization block in the OB\_NR parameter. The assignment of this organization block to the event specified in the EVENT parameter will then be canceled.

### Parameters

The following table shows the parameters of the "DETACH" instruction:

Parameters	Declaration	Data type	Memory area	Description
OB_NR	Input	OB_ATT	I, Q, M, D, L or constant	Organization block (numbers up to 32767 are supported.)
EVENT	Input	EVENT_ATT	D, L or constant	Event
RET_VAL	Return	INT	I, Q, M, D, L	Status of the instruction

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameter RET\_VAL

Error code* (W#16#...)	Description
0	No error
1	No assignment exists (warning)
8090	OB does not exist
8091	OB has incorrect type
8093	Event does not exist

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### Cyclic interrupt

#### SET\_CINT: Set cyclic interrupt parameters

#### Description

You use this instruction to set the parameters for a cyclic interrupt OB. The start time for a cyclic interrupt OB is generated from the respective time interval of the OB and the phase offset.

- The time interval of an OB is the interval at which the OB is periodically called. For example, if the time interval is 100 µs, the OB will be called every 100 µs during program execution.
- The phase offset is a time interval by which the call of a cyclic interrupt OB is offset. You can use the phase offset to process low priority organization blocks in a precise time base.

If the OB does not exist or if the time interval used is not supported, a corresponding error alarm is output in the RET\_VAL parameter.

A time interval in the CYCLE parameter of "0" means that the OB will not be called.

#### Functional description

If a lower priority OB and a higher priority OB are called in the same time interval, the lower priority OB will only be called once the higher priority OB has been executed. The call time for

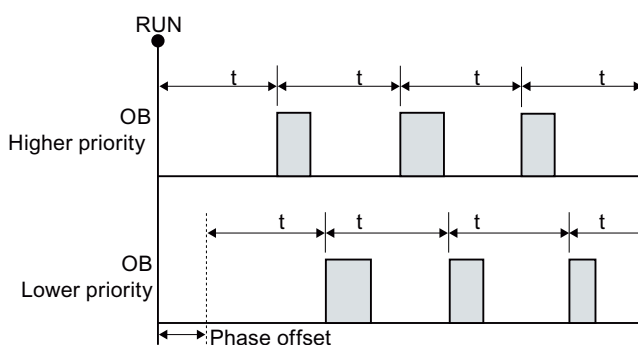

the lower priority OB can be offset according to the length of time to execute the higher-priority OB.

OB call without phase offset

If a phase offset is configured for the lower priority OB and the phase offset is greater than the current execution time of the respective higher priority OB, then the block will be called in a fixed time base.

OB call with phase offset

## Parameters

The following table shows the parameters of the "SET\_CINT" instruction:

Parameter	Declaration	Data type	Memory area	Description
OB_NR	Input	OB_CYCLIC	I, Q, M, D, L or constant	OB number (<32768)
CYCLE	Input	UDINT	I, Q, M, D, L or constant	Time interval in microseconds
PHASE	Input	UDINT	I, Q, M, D, L or constant	Phase offset
RET_VAL	Return	INT	I, Q, M, D, L	Status of the instruction

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameter RET\_VAL

Error code* (W#16#...)	Description
0	No error
8090	OB does not exist or is of the wrong type
8091	Incorrect time interval
8092	Incorrect phase offset
80B2	No event assigned to OB

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### QRY\_CINT: Query cyclic interrupt parameters

#### Description

You can use this instruction to query the current parameters of a cyclic interrupt OB. The cyclic interrupt OB is identified using the OB\_NR parameter.

The values of the queried cyclic interrupt parameters correspond to those at the time the "QRY\_CINT" instruction is executed.

#### Parameters

The following table shows the parameters of the "QRY\_CINT" instruction:

Parameter	Declaration	Data type	Memory area	Description
OB_NR	Input	OB_CYCLIC (INT)	I, Q, M, D, L or constant	OB number (<32768) or symbolic addressing via the name of the OB (e.g. OB_MyOB)
CYCLE	Output	UDINT	I, Q, M, D, L	Time interval in microseconds
PHASE	Output	UDINT	I, Q, M, D, L	Phase offset
STATUS	Output	WORD	I, Q, M, D, L	Status of the cyclic interrupt: <ul style="list-style-type: none"> <li>• Bit 0 to bit 4: see parameter STATUS</li> <li>• Other bits: Always "0"</li> </ul>
RET_VAL	Return	INT	I, Q, M, D, L	Status of the instruction

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameter STATUS

Bit	Value	Meaning
0	0	Not used (always "0").
1	0	The cyclic interrupt is enabled.

Bit	Value	Meaning
	1	The cyclic interrupt is delayed.
2	0	The cyclic interrupt is not enabled or has expired.
	1	The cyclic interrupt is enabled.
3	0	Not used (always "0").
4	0	An OB with the specified number does not exist.
	1	An OB with the specified number exists.
Other bits		Not used (always "0").

### Parameter RET\_VAL

If an error occurs, the relevant error code will be displayed in the RET\_VAL parameter and the STATUS parameter is set to "0".

Error code* (W#16#....)	Description
0	No error.
8090	OB does not exist or is of the wrong type
80B2	No result assigned to OB.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

### Time-of-day interrupt

#### SET\_TINT: Set time-of-day interrupt

#### Description

The instruction "SET\_TINT" is used to set the start data and time of the time-of-day interrupt organization blocks from the user program, without having to make settings in the hardware configuration.

- Enter the number of the time-of-day interrupt-OBs at the parameter OB\_NR for which you would like to set the start date and the time-of-day.
- Use the parameter SDT and PERIOD to specify when and how often the time-of-day interrupt OB should be called:
  - One-time call: Enter at the parameter SDT the date and the time-of-day and use the value "0" at the parameter PERIOD.
  - Repeated call: Enter the date and the time-of-day of the first call at the parameter SDT. Use the parameter PERIOD to define the time interval in which subsequent calls of the OBs should take place.

Observe the following when setting the start date and start time:

- The date and the time-of-day specification at the parameter SDT refers to the system time.
- The seconds and milliseconds specification is ignored and set to "0" at the start time.
- Only the starting date days 1, 2, ... 28 are possible if you want to specify a monthly time-of-day interrupt OBs. This restriction prevents skipping the monthly call (e.g. 30-day months or in February).  
The setting "end of the month" (W#16#2001) can be used at the parameter PERIOD as an alternative to the 29th 30th and the 31st of the month.

After setting the time-of-day interrupt with "SET\_TINT" it still must be activated with the instruction "ACT\_TINT".

---

**Note**

**Additional information about time-of-day interrupt OBs**

Other special features for the use of time-of-day interrupt OBs can be found in the descriptions of the organization blocks of the respective CPU:

For the S7-1200: Auto-Hotspot

For the S7-1500: Auto-Hotspot

The settings at the parameters SDT and PERIOD coincide with the settings for time-of-day interrupt in the properties of the time-of-day interrupt OBs.

---

**Parameters**

The following table shows the parameters of the "SET\_TINT" instruction:

Parameters	Declaration	Data type	Memory area	Description
OB_NR	Input	OB_TOD	I, Q, M, D, L or constant	Number of the time-of-day interrupt OBs <ul style="list-style-type: none"> <li>• The numbers 10 to 17 are available for the time-of-day interrupt OBs.</li> <li>• An OB number starting with 123 can also be assigned as an alternative.</li> </ul> The OB number is displayed in the program block folder and in the system constants.
SDT	Input	DT	D, L or constant	Start date and start time

Parameters	Declaration	Data type	Memory area	Description
PERIOD	Input	WORD	I, Q, M, D, L or constant	Execution intervals from the starting point SDT to: <ul style="list-style-type: none"> <li>• W#16#0000 = single execution</li> <li>• W#16#0201 = once every minute</li> <li>• W#16#0401 = once hourly</li> <li>• W#16#1001 = once daily</li> <li>• W#16#1201 = once weekly</li> <li>• W#16#1401 = once monthly</li> <li>• W#16#1801 = once yearly</li> <li>• W#16#2001 = at month's end</li> </ul>
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs during execution of the instruction, the actual parameter of RET_VAL contains an error code.

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### RET\_VAL parameter

Error code* (W#16#...)	Description
0000	No error occurred.
8090	Error at the parameter OB_NR (no time-of-day interrupt OB addressed).
8091	Error at the parameter SDT (invalid date and time-of-day specification).
8092	Incorrect input at the parameter PERIOD.
80A1	The set start time is in the past. This error code only occurs at PERIOD = W#16#0000.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### See also

ACT\_TINT: Enable time-of-day interrupt (Page 2761)

## SET\_TINTL: Set time-of-day interrupt

### Description

The instruction "SET\_TINTL" is used to set the start data and time of the time-of-day interrupt organization blocks from the user program, without having to make settings in the hardware configuration.

- Enter the number of the time-of-day interrupt-OBs at the parameter OB\_NR for which you would like to set the start date and the time-of-day.
- Use the parameter SDT and PERIOD to specify when and how often the time-of-day interrupt OB should be called:
  - One-time call: Enter at the parameter SDT the date and the time-of-day and use the value "0" at the parameter PERIOD.
  - Repeated call: Enter the date and the time-of-day of the first call at the parameter SDT. Use the parameter PERIOD to define the time interval in which subsequent calls of the OBs should take place.
- Use the parameter LOCAL to select whether the time specified at the parameter SDT refers to the local time or the system time.
- With the ACTIVATE parameter, you specify whether the settings made for the organization block are to be applied directly (ACTIVATE = true) or only after "ACT\_TINT (Page 2761)" for the time-of-day interrupt organization block is called (ACTIVATE = false).

Observe the following when setting the start date and start time:

- The seconds and milliseconds specification is ignored and set to "0" at the start time.
- Only the starting date days 1, 2, ... 28 are possible if you want to specify a monthly time-of-day interrupt OBs. This restriction prevents skipping the monthly call (e.g. 30-day months or in February).  
The setting "end of the month" (W#16#2001) can be used at the parameter PERIOD as an alternative to the 29th 30th and the 31st of the month.

Please observe the following during the use of local time:

- Changeover from daylight saving to standard time: When calling time-of-day interrupt organization blocks with a start time within the second hour during changeover from daylight saving time to standard time, also use a time-delay interrupt during the first hour of the time changeover.
- Changeover from standard to daylight saving time: If you specify the skipped hour as the time-of-day for the daylight saving time changeover day, the error code 16#8091 will be output at a single execution (PERIOD = W#16#0000).

**Note****Additional information about time-of-day interrupt OBs**

Other special features for the use of time-of-day interrupt OBs can be found in the descriptions of the organization blocks of the respective CPU:

For the S7-1200: Auto-Hotspot

For the S7-1500: Auto-Hotspot

The settings at the parameters SDT and PERIOD coincide with the settings for time-of-day interrupt in the properties of the time-of-day interrupt OBs.

**Parameters**

The following table shows the parameters of the "SET\_TINTL" instruction:

Parameters	Declaration	Data type	Memory area	Description
OB_NR	Input	OB_TOD	I, Q, M, D, L or constant	Number of the time-of-day interrupt OBs <ul style="list-style-type: none"> <li>The numbers 10 to 17 are available for the time-of-day interrupt OBs.</li> <li>An OB number starting with 123 can also be assigned as an alternative.</li> </ul> The OB number is displayed in the program block folder and in the system constants.
SDT	Input	DTL	D, L or constant	Start date and start time
LOCAL	Input	BOOL	I, Q, M, D, L or constant	<ul style="list-style-type: none"> <li>true: Use local time</li> <li>false: Use system time</li> </ul>
PERIOD	Input	WORD	I, Q, M, D, L or constant	Execution intervals from the starting point SDT to: <ul style="list-style-type: none"> <li>W#16#0000 = single execution</li> <li>W#16#0201 = Once every minute</li> <li>W#16#0401 = once hourly</li> <li>W#16#1001 = once daily</li> <li>W#16#1201 = once weekly</li> <li>W#16#1401 = once monthly</li> <li>W#16#1801 = once yearly</li> <li>W#16#2001 = at month's end</li> </ul>
ACTIVATE	Input	BOOL	I, Q, M, D, L or constant	<ul style="list-style-type: none"> <li>true: set and activate the time-of-day interrupt</li> <li>false: set the time-of-day interrupt and only activate at call of "ACT_TINT (Page 2761)"</li> </ul>
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs during execution of the instruction, the actual parameter of RET_VAL contains an error code.

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### RET\_VAL parameter

Error code* (W#16#...)	Description
0000	No error occurred.
8090	Error at the parameter OB_NR (no time-of-day interrupt OB addressed).
8091	Error at the parameter SDT (invalid date and time-of-day specification).
8092	Incorrect input at the parameter PERIOD.
80A1	The set start time is in the past. This error code only occurs at PERIOD = W#16#0000.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### CAN\_TINT: Cancel time-of-day interrupt

#### Description

The instruction "CAN\_TINT" is used to delete the start data and start time of a specified time-of-day interrupt organization block. This deactivates the time-of-day interrupt, and the organization block is no longer called.

If you want to reuse the time-of-day interrupt, the start time must be reset (instruction "SET\_TINTL (Page 2758)" or "SET\_TINT (Page 2755)").

Thereafter, you must reactivate the time-of-day interrupt:

- If you use the instruction "SET\_TINT (Page 2755)" or "SET\_TINTL (Page 2758)" with parameter ACTIVE=false to set the time-of-day interrupt, call "ACT\_TINT (Page 2761)".
- By using the instruction "SET\_TINTL (Page 2758)" you can also activate the time-of-day interrupt directly with the parameter ACTIVE=true.

#### Parameters

The following table shows the parameters of the instruction "CAN\_TINT":

Parameters	Declaration	Data type	Memory area	Description
OB_NR	Input	OB_TOD	I, Q, M, D, L or constant	Number of the time-of-day interrupt OB, whose starting date and time-of-day are to be deleted.
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs during execution of the instruction, the actual parameter of RET_VAL contains an error code.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter RET\_VAL

Error code* (W#16#...)	Description
0000	No error occurred.
8090	Error at the parameter OB_NR.
80A0	No starting date/time-of-day defined for the affected time-of-day interrupt OB.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## ACT\_TINT: Enable time-of-day interrupt

### Description

With the instruction "ACT\_TINT" you can activate a time-of-day interrupt organization block from the user program. A prerequisite for the execution of the instruction is that the starting date and time-of-day are already set for the time-of-day interrupt OB.

### Parameters

The following table shows the parameters of the instruction "ACT\_TINT":

Parameters	Declaration	Data type	Memory area	Description
OB_NR	Input	OB_TOD	I, Q, M, D, L or constant	Number of the time-of-day interrupt OBs <ul style="list-style-type: none"> <li>The numbers 10 to 17 are available for the time-of-day interrupt OBs.</li> <li>An OB number starting with 123 can also be assigned as an alternative.</li> </ul> The OB number is displayed in the program block folder and in the system constants.
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs during execution of the instruction, the actual parameter of RET_VAL contains an error code.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter RET\_VAL

Error code* (W#16#...)	Description
0000	No error occurred.
8090	Error at the parameter OB_NR (no time-of-day interrupt OB addressed).

Error code* (W#16#...)	Description
80A0	Start date and time-of day not set for the relevant time-of-day interrupt OB.
80A1	The activated time is in the past. The error only occurs if the time-of-day interrupt is only to be executed once.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

### QRY\_TINT: Query status of time-of-day interrupt

#### Description

You can use this instruction to display the status of a time-of-day interrupt organization block in the STATUS output parameter.

#### Parameters

The following table shows the parameters of the "QRY\_TINT" instruction:

Parameters	Declaration	Data type	Memory area	Description
OB_NR	Input	OB_TOD	I, Q, M, D, L or constant	Number of the time-of-day interrupt OB whose status is queried The OB number is displayed in the program block folder and in the system constants.
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs during execution of the instruction, the actual parameter of RET_VAL contains an error code.
STATUS	Output	WORD	I, Q, M, D, L	Status of the time-of-day interrupt (see below)

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

#### Parameter RET\_VAL

Error code* (W#16#...)	Description
0000	No error occurred. Exception: Status message "0" on bit 4 (no OB with this number created).
8090	Error at the parameter OB_NR. Possible causes: <ul style="list-style-type: none"> <li>The value at the parameter OB_NR is not an OB number (&lt;1 or &gt; 32767) supported by the CPU.</li> <li>The OB number does not address a time-of-day interrupt OB.</li> </ul>

Error code* (W#16#...)	Description
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## Parameter STATUS

If an error occurs (see RET\_VAL parameter), "0" is output in the STATUS parameter.

Bit	Value	Meaning
0	0	In Run.
	1	During startup.
1	0	The time-of-day interrupt is enabled.
	1	The time-of-day interrupt is disabled.
2	0	Time-of-day interrupt is not activated or has elapsed.
	1	The time-of-day interrupt is activated.
4	0	An OB with an OB number as specified at OB_NR parameter does not exist.
	1	An OB with an OB number as specified at OB_NR parameter does exist.
6	0	The time-of-day interrupt is based on the system time
	1	The time-of-day interrupt is based on the local time
Other		Always "0"

## Time-delay interrupt

### Using time-delay interrupts

#### Definition

After you have called the "SRT\_DINT (Page 2765)" instruction, the operating system generates an interrupt after the specified delay time has elapsed, in other words, the assigned time-delay interrupt OB is called.

#### Prerequisites for the call

Before a time-delay interrupt can be called by the operating system, the following conditions must be met:

- The time-delay interrupt OB must be started by the "SRT\_DINT (Page 2765)" instruction.
- The time-delay interrupt OB must not be deselected during configuration.
- The time-delay interrupt OB must exist in the CPU.

**Purpose of the instructions "SRT\_DINT", "CAN\_DINT" and "QRY\_DINT"**

You use the instructions to

- Start time-delay interrupts ("SRT\_DINT (Page 2765)")
- Cancel time-delay interrupts ("CAN\_DINT (Page 2766)")
- Query time-delay interrupts ("QRY\_DINT (Page 2766)")

**Effects on the time-delay interrupt**

The following table lists a number of different situations and explains the effect they have on a time-delay interrupt.

If ...	and ...	Then ...
A time-delay interrupt is started (by calling "SRT_DINT (Page 2765)")	The time-delay interrupt has already started,	The delay time is overwritten; the time-delay interrupt is started again.
	The time-delay interrupt OB does not exist at the time of the call,	The operating system generates a priority class error (calls OB 85). If OB 85 does not exist, the CPU changes to STOP.
	The interrupt is started in a startup OB and the delay time elapses before the CPU changes to RUN,	The call of the time-delay interrupt OB is delayed until the CPU is in RUN mode.
The delay time has elapsed,	A previously started time-delay interrupt OB is still being executed,	The operating system generates a time error (calls OB 80). If OB 80 does not exist, the CPU changes to STOP.

**Response to warm restart and cold restart**

During a warm restart or a cold restart, all the time-delay interrupt settings made in the user program by means of instructions are cleared.

**Starting in a startup OB**

A time-delay interrupt can be started in a startup OB. Two conditions must be satisfied to call the time-delay OB:

- The delay time must have elapsed.
- The CPU must be in the RUN mode.

If the delay time has elapsed and the CPU is not yet in the RUN mode, the time-delay interrupt OB call is delayed until the CPU is in RUN mode. The time-delay interrupt OB is then called before the first instruction in OB Main [OB 1] is executed.

**SRT\_DINT: Start time-delay interrupt****Description**

The instruction "SRT\_DINT" is used to start a time-delay interrupt, which calls a time-delay interrupt OB after the expiry of the delay time specified at the parameter DTIME. The delay time is started when a negative edge is generated in the EN enable input. The signal state of enable input EN must be "0" during delay time countdown. If the delay time countdown is interrupted, the OB configured in the OB\_NR parameter is not executed.

**Accuracy**

The maximum time between the call of the "SRT\_DINT" instruction and the start of the time-delay interrupt OB is one millisecond longer than the configured delay time, provided that no interruption events delay the call.

**Parameters**

The following table shows the parameters of the instruction "SRT\_DINT":

Parameter	Declaration	Data type	Memory area	Description
OB_NR	Input	OB_DELAY (INT)	I, Q, M, D, L or constant	Number of the OB to be executed after a delay time
DTIME	Input	TIME	I, Q, M, D, L or constant	Delay time (1 to 60000 ms) You can realize longer times, for example, by using a counter in a time-delay interrupt OB.
SIGN	Input	WORD	I, Q, M, D, L or constant	Identifier that appears when the time-delay interrupt OB is called in the start event information of the OB.
RET_VAL	Return	INT	I, Q, M, D, L	Status of the instruction

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**Parameter RET\_VAL**

Error code* (W#16#...)	Description
0000	No error
8090	Incorrect parameter OB_NR
8091	Incorrect parameter DTIME
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## CAN\_DINT: Cancel time-delay interrupt

### Description

You use this instruction to cancel a started time-delay interrupt and, thus, also cancel the call of the time delay interrupt OB that is to be executed after the configured delay time. You specify the number of the organization block whose call is to be canceled in the OB\_NR parameter.

### Parameters

The following table shows the parameters of the "CAN\_DINT" instruction:

Parameter	Declaration	Data type	Memory area	Description
OB_NR	Input	OB_DELAY (INT)	I, Q, M, D, L or constant	Number of the OB whose call will be canceled
RET_VAL	Return	INT	I, Q, M, D, L	Status of the instruction

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameter RET\_VAL

Error code* (W#16#...)	Description
0000	No error
8090	Incorrect parameter OB_NR
80A0	Time-delay interrupt has not started.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## QRY\_DINT: Query time-delay interrupt status

### Description

The instruction "QRY\_DINT" is used to query the status of the time-delay interrupt.

## Parameters

The following table shows the parameters of the instruction "QRY\_DINT":

Parameter	Declaration	Data type	Memory area	Description
OB_NR	Input	OB_DELAY (INT)	I, Q, M, D, L or constant	Number of the OB whose status is being queried.
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs during execution of the instruction, the actual parameter of RET_VAL contains an error code. The value "0" is displayed in the STATUS parameter.
STATUS	Output	WORD	I, Q, M, D, L	Status of the time-delay interrupt, see following table.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter STATUS

Bit	Value	Meaning
0	0	Operating system in RUN
	1	Operating system in startup
1	0	Time-delay interrupt is enabled by the operating system.
	1	Time-delay interrupt is disabled.
2	0	Time-delay interrupt is not activated or has elapsed.
	1	Time-delay interrupt is activated.
3	-	-
4	0	Time-delay interrupt OB with the specified number does not exist.
	1	Time-delay interrupt OB with the specified number exists.
Other bits		Always "0"

## Parameter RET\_VAL

Error code* (W#16#...)	Description
0000	No error occurred.
8090	Incorrect information in the OB_NR parameter
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## Synchronous errors

### Mask synchronous error events

#### Introduction

Synchronous errors are programming and access errors. Such errors occur as a result of programming with incorrect operand areas or numbers, or incorrect addresses. **Masking** these synchronous errors means the following:

- Masked synchronous errors do not trigger an error OB call and do not lead to a programmed alternative reaction.
- The CPU "records" the masked errors that have occurred in an error status register.

Masking is carried out by calling the "MSK\_FLT (Page 2773)" instruction.

**Unmasking** errors means canceling a previously set mask and clearing the corresponding bit in the event status register of the current priority class. Masking is canceled as follows:

- By calling the "DMSK\_FLT (Page 2774)" instruction.
- Once the current priority class has been completed.

If an error event occurs after it has been unmasked, then the operating system will start the associated error OB.

You can use the "READ\_ERR (Page 2775)" instruction to read the masked errors that have occurred.

---

#### Note

Regardless of masking or unmasking of the error events for the S7-1500, the error event is entered in the diagnostic buffer and the group error LED of the CPU lights up.

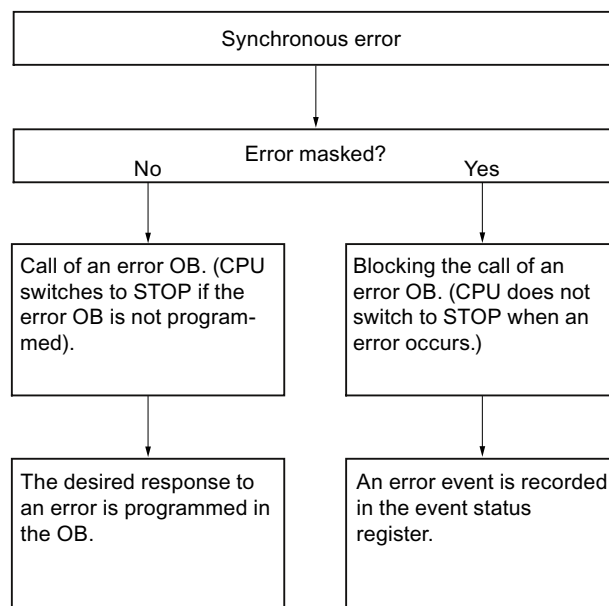

---

## Handling errors in general

Different actions are possible if programming and I/O area access errors occur in a user program:

- You can program an error OB that is called by the operating system when the corresponding error occurs.
- You can disable the error OB call individually for each priority class. In this case, the CPU does not change to STOP when an error of this type occurs in the particular priority class. The CPU enters the error in an error register. From this entry, however, you cannot recognize when or how often the error occurred.

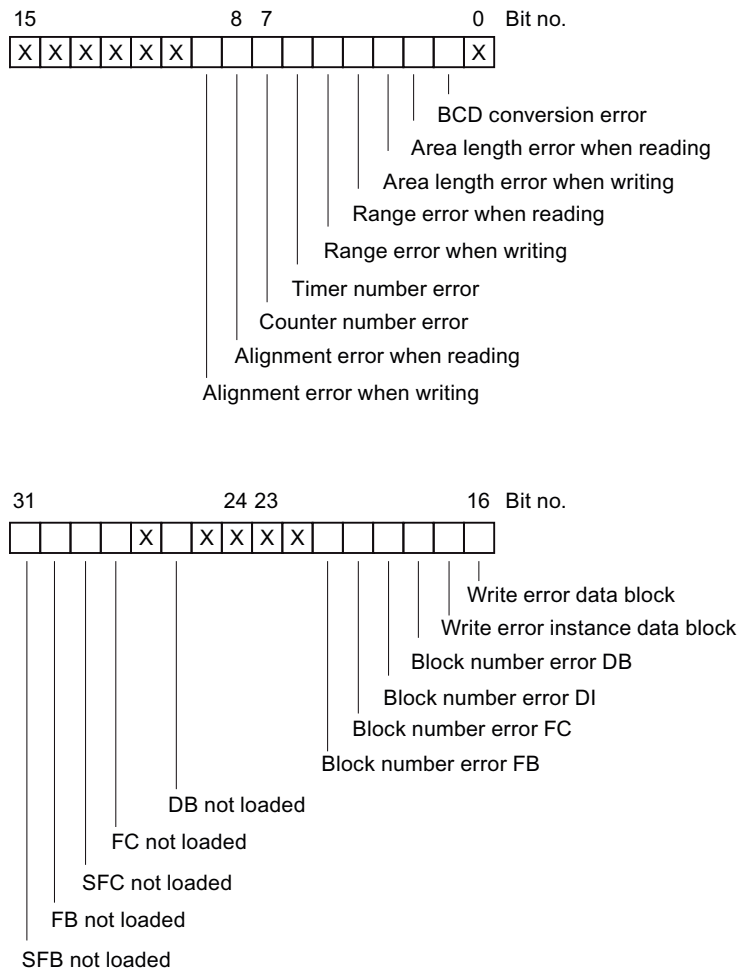

**Synchronous errors** are assigned to a particular bit pattern known as the **error filter**. You can find this error filter in the input and output parameters of the "MSK\_FLT (Page 2773)", "DMSK\_FLT (Page 2774)", and "READ\_ERR (Page 2775)" instructions.

Synchronous errors are divided into **programming and access errors** which you can mask in two error masks. The error filters are illustrated in the following figures.

**Programming error filter**

The following figure shows the bit pattern of the error filter for programming errors. The error filter for the programming errors is available in the "PRGFLT\_..." parameters (see below "Programming errors, Low-Word" or "Programming errors, High-Word").

Legend: X Not relevant

The non-relevant bits "x" are set to "0" for the input and output parameters of the instructions "MSK\_FLT (Page 2773)", "DMSK\_FLT (Page 2774)", "READ\_ERR (Page 2775)".

### Access error mask

The following figure shows the bit pattern of the error mask for access errors. The error mask for access errors is located in the parameters ACCFLT\_...

Legend:

**Programming error low word**

The following table lists the errors assigned to the low word of the error filter for programming errors. The possible causes of the errors are also listed.

Error	Event ID (W#16#...)	Possible cause of error
BCD conversion error	2521	The value to be converted is not a BCD number (e.g. 5E8).
Area length error when reading	2522	An addressed operand is not located entirely within the possible operand range. Example: MW 320 should be read although the memory area is only 256 bytes long.
Area length error when writing	2523	An addressed operand is not located entirely within the possible operand range. Example: A value should be written to MW 320 although the memory area is only 256 bytes long.
Range error when reading	2524	An incorrect range identifier for the operand was specified during indirect, overlapping range addressing. Example: <ul style="list-style-type: none"> <li>• Correct: LAR1 P#E 12.0 L W[AR1, P#0.0]</li> <li>• Incorrect: LAR1 P#12.0 L W[AR1, P#0.0] The range error is reported during this operation.</li> </ul>
Range error when writing	2525	An incorrect range identifier for the operand was specified during indirect, overlapping range addressing. Example: <ul style="list-style-type: none"> <li>• Correct: LAR1 P#E 12.0 T W[AR1, P#0.0]</li> <li>• Incorrect: LAR1 P#12.0 T W[AR1, P#0.0] The range error is reported during this operation.</li> </ul>
Timer number error	2526	A non-existent timer is accessed. Example: <ul style="list-style-type: none"> <li>• SI T [MW 0] with MW 0 = 129; the timer 129 should be started although there are only 128 timers available.</li> </ul>
Counter number error	2527	A non-existent counter is accessed. <ul style="list-style-type: none"> <li>• Example: ZV Z [MW 0] with MW 0 = 600; the counter 600 is accessed although only 512 counters are available.</li> </ul>
Alignment error when reading	2528	A byte, word or double word operand with a bit address ≠ 0 is addressed. Example: <ul style="list-style-type: none"> <li>• Correct: LAR1 P#M12.0 L B[AR1, P#0.0]</li> <li>• Incorrect: LAR1 P#M12.4 L B[AR1, P#0.0]</li> </ul>
Alignment error when writing	2529	A byte, word or double word operand with a bit address ≠ 0 is addressed. Example: <ul style="list-style-type: none"> <li>• Correct: LAR1 P#M12.0 T B[AR1, P#0.0]</li> <li>• Incorrect: LAR1 P#M12.4 T B[AR1, P#0.0]</li> </ul>

## Programming error high word

The following table lists the errors assigned to the high word of the error filter for programming errors. The possible causes of the errors are also listed.

Error	Event ID (W#16#...)	Possible cause of error
Write error data block	2530	The data block to be written to is write-protected.
Write error instance data block	2531	The instance data block to be written to is write-protected.
Block number error DB	2532	The number of the data block is greater than the highest permissible number.
Block number error DI	2533	The number of the instance data block is greater than the highest permissible number.
Block number error FC	2534	The number of a called function (FC) is greater than the highest permissible number.
Block number error FB	2535	The number of a called function block (FB) is greater than the highest permissible number.
DB not loaded	253A	The data block is not loaded.
Instruction not loaded	253C to 253F	The instruction to be called is not loaded.

## Access error

The following table contains the errors that are assigned to the error mask for access errors. The possible causes of the errors are also listed.

Error	Event ID (W#16#...)	Possible cause of error
I/O access error when reading	2942	<ul style="list-style-type: none"> <li>The address in the I/O area has no assigned signal module.</li> <li>Access to this I/O area was not acknowledged within the specified module monitoring time (timeout).</li> </ul>
I/O access error when writing	2943	

## MSK\_FLT: Mask synchronous error events

### Description

You use the instruction to control the reaction of the CPU to synchronous errors. This is done by masking the respective synchronous errors (for error filters, see Mask synchronous error events (Page 2768)). When you call "MSK\_FLT", you mask the synchronous errors in the current priority class.

If you set individual bits of the synchronous error filter to "1" in the input parameters, other bits that were set previously retain their value of "1". You obtain new error filters that you can read out using the output parameters. The synchronous errors you have masked do not call an OB but are simply entered in an error register. You can read the error register with the "READ\_ERR (Page 2775)" instruction.

### Parameters

The following table shows the parameters of the instruction "MSK\_FLT":

Parameter	Declaration	Data type	Memory area	Description
PRGFLT_SET_MASK	Input	DWORD	I, Q, M, D, L or constant	Programming error to be masked
ACCFLT_SET_MASK	Input	DWORD	I, Q, M, D, L or constant	Access error to be masked
RET_VAL	Return	INT	I, Q, M, D, L	Error information
PRGFLT_MASKED	Output	DWORD	I, Q, M, D, L	Masked programming errors
ACCFLT_MASKED	Output	DWORD	I, Q, M, D, L	Masked access errors

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

### Parameter RET\_VAL

Error code* (W#16#...)	Description
0000	None of the errors were already masked.
0001	At least one of the errors was already masked. Nevertheless the other errors will be masked.
-	General error information See also: Getting error ID locally with GetErrorID (Page 2520)

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### See also

Evaluating errors with output parameter RET\_VAL (Page 1796)

### DMSK\_FLT: Unmask synchronous error events

#### Description

You use the instruction to unmask the errors masked with "MSK\_FLT (Page 2773)". To do this, you must set the corresponding bits of the error filter to "1" in the input parameters. With the "DMSK\_FLT" call, you unmask the corresponding synchronous errors of the current priority class. At the same time, the queried entries are cleared in the error register. You can read out the new error filters using the output parameters.

## Parameters

The following table shows the parameters of the instruction "DMSK\_FLT":

Parameter	Declaration	Data type	Memory area	Description
PRGFLT_RESET_MASK	Input	DWORD	I, Q, M, D, L or constant	Programming errors to be unmasked
ACCFLT_RESET_MASK	Input	DWORD	I, Q, M, D, L or constant	Access errors to be unmasked
RET_VAL	Return	INT	I, Q, M, D, L	Error information
PRGFLT_MASKE D	Output	DWORD	I, Q, M, D, L	Still masked programming errors
ACCFLT_MASKE D	Output	DWORD	I, Q, M, D, L	Still masked access errors

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## Parameter RET\_VAL

Error code* (W#16#...)	Description
0000	All specified errors were unmasked.
0001	At least one of the errors was not masked. Nevertheless the other errors will be unmasked.
-	General error information See also: GET_ERR_ID: Get error ID locally (Page 2520)

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## READ\_ERR: Read out event status register

### Description

You use the instruction to read the error register. The structure of the error register corresponds to that of the programming and access error filters, which you can program as input parameters with "MSK\_FLT (Page 2773)" and "DMSK\_FLT (Page 2774)".

In the input parameters, you enter the synchronous errors you want to read from the error register. When you call "READ\_ERR", you read the required entries from the error register and at the same time clear these entries.

The error register contains information that tells you which of the masked synchronous errors in the current priority class occurred at least once. If a bit is set, this means that the corresponding masked synchronous error occurred at least once.

## Parameters

The following table shows the parameters of the instruction "READ\_ERR":

Parameter	Declaration	Data type	Memory area	Description
PRGFLT_QUERY	Input	DWORD	I, Q, M, D, L or constant	Query programming error
ACCFLT_QUERY	Input	DWORD	I, Q, M, D, L or constant	Query access error
RET_VAL	Return	INT	I, Q, M, D, L	Error information
PRGFLT_CLR	Output	DWORD	I, Q, M, D, L	Programming errors that occurred
ACCFLT_CLR	Output	DWORD	I, Q, M, D, L	Access errors that occurred

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## Parameter RET\_VAL

Error code* (W#16#...)	Description
0000	All queried errors are masked.
0001	At least one of the queried errors is not masked.
-	General error information See also: Getting error ID locally with GetErrorID (Page 2520)

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## See also

Evaluating errors with output parameter RET\_VAL (Page 1796)

## Asynchronous error event

### DIS\_IRT: Disable interrupt event

#### Description

The instruction "DIS\_IRT" is used to disable the processing of new interrupts and asynchronous error events. Disabling means that if an interrupting event occurs, the operating system of the CPU reacts as follows:

- It **neither** calls an interrupt OB nor an asynchronous error OB,
- **nor** does it trigger the normal reaction if an interrupt OB or asynchronous error OB is not programmed.

If you disable interrupts and asynchronous error events, this remains in effect for all priority classes. The disable can only be canceled with the "EN\_IRT (Page 2778)" instruction or by a warm or a cold restart.

Whether the operating system writes interrupts and asynchronous error events to the diagnostics buffer when they occur depends on the input parameter setting you select for MODE.

#### Note

Remember that when you program the "DIS\_IRT" instruction, all interrupts that occur will be discarded.

## Parameters

The following table shows the parameters of the instruction "DIS\_IRT":

Parameter	Declaration	Data type	Memory area	Description
MODE	Input	BYTE	I, Q, M, D, L or constant	Specifies which interrupts and asynchronous errors are disabled.
OB_NR	Input	INT	I, Q, M, D, L or constant	OB number
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## Parameter MODE

MODE (B#16#...)	Meaning
00	All newly occurring interrupts and asynchronous error events are disabled. (Synchronous errors are not disabled.) Assign the value "0" to the OB_NR parameter. Entries continue to be made in the diagnostics buffer.
01	All newly occurring events belonging to a specified interrupt class are disabled. Identify the interrupt class by specifying it as follows: <ul style="list-style-type: none"> <li>• Time-of-day interrupts: 10</li> <li>• Time-delay interrupts: 20</li> <li>• Cyclic interrupts: 30</li> <li>• Process interrupts: 40</li> <li>• Interrupts for DPV1: 50</li> <li>• Multicomputing interrupt: 60</li> <li>• Redundancy error interrupts: 70</li> <li>• Asynchronous error interrupts: 80</li> </ul> Entries continue to be made in the diagnostics buffer.
02	All new occurrences of a specified interrupt are disabled. You designate the interrupt using the OB number. Entries continue to be made in the diagnostics buffer.

**Parameter RET\_VAL**

Error code* (W#16#...)	Description
0000	No error occurred.
8090	The OB_NR input parameter contains an invalid value.
8091	The MODE input parameter contains an invalid value.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**EN\_IRT: Enable interrupt event**

**Description**

You use the instruction to enable the processing of new interrupts and asynchronous error events that you have previously disabled with the "DIS\_IRT (Page 2776)" instruction. This means that if an interrupting event occurs, the operating system of the CPU reacts in one of the following ways:

- It calls an interrupt OB or asynchronous error OB.  
or
- It triggers the standard reaction if the interrupt OB or asynchronous error OB is not programmed.

**Parameters**

The following table shows the parameters of the instruction "EN\_IRT":

Parameter	Declaration	Data type	Memory area	Description
MODE	Input	BYTE	I, Q, M, D, L or constant	Specifies which interrupts and asynchronous error events will be enabled.
OB_NR	Input	INT	I, Q, M, D, L or constant	OB number
RET_VAL	Return	INT	I, Q, M, D, L	If an error occurs while the instruction is being executed, the return value contains an error code.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter MODE

MODE	Meaning
0	All newly occurring interrupts and asynchronous error events are enabled.
1	All newly occurring events belonging to a specified interrupt class are enabled. Identify the interrupt class by specifying it as follows: <ul style="list-style-type: none"> <li>• Time-of-day interrupts: 10</li> <li>• Time-delay interrupts: 20</li> <li>• Cyclic interrupts: 30</li> <li>• Process interrupts: 40</li> <li>• Interrupts for DPV1: 50</li> <li>• Multicomputing interrupt: 60</li> <li>• Redundancy error interrupts: 70</li> <li>• Asynchronous error interrupts: 80</li> </ul>
2	All newly occurring events of a specified interrupt are enabled. You designate the interrupt using the OB number.

## Parameter RET\_VAL

Error code* (W#16#...)	Description
0000	No error occurred.
8090	The OB_NR input parameter contains an invalid value.
8091	The MODE input parameter contains an invalid value.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## DIS\_AIRT: Delay execution of higher priority interrupts and asynchronous error events

### Description

You use "DIS\_AIRT" to delay the processing of interrupt OBs whose priority are higher than the priority of the current organization block.

You can call "DIS\_AIRT" multiple times in an organization block. The "DIS\_AIRT" calls are counted by the operating system. Processing is delayed more and more each time "DIS\_AIRT" is executed. To cancel a delay, you must execute the "EN\_AIRT (Page 2780)" instruction. To cancel all delays, the number of "EN\_AIRT (Page 2780)" executions must be equal to the number of "DIS\_AIRT" calls.

You can query the number of delays in the RET\_VAL parameter of the "DIS\_AIRT" instruction. If the value in the RET\_VAL parameter is "0", there are no delays.

**Parameters**

The following table shows the parameters of the "DIS\_AIRT" instruction:

Parameter	Declaration	Data type	Memory area	Description
RET_VAL	Return	INT	I, Q, M, D, L	Number of delays

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**EN\_AIRT: Enable execution of higher priority interrupts and asynchronous error events**

**Description**

You use "EN\_AIRT" to enable processing of organization blocks when interrupts occur that have been delayed by the "DIS\_AIRT (Page 2779)" instruction.

When "EN\_AIRT" is executed, you cancel a processing delay that was registered by the operating system when "DIS\_AIRT (Page 2779)" was called. To cancel all delays, the number of "EN\_AIRT" executions must be equal to the number of "DIS\_AIRT (Page 2779)" calls. If, for example, you have called "DIS\_AIRT (Page 2779)" five times and thereby also delayed the processing five times, you must call the "EN\_AIRT" instruction five times in order to cancel all five delays.

You can query the number of interrupt delays that have not yet been enabled after the execution of "EN\_AIRT" in the RET\_VAL parameter of the "EN\_AIRT" instruction. The value "0" in the RET\_VAL parameter means that all delays enabled by "DIS\_AIRT (Page 2779)" have been cancelled.

**Parameters**

The following table shows the parameters of the "EN\_AIRT" instruction:

Parameter	Declaration	Data type	Memory area	Description
RET_VAL	Return	INT	I, Q, M, D, L	Number of configured delays

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**9.7.3.8 Alarms**

**Program\_Alarm: Generate program alarm with associated values**

**Description**

The instruction "Program\_Alarm" monitors a signal and generates a program alarm when a signal change occurs at the SIG parameter (for definition, see also: Auto-Hotspot). An incoming program message is generated with a signal change from 0 to 1 and an outgoing program

message is generated with a signal change from 1 to 0. The program alarm is triggered synchronously to program execution.

You can append up to ten associated values to the program alarm at the parameters SD\_i ( $0 \leq i \leq 10$ ). The associated values are detected at the time of signal change at parameter SIG and assigned to the program alarm. For more information on configuring associated values, refer to the following sections: Auto-Hotspot, Auto-Hotspot.

Each incoming or outgoing alarm is assigned a time stamp:

- The current system time of the PLC when the signal change occurs is used by default (default value at the TIMESTAMP parameter).
- If you wish to specify a different time stamp, you can create one at the TIMESTAMP parameter.  
The time value must always be specified in system time (i.e. UTC) as this is the time used for time synchronization throughout the plant.
- If an alarm is to be time-stamped with a local time, a conversion module, which converts the local time to system time, must be connected in series. This is the only way to make sure that the time stamp is shown properly in the alarm display.

To use the current system time of the CPU, set the TIMESTAMP parameter to its default value (LDT#1970-1-1-0:0:0.0).

### Calling the "Program\_Alarm" instruction

The instruction "Program\_Alarm" can only be called in a function block (FB).

Once the instruction has been inserted in the FB, a multi-instance of the data type "Program\_Alarm" is created in the "Static" section of the FB interfaces. You can choose any name for this multi-instance in the dialog which appears. The name of the multi-instance is also the name of the program alarm.

Finally, add the parameters of the "Program\_Alarm" instruction in line with your requirements (see the "Parameters" table).

### Configuring the program alarm

The program alarm settings are displayed in the "Properties" window when you select the name of the program alarm in the "Static" section or in the network of the FB. In this window, you can select the alarm class, priority, etc. and edit the alarm text.

The settings that are made here can be edited in the project tree. Go to "PLC alarms" and open the "Program alarms" tab. All existing program alarms are then displayed in the "Alarm types" table.

**Parameters**

The following table shows the parameters of the "Program\_Alarm" instruction:

Parameter	Declaration	Data type	Memory area	Description
SIG	Input	BOOL	I, Q, M, D, L, T, C or constant	The signal to be monitored.
TIMESTAMP	Input	LDT	M, D, L or constant	<p>This parameter is used to assign an alarm a time stamp, for example, from an input signal with a distributed stamp. The time value must always be specified in system time (i.e. UTC), as this is the time used for time synchronization throughout the plant.</p> <ul style="list-style-type: none"> <li>"Not assigned" means that the system time of the CPU will be used as the interrupt time stamp when a signal change occurs (default).</li> <li>Any system time input will be used as the interrupt time stamp when a signal change occurs.</li> </ul> <p>Note: If an interrupt is to be time-stamped with a local time, a conversion module must be connected in series to convert the local time to system time. This is the only way to make sure that the time stamp is shown correctly in the interrupt display.</p>
SD_i	Input	LREAL, REAL, DINT, INT, SINT, UDINT, UINT, USINT, DWORD, WORD, BYTE, BOOL, WSTRING, STRING, WCHAR, CHAR	I, Q, M, D, L	i-th associated value (0 ≤ i ≤ 10)
ERROR	Output	BOOL	I, Q, M, D, L	<p>Status parameter ERROR</p> <p>ERROR = TRUE indicates that an error has occurred during processing. The possible error cause is displayed at the STATUS parameter.</p>
STATUS	Output	WORD	I, Q, M, D, L	<p>Status parameter STATUS</p> <p>Display of error information (see "ERROR and STATUS parameters").</p>

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## ERROR and STATUS parameters

The following table contains all specific error information that can be output via the ERROR and STATUS parameters.

ERROR	STATUS*	Explanation
0	0000	No error
1	0085	"Only information" alarm type.
1	8001	Invalid static alarm information.
1	8002	No valid static alarm information.
1	8004	Maximum size of 512 bytes reached for the associated values of the alarm.
1	8005	Incoming alarm.
1	8007	Outgoing alarm, preceded by no incoming alarm.
1	8087	Deactivate static alarms.
1	8089	Length of the alarm is too large.
1	80Ax	The SD_i parameter has an invalid value.
1	80C1	The CPU cannot generate any alarms at this time because initialization routines are running (this is the case after download in RUN, for example). Try again later.
1	80C2	The maximum number of alarms per time unit has been sent. Try again later.
1	80C3	All dynamic alarm instances are being used. Try again later.
1	80C4	Alarm is being output and cannot be overwritten. Try again later.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## Get\_AlarmState: Output alarm status

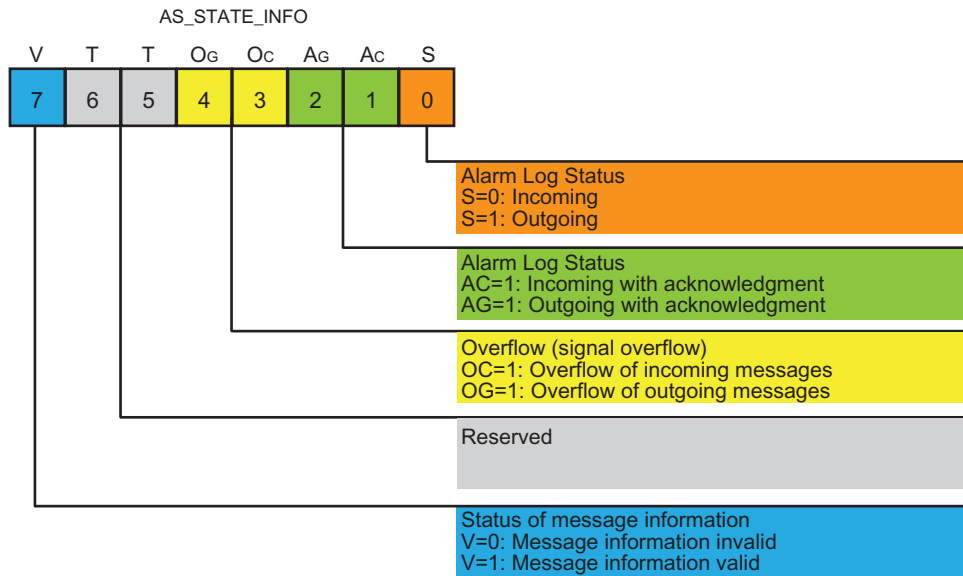

### Description

The "Get\_AlarmState" instruction outputs the alarm status of a program alarm. The output of the alarm status always refers to a program alarm that was created using the "Program\_Alarm (Page 2780)" instruction.

The program alarm is selected with the Alarm input parameter. Specify the instance DB of the "Program\_Alarm" instruction at the Alarm parameter.

The alarm status is returned in a byte via the AlarmState output parameter. The meaning of the individual bits is shown in the following figure:

You can find more information about the possible alarm states in the section "Auto-Hotspot".

The execution status of the instruction is shown with the output parameters ERROR and STATUS.

### Parameters

The following table shows the parameters of the "Get\_AlarmState" instruction:

Parameter	Declaration	Data type	Memory area	Description
Alarm	Input	ALARM_BASE	D	Instance of the "Program_Alarm (Page 2780)" instruction.
AlarmState	Output	BYTE	I, Q, M, D, L	Status of the alarm as a bit array.
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output via the STATUS parameter.
STATUS	Output	WORD	I, Q, M, D, L	Status parameter The parameter is only set for the duration of one call. To display the status, you should therefore copy STATUS to a free data area.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter STATUS

Error code* (W#16#...)	Explanation
8001	Invalid static alarm instance.
8002	ID of the alarm is invalid.
8003	No active alarms within the message class.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## Gen\_UsrMsg: Generate user diagnostic alarms

### Description

You can use the "Gen\_UsrMsg" instruction to create a message for entry into the diagnostic buffer.

You can use the Mode parameter to select whether an incoming or an outgoing message is to be generated:

- With Mode = 0: Create an incoming message.
- With Mode = 1: Create an outgoing message.
- Regardless of whether an incoming or outgoing message is generated, the message always has the attribute "Information only".

The content of the message is defined with a text list:

- Specify the text list you want to use with the parameter TextListID. For this purpose open the dialog "Text lists" in the project navigation. Show the column "ID" in the dialog "Text lists". Apply the ID at the parameter TextListID.
- Use the parameter TextID to select the text list entry you want to write in the diagnostic buffer. For this purpose select an entry from the "Text lists entries" dialog by applying a number from the columns "Range from / range to" at the parameter TextID. The same number must be used from both the "Range from" and "Range to" columns for the text list entry.
- Additional information about text lists can be found here: [Text lists \(Page 377\)](#)

New associated values can be defined in the text entry and then added to the message:

- Associated values are defined by adding the following information in the text list entry:  
@<Nr. des Begleitwertes><Formatangabe>@
- Use the system data type AssocValues to specify which associated value is added when generating the message.
- Additional information on the structure of associated values can be found here: [Auto-Hotspot](#)

The entry in the diagnostic buffer is created synchronously. Message transmission is asynchronous.

If an error occurs during the execution of an instruction, it is output via the parameter RET\_VAL.

### Parameters

The following table shows the parameters of the "Gen\_UsrMsg" instruction:

Parameter	Declaration	Data type	Memory area	Description
Mode	Input	UInt	I, Q, M, D, L or constant	Parameters for selecting the status of the message: <ul style="list-style-type: none"> <li>• 1: incoming message</li> <li>• 2: outgoing message</li> </ul>
TextID	Input	UInt	I, Q, M, D, L or constant	ID of the text list entry that should be used for the message text.
TextListID	Input	UInt	I, Q, M, D, L or constant	ID of the text list that contains text list entry.
Ret_Val	Return	Int	I, Q, M, D, L	Error code of the instruction.
AssocValues	InOut	VARIANT	I, Q, M, D, L	Pointer to the system data type AssocValues that allows you to define the associated values

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### AssocValues parameter

Use the system data type AssocValues to define which associated values will be sent. A maximum of 8 associated values are possible. The structure of the system data type is created by entering the data type "AssocValues" as a data block.

The associated values are selected by entering the numbers of the associated values for the parameters Value[x]. The associated value must be used in the selected text list entry (parameter TextID). Note the following:

- The values for TextID and TextListID are treated by the instruction as the associated values to be sent. This means that the digits "1" and "2" can not be used as a numbers for associated values.
- Therefore, use "3" as the first number at the parameter Value [0] and "4" at the parameter Value [1] etc.

Byte	Parameters	Data type	Start value	Description
0..1	Value[1]	UINT	0	First associated value of the message.
2..3	Value[2]	UINT	0	Second associated value of the message.
4..5	Value[3]	UINT	0	...
6..7	Value[4]	UINT	0	...
8..9	Value[5]	UINT	0	...
10..11	Value[6]	UINT	0	...
12..13	Value[7]	UINT	0	...
14..15	Value[8]	UINT	0	Eighth associated value of the message.

**RET\_VAL parameter**

The following table contains all specific error information that can be output via the RET\_VAL parameter.

Error code* (W#16#...)	Explanation
0000	No error
8080	Value in the Mode parameter is not supported.
80C1	Resource bottleneck due to too many parallel calls.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**9.7.3.9 Diagnostics****RD\_SINFO: Read current OB start information****Description**

You use the instruction "RD\_SINFO" to read the start information

- of the last OB called that has not yet been completely executed, and
- of the last startup OB started.

There is no time stamp in either case. If the call is in OB 100, OB 101 or OB 102, two identical start information messages will be returned.

**Parameter**

The following table shows the parameters of the "RD\_SINFO" instruction:

Parameter	Declaration	Data type	Memory area	Description
RET_VAL	Return	INT	I, Q, M, D, L	Error information
TOP_SI	Output	VARIANT	D, L	Start information of the current OB
START_UP_SI	Output	VARIANT	D, L	Start information of the startup OB last started

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**SDTs of the TOP\_SI parameter**

The following table shows the possible SDTs for the TOP\_SI parameter:

Organization blocks (OB)	System data types (SDT)	System data type numbers
Any	SI_classic	592
	SI_none	593
ProgramCycleOB	SI_ProgramCycle	594
TimeOfDayOB	SI_TimeOfDay	595
TimeDelayOB	SI_Delay	596
CyclicOB	SI_Cyclic	597
ProcessEventOB	SI_HWInterrupt	598
ProfileEventOB	SI_Submodule	601
StatusEventOB		
UpdateEventOB		
SynchronousCycleOB	SI_SynchCycle	602
IOredundancyErrorOB	SI_IORedundancyError	604
CPUredundancyErrorOB	SI_CPURedundancyError	605
TimeErrorOB	SI_TimeError	606
DiagnosticErrorOB	SI_DiagnosticInterrupt	607
PullPlugEventOB	SI_PlugPullModule	608
PeripheralAccessErrorOB	SI_AccessError	609
RackStationFailureOB	SI_StationFailure	610
ServoOB	SI_Servo	611
IpoOB	SI_Ipo	612
StartupOB	SI_Startup	613
ProgrammingErrorOB	SI_ProgIOAccessError	614
IOaccessErrorOB		

**SDTs of the START\_UP\_SI parameter**

The following table shows the possible SDTs for the START\_UP\_SI parameter:

System data types (SDT)	System data type numbers
SI_classic	592
SI_none	593
SI_Startup	613

**Structures**

The following tables set out the meaning of the structure elements of the individual structures:

Table 9-59 SI\_classic structure

Structure element	Data type	Description
EV_CLASS	BYTE	<ul style="list-style-type: none"> <li>• Bits 0 to 3: Event ID</li> <li>• Bits 4 to 7: Event class</li> </ul>
EV_NUM	BYTE	Event number
PRIORITY	BYTE	Priority class number (Meaning of B#16#FE: OB not available or disabled or cannot be started in current operating mode)
NUM	BYTE	OB number
TYP2_3	BYTE	Data ID 2_3: Identifies the information entered in ZI2_3
TYP1	BYTE	Data ID 1: Identifies the information entered in ZI1
ZI1	WORD	Additional information 1
ZI2_3	DWORD	Additional information 2_3

Table 9-60 SI\_none structure

Structure element	Data type	Description
SI_Format	USINT	<ul style="list-style-type: none"> <li>• 16#FF = No information</li> <li>• 16#FE = Optimized start information</li> </ul>
OB_Class	USINT	OB class for "No information" or "Optimized start information"
OB_Nr	UINT	OB number (1 ... 32767)

Table 9-61 SI\_ProgramCycle structure

Structure element	Data type	Description
SI_Format	USINT	<ul style="list-style-type: none"> <li>• 16#FF = No information</li> <li>• 16#FE = Optimized start information</li> </ul>
OB_Class	USINT := 1	OB class for "No information" or "Optimized start information"
OB_Nr	UINT	OB number (1 ... 32767)
Initial_Call	BOOL	For OB_Class = 1, 30, 52, 61, 65
Remanence	BOOL	For OB_Class = 1

Table 9-62 SI\_TimeOfDay structure

**Note**

The structure elements specified for the SI\_classic structure are identical in content to the temporary tags of any OB created with the block property "Default".

Please note, however, that temporary tags of the individual OBs can have different names and different data types. Also note that the call interface of each OB includes additional information regarding the date and the time of the OB request.

Bits 4 to 7 of the EV\_CLASS structure element contain the event class. The following values are possible here:

- 1: Start events from standard OBs
- 2: Start events from synchronous error OBs
- 3: Start events from asynchronous error OBs

The PRIORITY structure element supplies the priority class belonging to the current OB.

Apart from these two elements, NUM is also relevant. NUM contains the number of the current OB or the startup OB that was started last.

**RET\_VAL parameter**

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
8080	Start information of the current OB does not correspond to the specified user-defined data type
8081	Start information of the current OB does not correspond to the specified system data type
8082	Start information of the last startup OB started does not correspond to the specified user-defined data type
8083	Start information of the last startup OB started does not correspond to the specified system data type

**Example**

OB 80 is the OB that was called last and that has not yet been completely processed and OB 100 is the start-up OB that was started last.

The following table shows the assignment between the structure elements of the TOP\_SI parameter of the "RD\_SINFO" instruction and the associated local tags of OB 80.

TOP_SI structure element	Data type	OB 80 - Associated local tag	Data type
EV_CLASS	BYTE	OB80_EV_CLASS	BYTE
EV_NUM	BYTE	OB80_FLT_ID	BYTE
PRIORITY	BYTE	OB80_PRIORITY	BYTE
NUM	BYTE	OB80_OB_NUMBR	BYTE
TYP2_3	BYTE	OB80_RESERVED_1	BYTE
TYP1	BYTE	OB80_RESERVED_2	BYTE
ZI1	WORD	OB80_ERROR_INFO	WORD
ZI2_3	DWORD	OB80_ERR_EV_CLASS	BYTE
		OB80_ERR_EV_NUM	BYTE
		OB80_OB_PRIORITY	BYTE
		OB80_OB_NUM	BYTE

The following table shows the assignment between the structure elements of the START\_UP\_SI parameter of the "RD\_SINFO" instruction and the associated local tags of OB 100.

START_UP_SI structure element	Data type	OB 100 - Local tag	Data type
EV_CLASS	BYTE	OB100_EV_CLASS	BYTE
EV_NUM	BYTE	OB100_STRTUP	BYTE
PRIORITY	BYTE	OB100_PRIORITY	BYTE
NUM	BYTE	OB100_OB_NUMBR	BYTE
TYP2_3	BYTE	OB100_RESERVED_1	BYTE
TYP1	BYTE	OB100_RESERVED_2	BYTE
ZI1	WORD	OB100_STOP	WORD
ZI2_3	DWORD	OB100_STRT_INFO	DWORD

## RT\_INFO: Read out runtime statistics

### Description

Use the instruction "RT\_INFO" to generate statistics on the runtime of specific organization blocks, communication or the user program.

Use the MODE parameter to select which information is going to be output:

9.7 References

- MODE 1 to 3 return the data on the runtime of a specific organization block whose number was specified at the OB parameter.
- MODE 10 and 11 return the proportions of runtime used for communication and the user program.
- MODE 30 to 32 return data on configured settings of the user program.

All measurements are started once again when the CPU transitions from startup to RUN.

**Parameters**

The following table shows the parameters of the instruction "RT\_INFO":

Parameter	Declaration	Data type	Memory area	Description
MODE	Input	UINT	I, Q, M, D, L or constant	Use the MODE parameter to select the information you want to read out (see table "MODE parameter").
OB	Input	OB_ANY	I, Q, M, D, L or constant	Use the OB parameter to select the OB for which you want to read out information.
RET_VAL	Return	INT	I, Q, M, D, L	Error information (see "RET_VAL parameter").
INFO	InOut	VARIANT	I, Q, M, D, L	Pointer to the area to which the read data is to be written. The data type required for INFO depends on the MODE parameter (see table "MODE parameter").

You can find additional information on valid data types in "Overview of the valid data types (Page 1262)".

**MODE parameter**

The following table shows which information is returned for the values at the MODE parameter.

MODE (decimal)	Description	Note	Value at OB parameter	Data type of INFO	Available as of CPU version
1	Runtime of a specific OB	The runtime information always refers to the specified OB. Processes, such as interruptions by OBs of a higher priority or communication, are not included.  You can use the instruction "RUNTIME" to measure the runtime of the entire program.	OB number	LTIME	S7-1500 V1.5
2	Maximum runtime of a specific OB		OB number	LTIME	S7-1500 V1.5
3	Minimum runtime of a specific OB		OB number	LTIME	S7-1500 V1.5

MODE (decimal)	Description	Note	Value at OB parameter	Data type of INFO	Available as of CPU version
10	Percentage of total runtime used by higher-priority OBs The runtime of all OBs used in the user program with a higher priority than cyclical program OBs is output (ProgramCycle). These usually include all OB types except startup OBs. The CPU determines which OBs can be used and their priority. This information is included in the basic chapters on programming.	The percentages of MODE 10, 11 and 12 always add up to 100 (=total runtime).	Not relevant	UINT	S7-1500 V1.5
11	Percentage of total runtime used by communication The percentage of communication processes in the total runtime of the user program is output.		Not relevant	UINT	S7-1500 V1.5
30	Output of the warning limit from which a time error OB is called. The warning limit is the maximum permitted number of requested but not yet completely processed requirements of an OB.		Not relevant	LTIME	S7-1500 V1.5
31	Output of the configured minimum cycle time for the user program		Not relevant	UINT	S7-1500 V1.5
32	Output of the configured maximum communication load		Not relevant	UINT	S7-1500 V1.5

### RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0	No error
8080	Selection for MODE parameter is not supported.
8081	Organization block selected at OB parameter does not exist in the user program.
80C3	Insufficient resources. Try to call the instruction again at a later time.
8452	Data type at INFO parameter is incorrect. Check whether the correct data type was selected depending on the MODE parameter.

**See also**

Evaluating errors with output parameter RET\_VAL (Page 1796)

**LED: Read LED status**

**Description**

You can use the "LED" instruction to read out the status (e.g., "On" or "Off") of a particular module LED.

- With the LADDR parameter, you address the CPU or the interface.
- With the LED parameter, you select the module LED whose current status is to be read out using the instruction.
- The RET\_VAL parameter outputs the status of the selected LED when the instruction is called. Depending on the LED selected, only certain status information may be displayed. For example, some LEDs have only color information. Refer to the hardware documentation of the respective module for the available status information of a particular LED.

**Parameters**

The following table shows the parameters of the "LED" instruction:

Parameter	Declaration	Data type	Memory area	Description
LADDR	Input	HW_IO	I, Q, M, L or constant	Identification number of the CPU or interface. The number is automatically assigned and stored in the CPU properties or the interface in the hardware configuration.
LED	Input	UINT	I, Q, M, D, L or constant	Identification number of the LED: <ul style="list-style-type: none"> <li>• 1: STOP/RUN</li> <li>• 2: ERROR</li> <li>• 3: MAINT (maintenance)</li> <li>• 4: Redundant</li> <li>• 5: Link (green)</li> <li>• 6: Rx/Tx (yellow)</li> </ul>
RET_VAL	Return	INT	I, Q, M, D, L	Status of LED

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter RET\_VAL

RET_VAL	Description
0 to 9	LED status: <ul style="list-style-type: none"> <li>• 0 = LED does not exist</li> <li>• 1 = Permanently switched off</li> <li>• 2 = Color 1 (e.g., for LED STOP/RUN: green) permanently ON</li> <li>• 3 = Color 2 (e.g., for LED STOP/RUN: orange) permanently ON</li> <li>• 4 = Color 1 flashing at 2 Hz</li> <li>• 5 = Color 2 flashing at 2 Hz</li> <li>• 6 = Colors 1 and 2 flashing alternately at 2 Hz</li> <li>• 7 = LED is active, color 1</li> <li>• 8 = LED is active, color 2</li> <li>• 9 = LED exists, but status information not available</li> </ul>
8091	Module addressed with the LADDR parameter does not exist.
8092	A module that does not support LEDs was addressed with the LADDR parameter.
8093	The identification number specified in the LED parameter is not defined.
80Bx	The CPU specified in the LADDR parameter does not support the "LED" instruction.

## Get\_IM\_Data: Reading identification and maintenance data

### Description

The "Get\_IM\_Data" instruction reads the identification and maintenance data (I&M) data from a device. Use the LADDR parameter to select the device from which you want to read the I&M via the hardware identifier.

You select the data to be read via the instruction using the IM\_TYPE parameter:

- IM\_TYPE = 0: I&M 0 data  
The I&M 0 data are the device-specific basic information of a device and contain information such as the manufacturer ID, order number, serial number and the hardware and firmware version. Only read access is possible to the I&M 0 data. The information is also displayed in the TIA Portal with the "Online & Diagnostics" view of a device.
- IM\_TYPE = 11: I&M 1 data from the parameter assignment data of the CPU  
The I&M 1 data contains a functional description of the device and the location ID, i.e. the information about how the device is designated within the plant.
- IM\_TYPE = 12: I&M 2 data from the parameter assignment data of the CPU  
The I&M 2 data includes the date of installation, i.e. the information about when the device was installed in the plant.
- IM\_TYPE = 13: I&M 3 data from the parameter assignment data of the CPU  
The I&M 3 data contains additional information about the installed device. The additional information is free text and can be assigned as desired.

The I&M data read is written to the addressed area defined at the DATA parameter.

The execution status of the read job is displayed via the BUSY, DONE, ERROR output parameters and the two middle bytes of the STATUS output parameter.

**Definition: Identification and maintenance data (I&M)**

Identification and maintenance (I&M) data refers to information stored in a module, which assists you in checking the plant configuration, locating hardware changes in a plant and eliminating errors.

- Identification data (I data) are static information about a device that can only be read.
- Maintenance data (M-data) refers to plant-dependent information, such as the installation location or date. Maintenance data are created during configuration and written to the module.

**Parameters**

The following table shows the parameters of the "Get\_IM\_Data" instruction:

Parameter	Declaration	Data type	Memory area	Description
LADDR	Input	HW_IO	I, Q, M, D, L or constant	Hardware ID of the device The number is assigned automatically and is stored in the properties of the device or in the hardware configuration.
IM_TYPE	Input	UINT	I, Q, M, D, L or constant	Identification and maintenance data number Possible values: <ul style="list-style-type: none"> <li>• 0: I&amp;M 0 data</li> <li>• 11: I&amp;M 1 data from the parameter assignment data of the CPU</li> <li>• 12: I&amp;M 2 data from the parameter assignment data of the CPU</li> <li>• 13: I&amp;M 3 data from the parameter assignment data of the CPU</li> </ul>
DATA	InOut	VARIANT	I, Q, M, D, L	Area for storing the read identification and maintenance data (see DATA parameter).
DONE	Output	BOOL	I, Q, M, D, L	The instruction was executed successfully. The I&M data were transferred to the DATA parameter.
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: Execution of the instruction complete or not yet started.</li> <li>• 1: Execution of the instruction not yet complete.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: No error.</li> <li>• 1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output via the STATUS parameter.
STATUS	Output	WORD	I, Q, M, D, L	Status parameter The parameter is only set for the duration of one call. To display it, you should therefore copy STATUS to a free data area.

You can find more information on the data types in "Overview of the valid data types (Page 1262)".

## DATA parameter

You can use a string (STRING), an array (ARRAY of CHAR/BYTE) or a data structure (STRUCT) to store the I&M data:

- If you address a string (STRING data type) at the the DATA parameter, the length of the string automatically adjusts the length of the read I&M data (up to 254 characters).
- If you address a data structure (ARRAY of CHAR/BYTE or STRUCT) a the DATA parameter, the I&M data read are written to the individual components of the data type used. If the addressed data structure is longer than the read data, the remaining components are filled with zeros.
- If you crate a data structure with a STRUCT data type at the DATA parameter, use a data block without optimized block access (see category "Attributes" of the block properties).

If a data type other than STRING, ARRAY of BYTE/CHAR or STRUCT is used at the DATA parameter, the STATUS parameter generates error code 8093. There is an exception for I&M 0 data (IM\_TYPE parameter = 0). For I&M 0 data, the following "IuM0\_data" structure can also be used at the DATA parameter:

Parameter	Data type	Bytes	Description
Manufacturer_ID	UINT	2	Manufacturer ID (e.g. "42" for SIEMENS)
Order_ID	CHAR[20]	20	Order number
Serial_Number	CHAR[16]	16	Serial number
Hardware_Revision	UNIT	2	Hardware revision
Software_Revision	STRUCT	4	Firmware revision
	Type	CHAR	-
	Functional	UNIT8	-
	Bugfix	UNIT8	-
	Internal	UINT8	-
Revision_Counter	UINT	2	Revision counter
Profile_ID	UNIT	2	Profile
Profile_Specific_Type	UNIT	2	Device class
IM_Version	UNIT	2	I&M version
I&M_Supported	UNIT	2	I&M data (I&M 0-I&M 4) supported at the device end

## STATUS parameter

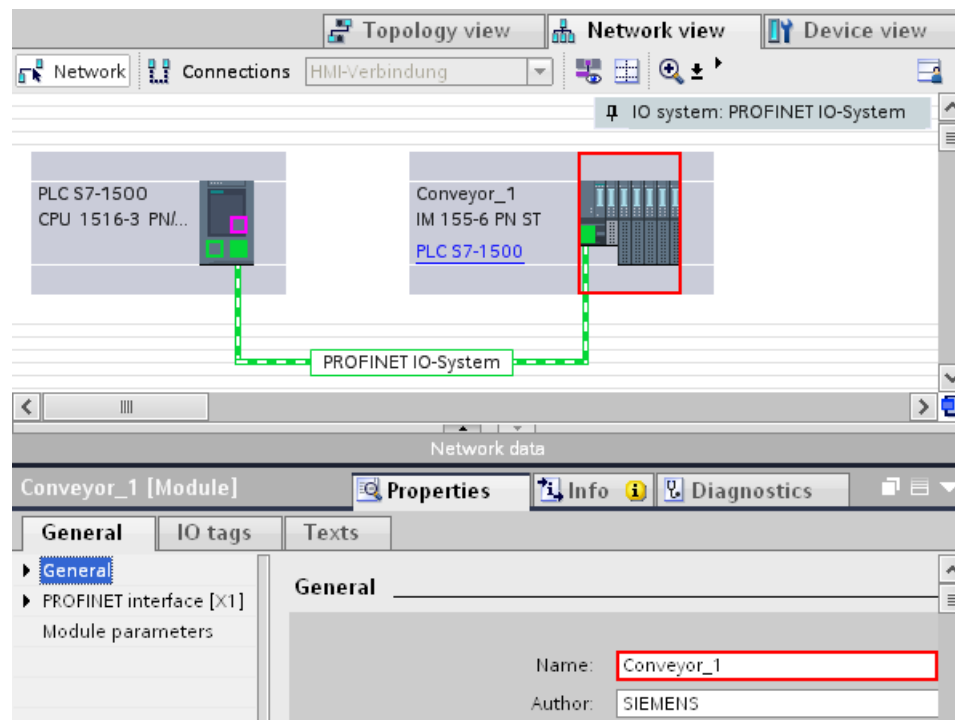

Error code* (W#16#...)	Description
0	No error
7000	No job in progress.

Error code* (W#16#...)	Description
7001	First call of the asynchronous instruction "Get_IM_Data". Execution of the instruction not yet complete (BUSY = 1, DONE = 0).
7002	Additional call of the asynchronous instruction "Get_IM_Data". Execution of the instruction not yet complete (BUSY = 1, DONE = 0).
807F	Maximum of 10 parallel executions of the instances exceeded: <ul style="list-style-type: none"> <li>• Avoid more than 10 parallel calls of the instruction.</li> <li>• Repeat the call at a later time, as this is a temporary error.</li> </ul>
8091	The device addressed at the LADDR parameter does not exist.
8092	LADDR addresses a device that does not support the output of the I&M data.
8093	Data type at the DATA parameter is not supported.
80B1	The "Get_IM_Data" instruction is not supported by the CPU used.
80B2	Invalid value at the IM_TYPE parameter or the selected IM_TYPE is not supported by the CPU or the addressed device.
8752	The memory area specified at the DATA parameter is too small to store all the I&M data. The read I&M data are stored only up to the maximum length of the specified memory area.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## GET\_NAME: Reading the name of a module

### Description

The instruction "GET\_NAME" reads the name of an IO device. The name is displayed in the network view and in the properties of the IO device:

You select the IO device by using the hardware identifier of the PROFINET IO system (at the LADDR parameter) and the device number of the IO device (STATION\_NR parameter).

Once the instruction has been executed, the name of the IO device is written to the area addressed with the DATA parameter.

The name that is read depends on the type of IO device:

- For a DP slave or IO device, the name of the head module is output.
- For an I-slave or I-device, the name of the interface module is output.
- The station name is output for an HMI panel.
- The name of the interface module is output for a PC station.
- The name of the Device Access Point (DAP) is displayed (name of the interface or head module) for GSD devices.

The length of the name is output at the LEN parameter. If the name is longer than the area specified at the DATA parameter, only that section which corresponds to the maximum length of the addressed area will be written.

The maximum length for a name is 128 characters.

**Note**

**Name of the CPU readout (Version 1.1)**

If you assign a "0" at each of the parameters LADDR and STATION\_NR the instruction will output the name of the CPU.

**Parameters**

The following table shows the parameters of the "GET\_NAME" instruction:

Parameter	Declaration	Data type	Memory area	Description
LADDR	Input	HW_IOSYSTEM	I, Q, M, D, L or constant	Hardware identifier of the PROFINET IO system. The number can be taken from the system constants or the properties of the IO system.
STATION_NR	Input	UINT	I, Q, M, D, L or constant	Device number of the IO device. The device number can be applied in the Network view from the properties of the IO device under "Ethernet addresses".
DATA	InOut	VARIANT	I, Q, M, D, L	Pointer to the area to which the name of the module is written.
DONE	Output	BOOL	I, Q, M, D, L	The instruction was executed successfully. Name of the module transferred to the area at the DATA parameter.
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: Execution of the instruction complete.</li> <li>• 1: Execution of the instruction not yet complete.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: No error.</li> <li>• 1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output via the STATUS parameter.
LEN	Output	DINT	I, Q, M, D, L	Length of the name of the IO device (number of characters).
STATUS	Output	WORD	I, Q, M, D, L	Status parameter The parameter is only set for the duration of one call. To display the status, you should therefore copy STATUS to a free data area.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter STATUS

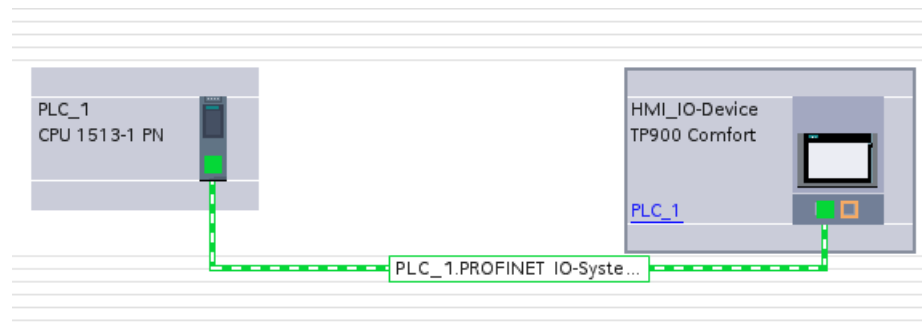

Error code* (W#16#...)	Explanation
0	No error
7000	No job in progress.
7001	First call of the asynchronous instruction "GET_NAME". Execution of the instruction not yet complete (BUSY = 1, DONE = 0).
7002	Additional call of the asynchronous instruction "GET_NAME". Execution of the instruction not yet complete (BUSY = 1, DONE = 0).
8090	The LADDR input parameter contains an invalid value. Possible causes: <ul style="list-style-type: none"> <li>The specified number is not a hardware identifier of a PROFINET IO system.</li> <li>You have not specified a number at the LADDR parameter.</li> </ul>
8092	The value at the LADDR parameter does not address a PROFINET IO system.
8093	Instruction does not support data type at the DATA parameter.
8095	Device number (STATION_NR parameter) does not exist in the selected PROFINET IO system.
80B1	The CPU used does not support the instruction.
80C3	Temporary resource error: The CPU is currently processing the maximum possible number of simultaneous block calls. "GET_NAME" cannot be executed unless at least one of the block calls is finished.
8852	The area specified at the DATA parameter is too short for the full name of the IO device. The name will be written up to the maximum possible length.  To read the full name, use a longer data area at the DATA parameter. The area must have at least as many characters as there are at the LEN parameter.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## Example

The following example shows how you can read out the station name of a HMI panel.

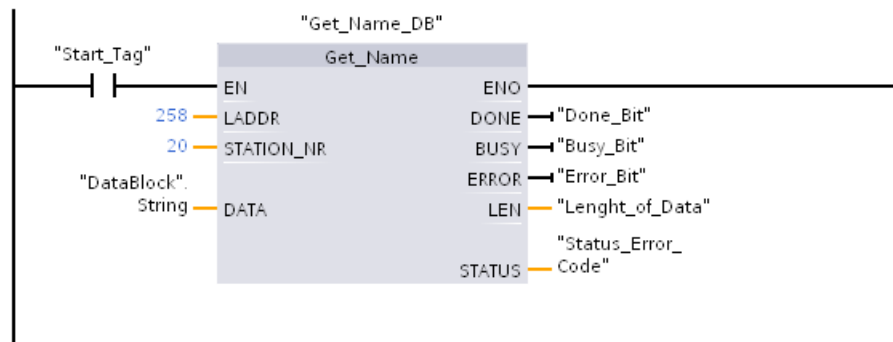

Configuration of the HMI panel:

- The HMI panel with the station name "HMI\_IO-Device" is created in the network view and assigned to the same PROFINET IO system as the CPU.
- The operating mode "IO device" was activated in the properties of the hardware configuration for the HMI panel and the CPU was assigned as the IO controller.
- The device number "20" assigned in the properties under "Ethernet addresses".

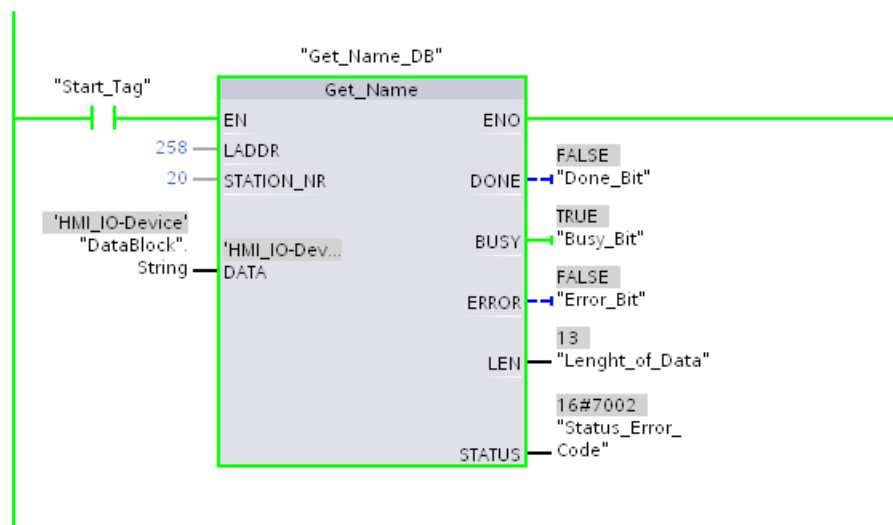

Assigning parameters to the instruction "GET\_NAME":

- The hardware ID (258) of the IO system was specified at the parameter LADDR.
- The device number (20) of the HMI panel was specified at the parameter STATION\_NR.
- A tag was connected with the data type STRING of a data block at the parameter DATA.
- PLC tags (memory area, flags) were defined for the output parameters of the instruction.

Execution of the instruction:

- After execution of the instruction, the name of the station of the HMI panels (HMI\_IO-Device) is written into the data block at the parameter DATA.
- The number of characters of the name is output (13) at the parameter LEN.

## GetStationInfo: Read information of an IO device

### Description

You can use the "GetStationInfo" instruction to read information of a PROFINET IO device. The instruction also enables you to read the information of an IO device located in a lower-level IO system (connected via CP/CM).

The IO device is addressed via the hardware identifier of the station at the LADDR parameter. The hardware identifier is displayed in the "Devices & Networks" view in the station properties.

Use the MODE parameter to select the information to be read. The instruction supports reading the IP address parameters according IPv4 in TIA V12 SP1 (MODE = 1).

At the DATA parameter, specify the data area to which you want to write the read address data. Use the "IF\_CONF\_v4" structure to store the IP address.

Enable reading of the address data using the REQ control parameter. This requires the IO device to be accessible.

The execution status of the read job is displayed via the BUSY, DONE, ERROR output parameters and the STATUS output parameter.

---

### Note

#### Address the IO device using only the hardware identifier of the station

The station, the IO device and PROFINET interface have their own hardware identifier. Use only the hardware identifier of the station for the "GetStationInfo" instruction.

If a PROFINET is addressed via the LADDR parameter, for example, the address data is not read and the error code 8092 is generate.

To read the address data of an integrated PROFINET interface or a CM/CP in the central configuration, use the "RDREC" instruction.

---

## Parameters

The following table shows the parameters of the "GetStationInfo" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L	Control parameter Request Activates the reading of the information with REQ = "1".
LADDR	Input	HW_DEVICE	I, Q, M, D, L or constant	Hardware identifier of the station of the IO device The number can be taken from the properties of the station in the Network view or from the "System constants" tab of the standard tag table.
DETAIL	Input	HW_SUBMODULE	I, Q, M, D, L or constant	The DETAIL parameter is not used. Leave the parameter unconnected.
MODE	Input	UNIT	I, Q, M, D, L or constant	Selection of address data to be read Connect the MODE parameter with "1" (read address parameter according to IPv4).
DATA	InOut	VARIANT	D, L	Pointer to the area to which the address data of the IO device is written. Use the "IF_CONF_v4" structure for MODE = 1.

Parameter	Declaration	Data type	Memory area	Description
DONE	Output	BOOL	I, Q, M, D, L	The instruction was executed successfully. The address data was transferred to the DATA parameter.
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: Execution of the instruction complete.</li> <li>• 1: Execution of the instruction not yet complete.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: No error.</li> <li>• 1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output via the STATUS parameter.
STATUS	Output	WORD	I, Q, M, D, L	Status parameter The parameter is only set for the duration of one call. To display the status, you should therefore copy STATUS to a free data area.

You can find more information on the data types in "Overview of the valid data types (Page 1262)".

### Parameter DATA

Use the "IF\_CONF\_v4" structure at the DATA parameter to store the address parameter according to IPv4.

Byte	Parameter	Data type	Start value	Description
0 ... 1	Id	UINT	30	ID of the "IF_CONF_v4" structure.
2 ... 3	Length	UNIT	18	Length of data read in BYTE.
4 ... 5	Mode	UNIT	0	Not relevant for the "GetStationInfo" instruction (left at "0").
6 ... 9	InterfaceAddress	ARRAY [1..4] of BYTE	-	IP address of the IO device in the format IP_V4, e.g. for 192.168.3.10: <ul style="list-style-type: none"> <li>• addr[1] = 192</li> <li>• addr[2] = 168</li> <li>• addr[3] = 3</li> <li>• addr[4] = 10</li> </ul>

Byte	Parameter	Data type	Start value	Description
10 ... 13	SubnetMask	ARRAY [1..4] of BYTE	-	Subnet mask of the IO device in the format IP_V4, e.g. for 255.255.255.0: <ul style="list-style-type: none"> <li>• addr[1] = 255</li> <li>• addr[2] = 255</li> <li>• addr[3] = 255</li> <li>• addr[4] = 0</li> </ul>
14 ... 17	DefaultRouter	ARRAY [1..4] of BYTE	-	IP address of the router in the format IP_V4, e.g. for 192.168.3.1: <ul style="list-style-type: none"> <li>• addr[1] = 192</li> <li>• addr[2] = 168</li> <li>• addr[3] = 3</li> <li>• addr[4] = 1</li> </ul>

## Parameter STATUS

Error code* (W#16#...)	Explanation
0	No error
7000	No job in progress.
7001	First call of the asynchronous instruction "GetStationInfo". Execution of the instruction not yet complete (BUSY = 1, DONE = 0).
7002	Additional call of the asynchronous instruction "GetStationInfo". Execution of the instruction not yet complete (BUSY = 1, DONE = 0).
8080	Value at the MODE parameter is not supported.
8090	The hardware identifier specified at the LADDR parameter is not configured.
8092	The LADDR parameter does not address a PROFINET IO device.
8093	Invalid data type at the DATA parameter.
80A0	Cannot read requested information.
80C0	Addressed IO device is not reachable.
80C3	The maximum number of simultaneous calls of the "GetStationInfo" instruction (10 instances) has been reached.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## DeviceStates: Read module status information in an IO system

### Description

You use the instruction "DeviceStates" to query specific status information for all modules in an IO system, which means:

- Either for all IO devices in a PROFINET IO system
- Or for all DP slaves in a DP master system

The Boolean value that is output indicates the modules to which the selected status applies. You can, for example, read which IO devices are currently disabled in a PROFINET IO system.

Information is also displayed as to whether the status information to be read applies to at least one of the IO devices or DP slaves.

The instruction can be called in a cyclic OB as well as in an interrupt OB (e.g. OB82 - diagnostic interrupt).

## Parameters

The following table shows the parameters of the "DeviceStates" instruction:

Parameter	Declaration	Data type	Memory area	Description
LADDR	Input	HW_IOSYSTEM	I, Q, M, L or constant	Hardware identifier of the PROFINET IO or DP master system (see description below)
MODE	Input	UINT	I, Q, M, D, L or constant	Selection of status information to be read (see description below)
RET_VAL	Return	INT	I, Q, M, D, L	Status of instruction (see description below)
STATE	InOut	VARIANT	I, Q, M, D, L	Buffer for status of the IO devices or the DP slaves (see description below)

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

### Parameter LADDR

You select the PROFINET IO or DP master system at the LADDR parameter by means of the hardware identifier.

The hardware identifier is available:

- Either in the Network view of the properties of the PROFINET IO or DP master system.
- Or in the PLC tag table in the listed system constants with the data type HW\_IOSYSTEM.

### Parameter MODE

You use the MODE parameter to read out status information. You can read out one of the following status information items for the entire PROFINET IO or DP master system:

- 1: IO devices/DP slaves are configured
- 2: IO devices/DP slaves are faulty
- 3: IO devices/DP slaves are disabled

- 4: IO devices/DP slaves exist
- 5: IO devices/DP slaves for which a problem has occurred. For example:
  - Maintenance demanded or recommended
  - Not accessible
  - Not available
  - Error occurred

## Parameter STATE

With the STATE parameter, the status of the IO devices/DP slaves that was selected with the MODE parameter is output.

If the status selected using MODE applies to an IO device/DP slave, the following bits are set to "1" at the STATE parameter:

- Bit 0 = 1: Group display. The bit n of at least one IO device/DP slave was set to "1".
- Bit n = 1: The status selected with MODE applies to the IO device/DP slave.
  - With a PROFINET IO system, bit n corresponds to the device number of the respective IO device (see properties of the PROFINET interface in the device view and network view)
  - With a PROFIBUS DP system, bit n corresponds to the PROFIBUS address of the DP slave (see properties of the DP slave in the device view and network view)

Use "BOOL" or "Array of BOOL" as data type:

- To only output the bit for group display of the status information, you can use the data type BOOL at the STATE parameter.
- To output the status information for all IO devices/DP slaves, use Array of BOOL with the following length:
  - With PROFINET IO system: 1024 bits
  - With DP master system: 128 bits

## Parameter RET\_VAL

Error code* (W#16#...)	Description
0	No error
8091	Hardware identifier of the LADDR parameter does not exist. Check (for example, in the system constants) whether the value for LADDR exists in the project.
8092	LADDR does not address a PROFINET IO or DP master system.
8093	Invalid data type at the STATE parameter.
80B1	Instruction "DeviceStates" is not supported by the CPU.
80B2	The selected MODE parameter is not supported by the used CPU for the IO system specified in the LADDR parameter.

Error code* (W#16#...)	Description
8452	The complete status information does not fit in the tag configured in the STATE parameter.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**Example - Reading the faulty stations of a PROFINET IO master system**

A PROFINET IO system consists of 4 IO devices with the device numbers 1, 2, 3 and 4. The IO device with number 2 is faulty.

The instruction "DeviceStates" is executed for the PROFINET IO system with MODE = 2 (faulty/not faulty).

The following bits are set in the STATE parameter:

- Bit 0 = 1: A fault exists for at least one of the IO devices.
- Bit 1 = 0: IO device with device number 1 is not faulty.
- Bit 2 = 1: IO device with device number 2 is faulty.
- Bit 3 = 0: IO device with device number 3 is not faulty.
- Bit 4 = 0: IO device with device number 4 is not faulty.
- Bit 5 = 0: irrelevant
- Bit 6 = 0: irrelevant
- ...

**Example - Reading the faulty stations of a PROFIBUS DP master system**

A DP master system consists of 4 DP slaves with the PROFIBUS addresses 3, 4, 5 and 6. The DP slave with address 4 is faulty.

The instruction "DeviceStates" is executed for the DP master system with MODE = 2 (faulty/not faulty).

The following bits are set in the STATE parameter:

- Bit 0 = 1: A fault exists for at least one of the DP slaves.
- Bit 1 = 0: irrelevant
- Bit 2 = 0: irrelevant
- Bit 3 = 0: DP slave with address 3 is not faulty.
- Bit 4 = 1: DP slave with address 4 is faulty.
- Bit 5 = 0: DP slave with address 5 is not faulty.
- Bit 6 = 0: DP slave with address 6 is not faulty.
- Bit 7 = 0: irrelevant
- Bit 8 = 0: irrelevant
- ...

## ModuleStates: Read module status information of a module

### Description

You can use the "ModuleStates" instruction to read the status information of the modules of a PROFINET IO device or PROFIBUS DP slave.

The Boolean value that is output indicates the modules to which the selected status applies. You can, for example, read which modules are currently disabled in a PROFINET IO device.

Information is also displayed as to whether the status information to be read applies to at least one of the modules.

The instruction can be called in a cyclic OB as well as in an interrupt OB (e.g. OB82 - diagnostic interrupt).

### Parameters

The following table shows the parameters of the "ModuleStates" instruction:

Parameter	Declaration	Data type	Memory area	Description
LADDR	Input	HW_DEVICE	I, Q, M, D, L or constant	Hardware identifier of the station (see description below)
MODE	Input	UINT	I, Q, M, D, L or constant	Selection of module status information to be read (see description below)
RET_VAL	Return	INT	I, Q, M, D, L	Status of instruction (see description below)
STATE	InOut	VARIANT	I, Q, M, D, L	Buffer for the module status (see description below)

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

### Parameter LADDR

You select the IO device or the DP slave at the LADDR parameter by means of the hardware identifier of the station.

The hardware identifier is available:

- Either in the network view of the properties of the IO device station or DP slave station.
- Or in the PLC tag table for the listed system constants with the data type HW\_DEVICE (for an IO device) or with the data type HW\_DPSLAVE (for a DP slave).

### Parameter MODE

You use the MODE parameter to read out status information. One of the following status information items can be read for the modules:

- 1: Modules are configured
- 2: Modules are faulty
- 3: Modules are disabled

9.7 References

- 4: Modules exist
- 5: There is a problem in the modules. For example:
  - Maintenance demanded or recommended
  - Not accessible
  - Not available
  - Error occurred

**Parameter STATE**

The STATE parameter outputs the status of the modules selected with the MODE parameter.

If the status selected using MODE applies to a module, the following bits are set to "1":

- Bit 0 = 1: Group display. The bit n of at least one module was set to "1".
- Bit n = 1: The status selected with MODE applies to the module in slot n-1 (example: bit 3 = slot 2).

Use "BOOL" or "Array of BOOL" as data type:

- To only output the bit for group display of the status information, you can use the data type BOOL at the STATE parameter.
- To output the status information for all modules, use Array of BOOL with a length of 128 bits.

**Parameter RET\_VAL**

Error code* (W#16#...)	Description
0	No error
8091	Hardware identifier of the LADDR parameter does not exist. Check (for example, in the system constants) whether the value for LADDR exists in the project.
8092	LADDR does not address an IO device or DP slave.
8093	Invalid data type at the STATE parameter.
80B1	The instruction "ModuleStates" is not supported by the CPU.
80B2	The selected MODE parameter is not supported by the used CPU for the IO device/the DP slave in the LADDR parameter.
8452	The complete status information does not fit in the tag configured in the STATE parameter.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**Example**

An IO device includes 4 modules in slots 1 to 4. The module in slot 2 is faulty.

The instruction "ModuleStates" is executed for the IO device with MODE = 2 (faulty/not faulty).

The following bits are set in the STATE parameter:

- Bit 0 = 1: A fault exists for at least one module.
- Bit 1 = 0: Slot number 0 (used by IO device)
- Bit 2 = 0: Module in slot number 1 is not faulty.
- Bit 3 = 1: Module in slot number 2 is faulty.
- Bit 4 = 0: Module in slot number 3 is not faulty.
- Bit 5 = 0: Module in slot number 4 is not faulty.
- Bit 6 = 0: irrelevant
- Bit 7 = 0: irrelevant

## GEN\_DIAG: Generate diagnostics information

### Description

The "GEN\_DIAG" instruction generates diagnostics information for hardware components from other manufacturers for use in TIA Portal diagnostics. The GSD(GSDL/GSDML) file supplied by the manufacturer must first be installed before the instruction can be used.

The instruction generates all diagnostic events (including those for maintenance).

- Use the LADDR parameter to select the hardware component for which you want to generate a diagnostic event.
- Use the MODE parameter to specify whether the event is to be outgoing or incoming.
- Use the DiagEvent parameter to define the diagnostic event in the DiagnosticDetail structure. The structure is created automatically in the local interface of the block when you define a tag at the DiagEvent parameter.

The diagnostics information is provided synchronously. Diagnostics information transfer and alarm output are asynchronous.

#### NOTICE

##### **Failsafe-specific errors messages are not valid**

If you define failsafe-specific diagnostics information at the DiagEvent parameter, the instruction will check this information and output the error code 80A1.

**Parameters**

The following table shows the parameters of the "GEN\_DIAG" instruction:

Parameter	Declaration	Data type	Memory area	Description
LADDR	Input	HW_ANY	I, Q, M, D, L or constant	Identification number of the hardware component
MODE	Input	UINT	I, Q, M, D, L or constant	Selection of incoming/outgoing information: <ul style="list-style-type: none"> <li>• 1: The diagnostic event specified is an incoming event</li> <li>• 2: The diagnostic event specified is an outgoing event</li> <li>• 3: All diagnostic events are outgoing. There are therefore no hardware component faults (green diagnostics symbol). The DiagEvent parameter is not evaluated when MODE = 3.</li> </ul>
DiagEvent	InOut	DiagnosticDetail	L	Specifies the diagnostic event (see "DiagEvent parameter").
RET_VAL	Return	INT	I, Q, M, D, L	Status of instruction / error message (see "RET_VAL parameter")

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**DiagEvent parameter**

The structure DiagnosticDetail is a system data type for specifying the diagnostic event. Its structure is as follows:

Parameter	Data type	Description
DiagnosticDetail	Struct	
ChannelInfo	WORD	Channel properties (0...7)
ALID	UINT	Local ID of the alarm. The ID uniquely identifies the alarm.
TextID	UINT	ID of an alarm text in a text list.
ChannelNumber	UINT	Manufacturer-specific channel number (0x0000 — 0x7FFF)
Addval_0	DWORD	Placeholder for additional information The value / list of values depends on the connection error.
TextID2	UINT	Texts for CPU response (mode, OB calls, etc.).
LADDR	HW_ANY	Identical to the LADDR parameter.
TextListId	UINT	<ul style="list-style-type: none"> <li>• 0: No text list</li> <li>• ≠0: ID of the text list</li> </ul>

Parameter	Data type	Description
Channel Direction	UINT	<ul style="list-style-type: none"> <li>• 0000: irrelevant</li> <li>• FFF1: Input</li> <li>• FFF2: Output</li> <li>• FFF3: Input/Output</li> </ul>
Addval_1	DWORD	Placeholder for additional information on the channel error (depends on the GSD file). For channel error types, see also: IEC 61158 (PROFINET IO Type 10 and PROFIBUS DP Type 3).

## Parameter RET\_VAL

Error code* (W#16#...)	Explanation
0	No error
8080	Value in the MODE parameter is not supported.
8090	Identification for hardware component not available at the LADDR parameter.
8091	Diagnostics information cannot be generated for the hardware component addressed at the LADDR parameter.
80A1	<ul style="list-style-type: none"> <li>• Content of the DiagnosticsDetail structure at the DiagEvent parameter is invalid or inconsistent.</li> <li>• Failsafe-specific diagnostics information defined at the DiagEvent parameter (not valid).</li> </ul>
80A4	Hardware component addressed cannot be accessed.
80C1	Insufficient resources for parallel execution.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## GET\_DIAG: Read diagnostic information

### Description

You can use the "GET\_DIAG" instruction to read out the diagnostic information of a hardware object. The hardware object is selected using the parameter LADDR. With the MODE parameter, you select which diagnostic information is to be read out.

### Parameters

The following table shows the parameters of the "GET\_DIAG" instruction:

Parameter	Declaration	Data type	Memory area	Description
MODE	Input	UINT	I, Q, M, D, L or constant	Use the MODE parameter to select which diagnostic data is to be output.
LADDR	Input	HW_ANY (WORD)	I, Q, M, L or constant	Hardware identifier of the device.
RET_VAL	Return	INT	I, Q, M, D, L	Status of the instruction
CNT_DIAG	Output	UINT	I, Q, M, D, L	Number of output diagnostic details

Parameter	Declaration	Data type	Memory area	Description
DIAG	InOut	VARIANT	I, Q, M, D, L	Diagnostic information corresponds to the selected mode, see table below
DETAIL	InOut	VARIANT	I, Q, M, D, L	Diagnostics details correspond with the selected mode. Parameter is hidden (only used for MODE = 3).

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### MODE parameter

Depending on the value at the MODE parameter, different diagnostic data is output at the DIAG, CNT\_DIAG and DETAIL output parameters.

MODE	Description	DIAG	CNT_DIAG	DETAIL
0	Output of all supported diagnostic information for a module as DWORD, where Bit X=1 indicates that mode X is supported.	Bit string of the supported modes as DWORD, where Bit X=1 indicates that mode X is supported.	0	-
1	Output of the inherent status of the addressed hardware object.	Diagnostics status. Output of the inherent status of the addressed hardware object in accordance with the DIS structure.	0	-
2	Output of the status of all subordinate modules of the addressed hardware object.	Diagnostics status. Output in accordance with the DNN structure.	0	-
3 *	Output of the inherent status of the addressed hardware object and detailed information on channel diagnostics.	Output of the inherent status of the addressed hardware object in accordance with the DIS structure.	Number of module status information.	Module status information in accordance with the DiagnosticDetail structure.

\* Not supported by CPU S7-1200.

### DIS structure

With parameter MODE = 1 or = 3, the diagnostic information is output in accordance with the DIS structure. In this case, enter the system data type "DIS" as data type for the tag declaration.

The following table shows the meaning of the individual parameter values.

Parameter	Data type	Value	Description
MaintenanceState	DWORD	Enum	
		0	No maintenance required
		1	The module or device is disabled.
		2	-

Parameter	Data type	Value	Description
		3	-
		4	-
		5	Maintenance required
		6	Maintenance demanded
		7	Error
		8	Status unknown / error in subordinate module
		9	-
		10	Inputs/outputs are not available.
ComponentStateDetail	DWORD	Bit array	Status of the module sub-modules: <ul style="list-style-type: none"> <li>• Bit 0 to 15: Status message of the module</li> <li>• Bit 16 to 31: Status message of the CPU</li> </ul>
		0 to 2 (enum)	Additional information: <ul style="list-style-type: none"> <li>• Bit 0: No additional information</li> <li>• Bit 1: Transfer not permitted</li> </ul>
		3	Bit 3 = 1: At least one channel supports qualifiers for diagnostics
		4	Bit 4 = 1: Maintenance required for at least one channel or one component.
		5	Bit 5 = 1: Maintenance demanded for at least one channel or one component.
		6	Bit 6 = 1: Error in at least one channel or one component.
		7 to 10	Reserved (always = 0)
		11 to 14	<ul style="list-style-type: none"> <li>• Bit 11 = 1: PNIO - sub-module correct</li> <li>• Bit 12 = 1: PNIO - replacement module</li> <li>• Bit 13 = 1: PNIO - incorrect module</li> <li>• Bit 14 = 1: PNIO - module disconnected</li> </ul>
		15	Reserved (always = 0)
		16 to 31	Status information for modules generated by the CPU: <ul style="list-style-type: none"> <li>• Bit 16 = 1: Module disabled</li> <li>• Bit 17 = 1: CiR operation active</li> <li>• Bit 18 = 1: Input not available</li> <li>• Bit 19 = 1: Output not available bit</li> <li>• 20 = 1: Overflow diagnostics buffer bit</li> <li>• 21 = 1: Diagnostics not available bit</li> <li>• 22 - 31: Reserved (always 0)</li> </ul>
OwnState	UINT	Enum	The value of the parameter Ownstate describes the maintenance status of the module.
		0	No fault
		1	The module or device is disabled.
		2	Maintenance required
		3	Maintenance demanded
		4	Error
		5	The module or the device cannot be reached from the CPU (valid for modules and devices below a CPU).
6	Inputs/outputs are not available.		

Parameter	Data type	Value	Description
		7	-
IOState	WORD	Bit array	I/O status of the module
		0	Bit 0 = 1: No maintenance required
		1	Bit 1 = 1: The module or device is disabled.
		2	Bit 2 = 1: Maintenance required
		3	Bit 3 = 1: Maintenance demanded
		4	Bit 4 = 1: Error
		5	Bit 5 = 1: The module or the device cannot be reached from the CPU (valid for modules and devices below a CPU).
		6	Inputs/outputs are not available.
		7	Qualifier; bit 7 = 1, if bit 0, 2, or 3 are set
		8 to 15	Reserved (always = 0)
OperatingState	UINT	Enum	
		0	-
		1	In STOP / Firmware update
		2	In STOP / reset memory
		3	In STOP / self start
		4	In STOP
		5	Memory reset
		6	In START
		7	In RUN
		8	-
		9	In HOLD
		10	-
		11	-
		12	Module defective
		13	-
		14	No power
		15	CiR
		16	In STOP / without ODIS
		17	In
		18	
19			
20			

**DNN structure**

With parameter MODE = 2, the diagnostic information details are output in accordance with the DNN structure. In this case, enter the system data type "DNN" as data type for the tag declaration.

The following table shows the meaning of the individual parameter values.

Parameter	Data type	Value	Description
SubordinateState	UINT	Enum	Status of the subordinate module (see parameter OwnState of the DIS structure)
SubordinateIOState	WORD	Bitarray	Status of the inputs and outputs of the subordinate module (see parameter IO State of the DIS structure)
DNNmode	WORD	Bitarray	<ul style="list-style-type: none"> <li>• Bit 0 = 0: Diagnostics enabled</li> <li>• Bit 0 = 1: Diagnostics disabled</li> <li>• Bit 1 to 15: Reserved</li> </ul>

### DiagnosticDetail structure

With parameter MODE = 3, the diagnostic information details are output in accordance with the DiagnosticDetail structure. In this case, enter the system data type "DiagnosticDetail" as data type for the tag declaration.

The following table shows the meaning of the individual parameter values.

Parameter	Data type	Description
ChannelInfo	WORD	Channel properties (0...7)
ALID	UInt	Identification ID of alarm
TextID	UNIT	ID of an alarm text in a text list.
ChannelNumber	UINT	Manufacturer-specific channel number (0x0000 — 0x7FFF)
Addval_0	DWORD	Placeholder for additional information The value / list of values depends on the connection error.
TextID2	UInt	Texts for CPU response (mode, OB calls, etc.).
LADDR	HW_ANY	Identical to the LADDR parameter.
TextListId	UInt	<ul style="list-style-type: none"> <li>• 0: No text list</li> <li>• ≠0: ID of the text list</li> </ul>
ChannelDirection	UInt	<ul style="list-style-type: none"> <li>• 000: Manufacturer-specific</li> <li>• 001: Input</li> <li>• 002: Output</li> <li>• 003: Input/Output</li> <li>• 004 - 007: Reserved</li> </ul>
AddVal_1	DWORD	Placeholder for additional information on the channel error (depends on the GSD file). For channel error types, see also: IEC 61158 (PROFINET IO Type 10 and PROFIBUS DP Type 3).

### RET\_VAL parameter

Error code*	Description
(W#16#...)	
0	No error
n	The data area at the DETAIL parameter is too small. Not all details of the diagnostic data can be output.

Error code* (W#16#...)	Description
8080	Value in the MODE parameter is not supported.
8081	Type at the DIAG parameter is not supported with the selected mode (parameter MODE).
8082	Type at the DETAIL parameter is not supported by the selected mode (parameter MODE).
8090	LADDR does not exist
80C1	Insufficient resources for parallel execution.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

### 9.7.3.10 Pulse

#### CTRL\_PWM: Pulse-width modulation

##### Description

You can use the "CTRL\_PWM" instruction to enable and disable a pulse output supported by the CPU using the software.

- Enter the hardware ID of the pulse generator that you want to control with the instruction at the input PWM.
- The pulse output is enabled when the bit in the ENABLE input of the instruction is set.
  - If ENABLE has a value of TRUE the pulse generator will generate a pulse with the properties defined in the device configuration.
  - When the bit in the ENABLE input is reset or the CPU changes to STOP, the pulse output is disabled and no more pulses are generated.

BUSY always has the value of FALSE for S7-1200 since S7-1200 activates the pulse generator if the instruction "CTRL\_PWM" is executed.

The ENO enable output is set only when the EN enable input has signal state "1" and no errors have occurred during execution of the instruction.

---

##### Note

##### Use of the force table for PWM and PTO

Digital inputs and outputs that are used for PWM and PTO cannot be forced. Digital inputs and outputs that were assigned via device configuration cannot be controlled by either the force table or the monitoring table.

---

##### Requirement

A prerequisite for the correct execution of the instruction is that the specified pulse generator is activated in the hardware configuration.

Open the properties of the module in the device view. Go to "Pulse generators (PTO/PWM)", open the desired PTO/PWM and activate the function the "Activate this pulse generator" under "General".

Go to "Assigning parameters" and set the Pulse options.

---

#### Note

Pulse output parameters are assigned exclusively in the device configuration and not using the "CTRL\_PWM" instruction. Any change of parameters that is intended to have an effect on the CPU must therefore be made while the CPU is in STOP mode. Changing the duration of the pulse is an exception.

---

### Changing the pulse duration from the user program

The pulse duration setting made in the dialog "Pulse options" can be changed from the user program.

The value set for "Initial pulse duration" is written in the output bytes of the pulse generator. The start address and the end address are displayed in the properties of the pulse generator under "I/O-addresses".

To change the pulse duration, write the desired values in the output word address specified in the device configuration.

Example:

- A value of 500 (decimal) is used for the "Initial pulse duration". The start address of the PTO/PWM is "1000" and the end address is "1001".
- The binary value of "0000000111110100" (=500 decimal) is written in both of the output bytes.
  - Start address (AB1000): 0000\_0001 (BIN)
  - End address (AB1001): 1111\_0100 (BIN)

Please note that the pulse duration always depends on the parameters set for the Pulse duration format (hundredths, thousandths, ...).

### Parameters

The following table shows the parameters of the "CTRL\_PWM" instruction:

Parameters	Declaration	Data type	Memory area	Description
PWM	Input	HW_PWM	I, Q, M, D, L or constant	Hardware ID of the pulse generator The hardware ID can be found in the properties of the pulse generator in the Device view. The hardware IDs of the pulse generators are also listed in the system constants.
ENABLE	Input	BOOL	I, Q, M, D, L or constant	The pulse output is enabled when ENABLE = TRUE and disabled when ENABLE = FALSE.

Parameters	Declaration	Data type	Memory area	Description
BUSY	Output	BOOL	I, Q, M, D, L	Processing status
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction (see below).

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameter STATUS

Error code* (W#16#...)	Description
0	No errors
80A1	Hardware ID of the pulse generator is invalid.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

### 9.7.3.11 Recipes and data logging

#### Recipe functions

#### RecipeExport: Exporting recipes

##### Description

The "RecipeExport" instruction exports the recipe data from a data block to a CSV file on the memory card of the CPU.

The export is triggered by the "REQ" parameter. The BUSY parameter is set to "1" during the export. During the export, the CSV file is created in the "Recipes" folder in the main directory of the memory card. The name of the data block is used as file name of the created CSV file. If a CSV file with an identical name already exists, it must be deleted before this export.

After the execution of the instruction, BUSY is reset to "0" and the completion of the operation is indicated with "1" at the DONE parameter. If an error occurs during execution, this is signaled by the parameters ERROR and STATUS.

## Parameters

The following table shows the parameters of the "RecipeExport" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L, T, C or constant (T and C are only available in LAD and FBD with S7-1500)	Control parameter REQUEST: Activates the export on a rising edge.
RECIPE_DB	InOut	VARIANT	D	Pointer to the recipe data block. For information on the structure of the data block, refer to: Structure of a recipe DB (Page 2828)
DONE	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>0: Job not yet started or still executing.</li> <li>1: Job executed without errors.</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>0: The instruction is not executed.</li> <li>1: The instruction is executed.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>0: Neither warning nor error.</li> <li>1: An error has occurred. STATUS supplies detailed information on the type of error.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status parameter See the "STATUS" parameter table.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter STATUS

Error code* (W#16#...)	Explanation
0	No error occurred
7000	No job processing active
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
7002	Intermediate call (REQ irrelevant): Instruction already active; BUSY has the value "1".
8090	File name of the CSV file contains invalid characters. The file name of the CSV file is identical to the name of the data block.
8091	The data structure referenced with RECIPE_DB cannot be processed.
8092	Data structure at RECIPE_DB parameter exceeds 5000 bytes.
80B3	Insufficient memory space on the memory card or the internal load memory.
80B4	The memory card is write-protected.
80C0	CSV files is temporarily locked.

Error code* (W#16#...)	Explanation
80C1	Data block temporarily locked.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## RecipeImport: Importing recipes

### Description

The "RecipeImport" instruction imports the recipe data from a CSV file on the memory card into the data block at the RECIPE\_DB parameter. The values in the data block are overwritten in the process.

Note the following when importing the CSV file:

- The CSV file must be located in the "Recipes" directory of the memory card.
- The name of the CSV file must match the name of the data block at the RECIPE\_DB parameter.
- The first line (header) of the CSV file contains the name of the recipe components (see also: Structure of a recipe DB (Page 2828)). The first line is ignored during import. The names of the recipe components in the CSV file and the data block are not reconciled during import.
- In each case the first value in each line of the CSV file is the index number of the recipe. The individual recipes are imported in the order of the index. For this, the index in the CSV file has to be in ascending order and may contain no gaps (if this is not the case, the error message 80B0 is output at the STATUS parameter.
- The CSV file may not contain more recipe data records than provided for in the data block. The maximum number of data records is indicated by the array limits in the data block.

The import is triggered by the "REQ" parameter. The BUSY parameter is set to "1" during the import. After the execution of the instruction, BUSY is reset to "0" and the completion of the operation is indicated with "1" at the DONE parameter. If an error occurs during execution, this is signaled by the parameters ERROR and STATUS.

### Parameters

The following table shows the parameters of the "RecipeImport" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L, T, C or constant (T and C are only available in LAD and FBD with S7-1500)	Control parameter REQUEST: Activates the import on a positive edge.
RECIPE_DB	InOut	VARIANT	D	Pointer to the recipe data block. For information on the structure of the data block, refer to: Structure of a recipe DB (Page 2828)

Parameter	Declaration	Data type	Memory area	Description
DONE	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: Job not yet started or still executing.</li> <li>• 1: Job executed without errors.</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: The instruction is not executed.</li> <li>• 1: The instruction is executed.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: Neither warning nor error.</li> <li>• 1: An error has occurred. STATUS supplies detailed information on the type of error.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status parameter See the "STATUS" parameter table.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter STATUS

Error code* (W#16#...)	Explanation
0	No error occurred
7000	No job processing active
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
7002	Intermediate call (REQ irrelevant): Instruction already active; BUSY has the value "1".
8090	The file name contains invalid characters.
8092	No matching CSV file found for the import. Possible cause: The name of the CSV file does not match the name of the recipe DB.
80C0	CSV file is temporarily locked.
80C1	Data block is temporarily locked.
80B0	Numbering in the index of the CSV file is not continuous, not ascending or exceeds the maximum number (array limit) in the data block.
80B1	Structure of the recipe data block and the CSV file do not match: The CSV file contains too many fields.
80B2	Structure of the recipe data block and the CSV file do not match: The CSV file contains too few fields.
80D0 +n	Structure of the recipe data block and the CSV file do not match: Data type in field n does not match (n<=46).
80FF	Structure of the recipe data block and the CSV file do not match: Data type in field n does not match (n>46).
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## Structure of a recipe DB

### Introduction

The following sections describes the structure of a recipe DB based on a simple example. The recipe DB consists of five data records, three of which are used. The fourth and fifth data records are left free for later expansions. Each data record contains one recipe, which is made up of the recipe name and eight ingredients.

product name	water	barley	wheat	hops	yeast	waterTemp	mashTemp	mashTime	QTest
Pils	10	9	3	280	39	40	30	100	0
Lager	10	9	3	150	33	50	30	120	0
BlackBeer	10	9	3	410	47	60	30	90	1
Not_used	0	0	0	0	0	0	0	0	0
Not_used	0	0	0	0	0	0	0	0	0

### Structure of the recipe data block

The recipe data are implemented as follows in a global data block:

- The template for all recipes is the PLC data type "Beer\_Recipe" with the recipe components "productname", "water", etc. with the corresponding data types.
- In a global data block, the PLC data type is used as Array [1.. 5] of "Beer\_Recipe". The array limits (1 to 5 in this case) indicate the maximum number of recipes that the DB may contain.
- The values for the recipe components are added as start value in the data block.
- The global DB is interconnected with the instruction via the InOut parameter RECIPE\_DB.

Recipe_DB				
	Name	Data type	Offset	Start value
1	Static			
2	Products	Array [1.. 5] of "Beer_Recipe"	...	
3	Products[1]	"Beer_Recipe"	...	
4	Products[2]	"Beer_Recipe"	...	
5	Products[3]	"Beer_Recipe"	...	
6	productname	String[20]	...	'BlackBeer'
7	water	UInt	...	10
8	barley	UInt	...	9
9	wheat	UInt	...	3
10	hops	UInt	...	410
11	yeast	UInt	...	47
12	waterTemp	UInt	...	60
13	mashTemp	UInt	...	30
14	mashTime	UInt	...	90
15	QTest	UInt	...	1
16	Products[4]	"Beer_Recipe"	...	
17	Products[5]	"Beer_Recipe"	...	

## Exporting to CSV file

After the execution of the "RecipeExport (Page 2824)" instruction the data of the DB are written to a CSV file with the following structure:

### Recipe\_DB.csv

```
index,productname,water,barley,wheat,hops,yeast,waterTmp,mashTmp,mashTime,QTest
1,"Pils",10,9,3,280,39,40,30,100,0
2,"Lager",10,9,3,150,33,50,30,120,0
3,"BlackBeer",10,9,3,410,47,60,30,90,1
4,"Not_used",0,0,0,0,0,0,0,0,0
5,"Not_used",0,0,0,0,0,0,0,0,0
```

### Display in Excel

The CSV file can be opened in Excel to make reading and editing easier. If the commas are not recognized as separators when you open the file, use the Excel import function to output the data in structured form:

	A	B	C	D	E	F	G	H	I	J	K
1	index	product	water	barley	wheat	hops	yeast	waterTmp	mashTmp	mashTime	QTest
2	1	"Pils"	10	9	3	280	39	40	30	100	0
3	2	"Lager"	10	9	3	150	33	50	30	120	0
4	3	"BlackBeer"	10	9	3	410	47	60	30	90	1
5	4	"Not_used"	0	0	0	0	0	0	0	0	0
6	5	"Not_used"	0	0	0	0	0	0	0	0	0

## Editing the CSV file

The CSV file can be uploaded to the PC/programming device by means of the Web server and edited. After editing, the modified file can be reloaded in the CPU. You can use the "RecipeImport (Page 2826)" instruction to re-import the modified data from the CSV file into the data block.

Note that the modified data must still be compatible with the data block. In other words:

- No changes may be made to the structure in the table (for example, by adding ingredients in a new column).
- If you add data records to the file, make sure when importing into the data block that the array limits through which you specify the maximum number of data records correspond to at least the number of data records.
- An index is automatically generated during export to the CSV file. If you create additional data records, add consecutive index numbers accordingly.
- The values in the table cells must correspond to the data types used in the data block with respect to format as well as length.
  - Example 1: If data type INT was used in the data block, you can only use integers in the table.
  - Example 2: If data type SINT was used in the data block, you can only use integers with the values -128 to +127 in the table.

Always keep in mind the permitted data types and data areas as listed in the table below when you make changes in the table.

Data type		Format	Note
Floating-point numbers	LReal	+9.999999999999999E+999	Always written exponentially
	Real	+9.999999E+99	Always written exponentially
Signed integers	LInt	+9999999999999999999	Value range for signed integers: -9223372036854775808 .. +9223372036854775807
	DInt	+9999999999	Value range of integers: -2147483648 to +2147483647
	Int	+99999	Value range of integers: -32768 to +32767
	SInt	+999	Value range of integers: -128 to +127
Unsigned integers	ULInt	+999999999999999999999	Value range of integers: 0 to +18446744073709551615
	UDInt	+9999999999	Value range of integers: 0 to +4294967295
	UInt	+99999	Value range of integers: 0 to + 65535
	USInt	+999	Value range of integers: 0 to +255
Binary numbers	LWord	+99999999999999999999999	Value range of integers: +000000000000000000000 to +18446744073709551615
	DWord	+9999999999	Value range of integers: +0000000000 to +4294967295
	Word	+99999	Value range of integers: +00000 to + 65535
	Byte	+999	Value range of integers: +000 to +255
	Bool	9	Range of values: 0 or 1
Date and time	LTIME	hhh:mm:ss.999	ISO format with milliseconds
	TIME	hhh:mm:ss.999	ISO format with milliseconds
	S5TIME	hhh:mm:ss.999	ISO format with milliseconds
	LDT	YYYY-MM-DD hh:mm:ss.999	ISO format with milliseconds
	DTL	YYYY-MM-DD hh:mm:ss.999	ISO format with milliseconds
	DT	YYYY-MM-DD hh:mm:ss.999	ISO format with milliseconds

	LTime_Of_Day	hh:mm:ss.999_999_999	ISO format
TOD	hh:mm:ss.999	ISO format	
Character	String	"abcd"	The string must be in double quotation marks.
	Char	"a"	Individual character in double quotation marks.

## Data logging

### Data logging - Overview

#### Saving process values

The data logging instructions are used in the user program to save process values to data logs. Data logs can be saved on the Memory Card (MC) or in the internal load memory. The data logs are saved in CSV format (Comma Separated Value).

The data logging instructions are used in your program to create or open a data log, to write an entry and to close the data log file.

You decide by the creation of the data buffer which program values are stored in the data log during the creation of the data buffer. The data buffer is used as a memory for new data log entries. New values have to be written to the buffer before "DataLogWrite (Page 2845)" is called. During execution of the "DataLogWrite (Page 2845)" instruction, data is written from the buffer to a data log record.

Data log files can be copied to the PC as follows:

- If the PROFINET interface is connected to the PC, you use a Web browser to access the data logs via the Web server. The CPU can be in RUN or STOP mode for this. If the CPU is in "RUN" mode, the program continues running while the Web server is transferring data.
- If there is a memory card in the CPU, you can remove this card and insert it into a standard slot for SD (Secure Digital) cards or MMC (MultiMediaCard) cards on a PC or programming device. Use File Manager to transfer the data log files from the memory card to the PC. The CPU goes to "STOP" when you remove the memory card.

### Properties of the data log

Writing of the data records of a data log is carried out in accordance with the principle of a ring buffer. New data records are added until the maximum number of data records is reached (RECORD parameter). The next data record then overwrites the "oldest" data record of the data log.

If you want to prevent data records from being overwritten, use the "DataLogNewFile (Page 2850)" instruction to create a new data log file based on the current data log. New data records are then written into the new data log.

### Creating data logs

With the "DataLogCreate (Page 2833)" instruction, you can create a new data log file in the "\\DataLogs" directory of the load memory.

- The name assigned at the NAME parameter is the designation for the data log and is also used the file name for the CSV file. The file is stored in the directory "DataLogs".
- The block parameter DATA specifies the data buffer for the new data log object and the columns and data types in the data log. The columns and data types of a data record in the data log are generated by the elements in the structure declaration or the array declaration of this data buffer. Each element of a structure or of an array corresponds to a column in a line in the data log.
- You can use the HEADER block parameter to assign a header text in the header to each column.
- The "DataLogCreate (Page 2833)" instruction returns an ID. This ID is used by the other data logging instructions as a reference for the created data log.

### Opening data logs

You use the instruction "DataLogOpen" (S7-1200 and S7-1500) to open an existing data log on the memory card. A data log must be open before you can write new data records to it.

Data log opens automatically when you execute the instructions "DataLogCreate (Page 2833)" and "DataLogNewFile (Page 2850)".

Up to 10 data logs can be open simultaneously. You can select the data log to be opened using the ID or name of the data log.

- If you specify the ID and the name of the data log in the ID and NAME parameters, respectively, the data log will be identified based on the ID. The data log name will not be compared.
- If you select the data log using the NAME parameter and no ID is specified, the ID will be displayed in the ID parameter when the data log is opened.
- If you select the data log using the ID parameter and no name is specified, the name will be displayed in the NAME parameter when the data log is opened.

You use the MODE parameter to specify whether the data records of the data log are to be deleted upon opening.

### Writing to data logs

A data log must be open ("DataLogOpen (Page 2840)" instruction) before a data record can be written to a data log. The "DataLogWrite (Page 2845)" instruction writes a data record to the data log.

### Closing data logs

You use the "DataLogClose (Page 2847)" instruction to close an open data log. You select the data log using the ID parameter.

The data log is closed automatically when the CPU switches to STOP and upon restart.

## Deleting data logs

You use the instruction "DataLogDelete (Page 2849)" (S7-1500) to delete a data log file from the memory card. The data log and the data records it contains can only be deleted if the log was created with the instruction "DataLogCreate (Page 2833)".

Select the data log to be deleted using the NAME and ID parameters. The ID parameter is evaluated first. If there is a data log with the relevant ID, the NAME parameter will not be evaluated. If the value "0" is used at the ID parameter, a value with the data type STRING must be used at the NAME parameter.

## Clearing data logs

You use the instruction "DataLogClear (Page 2843)" (S7-1500) to delete all the data records in an existing data log. The instruction does not delete the optional header of the CSV file (see the description of the HEADER parameter of the instruction "DataLogCreate (Page 2833)").

You use the ID parameter to select the data log whose data records are to be deleted. Before you can delete data records, the data log must be open.

## New file for data logs

You use the instruction "DataLogNewFile (Page 2850)" (S7-1200) or "DataLogTypedNewFile (Page 2852)" (S7-1500) to create a new data log with the same properties as an existing data log. This allows you to retain the contents of an existing data log.

When called, the instruction creates a new data log on the memory card or in the internal load memory with the name defined at the NAME parameter. You use the ID parameter to specify the ID of the old data log whose properties you want to apply to the new data log. The ID of the new data log is then output via the ID parameter.

You specify the file size of the new data log with the RECORDS parameter of the instruction.

You can run a consistency check for "DataLogTypedNewFile (Page 2852)" (S7-1500).

## DataLogCreate: Create data log

### Description

With the "DataLogCreate" instruction you create a data log.

The data log is saved on the memory card or in the internal load memory in the directory "\\DataLogs". The amount of data that can be stored in a data log is dependent on the available space on the memory card or the storage space in the internal load memory of the CPU.

You specify the maximum number of data records that can be stored in a data log in the RECORDS parameter. If the specified maximum number of data records in the data log is reached, the oldest data record will be overwritten. To avoid overwriting of existing data records, use the "DataLogNewFile (Page 2850)" instruction. The instruction can be used to create a new data log with the same structure when the number specified at the RECORDS parameter is reached (return value 1 at the STATUS parameter of the "DataLogWrite (Page 2845)" instruction). The data records are then saved in the new data log.

You can specify the name for the data log in the NAME parameter. The data log is created in CSV (Comma Separated Value) format. With the HEADER parameter, you can create an (optional) header for the data log.

Once the data log is created, it is opened automatically. This means that data can be written.

### Parameters

The following table shows the parameters of the "DataLogCreate" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, L, D, T, C or constant (T and C are only available in LAD and FBD with S7-1500)	Execution of the instruction The data log is created with a rising edge at the parameter REQ.
RECORDS	Input	UDInt	I, Q, M, L, D or constant	Maximum number of data records in the data log If the instruction "DataLogWrite (Page 2845)" writes more records than specified in this parameter, the oldest record is overwritten.
FORMAT	Input	UInt	I, Q, M, L, D or constant	Data format: <ul style="list-style-type: none"> <li>0: Internal (not supported)</li> <li>1: CSV (Comma separated values)</li> </ul>
TIMESTAMP	Input	UInt	I, Q, M, L, D or constant	Time stamp: <ul style="list-style-type: none"> <li>0: No time stamp</li> <li>1: Date and time</li> </ul> The extra columns in the header are automatically added if time-stamping is activated.
NAME	Input	VARIANT	L, D	Name of the data log The specified name is also used as a file name for the csv file. The restrictions for Windows file names apply when assigning the name. The following characters must not be used: "\", "/", ":", "**", "?", "<", ">", " ", "space"
ID	InOut	DWORD	I, Q, M, L, D	Object ID of the data log (only output) The ID of the data log is required for further data logging instructions to address the created data log.
HEADER	InOut	VARIANT	L, D	Header of the data log (optional) The parameter is hidden after the instruction is added. The header is written as the first line in the CSV file.
DATA	InOut	VARIANT	L, D	Pointer to the data structure that is to be written as data record when executing the instruction "DataLogWrite (Page 2845)".

Parameter	Declaration	Data type	Memory area	Description
DONE	Output	BOOL	I, Q, M, L, D	Status parameter: <ul style="list-style-type: none"> <li>0: Processing not yet complete.</li> <li>1: Processing of instruction finished successfully.</li> </ul>
BUSY	Output	BOOL	I, Q, M, L, D	Status parameter: <ul style="list-style-type: none"> <li>0: Processing of the instruction has not started, completed, or canceled.</li> <li>1: Processing of the instruction is in progress.</li> </ul>
ERROR	Output	BOOL	I, Q, M, L, D	Status parameter: <ul style="list-style-type: none"> <li>0: No error.</li> <li>1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output via the STATUS parameter.
STATUS	Output	WORD	I, Q, M, L, D	Detailed status information: <p>Detailed error and status information is output at the parameter STATUS. The parameter is only set for the duration of one call. To display the status, you should therefore copy the STATUS parameter to a free data area.</p>

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### HEADER parameter

The HEADER parameter is a VARIANT pointer to a data block that defines a header for the CSV file (header). The header is always the first line in the CSV file representation.

- When creating a header, remember that the individual columns must be separated by a comma (S7-1200) or a semicolon (S7-1500).
- A STRING, Array of BYTE, or Array of CHAR data type can be used for the individual column names. A longer character string is possible with the Array [...] of type data type than with the STRING data type. When the STRING data type is used, the length is limited to 254 bytes.

If no header is to be created, do not specify a value in the HEADER parameter.

### DATA parameter

The DATA parameter is a VARIANT pointer to a structure or an array in a data block. An element of a structure or an array corresponds to a column in the data log with a specific data type.

Note the following when creating the data block:

9.7 References

- The number of columns must correspond to the number of columns defined in the HEADER parameter.
- Each element of the structure or the array corresponds to a column entry in the CSV file. Therefore, no nesting structures (STRUCT in STRUCT) may be used when using the data type STRUCT.
- The data structure can contain up to 256 elements. If there are more than 256 elements, error code 8C52 is output at the STATUS parameter.
- The tags of the data block can be set as retentive or non-retentive tags. However, the retentivity setting must be the same for all tags of the data block.

**STATUS (S7-1200) parameter**

Error code* (W#16#...)	Description
0	No errors.
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
7002	Intermediate call (REQ irrelevant): Instruction already active; BUSY has the value "1".
8070	Complete internal instance memory is assigned.
8090	Invalid file name (see description of the NAME parameter).
8093	Data log already exists.
8097	File length exceeds the file system limit.
80B3	Insufficient memory space on the memory card.
80B4	The memory card is write-protected.
80C1	Too many data logs are open.
80C3	Resources are not sufficient. Possible causes: <ul style="list-style-type: none"> <li>• Multiple calling of instructions with different parameters.</li> <li>• More than 10 data logs open simultaneously. At least one data log must be closed in order to continue because the instruction "DataLogCreate" automatically opens the the log that is being created.</li> </ul>
8453	Invalid format selection.
8553	Invalid time stamp.
8B51	Invalid data type at HEADER parameter.
8C20	String with length specification other than 254 used.
8C51	Invalid data type at DATA parameter.
8C52	Structure at the parameter DATA contains more than 256 elements.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**STATUS (S7-1500) parameter**

Error code* (W#16#...)	Description
0	No errors.
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
8070	Complete internal instance memory is assigned.
8090	Invalid file name (see description of the NAME parameter).
8091	"NAME" parameter is not a string.
8093	Data log already exists.
8097	File length exceeds the file system limit.
80B3	Insufficient memory space on the memory card.
80B4	The memory card is write-protected.
80C0	Access currently not possible.
80C1	Too many data logs are open.
80C3	Resources are not sufficient. Possible causes: <ul style="list-style-type: none"> <li>• Multiple calling of instructions with different parameters.</li> <li>• More than 10 data logs open simultaneously. At least one data log must be closed in order to continue because the instruction "DataLogCreate" automatically opens the the log that is being created.</li> </ul>
8253	The RECORDS parameter has an invalid value.
8353	Invalid format selection.
8453	Invalid time stamp.
8B51	Invalid data type at HEADER parameter.
8C51	Invalid data type at DATA parameter.
8C52	Structure at the parameter DATA contains more than 256 elements.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**Example**

In the following example, a simple data log is created with a time stamp and three process values.

**Tags in the global data block**

The values for the input parameters of the data log are stored in the global data block "DataLogDB":

- DataLogName (String): The tag contains the name of the data log which is also used as the file name for the CSV file.
- DataLogID (DInt): The ID of the data log is written in this tag when the instruction is called.
  - The ID is automatically assigned by the instruction.
  - Use the tag "DataLogID" in other DataLog instructions in order to address this data log.

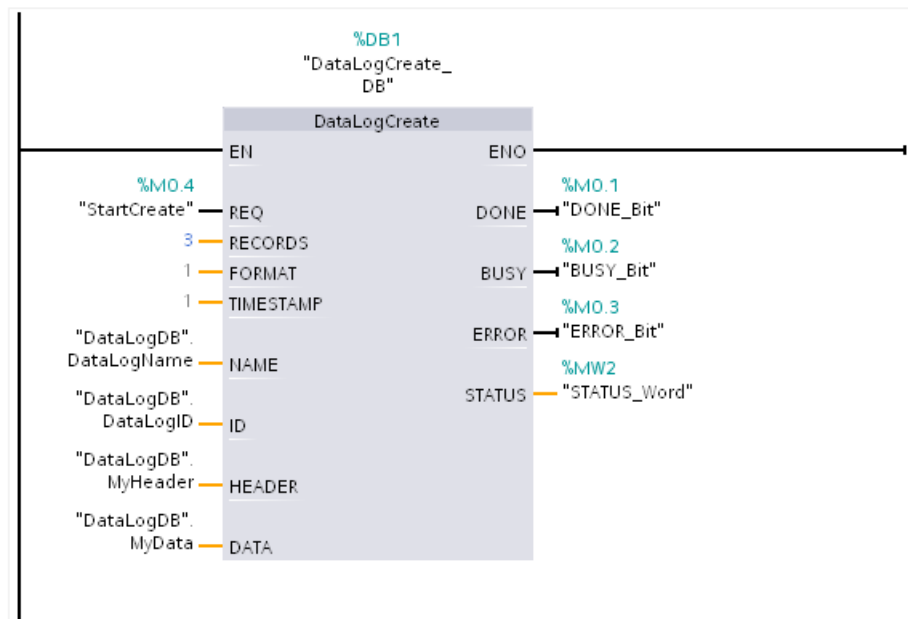

- MyHeader (String): This tag contains the header of the DataLog, i.e. the column headings for the process values. A semicolon is used as a delimiter for the columns when using a S7-1500.
- MyData (Struct): This tag contains the three process values that are written in the data log. Each time a record is written (instruction "DataLogWrite (Page 2845)") the current values are written in a new record.

DataLogDB				
	Name	Data type	Start value	Retain
1	Static			<input type="checkbox"/>
2	DataLogName	String	'MyDataLog'	<input type="checkbox"/>
3	DataLogID	DInt	0	<input type="checkbox"/>
4	MyHeader	String	'Value1;Value2;Value3'	<input type="checkbox"/>
5	MyData	Struct		<input type="checkbox"/>
6	ProcessValue1	Int	2	<input type="checkbox"/>
7	ProcessValue2	Int	3	<input type="checkbox"/>
8	ProcessValue3	Int	4	<input type="checkbox"/>

### Calling the "DataLogCreate" instruction

The instruction is called with the following input parameters:

- REQ (BOOL): With REQ = "1" the data log is created.
- RECORD (3): A maximum of three data records can be written in the data log. Thereafter, the oldest data record is overwritten.
- FORMAT (1): The data log is created as a CSV file.
- TIMESTAMP (1): Activated. Two additional columns are automatically created (date and time) for the data log. The current time stamp is written in the data record each time "DataLogWrite (Page 2845)" is executed.
- NAME (VARIANT): Pointer to the tag "DataLogName" in the data block "DataLogDB".
- ID (VARIANT): Pointer to the tag "DataLogID" in the data block "DataLogDB".
- HEADER (VARIANT): Pointer to the tag "MyHeader" in the data block "DataLogDB".
- DATA (VARIANT): Pointer to the tag "MyData" in the data block "DataLogDB".

### Readout of the data log via the web server

You can readout the created data log with the web server:

- Activate the web server in the properties of the CPU. The authorization "...to read files" must be activated for the web server in order to readout the data log.
- You can access the web server via the Internet browser by entering the IP address of the CPU as a URL.
- Under "Filebrowser" the directory "\\DataLogs" was automatically created which contains the data log.
- The DataLog only contains one entry "//END" if the instruction "DataLogWrite (Page 2845)" has still not been executed. The first data record is written after the initial execution of "DataLogWrite (Page 2845)".

	A	B	C	D	E	F
1	SeqNo	Date	Time	ProcessValue1	ProcessValue2	ProcessValue3
2	1	01.07.2013	12:33:42.917	2	3	4
3						
4						
5

Data logging - Overview (Page 2830)

**DataLogOpen: Open data log**

**DataLogOpen: Open data log**

**Description**

You use the "DataLogOpen" instruction to open an existing data log on the memory card. A data log must be open before you can write new data records to it.

Data log opens automatically when you execute the instructions "DataLogCreate (Page 2833)" and "DataLogNewFile (Page 2850)".

Up to 10 data logs can be open simultaneously. You can select the data log to be opened using the ID or name of the data log.

- If you specify the ID and the name of the data log in the ID and NAME parameters, respectively, the data log will be identified based on the ID. The data log name will not be compared.
- If you select the data log using the NAME parameter and no ID is specified, the ID will be displayed in the ID parameter when the data log is opened.
- If you select the data log using the ID parameter and no name is specified, the name will be displayed in the NAME parameter when the data log is opened.

You use the MODE parameter to specify whether the data records of the data log are to be deleted upon opening.

**Parameters**

The following table shows the parameters of the "DataLogOpen" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, L, D or constant	Execution of the instruction upon a rising edge.
MODE	Input	UInt	I, Q, M, L, D or constant	Mode for opening the data log: <ul style="list-style-type: none"> <li>• MODE= "0" Data records of the data log are retained</li> <li>• MODE= "1" Data records of the data log are deleted, but the header is retained</li> </ul>
NAME	Input	VARIANT	L, D	(File) name of the data log.
ID	InOut	DWORD	I, Q, M, L, D	Object ID of the data log.
DONE	Output	BOOL	I, Q, M, L, D	Instruction was executed successfully.
BUSY	Output	BOOL	I, Q, M, L, D	Execution of instruction not yet complete.

Parameter	Declaration	Data type	Memory area	Description
ERROR	Output	BOOL	I, Q, M, L, D	<ul style="list-style-type: none"> <li>• 0: No error.</li> <li>• 1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output via the STATUS parameter.
STATUS	Output	WORD	I, Q, M, L, D	Status parameter The parameter is only set for the duration of one call. To display the status, you should therefore copy the STATUS parameter to a free data area.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter STATUS

Error code* (W#16#...)	Description
0	No errors.
2	Warning: Data log file has already been opened by this application.
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
7002	Intermediate call (REQ irrelevant): Instruction already active; BUSY has the value "1".
8070	Complete internal instance memory is assigned.
8090	There are inconsistencies between the data log definition and existing data log data.
8091	A data type other than String was used at the NAME parameter.
8092	Data log does not exist.
80B4	The memory card is write-protected.
80C0	The data log file is locked.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

Data logging - Overview (Page 2830)

## DataLogOpen: Open data log

### Description

You use the "DataLogOpen" instruction to open an existing data log on the memory card. A data log must be open to write new data records to it.

Data log opens automatically when you execute the instructions "DataLogCreate (Page 2833)" and "DataLogNewFile (Page 2850)".

Up to 10 data logs can be open simultaneously. You can select the data log to be opened using the ID or name of the data log.

- If you specify the ID and the name of the data log in the ID and NAME parameters, respectively, the data log will be identified based on the ID. The data log name will not be compared.
- If you select the data log using the NAME parameter and no ID is specified, the ID will be displayed in the ID parameter when the data log is opened.
- If you select the data log using the ID parameter and no name is specified, the name will be displayed in the NAME parameter when the data log is opened.

You use the MODE parameter to specify whether the data records of the data log are to be deleted upon opening.

The parameter DATA enables a consistency check between the data log to be opened and the definition of the data log of the instruction "DataLogCreate (Page 2833)". The consistency check can only be executed if the data log was created with the instruction "DataLogCreate (Page 2833)":

- If you are using the same pointer at the DATA parameter as at the DATA parameter of the "DataLogCreate (Page 2833)" instruction, a check is performed to determine whether the data types match. If the data types do not match, the error code W#16#80A0 is output at the STATUS parameter.
- If the data log to be opened was not created with "DataLogCreate (Page 2833)", a consistency check is not possible. In this case, enter the value "NULL" in the DATA parameter.

## Parameters

The following table shows the parameters of the "DataLogOpen" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, L, D, T, C or constant (T and C are only available in LAD and FBD with S7-1500)	Execution of the instruction upon a rising edge.
MODE	Input	UInt	I, Q, M, L, D or constant	Mode for opening the data log: <ul style="list-style-type: none"> <li>• MODE= "0" Data records of the data log are retained</li> <li>• MODE= "1" Data records of the data log are deleted, but the header is retained</li> </ul>
NAME	Input	VARIANT	L, D	(File) name of the data log.
ID	InOut	DWORD	I, Q, M, L, D	Object ID of the data log.
DATA	InOut	VARIANT	L, D	With consistency check: Pointer to the data area at the DATA parameter of the "DataLogCreate (Page 2833)" instruction.
DONE	Output	BOOL	I, Q, M, L, D	Instruction was executed successfully.
BUSY	Output	BOOL	I, Q, M, L, D	Execution of instruction not yet complete.

Parameter	Declaration	Data type	Memory area	Description
ERROR	Output	BOOL	I, Q, M, L, D	<ul style="list-style-type: none"> <li>0: No error.</li> <li>1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output via the STATUS parameter.
STATUS	Output	WORD	I, Q, M, L, D	Status parameter The parameter is only set for the duration of one call. To display the status, you should therefore copy the STATUS parameter to a free data area.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter STATUS

Error code* (W#16#...)	Description
0	No errors.
2	Warning: Data log file has already been opened by this application.
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
7002	Intermediate call (REQ irrelevant): Instruction already active; BUSY has the value "1".
8070	Complete internal instance memory is assigned.
8090	There are inconsistencies between the data log definition and existing data log data.
8091	A data type other than String was used at the NAME parameter.
8092	Data log does not exist.
80A0	Data types inconsistent. The data log at the ID parameter uses different data types than specified in the DATA parameter.
80B4	The memory card is write-protected.
80C1	Too many files open.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## DataLogClear: Empty data log

### Description

The "DataLogClear" instruction deletes all data records in an existing data log. The instruction does not delete the optional header of the CSV file (see the description of the HEADER parameter of the instruction "DataLogCreate (Page 2833)").

You use the ID parameter to select the data log whose data records are to be deleted.

**Requirement**

Before you can delete data records, the data log must be open (see "DataLogOpen (Page 2840) instruction").

**Parameters**

The following table shows the parameters of the "DataLogClear" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, L, D, T, C or constant (T and C are only available in LAD and FBD with S7-1500)	Execution of the instruction upon a rising edge.
ID	InOut	DWORD	I, Q, M, D, L	Object ID of the data log
DONE	Output	BOOL	I, Q, M, D, L	Instruction was executed successfully.
BUSY	Output	BOOL	I, Q, M, D, L	Execution of the instruction not yet complete.
ERROR	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>0: No error.</li> <li>1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output at the STATUS parameter.
STATUS	Output	WORD	I, Q, M, D, L	Status parameter The parameter is only set for the duration of one call. To display the status, you should therefore copy the STATUS parameter to a free data area.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**Parameter STATUS**

Error code* (W#16#...)	Explanation
0000	No error.
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
7002	Intermediate call (REQ irrelevant): Instruction already active; BUSY has the value "1".
8080	The data log file selected with the ID parameter cannot be processed with the "DataLogClear" instruction.
8092	Data log does not exist.
80B0	Data log is not open.

Error code* (W#16#...)	Explanation
80B4	The memory card is write-protected.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

Data logging - Overview (Page 2830)

## DataLogWrite: Write data log

### Description

The instruction "DataLogWrite" is used to write a data record to an existing data log. The ID parameter is used to select the data log to which the data record is to be written. To create a new data record, the data log must be open. The instruction creates a new data record in the format that was specified in the DATA parameter when the data log was created.

Before calling the "DataLogWrite" instruction, transfer the data to the tag that you interconnected at the DATA parameter of the "DataLogCreate" instruction. When the "DataLogWrite" instruction is executed, the transferred data is copied to the data log.

#### NOTICE

##### Data log data loss when the power supply to the CPU is interrupted

If the power supply is interrupted during execution of the "DataLogWrite" instruction, the data record to be transferred is lost.

### Parameters

The following table shows the parameters of the "DataLogWrite" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, L, D, T, C or constant (T and C are only available in LAD and FBD with S7-1500)	Execution of the instruction upon a rising edge.
ID	InOut	DWORD	I, Q, M, L, D	Object ID of the data log
DONE	Output	BOOL	I, Q, M, L, D	Instruction was executed successfully.
BUSY	Output	BOOL	I, Q, M, L, D	Execution of the instruction not yet complete.

Parameter	Declaration	Data type	Memory area	Description
ERROR	Output	BOOL	I, Q, M, L, D	<ul style="list-style-type: none"> <li>0: No error.</li> <li>1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output via the STATUS parameter.
STATUS	Output	WORD	I, Q, M, L, D	Status parameter The parameter is only set for the duration of one call. To display the status, you should therefore copy the STATUS parameter to a free data area.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameter STATUS (S7-1200)

Error code* (W#16#...)	Description
0	No errors
0001	Last possible data record created at the end of the file. Creating another data record will overwrite an older data record.
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
7002	Intermediate call (REQ irrelevant): Instruction already active; BUSY has the value "1".
8070	Complete internal instance memory is assigned.
8092	Data log does not exist.
80B0	Data log is not open.
80B3	Insufficient memory space on the memory card.
80B4	The memory card is write-protected.
80C0	Data log is locked.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### Parameter STATUS (S7-1500)

Error code* (W#16#...)	Description
0	No errors
0001	Last possible data record created at the end of the file. Creating another data record will overwrite an older data record.
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
8070	Complete internal instance memory is assigned.
8092	Data log does not exist.

Error code* (W#16#...)	Description
80B0	Data log is not open.
80B3	Insufficient memory space on the memory card.
80B4	The memory card is write-protected.
80C0	Data log is locked.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## DataLogClose: Close data log

### Description

You use the "DataLogClose" instruction to close an open data log. You select the data log using the ID parameter.

#### Note

#### Closing data logs automatically

The data log is closed automatically when the CPU goes to STOP or if there is a restart.

## Parameters

The following table shows the parameters of the "DataLogClose" instruction:

Parameters	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, L, D, T, C or constant (T and C are only available in LAD and FBD with S7-1500)	Execute function on a rising edge.
ID	InOut	DWORD	I, Q, M, L, D	Object ID of the data log
DONE	Output	BOOL	I, Q, M, L, D	Instruction was executed successfully.
BUSY	Output	BOOL	I, Q, M, L, D	Execution of the instruction not yet complete.

9.7 References

Parameters	Declaration	Data type	Memory area	Description
ERROR	Output	BOOL	I, Q, M, L, D	<ul style="list-style-type: none"> <li>• 0: No error.</li> <li>• 1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output via the STATUS parameter.
STATUS	Output	WORD	I, Q, M, L, D	Status parameter The parameter is only set for the duration of one call. To display the status, you should therefore copy the STATUS parameter to a free data area.

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

**STATUS (S7-1200) parameter**

Error code* (W#16#...)	Description
0	No errors
1	Data log is not open
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
7002	Intermediate call (REQ irrelevant): Instruction already active; BUSY has the value "1".
8092	Data log does not exist.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

**STATUS (S7-1500) parameter**

Error code* (W#16#...)	Description
0	No errors
1	Data log is not open
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
8070	Complete internal instance memory is assigned.
8092	Data log does not exist.
80B4	The memory card is write-protected.
80C0	Access currently not possible.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

**DataLogDelete: Delete data log****Description**

You use the "DataLogDelete" instruction to delete a data log file from the memory card. The data log and the data records it contains can only be deleted if it was created with the "DataLogCreate" or "DataLogNewFile" instruction.

**Parameters**

The following table shows the parameters of the "DataLogDelete" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, L, D, T, C or constant (T and C are only available in LAD and FBD with S7-1500)	Execution of the instruction upon a rising edge.
NAME	Input	VARIANT	L, D	File name of the data log
DELFILE	Input	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• 0: Data log is retained.</li> <li>• 1: Data log is deleted.</li> </ul> Detailed information is output at the STATUS parameter.
ID	InOut	DWORD	I, Q, M, D, L	Object ID of the data log
DONE	Output	BOOL	I, Q, M, D, L	Instruction was executed successfully.
BUSY	Output	BOOL	I, Q, M, D, L	Deletion of the data log is not yet complete.
ERROR	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• 0: No error.</li> <li>• 1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output at the STATUS parameter.
STATUS	Output	WORD	I, Q, M, D, L	Status parameter The parameter is only set for the duration of one call. To display the status, you should therefore copy the STATUS parameter to a free data area.

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

**NAME and ID parameters**

Select the data log to be deleted using the NAME and ID parameters. The ID parameter is evaluated first. If there is a data log with the relevant ID, the NAME parameter will not be evaluated. If the value "0" is used at the ID parameter, a value with the data type STRING must be used at the NAME parameter.

### RET\_VAL parameter

Error code* (W#16#...)	Explanation
0	No error.
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
7002	Intermediate call (REQ irrelevant): Instruction already active; BUSY has the value "1".
8091	A data type other than STRING is being used at the NAME parameter.
8092	Data log does not exist.
80A2	Write error
80B4	The memory card is write-protected.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

DataLogCreate: Create data log (Page 2833)

### DataLogNewFile: Data log in new file

### DataLogNewFile: Data log in new file

### Description

You use the "DataLogNewFile" instruction to create a new data log with the same properties as an existing data log. This allows the contents of an existing data log to be retained.

When called, the instruction creates a new data log on the memory card or in the internal load memory with the name defined at the NAME parameter. You use the ID parameter to specify the ID of the old data log whose properties you want to apply to the new data log. The ID of the new data log is then output via the ID parameter.

You specify the file size of the new data log with the RECORDS parameter of the instruction.

Once the new data log is created, it is opened automatically. This means that data can be written.

## Parameters

The following table shows the parameters of the "DataLogNewFile" instruction:

Parameters	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, L, D or constant	Execution of the instruction upon a rising edge.
RECORDS	Input	UDInt	I, Q, M, L, D or constant	Number of data records in the data log.
NAME	Input	VARIANT	L, D	File name of the new data log.
ID	InOut	DWORD	I, Q, M, L, D	Object ID of the data log <ul style="list-style-type: none"> <li>In: ID of the existing data log</li> <li>Out: ID of the new data log</li> </ul>
DONE	Output	BOOL	I, Q, M, L, D	Instruction was executed successfully.
BUSY	Output	BOOL	I, Q, M, L, D	Execution of the instruction not yet complete.
ERROR	Output	BOOL	I, Q, M, L, D	<ul style="list-style-type: none"> <li>0: No error.</li> <li>1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output via the STATUS parameter.
STATUS	Output	WORD	I, Q, M, L, D	Status parameter The parameter is only set for the duration of one call. To display the status, you should therefore copy the STATUS parameter to a free data area.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter STATUS

Error code* (W#16#...)	Description
0	No errors.
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
7002	Intermediate call (REQ irrelevant): Instruction already active; BUSY has the value "1".
8070	Complete internal instance memory is assigned.
8090	Invalid file name.
8091	Path does not exist.
8092	Source data log does not exist.
8093	New data log already exists.
8097	File length exceeds the file system limit.
80B3	Load memory not sufficient.
80B4	The memory card is write-protected.

Error code* (W#16#...)	Description
80C1	Too many files open.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

### DataLogNewFile: Data log in new file

#### Description

You use the "DataLogNewFile" instruction to create a new data log with the same properties as an existing data log. This allows the contents of an existing data log to be retained.

When called, the instruction creates a new data log on the memory card or in the internal load memory with the name defined at the NAME parameter. You use the ID parameter to specify the ID of the old data log whose properties you want to apply to the new data log. The ID of the new data log is then output via the ID parameter.

You specify the file size of the new data log with the RECORDS parameter of the instruction.

The parameter DATA enables a consistency check between the new data log to be created and the definition of the data log of the instruction "DataLogCreate (Page 2833)". The consistency check can only be executed if the data log was created with the instruction "DataLogCreate (Page 2833)":

- If you are using the same pointer at the DATA parameter as at the DATA parameter of the "DataLogCreate (Page 2833)" instruction, a check is performed to determine whether the data types match. If the data types do not match, the error code W#16#80A0 is output at the STATUS parameter.
- If the data log to be opened was not created with "DataLogCreate (Page 2833)", a consistency check is not possible. In this case, enter the value "NULL" in the DATA parameter.

Once the new data log is created, it is opened automatically. This means that data can be written.

#### Parameters

The following table shows the parameters of the "DataLogNewFile" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, L, D, T, C or constant (T and C are only available in LAD and FBD with S7-1500)	Execution of the instruction upon a rising edge.
RECORDS	Input	UDInt	I, Q, M, L, D or constant	Number of data records in the data log.
NAME	Input	VARIANT	L, D	File name of the new data log.

Parameter	Declaration	Data type	Memory area	Description
ID	InOut	DWORD	I, Q, M, L, D	Object ID of the data log <ul style="list-style-type: none"> <li>• In: ID of the existing data log</li> <li>• Out: ID of the new data log</li> </ul>
DATA	InOut	VARIANT	L, D	Data type for consistency check
DONE	Output	BOOL	I, Q, M, L, D	Instruction was executed successfully.
BUSY	Output	BOOL	I, Q, M, L, D	Execution of the instruction not yet complete.
ERROR	Output	BOOL	I, Q, M, L, D	<ul style="list-style-type: none"> <li>• 0: No error.</li> <li>• 1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output via the STATUS parameter.
STATUS	Output	WORD	I, Q, M, L, D	Status parameter The parameter is only set for the duration of one call. To display the status, you should therefore copy the STATUS parameter to a free data area.

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## STATUS parameter

Error code* (W#16#...)	Description
0	No errors.
7000	No job processing active.
7001	Start of job processing. Parameter BUSY = 1, DONE = 0
7002	Intermediate call (REQ irrelevant): Instruction already active; BUSY has the value "1".
8070	Complete internal instance memory is assigned.
8090	<ul style="list-style-type: none"> <li>• Invalid file name.</li> <li>• Data types inconsistent. The data log at the ID parameter uses different data types than specified in the DATA parameter.</li> </ul>
8091	Path does not exist.
8092	Source data log does not exist.
8093	New data log already exists.
8097	File length exceeds the file system limit.
80B3	Load memory not sufficient.
80B4	The memory card is write-protected.
80C0	Access currently not possible.
80C1	Too many files open.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### 9.7.3.12 Data block functions

#### CREATE\_DB: Create data block

##### Description

The instruction "CREATE\_DB" is used to create a new data block in the load and/or work memory.

The instruction "CREATE\_DB" does not change the checksum of the user program.

##### Number of the data block

The data block created is assigned a number from the range defined at the LOW\_LIMIT (low limit) and UP\_LIMIT (high limit) parameters. "CREATE\_DB" assigns the smallest possible number from the specified range to the DB. You cannot assign the numbers of the DBs already contained in the user program.

To create a DB with a specific number, enter the same number for the high and low limit of the range to be specified. If a DB with the same number already exists in the work memory and/or load memory, or if the DB exists as a copied version, the instruction will be terminated and an error message will be generated at the RET\_VAL parameter.

##### Start values of the data block

Using the SRCBLK parameter, you can define start values for the DB to be created. The SRCBLK parameter is a pointer to a DB or a DB area from which you apply the start values. The DB addressed at the SRCBLK parameter must have been generated with standard access ("Optimized block access" attribute disabled).

- If the area specified at the SRCBLK parameter is larger than the DB generated, the values up to the length of the DB generated will be applied as start values.
- If the area specified at the SRCBLK parameter is smaller than the DB generated, the remaining values will be filled with "0".

To ensure data consistency, you must not change this data area while "CREATE\_DB" is being executed (which means as long as the BUSY parameter has the value TRUE).

##### Parameters

The following table shows the parameters of the "CREATE\_DB" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ= 1: Request to create the DB
LOW_LIMIT	Input	UINT	I, Q, M, D, L or constant	Low limit of the area ### used by "CREATE_DB" to assign a number to your DB (60000)
UP_LIMIT	Input	UINT	I, Q, M, D, L or constant	High limit of the area ### used by "CREATE_DB" to assign a number to your DB (largest possible DB number: 60999)

Parameter	Declaration	Data type	Memory area	Description		
COUNT	Input	UDINT	I, Q, M, D, L or constant	The count value specifies the number of bytes which you want to reserve for the DB generated. The number of bytes must be an even number. The maximum length is 65534 bytes.		
ATTRIB	Input	BYTE	I, Q, M, D, L or constant	The first 4 bits of the byte at the ATTRIB parameter define the properties of the data block: <ul style="list-style-type: none"> <li>• Bit 0 = 0: DB only in the work memory</li> <li>• Bit 0 = 1: DB only in the load memory</li> <li>• Bit 1 = 0: DB is not write-protected.</li> <li>• Bit 1 = 1: DB is write-protected</li> <li>• Bit 2 = 0: DB is retentive (only for DBs generated in the load memory)</li> <li>• Bit 2 = 1: DB is not retentive</li> <li>• Bit 3 = 0: DB generated either in load or in work memory</li> <li>• Bit 3 = 1: DB generated both in load and in work memory</li> </ul> To ensure compatibility with STEP7 V5.x, bits 1 and 3 must be used in combination:		
				<b>Bit 0</b>	<b>Bit 3</b>	<b>DB generation</b>
				0	0	In work memory only
				1	0	In load memory only
				0	1	Work and load memory
				1	1	Work and load memory
				<ul style="list-style-type: none"> <li>• Bit 4 = 0 - No start values specified (input values at the SRCBLK parameter will be ignored).</li> <li>• Bit 4 = 1 - Specify start values (values correspond to the DB addressed by the SRCBLK parameter).</li> </ul>		
SRCBLK	Input	VARIANT	D	Pointer to the data block whose values will be used to initialize the data block to be generated.		
RET_VAL	Return	INT	I, Q, M, D, L	Error information		
BUSY	Output	BOOL	I, Q, M, D, L	BUSY= 1: The process is not yet complete.		
DB_NUM	Output	DB_DYN (UINT)	I, Q, M, D, L	Number of the DB created.		

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter RET\_VAL

Error code* (W#16#...)	Description
0000	No error
0081	The target range is greater than the source range. The complete source range is written to the target range. The remaining bytes of the target range are filled with 0.
7000	First call with REQ = 0: No data transfer active; BUSY has the value "0".
7001	First call with REQ = 1: Data transfer triggered; BUSY has the value "1".

Error code* (W#16#...)	Description
7002	Intermediate call (REQ irrelevant): Data transfer already active; BUSY has the value "1".
8081	The source range is larger than the target range. The complete target range is written. The remaining bytes of the source range are ignored.
8092	The "Create data block" function is currently unavailable because <ul style="list-style-type: none"> <li>• The "Compress user memory" function is currently active.</li> <li>• The maximum number of blocks on your CPU has already been reached.</li> </ul>
8093	No data block or a data block that is not in the work memory is specified for the SRCBLK parameter.
8094	A not yet supported attribute was specified for the ATTRIBparameter.
80A1	DB number error: <ul style="list-style-type: none"> <li>• The number is "0"</li> <li>• Low limit &gt; high limit</li> </ul>
80A2	DB length error: <ul style="list-style-type: none"> <li>• The length is "0"</li> <li>• The length is an odd number</li> <li>• The length is greater than permitted by the CPU</li> </ul>
80A3	The data block at the SRCBLK parameter was not created with standard access.
80B1	There is no DB number free.
80B2	Not enough work memory.
80B4	The memory card is write-protected.
80BB	Not enough load memory.
80C0	The destination is currently being processed by another instruction or a communication function.
80C1	A DB with this DB number is currently being deleted.
80C3	The maximum number of simultaneously active "CREATE_DB" instructions has already been reached.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## READ\_DBL: Read from data block in the load memory

### Description

With the instruction you copy a DB or an area of a DB in load memory (Micro Memory Card) to the data area of a destination DB. The destination DB must be relevant for execution; that is, it must not be created with the attribute UNLINKED. The content of the load memory is not changed during the copy process.

To ensure data consistency, you must not change the target range while "READ\_DBL" is being executed (i.e., as long as the BUSY parameter has the value TRUE).

The following restrictions apply to the SRCBLK and DSTBLK parameters (source and destination blocks):

- You must be able to divide the length of the VARIANT pointer by eight.
- For a VARIANT pointer of type STRING, the length must be equal to 1.
- The source and destination block must have been created with the same block access, i.e. both must use either the access type "Optimized" or "Standard".

---

#### Note

"READ\_DBL" is processed asynchronously. Therefore, it is not suitable for frequent (or cyclical) reading of tags in the load memory.

Once started, a job is always completed. If the maximum number of simultaneously active "READ\_DBL" instructions is reached and you call "READ\_DBL" once again at this time in a priority class having higher priority, error code W#16#80C3 will be returned. Consequently it does not make sense to restart the high-priority job right away.

---

### Functional description

The "READ\_DBL" instruction works asynchronously, that is, its execution extends over multiple calls. You start the job by calling "READ\_DBL" with REQ = 1.

The output parameters RET\_VAL and BUSY indicate the status of the job.

See also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794)

### Parameters

The following table shows the parameters of the "READ\_DBL" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ = 1: Read request
SRCBLK	Input	VARIANT	D	Pointer to data block in the load memory that is to be read from
RET_VAL	Return	INT	I, Q, M, D, L	Error information
BUSY	Output	BOOL	I, Q, M, D, L	BUSY = 1: The reading process is not yet complete.
DSTBLK	Output	VARIANT	D	Pointer to the data block in the work memory that is to be written to

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**Parameter RET\_VAL**

Error code* (W#16#...)	Description
0000	No error
0081	The target range is greater than the source range. The source range is written completely to the target range; the remaining bytes of the target range will not be changed.
7000	First call with REQ = 0: No data transfer active; BUSY has the value "0".
7001	First call with REQ=1: Data transfer triggered; BUSY has the value "1".
7002	Intermediate call (REQ irrelevant): Data transfer already active; BUSY has the value "1".
8081	The source range is larger than the target range. The complete target range is written. The remaining bytes of the source range are ignored.
8082	Destination DB type different from source DB type (optimized/standard access).
8093	No data block or a data block that is not in the work memory is specified for the DSTBLK parameter.
80B1	No data block is specified for the SRCBLK parameter, or the data block specified there is not a load memory object.
80B4	DB with F-attribute must not be read.
80C3	The maximum number of simultaneously active "READ_DBL" instructions has already been reached.
80C0	The destination DB is currently being processed by another instruction or a communication function.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**See also**

GET\_ERR\_ID: Get error ID locally (Page 2520)

**WRIT\_DBL: Write to data block in the load memory**

**Description**

The instruction "WRIT\_DBL" is used to transfer the contents of a DB or a DB area from the work memory to a DB or a DB area in the load memory (Micro Memory Card). The source DB must be relevant for execution, which means it must not be created with the attribute UNLINKED.

To ensure data consistency, it is not permitted to change the source range while "WRIT\_DBL" is being executed (i.e., as long as the BUSY parameter has the value TRUE).

The following restrictions apply to the SRCBLK and DSTBLK parameters (source and destination blocks):

- For a VARIANT pointer of type BOOL, the length must be divisible by 8.
- For a VARIANT pointer of type STRING, the length must be equal to 1.
- The source and destination block must have been created with the same block access, i.e. both must use either the access type "Optimized" or "Standard - compatible with S7-300/400".

The "WRIT\_DBL" instruction does not change the checksum of the user program if you write a DB that was created using an instruction. However, when a loaded DB is written, the first entry in this DB changes the checksum of the user program.

#### Note

"WRIT\_DBL" is not suitable for frequent (or cyclical) writing of tags in the load memory. This is because the Micro Memory Card technology limits the number of write accesses that can be made to a Micro Memory Card.

### Functional description

The "WRIT\_DBL" instruction works asynchronously, that is, its execution extends over multiple calls. You start the job by calling "WRIT\_DBL" with REQ=1.

The output parameters RET\_VAL and BUSY indicate the status of the job.

See also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794).

### Parameters

The following table shows the parameters of the instruction "WRIT\_DBL":

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ = 1: Write request
SRCBLK	Input	VARIANT	D	Pointer to the DB in the work memory that is to be read from
RET_VAL	Return	INT	I, Q, M, D, L	Error information
BUSY	Output	BOOL	I, Q, M, D, L	BUSY = 1: The writing process is not yet completed.
DSTBLK	Output	VARIANT	D	Pointer to the data block in the load memory that is to be written to

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

### Parameter RET\_VAL

Error code* (W#16#...)	Description
0000	No error
0081	The target range is greater than the source range. The source range is written completely to the target range; the remaining bytes of the target range will not be changed.
7000	First call with REQ = 0: No data transfer active; BUSY has the value "0".
7001	First call with REQ = 1: Data transfer triggered; BUSY has the value "1".

Error code* (W#16#...)	Description
7002	Intermediate call (REQ irrelevant): Data transfer already active; BUSY has the value "1".
8081	The source range is larger than the target range. <b>The complete target range is written. The remaining bytes of the source range are ignored.</b>
8082	Destination DB type different from source DB type (optimized/non-optimized access).
8092	Incorrect operating mode: While "WRIT_DBL" was active, the CPU went into STOP mode. This error code is supplied at the next transition to RUN. Call "WRIT_DBL" again.
8093	No data block or a data block that is not in the work memory is specified for the SRCBLK parameter.
80B1	No data block has been specified for the DSTBLK parameter, or the data block specified there is not a load memory object.
80B4	<ul style="list-style-type: none"> <li>DB with F-attribute must not be read.</li> <li>The memory card is write-protected.</li> </ul>
80BB	Insufficient load memory available.
80C3	The maximum number of simultaneously active "WRIT_DBL" instructions has already been reached.
80C0	The destination DB is currently being processed by another instruction or a communication function.
General error codes	See also: GET_ERR_ID: Get error ID locally (Page 2022)

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## ATTR\_DB: Read data block attribute

### Description

You use the instruction "ATTR\_DB" to obtain information about a data block (DB) located in the work memory of the CPU. The instruction determines the attributes set at the ATTRIB parameter for the DB selected.

The length cannot be read out for data blocks with optimized access, the DB\_LENGTH parameter contains the length "0" for DBs with optimized access.

Data blocks for Motion Control cannot be read out with the "ATTR\_DB" instruction. The error code 80B2 is output for this.

### Parameters

The following table shows the parameters of the "ATTR\_DB" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ = 1: Read request for block attributes
DB_NUMBE R	Input	DB_ANY (UINT)	I, Q, M, D, L or constant	Number of the DB to be tested
RET_VAL	Output	INT	I, Q, M, D, L	Error information
DB_LENGTH	Output	UDINT	I, Q, M, D, L	Number of data bytes which the selected DB contains.

Parameter	Declaration	Data type	Memory area	Description
ATTRIB	Output	BYTE	I, Q, M, D, L	DB properties: <ul style="list-style-type: none"> <li>• Bit 0*= 0: LINKED - The DB only exists in the work memory</li> <li>• Bit 0*= 1: UNLINKED - The DB only exists in the load memory</li> <li>• Bit 1 = 0: READ_ONLY - The DB is not write-protected.</li> <li>• Bit 1 = 1: READ_ONLY - The DB is write-protected.</li> <li>• Bit 2 = 0: RETAIN - The DB is retentive.</li> <li>• Bit 2 = 1: NON_RETAIN - The DB is not retentive.</li> <li>• Bit 3*= 0: The DB exists either in the load or the work memory</li> <li>• Bit 3*= 1: The DB is generated in both the load and the work memory</li> </ul>
* The relationship between bit 0 and bit 3 is explained in the parameters of the instruction "CREATE_DB: Create data block (Page 2854)".				

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## Parameter RET\_VAL

Error code* (W#16#...)	Explanation
0000	No error occurred.
80A1	Error in input parameter DB_NUMBER: the actual parameter selected <ul style="list-style-type: none"> <li>• Is "0"</li> <li>• Is greater than the maximum permitted DB number for the CPU used.</li> </ul>
80B1	The DB with the specified number does not exist on the CPU.
80B2	Data blocks of Motion Control technology objects cannot be read out with the "ATTR_DB" instruction.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## DELETE\_DB: Delete data block

### Description

You use the instruction "DELETE\_DB" to delete a data block (DB) that was created from the user program by calling the instruction "CREATE\_DB (Page 2854)".

If the data block was not created with "CREATE\_DB", the error code W#16#80B5 is output at the RET\_VAL parameter.

The DB to be deleted may not be located in the current or in a lower priority class. Otherwise, the CPU starts OB 121 when the "DELETE\_DB" instruction is called. If OB 121 is not present, the CPU switches to STOP mode. The instruction "DELETE\_DB" can be interrupted by higher

priority classes. If the instruction is called again there, then this second call will be aborted and W#16#8091 will be entered in RET\_VAL .

### Parameters

The following table shows the parameters of the "DELETE\_DB" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ =1: Request to delete the DB with the number in parameter DB_NUMBER
DB_NUMBER	Input	UINT	I, Q, M, D, L or constant	Number of the DB to be deleted
RET_VAL	Output	INT	I, Q, M, D, L	Error information (see "RET_VAL parameter")
BUSY	Output	BOOL	I, Q, M, D, L	BUSY= 1: The process is not yet complete.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

### Parameter RET\_VAL

Error code* (W#16#...)	Explanation
0000	No error occurred.
8091	"DELETE_DB" calls were nested and the maximum nesting level of the CPU used was exceeded.
8092	The instruction can currently not be executed because: <ul style="list-style-type: none"> <li>• The "Compress user memory" function is currently active.</li> <li>• You are copying the DB to be deleted from the CPU to an offline project.</li> </ul>
80A1	Error in input parameter DB_NUMBER: <ul style="list-style-type: none"> <li>• The value at the parameter is "0".</li> <li>• The value at the parameter is greater than the maximum permitted DB number for the CPU used.</li> </ul>
80B1	The DB with the specified number does not exist on the CPU.
80B4	The DB cannot be deleted because the memory card of the CPU is write-protected.
80B5	The DB was not created using "CREATE_DB".
80BB	Not enough load memory.
80C1	The "Delete a DB" function cannot be executed at this time due to a temporary resource bottleneck.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### 9.7.3.13 Addressing

#### Instructions for address conversion

##### Description

There are different options for addressing a module (IO address, hardware identifier, slot).

You can convert the address data with the following instructions:

- GEO2LOG: Determine hardware identifier from slot (Page 2864)
- LOG2GEO: Determine slot from hardware identifier (Page 2866)
- LOG2MOD: Determine the hardware identifier from addressing of STEP 7 V5.5 SPx (Page 2867)
- IO2MOD: Determine hardware identifier from an IO address (Page 2868)
- RD\_ADDR: Determine IO addresses from the hardware identifier (Page 2869)

The following instructions are supported in addition for migrated projects:

- GEO\_LOG: Determine hardware identifier from slot (Page 2871)
- LOG\_GEO: Determine slot from hardware identifier (Page 2872)
- RD\_LGADR: Determine IO addresses from the hardware identifier (Page 2874)
- GADR\_LGC: Determine hardware identifier from slot and offset in the user data address area (Page 2875)
- LGC\_GADR: Determine slot from hardware identifier (Page 2876)

**Type of address conversion**

The figure below shows which instruction runs which address conversion.

Name	Type	IO address(es)	Hardware identifier	Slot
GEO2LOG	SFC		←	●
LOG2GEO	SFC		●	→
LOG2MOD	SFC	●	→	
IO2MOD	SFC	●	→	
RD_ADDR	SFC	←	←	←
GEO_LOG	FC		←	●
LOG_GEO	FC		●	→
RD_LGADR	FC	←	←	←
GADR_LGC	FC		←	●
LGC_GADR	FC		●	→

**GEO2LOG: Determine hardware identifier from slot**

**Description**

You use the "GEO2LOG" instruction to determine hardware identifier based on slot information that you define using the system data type GEOADDR.

Depending on the type of hardware you define at the parameter HWTYPE the following information is evaluated from the other parameters GEOADDR:

- With HWTYPE = 1 (PROFINET IO system):
  - Only IOSYSTEM is evaluated. The other parameters of GEOADDR are not taken into consideration.
  - The hardware identifier of the PROFINET IO system is output.
- With HWTYPE = 2 (PROFINET IO device):
  - IOSYSTEM and STATION are evaluated. The other parameters of GEOADDR are not taken into consideration.
  - The hardware identifier of the PROFINET IO device is output.
- With HWTYPE = 3 (rack):
  - Only IOSYSTEM and STATION are evaluated. The other parameters of GEOADDR are not taken into consideration.
  - The hardware identifier of the rack is output.

- With HWTYPE = 4 (module):
  - IOSYSTEM, STATION and SLOT are evaluated. The SUBSLOT parameter of GEOADDR is not taken into consideration.
  - The hardware identifier of the module is output.
- With HWTYPE = 5 (submodule):
  - All parameters of GEOADDR are evaluated.
  - The hardware identifier of the submodule is output.

The AREA parameter of the GEOADDR system data type is not evaluated.

## Parameter

The following table shows the parameters of the "GEO2LOG" instruction:

Parameter	Declaration	Data type	Memory area	Description
GEOADDR	Input	VARIANT	D, L	Pointer to the structure of the GEOADDR system data type. The system data type contains the slot information from which the hardware ID is determined. See also: System data type GEOADDR (Page 2870)
RET_VAL	Return	INT	I, Q, M, D, L	Output of error information.
LADDR	Output	HW_ANY	I, Q, M, D, L	Hardware identifier of the assembly or the module. The number is automatically assigned and is stored in the properties in the hardware configuration.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter RET\_VAL

Error code* (W#16#...)	Explanation
0	No error occurred.
8091	Invalid value for in GEOADDR for HWTYPE.
8094	Invalid value for in GEOADDR for IOSYSTEM.
8095	Invalid value for in GEOADDR for STATION.
8096	Invalid value for in GEOADDR for SLOT.
8097	Invalid value for in GEOADDR for SUBSLOT.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**See also**

Instructions for address conversion (Page 2863)

**LOG2GEO: Determine slot from hardware identifier**

**Description**

You use the "LOG2GEO" instruction to determine the module slot belonging to a hardware identifier.

**Parameters**

The following table shows the parameters of the "LOG2GEO" instruction:

Parameter	Declaration	Data type	Memory area	Description
LADDR	Input	HW_ANY	I, Q, M, D, L or constant	Hardware identifier of the module whose slot you want to find. The hardware ID is assigned automatically and is stored in the properties of the module in the hardware configuration and the system constants.
RET_VAL	Output	INT	I, Q, M, D, L	Output of error information.
GEOADDR	InOut	VARIANT	D	Pointer to the GEOADDR system data type. The slot information is written in the system data type GEOADDR. See also: System data type GEOADDR (Page 2870)

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**Parameter RET\_VAL**

Error code* (W#16#...)	Explanation
0	No error occurred.
8090	The address specified at the LADDR parameter is invalid.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**LOG2MOD: Determine the hardware identifier from addressing of STEP 7 V5.5 SPx****Description**

You use the "LOG2MOD" instruction to determine the hardware identifier for an IO (sub)module from the addressing of STEP 7 5.5 SPx (IO data address or diagnostic address).

The hardware identifier is used at the LADDR input parameter for addressing of various instructions. You can convert the addressing parameters from STEP 7 5.5 SPx by calling "LOG2MOD" beforehand.

**Parameter**

The following table shows the parameters of the "LOG2MOD" instruction:

Parameter	Declaration	Data type	Memory area	Description
IOID	Input	BYTE	I, Q, M, D, L or constant	Identifier of the address area as in STEP 7 5.5 SPx: <ul style="list-style-type: none"> <li>• B#16#00: Bit15 of ADDR specifies whether an input (Bit15=0) or output address (Bit15=1) exists.</li> <li>• B#16#54= Peripheral input (PI)</li> <li>• B#16#55= Peripheral output (PQ)</li> </ul>
ADDR	Input	WORD	I, Q, M, D, L or constant	Logical address of the IO data of the module as offset (corresponding addressing in STEP 7 5.5 SPx) or diagnostic address.
RET_VAL	Return	INT	I, Q, M, D, L	Error code of the instruction.
HWID	Output	HW_IO	I, Q, M, D, L	Determined hardware identifier (logical address) of the IO (sub)module.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**RET\_VAL parameter**

Error code* (W#16#...)	Explanation
0	No error occurred.
8093	<ul style="list-style-type: none"> <li>• Specified address is not used by any hardware components.</li> <li>• Specified value at IOID parameter is invalid.</li> </ul>
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**IO2MOD: Determine hardware identifier from an IO address**

**Description**

The "IO2MOD" instruction determines the hardware identifier of the module from an IO address (I, Q, PI, PQ) of a (sub)module.

Enter the IO address at the ADDR parameter. If a series of IO addresses is used at this parameter, only the first address is evaluated to determine the hardware identifier. If the first address is correctly specified, the length for the address specification at the ADDR is of no significance. If an address area is used that encompasses several modules or non-used addresses, the hardware identifier of the first module can also be determined.

If no IO address of a sub(module) is specified at the ADDR parameter, the error code 8090 is output at the RET\_VAL parameter.

**Note**

**Input of IO address in SCL**

You cannot program using the IO access ID "%QWx:P" in SCL. In this case, use the symbolic tag name or the absolute address in the process image.

**Parameters**

The following table shows the parameters of the "IO2MOD" instruction:

Parameter	Declaration	Data type	Memory area	Description
ADDR	Input	VARIANT	I, Q, M, D, L	IO address (I, Q, PI, PQ) within a (sub)module. Make sure that slice access is not used for the parameter ADDR. If this is the case, incorrect values are output at the LADDR parameter.
RET_VAL	Return	INT	I, Q, M, D, L	Error code of the instruction.
LADDR	Output	HW_IO	I, Q, M, D, L	Determined hardware identifier (logical address) of the IO (sub)module.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**RET\_VAL parameter**

Error code* (W#16#...)	Explanation
0	No error occurred.
8090	IO address specified at ADDR parameter is not used by any hardware component.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

**RD\_ADDR: Determine IO addresses from the hardware identifier****Description**

The "RD\_ADDR" instruction determines the length and the start address of the inputs or outputs based on the hardware identifier of a sub(module).

- Use the LADDR parameter to select the input or output module based on the hardware identifier.
- The following output parameters are used depending on whether it is an input module or output module:
  - In the case of an input module the determined values are output at the PIADDR and PICOOUNT parameters.
  - In the case of an output module the determined values are output at the PQADDR and PQCOUNT parameters.
- The PIADDR and PQADDR parameters each contain the start address of the I/O addresses of the module.
- The PICOOUNT and PQCOUNT parameters each contain the number of bytes of the inputs or outputs (1 byte for 8 inputs/outputs, 2 bytes for 16 inputs/outputs).

**Note****Addressing packed modules**

If packed modules (not the first module of the packed module group) are addressed, the displayed data deviates from the hardware configuration. "0" is returned for PIADDR or PQADDR and PICOOUNT or PQCOUNT. RET\_VAL does not indicate an error (16#0000).

**Parameters**

The following table shows the parameters of the "RD\_ADDR" instruction:

Parameter	Declaration	Data type	Memory area	Description
LADDR	Input	HW_IO	I, Q, M, D, L or constant	Hardware identifier of the (sub)module.
RET_VAL	Return	INT	I, Q, M, D, L	Error code of the instruction.
PIADDR	Output	UDINT	I, Q, M, D, L	Start address of the input module.
PICOOUNT	Output	UINT	I, Q, M, D, L	Number of bytes of the inputs.
PQADDR	Output	UDINT	I, Q, M, D, L	Start address of the output module.
PQCOUNT	Output	UINT	I, Q, M, D, L	Number of bytes of the outputs.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**Parameter RET\_VAL**

Error code* (W#16#...)	Explanation
0	No error occurred.
8090	Hardware identifier of the module at the LADDR parameter is invalid.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

**System data type GEOADDR**

**Geographical address**

The system data type GEOADDR contains the geographical address of a module, i.e. the slot information.

- Geographical address for PROFINET IO  
For PROFINET IO the geographical address was composed of the ID of the PROFINET IO system, the device number, the slot number and the submodule (if a sub-module is used).
- Geographical address for PROFIBUS DP  
For PROFIBUS DP, the geographical address consists of the ID of the DP master system, the station number and the slot number.

The slot information of the modules can be found in the hardware configuration of each module.

**System data type GEOADDR**

The structure GEOADDR is automatically created if you enter "GEOADDR" as the data type in a data block.

The system data type GEOADDR has the following structure:

Parameter name	Data type	Description
GEOADDR	STRUCT	
HWTYPE	UINT	Hardware type: <ul style="list-style-type: none"> <li>• 1: IO system (PROFINET/PROFIBUS)</li> <li>• 2: IO device/DP slave</li> <li>• 3: Rack</li> <li>• 4: Module</li> <li>• 5: Submodule</li> </ul> If a hardware type is not supported by the instruction, a HWTYPE "0" is output.
AREA	UINT	Area ID: <ul style="list-style-type: none"> <li>• 0 = CPU</li> <li>• 1 = PROFINET IO</li> <li>• 2 = PROFIBUS DP</li> <li>• 3 = AS-i</li> </ul>
IOSYSTEM	UINT	PROFINET IO system (0=central unit in the rack)

Parameter name	Data type	Description
STATION	UINT	<ul style="list-style-type: none"> <li>Number of the rack if area identifier AREA = 0 (central module).</li> <li>Station number if area identifier AREA &gt; 0.</li> </ul>
SLOT	UINT	Slot number
SUBSLOT	UINT	Number of the submodule. This parameter has the value "0" if no submodule is available or can be plugged.

## Other

### GEO\_LOG: Determine hardware identifier from slot

#### Description

The corresponding module slot of a signal module is known. Use the "GEO\_LOG" instruction to determine the corresponding hardware identifier of the module from this.

#### Parameters

The following table shows the parameters of the instruction "GEO\_LOG":

Parameter	Declaration	Data type	Memory area	Description
MASTER	Input	INT	I, Q, M, D, L or constant	Area ID: <ul style="list-style-type: none"> <li>0, if the slot is located in a centralized configuration.</li> <li>1 to 32: DP master system ID of the associated field device if the slot is located in a field device on PROFIBUS</li> <li>100 to 115: PROFINET IO system ID of the associated field device if the slot is located in a field device on PROFINET</li> </ul>
STATION	Input	INT	I, Q, M, D, L or constant	<ul style="list-style-type: none"> <li>If MASTER = 0: Number of the rack</li> <li>If MASTER &gt; 0: Station number of the field device</li> </ul>
SLOT	Input	INT	I, Q, M, D, L or constant	Slot number
SUBSLOT	Input	INT	I, Q, M, D, L or constant	The parameter SUBSLOT is not evaluated by the instruction.
RET_VAL	Return	INT	I, Q, M, D, L	Error information
LADDR	Output	HW_IO	I, Q, M, D, L	Hardware identifier of the module

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**Parameter RET\_VAL**

Error code* (W#16#...)	Explanation
0000	No error occurred.
8094	No subnet was configured with the specified SUBNETID .
8095	Illegal value for STATION parameter
8096	Illegal value for SLOT parameter
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**See also**

Instructions for address conversion (Page 2863)

**LOG\_GEO: Determine slot from hardware identifier**

**Description**

You use the "LOG\_GEO" instruction to determine the module slot belonging to a hardware identifier.

**Parameters**

The following table shows the parameters of the instruction "LOG\_GEO":

Parameter	Declaration	Data type	Memory area	Description
LADDR	Input	HW_IO	I, Q, M, D, L or constant	Hardware identifier of the module for which the slot is to be determined.
RET_VAL	Return	INT	I, Q, M, D, L	Error information
AREA	Output	INT	I, Q, M, D, L	Area ID: indicates how the remaining output parameters are to be interpreted: <ul style="list-style-type: none"> <li>• 0: central device</li> <li>• 2: PROFIBUS DP / PROFINET IO</li> </ul>

Parameter	Declaration	Data type	Memory area	Description
MASTER	Output	INT	I, Q, M, D, L	With AREA = 0: <ul style="list-style-type: none"> <li>0: If the slot is located in one of the racks (central device).</li> </ul> With AREA = 2: <ul style="list-style-type: none"> <li>1 to 32: DP master system ID of the associated field device if the slot is located in a field device on PROFIBUS</li> <li>100 to 115: PROFINET IO system ID of the associated field device if the slot is located in a field device on PROFINET</li> </ul>
STATION	Output	INT	I, Q, M, D, L	<ul style="list-style-type: none"> <li>With MASTER = 0: Number of the rack</li> <li>With MASTER &gt; 0: Station number of the field device</li> </ul>
SLOT	Output	INT	I, Q, M, D, L	Slot number
SUBSLOT	Output	INT	I, Q, M, D, L	The SUBSLOT parameter is not output by the instruction (always "0").
OFFSET	Output	INT	I, Q, M, D, L	The OFFSET parameter is not output by the instruction (always "0").

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

### Parameter RET\_VAL

Error code* (W#16#...)	Explanation
0000	No error occurred.
8090	Specified logical address invalid
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

### See also

## RD\_LGADR: Determine IO addresses from the hardware identifier

### Description

Based on the hardware identifier, you can determine the logical addresses of a module, a central submodule or a submodule for PNIO with the "RD\_LGADR" instruction.

- You can specify the hardware ID of the submodule at the LADDR parameter.
- The addresses are written to the PEADDR and PAADDR parameters in ascending order.
  - For an input module, only the PEADDR parameter is written. For an output module, the PAADDR parameter is written.
  - An Array of WORD is used to store the addresses in each case.
- The number of addresses is output at the PECOUNT parameter (for an input module) and PACOUNT parameter (for an output module).

### Parameters

The following table shows the parameters of the instruction "RD\_LGADR":

Parameter	Declaration	Data type	Memory area	Description
IOID	Input	BYTE	I, Q, M, D, L or constant	Address area identifier: <ul style="list-style-type: none"> <li>• B#16#54 = Peripheral input (PI)</li> <li>• B#16#55 = Peripheral output (PQ)</li> </ul>
LADDR	Input	HW_ANY	I, Q, M, D, L or constant	Hardware identifier of the module or the submodule.
RET_VAL	Return	INT	I, Q, M, D, L	Error information
PEADDR	Output	ANY	I, Q, M, D, L	Field for the PI addresses with the Array of WORD data type
PECOUNT	Output	INT	I, Q, M, D, L	Number of returned PI addresses
PAADDR	Output	ANY	I, Q, M, D, L	Field for the PQ addresses with the Array of WORD data type
PACOUNT	Output	INT	I, Q, M, D, L	Number of returned PQ addresses

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### RET\_VAL parameter

Error code (W#16#...)	Explanation
0000	No error occurred.
8090	Specified logical address invalid or illegal value for the IOID parameter.
80A0	Error in the output parameter PEADDR: The data type of the array elements is not WORD.

Error code (W#16#...)	Explanation
80A1	Error in the output parameter PAADDR: The data type of the array elements is not WORD.
80A2	Error in the output parameter PEADDR: The specified array could not accommodate all the logical addresses.
80A3	Error in the output parameter PAADDR: The specified array could not accommodate all the logical addresses.
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)

### See also

Instructions for address conversion (Page 2863)

### GADR\_LGC: Determine hardware identifier from slot and offset in the user data address area

#### Description

You use the "GADR\_LGC" instruction to determine the hardware identifier of a signal module. The hardware identifier is determined from the module slot and the offset in the user data address area of the module.

If you use the "GADR\_LGC" instruction on power modules or modules with packed addresses (ET 200S), then the diagnostics address will be returned.

#### Parameters

The following table shows the parameters of the instruction "GADR\_LGC":

Parameter	Declaration	Data type	Memory area	Description
SUBNETID	Input	BYTE	I, Q, M, D, L or constant	Area ID: <ul style="list-style-type: none"> <li>0: If the slot is located in the central module</li> <li>1 to 32: DP master system ID of the corresponding distributed I/O system if the slot is in a distributed I/O device.</li> <li>100 to 115: PROFINET IO system ID of the associated field device if the slot is located in a field device on PROFINET</li> </ul>
RACK	Input	WORD	I, Q, M, D, L or constant	<ul style="list-style-type: none"> <li>Number of the rack, if area identifier is 0</li> <li>Device number of the distributed I/O device if the area identifier &gt; 0</li> </ul>
SLOT	Input	WORD	I, Q, M, D, L or constant	Slot no.
SUBSLOT	Input	BYTE	I, Q, M, D, L or constant	Sub-module slot (if no sub-module can be inserted, 0 must be entered here)

Parameter	Declaration	Data type	Memory area	Description
SUBADDR	Input	WORD	I, Q, M, D, L or constant	Offset in the user data address area of the module
RET_VAL	Return	INT	I, Q, M, D, L	Error information
IOID	Output	BYTE	I, Q, M, D, L	The IOID output parameter is not written (always "0").
LADDR	Output	HW_MODULE	I, Q, M, D, L	Hardware identifier of the module

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

### Parameter RET\_VAL

Error code* (W#16#...)	Explanation
0000	No error occurred.
8093	Illegal value for SUBNETID parameter
8094	No subnet was configured with the specified SUBNETID .
8095	Illegal value for RACK parameter.
8096	Illegal value for SLOT parameter.
8097	Illegal value for SUBSLOT parameter.
8098	Illegal value for SUBADDR parameter.
8099	The slot is not configured.
809A	The sub-address of the selected slot is not configured (only possible with central I/O for CPU and IM).
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### LGC\_GADR: Determine slot from hardware identifier

#### Description

You use the "LGC\_GADR" instruction to determine the module slot belonging to a hardware identifier.

#### Note

The "LGC\_GADR" instruction cannot be used on a module with packed addresses (ET 200S).

## Parameters

The following table shows the parameters of the instruction "LGC\_GADR":

Parameter	Declaration	Data type	Memory area	Description
IOID	Input	BYTE	I, Q, M, D, L or constant	Is not evaluated.
LADDR	Input	HW_MODULE	I, Q, M, D, L or constant	Hardware identifier of the module
RET_VAL	Return	INT	I, Q, M, D, L	Error information
AREA	Output	BYTE	I, Q, M, D, L	Area ID: indicates how the remaining output parameters are to be interpreted: <ul style="list-style-type: none"> <li>• 0: Central module</li> <li>• 2: PROFIBUS DP</li> </ul>
RACK	Output	WORD	I, Q, M, D, L	Rack number: <ul style="list-style-type: none"> <li>• With central module AREA= 0): <ul style="list-style-type: none"> <li>– Rack number</li> </ul> </li> <li>• For PROFIBUS DP (AREA=2): <ul style="list-style-type: none"> <li>– Low byte: Station number</li> <li>– High byte: DP master system ID</li> </ul> </li> </ul>
SLOT	Output	WORD	I, Q, M, D, L	Slot number: <ul style="list-style-type: none"> <li>• With central module AREA= 0): <ul style="list-style-type: none"> <li>– Slot number</li> </ul> </li> <li>• For PROFIBUS DP (AREA=2): <ul style="list-style-type: none"> <li>– Slot no. in the station</li> </ul> </li> </ul>
SUBADDR	Output	WORD	I, Q, M, D, L	Is not output (always "0").

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## Parameter RET\_VAL

Error code* (W#16#...)	Explanation
0000	No error occurred.
8090	Specified logical address invalid or illegal value for the IOID parameter.
8093	This instruction is not permitted for the module selected by the parameters IOID and LADDR .
General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## 9.7.4 Technology

### 9.7.4.1 S7-1200 Motion Control

#### S7-1200 Motion Control V4

#### MC\_Power

#### MC\_Power: Enable, disable axis V4

#### Description

The Motion Control instruction "MC\_Power" enables or disables an axis.

#### Requirements

- The positioning axis technology object has been configured correctly.
- There is no pending enable-inhibiting error.

#### Override response

Execution of "MC\_Power" cannot be aborted by a Motion Control command.

Disabling the axis (input parameter "Enable" = FALSE) aborts all Motion Control commands for the associated technology object in accordance with the selected "StopMode".

#### Parameters

Parameter	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_Axis	-	Axis technology object	
Enable	INPUT	BOOL	FALSE	TRUE	The axis is enabled.
				FALSE	All current jobs are interrupted in accordance with the "StopMode" configured. The axis is stopped and disabled.
StopMode	INPUT	INT	0	0	Emergency stop If a request to disable the axis is pending, the axis brakes at the configured emergency stop deceleration. The axis is disabled after reaching standstill.
				1	Immediate stop If a request to disable the axis is pending, this axis is disabled without deceleration. The pulse output is stopped immediately.

Parameter	Declaration	Data type	Default value	Description	
				2 Emergency stop with jerk control If a request to disable the axis is pending, the axis brakes at the configured emergency stop deceleration. If the jerk control is activated, the configured jerk is taken into account. The axis is disabled after reaching standstill.	
Status	OUTPUT	BOOL	FALSE	Status of axis enable	
				FALSE	The axis is disabled. The axis does not execute Motion Control commands and does not accept any new commands (exception: MC_Reset command). The axis is not homed. Upon disabling, the status does not change to FALSE until the axis reaches a standstill.
				TRUE	The axis is enabled. The axis is ready to execute Motion Control commands. Upon axis enabling, the status does not change to TRUE until the signal "Drive ready" is pending. If the "Drive ready" drive interface was not configured in the axis configuration, the status changes to TRUE immediately.
Busy	OUTPUT	BOOL	FALSE	TRUE	"MC_Power" is active.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred in Motion Control instruction "MC_Power" or in the associated technology object. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000		Error ID (Page 6538) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000		Error info ID (Page 6538) for parameter "ErrorID"

**Note**

If the axis is switched off due to an error, it will be enabled again automatically after the error has been eliminated and acknowledged. This requires that the input parameter "Enable" has retained the value TRUE during this process.

**Enabling an axis with configured drive interface**

To enable the axis, follow these steps:

1. Check the requirements indicated above.
2. Initialize input parameter "StopMode" with the desired value. Set the input parameter "Enable" to TRUE.  
The enable output for "Drive enabled" changes to TRUE to enable the power to the drive. The CPU waits for the "Drive ready" signal of the drive.  
When the "Drive ready" signal is available at the configured ready input of the CPU, the axis is enabled. Output parameter "Status" and tag of technology object <Axis name>.StatusBits.Enable indicate the value TRUE.

### Enabling an axis without configured drive interface

To enable the axis, follow these steps:

1. Check the requirements indicated above.
2. Initialize input parameter "StopMode" with the desired value. Set the input parameter "Enable" to TRUE. The axis is enabled. The output parameter "Status" and the tag of the technology object <Axis name>.StatusBits.Enable indicate the value TRUE.

### Disabling an axis

To disable an axis, you can follow the steps described below:

1. Bring the axis to a standstill.  
You can identify when the axis is at a standstill in the tag of the technology object <Axis name>.StatusBits.StandStill.
2. Set input parameter "Enable" to FALSE after standstill is reached.
3. If output parameters "Busy" and "Status" and tag of technology object <Axis name>.StatusBits.Enable indicate the value FALSE, disabling of the axis is complete.

## MC\_Power: Function chart V4

### Function chart

- |   |  |
|---|--|
| ① | An axis is enabled and then disabled again. When the drive has signaled "Drive ready" back to the CPU, the successful enable can be read out via "Status_1".                   |
| ② | Following an axis enable, an error has occurred that caused the axis to be disabled. The error is eliminated and acknowledged with "MC_Reset". The axis is then enabled again. |

### See also

MC\_Power: Enable, disable axis V4 (Page 2878)

## MC\_Reset

### MC\_Reset: Acknowledge fault V4

#### Description

Motion Control instruction "MC\_Reset" can be used to acknowledge "Operating error with axis stop" and "Configuration error". The errors that require acknowledgement can be found in the "List of ErrorIDs and ErrorInfos" under "Remedy".

The axis configuration can be downloaded to the work memory after a download in RUN operating mode.

#### Requirements

- The positioning axis technology object has been configured correctly.
- The cause of a pending configuration error requiring acknowledgement has been eliminated (for example, acceleration in positioning axis technology object has been changed to a valid value).

#### Override response

The MC\_Reset command cannot be aborted by any other Motion Control command.

The new MC\_Reset command does not abort any other active Motion Control commands.

#### Parameters

Parameter	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_Axis	-	Axis technology object	
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge	
Restart	INPUT	BOOL	FALSE	TRUE	Download the axis configuration from the load memory to the work memory. The command can only be executed when the axis is disabled. Refer to the notes on Download to the CPU (Page 6480).
				FALSE	Acknowledges pending errors
Done	OUTPUT	BOOL	FALSE	TRUE	Error has been acknowledged.
Busy	OUTPUT	BOOL	FALSE	TRUE	The command is being executed.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6538) for parameter "Error"	
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6538) for parameter "ErrorID"	

## Acknowledging an error requiring acknowledgement with MC\_Reset

To acknowledge an error, follow these steps:

1. Check the requirements indicated above.
2. Start the acknowledgement of the error with a rising edge at input parameter "Execute".
3. If output parameter "Done" indicates the value TRUE and tag of technology object <Axis name>.StatusBits.Error the value FALSE, the error has been acknowledged.

## MC\_Home

### MC\_Home: Home axes, set reference point V4

#### Description

Motion Control instruction "MC\_Home" is used to match the axis coordinates to the real, physical drive position. Homing is required for absolute positioning of the axis. The following types of homing can be executed:

- Active homing (Mode = 3)  
The homing procedure is executed automatically.
- Passive homing (Mode = 2)  
During passive homing, the "MC\_Home" Motion Control instruction does not carry out any homing motion. The traversing motion required for this must be implemented by the user via other Motion Control instructions. When the homing switch is detected, the axis is homed.
- Direct homing absolute (Mode = 0)  
The current axis position is set to the value of parameter "Position".
- Direct homing relative (Mode = 1)  
The current axis position is offset by the value of parameter "Position".

#### Requirements

- The positioning axis technology object has been configured correctly.
- The axis is enabled.
- No MC\_CommandTable command may be active upon start with Mode = 0, 1, or 2.

#### Override response

The override response depends on the selected mode:

##### Mode = 0, 1

The MC\_Home command cannot be aborted by any other Motion Control command.

The MC\_Home command does not abort any active Motion Control commands. Position-related motion commands are resumed after homing according to the new homing position (value at input parameter: "Position").

##### Mode = 2

The MC\_Home command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 2, 3

The new MC\_Home command aborts the following active Motion Control command:

- MC\_Home command Mode = 2

Position-related motion commands are resumed after homing according to the new homing position (value at input parameter: "Position").

**Mode = 3**

The MC\_Home command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_Home command aborts the following active Motion Control commands:

- MC\_Home command Mode = 2, 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

**Parameters**

Parameter	Declaration	Data type	Default value	Description				
Axis	INPUT	TO_Axis	-	Axis technology object				
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge				
Position	INPUT	REAL	0.0	<ul style="list-style-type: none"> <li>• Mode = 0, 2, and 3 Absolute position of axis after completion of the homing operation</li> <li>• Mode = 1 Correction value for the current axis position</li> </ul> Limit values: $-1.0e^{12} \leq \text{Position} \leq 1.0e^{12}$				
Mode	INPUT	INT	0	Homing mode <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="text-align: center;">0</td> <td>Direct homing (absolute) New axis position is the position value of parameter "Position".</td> </tr> <tr> <td style="text-align: center;">1</td> <td>Direct homing (relative) New axis position is the current axis position + position value of parameter "Position".</td> </tr> </table>	0	Direct homing (absolute) New axis position is the position value of parameter "Position".	1	Direct homing (relative) New axis position is the current axis position + position value of parameter "Position".
0	Direct homing (absolute) New axis position is the position value of parameter "Position".							
1	Direct homing (relative) New axis position is the current axis position + position value of parameter "Position".							

Parameter	Declaration	Data type	Default value	Description	
				2	Passive homing Homing according to the axis configuration. Following homing, the value of parameter "Position" is set as the new axis position.
				3	Active homing Homing procedure in accordance with the axis configuration. Following homing, the value of parameter "Position" is set as the new axis position.
Done	OUTPUT	BOOL	FALSE	TRUE	Command completed
Busy	OUTPUT	BOOL	FALSE	TRUE	The command is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the command was aborted by another command.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6538) for parameter "Error"	
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6538) for parameter "ErrorID"	

**Note**

Axis homing is lost under the following conditions:

- Disabling of axis by the "MC\_Power" Motion Control instruction
- Changeover between automatic mode and manual control
- Upon start of active homing. After successful completion of the homing operation, axis homing is again available.
- After POWER OFF -> POWER ON of the CPU
- After CPU restart (RUN-STOP -> STOP-RUN)

**Homing an axis**

To home the axis, follow these steps:

1. Check the requirements indicated above.
2. Initialize the necessary input parameters with values, and start the homing operation with a rising edge at input parameter "Execute"
3. If output parameter "Done" and technology object tag <Axis name>.StatusBits.HomingDone indicate the value TRUE, homing is complete.

## MC\_Halt

### MC\_Halt: Halt axes V4

#### Description

The "MC\_Halt" Motion Control instruction stops all movements and brings the axis to a standstill with the configured deceleration. The standstill position is not defined.

#### Requirements

- The positioning axis technology object has been configured correctly.
- The axis is enabled.

#### Override response

The MC\_Halt command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_Halt command aborts the following active Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

**Parameters**

Parameter	Declaration	Data type	Default value	Description
Axis	INPUT	TO_SpeedAxis	-	Axis technology object
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge
Done	OUTPUT	BOOL	FALSE	TRUE Zero velocity reached
Busy	OUTPUT	BOOL	FALSE	TRUE The command is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE During execution the command was aborted by another command.
Error	OUTPUT	BOOL	FALSE	TRUE An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6538) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6538) for parameter "ErrorID"

S7-1200 Motion Control V1...3 (Page 2911)

### MC\_Halt: Function chart V4

#### Function chart

The following values were configured in the configuration window **Dynamics > General**:

- Acceleration: 10.0
- Deceleration: 5.0

①	The axis is braked by an MC_Halt command until it comes to a standstill. The axis standstill is signaled via "Done_2".
②	While an MC_Halt command is braking the axis, this command is aborted by another motion command. The abort is signaled via "Abort_2".

**See also**

MC\_Halt: Halt axes V4 (Page 2887)

**MC\_MoveAbsolute**

**MC\_MoveAbsolute: Absolute positioning of axes V4**

**Description**

The "MC\_MoveAbsolute" Motion Control instruction starts an axis positioning motion to move it to an absolute position.

**Requirements**

- The positioning axis technology object has been configured correctly.
- The axis is enabled.
- The axis is homed.

**Override response**

The MC\_MoveAbsolute command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_MoveAbsolute command aborts the following active Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command

- MC\_MoveJog command
- MC\_CommandTable command

## Parameters

Parameter	Declaration	Data type	Default value	Description
Axis	INPUT	TO_Positioning Axis	-	Axis technology object
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge
Position	INPUT	REAL	0.0	Absolute target position Limit values: $-1.0e^{12} \leq \text{Position} \leq 1.0e^{12}$
Velocity	INPUT	REAL	10.0	Velocity of axis This velocity is not always reached on account of the configured acceleration and deceleration and the target position to be approached. Limit values: $\text{Start/stop velocity} \leq \text{Velocity} \leq \text{maximum velocity}$
Done	OUTPUT	BOOL	FALSE	TRUE Absolute target position reached
Busy	OUTPUT	BOOL	FALSE	TRUE The command is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE During execution the command was aborted by another command.
Error	OUTPUT	BOOL	FALSE	TRUE An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6538) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6538) for parameter "ErrorID"

### MC\_MoveAbsolute: Function chart V4

#### Function chart

The following values were configured in the configuration window **Dynamics > General**:

- Acceleration: 10.0
- Deceleration: 10.0

①	An axis is moved to absolute position 1000.0 with an MC_MoveAbsolute command. When the axis reaches the target position, this is signaled via "Done_1". When "Done_1" = TRUE, another MC_MoveAbsolute command, with target position 1500.0, is started. Because of the response times (e.g., cycle time of user program, etc.), the axis comes to a standstill briefly (see zoomed-in detail). When the axis reaches the new target position, this is signaled via "Done_2".
②	An active MC_MoveAbsolute command is aborted by another MC_MoveAbsolute command. The abort is signaled via "Abort_1". The axis is then moved at the new velocity to the new target position 1500.0. When the new target position is reached, this is signaled via "Done_2".

## See also

MC\_MoveAbsolute: Absolute positioning of axes V4 (Page 2890)

## MC\_MoveRelative

### MC\_MoveRelative: Relative positioning of axes V4

## Description

The "MC\_MoveRelative" Motion Control instruction starts a positioning motion relative to the start position.

## Requirements

- The positioning axis technology object has been configured correctly.
- The axis is enabled.

## Override response

The MC\_MoveRelative command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_MoveRelative command aborts the following active Motion Control commands:

9.7 References

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

Parameters

Parameter	Declaration	Data type	Default value	Description
Axis	INPUT	TO_Positioning Axis	-	Axis technology object
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge
Distance	INPUT	REAL	0.0	Travel distance for the positioning operation Limit values: $-1.0e^{12} \leq \text{Distance} \leq 1.0e^{12}$
Velocity	INPUT	REAL	10.0	Velocity of axis This velocity is not always reached on account of the configured acceleration and deceleration and the distance to be traveled. Limit values: $\text{Start/stop velocity} \leq \text{Velocity} \leq \text{maximum velocity}$
Done	OUTPUT	BOOL	FALSE	TRUE Target position reached
Busy	OUTPUT	BOOL	FALSE	TRUE The command is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE During execution the command was aborted by another command.
Error	OUTPUT	BOOL	FALSE	TRUE An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6538) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6538) for parameter "ErrorID"

### MC\_MoveRelative: Function chart V4

#### Function chart

The following values were configured in the configuration window **Dynamics > General**:

- Acceleration: 10.0
- Deceleration: 10.0

①	The axis is moved by an MC_MoveRelative command by the distance ("Distance") 1000.0. When the axis reaches the target position, this is signaled via "Done_1". When "Done_1" = TRUE, another MC_MoveRelative command, with travel distance 500.0, is started. Because of the response times (e.g., cycle time of user program, etc.), the axis comes to a standstill briefly (see zoomed-in detail). When the axis reaches the new target position, this is signaled via "Done_2".
②	An active MC_MoveRelative command is aborted by another MC_MoveRelative command. The abort is signaled via "Abort_1". The axis is then moved at the new velocity by the new distance ("Distance") 500.0. When the new target position is reached, this is signaled via "Done_2".

MC\_MoveRelative: Relative positioning of axes V4 (Page 2893)

**MC\_MoveVelocity****MC\_MoveVelocity: Move axes at preset rotational speed V4****Description**

The Motion Control instruction "MC\_MoveVelocity" moves the axis constantly at the specified velocity.

**Requirements**

- The positioning axis technology object has been configured correctly.
- The axis is enabled.

**Override response**

MC\_MoveVelocity can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_MoveVelocity command aborts the following active Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command

9.7 References

- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

Parameters

Parameter	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_SpeedAxis	-	Axis technology object	
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge	
Velocity	INPUT	REAL	10.0	Velocity specification for axis motion Limit values: Start/stop velocity ≤  Velocity  ≤ maximum velocity (Velocity = 0.0 is permitted)	
Direction	INPUT	INT	0	Direction specification	
				0	Direction of rotation corresponds to the sign of the value in parameter "Velocity"
				1	Positive direction of rotation (The sign of the value in parameter "Velocity" is ignored)
				2	Negative direction of rotation (The sign of the value in parameter "Velocity" is ignored)
Current	INPUT	BOOL	FALSE	Maintain current velocity	
				FALSE	"Maintain current velocity" is deactivated. The values of parameters "Velocity" and "Direction" are used.
				TRUE	"Maintain current velocity" is activated. The values in parameters "Velocity" and "Direction" are not taken into account. When the axis resumes motion at the current velocity, the "InVelocity" parameter returns the value TRUE.
InVelocity	OUTPUT	BOOL	FALSE	TRUE <ul style="list-style-type: none"> <li>• "Current" = FALSE: The velocity specified in parameter "Velocity" was reached.</li> <li>• "Current" = TRUE: The axis travels at the current velocity at the start time.</li> </ul>	
Busy	OUTPUT	BOOL	FALSE	TRUE	The command is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the command was aborted by another command.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000		Error ID (Page 6538) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000		Error info ID (Page 6538) for parameter "ErrorID"

---

**Note****PLCopen Version 2.0**

The Motion Control instruction "MC\_MoveVelocity" is compatible to PLCopen Version 2.0 as of V4.

The "InVelocity" and "Busy" parameters show their status regardless of the "Execute" parameter until the command is overridden or stopped by an error. For more information, refer to the section "Tracking active commands (Page 6512)".

---

**Behavior with zero setpoint velocity (Velocity = 0.0)**

An MC\_MoveVelocity command with "Velocity" = 0.0 (such as an MC\_Halt command) aborts active motion commands and stops the axis with the configured deceleration.

When the axis comes to a standstill, output parameter "InVelocity" indicates TRUE for at least one program cycle.

"Busy" indicates the value TRUE during the deceleration process and changes to FALSE together with "InVelocity". If parameter "Execute" = TRUE is set, "InVelocity" and "Busy" are latched.

When the "MC\_MoveVelocity" command is started, status bit "SpeedCommand" is set in the technology object. Status bit "ConstantVelocity" is set upon axis standstill. Both bits are adapted to the new situation when a new motion command is started.

### MC\_MoveVelocity: Function chart V4

#### Function chart

The following values were configured in the configuration window **Dynamics > General**:

- Acceleration: 10.0
- Deceleration: 10.0

①	An active MC_MoveVelocity command signals via "InVel_1" that its target velocity has been reached. It is then aborted by another MC_MoveVelocity command. The abort is signaled via "Abort_1". When the new target velocity 15.0 is reached, this is signaled via "InVel_2". The axis then continues moving at the new constant velocity.
②	An active MC_MoveVelocity command is aborted by another MC_MoveVelocity command prior to reaching its target velocity. The abort is signaled via "Abort_1". When the new target velocity 15.0 is reached, this is signaled via "InVel_2". The axis then continues moving at the new constant velocity.

MC\_MoveVelocity: Move axes at preset rotational speed V4 (Page 2897)

**MC\_MoveJog****MC\_MoveJog: Move axes in jog mode V4****Description**

Motion control instruction "MC\_MoveJog" moves the axis constantly at the specified velocity in jog mode. You use this Motion Control instruction, for example, for testing and commissioning purposes.

**Requirements**

- The positioning axis technology object has been configured correctly.
- The axis is enabled.

**Override response**

The MC\_MoveJog command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_MoveJog command aborts the following active Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

**Parameters**

Parameter	Declaration	Data type	Default value	Description
Axis	INPUT	TO_SpeedAxis	-	Axis technology object
JogForward	INPUT	BOOL	FALSE	As long as the parameter is TRUE, the axis moves in the positive direction at the velocity specified in parameter "Velocity".
JogBackward	INPUT	BOOL	FALSE	As long as the parameter is TRUE, the axis moves in the negative direction at the velocity specified in parameter "Velocity".
If both parameters are simultaneously TRUE, the axis stops with the configured deceleration. An error is indicated in parameters "Error", "ErrorID", and "ErrorInfo".				
Velocity	INPUT	REAL	10.0	Preset velocity for jog mode Limit values: Start/stop velocity ≤ velocity ≤ maximum velocity
InVelocity	OUTPUT	BOOL	FALSE	TRUE The velocity specified in parameter "Velocity" was reached.
Busy	OUTPUT	BOOL	FALSE	TRUE The command is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE During execution the command was aborted by another command.
Error	OUTPUT	BOOL	FALSE	TRUE An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6538) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6538) for parameter "ErrorID"

### MC\_MoveJog: Function chart V4

#### Function chart

The following values were configured in the configuration window **Dynamics > General**:

- Acceleration: 10.0
- Deceleration: 5.0

①	The axis is moved in the positive direction in jog mode via "Jog_F". When the target velocity 50.0 is reached, this is signaled via "InVel_1". After "Jog_F" is reset, the axis is braked to a standstill.
②	The axis is moved in the negative direction in jog mode via "Jog_B". When the target velocity -50.0 is reached, this is signaled via "InVel_1". When "Jog_B" is set, the value at parameter "Velocity" changes to 25.0. "InVel_1" is reset and the axis is braked. When the new target velocity -25.0 is reached, this is signaled via "InVel_1". After "Jog_B" is reset, the axis is braked to a standstill.

## MC\_CommandTable

### MC\_CommandTable: Run axis commands as motion sequence V4

#### Description

The Motion Control instruction "MC\_CommandTable" combines multiple individual axis control commands in one movement sequence.

#### Requirements

- The positioning axis technology object has been inserted and correctly configured.
- The command table technology object has been inserted and correctly configured.
- The axis is enabled.

#### Override response

The MC\_CommandTable command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_CommandTable command aborts the following active Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The active Motion Control command is cancelled by the start of the first "Positioning Relative", "Positioning Absolute", "Velocity set point" or "Halt" command.

## Parameters

Parameter	Declaration	Data type	Default value	Description
Axis	INPUT	TO_SpeedAxis	-	Axis technology object
CommandTable	INPUT	TO_CommandTable	-	Command table technology object
Execute	INPUT	BOOL	FALSE	Command table start with positive edge
StartStep	INPUT	INT	1	Defines the step at which the execution of the command table should begin Limit values: $1 \leq \text{StartStep} \leq \text{EndStep}$
EndStep	INPUT	INT	32	Defines the step up to which the execution of command table should take place Limit values: $\text{StartStep} \leq \text{EndStep} \leq 32$
Done	OUTPUT	BOOL	FALSE	TRUE Command table has been successfully executed
Busy	OUTPUT	BOOL	FALSE	TRUE The command table is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE The command table was cancelled by another command.
Error	OUTPUT	BOOL	FALSE	TRUE An error occurred during execution of the command table. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6538) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6538) for parameter "ErrorID"
CurrentStep	OUTPUT	INT	0	Step in command table currently being executed
StepCode	OUTPUT	WORD	16#0000	User-defined numerical value / bit pattern of the step currently being executed

## MC\_ChangeDynamic

### MC\_ChangeDynamic: Change dynamic settings of axis V4

#### Description

Motion Control instruction "MC\_ChangeDynamic" allows you to change the following settings of the axis:

- Change the ramp-up time (acceleration) value
- Change the ramp-down time (deceleration) value
- Change the emergency stop ramp-down time (emergency stop deceleration) value
- Change the smoothing time (jerk) value

For the effectiveness of the change, refer to the description of the tag (Page 6548).

#### Requirements

The positioning axis technology object has been configured correctly.

#### Override response

A MC\_ChangeDynamic command cannot be aborted by any other Motion Control command.

A new MC\_ChangeDynamic command does not abort any active Motion Control commands.

#### Parameters

Parameter	Declaration	Data type	Default value	Description
Axis	INPUT	TO_SpeedAxis	-	Axis technology object
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge
ChangeRampUp	INPUT	BOOL	FALSE	TRUE   Change ramp-up time in line with input parameter "RampUpTime"
RampUpTime	INPUT	REAL	5.00	Time (in seconds) to accelerate axis from standstill to configured maximum velocity without jerk limit. The change will influence the tag <Axis name>. Config.DynamicDefaults.Acceleration. For the effectiveness of the change, refer to the description of this tag.
ChangeRampDown	INPUT	BOOL	FALSE	TRUE   Change ramp-down time to correspond to input parameter "RampDownTime"

Parameter	Declaration	Data type	Default value	Description
RampDownTime	INPUT	REAL	5.00	Time (in seconds) to decelerate axis from the configured maximum velocity to standstill without jerk limiter. The change will influence the tag <Axis name>. Config.DynamicDefaults.Deceleration . For the effectiveness of the change, refer to the description of this tag.
ChangeEmergency	INPUT	BOOL	FALSE	TRUE   Change emergency stop ramp-down time in line with input parameter "EmergencyRampTime"
EmergencyRampTime	INPUT	REAL	2.00	Time (in seconds) to decelerate the axis from configured maximum velocity to standstill without jerk limiter in emergency stop mode. The change will influence the tag <Axis name>. Config.DynamicDefaults.EmergencyDeceleration . For the effectiveness of the change, refer to the description of this tag.
ChangeJerkTime	INPUT	BOOL	FALSE	TRUE   Change smoothing time according to the input parameter "JerkTime"
JerkTime	INPUT	REAL	0.25	Smoothing time (in seconds) used for the axis acceleration and deceleration ramps The change will influence the tag <Axis name>. Config.DynamicDefaults.Jerk . For the effectiveness of the change, refer to the description of this tag.
Done	OUTPUT	BOOL	FALSE	TRUE   The changed values have been written to the technology data block. The description of the tags will show when the change becomes effective.
Error	OUTPUT	BOOL	FALSE	TRUE   An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6538) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6538) for parameter "ErrorID"

**Note**

At the input parameters "RampUpTime", "RampDownTime", "EmergencyRampTime" and "JerkTime", values can be entered which exceed the admissible limits of the resulting parameters: "Acceleration", "Deceleration", "Emergency stop deceleration" and "Jerk".

Ensure that your inputs are within the valid range, taking into consideration the equations and limits in section "Dynamic (Page 6447)".

- S7-1200 Motion Control V1...3 (Page 2911)

## MC\_ReadParam

### MC\_ReadParam: Continuously read motion data of a positioning axis V4

#### Description

Motion Control instruction "MC\_ReadParam" enables continuous reading of motion data of an axis. The current value of the corresponding tag is determined at the start of the command.

The following motion data can be read:

- Current position of the axis
- Current velocity of the axis
- Current distance of axis from target position
- Target position of the axis

#### Requirements

The positioning axis technology object has been configured correctly.

#### Override response

A MC\_ReadParam command cannot be aborted by any other Motion Control command.

A new MC\_ReadParam command does not abort any active Motion Control commands.

## Parameters

Parameter	Declaration	Data type	Default value	Description	
Enable	INPUT	BOOL	FALSE	TRUE	Read the tag specified with the "Parameter" and store the value in the destination address specified with "Value".
				FALSE	Do not update assigned motion data
Parameter	INPUT	VARIANT (REAL)	-	VARIANT pointer to the value to be read. The following tags are permitted: <ul style="list-style-type: none"> <li>• &lt;Axis name&gt;.Position</li> <li>• &lt;Axis name&gt;.Velocity</li> <li>• &lt;Axis name&gt;.StatusPositioning.Distance</li> <li>• &lt;Axis name&gt;.StatusPositioning.TargetPosition</li> </ul>	
Value	INOUT	VARIANT (REAL)	-	VARIANT pointer to the target tag or destination address to which the read value is to be written.	
Valid	OUTPUT	BOOL	FALSE	TRUE	The read value is valid.
				FALSE	The read value is invalid.
Busy	OUTPUT	BOOL	FALSE	TRUE	The command is being executed.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6538) for parameter "Error"	
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6538) for parameter "ErrorID"

MC\_ChangeDynamic: Change dynamic settings of axis V4 (Page 2906)

MC\_WriteParam: Write tag of positioning axis V4 (Page 2910)

## MC\_WriteParam

### MC\_WriteParam: Write tag of positioning axis V4

#### Description

Motion Control instruction "MC\_WriteParam" enables the writing of tags of the positioning axis technology object in the user program. In contrast to the value assignment of the tags in the user program, "MC\_WriteParam" can also change values of read-only tags.

You can learn about the tags, the conditions under which they can be written and the time at which they take effect in the description of the technology object tags (Page 6548).

#### Requirements

- The positioning axis technology object has been configured correctly.
- To write tags that are read-only in the user program, the axis must be disabled.

#### Override response

A MC\_WriteParam command cannot be aborted by any other Motion Control command.

A new MC\_WriteParam command does not abort any active Motion Control commands.

#### Parameters

Parameter	Declaration	Data type	Default value	Description
Parameter	INPUT	VARIANT (BOOL, INT, DINT, REAL)	-	VARIANT pointer to the technology object tag (Page 6548) positioning axis (destination address) to be written
Value	INPUT	VARIANT (BOOL, INT, DINT, REAL)	-	VARIANT pointer to the value to be written (source address)
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge
Done	OUTPUT	BOOL	FALSE	TRUE Value was written
Busy	OUTPUT	BOOL	FALSE	TRUE The command is being executed.
Error	OUTPUT	BOOL	FALSE	TRUE An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6538) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6538) for parameter "ErrorID"

## S7-1200 Motion Control V1...3

### MC\_Power

#### MC\_Power: Enable, disable axis V1...3

#### Description

The Motion Control instruction "MC\_Power" enables or disables an axis.

#### Requirements

- The axis technology object has been configured correctly.
- There is no pending enable-inhibiting error.

#### Override response

Execution of "MC\_Power" cannot be aborted by a Motion Control command.

Disabling the axis (input parameter "Enable" = FALSE) aborts all Motion Control commands for the associated technology object in accordance with the selected "StopMode".

Parameters

Parameter	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_Axis_1	-	Axis technology object	
Enable	INPUT	BOOL	FALSE	TRUE	Motion Control attempts to enable the axis.
				FALSE	All current jobs are interrupted in accordance with the "StopMode" configured. The axis is stopped and disabled.
StopMode	INPUT	INT	0	0	Emergency stop If a request to disable the axis is pending, the axis brakes at the configured emergency stop deceleration. The axis is disabled after reaching standstill.
				1	Immediate stop If a request to disable the axis is pending, this axis is disabled without deceleration. The pulse output is stopped immediately.
				2	Emergency stop with jerk control If a request to disable the axis is pending, the axis brakes at the configured emergency stop deceleration. If the jerk control is activated, the configured jerk is taken into account. The axis is disabled after reaching standstill.
Status	OUTPUT	BOOL	FALSE	Status of axis enable	
				FALSE	The axis is disabled. The axis does not execute Motion Control commands and does not accept any new commands (exception: MC_Reset command). The axis is not homed. Upon disabling, the status does not change to FALSE until the axis reaches a standstill.
				TRUE	The axis is enabled. The axis is ready to execute Motion Control commands. Upon axis enabling, the status does not change to TRUE until the signal "Drive ready" is pending. If the "Drive ready" drive interface was not configured in the axis configuration, the status changes to TRUE immediately.
Busy	OUTPUT	BOOL	FALSE	TRUE	"MC_Power" is active.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred in Motion Control instruction "MC_Power" or in the associated technology object. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000		Error ID (Page 6583) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000		Error info ID (Page 6583) for parameter "ErrorID"

**Note**

If the axis is switched off due to an error, it will be enabled again automatically after the error has been eliminated and acknowledged. This requires that the input parameter "Enable" has retained the value TRUE during this process.

---

**Enabling an axis with configured drive interface**

To enable the axis, follow these steps:

1. Check the requirements indicated above.
2. Initialize input parameter "StopMode" with the desired value. Set the input parameter "Enable" to TRUE.  
The enable output for "Drive enabled" changes to TRUE to enable the power to the drive. The CPU waits for the "Drive ready" signal of the drive.  
When the "Drive ready" signal is available at the configured Ready input of the CPU, the axis is enabled. The output parameter "Status" and the tag of the technology object <Axis name>.StatusBits.Enable indicate the value TRUE.

**Enabling an axis without configured drive interface**

To enable the axis, follow these steps:

1. Check the requirements indicated above.
2. Initialize input parameter "StopMode" with the desired value. Set the input parameter "Enable" to TRUE. The axis is enabled. The output parameter "Status" and the tag of the technology object <Axis name>.StatusBits.Enable indicate the value TRUE.

**Disabling an axis**

To disable an axis, you can follow the steps described below:

1. Bring the axis to a standstill.  
You can identify when the axis is at a standstill in the tag of the technology object <Axis name>.StatusBits.StandStill.
2. Set input parameter "Enable" to FALSE after standstill is reached.
3. If output parameters "Busy" and "Status" and the tag of technology object <Axis name>.StatusBits.Enable indicate the value FALSE, disabling of the axis is complete.

**Function chart**

①	An axis is enabled and then disabled again. When the drive has signaled "Drive ready" back to the CPU, the successful enable can be read out via "Status_1".
②	Following an axis enable, an error has occurred that caused the axis to be disabled. The error is eliminated and acknowledged with "MC_Reset". The axis is then enabled again.

## See also

MC\_Power: Enable, disable axis V1...3 (Page 2911)

## MC\_Reset

### MC\_Reset: Acknowledge fault V1...3

## Description

Motion Control instruction "MC\_Reset" can be used to acknowledge "Operating error with axis stop" and "Configuration error". The errors that require acknowledgement can be found in the "List of ErrorIDs and ErrorInfos" under "Remedy".

From version V3.0, the axis configuration can be downloaded to the work memory in RUN operating mode.

## Requirements

- The axis technology object has been configured correctly.
- The cause of a pending configuration error requiring acknowledgement has been eliminated (for example, acceleration in positioning axis technology object has been changed to a valid value).

## Override response

The MC\_Reset command cannot be aborted by any other Motion Control command.

The new MC\_Reset command does not abort any other active Motion Control commands.

## Parameters

Parameter	Declaration	Data type	Default value	Description
Axis	INPUT	TO_Axis_1	-	Axis technology object
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge
Restart	INPUT	BOOL	FALSE	(From version V3.0)
				TRUE

Parameter	Declaration	Data type	Default value	Description
				FALSE Acknowledges pending errors
Done	OUTPUT	BOOL	FALSE	TRUE Error has been acknowledged.
Busy	OUTPUT	BOOL	FALSE	TRUE The command is being executed.
Error	OUTPUT	BOOL	FALSE	TRUE An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6583) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6583) for parameter "ErrorID"

### Acknowledging an error requiring acknowledgement with MC\_Reset

To acknowledge an error, follow these steps:

1. Check the requirements indicated above.
2. Start the acknowledgement of the error with a rising edge at input parameter "Execute".
3. If output parameter "Done" indicates the value TRUE and tag of technology object <Axis name>.StatusBits.Error the value FALSE, the error has been acknowledged.

## MC\_Home

### MC\_Home: Home axes, set reference point V1...3

#### Description

Motion Control instruction "MC\_Home" is used to match the axis coordinates to the real, physical drive position. Homing is required for absolute positioning of the axis. The following types of homing can be executed:

- Active homing (Mode = 3)  
The homing procedure is executed automatically.
- Passive homing (Mode = 2)  
During passive homing, the "MC\_Home" Motion Control instruction does not carry out any homing motion. The traversing motion required for this must be implemented by the user via other Motion Control instructions. When the homing switch is detected, the axis is homed.
- Direct homing absolute (Mode = 0)  
The current axis position is set to the value of parameter "Position".
- Direct homing relative (Mode = 1)  
The current axis position is offset by the value of parameter "Position".

#### Requirements

- The axis technology object has been configured correctly.
- The axis is enabled.
- No MC\_CommandTable command may be active upon start with Mode = 0, 1, or 2.

#### Override response

The override response depends on the selected mode:

##### **Mode = 0, 1**

The MC\_Home command cannot be aborted by any other Motion Control command.

The MC\_Home command does not abort any active Motion Control commands. Position-related motion commands are resumed after homing according to the new homing position (value at input parameter: "Position").

##### **Mode = 2**

The MC\_Home command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 2, 3

The new MC\_Home command aborts the following active Motion Control command:

- MC\_Home command Mode = 2

Position-related motion commands are resumed after homing according to the new homing position (value at input parameter: "Position").

**Mode = 3**

The MC\_Home command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_Home command aborts the following active Motion Control commands:

- MC\_Home command Mode = 2, 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

**Parameters**

Parameter	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_Axis_1	-	Axis technology object	
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge	
Position	INPUT	REAL	0.0	<ul style="list-style-type: none"> <li>• Mode = 0, 2, and 3 Absolute position of axis after completion of the homing operation</li> <li>• Mode = 1 Correction value for the current axis position</li> </ul> Limit values: $-1.0e^{12} \leq \text{Position} \leq 1.0e^{12}$	
Mode	INPUT	INT	0	Homing mode	
				0	Direct homing absolute New axis position is the position value of parameter "Position".
				1	Direct homing relative New axis position is the current axis position + position value of parameter "Position".

Parameter	Declaration	Data type	Default value	Description	
				2	Passive homing Homing according to the axis configuration. Following homing, the value of parameter "Position" is set as the new axis position.
				3	Active homing Homing procedure in accordance with the axis configuration. Following homing, the value of parameter "Position" is set as the new axis position.
Done	OUTPUT	BOOL	FALSE	TRUE	Command completed
Busy	OUTPUT	BOOL	FALSE	TRUE	The command is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the command was aborted by another command.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6583) for parameter "Error"	
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6583) for parameter "ErrorID"	

**Note**

Axis homing is lost under the following conditions:

- Disabling of axis by the "MC\_Power" Motion Control instruction
- Changeover between automatic mode and manual control
- Upon start of active homing. After successful completion of the homing operation, axis homing is again available.
- After POWER OFF -> POWER ON of the CPU
- After CPU restart (RUN-STOP -> STOP-RUN)

**Homing an axis**

To home the axis, follow these steps:

1. Check the requirements indicated above.
2. Initialize the necessary input parameters with values, and start the homing operation with a rising edge at input parameter "Execute"
3. If output parameter "Done" and technology object tag <Axis name>.StatusBits.HomingDone indicate the value TRUE, homing is complete.

## MC\_Halt

### MC\_Halt: Halt axes V1...3

#### Description

The "MC\_Halt" Motion Control instruction stops all movements and brings the axis to a standstill with the configured deceleration. The standstill position is not defined.

#### Requirements

- The axis technology object has been configured correctly.
- The axis is enabled.

#### Override response

The MC\_Halt command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_Halt command aborts the following active Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command

- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

## Parameters

Parameter	Declaration	Data type	Default value	Description
Axis	INPUT	TO_Axis_1	-	Axis technology object
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge
Done	OUTPUT	BOOL	FALSE	TRUE Zero velocity reached
Busy	OUTPUT	BOOL	FALSE	TRUE The command is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE During execution the command was aborted by another command.
Error	OUTPUT	BOOL	FALSE	TRUE An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6583) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6583) for parameter "ErrorID"

### MC\_Halt: Function chart V1...3

#### Function chart

The following values were configured in the configuration window **Dynamics > General**:

- Acceleration: 10.0
- Deceleration: 5.0

①	The axis is braked by an MC_Halt command until it comes to a standstill. The axis standstill is signaled via "Done_2".
②	While an MC_Halt command is braking the axis, this command is aborted by another motion command. The abort is signaled via "Abort_2".

**See also**

MC\_Halt: Halt axes V1...3 (Page 2920)

**MC\_MoveAbsolute****MC\_MoveAbsolute: Absolute positioning of axes V1...3****Description**

The "MC\_MoveAbsolute" Motion Control instruction starts an axis positioning motion to move it to an absolute position.

**Requirements**

- The axis technology object has been configured correctly.
- The axis is enabled.
- The axis is homed.

**Override response**

The MC\_MoveAbsolute command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_MoveAbsolute command aborts the following active Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

**Parameters**

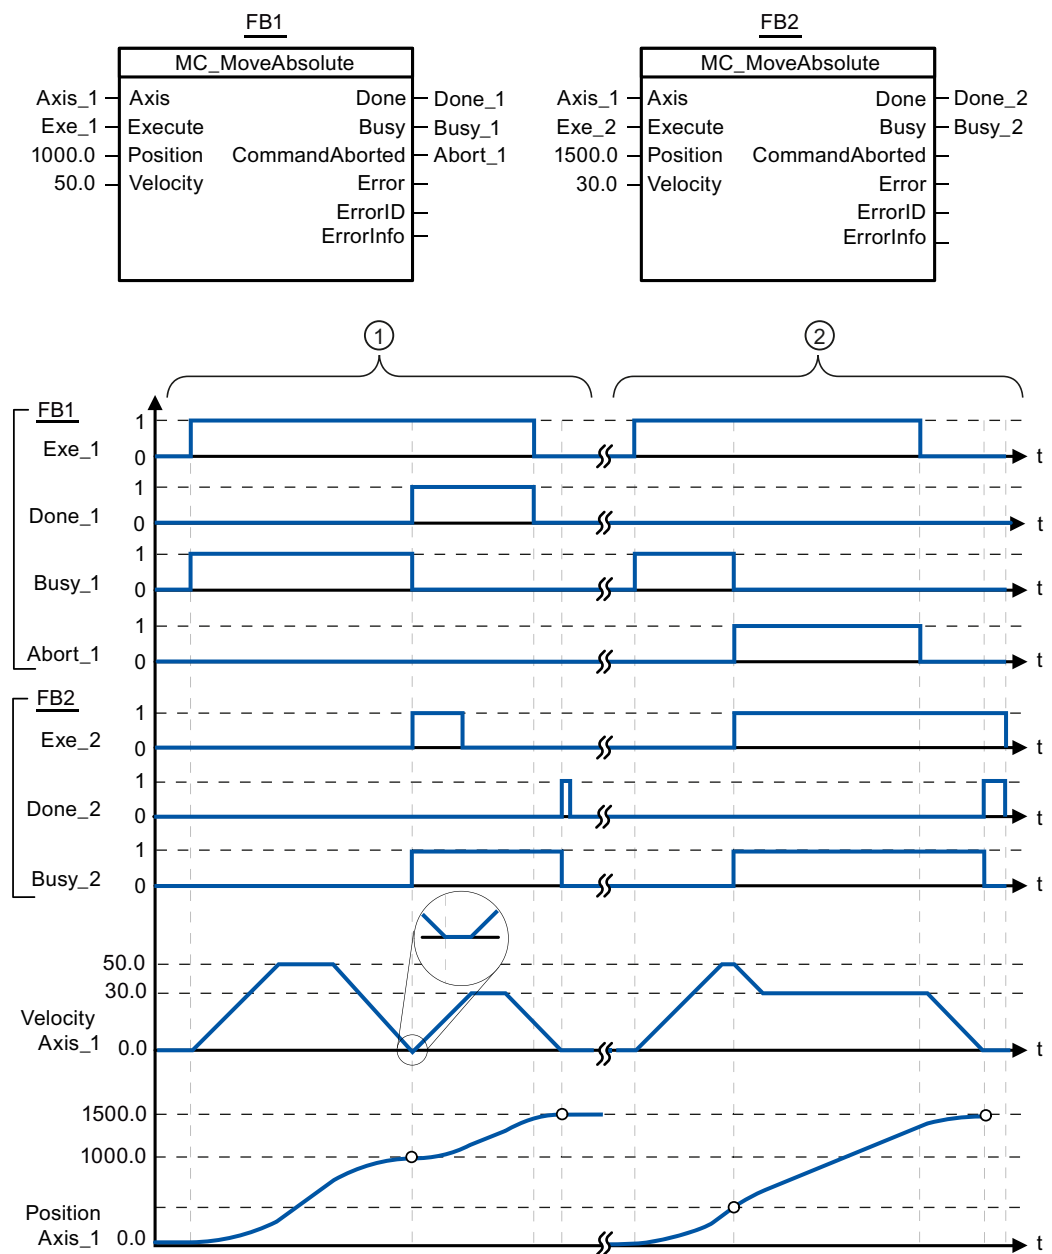

Parameter	Declaration	Data type	Default value	Description
Axis	INPUT	TO_Axis_1	-	Axis technology object
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge
Position	INPUT	REAL	0.0	Absolute target position Limit values: $-1.0e^{12} \leq \text{Position} \leq 1.0e^{12}$
Velocity	INPUT	REAL	10.0	Velocity of axis This velocity is not always reached on account of the configured acceleration and deceleration and the target position to be approached. Limit values: Start/stop velocity $\leq$ Velocity $\leq$ maximum velocity
Done	OUTPUT	BOOL	FALSE	TRUE Absolute target position reached
Busy	OUTPUT	BOOL	FALSE	TRUE The command is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE During execution the command was aborted by another command.
Error	OUTPUT	BOOL	FALSE	TRUE An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6583) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6583) for parameter "ErrorID"

### MC\_MoveAbsolute: Function chart V1...3

#### Function chart

The following values were configured in the configuration window **Dynamics > General**:

- Acceleration: 10.0
- Deceleration: 10.0

①	An axis is moved to absolute position 1000.0 with an MC_MoveAbsolute command. When the axis reaches the target position, this is signaled via "Done_1". When "Done_1" = TRUE, another MC_MoveAbsolute command, with target position 1500.0, is started. Because of the response times (e.g., cycle time of user program, etc.), the axis comes to a standstill briefly (see zoomed-in detail). When the axis reaches the new target position, this is signaled via "Done_2".
②	An active MC_MoveAbsolute command is aborted by another MC_MoveAbsolute command. The abort is signaled via "Abort_1". The axis is then moved at the new velocity to the new target position 1500.0. When the new target position is reached, this is signaled via "Done_2".

**See also**

MC\_MoveAbsolute: Absolute positioning of axes V1...3 (Page 2923)

**MC\_MoveRelative**

**MC\_MoveRelative: Relative positioning of axes V1...3**

**Description**

The "MC\_MoveRelative" Motion Control instruction starts a positioning motion relative to the start position.

**Requirements**

- The axis technology object has been configured correctly.
- The axis is enabled.

**Override response**

The MC\_MoveRelative command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_MoveRelative command aborts the following active Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command

- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

## Parameters

Parameter	Declaration	Data type	Default value	Description
Axis	INPUT	TO_Axis_1	-	Axis technology object
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge
Distance	INPUT	REAL	0.0	Travel distance for the positioning operation Limit values: $-1.0e^{12} \leq \text{Distance} \leq 1.0e^{12}$
Velocity	INPUT	REAL	10.0	Velocity of axis This velocity is not always reached on account of the configured acceleration and deceleration and the distance to be traveled. Limit values: Start/stop velocity $\leq$ Velocity $\leq$ maximum velocity
Done	OUTPUT	BOOL	FALSE	TRUE   Target position reached
Busy	OUTPUT	BOOL	FALSE	TRUE   The command is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE   During execution the command was aborted by another command.
Error	OUTPUT	BOOL	FALSE	TRUE   An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6583) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6583) for parameter "ErrorID"

### MC\_MoveRelative: Function chart V1...3

#### Function chart

The following values were configured in the configuration window **Dynamics > General**:

- Acceleration: 10.0
- Deceleration: 10.0

①	The axis is moved by an MC_MoveRelative command by the distance ("Distance") 1000.0. When the axis reaches the target position, this is signaled via "Done_1". When "Done_1" = TRUE, another MC_MoveRelative command, with travel distance 500.0, is started. Because of the response times (e.g., cycle time of user program, etc.), the axis comes to a standstill briefly (see zoomed-in detail). When the axis reaches the new target position, this is signaled via "Done_2".
②	An active MC_MoveRelative command is aborted by another MC_MoveRelative command. The abort is signaled via "Abort_1". The axis is then moved at the new velocity by the new distance ("Distance") 500.0. When the new target position is reached, this is signaled via "Done_2".

### MC\_MoveVelocity

#### MC\_MoveVelocity: Move axes at preset rotational speed V1...3

### Description

Motion control instruction "MC\_MoveVelocity" moves the axis constantly at the specified velocity.

### Requirements

- The axis technology object has been configured correctly.
- The axis is enabled.

### Override response

MC\_MoveVelocity can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_MoveVelocity command aborts the following active Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command

9.7 References

- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

Parameters

Parameter	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_Axis_1	-	Axis technology object	
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge	
Velocity	INPUT	REAL	10.0	Velocity specification for axis motion Limit values: Start/stop velocity ≤  Velocity  ≤ maximum velocity (Velocity = 0.0 is permitted)	
Direction	INPUT	INT	0	Direction specification	
				0	Direction of rotation corresponds to the sign of the value in parameter "Velocity"
				1	Positive direction of rotation (The sign of the value in parameter "Velocity" is ignored)
				2	Negative direction of rotation (The sign of the value in parameter "Velocity" is ignored)
Current	INPUT	BOOL	FALSE	Maintain current velocity	
				FALSE	"Maintain current velocity" is deactivated. The values of parameters "Velocity" and "Direction" are used.
				TRUE	"Maintain current velocity" is activated. The values in parameters "Velocity" and "Direction" are not taken into account. When the axis resumes motion at the current velocity, the "InVelocity" parameter returns the value TRUE.
InVelocity	OUTPUT	BOOL	FALSE	TRUE <ul style="list-style-type: none"> <li>• "Current" = FALSE: The velocity specified in parameter "Velocity" was reached.</li> <li>• "Current" = TRUE: The axis travels at the current velocity at the start time.</li> </ul>	
Busy	OUTPUT	BOOL	FALSE	TRUE	The command is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the command was aborted by another command.

Parameter	Declaration	Data type	Default value	Description
Error	OUTPUT	BOOL	FALSE	TRUE An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6583) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6583) for parameter "ErrorID"

### Behavior with zero setpoint velocity (Velocity = 0.0)

An MC\_MoveVelocity command with "Velocity" = 0.0 (such as an MC\_Halt command) aborts active motion commands and stops the axis with the configured deceleration.

When the axis comes to a standstill, output parameter "InVelocity" indicates TRUE for at least one program cycle.

"Busy" indicates the value TRUE during the deceleration process and changes to FALSE together with "InVelocity". If parameter "Execute" = TRUE is set, "InVelocity" and "Busy" are latched.

When the "MC\_MoveVelocity" command is started, status bit "SpeedCommand" is set in the technology object. Status bit "ConstantVelocity" is set upon axis standstill. Both bits are adapted to the new situation when a new motion command is started.

### MC\_MoveVelocity: Function chart V1...3

#### Function chart

The following values were configured in the configuration window **Dynamics > General**:

- Acceleration: 10.0
- Deceleration: 10.0

①	An active MC_MoveVelocity command signals via "InVel_1" that its target velocity has been reached. It is then aborted by another MC_MoveVelocity command. The abort is signaled via "Abort_1". When the new target velocity 15.0 is reached, this is signaled via "InVel_2". The axis then continues moving at the new constant velocity.
②	An active MC_MoveVelocity command is aborted by another MC_MoveVelocity command prior to reaching its target velocity. The abort is signaled via "Abort_1". When the new target velocity 15.0 is reached, this is signaled via "InVel_2". The axis then continues moving at the new constant velocity.

MC\_MoveVelocity: Move axes at preset rotational speed V1...3 (Page 2929)

**MC\_MoveJog****MC\_MoveJog: Move axes in jog mode V1...3****Description**

Motion control instruction "MC\_MoveJog" moves the axis constantly at the specified velocity in jog mode. You use this Motion Control instruction, for example, for testing and commissioning purposes.

**Requirements**

- The axis technology object has been configured correctly.
- The axis is enabled.

**Override response**

The MC\_MoveJog command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_MoveJog command aborts the following active Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

Parameters

Parameter	Declaration	Data type	Default value	Description
Axis	INPUT	TO_Axis_1	-	Axis technology object
JogForward	INPUT	BOOL	FALSE	As long as the parameter is TRUE, the axis moves in the positive direction at the velocity specified in parameter "Velocity".
JogBackward	INPUT	BOOL	FALSE	As long as the parameter is TRUE, the axis moves in the negative direction at the velocity specified in parameter "Velocity".
If both parameters are simultaneously TRUE, the axis stops with the configured deceleration. An error is indicated in parameters "Error", "ErrorID", and "ErrorInfo".				
Velocity	INPUT	REAL	10.0	Preset velocity for jog mode
				Limit values, instruction version V1.0: Start/stop velocity ≤  Velocity  ≤ maximum velocity
				Limits, instruction version V2.0: Start/stop velocity ≤ velocity ≤ maximum velocity
InVelocity	OUTPUT	BOOL	FALSE	TRUE The velocity specified in parameter "Velocity" was reached.
Busy	OUTPUT	BOOL	FALSE	TRUE The command is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE During execution the command was aborted by another command.
Error	OUTPUT	BOOL	FALSE	TRUE An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6583) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6583) for parameter "ErrorID"

### MC\_MoveJog: Function chart V1...3

#### Function chart

The following values were configured in the configuration window **Dynamics > General**:

- Acceleration: 10.0
- Deceleration: 5.0

①	The axis is moved in the positive direction in jog mode via "Jog_F". When the target velocity 50.0 is reached, this is signaled via "InVelo_1". After "Jog_F" is reset, the axis brakes again until it comes to a standstill.
②	The axis is moved in the negative direction in jog mode via "Jog_B". When the target velocity 50.0 is reached, this is signaled via "InVelo_1". After "Jog_B" is reset, the axis brakes again until it comes to a standstill.

### See also

MC\_MoveJog: Move axes in jog mode V1...3 (Page 2933)

### MC\_CommandTable

### MC\_CommandTable: Run axis commands as motion sequence V2...3

#### Description

The Motion Control instruction "MC\_CommandTable" combines multiple individual axis control commands in one movement sequence.

#### Requirements

- The axis technology object has been inserted in V2 and correctly configured.
- The command table technology object has been inserted and correctly configured.
- The axis is enabled.

#### Override response

The MC\_CommandTable command can be aborted by the following Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The new MC\_CommandTable command aborts the following active Motion Control commands:

- MC\_Home command Mode = 3
- MC\_Halt command
- MC\_MoveAbsolute command
- MC\_MoveRelative command
- MC\_MoveVelocity command
- MC\_MoveJog command
- MC\_CommandTable command

The active Motion Control command is cancelled by the start of the first "Positioning Relative", "Positioning Absolute", "Velocity set point" or "Halt" command.

## Parameters

Parameter	Declaration	Data type	Default value	Description
Axis	INPUT	TO_Axis_1	-	Axis technology object
CommandTable	INPUT	TO_CommandTable_1	-	Command table technology object
Execute	INPUT	BOOL	FALSE	Command table start with positive edge
StartStep	INPUT	INT	1	Defines the step at which the execution of the command table should begin Limit values: $1 \leq \text{StartStep} \leq \text{EndStep}$
EndStep	INPUT	INT	32	Defines the step up to which the execution of command table should take place Limit values: $\text{StartStep} \leq \text{EndStep} \leq 32$
Done	OUTPUT	BOOL	FALSE	TRUE Command table has been successfully executed
Busy	OUTPUT	BOOL	FALSE	TRUE The command table is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE The command table was cancelled by another command.
Error	OUTPUT	BOOL	FALSE	TRUE An error occurred during execution of the command table. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6583) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6583) for parameter "ErrorID"
CurrentStep	OUTPUT	INT	0	Step in command table currently being executed
StepCode	OUTPUT	WORD	16#0000	User-defined numerical value / bit pattern of the step currently being executed

## MC\_ChangeDynamic

### MC\_ChangeDynamic: Change dynamic settings of axis V2...3

#### Description

Motion Control instruction "MC\_ChangeDynamic" allows you to change the following settings of the axis:

- Change the ramp-up time (acceleration) value
- Change the ramp-down time (deceleration) value
- Change the emergency stop ramp-down time (emergency stop deceleration) value
- Change the smoothing time (jerk) value

For the effectiveness of the change, refer to the description of the tag (Page 6596).

#### Requirements

- The axis technology object has been inserted in Version V2.
- The axis technology object has been configured correctly.

#### Override response

A MC\_ChangeDynamic command cannot be aborted by any other Motion Control command.

A new MC\_ChangeDynamic command does not abort any active Motion Control commands.

#### Parameters

Parameter	Declaration	Data type	Default value	Description
Axis	INPUT	TO_Axis_1	-	Axis technology object
Execute	INPUT	BOOL	FALSE	Start of the command with a positive edge
ChangeRampUp	INPUT	BOOL	FALSE	TRUE   Change ramp-up time in line with input parameter "RampUpTime"
RampUpTime	INPUT	REAL	5.00	Time (in seconds) to accelerate axis from standstill to configured maximum velocity without jerk limit. The change will influence the tag <Axis name>. Config.DynamicDefaults.Acceleration. For the effectiveness of the change, refer to the description of this tag.
ChangeRampDown	INPUT	BOOL	FALSE	TRUE   Change ramp-down time in line with input parameter "RampDownTime"
RampDownTime	INPUT	REAL	5.00	Time (in seconds) to decelerate axis from the configured maximum velocity to standstill without jerk limiter. The change will influence the tag <Axis name>. Config.DynamicDefaults.Deceleration. For the effectiveness of the change, refer to the description of this tag.

Parameter	Declaration	Data type	Default value	Description
ChangeEmergency	INPUT	BOOL	FALSE	TRUE   Change emergency stop ramp-down time in line with input parameter "EmergencyRampTime"
EmergencyRampTime	INPUT	REAL	2.00	Time (in seconds) to decelerate the axis from configured maximum velocity to standstill without jerk limiter in emergency stop mode. The change will influence the tag <Axis name>. Config.DynamicDefaults.EmergencyDeceleration . For the effectiveness of the change, refer to the description of this tag.
ChangeJerkTime	INPUT	BOOL	FALSE	TRUE   Change smoothing time according to the input parameter "JerkTime"
JerkTime	INPUT	REAL	0.25	Smoothing time (in seconds) used for the axis acceleration and deceleration ramps The change will influence the tag <Axis name>. Config.DynamicDefaults.Jerk . For the effectiveness of the change, refer to the description of this tag.
Done	OUTPUT	BOOL	FALSE	TRUE   The changed values have been written to the technology data block. The description of the tags will show when the change becomes effective.
Error	OUTPUT	BOOL	FALSE	TRUE   An error occurred during execution of the command. The cause of the error can be found in parameters "ErrorID" and "ErrorInfo".
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 6583) for parameter "Error"
ErrorInfo	OUTPUT	WORD	16#0000	Error info ID (Page 6583) for parameter "ErrorID"

### Note

At the input parameters "RampUpTime", "RampDownTime", "EmergencyRampTime" and "JerkTime", values can be entered which exceed the admissible limits of the resulting parameters: "Acceleration", "Deceleration", "Emergency stop deceleration" and "Jerk".

Please note the equations and limits in "Axis technology object" -> "Configuring the technology object" -> "Dynamics" and ensure that the values you input are within the valid range.

### 9.7.4.2 High-speed counters

#### CTRL\_HSC: Control high-speed counters

##### Parameter

Parameter	Declaration	Data type	Memory area	Description
EN	INPUT	BOOL	I, Q, M, D, L, T, C	Enable input
ENO	OUTPUT	BOOL	I, Q, M, D, L	Enable output
HSC	INPUT	HW_HSC	I, Q, M or constant	Hardware address of the high-speed counter (HW-ID)
DIR	INPUT	BOOL	I, Q, M, D, L or constant	Enables the new count direction (see NEW_DIR)
CV	INPUT	BOOL	I, Q, M, D, L or constant	Enables the new count value (see NEW_CV)
RV	INPUT	BOOL	I, Q, M, D, L or constant	Enables the new reference value (see NEW_RV)
PERIOD	INPUT	BOOL	I, Q, M, D, L or constant	Enables the new period of a frequency measurement (see NEW_PERIOD)
NEW_DIR	INPUT	INT	I, Q, M, D, L or constant	Count direction loaded when DIR = TRUE.
NEW_CV	INPUT	DINT	I, Q, M, D, L or constant	Count value loaded when CV = TRUE.
NEW_RV	INPUT	DINT	I, Q, M, D, L or constant	Reference value loaded when RV = TRUE.
NEW_PERIOD	INPUT	INT	I, Q, M, D, L or constant	Period of the frequency measurement loaded when PERIOD = TRUE.

Parameter	Declaration	Data type	Memory area	Description
BUSY	OUTPUT	BOOL	I, Q, M, D, L	Processing status
STATUS	OUTPUT	WORD	I, Q, M, D, L	Status of the operation

## Description

With the "Control high-speed counter" instruction, you can make parameter settings and control the high-speed counters supported by the CPU by loading new values into the counter. Execution of the instruction requires that the high-speed counter to be controlled is enabled. You cannot execute multiple "Control high-speed counter" instructions simultaneously in the program for a given high-speed counter.

You can load the following parameter values into a high-speed counter using the "Control high-speed counter" instruction:

- **Count direction (NEW\_DIR):** The count direction defines whether a high-speed counter counts up or down. The count direction is defined by the following values at the NEW\_DIR input: 1 = up, -1 = down.  
A change to the count direction with the "Control high-speed counter" instruction is only possible when direction control is set in the parameters by the program. The count direction specified at the NEW\_DIR input is loaded into a high-speed counter when the bit at the DIR input is set.
- **Count value (NEW\_CV):** The count value is the initial value at which a high-speed counter starts counting. The count value can be in the range -2147483648 to 2147483647.  
The count value specified at the NEW\_CV input is loaded into a high-speed counter when the bit at the CV input is set.
- **Reference value (NEW\_RV):** You can compare the reference value with the current counter value to trigger an alarm. Similar to the counter value, the reference value can be in the range -2147483648 to 2147483647.  
The reference value specified at the NEW\_RV input is loaded into a high-speed counter when the bit at the RV input is set.
- **Period of the frequency measurement (NEW\_PERIOD):** The period of the frequency measurement is specified by the following values at the NEW\_PERIOD input: 10 = 0.01s, 100 = 0.1s, 1000 = 1s.  
The time period can be updated if the "Measure frequency" function for the specified high-speed counter is configured. The time period specified at the NEW\_PERIOD input is loaded into a high-speed counter when the bit at the PERIOD input is set.

The "Control high-speed counter" instruction is only executed if the signal state at the EN input is "1". As long as the operation is executing, the bit at the BUSY output is set. Once the operation has executed completely, the bit at the BUSY output is reset.

The ENO enable output is set only when the EN enable input has signal state "1" and no errors occur during execution of the operation.

When inserting the "Control high-speed counter" instruction, an instance data block is created in which the operation data is saved.

## Parameter STATUS

At the STATUS output, you can query whether errors occurred during execution of the "Control high-speed counter" instruction. The following table shows the meaning of the values output at the STATUS output:

Error code (hexadecimal)	Description
0	No error
80A1	Hardware identifier of the high-speed counter invalid
80B1	Count direction (NEW_DIR) invalid
80B2	Count value (NEW_CV) invalid
80B3	Reference value (NEW_RV) invalid
80B4	Period of the frequency measurement (NEW_PERIOD) invalid
80C0	Multiple access to the high-speed counter
80D0	The high-speed counter (HSC) is not enabled in the CPU hardware configuration.

### 9.7.4.3 PID Control

#### PID\_Compact

#### New features of PID\_Compact

#### PID\_Compact V2.2

- **Use with S7-1200**  
As of PID\_Compact V2.2, the instruction with V2 functionality can also be used on S7-1200 with firmware version 4.0 or higher.

#### PID\_Compact V2.0

- **Reaction to error**  
The reaction to error has been completely overhauled. PID\_Compact now reacts in a more fault-tolerant manner in the default setting. This reaction is set when copying PID\_Compact V1.X from an S7-1200 CPU to an S7-1500 CPU.

NOTICE
<p><b>Your system may be damaged.</b></p> <p>If you use the default setting, PID_Compact remains in automatic mode when the process value limits are exceeded. This may damage your system.</p> <p>It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.</p>

The Error parameter indicates if an error is pending. When the error is no longer pending, Error = FALSE. The ErrorBits parameter shows which errors have occurred. Use ErrorAck to acknowledge the errors and warnings without restarting the controller or clearing the integral action. Switching operating modes no longer clears errors that are no longer pending.

You can configure the reaction to error with SetSubstituteOutput and ActivateRecoverMode.

- **Substitute output value**  
You can configure a substitute output value that is to be output if an error occurs.
- **Switching the operating mode**  
You specify the operating mode at the Mode in/out parameter and use a rising edge at ModeActivate to start the operating mode. The sRet.i\_Mode tag has been omitted.
- **Multi-instance capability**  
You can call up PID\_Compact as multi-instance DB. No technology object is created in this case and no parameter assignment interface or commissioning interface is available. You must assign parameters for PID\_Compact directly in the multi-instance DB and commission it via a watch table.
- **Startup characteristics**  
The operating mode specified at the Mode parameter is also started on a falling edge at Reset and during a CPU cold restart, if RunModeByStartup = TRUE.

- **ENO characteristics**  
ENO is set depending on the operating mode.  
If State = 0, then ENO = FALSE.  
If State ≠ 0, then ENO = TRUE.
- **Setpoint value specification during tuning**  
You configure the permitted fluctuation of the setpoint during tuning at the CancelTuningLevel tag.
- **Value range for output value limits**  
The value 0.0 no longer has to fall within the output value limits.
- **Pre-assigning the integral action**  
Using the tags IntegralResetMode and OverwriteInitialOutputValue, you can determine the pre-assignment of the integral action when switching from "Inactive" operating mode to "Automatic mode".
- **Switching a disturbance variable on**  
You can switch a disturbance variable on at the Disturbance parameter.
- **Default value of PID parameters**  
The following default settings have been changed:
  - Proportional action weighting (PWeighting) from 0.0 to 1.0
  - Derivative action weighting (DWeighting) from 0.0 to 1.0
  - Coefficient for derivative delay (TdFiltRatio) from 0.0 to 0.2
- **Renaming tags**  
The static tags have been given new names that are compatible with PID\_3Step.

## PID\_Compact V1.2

- **Manual mode on CPU startup**  
If ManualEnable = TRUE when the CPU starts, PID\_Compact starts in manual mode. A rising edge at ManualEnable is not necessary.
- **Pretuning**  
If the CPU is switched off during pretuning, pretuning starts again when the CPU is switched back on.

## PID\_Compact V1.1

- **Manual mode on CPU startup**  
When the CPU starts up, PID\_Compact only switches to manual mode with a rising edge at ManualEnable. Without rising edge, PID\_Compact starts in the last operating mode in which ManualEnable was FALSE.
- **Reaction to reset**  
A rising edge at Reset resets the errors and warnings and clears the integral action. A falling edge at Reset triggers a switchover to the most recently active operating mode.
- **Default of process value high limit**  
The default value of r\_Pv\_Hlm has been changed to 120.0.

- **Monitoring the sampling time**
  - An error is no longer output when the current sampling time is  $\geq 1.5 \times$  current mean value or when the current sampling time is  $\leq 0.5 \times$  current mean value. The sampling time may deviate much more in automatic mode.
  - PID\_Compact is compatible with FW, V2.0 or higher.
- **Access to tags**  
The following tags can now be used in the user program.
  - i\_Event\_SUT
  - i\_Event\_TIR
  - r\_Ctrl\_loutv
- **Troubleshooting**  
PID\_Compact now outputs the correct pulses when the shortest ON time is not equal to the shortest OFF time.

### Compatibility with CPU and FW

The following table shows which version of PID\_Compact can be used on which CPU.

CPU	FW	PID_Compact
S7-1200	V4.x	V2.2 V1.2
S7-1200	V3.X	V1.2 V1.1
S7-1200	V2.X	V1.2 V1.1
S7-1200	V1.X	V1.0
S7-1500	V1.1	V2.2 V2.1 V2.0
S7-1500	V1.0	V2.0

### PID\_Compact V2

#### Description of PID\_Compact V2

##### Description

The PID\_Compact instruction provides a PID controller with integrated tuning for actuators with proportional action.

The following operating modes are possible:

9.7 References

- Inactive
- Pretuning
- Fine tuning
- Automatic mode
- Manual mode
- Substitute output value with error monitoring

For a more detailed description of the operating modes, see the State parameter.

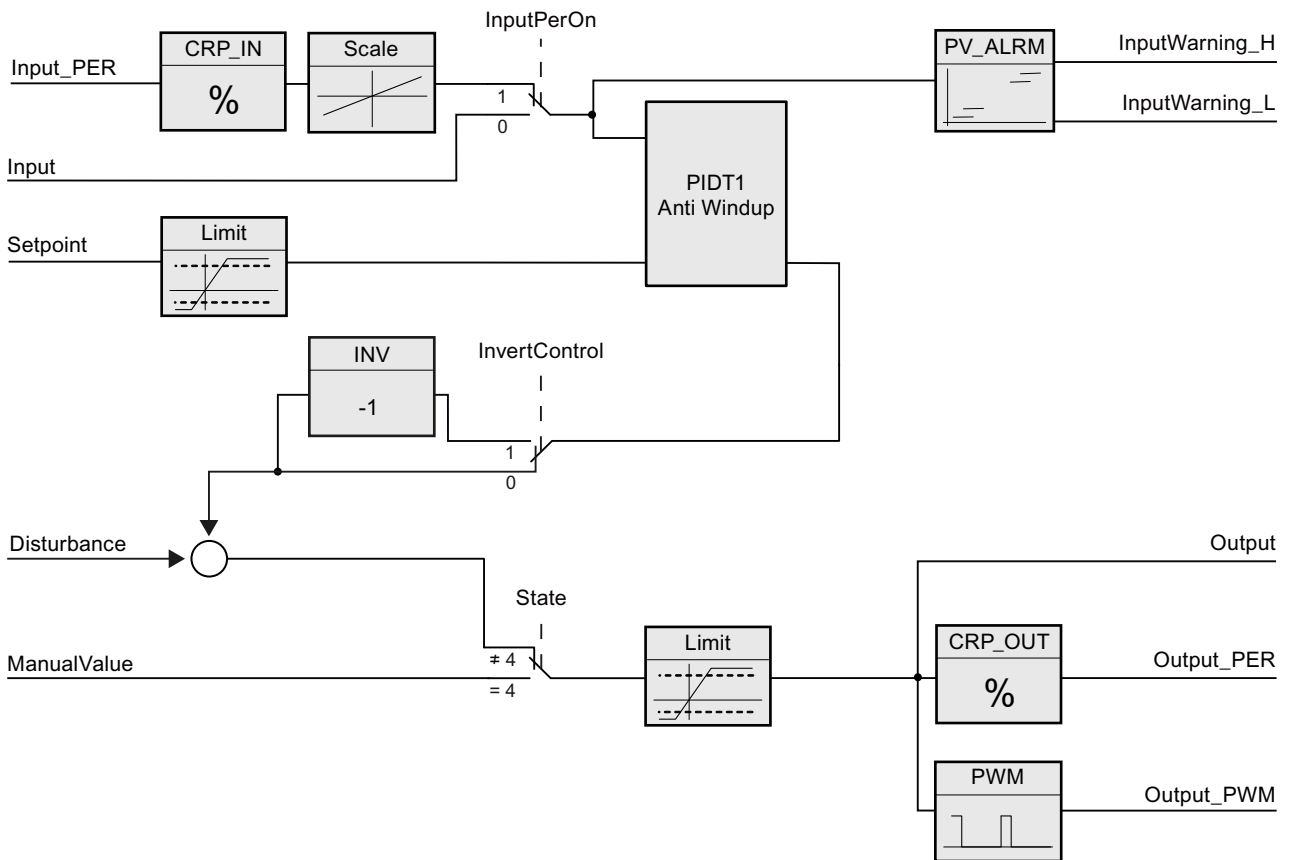

**PID algorithm**

PID\_Compact is a PIDT1 controller with anti-windup and weighting of the proportional and derivative actions. The PID algorithm operates according to the following equation:

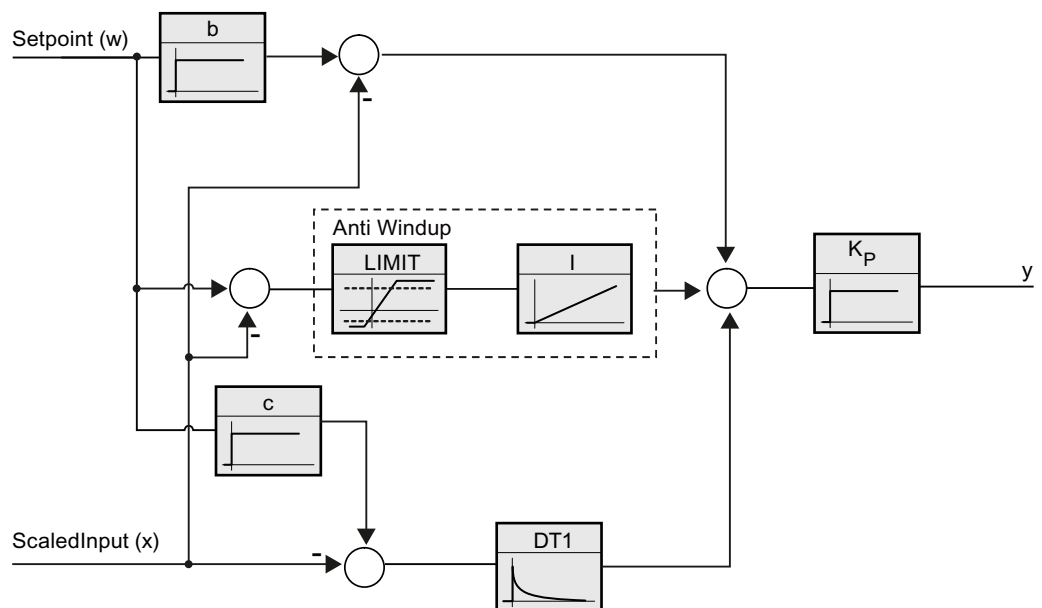

$$y = K_p \left[ (b \cdot w - x) + \frac{1}{T_i \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

Symbol	Description
y	Output value of the PID algorithm
K <sub>p</sub>	Proportional gain
s	Laplace operator
b	Proportional action weighting
w	Setpoint
x	Process value
T <sub>i</sub>	Integral action time
T <sub>D</sub>	Derivative action time
a	Derivative delay coefficient (derivative delay T1 = a × T <sub>D</sub> )
c	Derivative action weighting

**Block diagram of PID\_Compact**

**Block diagram of PIDT1 with anti-windup**

**Call**

PID\_Compact is called in the constant time scale of a cycle interrupt OB.

If you call PID\_Compact as a multi-instance DB, no technology object is created. No parameter assignment interface or commissioning interface is available. You must assign parameters for PID\_Compact directly in the multi-instance DB and commission it via a watch table.

**Download to device**

The actual values of retentive variables are only updated when you download PID\_Compact completely.

Downloading technology objects to device (Page 6325)

**Startup**

When the CPU starts up, PID\_Compact starts in the operating mode that is saved in the Mode in/out parameter. To switch to "Inactive" operating mode during startup, set RunModeByStartup = FALSE.

**Reaction to error**

In automatic mode and during commissioning, the reaction to error depends on the SetSubstituteOutput and ActivateRecoverMode variables. In manual mode, the reaction is independent of SetSubstituteOutput and ActivateRecoverMode. If ActivateRecoverMode = TRUE, the reaction additionally depends on the error that occurred.

SetSubstituteOutput	ActivateRecoverMode	Configuration editor > output value > Set Output to	Reaction
Not relevant	FALSE	Zero (inactive)	Switch to "Inactive" mode (State = 0) The value 0.0 0 is transferred to the actuator.
FALSE	TRUE	Current output value while error is pending	Switch to "Substitute output value with error monitoring" mode (State = 5) The current output value is transferred to the actuator while the error is pending.
TRUE	TRUE	Substitute output value while error is pending	Switch to "Substitute output value with error monitoring" mode (State = 5) The value at SubstituteOutput is transferred to the actuator while the error is pending.

In manual mode, PID\_Compact uses ManualValue as output value, unless ManualValue is invalid. If ManualValue is invalid, SubstituteOutput is used. If ManualValue and SubstituteOutput are invalid, Config.OutputLowerLimit is used.

The Error parameter indicates if an error is pending. When the error is no longer pending, Error = FALSE. The ErrorBits parameter shows which errors have occurred. ErrorBits is reset by a rising edge at Reset or ErrorAck.

## PID\_Compact V2 mode of operation

### Monitoring process value limits

You specify the high limit and low limit of the process value in the Config.InputUpperLimit and Config.InputLowerLimit tags. If the process value is outside these limits, an error occurs (ErrorBits = 0001h).

You specify a high and low warning limit of the process value in the Config.InputUpperWarning and Config.InputLowerWarning tags. If the process value is outside these warning limits, a warning occurs (Warning = 0040h), and the InputWarning\_H or InputWarning\_L output parameter changes to TRUE.

### Limiting the setpoint

You specify a high limit and low limit of the setpoint in the Config.SetpointUpperLimit and Config.SetpointLowerLimit tags. PID\_Compact automatically limits the setpoint to the process value limits. You can limit the setpoint to a smaller range. PID\_Compact checks whether this range falls within the process value limits. If the setpoint is outside these limits, the high or low limit is used as the setpoint, and output parameter SetpointLimit\_H or SetpointLimit\_L is set to TRUE.

The setpoint is limited in all operating modes.

### Limiting the output value

You specify a high limit and low limit of the output value in the Config.OutputUpperLimit and Config.OutputLowerLimit tags. Output, ManualValue, and SubstituteOutput are limited to these values. The output value limits must match the control logic.

The valid output value limit values depend on the Output used.

Output	-100.0 to 100.0%
Output_PER	-100.0 to 100.0%
Output_PWM	0.0 to 100.0%

Rule:

OutputUpperLimit > OutputLowerLimit

### Substitute output value

In the event of an error, PID\_Compact can output a substitute output value that you define at the tag SubstituteOutput. The substitute output value must be within the output value limits.

### Monitoring signal validity

The values of the following parameters are monitored for validity when used:

- Setpoint
- Input

- Input\_PER
- Disturbance
- ManualValue
- SubstituteOutput
- Output
- Output\_PER
- Output\_PWM

### Monitoring of the sampling time PID\_Compact

Ideally, the sampling time is equivalent to the cycle time of the calling OB. The PID\_Compact instruction measures the time interval between two calls. This is the current sampling time. On every switchover of operating mode and during the initial startup, the mean value is formed from the first 10 sampling times. Too great a difference between the current sampling time and this mean value triggers an error (Error = 0800h).

The error occurs during tuning if:

- New mean value  $\geq 1.1 \times$  old mean value
- New mean value  $\leq 0.9 \times$  old mean value

The error occurs in automatic mode if:

- New mean value  $\geq 1.5 \times$  old mean value
- New mean value  $\leq 0.5 \times$  old mean value

If you deactivate the sampling time monitoring (`CycleTime.EnMonitoring = FALSE`), you can also call PID\_Compact in OB1. You must then accept a lower control quality due to the deviating sampling time.

### Sampling time of the PID algorithm

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the cycle time. All other functions of PID\_Compact are executed at every call.

If you use Output\_PWM, the accuracy of the output signal is determined by the ratio of the PID algorithm sampling time to the cycle time of the OB. The cycle time should be at least 10 times the PID algorithm sampling time.

### Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic. For cooling and discharge control systems, it may be necessary to invert the control logic. PID\_Compact does not work with negative proportional gain. If `InvertControl = TRUE`, an increasing control deviation causes a reduction in the output value. The control logic is also taken into account during pretuning and fine tuning.

## Input parameters of PID\_Compact V2

Table 9-79

Parameter	Data type	Default	Description
Setpoint	REAL	0.0	Setpoint of the PID controller in automatic mode
Input	REAL	0.0	A tag of the user program is used as the source of the process value. If you are using the Input parameter, then Config.InputPerOn = FALSE must be set.
Input_PER	INT	0	An analog input is used as the source of the process value. If you are using the Input_PER parameter, then Config.InputPerOn = TRUE must be set.
Disturbance	REAL	0.0	Disturbance variable or precontrol value
ManualEnable	BOOL	FALSE	<ul style="list-style-type: none"> <li>A FALSE -&gt; TRUE edge activates "manual mode", while State = 4, Mode remain unchanged. As long as ManualEnable = TRUE, you cannot change the operating mode via a rising edge at ModeActivate or use the commissioning dialog.</li> <li>A TRUE -&gt; FALSE edge activates the operating mode that is specified by Mode.</li> </ul> We recommend that you change the operating mode using ModeActivate only.
ManualValue	REAL	0.0	Manual value This value is used as the output value in manual mode. Values from Config.OutputLowerLimit to Config.OutputUpperLimit are permitted.
ErrorAck	BOOL	FALSE	<ul style="list-style-type: none"> <li>FALSE -&gt; TRUE edge ErrorBits and Warning are reset.</li> </ul>
Reset	BOOL	FALSE	Restarts the controller. <ul style="list-style-type: none"> <li>FALSE -&gt; TRUE edge               <ul style="list-style-type: none"> <li>Switch to "Inactive" mode</li> <li>ErrorBits and Warnings are reset.</li> <li>Integral action is cleared (PID parameters are retained)</li> </ul> </li> <li>As long as Reset = TRUE, PID_Compact remains in "Inactive" mode (State = 0).</li> <li>TRUE -&gt; FALSE edge PID_Compact switches to the operating mode that is saved in the Mode parameter.</li> </ul>
ModeActivate	BOOL	FALSE	<ul style="list-style-type: none"> <li>FALSE -&gt; TRUE edge PID_Compact switches to the operating mode that is saved in the Mode parameter.</li> </ul>

Output parameters of PID\_Compact V2

Table 9-80

Parameter	Data type	Default	Description
ScaledInput	REAL	0.0	Scaled process value
The "Output", "Output_PER", and "Output_PWM" outputs can be used concurrently.			
Output	REAL	0.0	Output value in REAL format
Output_PER	INT	0	Analog output value
Output_PWM	BOOL	FALSE	Pulse-width-modulated output value The output value is formed by by variable On and Off times.
SetpointLimit_H	BOOL	FALSE	If SetpointLimit_H = TRUE, the absolute setpoint high limit is reached (Setpoint ≥ Config.SetpointUpperLimit). The setpoint is limited to Config.SetpointUpperLimit .
SetpointLimit_L	BOOL	FALSE	If SetpointLimit_L = TRUE, the absolute setpoint low limit has been reached (Setpoint ≤ Config.SetpointLowerLimit). The setpoint is limited to Config.SetpointLowerLimit .
InputWarning_H	BOOL	FALSE	If InputWarning_H = TRUE, the process value has reached or exceeded the warning high limit.
InputWarning_L	BOOL	FALSE	If InputWarning_L = TRUE, the process value has reached or fallen below the warning low limit.
State	INT	0	The State parameter (Page 2962) shows the current operating mode of the PID controller. You can change the operating mode using the input parameter Mode and a rising edge at ModeActivate. <ul style="list-style-type: none"> <li>• State = 0: Inactive</li> <li>• State = 1: Pretuning</li> <li>• State = 2: Fine tuning</li> <li>• State = 3: Automatic mode</li> <li>• State = 4: Manual mode</li> <li>• State = 5: Substitute output value with error monitoring</li> </ul>
Error	BOOL	FALSE	If Error = TRUE, at least one error message is pending in this cycle.
ErrorBits	DWORD	DW#16#0	The ErrorBits parameter (Page 2966) shows which error messages are pending. ErrorBits is retentive and is reset upon a rising edge at Reset or ErrorAck.

## In/out parameters of PID\_Compact V2

Table 9-81

Parameter	Data type	Default	Description
Mode	INT	4	<p>At Mode, specify the operating mode to which PID_Compact is to switch. Options are:</p> <ul style="list-style-type: none"> <li>• Mode = 0: Inactive</li> <li>• Mode = 1: Pretuning</li> <li>• Mode = 2: Fine tuning</li> <li>• Mode = 3: Automatic mode</li> <li>• Mode = 4: Manual mode</li> </ul> <p>The operating mode is activated by:</p> <ul style="list-style-type: none"> <li>• Rising edge at ModeActivate</li> <li>• Falling edge at Reset</li> <li>• Falling edge at ManualEnable</li> <li>• Cold restart of CPU if RunModeByStartup = TRUE</li> </ul> <p>Mode is retentive.</p> <p>A detailed description of the operating modes can be found in Parameters State and Mode V2 (Page 2962).</p>

**See also**

Parameters State and Mode V2 (Page 2962)

**Static tags of PID\_Compact V2**

You must not change variables that are not listed. These are used for internal purposes only.

Table 9-82

Tag	Data type	Default	Description
IntegralResetMode	INT	1	<p>The tag IntegralResetMode determines how PIDCtrl.IntegralSum is pre-assigned when switching from "Inactive" operating mode to "Automatic mode". This setting only works for one cycle.</p> <p>Options are:</p> <ul style="list-style-type: none"> <li>• IntegralResetMode = 0: Smoothing The value of IntegralSum is pre-assigned so that the switchover is bumpless.</li> <li>• IntegralResetMode = 1: Deleting The value of IntegralSum is deleted. Any control deviation will cause a jump change of the output value.</li> <li>• IntegralResetMode = 2: Holding The value of IntegralSum is not changed. You can define a new value using the user program.</li> <li>• IntegralResetMode = 3: Pre-assigning The value of IntegralSum is automatically pre-assigned so that Output is calculated with reference to the value OverwriteInitialOutputValue. This setting is useful, for example, for an override controller.</li> </ul>
OverwriteInitialOutputValue	REAL	0.0	<p>If IntegralResetMode = 3, the value of IntegralSum is automatically pre-assigned so that Output = OverwriteInitialOutputValue in the next cycle.</p>
RunModeByStartup	BOOL	TRUE	<p>Activate operating mode at Mode parameter after CPU restart</p> <p>If RunModeByStartup = TRUE, PID_Compact starts in the operating mode saved in the Mode parameter after CPU startup.</p> <p>If RunModeByStartup = FALSE, PID_Compact remains in "Inactive" mode after CPU startup.</p>
LoadBackUp	BOOL	FALSE	<p>If LoadBackUp = TRUE, the last set of PID parameters is reloaded. The set was saved prior to the last tuning. LoadBackUp is automatically set back to FALSE.</p>
PhysicalUnit	INT	0	<p>Unit of measurement of the process value and setpoint, e.g., °C, or °F.</p>
PhysicalQuantity	INT	0	<p>Physical quantity of the process value and setpoint, e.g., temperature.</p>
ActivateRecoverMode	BOOL	TRUE	<p>The Tag ActivateRecoverMode V2 (Page 2968) determines the reaction to error.</p>
Warning	DWORD	0	<p>Tag Warning V2 (Page 2970) shows the warnings since Reset = TRUE or ErrorAck =TRUE. Warning is retentive.</p>
Progress	REAL	0.0	<p>Progress of tuning as a percentage (0.0 - 100.0)</p>

Tag	Data type	Default	Description
CurrentSetpoint	REAL	0.0	CurrentSetpoint always displays the current setpoint. This value is frozen during tuning.
CancelTuningLevel	REAL	10.0	Permissible fluctuation of setpoint during tuning. Tuning is not canceled until: <ul style="list-style-type: none"> <li>• Setpoint &gt; CurrentSetpoint + CancelTuningLevel or</li> <li>• Setpoint &lt; CurrentSetpoint - CancelTuningLevel</li> </ul>
SubstituteOutput	REAL	0.0	Substitute output value When the following conditions are met, the substitute output value is used: <ul style="list-style-type: none"> <li>• An error has occurred in automatic mode.</li> <li>• SetSubstituteOutput = TRUE</li> <li>• ActivateRecoverMode = TRUE</li> </ul>
SetSubstituteOutput	BOOL	TRUE	If SetSubstituteOutput = TRUE and ActivateRecoverMode = TRUE, the substitute output value configured is output as long as an error is pending. If SetSubstituteOutput = FALSE and ActivateRecoverMode = TRUE, the actuator remains at the current output value as long as an error is pending. If ActivateRecoverMode = FALSE, SetSubstituteOutput is not effective. If SubstituteOutput is invalid (ErrorBits = 20000h), the substitute output value cannot be output.
Config.InputPerOn	BOOL	TRUE	If InputPerOn = TRUE, the Input_PER parameter is used. If InputPerOn = FALSE, the Input parameter is used.
Config.InvertControl	BOOL	FALSE	Invert control logic If InvertControl = TRUE, an increasing control deviation causes a reduction in the output value.
Config.InputUpperLimit	REAL	120.0	High limit of the process value Input and Input_PER are monitored to ensure adherence to this limit. At the I/O input, the process value can be a maximum of 18% higher than the standard range (overrange). This pre-assignment ensures that an error is no longer signaled due to a violation of the "Process value high limit". Only a wire-break and a short-circuit are recognized and PID_Compact reacts according to the configured reaction to error. InputUpperLimit > InputLowerLimit
Config.InputLowerLimit	REAL	0.0	Low limit of the process value Input and Input_PER are monitored to ensure adherence to this limit. InputLowerLimit < InputUpperLimit

9.7 References

Tag	Data type	Default	Description
Config.InputUpperWarning	REAL	3.402822e+38	Warning high limit of the process value If you set InputUpperWarning outside the process value limits, the configured absolute process value high limit is used as the warning high limit. If you configure InputUpperWarning within the process value limits, this value is used as the warning high limit. InputUpperWarning > InputLowerWarning InputUpperWarning ≤ InputUpperLimit
Config.InputLowerWarning	REAL	-3.402822e+38	Warning low limit of the process value If you set InputLowerWarning outside the process value limits, the configured absolute process value low limit is used as the warning low limit. If you configure InputLowerWarning within the process value limits, this value is used as the warning low limit. InputLowerWarning < InputUpperWarning InputLowerWarning ≥ InputLowerLimit
Config.OutputUpperLimit	REAL	100.0	High limit of output value For details, see OutputLowerLimit OutputUpperLimit > OutputLowerLimit
Config.OutputLowerLimit	REAL	0.0	Low limit of output value For Output and Output_PER, the range of values from -100.0 to +100.0, including zero, is valid. At -100.0, Output_PER = -27648; at +100.0, Output_PER = 27648. For Output_PWM, the value range 0.0 to +100.0 applies. The output value limits must match the control logic. OutputLowerLimit < OutputUpperLimit
Config.SetpointUpperLimit	REAL	3.402822e+38	High limit of setpoint If you configure SetpointUpperLimit outside the process value limits, the configured absolute process value high limit is used as the setpoint high limit. If you configure SetpointUpperLimit within the process value limits, this value is used as the setpoint high limit.
Config.SetpointLowerLimit	REAL	-3.402822e+38	Low limit of the setpoint If you set SetpointLowerLimit outside the process value limits, the configured process value absolute low limit is used as the setpoint low limit. If you set SetpointLowerLimit within the process value limits, this value is used as the setpoint low limit.
Config.MinimumOnTime	REAL	0.0	The minimum ON time of the pulse width modulation in seconds is rounded to MinimumOnTime = n×CycleTime.Value
Config.MinimumOffTime	REAL	0.0	The minimum OFF time of the pulse width modulation in seconds is rounded to MinimumOffTime = n×CycleTime.Value

Tag	Data type	Default	Description
Config.InputScaling.UpperPointIn	REAL	27648.0	Scaling Input_PER high Input_PER is converted to percent based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn.
Config.InputScaling.LowerPointIn	REAL	0.0	Scaling Input_PER low Input_PER is converted to percent based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn.
Config.InputScaling.UpperPointOut	REAL	100.0	Scaled high process value Input_PER is converted to percent based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn.
Config.InputScaling.LowerPointOut	REAL	0.0	Scaled low process value Input_PER is converted to percent based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn.
CycleTime.StartEstimation	BOOL	TRUE	If CycleTime.StartEstimation = TRUE, the automatic determination of the cycle time is started. CycleTime.StartEstimation = FALSE once measurement is complete.
CycleTime.EnEstimation	BOOL	TRUE	If CycleTime.EnEstimation = TRUE, the PID_Compact sampling time is calculated. If CycleTime.EnEstimation = FALSE, the PID_Compact sampling time is not calculated and you need to correct the configuration of CycleTime.Value manually.
CycleTime.EnMonitoring	BOOL	TRUE	If CycleTime.EnMonitoring = FALSE, the PID_Compact sampling time is not monitored. If it is not possible to execute PID_Compact within the sampling time, no error (ErrorBits=0800h) is output and PID_Compact does not switch to "Inactive" mode.
CycleTime.Value	REAL	0.1	PID_Compact sampling time in seconds CycleTime.Value is determined automatically and is usually equivalent to the cycle time of the calling OB.
CtrlParamsBackUp.Gain	REAL	1.0	Saved proportional gain You can reload values from the CtrlParamsBackUp structure with LoadBackUp = TRUE.
CtrlParamsBackUp.Ti	REAL	20.0	Saved integral action time [s]
CtrlParamsBackUp.Td	REAL	0.0	Saved derivative action time [s]
CtrlParamsBackUp.TdFiltRatio	REAL	0.2	Saved derivative delay coefficient
CtrlParamsBackUp.PWeighting	REAL	1.0	Saved proportional action weighting factor
CtrlParamsBackUp.DWeighting	REAL	1.0	Saved derivative action weighting factor
CtrlParamsBackUp.Cycle	REAL	1.0	Saved sampling time of PID algorithm

Tag	Data type	Default	Description
PIDSelfTune.SUT.CalculateParams	BOOL	FALSE	The properties of the controlled system are saved during tuning. If SUT.CalculateParams = TRUE, the parameters for pretuning are recalculated according to these properties. This enables you to change the parameter calculation method without having to repeat controller tuning. SUT.CalculateParams is set to FALSE after the calculation.
PIDSelfTune.SUT.TuneRule	INT	0	Methods used to calculate parameters during pretuning: <ul style="list-style-type: none"> <li>• SUT.TuneRule = 0: PID according to Chien, Hrones and Reswick</li> <li>• SUT.TuneRule = 1: PI according to Chien, Hrones and Reswick</li> </ul>
PIDSelfTune.SUT.State	INT	0	The SUT.State tag indicates the current phase of pretuning: <ul style="list-style-type: none"> <li>• State = 0: Initialize pretuning</li> <li>• State = 100: Calculate standard deviation</li> <li>• State = 200: Determine point of inflection</li> <li>• State = 9900: Pretuning successful</li> <li>• State = 1: Pretuning not successful</li> </ul>
PIDSelfTune.TIR.RunIn	BOOL	FALSE	With the RunIn tag, you can specify that fine tuning can also be performed without pretuning. <ul style="list-style-type: none"> <li>• RunIn = FALSE Pretuning is started when fine tuning is started from inactive or manual mode. If the requirements for pretuning are not met, PID_Compact reacts as when RunIn = TRUE. If fine tuning is started from automatic mode, the system uses the existing PID parameters to control to the setpoint. Only then will fine tuning start. If pretuning is not possible, PID_Compact switches to the mode from which tuning was started.</li> <li>• RunIn = TRUE The pretuning is skipped. PID_Compact tries to reach the setpoint with minimum or maximum output value. This can produce increased overshoot. Fine tuning then starts automatically. RunIn is set to FALSE after fine tuning.</li> </ul>
PIDSelfTune.TIR.CalculateParams	BOOL	FALSE	The properties of the controlled system are saved during tuning. If TIR.CalculateParams = TRUE, the parameters for fine tuning are recalculated according to these properties. This enables you to change the parameter calculation method without having to repeat controller tuning. TIR.CalculateParams is set to FALSE after the calculation.

Tag	Data type	Default	Description
PIDSelfTune.TIR.TuneRule	INT	0	Methods used to calculate parameters during fine tuning: <ul style="list-style-type: none"> <li>• TIR.TuneRule = 0: PID automatic</li> <li>• TIR.TuneRule = 1: PID rapid</li> <li>• TIR.TuneRule = 2: PID slow</li> <li>• TIR.TuneRule = 3: Ziegler-Nichols PID</li> <li>• TIR.TuneRule = 4: Ziegler-Nichols PI</li> <li>• TIR.TuneRule = 5: Ziegler-Nichols P</li> </ul>
PIDSelfTune.TIR.State	INT	0	The TIR.State tag indicates the current phase of fine tuning: <ul style="list-style-type: none"> <li>• State = -100 Fine tuning is not possible. Pretuning will be performed first.</li> <li>• State = 0: Initialize fine tuning</li> <li>• State = 200: Calculate standard deviation</li> <li>• State = 300: Attempt to reach the setpoint</li> <li>• State = 400: Attempt to reach the setpoint with existing PID parameters (if pretuning was successful)</li> <li>• State = 500: Determine oscillation and calculate parameters</li> <li>• State = 9900: Fine tuning successful</li> <li>• State = 1: Fine tuning not successful</li> </ul>
PIDCtrl.IntegralSum	REAL	0.0	Current integral action
Retain.CtrlParams.Gain	REAL	1.0	Active proportional gain To invert the control logic, use the Config.InvertControl tag. Negative values at Gain also invert the control logic. We recommend you use only InvertControl to set the control logic. The control logic is also inverted if InvertControl = TRUE and Gain < 0.0. Gain is retentive.
Retain.CtrlParams.Ti	REAL	20.0	<ul style="list-style-type: none"> <li>• CtrlParams.Ti &gt; 0.0: Active integral action time</li> <li>• CtrlParams.Ti = 0.0: Integral action is deactivated</li> </ul> Ti is retentive.

## Parameters State and Mode V2

### Correlation of the parameters

The State parameter shows the current operating mode of the PID controller. You cannot change the State parameter.

With a rising edge at ModeActivate, PID\_Compact switches to the operating mode saved in the Mode in-out parameter.

When the CPU is switched on or switches from Stop to RUN mode, PID\_Compact starts in the operating mode that is saved in the Mode parameter. To leave PID\_Compact in "Inactive" mode, set RunModeByStartup = FALSE.

## Meaning of values

State / Mode	Description of operating mode
0	<p>Inactive</p> <p>In "Inactive" operating mode, the output value 0.0 is always output, regardless of Config.OutputUpperLimit and Config.OutputLowerLimit. Pulse width modulation is off.</p>
1	<p>Pretuning</p> <p>The pretuning determines the process response to a jump change of the output value and searches for the point of inflection. The PID parameters are calculated from the maximum rate of rise and dead time of the controlled system. You obtain the best PID parameters when you perform pretuning and fine tuning.</p> <p>Pretuning requirements:</p> <ul style="list-style-type: none"> <li>• Inactive (State = 0), manual mode (State = 4), or automatic mode (State = 3)</li> <li>• ManualEnable = FALSE</li> <li>• Reset = FALSE</li> <li>• The process value must not be too close to the setpoint.  <math> \text{Setpoint} - \text{Input}  &gt; 0.3 *  \text{Config.InputUpperLimit} - \text{Config.InputLowerLimit} </math> and  <math> \text{Setpoint} - \text{Input}  &gt; 0.5 *  \text{Setpoint} </math></li> <li>• The setpoint and the process value lie within the configured limits.</li> </ul> <p>The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise.</p> <p>The setpoint is frozen in the CurrentSetpoint tag. Tuning is canceled when:</p> <ul style="list-style-type: none"> <li>• <math>\text{Setpoint} &gt; \text{CurrentSetpoint} + \text{CancelTuningLevel}</math> or</li> <li>• <math>\text{Setpoint} &lt; \text{CurrentSetpoint} - \text{CancelTuningLevel}</math></li> </ul> <p>Before the PID parameters are recalculated, they are backed up and can be reactivated with LoadBackUp.</p> <p>The controller switches to automatic mode following successful pretuning. If pretuning is unsuccessful, the switchover of the operating mode is dependent on ActivateRecoverMode.</p> <p>The phase of pretuning is indicated with PIDSelfTune.SUT.State.</p>

State / Mode	Description of operating mode
2	<p>Fine tuning</p> <p>Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are recalculated based on the amplitude and frequency of this oscillation. PID parameters from fine tuning usually have better master control and disturbance characteristics than PID parameters from pretuning. You obtain the best PID parameters when you perform pretuning and fine tuning.</p> <p>PID_Compact automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value.</p> <p>The setpoint is frozen in the CurrentSetpoint tag. Tuning is canceled when:</p> <ul style="list-style-type: none"> <li>• Setpoint &gt; CurrentSetpoint + CancelTuningLevel</li> <li>or</li> <li>• Setpoint &lt; CurrentSetpoint - CancelTuningLevel</li> </ul> <p>Before the PID parameters are recalculated, they are backed up and can be reactivated with LoadBackUp.</p> <p>Requirements for fine tuning:</p> <ul style="list-style-type: none"> <li>• No disturbances are expected.</li> <li>• The setpoint and the process value lie within the configured limits.</li> <li>• ManualEnable = FALSE</li> <li>• Reset = FALSE</li> <li>• Automatic (State = 3), inactive (State = 0) or manual (State = 4) mode</li> </ul> <p>Fine tuning proceeds as follows when started from:</p> <ul style="list-style-type: none"> <li>• Automatic mode (State = 3) Start fine tuning from automatic mode if you wish to improve the existing PID parameters through tuning. PID_Compact controls the system using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.</li> <li>• Inactive (State = 0) or manual mode (State = 4) If the requirements for pretuning are met, pretuning is started. The determined PID parameters will be used for control until the control loop has stabilized and the requirements for fine tuning have been met. If the process value for pretuning is already too near the setpoint or PIDSelfTune.TIR.RunIn = TRUE, an attempt is made to reach the setpoint with the minimum or maximum output value. This can produce increased overshoot. Only then will fine tuning start.</li> </ul> <p>The controller switches to automatic mode following successful fine tuning. If fine tuning is unsuccessful, the switchover of the operating mode is dependent on ActivateRecoverMode.</p> <p>The "Fine tuning" phase is indicated with PIDSelfTune.TIR.State.</p>
3	<p>Automatic mode</p> <p>In automatic mode, PID_Compact corrects the controlled system in accordance with the parameters specified. The controller switches to automatic mode if one the following requirements is fulfilled:</p> <ul style="list-style-type: none"> <li>• Pretuning successfully completed</li> <li>• Fine tuning successfully completed</li> <li>• Changing of the Mode in-out parameter to the value 3 and a rising edge at ModeActivate.</li> </ul> <p>The switchover from automatic mode to manual mode is only bumpless if carried out in the commissioning editor.</p> <p>The ActivateRecoverMode tag is taken into consideration in automatic mode.</p>

State / Mode	Description of operating mode
4	<p>Manual mode</p> <p>In manual mode, you specify a manual output value in the ManualValue parameter.</p> <p>You can also activate this operating mode using ManualEnable = TRUE. We recommend that you change the operating mode using Mode and ModeActivate only.</p> <p>The switchover from manual mode to automatic mode is bumpless. Manual mode is also possible when an error is pending.</p>
5	<p>Substitute output value with error monitoring</p> <p>The control algorithm is deactivated. The SetSubstituteOutput tag determines which output value is output in this operating mode.</p> <ul style="list-style-type: none"> <li>• SetSubstituteOutput = FALSE: Last valid output value</li> <li>• SetSubstituteOutput = TRUE: Substitute output value</li> </ul> <p>You cannot activate this operating mode using Mode = 5.</p> <p>In the event of an error, it is activated instead of "Inactive" operating mode if all the following conditions are met:</p> <ul style="list-style-type: none"> <li>• Automatic mode (Mode = 3)</li> <li>• ActivateRecoverMode = TRUE</li> <li>• One or more errors have occurred in which ActivateRecoverMode is effective.</li> </ul> <p>As soon as the errors are no longer pending, PID_Compact switches back to automatic mode.</p>

### ENO characteristics

If State = 0, then ENO = FALSE.

If State ≠ 0, then ENO = TRUE.

### Automatic switchover of operating mode during commissioning

Automatic mode is activated following successful pretuning or fine tuning. The following table shows how Mode and State change during successful pretuning.

Cycle no.	Mode	State	Action
0	4	4	Set Mode = 1
1	1	4	Set ModeActivate = TRUE
1	4	1	Value of State is saved in Mode parameter Pretuning is started
n	4	1	Pretuning successfully completed
n	3	3	Automatic mode is started

PID\_Compact automatically switches the operating mode in the event of an error. The following table shows how Mode and State change during pretuning with errors.

Cycle no.	Mode	State	Action
0	4	4	Set Mode = 1
1	1	4	Set ModeActivate = TRUE

Cycle no.	Mode	State	Action
1	4	1	Value of State is saved in Mode parameter Pretuning is started
n	4	1	Pretuning canceled
n	4	4	Manual mode is started

If ActivateRecoverMode = TRUE, the operating mode that is saved in the Mode parameter is activated. At the start of pretuning or fine tuning, PID\_Compact has saved the value of State in the Mode in/out parameter. PID\_Compact therefore switches to the operating mode from which tuning was started.

If ActivateRecoverMode = FALSE, the system switches to "Inactive" operating mode.

**See also**

Output parameters of PID\_Compact V2 (Page 2952)

**Parameter ErrorBits V2**

If several errors are pending simultaneously, the values of the ErrorBits are displayed with binary addition. The display of ErrorBits = 0003h, for example, indicates that the errors 0001h and 0002h are pending simultaneously.

In manual mode, PID\_Compact uses ManualValue as output value. The exception is Errorbits = 10000h.

ErrorBits (DW#16#...)	Description
0000	There is no error.
0001	The "Input" parameter is outside the process value limits. <ul style="list-style-type: none"> <li>• Input &gt; Config.InputUpperLimit or</li> <li>• Input &lt; Config.InputLowerLimit</li> </ul> If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact remains in automatic mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact switches to the operating mode that is saved in the Mode parameter.
0002	Invalid value at "Input_PER" parameter. Check whether an error is pending at the analog input. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact outputs the configured substitute output value. As soon as the error is no longer pending, PID_Compact switches back to automatic mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact switches to the operating mode that is saved in the Mode parameter.
0004	Error during fine tuning. Oscillation of the process value could not be maintained. If ActivateRecoverMode = TRUE before the error occurred, PID_Compact cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0008	Error at start of pretuning. The process value is too close to the setpoint. Start fine tuning. If ActivateRecoverMode = TRUE before the error occurred, PID_Compact cancels the tuning and switches to the operating mode that is saved in the Mode parameter.

ErrorBits (DW#16#...)	Description
0010	<p>The setpoint was changed during tuning.</p> <p>You can set the permitted fluctuation of the setpoint at the CancelTuningLevel tag.</p> <p>If ActivateRecoverMode = TRUE before the error occurred, PID_Compact cancels the tuning and switches to the operating mode that is saved in the Mode parameter.</p>
0020	<p>Pretuning is not permitted during fine tuning.</p> <p>If ActivateRecoverMode = TRUE before the error occurred, PID_Compact remains in fine tuning mode.</p>
0080	<p>Error during pretuning. Incorrect configuration of output value limits.</p> <p>Check whether the limits of the output value are configured correctly and match the control logic.</p> <p>If ActivateRecoverMode = TRUE before the error occurred, PID_Compact cancels the tuning and switches to the operating mode that is saved in the Mode parameter.</p>
0100	<p>Error during fine tuning resulted in invalid parameters.</p> <p>If ActivateRecoverMode = TRUE before the error occurred, PID_Compact cancels the tuning and switches to the operating mode that is saved in the Mode parameter.</p>
0200	<p>Invalid value at "Input" parameter: Value has an invalid number format.</p> <p>If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact outputs the configured substitute output value. As soon as the error is no longer pending, PID_Compact switches back to automatic mode.</p> <p>If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact switches to the operating mode that is saved in the Mode parameter.</p>
0400	<p>Calculation of output value failed. Check the PID parameters.</p> <p>If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact outputs the configured substitute output value. As soon as the error is no longer pending, PID_Compact switches back to automatic mode.</p> <p>If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact switches to the operating mode that is saved in the Mode parameter.</p>
0800	<p>Sampling time error: PID_Compact is not called within the sampling time of the cyclic interrupt OB.</p> <p>If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact remains in automatic mode.</p> <p>If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact switches to the operating mode that is saved in the Mode parameter.</p>
1000	<p>Invalid value at "Setpoint" parameter: Value has an invalid number format.</p> <p>If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact outputs the configured substitute output value. As soon as the error is no longer pending, PID_Compact switches back to automatic mode.</p> <p>If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact switches to the operating mode that is saved in the Mode parameter.</p>
10000	<p>Invalid value at ManualValue parameter. Value has an invalid number format.</p> <p>If ActivateRecoverMode = TRUE before an error occurred, PID_Compact uses SubstituteOutput as the output value. As soon as you specify a valid value in ManualValue, PID_Compact uses it as the output value.</p>

ErrorBits (DW#16#...)	Description
20000	Invalid value at SubstituteOutput tag. Value has an invalid number format. PID_Compact uses the output value low limit as the output value. If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_Compact switches back to automatic mode.
40000	Invalid value at Disturbance parameter. Value has an invalid number format. If automatic mode was active and ActivateRecoverMode = TRUE before the error occurred, Disturbance is set to zero. PID_Compact remains in automatic mode. If pretuning or fine tuning mode was active and ActivateRecoverMode = TRUE before the error occurred, PID_Compact switches to the operating mode saved in the Mode parameter. If Disturbance in the current phase has no effect on the output value, tuning is not be canceled.

### Tag ActivateRecoverMode V2

The ActivateRecoverMode tag determines the reaction to error. The Error parameter indicates if an error is pending. When the error is no longer pending, Error = FALSE. The ErrorBits parameter shows which errors have occurred.

### Automatic mode

<p><b>NOTICE</b></p>
<p><b>Your system may be damaged.</b></p> <p>If ActivateRecoverMode = TRUE, PID_Compact remains in automatic mode even if there is an error and the process limit values are exceeded. This may damage your system.</p> <p>It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.</p>

ActivateRecover Mode	Description
FALSE	PID_Compact automatically switches to "Inactive" mode in the event of an error. The controller is only activated by a falling edge at Reset or a rising edge at ModeActivate.
TRUE	<p>If errors occur frequently in automatic mode, this setting has a negative effect on the control response, because PID_Compact switches between the calculated output value and the substitute output value at each error. In this case, check the ErrorBits parameter and eliminate the cause of the error.</p> <p>If one or more of the following errors occur, PID_Compact stays in automatic mode:</p> <ul style="list-style-type: none"> <li>• 0001h: The "Input" parameter is outside the process value limits.</li> <li>• 0800h: Sampling time error</li> <li>• 40000h: Invalid value at parameter Disturbance.</li> </ul> <p>If one or more of the following errors occur, PID_Compact switches to "Substitute output value with error monitoring" mode:</p> <ul style="list-style-type: none"> <li>• 0002h: Invalid value at Input_PER parameter.</li> <li>• 0200h: Invalid value at Input parameter.</li> <li>• 0400h: Calculation of output value failed.</li> <li>• 1000h: Invalid value at Setpoint parameter.</li> </ul> <p>If the following error occurs, PID_Compact switches to "Substitute output value with error monitoring" mode and moves the actuator to Config.OutputLowerLimit:</p> <ul style="list-style-type: none"> <li>• 20000h: Invalid value at SubstituteOutput tag. Value has an invalid number format.</li> </ul> <p>This characteristics are independent of SetSubstituteOutput.</p> <p>As soon as the errors are no longer pending, PID_Compact switches back to automatic mode.</p>

### Pretuning and fine tuning

ActivateRecover Mode	Description
FALSE	PID_Compact automatically switches to "Inactive" mode in the event of an error. The controller is only activated by a falling edge at Reset or a rising edge at ModeActivate.
TRUE	<p>If the following error occurs, PID_Compact remains in the active mode:</p> <ul style="list-style-type: none"> <li>• 0020h: Pretuning is not permitted during fine tuning.</li> </ul> <p>The following errors are ignored:</p> <ul style="list-style-type: none"> <li>• 10000h: Invalid value at ManualValue parameter.</li> <li>• 20000h: Invalid value at SubstituteOutput tag.</li> </ul> <p>When any other error occurs, PID_Compact cancels the tuning and switches to the mode from which tuning was started.</p>

### Manual mode

ActivateRecoverMode is not effective in manual mode.

### Tag Warning V2

If several warnings are pending simultaneously, the values of the Warning tag are displayed with binary addition. The display of warning 0003h, for example, indicates that the warnings 0001h and 0002h are pending simultaneously.

Warning (DW#16#...)	Description
0000	No warning pending.
0001	The point of inflection was not found during pretuning.
0004	The setpoint was limited to the configured limits.
0008	Not all the necessary controlled system properties were defined for the selected method of calculation. Instead, the PID parameters were calculated using the TIR.TuneRule = 3 method.
0010	The operating mode could not be changed because Reset = TRUE or ManualEnable = TRUE.
0020	The cycle time of the calling OB limits the sampling time of the PID algorithm. Improve results by using shorter OB cycle times.
0040	The process value exceeded one of its warning limits.
0080	Invalid value at Mode. The operating mode is not switched.
0100	The manual value was limited to the limits of the controller output.
0200	The specified rule for tuning is not supported. No PID parameters are calculated.
1000	The substitute output value cannot be reached because it is outside the output value limits.

The following warnings are deleted as soon as the cause is eliminated:

- 0001h
- 0004h
- 0008h
- 0040h
- 0100h

All other warnings are cleared with a rising edge at Reset or ErrorAck.

### PID\_Compact V1

#### Description of PID\_Compact V1

##### Description

The PID\_Compact instruction provides a PID controller with integrated tuning for automatic and manual mode.

##### Call

PID\_Compact is called in the constant interval of the cycle time of the calling OB (preferably in a cyclic interrupt OB).

## Download to device

The actual values of retentive tags are only updated when you download PID\_Compact completely.

Downloading technology objects to device (Page 6325)

## Startup

At the startup of the CPU, PID\_Compact starts in the operating mode that was last active. To retain PID\_Compact in "Inactive" mode, set `sb_RunModeByStartup = FALSE`.

## Monitoring of the sampling time PID\_Compact

Ideally, the sampling time is equivalent to the cycle time of the calling OB. The PID\_Compact instruction measures the time interval between two calls. This is the current sampling time. On every switchover of operating mode and during the initial startup, the mean value is formed from the first 10 sampling times. If the current sampling time deviates too much from this mean value, Error = 0800 hex occurs and PID\_Compact switches to "Inactive" mode.

PID\_Compact, Version 1.1 or higher is set to "Inactive" mode during controller tuning under the following conditions:

- New mean value  $\geq 1.1 \times$  old mean value
- New mean value  $\leq 0.9 \times$  old mean value

In automatic mode, PID\_Compact, Version 1.1 or higher, is set to "Inactive" mode under the following conditions:

- New mean value  $\geq 1.5 \times$  old mean value
- New mean value  $\leq 0.5 \times$  old mean value

During controller tuning and in automatic mode, PID\_Compact 1.0 is set to "Inactive" operating mode under the following conditions:

- New mean value  $\geq 1.1 \times$  old mean value
- New mean value  $\leq 0.9 \times$  old mean value
- Current sampling time  $\geq 1.5 \times$  current mean value
- Current sampling time  $\leq 0.5 \times$  current mean value

## Sampling time of the PID algorithm

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the cycle time. All other functions of PID\_Compact are executed at every call.

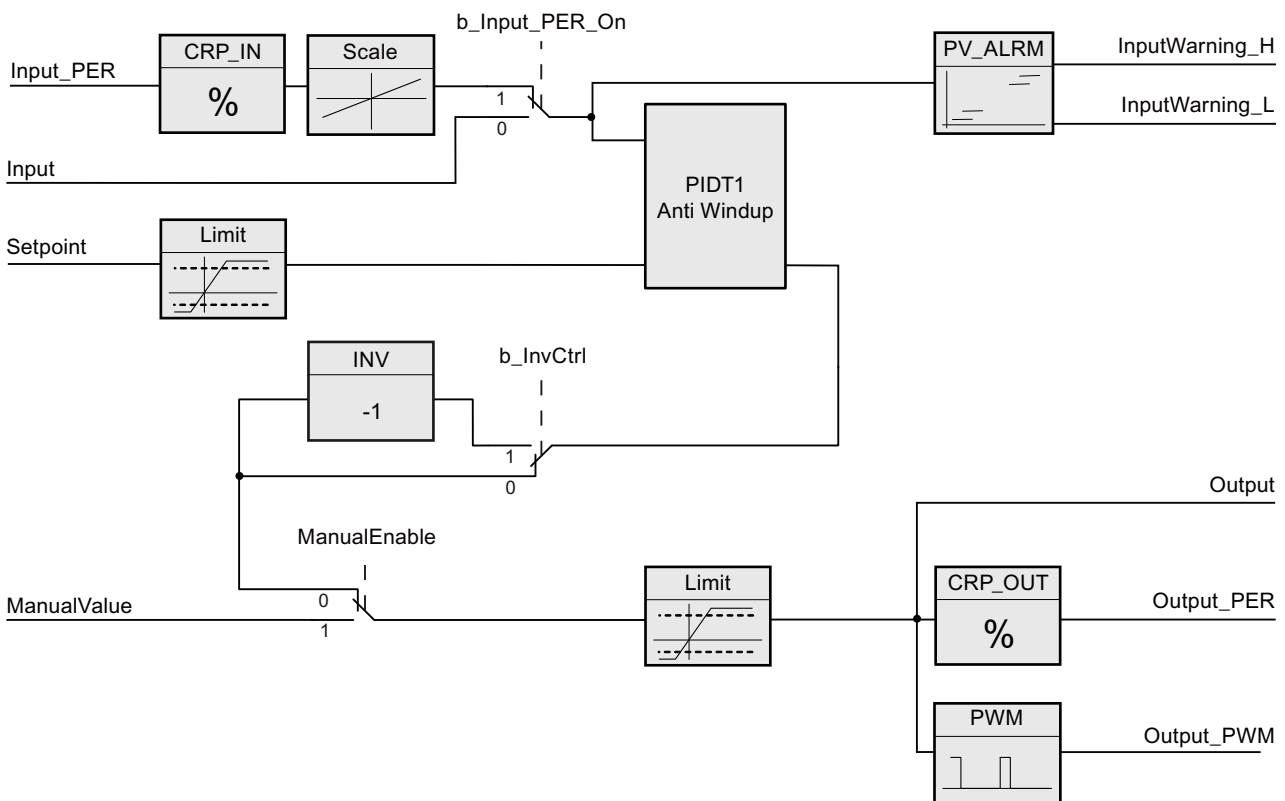

**PID algorithm**

PID\_Compact is a PIDT1 controller with anti-windup and weighting of the proportional and derivative actions. The following equation is used to calculate the output value.

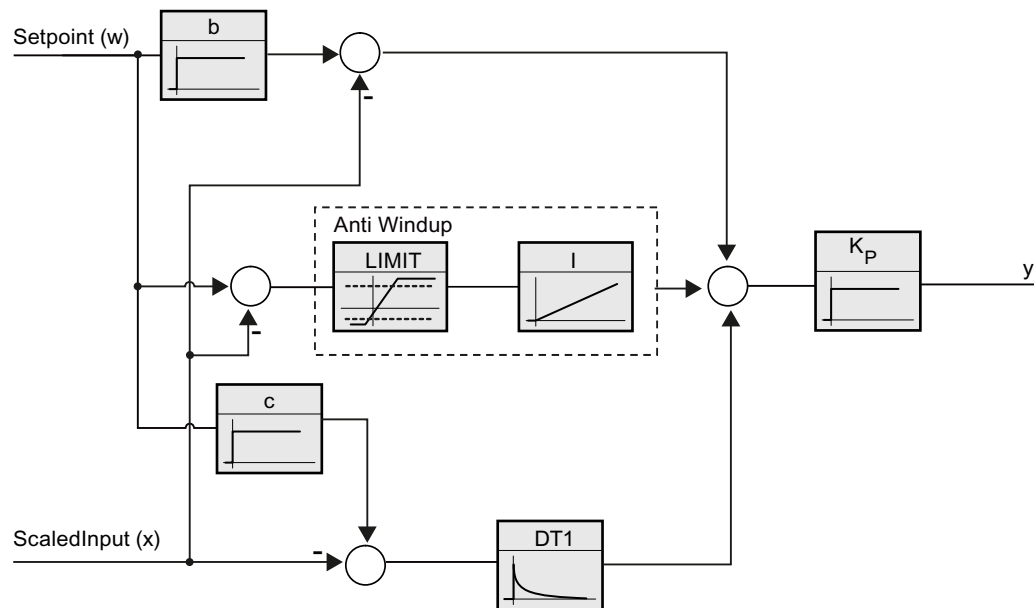

$$y = K_p \left[ (b \cdot w - x) + \frac{1}{T_i \cdot s} (w - x) + \frac{T_d \cdot s}{a \cdot T_d \cdot s + 1} (c \cdot w - x) \right]$$

Symbol	Description
y	Output value
K <sub>p</sub>	Proportional gain
s	Laplace operator
b	Proportional action weighting
w	Setpoint
x	Process value
T <sub>i</sub>	Integral action time
a	Derivative delay coefficient (T1 = a × T <sub>D</sub> )
	Derivative action time
c	Derivative action weighting

**Block diagram of PID\_Compact**

### Block diagram of PIDT1 with anti-windup

### Reaction to error

If errors occur, they are output in parameter Error, and PID\_Compact changes to "Inactive" mode. Reset the errors using the Reset parameter.

### Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic. For cooling and discharge control systems, it may be necessary to invert the control logic. PID\_Compact does not work with negative proportional gain. If InvertControl = TRUE, an increasing control deviation causes a reduction in the output value. The control logic is also taken into account during pretuning and fine tuning.

### Input parameters of PID\_Compact V1

Table 9-83

Parameter	Data type	Default	Description
Setpoint	REAL	0.0	Setpoint of the PID controller in automatic mode
Input	REAL	0.0	A variable of the user program is used as source for the process value. If you are using parameter Input, then sPid_Cmpt.b_Input_PER_On = FALSE must be set.

Parameter	Data type	Default	Description
Input_PER	WORD	W#16#0	Analog input as the source of the process value If you are using parameter Input_PER, then sPid_Cmpt.b_Input_PER_On = TRUE must be set.
ManualEnable	BOOL	FALSE	<ul style="list-style-type: none"> <li>• A FALSE -&gt; TRUE edge selects "Manual mode", while State = 4, sRet.i_Mode remains unchanged.</li> <li>• A TRUE -&gt; FALSE edge selects the most recently active operating mode, State =sRet.i_Mode</li> </ul> <p>A change of sRet.i_Mode will not take effect during ManualEnable = TRUE. The change of sRet.i_Mode will only be considered upon a TRUE -&gt; FALSE edge at ManualEnable .</p> <p><b>PID_Compact V1.2 und PID_Compact V1.0</b> If at start of the CPU ManualEnable = TRUE, PID_Compact starts in manual mode. A rising edge (FALSE &gt; TRUE) at ManualEnable is not necessary.</p> <p><b>PID_Compact V1.1</b> At the start of the CPU, PID_Compact only switches to manual mode with a rising edge (FALSE-&gt;TRUE) at ManualEnable . Without rising edge, PID_Compact starts in the last operating mode in which ManualEnable was FALSE.</p>
ManualValue	REAL	0.0	Manual value This value is used as the output value in manual mode.
Reset	BOOL	FALSE	The Reset parameter (Page 2983) restarts the controller.

### Output parameters of PID\_Compact V1

Table 9-84

Parameter	Data type	Default	Description
ScaledInput	REAL	0.0	Output of the scaled process value
Outputs "Output", "Output_PER", and "Output_PWM" can be used concurrently.			
Output	REAL	0.0	Output value in REAL format
Output_PER	WORD	W#16#0	Analog output value
Output_PWM	BOOL	FALSE	Pulse-width-modulated output value The output value is formed by minimum On and Off times.
SetpointLimit_H	BOOL	FALSE	If SetpointLimit_H = TRUE, the setpoint absolute high limit is reached. The setpoint in the CPU is limited to the configured setpoint absolute high limit. The configured process value absolute high limit is the default for the setpoint high limit. If you set sPid_Cmpt.r_Sp_Hlm to a value within the process value limits, this value is used as the setpoint high limit.
SetpointLimit_L	BOOL	FALSE	If SetpointLimit_L = TRUE, the setpoint absolute low limit has been reached. In the CPU, the setpoint is limited to the configured setpoint absolute low limit. The configured process value absolute low limit is the default setting for the setpoint low limit. If you set sPid_Cmpt.r_Sp_Llm to a value within the process value limits, this value is used as the setpoint low limit.

Parameter	Data type	Default	Description
InputWarning_H	BOOL	FALSE	If InputWarning_H = TRUE, the process value has reached or exceeded the warning high limit.
InputWarning_L	BOOL	FALSE	If InputWarning_L = TRUE, the process value has reached or fallen below the warning low limit.
State	INT	0	The State parameter (Page 2980) shows the current operating mode of the PID controller. To change the operating mode, use variable sRet.i_Mode. <ul style="list-style-type: none"> <li>• State = 0: Inactive</li> <li>• State = 1: pretuning</li> <li>• State = 2: fine tuning</li> <li>• State = 3: Automatic mode</li> <li>• State = 4: Manual mode</li> </ul>
Error	DWORD	W#16#0	The Error parameter (Page 2983) indicates the error messages. Error = 0000: No error pending.

### Static tags of PID\_Compact V1

You must not change tags that are not listed. These are used for internal purposes only.

Table 9-85

Tag	Data type	Default	Description
sb_GetCycleTime	BOOL	TRUE	If sb_GetCycleTime = TRUE, the automatic determination of the cycle time is started. CycleTime.StartEstimation = FALSE once measurement is complete.
sb_EnCyclEstimation	BOOL	TRUE	If sb_EnCyclEstimation = TRUE, the sampling time PID_Compact is calculated.
sb_EnCyclMonitoring	BOOL	TRUE	If sb_EnCyclMonitoring = FALSE, the sampling time PID_Compact is not monitored. If it is not possible to execute PID_Compact within the sampling time, an 0800 error is not output and PID_Compact does not change to "Inactive" mode.
sb_RunModeByStartup	BOOL	TRUE	Activate Mode after CPU restart If sb_RunModeByStartup = FALSE, the controller will remain inactive after a CPU startup. After a CPU startup and if sb_RunModeByStartup = TRUE, the controller will return to the most recently active operating mode.
si_Unit	INT	0	Unit of measurement of the process value and setpoint, e.g., °C, or °F.
si_Type	INT	0	Physical quantity of the process value and setpoint, e.g., temperature.
sd_Warning	DWORD	DW#16#0	Variable sd_warning (Page 2985) displays the warnings generated since the reset, or since the last change of the operating mode.

9.7 References

Tag	Data type	Default	Description
sBackUp.r_Gain	REAL	1.0	Saved proportional gain You can reload values from the sBackUp structure with sPid_Cmpt.b_LoadBackUp = TRUE.
sBackUp.r_Ti	REAL	20.0	Saved integral action time [s]
sBackUp.r_Td	REAL	0.0	Saved derivative action time [s]

sPid_Calc.r_Cycle	REAL	0.1	Sampling time of the PID_Compact instruction r_Cycle is determined automatically and usually equivalent to the cycle time of the calling OB.
sPid_Calc.b_RunIn	BOOL	FALSE	<ul style="list-style-type: none"> <li>• b_RunIn = FALSE Pretuning is started when fine tuning is started from inactive or manual mode. If the requirements for pretuning are not met, PID_Compact reacts like b_RunIn = TRUE. If fine tuning is started from automatic mode, the system uses the existing PID parameters to control to the setpoint. Only then will fine tuning start. If pretuning is not possible, PID_Compact will change to "Inactive" mode.</li> <li>• b_RunIn = TRUE The pretuning is skipped. PID_3Compact tries to reach the setpoint with minimum or maximum output value. This can produce increased overshoot. Fine tuning then starts automatically. b_RunIn is set to FALSE after fine tuning.</li> </ul>
sPid_Calc.b_CalcParamSUT	BOOL	FALSE	The parameters for pretuning will be recalculated if b_CalcParamSUT = TRUE. This enables you to change the parameter calculation method without having to repeat controller tuning. b_CalcParamSUT will be set to FALSE after calculation.
sPid_Calc.b_CalcParamTIR	BOOL	FALSE	The parameters for fine tuning will be recalculated if b_CalcParamTIR = TRUE. This enables you to change the parameter calculation method without having to repeat controller tuning. b_CalcParamTIR will be set to FALSE after calculation.
sPid_Calc.i_CtrlTypeSUT	INT	0	Methods used to calculate parameters during pretuning: <ul style="list-style-type: none"> <li>• i_CtrlTypeSUT = 0: PID according to Chien, Hrones and Reswick</li> <li>• i_CtrlTypeSUT = 1: PI according to Chien, Hrones and Reswick</li> </ul>

Tag	Data type	Default	Description
sPid_Calc.i_CtrlTypeTIR	INT	0	Methods used to calculate parameters during fine tuning: <ul style="list-style-type: none"> <li>• i_CtrlTypeTIR = 0: PID automatic</li> <li>• i_CtrlTypeTIR = 1: PID rapid</li> <li>• i_CtrlTypeTIR = 2: PID slow</li> <li>• i_CtrlTypeTIR = 3: Ziegler-Nichols PID</li> <li>• i_CtrlTypeTIR = 4: Ziegler-Nichols PI</li> <li>• i_CtrlTypeTIR = 5: Ziegler-Nichols P</li> </ul>
sPid_Calc.r_Progress	REAL	0.0	Progress of tuning as a percentage (0.0 - 100.0)
sPid_Cmpt.r_Sp_Hlm	REAL	+3.402822e+38	High limit of setpoint If you set sPid_Cmpt.r_Sp_Hlm outside the process value limits, the configured process value absolute high limit is used as the setpoint high limit. If you set sPid_Cmpt.r_Sp_Hlm within the process value limits, this value is used as the setpoint high limit.
sPid_Cmpt.r_Sp_Llm	REAL	-3.402822e+38	Low limit of the setpoint If you set sPid_Cmpt.r_Sp_Llm outside the process value limits, the configured process value absolute low limit is used as the setpoint low limit. If you set sPid_Cmpt.r_Sp_Llm within the process value limits, this value is used as the setpoint low limit.
sPid_Cmpt.r_Pv_Norm_IN_1	REAL	0.0	Scaling Input_PER low Input_PER is converted to percent based on the two value pairs r_Pv_Norm_OUT_1, r_Pv_Norm_IN_1 and r_Pv_Norm_OUT_2, r_Pv_Norm_IN_2 from the sPid_Cmpt structure.
sPid_Cmpt.r_Pv_Norm_IN_2	REAL	27648.0	Scaling Input_PER high Input_PER is converted to percent based on the two value pairs r_Pv_Norm_OUT_1, r_Pv_Norm_IN_1 and r_Pv_Norm_OUT_2, r_Pv_Norm_IN_2 from the sPid_Cmpt structure.
sPid_Cmpt.r_Pv_Norm_OUT_1	REAL	0.0	Scaled low process value Input_PER is converted to percent based on the two value pairs r_Pv_Norm_OUT_1, r_Pv_Norm_IN_1 and r_Pv_Norm_OUT_2, r_Pv_Norm_IN_2 from the sPid_Cmpt structure.
sPid_Cmpt.r_Pv_Norm_OUT_2	REAL	100.0	Scaled high process value Input_PER is converted to percent based on the two value pairs r_Pv_Norm_OUT_1, r_Pv_Norm_IN_1 and r_Pv_Norm_OUT_2, r_Pv_Norm_IN_2 from the sPid_Cmpt structure.
sPid_Cmpt.r_Lmn_Hlm	REAL	100.0	Output value high limit for output parameter "Output"
sPid_Cmpt.r_Lmn_Llm	REAL	0.0	Low output value limit for output parameter "Output"
sPid_Cmpt.b_Input_PER_On	BOOL	TRUE	If b_Input_PER_On = TRUE, then parameter Input_PER is used. If b_Input_PER_On = FALSE, then parameter Input is used.

9.7 References

Tag	Data type	Default	Description
sPid_Cmpt.b_LoadBackUp	BOOL	FALSE	Activate the back-up parameter set. If an optimization has failed, you can reactivate the previous PID parameters by setting this bit.
sPid_Cmpt.b_InvCtrl	BOOL	FALSE	Invert control logic With b_InvCtrl = TRUE, a rising control deviation reduces the output value.
sPid_Cmpt.r_Lmn_Pwm_PPTm	REAL	0.0	The minimum ON time of the pulse width modulation in seconds is rounded to $r\_Lmn\_Pwm\_PPTm = r\_Cycle$ or $r\_Lmn\_Pwm\_PPTm = n * r\_Cycle$
sPid_Cmpt.r_Lmn_Pwm_PBTm	REAL	0.0	The minimum OFF time of the pulse width modulation in seconds is rounded to $r\_Lmn\_Pwm\_PBTm = r\_Cycle$ or $r\_Lmn\_Pwm\_PBTm = n * r\_Cycle$
sPid_Cmpt.r_Pv_Hlm	REAL	120.0	High limit of the process value At the I/O input, the process value can be a maximum of 18% higher than the standard range (overrange). An error is no longer reported for a violation of the "Process value high limit". Only a wire-break and a short-circuit are recognized and the PID_Compact switches to "Inactive" mode. $r\_Pv\_Hlm > r\_Pv\_Llm$
sPid_Cmpt.r_Pv_Llm	REAL	0.0	Low limit of the process value $r\_Pv\_Llm < r\_Pv\_Hlm$
sPid_Cmpt.r_Pv_HWrn	REAL	+3.402822e+38	Warning high limit of the process value If you set r_Pv_HWrn outside the process value limits, the configured process value absolute high limit is used as the warning high limit. If you set r_Pv_HWrn within the process value limits, this value is used as the warning high limit. $r\_Pv\_HWrn > r\_Pv\_LWrn$ $r\_Pv\_HWrn \leq r\_Pv\_Hlm$
sPid_Cmpt.r_Pv_LWrn	REAL	-3.402822e+38	Warning low limit of the process value If you set r_Pv_LWrn outside the process value limits, the configured process value absolute low limit is used as the warning low limit. If you set r_Pv_LWrn within the process value limits, this value is used as the warning low limit. $r\_Pv\_LWrn < r\_Pv\_HWrn$ $r\_Pv\_LWrn \geq r\_Pv\_Lwrn$
sParamCalc.i_Event_SUT	INT	0	Variable i_Event_SUT (Page 2986) indicates the current phase of "pretuning":
sParamCalc.i_Event_TIR	INT	0	Variable i_Event_TIR (Page 2986) indicates the current phase of "fine tuning":

Tag	Data type	Default	Description
sRet.i_Mode	INT	0	The operating mode is changed edge-triggered. The following operating mode is enabled on a change to <ul style="list-style-type: none"> <li>• i_Mode = 0: "Inactive" (controller stop)</li> <li>• i_Mode = 1: "Pretuning" mode</li> <li>• i_Mode = 2: "Fine tuning" mode</li> <li>• i_Mode = 3: "Automatic mode"</li> <li>• i_Mode = 4: "Manual mode"</li> </ul> i_Mode is retentive.
sRet.r_Ctrl_Gain	REAL	1.0	Active proportional gain Gain is retentive.
sRet.r_Ctrl_Ti	REAL	20.0	<ul style="list-style-type: none"> <li>• r_Ctrl_Ti &gt; 0.0: active integral action time</li> <li>• r_Ctrl_Ti = 0.0: Integral action is disabled</li> </ul> r_Ctrl_Ti is retentive.

sRet.r_Ctrl_A	REAL	0.0	Active derivative delay coefficient r_Ctrl_A is retentive.
sRet.r_Ctrl_B	REAL	0.0	Active proportional action weighting r_Ctrl_B is retentive.
sRet.r_Ctrl_C	REAL	0.0	Active derivative action weighting r_Ctrl_C is retentive.
sRet.r_Ctrl_Cycle	REAL	1.0	Active sampling time of the PID algorithm r_Ctrl_Cycle is calculated during controller tuning and rounded to an integer multiple of r_Cycle. r_Ctrl_Cycle is retentive.

**Note**

Change the tags listed in this table in "Inactive" mode to prevent malfunction of the PID controller. The "Inactive" mode is forced by setting variable "sRet.i\_Mode" to "0".

**See also**

Downloading technology objects to device (Page 6325)

## Parameters State and sRet.i\_Mode V1

### Correlation of the parameters

The State parameter indicates the current operating mode of the PID controller. You cannot modify the State parameter.

You need to modify the sRet.i\_Mode tag to change the operating mode. This also applies when the value for the new operating mode is already in sRet.i\_Mode. First set sRet.i\_Mode = 0 and then sRet.i\_Mode = 3. Provided the current operating mode of the controller supports this change, State is set to the value of sRet.i\_Mode.

When PID\_Compact automatically switches the operating mode, the following applies: State ! = sRet.i\_Mode.

Examples:

- Successful pretuning  
State = 3 and sRet.i\_Mode = 1
- Error  
State = 0 and sRet.i\_Mode remains at the same value, e.g sRet.i\_Mode = 3
- ManualEnalbe = TRUE  
State = 4 and sRet.i\_Mode remain at the previous value, for example, sRet.i\_Mode = 3

---

#### Note

You wish to repeat successful fine tuning without exiting automatic mode with i\_Mode = 0.

Setting sRet.i\_Mode to an invalid value such as 9999 for one cycle has no effect on State. Set Mode = 2 in the next cycle. You can generate a change to sRet.i\_Mode without first switching to "inactive" mode.

---

## Meaning of values

State / sRet.i_Mode	Description of the operating mode
0	<p>Inactive</p> <p>The controller is switched off.</p> <p>The controller was in "inactive" mode before pretuning was performed.</p> <p>The PID controller will change to "inactive" mode when running if an error occurs or if the "Deactivate controller" icon is clicked in the commissioning window.</p>
1	<p>Pretuning</p> <p>The pretuning determines the process response to a jump of the output value and searches for the point of inflection. The optimized PID parameters are calculated as a function of the maximum rate of rise and dead time of the controlled system.</p> <p>Pretuning requirements:</p> <ul style="list-style-type: none"> <li>• The controller is in inactive mode or manual mode</li> <li>• ManualEnable = FALSE</li> <li>• The process value must not be too close to the setpoint.  <math> \text{Setpoint} - \text{Input}  &gt; 0.3 *  \text{sPid\_Cmpt.r\_Pv\_Hlm} - \text{sPid\_Cmpt.r\_Pv\_Llm} </math> and  <math> \text{Setpoint} - \text{Input}  &gt; 0.5 *  \text{Setpoint} </math></li> <li>• The setpoint may not be changed during pretuning.</li> </ul> <p>The higher the stability of the process value, the easier it is to calculate the PID parameters and increase precision of the result. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise.</p> <p>PID parameters are backed up before they are recalculated and can be reactivated with sPid_Cmpt.b_LoadBackUp.</p> <p>There is a change to automatic mode following successful pretuning and to "inactive" mode following unsuccessful pretuning.</p> <p>The phase of pretuning is indicated with Tag i_Event_SUT V1 (Page 2986).</p>

State / sRet.i_Mode	Description of the operating mode
2	<p>Fine tuning</p> <p>Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are optimized based on the amplitude and frequency of this oscillation. The differences between the process response during pretuning and fine tuning are analyzed. All PID parameters are recalculated on the basis of the findings. PID parameters from fine tuning usually have better master control and disturbance behavior than PID parameters from pretuning.</p> <p>PID_Compact automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value.</p> <p>PID parameters are backed up before they are recalculated and can be reactivated with sPid_Cmpt.b_LoadBackUp.</p> <p>Requirements for fine tuning:</p> <ul style="list-style-type: none"> <li>• No disturbances are expected.</li> <li>• The setpoint and the process value lie within the configured limits.</li> <li>• The setpoint may not be changed during fine tuning.</li> <li>• ManualEnable = FALSE</li> <li>• Automatic (State = 3), inactive (State = 0) or manual (State = 4) mode</li> </ul> <p>Fine tuning proceeds as follows when started in:</p> <ul style="list-style-type: none"> <li>• Automatic mode (State = 3) Start fine tuning in automatic mode if you wish to improve the existing PID parameters using controller tuning. PID_Compact will regulate using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.</li> <li>• Inactive (State = 0) or manual (State = 4) mode If the requirements for pretuning are met, pretuning is started. The PID parameters established will be used for adjustment until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start. If pretuning is not possible, PID_Compact will change to "Inactive" mode. An attempt is made to reach the setpoint with a minimum or maximum output value if the process value for pretuning is already too near the setpoint or sPid_Calc.b_RunIn = TRUE. This can produce increased overshoot.</li> </ul> <p>The controller will change to "automatic mode" after successfully completed "fine tuning" and to "inactive" mode if "fine tuning" has not been successfully completed.</p> <p>The "Fine tuning" phase is indicated with Tag i_Event_TIR V1 (Page 2986).</p>
3	<p>Automatic mode</p> <p>In automatic mode, PID_Compact corrects the controlled system in accordance with the parameters specified. The controller changes to automatic mode if one of the following conditions is fulfilled:</p> <ul style="list-style-type: none"> <li>• Pretuning successfully completed</li> <li>• Fine tuning successfully completed</li> <li>• Change of variable sRet.i_Mode to the value 3.</li> </ul> <p>After CPU startup or change from Stop to RUN mode, PID_Compact will start in the most recently active operating mode. To retain PID_Compact in "Inactive" mode, set sb_RunModeByStartup = FALSE.</p>
4	<p>Manual mode</p> <p>In manual mode, you specify a manual output value in the ManualValue parameter.</p> <p>This operating mode is enabled if sRet.i_Mode = 4, or at the rising edge on ManualEnable. If ManualEnable changes to TRUE, only State will change. sRet.i_Mode will retain its current value. PID_Compact will return to the previous operating mode upon a falling edge at ManualEnable.</p> <p>The change to automatic mode is bumpless.</p>

**Parameter Error V1**

If several errors are pending simultaneously, the values of the error codes are displayed with binary addition. The display of error code 0003, for example, indicates that the errors 0001 and 0002 are pending simultaneously.

Error (DW#16#...)	Description
0000	There is no error.
0001	The "Input" parameter is outside the process value limits. <ul style="list-style-type: none"> <li>• Input &gt; sPid_Cmpt.r_Pv_Hlm or</li> <li>• Input &lt; sPid_Cmpt.r_Pv_Llm</li> </ul> You cannot move the actuator again until you eliminate the error.
0002	Invalid value at "Input_PER" parameter. Check whether an error is pending at the analog input.
0004	Error during fine tuning. Oscillation of the process value could not be maintained.
0008	Error at start of pretuning. The process value is too close to the setpoint. Start fine tuning.
0010	The setpoint was changed during tuning.
0020	Pretuning is not permitted in automatic mode or during fine tuning.
0080	Incorrect configuration of output value limits. Check whether the limits of the output value are configured correctly and match the control logic.
0100	Error during tuning resulted in invalid parameters.
0200	Invalid value at "Input" parameter: Value has an invalid number format.
0400	Calculation of output value failed. Check the PID parameters.
0800	Sampling time error: PID_Compact is not called within the sampling time of the cyclic interrupt OB.
1000	Invalid value at "Setpoint" parameter: Value has an invalid number format.

Output parameters of PID\_Compact V1 (Page 2974)

**Parameter Reset V1**

The response to Reset = TRUE depends on the version of the PID\_Compact instruction.

### Reset response PID\_Compact V.1.1 or higher

A rising edge at Reset resets the errors and warnings and clears the integral action. A falling edge at Reset triggers a change to the most recently active operating mode.

### Reset response PID\_Compact V.1.0

A rising edge at Reset resets the errors and warnings and clears the integral action. The controller is not reactivated until the next edge at i\_Mode.

### Tag sd\_warning V1

If several warnings are pending, the values of variable sd\_warning are displayed by means of binary addition. The display of warning 0003, for example, indicates that the warnings 0001 and 0002 are also pending.

sd_warning (DW#16#...)	Description
0000	No warning pending.
0001	The point of inflection was not found during pretuning.
0002	Oscillation increased during fine tuning.
0004	The setpoint was outside the set limits.
0008	Not all the necessary controlled system properties were defined for the selected method of calculation. The PID parameters were instead calculated using the "i_CtrlTypeTIR = 3" method.
0010	The operating mode could not be changed because ManualEnable = TRUE.
0020	The cycle time of the calling OB limits the sampling time of the PID algorithm. Improve results by using shorter OB cycle times.
0040	The process value exceeded one of its warning limits.

9.7 References

The following warnings are deleted as soon as the cause is dealt with:

- 0004
- 0020
- 0040

All other warnings are cleared with a rising edge at Reset.

**Tag i\_Event\_SUT V1**

## PID\_3Step

### New features of PID\_3Step

#### PID\_3Step V2.2

- **Use with S7-1200**  
As of PID\_3Step V2.2, the instruction with V2 functionality can also be used on S7-1200 with firmware version 4.0 or higher.

#### PID\_3Step V2.0

- **Reaction to error**  
The reaction to ActivateRecoverMode = TRUE has been completely overhauled. PID\_3Step reacts in a more fault tolerant manner in the default setting.

NOTICE
<p><b>Your system may be damaged.</b></p> <p>If you use the default setting, PID_3Step remains in automatic mode even if the process value limits are exceeded. This may damage your system.</p> <p>It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.</p>

You use the ErrorAck input parameter to acknowledge the errors and warnings without restarting the controller or clearing the integral action.

Switching operating modes does not acknowledge errors that are no longer pending.

- **Switching the operating mode**  
You specify the operating mode at the Mode in/out parameter and use a rising edge at ModeActivate to start the operating mode. The Retain.Mode tag has been omitted. The transition time measurement can no longer be started with GetTransitTime.Start, but only with Mode = 6 and a rising edge at ModeActivate.
- **Multi-instance capability**  
You can call up PID\_3Step as multi-instance DB. No technology object is created in this case and no parameter assignment interface or commissioning interface is available. You must assign parameters for PID\_3Step directly in the multi-instance DB and commission it via a watch table.
- **Startup characteristics**  
The operating mode specified at the Mode parameter is also started on a falling edge at Reset and during a CPU cold restart, if RunModeByStartup = TRUE.
- **ENO characteristics**  
ENO is set depending on the operating mode.  
If State = 0, then ENO = FALSE.  
If State ≠ 0, then ENO = TRUE.

- **Manual mode**  
The Manual\_UP and Manual\_DN input parameters no longer function as edge-triggered parameters. Edge-triggered manual mode continues to be possible using the ManualUpInternal and ManualDnInternal tags.  
In "Manual mode without endstop signals" (Mode = 10), the endstop signals Actuator\_H and Actuator\_L are ignored even though they are activated.
- **Default value of PID parameters**  
The following default settings have been changed:
  - Proportional action weighting (PWeighting) from 0.0 to 1.0
  - Derivative action weighting (DWeighting) from 0.0 to 1.0
  - Coefficient for derivative delay (TdFiltRatio) from 0.0 to 0.2
- **Limiting of motor transition time**  
You configure the maximum percentage of the motor transition time that the actuator will travel in one direction in the Config.VirtualActuatorLimit tag.
- **Setpoint value specification during tuning**  
You configure the permitted fluctuation of the setpoint during tuning at the CancelTuningLevel tag.
- **Switching a disturbance variable on**  
You can switch a disturbance variable on at the Disturbance parameter.
- **Troubleshooting**  
If the endstop signals are not activated (ActuatorEndStopOn = FALSE), ScaledFeedback is determined without Actuator\_H or Actuator\_L.

### PID\_3Step V1.1

- **Manual mode on CPU startup**  
If ManualEnable = TRUE when the CPU starts, PID\_3Step starts in manual mode. A rising edge at ManualEnable is not necessary.
- **Reaction to error**  
The ActivateRecoverMode tag is no longer effective in manual mode.
- **Troubleshooting**  
The Progress tag is reset following successful tuning or transition time measurement.

### Compatibility with CPU and FW

The following table shows which version of PID\_3Step can be used on which CPU.

CPU	FW	PID_3Step
S7-1200	V4.X	V2.2 V1.1
S7-1200	V3.X	V1.1 V1.0
S7-1200	V2.X	V1.1 V1.0

CPU	FW	PID_3Step
S7-1200	V1.X	-
S7-1500	V1.1	V2.2 V2.1 V2.0
S7-1500	V1.0	V2.0

## PID\_3Step V2

### Description of PID\_3Step V2

#### Description

You use the PID\_3Step instruction to configure a PID controller with self tuning for valves or actuators with integrating behavior.

The following operating modes are possible:

- Inactive
- Pretuning
- Fine tuning
- Automatic mode
- Manual mode
- Approach substitute output value
- Transition time measurement
- Error monitoring
- Approach substitute output value with error monitoring
- Manual mode without endstop signals

For a more detailed description of the operating modes, see the State parameter.

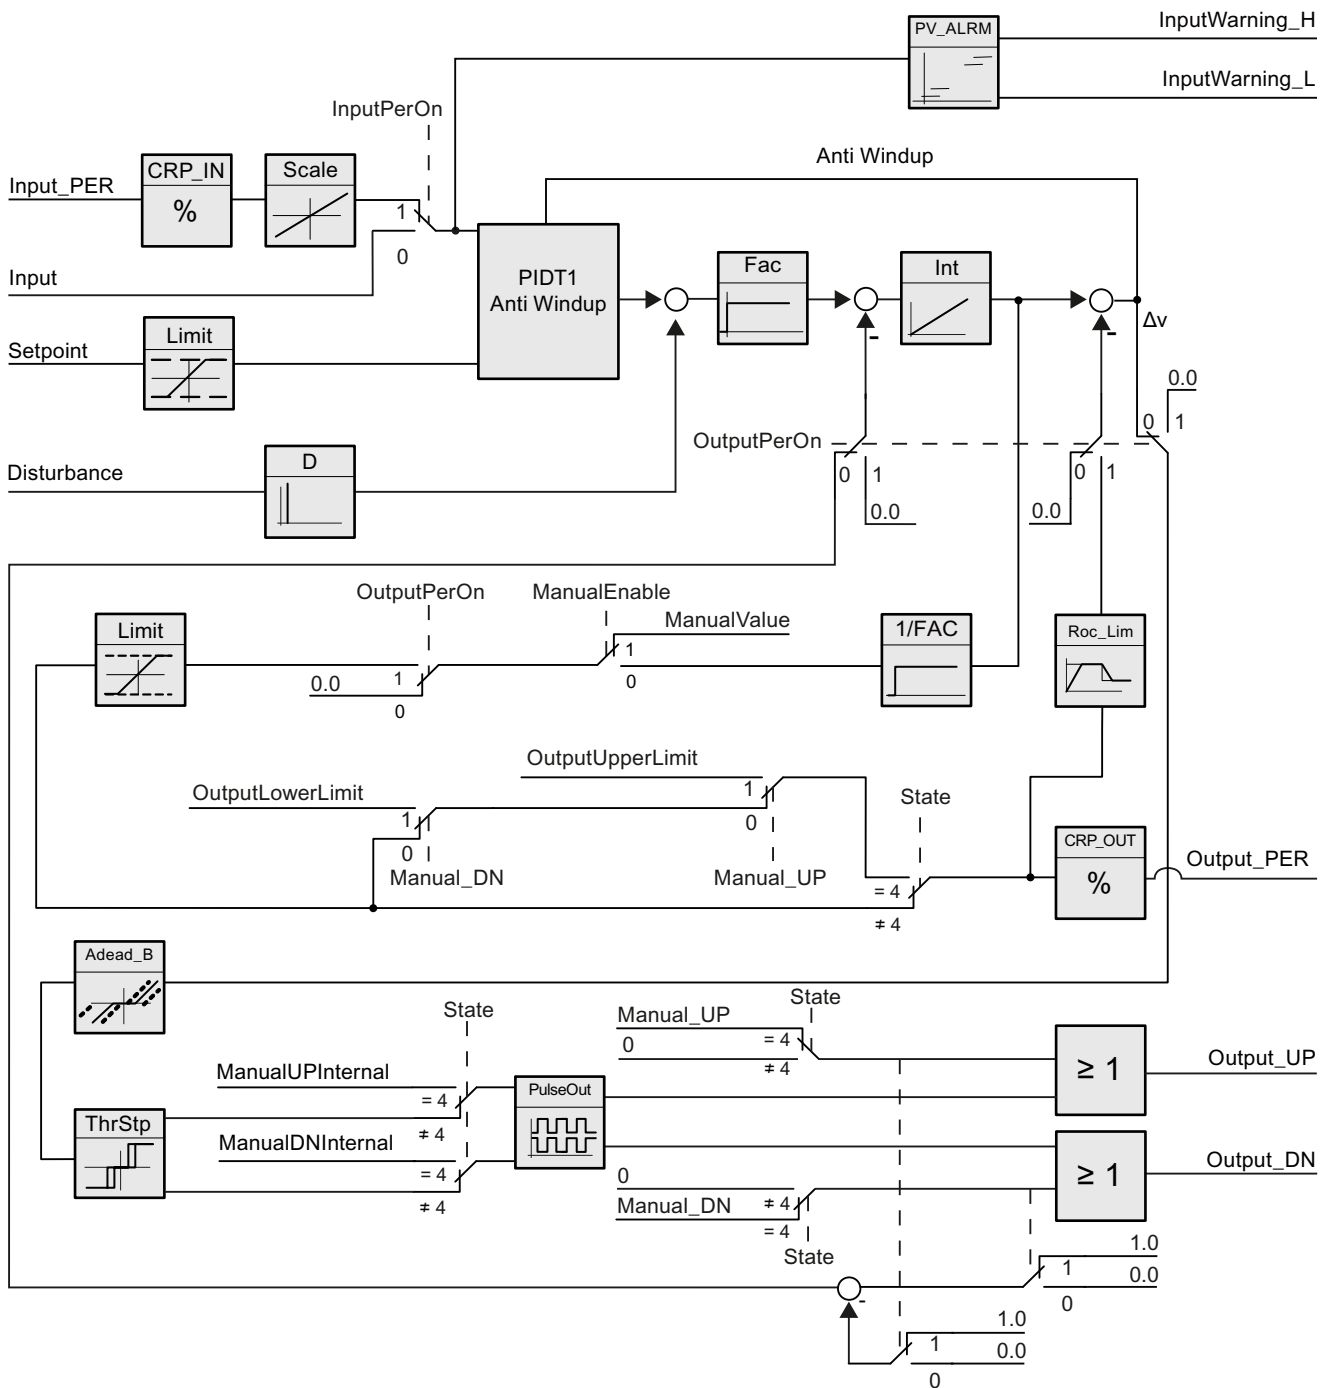

**PID algorithm**

PID\_3Step is a PIDT1 controller with anti-windup and weighting of the proportional and derivative actions. The PID algorithm operates according to the following equation:

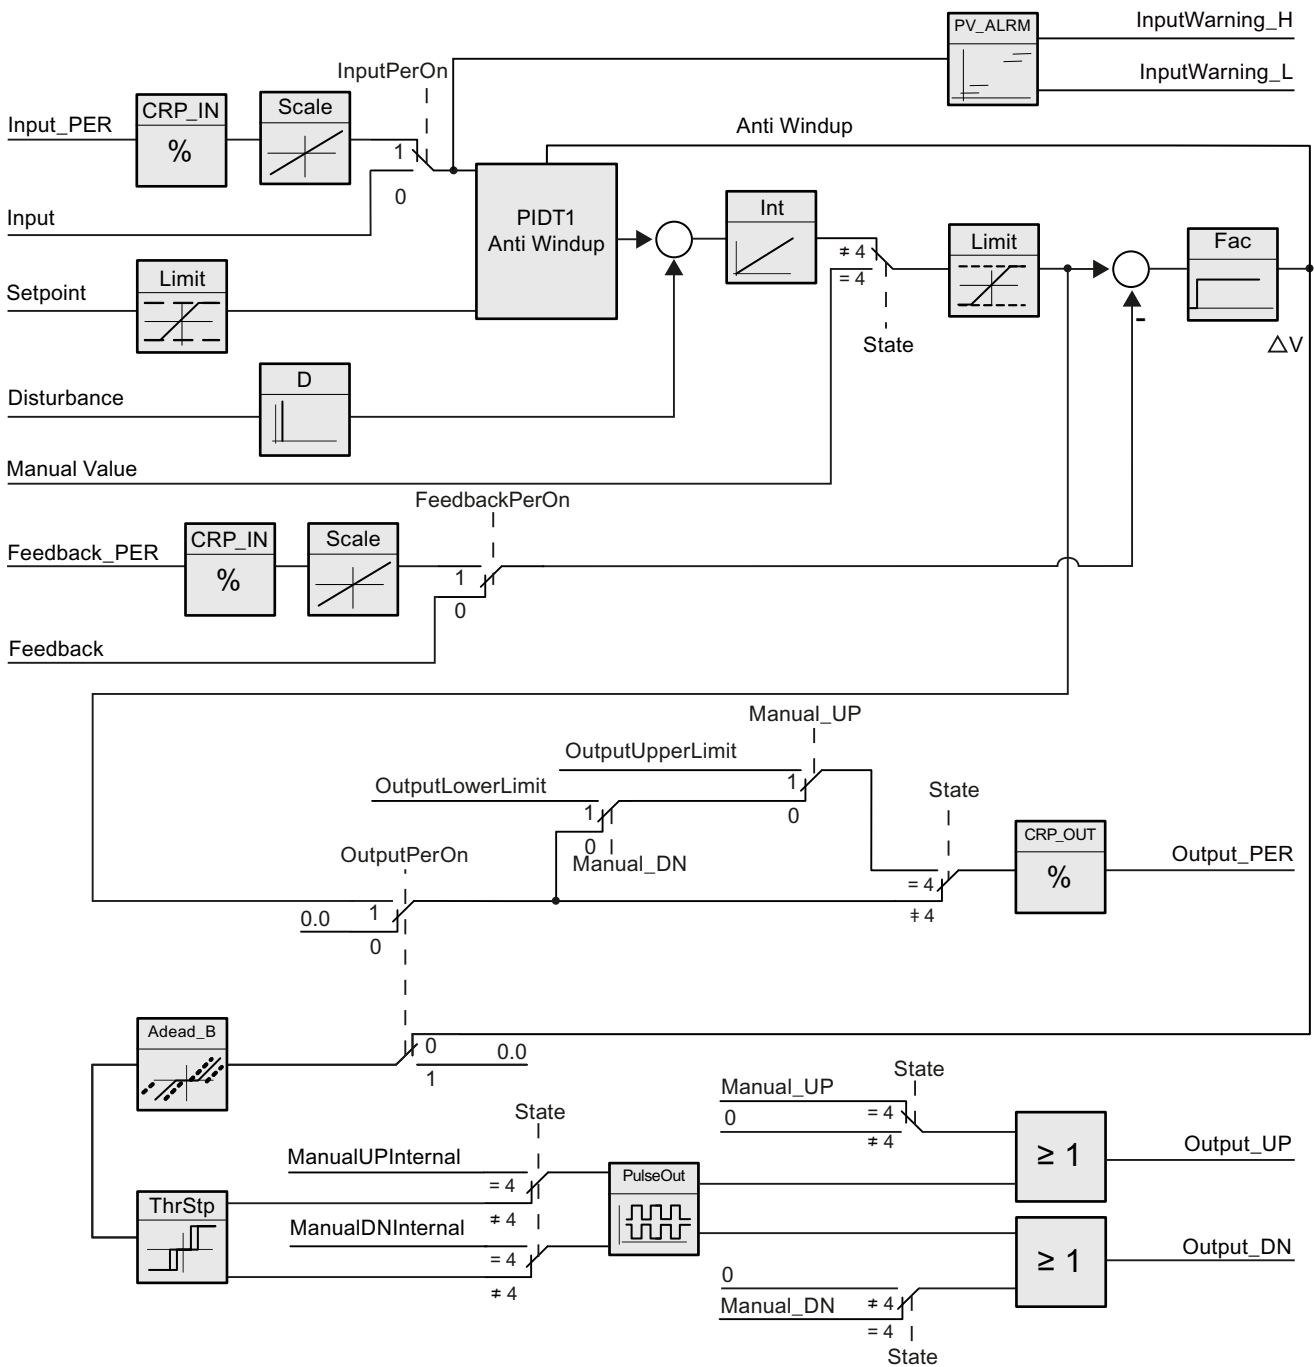

$$\Delta y = K_p \cdot s \cdot \left[ (b \cdot w - x) + \frac{1}{T_i \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

Symbol	Description
$\Delta y$	Output value of the PID algorithm
$K_p$	Proportional gain
$s$	Laplace operator
$b$	Proportional action weighting
$w$	Setpoint
$x$	Process value
$T_i$	Integral action time
$T_D$	Derivative action time
$a$	Derivative delay coefficient (derivative delay $T1 = a \times T_D$ )
$c$	Derivative action weighting

Block diagram without position feedback

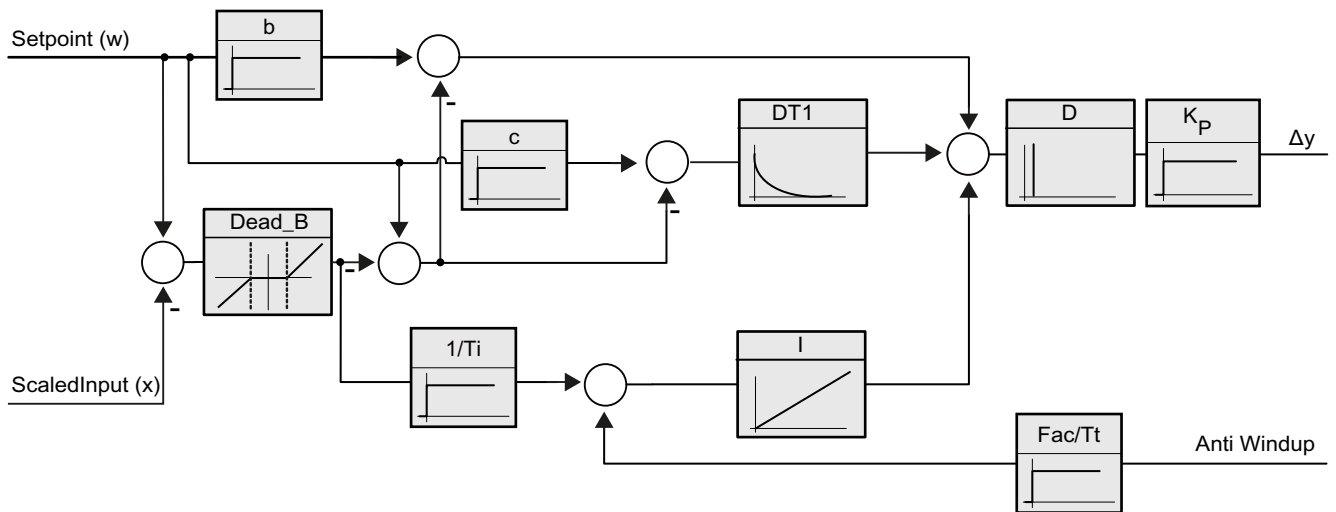

Block diagram with position feedback

### Block diagram of PIDT1 with anti-windup

### Call

PID\_3Step is called in the constant time scale of a cycle interrupt OB.

If you call PID\_3Step as a multi-instance DB, no technology object is created. No parameter assignment interface or commissioning interface is available. You must assign parameters for PID\_3Step directly in the multi-instance DB and commission it via a watch table.

### Download to device

The actual values of retentive tags are only updated when you download PID\_3Step completely.

Downloading technology objects to device (Page 6325)

### Startup

When the CPU starts up, PID\_3Step starts in the operating mode that is saved in the Mode in/out parameter. To leave PID\_3Step in "Inactive" mode, set RunModeByStartup = FALSE.

### Reaction to error

In automatic mode and during commissioning, the reaction to error depends on the ErrorBehaviour and ActivateRecoverMode tags. In manual mode, the reaction is independent

of ErrorBehaviour and ActivateRecoverMode. If ActivateRecoverMode = TRUE, the reaction additionally depends on the error that occurred.

ErrorBehaviour	ActivateRecoverMode	Configuration editor > actuator setting > Set Output to	Reaction
FALSE	FALSE	Current output value	Switch to "Inactive" mode (State = 0) The actuator remains in the current position.
FALSE	TRUE	Current output value while error is pending	Switch to "Error monitoring" mode (State = 7) The actuator remains in the current position while the error is pending.
TRUE	FALSE	Substitute output value	Switch to "Approach substitute output value" mode (State = 5) The actuator moves to the configured substitute output value. Switch to "Inactive" mode (State = 0) The actuator remains in the current position.
TRUE	TRUE	Substitute output value while error is pending	Switch to "Approach substitute output value with error monitoring" mode (State = 8) The actuator moves to the configured substitute output value. Switch to "Error monitoring" mode (State = 7)

In manual mode, PID\_3Step uses ManualValue as output value, unless the following errors occur:

- 2000h: Invalid value at Feedback\_PER parameter.
- 4000h: Invalid value at Feedback parameter.
- 8000h: Error during digital position feedback.

You can only change the position of the actuator with Manual\_UP and Manual\_DN, not with ManualValue.

The Error parameter indicates whether an error has occurred in this cycle. The ErrorBits parameter shows which errors have occurred. ErrorBits is reset by a rising edge at Reset or ErrorAck.

Configuring PID\_3Step V2 (Page 6379)

## Mode of operation of PID\_3Step V2

### Monitoring process value limits

You specify the high limit and low limit of the process value in the Config.InputUpperLimit and Config.InputLowerLimit variables. If the process value is outside these limits, an error occurs (ErrorBits = 0001h).

You specify a high and low warning limit of the process value in the Config.InputUpperWarning and Config.InputLowerWarning variables. If the process value is outside these warning limits, a warning occurs (Warning = 0040h), and the InputWarning\_H or InputWarning\_L output parameter changes to TRUE.

### Limiting the setpoint

You specify a high limit and low limit of the setpoint in the Config.SetpointUpperLimit and Config.SetpointLowerLimit variables. PID\_3Step automatically limits the setpoint to the process value limits. You can limit the setpoint to a smaller range. PID\_3Step checks whether this range falls within the process value limits. If the setpoint is outside these limits, the high or low limit is used as the setpoint, and output parameter SetpointLimit\_H or SetpointLimit\_L is set to TRUE.

The setpoint is limited in all operating modes.

### Limiting the output value

You specify a high limit and low limit of the output value in the Config.OutputUpperLimit and Config.OutputLowerLimit variables. The output value limits must be within "Low endstop" and "High endstop".

- High endstop: Config.FeedbackScaling.UpperPointOut
- Low endstop: Config.FeedbackScaling.LowerPointOut

Rule:

$$\text{UpperPointOut} \geq \text{OutputUpperLimit} > \text{OutputLowerLimit} \geq \text{LowerPointOut}$$

The valid values for "High endstop" and "Low endstop" depend upon:

- FeedbackOn
- FeedbackPerOn
- OutputPerOn

OutputPerOn	FeedbackOn	FeedbackPerOn	LowerPointOut	UpperPointOut
FALSE	FALSE	FALSE	Cannot be set (0.0%)	Cannot be set (100.0%)
FALSE	TRUE	FALSE	-100.0% or 0.0%	0.0% or +100.0%
FALSE	TRUE	TRUE	-100.0% or 0.0%	0.0% or +100.0%
TRUE	FALSE	FALSE	Cannot be set (0.0%)	Cannot be set (100.0%)
TRUE	TRUE	FALSE	-100.0% or 0.0%	0.0% or +100.0%
TRUE	TRUE	TRUE	-100.0% or 0.0%	0.0% or +100.0%

If OutputPerOn = FALSE and FeedbackOn = FALSE, you cannot limit the output value. Output\_UP and Output\_DN are then reset at Actuator\_H = TRUE or Actuator\_L = TRUE. If endstop signals are also not present, Output\_UP and Output\_DN are reset after a travel time of  $\text{Config.VirtualActuatorLimit} \times \text{Retain.TransitTime}/100$ .

The output value is 27648 at 100% and -27648 at -100%. PID\_3Step must be able to close the valve completely.

### Substitute output value

If an error has occurred, PID\_3Step can output a substitute output value and move the actuator to a safe position that is specified in the SavePosition tag. The substitute output value must be within the output value limits.

### Monitoring signal validity

The values of the following parameters are monitored for validity when used:

- Setpoint
- Input
- Input\_PER
- Input\_PER
- Feedback
- Feedback\_PER
- Disturbance
- ManualValue
- SavePosition
- Output\_PER

### Monitoring the PID\_3Step sampling time

Ideally, the sampling time is equivalent to the cycle time of the calling OB. The PID\_3Step instruction measures the time interval between two calls. This is the current sampling time. On every switchover of operating mode and during the initial startup, the mean value is formed from the first 10 sampling times. Too great a difference between the current sampling time and this mean value triggers an error (ErrorBits = 0800h).

The error occurs during tuning if:

- New mean value  $\geq 1.1 \times$  old mean value
- New mean value  $\leq 0.9 \times$  old mean value

The error occurs in automatic mode if:

- New mean value  $\geq 1.5 \times$  old mean value
- New mean value  $\leq 0.5 \times$  old mean value

If you deactivate the sampling time monitoring (`CycleTime.EnMonitoring = FALSE`), you can also call `PID_3Step` in `OB1`. You must then accept a lower control quality due to the deviating sampling time.

### Sampling time of the PID algorithm

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the cycle time. All other functions of `PID_3Step` are executed at every call.

### Measuring the motor transition time

The motor transition time is the time in seconds the motor requires to move the actuator from the closed to the opened state. The actuator is moved in one direction for a maximum time of  $\text{Config.VirtualActuatorLimit} \times \text{Retain.TransitTime}/100$ . `PID_3Step` requires the motor transition time to be as accurate as possible for good controller results. The data in the actuator documentation contains average values for this type of actuator. The value for the specific actuator used may differ. You can measure the motor transition time during commissioning. The output value limits are not taken into consideration during the motor transition time measurement. The actuator can travel to the high or the low endstop.

### Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic. For cooling and discharge control systems, it may be necessary to invert the control logic. `PID_3Step` does not work with negative proportional gain. If `InvertControl = TRUE`, an increasing control deviation causes a reduction in the output value. The control logic is also taken into account during pretuning and fine tuning.

### Input parameters of PID\_3Step V2

Table 9-86

Parameter	Data type	Default	Description
Setpoint	REAL	0.0	Setpoint of the PID controller in automatic mode
Input	REAL	0.0	A tag of the user program is used as the source of the process value. If you are using the Input parameter, then Config.InputPerOn = FALSE must be set.
Input_PER	INT	0	An analog input is used as the source of the process value. If you are using the Input_PER parameter, then Config.InputPerOn = TRUE must be set.
Actuator_H	BOOL	FALSE	Digital position feedback of the valve for the high endstop If Actuator_H = TRUE, the valve is at the high endstop and is no longer moved towards this direction.
Actuator_L	BOOL	FALSE	Digital position feedback of the valve for the low endstop If Actuator_L = TRUE, the valve is at the low endstop and is no longer moved towards this direction.
Feedback	REAL	0.0	Position feedback of the valve If you are using the Feedback parameter, then Config.FeedbackPerOn = FALSE must be set.

Parameter	Data type	Default	Description
Feedback_PER	INT	0	<p>Analog position feedback of a valve</p> <p>If you are using the Feedback_PER parameter, then Config.FeedbackPerOn = TRUE must be set.</p> <p>Feedback_PER is scaled based on the tags:</p> <ul style="list-style-type: none"> <li>• Config.FeedbackScaling.LowerPointIn</li> <li>• Config.FeedbackScaling.UpperPointIn</li> <li>• Config.FeedbackScaling.LowerPointOut</li> <li>• Config.FeedbackScaling.UpperPointOut</li> </ul>
Disturbance	REAL	0.0	Disturbance tag or precontrol value
ManualEnable	BOOL	FALSE	<ul style="list-style-type: none"> <li>• A FALSE -&gt; TRUE edge activates "manual mode", while State = 4, Mode remain unchanged.</li> <li>• As long as ManualEnable = TRUE, you cannot change the operating mode via a rising edge at ModeActivate or use the commissioning dialog.</li> <li>• A TRUE -&gt; FALSE edge activates the operating mode that is specified by Mode.</li> </ul> <p>We recommend that you change the operating mode using ModeActivate only.</p>
ManualValue	REAL	0.0	In manual mode, the absolute position of the valve is specified. ManualValue is only evaluated if you are using Output_PER, or if position feedback is available.
Manual_UP	BOOL	FALSE	<ul style="list-style-type: none"> <li>• Manual_UP = TRUE The valve is opened even if you are using Output_PER or a position feedback. The valve is no longer moved if the high endstop has been reached. See also Config.VirtualActuatorLimit</li> <li>• Manual_UP = FALSE If you are using Output_PER or a position feedback, the valve is moved to ManualValue. Otherwise, the valve is no longer moved.</li> </ul> <p>If Manual_UP and Manual_DN are set to TRUE simultaneously, the valve is not moved.</p>
Manual_DN	BOOL	FALSE	<ul style="list-style-type: none"> <li>• Manual_DN = TRUE The valve is closed even if you are using Output_PER or a position feedback. The valve is no longer moved if the low endstop has been reached. See also Config.VirtualActuatorLimit</li> <li>• Manual_DN = FALSE If you are using Output_PER or a position feedback, the valve is moved to ManualValue. Otherwise, the valve is no longer moved.</li> </ul>
ErrorAck	BOOL	FALSE	<ul style="list-style-type: none"> <li>• FALSE -&gt; TRUE edge ErrorBits and Warning are reset.</li> </ul>

Parameter	Data type	Default	Description
Reset	BOOL	FALSE	<p>Restarts the controller.</p> <ul style="list-style-type: none"> <li>• FALSE -&gt; TRUE edge                             <ul style="list-style-type: none"> <li>- Switch to "Inactive" mode</li> <li>- ErrorBits and Warning are reset.</li> <li>- Integral action is cleared (PID parameters are retained)</li> </ul> </li> <li>• As long as Reset = TRUE, PID_3Step remains in "Inactive" mode (State = 0).</li> <li>• TRUE -&gt; FALSE edge PID_3Step switches to the operating mode that is saved in the Mode parameter.</li> </ul>
ModeActivate	BOOL	FALSE	<ul style="list-style-type: none"> <li>• FALSE -&gt; TRUE edge PID_3Step switches to the operating mode that is saved in the Mode parameter.</li> </ul>

### Output parameters of PID\_3Step V2

Table 9-87

Parameter	Data type	Default	Description
ScaledInput	REAL	0.0	Scaled process value
ScaledFeedback	REAL	0.0	<p>Scaled position feedback</p> <p>For an actuator without position feedback, the position of the actuator indicated by ScaledFeedback is very imprecise. ScaledFeedback may only be used for rough estimation of the current position in this case.</p>
Output_UP	BOOL	FALSE	<p>Digital output value for opening the valve</p> <p>If Config.OutputPerOn = FALSE, the Output_UP parameter is used.</p>
Output_DN	BOOL	FALSE	<p>Digital output value for closing the valve</p> <p>If Config.OutputPerOn = FALSE, the Output_DN parameter is used.</p>
Output_PER	INT	0	<p>Analog output value</p> <p>If Config.OutputPerOn = TRUE, Output_PER is used.</p>
SetpointLimit_H	BOOL	FALSE	<p>If SetpointLimit_H = TRUE, the absolute setpoint high limit is reached (Setpoint ≥ Config.SetpointUpperLimit). The setpoint is limited to Config.SetpointUpperLimit .</p>
SetpointLimit_L	BOOL	FALSE	<p>If SetpointLimit_L = TRUE, the absolute setpoint low limit has been reached (Setpoint ≤ Config.SetpointLowerLimit). The setpoint is limited to Config.SetpointLowerLimit .</p>
InputWarning_H	BOOL	FALSE	<p>If InputWarning_H = TRUE, the process value has reached or exceeded the warning high limit.</p>
InputWarning_L	BOOL	FALSE	<p>If InputWarning_L = TRUE, the process value has reached or fallen below the warning low limit.</p>

Parameter	Data type	Default	Description
State	INT	0	<p>The State parameter (Page 3010) shows the current operating mode of the PID controller. You can change the operating mode using the input parameter Mode and a rising edge at ModeActivate.</p> <ul style="list-style-type: none"> <li>• State = 0: Inactive</li> <li>• State = 1: Pretuning</li> <li>• State = 2: Fine tuning</li> <li>• State = 3: Automatic mode</li> <li>• State = 4: Manual mode</li> <li>• State = 5: Approach substitute output value</li> <li>• State = 6: Transition time measurement</li> <li>• State = 7: Error monitoring</li> <li>• State = 8: Approach substitute output value with error monitoring</li> <li>• State = 10: Manual mode without end stop signals</li> </ul>
Error	BOOL	FALSE	If Error = TRUE, at least one error message is pending in this cycle.
ErrorBits	DWORD	DW#16#0	The ErrorBits parameter (Page 3015) shows which error messages are pending. ErrorBits is retentive and is reset upon a rising edge at Reset or ErrorAck.

### In-out parameters of PID\_3Step V2

Table 9-88

Parameter	Data type	Default	Description
Mode	INT	4	<p>At the Mode parameter, you specify the operating mode to which PID_3Step is to switch. Options are:</p> <ul style="list-style-type: none"> <li>• Mode = 0: Inactive</li> <li>• Mode = 1: Pretuning</li> <li>• Mode = 2: Fine tuning</li> <li>• Mode = 3: Automatic mode</li> <li>• Mode = 4: Manual mode</li> <li>• Mode = 6: Transition time measurement</li> <li>• Mode = 10: Manual mode without endstop signals</li> </ul> <p>The operating mode is activated by:</p> <ul style="list-style-type: none"> <li>• Rising edge at ModeActivate</li> <li>• Falling edge at Reset</li> <li>• Falling edge at ManualEnable</li> <li>• Cold restart of CPU if RunModeByStartup = TRUE</li> </ul> <p>Mode is retentive.</p> <p>A detailed description of the operating modes can be found in Parameters State and Mode V2 (Page 3010).</p>

### Static tags of PID\_3Step V2

You must not change tags that are not listed. These are used for internal purposes only.

Tag	Data type	Default	Description
ManualUpInternal	BOOL	FALSE	In manual mode, each rising edge opens the valve by 5% of the total control range or for the duration of the minimum motor transition time. ManualUpInternal is only evaluated if you are not using Output_PER or a position feedback. This tag is used in the commissioning dialog.
ManualDnInternal	BOOL	FALSE	In manual mode, every rising edge closes the valve by 5% of the total control range or for the duration of the minimum motor transition time. ManualDnInternal is only evaluated if you are not using Output_PER or position feedback. This tag is used in the commissioning dialog.
ActivateRecoverMode	BOOL	TRUE	The ActivateRecoverMode V2 (Page 3018) tag determines the reaction to error.
RunModeByStartup	BOOL	TRUE	<p>Activate operating mode at Mode parameter after CPU restart</p> <p>If RunModeByStartup = TRUE, PID_3Step starts in the operating mode saved in the Mode parameter after CPU startup.</p> <p>If RunModeByStartup = FALSE, PID_3Step remains in "Inactive" mode after CPU startup.</p>
LoadBackUp	BOOL	FALSE	If LoadBackUp = TRUE, the last set of PID parameters is reloaded. The set was saved prior to the last tuning. LoadBackUp is automatically set back to FALSE.

Tag	Data type	Default	Description
PhysicalUnit	INT	0	Unit of measurement of the process value and setpoint, e.g., °C, or °F.
PhysicalQuantity	INT	0	Physical quantity of the process value and setpoint, e.g., temperature
ErrorBehaviour	BOOL	FALSE	<p>If ErrorBehaviour = FALSE and an error has occurred, the valve stays at its current position and the controller switches directly to "Inactive" or "Error monitoring" mode.</p> <p>If ErrorBehaviour = TRUE and an error occurs, the actuator moves to the substitute output value and only then switches to "Inactive" or "Error monitoring" mode.</p> <p>If the following errors occur, you can no longer move the valve to a configured substitute output value.</p> <ul style="list-style-type: none"> <li>• 2000h: Invalid value at Feedback_PER parameter.</li> <li>• 4000h: Invalid value at Feedback parameter.</li> <li>• 8000h: Error during digital position feedback.</li> <li>• 20000h: Invalid value at SavePosition tag.</li> </ul>
Warning	DWORD	DW#16#0	<p>The Warning tag (Page 3010) shows the warnings since Reset = TRUE or ErrorAck = TRUE. Warning is retentive.</p> <p>Cyclic warnings (for example, process value warning) are shown until the cause of the warning is removed. They are automatically deleted once their cause has gone. Non-cyclic warnings (for example, point of inflection not found) remain and are deleted like errors.</p>
SavePosition	REAL	0.0	<p>Substitute output value</p> <p>If ErrorBehaviour = TRUE, the actuator is moved to a position that is safe for the plant when an error occurs. As soon as the substitute output value has been reached, PID_3Step switches the operating mode according to ActivateRecoverMode.</p>
CurrentSetpoint	REAL	0.0	Currently active setpoint. This value is frozen at the start of tuning.
CancelTuningLevel	REAL	10.0	<p>Permissible fluctuation of setpoint during tuning. Tuning is not canceled until:</p> <ul style="list-style-type: none"> <li>• Setpoint &gt; CurrentSetpoint + CancelTuningLevel</li> <li>or</li> <li>• Setpoint &lt; CurrentSetpoint - CancelTuningLevel</li> </ul>
Progress	REAL	0.0	Progress of tuning as a percentage (0.0 - 100.0)
Config.InputPerOn	BOOL	TRUE	If InputPerOn = TRUE, the Input_PER parameter is used. If InputPerOn = FALSE, the Input parameter is used.
Config.OutputPerOn	BOOL	FALSE	If OutputPerOn = TRUE, the Output_PER parameter is used. If OutputPerOn = FALSE, the Ouput_UP and Output_DN parameters are used.
Config.InvertControl	BOOL	FALSE	<p>Invert control logic</p> <p>If InvertControl = TRUE, an increasing control deviation causes a reduction in the output value.</p>
Config.FeedbackOn	BOOL	FALSE	<p>If FeedbackOn = FALSE, a position feedback is simulated.</p> <p>Position feedback is generally activated when FeedbackOn = TRUE.</p>

9.7 References

Tag	Data type	Default	Description
Config.FeedbackPerOn	BOOL	FALSE	FeedbackPerOn is only effective when FeedbackOn = TRUE. If FeedbackPerOn = TRUE, the analog input is used for the position feedback (Feedback_PER parameter). If FeedbackPerOn = FALSE, the Feedback parameter is used for the position feedback.
Config.ActuatorEndStopOn	BOOL	FALSE	If ActuatorEndStopOn = TRUE, the digital position feedback Actuator_L and Actuator_H are taken into consideration.
Config.InputUpperLimit	REAL	120.0	High limit of the process value Input and Input_PER are monitored to ensure adherence to this limit. At the I/O input, the process value can be a maximum of 18% higher than the standard range (overrange). An error is no longer signaled due to a violation of the "Process value high limit". Only a wire-break and a short-circuit are recognized and PID_3Step reacts according to the configured reaction to error. InputUpperLimit > InputLowerLimit
Config.InputLowerLimit	REAL	0.0	Low limit of the process value InputLowerLimit < InputUpperLimit
Config.InputUpperWarning	REAL	+3.40282 2e+38	Warning high limit of the process value If you set InputUpperWarning outside the process value limits, the configured absolute process value high limit is used as the warning high limit. If you configure InputUpperWarning within the process value limits, this value is used as the warning high limit. InputUpperWarning > InputLowerWarning InputUpperWarning ≤ InputUpperLimit
Config.InputLowerWarning	REAL	-3.40282 2e+38	Warning low limit of the process value If you set InputLowerWarning outside the process value limits, the configured absolute process value low limit is used as the warning low limit. If you configure InputLowerWarning within the process value limits, this value is used as the warning low limit. InputLowerWarning < InputUpperWarning InputLowerWarning ≥ InputLowerLimit
Config.OutputUpperLimit	REAL	100.0	High limit of output value For details, see OutputLowerLimit
Config.OutputLowerLimit	REAL	0.0	Low limit of output value If OutputPerOn = TRUE or FeedbackOn = TRUE, the range of values from -100% to +100%, including zero, is valid. At -100%, Output = -27648; at +100% Output = 27648 If OutputPerOn = FALSE, the range of values from 0% to 100% is valid. The valve is completely closed at 0% and completely opened at 100%.
Config.SetpointUpperLimit	REAL	+3.40282 2e+38	High limit of setpoint If you set SetpointUpperLimit outside the process value limits, the configured absolute process value high limit is preassigned as the setpoint high limit. If you configure SetpointUpperLimit within the process value limits, this value is used as the setpoint high limit.

Tag	Data type	Default	Description
Config.SetpointLowerLimit	REAL	- 3.402822 e+38	Low limit of the setpoint If you set SetpointLowerLimit outside the process value limits, the configured absolute process value low limit is preassigned as the setpoint low limit. If you set SetpointLowerLimit within the process value limits, this value is used as the setpoint low limit.
Config.MinimumOnTime	REAL	0.0	Minimum ON time Minimum time in seconds for which the servo drive must be switched on.
Config.MinimumOffTime	REAL	0.0	Minimum OFF time Minimum time in seconds for which the servo drive must be switched off.
Config.VirtualActuatorLimit	REAL	150.0	If all the following conditions have been satisfied, the actuator is moved in one direction for the maximum period of VirtualActuatorLimit × Retain.TransitTime/100 and the warning 2000h is output: <ul style="list-style-type: none"> <li>• Config.OutputPerOn = FALSE</li> <li>• Config.ActuatorEndStopOn = FALSE</li> <li>• Config.FeedbackOn = FALSE</li> </ul> If Config.OutputPerOn = FALSE and Config.ActuatorEndStopOn = TRUE or Config.FeedbackOn = TRUE, only the warning 2000h is output. If Config.OutputPerOn = TRUE, VirtualActuatorLimit is not taken into consideration.
Config.InputScaling.UpperPointIn	REAL	27648.0	Scaling Input_PER high Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the InputScaling structure.
Config.InputScaling.LowerPointIn	REAL	0.0	Scaling Input_PER low Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the InputScaling structure.
Config.InputScaling.UpperPointOut	REAL	100.0	Scaled high process value Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the InputScaling structure.
Config.InputScaling.LowerPointOut	REAL	0.0	Scaled low process value Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the InputScaling structure.
Config.FeedbackScaling.UpperPointIn	REAL	27648.0	Scaling Feedback_PER high Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the FeedbackScaling structure.
Config.FeedbackScaling.LowerPointIn	REAL	0.0	Scaling Feedback_PER low Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the FeedbackScaling structure.

9.7 References

Tag	Data type	Default	Description
Config.FeedbackScaling.UpperPointOut	REAL	100.0	High endstop Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the FeedbackScaling structure.
Config.FeedbackScaling.LowerPointOut	REAL	0.0	Low endstop Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the FeedbackScaling structure.
GetTransitTime.InvertDirection	BOOL	FALSE	If InvertDirection = FALSE, the valve is fully opened, closed, and then reopened in order to determine the valve transition time. If InvertDirection = TRUE, the valve is fully closed, opened, and then closed again.
GetTransitTime.SelectFeedback	BOOL	FALSE	If SelectFeedback = TRUE, then Feedback_PER, or Feedback is taken into consideration in the transition time measurement. If SelectFeedback = FALSE, then Actuator_H and Actuator_L are taken into consideration in the transition time measurement.
GetTransitTime.State	INT	0	Current phase of the transition time measurement <ul style="list-style-type: none"> <li>State = 0: Inactive</li> <li>State = 1: Open valve completely</li> <li>State = 2: Close valve completely</li> <li>State = 3: Move valve to target position (NewOutput)</li> <li>State = 4: Transition time measurement successfully completed</li> <li>State = 5: Transition time measurement canceled</li> </ul>
GetTransitTime.NewOutput	REAL	0.0	Target position for transition time measurement with position feedback The target position must be between "High endstop" and "Low endstop". The difference between NewOutput and ScaledFeedback must be at least 50% of the permissible control range.
CycleTime.StartEstimation	BOOL	TRUE	If StartEstimation = TRUE, the measurement of the PID_3Step sampling time is started. CycleTime.StartEstimation = FALSE once measurement is complete.
CycleTime.EnEstimation	BOOL	TRUE	If EnEstimation = TRUE, the PID_3Step sampling time is calculated. If CycleTime.EnEstimation = FALSE, the PID_3Step sampling time is not calculated and you need to correct the configuration of CycleTime.Value manually.
CycleTime.EnMonitoring	BOOL	TRUE	If EnMonitoring = TRUE, the PID_3Step sampling time is monitored. If it is not possible to execute PID_3Step within the sampling time, the error 0800h is output and the operating mode is switched. ActivateRecoverMode and ErrorBehaviour determine which operating mode is switched to. If EnMonitoring = FALSE, the PID_3Step sampling time is not monitored, the error 0800h is not output, and the operating mode is not switched.
CycleTime.Value	REAL	0.1	PID_3Step sampling time in seconds CycleTime.Value is determined automatically and is usually equivalent to the cycle time of the calling OB.

Tag	Data type	Default	Description
CtrlParamsBackUp.SetByUser	BOOL	FALSE	Saved value of Retain.CtrlParams.SetByUser You can reload values from the CtrlParamsBackUp structure with LoadBackUp = TRUE.
CtrlParamsBackUp.Gain	REAL	1.0	Saved proportional gain
CtrlParamsBackUp.Ti	REAL	20.0	Saved integral action time in seconds
CtrlParamsBackUp.Td	REAL	0.0	Saved derivative action time in seconds
CtrlParamsBackUp.TdFiltRatio	REAL	0.2	Saved derivative delay coefficient
CtrlParamsBackUp.PWeighting	REAL	1.0	Saved proportional action weighting
CtrlParamsBackUp.DWeighting	REAL	1.0	Saved derivative action weighting
CtrlParamsBackUp.Cycle	REAL	1.0	Saved sampling time of PID algorithm in seconds
CtrlParamsBackUp.InputDeadBand	REAL	0.0	Saved deadband width of the control deviation
PIDSelfTune.SUT.CalculateParams	BOOL	FALSE	The properties of the controlled system are saved during tuning. If CalculateParams = TRUE, the PID parameters are recalculated on the basis of these properties. The PID parameters are calculated using the method set in TuneRule. CalculateParams is set to FALSE following calculation.
PIDSelfTune.SUT.TuneRule	INT	1	Methods used to calculate parameters during pretuning: <ul style="list-style-type: none"> <li>• SUT.TuneRule = 0: PID rapid I</li> <li>• SUT.TuneRule = 1: PID slow I</li> <li>• SUT.TuneRule = 2: Chien, Hrones and Reswick PID</li> <li>• SUT.TuneRule = 3: Chien, Hrones, Reswick PI</li> <li>• SUT.TuneRule = 4: PID rapid II</li> <li>• SUT.TuneRule = 5: PID slow II</li> </ul>
PIDSelfTune.SUT.State	INT	0	The SUT.State tag indicates the current phase of pretuning: <ul style="list-style-type: none"> <li>• State = 0: Initialize pretuning</li> <li>• State = 50: Determine start position without position feedback</li> <li>• State = 100: Calculate standard deviation</li> <li>• State = 200: Determine point of inflection</li> <li>• State = 300: Determine rise time</li> <li>• State = 9900: Pretuning successful</li> <li>• State = 1: Pretuning not successful</li> </ul>

Tag	Data type	Default	Description
PIDSelfTune.TIR.RunIn	BOOL	FALSE	<p>With the RunIn tag, you can specify that fine tuning can also be performed without pretuning.</p> <ul style="list-style-type: none"> <li>RunIn = FALSE Pretuning is started when fine tuning is started from inactive or manual mode. If fine tuning is started from automatic mode, the system uses the existing PID parameters to control to the setpoint. Only then will fine tuning start. If pretuning is not possible, PID_3Step switches to the mode from which tuning was started.</li> <li>RunIn = TRUE The pretuning is skipped. PID_3Step attempts to reach the setpoint with the minimum or maximum output value. This can produce increased overshoot. Only then will fine tuning start. RunIn is set to FALSE after fine tuning.</li> </ul>
PIDSelfTune.TIR.CalculateParams	BOOL	FALSE	<p>The properties of the controlled system are saved during tuning. If CalculateParams = TRUE, the PID parameters are recalculated on the basis of these properties. The PID parameters are calculated using the method set in TuneRule. CalculateParams is set to FALSE following calculation.</p>
PIDSelfTune.TIR.TuneRule	INT	0	<p>Methods used to calculate parameters during fine tuning:</p> <ul style="list-style-type: none"> <li>TIR.TuneRule = 0: PID automatic</li> <li>TIR.TuneRule = 1: PID rapid</li> <li>TIR.TuneRule = 2: PID slow</li> <li>TIR.TuneRule = 3: Ziegler-Nichols PID</li> <li>TIR.TuneRule = 4: Ziegler-Nichols PI</li> <li>TIR.TuneRule = 5: Ziegler-Nichols P</li> </ul>
PIDSelfTune.TIR.State	INT	0	<p>The TIR.State tag indicates the current phase of fine tuning:</p> <ul style="list-style-type: none"> <li>State = -100 Fine tuning is not possible. **Parameters State and Mode V2**

**Correlation of the parameters**

The State parameter shows the current operating mode of the PID controller. You cannot change the State parameter.

With a rising edge at ModeActivate, PID\_3Step switches to the operating mode saved in the Mode in-out parameter.

When the CPU is switched on or switches from Stop to RUN mode, PID\_3Step starts in the operating mode that is saved in the Mode parameter. To leave PID\_3Step in "Inactive" mode, set RunModeByStartup = FALSE.

## Meaning of values

State	Description of operating mode
0	<p>Inactive</p> <p>The controller is switched off and no longer changes the valve position.</p>
1	<p>Pretuning</p> <p>The pretuning determines the process response to a pulse of the output value and searches for the point of inflection. The PID parameters are calculated from the maximum rate of rise and dead time of the controlled system. You obtain the best PID parameters when you perform pretuning and fine tuning.</p> <p>Pretuning requirements:</p> <ul style="list-style-type: none"> <li>• The motor transition time has been configured or measured.</li> <li>• Inactive (State = 0), manual mode (State = 4), or automatic mode (State = 3)</li> <li>• ManualEnable = FALSE</li> <li>• Reset = FALSE</li> <li>• The setpoint and the process value lie within the configured limits.</li> </ul> <p>The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher as compared to the noise. This is most likely the case in operating modes "Inactive" and "manual mode".</p> <p>The setpoint is frozen in the CurrentSetpoint tag. Tuning is canceled when:</p> <ul style="list-style-type: none"> <li>• <math>\text{Setpoint} &gt; \text{CurrentSetpoint} + \text{CancelTuningLevel}</math></li> <li>or</li> <li>• <math>\text{Setpoint} &lt; \text{CurrentSetpoint} - \text{CancelTuningLevel}</math></li> </ul> <p>Before the PID parameters are recalculated, they are backed up and can be reactivated with LoadBackUp.</p> <p>The controller switches to automatic mode following successful pretuning. If pretuning is unsuccessful, the switchover of operating mode is dependent on ActivateRecoverMode and ErrorBehaviour.</p> <p>The pretuning phase is indicated with the SUT.State tag.</p>

State	Description of operating mode
2	<p>Fine tuning</p> <p>Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are recalculated based on the amplitude and frequency of this oscillation. PID parameters from fine tuning usually have better master control and disturbance characteristics than PID parameters from pretuning. You obtain the best PID parameters when you perform pretuning and fine tuning.</p> <p>PID_3Step automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value.</p> <p>The setpoint is frozen in the CurrentSetpoint tag. Tuning is canceled when:</p> <ul style="list-style-type: none"> <li>• Setpoint &gt; CurrentSetpoint + CancelTuningLevel</li> <li>or</li> <li>• Setpoint &lt; CurrentSetpoint - CancelTuningLevel</li> </ul> <p>The PID parameters are backed up before fine tuning. They can be reactivated with LoadBackUp.</p> <p>Requirements for fine tuning:</p> <ul style="list-style-type: none"> <li>• The motor transition time has been configured or measured.</li> <li>• The setpoint and the process value lie within the configured limits.</li> <li>• ManualEnable = FALSE</li> <li>• Reset = FALSE</li> <li>• Automatic (State = 3), inactive (State = 0) or manual (State = 4) mode</li> </ul> <p>Fine tuning proceeds as follows when started from:</p> <ul style="list-style-type: none"> <li>• Automatic mode (State = 3) Start fine tuning from automatic mode if you wish to improve the existing PID parameters through tuning. PID_3Step controls the system using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.</li> <li>• Inactive (State = 0) or manual mode (State = 4) If the requirements for pretuning are met, pretuning is started. The determined PID parameters will be used for control until the control loop has stabilized and the requirements for fine tuning have been met. If PIDSelfTune.TIR.RunIn = TRUE, pretuning is skipped and an attempt is made to reach the setpoint with the minimum or maximum output value. This can produce increased overshoot. Fine tuning then starts automatically.</li> </ul> <p>The controller switches to automatic mode following successful fine tuning. If fine tuning is unsuccessful, the switchover of operating mode is dependent on ActivateRecoverMode and ErrorBehaviour.</p> <p>The fine tuning phase is indicated with the TIR.State tag.</p>
3	<p>Automatic mode</p> <p>In automatic mode, PID_3Step controls the controlled system in accordance with the parameters specified. The controller switches to automatic mode if one of the following requirements is fulfilled:</p> <ul style="list-style-type: none"> <li>• Pretuning successfully completed</li> <li>• Fine tuning successfully completed</li> <li>• Changing of the Mode in-out parameter to the value 3 and a rising edge at ModeActivate.</li> </ul> <p>The switchover from automatic mode to manual mode is only bumpless if carried out in the commissioning editor.</p> <p>The ActivateRecoverMode tag is taken into consideration in automatic mode.</p>

State	Description of operating mode
4	<p>Manual mode</p> <p>In manual mode, you specify manual output values in the Manual_UP and Manual_DN parameters or ManualValue parameter. Whether or not the actuator can be moved to the output value in the event of an error is described in the ErrorBits parameter.</p> <p>You can also activate this operating mode using ManualEnable = TRUE. We recommend that you change the operating mode using Mode and ModeActivate only.</p> <p>The switchover from manual mode to automatic mode is bumpless. Manual mode is also possible when an error is pending.</p>
5	<p>Approach substitute output value</p> <p>This operating mode is activated in the event of an error, if Errorbehaviour = TRUE and ActivateRecoverMode = FALSE..</p> <p>PID_3Step moves the actuator to the substitute output value and then switches to "Inactive" mode.</p>
6	<p>Transition time measurement</p> <p>The time that the motor needs to completely open the valve from the closed condition is determined.</p> <p>This operating mode is activated when Mode = 6 and ModeActivate = TRUE is set.</p> <p>If endstop signals are used to measure the transition time, the valve will be opened completely from its current position, closed completely, and opened completely again. If GetTransitTime.InvertDirection = TRUE, this behavior is inverted.</p> <p>If position feedback is used to measure the transition time, the actuator will be moved from its current position to a target position.</p> <p>The output value limits are not taken into consideration during the transition time measurement. The actuator can travel to the high or the low endstop.</p>
7	<p>Error monitoring</p> <p>The control algorithm is switched off and no longer changes the valve position.</p> <p>This operating mode is activated instead of "Inactive" mode in the event of an error.</p> <p>All the following conditions must be met:</p> <ul style="list-style-type: none"> <li>• Automatic mode (Mode = 3)</li> <li>• Errorbehaviour = FALSE</li> <li>• ActivateRecoverMode = TRUE</li> <li>• One or more errors have occurred in which ActivateRecoverMode (Page 3018) is effective.</li> </ul> <p>As soon as the errors are no longer pending, PID_3Step switches back to automatic mode.</p>
8	<p>Approach substitute output value with error monitoring</p> <p>This operating mode is activated instead of "approach substitute output value" mode when an error occurs. PID_3Step moves the actuator to the substitute output value and then switches to "error monitoring" mode.</p> <p>All the following conditions must be met:</p> <ul style="list-style-type: none"> <li>• Automatic mode (Mode = 3)</li> <li>• Errorbehaviour = TRUE</li> <li>• ActivateRecoverMode = TRUE</li> <li>• One or more errors have occurred in which ActivateRecoverMode (Page 3018) is effective.</li> </ul> <p>As soon as the errors are no longer pending, PID_3Step switches back to automatic mode.</p>
10	<p>Manual mode without endstop signals</p> <p>The endstop signals are <b>not</b> taken into consideration, even though Config.ActuatorEndStopOn = TRUE. The output value limits are not taken into consideration. Otherwise, PID_3Step behaves the same as in manual mode.</p>

**ENO characteristics**

If State = 0, then ENO = FALSE.

If State ≠ 0, then ENO = TRUE.

**Automatic switchover of operating mode during commissioning**

Automatic mode is activated following successful pretuning or fine tuning. The following table shows how Mode and State change during successful pretuning.

Cycle no.	Mode	State	Action
0	4	4	Set Mode = 1
1	1	4	Set ModeActivate = TRUE
1	4	1	Value of State is saved in Mode parameter Pretuning is started
n	4	1	Pretuning successfully completed
n	3	3	Automatic mode is started

PID\_3Step automatically switches the operating mode in the event of an error. The following table shows how Mode and State change during pretuning with errors.

Cycle no.	Mode	State	Action
0	4	4	Set Mode = 1
1	1	4	Set ModeActivate = TRUE
1	4	1	Value of State is saved in Mode parameter Pretuning is started
n	4	1	Pretuning canceled
n	4	4	Manual mode is started

If ActivateRecoverMode = TRUE, the operating mode that is saved in the Mode parameter is activated. At the start of transition time measurement, pretuning, or fine tuning, PID\_3Step saved the value of State in the Mode in/out parameter. PID\_3Step therefore switches to the operating mode from which transition time measurement or tuning was started.

If ActivateRecoverMode = FALSE, "Inactive" or "Approach substitute output value" mode is activated.

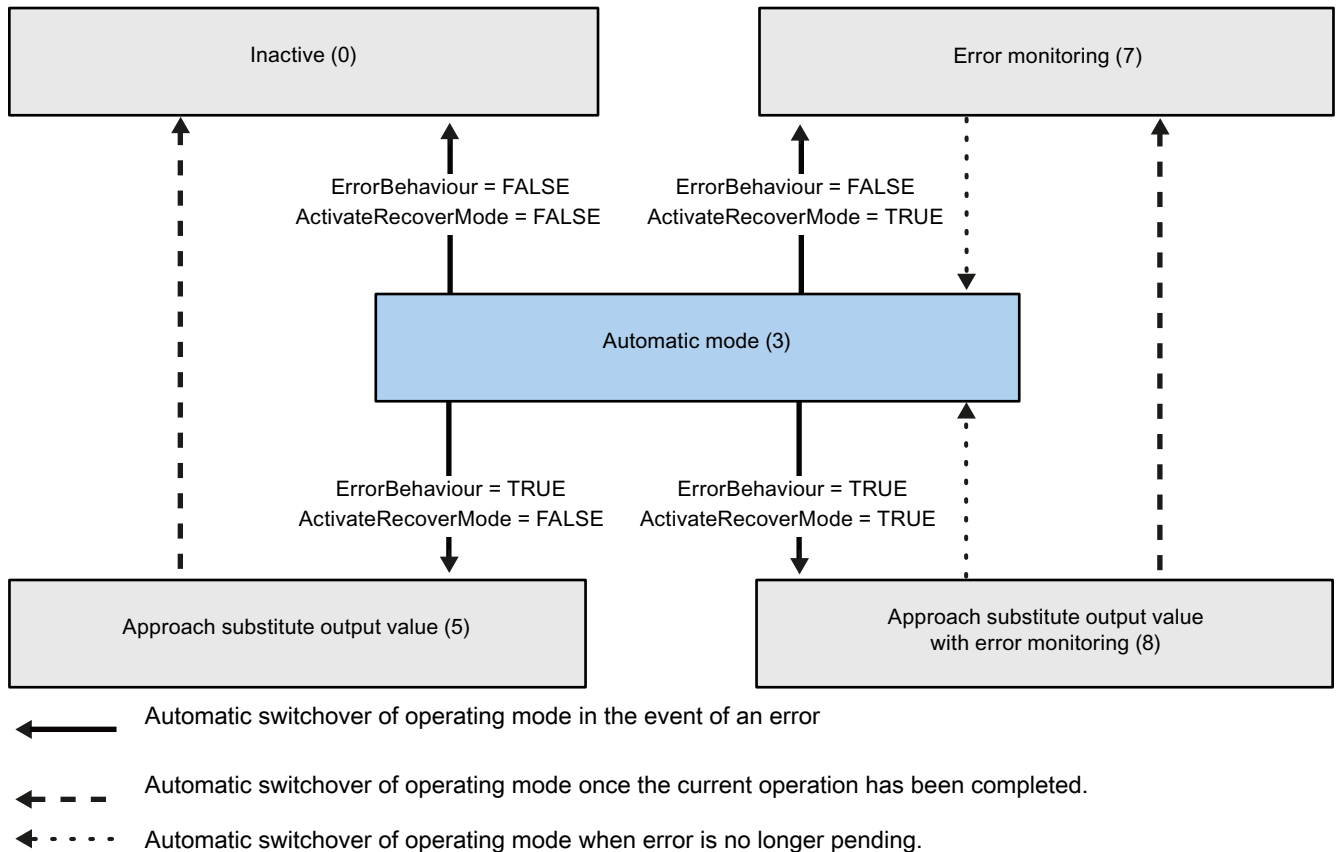

**Automatic switchover of operating mode after transition time measurement**

If ActivateRecoverMode = TRUE, the operating mode that is saved in the Mode parameter is activated after successful transition time measurement.

If ActivateRecoverMode = FALSE, the system switches to "Inactive" operating mode after successful transition time measurement.

### Automatic switchover of operating mode in automatic mode

PID\_3Step automatically switches the operating mode in the event of an error. The following diagram illustrates the influence of ErrorBehaviour and ActivateRecoverMode on this switchover of operating mode.

### Parameter ErrorBits V2

If several errors are pending simultaneously, the values of the ErrorBits are displayed with binary addition. The display of ErrorBits = 0003h, for example, indicates that the errors 0001h and 0002h are pending simultaneously.

If there is a position feedback, PID\_3Step uses ManualValue as output value in manual mode. The exception is Errorbits = 10000h.

ErrorBits (DW#16#...)	Description
0000	There is no error.
0001	<p>The "Input" parameter is outside the process value limits.</p> <ul style="list-style-type: none"> <li>• Input &gt; Config.InputUpperLimit or</li> <li>• Input &lt; Config.InputLowerLimit</li> </ul> <p>If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_3Step remains in automatic mode.</p> <p>If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.</p>
0002	<p>Invalid value at "Input_PER" parameter. Check whether an error is pending at the analog input.</p> <p>If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode. As soon as the error is no longer pending, PID_3Step switches back to automatic mode.</p> <p>If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.</p>
0004	<p>Error during fine tuning. Oscillation of the process value could not be maintained.</p> <p>If ActivateRecoverMode = TRUE before the error occurred, PID_3Step cancels the tuning and switches to the operating mode that is saved in the Mode parameter.</p>
0010	<p>The setpoint was changed during tuning.</p> <p>You can set the permitted fluctuation of the setpoint at the CancelTuningLevel tag.</p> <p>If ActivateRecoverMode = TRUE before the error occurred, PID_3Step cancels the tuning and switches to the operating mode that is saved in the Mode parameter.</p>
0020	<p>Pretuning is not permitted during fine tuning.</p> <p>If ActivateRecoverMode = TRUE before the error occurred, PID_3Step remains in fine tuning mode.</p>
0080	<p>Error during pretuning. Incorrect configuration of output value limits.</p> <p>Check whether the limits of the output value are configured correctly and match the control logic.</p> <p>If ActivateRecoverMode = TRUE before the error occurred, PID_3Step cancels the tuning and switches to the operating mode that is saved in the Mode parameter.</p>
0100	<p>Error during fine tuning resulted in invalid parameters.</p> <p>If ActivateRecoverMode = TRUE before the error occurred, PID_3Step cancels the tuning and switches to the operating mode that is saved in the Mode parameter.</p>
0200	<p>Invalid value at "Input" parameter: Value has an invalid number format.</p> <p>If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode. As soon as the error is no longer pending, PID_3Step switches back to automatic mode.</p> <p>If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.</p>
0400	<p>Calculation of output value failed. Check the PID parameters.</p> <p>If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode. As soon as the error is no longer pending, PID_3Step switches back to automatic mode.</p> <p>If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.</p>

ErrorBits (DW#16#...)	Description
0800	<p>Sampling time error: PID_3Step is not called within the sampling time of the cyclic interrupt OB.</p> <p>If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_3Step remains in automatic mode.</p> <p>If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.</p>
1000	<p>Invalid value at "Setpoint" parameter: Value has an invalid number format.</p> <p>If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode. As soon as the error is no longer pending, PID_3Step switches back to automatic mode.</p> <p>If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.</p>
2000	<p>Invalid value at Feedback_PER parameter.</p> <p>Check whether an error is pending at the analog input.</p> <p>The actuator cannot be moved to the substitute output value and remains in its current position. In manual mode, you can change the position of the actuator only with Manual_UP and Manual_DN, and not with ManualValue.</p> <p>If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.</p> <p>If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.</p>
4000	<p>Invalid value at Feedback parameter. Value has an invalid number format.</p> <p>The actuator cannot be moved to the substitute output value and remains in its current position. In manual mode, you can change the position of the actuator only with Manual_UP and Manual_DN, and not with ManualValue.</p> <p>If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.</p> <p>If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.</p>
8000	<p>Error during digital position feedback. Actuator_H = TRUE and Actuator_L = TRUE.</p> <p>The actuator cannot be moved to the substitute output value and remains in its current position. Manual mode is not possible in this state.</p> <p>In order to move the actuator from this state, you must deactivate the "Actuator endstop" (Config.ActuatorEndStopOn = FALSE) or switch to manual mode without endstop signals (Mode = 10).</p> <p>If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.</p> <p>If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.</p>
10000	<p>Invalid value at ManualValue parameter. Value has an invalid number format.</p> <p>The actuator cannot be moved to the manual value and remains in its current position.</p> <p>Specify a valid value in ManualValue or move the actuator in manual mode with Manual_UP and Manual_DN.</p>

ErrorBits (DW#16#...)	Description
20000	Invalid value at SavePosition tag. Value has an invalid number format. The actuator cannot be moved to the substitute output value and remains in its current position.
40000	Invalid value at Disturbance parameter. Value has an invalid number format. If automatic mode was active and ActivateRecoverMode = TRUE before the error occurred, Disturbance is set to zero. PID_3Step remains in automatic mode. If pretuning or fine tuning mode was active and ActivateRecoverMode = TRUE before the error occurred, PID_3Step switches to the operating mode saved in the Mode parameter. If Disturbance in the current phase has no effect on the output value, tuning is not be canceled. The error has no effect during transition time measurement.

### Tag ActivateRecoverMode V2

The ActivateRecoverMode tag determines the reaction to error. The Error parameter indicates if an error is pending. When the error is no longer pending, Error = FALSE. The ErrorBits parameter shows which errors have occurred.

<b>NOTICE</b>
<p><b>Your system may be damaged.</b></p> <p>If ActivateRecoverMode = TRUE, PID_3Step remains in automatic mode even if the process limit values are exceeded. This may damage your system.</p> <p>It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.</p>

## Automatic mode

ActivateRecover Mode	Description
FALSE	In the event of an error, PID_3Step switches to "Inactive" or "Approach substitute output value" mode. The controller is only activated by a falling edge at Reset or a rising edge at ModeActivate.
TRUE	<p>If errors occur frequently in automatic mode, this setting has a negative effect on the control response, because PID_3Step switches between the calculated output value and the substitute output value at each error. In this case, check the ErrorBits parameter and eliminate the cause of the error.</p> <p>If one or more of the following errors occur, PID_3Step stays in automatic mode:</p> <ul style="list-style-type: none"> <li>• 0001h: The "Input" parameter is outside the process value limits.</li> <li>• 0800h: Sampling time error</li> <li>• 40000h: Invalid value at Disturbance parameter.</li> </ul> <p>If one or more of the following errors occur, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode:</p> <ul style="list-style-type: none"> <li>• 0002h: Invalid value at Input_PER parameter.</li> <li>• 0200h: Invalid value at Input parameter.</li> <li>• 0400h: Calculation of output value failed.</li> <li>• 1000h: Invalid value at Setpoint parameter.</li> </ul> <p>If one or more of the following errors occur, PID_3Step can no longer move the actuator:</p> <ul style="list-style-type: none"> <li>• 2000h: Invalid value at Feedback_PER parameter.</li> <li>• 4000h: Invalid value at Feedback parameter.</li> <li>• 8000h: Error during digital position feedback.</li> <li>• 20000h: Invalid value at SavePosition tag. Value has an invalid number format.</li> </ul> <p>The characteristics are independent of ErrorBehaviour.</p> <p>As soon as the errors are no longer pending, PID_3Step switches back to automatic mode.</p>

## Pretuning, fine tuning, and transition time measurement

ActivateRecover Mode	Description
FALSE	In the event of an error, PID_3Step switches to "Inactive" or "Approach substitute output value" mode. The controller is only activated by a falling edge at Reset or a rising edge at ModeActivate. The controller changes to "Inactive" mode after successful transition time measurement.
TRUE	<p>If the following error occurs, PID_3Step remains in the active mode:</p> <ul style="list-style-type: none"> <li>• 0020h: Pretuning is not permitted during fine tuning.</li> </ul> <p>The following errors are ignored:</p> <ul style="list-style-type: none"> <li>• 10000h: Invalid value at ManualValue parameter.</li> <li>• 20000h: Invalid value at SavePosition tag.</li> </ul> <p>When any other error occurs, PID_3Step cancels the tuning and switches to the mode from which tuning was started.</p>

## Manual mode

ActivateRecoverMode is not effective in manual mode.

**Tag Warning V2**

If several warnings are pending simultaneously, their values are displayed with binary addition. The display of warning 0005h, for example, indicates that the warnings 0001h and 0004h are pending simultaneously.

Warning (DW#16#...)	Description
0000	No warning pending.
0001	The point of inflection was not found during pretuning.
0004	The setpoint was limited to the configured limits.
0008	Not all the necessary controlled system properties were defined for the selected method of calculation. Instead, the PID parameters were calculated using the TIR.TuneRule = 3 method.
0010	The operating mode could not be changed because Reset = TRUE or ManualEnable = TRUE.
0020	The cycle time of the calling OB limits the sampling time of the PID algorithm. Improve results by using shorter OB cycle times.
0040	The process value exceeded one of its warning limits.
0080	Invalid value at Mode. The operating mode is not switched.
0100	The manual value was limited to the limits of the controller output.
0200	The specified rule for tuning is not supported. No PID parameters are calculated.
0400	The transition time cannot be measured because the actuator settings do not match the selected measuring method.
0800	The difference between the current position and the new output value is too small for transition time measurement. This can produce incorrect results. The difference between the current output value and new output value must be at least 50% of the entire control range.
1000	The substitute output value cannot be reached because it is outside the output value limits.
2000	The actuator was moved in one direction for longer than Config.VirtualActuatorLimit × Retain.TransitTime. Check whether the actuator has reached an endstop signal.

The following warnings are deleted as soon as the cause is eliminated:

- 0001h
- 0004h
- 0008h
- 0040h
- 0100h
- 2000h

All other warnings are cleared with a rising edge at Reset or ErrorAck.

## PID\_3Step V1

### Description PID\_3Step V1

#### Description

You use the PID\_3Step instruction to configure a PID controller with self tuning for valves or actuators with integrating behavior.

The following operating modes are possible:

- Inactive
- Pretuning
- Fine tuning
- Automatic mode
- Manual mode
- Approach substitute output value
- Transition time measurement
- Approach substitute output value with error monitoring
- Error monitoring

For a more detailed description of the operating modes, see the State parameter.

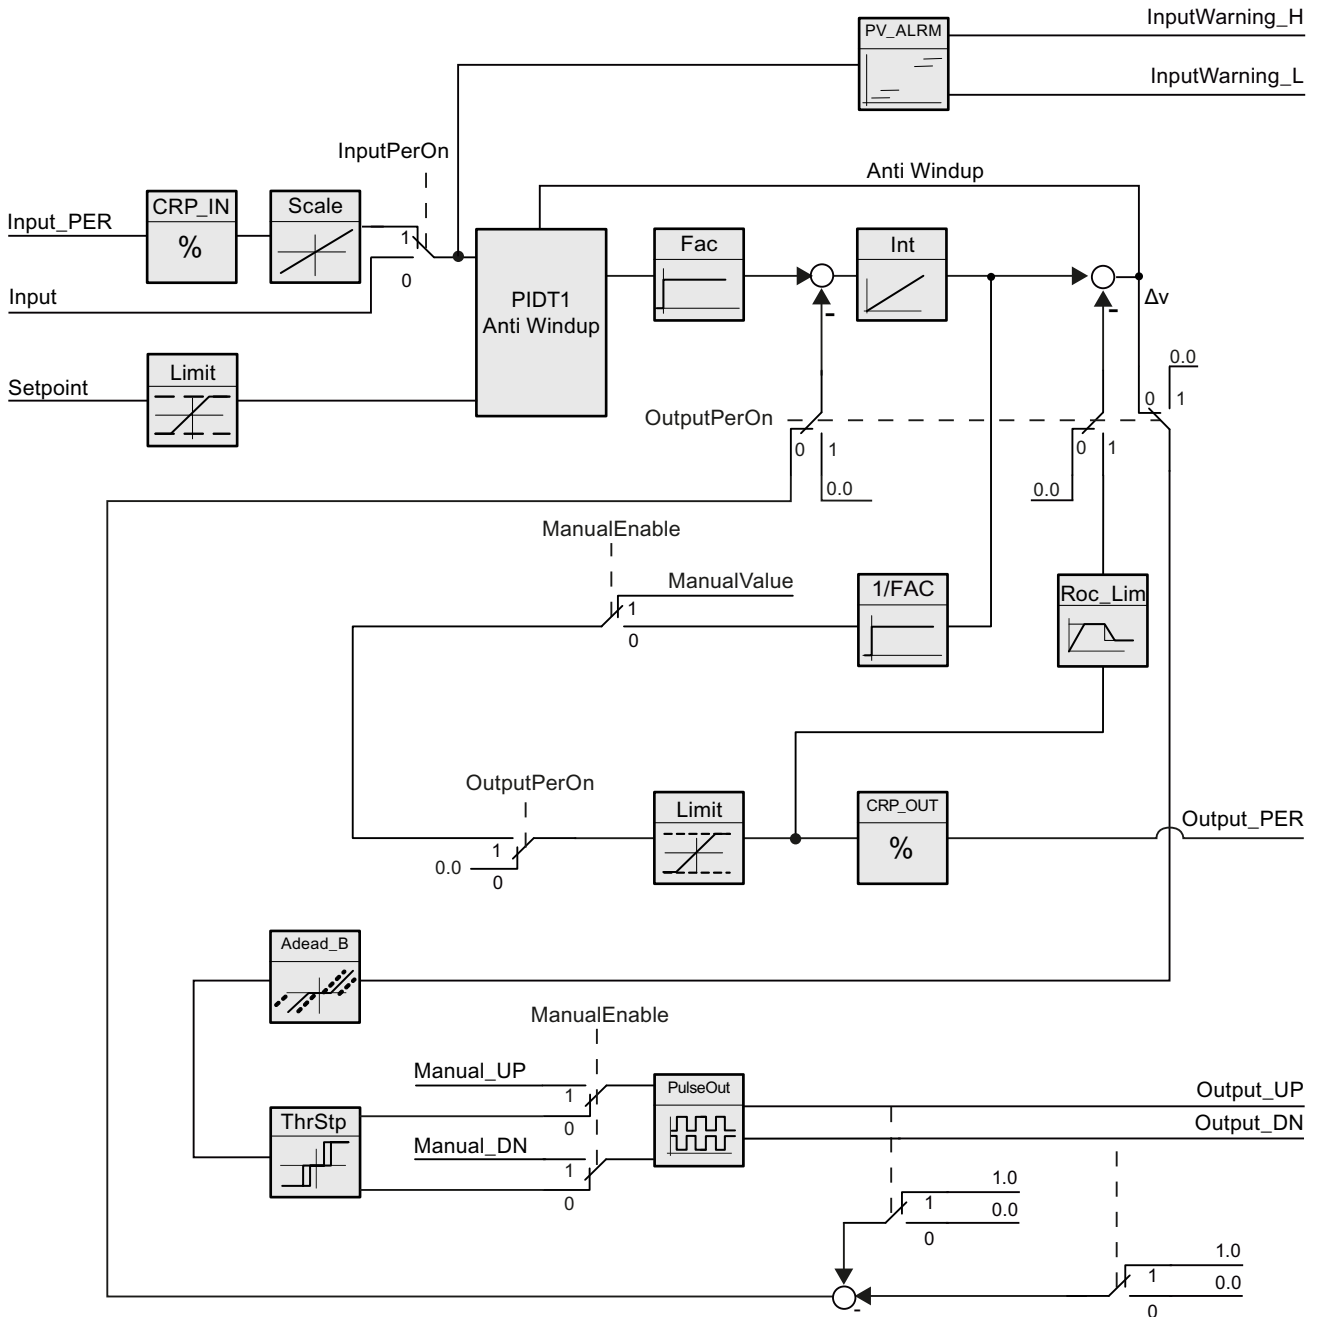

**PID algorithm**

PID\_3Step is a PIDT1 controller with anti-windup and weighting of the proportional and derivative actions. The following equation is used to calculate the output value.

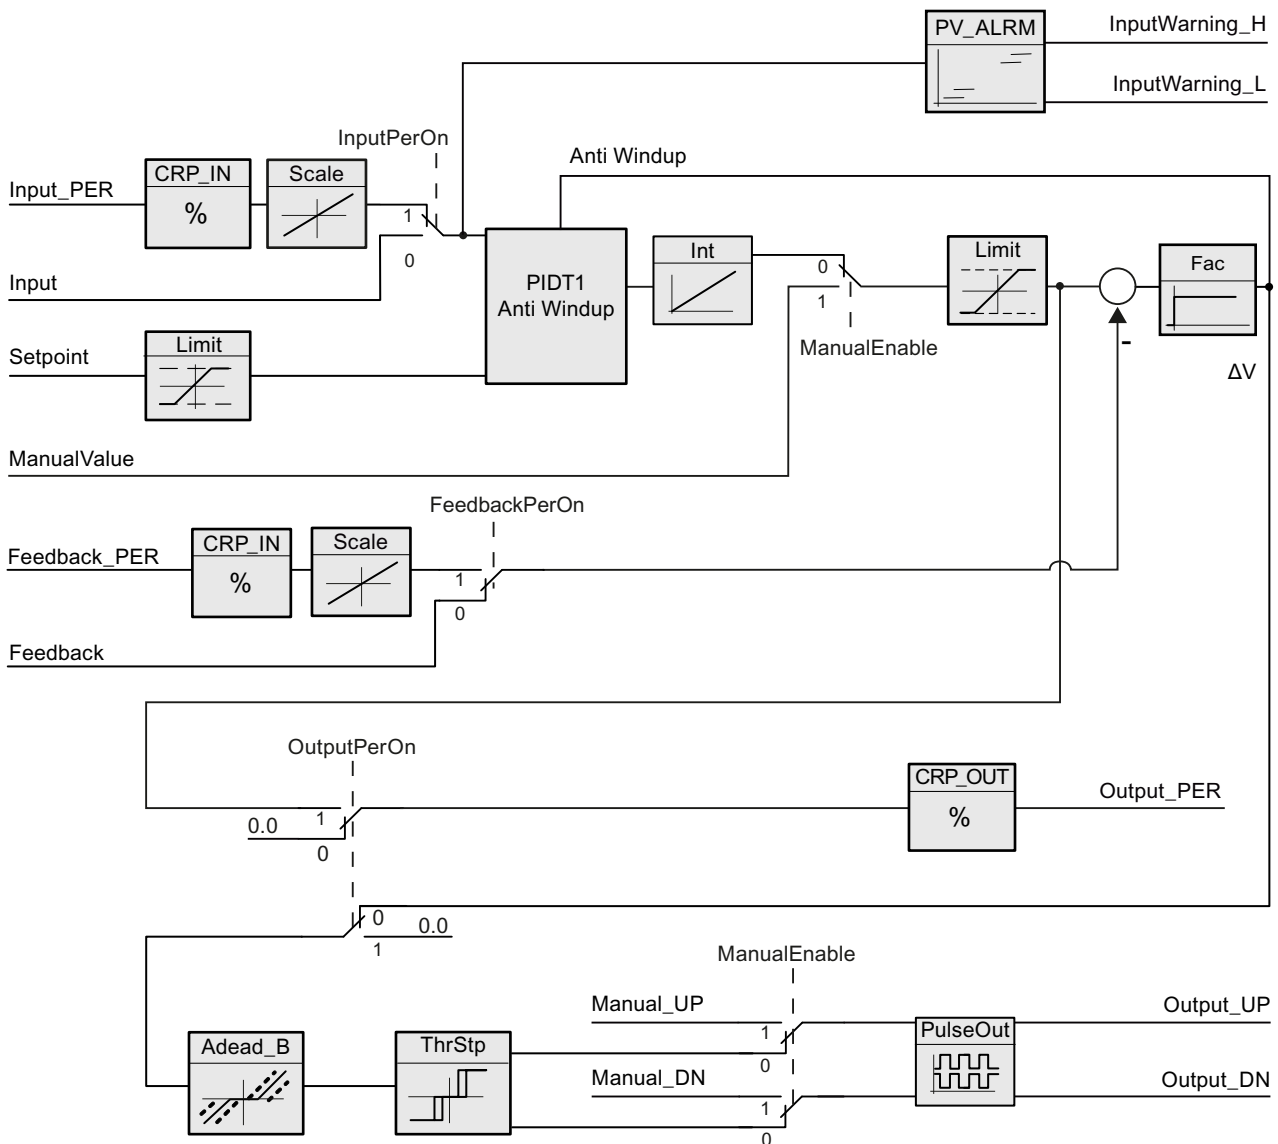

$$\Delta y = K_p \cdot s \cdot \left[ (b \cdot w - x) + \frac{1}{T_i \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

Symbol	Description
y	Output value
K <sub>p</sub>	Proportional gain
s	Laplace operator
b	Proportional action weighting
w	Setpoint
x	Process value
T <sub>i</sub>	Integral action time
a	Derivative delay coefficient (T1 = a × T <sub>D</sub> )
T <sub>D</sub>	Derivative action time
c	Derivative action weighting

Block diagram without position feedback

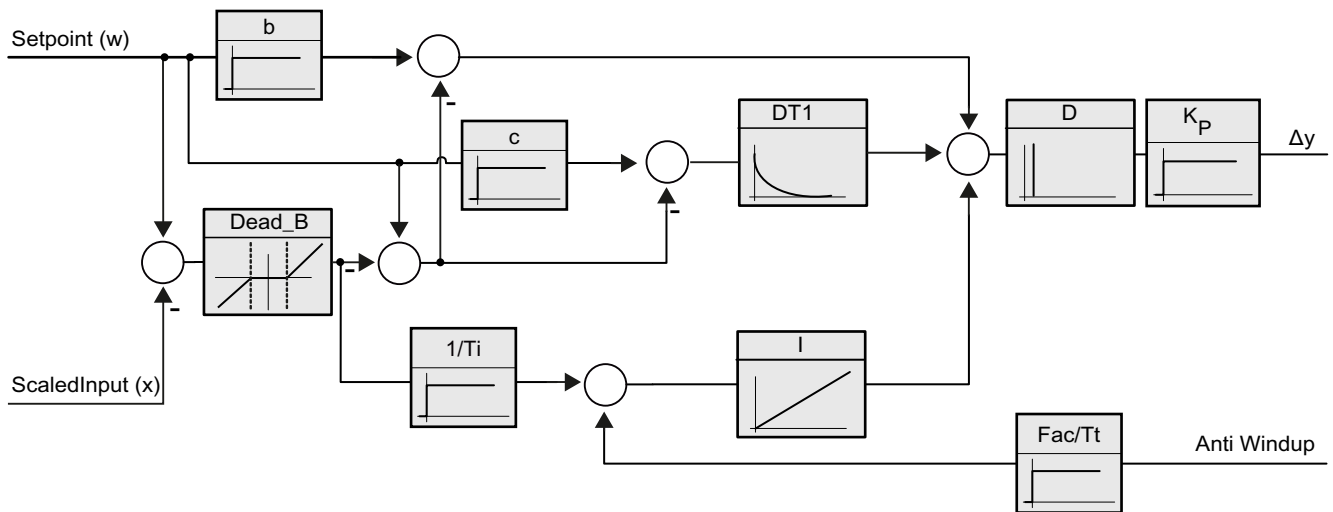

Block diagram with position feedback

**Block diagram of PIDT1 with anti-windup**

**Call**

PID\_3Step is called in a constant time interval of the cycle time of the calling OB (preferably in a cyclic interrupt OB).

**Download to device**

The actual values of retentive tags are only updated when you download PID\_3Step completely.

Downloading technology objects to device (Page 6325)

**Startup**

At the startup of the CPU, PID\_3Step starts in the operating mode that was last active. To leave PID\_3Step in "Inactive" mode, set RunModeByStartup = FALSE.

**Reaction to error**

If errors occur, these are output in the Error parameter. You configure the reaction of PID\_3Step using the ErrorBehaviour and ActivateRecoverMode tags.

ErrorBehaviour	ActivateRecoverMode	Actuator setting configuration Set Output to	Reaction
0	FALSE	Current output value	Switch to "Inactive" mode (Mode = 0)
0	TRUE	Current output value while error is pending	Switch to "Error monitoring" mode (Mode = 7)

ErrorBehaviour	ActivateRecoverMode	Actuator setting configuration Set Output to	Reaction
1	FALSE	Substitute output value	Switch to "Approach substitute output value" mode (Mode = 5) Switch to "Inactive" mode (Mode = 0)
1	TRUE	Substitute output value while error is pending	Switch to "Approach substitute output value with error monitoring" mode (Mode = 8) Switch to "Error monitoring" mode (Mode = 7)

The ErrorBits parameter shows which errors have occurred.

Parameter ErrorBits V1 (Page 3045)

Configuring PID\_3Step V1 (Page 6396)

**Operating principle PID\_3Step V1**

**Monitoring process value limits**

You specify the high limit and low limit of the process value in the Config.InputUpperLimit and Config.InputLowerLimit tags. If the process value is outside these limits, an error occurs (ErrorBits = 0001hex).

You specify a high and low warning limit of the process value in the Config.InputUpperWarning and Config.InputLowerWarning tags. If the process value is outside these warning limits, a warning occurs (Warnings = 0040hex), and the InputWarning\_H or InputWarning\_L output parameter changes to TRUE.

**Limiting the setpoint**

You specify a high limit and low limit of the setpoint in the Config.SetpointUpperLimit and Config.SetpointLowerLimit tags. PID\_3Step automatically limits the setpoint to the process value limits. You can limit the setpoint to a smaller range. PID\_3Step checks whether this range falls within the process value limits. If the setpoint is outside these limits, the high or low limit is used as the setpoint, and output parameter SetpointLimit\_H or SetpointLimit\_L is set to TRUE.

The setpoint is limited in all operating modes.

## Limiting the output value

You specify a high limit and low limit of the output value in the Config.OutputUpperLimit and Config.OutputLowerLimit tags. The output value limits must be within "Low endstop" and "High endstop".

- High endstop: Config.FeedbackScaling.UpperPointOut
- Low endstop: Config.FeedbackScaling.LowerPointOut

Rule:

UpperPointOut  $\geq$  OutputUpperLimit > OutputLowerLimit  $\geq$  LowerPointOut

The valid values for "High endstop" and "Low endstop" depend upon:

- FeedbackOn
- FeedbackPerOn
- OutputPerOn

OutputPerOn	FeedbackOn	FeedbackPerOn	LowerPointOut	UpperPointOut
FALSE	FALSE	FALSE	Cannot be set (0.0%)	Cannot be set (100.0%)
FALSE	TRUE	FALSE	-100.0% or 0.0%	0.0% or +100.0%
FALSE	TRUE	TRUE	-100.0% or 0.0%	0.0% or +100.0%
TRUE	FALSE	FALSE	Cannot be set (100.0%)	Cannot be set (100.0%)
TRUE	TRUE	FALSE	-100.0% or 0.0%	0.0% or +100.0%
TRUE	TRUE	TRUE	-100.0% or 0.0%	0.0% or +100.0%

If OutputPerOn = FALSE and FeedbackOn = FALSE, you cannot limit the output value. The digital outputs are reset with Actuator\_H = TRUE or Actuator\_L = TRUE, or after a travel time amounting to 110% of the motor transition time.

The output value is 27648 at 100% and -27648 at -100%. PID\_3Step must be able to close the valve completely. Therefore, zero must be included in the output value limits.

## Substitute output value

If an error has occurred, PID\_3Step can output a substitute output value and move the actuator to a safe position that is specified in the SavePosition tag. The substitute output value must be within the output value limits.

## Monitoring signal validity

The values of the following parameters are monitored for validity:

- Setpoint
- Input
- Input\_PER
- Feedback
- Feedback\_PER
- Output

### Monitoring the PID\_3Step sampling time

Ideally, the sampling time is equivalent to the cycle time of the calling OB. The PID\_3Step instruction measures the time interval between two calls. This is the current sampling time. On every switchover of operating mode and during the initial startup, the mean value is formed from the first 10 sampling times. Too great a difference between the current sampling time and this mean value triggers an error (ErrorBits = 0800 hex).

PID\_3Step is set to "Inactive" mode during tuning under the following conditions:

- New mean value  $\geq 1.1 \times$  old mean value
- New mean value  $\leq 0.9 \times$  old mean value

In automatic mode, PID\_3Step is set to "Inactive" mode under the following conditions:

- New mean value  $\geq 1.5 \times$  old mean value
- New mean value  $\leq 0.5 \times$  old mean value

### Sampling time of the PID algorithm

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the cycle time. All other functions of PID\_3Step are executed at every call.

### Measuring the motor transition time

The motor transition time is the time in seconds the motor requires to move the actuator from the closed to the opened state. The maximum time that the actuator is moved in one direction is 110% of the motor transition time. PID\_3Step requires the motor transition time to be as accurate as possible for good controller results. The data in the actuator documentation contains average values for this type of actuator. The value for the specific actuator used may differ. You can measure the motor transition time during commissioning. The output value limits are not taken into consideration during the motor transition time measurement. The actuator can travel to the high or the low endstop.

### Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic. For cooling and discharge control systems, it may be necessary to invert the control logic. PID\_3Step does not work with negative proportional gain. If InvertControl = TRUE, an increasing control deviation causes a reduction in the output value. The control logic is also taken into account during pretuning and fine tuning.

## PID\_3Step V1 input parameters

Table 9-89

Parameters	Data type	Default	Description
Setpoint	REAL	0.0	Setpoint of the PID controller in automatic mode
Input	REAL	0.0	A variable of the user program is used as source for the process value. If you are using parameter Input, then Config.InputPerOn = FALSE must be set.
Input_PER	WORD	W#16#0	An analog input is used as source for the process value. If you are using parameter Input_PER, then Config.InputPerOn = TRUE must be set.
Actuator_H	BOOL	FALSE	Digital position feedback of the valve for the high endstop If Actuator_H = TRUE, the valve is at the high endstop and is no longer moved towards this direction.
Actuator_L	BOOL	FALSE	Digital position feedback of the valve for the low endstop If Actuator_L = TRUE, the valve is at the low endstop and is no longer moved towards this direction.
Feedback	REAL	0.0	Position feedback of the valve If you are using parameter Feedback, then Config.FeedbackPerOn = FALSE must be set.
Feedback_PER	WORD	W#16#0	Analog feedback of the valve position If you are using parameter Feedback_PER, then Config.FeedbackPerOn = TRUE must be set. Feedback_PER is scaled based on the variables: <ul style="list-style-type: none"> <li>• Config.FeedbackScaling.LowerPointIn</li> <li>• Config.FeedbackScaling.UpperPointIn</li> <li>• Config.FeedbackScaling.LowerPointOut</li> <li>• Config.FeedbackScaling.UpperPointOut</li> </ul>
ManualEnable	BOOL	FALSE	<ul style="list-style-type: none"> <li>• A FALSE -&gt; TRUE edge selects "Manual mode", while State = 4, Retain.Mode remains unchanged.</li> <li>• A TRUE -&gt; FALSE edge selects the most recently active operating mode</li> </ul> <p>A change of Retain.Mode will not take effect during ManualEnable = TRUE. The change of Retain.Mode will only be considered upon a TRUE -&gt; FALSE edge at ManualEnable .</p> <p><b>PID_3Step V1.1</b> If at start of the CPU ManualEnable = TRUE, PID_3Step starts in manual mode. A rising edge (FALSE &gt; TRUE) at ManualEnable is not necessary.</p> <p><b>PID_3Step V1.0</b> At the start of the CPU, PID_3Step only switches to manual mode with a rising edge (FALSE-&gt;TRUE) at ManualEnable . Without rising edge, PID_3Step starts in the last operating mode in which ManualEnable was FALSE.</p>
ManualValue	REAL	0.0	In manual mode, you specify the absolute position of the valve. ManualValue will only be evaluated if you are using OutputPer, or if position feedback is available.

9.7 References

Parameters	Data type	Default	Description
Manual_UP	BOOL	FALSE	In manual mode, every rising edge opens the valve by 5% of the total control range, or for the duration of the minimum motor transition time. Manual_UP is evaluated only if you are not using Output_PER and there is no position feedback available.
Manual_DN	BOOL	FALSE	In manual mode, every rising edge closes the valve by 5% of the total control range, or for the duration of the minimum motor transition time. Manual_DN is evaluated only if you are not using Output_PER and there is no position feedback available.
Reset	BOOL	FALSE	<p>Restarts the controller.</p> <ul style="list-style-type: none"> <li>• FALSE -&gt; TRUE edge                             <ul style="list-style-type: none"> <li>- Change to "Inactive" mode</li> <li>- Intermediate controller values are reset (PID parameters are retained)</li> </ul> </li> <li>• TRUE -&gt; FALSE edge                             <ul style="list-style-type: none"> <li>- Change in most recent active mode</li> </ul> </li> </ul>

PID\_3Step V1 output parameters

Table 9-90

Parameter	Data type	Default	Description
ScaledInput	REAL	0.0	Scaled process value
ScaledFeedback	REAL	0.0	<p>Scaled position feedback</p> <p>For an actuator without position feedback, the position of the actuator indicated by ScaledFeedback is very imprecise. ScaledFeedback may only be used for rough estimation of the current position in this case.</p>
Output_UP	BOOL	FALSE	<p>Digital output value for opening the valve</p> <p>If Config.OutputPerOn = FALSE, the Output_UP parameter is used.</p>
Output_DN	BOOL	FALSE	<p>Digital output value for closing the valve</p> <p>If Config.OutputPerOn = FALSE, the Output_DN parameter is used.</p>
Output_PER	WORD	W#16#0	<p>Analog output value</p> <p>If Config.OutputPerOn = TRUE, Output_PER is used.</p>
SetpointLimit_H	BOOL	FALSE	<p>If SetpointLimit_H = TRUE, the absolute setpoint high limit is reached. In the CPU, the setpoint is limited to the configured absolute setpoint high limit. The configured absolute process value high limit is the default for the setpoint high limit.</p> <p>If you configure Config.SetpointUpperLimit to a value within the process value limits, this value is used as the setpoint high limit.</p>
SetpointLimit_L	BOOL	FALSE	<p>If SetpointLimit_L = TRUE, the absolute setpoint low limit has been reached. In the CPU, the setpoint is limited to the configured absolute setpoint low limit. The configured absolute process value low limit is the default setting for the setpoint low limit.</p> <p>If you configure Config.SetpointLowerLimit to a value within the process value limits, this value is used as the setpoint low limit.</p>

Parameter	Data type	Default	Description
InputWarning_H	BOOL	FALSE	If InputWarning_H = TRUE, the process value has reached or exceeded the warning high limit.
InputWarning_L	BOOL	FALSE	If InputWarning_L = TRUE, the process value has reached or fallen below the warning low limit.
State	INT	0	The State parameter (Page 3038) shows the current operating mode of the PID controller. You change the operating mode with the Retain.Mode tag. <ul style="list-style-type: none"> <li>• State = 0: Inactive</li> <li>• State = 1: Pretuning</li> <li>• State = 2: Fine tuning</li> <li>• State = 3: Automatic mode</li> <li>• State = 4: Manual mode</li> <li>• State = 5: Approach substitute output value</li> <li>• State = 6: Transition time measurement</li> <li>• State = 7: Error monitoring</li> <li>• State = 8: Approach substitute output value with error monitoring</li> </ul>
Error	BOOL	FALSE	If Error = TRUE, at least one error message is pending.
ErrorBits	DWORD	DW#16#0	The ErrorBits parameter (Page 3045) indicates the error messages.

### PID\_3Step V1 static tags

You must not change tags that are not listed. These are used for internal purposes only.

Table 9-91

Tag	Data type	Default	Description
ActivateRecoverMode	BOOL	TRUE	The ActivateRecoverMode tag (Page 3046) determines the reaction to error.
RunModeByStartup	BOOL	TRUE	Activate Mode after CPU restart If RunModeByStartup = TRUE, the controller returns to the last active operating mode after a CPU restart. If RunModeByStartup = FALSE, the controller remains inactive after a CPU restart.
PhysicalUnit	INT	0	Unit of measurement of the process value and setpoint, e.g., °C, or °F.
PhysicalQuantity	INT	0	Physical quantity of the process value and setpoint, e.g., temperature.

Tag	Data type	Default	Description
ErrorBehaviour	INT	0	<p>If ErrorBehaviour = 0 and an error has occurred, the valve stays at its current position and the controller switches directly to "Inactive" or "Error monitoring" mode.</p> <p>If ErrorBehaviour = 1 and an error occurs, the actuator moves to the substitute output value and only then switches to "Inactive" or "Error monitoring" mode.</p> <p>If the following errors occur, you can no longer move the valve to a configured substitute output value.</p> <ul style="list-style-type: none"> <li>• 2000h: Invalid value at Feedback_PER parameter.</li> <li>• 4000h: Invalid value at Feedback parameter.</li> <li>• 8000h: Error during digital position feedback.</li> </ul>
Warning	DWORD	DW#16#0	<p>The Warning tag (Page 3038) displays the warnings generated since a Reset or since the last switchover of operating mode.</p> <p>Cyclic warnings (for example, process value warning) are shown until the cause of the warning is removed. They are automatically deleted once their cause has gone. Non-cyclic warnings (for example, point of inflection not found) remain and are deleted like errors.</p>
SavePosition	REAL	0.0	<p>Substitute output value</p> <p>If ErrorBehaviour = 1 and an error occurs, the actuator moves to a safe position for the plant and only then switches to "Inactive" mode.</p>
CurrentSetpoint	REAL	0.0	Currently active setpoint. This value is frozen at the start of tuning.
Progress	REAL	0.0	Progress of tuning as a percentage (0.0 - 100.0)
Config.InputPerOn	BOOL	TRUE	If InputPerOn = TRUE, the Input_PER parameter is used. If InputPerOn = FALSE, the Input parameter is used.
Config.OutputPerOn	BOOL	FALSE	If OutputPerOn = TRUE, the Output_PER parameter is used. If OutputPerOn = FALSE, the Ouput_UP and Output_DN parameters are used.
Config.LoadBackUp	BOOL	FALSE	If LoadBackUp = TRUE, the last set of PID parameters is reloaded. This set was saved prior to the last tuning operation. LoadBackUp is automatically reset to FALSE.
Config.InvertControl	BOOL	FALSE	<p>Invert control logic</p> <p>If InvertControl = TRUE, an increasing control deviation causes a reduction in the output value.</p>
Config.FeedbackOn	BOOL	FALSE	<p>If FeedbackOn = FALSE, a position feedback is simulated.</p> <p>Position feedback is generally activated when FeedbackOn = TRUE.</p>
Config.FeedbackPerOn	BOOL	FALSE	<p>FeedbackPerOn is only effective when FeedbackOn = TRUE.</p> <p>If FeedbackPerOn = TRUE, the analog input is used for the position feedback (Feedback_PER parameter).</p> <p>If FeedbackPerOn = FALSE, the Feedback parameter is used for the position feedback.</p>
Config.ActuatorEndStopOn	BOOL	FALSE	If ActuatorEndStopOn = TRUE, the digital position feedback Actuator_L and Actuator_H are taken into consideration.

Tag	Data type	Default	Description
Config.InputUpperLimit	REAL	120.0	High limit of the process value At the I/O input, the process value can be a maximum of 18% higher than the standard range (overrange). An error is no longer signaled due to a violation of the "Process value high limit". Only a wire-break and a short-circuit are recognized and PID_3Step reacts according to the configured reaction to error. InputUpperLimit > InputLowerLimit
Config.InputLowerLimit	REAL	0.0	Low limit of the process value InputLowerLimit < InputUpperLimit
Config.InputUpperWarning	REAL	+3.40282 2e+38	Warning high limit of the process value If you set InputUpperWarning outside the process value limits, the configured absolute process value high limit is used as the warning high limit. If you configure InputUpperWarning within the process value limits, this value is used as the warning high limit. InputUpperWarning > InputLowerWarning InputUpperWarning ≤ InputUpperLimit
Config.InputLowerWarning	REAL	-3.40282 2e+38	Warning low limit of the process value If you set InputLowerWarning outside the process value limits, the configured absolute process value low limit is used as the warning low limit. If you configure InputLowerWarning within the process value limits, this value is used as the warning low limit. InputLowerWarning < InputUpperWarning InputLowerWarning ≥ InputLowerLimit
Config.OutputUpperLimit	REAL	100.0	High limit of output value For details, see OutputLowerLimit
Config.OutputLowerLimit	REAL	0.0	Low limit of output value If OutputPerOn = TRUE or FeedbackOn = TRUE, the range of values from -100% to +100%, including zero, is valid. At -100%, Output = -27648; at +100%, Output = 27648 If OutputPerOn = FALSE, the range of values from 0% to 100% is valid. The valve is completely closed at 0% and completely opened at 100%.
Config.SetpointUpperLimit	REAL	+3.40282 2e+38	High limit of setpoint If you set SetpointUpperLimit outside the process value limits, the configured absolute process value high limit is preassigned as the setpoint high limit. If you configure SetpointUpperLimit within the process value limits, this value is used as the setpoint high limit.
Config.SetpointLowerLimit	REAL	- 3.40282 e+38	Low limit of the setpoint If you set SetpointLowerLimit outside the process value limits, the configured absolute process value low limit is preassigned as the setpoint low limit. If you set SetpointLowerLimit within the process value limits, this value is used as the setpoint low limit.

Tag	Data type	Default	Description
Config.MinimumOnTime	REAL	0.0	Minimum ON time Minimum time in seconds for which the servo drive must be switched on.
Config.MinimumOffTime	REAL	0.0	Minimum OFF time Minimum time in seconds for which the servo drive must be switched off.
Config.TransitTime	REAL	30.0	Motor transition time Time in seconds the actuating drive requires to move the valve from the closed to the opened state.
Config.InputScaling.UpperPointIn	REAL	27648.0	Scaling Input_PER high Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the InputScaling structure.
Config.InputScaling.LowerPointIn	REAL	0.0	Scaling Input_PER low Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the InputScaling structure.
Config.InputScaling.UpperPointOut	REAL	100.0	Scaled high process value Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the InputScaling structure.
Config.InputScaling.LowerPointOut	REAL	0.0	Scaled low process value Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the InputScaling structure.
Config.FeedbackScaling.UpperPointIn	REAL	27648.0	Scaling Feedback_PER high Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the FeedbackScaling structure.
Config.FeedbackScaling.LowerPointIn	REAL	0.0	Scaling Feedback_PER low Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the FeedbackScaling structure.
Config.FeedbackScaling.UpperPointOut	REAL	100.0	High endstop Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the FeedbackScaling structure.
Config.FeedbackScaling.LowerPointOut	REAL	0.0	Low endstop Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the FeedbackScaling structure.
GetTransitTime.InvertDirection	BOOL	FALSE	If InvertDirection = FALSE, the valve is fully opened, closed, and then reopened in order to determine the valve transition time. If InvertDirection = TRUE, the valve is fully closed, opened, and then closed again.

Tag	Data type	Default	Description
GetTransitTime.SelectFeedback	BOOL	FALSE	If SelectFeedback = TRUE, then Feedback_PER, or Feedback is taken into consideration in the transition time measurement. If SelectFeedback = FALSE, then Actuator_H and Actuator_L are taken into consideration in the transition time measurement.
GetTransitTime.Start	BOOL	FALSE	If Start = TRUE, the transition time measurement is started.
GetTransitTime.State	INT	0	Current phase of the transition time measurement <ul style="list-style-type: none"> <li>• State = 0: Inactive</li> <li>• State = 1: Open valve completely</li> <li>• State = 2: Close valve completely</li> <li>• State = 3: Move valve to target position (NewOutput)</li> <li>• State = 4: Transition time measurement successfully completed</li> <li>• State = 5: Transition time measurement canceled</li> </ul>
GetTransitTime.NewOutput	REAL	0.0	Target position for transition time measurement with position feedback The target position must be between "High endstop" and "Low endstop". The difference between NewOutput and ScaledFeedback must be at least 50% of the permissible control range.
CycleTime.StartEstimation	BOOL	TRUE	If StartEstimation = TRUE, the measurement of the PID_3Step sampling time is started. CycleTime.StartEstimation = FALSE once measurement is complete.
CycleTime.EnEstimation	BOOL	TRUE	If EnEstimation = TRUE, the PID_3Step sampling time is calculated.
CycleTime.EnMonitoring	BOOL	TRUE	If EnMonitoring = TRUE, the PID_3Step sampling time is monitored. If it is not possible to execute PID_3Step within the sampling time, the error 0800h is output and the operating mode is switched. ActivateRecoverMode and ErrorBehaviour determine which operating mode is switched to. If EnMonitoring = FALSE, the PID_3Step sampling time is not monitored, the error 0800h is not output, and the operating mode is not switched.
CycleTime.Value	REAL	0.1	PID_3Step sampling time in seconds CycleTime.Value is determined automatically and is usually equivalent to the cycle time of the calling OB.
CtrlParamsBackUp.SetByUser	BOOL	FALSE	Saved value of Retain.CtrlParams.SetByUser. You can reload values from the CtrlParamsBackUp structure with Config.LoadBackUp = TRUE.
CtrlParamsBackUp.Gain	REAL	1.0	Saved proportional gain
CtrlParamsBackUp.Ti	REAL	20.0	Saved integral action time
CtrlParamsBackUp.Td	REAL	0.0	Saved derivative action time
CtrlParamsBackUp.TdFiltRatio	REAL	0.0	Saved derivative delay coefficient
CtrlParamsBackUp.PWeighting	REAL	0.0	Saved proportional action weighting
CtrlParamsBackUp.DWeighting	REAL	0.0	Saved derivative action weighting
CtrlParamsBackUp.Cycle	REAL	1.0	Saved sampling time of PID algorithm
CtrlParamsBackUp.InputDeadBand	REAL	0.0	Saved dead band width of the control deviation

Parameter State and Retain.Mode V1 (Page 3038)

Tag ActivateRecoverMode V1 (Page 3046)

Downloading technology objects to device (Page 6325)

**Parameter State and Retain.Mode V1**

**Correlation of the parameters**

The State parameter shows the current operating mode of the PID controller. You cannot change the State parameter.

To switch from one operating mode to another, you must change the Retain.Mode tag. This also applies when the value for the new operating mode is already in Retain.Mode. For example, set Retain.Mode = 0 first and then Retain.Mode = 3. Provided the current operating mode of the controller permits this switchover, State will be set to the value of Retain.Mode.

When PID\_3Step automatically switches from one operating mode to another, the following applies: State != Retain.Mode.

Examples:

- After successful pretuning  
State = 3 and Retain.Mode = 1
- In the event of an error  
State = 0 and Retain.Mode remain at the previous value, for example, Retain.Mode = 3
- ManualEnalbe = TRUE  
State = 4 and Retain.Mode remain at the previous value, e.g., Retain.Mode = 3

---

**Note**

You want, for example, to repeat successful fine tuning without exiting automatic mode with Mode = 0.

Setting Retain.Mode to an invalid value such as 9999 for one cycle has no effect on State. Set Mode = 2 in the next cycle. In this way, you can generate a change to Retain.Mode without first switching to "Inactive" mode.

---

## Meaning of values

State / Retain.Mode	Description
0	<p>Inactive</p> <p>The controller is switched off and no longer changes the valve position.</p>
1	<p>Pretuning</p> <p>The pretuning determines the process response to a pulse of the output value and searches for the point of inflection. The optimized PID parameters are calculated as a function of the maximum rate of rise and dead time of the controlled system.</p> <p>Pretuning requirements:</p> <ul style="list-style-type: none"> <li>• State = 0 or State = 4</li> <li>• ManualEnable = FALSE</li> <li>• The motor transition time has been configured or measured.</li> <li>• The setpoint and the process value lie within the configured limits.</li> </ul> <p>The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher as compared to the noise.</p> <p>Before the PID parameters are recalculated, they are backed up and can be reactivated with Config.LoadBackUp. The setpoint is frozen in the CurrentSetpoint tag.</p> <p>The controller switches to automatic mode following successful pretuning and to "Inactive" mode following unsuccessful pretuning.</p> <p>The pretuning phase is indicated with the SUT.State tag.</p>

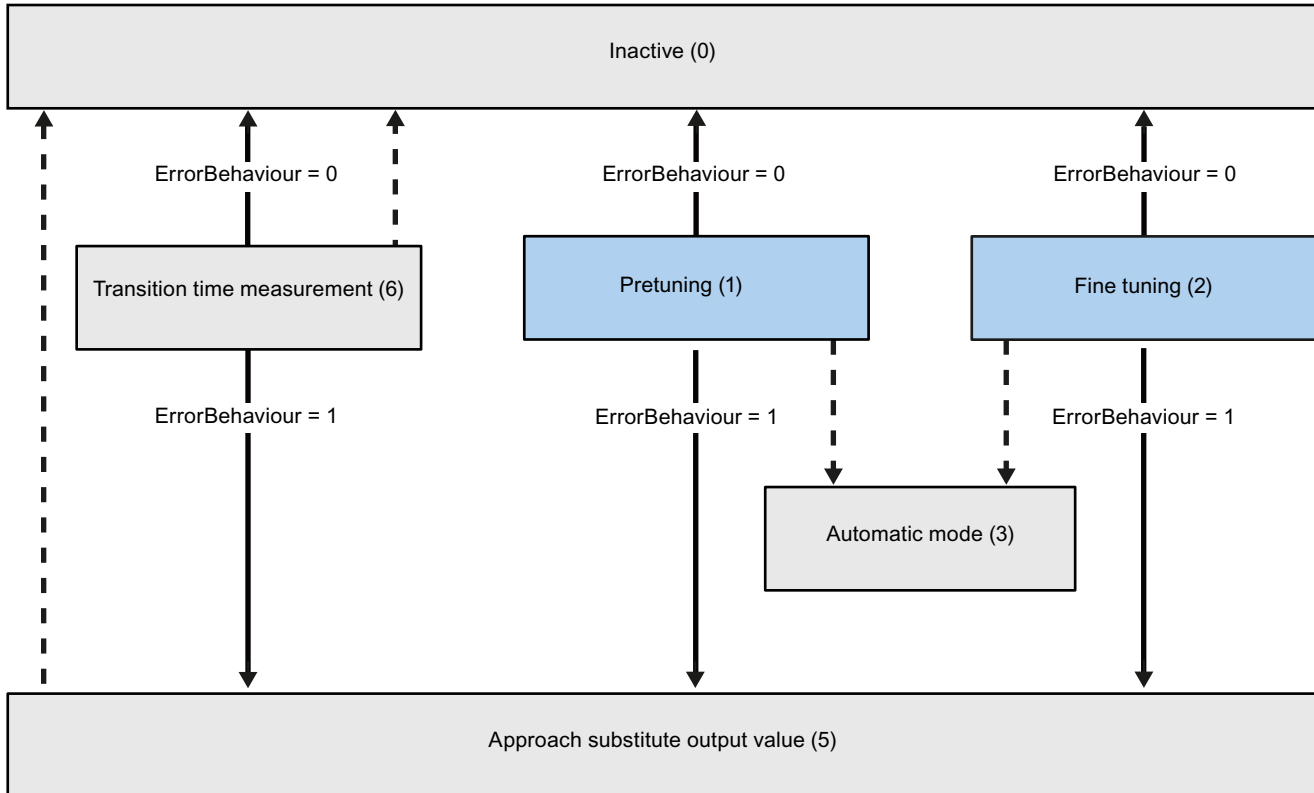

State / Retain.Mode	Description
2	<p>Fine tuning</p> <p>Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are tuned based on the amplitude and frequency of this oscillation. The differences between the process response during pretuning and fine tuning are analyzed. All PID parameters are recalculated from the results. PID parameters from fine tuning usually have better master control and disturbance characteristics than PID parameters from pretuning.</p> <p>PID_3Step automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value.</p> <p>The PID parameters are backed up before fine tuning. They can be reactivated with Config.LoadBackUp. The setpoint is frozen in the CurrentSetpoint tag.</p> <p>Requirements for fine tuning:</p> <ul style="list-style-type: none"> <li>• The motor transition time has been configured or measured.</li> <li>• The setpoint and the process value lie within the configured limits.</li> <li>• ManualEnable = FALSE</li> <li>• Automatic (State = 3), inactive (State = 0) or manual (State = 4) mode</li> </ul> <p>Fine tuning proceeds as follows when started from:</p> <ul style="list-style-type: none"> <li>• Automatic mode (State = 3) Start fine tuning from automatic mode if you wish to improve the existing PID parameters through tuning. PID_3Step controls the system using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.</li> <li>• Inactive (State = 0) or manual mode (State = 4) Pretuning is always started first. The determined PID parameters will be used for control until the control loop has stabilized and the requirements for fine tuning have been met. If PIDSelfTune.TIR.RunIn = TRUE, pretuning is skipped and an attempt is made to reach the setpoint with the minimum or maximum output value. This can produce increased overshoot. Fine tuning then starts automatically.</li> </ul> <p>The controller switches to automatic mode following successful fine tuning. If fine tuning was not successful, the controller switches to "Inactive" mode.</p> <p>The fine tuning phase is indicated with the TIR.State tag.</p>
3	<p>Automatic mode</p> <p>In automatic mode, PID_3Step controls the controlled system in accordance with the parameters specified. The controller switches to automatic mode if one the following requirements is fulfilled:</p> <ul style="list-style-type: none"> <li>• Pretuning successfully completed</li> <li>• Fine tuning successfully completed</li> <li>• Changing the Retain.Mode tag to the value 3.</li> </ul> <p>When the CPU is switched on or switches from Stop to RUN mode, PID_3Step starts in the most recently active operating mode. To leave PID_3Step in "Inactive" mode, set RunModeByStartup = FALSE.</p> <p>The ActivateRecoverMode tag is taken into consideration in automatic mode.</p>

State / Retain.Mode	Description
4	<p>Manual mode</p> <p>In manual mode, you specify manual output values in the Manual_UP and Manual_DN parameters or ManualValue parameter. Whether or not the actuator can be moved to the output value in the event of an error is described in the ErrorBits parameter.</p> <p>This operating mode is enabled if Retain.Mode = 4, or on a rising edge at ManualEnable.</p> <p>If ManualEnable changes to TRUE, only State changes. Retain.Mode retains its current value. On a falling edge at ManualEnable, PID_3Step returns to the previous operating mode.</p> <p>The switchover to automatic mode is bumpless.</p> <p><b>PID_3Step V1.1</b></p> <p>Manual mode is always possible in the event of an error.</p> <p><b>PID_3Step V1.0</b></p> <p>Manual mode is dependent on the ActivateRecoverMode tag in the event of an error.</p>
5	<p>Approach substitute output value</p> <p>This operating mode is activated in the event of an error or when Reset = TRUE if Errorbehaviour = 1 and ActivateRecoverMode = FALSE..</p> <p>PID_3Step moves the actuator to the substitute output value and then switches to "Inactive" mode.</p>
6	<p>Transition time measurement</p> <p>The time that the motor needs to completely open the valve from the closed condition is determined.</p> <p>This operating mode is activated when GetTransitTime.Start = TRUE is set.</p> <p>If endstop signals are used to measure the transition time, the valve will be opened completely from its current position, closed completely, and opened completely again. If GetTransitTime.InvertDirection = TRUE, this behavior is inverted.</p> <p>If position feedback is used to measure the transition time, the actuator will be moved from its current position to a target position.</p> <p>The output value limits are not taken into consideration during the transition time measurement. The actuator can travel to the high or the low endstop.</p>
7	<p>Error monitoring</p> <p>The control algorithm is switched off and no longer changes the valve position.</p> <p>This operating mode is activated instead of "Inactive" mode in the event of an error.</p> <p>All the following conditions must be met:</p> <ul style="list-style-type: none"> <li>• Mode = 3 (automatic mode)</li> <li>• Errorbehaviour = 0</li> <li>• ActivateRecoverMode = TRUE</li> <li>• One or more errors have occurred in which ActivateRecoverMode (Page 3046) is effective.</li> </ul> <p>As soon as the errors are no longer pending, PID_3Step switches back to automatic mode.</p>
8	<p>Approach substitute output value with error monitoring</p> <p>This operating mode is activated instead of "Approach substitute output value" mode in the event of an error. PID_3Step moves the actuator to the substitute output value and then switches to "Error monitoring" mode.</p> <p>All the following conditions must be met:</p> <ul style="list-style-type: none"> <li>• Mode = 3 (automatic mode)</li> <li>• Errorbehaviour = 1</li> <li>• ActivateRecoverMode = TRUE</li> <li>• One or more errors have occurred in which ActivateRecoverMode (Page 3046) is effective.</li> </ul> <p>As soon as the errors are no longer pending, PID_3Step switches back to automatic mode.</p>

**Automatic switchover of operating mode during commissioning**

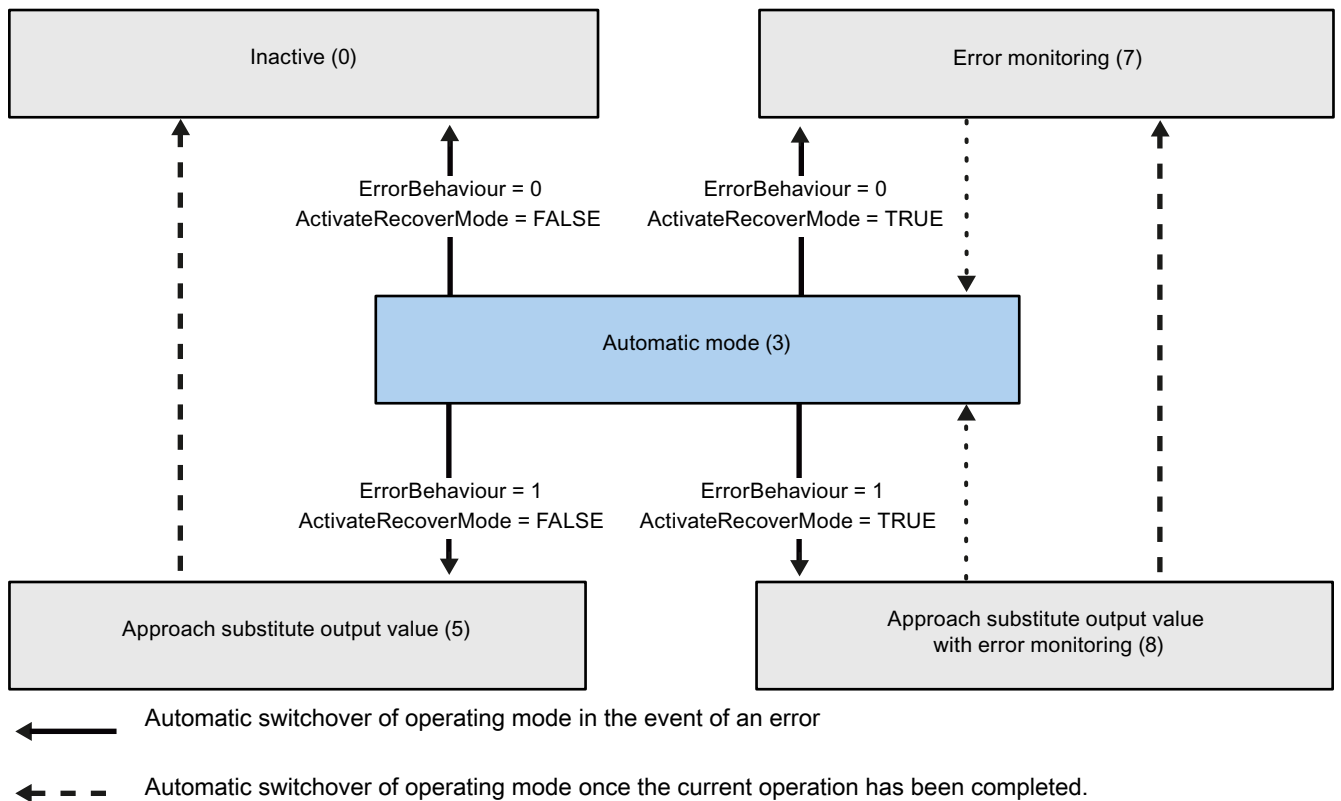

PID\_3Step automatically switches the operating mode in the event of an error. The following diagram illustrates the influence of ErrorBehaviour on the switchover of operating mode from transition time measurement, pretuning, and fine tuning modes.

- ← Automatic switchover of operating mode in the event of an error
- ← - - - Automatic switchover of operating mode once the current operation has been completed.

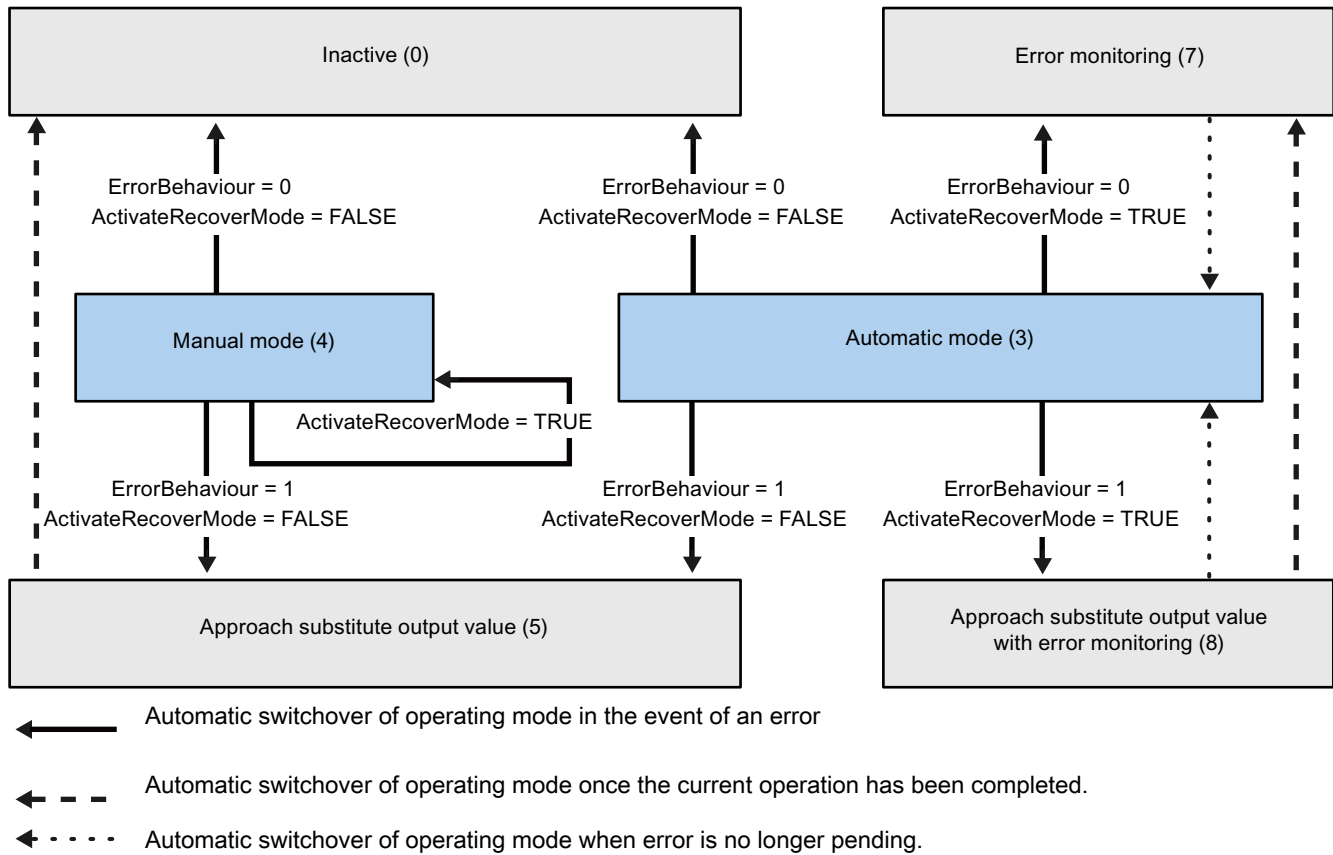

### Automatic switchover of operating mode in automatic mode (PID\_3Step V1.1)

PID\_3Step automatically switches the operating mode in the event of an error. The following diagram illustrates the influence of ErrorBehaviour and ActivateRecoverMode on this switchover of operating mode.

**Automatic switchover of operating mode in automatic and manual modes (PID\_3Step V1.0)**

PID\_3Step automatically switches the operating mode in the event of an error. The following diagram illustrates the influence of ErrorBehaviour and ActivateRecoverMode on this switchover of operating mode.

## Parameter ErrorBits V1

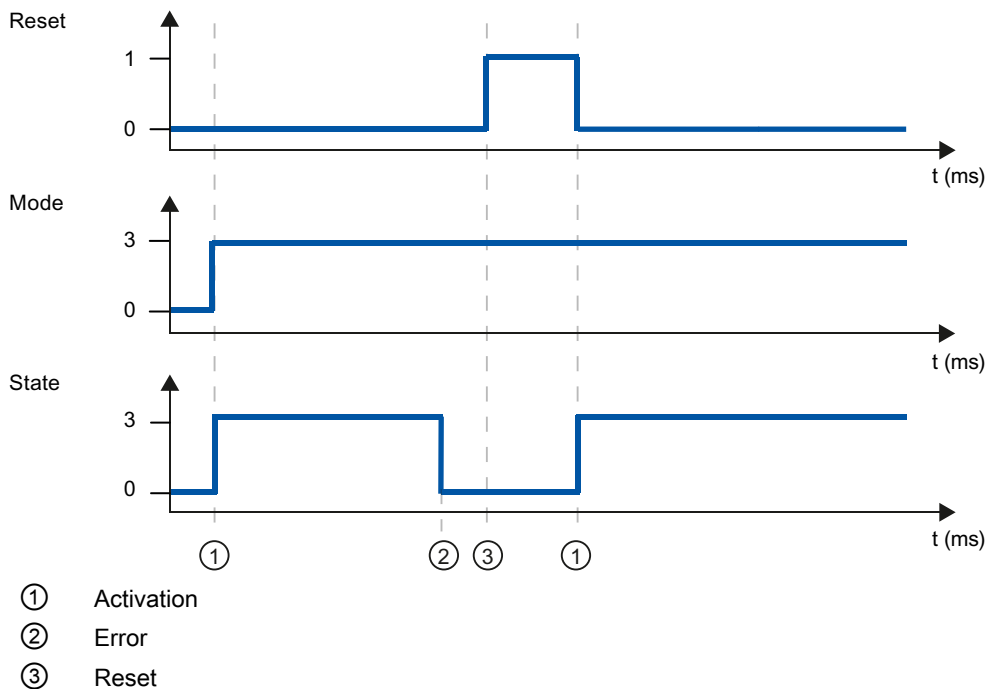

If several errors are pending simultaneously, the values of the error codes are displayed with binary addition. The display of error code 0003, for example, indicates that the errors 0001 and 0002 are pending simultaneously.

ErrorBits (DW#16#...)	Description
0000	There is no error.
0001	<p>The "Input" parameter is outside the process value limits.</p> <ul style="list-style-type: none"> <li>• Input &gt; Config.InputUpperLimit or</li> <li>• Input &lt; Config.InputLowerLimit</li> </ul> <p>If ActivateRecoverMode = TRUE and ErrorBehaviour = 1, the actuator moves to the substitute output value. If ActivateRecoverMode = TRUE and ErrorBehaviour = 0, the actuator stops in its current position. If ActivateRecoverMode = FALSE, the actuator stops in its current position.</p> <p>PID_3Step V1.1 You can move the actuator in manual mode. PID_3Step V1.0 Manual mode is not possible in this state. You cannot move the actuator again until you eliminate the error.</p>
0002	<p>Invalid value at "Input_PER" parameter. Check whether an error is pending at the analog input.</p> <p>If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.</p>
0004	Error during fine tuning. Oscillation of the process value could not be maintained.
0020	Pretuning is not permitted in automatic mode or during fine tuning.
0080	<p>Error during pretuning. Incorrect configuration of output value limits.</p> <p>Check whether the limits of the output value are configured correctly and match the control logic.</p>
0100	Error during fine tuning resulted in invalid parameters.
0200	<p>Invalid value at "Input" parameter: Value has an invalid number format.</p> <p>If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.</p>
0400	Calculation of output value failed. Check the PID parameters.
0800	<p>Sampling time error: PID_3Step is not called within the sampling time of the cyclic interrupt OB.</p> <p>If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.</p>
1000	<p>Invalid value at "Setpoint" parameter: Value has an invalid number format.</p> <p>If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.</p>

Manual mode is not possible in this state. You must deactivate position feedback (Config. FeedbackOn = FALSE) to move the actuator from this state.</p> <p>If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.</p>

ErrorBits (DW#16#...)	Description
4000	<p>Invalid value at Feedback parameter. Value has an invalid number format.</p> <p>The actuator cannot be moved to the substitute output value and remains in its current position. Manual mode is not possible in this state. You must deactivate position feedback (Config.FeedbackOn = FALSE) to move the actuator from this state.</p> <p>If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.</p>
8000	<p>Error during digital position feedback. Actuator_H = TRUE and Actuator_L = TRUE.</p> <p>The actuator cannot be moved to the substitute output value and remains in its current position. Manual mode is not possible in this state.</p> <p>In order to move the actuator from this state, you must deactivate the "Actuator endstop" (Config.ActuatorEndStopOn = FALSE).</p> <p>If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.</p>

### Parameter Reset V1

A rising edge at Reset resets the errors and warnings and clears the integral action. A falling edge at Reset triggers a change to the most recently active operating mode.

### Tag ActivateRecoverMode V1

The effect of the ActivateRecoverMode variable depends on the version of the PID\_3Step.

### Behavior in version 1.1

The ActivateRecoverMode variable determines the behavior in the event of an error in automatic mode. ActivateRecoverMode is not effective during pretuning, fine tuning and transition time measurement.

ActivateRecover Mode	Description
FALSE	In the event of an error, PID_3Step switches to "Inactive" or "Approach substitute output value" operating mode. The controller is activated by a reset or a change in Retain.Mode.
TRUE	<p>If errors occur frequently in automatic mode, this setting has a negative effect on the control response. In this case, check the ErrorBits parameter and eliminate the cause of the error.</p> <p>If one or more errors occur, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode:</p> <ul style="list-style-type: none"> <li>• 0002h: Invalid value at parameter Input_PER.</li> <li>• 0200h: Invalid value at parameter Input.</li> <li>• 0800h: Sampling time error</li> <li>• 1000h: Invalid value at parameter Setpoint.</li> <li>• 2000h: Invalid value at parameter Feedback_PER.</li> <li>• 4000h: Invalid value at parameter Feedback.</li> <li>• 8000h: Error in digital position feedback.</li> </ul> <p>With errors 2000h, 4000h and 8000h, PID_3Step <b>cannot</b> approach the configured substitute output value. As soon as the errors are no longer pending, PID_3Step switches back to automatic mode.</p>

**Behavior in version 1.0**

The ActivateRecoverMode variable determines the behavior in the event of an error in automatic and manual mode. ActivateRecoverMode is not effective during pretuning, fine tuning and transition time measurement.

ActivateRecover Mode	Description
FALSE	In the event of an error, PID_3Step switches to "Inactive" or "Approach substitute output value" operating mode. The controller is activated by a reset or a change in Retain.Mode.
TRUE	<p><b>Errors in automatic mode</b></p> <p>If errors occur frequently in automatic mode, this setting has a negative effect on the control response. In this case, check the ErrorBits parameter and eliminate the cause of the error.</p> <p>If one or more errors occur, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode:</p> <ul style="list-style-type: none"> <li>• 0002h: Invalid value at parameter Input_PER.</li> <li>• 0200h: Invalid value at parameter Input.</li> <li>• 0800h: Sampling time error</li> <li>• 1000h: Invalid value at parameter Setpoint.</li> <li>• 2000h: Invalid value at parameter Feedback_PER.</li> <li>• 4000h: Invalid value at parameter Feedback.</li> <li>• 8000h: Error in digital position feedback.</li> </ul> <p>With errors 2000h, 4000h and 8000h, PID_3Step <b>cannot</b> approach the configured substitute output value. As soon as the errors are no longer pending, PID_3Step switches back to automatic mode.</p> <p><b>Errors in manual mode</b></p> <p>If one or more of the following errors occur, PID_3Step stays in manual mode:</p> <ul style="list-style-type: none"> <li>• 0002h: Invalid value at parameter Input_PER.</li> <li>• 0200h: Invalid value at parameter Input.</li> <li>• 0800h: Sampling time error</li> <li>• 1000h: Invalid value at parameter Setpoint.</li> <li>• 2000h: Invalid value at parameter Feedback_PER.</li> <li>• 4000h: Invalid value at parameter Feedback.</li> <li>• 8000h: Error in digital position feedback.</li> </ul> <p>With errors 2000h, 4000h and 8000h, you <b>cannot</b> move the valve to a suitable position.</p>

## Tag Warning V1

If several warnings are pending simultaneously, their values are displayed with binary addition. The display of warning 0003, for example, indicates that the warnings 0001 and 0002 are pending simultaneously.

Warning (DW#16#...)	Description
0000	No warning pending.
0001	The point of inflection was not found during pretuning.
0002	Oscillation increased during fine tuning.
0004	The setpoint was limited to the configured limits.
0008	Not all the necessary controlled system properties were defined for the selected method of calculation. The PID parameters were instead calculated using the TuneRuleTIR = 3 method.
0010	The operating mode could not be changed because ManualEnable = TRUE.
0020	The cycle time of the calling OB limits the sampling time of the PID algorithm. Improve results by using shorter OB cycle times.
0040	The process value exceeded one of its warning limits.
0080	Invalid value at Retain.Mode. The operating mode is not switched.
0100	The manual value was limited to the limits of the controller output.
0200	The rule used for tuning produces an incorrect result, or is not supported.
0400	Method selected for transition time measurement not suitable for actuator. The transition time cannot be measured because the actuator settings do not match the selected measuring method.
0800	The difference between the current position and the new output value is too small for transition time measurement. This can produce incorrect results. The difference between the current output value and new output value must be at least 50% of the entire control range.
1000	The substitute output value cannot be reached because it is outside the output value limits.

The following warnings are deleted as soon as the cause is eliminated:

- 0004
- 0020
- 0040
- 0100

All other warnings are cleared with a rising edge at Reset.

## Tag SUT.State V1

SUT.State	Name	Description
0	SUT_INIT	Initialize pretuning
50	SUT_TPDN	Determine start position without position feedback
100	SUT_STDABW	Calculate the standard deviation
200	SUT_GET_POI	Find the point of inflection

9.7 References

SUT.State	Name	Description
300	SUT_GET_RISETM	Determine the rise time
9900	SUT_IO	Pretuning successful
1	SUT_NIO	Pretuning not successful

Tag TIR.State V1

TIR.State	Name	Description
-100	TIR_FIRST_SUT	Fine tuning is not possible. Pretuning will be executed first.
0	TIR_INIT	Initialize fine tuning
200	TIR_STDABW	Calculate the standard deviation
300	TIR_RUN_IN	Attempt to reach the setpoint with the maximum or minimum output value
400	TIR_CTRLN	Attempt to reach the setpoint with the existing PID parameters (if pretuning has been successful)
500	TIR_OSZIL	Determine oscillation and calculate parameters
9900	TIR_IO	Fine tuning successful
1	TIR_NIO	Fine tuning not successful

9.7.5 Communication

9.7.5.1 Communications processor

Point-to-point

PORT\_CFG: Configure communication parameters dynamically

Description

The instruction "PORT\_CFG" allows dynamic configuration of communications parameters for a point-to-point communications port.

You set up the original static configuration of the port in the hardware configuration. You can change this configuration by executing the "PORT\_CFG" instruction. You can also use this function to save created blocks in libraries and to avoid configuration in the hardware configuration when you reuse it.

With "PORT\_CFG" you can influence the following communications parameter settings:

- Parity
- Baud rate
- Number of bits per character

- Number of stop bits
- Type and properties of flow control

The changes made by the "PORT\_CFG" instruction are not stored permanently on the target system.

You can transfer serial data via the electrical connections RS-232 (half and full duplex) and RS-485 (half duplex).

## Parameters

The following table shows the parameters of the "PORT\_CFG" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Activates the configuration change on a rising edge
PORT	Input	PORT	I, Q, M, D, L or constant	Identification of the communication port (HW-ID)
PROTOCOL	Input	UINT	I, Q, M, D, L or constant	Transmission protocol: <ul style="list-style-type: none"> <li>• 0: Point-to-point communication protocol</li> <li>• 1..n: Future definition for specific transmission protocols</li> </ul>
BAUD	Input	UINT	I, Q, M, D, L or constant	Baud rate of the port: <ul style="list-style-type: none"> <li>• 1: 300 baud</li> <li>• 2: 600 baud</li> <li>• 3: 1200 baud</li> <li>• 4: 2400 baud</li> <li>• 5: 4800 baud</li> <li>• 6: 9600 baud (default)</li> <li>• 7: 19200 baud</li> <li>• 8: 38400 baud</li> <li>• 9: 57600 baud</li> <li>• 10: 76800 baud</li> <li>• 11: 115200 baud</li> </ul>
PARITY	Input	UINT	I, Q, M, D, L or constant	Parity of the port: <ul style="list-style-type: none"> <li>• 1: No parity (default)</li> <li>• 2: Even parity</li> <li>• 3: Odd parity</li> <li>• 4: Mark parity</li> <li>• 5: Space parity</li> </ul>
DATABITS	Input	UINT	I, Q, M, D, L or constant	Bits per character: <ul style="list-style-type: none"> <li>• 1: 8 bits per character (default)</li> <li>• 2: 7 bits per character</li> </ul>
STOPBITS	Input	UINT	I, Q, M, D, L or constant	Number of stop bits: <ul style="list-style-type: none"> <li>• 1: 1 stop bit (default)</li> <li>• 2: 2 stop bits</li> </ul>

Parameter	Declaration	Data type	Memory area	Description
FLOWCTRL	Input	UINT	I, Q, M, D, L or constant	Data flow control: <ul style="list-style-type: none"> <li>• 1: None (default)</li> <li>• 2: XON/XOFF</li> <li>• 3: Hardware flow control (RTS always activated)</li> <li>• 4: Hardware flow control (RTS can be deactivated during transmission)</li> </ul>
XONCHAR	Input	CHAR	I, Q, M, D, L or constant	Indicates the character used as XON character. The character DC1 (11H) is set as default.
XOFFCHAR	Input	CHAR	I, Q, M, D, L or constant	Indicates the character used as XOFF character. The character DC3 (13H) is set as default.
WAITTIME	Input	UINT	I, Q, M, D, L or constant	Specifies the wait time for XON or CTS after the start of the transmission. The specified value must be greater than 0. 2000 milliseconds are set as default.
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or is still executing</li> <li>• 1: Job executed without errors</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

### STATUS parameter

Error code* (W#16#...)	Description
80A0	The specified protocol is invalid.
80A1	The specified baud rate is invalid.
80A2	The specified parity rate is invalid.
80A3	The specified number of bits per character is invalid.
80A4	The specified number of stop bits is invalid.
80A5	The specified type of flow control is invalid.
80A6	Incorrect value at the WAITTIME parameter When the data flow control is enabled, the value at the WAITTIME parameter must be greater than zero.
80A7	Invalid values at XONCHAR and XOFFCHAR parameters.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3067)".

## SEND\_CFG: Configure serial transmission parameters dynamically

### Description

The instruction "SEND\_CFG" allows dynamic configuration of serial transmission parameters for a point-to-point communications port. All the messages waiting for transfer are discarded after execution of SEND\_CFG.

You set up the original static configuration of the port in the hardware configuration. You can change this configuration by executing the "SEND\_CFG" instruction. You can also use this function to save created blocks in libraries and to avoid configuration in the hardware configuration when you reuse it. With "SEND\_CFG" you can influence the following transmission parameter settings:

- Time between the activation of RTS (Request to Send) and the start of the transmission
- Time between the end of transmission and the deactivation of RTS
- Define bit times for breaks

The changes made by the "SEND\_CFG" instruction are not stored permanently on the target system.

You can transfer serial data via the electrical connections RS-232 (half and full duplex) and RS-485 (half duplex).

### Parameters

The following table shows the parameters of the "SEND\_CFG" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Activates the configuration change on a rising edge
PORT	Input	PORT	I, Q, M, D, L or constant	Identification of the communication port (HW-ID)
RTSONDLY	Input	UINT	I, Q, M, D, L or constant	The time that should elapse after activating RTS until the start of transmission. Valid values for this parameter are as follows: <ul style="list-style-type: none"> <li>• 0 (default)</li> <li>• 0 to 65535 ms in steps of 1 ms</li> </ul> This parameter does not apply to RS-485 modules.
RTSOFFDLY	Input	UINT	I, Q, M, D, L or constant	Time that should elapse after the end of transmission until deactivation of RTS. Valid values for this parameter are as follows: <ul style="list-style-type: none"> <li>• 0 (default)</li> <li>• 0 to 65535 ms in steps of 1 ms</li> </ul> This parameter does not apply to RS-485 modules.
BREAK	Input	UINT	I, Q, M, D, L or constant	Specifies the bit times for a break, which are sent at the start of the message. 12 bit times are set as default. A maximum of 25000 bit times can be specified.

Parameter	Declaration	Data type	Memory area	Description
IDLELINE	Input	UINT	I, Q, M, D, L or constant	Specifies the bit times for idle line after the break at the start of the message. 12 bit times are set as default. A maximum of 25000 bit times can be specified.
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or is still executing</li> <li>• 1: Job executed without errors</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

### STATUS parameter

Error code* (W#16#...)	Description
80B0	The configuration of a transmission interruption is not permitted.
80B1	The specified break time exceeds the permitted maximum of 25000 bit times.
80B2	The specified time for idle line exceeds the permitted maximum of 25000 bit times.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3067)".

### RCV\_CFG: Configure serial receive parameters dynamically

#### Description

The instruction "RCV\_CFG" allows dynamic configuration of serial receive parameters for a point-to-point communications port. You can use this instruction to configure the conditions that specify the start and end of the message to be transmitted. The receipt of messages that correspond to these conditions can be enabled by the "RCV\_PTP (Page 3063)" instruction.

You set up the original static configuration of the port in the properties of the hardware configuration. Execute the "RCV\_CFG" instruction in your program to change the configuration. You can also use this function to save created blocks in libraries and to avoid configuration in the hardware configuration when you reuse it. The changes made by the "RCV\_CFG" instruction are not stored permanently on the target system.

All the messages waiting for transfer are discarded after execution of the "RCV\_CFG" instruction.

## Parameters

The following table shows the parameters of the "RCV\_CFG" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Activates the configuration change on a rising edge.
PORT	Input	PORT	I, Q, M, D, L or constant	Identification of the communication port (HW-ID)
CONDITIONS	Input	CONDITIONS	D, L	Data structure defining the conditions for start and end of data transmission.
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or is still executing</li> <li>• 1: Job executed without errors</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## Data type CONDITIONS

You can use the CONDITIONS structure to define the start and end conditions for the message transmission. The structure CONDITIONS is included in the instance DB of the "RCV\_CFG" instruction. Use the structure CONDITIONS to define the start and end conditions when the transmission of a message is complete and when the next message transfer is to start:

- You define the start conditions for the data transfer in the START structure.
- You define the end conditions for the data transfer in the END structure.

You can define one or more start and end conditions for this. If you specify multiple start or end conditions these are linked by an OR logic instruction.

The following table shows the "CONDITIONS" structure:

Parameters	Data type	Description
START	STRUCT	Start conditions
STARTCOND	UINT	<p>Specifies the start condition (details, see below).</p> <p>The start condition can be specified as a 16-bit hexadecimal value. Possible values for the start condition are:</p> <ul style="list-style-type: none"> <li>• 1: Start character</li> <li>• 2: Any character (default)</li> <li>• 4: Line break</li> <li>• 8: Idle line</li> <li>• 16: Character string 1</li> <li>• 32: Character string 2</li> <li>• 64: Character string 3</li> <li>• 128: Character string 4</li> </ul> <p>Multiple start conditions can also be defined at the STARTCOND parameter. The total from the values of the individual conditions is specified for this. If, for example, you want to define "Idle line" OR "Character string 1" OR "Character string 4" as start condition, the value "152" must be specified.</p>
IDLETIME	UINT	<p>Specifies the maximum idle time of the line before receipt is started.</p> <p>Valid values for this parameter are as follows:</p> <ul style="list-style-type: none"> <li>• 40 bit times (default)</li> <li>• 0 to 2500 bit times</li> </ul>
STARTCHAR	BYTE	<p>Specifies the start character. This setting is only enabled when the configured start condition is "Start character".</p> <p>Valid values for this parameter are as follows:</p> <ul style="list-style-type: none"> <li>• 02 (STX): Default setting</li> <li>• B#16#00 to B#16#FF</li> </ul>
SEQ[1].CTL	BYTE	<p>Character string 1: Control sequence for each character</p> <p>You can use the bit position of the character to define which characters of the character string will be considered or ignored. To evaluate the characters, the corresponding bits have to be set.</p> <ul style="list-style-type: none"> <li>• Bit 0: 1 character</li> <li>• Bit 1: 2 characters</li> <li>• Bit 2: 3 characters</li> <li>• Bit 3: 4 characters</li> <li>• Bit 4: 5 characters</li> </ul> <p>A character is ignored when the corresponding bit is reset.</p>
SEQ[1].STR	CHAR[5]	Character string 1: Start character (5 characters)
SEQ[2].CTL	BYTE	Character string 2: Ignore/compare control sequence for each character
SEQ[2].STR	CHAR[5]	Character string 2: Start character (5 characters)
SEQ[3].CTL	BYTE	Character string 3: Ignore/compare control sequence for each character
SEQ[3].STR	CHAR[5]	Character string 3: Start character (5 characters)
SEQ[4].CTL	BYTE	Character string 4: Ignore/compare control sequence for each character
SEQ[4].STR	CHAR[5]	Character string 4: Start character (5 characters)
END	STRUCT	End conditions

Parameters	Data type	Description
ENDCOND	UINT	<p>Specifies the end condition (details, see below).</p> <p>The end condition can be specified as a 16-bit hexadecimal value. Possible values for the end condition are:</p> <ul style="list-style-type: none"> <li>• 1: Reply timeout</li> <li>• 2: Message timeout</li> <li>• 4: Timeout within the character string</li> <li>• 8: Maximum length</li> <li>• 16: N+LEN+M; the information on the message length is integrated in the message and will be evaluated.</li> <li>• 32: Character string 1</li> </ul> <p>Multiple end conditions can also be defined at the ENDCOND parameter. The total from the values of the individual end conditions is specified for this. If, for example, you want to define the end condition "Maximum length" OR "Sequence 1", the value "40" must be specified.</p>
MAXLEN	UINT	<p>Specifies the maximum number of characters in a message.</p> <p>Valid values* for this parameter are as follows:</p> <ul style="list-style-type: none"> <li>• 1 character (default)</li> <li>• 0 to 1024 characters</li> </ul> <p>This setting is only enabled if the "Maximum length" end condition is set at the ENDCOND parameter.</p>
N	UINT	<p>Offset of the length field in the message</p> <p>Valid values for this parameter are as follows:</p> <ul style="list-style-type: none"> <li>• 0 characters (default)</li> <li>• 0 to 1024 characters</li> </ul> <p>This setting is only enabled if the "N+LEN+M" end condition is set at the ENDCOND parameter.</p>
LENGTHSIZE	UINT	<p>Size of the length field in bytes</p> <p>Valid values* for this parameter are as follows:</p> <ul style="list-style-type: none"> <li>• 0 bytes (default)</li> <li>• 1 byte</li> <li>• 2 bytes</li> <li>• 4 bytes</li> </ul> <p>This setting is only enabled if the "N+LEN+M" end condition is set at the ENDCOND parameter.</p>
LENGTHM	UINT	<p>Specifies the number of end characters that follow the length field but are not contained in the length of the message.</p> <p>Valid values for this parameter are as follows:</p> <ul style="list-style-type: none"> <li>• 0 characters (default)</li> <li>• 0 to 255 characters</li> </ul> <p>This setting is only enabled if the "N+LEN+M" end condition is set at the ENDCOND parameter.</p>

Parameters	Data type	Description
RCVTIME	UINT	Specifies the maximum duration for the receipt of the first character of a message. Valid values for this parameter are as follows: <ul style="list-style-type: none"> <li>• 200 ms (default)</li> <li>• 0 to 65535 ms in steps of 1 ms</li> </ul> This setting is only enabled if the "Reply timeout" end condition is set at the ENDCOND parameter.
MSGTIME	UINT	Specifies the maximum duration of the receipt of a message. Valid values for this parameter are as follows: <ul style="list-style-type: none"> <li>• 200 ms (default)</li> <li>• 0 to 65535 ms in steps of 1 ms</li> </ul> This setting is only enabled if the "Message timeout" end condition is set at the ENDCOND parameter.
CHARGAP	UINT	Specifies the time interval between received consecutive characters. Valid values for this parameter are as follows: <ul style="list-style-type: none"> <li>• 12 bit times (default)</li> <li>• 0 to 2500 bit times</li> </ul> This setting is only enabled if the "Timeout within the character string" end condition is set at the ENDCOND parameter.
SEQ.CTL	BYTE	Character string: Control sequence for each character You can use the bit position of the character to define which characters of the character string will be considered or ignored. To evaluate the characters, the corresponding bits have to be set. <ul style="list-style-type: none"> <li>• Bit 0: 1 character</li> <li>• Bit 1: 2 characters</li> <li>• Bit 2: 3 characters</li> <li>• Bit 3: 4 characters</li> <li>• Bit 4: 5 characters</li> </ul> A character is ignored when the corresponding bit is reset.
SEQ.STR	CHAR[5]	Character string: Start character (5 characters)
* These value ranges also apply to the corresponding hardware settings for specifying the end of message.		

**Start conditions for the message receipt (STARTCOND parameter)**

The start of the message is recognized by the receiver if a configured start condition applies. The following conditions can be defined as start conditions for message receipt:

- Start character: The start of a message is recognized when a certain character occurs. This character is stored as first character of the message. All characters received before the start character are rejected.
- Any character: Any character can define the start of a message. This character is stored as first character of the message.
- Line break: The start of a message is recognized if the received data stream is interrupted for longer than one character length.

- **Idle line:** The start of a message is recognized when the send transmission line is in the idle state for a certain time (specified in bit times) followed by renewed transmission of characters.
- **Character string (sequence):** The start of a message is recognized when a specified character sequence occurs in the data stream. You can specify up to four character sequences with up to five characters each.  
 Example: A received hexadecimal message includes the following characters: "68 10 aa 68 bb 10 aa 16". The configured start character sequences are listed in the following table. Start character sequences will be evaluated once the first character 68H has been received successfully. After the fourth character has been received successfully (the second 68H), the start condition "1" has been met. Once the start conditions have been met, evaluation of the end conditions will start.  
 Processing of the start character sequence can end due to different errors in parity, framing or time intervals between characters. These errors will prevent reception of the message, because the start condition has not been met.

Start condition	First character	First character +1	First character +2	First character +3	First character +4
1	68H	xx	xx	68H	xx
2	10H	aaH	xx	xx	xx
3	dcH	aaH	xx	xx	xx
4	e5H	xx	xx	xx	xx

### End conditions for the message receipt (ENDCOND parameter)

The start of a message is recognized by the receiver if a configured end condition applies. The following conditions can be defined as end conditions for message receipt:

- **Reply timeout:** The receipt of messages will end when the specified maximum duration for the receipt of a character is exceeded. The maximum duration is defined at the RCVTIME parameter. The defined time starts to run down as soon as the last transmission is completed and the RCV\_PTP instruction enables the receipt of the message. If no character was received within the defined time (RCVTIME), the RCV\_PTP instruction reports an error.
- **Message timeout:** The receipt of messages will end when the specified maximum duration for the receipt of a message is exceeded. The maximum duration is defined at the MSGTIME parameter. The defined time starts to run down as soon as the first character of the message is received.
- **Timeout within the character string:** The receipt of messages will end when the time interval between the receipt of two consecutive characters is longer than the value at the CHARGAP parameter.
- **Maximum length:** The receipt of messages will end when the length of the message defined at the MAXLEN parameter is exceeded.

- Reading message length (N+LEN+M): The receipt of messages will end when a certain message length is reached. This length is calculated by the values of the following parameters:
  - N: Position of the character in the message from which the length field begins.
  - LENGTHSIZE: Size of the length field in bytes
  - LENGTHM: Number of end characters that follow the length field. These characters are not taken into account in the evaluation of the message length.
- Character string: The receipt of messages will end when a defined character sequence is received. The character string can contain a maximum of five characters. For each character of the character string, you can use the bit position to define if this will be considered or ignored in the evaluation.

**STATUS parameter**

Error code* (W#16#...)	Description
80C0	Error in start condition
80C1	<ul style="list-style-type: none"> <li>• Error in end condition</li> <li>• No end condition defined</li> </ul>
80C2	Receive interrupt enabled
80C3	A value that is equal to 0 or greater than 4132 was entered at the MAXLEN parameter while the "Maximum length" end condition was set.
80C4	A value that is greater than 4131 was entered at the N parameter while the "N+LEN+M" end condition was set.
80C5	A value that is equal to 0 or invalid was entered at the LENGTHSIZE parameter while the "N+LEN+M" end condition was set.
80C6	A value that is greater than 255 was entered at the LENGTHM parameter while the "N+LEN+M" end condition was set.
80C7	A message length greater than 4132 was calculated while the "N+LEN+M" end condition was set.
80C8	A value that is equal to 0 was entered at the RCVTIME parameter while the "Reply timeout" end condition was set.
80C9	A value that is equal to 0 or greater than 2500 was entered at the CHARGAP parameter while the "Timeout within a character string" end condition was set.
80CA	A value that is equal to 0 or greater than 2500 was entered at the IDLETIME parameter while the "Idle line" start condition was set.
80CB	All characters of the character string are marked as "Don't care" even though "Character string" is set as the end condition.
80CC	All characters of the character string are marked as "Don't care" even though "Character string" is set as the start condition.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3067)".

**SEND\_PTP: Transmit send buffer data****Description**

You use the "SEND\_PTP" instruction to start the transmission of data. The "SEND\_PTP" instruction does not execute the actual transmission of the data. The data of the send buffer is transmitted to the relevant point-to-point communication module (CM). The CM executes the actual transmission.

**Parameters**

The following table shows the parameters of the "SEND\_PTP" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Enables the requested transmission on a rising edge of this enable input. The content of buffer is transmitted to the point-to-point communication module (CM).
PORT	Input	PORT	I, Q, M, D, L or constant	Identification of the communication port (HW-ID)
BUFFER	Input	VARIANT	I, Q, M, D, L or constant	Pointer to the start address of the send buffer. Boolean values or Array of BOOL are not supported.
LENGTH	Input	UINT	I, Q, M, D, L or constant	Length of the send buffer
PTRCL	Input	BOOL	I, Q, M, D, L or constant	This parameter selects the buffer for normal point-to-point communication or for specific Siemens protocols implemented in the connected CM. FALSE = point-to-point operations controlled by the user program (only valid option)
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or is still executing</li> <li>• 1: Job executed without errors</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**STATUS parameter**

Error code* (W#16#...)	Description
7000	The send operation is not active.
7001	The send operation is processing the first call.
7002	The send operation is processing subsequent calls (queries following the first call).

Error code* (W#16#...)	Description
8080	The identifier entered for the communications port number is invalid.
8088	The length of the LENGHT parameter does not correspond to the length of data to be sent. See also: Parameters LENGHT and BUFFER.
80D0	A new send request was received while a transmission was taking place.
80D1	The transmission was interrupted because the CTS signal was not confirmed within the specified wait time.
80D2	The send request was interrupted because the communications partner (DCE) signaled that it was not willing to receive (DSR).
80D3	The send request was interrupted because the maximum size of the waiting loop was exceeded (more than 1024 Byte).
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3067)".

### Parameters LENGTH and BUFFER

The minimum data size that can be sent by the "PTP\_SEND" instruction is one byte. The parameter BUFFER defines the size of the data to be sent. You can use neither the BOOL nor the Array of BOOL data type for the BUFFER parameter.

LENGTH parameter	BUFFER parameter	Description
LENGTH = 0	Not used	The complete data is sent as defined by the BUFFER parameter. If LENGTH = 0, you do not need to specify the number of bytes transferred.
LENGTH > 0	Elementary data type	The LENGTH value must contain the byte count of this data type. Otherwise, data is not transferred and error 8088 is output.
	STRUCT	The LENGTH value can contain a byte count that is smaller than the complete byte length of the structure. In this case, only the first LENGTH bytes are transferred.
	ARRAY	The LENGTH value can contain a byte count that is smaller than the complete byte length of the field. In this case, only the field elements that fit completely in the LENGTH bytes are transferred. The LENGTH value must be a multiple of the byte count of the data elements. Otherwise, STATUS = 8088, ERROR = 1, and no data is transferred.
	STRING	The complete memory arrangement of the character sequence format will be transmitted as well as the information about maximum length of the character string and the actual length of the character string. The LENGTH value must contain bytes for maximum length, actual length, and the characters of the character string. With the data type STRING, all lengths and characters have the size of one byte. If a character string is used for the BUFFER parameter, the LENGTH value must also contain two bytes for the two length fields.

**RCV\_PTP: Enable receive messages****Description**

With the RCV\_PTP instruction you enable receipt of a sent message. Each message must be enabled individually. The sent data is only available in the receive area when the message has been acknowledged by the relevant communications partner.

**Parameters**

The following table shows the parameters of the "RCV\_PTP" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN_R	Input	BOOL	I, Q, M, D, L or constant	Enables receipt on a rising edge
PORT	Input	PORT	I, Q, M, D, L or constant	Identification of the communication port (HW-ID)
BUFFER	Input	VARIANT	I, Q, M, D, L or constant	Points to the start address of the receive buffer. Do not use a tag of the type STRING in the receive buffer.
NDR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or is still executing</li> <li>• 1: Job executed without errors</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction
LENGTH	Output	UINT	I, Q, M, D, L	Length of the message in the receive buffer

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**STATUS parameter**

Error code* (W#16#...)	Description
80E0	Receipt of messages was terminated because the receive buffer is full.
80E1	Receipt of messages was terminated as a result of a parity error.
80E2	Receipt of messages was terminated as a result of a framing error.
80E3	Receipt of messages was terminated as a result of an overflow error.
80E4	Receipt of messages was terminated because the calculated message length (N+LEN+M) exceeds the size of the receive buffer.
8080	The identifier entered for the communications port number is invalid.
8088	A data type STRING is referenced via the BUFFER parameter.
0094	Receipt of messages was terminated because the maximum character length was received.
0095	Receipt of messages was terminated as a result of a timeout.

Error code* (W#16#...)	Description
0096	Receipt of messages was terminated because of a timeout within the character string.
0097	Receipt of messages was terminated as a result of a reply timeout.
0098	Receipt of messages was terminated because the "N+LEN+M" length condition has been satisfied.
0099	Receipt of messages was terminated because the character string defined as the end condition was received.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3067)".

### RCV\_RST: Delete receive buffer

#### Description

With the "RCV\_RST" instruction, you delete the receive buffer of a communications partner.

#### Parameters

The following table shows the parameters of the "RCV\_RST" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Enables deleting of the receive buffer on a rising edge
PORT	Input	PORT	I, Q, M, D, L or constant	Identification of the communication port (HW-ID)
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or is still executing</li> <li>• 1: Job executed without errors</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3067)".

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**SGN\_GET: Query RS-232 signals****Description**

With the "SGN\_GET" instruction, you query the current state of several signals of an RS-232 communications module.

**Parameters**

The following table shows the parameters of the "SGN\_GET" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Enables the query on a rising edge
PORT	Input	PORT	I, Q, M, D, L or constant	Identification of the communication port (HW-ID)
NDR	Output	BOOL	I, Q, M, D, L	Is set for one cycle if new data are ready for sending and the instruction was executed error-free.
DTR	Output	BOOL	I, Q, M, D, L	Data terminal ready, module ready
DSR	Output	BOOL	I, Q, M, D, L	Data set ready, communications partner ready
RTS	Output	BOOL	I, Q, M, D, L	Send request, module ready to send
CTS	Output	BOOL	I, Q, M, D, L	Clear to send, communications partner can receive data (reaction to RTS = ON of the module).
DCD	Output	BOOL	I, Q, M, D, L	Data carrier detect, received signal level
RING	Output	BOOL	I, Q, M, D, L	Ring display, display of an incoming call
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**STATUS parameter**

Error code* (W#16#...)	Description
80F0	The communication module is an RS-485 module and no signals are available.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3067)".

## SGN\_SET: Set RS-232 signals

### Description

With the "SGN\_SET" instruction, you set the status of the output signals of an RS-232 communications module.

### Parameters

The following table shows the parameters of the "SGN\_SET" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Activates the action on a rising edge Initial value: FALSE
PORT	Input	PORT	I, Q, M, D, L or constant	Identification of the communication port (HW-ID) Initial value: FALSE
SIGNAL	Input	BYTE	I, Q, M, D, L or constant	Specifies the signals to be set: <ul style="list-style-type: none"> <li>• Set 01H = RTS</li> <li>• Set 02H = DTR</li> <li>• Set 04H = DSR</li> </ul> Initial value: FALSE
RTS	Input	BOOL	I, Q, M, D, L or constant	Send request, module ready to send Initial value: FALSE
DTR	Input	BOOL	I, Q, M, D, L or constant	Data terminal ready, module ready Initial value: FALSE
DSR	Input	BOOL	I, Q, M, D, L or constant	Data set ready (applies only to interfaces of the DCE type) Initial value: FALSE
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or is still executing</li> <li>• 1: Job executed without errors</li> </ul> Initial value: FALSE
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred</li> </ul> Initial value: FALSE
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction Initial value: 0

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## STATUS parameter

Error code* (W#16#...)	Description
80F0	The communication module is an RS-485 module and no signals are available.
80F1	No signals are settable because H/W flow control is enabled.
80F2	The DSR signal cannot be set because the module is a DTE device.
80F3	The DTR signal cannot be set because the module is a DCE device.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

You will find more detailed information on general error codes of the communication instructions in: "General status information of the communications blocks (Page 3067)".

## General status information of the communications blocks

### General information on execution status of the communications blocks

The following table shows which general information can be output at the STATUS parameter of the communications blocks:

Error code* (W#16#...)	Description
8070	All internal instance memory is in use
8080	The identifier entered for the communications port is invalid
8081	Timeout, module error, internal error
8085	Error specifying the length at the LENGHT parameter. The specified length is "0" or greater than the maximum permitted value.
8090	Message length invalid, module invalid, message invalid
8091	Incorrect version in parameterization message
8092	Invalid record length in parameterization message
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## USS

### Overview of USS instructions

#### Introduction

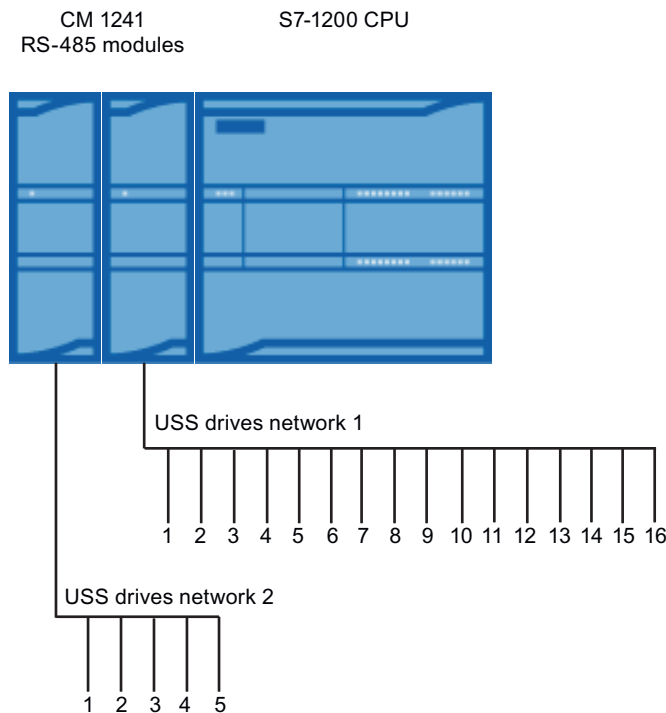

The USS instructions control the operation of drives that support the universal serial interface (USS). With the USS instructions, you can communicate with more than one drive via an RS-485 connection.

To do this, you require a CM 1241 RS-485 communications module or a CB 1241 RS-485 communications board. Up to three CM 1241 RS-485 modules and one CB 1241 RS-485 board can be installed in an S7-1200 CPU.

Each RS-485 port can operate up to sixteen drives.

The USS protocol uses a master/slave network for communication via a serial bus. The master uses an address parameter to send a message to a selected slave. A slave itself can never send without previously receiving a request. Direct exchange of messages between slaves is not possible. USS communication works in half duplex mode.

The following figure shows an example of a USS network diagram:

## Requirements for using the USS protocol

### General requirements for setting up a drive

- The use of 4 PKW words must be set up for the drives.
- The drives can be configured for 2, 4, 6 or 8 PZD words.
- The number of PZD words in the drive must correspond to the PZD\_LEN input of the "USS\_DRIVE (Page 3073)" instruction of the drive.
- The baud rate of all drives must match the baud rate of the BAUD input parameter of the "USS\_PORT (Page 3072)" instruction.
- The drive must be set up for remote control.
- USS must be specified for the desired frequency value on the COM connection of the drive.

- 1 to 16 must be set as the drive address. This address must correspond to the address of the DRIVE input parameter of the "USS\_DRIVE (Page 3073)" instruction.
- To control the direction of the drive, the polarity of the drive desired value must be set up.
- The RS-485 network must be connected correctly.

**Definition: PKW / PZD area**

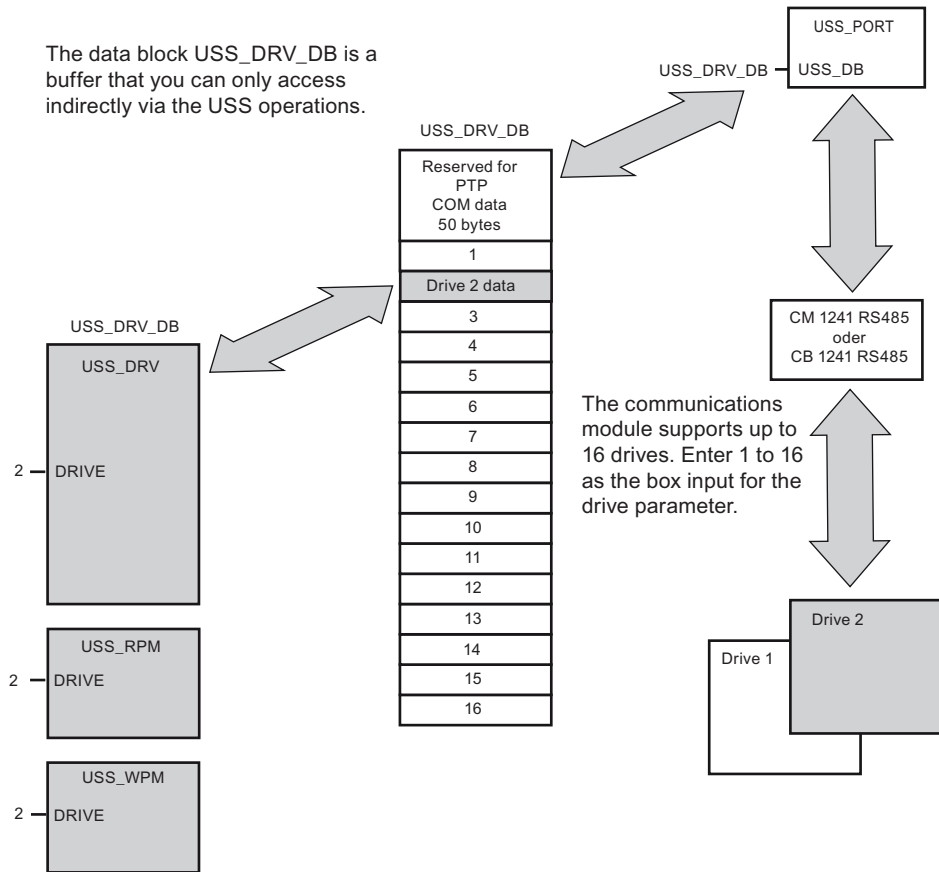

- The PKW area relates to the handling of the parameter-identifier-value interface. The PKW interface is not a physical interface but describes a mechanism that controls the exchange of parameters between two communications partners, in other words, reading and writing parameter values, parameter descriptions and corresponding texts and the handling of parameter changes due to spontaneous messages. All the tasks handled via the PKW interface are essentially tasks for operator control and monitoring, service and diagnostics.
- The PZD area includes the signals required for automation:
  - Control word(s), and setpoint(s) from the master to the slave
  - Status word(s), and actual value(s) from the slave to the master.

Both areas together result in the user data field. This is transferred by the master to the slave as a job frame or by the slave to the master as a reply frame.

**Description**

Each communication module CM 1241 RS485 supports a maximum of 16 drives. A single instance data block contains temporary memory and buffer functions for all drives in the USS

network that are connected to a PtP communications module you installed. The USS instructions for these drives have shared access to the information in this data block.

- All drives (max. 16) that are connected to an RS485 port are part of the same USS network. All drives that are connected to a different RS485 port are part of a different USS network. As the S7-1200 supports up to three CM 1241 RS485 modules, you can set up up to three USS networks, each having a maximum of 16 drives, thus a total of 48 USS drives are supported.
- Each USS network is managed via a unique data block (three data blocks are required for three USS networks with three CM 1241 RS485 modules). All instructions that belong to a USS network must share this data block. This includes all "USS\_DRIVE (Page 3073)", "USS\_PORT (Page 3072)", "USS\_RPM (Page 3075)", and "USS\_WPM (Page 3077)" instructions for controlling all drives in a USS network.

- The instruction "USS\_DRIVE (Page 3073)" is a function block (FB). When you insert the instruction "USS\_DRIVE" in the editor, the "Call options" dialog will ask you to assign a DB to the instruction.
  - If this is the first "USS\_DRIVE" instruction in this program for this USS network, you can accept the default DB assignment (or, if necessary, change the name) and the new DB will be created.
  - If, however, this is not the first "USS\_DRIVE" instruction for this network, you must select the DB that was previously assigned to this USS network in the drop-down list in the "Call options" dialog.
- All "USS\_PORT (Page 3072), USS\_RPM (Page 3075)", and "USS\_WPM (Page 3077)" instructions are functions (FCs). When you insert these FCs in the editor, no DB is assigned. Instead, you have to assign the DB in question to the USS\_DB input of these instructions (double-click on the parameter field and then on the icon to display the available DBs).
- The instruction "USS\_PORT (Page 3072)" controls communication between the CPU and the drives via the PtP communications module. Whenever this instruction is called, communication with a drive is processed. Your program must call this function quickly enough so that the drives do not report a timeout. The instruction can be called from the main program or any interrupt OB.
- The function block "USS\_DRIVE (Page 3073)" gives your program access to a specified drive in the USS network. Its inputs and outputs correspond to the states and operating functions of the drive. If there are 16 drives in the network, "USS\_DRIVE" must be called at least 16 times in your program, i.e., once for each drive. How quickly these blocks are called depends on the required speed for controlling drive functions. You can only call the instruction "USS\_DRIVE" from the main program OB.

**CAUTION**

Call "USS\_DRIVE", "USS\_RPM", "USS\_WPM" only from the main program OB. The instruction "USS\_PORT" can be called from any OB, it is usually called from a time-delay interrupt OB. If the instruction "USS\_PORT" is interrupted during execution, this may result in unexpected errors.

The "USS\_RPM" and "USS\_WPM" instructions are used to read and write the operating parameters of the drive. These parameters control the internal mode of operation of the drive. A definition of these parameters can be found in the drive manual.

Your program may also contain any number of these instructions; however only one read or write request can be active for a drive. You may only call the instructions "USS\_RPM" and "USS\_WPM" from the main program OB.

### Calculating the time for communication with the drive

Communication with the drive is runs asynchronous to the cycle of the S7-1200. The S7-1200 runs through several cycles before communication with a drive is completed.

The interval of "USS\_PORT" is the time required for a drive transaction. The following table shows the minimum intervals for "USS\_PORT" for each baud rate. Calling the "USS\_PORT" more frequently than the "USS\_PORT" interval will not increase the number of transactions. The timeout interval of the drive is the period of time available to a transaction if 3 attempts

are required to complete the transaction due to communications errors. By default, up to 2 further attempts are made for each transaction with the USS protocol.

Baud rate	Calculated minimum interval for calling USS_PORT (ms)	Drive message interval timeout per drive (ms)
1200	790	2370
2400	405	1215
4800	212.5	638
9600	116.3	349
19200	68.2	205
38400	44.1	133
57600	36.1	109
115200	28.1	85

### USS\_PORT: Edit communication via USS network

#### Description

The "USS\_PORT" instruction handles communication over the USS network. In the program, use one "USS\_PORT" instruction per PtP communications port to control the transmission to or from one drive.

All USS instructions that are assigned to one USS network and one PtP communications port must use the same instance data block.

#### Call

Your program must execute the "USS\_PORT" instruction often enough to prevent timeouts in the drive. You should therefore call the "USS\_PORT" instruction from a cyclic interrupt OB to prevent drive timeouts and keep the most recent USS data updates available for "USS\_DRIVE (Page 3073)" calls.

#### Parameters

The following table shows the parameters of the "USS\_PORT" instruction:

Parameter	Declaration	Data type	Memory area	Description
PORT	Input	PORT	D, L or constant	PtP communications port identifier Constant that can be referenced within the "Constants" tab of the default tag table.
BAUD	Input	DINT	I, Q, M, D, L or constant	Baud rate for USS communication.
USS_DB	InOut	USS_BASE	D	Reference to the instance DB of the "USS_DRIVE (Page 3073)" instruction.

Parameter	Declaration	Data type	Memory area	Description
ERROR	Output	BOOL	I, Q, M, D, L	ERROR is set to TRUE if an error occurs. A corresponding error code will be output at the STATUS output.
STATUS (Page 3078)	Output	WORD	I, Q, M, D, L	Status value of the request. It indicates the result of the cycle or initialization. Additional information is available in the "USS_Extended_Error (Page 3078)" tag for some status codes.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## USS\_DRIVE: Swap data with drive

### Description

The "USS\_DRIVE" instruction exchanges data with the drive by creating request messages and interpreting the drive response messages. A separate instruction must be used for each drive, but all USS instructions assigned to one USS network and one PtP communications module must use the same instance data block. You must create the DB name when you place the first "USS\_DRIVE" instruction. Then reuse this DB that was created when the initial instruction was inserted.

When the "USS\_DRIVE" instruction is executed the first time, the drive indicated by the USS address (parameter DRIVE) is initialized in the instance DB. After this initialization, subsequent "USS\_PORT (Page 3072)" instructions can start communication with the drive at this drive number.

Changing the drive number requires a PLC STOP to RUN mode transition that initializes the instance DB. Input parameters are configured in the USS send buffer, and outputs are read from a "previous" valid response buffer if any exists. There is no data transmission during execution of the "USS\_DRIVE" instruction. Communication with the drives takes place when "USS\_PORT (Page 3072)" is executed. "USS\_DRIVE" only configures the messages to be sent and interprets data received in a previous request.

You can control the drive direction of rotation using either the DIR (BOOL) input or using the sign (positive or negative) at the SPEED\_SP (REAL) input. The following table explains how these inputs work together to determine the drive direction, assuming the motor is wired for forward rotation.

SPEED_SP	DIR	Direction of rotation of drive
Value > 0	0	Reverse
Value > 0	1	Forward
Value < 0	0	Forward
Value < 0	1	Reverse

### Parameters

Expand the box to display all the parameters by clicking the bottom of the box. The parameter connections that are grayed are optional and do not need to be assigned.

The following table shows the parameters of the "USS\_DRIVE" instruction:

Parameter	Declaration	Data type	Memory area	Description
RUN	Input	BOOL	I, Q, M, D, L or constant	Drive start bit: If this parameter has the value TRUE, this input enables the drive to run at the preset speed.
OFF2	Input	BOOL	I, Q, M, D, L or constant	"Electrical stop" bit: If this parameter has the value FALSE, this bit cause the drive to coast to a stop without braking.
OFF3	Input	BOOL	I, Q, M, D, L or constant	Fast stop bit - If this parameter has the value FALSE, this bit causes a fast stop by braking the drive.
F_ACK	Input	BOOL	I, Q, M, D, L or constant	Fault acknowledge bit - This bit resets the fault bit on a drive. This bit is set after the fault is cleared to indicate to the drive that it no longer needs to indicate the previous fault.
DIR	Input	BOOL	I, Q, M, D, L or constant	Drive direction control - This bit is set to indicate that the direction is forward (when SPEED_SP is positive).
DRIVE	Input	USINT	I, Q, M, D, L or constant	Drive address: This input is the address of the USS drive. The valid range is drive 1 to drive 16.
PZD_LEN	Input	USINT	I, Q, M, D, L or constant	Word length - This is the number of words of PZD data. Valid values are 2, 4, 6, or 8 words. The default is 2.
SPEED_SP	Input	REAL	I, Q, M, D, L or constant	Speed setpoint - This is the speed of the drive as a percentage of configured frequency. A positive value specifies forward direction (when DIR has the value TRUE).
CTRL3	Input	WORD	I, Q, M, D, L or constant	Control word 3 - A value written to a user-configurable parameter on the drive. The user must configure this on the drive. Optional parameter
CTRL4	Input	WORD	I, Q, M, D, L or constant	Control word 4 - A value written to a user-configurable parameter on the drive. The user must configure this on the drive. Optional parameter
CTRL5	Input	WORD	I, Q, M, D, L or constant	Control word 5 - A value written to a user-configurable parameter on the drive. The user must configure this on the drive. Optional parameter
CTRL6	Input	WORD	I, Q, M, D, L or constant	Control word 6 - A value written to a user-configurable parameter on the drive. The user must configure this on the drive.
CTRL7	Input	WORD	I, Q, M, D, L or constant	Control word 7 - A value written to a user-configurable parameter on the drive. The user must configure this on the drive. Optional parameter
CTRL8	Input	WORD	I, Q, M, D, L or constant	Control word 8 - A value written to a user-configurable parameter on the drive. The user must configure this on the drive. Optional parameter
NDR	Output	BOOL	I, Q, M, D, L	New data ready - If this parameter has the value TRUE, the bit indicates that the output contains data from a new communication request.

Parameter	Declaration	Data type	Memory area	Description
ERROR	Output	BOOL	I, Q, M, D, L	Error occurred - If this parameter has the value TRUE, this indicates that an error has occurred and the STATUS output is valid. All other outputs are set to zero on an error. Communication errors are only reported at the ERROR and STATUS outputs of the "USS_PORT" instruction.
STATUS (Page 3078)	Output	WORD	I, Q, M, D, L	Status value of the request. It indicates the result of the cycle. This is not a status word returned from the drive.
RUN_EN	Output	BOOL	I, Q, M, D, L	Run enabled - This bit indicates whether the drive is running.
D_DIR	Output	BOOL	I, Q, M, D, L	Drive direction - This bit indicates whether the drive is running forward.
INHIBIT	Output	BOOL	I, Q, M, D, L	Drive inhibited - This bit indicates the state of the inhibit bit on the drive.
FAULT	Output	BOOL	I, Q, M, D, L	Drive fault - This bit indicates that the drive has registered a fault. The user must eliminate the fault and then set the F_ACK bit to clear this bit.
SPEED	Output	REAL	I, Q, M, D, L	Drive current speed (scaled value of drive status word 2) - The value of the speed of the drive as a percentage of configured speed.
STATUS1	Output	WORD	I, Q, M, D, L	Drive status word 1 - This value contains fixed status bits of a drive.
STATUS3	Output	WORD	I, Q, M, D, L	Drive status word 3 - This value contains a user-configurable status word on the drive.
STATUS4	Output	WORD	I, Q, M, D, L	Drive status word 4 - This value contains a user-configurable status word on the drive.
STATUS5	Output	WORD	I, Q, M, D, L	Drive status word 5 - This value contains a user-configurable status word on the drive.
STATUS6	Output	WORD	I, Q, M, D, L	Drive status word 6 - This value contains a user-configurable status word on the drive.
STATUS7	Output	WORD	I, Q, M, D, L	Drive status word 7 - This value contains a user-configurable status word on the drive.
STATUS8	Output	WORD	I, Q, M, D, L	Drive status word 8 - This value contains a user-configurable status word on the drive.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## USS\_RPM: Readout parameters from the drive

### Description

The "USS\_RPM" instruction reads a parameter from the drive. All USS functions that are assigned to one USS network and one PtP communications module must use the same instance data block. "USS\_RPM" must be called from the main program OB.

**Parameter**

The following table shows the parameters of the "USS\_RPM" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L	Send request: If this parameter has the value TRUE, it indicates that a new read request is desired. This is ignored if the request for this parameter is already pending.
DRIVE	Input	USINT	I, Q, M, D, L or constant	Drive address: This input is the address of the USS drive. The valid range is drive 1 to drive 16.
PARAM	Input	UINT	I, Q, M, D, L or constant	Parameter number: This input specifies which drive parameter is written. The range of this parameter is 0 to 2047. See your drive manual for details on how to access any parameters above this range.
INDEX	Input	UINT	I, Q, M, D, L or constant	Parameter index: This input specifies which drive parameter index is to be written. This is a 16-bit value where the least significant byte is the actual index value with a range of (0 to 255). The most significant byte may also be used by the drive and is drive-specific. See your drive manual for additional information.
USS_DB	InOut	USS_BASE	D	Reference to the instance DB that is created and initialized when a "USS_DRIVE" instruction is inserted in your program.
DONE	Output	BOOL	I, Q, M, D, L	If this parameter has the value TRUE, it indicates that the VALUE output holds the previously requested read parameter value.  This bit is set when the "USS_DRIVE" instruction recognizes the read response from the drive.  This bit is reset when either: <ul style="list-style-type: none"> <li>• you request the response data via another "USS_RPM" poll</li> <li>or</li> <li>• the second of the next two calls of "USS_DRIVE (Page 3073)" is executed</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Error occurred - If this parameter has the value TRUE, this indicates that an error has occurred and the STATUS output is valid. All other outputs are set to zero on an error. Communication errors are only reported at the ERROR and STATUS outputs of the "USS_PORT (Page 3072)" instruction.
STATUS (Page 3078)	Output	WORD	I, Q, M, D, L	This is the status value of the request. It indicates the result of the read request. Additional information is available in the "USS_Extended_Error (Page 3078)" tag for some status codes.
VALUE	Output	VARIANT	I, Q, M, D, L	This is the value of the parameter that was read and is valid only when the DONE bit has the value TRUE.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**USS\_WPM: Change parameters in the drive****Description**

The "USS\_WPM" instruction modifies a parameter in the drive. All USS functions that are assigned to one USS network and one PtP communications module must use the same instance data block. "USS\_WPM" must be called from the main program OB.

**Note****EEPROM write operations**

Beware of overusing the EEPROM write operation. Minimize the number of EEPROM write operations to extend the EEPROM life.

**Parameter**

The following table shows the parameters of the "USS\_WPM" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L	Send request: If this parameter has the value TRUE, it indicates that a new write request is desired. This is ignored if the request for this parameter is already pending.
DRIVE	Input	USINT	I, Q, M, D, L or constant	Drive address: This input is the address of the USS drive. The valid range is drive 1 to drive 16.
PARAM	Input	UINT	I, Q, M, D, L or constant	Parameter number: This input specifies which drive parameter is written. The range of this parameter is 0 to 2047. See your drive manual for details on how to access any parameters above this range.
INDEX	Input	UINT	I, Q, M, D, L or constant	Parameter index: This input specifies which drive parameter index is to be written. This is a 16-bit value where the least significant byte is the actual index value with a range of (0 to 255). The most significant byte may also be used by the drive and is drive-specific. See your drive manual for additional information.
EEPROM	Input	BOOL	I, Q, M, D, L or constant	Store to drive EEPROM: If this parameter has the value TRUE, values written to the drive parameter will be stored in the drive EEPROM. If this parameter has the value FALSE, the value written is only temporarily saved and will be lost the next time the drive is switched on.
VALUE	Input	VARIANT	I, Q, M, D, L or constant	The value of the parameter that is to be written. It must be valid on the transition of REQ.
USS_DB	InOut	USS_BASE	D	This is a reference to the instance DB that is created and initialized when a "USS_DRIVE (Page 3073)" instruction is inserted in your program.

Parameter	Declaration	Data type	Memory area	Description
DONE	Output	BOOL	I, Q, M, D, L	If this parameter has the value TRUE, the VALUE input was written to the drive. This bit is set when the "USS_DRIVE (Page 3073)" instruction recognizes the write response from the drive. This bit is reset when either: You request the drive's confirmation that the write operation has been completed via another "USS_WPM" query or when the second of the next two calls of "USS_DRIVE (Page 3073)" is executed.
ERROR	Output	BOOL	I, Q, M, D, L	Error occurred: If this parameter has the value TRUE, this indicates that an error has occurred and the STATUS output is valid. All other outputs are set to zero on an error. Communication errors are only reported at the ERROR and STATUS outputs of the "USS_PORT (Page 3072)" instruction.
STATUS (Page 3078)	Output	WORD	I, Q, M, D, L	This is the status value of the request. It indicates the result of the write request. Additional information is available in the "USS_Extended_Error (Page 3078)" tag for some status codes.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

### Parameter STATUS of USS instructions

#### STATUS parameter

The following table contains the status codes of the USS operation that are output at the STATUS output of the USS instructions:

STATUS* (W#16#...)	Description
0000	No error
8180	The length of the drive response did not match the characters received from the drive. The drive number where the error occurred is returned in the "USS_Extended_Error" tag. See the extended error description below this table.
8181	The parameter VALUE is not of the data type WORD, REAL, or DWORD
8182	User supplied a parameter value of the type word and received a DWORD or REAL from the drive in the response
8183	User supplied a parameter value of the type DWORD or REAL and received a word from the drive in the response
8184	Response telegram from drive had a bad checksum. The drive number where the error occurred is returned in the "USS_Extended_Error" tag. See the extended error description below this table.
8185	Illegal drive address (valid drive address range: 1-16)
8186	Speed set point out of valid range (valid speed SP range: -200% to 200%)
8187	Wrong drive number responded to the request sent. The drive number where the error occurred is returned in the "USS_Extended_Error" tag. See the extended error description below this table.
8188	Illegal PZD word length specified (valid range = 2, 4, 6 or 8 words)

STATUS* (W#16#....)	Description
8189	Illegal baud rate was specified
818A	Parameter request channel is in use by another request for this drive
818B	Drive has not responded to requests and retries. The drive number where the error occurred is returned in the "USS_Extended_Error" tag. See the extended error description below this table.
818C	Drive returned an extended error on a parameter request operation. See the extended error description below this table.
818D	Drive returned an invalid access error on a parameter request operation. See your drive manual for information of why parameter access may be limited
818E	Drive has not been initialized: This error code is output at "USS_RPM (Page 3075)" or "USS_WPM (Page 3077)" if the "USS_DRIVE (Page 3073)" instruction has not been called at least once for this drive. This prevents the initialization of the first cycle of "USS_DRIVE (Page 3073)" from overwriting a pending parameter read or write request since it initializes the drive as a new entry. To eliminate this error, call the "USS_DRIVE (Page 3073)" instruction for this drive.
80Ax-80Fx	Specific errors returned from PtP (Point-to-Point) communication instructions called by the USS library: These error code values are not modified by the USS library and are defined in the PtP instruction descriptions.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

### USS\_Extended\_Error - USS drive extended error codes

USS drives support read and write access to a drive's internal parameters. This feature allows distributed control and configuration of the drive. Drive parameter access operations can fail due to errors such as values out of range or invalid requests in a drive's current mode. The drive generates an error code that is output in the "USS\_Extended\_Error" variable in the instance DB of the "USS\_DRIVE (Page 3073)" instruction. This error code value is only valid for the last execution of the "USS\_RPM (Page 3075)" or "USS\_WPM (Page 3077)" instruction. The drive error code is put into the "USS\_Extended\_Error" tag when the value of STATUS is hexadecimal 818C. The error code of "USS\_Extended\_Error" depends on the drive variant. See the drive's manual for a description of the extended error codes for read and write parameter operations.

### MODBUS (RTU)

#### MB\_COMM\_LOAD: Configure port on the PtP module for Modbus RTU

##### Description

The "MB\_COMM\_LOAD" instruction configures a port for communication using the Modbus RTU protocol. The following hardware can be used for this:

- Up to three point-to-point modules (PtP) CM 1241 RS485 or CM 1241 RS232
- A communications board CB 1241 RS485 in addition to this

After configuration of the port, you communicate over Modbus by executing the "MB\_SLAVE" or "MB\_MASTER" instruction.

**Call**

"MB\_COMM\_LOAD" must be called once to configure the port for the Modbus RTU protocol. On completion of the configuration, the port can be used by the "MB\_MASTER (Page 3083)" and "MB\_SLAVE (Page 3090)" instructions.

"MB\_COMM\_LOAD" only needs to be called again if one of the communication parameters has to be modified. Each "MB\_COMM\_LOAD" call deletes the communications buffer. To avoid data loss during communication, you should not call the instruction unnecessarily.

One instance of "MB\_COMM\_LOAD" must be used to configure the port of each communication module that is used for Modbus communication. You assign a unique "MB\_COMM\_LOAD" instance data block for each port that you use. The S7-1200 CPU is limited to three communication modules.

An instance data block is assigned when you insert the "MB\_MASTER (Page 3083)" or "MB\_SLAVE (Page 3090)" instruction. This instance data block is referenced when you specify the MB\_DB parameter on the "MB\_COMM\_LOAD" instruction.

**Parameters**

The following table shows the parameters of the instruction "MB\_COMM\_LOAD":

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L	Execution of the instruction upon a rising edge.
PORT	Input	PORT	I, Q, M, D, L or constant	ID of the communications port: After you have inserted the communications module in the device configuration, the port ID appears in the drop-down list at the PORT box connection. This constant can also be referenced within the "Constants" tab of the tag table.
BAUD	Input	UDINT	I, Q, M, D, L or constant	Baud rate selection: 300, 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, 76800, 115200 All other values are invalid.
PARITY	Input	UINT	I, Q, M, D, L or constant	Parity selection: <ul style="list-style-type: none"> <li>• 0 – None</li> <li>• 1 – Odd</li> <li>• 2 – Even</li> </ul>
FLOW_CTRL	Input	UINT	I, Q, M, D, L or constant	Flow control selection: <ul style="list-style-type: none"> <li>• 0 – (default) No flow control</li> <li>• 1 – Hardware flow control with RTS always ON (does not apply to RS485 ports)</li> <li>• 2 - Hardware flow control with RTS switched</li> </ul>

Parameter	Declaration	Data type	Memory area	Description
RTS_ON_DLY	Input	UINT	I, Q, M, D, L or constant	RTS on-delay selection: <ul style="list-style-type: none"> <li>0 – (default) No delay of RTS active until the first character of the message is transmitted.</li> <li>1 to 65535 – Delay in milliseconds of "RTS active" until the first character of the message is transmitted (does not apply to RS-485 ports). RTS delays must be applied independent of the FLOW_CTRL selection.</li> </ul>
RTS_OFF_DLY	Input	UINT	I, Q, M, D, L or constant	RTS off-delay selection: <ul style="list-style-type: none"> <li>0 – (default) No delay after the last character transmitted until "RTS inactive"</li> <li>1 to 65535 – Delay in milliseconds after the last character transmitted until "RTS inactive" (does not apply to RS-485 ports). RTS delays must be applied independent of the FLOW_CTRL selection.</li> </ul>
RESP_TO	Input	UINT	I, Q, M, D, L or constant	Response timeout: Time in milliseconds allowed by "MB_MASTER (Page 3083)" for the slave to respond. If the slave does not respond in this time, "MB_MASTER (Page 3083)" repeats the request or terminates the request with an error if the specified number of retries has been sent. 5 ms to 65535 ms (default = 1000 ms).
MB_DB	Input	MB_BASE	D	A reference to the instance data block of the "MB_MASTER (Page 3083)" or "MB_SLAVE (Page 3090)" instructions. After you insert "MB_SLAVE (Page 3090)" or "MB_MASTER (Page 3083)" in your program, the DB identifier appears in the drop-down list at the MB_DB box connection.
DONE	Output	BOOL	I, Q, M, D, L	Execution of instruction completed without error.
ERROR	Output	BOOL	I, Q, M, D, L	Error: <ul style="list-style-type: none"> <li>0 – No error detected</li> <li>1 – Indicates that an error was detected. An error code is output in the STATUS parameter.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Port configuration error code

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

## Parameter STATUS

Error code* (W#16#...)	Description
0000	No error
8180	Invalid value for the port ID (wrong address for the communications module).

Error code* (W#16#...)	Description
8181	Invalid baud rate value.
8182	Invalid parity value.
8183	Invalid flow control value.
8184	Invalid value for the timeout of the response (the time before which a timeout is reported must be at least 25 ms).
8185	Incorrect pointer in the MB_DB parameter to the instance DB of the "MB_MASTER (Page 3083)" or "MB_SLAVE (Page 3090)" instruction.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### MB\_COMM\_LOAD data block tags

The table below shows the public static tags in the instance DB of MB\_COMM\_LOAD that you can use in your program.

Table 9-92 Static tags in the instance DB

Tag	Data type	Default	Description
ICHAR_GAP	WORD	0	Delay for the character spacing between characters. This parameter is specified in milliseconds and is used to increase the anticipated period between the received characters. The corresponding number of bit times for this parameter is added to the Modbus standard value of 35 bit times (3.5 character times).
RETRIES	WORD	2	The number of repeated attempts by the master before the error code 0x80C8 is returned for "No response".
MODE	USINT	0	Mode Permitted modes are: <ul style="list-style-type: none"> <li>• 0 = Full duplex (RS232)</li> <li>• 1 = Full duplex (RS422) four-wire mode (point-to-point)</li> <li>• 2 = Full duplex (RS422) four-wire mode (multipoint master)</li> <li>• 3 = Full duplex (RS422) four-wire mode (multipoint slave)</li> <li>• 4 = Half duplex (RS485) two-wire mode</li> </ul>
LINE_PRE	USINT	0	Receive line initial state Permitted defaults are: <ul style="list-style-type: none"> <li>• 0 = "No" default</li> <li>• 1 = Signal R(A)=5V, signal R(B)=0 V (break detection): No break detection is possible with this default. Can only be selected with: "Full duplex (RS422) four-wire mode (point-to-point connection)" and "Full duplex (RS422) four-wire mode (multipoint slave)".</li> <li>• 2 = Signal R(A)=0 V, signal R(B)=5 V: This default corresponds to the at-rest state (no send process is active). No break detection is possible with this default.</li> </ul>
CABLE-BREAK	USINT	0	Activate cable break detection: <ul style="list-style-type: none"> <li>• 0 - not activated</li> <li>• 1 - activated</li> </ul>

## MB\_MASTER: Communicate via the PtP port as Modbus master

### Description of MB\_MASTER

#### Description

The "MB\_MASTER" instruction allows your program to communicate as a Modbus master using a port on a point-to-point module (CM) or a communications board (CB). You can access data in one or more Modbus slave devices.

Before the "MB\_MASTER" instruction can communicate with a port, "MB\_COMM\_LOAD (Page 3079)" must first execute.

An instance DB is created when you insert the "MB\_MASTER" instruction in your program. You specify this instance DB in the MB\_DB input parameter of the "MB\_COMM\_LOAD (Page 3079)" instruction.

#### Rules for Modbus master communication

- A port used for Modbus master requests cannot be used for "MB\_SLAVE".
- A port can be used for one or more "MB\_MASTER" calls if the same instance DB is used.
- The Modbus instructions do not use communication interrupt events to control the communication process. Your program must poll the "MB\_MASTER" instruction for completed send and receive operations.
- Calling the instruction:
  - Call the "MB\_MASTER" instruction if possible in a cyclic program OB. The instruction can only be called in a time delay or cyclic interrupt OB.
  - Do not call more than one "MB\_MASTER" instruction in organization blocks with different priority classes. If a "MB\_MASTER" instruction executes "preemptively" from a higher priority class, the instruction may execute incorrectly.
  - Do not call the "MB\_MASTER" instruction in a startup, diagnostics or time error OB.
- After a transfer has started, the EN parameter (LAD/FBD) must remain set to the value "1" until the DONE or ERROR output parameter is set to "1" by the instruction. A renewed call by the REQ parameter while the instruction is executing causes an error. After the instruction executes, the bit in the REQ parameter remains set for the time specified by the BLOCKED\_PROC\_TIMEOUT parameter in the instance DB.
- If "MB\_MASTER" sends a request to a slave, make sure that "MB\_MASTER" continues to execute until the response from the slave arrives.

**Parameters**

The following table shows the parameters of the "MB\_MASTER" instruction:

Parameters	Declaration	Data type	Memory area	Description
REQ (Page 3086)	Input	BOOL	I, Q, M, D, L	Request input: <ul style="list-style-type: none"> <li>• 0 – No request</li> <li>• 1 – Request to transmit data to Modbus slave(s)</li> </ul>
MB_ADDR	Input	UINT	I, Q, M, D, L or constant	Modbus RTU station address: <ul style="list-style-type: none"> <li>• Default address range: 0 to 247</li> <li>• Extended address range: 0 to 65535</li> </ul> The value "0" is reserved for broadcasting a message to all Modbus slaves. Modbus function codes 05, 06, 15, and 16 are the only function codes supported for broadcast.
MODE (Page 3086)	Input	USINT	I, Q, M, D, L or constant	Mode selection: Specifies the type of request: Read, write, or diagnostics: Refer to the Modbus functions table for details.
DATA_ADDR (Page 3086)	Input	UDINT	I, Q, M, D, L or constant	Starting address in the slave: Specifies the starting address of the data to be accessed in the Modbus slave. You will find the valid addresses in the Modbus functions table.
DATA_LEN	Input	UINT	I, Q, M, D, L or constant	Data length: Specifies the number of bits or words to be accessed in this request. You will find the valid lengths in the Modbus functions table.
DATA_PTR (Page 3087)	Input	VARIANT	M, D	Points to the DB or bit memory address of the CPU for the data to be written or read. For a DB, this must be created with the "Standard - compatible with S7-300/400" access type.
DONE	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• 0: Transaction not completed</li> <li>• 1: Transaction completed without error</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• 0: No "MB_MASTER" transaction in progress</li> <li>• 1: "MB_MASTER" transaction in progress</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error, the error code is indicated by the STATUS parameter</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Execution condition code

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**STATUS parameter**

Table 9-93 Communications and configuration error messages of the instruction

Error code* (W#16#...)	Description
0000	No error
80C8	Slave timeout. Check the baud rate, parity and the connectors on the slave.
80D1	The receiver issued a flow control request to suspend an active transmission and never re-enabled the transmission within the wait time. This error is also generated during hardware flow control if the recipient does not detect CTS within the wait time.
80D2	The send request was aborted because no DSR signal is received from the DCE.
80E0	The message was terminated because the receive buffer is full.
80E1	The message was terminated as a result of a parity error.
80E2	The message was terminated as a result of a framing error.
80E3	The message was terminated as a result of an overrun error.
80E4	The message was terminated as a result of the specified length exceeding the total buffer size.
8180	Invalid value for the port ID.
8186	Invalid Modbus station address
8188	The MODE parameter has an invalid value for a broadcast call.
8189	Invalid data address value.
818A	Invalid data length value.
818B	Invalid pointer to the local data source/destination: Size not correct
818C	The DATA_PTR parameter has an invalid pointer. Use a pointer to a bit memory area or a DB with the "Standard - compatible with S7-300/400" access type.
8200	Port is busy processing a send request
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

Table 9-94 Error messages of the Modbus protocol

Error code* (W#16#...)	Response code of slave	Description
8380	-	CRC error
8381	01	Function code not supported
8382	03	Data length error
8383	02	Error in the data address or address outside the valid range of DATA_PTR
8384	> 03	Data value error
8385	03	Data diagnostic code value not supported (function code 08)
8386	-	Function code of the response does not match the function code of the query.
8387	-	Response from wrong slave

Error code* (W#16#...)	Response code of slave	Description
8388	-	The response of the slave to a write call is not correct. The data sent by the slave does not match the query from the master.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### Parameter REQ

#### Description

- REQ = FALSE: No request
- REQ = TRUE: Request to transmit data to Modbus slave(s)

You can control this input by means of a level-controlled or edge-controlled contact.

A state machine is started every time this input is activated to ensure that another instruction "MB\_MASTER" that uses the same instance DB can only issue a request when the current request has been processed. All other input states are recorded and saved internally for the current request until the reply has been received or an error has been detected.

If the same instance of "MB\_MASTER" is executed again with REQ input = 1 before the current request is completely processed, no subsequent transfers are made. However, if the request has been processed, a new request is issued at the time when "MB\_MASTER" is executed again with REQ input = 1.

### DATA\_ADDR and MODE parameters

#### Description

You specify the start address for data access to the Modbus slave using the DATA\_ADDR parameter.

With the MODE parameter and the Modbus address, you specify the function code to be transferred to the Modbus slave. The following table shows the relationship between the MODE parameter, the function code and Modbus address range.

MODE	Modbus function	Data length	Operation and data	Modbus address
0	01	1 to 2000 1 to 1992 <sup>(1)</sup>	Read output bits: 1 to (1992 or 2000) bits per query	1 to 9999
0	02	1 to 2000 1 to 1992 <sup>(1)</sup>	Read input bits: 1 to (1992 or 2000) bits per query	10001 to 19999
0	03	1 to 125 1 to 124 <sup>(1)</sup>	Read holding register: 1 to (124 or 125) WORD per query	40001 to 49999 or 400001 to 465535
0	04	1 to 125 1 to 124 <sup>(1)</sup>	Read input WORD: 1 to (124 or 125) WORD per query	30001 to 39999

MODE	Modbus function	Data length	Operation and data	Modbus address
1	05	1	Writing an output bit: One bit per query	1 to 9999
1	06	1	Writing a holding register: 1 WORD per query	40001 to 49999 or 400001 to 465535
1	15	2 to 1968 2 to 1960 <sup>(1)</sup>	Writing multiple output bits: 2 to (1960 or 1968) bits per query	1 to 9999
1	16	2 to 123 2 to 122 <sup>(1)</sup>	Writing multiple holding registers: 2 to (122 or 123) WORD per query	40001 to 49999 or 400001 to 465535
2	15	1 to 1968 2 to 1960 <sup>(1)</sup>	Writing one or more output bits: 1 to (1960 or 1968) bits per query	1 to 9999
2	16	1 to 123 2 to 122 <sup>(1)</sup>	Writing one or more holding registers: 1 to (122 or 123) WORD per query	40001 to 49999 or 400001 to 465535
11	11	0	Reading out the communications status word of the slaves and the event counter:  The status word indicates execution of the instruction (0: is not executing; 0xFFFF: is executing). The event counter is incremented each time a message is transferred successfully.  The DATA_ADDR and DATA_LEN parameters of the "MB_MASTER" instruction are ignored with this function.	-
80	08	1	Checking the slave status by reading the error code (0x0000): 1 WORD per query	-
81	08	1	Resetting the event counter of the slave with the diagnostics code 0x000A: 1 WORD per query	-
3 to 10, 12 to 79, 82 to 2555			Reserved	-

<sup>(1)</sup>For the "Extended address range", the maximum data length is reduced by one byte or one WORD depending on which data type is used for the function.

## Parameter DATA\_PTR

### Description

The DATA\_PTR parameter is a pointer to a data block or bit memory from which the data should be written or read. If you use a data block, create a global data block with the "Standard - compatible with S7-300/400" access type.

**Data block structures for the DATA\_PTR parameter**

- These data types are valid for **reading of words** of Modbus addresses 30001 to 39999, 40001 to 49999, and 400001 to 465536 and also for **writing of words** to Modbus addresses 40001 to 49999 and 400001 to 465536.
  - Standard array of WORD, UINT, or INT data types (see below).
  - Named WORD, UINT, or INT structure where each element has a unique name and 16 bit data type.
  - Named complex structure where each element has a unique name and 16 bit or 32 bit data type.
- For reading and writing of bits of Modbus addresses 00001 to 09999 and 10001 to 19999.
  - Standard array of Boolean data types.
  - Named Boolean structure of uniquely named Boolean variables.
- Although not required, it is recommended that each "MB\_MASTER" instruction has its own separate memory area in a global data block. The reason for this recommendation is that there is a greater possibility of data corruption if multiple "MB\_MASTER" instructions are reading and writing the same area of a global data block.
- The memory areas for DATA\_PTR do not need to be in the same global data block. You can create one data block with multiple areas for Modbus read operations, one data block for Modbus write operations, or one data block for each slave station.

**Instance DB of the "MB\_MASTER" instruction**

**Static variables of the instance DB**

The following table describes the static variables of the instance DB of the instruction that you can use in the user program.

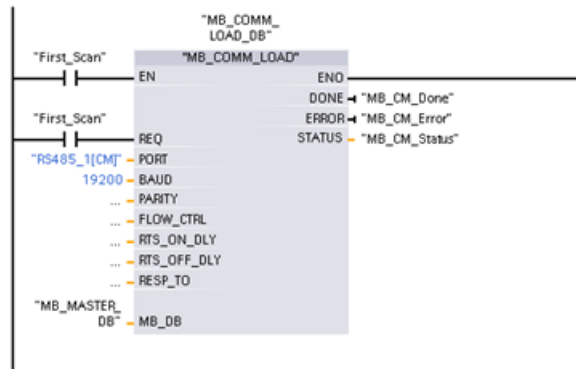

Variable	Data type	Description
MB_STATE	UINT	Internal status of the Modbus instruction
BLOCKED_ PROC_TIMEOUT	REAL	Time between completion of the instruction call and resetting the ACTIVE bit in the instance DB. The time buffer is used to avoid execution of the instruction being terminated before a job has been sent completely. The default time is 500 ms.
EXTENDED_ ADDRESSING	BOOL	Configuring addressing: <ul style="list-style-type: none"> <li>• 0: Default address area (1 byte)</li> <li>• 1: Extended address area (2 bytes)</li> </ul> For additional information, refer to the section EXTENDED_ADDRESSING: Instance DB of the "MB_SLAVE" instruction (Page 3093)

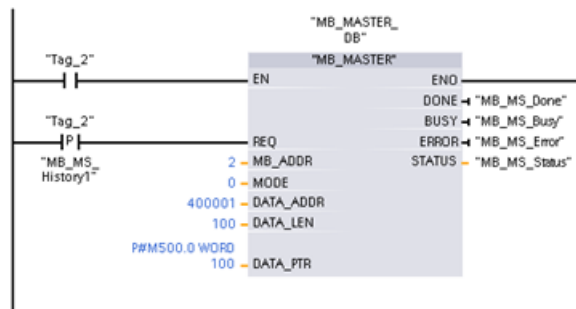

## Sample program for a Modbus master

### Networks (LAD)

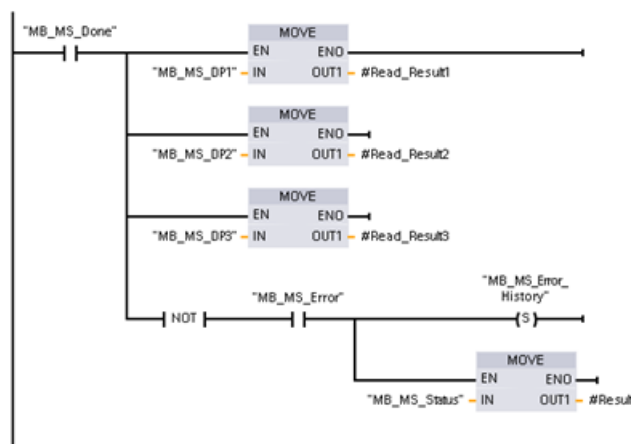

**Network 1:** Initialize parameters of the RS-485 module only once during the first cycle.

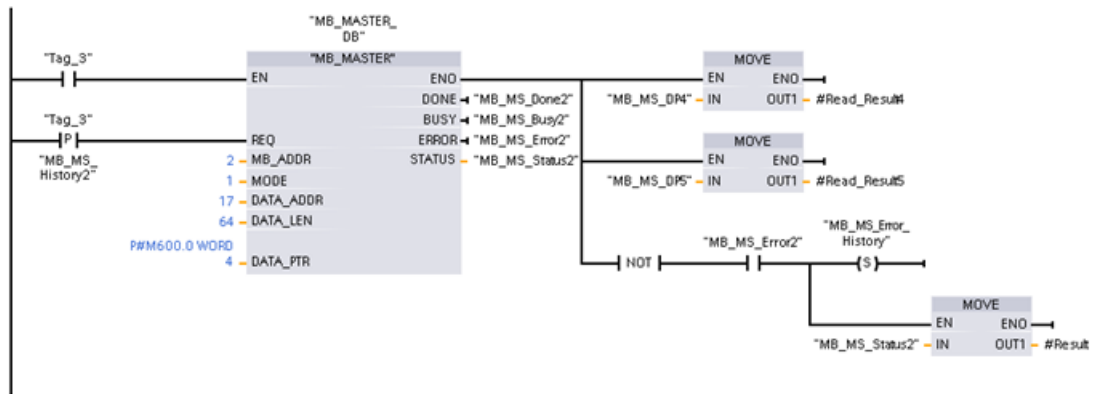

**Network 2:** Read 100 words from the holding register of the slave.

**Network 3:** This is an optional network that displays the values of the first 3 words as soon as the read operation has executed.

**Network 4:** Write 64 bits to the process image output, starting at slave address Q2.0.

**MB\_SLAVE: Communicate via the PtP port as Modbus slave**

**Description of MB\_SLAVE**

**Description**

The "MB\_SLAVE" instruction allows your program to communicate as a Modbus slave using a port on a point-to-point module (PtP) or a communications board (CB). A Modbus RTU master can issue a request and then your program responds via "MB\_SLAVE" execution.

You must assign a unique instance data block when you insert the "MB\_SLAVE" instruction in your program. This instance data block is used when you specify it at the MB\_DB parameter of the "MB\_COMM\_LOAD (Page 3079)" instruction.

Modbus communication function codes (1, 2, 4, 5, and 15) can read and write bits and words directly in the process image input and process image output in the target system. The following table shows the mapping of Modbus addresses to the process image in the CPU.

Modbus functions of "MB_SLAVE"					S7-1200		
Codes	Function	Data area	Address range		Data area	CPU address	
01	Read bits	Output	1	to	8192	Process image output	Q0.0 to Q1023.7
02	Read bits	Input	10001	to	18192	Process image input	I0.0 to I1023.7
04	Read words	Input	30001	to	30512	Process image input	IW0 to IW1022
05	Write bit	Output	1	to	8192	Process image output	Q0.0 to Q1023.7
15	Write bits	Output	1	to	8192	Process image output	Q0.0 to Q1023.7

Modbus communication function codes (function codes 3, 6, 16) use a separate holding register. To do this, you can use bit memory or a data block with the "Standard - compatible with S7-300/400" access type.

You specify the type of the holding register using the MB\_HOLD\_REG parameter of the MB\_SLAVE instruction. The following table shows the mapping of the Modbus holding register to the DB address of MB\_HOLD\_REG in the target system.

Modbus functions of "MB_SLAVE"				S7-1200	
Codes	Function	Data area	Address range (WORD number)	Address in the DB (BYTE number)	Bit memory address (BYTE number)
03	Read words	Holding register	40001 to 49999 or	DW0 to DW19998 or	MW0 to CPU limit
			400001 to 465535	DW0 to DW131068	
06	Write word	Holding register	40001 to 49999 or	DW0 to DW19998 or	
			400001 to 465535	DW0 to DW131068	
16	Write words	Holding register	40001 to 49999 or	DW0 to DW19998 or	
			400001 to 465535	DW0 to DW131068	

The table below shows the supported Modbus diagnostic functions.

S7-1200 "MB_SLAVE" Modbus diagnostic functions		
Codes	Subfunction	Description
08	0000H	Return query data echo test: The "MB_SLAVE" instruction returns the echo of a received data word to a Modbus master.
08	000AH	Clear communication event counter: The "MB_SLAVE" instruction clears the communication event counter that is used for Modbus function 11.
11	-	Get communication event counter: The "MB_SLAVE" instruction uses an internal communication event counter for recording the number of successful Modbus read and write requests that are sent to the Modbus slave. The counter is not incremented on any Function 8, Function 11, or broadcast requests. It is also not incremented on any requests that result in a communication error (for example, parity or CRC errors).

The "MB\_SLAVE" instruction supports broadcast write requests from Modbus masters as long as the requests include access to valid addresses.

Regardless of the validity of a request, "MB\_SLAVE" gives no response to a Modbus master as the result of a broadcast request.

### Rules of Modbus slave communication

- "MB\_COMM\_LOAD" must be executed to configure a port, before the "MB\_SLAVE" instruction can communicate with this port.
- If a port is to respond as a slave to a Modbus master, then that port cannot be used by "MB\_MASTER (Page 3083)". Only one instance of "MB\_SLAVE" can be used with a given port.
- The Modbus instructions do not use communication interrupt events to control the communication process. Your program must control the communication process by polling the "MB\_SLAVE" instruction for completed send and receive operations.
- The "MB\_SLAVE" instruction must be executed periodically at a rate that allows it to make a timely response to incoming requests from a Modbus master. It is therefore advisable to call the instruction in a cyclic program OB. Calling the "MB\_SLAVE" instruction in an interrupt OB is possible but not advisable since it can lead to long delays in execution.

### Frequency of execution of "MB\_SLAVE"

The "MB\_SLAVE" instruction must be executed periodically to receive each request from the Modbus master and to respond as required. The frequency of execution of "MB\_SLAVE" is dependent upon the specified response timeout period of the Modbus master. This is illustrated in the following diagram.

The response timeout period is the amount of time a Modbus master waits for the start of a response from a Modbus slave. This time period is not defined by the Modbus protocol, but rather by a parameter of each Modbus master. The frequency of execution (time between one execution and the next execution) of "MB\_SLAVE" must be based on the particular parameters of your Modbus master. As a minimum, you should execute "MB\_SLAVE" twice within the response timeout period of the Modbus master.

### Parameters

The following table shows the parameters of the "MB\_SLAVE" instruction:

Parameter	Declaration	Data type	Memory area	Description
MB_ADDR	Input	USINT	I, Q, M, D, L or constant	Station address of the Modbus slave (address range: 0 to 255)
MB_HOLD_REG	Input	VARIANT	D	Pointer to the Modbus holding register DB. The DB must be created with the "Standard - compatible with S7-300/400" access type.
NDR	Output	BOOL	I, Q, M, D, L	New data ready: <ul style="list-style-type: none"> <li>• 0: No new data</li> <li>• 1: Indicates that new data has been written by the Modbus master</li> </ul>
DR	Output	BOOL	I, Q, M, D, L	Read data: <ul style="list-style-type: none"> <li>• 0: No data read</li> <li>• 1: Indicates that data has been read by the Modbus master</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• 0: No error detected</li> <li>• 1: Error, a corresponding error code is output in the STATUS</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Error code

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

**STATUS parameter**

STATUS* (W#16#...)	Description	
80C8	The specified response timeout (refer to RCVTIME or MSGTIME) is "0".	
80D1	The receiver issued a flow control request to suspend an active transmission and never re-enabled the transmission within the wait time. This error is also generated during hardware flow control if the recipient does not detect CTS within the wait time.	
80D2	The send request was aborted because no DSR signal is received from the DCE.	
80E0	The message was terminated because the receive buffer is full	
80E1	The message was terminated as a result of a parity error	
80E2	The message was terminated as a result of a message frame error	
80E3	The message was terminated as a result of an overrun error	
80E4	The message was terminated as a result of the specified length exceeding the total buffer size	
8180	Invalid value for the port ID.	
8186	Invalid Modbus station address	
8187	Invalid pointer to MB_HOLD_REG-DB	
818C	Pointer to a type safe DB type MB_HOLD_REG (must be a Classic DB type)	
Response code sent to Modbus master (B#16#...)		
8380	No response	CRC error
8381	01	Function code not supported or not supported in a broadcast
8382	03	Data length error
8383	02	Error in the data address or address outside the valid range of MB_HOLD_REG
8384	03	Data value error
8385	03	Data diagnostic code value not supported (function code 08)
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

**Instance DB of the "MB\_SLAVE" instruction****Static variables of the instance DB**

The following table describes the static variables of the instance DB of the instruction that you can use in the user program. Your program can write values to the HR\_Start\_Offset and Extended\_Addressing variables and control the Modbus slave operations.

The other variables can be read to monitor the Modbus status.

Variable	Data type	Description
HR_Start_Offset	WORD	Start address of the Modbus holding register (default = " 0")
Extended_Addressing	BOOL	Configuring addressing: <ul style="list-style-type: none"> <li>• 0: Default address area (1 byte)</li> <li>• 1: Extended address area (2 bytes)</li> </ul>

Variable	Data type	Description
Request_Count	WORD	Total number of queries received by the slave
Slave_Message_Count	WORD	Number of queries sent to this specific slave
Bad_CRC_Count	WORD	Number of received queries with CRC errors
Broadcast_Count	WORD	Number of received broadcast queries
Exception_Count	WORD	Number of Modbus-specific errors that require the return of an exception
Success_Count	WORD	The number of requests received for this specific slave without protocol errors

### HR\_Start\_Offset

The addresses of the Modbus holding register start at 40001 or 400001. These addresses correspond to the start address of the holding register in the target system memory. Using the HR\_Start\_Offset variable, you can set the offset to a different start address.

Example: A holding register starts at MW 100 and has a length of 100 WORD. With an offset of 20 in the HR\_Start\_Offset parameter, the holding register begins at address 40021 instead of 40001. Each address below 40021 and above 400119 causes an addressing error.

	HR_Start_Offset = 0		HR_Start_Offset = 20	
	Modbus word address	S7-1200 byte address	Modbus word address	S7-1200 byte address
Minimum	40001	MW100	40021	MW100
Maximum	40099	MW198	40119	MW198

### Extended Addressing

To address the Modbus slave, a single byte (default address range) or a double byte (extended address range) can be configured. Extended addressing is used to address more than 247 devices in a single network. If you decide on extended addressing, you can address a maximum of 64,000 addresses. Below, you will see a frame of Modbus function 1 as an example.

Table 9-95 Slave address with one byte (byte 0)

Function 1	Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	
Request	Slave address	F code	Start address		Length of the coils		
Valid response	Slave address	F code	Length	Coil data			
Error response	Slave address	0x81	E code				

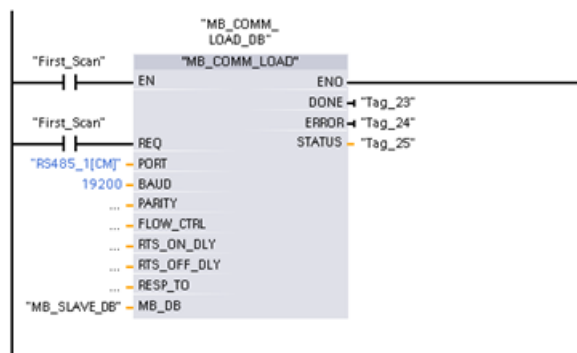

Table 9-96 Slave address with two bytes (byte 0 and byte 1)

Function 1	Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6
Request	Slave address		F code	Start address		Length of the coils	
Valid response	Slave address		F code	Length	Coil data		
Error response	Slave address		0x81	F code			

### Sample program for a Modbus slave

#### Networks (LAD)

**Network 1:** Initialize parameters of the RS-485 module only once during the first cycle.

**Network 2:** Check the requests of the Modbus master in every cycle. 100 words starting at MW1000 are configured for the Modbus holding register.

**MODBUS (TCP)**

**MODBUS (TCP) (S7-1200)**

**MB\_CLIENT: Communicating via PROFINET as a Modbus TCP client**

**Description of MB\_CLIENT**

**Description**

The "MB\_CLIENT" instruction communicates as a Modbus TCP client via the PROFINET connection of the S7-1200 CPU. To use the instruction, you do not require any additional hardware module. With the "MB\_CLIENT" instruction, you establish a connection between the client and the server, send requests and receive responses and control connection termination of the Modbus TCP server.

**Parameters**

The following table shows the parameters of the "MB\_CLIENT" instruction:

Parameter	Declaration	Data type	Description
REQ (Page 3098)	Input	BOOL	<p>Communication request with the Modbus TCP server</p> <p>The REQ parameter is level-controlled. This means that as long as the input is set (REQ=true), the instruction sends communication requests.</p> <ul style="list-style-type: none"> <li>• The instance DB for other clients is blocked with the communications request.</li> <li>• Changes to the input parameters will not become effective until the server has responded or an error message has been output.</li> <li>• If the parameter REQ is set again during an ongoing Modbus request, no additional transmission takes place afterwards.</li> </ul>
DISCONNECT (Page 3098)	Input	BOOL	<p>With this parameter, you control the establishment and termination of the connection to the Modbus server:</p> <ul style="list-style-type: none"> <li>• 0: Establish a communications connection to the specified IP address and port number.</li> <li>• 1: Disconnect the communication connection. No other function is executed during connection termination. The value 7003 is output at the STATUS parameter after successful connection termination.</li> </ul> <p>The request is sent immediately if the REQ parameter is set during connection establishment.</p>
CONNECT_ID	Input	UINT	<p>Unique ID to identify the connection. Each instance of the instructions "MB_CLIENT" and "MB_SERVER (Page 3103)" must be assigned a unique connection ID.</p>
IP_OCTET_1	Input	USINT	<p>1. Octet of the IP address* of the Modbus TCP server.</p>
IP_OCTET_2	Input	USINT	<p>2. Octet of the IP address* of the Modbus TCP server.</p>

Parameter	Declaration	Data type	Description
IP_OCTET_3	Input	USINT	3. Octet of the IP address* of the Modbus TCP server.
IP_OCTET_4	Input	USINT	4. Octet of the IP address* of the Modbus TCP server.
IP_PORT	Input	UINT	IP port number of the server to which the client establishes the connection and communicates using the TCP/IP protocol (default value: 502).
MB_MODE (Page 3099)	Input	USINT	Selects the mode of the request (read, write or diagnostics).
MB_DATA_ADDR (Page 3099)	Input	UDINT	Start address of the data accessed by the "MB_CLIENT" instruction.
DATA_LEN	Input	UINT	Data length: Number of bits or words for the data access (see "MB_MODE and MB_DATA_ADDR parameters" - data length).
MB_DATA_PTR (Page 3100)	InOut	VARIANT	Pointer to the Modbus data register: The register is a buffer for the data received from the Modbus server or to be sent to the Modbus server. The pointer must reference a global data block with standard access.  The number of bits addressed must be divisible by 8.
DONE	Out	BOOL	The bit at output parameter DONE is set to "1" as soon as the last job is completed without errors.
BUSY	Out	BOOL	<ul style="list-style-type: none"> <li>• 0: No "MB_CLIENT" job in progress</li> <li>• 1: "MB_CLIENT" job in progress</li> </ul>
ERROR	Out	BOOL	<ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred. The cause of error is indicated by the STATUS parameter.</li> </ul>
STATUS (Page 3101)	Out	WORD	Error code of the instruction.
* 8-bit long component of the 32-bit IPv4 IP address of the Modbus TCP server.			

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

#### Note

##### Consistent input data during an "MB\_CLIENT" call

When a Modbus client calls a Modbus instruction, the status of the input parameters is stored internally and then compared at the next call. The comparison is used to determine whether this particular call initialized the current request. Several "MB\_CLIENT" calls can be executed if you use a common instance DB. The values of the input parameters must not be changed while an "MB\_CLIENT" instance is being executed. If the input parameters are changed during execution, "MB\_CLIENT" cannot be used to check whether or not the instance is currently being executed.

## Multiple client connections

A Modbus TCP client can support several TCP connections and the maximum number of connections depends on the CPU being used. The total number of connections of one CPU, including those of the Modbus TCP clients and server must not exceed the maximum number of supported connections. Modbus TCP connections can also be shared by client and/or server connections.

With individual client connections, remember the following rules:

- Each "MB\_CLIENT" connection must use a unique instance DB.
- For each "MB\_CLIENT" connection, a unique server IP address must be specified.
- Each "MB\_CLIENT" connection requires a unique connection ID.  
The relevant individual connection ID must be used for each individual instance DB of the instruction. The connection ID and instance DB belong together in pairs and must be unique for each connection.
- Unique numbers for the IP port may or may not be required depending on the server configuration.

### Static tags of the instruction

The following table describes the editable static tags of the instance data block of the "MB\_CLIENT" instruction.

Tag	Data type	Start value	Description
Blocked_Proc_Timeout	REAL	3.0	Wait time in seconds before the static tag ACTIVE is reset if there is a blocked Modbus instance. This can, for example, occur if a client request is output and the execution of the client function aborts before the request was fully executed. The maximum wait time is 55 seconds.
MB_Transaction_ID	WORD	1	Transaction ID of the Modbus TCP protocol. The start value of "1" should only be changed if the Modbus TCP server requires a different value.
MB_Unit_ID	BYTE	255	Unit ID of the Modbus protocol. The tag corresponds to the slave address of the Modbus RTU protocol. Change this value only if the Modbus TCP server can be used as a gateway and is controlled by the application program within the Modbus server.
RCV_TIMEOUT	REAL	2.0	Time interval in seconds in which the "MB_CLIENT" instruction waits for a response from the server.
Connected	BOOL	0	Indicates whether the connection to the assigned client has been established or not: 1 = connected, 0 = not connected.

MB\_CLIENT example 2: Send multiple requests via several TCP connections (Page 3110)

MB\_CLIENT example 3: Coordinate several requests (Page 3111)

### REQ and DISCONNECT parameters

#### Description

If no instance of the "MB\_CLIENT" instruction is executing and if the value of the DISCONNECT parameter is "0", a new job executes if REQ=1. If there is not yet a connection, this is established during execution.

If the same instance of the "MB\_CLIENT" instruction executes again (DISCONNECT = 0 and REQ = 1), before the active job was executed, this is not executed on completion of the active job. A new job can only be started on completion of the active job (REQ = 1).

You can monitor the status of execution with the DONE parameter. You can use this to monitor the status of execution if the "MB\_CLIENT" instruction is executed sequentially.

Description of MB\_CLIENT (Page 3096)

## MB\_MODE and MB\_DATA\_ADDR parameters

### Description

Instead of a function code, the "MB\_CLIENT" instruction uses the MB\_MODE parameter. The MB\_DATA\_ADDR parameter is used to specify the Modbus start address of the data you want to access. The combination of the parameters MB\_MODE and MB\_DATA\_ADDR defines the function code used in the current Modbus message.

The following table shows the relationship between the MB\_MODE parameter, the Modbus function and the address space.

MB_MODE	Modbus function	Data length	Function and data type	MB_DATA_ADDR
0	01	1 to 2000	Read output bits: 1 to 2000 bits per call	1 to 9999
0	02	1 to 2000	Read input bits: 1 to 2000 bits per call	10001 to 19999
0	03	1 to 125	Read holding register: 1 to 125 WORD per call	40001 to 49999
0	04	1 to 125	Read input words: 1 to 125 WORD per call	30001 to 39999
1	05	1	Write an output bit: One bit per call	1 to 9999
1	06	1	Write a holding register: 1 WORD per call	40001 to 49999
1	15	2 to 1968	Write multiple output bits: 2 to 1968 bits per call	1 to 9999
1	16	2 to 123	Write several holding registers: 2 to 123 WORD per call	40001 to 49999
2	15	1 to 1968	Write one or more output bits: 1 to 1968 bits per call	1 to 9999
2	16	1 to 123	Write one or more holding registers: 1 to 123 WORD per call	40001 to 49999

MB_MODE	Modbus function	Data length	Function and data type	MB_DATA_ADDR
11	11	0	Read status word and event counter of server communication: <ul style="list-style-type: none"> <li>• The status word reflects the the processing status (0 - not processing, 0xFFFF - processing).</li> <li>• The event counter is incremented each time a message is sent successfully.</li> </ul> The MB_DATA_ADDR and MB_DATA_LEN parameters of the "MB_CLIENT" instruction are not evaluated when this function executes.	-
80	08	1	Check the server status with the error code 0x0000 (return loop test - the server sends the request back): 1 WORD per call	-
81	08	1	Reset the event counter of the server with the error code 0x000A: 1 WORD per call	
3 to 10, 12 to 79, 82 to 255			Reserved

Description of MB\_CLIENT (Page 3096)

**MB\_DATA\_PTR parameter**

**Description**

The MB\_DATA\_PTR parameter is a pointer to a data buffer for storing the data read from or written to the Modbus server. As the data buffer, you can use a global data block or a memory area (M).

For a buffer in the memory area (M), use a pointer in the ANY format as follows: "P#bit address" "data type" "length" (example: P#M1000.0 WORD 500).

The MB\_DATA\_PTR parameter uses a communications buffer:

- For the communication functions of the "MB\_CLIENT" instruction:
  - Reading and writing of 1 bit of data of the Modbus server addresses 00001 to 09999 and 10001 to 19999.
  - Reading of 16-bit WORD data of the Modbus server addresses 30001 to 39999 and 40001 to 49999.
  - Writing 16-bit WORD data of the Modbus server addresses 40001 to 49999.
- During data transmission (length: bit or WORD) from or to the global DB or the memory area (M) that you assigned with the MB\_DATA\_PTR parameter.

If you use a data block for the buffer in the MB\_DATA\_PTR parameter, you will need to assign data types to the DB elements.

- Use the 1-bit data type BOOL for a Modbus bit address
- Use a 16-bit data type such as WORD, UINT, INT or REAL for a Modbus WORD address.
- Use a 32-bit data type (double word) such as DWORD, DINT or REAL for two Modbus WORD addresses.
- With MB\_DATA\_PTR, you can also access complex DB elements such as:
  - Standard arrays
  - Structures with unique element names
  - Complex structures with unique naming of the elements and data type lengths of 16 or 32 bits.
- The data areas for the MB\_DATA\_PTR parameter can also be in different global data blocks (or in different memory areas). You can, for example, use a data block for the the read jobs and another one for the write jobs or a separate data block for each "MB\_CLIENT" station.

## Parameter STATUS

### Parameter STATUS (general status information)

STATUS* (W#16#)	Description
0000	Instruction executed without errors.
0001	Connection established.
0003	Connection terminated.
7000	No call active (REQ=0).
7001	First call with REQ=1: Processing started; BUSY has the value 1.
7002	Intermediate call (REQ irrelevant). Processing already active; BUSY has the value 1.
7003	Connection is being terminated.
7004	Connection established and monitored. No job processing active.
7005	Data was sent.
7006	Data was received.
80BB	Invalid value at ACTIVE_EST parameter (identifier for the type of connection establishment, see T_CON_PARAM): <ul style="list-style-type: none"> <li>• Only passive connection establishment permitted for server (ACTIVE_EST = FALSE).</li> <li>• Only active connection establishment permitted for client (ACTIVE_EST = TRUE).</li> </ul>

STATUS* (W#16#)	Description
8380	Received Modbus frame has incorrect format or too few bytes were received.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**Parameter STATUS (protocol error)**

STATUS* (W#16#)	Code of the response to the Modbus client (B#16#)	Description
8381	01	Function code is not supported.
8382	03	Error in data length.
8383	02	Error in the data address or access outside the address area of MB_DATA_PTR (Page 3100).
8384	03	Error in data value.
8385	03	Error codes of diagnostics not supported (function code 08).
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

**Parameter STATUS (parameter error)**

In addition to the errors listed in the following table, errors are also possible with the "MB\_CLIENT" instruction caused by the communications instructions ("TCON", "TDISCON", "TSEND" and "TRCV").

STATUS* (W#16#)	Description
80C8	No response of the server in the defined period. Check the connection to the Modbus server. This error is only reported on completion of the configured repeated attempts. If the "MB_CLIENT" instruction does not receive an answer with the originally transferred transaction ID (MB_TRANSACTION_ID tag) within the defined period, this error code is output.
8188	The MB_MODE parameter has an invalid value.
8189	Invalid addressing of data at the MB_DATA_ADDR parameter.
818A	Invalid data length at the MB_DATA_LEN parameter.
818B	The MB_DATA_PTR parameter has an invalid pointer. You should also check the values of the MB_DATA_ADDR (Page 3099) and MB_DATA_LEN parameters.
818C	<ul style="list-style-type: none"> <li>The MB_DATA_PTR (Page 3100) pointer references an an optimized data block. Either use a data block with standard access or a memory area</li> <li>Timeout at parameter BLOCKED_PROC_TIMEOUT (see static tags of instruction). The limit of 55 seconds has been exceeded.</li> </ul>
818D	The transaction ID (MB_TRANSACTION_ID tag) does not correspond to the one sent originally (see static tags of instruction).
8200	<ul style="list-style-type: none"> <li>A further Modbus request is currently being processed via the port.</li> <li>Another instance of MB_CLIENT with the same connection parameters is processing an existing Modbus request.</li> </ul>
8380	Received block of transferred Modbus data is not well-formed or too few bytes were received.

STATUS* (W#16#)	Description
8386	Received function code does not match the one sent originally.
8387	<ul style="list-style-type: none"> <li>The assigned connection ID is different from that used for previous requests. Only one connection ID can be used for each instance DB of the "MB_CLIENT" instruction.</li> <li>The error code is also output when the ID of the Modbus TCP protocol received by the server is not "0".</li> </ul>
8388	The Modbus server sent a different data length than was requested. This error occurs only when using the Modbus functions 15 or 16.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**Note****Error codes of internally used communications instructions.**

With the "MB\_CLIENT" instruction, in addition to the errors listed in the tables, errors caused by the communication instructions ("TCON", "TDISCON", "TSEND" and "TRCV") used by the instruction can occur.

The error codes are assigned via the instance data block of the "MB\_CLIENT" instruction. The error codes are displayed for the respective instruction under STATUS in the Static section.

The meaning of the error codes is available in the documentation of the corresponding communications instruction.

Description of MB\_CLIENT (Page 3096)

MB\_HOLD\_REG parameter (Page 3107)

**MB\_SERVER: Communicating via PROFINET as a Modbus TCP server****Description of MB\_SERVER****Description**

The "MB\_SERVER" instruction communicates as a Modbus TCP server via the PROFINET connection of the S7-1200 CPU. To use the instruction, you do not require any additional

hardware module. The "MB\_SERVER" instruction processes connection requests of a Modbus TCP client, receives requests from Modbus functions and sends responses.

<b>NOTICE</b>
<p><b>Safety instruction</b></p> <p>Note that each client on the network has access to the data of the Modbus instructions.</p> <p>Although the data block for the Modbus holding register cannot be addressed directly by the client, it is possible to indirectly access the data via the offset addresses. The option is available to restrict access to an IP address to prevent unauthorized read and write operations. Note, however, that the shared address can also be used for unauthorized access.</p>

**Parameters**

The following table shows the parameters of the "MB\_SERVER" instruction:

Parameter	Declaration	Data type	Description
DISCONNECT	Input	BOOL	<p>The instruction "MB_SERVER" enters into a passive connection with a partner module, which means the server responds to a TCP connection request from each requesting IP address. You can use this parameter to control when a connection request is accepted:</p> <ul style="list-style-type: none"> <li>• 0: A passive connection is established when there is no communications connection.</li> <li>• 1: Initialization of the connection termination. If the input is set, no other operations are executed. The value 7003 is output at the STATUS parameter after successful connection termination.</li> </ul>
CONNECT_ID	Input	UINT	<p>The parameter uniquely identifies a connection within the CPU. Each individual instance of the instructions "MB_CLIENT (Page 3096)" and "MB_SERVER" must have a unique CONNECT_ID parameter.</p>
IP_PORT	Input	UINT	<p>Start value = 502. The number of IP ports defines which IP port is monitored for connection requests of the Modbus client.</p> <p>The following TCP port numbers must not be used for the passive connection of the "MB_SERVER" instruction: 20, 21, 25, 80, 102, 123, 5001, 34962, 34963 and 34964.</p>
MB_HOLD_REG (Page 3107)	InOut	VARIANT	<p>Pointer to the Modbus holding register of the "MB_SERVER" instruction: Use a global data block with standard access as holding register. The holding register contains the values that may be accessed by a Modbus client using the Modbus functions 3 (read), 6 (write) and 16 (read).</p>
NDR	Output	BOOL	<p>"New Data Ready":</p> <ul style="list-style-type: none"> <li>• 0: No new data</li> <li>• 1: New data written by the Modbus client written</li> </ul>
DR	Output	BOOL	<p>"Data Read":</p> <ul style="list-style-type: none"> <li>• 0: No data read</li> <li>• 1: Data read by the Modbus client</li> </ul>

Parameter	Declaration	Data type	Description
ERROR	Output	BOOL	If an error occurs during the call of the "MB_SERVER" instruction, the output of the ERROR parameter is set to TRUE. Detailed information about the cause of the problem is indicated by the STATUS parameter.
STATUS (Page 3108)	Output	WORD	Error code of the instruction.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Mapping of Modbus addresses to the process image

The "MB\_SERVER" instruction allows incoming Modbus functions (1, 2, 4, 5 and 15) direct read and write access to the process image input and output of the S7-1200 CPU (use of the data types BOOL and WORD).

For the data transfer of the function codes 3, 6 and 16, the holding register (MB\_HOLD\_REG parameter) must be defined longer than one byte. The following table shows the mapping of the Modbus addresses to the process image of the CPU.

Modbus function					S7-1200	
Code	Function	Data area	Address space		Data area	CPU address
01	Read: Bits	Output	1	to	8192	Process image output Q0.0 to Q1023.7
02	Read: Bits	Input	10001	to	18192	Process image input I0.0 to I1023.7
04	Read: WORD	Input	30001	to	30512	Process image input IW0 to IW1022
05	Write: Bits	Output	1	to	8192	Process image output Q0.0 to Q1023.7
15	Write: Bits	Output	1	to	8192	Process image output Q0.0 to Q1023.7

Incoming Modbus messages with the function codes 3, 6 and 16 write to or read from the Modbus holding registers (you specify the holding registers with the MB\_HOLD\_REG parameter).

### Multiple server connections

You can create multiple Server connections. This allows a single CPU to establish connections to more than one Modbus TCP client at the same time.

A Modbus TCP server can support several TCP connections and the maximum number of connections depends on the CPU being used.

The total number of connections of one CPU, including those of the Modbus TCP clients and server must not exceed the maximum number of supported connections.

Modbus TCP connections can also be shared by client and/or server connections.

In the case of Server connections, remember the following rules:

- Each "MB\_SERVER" connection must use a unique instance DB.
- Each "MB\_SERVER" connection must be created with a unique IP port number. Only one connection is supported for each port.

9.7 References

- Each "MB\_SERVER" connection must use a unique connection ID. The relevant individual connection ID must be used for each individual instance DB of the instruction. The connection ID and instance DB belong together in pairs and must be unique for each connection.
- For each connection, the "MB\_SERVER" instruction must be called individually.

**Modbus diagnostics functions**

The table below contains a description of the Modbus diagnostics functions.

Code	Subfunction	Description
08	0x0000	Echo test: The "MB_SERVER" instruction receives a data word and returns this unchanged to the Modbus master.
08	0x000A	Reset event counter: The "MB_SERVER" instruction resets the event counter for communication that is used for Modbus function 11.
11	-	Fetch event counter of the communication: The "MB_SERVER" instruction uses an internal event counter for communication to record the number of successfully executed read and write requests sent to the Modbus server.  The event counter is not incremented by the functions 8, 11 or broadcast requests. The same applies to requests that result in a communications error (for example parity errors or CRC errors). The broadcast function is not available for Modbus TCP because only one client/server connection can exist at any one time.

**Static tags of the instruction**

The following table describes the static tags of the instance data block of the "MB\_SERVER" instruction used in the program. You can write the HR\_Start\_Offset tag. You can read the other tags to monitor the Modbus status.

Tag	Data type	Start value	Description
HR_Start_Offset	WORD	0	Assign the start address of the Modbus holding register.
Request_Count	WORD	0	Total number of requests received by the server.
Server_Message_Count	WORD	0	Total number of received messages for the relevant Server.
Xmt_Rcv_Count	WORD	0	Counter for detecting the number of transfers during which an error occurred. The counter is also incremented if an invalid Modbus message is received.
Exception_Count	WORD	0	Counter for detecting the number of errors specifically for Modbus cause an exception.
Success_Count	WORD	0	Counter for detecting the number of requests that contain no error in the transferred protocol.
Connected	BOOL	0	Indicates whether the connection to the assigned client has been established or not: 1 = connected, 0 = not connected.

**Example: Addressing via static tag HR\_Start\_Offset**

The addresses of the Modbus holding register start at 40001. These addresses correspond to the address space of the CPU memory area for the holding register. You can also define the HR\_Start\_Offset tag so that the Modbus holding register has a start address other than 40001.

Example: The holding register begins at MW100, and has a length of 100 WORD. An offset value in the HR\_Start\_Offset parameter means that the start address of the holding register is moved from 40001 to 40021. Whenever the holding register is addressed below the address 40021 and above the address 40119, this causes an error.

HR_Start_Offset	Address	Minimum	Maximum
0	Modbus address (WORD)	40001	40099
	S7-1200 address	MW100	MW298
20	Modbus address (WORD)	40021	40119
	S7-1200 address	MW100	MW298

**See also**

MB\_SERVER example: Multiple TCP connections (Page 3112)

**MB\_HOLD\_REG parameter****Description**

The MB\_HOLD\_REG parameter is a pointer to a data buffer for storing the data read from or written to the Modbus server. As the data buffer, you can use a global data block or a memory area (M).

As pointer to a buffer in the memory area (M), use the ANY format as follows: "P#bit address" "data type" "length" (example: P#M1000.0 WORD 500).

The following table shows examples of mapping Modbus addresses to the holding register for the Modbus functions 3 (read WORD), 6 (write WORD) and 16 (write several WORD). The upper limit for the number of addresses in the data block is decided by the maximum work memory of the CPU. If you use a memory area, the upper limit for the addresses is decided by the size of the memory area of the CPU.

Modbus addresses	MB_HOLD_REG parameter - examples		
P#M100.0 WORD 5	P#DB10.DBx0.0 WORD 5	"Recipe".ingredient	
40001	MW100	DB10.DBW0	"Recipe".ingredient[1]
40002	MW102	DB10.DBW2	"Recipe".ingredient[2]
40003	MW104	DB10.DBW4	"Recipe".ingredient[3]
40004	MW106	DB10.DBW6	"Recipe".ingredient[4]
40005	MW108	DB10.DBW8	"Recipe".ingredient[5]

**Parameter STATUS**

**Parameter STATUS (general status information)**

STATUS* (W#16#)	Description
0000	Instruction executed without errors.
0001	Connection established.
0003	Connection terminated.
7000	No call active (REQ=0).
7001	First call with REQ=1: Processing started; BUSY has the value 1.
7002	Intermediate call (REQ irrelevant). Processing already active; BUSY has the value 1.
7003	Connection is being terminated.
7004	Connection established and monitored. No job processing active.
7005	Data was sent.
7006	Data was received.
80BB	Invalid value at ACTIVE_EST parameter (identifier for the type of connection establishment, see T_CON_PARAM): <ul style="list-style-type: none"> <li>• Only passive connection establishment permitted for server (ACTIVE_EST = FALSE).</li> <li>• Only active connection establishment permitted for client (ACTIVE_EST = TRUE).</li> </ul>
8380	Received Modbus frame has incorrect format or too few bytes were received.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

**Parameter STATUS (parameter error)**

STATUS* (W#16#)	Code of the response to the Modbus server (B#16#)	Description
8187	No response	The MB_HOLD_REG parameter has an invalid pointer. Data area is too small.
818C	No response	<ul style="list-style-type: none"> <li>• The MB_HOLD_REG parameter references an an optimized data block. Either use a data block with standard access or a memory area</li> <li>• Error due to timeout of execution (more than 55 seconds).</li> </ul>
8381	01	Function code is not supported.
8382	03	Error in data length
8383	02	Error in data address or access outside the address area of the holding register (MB_HOLD_REG (Page 3107) parameter).
8384	03	Error in data value

STATUS* (W#16#)	Code of the response to the Modbus server (B#16#)	Description
8385	03	Value of the diagnostic code is not supported (only with function code 08).
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

---

### Note

#### Error codes of internally used communications instructions.

With the "MB\_SERVER" instruction, in addition to the errors listed in the tables, errors caused by the communication instructions ("TCON", "TDISCON", "TSEND" and "TRCV") used by the instruction can occur.

The error codes are assigned via the instance data block of the "MB\_SERVER" instruction. The error codes are displayed for the respective instruction under STATUS in the Static section.

The meaning of the error codes is available in the documentation of the corresponding communications instruction.

---

Description of MB\_SERVER (Page 3103)

### Examples

#### MB\_CLIENT example 1: Send several requests via a TCP connection

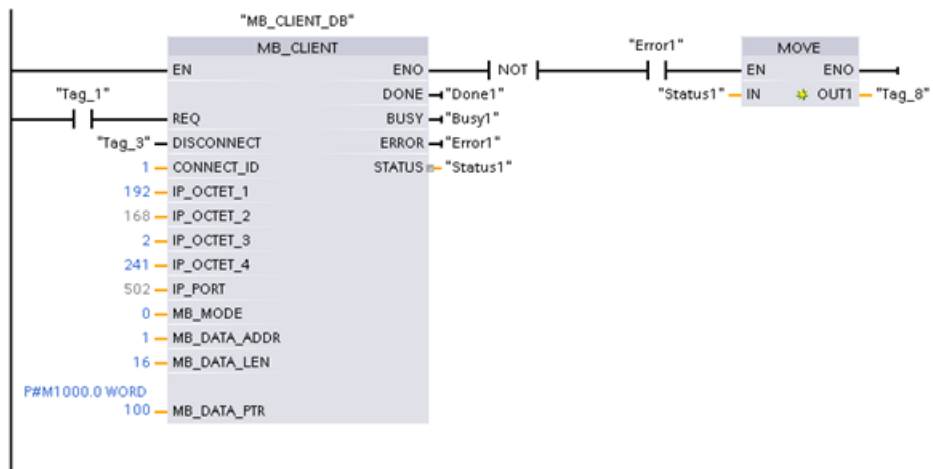

#### Description

Several requests of the Modbus Client can be sent via a TCP connection. To do this, use the same instance DB, the same connection ID and the same port number.

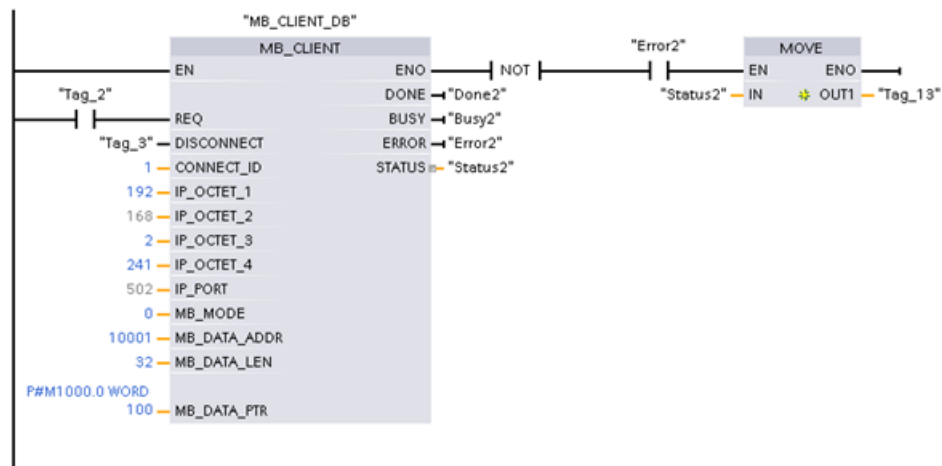

Only one client can be active at any one time. After processing of a client has been completed, the next client is processed. The order of execution must be defined in the program.

In the following sample program, the value of the STATUS output parameter is also copied.

**Network 1: Modbus function 1 - 16 read output bits**

**Network 2: Modbus function 2 - 32 read input bits**

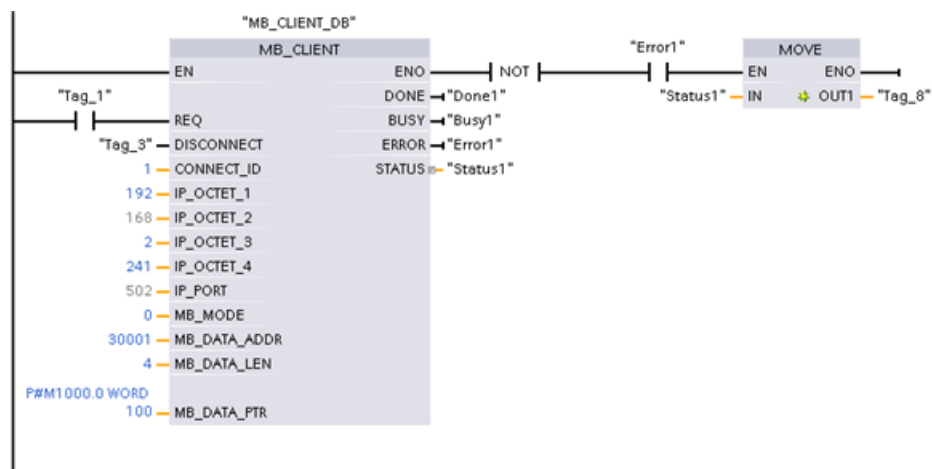

**MB\_CLIENT example 2: Send multiple requests via several TCP connections**

**Description**

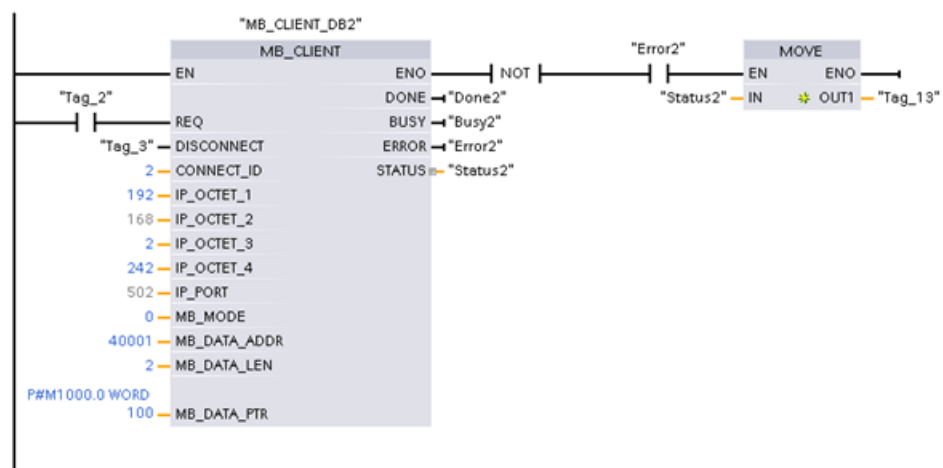

Requests from the Modbus client can be sent via different TCP connections. If you require this, use a different instance DB and a different connection ID.

Use a different port number, if the connections are to the same Modbus server. If the connections are to different Modbus servers, you can freely assign the port number.

### Network 1: Modbus function 4 - read input (WORD)

### Network 2: Modbus function 3 - read holding register (WORD)

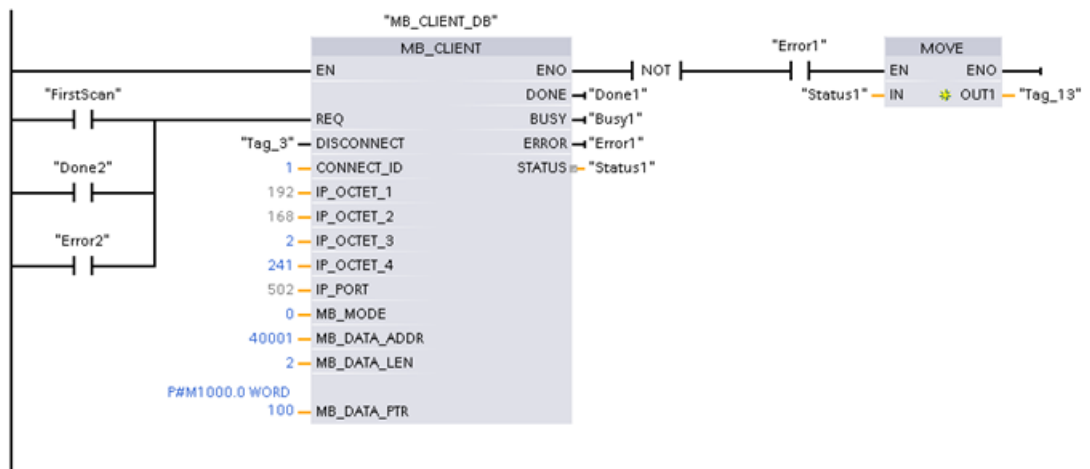

### MB\_CLIENT example 3: Coordinate several requests

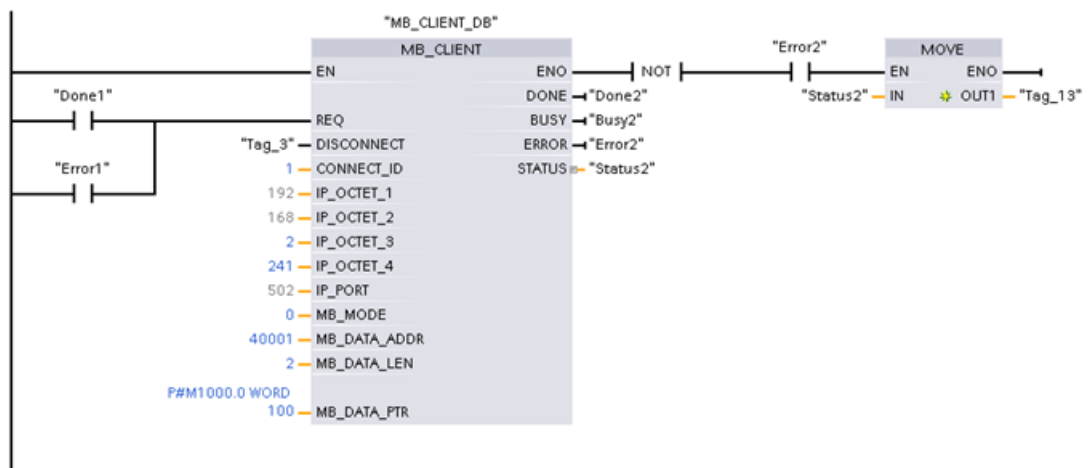

#### Description

Make sure that the individual Modbus requests are executed. You control coordination of requests with the program. The following example demonstrates how the output parameters of the first and second client request can be used to coordinate execution of the instructions.

Network 1: Modbus function 3 - read holding register (WORD)

Network 2: Modbus function 3 - read holding register (WORD)

MB\_SERVER example: Multiple TCP connections

Description

You can use several Modbus TCP server connections. To do this, the "MB\_SERVER" instruction must be called independently for each connection.

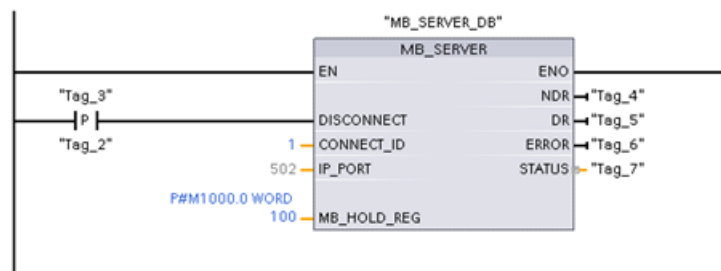

Every connection requires the following:

- An independent instance data block of the instruction
- A unique connection ID
- A separate IP port (on the S7-1200, only one connection is permitted per IP port)

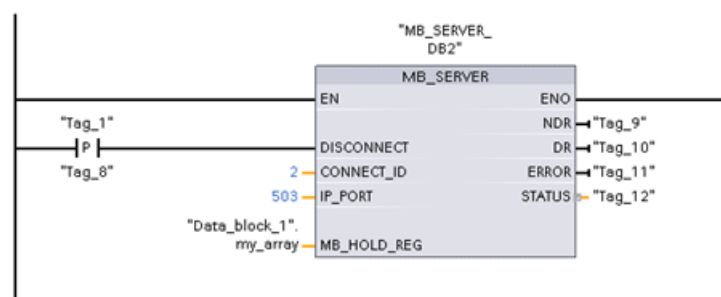

To optimize the performance "MB\_SERVER" should be executed once per program cycle for each connection.

### Network 1: Connection #1 with associated IP port connection ID and instance DB

### Network 2: Connection #1 with associated IP port connection ID and instance DB

## MODBUS (TCP) (S7-1200, S7-1500)

### MB\_CLIENT: Communicating via PROFINET as a Modbus TCP client

#### Description of MB\_CLIENT

#### Description

The "MB\_CLIENT" instruction communicates as a Modbus TCP client via the PROFINET connection. With the "MB\_CLIENT" instruction, you establish a connection between the client and the server, send Modbus requests and receive responses and control connection termination of the Modbus TCP client.

The "MB\_CLIENT" instruction V3.0 can be used for the S7-1500 as well as for the S7-1200 version 4.0 or higher. The connection can take place via the local interface of the CPU or CM/CP.

To use the instruction, you do not require an additional hardware module.

### Multiple client connections

A Modbus TCP client can support several TCP connections and the maximum number of connections depends on the CPU being used. The total number of connections of one CPU, including those of the Modbus TCP clients and server must not exceed the maximum number of supported connections. Modbus TCP connections can also be shared by "MB\_CLIENT" and/or "MB\_SERVER" instances.

With individual client connections, remember the following rules:

- Each "MB\_CLIENT" connection must use a unique instance DB.
- For each "MB\_CLIENT" connection, a unique server IP address must be specified.
- Each "MB\_CLIENT" connection requires a unique connection ID.  
The relevant individual connection ID must be used for each individual instance DB of the instruction. The connection ID and instance DB belong together in pairs and must be unique for each connection.
- Unique numbers for the IP port may or may not be required depending on the server configuration.

### Parameters

The following table shows the parameters of the "MB\_CLIENT" instruction:

Parameter	Declaration	Data type	Description
REQ (Page 3116)	Input	BOOL	<p>Communication request with the Modbus TCP server</p> <p>The REQ parameter is level-controlled. This means that as long as the input is set (REQ=true), the instruction sends communication requests.</p> <ul style="list-style-type: none"> <li>• The instance DB for other clients is blocked with the communications request.</li> <li>• Changes to the input parameters will not become effective until the server has responded or an error message has been output.</li> <li>• If the parameter REQ is set again during an ongoing Modbus request, no additional transmission takes place afterwards.</li> </ul>
DISCONNECT (Page 3116)	Input	BOOL	<p>With this parameter, you control the establishment and termination of the connection to the Modbus server:</p> <ul style="list-style-type: none"> <li>• 0: Establish communications connection to the connection partner configured at the CONNECT parameter (see CONNECT parameter).</li> <li>• 1: Disconnect the communication connection. No other function is executed during connection termination. The value 0003 is output at the STATUS parameter after successful connection termination.</li> </ul> <p>The Modbus request is sent immediately if the REQ parameter is set during connection establishment.</p>
MB_MODE (Page 3116)	Input	USINT	Selects the mode of the Modbus request (read, write or diagnostics).
MB_DATA_ADDR (Page 3116)	Input	UDINT	Start address of the data accessed by the "MB_CLIENT" instruction.

Parameter	Declaration	Data type	Description
MB_DATA_LEN	Input	UINT	Data length: Number of bits or words for the data access (see "MB_MODE and MB_DATA_ADDR parameters" - data length).
MB_DATA_PTR (Page 3118)	InOut	VARIANT	Pointer to the Modbus data register: The register is a buffer for the data received from the Modbus server or to be sent to the Modbus server. The pointer must reference a global data block with optimized access. The number of bits addressed must be divisible by 8.
CONNECT (Page 3119)	InOut	VARIANT	Pointer to the structure of the connection description The following structures (system data types) can be used: <ul style="list-style-type: none"> <li>• TCON_IP_v4: Includes all address parameters required for establishing a programmed connection. When using TCON_IP_v4, the connection is established when calling the instruction "MB_SERVER".</li> <li>• TCON_Configured: Includes the address parameters of a configured connection. When using TCON_Configured, an existing connection is used that was created by the CPU after download of the hardware configuration.</li> </ul>
DONE	Out	BOOL	The bit at output parameter DONE is set to "1" as soon as the last job is completed without errors.
BUSY	Out	BOOL	<ul style="list-style-type: none"> <li>• 0: No Modbus request in progress</li> <li>• 1: Modbus request being processed</li> </ul> The output parameter BUSY is not set during connection establishment and termination.
ERROR	Out	BOOL	<ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred. The cause of error is indicated by the STATUS parameter.</li> </ul>
STATUS (Page 3121)	Out	WORD	Detailed status information of the instruction.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

#### Note

##### Consistent input data during an "MB\_CLIENT" call

When a Modbus client instruction is called, the status of the input parameters is stored internally and then compared at the next call. The comparison is used to determine whether this particular call initialized the current request. Several "MB\_CLIENT" calls can be executed if you use a common instance DB. The values of the input parameters must not be changed while an "MB\_CLIENT" instance is being executed. If the input parameters are changed during execution, "MB\_CLIENT" cannot be used to check whether or not the instance is currently being executed.

**Static tags of the instruction**

The following table describes the editable static tags of the instance data block of the "MB\_CLIENT" instruction.

Tag	Data type	Start value	Description
Blocked_Proc_Timeout	REAL	3.0	Wait time in seconds before the static tag ACTIVE is reset if there is a blocked Modbus instance. This can, for example, occur if a client request is output and the execution of the client function aborts before the request was fully executed. The maximum wait time is 55 seconds.
MB_Transaction_ID	WORD	1	Transaction ID of the Modbus TCP protocol. The start value of "1" should only be changed if the Modbus TCP server requires a different value.
MB_Unit_ID	BYTE	255	Unit ID of the Modbus protocol. The tag corresponds to the slave address of the Modbus RTU protocol. Change this value only if the Modbus TCP server can be used as a gateway and is controlled by the application program within the Modbus server.
RCV_TIMEOUT	REAL	2.0	Time interval in seconds in which the "MB_CLIENT" instruction waits for a response from the server.
Connected	BOOL	0	Indicates whether the connection to the assigned server has been established or not: 1 = connected, 0 = not connected.

**REQ and DISCONNECT parameters**

**Description**

If no instance of the "MB\_CLIENT" instruction is executing and if the value of the DISCONNECT parameter is "0", a new job executes if REQ=1. If there is not yet a connection, this is established during execution.

If the same instance of the "MB\_CLIENT" instruction executes again (DISCONNECT = 0 and REQ = 1), before the active job was executed, this is not executed on completion of the active job. A new job can only be started on completion of the active job (REQ = 1).

The status of the execution is output by the output parameters. You can use it to monitor the execution status when the "MB\_CLIENT" instruction is executed sequentially.

**MB\_MODE and MB\_DATA\_ADDR parameters**

**Description**

Instead of a function code, the "MB\_CLIENT" instruction uses the MB\_MODE parameter. The MB\_DATA\_ADDR parameter is used to specify the Modbus start address of the data you want to access.

The combination of the parameters MB\_MODE, MB\_DATA\_ADDR and MB\_DATA\_LEN defines the function code used in the current Modbus message. For example:

- Function code 5
  - MB\_MODE=1
  - MB\_DATA\_ADDR=1
  - MB\_DATA\_LEN=1
- Function code 15
  - MB\_MODE=1
  - MB\_DATA\_ADDR=1
  - MB\_DATA\_LEN=2

The following table shows the relationship between the input parameters of the "MB\_CLIENT" instruction and the Modbus function.

MB_MODE	MB_DATA_ADDR	MB_DATA_LEN	Modbus function	Function and data type
0	Start address: • 1 to 9999	Data length (bits) per call: • 1 to 2000	01	Read input bits: • 1 to 2000
0	Start address: • 10001 to 19999	Data length (bits) per call: • 1 to 2000	02	Read input bits: • 1 to 2000
0	Start address: • 40001 to 49999 • 400001 to 465535	Data length (WORD) per call: • 1 to 125 • 1 to 125	03	Read holding register: • 0 to 9998 • 0 to 65534
0	Start address: • 30001 to 39999	Data length (WORD) per call: • 1 to 125	04	Read input words: • 0 to 9998
1	Start address: • 1 to 9999	Data length (bits) per call: • 1	05	Writing an output bit: • 0 to 9998
1	Start address: • 40001 to 49999 • 400001 to 465535	Data length (WORD) per call: • 1 • 1	06	Write a holding register: • 0 to 9998 • 0 to 65524
1	Start address: • 1 to 9999	Data length (bits) per call: • 2 to 1968	15	Write multiple output bits: • 0 to 9998
1	Start address: • 40001 to 49999 • 400001 to 465534	Data length (WORD) per call: • 2 to 123 • 2 to 123	16	Write multiple holding registers: • 0 to 9998 • 0 to 65534

MB_MODE	MB_DATA_A DDR	MB_DATA_L EN	Modbus function	Function and data type
2	Start address: • 1 to 9999	Data length (bits) per call: • 1 to 1968	15	Write one or more output bits: • 0 to 9998
2	Start address: • 40001 to 49999 • 400001 to 465535	Data length (WORD) per call: • 1 to 123 • 1 to 123	16	Write one or more holding registers: • 0 to 9998 • 0 to 65534
11	The MB_DATA_ADDR and MB_DATA_LEN parameters are not evaluated when this function is executed.		11	Read status word and event counter of the server: • The status word reflects the the processing status (0 - not processing, 0xFFFF - processing). • The event counter is incremented when the Modbus request was executed successfully. If an error occurred during execution of a Modbus function, a message is sent by the server but the event counter is not incremented.
80	-	Data length (WORD) per call: • 1	08	Check the server status with the diagnostic code 0x0000 (return loop test - the server sends the request back): • 1 WORD per call
81	-	Data length (WORD) per call: • 1	08	Reset the event counter of the server with the diagnostic code 0x000A: • 1 WORD per call
3 to 10, 12 to 79, 82 to 255				Reserved

### MB\_DATA\_PTR parameter

#### Description

The MB\_DATA\_PTR parameter is a pointer to a data buffer for storing the data read from or written to the Modbus server. As the data buffer, you can use a global data block or a memory area (M).

For a buffer in the memory area (M), use a pointer in the ANY format as follows: "P#bit address" "data type" "length" (example: P#M1000.0 WORD 500).

The MB\_DATA\_PTR parameter uses a communications buffer:

The communications buffer is used:

- For the communication functions of the "MB\_CLIENT" instruction:
  - Reading and writing of 1 bit of data of the Modbus server addresses 00001 to 09999 and 10001 to 19999.
  - Reading of 16-bit WORD data of the Modbus server addresses 30001 to 39999 and 40001 to 49999.
  - Writing of 16-bit WORD data of the Modbus server addresses 40001 to 49999.
- During data transmission (length: bit or WORD) from or to the global DB or the memory area (M) that you assigned with the MB\_DATA\_PTR parameter.

If you use a data block for the buffer in the MB\_DATA\_PTR parameter, you will need to assign data types to the DB elements.

- Use the 1-bit data type BOOL for a Modbus bit address
- Use a 16-bit data type such as WORD, UINT, INT or REAL for a Modbus WORD address.
- Use a 32-bit data type (double word) such as DWORD, DINT or REAL for two Modbus WORD addresses.
- With MB\_DATA\_PTR, you can also access complex DB elements such as:
  - Standard arrays
  - Structures with unique element names
  - Complex structures with unique naming of the elements and data type lengths of 16 or 32 bits.
- The data areas for the MB\_DATA\_PTR parameter can also be in different global data blocks (or in different memory areas). You can, for example, use a data block for the the read jobs and another one for the write jobs or a separate data block for each "MB\_CLIENT" station.

## CONNECT parameter

### Connection descriptions at CONNECT parameter

Two different connection descriptions can be used for the "MB\_CLIENT" instruction:

- Programmed connections with the structure TCON\_IP\_v4  
The connection parameters are stored in the TCON\_IP\_v4 structure and the connection is set up with the call of the instruction "MB\_CLIENT".
- Configured connections with the structure TCON\_Configured  
The configured connection has already been established by the CPU. Use the structure TCON\_Configured to specify which existing connection is to be used for the instruction.

Each instance of the instruction "MB\_CLIENT" requires a unique connection. Create a separate structure TCON\_IP\_v4 or TCON\_Configured for each instance of the instruction to describe the connection.

**Connection description for programmed connections**

Use the following structure for connection description to TCON\_IP\_v4 for programmed connections at the CONNECT parameter:

- Make sure that only connections of the type TCP are specified in the TCON\_IP\_v4 structure.
- The connection may not use the following TCP port numbers: 20, 21, 25, 80, 102, 123, 5001, 34962, 34963 and 34964.

Byte	Parameter	Data type	Start value	Description
0 ... 1	InterfacelD	HW_ANY	-	Hardware identifier of the local interface (value range: 0 to 65535).
2 ... 3	ID	CONN_OUC	-	Reference to this connection (value range: 1 to 4095). The parameter uniquely identifies a connection within the CPU. Each individual instance of the instruction "MB_CLIENT" must use a unique ID.
4	ConnectionType	BYTE	11	Connection type Select 11 (decimal) for TCP. Other connection types are not permitted. If another connection type (e.g. UDP) is used, a corresponding error message is output at the STATUS parameter of the instruction.
5	ActiveEstablished	BOOL	TRUE	ID for the manner in which the connection is established Select TRUE for active connection establishment.
6 ... 9	RemoteAddress	ARRAY [1..4] of BYTE	-	IP address of the connection partner (Modbus server), for example, for 192.168.0.1: <ul style="list-style-type: none"> <li>• addr[1] = 192</li> <li>• addr[2] = 168</li> <li>• addr[3] = 0</li> <li>• addr[4] = 1</li> </ul>
10 ... 11	RemotePort	UINT	502	Port number of the remote connection partner (value range: 1 to 49151). Use the IP port number of the server to which the client establishes the connection and communicates using the TCP/IP protocol (default value: 502).
12 ... 13	LocalPort	UINT	0	Port number of the local connection partner: <ul style="list-style-type: none"> <li>• Port numbers: 1 to 49151</li> <li>• Any port: "0"</li> </ul>

**Note****Migration of the instruction "MB\_CLIENT" version 2.1**

The parameters CONNECT\_ID, IP\_PORT and IP\_OCTET\_x are mapped in version 3.0 of the "MB\_CLIENT" instruction in the TCON\_IP\_v4 structure:

- The parameter CONNECT\_ID of the "MB\_CLIENT" V2.1 instruction corresponds to the ID parameter of TCON\_IP\_v4.
- The parameter IP\_PORT of the "MB\_CLIENT" V2.1 instruction corresponds to the RemotePort parameter of TCON\_IP\_v4.
- The four parameters IP\_OCTET\_x of the "MB\_CLIENT" V2.1 instruction correspond to the array of the RemoteAddress parameter of TCON\_IP\_v4.

**Connection description for configured connections**

For programmed connections at the CONNECT parameter, use the following structure for connection description to TCON\_Configured.

- Make sure that only connections of the type TCP are specified in the TCON\_Configured structure.
- The connection may not use the following TCP port numbers: 20, 21, 25, 80, 102, 123, 5001, 34962, 34963 and 34964.

Byte	Parameter	Data type	Start value	Description
0 ... 1	Interfaceld	HW_ANY	-	Hardware identifier of the local interface (value range: 0 to 65535).
2 ... 3	ID	CONN_OUC	-	Reference to this connection (value range: 1 to 4095). Enter the connection ID of the existing connection.
4	ConnectionType	BYTE	0	Connection type Select 254 (decimal) for a configured connection.

**Parameter STATUS****Parameter STATUS (general status information)**

STATUS* (W#16#)	Description
0000	Instruction executed without errors.
0001	Connection established.
0003	Connection terminated.
7000	No call active and no connection established (REQ=0).
7001	Connection establishment triggered.
7002	Intermediate call. Connection is being established.
7003	Connection is being terminated.

9.7 References

STATUS* (W#16#)	Description
7004	Connection established and monitored. No job processing active.
7005	Data is being sent.
7006	Data is being received.
80BB	Invalid value at ActiveEstablished parameter (identifier for the type of connection establishment, see CONNECT parameter (Page 3119)): <ul style="list-style-type: none"> <li>• Only passive connection establishment permitted for server (ActiveEstablished = FALSE).</li> <li>• Only active connection establishment permitted for client (ActiveEstablished = TRUE).</li> </ul>
8380	Received Modbus frame has incorrect format or too few bytes were received.

\* The status codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

Parameter STATUS (protocol error)

STATUS* (W#16#)	Error code in the error message from MB_SERVER (B#16#)	Description
8381	01	Function code is not supported.
8382	03	Error in data length: <ul style="list-style-type: none"> <li>• Invalid length specification in received Modbus frame.</li> <li>• The length of the Modbus frame in the frame header does not match the number of received bytes.</li> <li>• The number of bytes does not match the number of actually transmitted bytes (only functions 1-4).</li> <li>• The received start address does not match the one sent originally (functions 5, 6, 15, 16).</li> <li>• The number of words does not match the number of actually transmitted words (only functions 15 and 16).</li> </ul>
8383	02	Error reading or writing data or access outside the address area of MB_DATA_PTR (Page 3118). The error can occur locally as well as with the instruction "MB_SERVER".
8384	03	Error in data value: <ul style="list-style-type: none"> <li>• Error in data value for function 5 (error on server).</li> <li>• A different data value was received than was originally sent by the client (functions 5 and 6) (local error).</li> <li>• Invalid exception code received.</li> </ul>
8385	03	Diagnostic code is not supported (function code 08). The error can occur locally as well as on the server.
8386	-	Received function code does not match the one sent originally.
8387	-	<ul style="list-style-type: none"> <li>• The assigned connection ID is different from that used for previous requests. Only one connection ID can be used for each instance DB of the "MB_CLIENT" instruction.</li> <li>• The error code is also output when the protocol ID of the Modbus TCP frame received by the server is not "0".</li> </ul>

STATUS* (W#16#)	Error code in the error message from MB_SERVER (B#16#)	Description
8388	15 or 16	The Modbus server sent a different data length than was requested. This error occurs only when using the Modbus functions 15 or 16.

\* The status codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### Parameter STATUS (parameter error)

STATUS* (W#16#)	Description
80B6	Invalid connection type, only TCP connections are supported.
80C8	No response of the server in the defined period. Check the connection to the Modbus server. This error is only reported on completion of the configured repeated attempts. If the "MB_CLIENT" instruction does not receive an answer with the originally transferred transaction ID (see static MB_TRANSACTION_ID tag) within the defined period, this error code is output.
8188	The MB_MODE parameter has an invalid value.
8189	Invalid addressing of data at the MB_DATA_ADDR parameter.
818A	Invalid data length at the MB_DATA_LEN parameter.
818B	The MB_DATA_PTR parameter has an invalid pointer. You should also check the values of the MB_DATA_ADDR (Page 3118) and MB_DATA_LEN parameters.
818C	Timeout at parameter BLOCKED_PROC_TIMEOUT or RCV_TIMEOUT (see static tags of instruction). The limit of 55 seconds has been exceeded.
818D	The transaction ID (MB_TRANSACTION_ID tag) does not correspond to the one sent originally (see static tags of instruction).
8200	<ul style="list-style-type: none"> <li>• A different Modbus request is currently being processed via the port.</li> <li>• Another instance of MB_CLIENT with the same connection parameters is processing an existing Modbus request.</li> </ul>

\* The status codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

#### Note

##### Error codes of internally used communications instructions

With the "MB\_CLIENT" instruction, in addition to the errors listed in the tables, errors caused by the communication instructions ("TCON", "TDISCON", "TSEND", "TRCV", "T\_DIAG" and "TRESET") used by the instruction can occur.

The error codes are assigned via the instance data block of the "MB\_CLIENT" instruction. The error codes are displayed for the respective instruction under STATUS in the "Static" section.

The meaning of the error codes is available in the documentation of the corresponding communications instruction.

**See also**

GET\_ERR\_ID: Get error ID locally (Page 2022)

**MB\_SERVER: Communicating via PROFINET as a Modbus TCP server**

**Description of MB\_SERVER**

**Description**

The "MB\_SERVER" instruction communicates as Modbus TCP server via a PROFINET connection. The "MB\_SERVER" instruction processes connection requests of a Modbus TCP client, receives and processes Modbus requests and sends responses.

The "MB\_SERVER" instruction V3.0 can be used for the S7-1500 as well as for the S7-1200 version 4.0 or higher. The connection can take place via the local interface of the CPU or CM/CP.

To use the instruction, you do not require an additional hardware module.

<b>NOTICE</b>
<b>Safety instruction</b>
Note that each client on the network has access to the data of the Modbus instructions.
Although the data block for the Modbus holding register cannot be addressed directly by the client, it is possible to indirectly access the data via the offset addresses. The option is available to restrict access to an IP address to prevent unauthorized read and write operations. Note, however, that the shared address can also be used for unauthorized access.

**Multiple server connections**

You can create multiple Server connections. This allows a single CPU to accept connections from multiple Modbus TCP clients at the same time.

A Modbus TCP server can support several TCP connections and the maximum number of connections depends on the CPU being used.

The total number of connections of one CPU, including those of the Modbus TCP clients and server must not exceed the maximum number of supported connections.

Modbus TCP connections can also be shared by "MB\_CLIENT" and/or "MB\_SERVER" instances.

In the case of Server connections, remember the following rules:

- Each "MB\_SERVER" connection must use a unique instance DB.
- Each "MB\_SERVER" connection must use a unique connection ID.  
The relevant individual connection ID must be used for each individual instance DB of the instruction. The connection ID and instance DB belong together in pairs and must be unique for each connection.
- For each connection, the "MB\_SERVER" instruction must be called individually.

## Parameters

The following table shows the parameters of the "MB\_SERVER" instruction:

Parameter	Declaration	Data type	Description
DISCONNECT	Input	BOOL	<p>The "MB_SERVER" instruction is used to enter into a passive connection with a partner module. The server responds to a connection request from the IP address which is entered in the SDT "TCON_IP_v4" in the CONNECT parameter.</p> <p>You can use this parameter to control when a connection request is accepted:</p> <ul style="list-style-type: none"> <li>• 0: A passive connection is established when there is no communications connection.</li> <li>• 1: Initialization of the connection termination. If the input is set, no other operations are executed. The value 0003 is output at the STATUS parameter after successful connection termination.</li> </ul>
MB_HOLD_REG (Page 3128)	InOut	VARIANT	<p>Pointer to the Modbus holding register of the "MB_SERVER" instruction</p> <p>The holding register contains the values that may be accessed by a Modbus client using the Modbus functions 3 (read), 6 (write) and 16 (read).</p> <p>As the holding register, use either a global data block with optimized access or the memory area of the bit memories.</p>
CONNECT (Page 3128)	InOut	VARIANT	<p>Pointer to the structure of the connection description</p> <p>The following structures (SDTs) can be used:</p> <ul style="list-style-type: none"> <li>• TCON_IP_v4: Includes all address parameters required for establishing a programmed connection. The default address is 0.0.0.0 (any IP address), but you can enter a specific IP address so that the server only responds to requests from this address. When using TCON_IP_v4, the connection is established when calling the instruction "MB_SERVER".</li> <li>• TCON_Configured: Includes the address parameters of a configured connection. When using TCON_Configured, the connection is established by the CPU after download of the hardware configuration.</li> </ul>
NDR	Output	BOOL	<p>"New Data Ready":</p> <ul style="list-style-type: none"> <li>• 0: No new data</li> <li>• 1: New data written by the Modbus client written</li> </ul>
DR	Output	BOOL	<p>"Data Read":</p> <ul style="list-style-type: none"> <li>• 0: No data read</li> <li>• 1: Data read by the Modbus client</li> </ul>

Parameter	Declaration	Data type	Description
ERROR	Output	BOOL	If an error occurs during the call of the "MB_SERVER" instruction, the output of the ERROR parameter is set to "1". Detailed information about the cause of the problem is indicated by the STATUS parameter.
STATUS (Page 3130)	Output	WORD	Detailed status information of the instruction.

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

### Static tags of the instruction

The following table describes the static tags of the instance data block of the "MB\_SERVER" instruction used in the program. You can write the HR\_Start\_Offset tag. You can read the other tags to monitor the Modbus status.

Tag	Data type	Start value	Description
HR_Start_Offset	WORD	0	Assign the start address of the Modbus holding register.
Request_Count	WORD	0	Total number of requests received by the server.
Server_Message_Count	WORD	0	Total number of received messages for the relevant Server.
Xmt_Rcv_Count	WORD	0	Counter for detecting the number of transfers during which an error occurred. The counter is only incremented when an invalid Modbus request is received.
Exception_Count	WORD	0	Counters for detecting the number of errors specifically for Modbus which cause an error message to "MB_CLIENT".
Success_Count	WORD	0	Event counter for detecting the number of requests that were successfully executed by the server.
Connected	BOOL	0	Indicates whether the connection to the assigned client has been established or not: 1 = connected, 0 = not connected.

### Mapping of Modbus addresses to the process image

The "MB\_SERVER" instruction allows incoming Modbus functions (1, 2, 4, 5 and 15) direct read and write access to the process image inputs and outputs of the CPU (use of the data types BOOL and WORD).

For the data transfer of the function codes 3, 6 and 16, the holding register (MB\_HOLD\_REG parameter) must be defined longer than one byte. The following table shows the mapping of the Modbus addresses to the process image of the CPU.

Modbus function					S7-1500, S7-1200 V4.0		
Function code	Function	Data area	Address space			Data area	CPU address
01	Read: Bits	Output	1	to	9999	Process image output	Q0.0 to Q1249.6
02	Read: Bits	Input	1	to	19999	Process image input	I0.0 to I1249.6
04	Read: WORD	Input	1	to	39999	Process image input	IW0 to IW19996

Modbus function						S7-1500, S7-1200 V4.0	
05	Write: Bits	Output	1	to	9999	Process image output	Q0.0 to Q1249.6
15	Write: Bits	Output	1	to	9999	Process image output	Q0.0 to Q1249.6

Incoming Modbus requests with the function codes 3, 6, 16 and 23 write to or read from the Modbus holding register (you specify the holding register with the MB\_HOLD\_REG parameter).

### Example: Addressing via static tag HR\_Start\_Offset

The addresses of the Modbus holding register start at 40001. These addresses correspond to the address space of the CPU memory area for the holding register. You can also define the HR\_Start\_Offset tag so that the Modbus holding register has a start address other than 40001.

Example: The holding register begins at MW100, and has a length of 100 WORD. An offset value in the HR\_Start\_Offset parameter means that the start address of the holding register is moved from 40001 to 40021. Whenever the holding register is addressed below the address 40021 and above the address 40120, this causes an error.

HR_Start_Offset	Address	Minimum	Maximum
0	Modbus address (WORD)	40001	40100
	CPU address	MW100	MW298
20	Modbus address (WORD)	40021	40120
	CPU address	MW100	MW298

### Modbus diagnostics functions

The table below contains a description of the Modbus diagnostics functions.

Function code	Diagnostic code	Description
08	0x0000	Echo test: The "MB_SERVER" instruction receives a data word and returns this unchanged to the Modbus client.
08	0x000A	Reset event counter: The "MB_SERVER" instruction resets the following event counters: "Success_Count", "Xmt_Rcv_Count", "Exception_Count", "Server_Message_Co" and "Request_Count".
11	-	Fetch event counter of the communication: The "MB_SERVER" instruction uses an internal event counter for communication to record the number of successfully executed read and write requests sent to the Modbus server.  The event counter is not incremented with the functions 8 or 11. The same holds true for requests that cause a communications error, for example, if a protocol error has occurred (e.g., the function code in the received Modbus request is not supported).

## MB\_HOLD\_REG parameter

### Description

The MB\_HOLD\_REG parameter is a pointer to a data buffer for storing the data read from or written to the Modbus server. You can use a global data block or a bit memory (M) as memory area.

- The high limit for the number of addresses in the data block (D) is determined by the maximum work memory of the CPU.
- The high limit for the number of bit memories (M) is determined by the size of the CPU memory area.

The following table shows examples of mapping Modbus addresses to the holding register for the Modbus functions 3 (read WORD), 6 (write WORD), 16 (write several WORD) and 23 (write and read several words).

Modbus addresses	MB_HOLD_REG parameter - examples		
40001	MW100	DB10.DBW0	"Recipe".ingredient[1]
40002	MW102	DB10.DBW2	"Recipe".ingredient[2]
40003	MW104	DB10.DBW4	"Recipe".ingredient[3]
40004	MW106	DB10.DBW6	"Recipe".ingredient[4]
40005	MW108	DB10.DBW8	"Recipe".ingredient[5]

## CONNECT parameter

### Connection descriptions at CONNECT parameter

Two different connection descriptions can be used for the "MB\_SERVER" instruction:

- Programmed connections with the structure TCON\_IP\_v4  
The connection parameters are stored in the TCON\_IP\_v4 structure and the connection is set up with the call of the instruction "MB\_SERVER".
- Configured connections with the structure TCON\_Configured  
The configured connection has already been established by the CPU. Use the structure TCON\_Configured to specify which existing connection is to be used for the instruction.

Each instance of the instruction "MB\_SERVER" requires a unique connection. Create a separate structure TCON\_IP\_v4 or TCON\_Configured for each instance of the instruction to describe the connection.

### Connection description for programmed connections

For programmed connections at the CONNECT parameter, use the following structure for connection description to TCON\_IP\_v4.

- Make sure that only connections of the type TCP are specified in the TCON\_IP\_v4 structure.
- The connection may not use the following TCP port numbers: 20, 21, 25, 80, 102, 123, 5001, 34962, 34963 and 34964.

Byte	Parameter	Data type	Start value	Description
0 ... 1	InterfaceID	HW_ANY	-	Hardware identifier of the local interface (value range: 0 to 65535).
2 ... 3	ID	CONN_OUC	-	Reference to this connection (value range: 1 to 4095). The parameter uniquely identifies a connection within the CPU. Each individual instance of the instruction "MB_SERVER" must use a unique ID.
4	ConnectionType	BYTE	11	Connection type Select 11 (decimal) for TCP. Other connection types are not permitted. If another connection type (e.g. UDP) is used, a corresponding error message is output at the STATUS parameter of the instruction.
5	ActiveEstablished	BOOL	FALSE	ID for the manner in which the connection is established Select FALSE for passive connection establishment.
6 ... 9	RemoteAddress	ARRAY [1..4] of BYTE	0.0.0.0	IP address of the connection partner, for example, for 192.168.0.1: <ul style="list-style-type: none"> <li>• addr[1] = 192</li> <li>• addr[2] = 168</li> <li>• addr[3] = 0</li> <li>• addr[4] = 1</li> </ul> If the instruction "MB_SERVER" is to accept connection requests from any connection partner, use "0.0.0.0" as IP address.
10 ... 11	RemotePort	UINT	0	Port number of the remote connection partner (value range: 1 to 49151). If the instruction "MB_SERVER" is to accept connection requests from any remote partner, use "0" as port number.
12 ... 13	LocalPort	UINT	502	Port number of the local connection partner (value range: 1 to 49151). The number of the IP port defines which IP port is monitored for connection requests of the Modbus client. The following TCP port numbers must not be used for the passive connection of the "MB_SERVER" instruction: 20, 21, 25, 80, 102, 123, 5001, 34962, 34963 and 34964.

**Note**

**Migration of the instruction "MB\_SERVER" version 2.1**

The parameters CONNECT\_ID and IP\_PORT are mapped in version 3.0 of the "MB\_SERVER" instruction in the TCON\_IP\_v4 structure:

- The parameter CONNECT\_ID of the "MB\_SERVER" V2.1 instruction corresponds to the ID parameter of TCON\_IP\_v4.
- The parameter IP\_PORT of the "MB\_SERVER" V2.1 instruction corresponds to the LocalPort parameter of TCON\_IP\_v4.

**Connection description for configured connections**

For configured connections at the CONNECT parameter, use the following structure for connection description to TCON\_Configured.

- Make sure that only connections of the type TCP are specified in the TCON\_Configured structure.
- The connection may not use the following TCP port numbers: 20, 21, 25, 80, 102, 123, 5001, 34962, 34963 and 34964.

Byte	Parameter	Data type	Start value	Description
0 ... 1	InterfaceID	HW_ANY	-	Hardware identifier of the local interface (value range: 0 to 65535).
2 ... 3	ID	CONN_OUC	-	Reference to this connection (value range: 1 to 4095). Enter the connection ID of the existing connection.
4	ConnectionType	BYTE	-	Connection type Select 254 (decimal) for a configured connection.

**Parameter STATUS**

**Parameter STATUS (general status information)**

STATUS* (W#16#)	Description
0000	Instruction executed without errors.
0001	Connection established.
0003	Connection terminated.
7000	No call active (REQ=0).
7001	First call. Connection establishment triggered.
7002	Intermediate call. Connection is being established.
7003	Connection is being terminated.
7005	Data is being sent.
7006	Data is being received.

STATUS* (W#16#)	Description
80BB	Invalid value at ActiveEstablished parameter (identifier for the type of connection establishment, see CONNECT parameter (Page 3128)): <ul style="list-style-type: none"> <li>• Only passive connection establishment permitted for server (active_established = FALSE).</li> <li>• Only active connection establishment permitted for client (active_established = TRUE).</li> </ul>
8380	Received Modbus frame has incorrect format or too few bytes were received.
* The status codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

### Parameter STATUS (parameter error)

STATUS* (W#16#)	Error code in the error message from "MB_SERVER" (B#16#)	Description
8187	No response	The MB_HOLD_REG parameter has an invalid pointer. Data area is too small.
8381	01	Function code is not supported.
8382	03	Error in data length: <ul style="list-style-type: none"> <li>• Invalid length specification in received Modbus frame</li> <li>• The frame length entered in the header of the Modbus frame does not match the number of actually received bytes.</li> <li>• The number of bytes entered in the header of the Modbus frame does not match the number of actually received bytes (functions 15 and 16).</li> </ul>
8383	02	Error in data address or access outside the address area of the holding register (MB_HOLD_REG (Page 3128) parameter).
8384	03	Invalid data value (function 5).
8385	03	Diagnostic code is not supported (only with function code 08).
* The status codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

#### Note

##### Error codes of internally used communications instructions

With the "MB\_SERVER" instruction, in addition to the errors listed in the tables, errors caused by the communication instructions ("TCON", "TDISCON", "TSEND", "TRCV", "T\_DIAG" and "T\_RESET") used by the instruction can occur.

The error codes are assigned via the instance data block of the "MB\_SERVER" instruction. The error codes are displayed for the respective instruction under STATUS in the "Static" section.

The meaning of the error codes is available in the documentation of the corresponding communications instruction.

### 9.7.5.2 S7 communication

#### Data consistency

##### Definition

A data block which cannot be modified by concurrent processes is called consistent data area. A data block which is larger than the consistent data area can thus be falsified as a whole during transmission. This means that a data block which belongs together and which is larger than consistent data area can consist in part of new and of old consistent data at the same time.

##### Example

An inconsistency can occur when an instruction for communication is interrupted, for example, by a hardware interrupt OB with higher priority. If the user program in this OB now changes the data that has already been partly processed by the instruction, the transferred data originates:

- In part from the time before the hardware interrupt was processed
- And in part from the time after the hardware interrupt was processed

This means that these data are inconsistent (not coherent).

#### Ensuring data consistency

If the communication process can be interrupted by an interrupt OB, you must ensure that the data is transferred consistently. Make sure that only an image of the data and not the data to be transferred is not changed directly by the interrupt OB. Copy the image of the data to the transfer area of the communication instruction prior to the next data transfer.

- If the user program contains a communication instruction that accesses common data, access to this data area can be coordinated, for example, by means of the DONE parameter. The data consistency of the communication areas which are transferred locally with a communication instruction can therefore be ensured in the user program.
- In the case of S7 communication instructions "PUT (Page 3139)"/"GET (Page 3136)", the size of the consistent data areas must already be taken into consideration during programming or configuration, because a communication block is not available in the user program of the target device (server) to synchronize communication data to the user program.

- For the S7-300 and C7-300 (exception: CPU 318-2 DP) the communication data are copied consistently into the user memory in blocks of 32 bytes in the cycle control point of the operating system. Data consistency is not guaranteed for larger data areas. If a defined data consistency is required, the communication data in the user program may not exceed 32 bytes (maximum of 8 bytes, depending on the version).
- In the S7-400 and S7-1500, on the other hand, the communication data in 462-byte blocks is not processed at the cycle control point, but in fixed time slices during the program cycle. The consistency of a tag is ensured by the system. These communication areas can then be accessed consistently using the "PUT (Page 3139)" / "GET (Page 3136)" instructions or when reading/writing tags, for example by an OP or an OS.

---

**Note**

Additional information on data consistency is provided in the description of the specific instructions.

---

### Effect on interrupt reaction times

The interrupt reaction times of the CPU are slightly extended by copying the data. The greater the quantity of data which must be transferred with absolute consistency, the longer the interrupt reaction time of a system.

### Common parameters of instructions for S7 communication

#### Classification

The parameters of the instructions for S7 communication can be divided into the following five categories according to their functions:

1. Control parameters are used to activate an instruction.
2. Addressing parameters are used to address the remote communication partner.
3. Send parameters point to the data areas that are to be sent to the remote partner.
4. Receive parameters point to the data areas where the data received from remote partners will be entered.
5. Status parameters are used to monitor whether the instruction has completed its task without error or for the analysis of any errors that have occurred.

#### Control parameter

Data exchange will only be activated if the appropriate control parameters have a defined value (for example, are set) when the instruction is called or when the value has undergone a specific change since the previous call (for example, a positive edge).

### Addressing parameters

Parameter	Description
ID	Reference to the local connection description (specified by the configuration of the connection).
R_ID	With the R_ID parameter, you specify that a send and a receive instruction belong together: The R_ID parameter must match in the instruction at the sending end and the instruction at the receiving end. This allows the communication of several instruction pairs via the same logic connection. <ul style="list-style-type: none"><li>• R_ID must be specified in the form DW#16#wxyzWXYZ.</li><li>• The instruction pairs of a logical connection specified in R_ID must be unique for this connection.</li></ul>

---

#### Note

##### Addressing parameters ID and R\_ID

You can reassign the addressing parameters ID and R\_ID during runtime. The new parameters are validated with each new job after the previous job has been closed.

You can use the following options to reduce the number of instance DBs and therefore the work memory required:

1. With tag IDs, you can use several connections via one data instance block.
2. With tag R\_IDs, you can define several pairs of sending and receiving instructions for one job with a single instance.
3. You can combine cases 1 and 2.

Please note that the new parameters are valid after the last job is executed. When you activate the sending operation, the R\_ID parameter in the instruction at the sending end must match its counterpart at the receiving end.

---

### Status parameter

With the status parameters, you monitor whether the instruction has completed its task correctly or whether it is still active. The status parameters also indicate errors.

---

#### Note

The status parameters are valid for one cycle only, namely from the first command following the call until the next call. As a result, you must evaluate these parameters after each instruction cycle.

---

## Send and receive parameters

For communication instructions configured at both ends

- The number of the SD\_i and RD\_i parameters used must match at the send and receive end.
- The data types of the SD\_i and RD\_i parameters that belong together must match at the send and receive end.
- The amount of data to be sent according to the SD\_i parameter must not exceed the range made available by the corresponding RD\_i (does not apply to "BSEND (Page 3144)" / "BRCV (Page 3147)"). The RD\_i parameters must (with exception of "BSEND"/"BRCV") have the identical data size.

If you do not keep to the rules above, this is indicated by ERROR = 1 and STATUS = 4.

---

### Note

#### Supplying the send and receive parameters

With the VARIANT data type, send and receive parameters must always be supplied any time a communication instruction is called. It is not possible, for example, to supply the send parameters of the communication instructions at startup and to only trigger the send job in cyclic operation.

---

## User data size

With the "USEND (Page 3141)", "URCV (Page 3143)", "GET (Page 3136)" and "PUT (Page 3139)" instructions, the amount of data to be transferred must not exceed a defined user data size. The maximum user data size depends on:

- The instruction used
- The communication partner.

The guaranteed minimum size of the user data for an instruction with 1-4 tags is listed in the following table:

Instruction	Partner: S7-300	Partner: S7-400	Partner: S7-1200	Partner: S7-1500
PUT / GET	160 bytes	400 bytes	160 bytes	880 bytes
USEND / URCV	160 bytes	440 bytes	-	920 bytes
BSEND / BRCV	32768/65534 bytes	65534 bytes	-	<ul style="list-style-type: none"> <li>• 65534 bytes with standard access</li> <li>• 65535 bytes with optimized access</li> </ul>

Further information on the user data size can be found in the technical data of the respective CPU.

**Exact user data size**

If the user data size specified above is insufficient you can determine the maximum byte length of the user data as follows:

First read the data block size valid for communication from the following table:

Local CPU	Remote CPU	Data block size in bytes
S7-1200	Any	240
S7-1500	S7-300	240
	S7-400	480
	S7-1200	240
	S7-1500	960

Use this value in the following table to read the maximum possible user data length in bytes as total of the parameters used. It applies for even lengths of the areas SD\_i, RD\_i, and ADDR\_i.

For each range of uneven length the maximum possible user data length is reduced by one byte.

Data block size	Instruction	Number of SD_i, RD_i, ADDR_i parameters used			
		1	2	3	4
240 (S7-300)	PUT/GET/USEND	160	-	-	-
240 (S7-300 via integrated interface)	PUT	212	-	-	-
	GET	222	-	-	-
	USEND	212	-	-	-
240 (S7-400)	PUT	212	196	180	164
	GET	222	218	214	210
	USEND	212	-	-	-
480 (S7-400)	PUT	452	436	420	404
	GET	462	458	454	450
	USEND	452	448	444	440
240 (S7-1200)	PUT	212	196	180	164
	GET	222	218	214	210
960 (S7-1500)	PUT	932	916	900	884
	GET	942	938	934	930
	USEND	932	928	924	920

**GET: Read data from a remote CPU**

**Description**

With the instruction "GET", you can read data from a remote CPU.

The instruction is started on a positive edge at control input REQ:

- The relevant pointers to the areas to be read out (ADDR\_i) are then sent to the partner CPU. The partner CPU can be in RUN or STOP mode.
- The partner CPU returns the data:
  - If the reply exceeds the maximum user data length, this is displayed with error code "2" at the STATUS parameter.
  - The received data is copied to the configured receive areas (RD\_i) at the next call.
- Completion of this action is indicated by the status parameter NDR having the value "1".

Reading can only be activated again after the previous reading process has been completed. Errors and warnings are output via ERROR and STATUS if access problems occurred while the data was being read or if the data type check results in an error.

Changes in the data areas addressed on the partner CPU are not registered by the "GET" instruction.

### Requirements for using the instruction

- The "Permit access with PUT/GET communication from remote partner" function was activated in the properties of the partner CPU under "Protection".
- The blocks which you access with the "GET" instruction were created with the access type "standard".
- Make sure that the areas defined with the parameters ADDR\_i and SD\_i match in terms of number, length and data type.
- The area to be read (ADDR\_i parameter) cannot be larger than the area for data storage (RD\_i parameter).

### Parameters

The following table shows the parameters of the "GET" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Control parameter request, activates the data exchange on a positive edge.
ID	Input	WORD	I, Q, M, D, L or constant	Addressing parameters for specifying the connection to the partner CPU.
NDR	Output	BOOL	I, Q, M, D, L	Status parameter NDR: <ul style="list-style-type: none"> <li>• 0: Job not yet started or still running.</li> <li>• 1: Job successfully completed.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameters ERROR and STATUS, error code: <ul style="list-style-type: none"> <li>• ERROR=0 STATUS has the value:               <ul style="list-style-type: none"> <li>– 0000H: Neither warning nor error</li> </ul> </li> </ul>

Parameter	Declaration	Data type	Memory area	Description
STATUS	Output	WORD	I, Q, M, D, L	<ul style="list-style-type: none"> <li>- &lt;&gt; 0000H: Warning, STATUS supplies detailed information.</li> <li>• ERROR=1 An error has occurred. STATUS supplies detailed information on the type of error.</li> </ul>
ADDR_1	InOut	REMOTE	I, Q, M, D	Pointers to the areas on the partner CPU that are to be read. When the REMOTE pointer accesses a DB, the DB must always be specified. Example: P#DB10.DBX5.0 Byte 10.
ADDR_2	InOut	REMOTE		
ADDR_3	InOut	REMOTE		
ADDR_4	InOut	REMOTE		
RD_1	InOut	VARIANT	I, Q, M, D, L	Pointers to the areas on the local CPU in which the read data is entered.
RD_2	InOut	VARIANT		
RD_3	InOut	VARIANT		
RD_4	InOut	VARIANT		

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameters ERROR and STATUS

The following table contains all specific error information for the "GET" instruction that can be output via the ERROR and STATUS parameters.

ERROR	STATUS (decimal)	Explanation
0	11	Warning: New job not active because the previous job is still busy.
0	25	Communication has started. The job is being processed.
1	1	Communication problems, for example <ul style="list-style-type: none"> <li>• Connection description not loaded (local or remote)</li> <li>• Connection interrupted (for example: cable, CPU off, CP in STOP mode)</li> <li>• Connection to partner not yet established</li> </ul>
1	2	<ul style="list-style-type: none"> <li>• Negative acknowledgment from the partner device. The function cannot be executed.</li> <li>• Response from the remote station exceeds the maximum user data length (see: Common parameters of instructions for S7 communication (Page 3133)).</li> <li>• Access protection is activated on the partner CPU. Deactivate access protection in the CPU settings.</li> </ul>
1	4	Error in the pointers to the data storage RD_i: <ul style="list-style-type: none"> <li>• Data types of the parameters RD_i and ADDR_i are not compatible with each other.</li> <li>• The length of the area RD_i is smaller than the length of the data of the ADDR_i parameter that is to be read.</li> </ul>
1	8	Access error on the partner CPU.
1	10	Access to the local user memory not possible (for example, access to a deleted DB).
1	20	<ul style="list-style-type: none"> <li>• Maximum number of parallel jobs exceeded.</li> <li>• The job is currently being processed in a priority class with low priority (first call).</li> </ul>

**Note****Data consistency**

Data is received consistently if you read the part of the receive area RD\_i currently being used completely before initiating another job.

**PUT: Write data to a remote CPU****Description**

You can write data to a remote CPU with the instruction "PUT".

The instruction is started on a positive edge at control input REQ:

- The pointers to the areas to be written (ADDR\_i) and the data (SD\_i) are then sent to the partner CPU. The partner CPU can be in RUN or STOP mode.
- The data to be sent is copied from the configured send areas ((SD\_i). The partner CPU saves the sent data under the addresses supplied with the data and returns an execution acknowledgment.
- If no errors occur, this is indicated at the next instruction call with status parameter DONE = "1". The writing process can only be activated again after the last job is complete.

Errors and warnings are output via ERROR and STATUS if access problems occurred while the data was being written or if the execution check results in an error.

**Requirements for using the instruction**

- The "Permit access with PUT/GET communication from remote partner" function was activated in the properties of the partner CPU under "Protection".
- The blocks which you access with the "PUT" instruction were created with the access type "standard".
- Make sure that the areas defined with the parameters ADDR\_i and SD\_i match in terms of number, length and data type.
- The area to be written (ADDR\_i parameter) must be as large as the send area (SD\_i parameter).

**Parameters**

The following table shows the parameters of the "PUT" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Control parameter request, activates the data exchange on a positive edge.
ID	Input	WORD	I, Q, M, D, L or constant	Addressing parameters for specifying the connection to the partner CPU.

9.7 References

Parameter	Declaration	Data type	Memory area	Description
DONE	Output	BOOL	I, Q, M, D, L	Status parameter DONE: <ul style="list-style-type: none"> <li>0: Job not yet started or still executing</li> <li>1: Job executed without errors.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameters ERROR and STATUS, error code: <ul style="list-style-type: none"> <li>ERROR=0 STATUS has the value:                             <ul style="list-style-type: none"> <li>0000H: Neither warning nor error</li> <li>&lt;&gt; 0000H: Warning, STATUS supplies detailed information.</li> </ul> </li> <li>ERROR=1 An error has occurred. STATUS supplies detailed information on the type of error.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	
ADDR_1	InOut	REMOTE	I, Q, M, D	Pointers to the areas on the partner CPU to which the data will be written.  When the REMOTE pointer accesses a DB, the DB must always be specified. Example: P#DB10.DBX5.0 Byte 10.  When transferring data structures (e.g., Struct) the data type CHAR must be used at the ADDR_i parameters.
ADDR_2	InOut	REMOTE		
ADDR_3	InOut	REMOTE		
ADDR_4	InOut	REMOTE		
SD_1	InOut	VARIANT	I, Q, M, D, L	Pointers to the areas on the local CPU which contain the data to be sent.  Only the data types BOOL, BYTE, CHAR, WORD, INT, DWORD, DINT, REAL are permitted.  When transferring data structures (e.g., Struct) the data type CHAR must be used at the SD_i parameters.
SD_2	InOut	VARIANT		
SD_3	InOut	VARIANT		
SD_4	InOut	VARIANT		

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**Parameters ERROR and STATUS**

The following table contains all specific error information for the "PUT" instruction that can be output via the ERROR and STATUS parameters.

ERROR	STATUS (decimal)	Explanation
0	11	Warning: New job not active because the previous job is still busy.
0	25	Communication has started. The job is being processed.
1	1	Communication problems, for example <ul style="list-style-type: none"> <li>Connection description not loaded (local or remote).</li> <li>Connection interrupted (for example, cable, CPU off, CP in STOP mode).</li> <li>Connection to partner not yet established.</li> </ul>

ERROR	STATUS (decimal)	Explanation
1	2	<ul style="list-style-type: none"> <li>Negative acknowledgment of partner CPU. The function cannot be executed.</li> <li>Access on the partner CPU was not granted. Activate the access in the CPU settings.</li> </ul>
1	4	<p>Error in the pointers to the data storage:</p> <ul style="list-style-type: none"> <li>Data types of the parameters SD_i and ADDR_i are not compatible with each other.</li> <li>The length of the area SD_i is greater than the length of the data of the ADDR_i parameter that is to be written.</li> <li>Not possible to access SD_i.</li> <li>Maximum user data size exceeded.</li> <li>Number of the parameters SD_i and ADDR_i does not match.</li> </ul>
1	8	Access error with the partner CPU (e.g. DB not loaded or write-protected).
1	10	Access to the local user memory not possible (for example, access to a deleted DB).
1	20	<ul style="list-style-type: none"> <li>Maximum number of parallel jobs exceeded.</li> <li>The job is currently being processed in a priority class with low priority (first call).</li> </ul>

### Data consistency

When a send operation is activated (positive edge at REQ), the data to be sent from the send area SD\_i is copied from the user program. After the block call, you can write to these areas without corrupting the current send data.

---

#### Note

The send operation is only complete when the DONE status parameter has the value "1".

---

### Other

#### USEND: Send data uncoordinated

#### Description

The "USEND" instruction sends data to a remote partner instruction of type "URCV (Page 3143)". The sending process is carried out without coordination with the partner instruction. This means that the data transfer is carried out without acknowledgment by the partner instruction.

When a send operation is activated (positive edge at REQ), the data to be sent from the send areas SD\_i are copied from the user program. After the instruction call, you can write to these send areas again without corrupting the current send data.

Successful completion of the send operation is indicated by the value of the DONE status parameter being set to "1".

**Parameters**

The following table shows the parameters of the "USEND" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Control parameter request, activates the data exchange on a positive edge.
ID	Input	CONN_PRG	I, Q, M, D, L, P or constant	Addressing parameters for specifying the connection to the partner CPU.
R_ID	Input	CONN_R_ID	I, Q, M, D, L or constant	Addressing parameter R_ID for defining the instruction pairs "USEND" and "URCV". See also: Common parameters of instructions for S7 communication (Page 3133)
DONE	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: Job not yet started or still executing.</li> <li>• 1: Job executed without errors.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: Neither warning nor error.</li> <li>• 1: An error has occurred. STATUS supplies detailed information on the type of error.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status parameter See "ERROR and STATUS parameters" table.
SD_i (1 ≤ i ≤ 4)	InOut	VARIANT	I, Q, M, D	Pointer on the i-th send area. Only the BOOL data types are permitted (not permitted: bit array), BYTE, CHAR, WORD, INT, DWORD, DINT, REAL or STRUCT. The maximum user data size for SD_i parameters depends on the partner CPU ("URCV" instruction) and on the number of parameters used. Additional information is available in: Common parameters of instructions for S7 communication (Page 3133)

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**Parameters ERROR and STATUS**

ERROR	STATUS (decimal)	Explanation
0	11	Warning: New job not active because the previous job is still busy.
0	25	Communication has started. The job is being processed.
1	1	Communication problem has occurred. Possible causes: <ul style="list-style-type: none"> <li>• Connection description not loaded (local or remote)</li> <li>• Connection interrupted (for example: cable, CPU off, CP in STOP mode)</li> <li>• Connection to partner not yet established</li> </ul>

ERROR	STATUS (decimal)	Explanation
1	4	<ul style="list-style-type: none"> <li>Errors in the send area pointers SD_i relating to the data length or the data type.</li> <li>Maximum user data length was exceeded.</li> </ul>
1	10	Access to the local user memory not possible (for example, access to a deleted DB).
1	18	Value at R_ID parameter already exists in the connection specified at the ID parameter (R_ID value must be unique for the connection).
1	20	<ul style="list-style-type: none"> <li>Maximum number of parallel jobs exceeded.</li> <li>The job is currently being processed in a priority class with lower priority (first call).</li> </ul>

## URCV: Receive data uncoordinated

### Description

The "URCV" instruction receives data asynchronously from a remote partner instruction of type "USEND (Page 3141)" and copies this data into the configured receive areas.

The instruction is ready to receive if there is a logical 1 at the EN\_R input. An active job can be canceled with EN\_R=0.

The receive data areas are referenced by the parameters RD\_1 to RD\_4. Make sure that the areas defined by the parameters RD\_i / RD\_1 and SD\_i / SD\_1 (with the associated partner instruction "USEND (Page 3141)") match in terms of number and length.

Successful completion of the copy operation is indicated when the value of the NDR status parameter is set to logical "1". Once the status parameter NDR has changed to "1", there will be new receive data in your receive areas (RD\_i). A new block call may cause these data to be overwritten with new receive data. If you want to prevent this, call "URCV" (for example, during cyclic block processing) with the value 0 at EN\_R until you have finished processing the received data.

### Parameters

The following table shows the parameters of the "URCV" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN_R	Input	BOOL	I, Q, M, D, L or constant	Control parameter enabled to receive, signals ready to receive if the input is set.
ID	Input	CONN_PR G	I, Q, M, D, L, P or constant	Addressing parameters for specifying the connection to the partner CPU.
R_ID	Input	CONN_R_I D	I, Q, M, D, L or constant	Addressing parameter for defining the instruction pairs "USEND" and "URCV". See also: Common parameters of instructions for S7 communication (Page 3133)
NDR	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>0: Job not yet started or still running.</li> <li>1: Job successfully completed.</li> </ul>

Parameter	Declaration	Data type	Memory area	Description
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>0: Neither warning nor error</li> <li>1: An error has occurred. STATUS supplies detailed information on the type of error.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status parameter See "ERROR and STATUS parameters" table.
RD_i (1 ≤ i ≤ 4)	InOut	VARIANT	I, Q, M, D	Pointer to the i-th receive area: Only the BOOL data types are permitted (not permitted: bit array), BYTE, CHAR, WORD, INT, DWORD, DINT, REAL or STRUCT.  Additional information is available in: Common parameters of instructions for S7 communication (Page 3133)

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameters ERROR and STATUS

ERROR	STATUS (decimal)	Explanation
0	9	Warning: older received data were overwritten by newer received data.
0	11	Warning: The received data is already being processed in a priority class with lower priority (error can occur when copying data to the receive area).
0	25	Communication has started. The job is being processed.
1	1	Communication problem has occurred. Possible causes: <ul style="list-style-type: none"> <li>Connection description not loaded (local or remote)</li> <li>Connection interrupted (for example: cable, CPU off, CP in STOP mode)</li> <li>Connection to partner not yet established</li> </ul>

### BSEND: Send data in segments

#### Description

The "BSEND" instruction sends data to a remote partner instruction of type "BRCV (Page 3147)". With this type of data transfer, more data can be transported between the communication partners than is possible with all other communication instructions for

configured S7 connections. In each case, the maximum data volume amounts to 65534 bytes (standard access) or 65535 bytes (optimized access) for the integrated interface and for SIMATIC Net CP.

## Functional description

You specify the instruction pair "BSEND" and "BRCV" with the input parameter R\_ID. The R\_ID parameter must be identical in the related instructions.

The send job is activated after the instruction is called and a positive edge is detected at control input REQ. After the call, "BSEND" is not processed in the background, which means the data can only be read within the user program.

The data area to be transmitted is segmented. Each segment is sent individually to the partner. Each segment is acknowledged by the partner after the application of this segment by "BRCV (Page 3147)". If the data is segmented, "BSEND" must be called multiple times until all segments have been transferred.

The data area of the data to be sent is specified by SD\_1. To ensure data consistency, you may only write to the part of the currently used sending area SD\_1 after the current send operation is complete. This is the case when the value of the status parameter DONE changes to "1".

The length of the send data is specified by LEN based on the job. With LEN = "0", all data addressed with the SD\_1 parameter is sent.

If there is a positive edge at control input R, the current sending process is canceled.

Due to the asynchronous data transfer, a new data transfer can only be initiated if the previous data has been fetched by a partner instruction call. When the data has been collected, the status parameter "NDR" is set in the partner instruction "BRCV".

---

### Note

#### Migration of S7-400 user programs

An S7-400 CPU interprets the parameter SD\_1 as pointer and not as data area.

With S7-1500, LEN may not exceed the area of SD1. This was permitted with S7-400. Recommendation: Use the maximum size for the LEN parameter (65534 bytes for the integrated interface) as size of the data area at the SD\_1 parameter.

---

## Parameters

The following table shows the parameters of the "BSEND" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Control parameter request, activates the data exchange at a positive edge
R	Input	BOOL	I, Q, M, D, L or constant	Control parameter reset, activates an abort of the current data exchange at a positive edge

Parameter	Declaration	Data type	Memory area	Description
ID	Input	CONN_PR G	I, Q, M, D, L, P or constant	Addressing parameters for specifying the connection to the partner CPU.
R_ID	Input	CONN_R_I D	I, Q, M, D, L or constant	Addressing parameter for defining the instruction pairs "BSEND" and "BRCV (Page 3147)". See also: Common parameters of instructions for S7 communication (Page 3133)
SD_1	InOut	VARIANT	I, Q, M, D	Pointer to send area
LEN	InOut	WORD	I, Q, M, D, L	Length of the block of data to be sent in bytes. With LEN = "0", all data is sent by SD_1.
DONE	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: Job not yet started or still executing.</li> <li>• 1: Job executed without errors.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: Neither warning nor error.</li> <li>• 1: An error has occurred. STATUS supplies detailed information on the type of error.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status parameter See "ERROR and STATUS parameters" table.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameters ERROR and STATUS

The following table contains all specific error information for "BSEND" that can be output via the ERROR and STATUS parameters.

ERROR	STATUS (decimal)	Explanation
0	11	Warning: New job not active because the previous job is still busy.
0	25	Communication has started. The job is being processed.
1	1	Communication problem has occurred. Possible causes: <ul style="list-style-type: none"> <li>• Connection description not loaded (local or remote)</li> <li>• Connection interrupted (for example: cable, CPU off, CP in STOP mode)</li> <li>• Connection to partner not yet established</li> </ul>
1	2	Negative acknowledgment of partner instruction. The instruction cannot be executed.
1	3	R_ID is unknown on the connection specified by the ID or the receive block has not yet been called.
1	4	<ul style="list-style-type: none"> <li>• Error in the data length or data type in the send area pointer SD_1.</li> <li>• Value for LEN is greater than area SD_1.</li> </ul>
1	5	Reset request was executed.
1	6	Partner instruction is in DISABLED status (EN_R has the value "0"). Also check the input parameters of "BRCV (Page 3147)" for consistency with "BSEND".
1	7	"BRCV (Page 3147)" partner instruction not called since the last data transfer.

ERROR	STATUS (decimal)	Explanation
1	8	Access to remote object in the user memory was rejected: The destination area for the associated "BRCV (Page 3147)" is too small. ERROR = 1, STATUS = 4 or ERROR = 1, STATUS = 10 reported at the output parameters of "BRCV (Page 3147)".
1	10	Access to the local user memory not possible (for example, access to a deleted DB).
1	18	R_ID already exists in the connection.
1	20	<ul style="list-style-type: none"> <li>• Maximum number of parallel jobs exceeded.</li> <li>• The job is currently being processed in a priority class with lower priority (first call).</li> </ul>

## BRCV: Receive data in segments

### Description

The "BRCV" instruction receives data from a remote partner instruction of type "BSEND (Page 3144)". The R\_ID parameter must be identical in the related instructions.

The instruction is ready to receive data (STATUS = 25) after it is called with the value "1" at control input EN\_R. An active job can be canceled with EN\_R=0.

The maximum receive area is specified by RD\_1. Data will be received consistently if you fully evaluate the part of the RD\_1 receive area currently in use before calling the block again with value 1 at control input EN\_R.

After each received data segment, an acknowledgment is sent to the partner instruction. If there are multiple segments it will be necessary to call "BRCV" several times until all of the segments have been received. Asynchronous data receipt is indicated by STATUS = 17. The amount of data currently received is indicated at the parameter LEN. The RD\_1 parameter must remain constant during the operation.

Value "1" at the NDR status parameter indicates that all data segments have been received without error. The received data remains unchanged until the next call with EN\_R=1.

### Parameters

The following table shows the parameters of the "BRCV" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN_R	Input	BOOL	I, Q, M, D, L or constant	Control parameter enabled to receive, signals ready to receive if the input is set.
ID	Input	CONN_PRG	I, Q, M, D, L, P or constant	Addressing parameters for specifying the connection to the partner CPU.
R_ID	Input	CONN_R_ID	I, Q, M, D, L or constant	Addressing parameter for defining the instruction pairs "BSEND (Page 3144)" and "BRCV". See also: Common parameters of instructions for S7 communication (Page 3133)
RD_1	InOut	VARIANT	I, Q, M, D	Pointer to the receive area.
LEN	InOut	WORD	I, Q, M, D, L	Length of the data already received in bytes.

Parameter	Declaration	Data type	Memory area	Description
NDR	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: Job not yet started or still running.</li> <li>• 1: Job successfully completed.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• 0: Neither warning nor error</li> <li>• 1: An error has occurred. STATUS supplies detailed information on the type of error.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status parameter See "ERROR and STATUS parameters" table.

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

### Parameters ERROR and STATUS

The following table contains all specific error information for "BRCV" that can be output via the ERROR and STATUS parameters.

ERROR	STATUS (decimal)	Explanation
0	17	Warning: Instruction receives data asynchronously. The LEN parameter shows the amount of data already received in bytes.
0	25	Communication has started. The job is being processed.
1	1	Communication problem has occurred. Possible causes: <ul style="list-style-type: none"> <li>• Connection description not loaded (local or remote)</li> <li>• Connection interrupted (for example: cable, CPU off, CP in STOP mode)</li> <li>• Connection to partner not yet established</li> </ul>
1	2	Function cannot be executed (protocol error)
1	4	Error in the receive area pointer RD_1 relating to the data length or data type. The block of data sent is longer than the receive area.
1	5	Reset request received, incomplete transfer.
1	8	Access error in associated "BSEND (Page 3144)": After the last valid data segment has been sent, ERROR = 1 and STATUS = 4 or ERROR = 1 and STATUS = 10 is reported.
1	10	Access to the local user memory not possible (for example, access to a deleted DB).
1	18	Value at R_ID parameter already exists in the connection specified at the ID parameter (R_ID value must be unique for the connection).
1	20	<ul style="list-style-type: none"> <li>• Maximum number of parallel jobs exceeded.</li> <li>• The job is currently being processed in a priority class with lower priority (first call).</li> </ul>

### 9.7.5.3 Open User Communication

#### TSEND\_C: Send data via Ethernet

#### TSEND\_C: Send data via Ethernet

#### Description

The "TSEND\_C" instruction sets up and establishes a TCP or ISO-on-TCP communication connection. Once the connection has been set up and established, it is automatically maintained and monitored by the CPU. The connection description specified at the CONNECT parameter is used to set up the communication connection.

The instruction is executed asynchronously and has the following functions:

- A communication connection is set up and established:  
The communication connection is set up and established with CONT=1. Once the connection is successfully established, the DONE parameter is set to "1" for one cycle. An existing connection is terminated and the connection which has been set up is removed when the CPU goes into STOP mode. To set up and establish the connection again, you must execute "TSEND\_C" again. For information on the number of possible communication connections, refer to the technical specifications for your CPU.
- Sending data via an existing communication connection:  
You specify the send area with the DATA parameter. This includes the address and the length of the data to be sent. Do not use a data area with the data type BOOL or Array of BOOL at the DATA parameter. If you use purely symbolic values at the DATA parameter, the LEN parameter must have the value "0".
- The send job is executed when a rising edge is detected at the REQ parameter. With the LEN parameter, you specify the maximum number of bytes sent with a send job. When sending data (rising edge at the REQ parameter), the CONT parameter must have the value "1" in order to establish or maintain a connection. The data to be sent must not be edited until the send job is completed. If the send job executes successfully, the DONE parameter is set to "1". Signal state "1" at the DONE parameter is not confirmation that the data sent has already been read by the communication partner.
- Terminating the communication connection:  
The communication connection is terminated when the CONT parameter is set to "0" even if an ongoing data transmission is not complete yet. This does not apply if you are using an already configured connection for "TSEND\_C".

When setting the COM\_RST parameter to "1", the currently established connection or a current data transmission can be reset at any time. This terminates the existing communication connection and a new connection is established. If data is being transferred when it executes again, this can lead to a loss of data.

To enable "TSEND\_C" again after the execution (DONE = 1), call the instruction once with REQ = 0.

## Parameters

The following table shows the parameters of the "TSEND\_C" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L	Starts the send job on a rising edge.
CONT	Input	BOOL	I, Q, M, D, L	Controls the communication connection: <ul style="list-style-type: none"> <li>• 0: Disconnect the communication connection</li> <li>• 1: Establish and maintain the communication connection</li> </ul> When sending data (rising edge at the REQ parameter), the CONT parameter must have the value TRUE in order to establish or maintain a connection.
LEN	Input	UINT	I, Q, M, D, L or constant	Maximum number of bytes to be sent with the job. If you use purely symbolic values at the DATA parameter, the LEN parameter must have the value "0".
CONNECT	InOut	TCON_Param	D	Pointer to the connection description See also: Auto-Hotspot
DATA	InOut	VARIANT	I, Q, M, D, L	Pointer to the send area containing the address and the length of the data to be sent.
COM_RST	InOut	BOOL	I, Q, M, D, L	Restarts the instruction: <ul style="list-style-type: none"> <li>• 0: Irrelevant</li> <li>• 1: Complete restart of the instruction causing an existing connection to be terminated and a new connection to be established.</li> </ul>
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or still in progress</li> <li>• 1: Job completed without error</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or already completed</li> <li>• 1: Job not yet completed. A new job cannot be started.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### BUSY, DONE and ERROR parameters

You can check the status of the job with the BUSY, DONE, ERROR and STATUS parameters. The BUSY parameter indicates the processing status. With the DONE parameter, you can check whether or not a job executed successfully. The ERROR parameter is set when errors occurred during execution of "TSEND\_C". The error information is output at the STATUS parameter.

The following table shows the relationship between the BUSY, DONE and ERROR parameters:

BUSY	DONE	ERROR	Description
1	-	-	The job is being processed.
0	1	0	The job was completed successfully.
0	0	1	The job ended with an error. The cause of the error is specified in the STATUS parameter.
0	0	0	No new job was assigned.

## ERROR and STATUS parameters

ERROR	STATUS* (W#16#...)	Description
0	0000	Job completed without error.
0	0001	The connection establishment is complete.
0	0003	The connection termination is complete.
0	7000	No job processing active.
0	7001	<ul style="list-style-type: none"> <li>• Start execution of the job</li> <li>• Establish connection</li> <li>• Wait for connection partner</li> </ul>
0	7002	Data was sent.
0	7003	Connection is being terminated.
0	7004	Connection established and monitored, no job processing active.
1	80A0	Group error for error codes 80A1 and 80A2.
1	80A1	<ul style="list-style-type: none"> <li>• Connection or port already being used by user.</li> <li>• Communication error: <ul style="list-style-type: none"> <li>– The specified connection has not yet been established.</li> <li>– The specified connection is being terminated. Transfer via this connection is not possible.</li> <li>– The interface is being re-initialized.</li> </ul> </li> </ul>
1	80A2	Local or remote port is being used by the system.
1	80A3	Attempt being made to terminate a non-existent connection.
1	80A4	IP address of the remote endpoint of the connection is invalid, in other words, it matches the IP address of the local partner.
1	80A7	Communication error: You called the instruction with COM_RST = 1 before the send job was complete.
1	80AA	A connection is currently being established with the same connection ID by another block. Repeat the job with a new rising edge at the REQ parameter.
1	80B2	The CONNECT parameter points to a data block that was generated with the attribute "Only store in load memory".
1	80B3	Inconsistent parameter assignment: Group error for error codes 80A0 to 80A2, 80A4, 80B4 to 80B9.
1	80B4	You have violated one or both of the following conditions for passive connection establishment (active_est = FALSE) when using the ISO-on-TCP protocol variant (connection_type = B#16#12): "local_tsap_id_len >= B#16#02", and/or "local_tsap_id[1] = B#16#E0".
1	80B5	Only passive connection establishment is permitted for connection type 13 = UDP.

9.7 References

ERROR	STATUS* (W#16#...)	Description
1	80B6	Parameter assignment error in the connection_type parameter of the data block for connection description.
1	80B7	Error in one of the following parameters of the data block for connection description: block_length, local_tsap_id_len, rem_subnet_id_len, rem_staddr_len, rem_tsap_id_len, next_staddr_len.
1	8085	The LEN parameter is larger than the highest permitted value.
1	8086	The ID parameter within the CONNECT parameter is outside the permitted range.
1	8087	Maximum number of connections reached; no additional connection possible.
1	8088	The value at the LEN parameter does not correspond to the receive area set at the DATA parameter.
1	8089	The CONNECT parameter does not point to a data block.
1	8091	Maximum nesting depth exceeded.
1	809A	The CONNECT parameter points to a field that does not correspond to the length of the connection description.
1	809B	The ID of the local device in the connection description does not correspond to the CPU.
1	80C3	<ul style="list-style-type: none"> <li>• All connection resources are in use.</li> <li>• A block with this ID is already being processed in a different priority group.</li> </ul>
1	80C4	Temporary communication error: <ul style="list-style-type: none"> <li>• The connection cannot be established at this time.</li> <li>• The interface is receiving new parameters or the connection is being established.</li> <li>• The configured connection is currently being removed by a "TDISCON" instruction.</li> <li>• The connection used is being terminated by a call with COM_RST= 1.</li> </ul>
1	80C6	Remote network error. Remote partner cannot be reached.
1	8722	Parameter CONNECT: The source area is invalid. The area does not exist in the DB.
1	873A	Parameter CONNECT: Access to the connection description is not possible (for example, DB does not exist).
1	877F	Parameter CONNECT: Internal error.
1	8822	Parameter DATA: Invalid source area, the area does not exist in the DB.
1	8824	Parameter DATA: Area error in the VARIANT pointer.
1	8832	Parameter DATA: The DB number is too high.
1	883A	Parameter CONNECT: Access to specified connection data not possible (e.g. because the DB does not exist).
1	887F	Parameter DATA: Internal error, e.g. invalid VARIANT reference.
1	893A	Parameter DATA: Access to send area not possible (e.g. because the DB does not exist).
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

---

**Note****Error messages of the instructions "TCON", "TSEND", "T\_DIAG" and "TDISCON"**

Internally, the "TSEND\_C" instruction uses the instructions "TCON (Page 3182)", "TSEND (Page 3195)", "T\_DIAG (Page 3215)", "T\_RESET (Page 3214)" and "TDISCON (Page 3190)". The error messages of these instructions can also be output at the STATUS parameter. The meaning of the error codes is described in the corresponding instructions. In the event of identical error codes for internally used instructions with different meanings, the instance data block of "TSEND\_C" can be used to determine which instruction output the error.

---

## TSEND\_C: Send data via Ethernet

### Description

The "TSEND\_C" instruction sets up and establishes a communications connection. Once the connection has been set up and established, it is automatically maintained and monitored by the CPU.

The instruction is executed asynchronously and has the following functions:

- Setting up and establishing a communication connection
- Sending data via an existing communication connection
- Terminating or resetting the communication connection

Internally, the instruction "TSEND\_C" uses the communication instructions "TCON", "TSEND", "T\_DIAG", "T\_RESET" and "TDISCON".

### Setting up and establishing a communication connection

The communication connection is set up and established with CONT=1. For information on the number of possible communication connections, refer to the technical specifications for your CPU. The connection description specified at the CONNECT parameter is used to set up the communication connection. The following connection types can be used:

- Programmed connections (structure of connection via "TCON"):
  - TCP / UDP: Connection description via the TCON\_IP\_v4 system data type
  - ISO-on-TCP: Connection description via the TCON\_IP\_RFC system data type
  - ISO: Connection description via the TCON\_ISOnative system data type (for CP1543-1 only)
- Configured connections
  - Specify an existing connection in the TCON\_Configured system data type.

An existing connection is terminated and the connection which has been set up is removed when the CPU goes into STOP mode. To set up and establish the connection again, you must execute "TSEND\_C" again.

### Sending data via an existing communication connection

The send job is executed when a rising edge is detected at the REQ parameter. As described above, the communication connection is established first.

You specify the send area with the DATA parameter. This includes the address and the length of the data to be sent. Do not use a data area with the data type BOOL or Array of BOOL at the DATA parameter. With the LEN parameter, you specify the maximum number of bytes sent with a send job. If you use a send area with optimized access at the DATA parameter, the LEN parameter must have the value "0".

The data to be sent must not be edited until the send job is completed.

### Terminating and resetting the communication connection

The communication connection is terminated when the CONT parameter is set to "0" even if an ongoing data transmission is not complete yet. This does not apply if you are using a configured connection for "TSEND\_C".

The connection can be reset at any time by setting the parameter COM\_RST to "1". This terminates the existing communication connection and a new connection is established. If data is being transferred at this time, this can lead to data loss.

### Parameters

The following table shows the parameters of the "TSEND\_C" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L, T, C or constant	Starts the send job on a rising edge.
CONT	Input	BOOL	I, Q, M, D, L	Controls the communication connection: <ul style="list-style-type: none"> <li>• 0: Disconnect the communication connection.</li> <li>• 1: Establish and maintain the communication connection.</li> </ul>
LEN	Input	UDINT	I, Q, M, D, L or constant	Optional parameter (hidden) Maximum number of bytes to be sent with the job. If you use a send area with optimized access at the DATA parameter, the value "0" must be used at the LEN parameter.

Parameter	Declaration	Data type	Memory area	Description
CONNECT	InOut	VARIANT	D	<p>Pointer to the structure of the connection description:</p> <ul style="list-style-type: none"> <li>• Programmed connection: <ul style="list-style-type: none"> <li>– For TCP, use the TCON_IP_v4 system data type For description, refer to:Auto-Hotspot</li> <li>– For ISO-on-TCP, use the TCON_IP_RFC system data type For description, refer to: Auto-Hotspot</li> <li>– For ISO, use the TCON_ISOnative system data type (only for CP1543-1) For description, refer to instruction "TCON (Page 3185)".</li> </ul> </li> <li>• Configured connection: <ul style="list-style-type: none"> <li>– For existing connections, use the TCON_Configured system data type For a description see "System data type for configured connections" below</li> </ul> </li> </ul>
DATA	InOut	VARIANT	I, Q, M, D, L	Pointer to the send area containing the address and the length of the data to be sent.
ADDR	InOut	VARIANT	D	Optional parameter (hidden) Pointer to the address of the recipient.
COM_RST	InOut	BOOL	I, Q, M, D, L	<p>Optional parameter (hidden)</p> <p>Resets the connection:</p> <ul style="list-style-type: none"> <li>• 0: Irrelevant</li> <li>• 1: The existing connection is reset.</li> </ul> <p>The COM_RST parameter is reset after evaluation by the "TSEND_C" instruction and should not, therefore, be interconnected statically.</p>
DONE	Output	BOOL	I, Q, M, D, L	<p>Status parameter with the following values:</p> <ul style="list-style-type: none"> <li>• 0: Send job not yet started or still in progress.</li> <li>• 1: Send job executed without error. This state is only displayed for one cycle.</li> </ul> <p>The output parameter DONE is set if an intermediate step was completed successfully during processing (connection establishment, sending, connection termination) and if the execution of "TSEND_C" was completed successfully.</p>
BUSY	Output	BOOL	I, Q, M, D, L	<p>Status parameter with the following values:</p> <ul style="list-style-type: none"> <li>• 0: Send job not yet started or already completed.</li> <li>• 1: Send job not yet completed. A new send job cannot be started.</li> </ul>

Parameter	Declaration	Data type	Memory area	Description
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred during connection establishment, data transmission or connection termination.</li> </ul> The output parameter ERROR can be set due to an error in the "TSEND_C" instruction or the communication instructions used internally.
STATUS	Output	WORD	I, Q, M, D, L	Status of instruction (see the "ERROR and STATUS" parameters" description).

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### REQ, CONT and COM\_RST parameters

The parameter CONT controls the connection establishment of the "TSEND\_C" instruction regardless of the REQ parameter. The behavior of the CONT parameter partially depends on whether a programmed or a configured connection is used:

- With CONT = "0": No data is sent (regardless of whether a programmed or a configured connection is used).
- When changing CONT = "0" to "1":
  - With a programmed connection, it is established with "TCON".
  - With a configured connection, it is checked with "T\_DIAG".
- With CONT = "1":
  - As long as no data is sent (REQ="0"), the connection is checked with "T\_DIAG".
  - If the internally used communication instructions signal that no connection end point exists, the connection is automatically reestablished with "TCON".
- When changing CONT = "1" to "0":
  - With a programmed connection, it is terminated with "TDISCON".
  - With a configured connection, it is reset with "T\_RESET".

The parameter COM\_RST resets the connection when changing from "0" to "1":

- If a connection is established, it is reset with "T\_RESET" (regardless of whether a programmed or configured connection is used).
- If no connection is established, the setting of the parameter has no effect.

The REQ and COM\_RST parameters only have an effect if CONT has been set to "1". The following table shows the relationship between the REQ, CONT and COM\_RST parameters:

REQ	CONT	COM_RST	Status of the instruction	Description
irrelevant	0	irrelevant	Not yet executed	No job active (STATUS = 7000).
irrelevant	0	irrelevant	Initialization	Connection is being terminated. The instruction is being reset.
irrelevant	0 > 1	irrelevant	Connection establishment	Connection is being established. Data is not being transferred yet.
0	1	0	Connection established	The connection is established and is monitored with the instruction "T_DIAG".
irrelevant	1	0 > 1	Connection established	The connection is interrupted by "T_RESET" briefly and reset.
0 > 1	1	0	Connection established	Instruction starts sending.
irrelevant	1	0 > 1	Data is being sent	Data transmission is interrupted. The connection is being reset.

### System data type for configured connections

For configured connections at the CONNECT parameter, use the following structure for connection description to TCON\_Configured:

Byte	Parameter	Data type	Start value	Description
0 ... 1	InterfaceID	HW_ANY	-	Hardware identifier of the local interface (value range: 0 to 65535).
2 ... 3	ID	CONN_OUC	-	Reference to the connection (value range: 1 to 4095). Enter the connection ID of the existing connection.
4	ConnectionType	BYTE	-	Connection type Select 254 (decimal) for a configured connection.

### BUSY, DONE and ERROR parameters

You can check the status of the job with the BUSY, DONE, ERROR and STATUS parameters. The BUSY parameter indicates the processing status. With the DONE parameter, you can check whether or not a send job executed successfully. The ERROR parameter is set when errors occurred during execution of "TSEND\_C". The error information is output at the STATUS parameter.

The following table shows the relationship between the BUSY, DONE and ERROR parameters:

DONE	BUSY	ERROR	Description
0	0	0	The instruction has not been executed yet (no rising edge at REQ parameter).
0	1	0	The instruction is being executed and calls the internally used communication instructions.

DONE	BUSY	ERROR	Description
1	0	0	The send job was completed successfully. "0000" is output at the STATUS parameter. DONE = "1" is only displayed for one cycle.
0	0	1	The execution of the instruction or an intermediate step during processing was terminated with an error. If there is a subsequent error due to an internally used communication instruction, the error that occurred first during processing is displayed. This state is only displayed for one cycle.

### ERROR and STATUS parameters

ERROR	STATUS* (W#16#...)	Description
0	0000	Send job was executed without error.
0	0001	Communication connection established.
0	0003	Communication connection closed.
0	7000	No active send job execution; no communication connection established.
0	7001	Initial call for establishing a connection.
0	7002	Second call for establishing a connection
0	7003	Communication connection is being terminated.
0	7004	Communication connection has been established and is being monitored. No send job execution active.
0	7005	Data transmission in progress.
1	80A1	<ul style="list-style-type: none"> <li>• Connection or port already being used by user.</li> <li>• Communication error:                             <ul style="list-style-type: none"> <li>– The specified connection has not yet been established.</li> <li>– The specified connection is being terminated. Transfer via this connection is not possible.</li> <li>– The interface is being re-initialized.</li> </ul> </li> </ul>
1	80A3	The nested "T_DIAG" instruction has reported that the connection has closed.
1	80A4	IP address of the remote endpoint of the connection is invalid or it matches the IP address of the local partner.
1	80A7	Communication error: You called the instruction with COM_RST = 1 before the send job was complete.
1	80AA	A connection is currently being established with the same connection ID by another block. Repeat the job with a new rising edge at the REQ parameter.
1	80B4	You have violated one or both of the following conditions for passive connection establishment (active_est = FALSE) when using the ISO-on-TCP protocol variant (connection_type = B#16#12): <ul style="list-style-type: none"> <li>• local_tsap_id_len &gt;= B#16#02</li> <li>• local_tsap_id[1] = B#16#E0</li> </ul>
1	80B5	Only passive connection establishment is permitted for connection type 13 = UDP.
1	80B6	Parameter assignment error in the connection_type parameter of the data block for connection description.
1	80B7	Error in one of the following parameters of the data block for connection description: block_length, local_tsap_id_len, rem_subnet_id_len, rem_staddr_len, rem_tsap_id_len, next_staddr_len.

ERROR	STATUS* (W#16#...)	Description
1	8085	The LEN parameter is larger than the highest permitted value.
1	8086	The ID parameter within the CONNECT parameter is outside the permitted range.
1	8087	Maximum number of connections reached; no additional connection possible.
1	8088	The value at the LEN parameter does not correspond to the receive area set at the DATA parameter.
1	8089	The CONNECT parameter does not point to a data block.
1	8091	Maximum nesting depth exceeded.
1	809A	The CONNECT parameter points to a field that does not correspond to the length of the connection description.
1	809B	InterfacelD is invalid. It is either zero or it does not point to a local CPU interface or a CP.
1	80C3	<ul style="list-style-type: none"> <li>• All connection resources are in use.</li> <li>• A block with this ID is already being processed in a different priority group.</li> </ul>
1	80C4	Temporary communication error: <ul style="list-style-type: none"> <li>• The connection cannot be established at this time.</li> <li>• The interface is receiving new parameters or the connection is being established.</li> <li>• The configured connection is currently being removed by a "TDISCON (Page 3190)" instruction.</li> <li>• The connection used is being terminated by a call with COM_RST = 1.</li> </ul>
1	80C6	Remote network error. Remote partner cannot be reached.
1	8722	Parameter CONNECT: The source area is invalid. The area does not exist in the DB.
1	873A	Parameter CONNECT: Access to the connection description is not possible (for example, because the DB is not available).
1	877F	Parameter CONNECT: Internal error.
1	8822	Parameter DATA: Invalid source area, the area does not exist in the DB.
1	8824	Parameter DATA: Area error in the VARIANT pointer.
1	8832	Parameter DATA: The DB number is too high.
1	883A	Parameter CONNECT: Access to specified connection data not possible (e.g. because the DB does not exist).
1	887F	Parameter DATA: Internal error, e.g. invalid VARIANT reference.
1	893A	Parameter DATA: Access to send area not possible (e.g. because the DB does not exist).

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

### Note

#### Error messages of the instructions "TCON", "TSEND", "T\_DIAG", "T\_RESET" and "TDISCON"

Internally, the "TSEND\_C" instruction uses the instructions "TCON (Page 3185)", "TSEND (Page 3195)", "T\_DIAG (Page 3215)", "T\_RESET (Page 3214)" and "TDISCON (Page 3190)". The error messages of these instructions can also be output at the STATUS parameter. The meaning of the error codes is described in the corresponding instructions. In the event of identical error codes for internally used instructions with different meanings, the instance data block of "TSEND\_C" can be used to determine which instruction output the error.

## TRCV\_C: Receive data via Ethernet

## TRCV\_C: Receive data via Ethernet

### Description

The "TRCV\_C" instruction is executed asynchronously and has the following functions:

1. **Setting up and establishing a communication connection:**

"TRCV\_C" sets up and establishes a TCP or ISO-on-TCP communication connection. Once the connection has been set up and established, it is automatically maintained and monitored by the CPU.

The connection description specified at the CONNECT parameter is used to set up the communication connection. To establish a connection, the CONT parameter must be set to the value "1". Once the connection is successfully established, the DONE parameter is set to "1".

An existing connection is terminated and the connection which has been set up is removed when the CPU goes into STOP mode. To set up and establish the connection again, you must execute "TRCV\_C" again.

For information on the number of possible communication connections, refer to the technical specifications for your CPU.

2. **Receiving data via an existing communication connection:**

If the EN\_R parameter is set to the value "1", receipt of data is enabled. When receiving data (rising edge at the EN\_R parameter), the CONT parameter must have the value TRUE in order to establish or maintain a connection.

The received data is entered in a receive area. You specify the length of the receive area either with the LEN parameter (if LEN <> 0) or with the length information of the DATA parameter (if LEN = 0) in accordance with the protocol variant used. If you use purely symbolic values at the DATA parameter, the LEN parameter must have the value "0".

After data has been received successfully, the signal state at the DONE parameter is "1". If errors occur in the data transfer, the DONE parameter is set to "0".

3. **Terminating the communication connection:**

The communication connection is terminated immediately when the CONT parameter is set to "0".

TRCV\_C is executed again when the COM\_RST parameter is set. This terminates the existing communication connection and a new connection is established. If data is being received when it executes again, this can lead to a loss of data.

## Receive modes of TRCV\_C

The following table shows how the received data is entered in the receive area.

Protocol variant	Availability of data in the receive area	connection_type parameter of the connection description	LEN parameter
TCP (Ad-hoc mode)	The data is immediately available.	Hexadecimal value: B#16#11 Integer value: 17	0
TCP (Receipt of data with specified length)	The data is available as soon as the data length specified at the LEN parameter has been fully received.	Hexadecimal value: B#16#11 Integer value: 17	1 to 8192
ISO on TCP (Message-oriented data transfer)	The data is available as soon as the data length specified at the LEN parameter has been fully received.	Hexadecimal value: B#16#12 Integer value: 18	<ul style="list-style-type: none"> <li>• 1 to 1452, if a CP is used.</li> <li>• 1 to 8192, if no CP is used.</li> </ul>

### TCP (Ad-hoc mode)

The ad-hoc mode is only available with the TCP protocol variant. You use the ad-hoc mode to receive data with dynamic length with the "TRCV" instruction.

You set ad-hoc mode by assigning the value "0" to the LEN parameter. All data types can be used for data blocks with standard access when you use ad-hoc mode. Only ARRAY of BYTE or data types with a length of 8 bits can be used for data blocks with optimized access (e.g., CHAR, USINT, SINT, etc.). The data length actually received is output at the RCVD\_LEN parameter.

### TCP (Receipt of data with specified length)

You use the value of the LEN parameter to specify the length for the data receipt. The data receipt is not complete until the length of data specified at the LEN parameter has been completely received. Only then is the data available in the receive area (DATA parameter). The actually received data length in bytes at the RCVD\_LEN parameter corresponds to the data length at the LEN parameter after receipt.

### ISO on TCP (Message-oriented data transfer)

Complete message blocks are sent via a connection with the protocol variant ISO on TCP; these are recognized as such by the recipient. When using ISO on TCP, "TRCV\_C" signals data receipt as soon as the message block has been completely received. The receive area is defined by the LEN and DATA parameters. If the receive buffer (DATA parameter) is too small for the sent data, "TRCV\_C" signals an error. The actually received data length in bytes at the RCVD\_LEN parameter corresponds to the data length at the LEN parameter after receipt.

**Parameters**

The following table shows the parameters of the "TRCV\_C" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN_R	Input	BOOL	I, Q, M, D, L	Receive enable
CONT	Input	BOOL	I, Q, M, D, L	Controls the communication connection: <ul style="list-style-type: none"> <li>• 0: Disconnect the communication connection</li> <li>• 1: Establish and maintain the communication connection</li> </ul> When receiving data (rising edge at the EN_R parameter), the CONT parameter must have the value TRUE in order to establish or maintain a connection.
LEN	Input	UINT	I, Q, M, D, L or constant	Maximum length of the data to be received. If you use purely symbolic values at the DATA parameter, the LEN parameter must have the value "0".
CONNECT	InOut	TCON_Param	D	Pointer to the connection description See also: Auto-Hotspot
DATA	InOut	VARIANT	I, Q, M, D, L	Pointer to the receive area
COM_RST	InOut	BOOL	I, Q, M, D, L	Restarts the instruction: <ul style="list-style-type: none"> <li>• 0: Irrelevant</li> <li>• 1: Complete restart of the instruction causing an existing connection to be terminated</li> </ul>
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or still in progress</li> <li>• 1: Job completed without error</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or already completed</li> <li>• 1: Job not yet completed. A new job cannot be started</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter ERROR: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction
RCVD_LEN	Output	UDINT	I, Q, M, D, L	Amount of data actually received in bytes

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

**BUSY, DONE and ERROR parameters**

You can check the status of the job with the BUSY, DONE, ERROR and STATUS parameters. The BUSY parameter indicates the processing status. With the DONE parameter, you can check whether or not a job executed successfully. The ERROR parameter is set when errors occurred during execution of "TRCV\_C". The error information is output at the STATUS parameter.

The following table shows the relationship between the BUSY, DONE and ERROR parameters:

BUSY	DONE	ERROR	Description
1	-	-	The job is being processed.
0	1	0	The job was completed successfully.
0	0	1	The job ended with an error. The cause of the error is output at the STATUS parameter.
0	0	0	No new job was assigned.

## ERROR and STATUS parameters

ERROR	STATUS* (W#16#...)	Description
0	0000	Job completed without error.
0	0001	The connection establishment is complete.
0	0003	The connection termination is complete.
0	7000	No job processing active.
0	7001	<ul style="list-style-type: none"> <li>• Start execution of the job</li> <li>• Establish connection</li> <li>• Wait for connection partner</li> </ul>
0	7002	Data is being received.
0	7003	Connection is being terminated.
0	7004	<ul style="list-style-type: none"> <li>• Connection established and monitored</li> <li>• No job processing active</li> </ul>
0	7006	Data is currently being received.
1	8085	<ul style="list-style-type: none"> <li>• The LEN parameter is larger than the highest permitted value.</li> <li>• The value at the LEN or DATA parameter was changed after the first call.</li> </ul>
1	8086	The ID parameter is outside the permitted range.
1	8087	Maximum number of connections reached; no additional connection possible
1	8088	The value at the LEN parameter does not correspond to the receive area set at the DATA parameter.
1	8089	The CONNECT parameter does not point to a data block.
1	8091	Maximum nesting depth exceeded.
1	809A	The CONNECT parameter points to a field that does not correspond to the length of the connection description.
1	809B	The ID of the local device (local_device_id) in the connection description does not correspond to the CPU.
1	80A0	Group error for error codes W#16#80A1 and W#16#80A2.
1	80A1	<ul style="list-style-type: none"> <li>• Connection or port already being used by user.</li> <li>• Communication error: <ul style="list-style-type: none"> <li>– The specified connection has not yet been established.</li> <li>– The specified connection is being terminated. Transfer via this connection is not possible.</li> <li>– The interface is being re-initialized.</li> </ul> </li> </ul>
1	80A2	Local or remote port is being used by the system.

9.7 References

ERROR	STATUS* (W#16#...)	Description
1	80A3	<ul style="list-style-type: none"> <li>Attempt being made to re-establish an existing connection.</li> <li>Attempt being made to terminate a non-existent connection.</li> </ul>
1	80A4	IP address of the remote endpoint of the connection is invalid, in other words, it matches the IP address of the local partner.
1	80A7	Communication error: You called the instruction with COM_RST = 1 before the send job was complete.
1	80B2	The CONNECT parameter points to a data block that was generated with the attribute "Only store in load memory".
1	80B3	Inconsistent parameter assignment: Group error for error codes W#16#80A0 to W#16#80A2, W#16#80A4, W#16#80B4 to W#16#80B9.
1	80B4	You have violated one or both of the following conditions for passive connection establishment (active_est = FALSE) when using the ISO-on-TCP protocol variant (connection_type = B#16#12): "local_tsap_id_len >= B#16#02", and/or "local_tsap_id[1] = B#16#E0".
1	80B5	Only passive connection establishment is permitted for connection type 13 = UDP.
1	80B6	Parameter assignment error in the connection_type parameter of the data block for connection description.
1	80B7	Error in one of the following parameters of the data block for connection description: block_length, local_tsap_id_len, rem_subnet_id_len, rem_staddr_len, rem_tsap_id_len, next_staddr_len.
1	80C3	<ul style="list-style-type: none"> <li>All connection resources are in use.</li> <li>A block with this ID is already being processed in a different priority group.</li> </ul>
1	80C4	Temporary communication error: <ul style="list-style-type: none"> <li>The connection cannot be established at this time.</li> <li>The interface is receiving new parameters or the connection is being established.</li> <li>The configured connection is currently being removed by a "TDISCON" instruction.</li> <li>The connection used is being terminated by a call with COM_RST= 1.</li> </ul>
1	80C6	The remote partner cannot be reached (network error).
1	8722	Error in the CONNECT parameter: Invalid source area (area not declared in data block).
1	873A	Error in the CONNECT parameter: Access to connection description is not possible (no access to data block).
1	877F	Error in the CONNECT parameter: Internal error
1	8922	Parameter DATA: Invalid target area; the area does not exist in the DB.
1	8924	Parameter DATA: Area error in the VARIANT pointer.
1	8932	Parameter DATA: The DB number is too high.
1	893A	Parameter CONNECT: Access to specified connection data not possible (e.g. because the DB does not exist).
1	897F	Parameter DATA: Internal error, e.g. invalid VARIANT reference.
1	8A3A	Parameter DATA: No access to the data area, for example because the data block does not exist.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

---

**Note****Error messages of the instructions "TCON", "TRCV" and "TDISCON"**

Internally, the TRV\_C instruction uses the "TCON (Page 3182)", "TRCV (Page 3198)" and "TDISCON (Page 3190)" instructions. The error messages of these instructions are contained in the respective descriptions.

---

## TRCV\_C: Receive data via Ethernet

### Description

The "TRCV\_C" instruction is executed asynchronously and implements the following functions in sequence:

- Setting up and establishing a communication connection
- Receiving data via an existing communication connection
- Terminating or resetting the communication connection

Internally, the instruction "TRCV\_C" uses the communication instructions TCON", "TRCV", "T\_DIAG", "T\_RESET" and "TDISCON".

### Setting up and establishing a communication connection

The communication connection is set up and established with CONT=1. For information on the number of possible communication connections, refer to the technical specifications for your CPU. The connection description specified at the CONNECT parameter is used to set up the communication connection. The following connection types can be used:

- Programmed connections (structure of connection via "TCON"):
  - TCP / UDP: Connection description via the TCON\_IP\_v4 system data type
  - ISO-on-TCP: Connection description via the TCON\_IP\_RFC system data type
  - ISO: Connection description via the TCON\_ISOnative system data type (for CP1543-1 only)
- Configured connections
  - Specify an existing connection in the TCON\_Configured system data type.

An existing connection is terminated and the connection which has been set up is removed when the CPU goes into STOP mode. To set up and establish the connection again, you must execute "TRCV\_C" again.

### Receiving data via an existing communication connection

Receipt of data is enabled when the EN\_R parameter is set to the value "1". The received data is entered in a receive area. You specify the length of the receive area either with the LEN parameter (if LEN <> 0) or with the length information of the DATA parameter (if LEN = 0),

depending on the protocol variant being used. If you use purely symbolic values at the DATA parameter, the LEN parameter must have the value "0".

Receive modes of TRCV\_C:

- **TCP (Ad-hoc mode)**  
 The ad-hoc mode is only available with the TCP protocol variant. You use the ad-hoc mode to receive data with dynamic length with the "TRCV\_C" instruction.  
 You set ad-hoc mode by assigning the value "1" to the ADHOC parameter. All data types can be used for data blocks with standard access when you use ad-hoc mode. Only ARRAY of BYTE or data types with a length of 8 bits can be used for data blocks with optimized access (e.g., CHAR, USINT, SINT, etc.). The data length actually received is output at the RCVD\_LEN parameter.
- **TCP (Receipt of data with specified length)**  
 Assign the value "0" to the ADHOC parameter for receipt of data with specified length. If ad-hoc mode is disabled, the data receipt is not complete until the length of data specified at the LEN parameter has been completely received. Only then is the data available in the receive area (DATA parameter). The actually received data length in bytes at the RCVD\_LEN parameter corresponds to the data length at the LEN parameter after receipt.
- **ISO on TCP (Message-oriented data transfer)**  
 Complete message blocks are sent via a connection with the protocol variant ISO on TCP; these are recognized as such by the recipient. The receive area is defined by the LEN and DATA parameters. If the receive buffer (DATA parameter) is too small for the sent data, "TRCV\_C" signals an error. The actually received data length in bytes at the RCVD\_LEN parameter corresponds to the data length at the LEN parameter after receipt.

The following table shows how the received data is entered in the receive area.

Protocol variant	Availability of data in the receive area	connection_type parameter of the connection description	LEN parameter
TCP (Ad-hoc mode)	The data is immediately available.	Hexadecimal value: B#16#11 Integer value: 17	1 up to maximum length (depending on the CPU)
TCP (Receipt of data with specified length)	The data is available as soon as the data length specified at the LEN parameter has been fully received.	Hexadecimal value: B#16#11 Integer value: 17	1 to 8192
ISO on TCP (Message-oriented data transfer)	The data is available as soon as the data length specified at the LEN parameter has been fully received.	Hexadecimal value: B#16#12 Integer value: 18	1 to 8192

### Terminating the communication connection

The communication connection is terminated when the CONT parameter is set to "0" even if an ongoing data transmission is not complete yet. This does not apply if you are using a configured connection, however.

The connection can be reset at any time by setting the parameter COM\_RST to "1". This terminates the existing communication connection and a new connection is established. If data is being transferred at this time, this can lead to data loss.

## Parameters

The following table shows the parameters of the "TRCV\_C" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN_R	Input	BOOL	I, Q, M, D, L, T, C or constant	Receive enable
CONT	Input	BOOL	I, Q, M, D, L	Controls the communication connection: <ul style="list-style-type: none"> <li>• 0: Disconnect the communication connection.</li> <li>• 1: Establish communication connection and maintain after receipt of data.</li> </ul>
LEN	Input	UDINT	I, Q, M, D, L or constant	Maximum length of the data to be received. If you use a receive area with optimized access at the DATA parameter, the value "0" must be used at the LEN parameter.
ADHOC	Input	BOOL	I, Q, M, D, L or constant	Optional parameter (hidden) Use ad-hoc mode for the TCP protocol variant.
CONNECT	InOut	VARIANT	D	Pointer to the connection description <ul style="list-style-type: none"> <li>• Programmed connection: <ul style="list-style-type: none"> <li>– For TCP or UDP, use the structure TCON_IP_v4 For description, refer to:Auto-Hotspot</li> <li>– For ISO-on-TCP, use the structure TCON_IP_RFC For description, refer to: Auto-Hotspot</li> <li>– For ISO, use the structure TCON_ISOnative (only for CP1543-1) For description, refer to instruction "TCON (Page 3185)": "Structure of the connection description according to TCON_ISOnative"</li> </ul> </li> <li>• Configured connection: <ul style="list-style-type: none"> <li>– For existing connections, use the TCON_Configured system data type. For a description, see "System data type for configured connections" below.</li> </ul> </li> </ul>
DATA	InOut	VARIANT	I, Q, M, D, L	Pointer to the receive area.
ADDR	InOut	VARIANT	D	Optional parameter (hidden) Pointer to the address of the sender with connection type UDP.
COM_RST	InOut	BOOL	I, Q, M, D, L	Optional parameter (hidden) Resets the connection: <ul style="list-style-type: none"> <li>• 0: Irrelevant</li> <li>• 1: The existing connection is reset.</li> </ul> The COM_RST parameter is reset after evaluation by the "TRCV_C" instruction and should not, therefore, be interconnected statically.

Parameter	Declaration	Data type	Memory area	Description
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Receipt not yet started or still in progress.</li> <li>• 1: Receipt executed without error. This state is only displayed for one cycle.</li> </ul> The output parameter DONE is set if an intermediate step was completed successfully during processing (connection establishment, receipt, connection termination) and if the execution of "TRCV_C" was completed successfully.
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Receipt not yet started or already completed.</li> <li>• 1: Receipt not yet completed. A new send job cannot be started.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred during connection establishment, data receipt or connection termination.</li> </ul> The output parameter ERROR can be set due to an error in the "TRCV_C" instruction or the communication instructions used internally.
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction
RCVD_LEN	Output	UDINT	I, Q, M, D, L	Amount of data actually received in bytes

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### EN\_R, CONT and COM\_RST parameters

The parameter CONT controls the connection establishment of the "TRCV\_C" instruction regardless of the EN\_R parameter. The behavior of the CONT parameter partially depends on whether a programmed or a configured connection is used:

- With CONT = "0": No data is received (regardless of whether a programmed or a configured connection is used).
- When changing CONT = "0" to "1":
  - With a programmed connection, it is established with "TCON".
  - With a configured connection, it is checked with "T\_DIAG".
- With CONT = "1":
  - As long as no data is received (EN\_R="0"), the connection is checked with "T\_DIAG".
  - If the internally used communication instructions signal that no connection end point exists, the connection is automatically reestablished with "TCON".
- When changing CONT = "1" to "0":
  - With a programmed connection, it is terminated with "TDISCON".
  - With a configured connection, it is reset with "T\_RESET".

The parameter COM\_RST resets the connection when changing from "0" to "1":

- If a connection is established, it is reset with "T\_RESET" (regardless of whether a programmed or configured connection is used).
- If no connection is established, the setting of the parameter has no effect.

The EN\_R and COM\_RST parameters only have an effect if CONT has been set to "1". The following table shows the relationship between the EN\_R, CONT and COM\_RST parameters:

EN_R	CONT	COM_RST	Status of the instruction	Description
irrelevant	0	irrelevant	Not yet executed	No job active (STATUS = 7000).
irrelevant	0	irrelevant	Initialization	Connection is being terminated. The instruction is being reset.
irrelevant	0 > 1	irrelevant	Connection establishment	Connection is being established. Data is not being transferred yet.
0	1	0	Connection established	The connection is established and is monitored with the instruction "T_DIAG".
irrelevant	1	0 > 1	Connection established	The connection is interrupted by "T_RESET" briefly and reset.
0 > 1	1	0	Connection established	Instruction starts receiving.
irrelevant	1	0 > 1	Data is being received	Data transmission is interrupted. The connection is being reset.

### System data type for configured connections

For configured connections at the CONNECT parameter, use the following structure for connection description to TCON\_Configured:

Byte	Parameter	Data type	Start value	Description
0 ... 1	InterfaceID	HW_ANY	-	Hardware identifier of the local interface (value range: 0 to 65535).
2 ... 3	ID	CONN_OUC	-	Reference to the connection (value range: 1 to 4095). Enter the connection ID of the existing connection.
4	ConnectionType	BYTE	-	Connection type Select 254 (decimal) for a configured connection.

### BUSY, DONE and ERROR parameters

You can check the status of the job with the BUSY, DONE, ERROR and STATUS parameters. The BUSY parameter indicates the processing status. With the DONE parameter, you can check whether or not a job executed successfully. The ERROR parameter is set when errors occurred during execution of "TRCV\_C". The error information is output at the STATUS parameter.

The following table shows the relationship between the BUSY, DONE and ERROR parameters:

DONE	BUSY	ERROR	Description
0	0	0	The instruction has not been executed yet (no rising edge at EN_R parameter).
0	1	0	The instruction is being executed and calls the internally used communication instructions.
1	0	0	The receipt has been completed successfully. "0000" is output at the STATUS parameter. DONE = "1" is only displayed for one cycle.
0	0	1	The execution of the instruction or an intermediate step during processing was terminated with an error. If there is a subsequent error due to an internally used communication instruction, the error that occurred first during processing is displayed. This state is only displayed for one cycle.

**ERROR and STATUS parameters**

ERROR	STATUS (W#16#...)	Description
0	0000	Receive job executed without error.
0	0001	Communication connection established.
0	0003	Communication connection closed.
0	7000	No job processing active.
0	7001	Initial call for establishing a connection.
0	7002	Second call for establishing a connection.
0	7003	Communication connection is being terminated.
0	7004	Communication connection has been established and is being monitored. No receive job processing active.
0	7006	Data is currently being received.
1	8085	<ul style="list-style-type: none"> <li>• The LEN parameter is larger than the highest permitted value.</li> <li>• The value at the LEN or DATA parameter was changed after the first call.</li> </ul>
1	8086	The ID parameter is outside the permitted range.
1	8087	Maximum number of connections reached; no additional connection possible
1	8088	The value at the LEN parameter does not correspond to the receive area set at the DATA parameter.
1	8089	The CONNECT parameter does not point to a data block.
1	8091	Maximum nesting depth exceeded.
1	809A	The CONNECT parameter points to a field that does not correspond to the length of the connection description.
1	809B	InterfacelD is invalid. It is either zero or it does not point to a local CPU interface or a CP.
1	80A1	<ul style="list-style-type: none"> <li>• Connection or port already being used by user.</li> <li>• Communication error:                             <ul style="list-style-type: none"> <li>– The specified connection has not yet been established.</li> <li>– The specified connection is being terminated. Transfer via this connection is not possible.</li> <li>– The interface is being re-initialized.</li> </ul> </li> </ul>
1	80A3	The nested "T_DIAG" instruction has reported that the connection has closed.
1	80A4	IP address of the remote endpoint of the connection is invalid or it matches the IP address of the local partner.
1	80A7	Communication error: You called the instruction with COM_RST = 1 before the send job was complete.

ERROR	STATUS (W#16#...)	Description
1	80B4	You have violated one or both of the following conditions for passive connection establishment (active_est = FALSE) when using the ISO-on-TCP protocol variant (connection_type = B#16#12): "local_tsap_id_len >= B#16#02", and/or "local_tsap_id[1] = B#16#E0".
1	80B5	Only passive connection establishment is permitted for connection type 13 = UDP.
1	80B6	Parameter assignment error in the connection_type parameter of the data block for connection description.
1	80B7	Error in one of the following parameters of the data block for connection description: block_length, local_tsap_id_len, rem_subnet_id_len, rem_staddr_len, rem_tsap_id_len, next_staddr_len.
1	80C3	<ul style="list-style-type: none"> <li>All connection resources are in use.</li> <li>A block with this ID is already being processed in a different priority group.</li> </ul>
1	80C4	Temporary communication error: <ul style="list-style-type: none"> <li>The connection cannot be established at this time.</li> <li>The interface is receiving new parameters or the connection is being established.</li> <li>The configured connection is currently being removed by a "TDISCON" instruction.</li> <li>The connection used is being terminated by a call with COM_RST = 1.</li> </ul>
1	80C6	The remote partner cannot be reached (network error).
1	8722	Error in the CONNECT parameter: Invalid source area (area not declared in data block).
1	873A	Error in the CONNECT parameter: Access to connection description is not possible (no access to data block).
1	877F	Error in the CONNECT parameter: Internal error
1	8922	Parameter DATA: Invalid target area; the area does not exist in the DB.
1	8924	Parameter DATA: Area error in the VARIANT pointer.
1	8932	Parameter DATA: The DB number is too high.
1	893A	Parameter CONNECT: Access to specified connection data not possible (e.g. because the DB does not exist).
1	897F	Parameter DATA: Internal error, e.g. invalid VARIANT reference.
1	8A3A	Parameter DATA: No access to the data area, for example because the data block does not exist.

**Note****Error messages of the instructions "TCON", "TRCV" and "TDISCON"**

Internally, the TRV\_C instruction uses the "TCON (Page 3185)", "TRCV (Page 3198)" and "TDISCON (Page 3190)" instructions. The error messages of these instructions are contained in the respective descriptions.

TSEND\_C: Send data via Ethernet (Page 3153)

## TMAIL\_C: Transfer email

### Description of TMAIL\_C

#### Description

You use the instruction "TMAIL\_C" to send an e-mail via the Ethernet interface of the S7-1500 CPU or S7-1200 V4.0, a communication module (CM), or of a communication processor (CP).

The instruction can only be used once the hardware has been configured and if the network infrastructure allows for a communication connection to the mail server.

You define the content of the e-mail, and the connection data, using the following parameters:

- You define the recipient addresses with the parameters TO\_S and CC.
- You define the content of the e-mail with the parameters SUBJECT and TEXT.
- You can define an attachment using VARIANT pointers at the ATTACHMENT and ATTACHMENT\_NAME parameters.
- The connection data is defined, and addressing and authentication for the mail server executed, using the system data type Tmail\_v4, Tmail\_v6 or Tmail\_FQDN at the MAIL\_ADDR\_PARAM parameter.
  - If you are using the interface of the S7-1500 CPU, the system data type Tmail\_v4 must be used. In this case, the e-mail can only be sent via SMTP.
  - Any of the system data types can be used if you are using the interface of a CM/CP. The e-mail can then also be sent via SMTPS.
- You start the sending of an e-mail with an edge change from "0" to "1" for the REQ parameter.
- The job status is indicated by the output parameters "BUSY", "DONE", "ERROR" and "STATUS".

You cannot send an SMS directly with the "TMAIL\_C" instruction. Whether or not the e-mail can be forwarded by the mail server as an SMS depends on your telecommunications provider.

#### Operation of the instruction

The "TMAIL\_C" instruction works asynchronously, which means its execution extends over multiple calls. You must specify an instance when you call the instruction "TMAIL\_C".

In the following cases, the connection to the mail server will be lost:

- If the CPU switches to STOP while "TMAIL\_C" is active.
- If communication problems occur at the Industrial Ethernet bus.

In this case, the transfer of the e-mail will be interrupted and it will not reach its recipient. The connection is also canceled once the instruction has been successfully executed and the e-mail sent.

**NOTICE****Changing user programs**

You can change the parts of your user program that directly affect calls of "TMAIL\_C" only:

- The CPU is in "STOP" mode.
- No e-mail is being sent (REQ = 0 and BUSY = 0).

This relates, in particular, to deleting and replacing program blocks that contain "TMAIL\_C" calls or calls for the instance of "TMAIL\_C".

Ignoring this restriction can tie up connection resources. The automation system can change to an undefined status with the TCP/IP communication functions via Industrial Ethernet.

A warm or cold restart of the CPU is required after the changes are transferred.

**Data consistency**

The TO\_S, CC, SUBJECT, TEXT, ATTACHMENT and MAIL\_ADDR\_PARAM parameters are applied by the "TMAIL\_C" instruction while it is running, which means that they may only be changed after the job has been completed (BUSY = 0).

**SMTP authentication**

Authentication refers here to a procedure for verifying identity, for example, with a password query.

If you are using the S7-1500 CPU interface, the instruction "TMAIL\_C" supports the SMTP authentication procedure AUTH-LOGIN which is required by most mail servers. For information about the authentication procedure of your mail server, please refer to your mail server manual or the website of your Internet service provider.

- Before you can use the AUTH-LOGIN authentication procedure, the "TMAIL\_C" instruction requires the user name with which it is to log on to the mail server. This user name corresponds to the user name with which you set up a mail account on your mail server. It is transferred via the UserName parameter to the structure at parameter MAIL\_ADDR\_PARAM.

If no user name is specified at the MAIL\_ADDR\_PARAM parameter, the AUTH-LOGIN authentication procedure is not used. The e-mail is then sent without authentication.

- To log on, the "TMAIL\_C" instruction also requires the associated password. This password corresponds to the password you specified when you set up your mail account. It is transferred via the PassWord parameter to the structure at parameter MAIL\_ADDR\_PARAM.

Parameters

The following table shows the parameters of the "TMAIL\_C" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L, T, C or constant	Control parameter REQUEST: Activates the sending of an e-mail upon a rising edge.
TO_S (Page 3175)	Input	STRING	D, L or constant	Recipient addresses STRING with a maximum length of 240 characters (bytes). For the e-mail address format, see the example in the parameter description.
CC (Page 3175)	Input	STRING	D, L or constant	CC recipient addresses (optional) STRING with a maximum length of 240 characters (bytes). Same e-mail address format as for the TO_S parameter. If an empty string is assigned here, the e-mail is not sent to a CC recipient.
SUBJECT	Input	STRING	D, L or constant	Subject of the e-mail STRING with a maximum length of 240 characters (bytes).
TEXT	Input	STRING	D, L or constant	Text of the e-mail (optional) STRING with a maximum length of 240 characters (bytes). If an empty string is assigned at this parameter, the e-mail is sent without text.
ATTACHMENT	Input	VARIANT	D	E-mail attachment (optional) Reference to a byte/word/double word field (ArrayOfByte, ArrayOfWord or ArrayOfDWord) with a maximum length of 64 bytes. If no value is assigned, the e-mail is sent without an attachment.
ATTACHMENT_NAME	Input	STRING	D, L or constant	E-mail attachment name (optional) Reference to a character string with a maximum length of 50 characters (bytes) to define the file name of the attachment. If an empty string is assigned at this parameter, the e-mail attachment will be sent with the file name "attachment.bin".
MAIL_ADDR_PARAM (Page 3176)	Input	VARIANT	D	Connection parameter and address of the e-mail server To define the connection parameters, use the structure Tmail_v4, Tmail_v6 or Tmail_FQDN (see parameter description).
DONE (Page 3178)	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• DONE = 0: Job not yet started or still executing.</li> <li>• DONE = 1: Job was executed without errors.</li> </ul>

Parameter	Declaration	Data type	Memory area	Description
BUSY (Page 3178)	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• BUSY=0: The processing of "TMAIL_C" was stopped.</li> <li>• BUSY = 1: E-mail transmission is not yet complete.</li> </ul>
ERROR (Page 3178)	Output	BOOL	I, Q, M, D, L	Status parameter <ul style="list-style-type: none"> <li>• ERROR = 0: No error has occurred.</li> <li>• ERROR = 1: An error occurred during processing. STATUS supplies detailed information on the type of error.</li> </ul>
STATUS (Page 3179)	Output	WORD	I, Q, M, D, L	Status parameter Return value or error information of the "TMAIL_C" instruction (see parameter description).

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

#### Note

##### Optional parameters

The optional parameters CC, TEXT, and ATTACHMENT are only sent with the e-mail if the corresponding parameters contain a string of length > 0.

## TO\_S and CC parameters

### Description

The TO\_S and CC parameters are strings, for example, with the following content:

- <wenna@mydomain.com>, <ruby@mydomain.com>
- <admin@mydomain.com>, <judy@mydomain.com>

Note the following rules when entering the parameters:

- A space and an opening pointed bracket "<" must be entered before each address.
- A closing pointed bracket ">" must be entered after each address.
- A comma must be entered between the addresses in TO and CC.

For runtime and memory space reasons, the "TMAIL\_C" instruction does not perform a syntax check of parameter TO\_S or CC.

## MAIL\_ADDR\_PARAM parameter

### Description

At the MAIL\_ADDR\_PARAM parameter, you define the connection for sending the e-mail in the structure Tmail\_v4, Tmail\_v6 or Tmail\_FQDN, and save the e-mail server address and login details.

The structure you use at the MAIL\_ADDR\_PARAM parameter depends on the format in which the e-mail server is to be addressed:

- Tmail\_v4: Addressing by IP address (IPv4).
- Tmail\_v6: Addressing by IP address (IPv6).
- Tmail\_FQDN: Addressing by fully qualified domain name (FQDN).

Which structure you can use depends on the interface addressed at the Interfaceld parameter:

- If you want to use the "TMAIL\_C" instruction with the internal interface, the structure Tmail\_v4 must be used at the MAIL\_ADDR\_PARAM parameter.
- If you are using a communication processor (CP) or communication module (CM), you can use all three addressing options (IPv4, IPv6 and FQDN).

Table 9-97 Tmail\_v4: Addressing the mail server by IP address (IPv4)

Parameter	Data type	Description
Tmail_v4	Struct	
Interfaceld	LADDR	Hardware identifier of the interface
ID	CONN_OUC	Connection ID
ConnectionType	BYTE	Connection type. Select 16#20 as the connection type for IPv4.
ActiveEstablished	BOOL	Status bit. Set to "1" once the connection is established.
CertIndex	BYTE	<ul style="list-style-type: none"> <li>• =0: SMTP used (Simple Mail Transfer Protocol). SMTP must be used if the e-mail is being sent via the interface of an S7-1500 CPU.</li> <li>• ≠0: SMTPS used to secure the connection before it is established (with CPs/CMs). You use the CertIndex parameter to specify the certificate to be used (see "Project navigation" &gt; "Global security settings" &gt; "Certificate manager").</li> </ul>
WatchDogTime	TIME	<p>Execution watchdog. Use this parameter to define the maximum execution time for the send operation.</p> <p>Note: Connection establishment can take longer (approx. one minute) if the connection is slow. When you specify the WATCH_DOG_TIME parameter, remember to allow for the time required to establish the connection.</p> <p>The connection is terminated once the specified time has elapsed.</p>
MailServerAddress	IP_v4	<p>IP address of the mail server. IPv4 in the following format: XXX.XXX.XXX.XXX (decimal).</p> <p>Example: 192.142.131.237.</p>
UserName	STRING[254]	Mail server login name

Parameter	Data type	Description
PassWord	STRING[254]	Mail server password
From	EMAIL_ADDR	E-mail sender address, which is defined using the following two STRING parameters. For example: "myname@mymailserver.com".
LocalPartPlusAtSign	STRING[64]	Local part of sender address, including @ sign. Example: "myname@".
FullQualifiedDomainName	STRING[254]	Fully Qualified Domain Name ( FQDN for short) of the mail server. Example: "mymailserver.com".

Table 9-98 Tmail\_v6: Addressing the mail server by IP address (IPv6)

Parameter	Data type	Description
Tmail_v6	Struct	
InterfaceId	LADDR	Hardware identifier of the interface
ID	CONN_OUC	Connection ID
ConnectionType	BYTE	Connection type. Select 16#21 as the connection type for IPv6.
ActiveEstablished	BOOL	Status bit. Set to "1" once the connection is established.
CertIndex	BYTE	<ul style="list-style-type: none"> <li>=0: SMTP used (<b>S</b>imple <b>M</b>ail <b>T</b>ransfer <b>P</b>rotocol). SMTP must be used if the e-mail is being sent via the interface of an S7-1500 CPU.</li> <li>≠0: SMTPS used to secure the connection before it is established (with CPs/CMs). You use the CertIndex parameter to specify the certificate to be used (see "Project navigation" &gt; "Global security settings" &gt; "Certificate manager").</li> </ul>
WatchDogTime	TIME	<p>Execution watchdog. Use this parameter to define the maximum execution time for the send operation.</p> <p>Note: Connection establishment can take longer (approx. one minute) if the connection is slow. When you specify the WATCH_DOG_TIME parameter, remember to allow for the time required to establish the connection.</p> <p>The connection is terminated once the specified time has elapsed.</p>
MailServerAddress	IP_v6	<p>IP address of the mail server (IPv6) in the following format: XXXX.XXXX.XXXX.XXXX.XXXX.XXXX.XXXX.XXXX (hexadecimal).</p> <p>The address is divided into 8 blocks of 2 bytes each (16 bytes in total).</p> <p>Example: 2001:db8:1f11:08d3:290:27ff:0370:2093</p>
UserName	STRING[254]	Mail server login name
PassWord	STRING[254]	Mail server password
From	EMAIL_ADDR	E-mail sender address, which is defined using the following two STRING parameters. For example: "myname@mymailserver.com".
LocalPartPlusAtSign	STRING[64]	Local part of sender address, including @ sign. Example: "myname@".
FullQualifiedDomainName	STRING[254]	Fully Qualified Domain Name ( FQDN for short) of the mail server. Example: "mymailserver.com".

Table 9-99 Tmail\_FQDN: Addressing the mail server by FQDN

Parameter	Data type	Description
Tmail_v6	Struct	
Tmail_FQDN	LADDR	Hardware identifier of the interface
ID	CONN_OUC	Connection ID
ConnectionType	BYTE	Connection type. Select 16#22 as the connection type for FQDN.
ActiveEstablished	BOOL	Status bit. Set to "1" once the connection is established.
CertIndex	BYTE	<ul style="list-style-type: none"> <li>• =0: SMTP used (Simple Mail Transfer Protocol). SMTP must be used if the e-mail is being sent via the interface of an S7-1500 CPU.</li> <li>• ≠0: SMTPS used to secure the connection before it is established (with CPs/CMs). You use the CertIndex parameter to specify the certificate to be used (see "Project navigation" &gt; "Global security settings" &gt; "Certificate manager").</li> </ul>
WatchDogTime	TIME	<p>Execution watchdog. Use this parameter to define the maximum execution time for the send operation.</p> <p>Note: Connection establishment can take longer (approx. one minute) if the connection is slow. When you specify the WATCH_DOG_TIME parameter, remember to allow for the time required to establish the connection.</p> <p>The connection is terminated once the specified time has elapsed.</p>
MailServerAddress	STRING[254]	<p>FQDN (Fully Qualified Domain Name) of the mail server. The mail server is addressed using the fully qualified domain name.</p> <p>Example: "www.mymailserver.com".</p>
UserName	STRING[254]	Mail server login name
PassWord	STRING[254]	Mail server password
From	Struct	E-mail sender address, which is defined using the following two STRING parameters. For example: "myname@mymailserver.com".
LocalPartPlusAtSign	STRING[64]	Local part of sender address, including @ sign. Example: "myname@".
FullQualifiedDomainName	STRING[254]	Fully Qualified Domain Name ( FQDN for short) of the mail server. Example: "mymailserver.com".

### DONE, BUSY and ERROR parameters

#### Description

The output parameters DONE, BUSY and ERROR are each displayed for only one cycle if the status of the BUSY output parameter changes from "1" to "0".

The following table shows the relationship between DONE, BUSY, and ERROR. Using this table, you can determine the current status of the instruction "TMAIL\_C and when the sending of the e-mail is complete.

DONE	BUSY	ERROR	Description
0	1	0	The job is being processed.
1	0	0	Job successfully completed.
0	0	1	The job ended with an error. The cause of the error can be found in the STATUS (Page 3179) parameter.
0	0	0	The "TMAIL_C" instruction was not assigned a (new) job.

## STATUS parameter

### Description

The following table shows the return values of "TMAIL\_C" at the STATUS parameter:

Return value STATUS* (W#16#...):	Explanation	Notes
0000	The processing of "TMAIL_C" was completed without errors.	Error-free completion of "TMAIL_C" does not mean that the e-mail sent will necessarily arrive.  Incorrectly entering the recipient addresses does not generate a status error of the "TMAIL_C" instruction. In this case, there is no guarantee that the e-mail will be sent to other recipients, even if these were entered correctly.
7001	"TMAIL_C" is active (BUSY = 1).	First call: Job triggered.
7002	"TMAIL_C" is active (BUSY = 1).	Intermediate call: Job already active.
8xxx	The processing of "TMAIL_C" was completed with an error code of the communication instructions called internally.	For detailed information, please refer to the STATUS parameter descriptions for the "TCON (Page 3185)", "TDISCON (Page 3190)", "TSEND (Page 3195)" and "TRCV (Page 3198)" communication instructions.
8010	Error during connection establishment	You will find further information on evaluation in the SFB_STATUS parameter of the instance data block. The error code displayed at the SFB_STATUS parameter is explained in the STATUS parameter description for the "TCON (Page 3185)" instruction.
8011	Error sending the data	You will find further information on evaluation in the SFB_STATUS parameter of the instance data block. The error code displayed at the SFB_STATUS parameter is explained in the STATUS parameter description for the "TSEND (Page 3195)" instruction.

Return value STATUS* (W#16#...):	Explanation	Notes
8012	Error receiving the data	You will find further information on evaluation in the SFB_STATUS parameter of the instance data block. The error code displayed at the SFB_STATUS parameter is explained in the STATUS parameter description for the "TRCV (Page 3198)" instruction.
8013	Error during connection establishment	You will find further information on evaluation in the SFB_STATUS parameter of the instance data block. The error code displayed at the SFB_STATUS parameter is explained in the STATUS parameter description for the TCON (Page 3185)" and "TDISCON (Page 3190)" instructions.
8014	Establishment of a connection is not possible.	You may have entered an incorrect mail server IP address (MailServerAddress (Page 3176)) or too short a time span (WatchDogTime (Page 3176)) for connection establishment. It is also possible that the CPU has no connection to the network or that the CPU configuration is incorrect.
8015	Incorrect data type for MAIL_ADDR_PARAM	The only valid data types are the system data types (structures) Tmail_v4, Tmail_v6 and TMail_FQDN.
8016	Incorrect data type for the ATTACHMENT parameter	The only valid data types are ArrayOfByte, ArrayOfWord and ArrayOfDWord.
8017	Incorrect data length for the ATTACHMENT parameter	Data length must be <= 65534 bytes.
8401	No channels available. Possible cause: There is already an e-mail connection via the CP. A second connection cannot be established in parallel.	Specific error for CP 1543
8403	A TCP/IP connection to the mail server was not possible.	Specific error for CP 1543
8405	Server has denied login request.	Specific error for CP 1543
8406	SMTP client has detected an internal SSL error or a problem with the certificate structure.	Specific error for CP 1543
8407	Request to use SSL denied.	Specific error for CP 1543
8408	Client unable to identify socket for establishing a TCP/IP connection to the mail server.	Specific error for CP 1543
8409	Writing via the connection not possible. Possible cause: The communication partner has reset the connection or the connection has been lost.	Specific error for CP 1543

Return value STATUS* (W#16#...):	Explanation	Notes
8410	Reading via the connection not possible. Possible cause: The communication partner has reset the connection or the connection has been lost.	Specific error for CP 1543
8411	E-mail could not be sent. Cause: Insufficient memory space to execute the send operation.	Specific error for CP 1543
8412	DNS server configured was unable to resolve the specified domain name.	Specific error for CP 1543
8413	An internal error in the DNS subsystem prevented domain name resolution.	Specific error for CP 1543
8414	Empty character string entered as domain name.	Specific error for CP 1543
8415	An internal error has occurred in the cURL module. Execution was stopped.	Specific error for CP 1543
8416	An internal error has occurred in the SMTP module. Execution was stopped.	Specific error for CP 1543
8417	Request to SMTP on a channel already in use or invalid channel ID. Execution was stopped.	Specific error for CP 1543
8418	E-mail send job aborted. Possible causes: Execution time exceeded (WatchDogTime parameter) or CP transition from start to stop.	Specific error for CP 1543
8419	Channel interrupted and cannot be used before the connection is closed.	Specific error for CP 1543
8420	Server certificate string could not be verified with CP root certificate.	Specific error for CP 1543
8421	Internal error occurred. Execution was stopped.	Specific error for CP 1543
82xx, 84xx, or 85xx	The error message originates from the mail server and corresponds, except for the "8", to the error number of the SMTP protocol.  The following lines list several error codes that can occur.	You will find more detailed information on the SMTP error code and other error codes in the SMTP protocol on the Internet or in the error documentation of the mail server. You can also view the most recent error message from the mail server in your instance DB in the BUFFER1 parameter. You will find the last data sent by the "TMAIL_C" instruction under DATEN in the instance DB.
8450	Action not executed: Mailbox not available/cannot be reached	Try again later.
8451	Action aborted: Local processing error	Try again later.

Return value STATUS* (W#16#...):	Explanation	Notes
8500	Syntax error: Error not recognized. This also includes the error when a command string is too long. This can also occur when the e-mail server does not support the LOGIN authentication procedure.	Check the parameters of "TMAIL_C". Try to send an e-mail without authentication. To do this, replace the content of the UserName parameter with an empty string. If no user name is specified, the LOGIN authentication procedure is not used.
8501	Syntax error: Incorrect input at a parameter	Possible cause: Incorrect address at the TO_S or CC parameter (see also: TO_S and CC parameters (Page 3175)).
8502	Command unknown or not implemented	Check your entries, in particular the FROM parameter. It may be incomplete and you may have forgotten the "@" or "." (see also: TO_S and CC parameters (Page 3175)).
8504	Command parameters not implemented	Check your entries, in particular the FROM parameter. It may be incomplete and you may have forgotten the "@" or "." (see also: TO_S and CC parameters (Page 3175)).
8535	SMTP authentication incomplete	You have possibly entered an incorrect user name or incorrect password.
8550	Mail server cannot be reached. You have no access rights.	You may have entered an incorrect user name or password, or the mail server may not support your login. Another cause of error could be a mistake in the domain name after the "@" or a missing "." at the TO_S, CC and FROM parameters (see also: TO_S and CC parameters (Page 3175)).
8552	Action aborted: Assigned memory size has been exceeded	Try again later.
8554	Transfer failed	Try again later.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

Other

TCON: Establishing a communication connection

TCON: Establish communication connection

Description

You use the "TCON" instruction to set up and establish a communication connection. Once the connection has been set up and established, it is automatically maintained and monitored by the CPU. "TCON" is executed asynchronously.

The connection data specified for the CONNECT and ID parameters are used to set up the communication connection. To establish the connection, a rising edge must be detected at the

REQ parameter. Once the connection is successfully established, the DONE parameter is set to "1".

### Number of possible connections

For information on the number of possible communication connections, refer to the technical specifications for your CPU.

### Connection with TCP and ISO-on-TCP

Both communication partners call the "TCON" instruction to set up and establish the communication connection. During parameter assignment, you specify which partner is the active communication end point and which is the passive one.

If the connection aborts, for example due to a line break or due to the remote communication partner, the active partner attempts to reestablish the configured connection. You do not have to call "TCON" again. This applies only if "TCON" has been executed successfully once (DONE = 1).

An existing connection is terminated and the connection set up is removed when the "TDISCON (Page 3190)" instruction is executed or when the CPU changes to STOP mode. To set up and establish the connection again, you will need to execute "TCON" again.

### Parameters

The following table shows the parameters of the "TCON" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Starts the job to establish the connection specified in the ID upon a rising edge.
ID	Input	CONN_OUC	I, Q, M, D, L or constant	Reference to the assigned connection. Range of values: W#16#0001 to W#16#0FFF
CONNECT	InOut	TCON_Param	D	Pointer to the connection description See also: Auto-Hotspot
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>0: Job not yet started or still in progress</li> <li>1: Job completed without error</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>0: Job not yet started or already completed</li> <li>1: Job not yet completed. A new job cannot be started</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter ERROR: <ul style="list-style-type: none"> <li>0: No error</li> <li>1: Error occurred</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

**BUSY, DONE and ERROR parameters**

You can check the status of the job with the BUSY, DONE, ERROR and STATUS parameters. The BUSY parameter indicates the processing status. You use the DONE parameter to check whether or not a job has been executed successfully. The ERROR parameter is set when errors occurred during execution of "TCON". The error information is output at the STATUS parameter.

The following table shows the relationship between the BUSY, DONE and ERROR parameters:

BUSY	DONE	ERROR	Description
1	0	0	The job is being processed.
0	1	0	The job was completed successfully.
0	0	1	The job ended with an error. The cause of the error is output at the STATUS parameter.
0	0	0	No new job was assigned.

**ERROR and STATUS parameters**

ERROR	STATUS* (W#16#...)	Explanation
0	0000	Connection successfully established.
0	7000	No job processing active
0	7001	Start job execution, establish connection.
0	7002	Connection is being established (REQ irrelevant).
1	8085	Connection ID (ID parameter) is already being used by a configured connection.
1	8086	The ID parameter is outside the valid range.
1	8087	Maximum number of connections reached; no additional connection possible
1	8089	The CONNECT parameter does not point to a data block.
1	809A	The CONNECT parameter points to a field that does not correspond to the length of the connection description.
1	809B	The element Interfaceld within the TCON_xxx structure does not reference a hardware identifier of a CPU or CM/CP interface or has the value "0".
1	80A0	Group error for error codes W#16#80A1 and W#16#80A2.
1	80A2	Local or remote port is being used by the system.
1	80A3	Attempt being made to re-establish an existing connection.
1	80A4	IP address of the remote endpoint of the connection is invalid, in other words, it matches the IP address of the local partner.
1	80A5	Connection ID is already in use.
1	80A7	Communication error: You executed "TDISCON (Page 3190)" before "TCON" had completed.
1	80B2	The CONNECT parameter points to a data block that was generated with the attribute "Only store in load memory".

ERROR	STATUS* (W#16#...)	Explanation
1	80B4	You have violated one or more of the following conditions for passive connection establishment with the ISO-on-TCP protocol variant (connection_type = B#16#12): <ul style="list-style-type: none"> <li>• local_tsap_id_len &gt;= B#16#02</li> <li>• local_tsap_id[1] = B#16#E0</li> <li>• With local_tsap_id_len &gt;= B#16#03, local_tsap_id[1] is an ASCII character.</li> <li>• local_tsap_id[1] is an ASCII character and local_tsap_id_len &gt;= B#16#03.</li> </ul>
1	80B5	Only passive connection establishment is permitted for connection type 13 = UDP.
1	80B6	Parameter assignment error at the connection_type parameter of the SDT TCON_Param.
1	80B7	Error in one of the following parameters of the data block for connection description: block_length, local_tsap_id_len, rem_subnet_id_len, rem_staddr_len, rem_tsap_id_len, next_staddr_len.
1	80B8	Connection description of the structure element ID and the block parameter ID are not identical.
1	80C3	All connection resources are in use.
1	80C4	Temporary communication error: <ul style="list-style-type: none"> <li>• The connection cannot be established at this time.</li> <li>• The interface is currently receiving new parameters.</li> <li>• The configured connection is currently being removed by a "TDISCON (Page 3190)" instruction.</li> </ul>

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## TCON: Establish communication connection

### Description

You use the "TCON" instruction to set up and establish a communication connection. Once the connection has been set up and established, it is automatically maintained and monitored by the CPU. "TCON" is executed asynchronously.

The connection data specified for the CONNECT and ID parameters are used to set up the communication connection.

- At the CONNECT parameter, if possible, only use the predefined structures as created by the connection parameter assignment in the Inspector window of the program editor.
- If the CONNECT parameter is not interconnected with a structure listed in the parameter table or if the structure includes an error, the error code 8089 is output at the STATUS parameter.

To establish the connection, a rising edge must be detected at the REQ parameter. Once the connection is successfully established, the DONE parameter is set to "1".

The instruction "TCON" V3.0 can also be used with CPU S7-1200, Version 4.0 or later.

### Number of possible connections

For information on the number of possible communication connections, refer to the technical specifications for your CPU.

### Connection with TCP and ISO-on-TCP

Both communication partners call the "TCON" instruction to set up and establish the communication connection. During parameter assignment, you specify which partner is the active communication end point and which is the passive one.

If the connection aborts, for example due to a line break or due to the remote communication partner, the active partner attempts to reestablish the configured connection. You do not have to call "TCON" again. This applies only if "TCON" has been executed successfully once (DONE = 1).

An existing connection is terminated and the connection set up is removed when the "TDISCON (Page 3190)" instruction is executed or when the CPU changes to STOP mode. To set up and establish the connection again, you will need to execute "TCON" again.

### Parameters

The following table shows the parameters of the "TCON" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Starts the job to establish the connection specified on a rising edge.
ID	Input	CONN_OUC	I, Q, M, D, L or constant	Reference to the assigned connection. Range of values: W#16#0001 to W#16#0FFF
CONNECT	InOut	VARIANT	D	Pointer to the connection description <ul style="list-style-type: none"> <li>For TCP or UDP, use the structure TCON_IP_v4 For description, refer to: Auto-Hotspot</li> <li>For ISO-on-TCP, use the structure TCON_IP_RFC For description, refer to: Auto-Hotspot</li> <li>For ISO, use the structure TCON_ISOnative (only for CP1543-1) For description, refer to: "Structure of the connection description according to TCON_ISOnative"</li> </ul>
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>0: Job not yet started or still in progress</li> <li>1: Job completed without error</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>0: Job not yet started or already completed</li> <li>1: Job not yet completed. A new job cannot be started</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter ERROR: <ul style="list-style-type: none"> <li>0: No error</li> <li>1: Error occurred</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

## BUSY, DONE and ERROR parameters

You can check the status of the job with the BUSY, DONE, ERROR and STATUS parameters. The BUSY parameter indicates the processing status. You use the DONE parameter to check whether or not a job has been executed successfully. The ERROR parameter is set when errors occurred during execution of "TCON". The error information is output at the STATUS parameter.

The instruction "TCON" generates an error message in version 3.0 if an active connection establishment to a remote partner fails. Create a rising edge at the REQ parameter to establish a connection once again.

The following table shows the relationship between the BUSY, DONE and ERROR parameters:

BUSY	DONE	ERROR	Description
1	0	0	The job is being processed.
0	1	0	The job was completed successfully.
0	0	1	The job ended with an error. The cause of the error is output at the STATUS parameter.
0	0	0	No new job was assigned.

## Structure of the connection description according to TCON\_ISOnative

A connection description DB with a structure according to TCON\_ISOnative is used to assign the communication connection parameters for ISO. The fixed data structure of the TCON\_ISOnative contains all parameters that are required to establish the connection.

Byte	Parameter	Data type	Start value	Description
0 ... 1	InterfaceId	HW_ANY	64	Hardware identifier of the local interface (value range: 0 to 65535).
2 ... 3	ID	CONN_OUC	1	Reference to this connection (unique ID in the value range: 1 to 4095).
4	ConnectionType	BYTE	16#16	Connection type: ISO
5	ActiveEstablished	BOOL	TRUE	ID for the manner in which the connection is established: <ul style="list-style-type: none"> <li>FALSE: Passive connection establishment</li> <li>TRUE: Active connection establishment</li> </ul>
8 ... 13	RemoteMacAddress	ARRAY [1..6] of BYTE	-	MAC address of the partner end point, for example, for 00-74-41-FD-AE-84: <ul style="list-style-type: none"> <li>MacAddr[1] = 00</li> <li>MacAddr[2] = 74</li> <li>MacAddr[3] = 41</li> <li>MacAddr[4] = FD</li> <li>MacAddr[5] = AE</li> <li>MacAddr[6] = 84</li> </ul>

9.7 References

Byte	Parameter	Data type	Start value	Description
14 .. . 19	LocalMacAddress	ARRAY [1..6] of BYTE	-	MAC address of the local end point, for example, for 00-74-41-FD-AE-84: <ul style="list-style-type: none"> <li>• MacAddr[1] = 00</li> <li>• MacAddr[2] = 74</li> <li>• MacAddr[3] = 41</li> <li>• MacAddr[4] = FD</li> <li>• MacAddr[5] = AE</li> <li>• MacAddr[6] = 84</li> </ul>
20 .. . 53	RemoteTSelector	Struct	-	TSelector of the remote connection partner: <ul style="list-style-type: none"> <li>• Bytes 20 to 21 = TSelLength</li> <li>• Bytes 22 to 53: = TSel[1-32]</li> </ul>
	TSelLength	UINT	-	Value range from 0 to 32
	TSel	ARRAY [1..32] of BYTE	-	Value range in each case 0 to 255 in bytes
54 .. . 87	LocalTSelector	Struct	-	TSelector of the remote connection partner: <ul style="list-style-type: none"> <li>• Bytes 20 to 21 = TSelLength</li> <li>• Bytes 22 to 53: = TSel[1-32]</li> </ul>
	TSelLength	UINT	-	Value range from 0 to 32
	TSel	ARRAY [1..32] of BYTE	-	Value range in each case 0 to 255 in bytes
88 ... 89	CrRetransmissionTime	UINT	-	Duration until connection attempt is repeated in seconds.
90 .. . 91	DataRetransmissionTime	UINT	100 ms	Duration until data transfer is repeated in milliseconds.
92 .. . 93	MaxRetransmissionCount	UINT	-	Maximum number of repetitions.
94 .. . 95	InactivityTime	UINT	-	in seconds
96 .. . 97	WindowTime	UINT	-	in seconds

**ERROR and STATUS parameters**

ERROR	STATUS* (W#16#...)	Explanation
0	0000	Connection successfully established.
0	7000	No job processing active
0	7001	Start job execution, establish connection.
0	7002	Connection is being established (REQ irrelevant).
1	8085	Connection ID (ID parameter) is already being used by a configured connection.
1	8086	The ID parameter is outside the valid range.
1	8087	Maximum number of connections reached; no additional connection possible
1	8089	The CONNECT parameter does not point to a connection description or the connection description was created manually.

ERROR	STATUS* (W#16#...)	Explanation
1	809A	The structure at the CONNECT parameter is not supported or the length is invalid.
1	809B	The element Interfaceld within the TCON_xxx structure does not reference a hardware identifier of a CPU or CM/CP interface or has the value "0".
1	80A2	Local or remote port is being used by the system. The following ports are reserved locally: 20, 21, 80, 102, 135, 161, 162, 443, 34962, 34963, 34964 as well as the area 49152 to 65535.
1	80A3	ID is used by a connection created by the user program, which uses the same connection description at the CONNECT parameter.
1	80A4	IP address of the remote endpoint of the connection is invalid or it corresponds to the IP address of the local partner.
1	80A7	Communication error: You executed "TDISCON (Page 3190)" before "TCON" had completed.
1	80B4	Only with TCON_IP_RFC: The local T selector was not specified or the first byte does not contain the value 0x0E (only with a length of T selector = 2) or the local T selector starts with "SIMATIC-".
1	80B5	Only passive connection establishment is permitted for connection type 13 = UDP (parameter ActiveEstablished of the structure TCON_IP_v4 / TCON_PARAM has the value TRUE).
1	80B6	Parameter assignment error in the ConnectionType parameter of the data block for connection description. <ul style="list-style-type: none"> <li>• Only valid with TCON_IP_v4: 0x11, 0x0B and 0x13.</li> <li>• Only valid with TCON_IP_RFC: 0x0C and 0x12</li> </ul>
1	80B7	With TCON_IP_v4: <ul style="list-style-type: none"> <li>• TCP (active connection establishment): Remote port is "0".</li> <li>• TCP (passive connection establishment): Local port is "0".</li> <li>• UDP: Local port is "0".</li> </ul> With TCON_IP_RFC: <ul style="list-style-type: none"> <li>• Local (LocalTSelector) or remote (RemoteTSelector) T selector was specified with a length of more than 32 bytes.</li> <li>• For TSelectorLength of the T selector (local or remote), a length greater than 32 was entered.</li> <li>• Error in the length of the IP address of the specific connection partner.</li> </ul>
1	80B8	Parameter ID in the local connection description (structure at CONNECT parameter) and parameter ID of the instruction are different.
1	80C3	All connection resources are in use.
1	80C4	Temporary communication error: <ul style="list-style-type: none"> <li>• The connection cannot be established at this time.</li> <li>• The interface is currently receiving new parameters.</li> <li>• The configured connection is currently being removed by a "TDISCON (Page 3190)" instruction.</li> </ul>
1	80C5	The connection partner refuses to establish the connection, has terminated the connection or actively ended it.
1	80C6	The connection partner cannot be reached (network error).
1	80C7	Execution timeout.
1	80C8	Value at the ID parameter is already being used by a connection that was created using the user program. The connection uses the identical ID, but different connection settings at the parameter CONNECT.
1	80C9	Validation of the connection partner failed. The connection partner that wants to establish the connection does not match the defined partner of the structure at the CONNECT parameter.

ERROR	STATUS* (W#16#...)	Explanation
1	80CE	The IP address of the local interface is 0.0.0.0.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

## TDISCON: Terminate communication connection

### Description

The "TDISCON" instruction terminates a communications connection from the CPU to a connection partner.

### Functional description

"The TDISCON" instruction works asynchronously, which means its job processing extends over multiple calls. You start the job for terminating a connection by calling the "TDISCON" instruction with REQ = 1.

After "TDISCON" has been successfully executed, the ID specified for "TCON" is no longer valid and cannot be used for sending or receiving.

The job status is indicated by the output parameters BUSY and STATUS. Here, STATUS corresponds to the output parameter RET\_VAL of the asynchronous instructions (see also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794)).

The following table shows the relationship between BUSY, DONE and ERROR. Using this table, you can recognize the current status of "TDISCON" or when the establishment of the connection is completed.

BUSY	DONE	ERROR	Description
1	0	0	The job is being processed.
0	1	0	Job successfully completed.
0	0	1	The job ended with an error. The cause of the error can be found in the STATUS parameter.
0	0	0	The instruction was not assigned a (new) job.

## Parameters

The following table shows the parameters of the instruction "TDISCON":

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
REQ	Input	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Control parameter REQUEST starts the job for terminating the connection specified by ID. The job starts on a rising edge.
ID	Input	CONN_OUT C (WORD)	D, L or constant	I, Q, M, D, L or constant	Reference to the connection to be terminated (connection ID) Range of values: W#16#0001 to W#16#0FFF
DONE	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Status parameter: <ul style="list-style-type: none"> <li>0: Job not yet started or still executing.</li> <li>1: Job executed without errors</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Status parameter: <ul style="list-style-type: none"> <li>BUSY = 1: The job is not yet completed.</li> <li>BUSY = 0: The job is completed or has not started yet.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Status parameter: <ul style="list-style-type: none"> <li>ERROR=0: No error.</li> <li>ERROR=1: Error occurred during processing. STATUS supplies detailed information on the type of error</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	I, Q, M, D, L	Status parameter: Error information (see "Parameters ERROR and STATUS")

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## Parameters ERROR and STATUS

ERROR	STATUS* (W#16#...)	Explanation
0	0000	Connection terminated successfully.
0	7000	No job processing active.
0	7001	Start of job processing, connection being terminated.
0	7002	Intermediate call (REQ irrelevant), connection being terminated.
1	8086	The ID parameter is not in the permitted value range.
1	80A3	Attempt is being made to terminate a non-existent connection or the connection is already terminated.

ERROR	STATUS* (W#16#...)	Explanation
1	80C4	Temporary communication error: New parameters are being assigned to the interface or the connection is currently being established.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

**TSEND: Send data via communication connection**

**TSEND: Send data via communication connection**

**Description**

The following description of the "TSEND" instruction is valid for the CPU S7-1200 to version 3.0.

You use the "TSEND" instruction to send data over an existing communication connection. "TSEND" is executed asynchronously.

You specify the send area with the DATA parameter. This includes the address and the length of the data to be sent. All data types except BOOL and Array of BOOL can be used for the data to be sent.

The send job is executed when a rising edge is detected at the REQ parameter.

With the LEN parameter, you specify the maximum number of bytes sent with a send job.

- When data is transferred with TCP (streaming protocol), the "TSEND" instruction provides no information about the length of the data sent to "TRCV (Page 3198)".
- When data is transferred with ISO-on-TCP (message-oriented protocol), the length of the data sent is communicated to "TRCV (Page 3198)". The amount of data sent with "TSEND" as packet must also be received again at the receiving end ("TRCV (Page 3198)"):
  - If the receive buffer is too small for the sent data, an error occurs at the receiving end.
  - If the receive buffer is sufficiently large, "TRCV" returns with DONE=1 as soon as the data packet is received.

The data to be sent must not be edited until the send job is completed. If the send job executes successfully, the DONE parameter is set to "1". Signal state "1" at the DONE parameter is not confirmation that the data sent has already been read by the communication partner.

**Parameters**

The following table shows the parameters of the "TSEND" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Starts the send job on a rising edge.
ID	Input	CONN_OUC	I, Q, M, D, L or constant	Reference to the connection established with "TCON". Range of values: W#16#0001 to W#16#0FFF

Parameter	Declaration	Data type	Memory area	Description
LEN	Input	UINT	I, Q, M, D, L or constant	Maximum number of bytes to be sent with the job.
DATA	InOut	VARIANT	I, Q, M, D	Pointer to the send area containing the address and the length of the data to be sent. The address references: <ul style="list-style-type: none"> <li>• The process image of the inputs</li> <li>• The process image of the outputs</li> <li>• A bit memory</li> <li>• A data block</li> </ul>
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or still in progress</li> <li>• 1: Job completed without error</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or already completed</li> <li>• 1: Job not yet completed. A new job cannot be started.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### LEN and DATA parameters

- With LEN = 0 , all the data specified with the DATA parameter is sent.
- If the number of bytes at the LEN parameter is larger than the length of the data to be sent that was defined with the DATA parameter, the error code 8088 is output at the STATUS parameter (see description of the STATUS parameter below).
- If a structure (Struct) is referenced via the DATA parameter, LEN can be shorter than the structure. In this case, only the data up to the length of the LEN parameter is transferred.
- With data types STRING and WSTRING, all data is transferred if the parameter LEN = 0. When LEN > 0, the length must be at least the maximum number of bytes plus two additional bytes which contain the length information. You can find more detailed information on the structure of the data types in: "Overview of the valid data types (Page 1262)".
- The maximum number of bytes that can be transmitted is 65534.
- When you use structured tags from optimized DBs, the address of the structured tag should be interconnected at the DATA parameter and the parameter LEN = 0. This guarantees type-safe transmission of the entire structure if the same structure is used at the receiving end.

### BUSY, DONE and ERROR parameters

You can check the status of the job with the BUSY, DONE, ERROR and STATUS parameters. The BUSY parameter indicates the processing status. With the DONE parameter, you can check whether or not a job executed successfully. The ERROR parameter is set when errors occurred during execution of "TSEND". The error information is output at the STATUS parameter.

The following table shows the relationship between the BUSY, DONE and ERROR parameters:

BUSY	DONE	ERROR	Description
1	0	0	The job is being processed.
0	1	0	The job was completed successfully.
0	0	1	The job ended with an error. The cause of the error is specified in the STATUS parameter.
0	0	0	No new job was assigned.

#### Note

Because "TSEND" is executed asynchronously, you must keep the data in the send area consistent until the DONE parameter or the ERROR parameter changes to the value "1".

### ERROR and STATUS parameters

ERROR	STATUS* (W#16#...)	Description
0	0000	Send job completed without error.
0	7000	No job processing active.
0	7001	Start of job execution, data is being sent. When processing this job, the operating system accesses the data in the DATA send area.
0	7002	Job executing (REQ irrelevant). When processing this job, the operating system accesses the data in the DATA send area.
1	8085	<ul style="list-style-type: none"> <li>The LEN parameter is greater than the highest permitted value (65536).</li> <li>DATA and LEN parameters both have the value "0".</li> </ul>
1	8086	The ID parameter is outside the permitted address range (1..0xFFFF).
1	8088	The LEN parameter is greater than the area specified in DATA.
1	80A1	Communication error: <ul style="list-style-type: none"> <li>The specified connection has not yet been established.</li> <li>The specified connection is being terminated. Transfer via this connection is not possible.</li> <li>The interface is being re-initialized.</li> </ul>
1	80B3	The protocol variant (ConnectionType parameter in the connection description) is set to UDP. Use the instruction "TUSEND" with a UDP connection.
1	80C3	<ul style="list-style-type: none"> <li>A block with this ID is already being processed in a different priority group.</li> <li>Internal lack of resources.</li> </ul>

ERROR	STATUS* (W#16#...)	Description
1	80C4	Temporary communication error: <ul style="list-style-type: none"> <li>• The connection cannot be established to the partner at this time.</li> <li>• The interface is receiving new parameter settings or the connection is being established.</li> </ul>
1	80C5	Connection terminated by the communication partner.
1	80C6	Network error. Communication partner cannot be reached.
1	80C7	Execution timeout.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

## TSEND: Send data via communication connection

### Description

The following description of the "TSEND" instruction is valid for the CPU S7-1500 and S7-1200 V4.0.

You use the "TSEND" instruction to send data over an existing communication connection. "TSEND" is executed asynchronously.

You specify the send area with the DATA parameter. This includes the address and the length of the data to be sent. All data types except BOOL and Array of BOOL can be used for the data to be sent.

The send job is executed when a rising edge is detected at the REQ parameter.

With the LEN parameter, you specify the maximum number of bytes sent with a send job.

- When data is transferred with TCP (streaming protocol), the "TSEND" instruction provides no information about the length of the data sent to "TRCV (Page 3198)".
- When data is transferred with ISO-on-TCP (message-oriented protocol), the length of the data sent is communicated to "TRCV (Page 3198)". The amount of data sent with "TSEND" as packet must also be received again at the receiving end ("TRCV (Page 3198)"):
  - If the receive buffer is too small for the sent data, an error occurs at the receiving end.
  - If the receive buffer is sufficiently large, "TRCV" returns with DONE=1 as soon as the data packet is received.

The data to be sent must not be edited until the send job is completed. If the send job executes successfully, the DONE parameter is set to "1". Signal state "1" at the DONE parameter is not confirmation that the data sent has already been read by the communication partner.

### Parameters

The following table shows the parameters of the "TSEND" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Starts the send job on a rising edge.
ID	Input	CONN_OUC	I, Q, M, D, L or constant	Reference to the connection established with "TCON". Range of values: W#16#0001 to W#16#0FFF
LEN	Input	UDINT	I, Q, M, D, L or constant	Maximum number of bytes to be sent with the job.
DATA	InOut	VARIANT	I, Q, M, D	Pointer to the send area containing the address and the length of the data to be sent. The address references: <ul style="list-style-type: none"> <li>• The process image of the inputs</li> <li>• The process image of the outputs</li> <li>• A bit memory</li> <li>• A data block</li> </ul>
DONE	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or still in progress</li> <li>• 1: Job completed without error</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: Job not yet started or already completed</li> <li>• 1: Job not yet completed. A new job cannot be started.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>• 0: No error</li> <li>• 1: Error occurred</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### LEN and DATA parameters

- With LEN = 0 , all the data specified with the DATA parameter is sent.
- If the number of bytes at the LEN parameter is larger than the length of the data to be sent that was defined with the DATA parameter, the error code 8088 is output at the STATUS parameter (see description of the STATUS parameter below).
- If a structure (Struct) is referenced via the DATA parameter, LEN can be shorter than the structure. In this case, only the data up to the length of the LEN parameter is transferred.
- With data types STRING and WSTRING, all data is transferred if the parameter LEN = 0. When LEN > 0, the length must be at least the maximum number of bytes plus two additional bytes which contain the length information. You can find more detailed information on the structure of the data types in: "Overview of the valid data types (Page 1262)".

- The maximum number of bytes that can be transmitted depends on the device.
- When you use structured tags from optimized DBs, the address of the structured tag should be interconnected at the DATA parameter and the parameter LEN = 0. This guarantees type-safe transmission of the entire structure if the same structure is used at the receiving end.

### BUSY, DONE and ERROR parameters

You can check the status of the job with the BUSY, DONE, ERROR and STATUS parameters. The BUSY parameter indicates the processing status. With the DONE parameter, you can check whether or not a job executed successfully. The ERROR parameter is set when errors occurred during execution of "TSEND". The error information is output at the STATUS parameter.

The following table shows the relationship between the BUSY, DONE and ERROR parameters:

BUSY	DONE	ERROR	Description
1	0	0	The job is being processed.
0	1	0	The job was completed successfully.
0	0	1	The job ended with an error. The cause of the error is specified in the STATUS parameter.
0	0	0	No new job was assigned.

#### Note

Because "TSEND" is executed asynchronously, you must keep the data in the send area consistent until the DONE parameter or the ERROR parameter changes to the value "1".

### ERROR and STATUS parameters

ERROR	STATUS* (W#16#...)	Description
0	0000	Send job completed without error.
0	7000	No job processing active.
0	7001	Start of job execution, data is being sent. When processing this job, the operating system accesses the data in the DATA send area.
0	7002	Job executing (REQ irrelevant). When processing this job, the operating system accesses the data in the DATA send area.
1	8085	<ul style="list-style-type: none"> <li>• The LEN parameter is greater than the highest permitted value (65536).</li> <li>• DATA and LEN parameters both have the value "0".</li> </ul>
1	8086	The ID parameter is outside the permitted address range (1..0xFFFF).
1	8088	The LEN parameter is greater than the area specified in DATA.
1	80A1	Communication error: <ul style="list-style-type: none"> <li>• The specified connection has not yet been established.</li> <li>• The specified connection is being terminated. Transfer via this connection is not possible.</li> <li>• The interface is being re-initialized.</li> </ul>

ERROR	STATUS* (W#16#...)	Description
1	80B3	The protocol variant (ConnectionType parameter in the connection description) is set to UDP. Use the instruction "TUSEND" with a UDP connection.
1	80C3	<ul style="list-style-type: none"> <li>• A block with this ID is already being processed in a different priority group.</li> <li>• Internal lack of resources.</li> </ul>
1	80C4	Temporary communication error: <ul style="list-style-type: none"> <li>• The connection cannot be established to the partner at this time.</li> <li>• The interface is receiving new parameter settings or the connection is being established.</li> </ul>
1	80C5	Connection terminated by the communication partner.
1	80C6	Network error. Communication partner cannot be reached.
1	80C7	Execution timeout.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

**TRCV: Receive data via communication connection**

**TRCV: Receive data via communication connection**

**Description**

The following description of the "TRCV" instruction is valid for the CPU S7-1200 up to version 3.0.

You use the "TRCV" instruction to receive data over an existing communication connection. "TRCV" is executed asynchronously.

Receipt of data is enabled when the EN\_R parameter is set to the value "1". The received data is entered in a receive area. You specify the length of the receive area either with the LEN parameter (if LEN <> 0) or with the length information of the DATA parameter (if LEN = 0), depending on the protocol variant being used.

While data is being received, you cannot make changes to the DATA parameter or the defined receive area to ensure consistency of the received data.

After successful receipt of data, the NDR parameter is set to the value "1". You can query the amount of data actually received at the RCVD\_LEN parameter.

## Receive modes of "TRCV"

The following table shows how the received data is entered in the receive area.

Protocol variant	Availability of data in the receive area	connection_type* parameter of the connection description	LEN parameter
TCP (Ad-hoc mode)	The data is immediately available.	Hexadecimal value: B#16#11 Integer value: 17	0
TCP (Receipt of data with specified length)	The data is available as soon as the data length specified at the LEN parameter has been fully received.	Hexadecimal value: B#16#11 Integer value: 17	1 to 8192
ISO on TCP (Message-oriented data transfer)	The data is available as soon as the data length specified at the LEN parameter has been fully received.	Hexadecimal value: B#16#12 Integer value: 18	<ul style="list-style-type: none"> <li>• 1 to 1452, if a CP is used.</li> <li>• 1 to 8192, if no CP is used.</li> </ul>
* See "Auto-Hotspot".			

### TCP (Ad-hoc mode)

The ad-hoc mode is only available with the TCP protocol variant. You use the ad-hoc mode to receive data with dynamic length with the "TRCV" instruction.

You set ad-hoc mode by assigning the value "0" to the LEN parameter. All data types can be used for data blocks with standard access when you use ad-hoc mode. Only ARRAY of BYTE or data types with a length of 8 bits can be used for data blocks with optimized access (e.g., CHAR, USINT, SINT, etc.). When ad-hoc mode is active, receipt of data is already signaled after a received byte at the NDR parameter.

### TCP (Receipt of data with specified length)

For receipt of data with a specified length, enter the length of the data at the LEN parameter. The data receipt is not complete until the length of data specified at the LEN parameter has been completely received. Only then is the data available in the receive area (DATA parameter). The receipt of data is signaled by the NDR output parameter. The actually received data length in bytes at the RCVD\_LEN parameter corresponds to the data length at the LEN parameter after receipt.

### ISO on TCP (Message-oriented data transfer)

Complete message blocks are sent via a connection with the protocol variant ISO on TCP; these are recognized as such by the recipient. When using ISO on TCP, "TRCV" signals data receipt as soon as the message block has been completely received. The receive area is defined by the LEN and DATA parameters. If the receive buffer (DATA parameter) is too small for the sent data, "TRCV" signals an error. The successful receipt of data is signaled by the NDR output parameter. The actually received data length in bytes at the RCVD\_LEN parameter corresponds to the data length at the LEN parameter after receipt.

## Parameters

The following table shows the parameters of the "TRCV" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN_R	Input	BOOL	I, Q, M, D, L or constant	Receive enable
ID	Input	CONN_OUC	I, Q, M, D, L or constant	Reference to the connection established with "TCON (Page 3182)". Range of values: W#16#0001 (1) to W#16#0FFF (4095)
LEN	Input	UDINT	I, Q, M, D, L or constant	Length of the receive area in bytes (hidden). If you use a memory area with optimized access at the DATA parameter, the LEN parameter must have the value "0".
DATA	InOut	VARIANT	I, Q, M, D	Pointer to the receive area
NDR	Output	BOOL	I, Q, M, D, L	Status parameter (New Data Received): <ul style="list-style-type: none"> <li>0: Job not yet started or still in progress</li> <li>1: Job completed without error</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter: <ul style="list-style-type: none"> <li>0: Job not yet started or already completed</li> <li>1: Job not yet completed. A new job cannot be started</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter: <ul style="list-style-type: none"> <li>0: No error.</li> <li>1: An error occurred during execution of the instruction.</li> </ul> Detailed information is output via the STATUS parameter.
STATUS	Output	WORD	I, Q, M, D, L	Status parameter: Output of status and error information.
RCVD_LEN	Output	UDINT	I, Q, M, D, L	Amount of data actually received in bytes

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### LEN, DATA and RCVD\_LEN parameters

- If LEN = 0, the received data is saved in the receive area specified at the DATA parameter. The number of bytes received is indicated at the RCVD\_LEN parameter.
- If the length specified at the LEN parameter is greater than the length of the data received at the DATA parameter, the error code 8088 is output at the STATUS parameter (see description of the STATUS) parameter in the following.
- If a structure (Struct) is referenced via the DATA parameter, LEN can be shorter than the structure. In this case, only the data up to the length of the LEN parameter is transferred.
- If the DATA parameter references a data block with optimized access, the LEN parameter must be set to "0".

- If a STRING data type is referenced via the DATA parameter, the length specified at the LEN parameter must be 0 or  $\geq 2$  (LEN = 1 is not permitted).
- If a WSTRING data type is referenced via the DATA parameter, the length specified at the LEN parameter must be 0 or  $\geq 5$ .

### BUSY, NDR and ERROR parameters

You can check the status of the job with the BUSY, NDR, ERROR and STATUS parameters. The BUSY parameter indicates the processing status. With the NDR parameter, you can check whether or not a job executed successfully. The ERROR parameter is set when errors occurred during execution of TRCV. The error information is output at the STATUS parameter.

The following table shows the relationship between the BUSY, NDR and ERROR parameters:

BUSY	NDR	ERROR	Description
1	-	-	The job is being processed.
0	1	0	The job was completed successfully.
0	0	1	The job ended with an error. The cause of the error is output at the STATUS parameter.
0	0	0	No new job was assigned.

#### Note

Because "TRCV" is executed asynchronously, the data in the receive area is only consistent when the NDR parameter is set to the value "1".

### ERROR and STATUS parameters

ERROR	STATUS* (W#16#...)	Explanation
0	0000	Job completed successfully. The current length of the received data is output at the RCVD_LEN parameter.
0	7000	Block not ready to receive.
0	7001	Block is ready to receive, receive job was activated.
0	7002	Interim call, the receive job is executing. Note: While the job is being processed, data is written to the receive area. Access to the receive area during this time may provide inconsistent data.
1	8085	<ul style="list-style-type: none"> <li>• The LEN parameter is larger than the highest permitted value.</li> <li>• The value of the LEN or DATA parameter was changed after the first call.</li> <li>• Both LEN parameters and the DATA parameter have the value "0" or LEN is longer than the maximum permitted value (65536).</li> </ul>
1	8086	The ID parameter is outside the permitted address range (1 .. 0x0FFF).
1	8088	<ul style="list-style-type: none"> <li>• Receive area is too small.</li> <li>• The value at the LEN parameter is larger than the receive area set at the DATA parameter.</li> </ul>

ERROR	STATUS* (W#16#...)	Explanation
1	80A1	Communication error: <ul style="list-style-type: none"> <li>• The specified connection has not yet been established.</li> <li>• The specified connection is being terminated. Receive job over this connection is not possible.</li> <li>• The connection is being re-initialized.</li> </ul>
1	80B3	The protocol variant (connection_type parameter in the connection description) is set to UDP. Use the instruction "TRCV" with a UDP connection.
1	80C3	<ul style="list-style-type: none"> <li>• A block with this ID is already being processed in a different priority group.</li> <li>• Internal lack of resources.</li> </ul>
1	80C4	Temporary communication error: <ul style="list-style-type: none"> <li>• The connection cannot be established to the partner at this time.</li> <li>• The interface is receiving new parameter settings or the connection is being established.</li> </ul>
1	80C5	The remote partner has terminated the connection.
1	80C6	The remote partner cannot be reached (network error).
1	80C7	Execution timeout.
1	80C9	The length of the receive area is smaller than the length of the sent data.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

## TRCV: Receive data via communication connection

### Description

The following description of the "TRCV" instruction is valid for the CPU S7-1500 and S7-1200 V4.0.

You use the "TRCV" instruction to receive data over an existing communication connection. "TRCV" is executed asynchronously.

Receipt of data is enabled when the EN\_R parameter is set to the value "1". The received data is entered in a receive area. You specify the length of the receive area either with the LEN parameter (if LEN <> 0) or with the length information of the DATA parameter (if LEN = 0), depending on the protocol variant being used.

While data is being received, you cannot make changes to the DATA parameter or the defined receive area to ensure consistency of the received data.

After successful receipt of data, the NDR parameter is set to the value "1". You can query the amount of data actually received at the RCVD\_LEN parameter.

## Receive modes of "TRCV"

The following table shows how the received data is entered in the receive area.

Protocol variant	ADHOC parameter	Availability of data in the receive area	connection_type parameter of the connection description	LEN parameter
TCP (Ad-hoc mode)	1 (ad-hoc activated)	The data is immediately available.	Hexadecimal value: B#16#11 Integer value: 17	1 up to maximum length (depending on the CPU)
TCP (Receipt of data with specified length)	0 (ad-hoc deactivated)	The data is available as soon as the data length specified at the LEN parameter has been fully received.	Hexadecimal value: B#16#11 Integer value: 17	1 to 8192
ISO on TCP (Message-oriented data transfer)	-	The data is available as soon as the data length specified at the LEN parameter has been fully received.	Hexadecimal value: B#16#12 Integer value: 18	<ul style="list-style-type: none"> <li>• 1 to 1452, if a CP is used.</li> <li>• 1 to 8192, if no CP is used.</li> </ul>

### TCP (Ad-hoc mode)

The ad-hoc mode is only available with the TCP protocol variant. You use the ad-hoc mode to receive data with dynamic length with the "TRCV" instruction.

You set ad-hoc mode by assigning the value "1" to the ADHOC parameter. All data types can be used for data blocks with standard access when you use ad-hoc mode. Only ARRAY of BYTE or data types with a length of 8 bits can be used for data blocks with optimized access (e.g., CHAR, USINT, SINT, etc.). When ad-hoc mode is active, receipt of data is already signaled after a received byte at the NDR parameter.

### TCP (Receipt of data with specified length)

Assign the value "0" to the ADHOC parameter for receipt of data with specified length. If ad-hoc mode is disabled, the data receipt is not complete until the length of data specified at the LEN parameter has been completely received. Only then is the data available in the receive area (DATA parameter). The successful receipt of data is signaled by the NDR output parameter. The actually received data length in bytes at the RCVD\_LEN parameter corresponds to the data length at the LEN parameter after receipt.

### ISO on TCP (Message-oriented data transfer)

Complete message blocks are sent via a connection with the protocol variant ISO on TCP; these are recognized as such by the recipient. When using ISO on TCP, "TRCV" signals data receipt as soon as the message block has been completely received. The receive area is defined by the LEN and DATA parameters. If the receive buffer (DATA parameter) is too small for the sent data, "TRCV" signals an error. The successful receipt of data is signaled by the NDR output parameter. The actually received data length in bytes at the RCVD\_LEN parameter corresponds to the data length at the LEN parameter after receipt.

## Parameters

The following table shows the parameters of the "TRCV" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN_R	Input	BOOL	I, Q, M, D, L or constant	Receive enable
ID	Input	CONN_OUC	I, Q, M, D, L or constant	Reference to the connection established with "TCON". Range of values: W#16#0001 to W#16#0FFF
LEN	Input	UDINT	I, Q, M, D, L or constant	Length of the receive area in bytes (hidden). If you use a receive area with optimized access at the DATA parameter, the LEN parameter must have the value "0".
ADHOC	Input	BOOL	I, Q, M, D, L or constant	Use ad-hoc mode for the TCP protocol variant (hidden).
DATA	InOut	VARIANT	I, Q, M, D	Pointer to the receive area
NDR	Output	BOOL	I, Q, M, D, L	Status parameter (New Data Received): <ul style="list-style-type: none"> <li>0: Job not yet started or still in progress</li> <li>1: New data received</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter with the following values: <ul style="list-style-type: none"> <li>0: Job not yet started or already completed</li> <li>1: Job not yet completed. A new job cannot be started</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter ERROR: <ul style="list-style-type: none"> <li>0: No error</li> <li>1: Error occurred</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction
RCVD_LEN	Output	UDINT	I, Q, M, D, L	Amount of data actually received in bytes

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

### LEN, DATA and RCVD\_LEN parameters

- If LEN = 0, the received data is saved in the receive area specified at the DATA parameter. The number of bytes received is indicated at the RCVD\_LEN parameter.
- If the length specified at the LEN parameter is greater than the length of the data received at the DATA parameter, the error code 8088 is output at the STATUS parameter (see description of the STATUS) parameter in the following.
- If a structure (Struct) is referenced via the DATA parameter, LEN can be shorter than the structure. In this case, only the data up to the length of the LEN parameter is transferred.
- If the DATA parameter references a data block with optimized access, the LEN parameter must be set to "0". If the length of the data does not match for elementary data types, the data will not be received and the error code 8088 is output at the STATUS parameter.

- If a STRING data type is referenced via the DATA parameter, the length specified at the LEN parameter must be 0 or >=2 (LEN = 1 is not permitted).
- If a WSTRING data type is referenced via the DATA parameter, the length specified at the LEN parameter must be 0 or >=5.

### BUSY, NDR and ERROR parameters

You can check the status of the job with the BUSY, NDR, ERROR and STATUS parameters. The BUSY parameter indicates the processing status. With the NDR parameter, you can check whether or not a job executed successfully. The ERROR parameter is set when errors occurred during execution of TRCV. The error information is output at the STATUS parameter.

The following table shows the relationship between the BUSY, NDR and ERROR parameters:

BUSY	NDR	ERROR	Description
1	-	-	The job is being processed.
0	1	0	The job was completed successfully.
0	0	1	The job ended with an error. The cause of the error is output at the STATUS parameter.
0	0	0	No new job was assigned.

#### Note

Because "TRCV" is executed asynchronously, the data in the receive area is only consistent when the NDR parameter is set to the value "1".

### ERROR and STATUS parameters

ERROR	STATUS* (W#16#...)	Explanation
0	0000	Job completed successfully. The current length of the received data is output at the RCVD_LEN parameter.
0	7000	Block not ready to receive.
0	7001	Block is ready to receive, receive job was activated.
0	7002	Interim call, the receive job is executing. Note: While the job is being processed, data is written to the receive area. Access to the receive area during this time may provide inconsistent data.
1	8085	<ul style="list-style-type: none"> <li>• The LEN parameter is larger than the highest permitted value.</li> <li>• The value of the LEN or DATA parameter was changed after the first call.</li> <li>• Both LEN parameters and the DATA parameter have the value "0" or LEN is longer than the maximum permitted value (65536).</li> </ul>
1	8086	The ID parameter is outside the permitted value range (1 .. 0x0FFF).
1	8088	<ul style="list-style-type: none"> <li>• Receive area is too small.</li> <li>• The value at the LEN parameter is larger than the receive area set at the DATA parameter.</li> </ul>

ERROR	STATUS* (W#16#...)	Explanation
1	80A1	Communication error: <ul style="list-style-type: none"> <li>• The specified connection has not yet been established.</li> <li>• The specified connection is being terminated. Receive job over this connection is not possible.</li> <li>• The connection is being re-initialized.</li> </ul>
1	80B3	The protocol variant (connection_type parameter in the connection description) is set to UDP. Use the instruction "TURCV" with a UDP connection.
1	80C3	<ul style="list-style-type: none"> <li>• A block with this ID is already being processed in a different priority group.</li> <li>• Internal lack of resources.</li> </ul>
1	80C4	Temporary communication error: <ul style="list-style-type: none"> <li>• The connection cannot be established to the partner at this time.</li> <li>• The interface is receiving new parameter settings or the connection is being established.</li> </ul>
1	80C5	The remote partner has terminated the connection.
1	80C6	The remote partner cannot be reached (network error).
1	80C7	Execution timeout.
1	80C9	The length of the receive area is smaller than the length of the sent data.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

**See also**

TRCV: Receive data via communication connection (Page 3198)

TCON: Establish communication connection (Page 3185)

**Structure of the address information for the remote partner with UDP**

**Overview**

When using a UDP connection, the address information for the remote partner is stored in the system data type TADDR\_Param:

- By using the instruction "TUSEND (Page 3208)" the address information of the recipient is assigned to the parameter ADDR via TADDR\_Param. The stored address data of the remote partner are read from the system data type by the instruction.
- By using the instruction "TURCV (Page 3211)" the address of the sender is received at the parameter ADDR via TADDR\_Param. The address data is written by the instruction in the system data type.

**Structure of the address information according to TADDR\_Param**

The system data type TADDR\_Param contains the address information of the remote partner and consists of the IP address and the port number.

The system data type TADDR\_Param has the following structure:

Byte	Parameter	Data type	Start value	Description
0 to 3	rem_ip_addr	ARRAY [1..4] of USINT	B#16#00 ...	<p>IP address of the remote partner, e.g. 192.168.002.003:</p> <ul style="list-style-type: none"> <li>• rem_ip_addr[1] = B#16#C0 (192)</li> <li>• rem_ip_addr[2] = B#16#A8 (168)</li> <li>• rem_ip_addr[3] = B#16#02 (002)</li> <li>• rem_ip_addr[4] = B#16#03 (003)</li> </ul> <p>The IP address can be taken from the Devices &amp; networks view in the interface properties of the remote partner. As an alternative these are also displayed in the properties of the UDP connection under Address details.</p>
4 to 5	rem_port_nr	UINT	B#16#00 ...	<p>Remote port-number (possible values see: Auto-Hotspot):</p> <ul style="list-style-type: none"> <li>• rem_port_nr[1] = high byte of the port no. in hexadecimal notation</li> <li>• rem_port_nr[2] = low byte of port no. in hexadecimal notation</li> </ul> <p>The port number can be taken from the Devices &amp; networks view in the UDP connection properties. The port number is indicated under Address details as a decimal value.</p> <p>Example: Port number = 2000 (decimal) / W#16#07D0 (hexadecimal)</p> <ul style="list-style-type: none"> <li>• rem_port_nr[1] = 07 (high byte)</li> <li>• rem_port_nr[2] = D0 (low byte)</li> </ul>
6 to 7	reserved	WORD	B#16#00 ...	Not used. Leave the value "0" at this parameter.

### Creating TADDR\_Param in a data block

You have the following options for creating TADDR\_Param:

- Create a new data block and select TADDR\_Param as type in the dialog "Add new data block".
- Open an existing data block create a new tag and enter in the column Data type TADDR\_Param.

A data block can contain several system data types TADDR\_Param.

## TUSEND: Send data via Ethernet (UDP)

### Description

The "TUSEND" instruction sends data to the remote partner addressed by the ADDR parameter using UDP.

#### WARNING

##### Data transfer via UDP

Data transferred via UDP to RFC 768 to the remote partner are sent without acknowledgement and are therefore unsecured. This means the data can be lost without any indication at the block.

#### Note

For sequential send operations to different partners, you only need to adjust the ADDR parameter when calling "TUSEND". You do not need to call the "TCON (Page 3182)" and "TDISCON (Page 3190)" instructions again. The UDP port must be set up at the specific remote partner in order for this partner to receive data.

### Functional description

"The TUSEND" instruction works asynchronously, which means its job processing extends over multiple calls. Create a rising edge at the REQ parameter to establish a connection once again.

The output parameters BUSY, DONE, ERROR and STATUS indicate the status of the job.

See also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794).

The following table shows the relationship between BUSY, DONE and ERROR. Using this table, you can determine the current status of "TUSEND" or when the send process is concluded.

BUSY	DONE	ERROR	Description
TRUE	FALSE	FALSE	The job is being processed.
FALSE	TRUE	FALSE	Job successfully completed.
FALSE	FALSE	TRUE	The job ended with an error. The cause of the error can be found in the STATUS parameter.
FALSE	FALSE	FALSE	The instruction was not assigned a (new) job.

#### Note

Due to the asynchronous operation of "TUSEND", make sure the data in the send area remains consistent until the DONE parameter or the ERROR parameter has the value TRUE.

## Parameters

The following table shows the parameters of the "TUSEND" instruction:

Parameters	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Control parameter REQUEST starts the send job on a rising edge. The data is transferred from the area specified by DATA and LEN.
ID	Input	CONN_OU C	I, Q, M, D, L or constant	Reference to the associated connection between the user program and the communication layer of the operating system. ID must be identical to the associated parameter ID in the local connection description with the instruction "TCON". Range of values: W#16#0001 to W#16#0FFF
LEN	Input	UINT	I, Q, M, D, L or constant	Number of bytes to be sent with the job Range of values: 1 to 1472
DONE	Output	BOOL	I, Q, M, D, L	Status parameter DONE: <ul style="list-style-type: none"> <li>• 0: Job not yet started or still executing.</li> <li>• 1: Job executed without errors. This value is only displayed for one cycle.</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• BUSY = 1: The job is not yet completed. A new job cannot be triggered.</li> <li>• BUSY = 0: The job is completed.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter ERROR: <ul style="list-style-type: none"> <li>• ERROR=1: An error has occurred during processing, STATUS supplies detailed information on the type of error.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status parameter STATUS: Error information
DATA	InOut	VARIANT	I, Q, M, D	Send area, contains address and length  The address refers to: <ul style="list-style-type: none"> <li>• The process image of the inputs</li> <li>• The process image of the outputs</li> <li>• A bit memory</li> <li>• A data block</li> </ul>
ADDR	InOut	VARIANT	D	Pointer to the system data type TADDR_Param. Store the address information of the remote partner (IP address and port number) in a data block with the system data type TADDR_Param. See also: Structure of the address information for the remote partner with UDP (Page 3206)

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

**ERROR and STATUS parameters**

ERROR	STATUS* (W#16#...)	Explanation
0	0000	Send job completed without error
0	7000	No job processing active
0	7001	Start of job processing, data being sent Note: During this processing phase, the operating system accesses the data in the DATA send area.
0	7002	Intermediate call (REQ irrelevant), job is being processed Note: During this processing phase, the operating system accesses the data in the DATA send area.
1	8085	The LEN parameter has the value "0" or is greater than the highest permitted value.
1	8086	The ID parameter is not in the permitted value range.
0	8088	The LEN parameter is greater than the memory area specified in DATA.
1	8089	The ADDR parameter does not point to a data block with the TADDR_Param structure.
1	80A1	Communication error: <ul style="list-style-type: none"> <li>• The specified connection between user program and communication layer of the operating system has not yet been established.</li> <li>• The specified connection between the user program and the communication layer of the operating system is currently being terminated. Transmission over this connection is not possible.</li> <li>• The interface is being reinitialized.</li> </ul>
1	80A4	IP address (at the ADDR parameter) of the remote connection end point is invalid; it may correspond to the local partner's own IP address.
1	80B3	<ul style="list-style-type: none"> <li>• The protocol variant (connection_type parameter in the connection description) is not set to UDP. Please use "TSEND (Page 3195)".</li> <li>• ADDR parameter: Invalid information for port no.</li> </ul>
1	80B7	The length of the structure referenced by the parameter ADDR is not 8 bytes.
1	80C3	<ul style="list-style-type: none"> <li>• A block with this ID is already being processed in a different priority class.</li> <li>• Internal lack of resources.</li> </ul>
1	80C4	Temporary communication error: <ul style="list-style-type: none"> <li>• The connection between the user program and the communication layer of the operating system cannot be established at this time.</li> <li>• New parameter settings are being assigned to the interface.</li> </ul>
1	80C5	The remote partner has terminated the connection.
1	80C6	The remote partner cannot be reached (network error).
1	80C7	Execution timeout.
-	General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## TURCV: Receive data via Ethernet (UDP)

### Description

The "TURCV" instruction receives data via UDP. After successful completion of "TURCV", the ADDR parameter will show you the address of the remote partner (the sender).

#### WARNING

##### Unsecured data transfer

Data transferred via UDP to RFC 768 to the remote partner are sent without acknowledgement and are therefore unsecured. This means the data can be lost without any indication at the block.

### Functional description

"The TURCV" instruction works asynchronously, which means its job processing extends over multiple calls. You start the receive job by calling "TURCV" with EN\_R = 1.

The output parameters BUSY, DONE, ERROR and STATUS indicate the status of the job.

See also: Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions (Page 1794).

The following table shows the relationship between BUSY, NDR and ERROR. Using this table, you can determine the current status of TURCV or when the receive process is concluded.

BUSY	NDR	ERROR	Description
TRUE	FALSE	FALSE	The job is being processed.
FALSE	TRUE	FALSE	Job successfully completed. New data was received.
FALSE	FALSE	TRUE	The job ended with an error. The cause of the error can be found in the STATUS parameter.
FALSE	FALSE	FALSE	The instruction was not assigned a (new) job.

#### Note

Due to the asynchronous operation of "TURCV", the data in the receive area is only consistent when the NDR parameter has the value TRUE.

**Parameters**

The following table shows the parameters of the "TURCV" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN_R	Input	BOOL	I, Q, M, D, L or constant	Control parameter enabled to receive When EN_R = 1, "TURCV" is ready to receive. The receive job is being processed.
ID	Input	WORD	I, Q, M, D, L or constant	Reference to the associated connection between the user program and the communication layer of the operating system. ID must be identical to the corresponding parameter ID in the local connection description. Value range: W#16#0001 to W#16#0FFF
LEN	Input	UINT	I, Q, M, D, L or constant	Length of the receive area in bytes: 0 (recommended) or 1 to 1472
NDR	Output	BOOL	I, Q, M, D, L	Status parameter NDR: <ul style="list-style-type: none"> <li>NDR = 0: Job not yet started or still running</li> <li>NDR = 1: Job successfully completed</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter ERROR: <ul style="list-style-type: none"> <li>ERROR=1: Error occurred during processing. STATUS supplies detailed information on the type of error</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>BUSY = 1: The job is not yet completed. A new job cannot be triggered.</li> <li>BUSY = 0: The job is completed.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status parameter STATUS: Error information
RCVD_LEN	Output	UINT	I, Q, M, D, L	Amount of data actually received in bytes
DATA	InOut	VARIANT	I, Q, M, D, L	Receive area The address references: <ul style="list-style-type: none"> <li>The process image of the inputs</li> <li>The process image of the outputs</li> <li>A bit memory</li> <li>A data block</li> </ul>
ADDR	InOut	VARIANT	D	Pointer to the system data type TADDR_Param. The address information of the remote partner (IP address and port number) is written in a data block with the system data type TADDR_Param. See also: Structure of the address information for the remote partner with UDP (Page 3206)

You can find additional information on valid data types under "Overview of the valid data types (Page 1262)".

**ERROR and STATUS parameters**

ERROR	STATUS* (W#16#...)	Explanation
0	0000	New data was accepted. The current length of the received data is shown in RCVD_LEN.
0	7000	Block not ready to receive
0	7001	Block is ready to receive, receive job was activated
0	7002	Intermediate call, receive job being processed Note: During this processing phase, "TURCV" writes data to the receive area. For this reason, an error could result in inconsistent data in the receive area.
1	8085	The LEN parameter is greater than the largest permitted value, or you changed the value of the LEN or DATA parameter since the first call
1	8086	The ID parameter is not in the permitted value range
1	8088	<ul style="list-style-type: none"> <li>• Receive area is too small</li> <li>• Value in LEN is higher than the receive area specified by DATA</li> </ul>
1	8089	The ADDR parameter does not point to a data block with the TADDR_Param structure.
1	80A1	Communication error: <ul style="list-style-type: none"> <li>• The specified connection between user program and communication layer of the operating system has not yet been established.</li> <li>• The specified connection between the user program and the communication layer of the operating system is currently being terminated. A receive job over this connection is not possible.</li> <li>• New parameter settings are being assigned to the interface.</li> </ul>
1	80B3	The protocol variant (connection_type parameter in the connection description) is not set to UDP. Please use "TRCV (Page 3198)".
1	80B7	The length at ADDR parameter does not correspond to 8 bytes.
1	80C3	<ul style="list-style-type: none"> <li>• A block with this ID is already being processed in a different priority class.</li> <li>• Internal lack of resources.</li> </ul>
1	80C4	Temporary communication error: New parameter settings are being assigned to the interface.
1	80C5	The remote partner has terminated the connection.
1	80C7	Execution timeout.
1	80C9	With RFC1006 / UDP: The received data is longer than expected (size of receive buffer exceeded).
-	General error information	See also: GET_ERR_ID: Get error ID locally (Page 2022)

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

TCON: Establish communication connection (Page 3182)

TDISCON: Terminate communication connection (Page 3190)

## T\_RESET: Resetting the connection

### Description

The "T\_RESET" instruction terminates and then reestablishes an existing connection.

The local end points of the connection are retained. They are generated automatically:

- If a connection has been configured and loaded to the CPU.
- If a connection has been generated by the user program, for example, by calling the instruction "TCON (Page 3182)".

The instruction "T\_RESET" can be executed for all connection types (TCP, UDP, ISO-on-TCP, etc.). It does not matter whether the local interface of the CPU or the interface of a CM/CP was used for the connection.

Once the instruction "T\_RESET" has been called using the REQ parameter, the connection specified with the ID parameter is terminated and, if necessary, the data send and receive buffer cleared. Canceling the connection also cancels any data transfer in progress. There is therefore a risk of losing data if data transfer is in progress. The CPU defined as the active connection partner will then automatically attempt to restore the interrupted communication connection. You therefore do not need to call the "TCON (Page 3182)" instruction to reestablish the communication connection.

The output parameters DONE, BUSY and STATUS indicate the status of the job.

### Parameters

The following table shows the parameters of the "T\_RESET" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Control parameter REQUEST starts the job for terminating the connection specified by ID. The job starts on a rising edge.
ID	Input	CONN_OUC	I, Q, M, D, L or constant	Reference to the connection to the passive partner ID being interrupted must be identical to the corresponding parameter ID in the local connection description. Range of values: W#16#0001 to W#16#0FFF
DONE	Output	BOOL	I, Q, M, D, L	Status parameter DONE <ul style="list-style-type: none"> <li>• 0: Job not yet started or still executing.</li> <li>• 1: Job executed without errors</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter BUSY <ul style="list-style-type: none"> <li>• 0: Job is complete.</li> <li>• 1: The job is not yet completed.</li> </ul>

Parameter	Declaration	Data type	Memory area	Description
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter ERROR <ul style="list-style-type: none"> <li>• 0: No error occurred.</li> <li>• 1: Error occurred during processing. The STATUS parameter supplies detailed information on the type of error</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status parameter STATUS Error information (see "STATUS parameter" table).

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## Parameter STATUS

STATUS* (W#16#...)	Explanation
0000	No error.
0001	Connection has not been established.
7001	Connection termination launched.
7002	Connection being terminated.
8081	Unknown connection specified at the ID parameter.

\* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".

## T\_DIAG: Checking the connection

### Description

You use the "T\_DIAG" instruction to check the status of a connection and read further information on the local end point of this connection.

- The connection is referenced by the ID parameter. You can read both connection end points configured in the connection editor and programmed connection end points (e.g. with the "TCON" instruction).  
Temporary connection end points (for example end points created when you connect to an engineering station) cannot be diagnosed, as no connection ID is generated in this process.
- The connection information read is stored in a structure referenced by the RESULT parameter.
- The output parameter STATUS indicates whether it was possible to read the connection information. The connection information in the structure at the RESULT parameter is only valid if the "T\_DIAG" instruction has been completed with STATUS = W#16#0000 and ERROR = FALSE.  
Connection information cannot be evaluated if an error occurs.

**Possible connection information**

Two different structures can be used to read the connection information at the RESULT parameter:

- The "TDiag\_Status" structure only contains the most important information about a connection end point, for example the protocol used, the connection status and the number of data bytes sent or received.
- The structure "TDiag\_StatusExt" supplies not just the most important information, but also the number of connection attempts, the reason for a connection abort, etc.

The structure and parameters of the two structures are described below (see the "TDIAG\_Status and TDIAG\_StatusExt structures" table).

**Parameters**

The following table shows the parameters of the "T\_DIAG" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Starts the instruction to check the connection specified in the ID parameter when there is a positive edge.
ID	Input	CONN_OUC (WORD)	L, D or constant	Reference to the assigned connection. Range of values: W#16#0001 to W#16#0FFF
RESULT	InOut	VARIANT	D	Pointer to the structure in which the connection information is stored. The structure TDiag_Status or TDiag_StatusExt can be used at the RESULT parameter (for a description, see the "TDIAG_Status and TDIAG_StatusExt structures" table).
DONE	Output	BOOL	I, Q, M, D, L	Status parameter: <ul style="list-style-type: none"> <li>• 0: Instruction not yet started or still in progress.</li> <li>• 1: Instruction executed without errors.</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	Status parameter: <ul style="list-style-type: none"> <li>• 0: Instruction not yet started or already completed.</li> <li>• 1: Instruction not yet completed. A new job cannot be started.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	Status parameter: <ul style="list-style-type: none"> <li>• 0: No error.</li> <li>• 1: Error occurred.</li> </ul>
STATUS	Output	WORD	I, Q, M, D, L	Status of the instruction

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

## Parameters BUSY, DONE and ERROR

You can check the status of "T\_DIAG" instruction execution with the BUSY, DONE, ERROR and STATUS parameters. The BUSY parameter indicates the processing status. You use the DONE parameter to check whether or not an instruction has been executed successfully. The ERROR parameter is set if errors occur during execution of "T\_DIAG".

The following table shows the relationship between the BUSY, DONE and ERROR parameters:

BUSY	DONE	ERROR	Description
1	-	-	The instruction is being processed.
0	1	0	The instruction has been executed successfully. The data in the structure referenced by RESULT are only valid if this is the case.
0	0	1	Instruction completed with an error. The cause of the error is output at the STATUS parameter.
0	0	0	No new instruction has been assigned.

## Parameter STATUS

The following table shows the meaning of the values at the STATUS parameter:

STATUS* (W#16#.. ..)	Explanation
0000	The instruction "T_DIAG" has been executed successfully. The data in the structure referenced at the RESULT parameter can be evaluated.
7000	No instruction processing active.
7001	Instruction processing launched.
7002	Connection information is being read (REQ parameter irrelevant).
8086	The value at the ID parameter is outside the valid range (W#16#0001 ... W#16#0FFF).
8089	The RESULT parameter points to an invalid data type (structures TDIAG_Status and TDIAG_StatusExt only).
80A3	The ID parameter references a connection end point which does not exist. With programmed connections, this error can also occur after the "TDISCON" instruction is called.
80C4	Internal error. Access to the connection end point is temporarily unavailable.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".	

## Structures TDIAG\_Status and TDIAG\_StatusExt

The table below details the form of the TDIAG\_Status and TDIAG\_StatusExt structures:

- From the InterfaceID to the ReceivedBytes parameter, the "TDIAG\_StatusExt" and "TDIAG\_Status" structures are identical.
- The structure TDIAG\_StatusExt also includes the parameters ConnTrials to LastDisconnTimeStamp.

The value of each element is only valid if the instruction has been executed without errors. If an error occurs, the content of the parameters will not change.

Name	Data type	Description
The following parameters are in both the TDIAG_Status and the TDIAG_StatusExt structure:		
InterfaceID	HW_ANY	Interface ID (LADDR) of the CPU or the CM/CP.
ID	CONN_OUT	ID of the connection diagnosed. Following a successful call, the value of this element is identical to the parameter ID of the "T_DIAG" instruction.
ConnectionType	BYTE	<p>Protocol type used for connection:</p> <ul style="list-style-type: none"> <li>• 0x01: Not used.</li> <li>• ...</li> <li>• 0x0B: TCP protocol (IP_v4)</li> <li>• 0x0C: ISO-on-TCP protocol (RFC1006)</li> <li>• 0x0D: TCP protocol (DNS)</li> <li>• 0x0E: Dial-in protocol</li> <li>• 0x0F: WDC protocol</li> <li>• 0x10: SMTP protocol</li> <li>• 0x11: TCP protocol</li> <li>• 0x12: TCP and ISO-on-TCP protocol (RFC1006)</li> <li>• 0x13: UDP protocol</li> <li>• 0x14: Reserved</li> <li>• 0x15: PROFIBUS bus access protocol (FDL)</li> <li>• 0x16: ISO 8073 transport protocol (ISO native)</li> <li>• ...</li> <li>• 0x20: SMTP or SMTPS protocol - based on IPv4</li> <li>• 0x21: SMTP or SMTPS protocol - based on IPv6</li> <li>• 0x22: SMTP or SMTPS protocol - based on FQDN (<b>Fully Qualified Domain Name</b>)</li> <li>• ...</li> <li>• 0x70: S7 connection</li> <li>• Other: Reserved</li> </ul>
ActiveEstablished	BOOL	<ul style="list-style-type: none"> <li>• FALSE: Locally, the passive connection end point</li> <li>• TRUE: Locally, the active connection end point</li> </ul>
State	BYTE	<p>Current status of the connection end point</p> <ul style="list-style-type: none"> <li>• 0x00: Not used.</li> <li>• 0x01: Connection terminated. Temporary status, for example, after the "T_RESET" instruction is called. The system then automatically attempts to reestablish the connection.</li> <li>• 0x02: The active connection end point is attempting to establish a connection to the remote communication partner.</li> <li>• 0x03: The passive connection end point is waiting for establishment of the connection to the remote communication partner.</li> <li>• 0x04: Connection established.</li> <li>• 0x05: The connection is being terminated. This may be because the "T_RESET" or "T_DISCON" instruction has been called. Other possible reasons are protocol errors and line breaks.</li> <li>• 0x06..0xFF: Not used.</li> </ul>

Name	Data type	Description
Kind	BYTE	Mode of the connection end point: <ul style="list-style-type: none"> <li>• 0x00: Not used.</li> <li>• 0x01: Configured, static connection which has been configured and loaded to the CPU.</li> <li>• 0x02: Configured, dynamic connection which has been configured and loaded to the CPU (not currently supported).</li> <li>• 0x03: Programmed connection generated in the user program with the instruction "TCON". A call of the instruction "TDISCON" or a transition to CPU STOP status has destroyed the connection end point.</li> <li>• 0x04: Temporary, dynamic connection established by the engineering station (ES) or operator station (OS), for example. (this connection type cannot currently be diagnosed as there is no ID).</li> <li>• 0x05..0xFF: Not used.</li> </ul>
SentBytes	UDINT	Number of data bytes sent.
ReceivedBytes	UDINT	Number of data bytes received.
The following parameters only occur in the TDiag_StatusExt structure:		
ConnTrials	UDINT	Number of connection attempts. Once a connection has been established, ConnTrials has the value 0. If this element is not equal to 0, there are connection problems. Note: With a passive connection end point, this value is never greater than 1.
ConnTrialsSuccesses	UDINT	Number of successful connection attempts. This element is never reset during the life cycle of a connection end point, and returns to 0 after reaching 0xFFFF FFFF. Note: This parameter is 1 if there has never been a problem in this connection.
LastConnErrReason	UDINT	Error ID output during the last connection attempt with errors (the error messages are identical to those at the LastDisconnReason parameter): <ul style="list-style-type: none"> <li>• 0x4F01: Remote connection end point cannot be reached (this error usually occurs during connection establishment).</li> <li>• 0x4F02: Connection terminated locally.</li> <li>• 0x4F03: Connection terminated by remote communication partner.</li> <li>• 0x4F04: Connection terminated by a protocol error.</li> <li>• 0x4F05: Connection terminated by a network problem detected locally.</li> <li>• 0x4F06: Connection terminated by a network problem detected remotely.</li> <li>• 0x4F07: Connected terminated due to timeout in protocol.</li> <li>• 0x4F08: Incorrect parameter assignment: Connection to be established to local partner's own address.</li> <li>• 0x4F09: Connection temporarily reset by a call of the instruction "T_RESET".</li> <li>• 0x4F0A: Insufficient connection resources available (quantity exceeded)</li> <li>• 0x4F0B: Internal error: Incorrect addressing parameters</li> <li>• 0x4F0C: Internal CPU communication error</li> <li>• 0x4F0D: Internal AS communication error between CPU and CM/CP</li> <li>• 0x4F0E: The local TCP/UDP port (or RFC1006-T selector) specified is already in use.</li> </ul>
LastConnErrTimeStamp	LDT	Time of the last connection attempt with errors.

Name	Data type	Description
LastDisconnReason	UDINT	<p>Error ID which led to the last connection termination (the error messages are identical to those at the LastConnErrReason parameter):</p> <ul style="list-style-type: none"> <li>• 0x4F01: Remote connection end point cannot be reached (this error usually occurs during connection establishment).</li> <li>• 0x4F02: Connection terminated locally.</li> <li>• 0x4F03: Connection terminated by remote communication partner.</li> <li>• 0x4F04: Connection terminated by a protocol error.</li> <li>• 0x4F05: Connection terminated by a network problem detected locally.</li> <li>• 0x4F06: Connection terminated by a network problem detected remotely.</li> <li>• 0x4F07: Connected terminated due to timeout in protocol.</li> <li>• 0x4F08: Incorrect parameter assignment: Connection to be established to local partner's own address.</li> <li>• 0x4F09: Connection temporarily reset by a call of the instruction "T_RESET".</li> <li>• 0x4F0A: Insufficient connection resources available (quantity exceeded)</li> <li>• 0x4F0B: Internal error: Incorrect addressing parameters</li> <li>• 0x4F0C: Internal CPU communication error</li> <li>• 0x4F0D: Internal AS communication error between CPU and CP/CM</li> <li>• 0x4F0E: The local TCP/UDP port (or RFC1006-T selector) specified is already in use.</li> </ul>
LastDisconnTime Stamp	LDT	Time of the last connection termination.

### T\_CONFIG: Configure interface

#### Description T\_CONFIG

#### Description

The "T\_CONFIG" instruction is used for the program-controlled configuration of the integrated PROFINET interfaces of the CPU or the interface of a CP/CM.

You can change the Ethernet address of the PROFINET device name from the user program via the instruction. The existing configuration data is overwritten.

You can make the following changes via the instruction "T\_CONFIG":

- Settings for the IP protocol
  - IP address
  - Subnet mask
  - Router address
- Settings for PROFINET
  - Assignment of the PROFINET device name

The settings correspond with the configuration options under "IP protocol" and "PROFINET" in the dialog "Ethernet addresses". This is displayed in the view "devices & networks" under the properties of the PROFINET interface.

**WARNING****Restart of CPU after execution of the "T\_CONFIG" instruction**

The CPU is restarted after you have executed the instruction to change an IP parameter. The CPU goes to STOP mode, a warm restart is carried out and the CPU starts up again (RUN mode).

Make sure that the control process is in a secure operating mode after the CPU has been restarted following execution of the instruction. Uncontrolled operation can result in serious material damage or personal injury due to malfunctions or programming errors, for example. Non-retentive data could be lost.

## Requirement

In order to use the instruction must be explicitly specified in the hardware configuration that the assignment of IP address parameters and device name must be made by the user program.

- For this purpose open the properties of the PROFINET interface in the device view. Activate the following options in the dialog "Ethernet addresses":
  - In order to change the IP address parameters with "T\_CONFIG": Select the setting "Set IP address using a different method" under "IP protocol".
  - In order to change the PROFINET device name with "T\_CONFIG": Select the setting "Set PROFINET device name using a different method" under "PROFINET".
- The configuration data must be stored in the following system data types and assigned at the parameter CONF\_DATA (Page 3224):
  - Store the IP address, subnet mask, and the router address in the system data type IF\_CONF\_V4.
  - Store the device name in the system type IF\_CONF\_NOS. Observe the restrictions that exist for assigning the name of the device (see parameter CONF\_DATA (Page 3224)).

## Functional description

The "T\_CONFIG" instruction works asynchronously, which means its execution extends over multiple calls. The configuration process is started by calling "T\_CONFIG" with REQ = 1. Only one job can be active at any time.

The block is edge triggered which means that after BUSY= FALSE the block must be re-called with REQ=FALSE to enable the instance.

**Parameters**

The following table shows the parameters of the "T\_CONFIG" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Calling the instruction with REQ = 1 starts processing of the instruction.
INTERFACE	Input	HW_INTERFACE	I, Q, M, D, L or constant	Hardware identifier of the interface The hardware ID is displayed in the properties of the interface in the device view, and in the system constants of the PLC tags.
CONF_DATA (Page 3224)	Input	VARIANT	D, L	Pointer to the parent structure that contains the system data types IF_CONF_HEADER, IF_CONF_V4 and IF_CONF_NOS (see description of the parameters CONF_DATA).
DONE (Page 3228)	Output	BOOL	I, Q, M, D, L	Status parameter: <ul style="list-style-type: none"> <li>0: Processing not yet complete.</li> <li>1: Processing of instruction finished successfully.</li> </ul>
BUSY (Page 3228)	Output	BOOL	I, Q, M, D, L	Status parameter: <ul style="list-style-type: none"> <li>0: Processing of the instruction has not started, completed or canceled yet.</li> <li>1: Processing of instruction is in progress</li> </ul>
ERROR (Page 3228)	Output	BOOL	I, Q, M, D, L	Status parameter: <ul style="list-style-type: none"> <li>0: No error</li> <li>1: Error</li> </ul>
STATUS (Page 3228)	Output	DWORD	I, Q, M, D, L	Detailed status information: Detailed error and status information in the form of an error code are output at the parameter STATUS.
ERR_LOC (Page 3228)	Output	DWORD	I, Q, M, D, L	Error location: <ul style="list-style-type: none"> <li>0: Error during execution of the instruction or when assigning parameters.</li> <li>&gt; 0: Errors in the structure or content of the configuration data at the parameter CONF_DATA.</li> </ul>

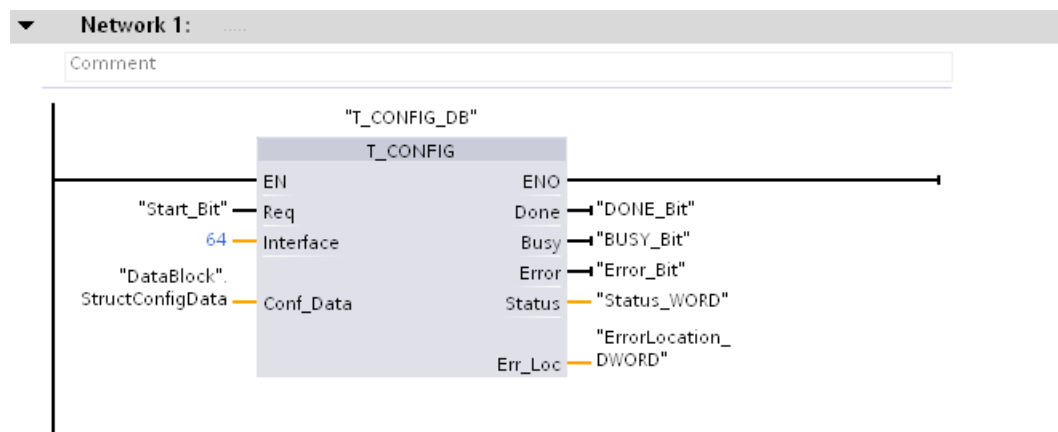

For additional information on valid data types, refer to "Overview of the valid data types (Page 1262)".

**Example**

In the following example the device name of an IO device is changed with the instruction "T\_CONFIG".

**Call of instruction**

- The execution of the instruction is started with REQ=1.
- The hardware ID of the PROFINET interface is specified at the parameter Interface.
- The structure "StructConfigData" is referenced at the parameter CONF\_DATA. The structure was created in the global data block "DataBlock".

### Parameters CONF\_DATA

The structure "StructConfigData" at the parameter CONF\_DATA contains the following information:

- In the Header (IF\_CONF\_HEADER).  
SubfieldCount = 1: Indicates that only one additional structure (nos) is used below.
- In the structure "nos" (system data type IF\_CONF\_NOS)
  - Length = 11: Information on overall length of the structure NOS (5 bytes for the device name "myplc" + 6 bytes for the parameters Id, Length and Mode)  
Note: Instead of an absolute length, you can use the default start value (Length = 0) for a dynamic length.
  - Mode = 1: Permanent change of the device name in "myplc".
  - NOS[1] ... NOS[5]: Device name (1 character / byte)

DataBlock			
	Name	Data type	Start value
1	▼ Static		
2	▼ StructConfigData	Struct	
3	▼ Header	IF_CONF_Header	
4	Fieldtype	UInt	0
5	FieldId	UInt	0
6	SubfieldCount	UInt	1
7	▼ nos	IF_CONF_NOS	
8	Id	UInt	40
9	Length	UInt	11
10	Mode	UInt	1
11	▼ NOS	array [1..240] of Byte	
12	NOS[1]	Byte	'm'
13	NOS[2]	Byte	'y'
14	NOS[3]	Byte	'p'
15	NOS[4]	Byte	'l'
16	NOS[5]	Byte	'c'
17	NOS[6]	Byte	16#0
18	NOS[7]	Byte	16#0
19	NOS[8]	Byte	16#0
20	NOS[9]	Byte	16#0
21	NOS[10]	Byte	16#0
22	NOS[11]	Byte	16#0

**See also**

Evaluating errors with output parameter RET\_VAL (Page 1796)

**Parameter CONF\_DATA**

**Structure of the configuration data**

The configuration data at the parameter CONF\_DATA can be stored in a global data block or in the section "Static" of the block interface.

The configuration data must be stored according to the following structure:

Name	Data type	Description
ConfData	Struct	Parent structure that is assigned at the parameter CONF_DATA.
Header	IF_CONF_HEADER	The header is used to define the number of these system data types. The system data type IF_CONF_HEADER must always be included.
IPData	IF_CONF_V4	The IP address, subnet mask and router address are stored in this system data type. Only create IF_CONF_V4 if you also want to change the Ethernet address with "T_CONFIG".
NoS	IF_CONF_NOS	The PROFINET device names are stored in this system data type. Only create IF_CONF_NOS if you also want to change the device names with "T_CONFIG".

The system data types IF\_CONF\_HEADER, IF\_CONF\_V4 and IF\_CONF\_NOS are created by entering the name of the system data type in the column "data type" of the data block or the block interface. The name for the system data types can be freely assigned.

### System data type IF\_CONF\_Header

Use the system data type IF\_CONF\_Header to specify the number of system data types IF\_CONF\_V4 and IF\_CONF\_NOS that are used during the execution of "T\_CONFIG".

Byte	Parameter	Data type	Start value	Description
0 ... 1	FieldType	UINT	0	Field type: Must always have the value "0".
2 ... 3	FieldId	UINT	0	Error ID: Must always have the value "0".
4 ... 5	SubfieldCount	UINT	0	Number of system data types IF_CONF_V4 and IF_CONF_NOS: <ul style="list-style-type: none"> <li>• 1: Only one of the system data types is used.</li> <li>• 2: Both system data types are used</li> </ul>

### System data type IF\_CONF\_V4

The IP address, subnet mask and router address are defined with the system data type IF\_CONF\_V4.

Byte	Parameter	Data type	Start value	Description
0 ... 1	Id	UINT	30	System data type ID The start value of this parameter may not be changed.
2 ... 3	Length	UINT	18	Length of the system data type IF_CONF_V4 The start value must be used for the length specification since the parameters of IF_CONF_V4 have a fixed length and structure.
4 ... 5	Mode	UINT	0	Validity of addressing: <ul style="list-style-type: none"> <li>• 1: Permanent validity of the configuration data</li> <li>• 2: Temporary validity of the configuration data including the deletion of existing permanent configuration data</li> </ul>
6 ... 9	InterfaceAddress	IP_V4 *	0.0.0.0	IP address
10 ... 12	SubnetMask	IP_V4 *	0.0.0.0	Subnet mask
14 ... 16	DefaultRouter	IP_V4 *	0.0.0.0	Router address

\* The data type IP\_V4 is a structure of 4 BYTE, which includes the respective address of the respective parameter (e.g. at parameter SubnetMask the four-digit address of the subnet mask of the IP protocol).

**Subfield IF\_CONF\_NOS**

Use the subfield IF\_CONF\_NOS to specify the station name to be assigned during execution of the instruction "T\_CONFIG".

Byte	Parameter	Data type	Start value	Description
0 ... 1	Id	UINT	40	System data type ID The start value of this parameter may not be changed.
2 ... 3	Length	UINT	246	<p>Length of the system data type IF_CONF_NOS in bytes.</p> <ul style="list-style-type: none"> <li>• For an absolute length, the value for the Length parameter consists of:                             <ul style="list-style-type: none"> <li>– 6 bytes for the parameter Id, Length and Mode.</li> <li>– up to 240 bytes for the device name (parameter NOS).</li> </ul> <p>Example: An overall length of 10 is the result for the device name "plc1" with a length of 4 characters (=4 bytes).</p> </li> <li>• Use the default start value 246 at the Length parameter for a dynamic length. Make sure that you enter the value "0" after the name (see description for NOS parameter).</li> </ul>

Byte	Parameter	Data type	Start value	Description
4 ... 5	Mode	UINT	0	Validity of the device name change: <ul style="list-style-type: none"> <li>• 1: Permanent validity of the device name.</li> <li>• 2: Temporary validity of the device name.</li> </ul>
6 ... 244	NOS	ARRAY [1...240] of Byte	0	<p>Device name (Name of Station)</p> <ul style="list-style-type: none"> <li>• You must occupy the ARRAY from the first byte. The station name is deleted if "0" is assigned as the first byte.</li> <li>• The minimum length for the name is 2 bytes. The maximum length for a name is 240 bytes.</li> <li>• If the device name is shorter than specified at the parameter Length then a zero byte (16#0 hex) must be entered after the actual station name (according to IEC 61185-6-10). Otherwise NOS will be rejected and the instruction "T_CONFIG" outputs the error code DW#16#C0809400 at the parameter STATUS.</li> <li>• If the device name is longer than specified at the parameter Length then the device name will only be written up to to specified length.</li> </ul> <p>The following restrictions apply for the device name:</p> <ul style="list-style-type: none"> <li>• The name must be specified in ASCII code.</li> <li>• Only lowercase letters, numbers, hyphen or dots may be used for the name. <ul style="list-style-type: none"> <li>– The name may not begin or end with a hyphen.</li> <li>– The name may not begin with numbers.</li> <li>– The name may not have the form n.n.n.n (n = 0, ... 999).</li> <li>– The name may not begin with the string "port-xyz" or "port-xyz-abcde" (a, b, c, d, e, x, y, z = 0, ... 9).</li> </ul> </li> <li>• A name component between two points may be up to 63 characters long.</li> <li>• No special characters such as umlauts, brackets, underscore, slash, blank etc.</li> </ul> <p>The error code C080_9400 is output at the parameter STATUS if an invalid character is used.</p>

## DONE, BUSY and ERROR parameters

### Description

The following table shows the relationship between BUSY, DONE and ERROR. Using this table, you can determine the current status of the instruction and when the transfer of configuration data is concluded.

BUSY	DONE	ERROR	Description
TRUE	FALSE	FALSE	The job is being processed.
FALSE	TRUE	FALSE	Job successfully completed.
FALSE	FALSE	TRUE	The job ended with an error. The cause of the error can be found in the parameter STATUS (Page 3228).
FALSE	FALSE	FALSE	The instruction was not assigned a (new) job.

## Parameter STATUS and ERR\_LOC

### Description

The status and error messages of the instruction "T\_CONFIG" are output at the parameters STATUS and ERR\_LOC.

- The cause of the error is output at the parameter STATUS.
- The location of the error that occurred is output at the parameter ERR\_LOC. The following options are available here:
  - 16#0000\_0000: Error when calling the instruction (e.g. errors when assigning parameters to the instruction or in communication with the PROFINET interface).
  - 16#0001\_0000: Error with the configuration data in the parameters of the system data type IF\_CONF\_HEADER.
  - 16#0001\_0001: Error with the configuration data in the parameters of the system types IF\_CONF\_V4 or IF\_CONF\_NOS.

The following table shows the possible values for the parameters STATUS and ERR\_LOC:

STATUS*	ERR_LOC*	Explanation
0000_0000	0000_0000	Order processing completed without errors.
0070_0000	0000_0000	No job processing active.
0070_0100	0000_0000	Start of the order processing.
0070_0200	0000_0000	Intermediate call (REQ irrelevant).
C08x_yy00	0000_0000	General error information. See also: GET_ERR_ID: Get error ID locally (Page 2022)
C080_8000	0000_0000	Error at call of the instruction: The hardware ID at the parameter Interface is invalid.
C080_8100	0000_0000	Error at call of the instruction: The hardware ID at the parameter Interface does not address a PROFINET interface.

STATUS*	ERR_LOC*	Explanation
C080_8700	0000_0000	Error at call of the instruction: Incorrect length of the data block at the parameter CONF_DATA.
C080_8800	0001_0000	Error in the system data type IF_CONF_HEADER: The parameter FieldType has an invalid value. Use the value "0" for FieldType.
C080_8900	0001_0000	Error in the system data type IF_CONF_HEADER: The parameter FieldId has an invalid value or was used several times. Use the value "0" for FieldId.
C080_8A00	0001_0000	Error in the system data type IF_CONF_HEADER: Incorrect number at the parameter SubfieldCount. Enter the correct number of system data types IF_CONF_V4 and IF_CONF_NOS in use.
C080_8B00	0001_0001	Error in the system data type IF_CONF_V4 or IF_CONF_NOS: The parameter Id has an invalid value. Use "30" and IF_CONF_NOS "40" for IF_CONF_V4.
C080_8C00	0001_0001	Error in the system data type IF_CONF_V4 or IF_CONF_NOS: Incorrect data type system used, wrong order or multiple use of a system data type.
C080_8D00	0001_0001	Error in the system data type IF_CONF_V4 or IF_CONF_NOS: The parameter Length has an incorrect or invalid value.
C080_8E00	0001_0001	Error in the system data type IF_CONF_V4 or IF_CONF_NOS: The parameter Mode has an incorrect or invalid value. Only the values "1" (permanent) or "2" (temporary) are valid.
C080_9000	0001_0001	Error in the system data type IF_CONF_V4 or IF_CONF_NOS: Configuration data cannot be applied. Possible cause: The setting "Set IP address on device" or "Set PROFINET device name on device" was not selected in the hardware configuration.
C080_9400	0001_0001	Error in the system data type IF_CONF_V4 or IF_CONF_NOS: A parameter value is undefined or invalid.
C080_9500	0001_0001	Error in the system data type IF_CONF_V4 or IF_CONF_NOS: The values of two parameters are inconsistent.
C080_C200	0000_0000	Error at call of the instruction: The configuration data can not be transferred. Possible cause: The PROFINET interface is not accessible.
C080_C300	0000_0000	Error at call of the instruction: Insufficient resources (e.g., multiple calling of "T_CONFIG" with different parameters).
C080_C400	0000_0000	Error at call of the instruction: Temporary communication error. Time indication for change to daylight saving time.
C080_D200	0000_0000	Error at call of the instruction: Call not possible. Instruction is not supported by the selected PROFINET interface.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".		

#### 9.7.5.4 Web server

### WWW: Synchronizing user-defined web pages

#### Description

The instruction WWW initializes the web server of the CPU or synchronizes user-defined web pages with the user program in the CPU.

User-defined web pages together with the web server make it possible for the CPU to access freely designed web pages of the CPU with a web browser.

Use script instructions (such as Javascript) and HTML code in user-defined web pages to transfer data via a web browser for further processing to the CPU and to display data from the operand area of the CPU in the web browser. Call the WWW instruction in the user program for synchronization of the user program and the web server as well as initialization.

#### Initialization

User-defined web pages are "packaged" in data blocks for processing by the CPU. You will have to generate appropriate data blocks from the source files (HTML files, screens, Javascript files, ...) during configuration. The Web Control DB has a special role (default: DB 333). It contains status and control information as well as links to additional data blocks with coded web pages. The data blocks with coded web pages are called fragment DBs.

When the data block is downloaded into the CPU, the CPU does not "know" that user-defined web pages are coded inside it. The instruction "WWW" in the startup OB, for example, will inform the CPU which DB is the Web Control DB. The user-defined web pages can be accessed via a web browser after this initialization.

#### Synchronization

If you want the user program to interact with the user-defined web pages, then the instruction WWW must be used in the cyclical program part.

Examples of interaction between user program and web page:

- Check received data
- Assemble and send back data to the web browser making the request

In this case it must be possible to evaluate the current status information and the web server must receive control information, such as release of a web page requested by a web browser.

## Parameter

The following table shows the parameters of the instruction "WWW":

Parameter	Declaration	Data type	Memory area	Description
CTRL_DB	Input	DB_WWW	D	Data block that describes the user-defined web pages (Web Control DB)
RET_VAL	Output	INT	I, Q, M, D, L	Error information

For additional information on valid data types, refer to Overview of the valid data types (Page 1262).

## Parameter RET\_VAL

Error code (W#16#...)	Explanation
0000	No error occurred. There are no web page requests that have to be released by the user program.
00xy	x: indicates whether an error has occurred during initialization of the Web Control DB (CTRL_DB): x=0: No errors occurred. x=1: Error occurred. The error is coded in the byte "CTRL_DB.last_error" of the Web Control DB, see description of Web Control DB. y: Number of the pending request. Several requests are possible (e. g. requests "0" and "1" are pending: y="3"). y="1": Request "0" y="2": Request "1" y="4": Request "2" y="8": Request "3"
803A	The specified Web Control DB does not exist on the CPU.
8081	Incorrect version or incorrect format of the Web Control DB
80C1	There are no resources to initialize the web application.

### 9.7.5.5 TeleService

#### TM\_MAIL: Transfer email

#### Description of TM\_MAIL

##### Description

The "TM\_MAIL" instruction works asynchronously, in other words, its execution extends over multiple calls. You must specify an instance when you call the instruction "TM\_MAIL". The attribute "retentive" may not be set in the instance. This attribute ensures that the instance is initialized when the CPU switches from STOP to RUN and that a new e-mail send job can be triggered afterwards.

You start the sending of an e-mail with an edge change from "0" to "1" for the REQ parameter. The job status is indicated by the output parameters BUSY , "DONE", "ERROR", "STATUS" and "SFC\_STATUS". "SFC\_STATUS" corresponds in this case to the "STATUS" output parameter of the called communication blocks.

The output parameters DONE, ERROR, STATUS, and SFC\_STATUS are each displayed for only one cycle if the status of the BUSY output parameter changes from "1" to "0". The following table shows the relationship between BUSY, DONE, and ERROR. Using this table, you can determine the current status of the instruction "TM\_MAIL" and when the sending of the e-mail is complete.

DONE	BUSY	ERROR	Description
0	1	0	The job is being processed.
1	0	0	Job successfully completed.
0	0	1	The job ended with an error. The cause of the error can be found in the STATUS and SFC_STATUS parameters.
0	0	0	The "TM_MAIL" instruction was not assigned a (new) job.

If the CPU changes to STOP mode while "TM\_MAIL" is active, the communication connection to the mail server aborts. The communication connection to the mail server will also be lost if

communication problems occur on the Industrial Ethernet bus. In this case, the transfer of the e-mail will be interrupted and it will not reach its recipient.

#### NOTICE

##### Changing user programs

You can change the parts of your user program that directly affect calls of "TM\_MAIL" only:

- when the CPU is in "STOP" mode or
- when no mail is being sent (REQ = 0 and BUSY = 0).

This relates, in particular, to deleting and replacing program blocks that contain "TM\_MAIL" calls or calls for the instance of "TM\_MAIL".

Ignoring this restriction can tie up connection resources. The automation system can change to an undefined status for the TPC/IP communication functions via Industrial Ethernet.

A warm or cold restart of the CPU is required after the changes are transferred.

## Data consistency

The ADDR\_MAIL\_SERVER input parameter of the instruction is taken from the "TM\_MAIL" instruction again each time the sending of an e-mail is triggered. If a change is made during operation, the "new" value only becomes effective once an e-mail is triggered again.

In contrast, the WATCH\_DOG\_TIME, TO\_S, CC, FROM, SUBJECT, TEXT, ATTACHMENT, and, if applicable, USERNAME and PASSWORD parameters are taken from the "TM\_MAIL" instruction while it is running, which means that they may only be changed after the job is complete (BUSY = 0)

## Setting the parameters of the TS Adapter IE

On the TS Adapter IE, you need to specify parameters for outgoing calls in such a way as to enable the TS Adapter IE to establish a connection to the dial-up server of your service provider.

If you set "When required" for connection establishment, the connection will only be established when an e-mail needs to be sent.

Connection establishment can take longer (approx. one minute) for an analog modem connection. When you specify the WATCH\_DOG\_TIME parameter, remember to allow for the time required to establish the connection.

**Parameters**

The following table shows the parameters of the "TM\_MAIL" instruction:

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	Control parameter REQUEST: Activates the sending of an e-mail on a rising edge.
ID	Input	CONN_OUT C (Word)	D, L or constant	Reference to the connection to be established. See ID parameter of the TCON (Page 3182), TDISCON (Page 3190), TSEND (Page 3195), and TRCV (Page 3198) instructions. A number that is not used for any additional instances of this instruction in the user program must be entered here.
TO_S (Page 3236)	Input	STRING	D	Input parameter for receiver addresses: STRING with a maximum length of 240 characters (see example call).
CC (Page 3236)	Input	STRING	D	Input parameter for CC recipient addresses (optional): STRING with a maximum length of 240 characters (see example call). If an empty string is assigned here, the e-mail is not sent to a CC recipient.
SUBJECT	Input	STRING	D	Input parameter for subject of the e-mail: STRING with a maximum length of 240 characters.
TEXT	Input	STRING	D	Input parameter for text of the e-mail (optional): Reference to a data string with a maximum length of 240 characters. If an empty string is assigned at this parameter, the e-mail is sent without text.
ATTACHMENT	Input	VARIANT	I, Q, M, D, L	Input parameter for e-mail attachment (optional): Reference to a byte/word/double word field with a maximum length of 65534 bytes. If no value is assigned, the e-mail is sent without an attachment.
DONE	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• DONE = 0: Job not yet started or still executing.</li> <li>• DONE = 1: Job was executed without errors.</li> </ul>
BUSY	Output	BOOL	I, Q, M, D, L	<ul style="list-style-type: none"> <li>• BUSY = 1: E-mail transmission is not yet complete.</li> <li>• BUSY=0: The processing of "TM_MAIL" was stopped.</li> </ul>
ERROR	Output	BOOL	I, Q, M, D, L	ERROR=1: An error occurred during processing. STATUS and SFC_STATUS supply detailed information about the type of error.
STATUS (Page 3237)	Output	WORD	I, Q, M, D, L	Output/status parameter STATUS: Return value or error information of the "TM_MAIL" instruction.

Parameter	Declaration	Data type	Memory area	Description
ADDR_MAIL_SERVER	Static*	DWORD	I, Q, M, D, L	IP address input parameter of the mail server: Specify as a data word in HEX format, for example: IP address = 192.168.0.200. ADDR_MAIL_SERVER = DW#16#C0A800C8, where: <ul style="list-style-type: none"> <li>• 192 = 16#C0,</li> <li>• 168 =16#A8</li> <li>• 0 = 16#00 and</li> <li>• 200 = 16#C8.</li> </ul>
WATCH_DOG_TIME	Static*	TIME	I, Q, M, D, L	Input parameter for max. period of time: The "TM_MAIL" instruction should establish a connection within the period specified by WATCH_DOG_TIME. The block is exited with an error if this period is exceeded. The time before the block is exited and the error is output can exceed the WATCH_DOG_TIME because connection termination also takes a certain amount of time. To begin with, you should set a period of 2 minutes. If you have an ISDN telephone connection, a significantly shorter period can be selected.
USERNAME	Static*	STRING	D	Input parameter for user name: STRING with a maximum length of 180 characters. A user name is an absolute requirement for authentication.
PASSWORD	Static*	STRING	D	Input parameter for password: STRING with a maximum length of 180 characters. A password is an absolute requirement for authentication.
FROM (Page 3236)	Static*	STRING	D	Input parameter for sender address: STRING with a maximum length of 240 characters (see example call).
SFC_STATUS (Page 3237)	Static*	WORD	I, Q, M, D, L	Output/status parameter "SFC_STATUS": Error information of the called communication blocks.
*The values of the parameter are not modified at every call of the instruction "TM_MAIL". The values are in the static parameters of the instance and are only written once at the first call of the instruction.				

You will find more detailed information on valid data types in "Overview of the valid data types (Page 1262)".

#### Note

##### Optional parameters

The optional parameters CC, TEXT, and ATTACHMENT are only sent with the e-mail if the corresponding parameters contain a string of length > 0.

## SMTP authentication

Authentication refers here to a procedure for ensuring an identity, for example, by a password query.

The "TM\_MAIL" instruction supports the SMTP authentication procedure AUTH-LOGIN that is requested by most mail servers. For information about the authentication procedure of your mail server, please refer to your mail server manual or the website of your Internet service provider.

To use the AUTH-LOGIN authentication procedure, the "TM\_MAIL" instruction requires the user name with which it can log onto the mail server. This user name corresponds to the user name with which you set up a mail account on your mail server. It is made available to the "TM\_MAIL" instruction in the USERNAME parameter.

To log on, the "TM\_MAIL" instruction also requires the associated password. This password corresponds to the password you specified when you set up your mail account. It is made available to the "TM\_MAIL" instruction in the PASSWORD parameter.

The user name and the password are each transferred to the mail server unencrypted (BASE64-coded).

If no user name is specified in the DB, the AUTH-LOGIN authentication procedure is not used. The e-mail is then sent without authentication.

## Parameters TO\_S, CC, and FROM

### Description

The TO\_S, CC, and FROM parameters are strings with, for example, the following content:

- TO: <wenna@mydomain.com>, <ruby@mydomain.com>,
- CC: <admin@mydomain.com>, <judy@mydomain.com>,
- FROM: <admin@mydomain.com>

Note the following rules when entering the parameters:

- The "TO:", "CC:", and "FROM:" characters must be entered.
- A space and an opening pointed bracket "<" must be entered before each address.
- A closing pointed bracket ">" must be entered after each address.
- A comma must be entered after each address in TO and CC.
- Only one e-mail may be entered in FROM, and there must not be a comma at the end of this address

Because of runtime and memory space, the "TM\_MAIL" instruction does not perform any syntax check of the parameters TO\_S, CC and FROM.

## STATUS and SFB\_STATUS parameters

### Description

The return values of the "TM\_MAIL" instruction can be classified as follows:

- W#16#0000: "TM\_MAIL" was completed successfully
- W#16#7xxx: Status of "TM\_MAIL"
- W#16#8xxx: An error was reported during the internal call of a communication block or from the mail server.

The following table shows the return values of "TM\_MAIL" except for error codes of the internally called communication blocks.

Return value STATUS* (W#16#...):	Return value SFB_STATUS (W#16#...):	Explanation	Notes
0000	-	The processing of "TM_MAIL" was completed without error.	A without error completion of "TM_MAIL" does not mean that the sent e-mail will necessarily arrive (see below - note on point 1)
7001		"TM_MAIL" is active (BUSY = 1).	Initial call; job has started
7002	7002	"TM_MAIL" is active (BUSY = 1).	Intermediate call; job already active
8xxx	xxxx	The processing of "TM_MAIL" was completed with an error code of the internally called communication instructions.	For detailed information on the evaluation of the SFB_STATUS parameter, refer to the descriptions of the STATUS parameter of the communication instructions.
8010	xxxx	Error during connection establishment.	For further information on the evaluation of the SFB_STATUS parameter, refer to the descriptions of the STATUS parameter of the "TCON (Page 3182)" instruction.
8011	xxxx	Error sending the data.	For further information on the evaluation of SFB_STATUS, refer to the descriptions of the STATUS parameter of the "TSEND (Page 3195)" instruction.
8012	xxxx	Error receiving the data.	For further information on the evaluation of SFB_STATUS, refer to the descriptions of the STATUS parameter of the "TRCV (Page 3198)" instruction.
8013	xxxx	Error during connection establishment.	For further information on the evaluation of SFB_STATUS, refer to the descriptions of the STATUS parameter of the "TCON (Page 3182)" and "TDISCON (Page 3190)" instructions.

9.7 References

Return value STATUS* (W#16#...):	Return value SFB_STATUS (W#16#...):	Explanation	Notes
8014	-	Establishment of a connection is not possible.	You have possibly entered an incorrect mail server IP address (ADDR_MAIL_SERVER) or a time span that is too short (WATCH_DOG_TIME) to establish the connection. It is also possible that the CPU has no connection to the network or that the CPU configuration is incorrect.
8016	-	Error copying the attachment	-
82xx, 84xx, or 85xx	-	The error message originates from the mail server and corresponds, except for the "8", to the error number of the SMTP protocol.  The following columns list several error codes that can occur:	See point 2 in the note.
8450	-	Action not executed: Mailbox not available/ not reachable.	Try again later.
8451	-	Action aborted: Local processing error	Try again later.
8500	-	Syntax error: Error not recognized. This also includes the error when a command string is too long. This can also occur when the e-mail server does not support the LOGIN authentication procedure.	Check the parameters of "TM_MAIL". Try to send an e-mail without authentication. To do this, replace the USERNAME parameter with an empty string.
8501	-	Syntax error: Parameter or argument incorrect	You have possibly entered an incorrect address in TO_S or CC.
8502	-	Command unknown or not implemented.	Check your entries, in particular the FROM parameter. This is possibly incomplete and you have forgotten "@" or ".".
8535	-	SMTP authentication incomplete.	You have possibly entered an incorrect user name or incorrect password.
8550	-	Mail server cannot be reached, you have no access rights.	You have possibly entered an incorrect user name or password, or the mail server does not support your LOGIN. Another cause of error could be an incorrect entry of the domain name after the "@" in TO_S or CC.
8552	-	Action aborted: Assigned memory size has been exceeded	Try again later.
8554	-	Transmission failed.	Try again later.
* The error codes can be displayed as integer or hexadecimal values in the program editor. For additional information on toggling display formats, refer to "See also".			

---

**Note**

**Status error**

1. An incorrect entry of the recipient addresses does not generate a status error of the "TM\_MAIL" instruction. In this case, there is no guarantee that the e-mail will be sent to other recipients, even if these were entered correctly.
  2. You can find more detailed information on the SMTP error code and other error codes in SMTP protocol on the Internet or in the error documentation of the mail server. You can also view the most recent message from the mail server in your instance DB in the BUFFER1 parameter. If you look under "Data", you will find the data most recently sent by the "TM\_MAIL" instruction.
-

## Visualize processes

### 10.1 Creating screens

#### 10.1.1 Basics

##### 10.1.1.1 Screen basics

#### Introduction

In WinCC you create screens that an operator can use to control and monitor machines and plants. When you create your screens, the object templates included support you in visualizing processes, creating images of your plant, and defining process values.

#### Application example

The figure shows a screen that was created in WinCC. With the help of this screen, the operator can operate and monitor the mixing station of a fruit juice manufacturing system. Fruit juice base is supplied from various tanks to a mixing unit. The screen indicates the fill level of the tanks.

#### Screen design

Insert an object you need to represent a process into your screen. Configure the object to correspond to the requirements of your process.

A screen may consist of static and dynamic elements.

## 10.1 Creating screens

- Static elements such as text or graphic objects do not change their status in runtime. The tank labels (W, K, Z, A) shown in this example of a mixing unit are static elements.
  - Dynamic elements change their status based on the process. Visual current process values as follows:
    - From the memory of the PLC
    - From the memory of the HMI device in the form of alphanumeric displays, trends and bars.
- Input fields on the HMI device are also considered dynamic objects. The fill level values of the tanks in our example of a mixing plant are dynamic objects.

Process values and operator inputs are exchanged between the controller and the HMI device via tags.

### Screen properties

The screen layout is determined by the features of the HMI device you are configuring. It corresponds with the layout of the user interface of this device. If the set HMI device has function keys, the screen shows these function keys. Other properties such as the screen resolution, fonts and colors are also determined by the characteristics of the selected HMI.

### Function keys

A function key is a key on the HMI device to which you can assign one or several functions in WinCC. The functions are triggered as soon as the operator presses the key on the HMI device.

A function key can be assigned global or local functions:

Global function keys always trigger the same action, regardless of the currently displayed screen.

Local function keys trigger different actions depending on the currently displayed screen on the HMI device. This assignment applies only to the screen in which you have defined the function key.

### Navigation

You configure a screen navigation to enable the operator to call a screen on the HMI device in Runtime.

- The "Screen" editor is used to configure buttons for calling other screens.
- You use the "Global Screen" editor to configure globally assigned function keys.

- Basic principles of graphics lists (Page 3326)

### **10.1.1.2 Device-specific functional scope of screens**

#### **Introduction**

The functions of an HMI device determine the display of the device in WinCC and the scope of functions of the editors.

The following screen properties are determined by the functions of the selected HMI device:

- Device layout
- Screen resolution
- Number of colors
- Fonts
- Objects available

#### **Device layout**

The device layout of a screen forms the image of the HMI device in your configuration. The device layout of the screen shows all the function keys available on the HMI device, for example.

#### **Screen resolution**

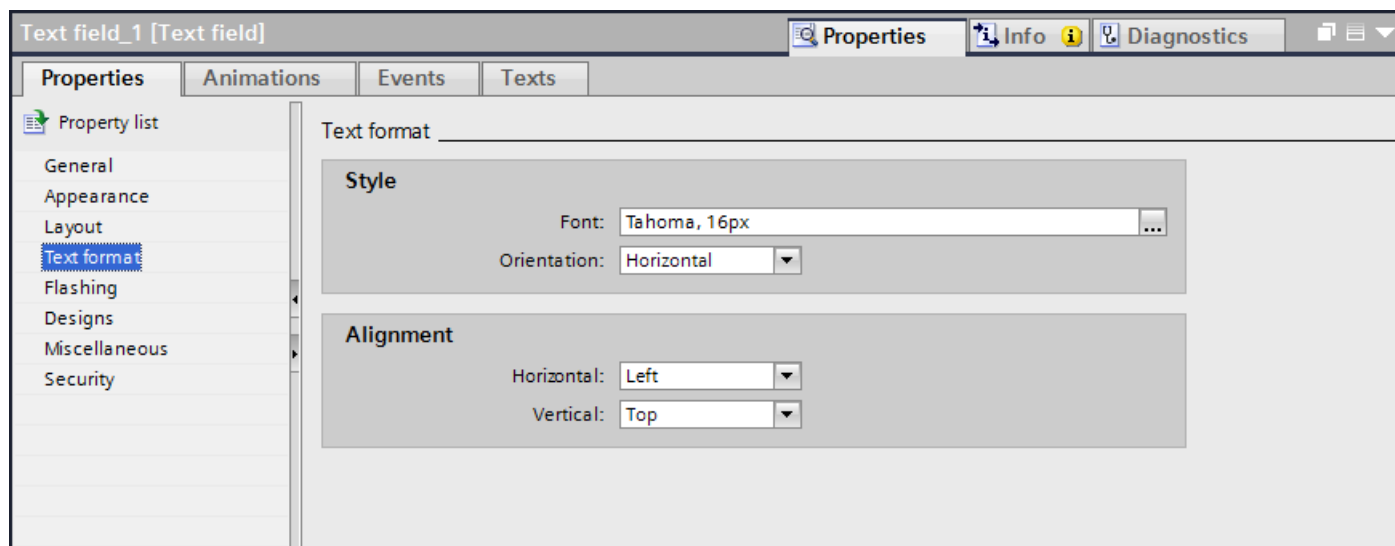

The screen resolution is determined by the different display dimensions of the various operator panels. You can only change the screen resolution if you configure the "WinCC Runtime Advanced" or "WinCC Runtime Professional" HMI device.

#### **Number of colors**

You can assign colors to the screen objects. The number of possible colors is determined by the color depth and specific colors supported on the selected HMI device.

## Fonts

You can customize the appearance of the texts in all the screen objects that contain static or dynamic text. How to highlight individual texts in a screen. Select the font, font style and size, and set additional effects such as underscoring, for example.

The settings for the text markups such as font style and effects always refer to the entire text of a screen object. That is, you can display the complete title in bold format, but not its individual characters or words, for example.

## Objects available

Some of the screen objects can not be configured globally for all HMI devices. These screen objects are not displayed in the "Tools" task card. For a KTP 1000 touch panel unit you can not configure a slider, for example.

### 10.1.1.3 Elements and basic settings

## Task cards

## Introduction

The following task cards are available in the "Screens" editor:

- Tools: Display and operating objects
- Animations: Templates for dynamic configuration

- Layout: Aid for customizing the display
- Libraries: Administration of the project library and of the global libraries

---

**Note**
**WinCC Basic**

The "Animations" task card is not available in WinCC Basic.

---

## Tools

The "Tools" task card contains objects in different panes:

- Basic objects
- Elements
- Controls
- User controls (optional)
- Graphics

You paste objects from the palettes into your screens by drag&drop or a double click. The objects available for selection are determined by the features of the HMI device you are configuring. The following icons are used to change the display mode:

Icon	Meaning
	Displays the objects as a list.
	Displays the objects as a graphic.

## Animations

The "Animations" task card contains the possible dynamizations of a screen object in the palettes. You paste the animations to a screen object by drag&drop or a double click from the "Movements", "Display" and "Tag Binding" palettes.

## Layout

The "Layout" task card contains the following panes for displaying objects and elements:

- Layers: Serves to manage screen object layers. The layers are displayed in a tree view and contain information about the active layer and the visibility of all layers.
- Grid: You specify whether you want to align the objects to a grid or to other objects and set the grid size for a grid.
- Objects out of range: Objects that lie outside the visible area are displayed with name, position and type.

## Libraries

The "Libraries" task card show the following libraries in separate panes:

- Project library: The project library is stored together with the project.
- Global library: The global library is stored in a separate file in the specified path on your configuration PC.

## Move view

### Introduction

To display only a section of the entire screen in the work area, use the  icon of the "Screens" editor:

### Requirement

- A screen is open.
- The view shows only a screen section.

### Procedure

To move the view:

1. Click the  icon at the bottom right corner of the work area and press the left mouse button. A miniature view of the full screen is shown. An orange frame shows the currently selected area.
2. Hold down the mouse button and drag the frame to the desired area.

---

#### Note

The screen is scrolled when you drag a screen object from the visible to a currently hidden section.

---

## Zooming the view

### Introduction

To view a small screen section in closer detail, use the zoom tool to magnify the screen in the working area. The maximum zoom amounts to 800%.

You can zoom with the toolbar in the work area or with the "Layout > Zoom" task card.

There are different ways to increase the screen, for example, with the zoom factor or by adapting the work area to the height of the screen.

### Requirement

The screen is opened.

## Procedure

Proceed as follows to zoom a view with the selection frame:

1. Click the  toolbar button.
2. Use the mouse to draw a selection frame in the screen.

After you have released the mouse button, the section enclosed by the selection frame is zoomed to fit the complete work area.

Alternatively, use the slider in the lower right-hand corner of the screen.

## Result

The selected screen section is magnified.

### 10.1.1.4 Working with screens

## Steps

## Steps

To create screens, you need to take the following initial steps:

- Plan the structure of the process visualization: Number of screens and their layout  
Example: Subprocesses are visualized in separate screens, and merged in a master screen.
- Define your screen navigation control strategies.
- Adapt the templates and the global screen.  
You define objects centrally and assign function keys for example.
- Create the screens. Use the following options of efficient screen creation:
  - Working with libraries
  - Working with layers
  - Working with faceplates

## Creating a new screen

### Introduction

Create screens to display processes in your system.

### Requirement

- The project has been created.
- The Inspector window is open.

## Procedure

1. Double-click "Screens > Add New Screen" in the project navigation.  
The screen is generated in the project and appears in your view. The screen properties are shown in the Inspector window.
2. Enter a meaningful name for the screen.
3. Configure the screen properties in the Inspector window:
  - Specify whether and on which template the screen is based.
  - Set the "Background Color" and the "Screen Number."
  - Specify a documenting text under "Tooltip".
  - Specify the layers to be displayed under "Layers" in the engineering system.
  - Select dynamic screen update under "Animations."
  - Select "Events" to define which functions you want to execute in Runtime when you call and exit the screen or at other events.

---

### Note

Not all HMI devices support the "Visibility" animation.

---

## Result

You created the screen in your project. You can now paste objects and control elements from the "Tools" task card and assign function keys in further work steps.

## Managing Screens

### Introduction

You can move screens within a project to other groups, or copy, rename, and delete them.

### Moving screens in a group

1. Select the "Screens" folder in the project tree.
2. Select the "Add group" command from the shortcut menu.  
A folder called "Group\_x" is inserted.
3. Select the screen in the project tree.
4. Drag-and-drop the screen to the required group.  
The screen is moved into this group.

### Copy screen

1. Select the screen in the project tree.
2. Select the "Copy" command in the shortcut menu to copy the screen to the clipboard.

3. In the project tree, select the screen insert position.
4. Select "Paste" from the shortcut menu to insert the screen.  
A copy of the screen is inserted. A consecutive number is appended to the name of the original in the copy.

Alternatively, press <Ctrl> while you drag the screen to the required position.

---

**Note**

If you copy a screen with interconnected template for several devices and projects, the template will also be copied. Any existing matching template is not used. This holds particularly true when you copy the screens with drag-and-drop.

---

**Rename screen**

1. Select the screen in the project tree.
2. Select "Rename" from the shortcut menu.
3. Type in a new name.
4. Press <Enter>.

As an option, use the <F2> function key to rename the screen.

**Delete screen**

1. Select the screen in the project tree.
2. Select "Delete" from the shortcut menu.  
The screen and all its objects are deleted from the current project.

**Defining the start screen of the project****Introduction**

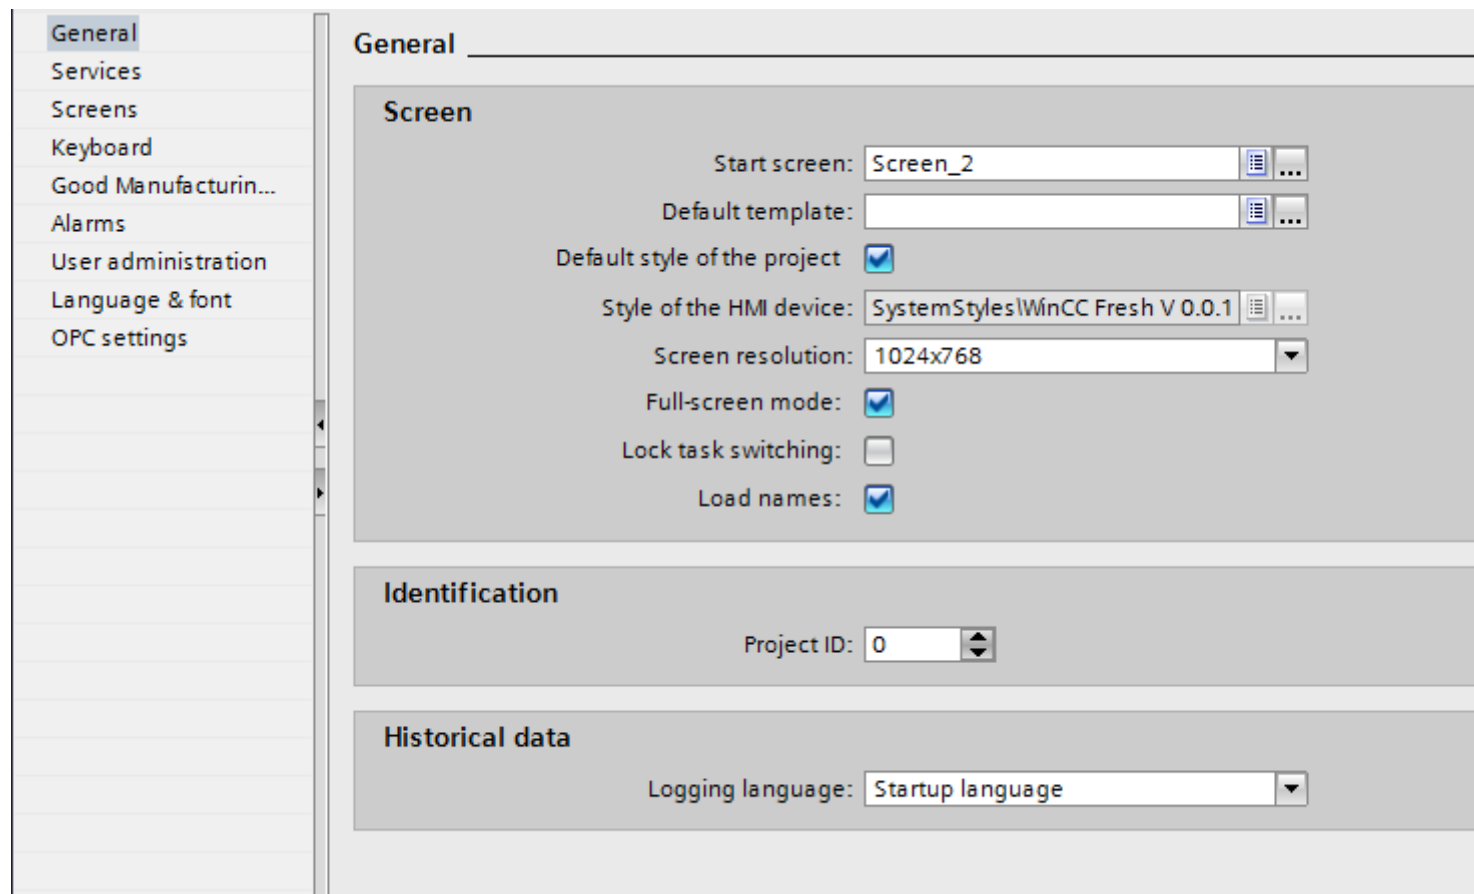

The start screen is the initial screen opened at the start of project in Runtime. You can define a different start screen for each one of the HMI devices. Beginning at this start screen, the operator calls the other screens.

**Requirement**

The project contains the screen you want to use as the start screen.

## Procedure

1. Double-click "Runtime settings > General" in the project tree.

2. Select the desired screen as "Start screen".

Alternatively select a screen in the project tree and select "Use as start screen" in the shortcut menu.

## Result

The start screen opens on the HMI at the start of Runtime.

## Changing the screen resolution

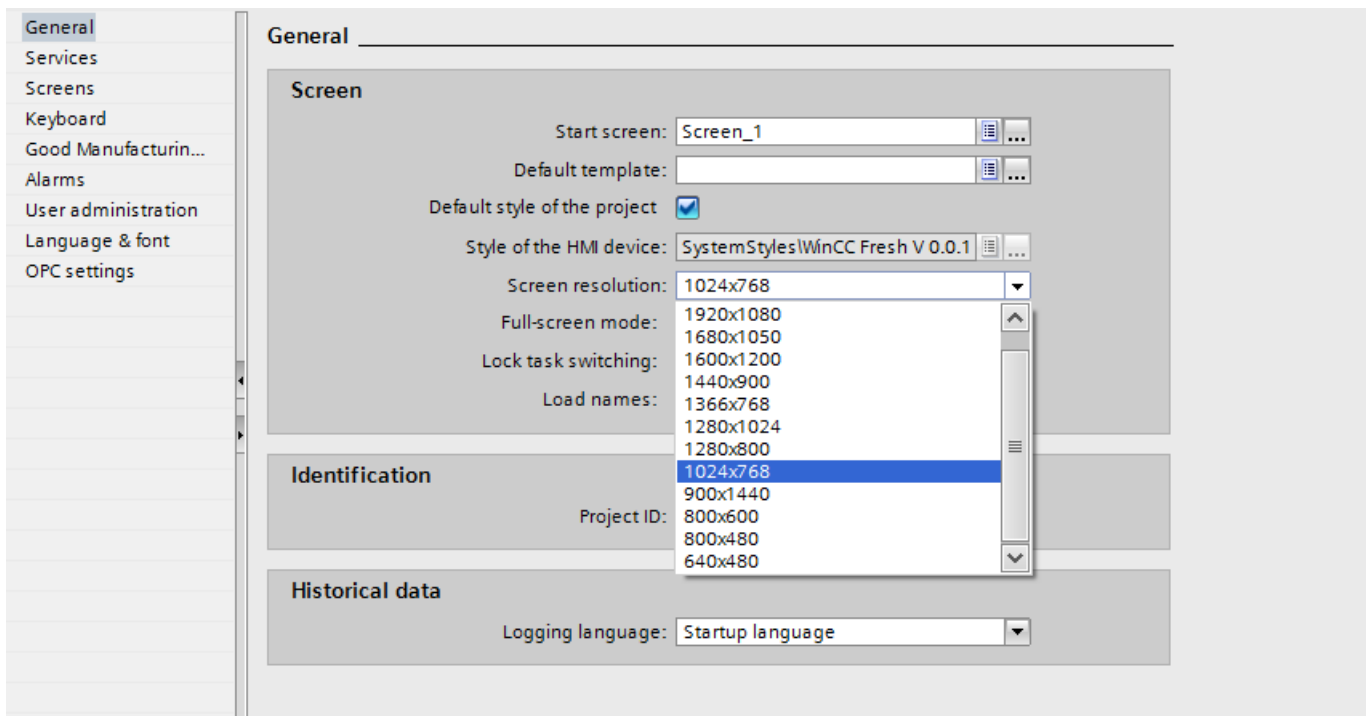

You change the screen resolution in the Runtime settings of the HMI device.

The screen resolution can be configured for the following HMI devices:

- RT Advanced

### Configuring a fixed screen resolution

1. Open the Runtime settings of the HMI device.
2. Select the screen resolution under "General > Screen > Screen resolution".

### Configuring a user-defined screen resolution

1. Open the Runtime settings of the HMI device.
2. Select the "User-defined" function under "General > Screen > Screen resolution".  
A dialog appears to input the width and height of the user-defined screen resolution.
3. Enter the width and height of the screen resolution.

#### 10.1.1.5 Working with templates

##### Basics on working with templates

##### Introduction

Configure the objects in a template which are to be displayed in all screens based on this template.

Note the following rules:

- A screen must not be based on a template.
- A screen is only based on one template.
- You can create several templates for one device.
- A template cannot be based on another template.

### Objects for a template

You determine functions and objects in the template which are to apply for all screens based on this template:

- Assignment of function keys: You also assign the function keys in the template for HMI devices with function keys. This assignment overwrites a possible global assignment.
- Permanent window: Some devices support a permanent window for all screens in the top area of the screen. In contrast to the template, the permanent window occupies an area of the screen for itself alone.
- Operator controls: You can paste all screen objects which you also use for a screen into a template.

### Application examples

- You want to assign the "ActivateScreen" function to a function key in the template. The operator uses this key to switch to another screen in runtime. This configuration applies to all screens that are based on this template.
- A graphic with your company logo can be added to the template. The logo appears on all screens that are based on this template.

---

#### Note

If an object from the template has the same position as an object in the screen, the template object is covered.

---

### See also

Screen basics (Page 3241)

Using a template in the screen (Page 3257)

Configuring a permanent window in the template (Page 3256)

### Global screen

#### Introduction

You define global elements for all screens of an HMI device independently of the used template.

## Function keys

For HMI devices with function keys you assign the function keys globally in the "Global Screen" editor. This global assignment applies for all screens of the HMI device.

Proceed as follows to assign function keys locally in screens or templates:

1. Click the function key in your screens or templates.
2. Deactivate "Properties > Properties > General > Use Global Assignment" in the inspection window.

## Indicator and control objects for alarms

The "Alarm window" and "Alarm indicator" objects that are available as global objects are configured within the "Global screen" editor.

The "Alarm window" and "Alarm indicator" are always shown in the foreground.

For Comfort Panels you also have the possibility of configuring a "System diagnostic view" in the global screen.

---

### Note

If you have configured a permanent window in a template, do not position the alarm window and alarm indicator in the area of the permanent window. Otherwise, the alarm window and the alarm indicator will not be displayed in Runtime.

The permanent window is not visible in the "Global screen" editor.

---

## Order of configuration of screens

The following order applies for the configuration:

- The global screen comes before screens and templates
- Screens come before templates

The system layer is not configurable. This contains

- input dialog boxes
- alarms from the operating system
- the direct keys for touch panels

## Managing templates

### Introduction

You can move, copy, rename, and delete templates within a project in the Project window.

### Moving a template into a group

1. Select the templates in the project navigation "Screen management > Templates".
2. Select "Add group" in the shortcut menu.  
A folder called "Group\_x" is inserted.
3. Select the template in the project navigation.
4. Drag-and-drop the template to the required group.  
The template is moved to this group.

## Copying templates

1. Select the template in the project navigation.
2. Select "Copy" in the shortcut menu.
3. Select the position in the project navigation where you want to paste the template.
4. Select "Paste" from the shortcut menu to insert the template.  
A unique name is assigned automatically to the copy.

Alternatively, you can hold down the <Ctrl> key, and drag the template into position.

## Deleting a template

1. In the project navigation, select the template to be deleted.
2. Select "Delete" in the shortcut menu.  
The template, and all its objects are deleted from the current project.

## Assigning a template to a screen

1. In the project navigation, select the screen to which you want to assign the template.
2. In the Inspector window, select "Properties > Properties > General".
3. Select the desired template under "Template."  
The selected template and all the objects contained in it are assigned to the screen.

## Creating a new template

### Introduction

In a template, you can centrally modify objects and function keys. Changes to an object or of a function key assignment in the template are applied to the object in all the screens which are based on this template.

---

#### Note

##### HMI device dependency

Function keys are not available on all HMI devices.

---

### Requirement

- The project has been created.
- The Inspector window is open.

## Procedure

1. Select "Screen management > Templates" in the project tree and then double-click "Add new template".  
The template is created in the project, and appears in your view.  
The properties of the template are displayed in the Inspector window.
2. Define the name of the template under "Properties > Properties > General" in the Inspector window.
3. Specify the layers in the engineering system that are displayed under "Properties > Properties > Layers" in the Inspector window.
4. Add the necessary objects from the "Tools" task card.
5. Configure the function keys.

## Result

The template is created in your project.

## Configuring a permanent window in the template

### Introduction

In the permanent window you configure objects which are visible in all screens. In contrast to the template, the permanent window occupies an area of the screen for itself alone.

### Configuring permanent windows

Proceed as follows to configure a permanent window:

1. Open a template for a HMI device with a permanent window.
2. Use the mouse (cursor shape: ) to drag the top edge of the editable screen area down.

3. Configure the desired objects in the area of the permanent window.

The default height of the permanent window is "0". The maximum height is the maximum height of the screen minus 10 pixels.

## **Result**

The content of the permanent window appears on every screen, and in the template. The area above this line is now used as a permanent window in all the screens of the HMI device. Already configured objects in the screens are moved down by the height of the permanent window.

## **See also**

Basics on working with templates (Page 3251)

## **Using a template in the screen**

### **Introduction**

You use a template in the screen. All the objects configured in the template are also available in the screen.

### **Requirement**

A template has been created.

A screen has been created.

### **Procedure**

Proceed as follows to use a template in a screen:

1. Double click a screen in the project tree. The screen opens in the work area.
2. Open "Properties > Properties > General" in the inspector window.
3. Select a template that is to be applied to the screen under "Template".

### **Show template in screen**

When you edit a screen, you can show an existing template in the screen.

Proceed as follows to show a template in the screen:

1. Activate "Extras > Settings > Visualization > Show template in screens" in the menu.

## **Result**

The screen is based on the selected template. All objects which you have configured in the template are available in the screen. The template is displayed in the screen.

## **See also**

Basics on working with templates (Page 3251)

### 10.1.1.6 Working with styles

#### Basics on working with styles

##### Introduction

The style editor is a global editor. You define a uniform appearance for display and operating elements in the style editor. In this way, you harmonize the display of objects in Runtime. The style editor offers predefined styles. You can choose one of the predefined styles or create your own style. You use the style editor independently of devices and projects.

##### Views in the style editor

Objects are grouped in the style editor according to their main visual features.

The following groups are available:

- Buttons, lines, and polygon-based objects
- Text-based objects
- Trend-based objects, such as trend view
- Graphic or value-based objects, such as value table.

#### Displaying predefined styles

##### Introduction

In the "Style" editor, you see predefined styles and create your own styles for representing display and operating objects in Runtime.

##### Open "Styles" editor

1. Double-click "Common data" in the project navigation.
2. Click the "Styles" editor. The editor opens.

---

**Note****Style editor in the project navigation**

The style editor is only visible in the project navigation if a device that supports styles, e.g., Comfort Panels, is created in the project.

---

3. The standard styles are displayed in the work area of the "Style" editor:
  - WinCC Light
  - WinCC Dark
  - WinCC Fresh
  - WinCC Wireframe.

## **Result**

The settings for the groups and individual objects are displayed in the work area.  
You will assign predefined styles or define your own styles in the next steps.  
Predefined styles are write-protected and cannot be changed.

## **See also**

Managing styles (Page 3261)  
Defining a style (Page 3259)

## **Defining a style**

### **Introduction**

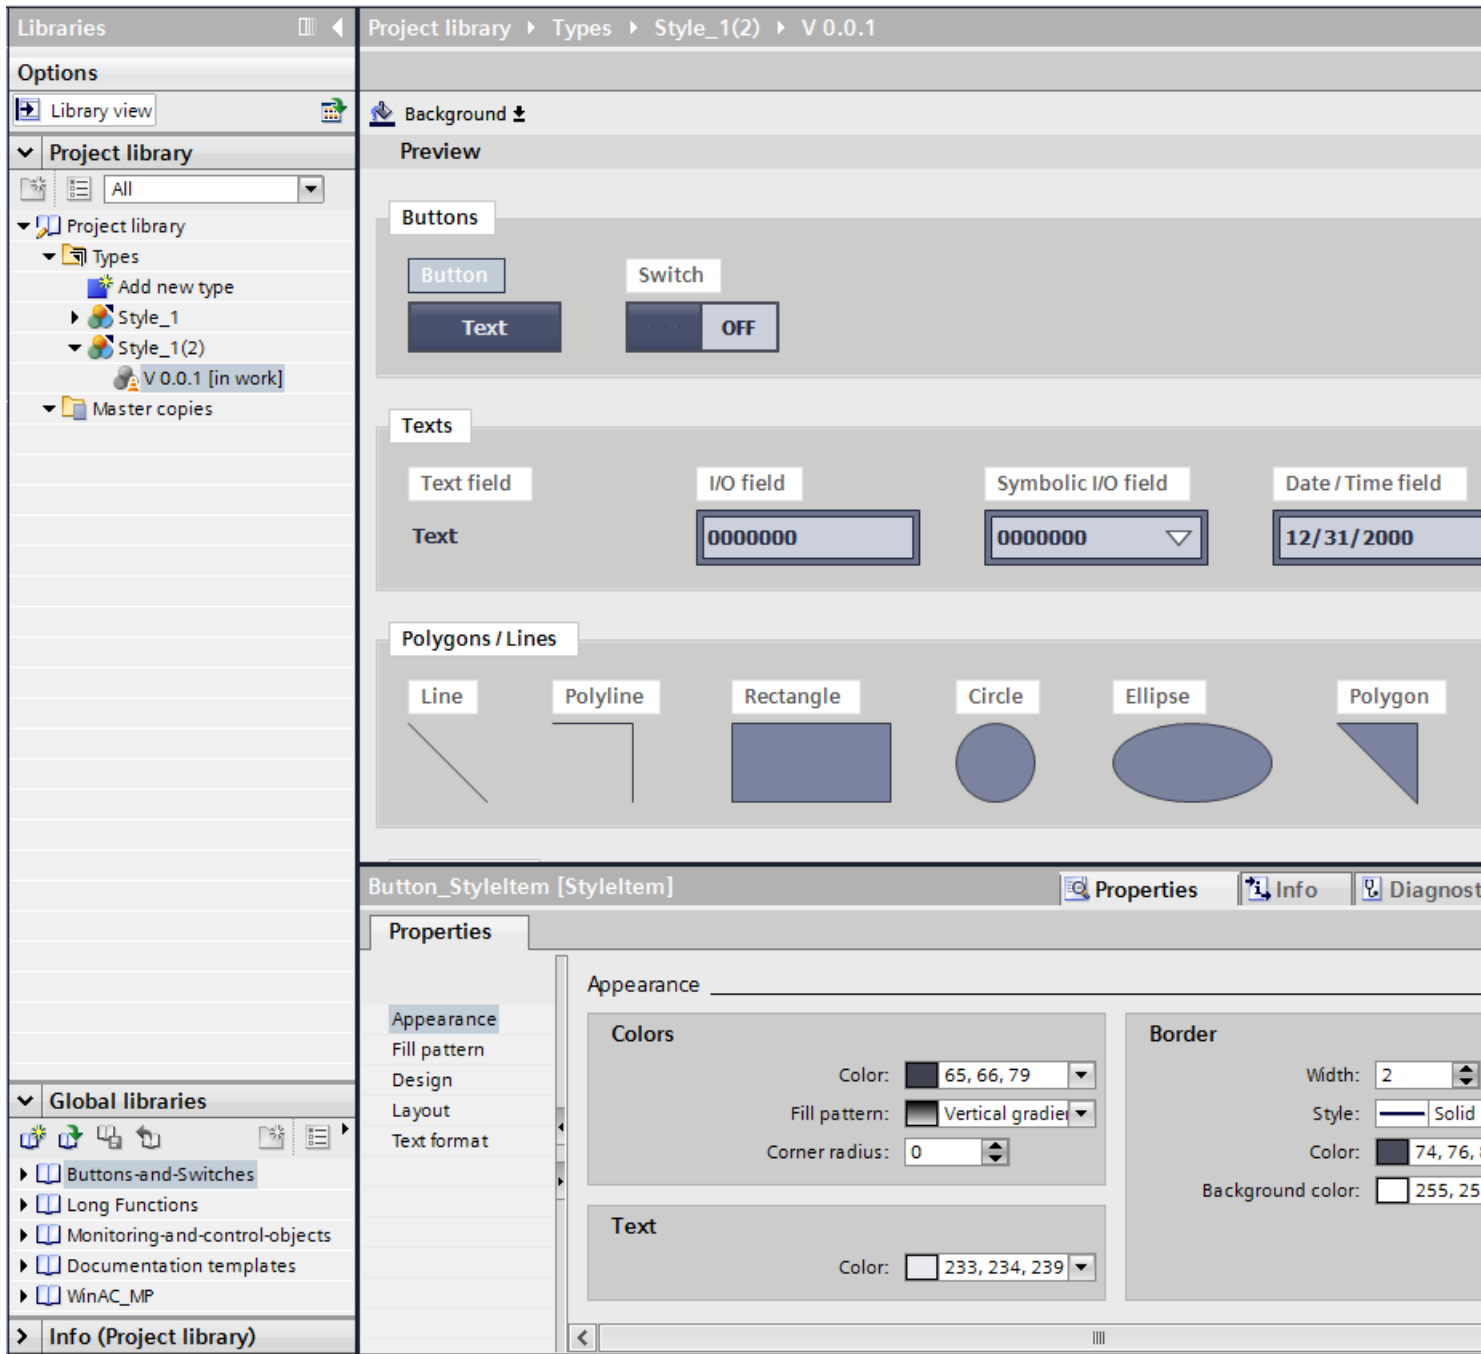

In the "Styles" editor, you see predefined styles. Predefined styles are write-protected and cannot be changed.

In addition, you have the option of defining your own styles and applying them to individual objects, groups, and even projects.

### **Defining a style**

1. Open the "Common data" folder in the project navigation.
2. Open the "Style" editor.
3. Click "Add new type" in the "Styles" area.  
A new style is created.  
The library view opens. The version of the type is displayed in the "Types" folder. The version 0.0.1 has the status "in progress".

- In the Inspector window, select the colors, borders and other settings for individual objects.

- In order to activate the new style, select the current version "in progress" and select "Release version" in the shortcut menu. The new style appears in the "Styles" editor.

## Result

You have added a new style which can be applied to objects or projects.

## Defining a style based on a predefined style

1. Open the "Common data" folder in the project navigation.
2. Open the "Style" editor.
3. Select a predefined style in the work area.
4. Select the "Duplicate type" command in the shortcut menu.  
The "Duplicate type" dialog opens.
5. Overwrite the suggested name with a meaningful name.
6. In the "Comment" column, enter a description of the style, e.g. the intended use.
7. Click "OK" to confirm your input.
8. Select the created type in the project library.
9. Select "Edit new type" in the shortcut menu.  
The library view opens. The version of the type is displayed in the "Types" folder. The version 0.0.2 has the status "in progress".
10. Configure the type as required.
11. Select the "Release version" command from the shortcut menu of the edited version.

## Result

They have configured a new style based on the predefined style of WinCC.

## See also

Displaying predefined styles (Page 3258)

## Managing styles

### Deleting a style

You can delete styles that you have defined yourself.

1. Open the "Common data" folder in the project navigation.
2. Open the "Style" editor.
3. Select the style in the work area that you want to delete.

---

#### Note

You cannot delete the predefined styles of WinCC.

---

4. Select the "Delete" command in the shortcut menu.

The style is deleted.

## Editing a style

You can edit styles that you have defined yourself.

1. Open the project library.
2. Select the released version of the style that you want to change.
3. Select "Edit type" in the shortcut menu.  
A new version "in progress" is created.
4. Make the required changes in the Inspector window.
5. Select the "Release version" command from the shortcut menu of the edited version to put the changes into effect.  
The changes made take effect.

## Determining a standard style for a project

A project can be assigned a standard style to achieve a visual conformity of all display objects in the project.

1. Open the "Common data" folder in the project navigation.
2. Open the "Style" editor.
3. Activate a style in the work area.

The activated style is used as standard style in the project. When you add a device to the project, this device uses the standard style.

## Changing the style for a specific device

Within a project, you change the style for a specific device.

1. Open the "Runtime settings" editor of the HMI device.
2. Select a device style under "General".

The selected style is applied to the device.

If the device style is not assigned, the device uses the standard style of the project.

## See also

Displaying predefined styles (Page 3258)

## 10.1.2 Working with objects

### 10.1.2.1 Overview of objects

#### Introduction

Objects are graphics elements which you use to design the screens of your project.

The "Tools" task card contains all objects that can be used for the HMI device. Display the Task Card with menu command "View" by activating the "Task Card" option.

The toolbox contains various palettes, depending on the currently active editor. If the "Screens" editor is open, the toolbox contains the following palettes:

- "Basic objects"  
The basic objects include basic graphic objects such as "Line", "Circle", "Text field" or "Graphic view".
- "Elements"  
The elements include basic control elements, e.g. "I/O field", "Button" or "Gauge".
- "Controls"  
The controls provide advanced functions. They also represent process operations dynamically, for example Trend view and Recipe view.

- "Graphics"  
 Graphics are broken down into subjects in the form of a directory tree structure. The various folders contain the following graphic illustrations:
  - Machine and plant areas
  - Measuring equipment
  - Control elements
  - Flags
  - Buildings

You can create links to your own graphic folders. The external graphics are located in these folders and subfolders. They are displayed in the toolbox and incorporated into the project using links.

- "Libraries" task card  
 In addition to the display and operating elements, the library objects are available. They are located within the palettes of the "Libraries" task card. A library contains preconfigured objects such as graphics of pipes, pumps, or preconfigured buttons. You can also integrate multiple instances of library objects into your project without having to reconfigure them. The WinCC software package includes libraries, e.g. "HMI Buttons & Switches". You can also store customized objects, and faceplates in user libraries. Faceplates are objects that you create from existing screen objects, and for which you define the configurable properties.

**Note**

**HMI device dependency**

Some of the toolbox objects are either available with restricted functionality, or not at all. This depends on the HMI device you are configuring. Unavailable properties of an object are displayed as deactivated, and cannot be selected.

**Basic objects**

Icon	Object	Instructions
	"Line"	-
	"Ellipse"	-
	"Circle"	-
	"Rectangle"	-
	"Text field"	One or more lines of text. The font and layout are adjustable.
	"Graphic view"	Displays graphics from external graphic programs, and inserts OLE objects. The following graphic formats can be used: ".emf", ".wmf", ".dib", ".bmp", ".jpg", ".jpeg", ".gif" and ".tif".

## Elements

Icon	Object	Instructions
	"I/O field"	Outputs the values of a tag, and/or writes values to a tag. You can define limits for the tag values shown in the I/O field. To hide the operator input in runtime, configure "Hidden input".
	"Button"	Executes a function list, or a script as configured.
	"Symbolic I/O field"	Outputs the values of a tag, and/or writes values to a tag. A text from a text list is displayed in relation to the tag value.
	"Graphic I/O field"	Outputs the values of a tag, and/or writes values to a tag. A graphic from a graphics list is displayed in relation to the tag value.
	"Date/time field"	Outputs the system date and time, or the time and date from a tag. This allows the operator to enter new values. The display format is adjustable.
	"Bar"	The bar represents a value from the PLC in the form of a scaled bar graph.
	"Switch"	Toggles between two defined states. You can label a switch with text, or a graphic.

## Controls

Icon	Object	Description
	"Alarm view"	Shows currently pending alarms or alarm events from the alarm buffer or alarm log.
	"Trend view"	Represents multiple curves with values from the PLC, or from a log.
	"User view"	Allows an administrator to administer users on the HMI device. It also allows an operator without administrator rights to change his password.
	"Recipe view"	Displays data records, and allows them to be edited.
	"System diagnostics view"	Provides an overview of all devices capable of diagnostics. Displays errors in the plant.

## 10.1.2.2 Overview of objects

### Introduction

Objects are graphics elements which you use to design the screens of your project.

The "Tools" task card contains all objects that can be used for the HMI device. Display the Task Card with menu command "View" by activating the "Task Card" option.

The toolbox contains various palettes, depending on the currently active editor. If the "Screens" editor is open, the toolbox contains the following palettes:

- "Basic objects"  
The basic objects include basic graphic objects such as "Line", "Circle", "Text field" or "Graphic view".
- "Elements"  
The elements include basic control elements, e.g. "I/O field", "Button" or "Gauge".
- "Controls"  
The controls provide advanced functions. They also represent process operations dynamically, for example Trend view and Recipe view.
- "Graphics"  
Graphics are broken down into subjects in the form of a directory tree structure. The various folders contain the following graphic illustrations:
  - Machine and plant areas
  - Measuring equipment
  - Control elements
  - Flags
  - Buildings

You can create links to your own graphic folders. The external graphics are located in these folders and subfolders. They are displayed in the toolbox and incorporated into the project using links.

- "Libraries" task card  
In addition to the display and operating elements, the library objects are available. They are located within the palettes of the "Libraries" task card. A library contains preconfigured objects such as graphics of pipes, pumps, or preconfigured buttons. You can also integrate multiple instances of library objects into your project without having to reconfigure them. The WinCC software package includes libraries, e.g. "HMI Buttons & Switches". You can also store customized objects, and faceplates in user libraries. Faceplates are objects that you create from existing screen objects, and for which you define the configurable properties.

---

#### Note

##### HMI device dependency

Some of the toolbox objects are either available with restricted functionality, or not at all. This depends on the HMI device you are configuring. Unavailable properties of an object are displayed as deactivated, and cannot be selected.

---

## Basic objects

Icon	Object	Instructions
	"Line"	-
	"Polyline"	The polyline is an open object. Even if the start and end points have the same coordinates, the area they enclose cannot be filled in. If you want to fill a polygon, select the "Polygon" object.
	"Polygon"	-
	"Ellipsis"	-
	"Circle"	-
	"Rectangle"	-
	"Text field"	One or more lines of text. The font and layout are adjustable.
	"Graphic view"	Displays graphics from external graphic programs, and inserts OLE objects. The following graphic formats can be used: "*.emf", "*.wmf", "*.dib", "*.bmp", "*.jpg", "*.jpeg", "*.gif" and "*.tif".

## Elements

Icon	Object	Instructions
	"I/O field"	Outputs the values of a tag, and/or writes values to a tag. You can define limits for the tag values shown in the I/O field. To hide the operator input in runtime, configure "Hidden input".
	"Button"	Executes a list of functions, or a script as configured.
	"Symbolic I/O field"	Outputs the values of a tag, and/or writes values to a tag. A text from a text list is displayed in relation to the tag value.
	"Graphic I/O field"	Outputs the values of a tag, and/or writes values to a tag. A graphic from a graphics list is displayed in relation to the tag value.
	"Date/time field"	Outputs the system date and time, or the time and date from a tag. This allows the operator to enter new values. The display format is adjustable.
	"Bar"	The bar represents a value from the PLC in the form of a scaled bar graph.
	"Charge condition"	Shows the charge condition of the battery for Mobile Wireless
	"Switch"	Toggles between two defined states. You can label a switch with text, or a graphic.
	"Slider"	Displays a current value from the PLC, or sends a numeric value to the PLC.

Icon	Object	Instructions
	"Symbol library"	Used to add screen objects based on controls of the same name.
	"Effective range name"	Shows the name of the effective range.
	"Effective range name (RFID)"	Displays the name of the effective range (RFID).
	"Effective range signal"	Indicates how accurately the Mobile Panel Wireless is positioned within an effective range.
	"WLAN reception"	Indicates how good the WLAN radio connection is.
	"Gauge"	Displays numeric values. The appearance of the gauge is adjustable.
	"Zone name"	Displays the name of the zone.
	"Zone signal"	Indicates how accurately the Mobile Panel Wireless is positioned within a zone.
	"Clock"	Displays the system time in analog or digital format.

## Controls

Icon	Object	Description
	"Alarm view"	Shows currently pending alarms or alarm events from the alarm buffer or alarm log.
	"Trend view"	Represents multiple curves with values from the PLC, or from a log.
	"User view"	Allows an administrator to administer users on the HMI device. It also allows an operator without administrator rights to change his password.
	"HTML browser"	Displays HTML pages.
	"Status/Force"	This function gives the operator direct read / write access from the HMI device to individual address areas in the connected SIMATIC S7.
	"Sm@rtClient view"	Allows an operator to monitor and maintain a connected device remotely.
	"Recipe view"	Displays data records, and allows them to be edited.
	"f(x) trend view"	Represents the values of a tag as a function of another tag.
	"System diagnostics view"	Provides an overview of all diagnostics capable devices. Displays errors in the plant.
	"Media Player"	Media files are shown in the media player.

### 10.1.2.3 Options for Editing Objects

#### Introduction

Objects are graphics elements which you use to design the screens of your project.

You have the following options for editing objects:

- Copying, pasting or deleting objects using the shortcut menu If you copy an object in a screen and the screen already includes an object of the same name, the name of the object is changed.
- Maintaining the standard size of the objects you are inserting or customizing their size on insertion.
- Moving an object in front of or behind other objects
- Rotating objects
- Mirroring objects
- Defining the tab sequence for objects
- Stamping: Inserting several objects of the same type

## 10.1 Creating screens

- Selecting several objects simultaneously
- Repositioning and resizing multiple objects
- You can assign external graphics to objects, e.g. in the Graphic View.  
You can view only the images you have previously stored in the graphic browser of your WinCC project.  
You can save graphics in the graphic browser:
  - Via drag & drop from the "Graphics" object group to the working area
  - As graphic files in the following formats: \*.bmp, \*.dib, \*.ico, \*.emf, \*.wmf, \*.gif, \*.tif, \*.jpeg or \*.jpg
  - As an OLE object  
You either create a new OLE object or save an existing graphic file as an OLE object.  
To save an OLE object, an OLE-compatible graphics program must be installed on the configuration computer.

### 10.1.2.4 Inserting an object

#### Introduction

In the "Screens" or "Reports" editor, insert the objects to the "Toolbox" task card. Use the mouse to drag the objects into the work area. You either keep the objects in their original size, or scale them up or down when you paste them.

In addition, you can copy or move objects via the clipboard from one editor to another, for example to transfer a screen object to a report. Alternatively, you can also use the mouse instead of the clipboard for copying and moving:

- Copying: <Ctrl + Drag&Drop>
- Moving: Drag&drop

---

#### Note

##### Basic Panels

The "Reports" editor is not available for Basic Panels.

---

#### Requirement

The "Tools" task card is open.

#### Inserting objects in their standard size

1. In the "Toolbox" task card, select the desired graphic object or the desired graphic in the WinCC graphics folder.  
When you move the cursor across the work area, it turns into a crosshair with an appended object icon.
2. Click the location in the work area where you want to insert the object or graphic.  
The object is inserted with its standard size at the desired position in the work area.

Alternatively, double-click the object in the "Toolbox" task card.

### Copying an object

1. Select the desired object.
2. Select "Copy" in the shortcut menu.
3. Click the desired location and select "Paste" in the shortcut menu.

WinCC inserts a copy of the object at the desired location. You can only change the properties that are appropriate for the relevant context.

Example: In the "Screens" editor, you can set for I/O fields and the mode for input and output. In the "Reports" editor, the mode is set to "Output".

Original and copy are not interconnected and are configured independently from one another.

### Inserting lines

1. Select the desired graphic object in the "Tools" task card.
2. Click on a location in the work area. A line in the standard size is inserted.

### Inserting a polygon or polyline

1. Select the desired object "Polyline" or "Polygon" in the "Tools" task card.
2. Click on a location in the work area. This fixes the starting point of the object.
3. Click another location in the work area. A corner point is set.
4. For every additional corner point, click on the corresponding location in the work area.
5. Double-click on a location in the work area. The last corner point is set. This fixes all the points of the polygon or polyline.

---

#### Note

##### Basic Panels

The "Polyline" and "Polygon" objects are not available for Basic Panels.

---

---

#### Note

If you want to insert several objects of the same type, use the "Stamp" function. This avoids having to reselect the object in the "Tools" task card every time before inserting it. To do so, select the  icon in the toolbar of the "Tools" task card.

---

## See also

Overview of objects (Page 3266)

Example: Configuring a rectangle (Page 3315)

Designing an object (Page 3282)

### 10.1.2.5 Deleting an Object

#### Introduction

You can delete objects individually or with a multiple selection.

#### Requirement

You have opened the work area containing at least one object.

#### Procedure

1. Select the object that you want to delete.  
To delete multiple objects, keep the <Shift> key pressed and select the objects to be deleted one after the other. Alternatively, drag and maximize an area around the desired objects with the mouse.
2. Select "Delete" from the shortcut menu.

#### Result

The selected objects are deleted.

## See also

Overview of objects (Page 3266)

Example: Configuring a rectangle (Page 3315)

Designing an object (Page 3282)

## 10.1.2.6 Positioning an object

### Introduction

When you select an object, it is enclosed by a rectangle with resizing handles. This rectangle is the rectangle which surrounds the object. The position of an object is defined by the coordinates of the top left corner of the rectangle surrounding the object.

---

### Note

If the position is outside the work area the object is not displayed in Runtime.

---

### Position and align

You have the possibility of having a grid displayed in the work area. You have three options for easier positioning of objects:

- "Snap to grid" When you reposition objects, they are automatically snapped and pasted to the grid. If you hold down the <Alt> key, the object is no longer snapped to the grid.
- "Snap to objects" When you reposition objects, they are displayed with help lines. You can use other objects for orientation during positioning.
- "None": You position the objects in any position.

You activate and deactivate the grid and options as follows:

- In the "Options > Settings > Visualization > Screens" menu
- In the "Layout > Grid" task card

### Requirement

You have opened the work area containing at least one object.

### Procedure

1. Select the object you want to move.  
The selected object is framed by a rectangle with resizing handles.

2. Left-click the object and keep the mouse button pressed.

3. Move the mouse pointer onto the new position.  
The contour of the object moves with the mouse and displays the new position for the object.

The object initially remains at its original position.

4. Now release the mouse button.  
The object is moved into the position indicated by the contour of the selection rectangle.

### Alternative procedure

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the X and Y values for the position under "Position & Size".

### Result

The object appears at its new position.

### See also

- Overview of objects (Page 3266)
- Example: Configuring a rectangle (Page 3315)
- Designing an object (Page 3282)

## 10.1.2.7 Resizing an object

### Introduction

When you select an object, it is enclosed by a rectangle with handles. You have the following options of resizing an object:

- Drag the handles using the mouse.
- Modify the "Size" property in the Inspector window.

### Requirement

You have opened the work area containing at least one object.

## Procedure

1. Select the object you want to resize.  
The selection rectangle appears. The following figure shows a selected object:

2. Drag a resizing contact of the rectangle to a new position.  
The size of the object changes.
  - The size of the object is aligned to the grid pattern, provided the "Snap to grid" function is set.
  - Press <ALT> to disable this function while you drag the object.  
In order to scale the object proportionally, keep the <Shift> key pressed while changing the size with the mouse.

## Alternative procedure

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the size of the object under "Position & Size".

## Harmonizing the object size

1. Select the objects.
2. Now, click one of the following buttons:  or  or   
The size of the selected objects is matched to each other.

The following screen shows how the selected objects are adapted to the height of the reference object:

Icon	Description
	Aligns the selected objects to the width of the reference object.
	Aligns the selected objects to the height of the reference object.
	Aligns the selected objects to the width and height of the reference object.

### Result

The object now appears with its new size.

### See also

Overview of objects (Page 3266)

Designing an object (Page 3282)

### 10.1.2.8 Aligning objects

#### Procedure

1. Select the objects via multiple selection.
2. Specify an object as the reference object.
3. Select the desired command in the toolbar or the shortcut menu - see table below.  
The selected objects will be aligned.

#### Aligning objects flush

The selected objects will be aligned flush to the reference object.

Icon	Description
	Aligns the selected objects to the left edge of the reference object.
	Aligns the selected objects to the vertical center axis of the reference object.
	Aligns the selected objects to the right edge of the reference object.
	Aligns the selected objects to the upper edge of the reference object.
	Aligns the selected objects to the horizontal center axis of the reference object.
	Aligns the selected objects to the lower edge of the reference object.
	Centers the selected objects to the center points of the reference object.
	Centers the selected objects vertically in the screen.

## Snap to object

When you reposition objects, they are displayed with help lines. You can use other objects for orientation during positioning.

If you are working with the keyboard, press the Alt key. When you move the selected object with the arrow keys, the next anchor point is displayed.

## Distributing objects evenly

You need at least three selected objects. A reference object is not required.

1. Select the objects.
2. Click one of the buttons "Distribute horizontally equal" or "Distribute vertically equal".  
The selected objects are distributed at equal distances.

The following screen shows how you align the vertical spacing of the selected objects:

Icon	Description
	Aligns the horizontal distance between the objects. The position of the objects on the extreme left and right side remains unchanged. All other objects are distributed evenly between them.
	Aligns the vertical distance between the objects. The position of the objects at the extreme top and bottom (right and left) remains unchanged. All other objects are distributed evenly between them.

Overview of objects (Page 3266)

Designing an object (Page 3282)

### 10.1.2.9 Moving an object forward or backward

#### Introduction

You can use the "Order" functions in the shortcut menu of a selected object or in the toolbar to move a selected object in front of or behind other objects within an object layer.

---

#### Note

ActiveX controls are always positioned in front of an object layer (.NET property).

---

#### Requirement

You have opened a screen which contains a layer with multiple objects.

#### Procedure

1. Select the object you want to move forward or backward.
2. Select the "Sort" command and one of the following commands from the shortcut menu:

Icon	Description
	Moves the selected object before all the other objects of the same layer
	Moves the selected object to the lowest position in the same layer
	Moves the selected object up by one position
	Moves the selected object down by one position

#### Alternative procedure

1. Open the "Layers" palette of the "Layout" task card.
2. Navigate to the required object.
3. Hold down the mouse button, and drag the object in the tree topology to the required position in the layer.
4. Now release the mouse button.

#### Result

The object is moved up or down.

#### See also

- Overview of objects (Page 3266)
- Example: Configuring a rectangle (Page 3315)
- Designing an object (Page 3282)

### 10.1.2.10 Show objects outside the screen area

#### Introduction

If you assign objects to positions that are outside the configurable area, these objects will be hidden. The functions of the "Objects outside the visible area" palette in the "Layout" task card are used to move these objects back into the screen.

#### Requirement

- You have opened a screen which contains objects that are outside the configurable area.
- The "Layout" task card is open.

#### Procedure

1. Open the "Layout > Objects outside the area" task card.  
This displays a list of objects that are outside the configurable area.
2. Select the the object which you want to move back into the screen from the list.
3. Select "Move to screen" in the object shortcut menu.

Alternatively open the "Layout > Layer" task card. Objects outside the area are indicated by the  icon. If you click this icon, the object is moved back into the screen.

#### Result

The objects are moved to the configurable area.

#### See also

Overview of objects (Page 3266)  
Example: Configuring a rectangle (Page 3315)  
Designing an object (Page 3282)

### 10.1.2.11 Rotating objects

#### Introduction

You can rotate a suitable object clockwise or counterclockwise around its center axis in steps of 90°.

---

#### Note

Not all the objects can be rotated. Some objects that can be rotated in screens cannot be rotated in reports.

---

You can also rotate multiple objects using the multiple selection function. Certain WinCC objects such as buttons cannot be rotated.

The alignment of elements in an object will change in a rotated object. The following figure shows how a rectangle and an ellipse behave under the different commands for rotating an object:

## Requirement

You have opened the work area containing at least one object.

## Procedure

1. Select the object that you want to rotate.
2. Click one of the following toolbar icons:
  - , to rotate the object clockwise around its center point. The angle of rotation is 90°.
  - , to rotate the object counterclockwise around its center point. The angle of rotation is 90°.
  - , to rotate the object clockwise by 180°.

## Result

The object is shown at its new angle.

## See also

- Overview of objects (Page 3266)
- Example: Configuring a rectangle (Page 3315)
- Designing an object (Page 3282)

### 10.1.2.12 Flipping objects

#### Introduction

You can flip an object along its vertical or horizontal center axis. The alignment of elements in an object will change when you flip an object. The following figure shows how a rectangle and an ellipse behave under the different commands for flipping an object.

#### Requirement

You have opened a screen which contains at least one object.

#### Procedure

1. Select the object that you want to flip.
2. Click the "Flip" command in the shortcut menu and select one of the options displayed:
  - , to flip the selected object along its vertical center axis.
  - , to flip the selected object along its horizontal center axis.

#### Result

The object is shown at its flipped position.

#### See also

- Overview of objects (Page 3266)
- Example: Configuring a rectangle (Page 3315)
- Designing an object (Page 3282)

### 10.1.2.13 Flashing

#### Introduction

You want an object to flash in Runtime.

#### Requirement

You have opened the work area containing at least one object.

#### Procedure

1. Select the object that you want to flash.
2. In the Inspector window, select the type "Default" under ""Properties > Properties > Flashing".

#### Result

The object flashes in runtime.

#### See also

Example: Configuring a rectangle (Page 3315)

Designing an object (Page 3282)

### 10.1.2.14 Designing an object

#### Introduction

You design the border and background of an object.

#### Requirements

A line has been created in a screen.

#### Procedure

1. Select the line on your screen.
2. In the Inspector window, select "Properties > Properties > Appearance":
3. Select "Dash" as the style.
4. To display the dashed line in two colors, select the line width "1".
5. Select the setting "Arrow" in the "Line ends" area.

## Result

The line is displayed in two colors as a dashed line. The end of the line is an arrow.

### 10.1.2.15 Designing the fill pattern

#### Introduction

WinCC lets you design the background color and the fill pattern of an object. The design options change in the Inspector window depending on object for which you are making the filling pattern.

For certain objects, you can not only define the color, but also a transparent background or a background with a color gradient.

---

#### Note

##### Device-specific nature of the properties

The fill style that is available depends on the object and the HMI device used.

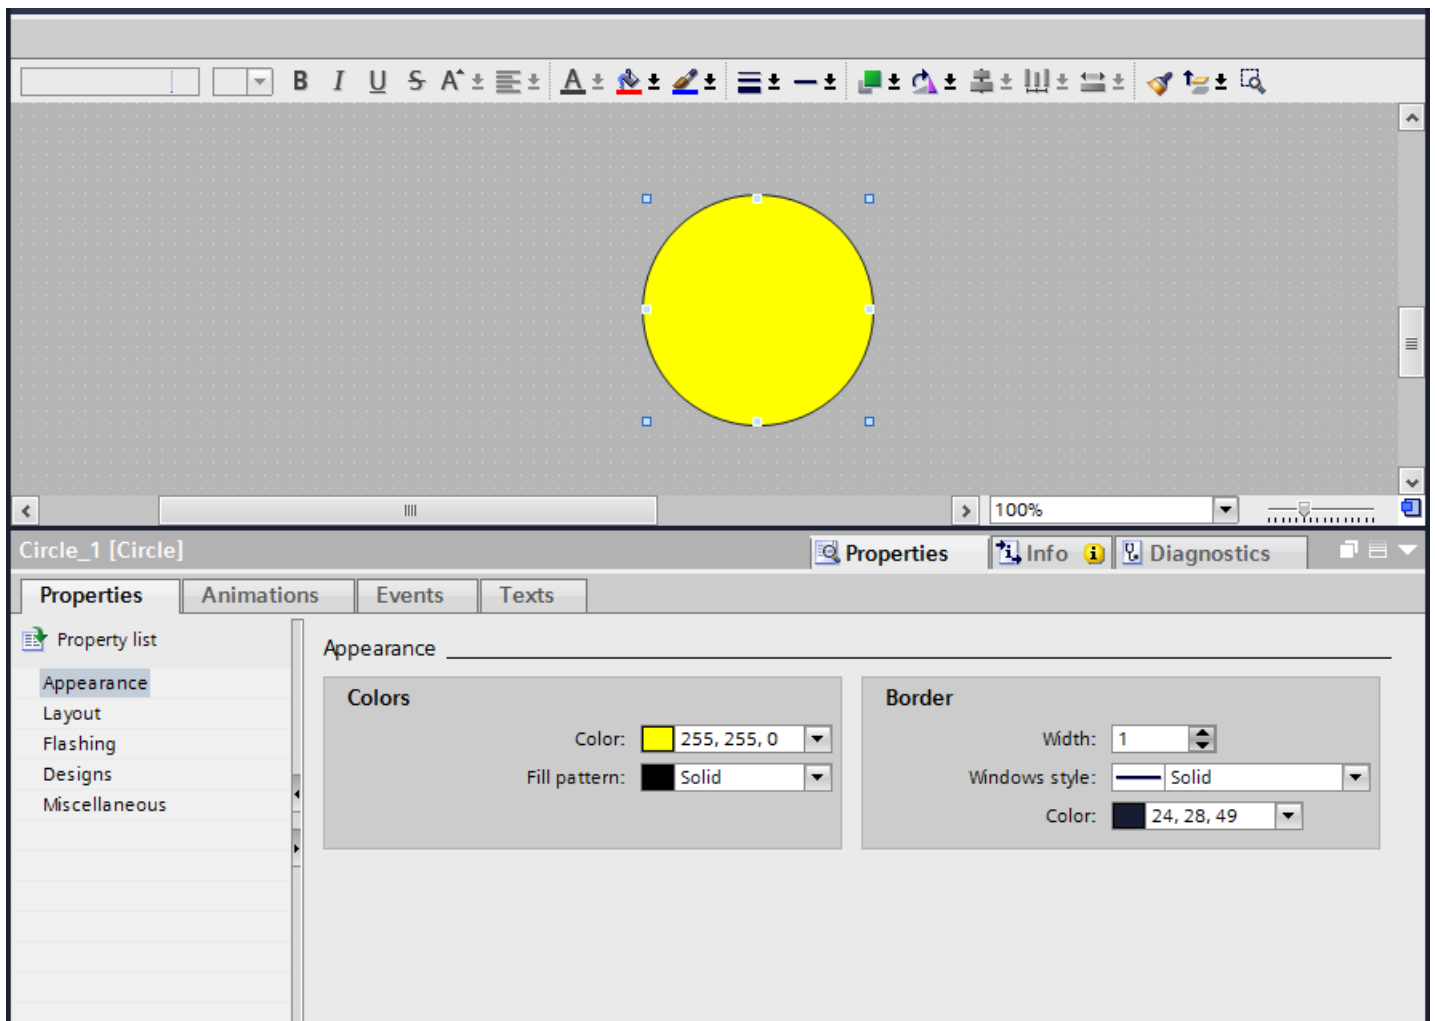

---

## Requirement

The object has been created and selected.

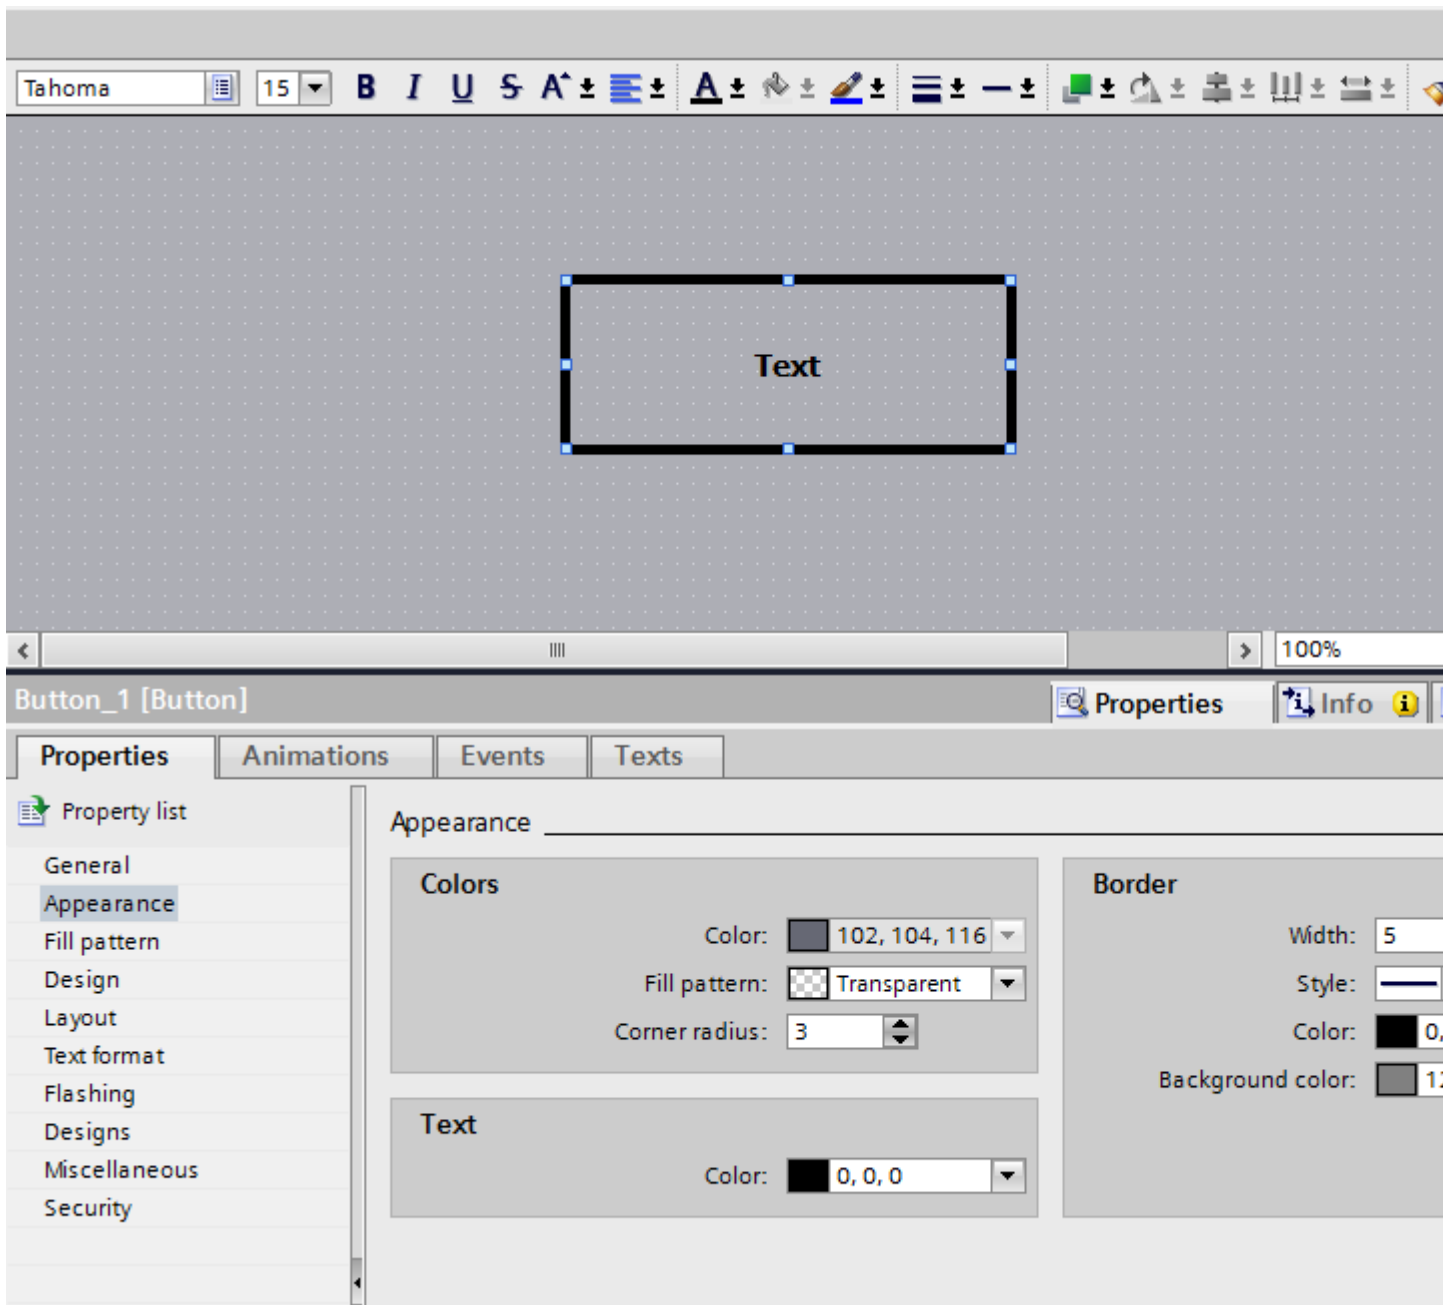

## Designing the background color of an object

1. In the Inspector window, select "Properties > Properties > Appearance".
2. Select a color for the background of the object, for example, yellow.  
The object is filled with the selected color.

## Designing the fill pattern of an object

1. In the Inspector window, select "Properties > Properties > Appearance".
2. To define a transparent background for the object, select transparent.  
You can find information about designing a fill pattern with a color gradient in the section Defining color gradients (Page 3291).  
The object is shown as transparent.

You can optionally set the fill pattern in the Inspector window under "Properties > Properties > Fill Pattern".

### See also

Defining color gradients (Page 3291)

## 10.1.2.16 Formatting text in an object

### Introduction

Some objects, for example, the I/O field, support text within the object. You have several options to align text.

### Configuring the distance from the object border

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the value "5" for the left border, for example.

The text is aligned five pixels from the left border of the object.

### Aligning the text position

1. In the Inspector window, select "Properties > Properties > Text format".
2. Select the horizontal alignment, for example, centered.
3. Select the vertical alignment, for example, top.  
The text is shown at the top center in the object.

### Defining the text orientation

1. In the Inspector window, select "Properties > Properties > Text format".
2. Select the orientation of the text, for example, vertical, right.  
The text flow is shown from bottom to top.

## 10.1.2.17 Formatting graphics in an object

### Introduction

WinCC lets you insert graphics into some objects and format them. You can change the size, orientation and distances of a graphic to the object border. You change the properties of the graphic in the Inspector window of the relevant object.

## Requirement

- The selected object is in graphic mode.
- The selected object contains at least one graphic.

## Resizing a graphic

1. In the Inspector window, select "Properties > Properties > Layout".
2. Select "No stretching of picture" or "Stretch picture".  
The contained graphic is displayed in its original size or stretched to the size of the object.

---

### Note

To adjust the object size to the contained graphic, select "Fit object to contents".

---

## Aligning a graphic horizontally and vertically

1. In the Inspector window, select "Properties > Properties > Layout".
2. To determine the horizontal position of the graphic, select "Right", for example.
3. To determine the vertical position of the graphic, select "Top", for example.  
The graphic is then shown at the top right of the object.

## Defining the distance from the object border

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the value for the distance to the object border, for example, "20" for the top border.  
The graphic is shown with a distance of 20 pixels to the top border of the object.

Icon	Description
	Sets the distance from the left border of the object.
	Sets the distance from the right border of the object.
	Sets the distance from the top border of the object.
	Sets the distance from the bottom border of the object.

### 10.1.2.18 Designing a border

#### Introduction

WinCC offers various properties for designing display and operating objects. The I/O field example below shows the possible settings for designing borders. You change the appearance in the Inspector window of the relevant object.

#### Designing a border

1. Open "Properties > Properties > Appearance".
2. Select the width of the border, e.g. "5".
3. Select the style of the border, e.g. double line.
4. Select the foreground color.
5. Select the background color.

Figure 10-1 "Double line" border style

## Border style

The figure below shows a border in "3D style".

The figure below shows a border in "Solid" style.

---

### Note

#### Device-specific nature of the properties

The border style that is available depends on the object and the HMI device used.

---

## 10.1.2.19 Designing table-based objects

### Introduction

WinCC offers various properties for designing display and operating objects.

You change the properties of table-based objects in the Inspector window of the relevant object.

## Designing colors

Select the colors for font, selections and areas under "Properties > Properties > Appearance".

Figure 10-2 Selecting table properties

## Designing the border of the table header

1. In the Inspector window, open "Properties > Properties > Table header border".
2. Select "Solid", for example, as the style.
3. Select 5, for example, as the "Width".
4. Select red, for example, as a foreground color.

The border of the table header is shown with a red border and width of 5 pixels. With "Solid" border style, only the foreground color is visible.

## Colors and color gradient in the table header

1. Select the table-based object in the screen.
2. In the Inspector window, open "Properties > Properties > Table header fill pattern".
3. Select the fill pattern, for example "Horizontal gradient".
4. Select a background color, for example, blue, under "Gradient".
5. Activate "Gradient 1".
6. Select a color for "Gradient 1", for example, white.
7. Select a "Width" for the color gradient, for example, 12.
8. Activate Gradient 2.
9. Select a color for Gradient 2, for example, yellow.
10. Select a "Width" for the color gradient, for example, 10

The table header is displayed with a color gradient.

### 10.1.2.20 Defining color gradients

#### Introduction

For the objects in WinCC, color gradients can be specified as background for various surfaces.

Change the category in the Inspector window, depending on which surface you fill with a color gradient. The procedure remains the same.

The following section describes how to configure the color gradient of buttons.

#### Horizontal color gradient with two colors

1. Select an object with buttons, for example, a button.
2. In the Inspector window, select "Properties > Properties > Fill Pattern".
3. Select "Fill Pattern > Horizontal gradient".
4. Select a background color for the vertical color gradient, for example, orange.
5. Activate "Gradient 1".
6. Select a "Color" for Gradient 1, for example, red.
7. Select a "Width" for Gradient 1, for example, "10".

The background of the button is displayed in orange.

For the horizontal color gradient, Gradient 1 is shown from the left border. Gradient 1 is 10 pixels wide.

#### Vertical color gradient with three colors

1. Select a button in the screen.
2. In the Inspector window, select "Properties > Properties > Fill Pattern".
3. Select the "Vertical gradient" background.
4. Select a background color under "Gradient", for example, orange.
5. Activate "Gradient 1".
6. Select a color for "Gradient 1", for example, red.
7. Select a "Width" for the color gradient, for example, 8.
8. Activate Gradient 2.
9. Select a color for Gradient 2, for example, yellow.
10. Select a "Width" for the color gradient, for example, 10.

For the vertical color gradient, Gradient 1 is shown from top to bottom. Gradient 1 is 8 pixels wide.

The background of the button is displayed in orange.

Gradient 2 is shown at the bottom border. Gradient 2 is 10 pixels wide.

### 10.1.2.21 Applying predefined styles

#### Introduction

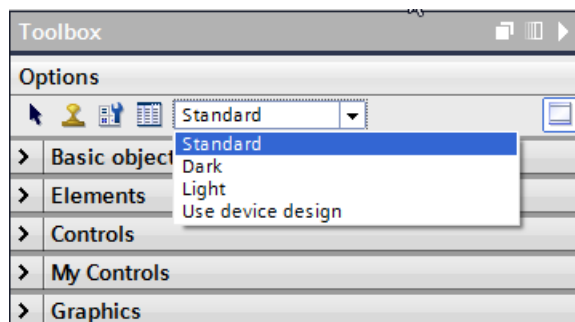

You can assign predefined styles to objects and faceplates in Runtime. You can change the background color of the display and operating elements using predefined styles. In this way, you harmonize the display in Runtime.

#### Requirement

The "Tools" task card is open.

#### Setting predefined styles

1. Select the object that you want to insert in the "Toolbox" task card.
2. Select one of the following options in the "Toolbox" task card:
  - "Default" to use the default style
  - "Dark" to use the dark color scheme
  - "Light" to use the light color scheme
  - "Use device design" to use the settings from the current device design

3. Insert the required object in the work area.  
The object is displayed in the selected style.
4. The objects are created in the selected style as long as the style remains activated in the toolbar.  
To return to the default style, select the "Default" option in the toolbar.

## See also

Working with styles (Page 3258)

### 10.1.2.22 Inserting multiple objects of the same type (stamping tool)

#### Introduction

WinCC offers the possibility to "stamp" several objects of the same type directly one after the other, i.e. paste without having to reselect the object every time. In addition you have the possibility of multiplying an object that has already been inserted.

#### Requirement

The "Tools" task card is open.

#### Inserting several objects of one type

1. Select the object that you want to insert in the "Tools" task card.
2. Click the  icon in the toolbar of the "Tools" task card.  
The "Stamp" function is activated.
3. To insert the object with its standard size, click the relevant insertion position in the work area.  
To insert the object with another size, position the mouse pointer at the desired location in the work area. Press the left mouse button and drag the object to the required size.  
The object is inserted in the work area as soon as you release the mouse button.
4. Repeat step 3 to insert further objects of the same type.
5. Click the  icon again.  
The "Stamp" function is deactivated.

---

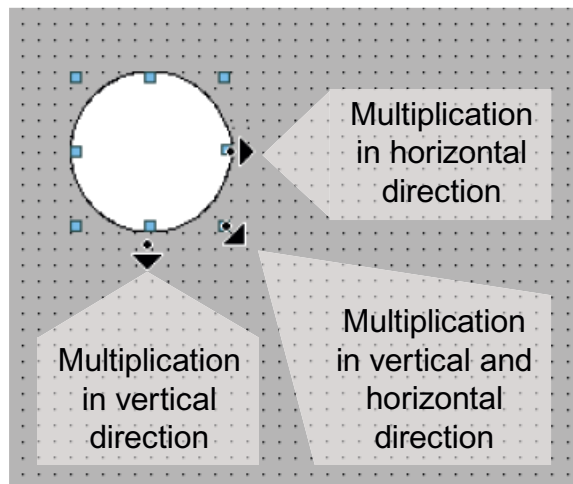

#### Note

You can copy existing objects using the drag-and-drop +<CTRL> function. The existing object is not moved in this case. You paste a copy of this object into the new position instead.

---

### Inserting and multiplying an object

1. Insert the desired object from the "Tools" task card.
2. Press the <Ctrl> key and position the cursor on one of the handles displayed in the figure shown below.

3. Drag the handles to the right and/or down while keeping the left mouse button pressed.
4. The object is multiplied depending on available space if you keep moving the cursor.

### Result

You have pasted and stamped an object in a screen.

### See also

- Overview of objects (Page 3266)
- Example: Configuring a rectangle (Page 3315)
- Designing an object (Page 3282)

### 10.1.2.23 Selecting multiple objects

#### Introduction

Select all objects you want to align with each other or to change global properties. This procedure is called "multiple selection."

The Inspector window shows all the properties of the selected objects.

You now have several options of selecting multiple objects:

- Draw a selection frame around the objects.
- Hold down the <Shift> key, and click the required objects.

### Selection frame of a multiple selection

The selection frame surrounds all objects of a multiple selection. The selection frame is comparable with the rectangle that surrounds an individual object.

The selection frame is not visible. When you have made your multiple selection, the following frame is displayed:

- The reference object is indicated by the rectangle around it.
- The other selected objects are indicated by a dashed-line frame.

### Specifying a reference object

The reference object is the object upon which the other objects are oriented. The reference object is framed by a rectangle with handles. The following figure shows a reference object with two other selected objects:

You have the following options to specify the reference object:

- Select the objects via multiple selection. The object selected first is then the reference object.
- Draw a selection frame around the objects. The reference object compiled automatically. If you wish to specify a different object within the selection as the reference object, click on the desired object. This action does not cancel your multiple selection.

### Requirement

You have opened the work area containing at least two objects.

### Selecting multiple objects with a selection frame

1. Position the mouse pointer in the work area close to one of the objects to be selected.
2. Hold down the mouse button, and draw a selection frame around the objects to be selected.

Or:

1. Hold down the <Shift> key.
  2. Click the relevant objects, working in succession.  
All the selected objects are identified by frames.  
The object selected first is identified as reference object.
- 

**Note**

To remove an object from the multiple selection, press <SHIFT>, hold it down and then click the relevant object once again.

---

**Result**

Multiple objects are selected. One of those is identified as the reference object. You can now perform the following steps:

- Changing the object properties of all the objects
- Resizing all the objects by the same ratio, by dragging the selection frame to increase or reduce the size
- Moving all the objects in one group
- Aligning the objects to the reference object

**See also**

Overview of objects (Page 3266)

Example: Configuring a rectangle (Page 3315)

Designing an object (Page 3282)

### 10.1.2.24 Repositioning and resizing multiple objects

#### Possible modifications

After you have selected multiple objects, you edit them:

- Shift using the mouse
  - To change the absolute position of the marked objects, position the mouse pointer over an object, and shift the multiple selection with the mouse button pressed.
  - To resize all the objects by the same ratio, grab the resizing handles of the reference object.
- Move over the work area with the icons of the toolbar
  - Change the position of the marked objects with respect to each other
  - Align the height and width of the marked objects
- Moving with the shortcut menu commands of the work area
  - Change the position of the marked objects with respect to each other
  - Align the height and width of the marked objects

#### See also

Overview of objects (Page 3266)

Designing an object (Page 3282)

### 10.1.2.25 Managing My Controls

#### Introduction

Add standardized or user-defined controls in the "Toolbox > My Controls" task card. All the ActiveX controls registered in the operating system and the .Net controls on your system are available for use in WinCC.

- ActiveX controls  
ActiveX controls are control elements from any providers, which can be used by other programs over a defined OLE-based interface.
- .Net controls  
.Net controls are control elements from any providers based on the Microsoft .Net Framework.
- Specific .Net controls  
.Net controls are control elements from any providers based on the Microsoft .Net Framework.

When you intend to run external controls in your WinCC project, you need to verify that these run on the HMI device you are configuring. If you are using controls from third parties, you

must first of all add these to the "My controls" palette before you copy the project to different PCs.

---

**Note**

If you use any controls that are not included in the product package (for example, from third parties), errors may occur, for example, reduced performance or system crashes. The user of such control software is alone responsible for any problems caused by its use. We therefore advise you to closely examine such elements prior to their use.

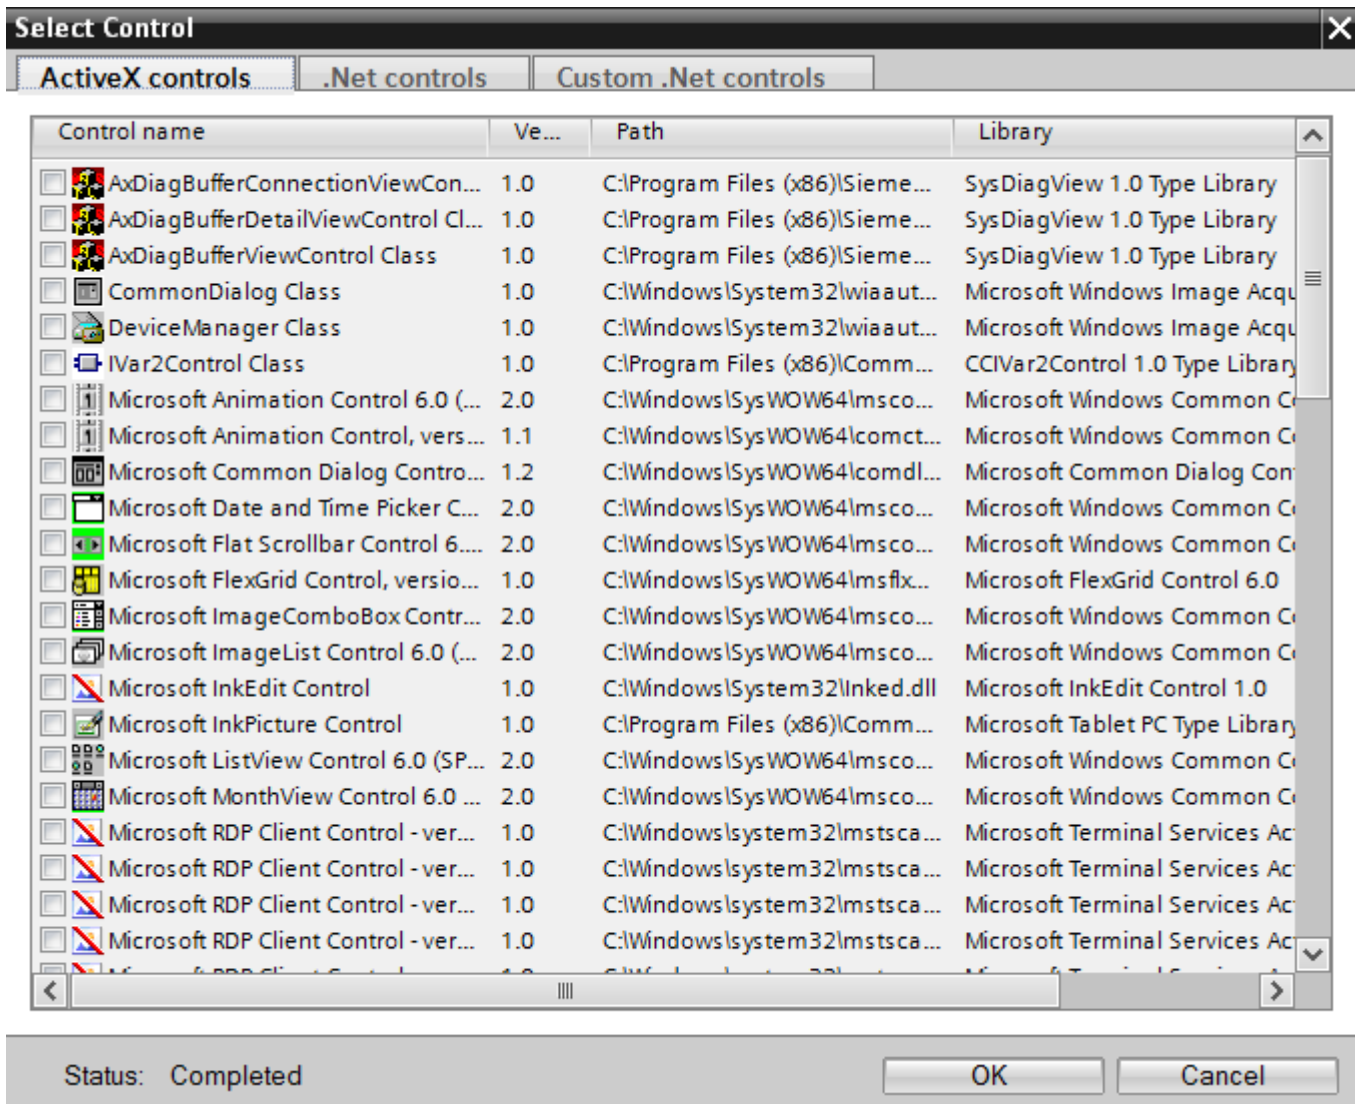

---

**Requirement**

- The required ActiveX control is installed in the PC's operating system.
- The required or specific .Net control is available on the PC in an assembly.
- A screen is open.
- The "Toolbox" task card is open.

### Adding a new control to the "My controls" group

1. Open "Toolbox > My controls" in the "Toolbox" task card.
2. Select "Select objects" from the shortcut menu.  
A dialog opens. This contains all the controls available on the system. Controls that already exist in the "Toolbox" task card are identified by a check mark.

3. Select the desired tab, e.g. ActiveX controls.
4. Activate the required control.
5. Confirm your selection with "OK".

### Inserting a specific .Net control in the "My controls" group

1. Select the "Specific .Net controls" tab. The list is empty the first time you select the tab.
2. Click the "..." button.

3. Select the folder in which the assembly is contained.
4. Select a file.
5. Click "Open." All the available controls are displayed in the "Specific .Net controls" tab.
6. Activate the required .Net control.
7. Confirm your selection with "OK".

## Result

The control now appears in the "Toolbox > My controls" task card and can be configured in a screen.

## Removing a control from the "My controls" group

1. Select "Delete" from the shortcut menu for the control concerned.  
The control is removed from the "My controls" group.

## See also

Designing an object (Page 3282)

### 10.1.2.26 External graphics

#### Introduction

You can use graphics created with an external graphic program in WinCC. To use these graphics you store them in the graphic browser of the WinCC project.

You can save graphics in the graphic browser:

- When you drag-and-drop graphics objects from the "Graphics" pane into the work area, these are stored automatically in the graphic browser. The graphic names are numbered in the order of their creation, for example, "Graphic\_1." Use the <F2> function key to rename the graphic.
- As a graphic file with the following formats:  
\*.bmp, \*.ico, \*.emf, \*.wmf, \*.gif, \*.tif, \*.png, \*.jpeg or \*.jpg
- As an OLE object that is embedded in WinCC and is linked to an external graphic editor. In the case of an OLE link, you open the external graphic editor from WinCC. The linked object is edited using the graphic editor. An OLE link only works if the external graphic editor is installed on your PC, and supports OLE.

## Use of graphics from the graphic browser

Graphics from the graphic browser are used in your screens:

- In a Graphic view
- In a graphics list
- As labeling for a button/function key

## Transparent graphics

In WinCC you also use graphics with a transparent background. When a graphic with a transparent background is inserted into a graphic object of WinCC, the transparency is replaced by the background color specified for the graphic object. The selected background color is linked firmly with the graphic. If you use the graphic in another graphic object of WinCC, this object is displayed with the same background color as the graphic object that was configured first. If you want to use the graphic with different background colors, include this graphic in the graphic browser again under a different name. The additional background color is configured when the graphic is used at the corresponding graphic object of WinCC.

## Managing graphics

An extensive collection of graphics, icons and symbols is installed with WinCC, for example:

In the Toolbox window of the "Graphic" pane the graphic objects are structured by topic in the "WinCC graphics folder." The link to the WinCC graphics folder cannot be removed, edited or renamed.

The "Graphics" pane is also used to manage the external graphics. The following possibilities are available:

- Creating links to graphics folders  
The external graphic objects in this folder, and in the subfolders, are displayed in the toolbox and are thus integrated in the project.
- Editing folder links
- You open the program required for editing of the external graphic in WinCC.

## See also

Overview of objects (Page 3266)

Example: Configuring a rectangle (Page 3315)

Designing an object (Page 3282)

### 10.1.2.27 Managing external graphics

#### Introduction

External graphics that you want to use in WinCC are managed in the "Screens" editor by using the "Tools" task card in the "Graphics" pane.

#### Requirement

- The "Screens" editor is open.
- The "Tools" task card is open.
- The graphics are available.
- The graphics have the following formats:  
\*.bmp, \*.ico, \*.emf, \*.wmf, \*.gif, \*.tif, \*.jpeg or \*.jpg

#### Creating a folder link

1. Click "My graphics folder."
2. Select "Link" in the shortcut menu.  
The "Create link to folder" dialog is opened. The dialog suggests a name for the folder link.
3. Edit the name as required. Select the path containing the graphic objects.
4. Click "OK" to confirm your input.  
The new folder link is added to the "Graphics" object group. The external graphics that are located in the target folder and in sub-folders are displayed in the toolbox.

#### Editing folder links

1. Select the folder link to edit.
2. Select the "Edit link..." command from the shortcut menu.  
The "Create link to folder" dialog is opened.
3. Edit the name and path of the folder link as required.
4. Click "OK" to confirm your input.

#### Renaming the folder link

1. Select the folder link to rename.
2. Select "Rename" from the shortcut menu.
3. Assign a name to the new folder link.

#### Removing a folder link

1. Select the folder link you want to delete.
2. Select "Remove" in the shortcut menu.

### **Edit external graphics**

1. Select the graphic you want to edit.
2. Select the "Edit graphic" command from the shortcut menu.  
This opens the screen editor associated with the graphic object file.

### **Editing graphics folders from WinCC**

1. Select the graphic you want to edit.
2. Select the "Open parent folder" command from the shortcut menu.  
The Windows Explorer opens.

### **See also**

- Overview of objects (Page 3266)
- Example: Configuring a rectangle (Page 3315)
- Designing an object (Page 3282)

### **10.1.2.28 Storing an external image in the graphics library.**

#### **Introduction**

To display graphics that have been created in an external graphics program in your screens, you will first have to store these graphics in the graphics browser of the WinCC project.

#### **Requirement**

- A screen has been created.
- A Graphic View is inserted in the screen.
- The Inspector window of the Graphic view is open.

To store an external graphic in the image browser:

- A graphic is available.

To store an OLE object in the browser:

- An OLE-compatible graphics program is installed on your configuration computer.

#### **Save graphics file**

1. Open the Windows Explorer.
2. Select the graphic that you want to store.
3. Drag-and-drop the graphic into the graphic browser.

### Creating and saving a new graphic as an OLE object

1. Select the Graphic view on your screen.
2. In the Inspector window, select "Properties > Properties > General":
3. Open the graphic selection list.
4. Click .
5. The "Insert object" dialog box opens.

---

#### Note

In addition, the dialog "External application running..." will open. The dialog will not close until you exit the external application.

---

6. From the "Insert object" dialog box, select "New" and an object type. The settings in "Settings > "OLE settings" determine which object types are shown.
7. Click "OK." The associated graphic program is opened.  
When you are finished creating graphics, end the graphic programming software with "File > Close" or "File > Close & return to WinCC."  
The graphic will be stored in the graphic programming software standard format and added to the graphic browser.

### Inserting created graphics in WinCC

---

#### Note

A new graphic object created as OLE object may not be directly accepted in WinCC when you save it to an external graphics program.

---

1. Reopen the dialog for inserting a graphic.
2. From the "Insert object" dialog box, select "Create from file."
3. Click the "Browse" button.
4. Navigate to the created graphic and select it.

### Saving an existing graphic object as an OLE object

1. In the Inspector window, select "Properties > Properties > General":
2. Open the graphic selection list.
3. Click .
4. The "Insert object" dialog box opens.

---

#### Note

In addition, the dialog "External application running..." will open. The dialog will not close until you exit the external application.

---

5. From the "Insert object" dialog box, select "Create from file."

6. Click the "Browse" button.
7. Use the dialog to help you navigate to the folder in which the graphic file is saved.

---

**Note**

To import graphics files, note the following size restrictions:

\*.bmp, \*.tif, \*.emf, \*.wmf ≤4 MB

\*.jpg, \*.jpeg, \*.ico, \*.gif "\*"≤1 MB

---

## Result

The image file is now stored in your image browser. It is shown in a screen with a Graphic view , or is added as a list element in an image list.

You can double-click OLE objects in your library to open them for editing in the corresponding graphic editor. When you have finished editing graphics, end the graphic programming software with "File > Close" or "File > Close & return to WinCC." The changes are applied to WinCC.

Overview of objects (Page 3266)

Example: Configuring a rectangle (Page 3315)

Designing an object (Page 3282)

## 10.1.2.29 Working with object groups

### Basics on groups

#### Introduction

Groups are several objects that are grouped together with the "Group" function. You edit a group in the same way as any other object.

#### Overview

WinCC offers the following methods for editing multiple objects:

- Multiple selection
- Creating object groups

#### Editing mode

To edit an individual object in a group, select the object in the "Layout > Layers" task card.

Alternatively select "Group > Edit group" in the object group's shortcut menu.

## Hierarchical groups

You add further objects or groups to extend a group. The group is enlarged by the new objects and is structured hierarchically in main and sub-groups. Such hierarchical groups must be broken up in stages. You also break up the group in the same order in which you grouped the objects or groups. It takes exactly the same number of steps to break up these hierarchical groups as it did to create them.

## Rectangle surrounding the object

Only one surrounding rectangle is now displayed for the whole group. The surrounding rectangles of all objects are displayed for a multiple selection on the other hand.

## Layers

All objects of a group are located in the same layer.

## See also

Example: Configuring a rectangle (Page 3315)

## Creating object groups

### Introduction

The "Group" command combines multiple objects to form a group.

You can change the size and position of the group. The following rules apply:

- The system automatically adapts the position coordinates of the grouped objects when you reposition the group. The relative position of the grouped objects to the group is not affected.
- The system automatically adapts the height and width of the grouped objects in proportion to a change of the group size.
- To change the size of the group proportionately, hold down the <Shift> key and drag the rectangle around the object until has the required size.

---

### Note

To create a hierarchical group, organize the individual groups like objects.

---

## Requirement

- You have opened a screen which contains at least two objects.

## Creating object groups

1. Select all the objects you want to organize in a group.
2. Select the command "Group > Group" from the shortcut menu.

The objects of the group are displayed with a rectangle around the objects.

## Grouping objects within a group

1. Select the group you want to edit.
2. Select the command "Group > Edit group" from the shortcut menu.  
The group that you are editing is highlighted by a red frame.
3. Select the objects of a group that you want to combine into a subgroup.
4. Select the command "Group > Group" from the shortcut menu.

A subgroup with the objects is created.

## Adding objects into an existing group

1. Select the group to which you want to add objects.
2. Press the <Shift> key and select the object you want to add to the group.
3. Select the "Group > Add to group" command from the shortcut menu.

The object is added to this group.

## Alternative procedure

You can also edit groups in the "Layout" task card. Using drag-and-drop you can also easily edit nested groups in the "Layers" pane.

## Result

The selected objects are combined in a group. The multiple selection rectangle becomes the rectangle surrounding the objects in the group. The handles are shown only for the group. The group is in the active layer.

## See also

Example: Configuring a rectangle (Page 3315)

## Ungroup

### Introduction

Select the "Ungroup" command to split a group into the original object fractions.

### Requirement

- You have opened a screen that contains a group.

### Ungroup

1. Select the group.
2. Select the "Group > Ungroup" command from the shortcut menu.

### Ungrouping a group within a group

1. Select the higher-level group.
2. Select the command "Group > Edit group" from the shortcut menu.  
The group that you are editing is highlighted by a red frame.
3. Select the lower-level group.
4. Select the "Group > Ungroup" command from the shortcut menu.

### Result

The lower-level group is ungrouped. The objects are assigned to the next higher group.

### Alternative procedure

You can also edit groups in the "Layout" task card. Using drag-and-drop you can also easily edit nested groups in the "Layers" pane.

### See also

Example: Configuring a rectangle (Page 3315)

## Adding objects to a group

### Introduction

The "Add objects to group" command is used to add objects to a group, without ungrouping it first.

## Requirements

A screen with one group and at least one other object is opened.

## Procedure

1. Select the group.
2. Press the <Shift> key and select the object you want to add to the group.
3. Select the "Group > Add to group" command from the shortcut menu.

## Result

The group consists of the original objects, and the newly-added objects. The added objects are arranged at the front of the group.

## Alternative procedure

You can also edit groups in the "Layout" task card. Using drag&drop you can also easily edit hierarchical groups in the "Layers" palette.

## See also

Example: Configuring a rectangle (Page 3315)

## Removing Objects from the Group

### Introduction

You use the "Remove objects from group" command to remove individual objects from a group, without ungrouping it first.

You do not have to remove the object from the group to edit an object in a group. You can edit the objects of a group individually.

### Requirement

- You have opened a screen that contains a group.

### Removing objects from a group

To remove an object from a group:

1. Select the group.
2. Select the command "Group > Edit group" from the shortcut menu.  
The group you want to edit is highlighted by a red frame.

3. Select all objects in the group that you want to remove from the group.
4. Select the "Group > Remove from group" command from the shortcut menu.

The objects are removed from the group.

---

**Note**

If there are only two objects in the group, the menu command "Remove from group" is not available.

---

### Deleting objects from a group

To remove an object from the group, and from the screen:

1. Select the group.
2. Select the command "Group > Edit group" from the shortcut menu.  
The group you want to edit is highlighted by a red frame.
3. Select the objects in the group that you want to delete.
4. Select "Delete" from the shortcut menu.

---

**Note**

If there are only two objects in the group, the menu command "Delete" is not available.

---

### Alternative procedure

You can also edit groups in the "Layout" task card. Using drag-and-drop you can also easily edit nested groups in the "Layers" pane.

### See also

Example: Configuring a rectangle (Page 3315)

### Editing an Object in a Group

#### Introduction

You can edit the objects of a group individually.

#### Requirement

You have opened a screen that contains a group.

## Editing grouped objects

1. Select the group.

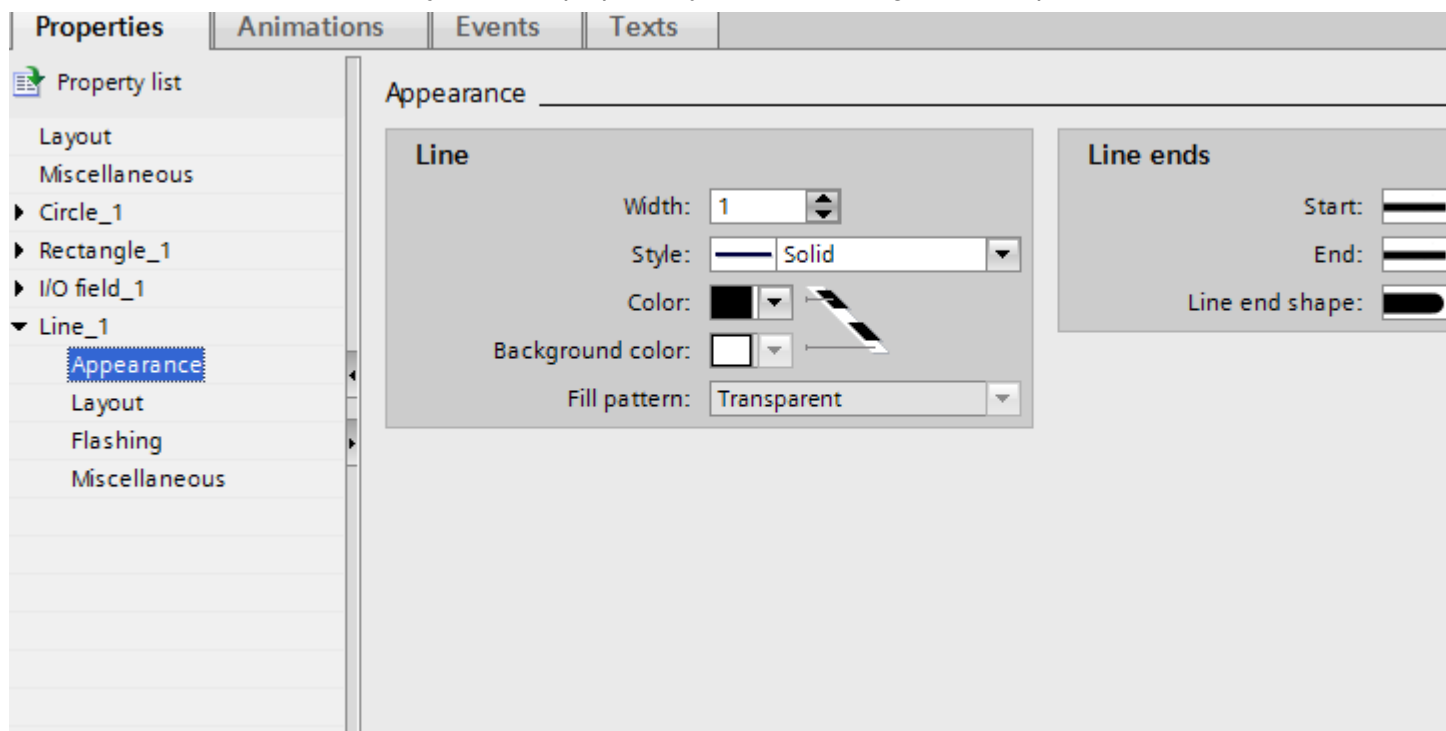

The properties of the group are displayed in the Inspector window.

2. Change the position and size of the grouped objects in "Properties > Properties >Layout."
3. Change the name of the group in "Properties > Properties > Miscellaneous."

## Modifying the properties of an object within a group

1. Select the group.
2. Select the object whose properties you want to change in the Inspector window.

The properties of the object are displayed.

3. Change the object properties.

---

**Note**

The dynamization of properties for all objects of the group which have these properties is not possible in a group. You can only dynamize the properties of the objects associated with a group for each object itself.

---

**Result**

Although you have edited the object, it is still an element of the group. These changes do not affect the other objects of the group.

**See also**

Example: Configuring a rectangle (Page 3315)

### 10.1.2.30 Configuring the keyboard access

#### Overview of keyboard access

#### Introduction

For keyboard units without a mouse, the operator activates control objects using the <Tab> key. You can set up keyboard input to make the process easier to run, and to make sure that the operator enters all the necessary values. If you are using the keyboard, use the <Tab> key to activate the objects in a certain order, and to enter the necessary values.

For HMI devices without key, you can simulate the <Tab> key by configuring the "SimulateSystemKey" system function to a function key.

#### Operator authorizations and operator control enables

If you configure an object for operator input with the <Tab> key, the object must have both an operator authorization, and an operator control enable.

#### Editing the tab sequence

The tab sequence is determined automatically when the control objects are created. The numbers of the tab sequence are assigned in the sequence in which the libraries are created.

It makes sense to change the tab sequence in the following cases:

- The operator changes directly to a specific control object.
- The screen requires a specific sequence

Change to the tab sequence mode to change the tab sequence. In this mode, the tab sequence number is displayed at the top left of the control objects. The tab sequence numbers of hidden objects are also shown. The distribution of these numbers is edited using the mouse.

---

**Note**

Other functions are not available in the tab sequence mode.

---

**See also**

Example: Configuring a rectangle (Page 3315)

**Defining the Operator Authorization and Operator Control Enable for an Object**

**Introduction**

If you configure an object for operator input with the <Tab> key, the object must have both an operator authorization, and an operator control enable.

**Requirement**

You have opened a screen which contains at least one object.

**Procedure**

1. Select the object.
2. Select "Properties > Properties > Security" in the Inspector window.
3. Select the operator authorization under "Authorization."
4. Activate the authorization to operate.

**Result**

The operator can use the <Tab> key in Runtime to select the object.

**See also**

Example: Configuring a rectangle (Page 3315)

## Setting the tab sequence order

### Introduction

All operable objects can be reached in runtime with the <Tab> key. You use the "Tab sequence" command to define the order in which the operator can activate objects in runtime.

---

#### Note

You cannot reach objects with the "Output" or "Two states" mode in runtime with the <Tab> key.

---

You can operate the screen in runtime:

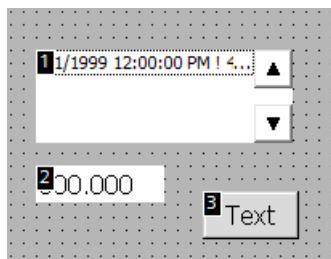

- Using the <Tab> key
- Using the mouse
- Using a configured hotkey

### Requirement

- The active screen contains operable objects.
- No object is selected.
- The objects have been enabled for use in runtime, and have operator authorization.

### Procedure

1. Select "Edit tab sequence" in the "Edit" menu.  
Tab sequence mode is activated. The tab sequence number is displayed for all objects that can be used. The tab sequence number is also displayed for hidden objects.
2. Use edit the tab sequence mode, click the accessible objects in the order in which you want them to be activated using <Tab> in runtime.  
The following figure shows how the tab sequence is defined in the screen. In runtime, the <Tab> key first activates the alarm view (number 1), then the I/O field (number 2), and then the button (number 3):

3. To exclude a screen object from the tab sequence, press the key combination <Shift+Ctrl> and click on the desired object.  
The tab sequence number is no longer displayed in the screen object. The screen object is now excluded from the tab sequence. The remaining tab sequence numbers are automatically decreased by 1.
4. To reenter an excluded screen object in the tab sequence, repeat step 3.  
The screen object entered as the first object in the tab sequence.

## Result

The operator selects the objects in the specified order in Runtime with the <Tab> key.

## See also

Example: Configuring a rectangle (Page 3315)

### 10.1.2.31 Examples

#### Example: Configuring a rectangle

## Task

In this example you configure a rectangle:

- Color = red
- Black frame 2 pixels wide
- Position = (20, 20)
- Size = (100,100)

#### Changing the color of the rectangle

To change the color of the rectangle:

1. Select the rectangle.
2. Define the background color in "Properties > Properties > Appearance > Background > Color" in the Inspector window.
3. Select "Solid" as the fill pattern.
4. Define the color for the border in "Properties > Properties > Appearance > Border > Color" in the Inspector window.
5. Enter the value "2" for "width".
6. Select "Solid" as the "Style".

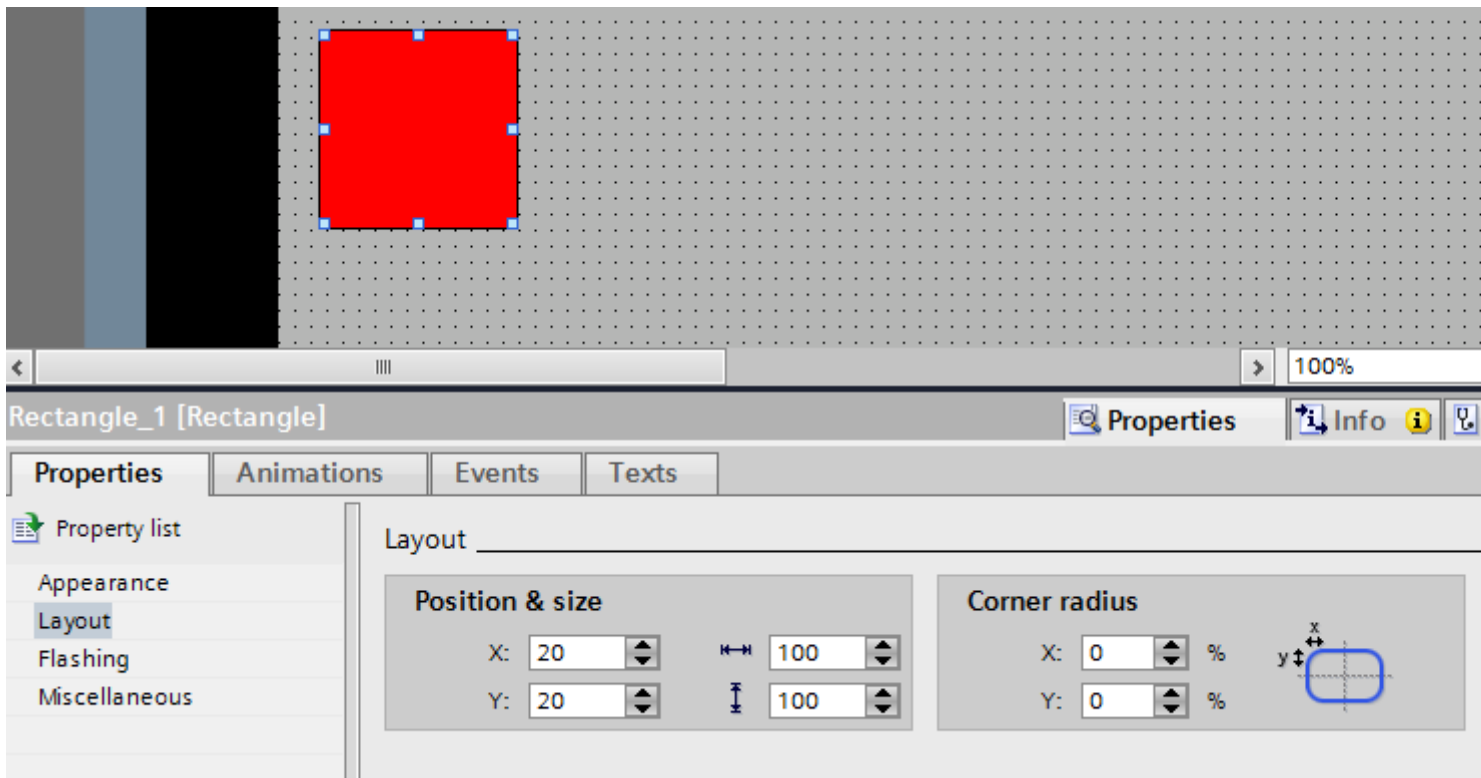

## Interim result

The rectangle is red and has a black frame with a width of two pixels.

## Repositioning and resizing the rectangle

To change the position and size of the rectangle:

1. Select the rectangle.
2. In the Inspector window, select "Properties > Properties > Layout".

3. Set "20" for the both the X and Y coordinates under "Position & Size".
4. Set "100" for the height and for the width.

## Result

The rectangle is positioned at the coordinates (20, 20), and has a width and height of 100 pixels.

## See also

Overview of objects (Page 3266)

## Example: Inserting a rectangle

### Task

In this example, you insert and rename a rectangle. Do not use the special characters ?, ", /, \, \*, <, > for the name.

### Requirement

- A screen is open.
- The Inspector window is open.
- The "Tools" task card is open.

### Procedure

1. Click the "Basic objects" palette in the "Tools" task card.
2. Drag the "Rectangle" object into the screen.
3. In the Inspector window, select "Properties > Properties > Miscellaneous".
4. Type in the new name "MyRectangle".

### Result

The rectangle is now inserted and named "MyRectangle". The rectangle has the default properties of the "rectangle" object.

## Example: Inserting and configuring a rectangle

### Task

In this example, you insert a rectangle in a screen. You can configure the following properties:

- Name = "MyRectangle"
- Position = (20, 20)
- Size = (100,100)
- Color = red
- Black frame 2 pixels wide

## Principle

The rectangle is a closed object which can be filled with a color or pattern. The height and width of a rectangle can be adjusted to allow its horizontal and vertical alignment.

## Overview

Carry out the following steps in order to create a rectangle:

- Inserting a rectangle
- Configuring a rectangle

### 10.1.3 Working with text lists and graphics lists

#### 10.1.3.1 Working with text lists

## Basics on text lists

### Introduction

Texts are assigned to the values of a tag in a text list. Assign the text list to a symbolic I/O field for example in the configuration. This supplies the text to be displayed to the object. The text lists are created in the ""Text List" editor. You configure the interface between the text list and a tag at the object that uses the text list.

The selection of objects that can have a text list assigned depends on the Runtime.

### Application

The text list is used, for example, to display a drop-down list in a symbolic I/O field.

If the symbolic I/O field is a display field, the associated texts will differ according to the value of the configured tags. If the symbolic I/O field is an input field, the configured tag assumes the associated value when the operator selects the corresponding text in Runtime.

---

**Note****Display of tag values without text**

The display of tag values to which no text has been assigned depends on the Runtime:

- The display and operating object remains empty.
  - Three asterisks \*\*\* are displayed.
- 

## Multilingual texts

You can configure multiple languages for the texts in a text list. The texts will then be displayed in the set language in Runtime. To this purpose you set the languages in the Project window under "Language support > Project languages."

## Configuration steps

The following steps are necessary to display texts in a symbolic I/O field for example:

1. Creating the text list
2. Assignment of the texts to values or value ranges of a text list
3. Assignment of a text list in the display object, e.g. the symbolic I/O field

## See also

Screen basics (Page 3241)

## Creating a text list

### Introduction

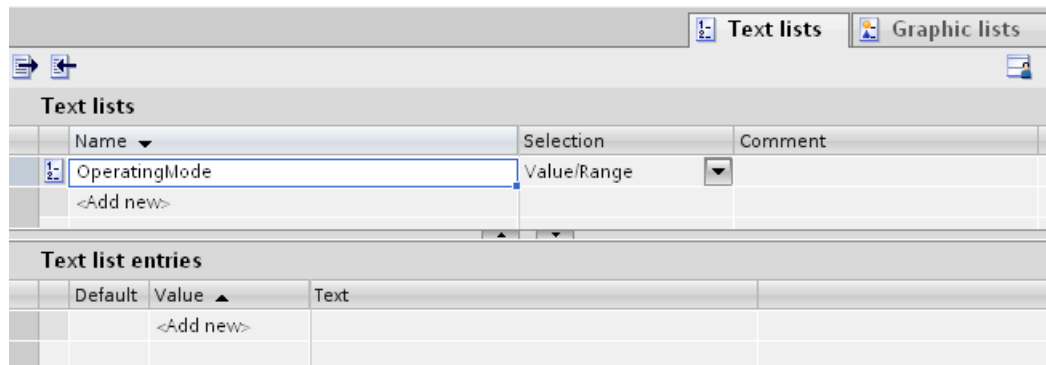

The text list allows you to assign specific texts to values and to output these in Runtime, for example in a symbolic I/O field. The type of symbolic I/O field can be specified, for example as a pure input field.

The following types of list are available:

- Value/Range
- Bit
- Bit Number

## Procedure

1. Double-click "Text and graphics lists" in the project window.
2. Open the "Text lists" tab.

3. Click "Add" in the "Text lists" table.  
The Inspector window of the text list is open.
4. Assign a name to the text list that indicates its function.
5. Select the text list type under "Selection":
  - Value/Range: Text from the text list is displayed when the tag has a value that lies within the specified range.
  - Bit (0,1): A text from the text list is displayed when the tag has the value 0. A different text from the text list is displayed when the tag has the value 1.
  - Bit number (0-31): Text from the text list is displayed when the tag has the value of the assigned bit number.
6. Enter a comment for the text list.

### Note

You must not use semicolons in the texts in a text list. The semicolon is a control character and is automatically deleted from a text.

## Result

A text list is created.

## Assigning texts and values to a range text list

## Introduction

For each area text list you specify which texts are displayed at which value range.

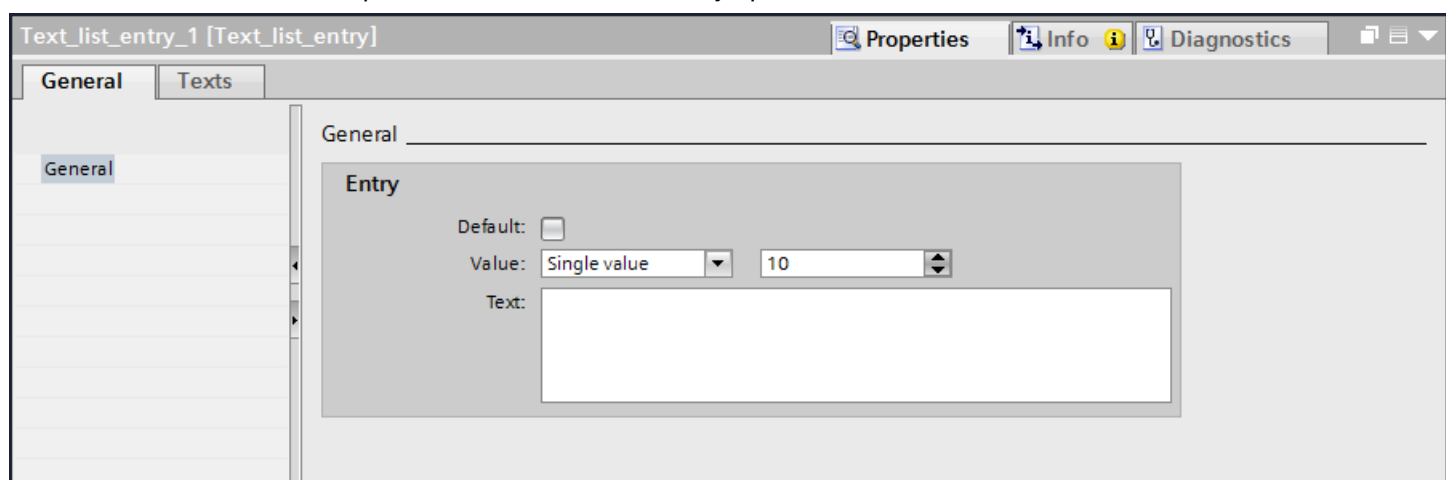

## Requirement

- The "Text and graphics list" editor is open.
- The "Text lists" tab is open.
- An area text list has been created and selected.

## Procedure

1. Click "Add" in the "Text list entries" table.  
The Inspector window for this list entry opens.

2. Select the setting "Range" in "Properties > Properties > General > Value" in the Inspector window.

- Enter the value "1" for "Min" for example.
- Enter the value "20" for "Max" for example.
- For "Text", enter the text that is displayed in Runtime if the tag is within the specified value range.

---

### Note

Use a maximum of 255 characters and no semicolons for the text.

---

3. Click "Add" in the "Text list entries" table. A second list entry is created.

4. Select the setting "Range" in "Properties > Properties > General > Value" in the Inspector window.
  - Enter the value "21" for "Min" for example.
  - Enter the value "40" for "Max" for example.
  - For "Text", enter the text that is displayed in Runtime when the tag is within the specified value range.
5. If required, activate the "default entry".

The entered text is always displayed when the tag has an undefined value. Only one default entry is possible per list.

## Result

An area text list is created. Texts have been assigned to the possible value ranges.

## Assigning texts and values to a bit text list

### Introduction

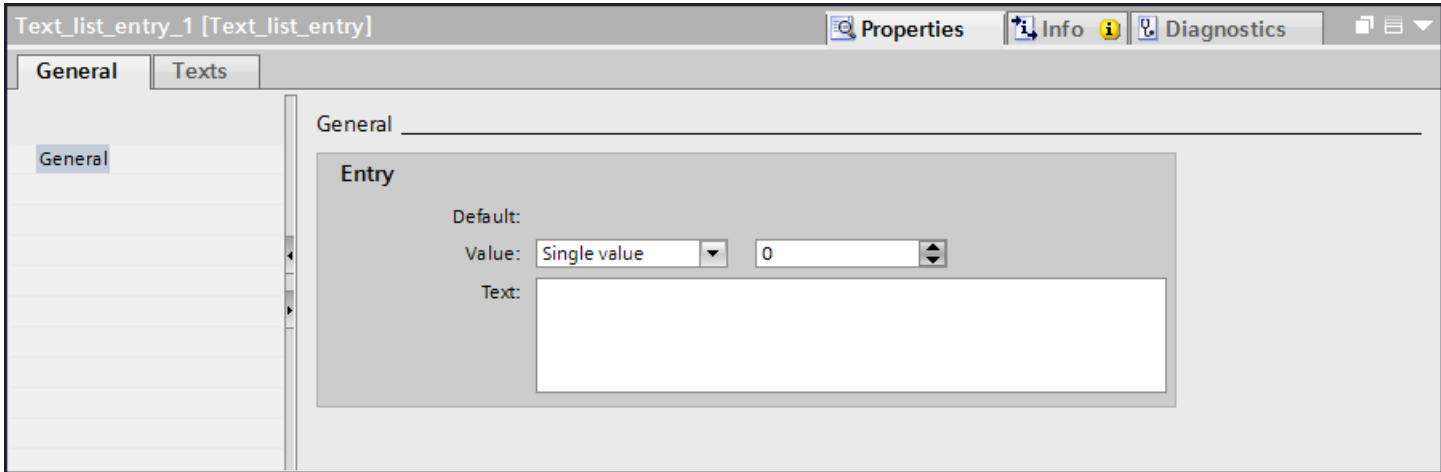

For each text list, you specify which text is displayed at which bit value.

### Requirement

- The "Text and graphics list" editor is open.
- The "Text lists" tab is open.
- A bit text list has been created and selected.

## Procedure

1. Click "Add" in the "Text list entries" table.  
The Inspector window for this list entry opens.

2. Select the setting "Single value" in "Properties > Properties > General > Value" in the Inspector window.
  - Enter "0" for "Value."
  - Enter the text which is displayed in Runtime under "Text" if the bit tag is set to "0".

---

### Note

Use a maximum of 255 characters and no semicolons for the text.

---

3. Click "Add" in the "Text list entries" table. A second list entry is created.
4. Select the setting "Single value" in "Properties > Properties > General > Value" in the Inspector window.
  - Enter "1" under "Value."
  - Enter the text which is to be displayed in Runtime under "Text" if the bit tag is set to "1".

## Result

A bit text list is created. Texts that appear in Runtime are assigned to the possible values "0" and "1".

## Assigning texts and values to a bit number text list

### Introduction

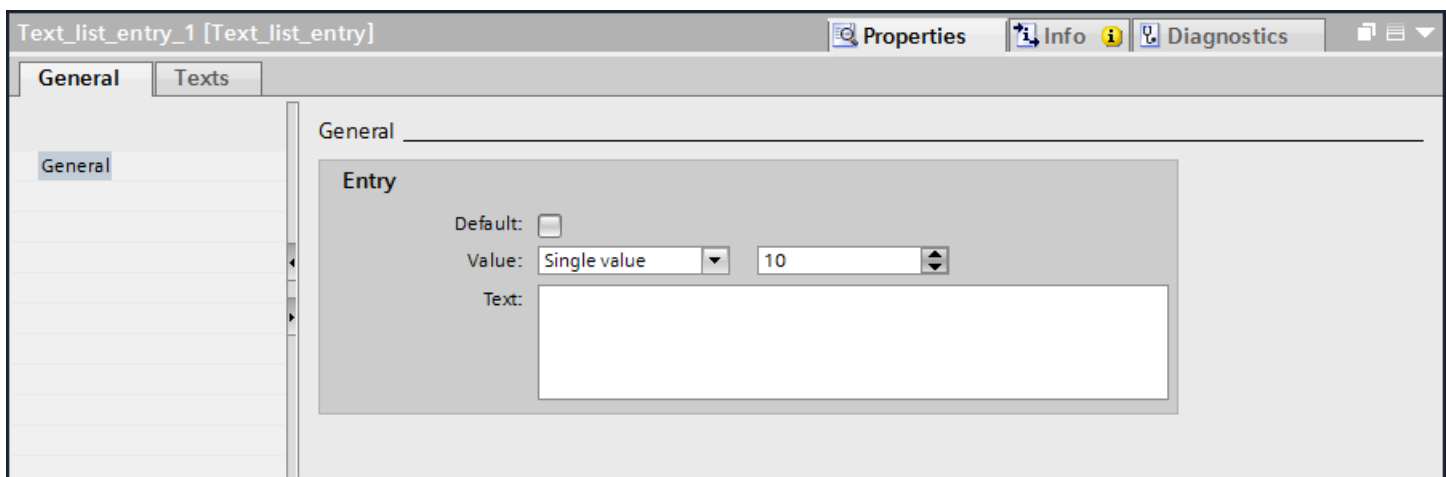

For each bit number text list you specify which texts are displayed at which bit number.

## Requirement

- The "Text and graphics list" editor is open.
- The "Text lists" tab is open.
- A bit number text list has been created and selected.

## Procedure

1. Click "Add" in the "Text list entries" table.  
The Inspector window for this list entry opens.

2. Select the setting "Single value" in "Properties > Properties > General > Value" in the Inspector window.
  - Enter "10", for example, for "Value".
  - Under "Text", enter the text that is displayed in Runtime when the tag has the value "10".

---

### Note

Use a maximum of 255 characters and no semicolons for the text.

---

3. If required, activate the "default entry".  
The entered text is always displayed when the tag has an undefined value. Only one default entry is possible per list.
4. Create further list entries for additional bit numbers of the same text list.

## Result

A bit number text list is created. Texts that appear in Runtime are assigned to the specified bit numbers.

## Configuring objects with a text list

### Introduction

The output value and value application for text lists are specified in the display and operating object that displays the texts of the text list in Runtime. The properties of these objects are configured as required.

### Requirement

- A text list is created.
- You have created a tag.
- The "Screens" editor is open.
- A screen with a symbolic I/O field is open. The object is edited.

### Procedure

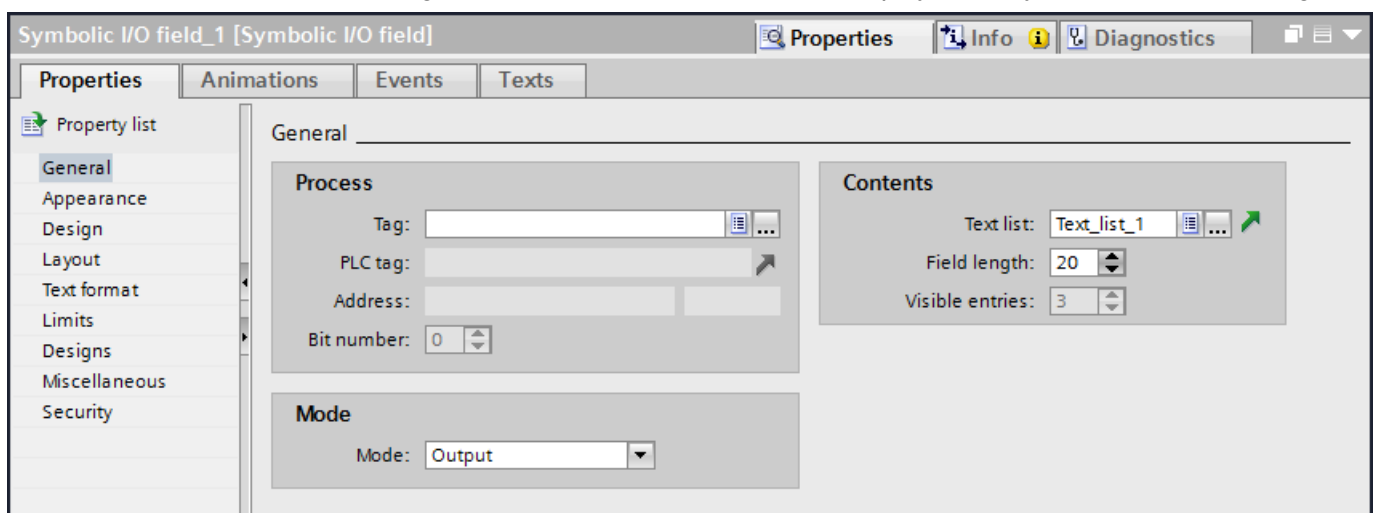

1. Select the text list which you want to have displayed in Runtime in "Properties > Properties > General > Text list" in the Inspection window.
2. Select the setting "Output" as the "Mode".

#### Note

##### Runtime dependency

Different field types are available for a symbolic I/O field depending on the Runtime.

3. Select the tag the value of which determines the display in the symbolic I/O field as "Tag".

### Result

The defined texts of the text list are displayed in the symbolic I/O field in Runtime when the tag has the specified value.

### 10.1.3.2 Working with graphics lists

#### Basic principles of graphics lists

##### Introduction

The possible values of a tag are assigned to specific graphics in a graphics list. During configuration, you can create a graphics list for a button or a graphic I/O field. This supplies the graphics to be displayed to the object.

The graphics lists are created with the "Text and graphics list" editor. You configure the interface between the graphics list and a tag at the object that uses the graphics list. The availability of the graphics list is determined by the HMI device used.

##### Application

You can configure the graphics list for the following situations:

- Drop-down list with a graphic I/O field
- State-specific graphic for a button

The graphics in a graphics list can be configured as multilingual. The graphics will then be displayed in the set language in runtime.

##### Graphic sources

Graphics can be added to the graphics list from the following sources:

- By selecting from a graphic browser
- By selecting an existing file  
You can use the following file types:  
.bmp, \*.ico, \*.emf, \*.wmf, \*.gif, \*.tiff, \*.png, \*.jpeg and \*.jpg.
- By creating a new file

##### Function

If the graphic I/O field is a display field, the associated graphics will differ according to the value of the configured tags. If the graphic I/O field is an input field, the configured tag assumes the associated value when the operator selects a graphic in runtime.

##### Configuration steps

The following tasks are required to display graphics, for example, in a graphic I/O field:

1. Creating the graphics list
2. Assignment of the graphics to values or value ranges of a graphics list
3. Assigning a graphics list in the display object, for example the graphic I/O field

## See also

Screen basics (Page 3241)

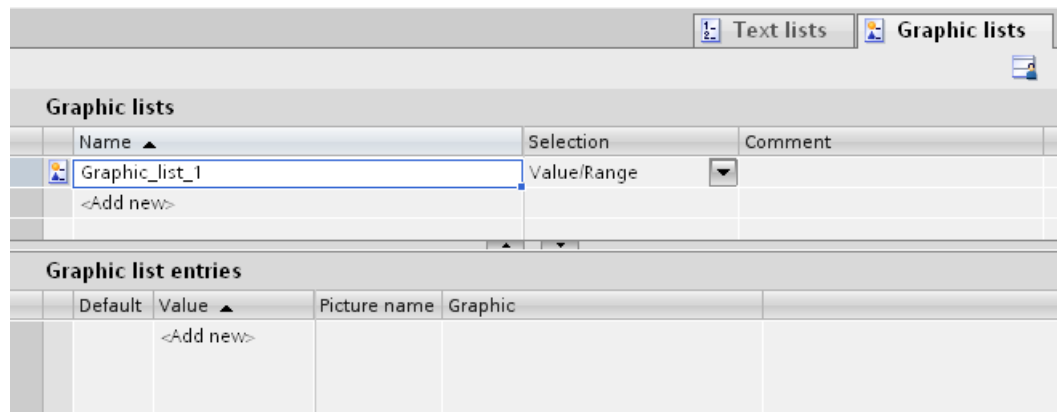

## Creating a graphics list

### Introduction

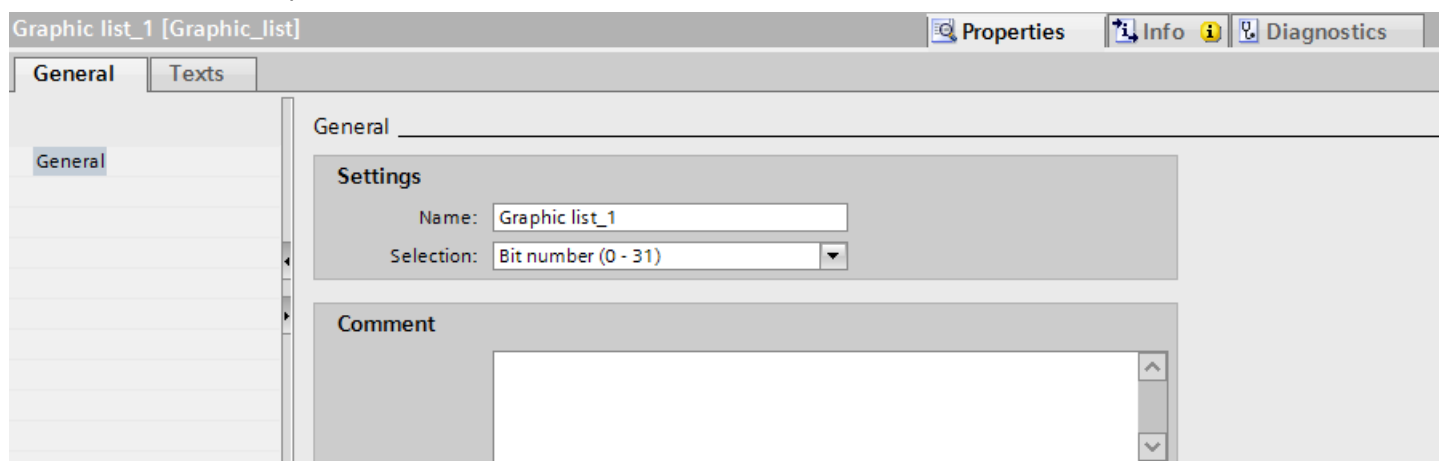

The graphics list allows you to assign specific graphics to variable values and to output these in a graphic IO field in Runtime. You can specify the type of graphic I/O field, for example as a pure output field.

### Procedure

1. Double-click "Text and graphics lists" in the project window.
2. Open the "Graphics lists" tab.

3. Click "Add" in the "Graphics lists" table. The Inspector window of the graphics list will open up.

4. Assign a name to the graphics list that indicates its function.

5. Select the graphics list type "Bit number (0 - 31)" for example under "Select".
6. Enter a comment for the graphics list.

## Result

A graphics list of the type "Range (0 - 31)" is created.

## Assigning a graphic and values to a range graphics list

### Introduction

For each area graphics list you specify which graphics are displayed at which value range.

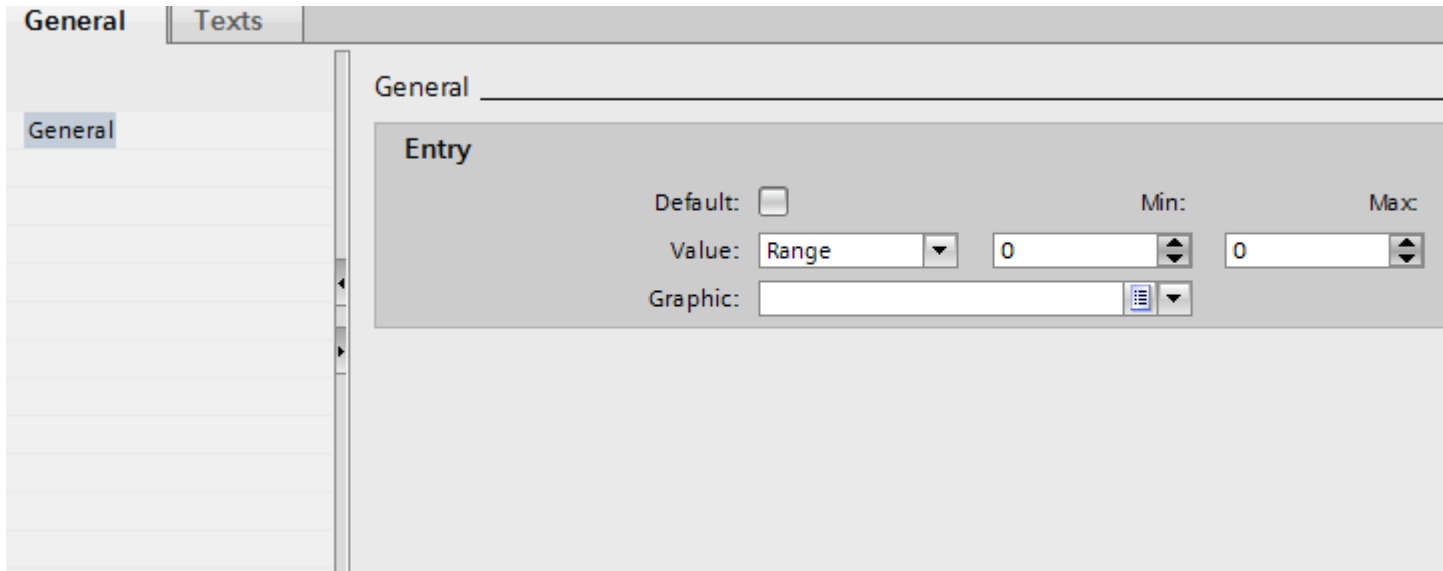

### Requirement

- The "Text and graphics list" editor is open.
- The "Graphics list" tab is open.
- An area graphics list has been created and selected.

## Procedure

1. Click "Add" in the "Graphics list entries" table.  
The Inspector window for this list entry opens.

2. Select the settings "Range" in "Properties > Properties > General > Value" in the Inspector window:
  - Enter the value "1" for "Min" for example.
  - Enter the value "20" for "Max" for example.
  - Select a graphic that is displayed in Runtime when the tag is within the specified value range.

---

### Note

As an alternative to the drop-down menu, you can insert graphics from libraries or from your file system:

1. Select a graphic in the library or in your file system.
  2. Drag-and-drop the graphic into the "Graphics list entries > Graphic" table.
- 

3. Click "Add" in the "Graphics list entries" table. A further list entry is created.

4. Select the settings "Single value" in "Properties > Properties > General > Value" in the Inspector window:
  - Enter the value "21" for example.
  - Select a graphic which is displayed in Runtime if the bit "21" is set in the tag.

5. If required, activate the "default entry".  
The graphic is always displayed when the tag has an undefined value. Only one default entry is possible per list.

## Result

An area graphics list is created. Graphics that appear in Runtime are assigned to the possible values.

## Assigning graphics and values to a bit graphics list

### Introduction

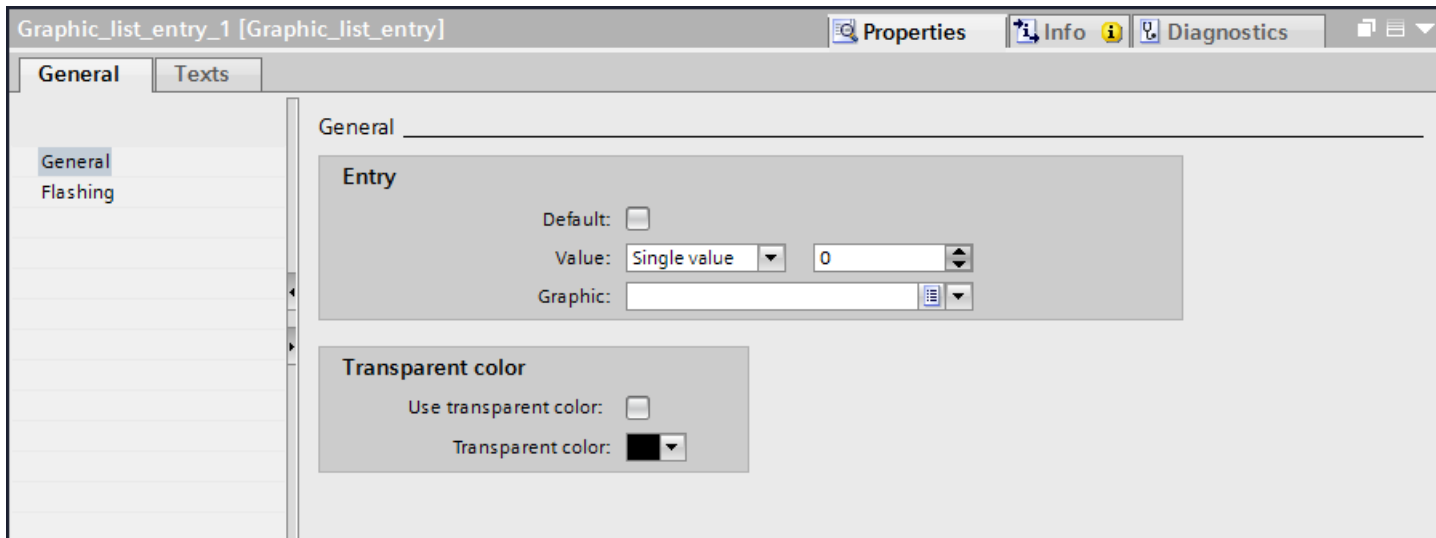

For each graphics list you specify which graphic is displayed at which bit value.

### Requirement

- The "Text and graphics list" editor is open.
- The "Graphics list" tab is opened.
- A bit graphics list has been created and selected.

## Procedure

1. Click "Add" in the "Graphics list entries" table.  
The Inspector window for this list entry opens.

2. Select the settings "Single value" in the inspector window "Properties > Properties > General > Value":
  - Enter "0" as the value.
  - Select a graphic which is displayed in Runtime if the bit "0" is set in the tag.

---

### Note

As an alternative to the drop-down menu, you can insert graphics from libraries or from your file system:

1. Select a graphic in the library or in your file system.
  2. Drag-and-drop the graphic into the "Graphics list entries > Graphic" table.
- 

3. Click "Add" in the "Graphics list entries" table. A new list entry is created.
4. Select "Properties > Properties > General > Value > Single value": in the Inspector window.
  - Enter "1" as the value.
  - Select a graphic which is displayed in Runtime if the bit "1" is set in the tag.

## Result

A bit graphics list is created. Graphics that appear in Runtime are assigned to the values "0" and "1".

## **Assigning graphics and values to a bit number graphics list**

### **Introduction**

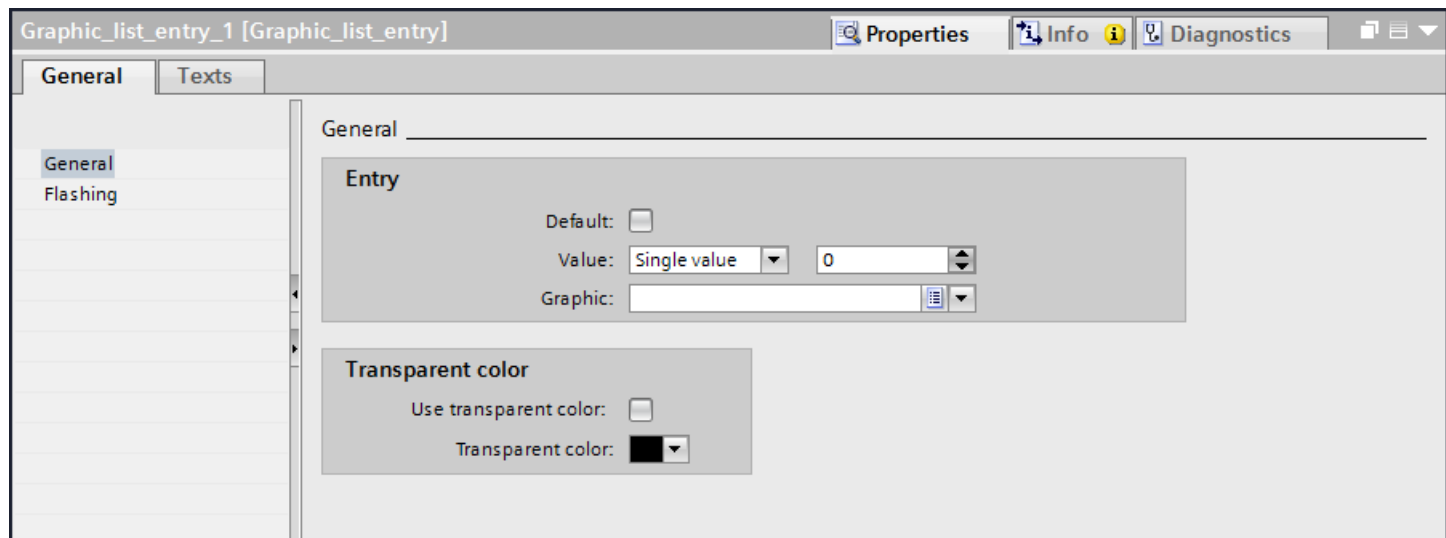

For each bit number graphics list you specify which graphics are displayed at which bit number.

### **Requirement**

- The "Text and graphics list" editor is open.
- The "Graphics list" tab is open.
- A bit number graphics list has been created and selected.

## Procedure

1. Click "Add" in the "Graphics list entries" table.  
The Inspector window for this list entry opens.

2. Select the settings "Single value" in "Properties > Properties > General > Value" in the Inspector window:
  - Enter the value "0" for example.
  - Select a graphic which is displayed in Runtime if the bit "0" is set in the tag.

### Note

As an alternative to the drop-down menu, you can insert graphics from libraries or from your file system:

1. Select a graphic in the library or in your file system.
2. Drag-and-drop the graphic into the "Graphics list entries > Graphic" table.

3. If required, activate the "default entry".  
The graphic is always displayed when the tag has an undefined value. Only one default entry is possible per list.
4. Create further list entries for additional bit numbers of the same graphics list.

## Result

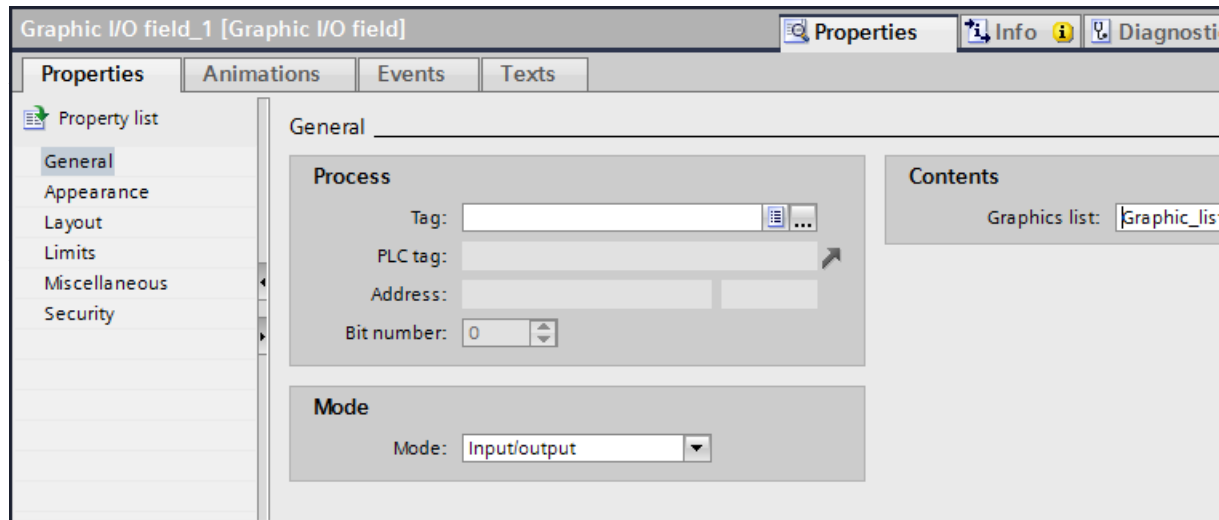

A bit number graphics list is created. Graphics that appear in Runtime are assigned to the specified bit numbers.

## Configuring objects with a graphics list

### Introduction

The output value and value application for graphics list are specified in the display and operating object that displays the graphics of the graphics list in Runtime. The properties of these objects are configured as required.

### Requirement

as the "Mode".

### Note

#### Runtime dependency

Different field types are available for a graphic I/O field depending on the Runtime.

3. As "Tag", select the tag whose values are defined by the display in the graphic I/O field.

### Result

The defined graphics of the graphics list are displayed in the graphic I/O field in Runtime when the tag has the specified value.

## 10.1.4 Dynamizing screens

### 10.1.4.1 Basics on dynamizing screens

#### Dynamizing objects

In WinCC you dynamize objects to map your system and show processes on HMI devices.

You implement dynamizations by

- Animations
- Tags
- System functions

One example is the mapping of a tank, the liquid level of which rises or falls in relation to a process value.

The options for dynamization depend on the object involved. When you copy an object, its dynamization functions are included.

### **See also**

Basics on dynamizing screens (Page 3335)

Screen basics (Page 3241)

Basics on dynamization in the property list (Page 3353)

Basic on events (Page 3357)

Dynamization in the inspector window (Page 3337)

Dynamization in the inspector window (Page 3336)

## **10.1.4.2 Basics on dynamizing screens**

### **Dynamizing objects**

In WinCC you dynamize objects to map your system and show processes on HMI devices.

You implement dynamizations by

- Animations
- System functions
- Tags
- Local scripts

One example is the mapping of a tank, the liquid level of which rises or falls in relation to a process value.

The options for dynamization depend on the object involved. When you copy an object, its dynamization functions are included.

### **See also**

Basics on dynamizing screens (Page 3334)

### 10.1.4.3 Dynamization in the inspector window

#### Introduction

Basically, you can dynamize all the screen objects which you have configured in a screen. Which dynamization possibilities and which events are available depends on the device and the selected object.

#### Animations

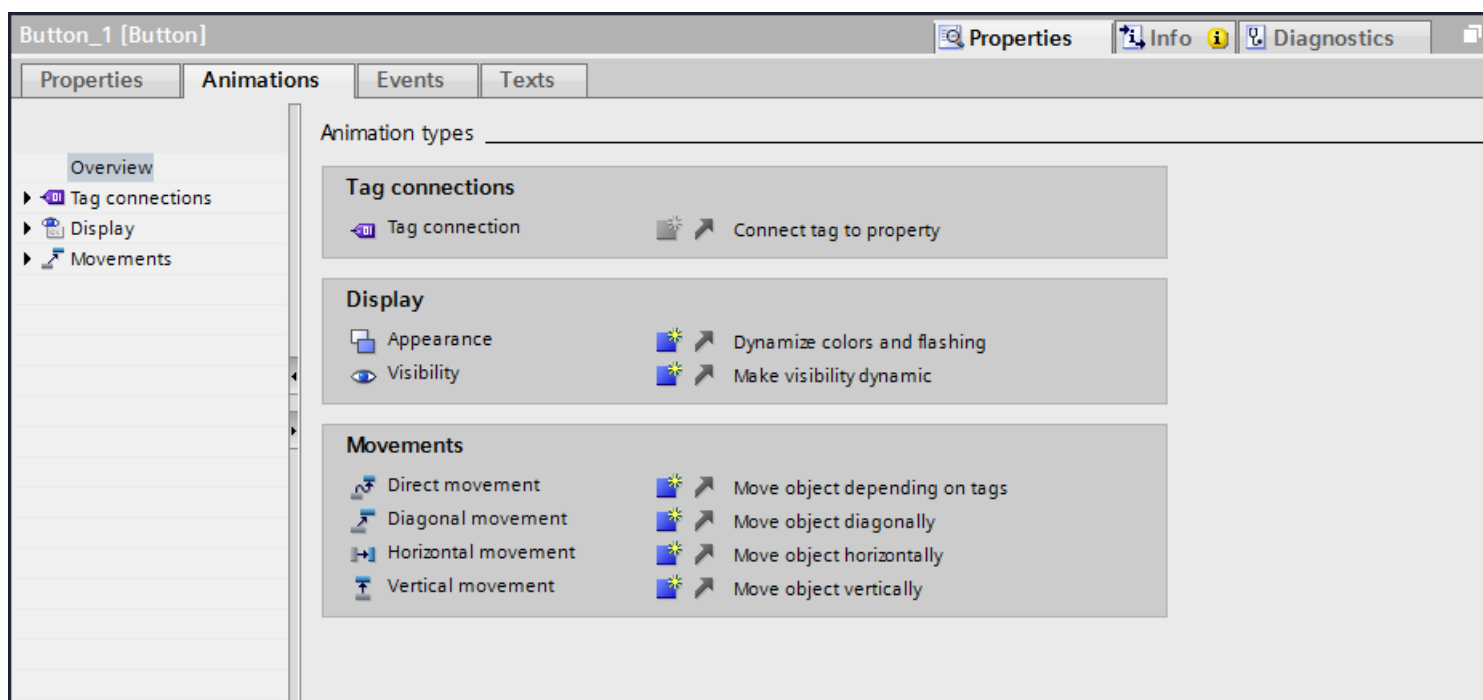

WinCC helps you to implement dynamization using predefined animations. If you want to animate an object, first configure the desired animation in the object's inspector window. Then adapt the animation to the requirements of your project.

The selection of the supported animations depends on the HMI device and the selected object. You choose between the following types of animation:

- Layout: Appearance, visibility
- Movements: direct, diagonal, horizontal and vertical movement
- Variable binding

You can configure the "Variable binding" type of animation several times for one object.

You configure animations in the "Properties > Animations" inspector window.

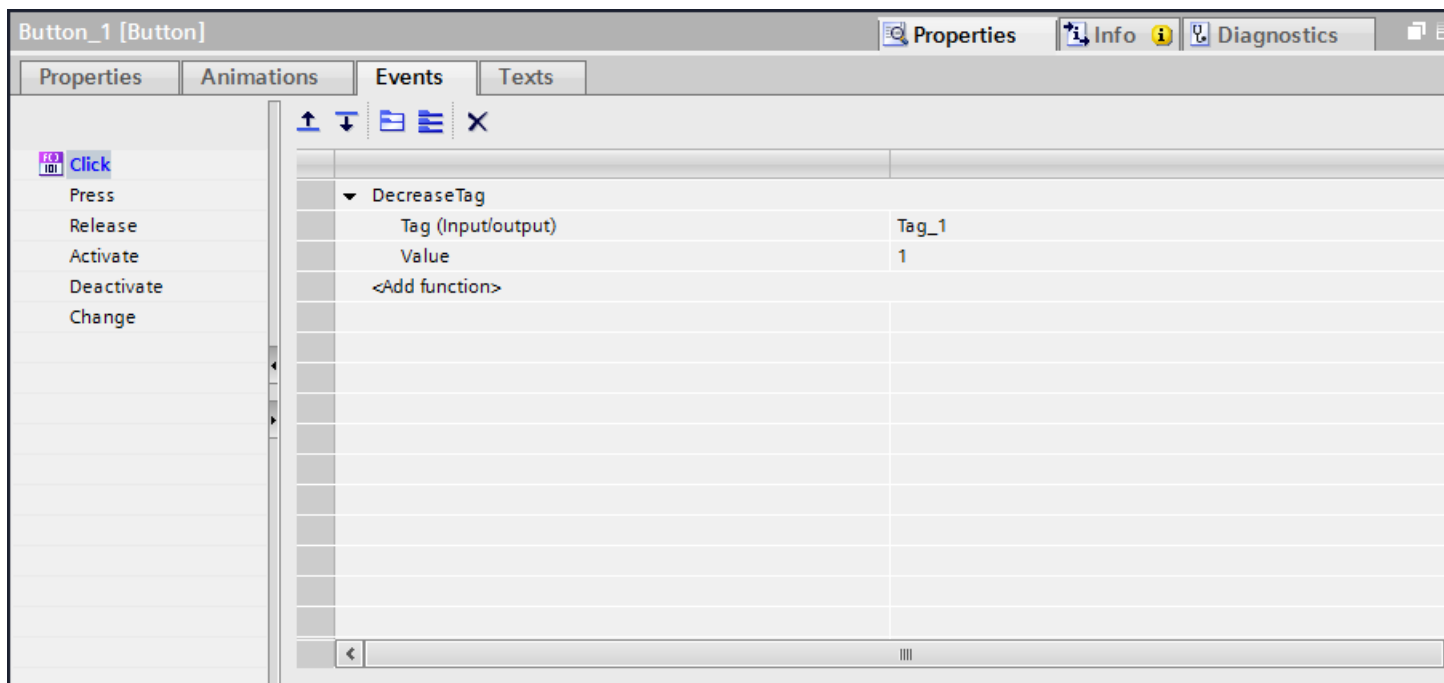

#### Events

Operable objects also react to events, such as a mouse click.

You configure a function list with system functions on an event. The system functions are processed as a reaction to the triggered event.

You configure events in the "Properties > Events" inspector window.

You will find further information in "Working with function lists".

## See also

Basics on dynamizing screens (Page 3334)

### 10.1.4.4 Dynamization in the inspector window

#### Introduction

Basically, you can dynamize all the screen objects which you have configured in a screen. Which dynamization possibilities and which events are available depends on the device and the selected object.

The inspector window offers you the possibilities for dynamization of screen objects in three tabs.

#### Property list

With the  button you go to the properties list in the "Properties > Properties" inspector window.

In the property list, you set any dynamization for the individual object properties using tags or local C and VB scripts. You can, for example, dynamically change the background color of an object.

In the "Dynamic Value" column you can dynamize the object property of a tag, a C-script or a VB-script.

Whether an object property can be dynamized is indicated in the Property list by means of the background color:

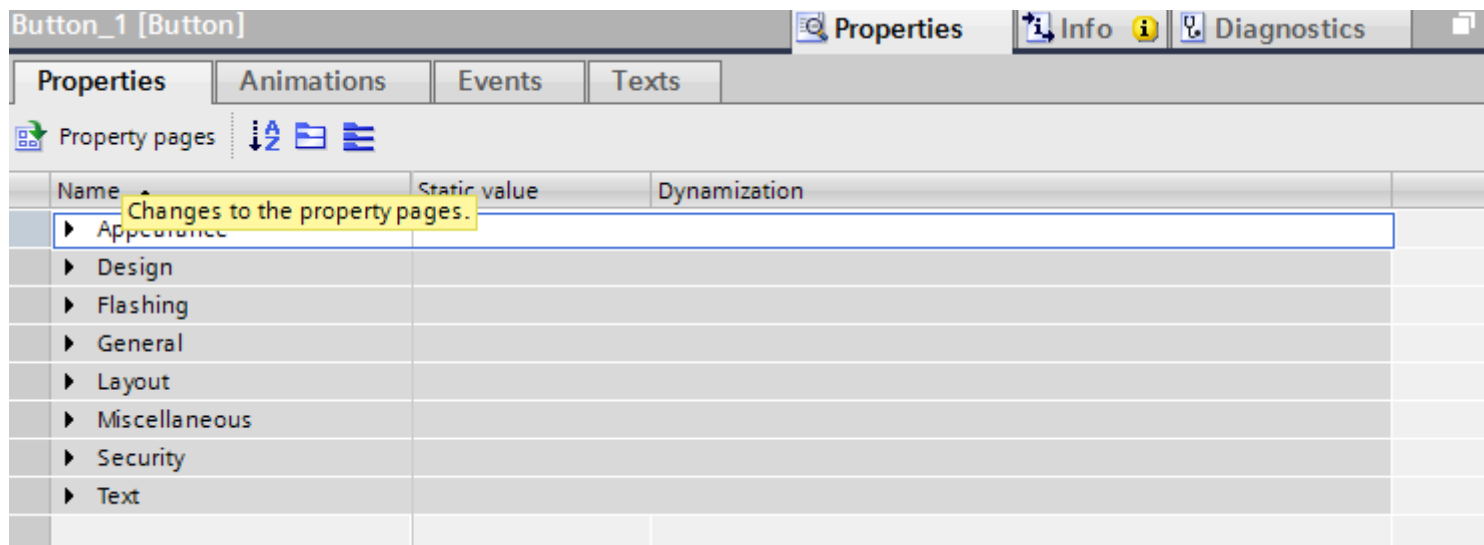

- Light gray: Can be dynamized
- Dark gray: Cannot be dynamized

Any animations you have already configured will also appear in the object property list, where you can edit the animations.

The following table shows you how to sort the property list:

	Sort by alphabet
	Sort by category

With the  button you return to the property pages in the inspector window.

## Animations

You have two different options for animating objects.

You configure animations

- in the inspector window under "Properties > Animations",
- in the "Animations" task card.

WinCC helps you to implement dynamization using predefined animations. If you want to animate an object, first configure the desired animation with the tools of the toolbox or in the

object's inspector window. Then customize the animation in the Inspector window to suit the requirements of your project.

The selection of the supported animations depends on the device and the selected object. You choose between the following types of animation:

- Tag binding
- Layout: Appearance, control enable, visibility
- Movements: direct, diagonal, horizontal and vertical movement
- Property animation

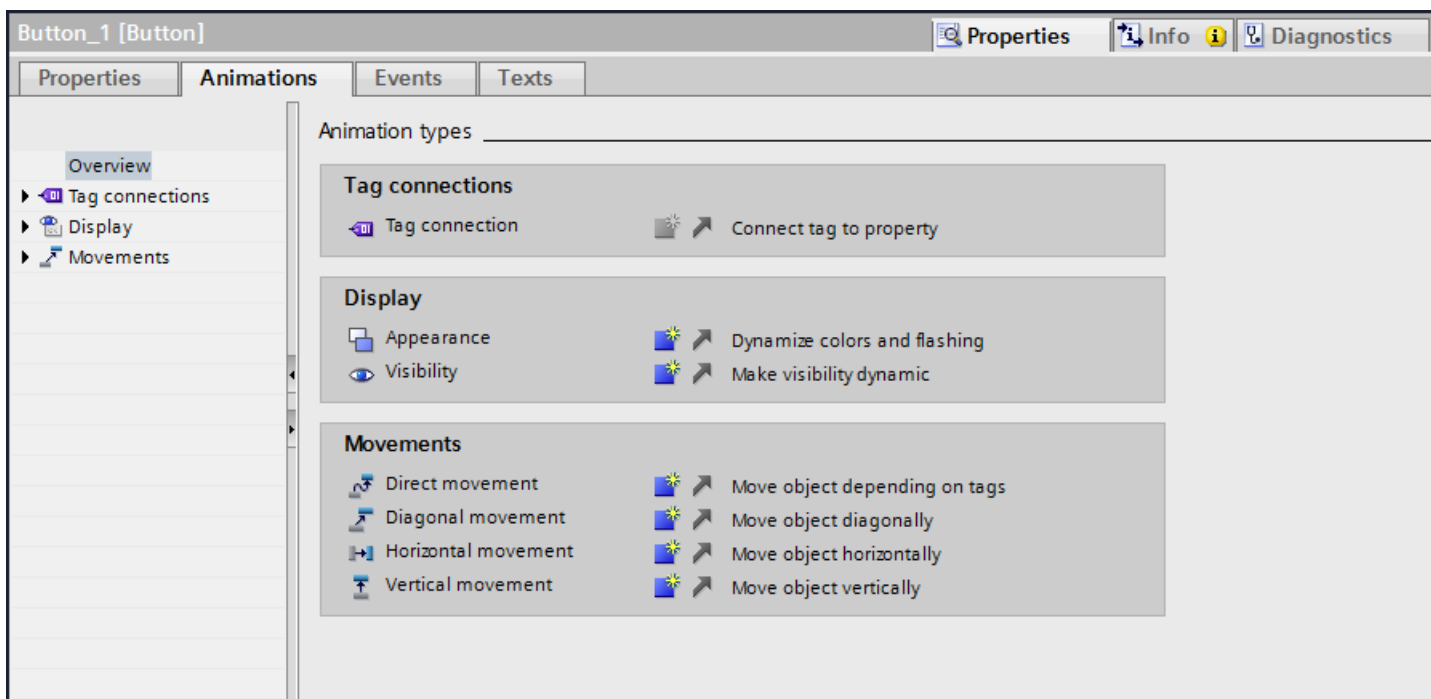

#### Note

##### HMI device dependency

The "Control enable" animation is not available for every HMI device.

You can configure the "Tag binding" and "Property animation" types of animation several times for one object.

You configure animations in the "Properties > Animations" inspector window.

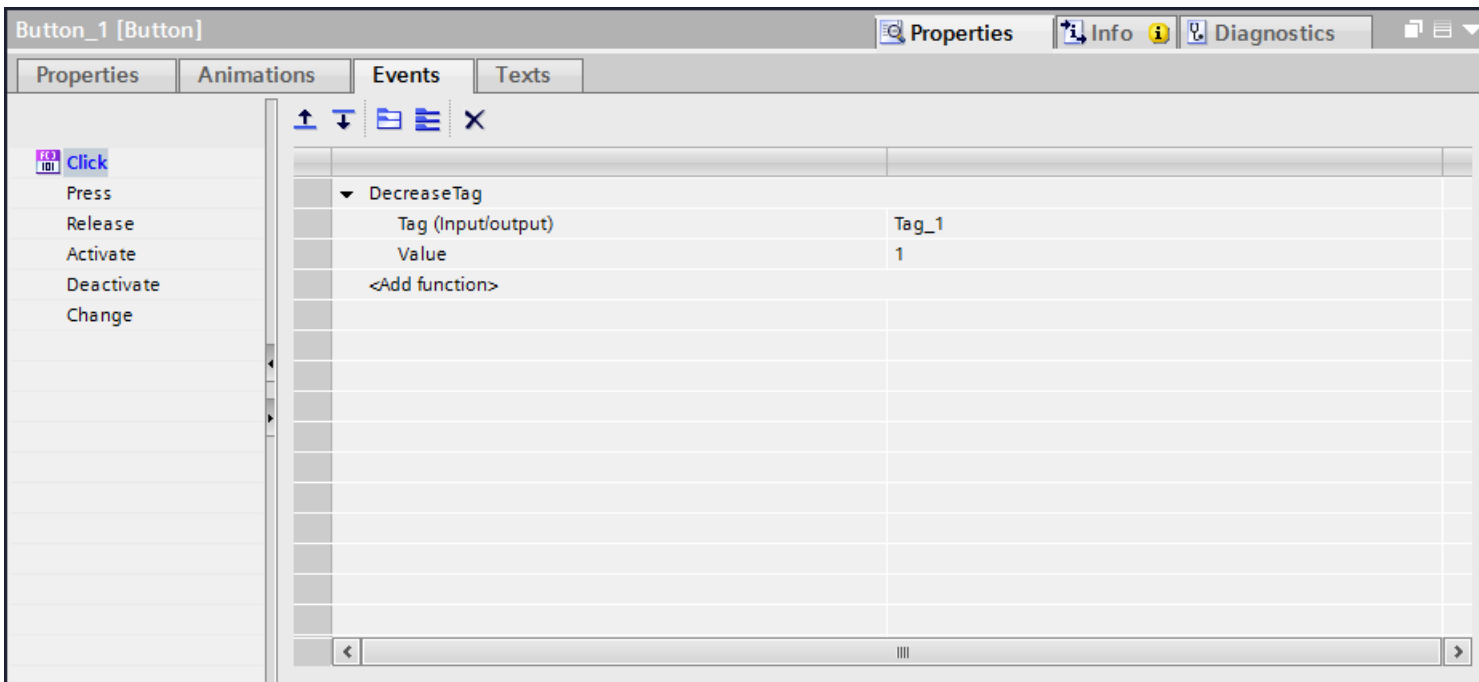

## Events

Operator control enabled objects also react to events, such as a mouse click.

You configure a function list with system functions or local scripts on an event. The system functions or the local script are processed as a reaction to the triggered event.

You configure events in the "Properties > Events" inspector window.

You will find further information in "Working with function lists".

## See also

Basics on dynamizing screens (Page 3334)

### 10.1.4.5 Dynamization with animations

#### Configuring a new animation

#### Introduction

Use predefined animations to dynamize screen objects.

#### Requirement

- You have opened a screen which contains at least one dynamic object.
- The Inspector window is open.
- The toolbox window is displayed.

### Procedure in the inspector window

1. In the Inspector window, select "Properties > Animations".
2. Select the animation you want to use.
3. Click the  button.

### Procedure in the "Animations" task card.

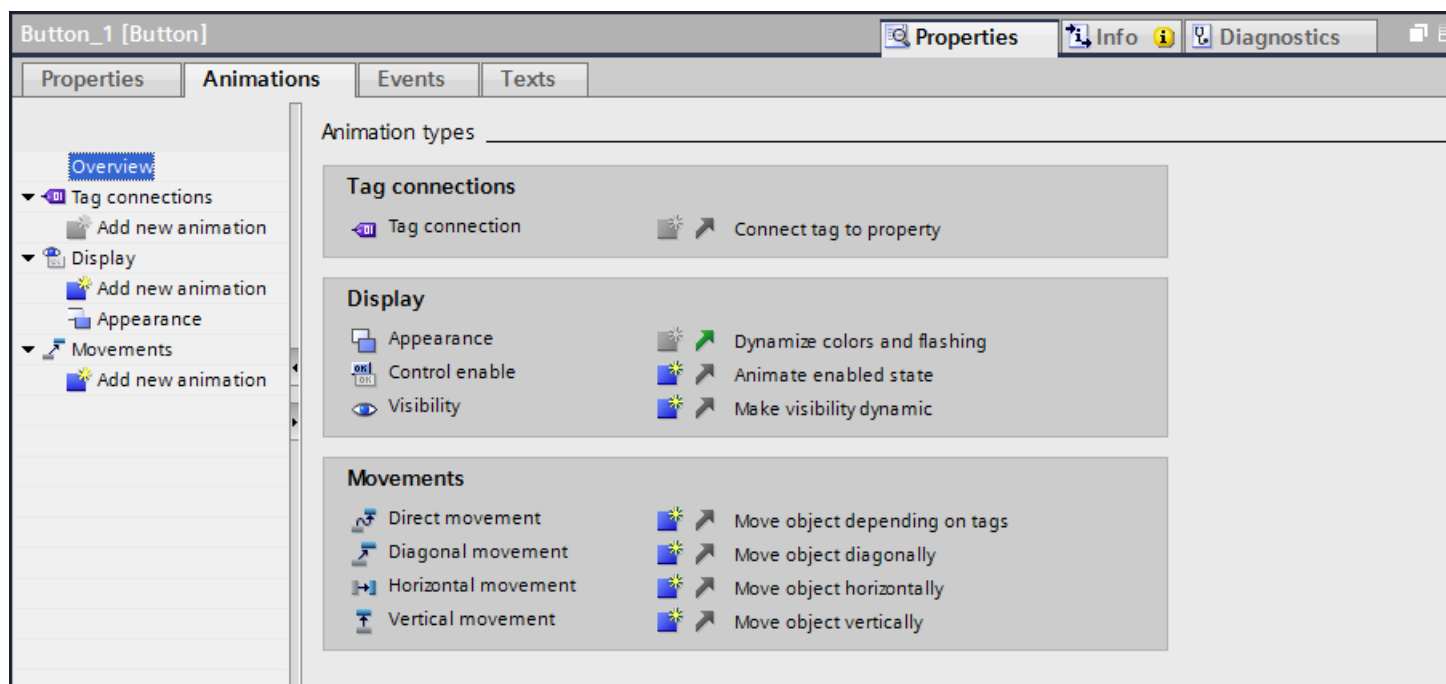

1. Open the object group containing the required animation in the "Animations" task card.
2. Drag the animation onto the object that you want to make dynamic.

Alternatively you select the object in the screen and double click the desired animation in the "Animation" task card.

### Result

The animation appears in the Inspector window of the object. You configure the animation in the following steps.

In the animations overview the green arrow indicates which animation is already configured. The configured animation opens in the inspector window when you click the green arrow.

### See also

- Animations in multiple selection (Page 3352)
- Animations of object groups (Page 3351)
- Animations of object groups (Page 3350)

- Configuring animation with tag binding (Page 3349)
- Dynamizing the visibility of an object (Page 3347)
- Dynamization of the control enable state of an operating element (Page 3346)
- Configuring direct movement (Page 3345)
- Configuring movement (Page 3343)
- Dynamizing the appearance of an object (Page 3342)

## Dynamizing the appearance of an object

### Introduction

The appearance of a screen object is controlled by changing the value of a tag in runtime. When the tag adopts a certain value, the screen object changes its color or flashing characteristics according to the configuration.

### Type

Areas or single values of the tag are observed in Runtime depending on the selection. The appearance of the object changes according to the configuration.

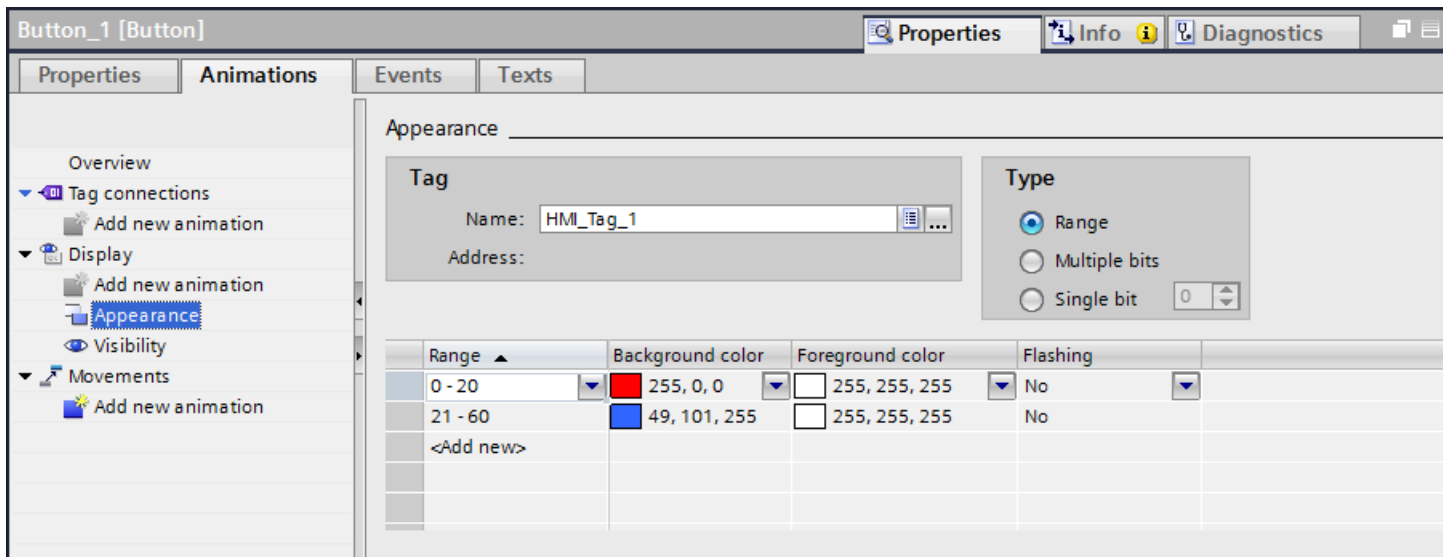

### Requirement

- A screen is open.
- A dynamic object is contained and selected in the screen.
- The Inspector window is open.
- The toolbox window is displayed.

### Procedure

1. In the Inspector window, select "Properties > Animations".  
The animations available for the selected object are displayed.
2. Select the animation "Appearance" and click the  button.  
The parameters of the animation are displayed.
3. Select a tag in "Tag > Name".
4. Select "Type > Range" for example.
5. Click "Add" in the table.
6. Enter the tag interval "0 - 20" in the "Range" column for example.
7. For "Foreground color" and "Background color", select the color the object is to acquire in Runtime when the tag reaches the interval.

8. Select a flashing mode for the object from the "Flashing" list.
9. Repeat steps 5 to 8 to create another tag interval, e.g. "21 - 60".

## Result

In Runtime, the flashing response, and color of the object change dynamically according to the process value returned in the tag.

## See also

Configuring a new animation (Page 3340)

## Configuring movement

### Introduction

You can configure dynamic objects in such a way that they move on a certain track. The movement is controlled via tags. The object moves every time the tag is updated.

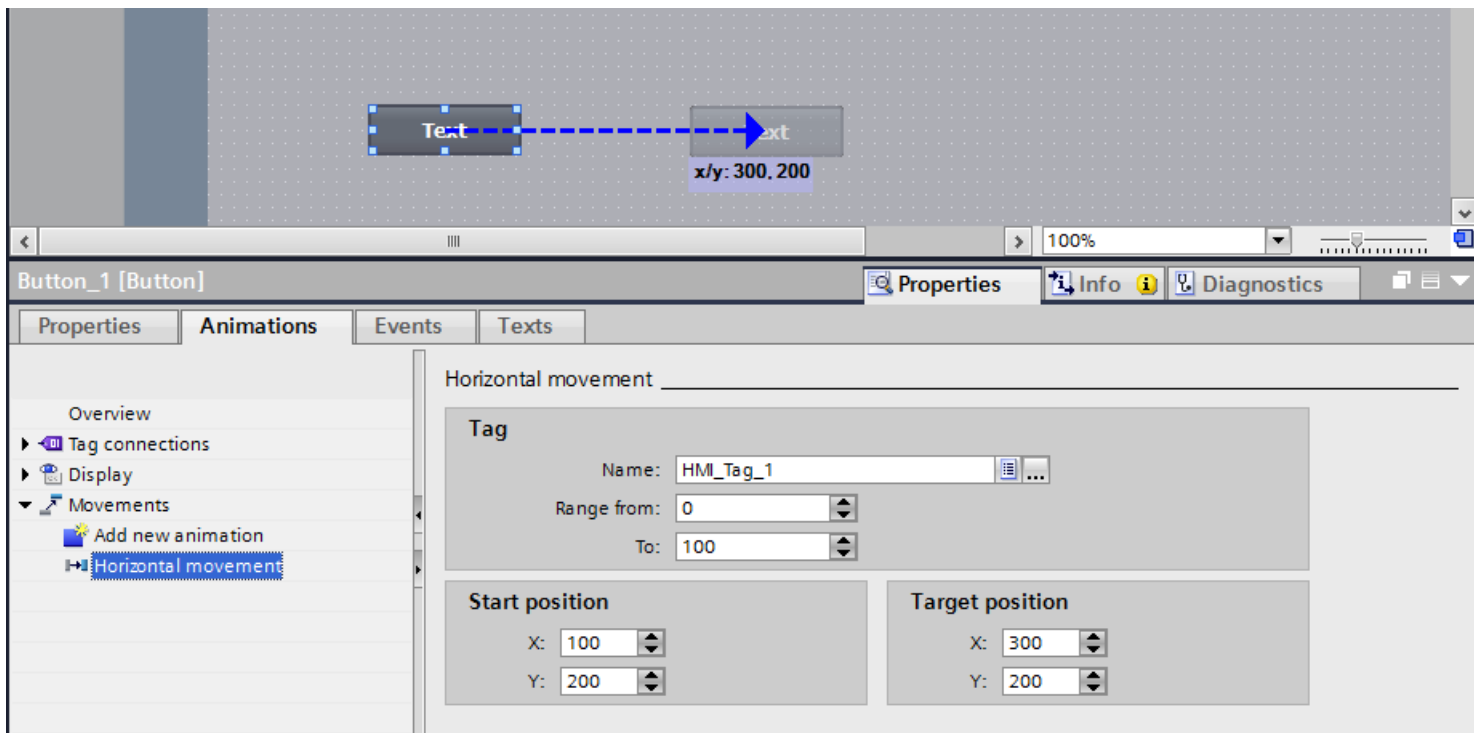

You can only program one type of movement for each object.

### Requirement

- You have created a tag.
- You have opened a screen which contains at least one dynamic object.
- The Inspector window is open.
- The toolbox window is displayed.

## Procedure

1. Select the screen object you want to control dynamically.  
The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animations".  
The animations available for the selected object are displayed.
3. Select "Horizontal movement" and click the  button.  
The parameters of the animation are displayed.  
A transparent copy of the object is shown in the work area, which is connected to the source object by means of an arrow.
4. Select a tag for control of movement.
5. Move the object copy to the relevant destination. The system automatically enters the pixel values of the final position in the Inspector window.
6. Customize the range of values for the tag as required.

## Result

In Runtime, the object moves in response to every change in value of the tag that is used to control the movement. The direction of movement corresponds to the configured type of movement "horizontal".

---

### Note

You configure vertical and diagonal movements similar to horizontal movements

---

## See also

Configuring a new animation (Page 3340)

## Configuring direct movement

### Introduction

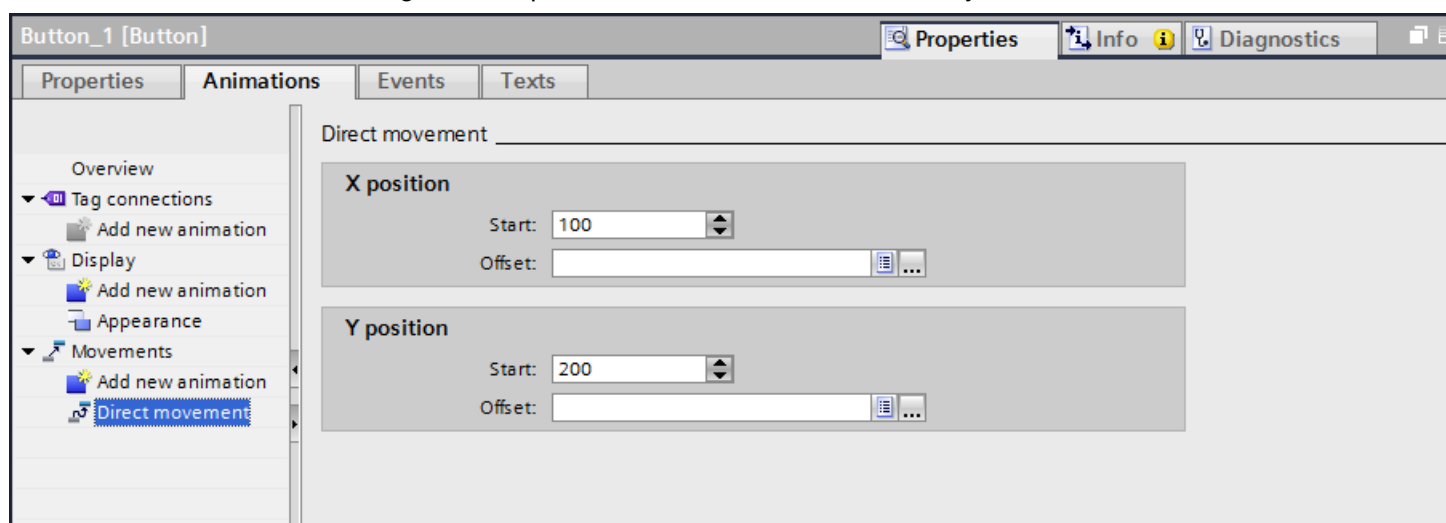

The object is moved respectively in x direction and y direction with "Direct movement". Two tags define the number of pixels by which the object moves from its original static start position.

### Requirement

- Two tags are set up.
- You have opened a screen which contains at least one dynamic object.
- The Inspector window is open.
- The toolbox window is displayed.

### Configuring "Direct movement"

1. Select the screen object you want to control dynamically.  
The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animations".
3. Select "Direct movement" and click the  button.  
The parameters of the animation are displayed.
4. Select a tag for the X position with which the movement in x direction is controlled.
5. Select a tag for the Y position with which the movement in y direction is controlled.

## Result

In Runtime, the object moves in response to every change in value of the tag that is used to control the movement.

## See also

Configuring a new animation (Page 3340)

## Dynamization of the control enable state of an operating element

### Introduction

You can dynamically change the usability of an operating element. The object either can, or cannot be used in Runtime, depending on the value of a tag.

You can use this dynamic control to restrict operator access to an operating element to specific situations, such as for maintenance.

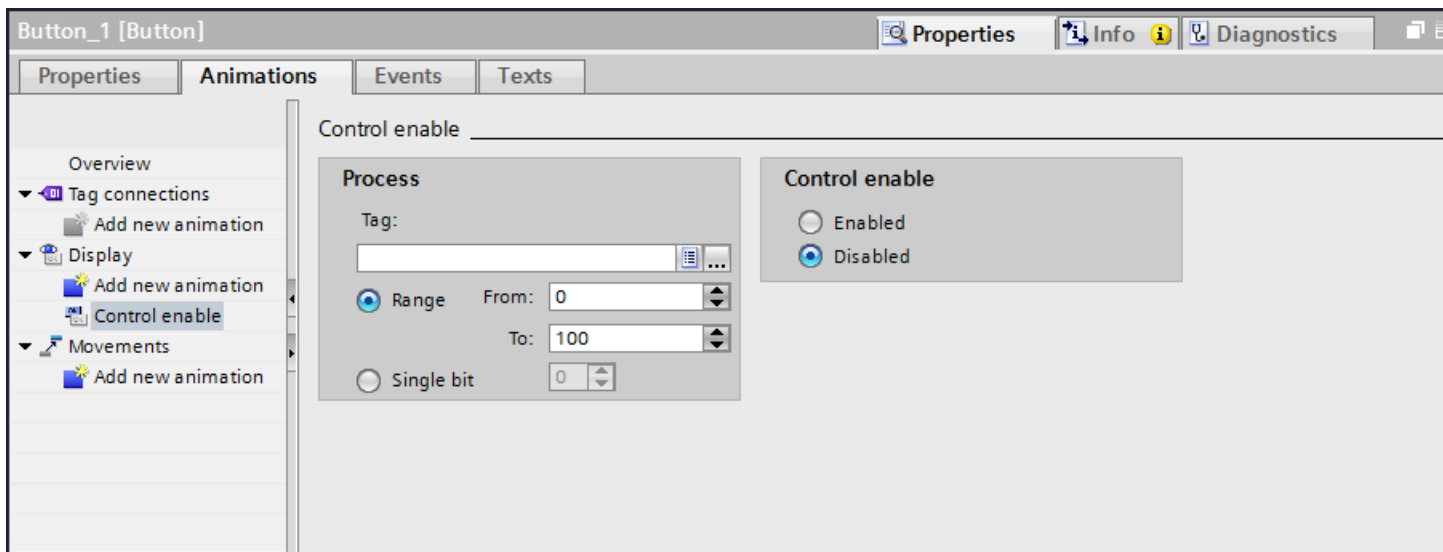

### Requirement

- You have created a tag.
- A screen with an operating element is open.
- The Inspector window is open.
- The toolbox window is displayed.

### Procedure

1. Select the operating element in the screen that you want to control dynamically.  
The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animations".  
The animations available for the selected object are displayed.

3. Select "Control enable" and click the  button.  
The parameters of the animation are displayed.

4. Select a tag.
5. Activate "Range".
  - For "From:" enter e.g. the value "0"
  - For "To:" enter e.g. the value "100"
6. Activate "Control enable > Activated".

## Result

The screen object is operator control enabled in Runtime depending on the tag value:

- The object becomes operator control enabled when the tag value is between 0 and 100.
- The object is not operator control enabled if the tag value is outside the range.

## See also

Configuring a new animation (Page 3340)

## Dynamizing the visibility of an object

### Introduction

Dynamization of the "Visibility" property allows you to output an alarm to your screen, which is triggered when the tag value exceeds a critical range, for example. The alarm is cleared when the tag value returns to the non-critical range.

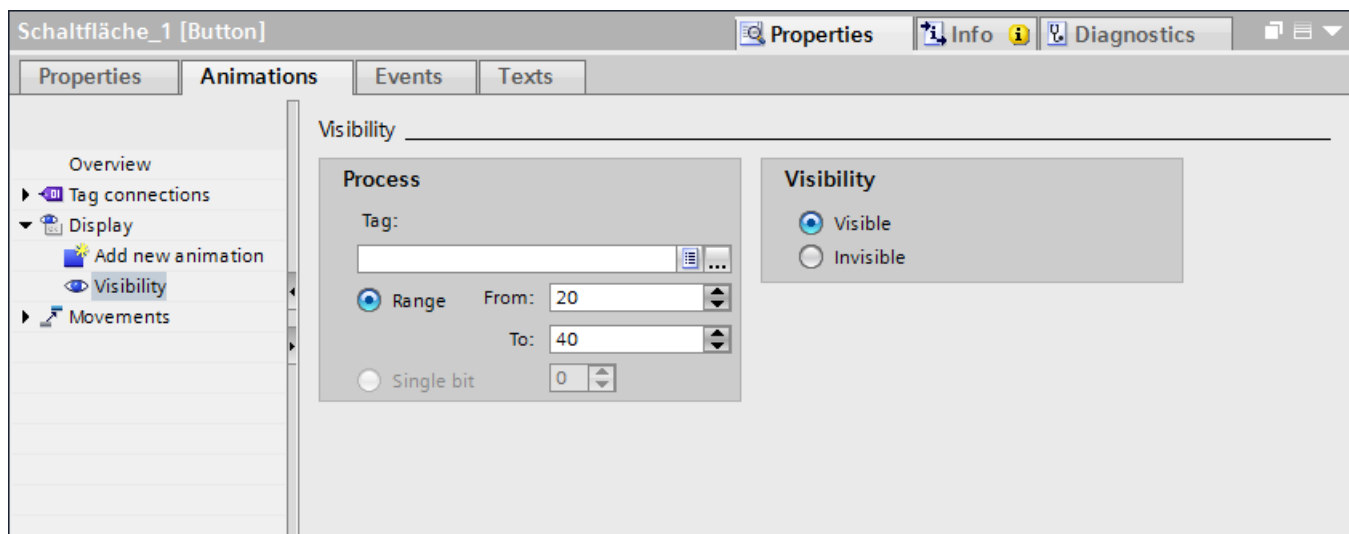

The "Simple recipe view" and "Simple alarm view" objects are always visible.

## Requirement

- You have created a tag.
- You have opened a screen containing an object that you want to show or hide in Runtime.
- The Inspector window is open.

## Procedure

1. Select the screen object you want to control dynamically.  
The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animations".  
The animations available for the selected object are displayed.
3. Select "Visibility" and click the  button.  
The parameters of the animation are displayed.
4. Select a tag.
5. Activate "Range".
6. Select, for example, "from 20" and "to 40"
7. Activate "Visible".

## Result

The screen object is shown or hidden in Runtime depending on the tag value.

- If the tag value matches the configured range between 20 and 40, the screen object is shown.
- If the tag value is outside the configured range, the screen object is hidden.

## See also

Configuring a new animation (Page 3340)

## Configuring animation with tag binding

### Introduction

When you object property an object property with a tag, the object property is changed in Runtime depending on the tag value.

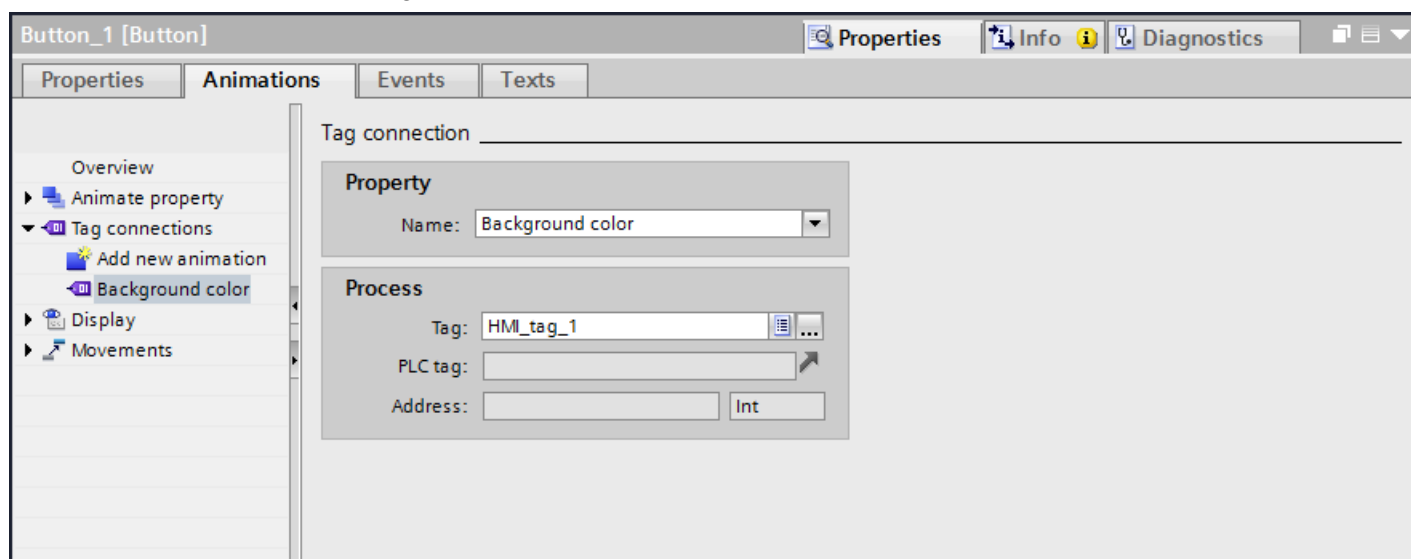

The following example shows the tag binding in the "Properties > Animations" inspector window. If you have configured tag binding it is also visible in the property list or in the property pages in the inspector window.

### Requirement

- An object with the property to be dynamized is selected.
- You have created a tag.
- The Inspector window is open.

### Procedure

1. Select the screen object whose properties you want to control dynamically.  
The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animation".  
The animations available for the selected object are displayed.
3. Select "Tag connection" and click the  button.  
The parameters of the animation are displayed.
4. Select the object property that you want to dynamize in "Properties > Animation > Tag binding > Property > Name", e.g. "Background color".
5. Select a tag.

## Result

You have dynamized the "Background color" property with a tag. The background color of the screen object changes in Runtime depending on which value the tag adopts.

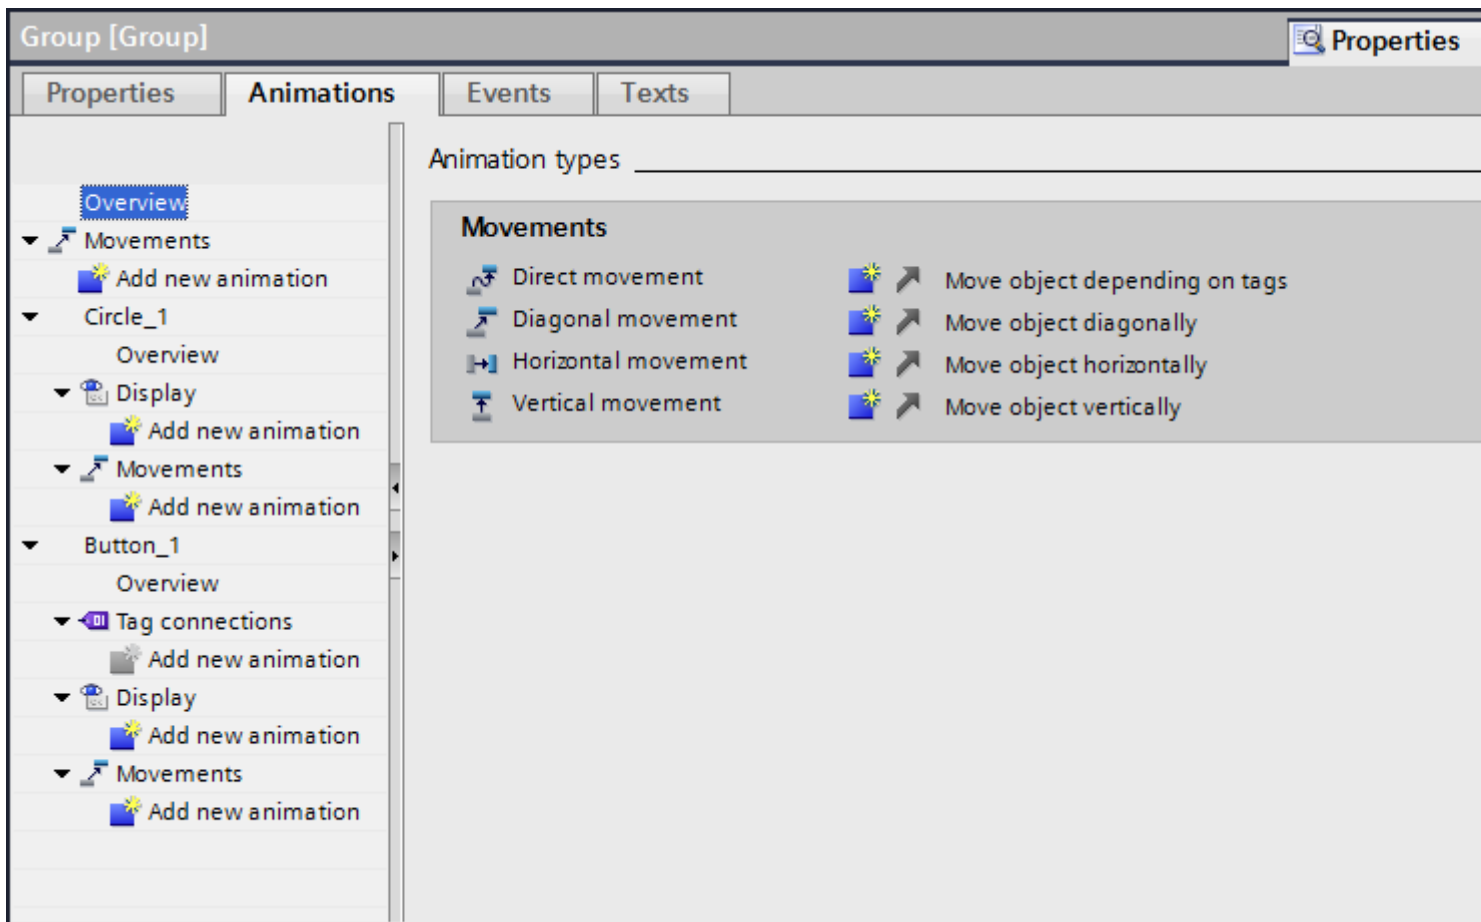

## See also

Configuring a new animation (Page 3340)

## Animations of object groups

### Applying animations to object groups

The inspector window shows all objects of a group and their possible animations. The animation types which are supported by all objects in the group are also listed separately.

If you configure an animation for an object group, this animation will apply to all individual objects that support this animation.

### Application example

The "horizontal movement" animation is configured for the object of an object group. The "direct movement" animation is configured for the whole object group. Only the animation of the object group i.e. "direct movement" is executed in Runtime. This also applies for object groups within object groups. Only the animation of the group on the top layer is listed.

### See also

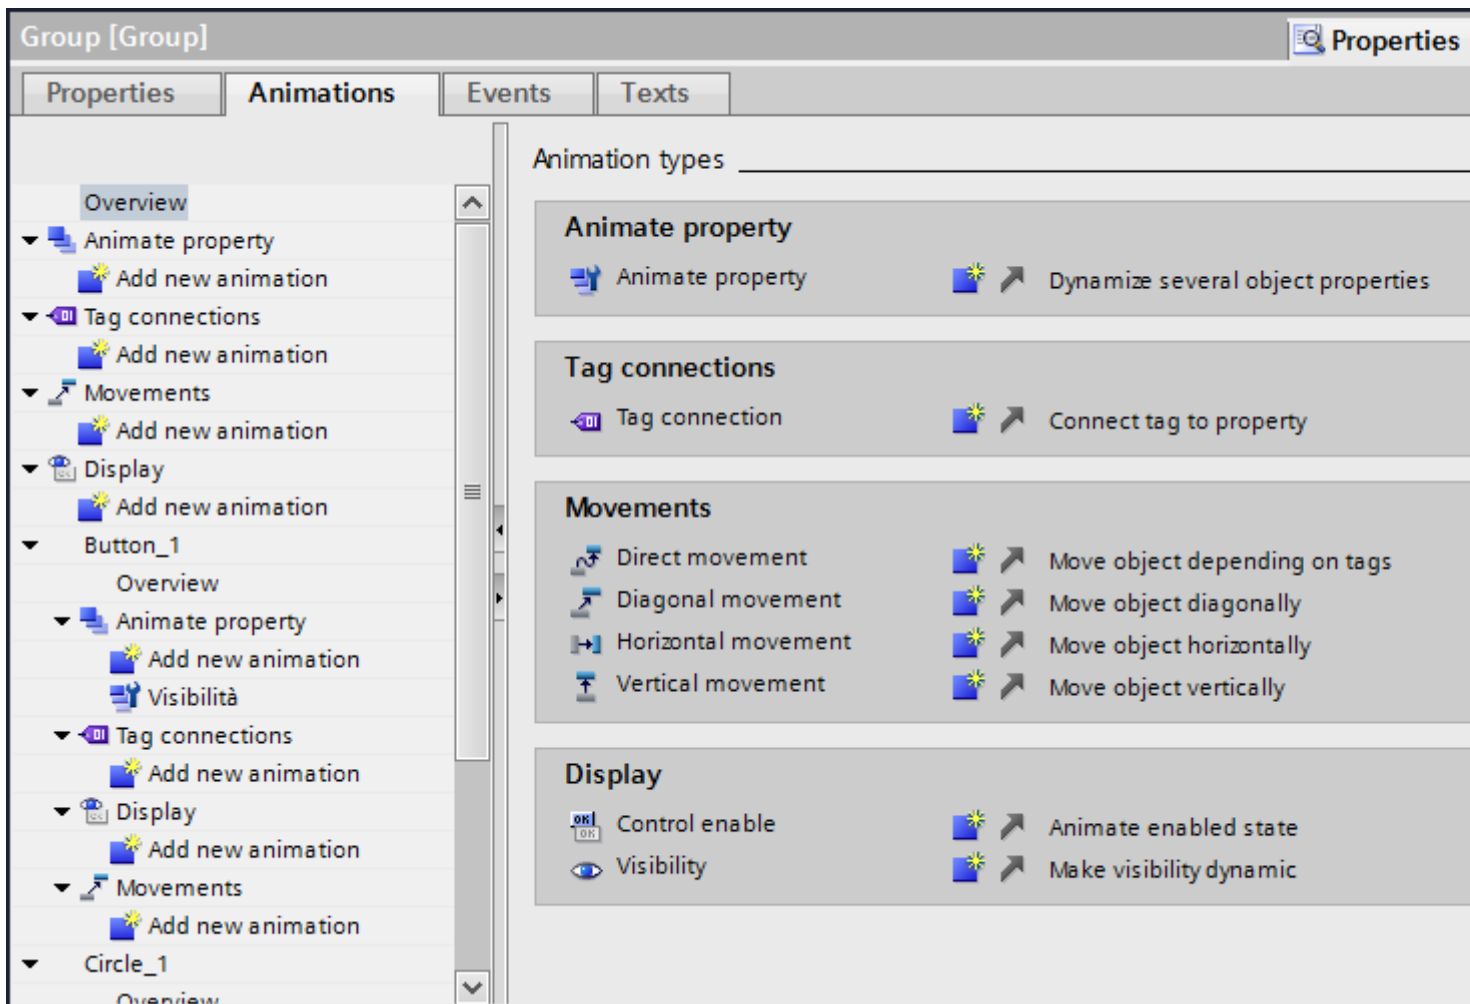

Configuring a new animation (Page 3340)

### Animations of object groups

#### Changing animations of object groups

The inspector window shows all objects of a group and their possible animations. The animation types which are supported by all objects in the group are also listed separately.

If you configure an animation for an object group, this animation will apply to all individual objects that support this animation.

### Application example

The "horizontal movement" animation is configured for the object of an object group. The "direct movement" animation is configured for the whole object group. Both animation types are executed in runtime. This also applies for object groups within object groups.

### See also

Configuring a new animation (Page 3340)

### Animations in multiple selection

### Changing animations for multiple objects

For a multiple selection, the animations that are configured for the reference object appear in the Inspector window. You can change the animations as usual. The changes will apply to all the objects in the multiple selection that support the configured animation. This means that

even objects for which you have not yet configured an animation will have the reference object's animation.

### Application example

Select a button, and a circle at the same time. The button is the reference object. The "Appearance" animation is already configured for the button, so it appears in the Inspector window of the multiple selection. When you activate "Properties > Animations > Appearance > Flashing" in the inspector window, the settings of the "Appearance" animation apply for the button and for the circle.

### Configuring new animations for multiple objects

If you configure a new animation for the objects of a multiple selection, this animation will apply to all selected objects that support the configured animation. If the new animation replaces an existing animation, a security prompt appears.

### Application example

You select a circle, and a rectangle. The "Diagonal movement" animation is already configured for the circle. You configure the "Horizontal movement" animation for the multiple selection. This animation applies to the rectangle since no animation of the Movement type is yet configured for it. For the circle, you are asked to confirm that you want to replace the existing "Diagonal movement" animation with the new "Horizontal movement" animation.

### See also

Configuring a new animation (Page 3340)

## 10.1.4.6 Dynamization in the property list

### Basics on dynamization in the property list

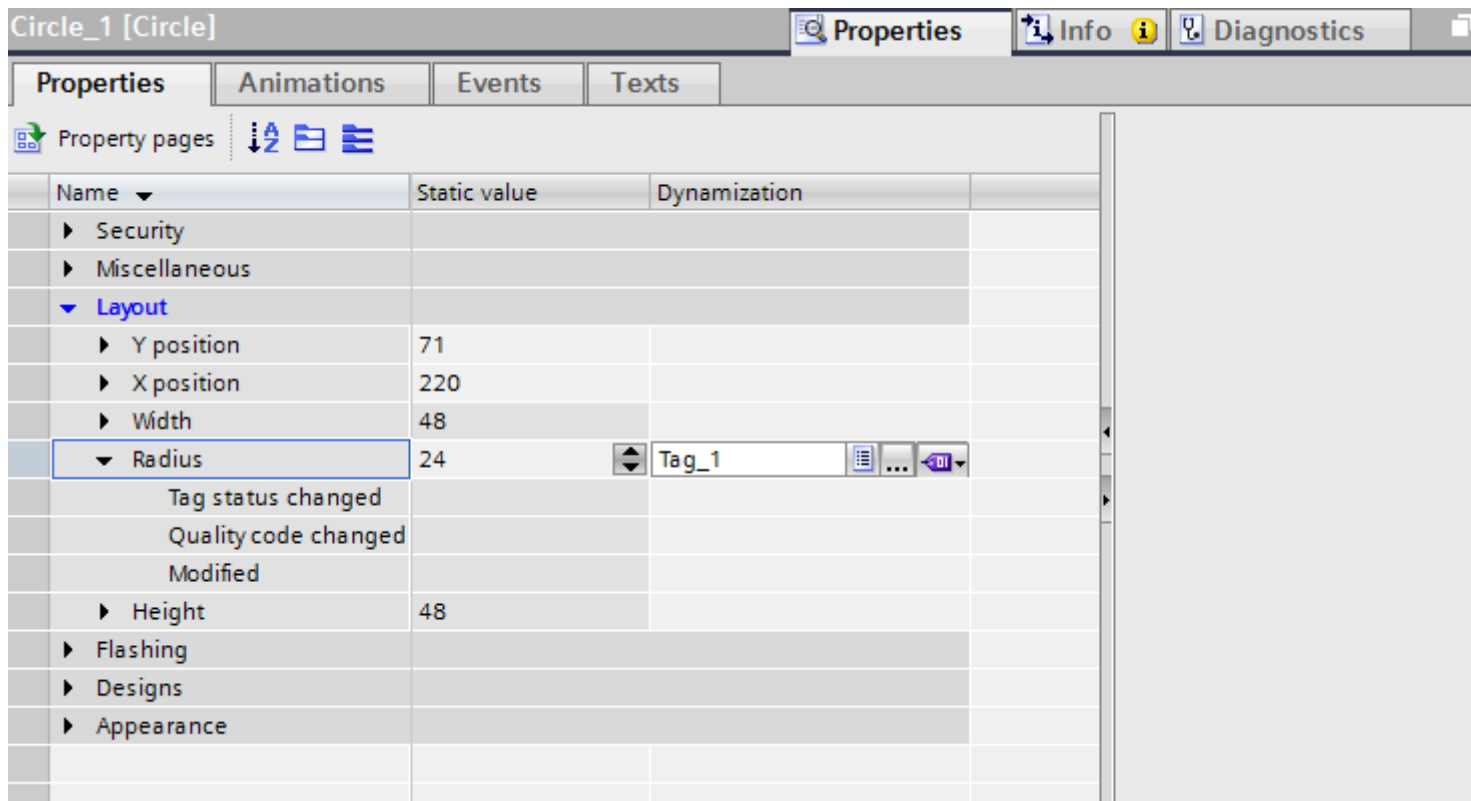

#### Basic principle of dynamization

Select a tag from the object list for a dynamizable object property in the property list. The object is dynamized if the tag value changes in Runtime.

#### Dynamization with tags

You dynamize an object property with a tag and configure a function list. The tags are updated in the update cycle set for the screen.

The figure below shows the "Radius" object property dynamized with a tag. When the value of the tag changes, a function list is executed additionally:

You can also convert the function list into a local script.

You can find additional information under "Basics on the function list (Page 3872)".

## See also

Basics on dynamizing screens (Page 3334)

Programming a dynamization method for a tag change (Page 3356)

Dynamizing an object property with a tag (Page 3354)

## Dynamizing an object property with a tag

### Introduction

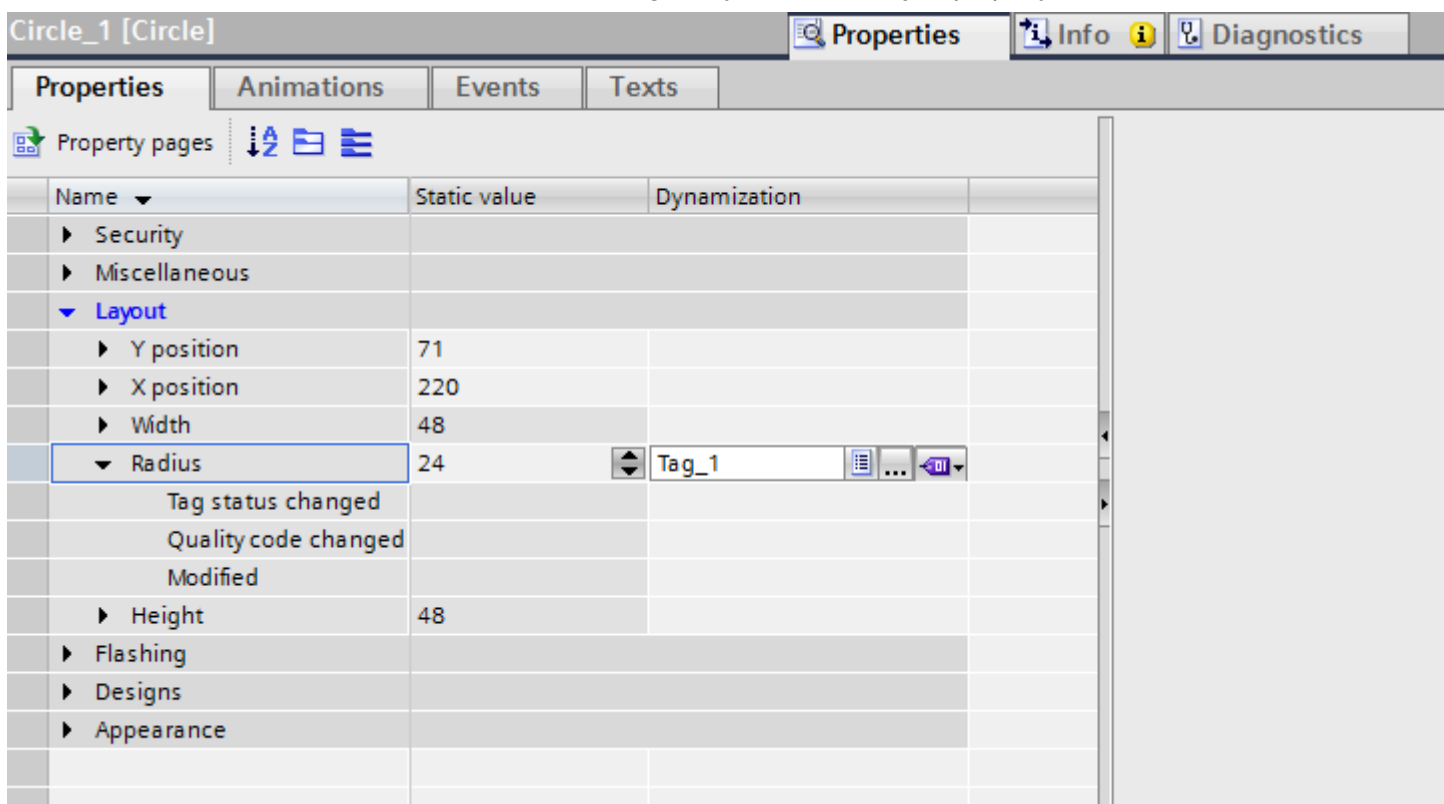

When you dynamize an object property with a tag, the object property is changed in Runtime depending on the tag value. When you indirectly dynamize the object property, you connect the property to a tag that sets the property value in Runtime.

### Requirement

- An object with the property to be dynamized is selected.
- You have created a tag.
- The Inspector window is open.

## Procedure

1. Select the screen object whose properties you want to control dynamically.  
The object properties are displayed in the Inspector window.
2. Click the  button in the Inspector window.  
The property list is displayed with the properties of the selected object.
3. Select the property to be dynamized.
4. In the "Dynamization" column, select the entry "HMI\_Tag".  
A dialog opens.
5. Select a tag.
6. Activate "Use indirect addressing" to dynamize the object property.

## Result

The object property changes in Runtime according to how the property list is configured.

## Representation of a multiple selection in the property list

If you selected multiple objects at the same time, the "Object type" column is added to the property list. The objects that support the property displayed in the row are displayed in this column. Changes to, or dynamization applied to a property affect all the objects displayed in the "Object type" column.

## **See also**

Basics on dynamization in the property list (Page 3353)

## **Programming a dynamization method for a tag change**

### **Introduction**

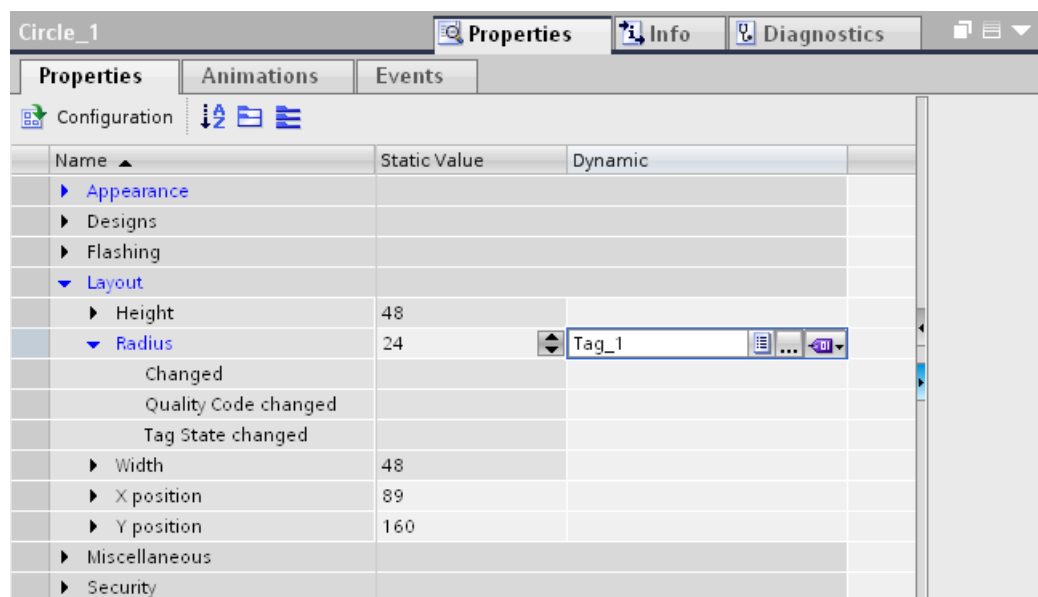

If you have entered a tag in the "Dynamization" column, you can configure a function list additionally on different events.

### **Requirement**

- An object with the property to be dynamized is selected.
- You have created a tag.
- The property list is open in the inspector window.
- An object property is connected with the tag.

## Procedure

1. Extend the property list by clicking next to the property which you have dynamized with a tag.
2. Three other lines with the following events are displayed below the property.
  - Changed
  - Tag status changed
  - Quality code changed
3. Configure a function list for the required event.  
Alternatively you can convert the function list into a local script.

## Result

The object property changes in Runtime according to how the property list is configured.

## See also

Basics on dynamization in the property list (Page 3353)

### 10.1.4.7 Dynamize with system functions

## Basic on events

## Introduction

Screen objects react to events. You configure a function list with system functions on the events of an object.

## Events

Which events and system functions are available depends on the object used.

If the operator activates a screen object for example, the configured system function is executed.

You can find additional information under "Basics on the function list (Page 3872)".

## See also

Basics on dynamizing screens (Page 3334)

Example: Configuring a button for language switching (Page 3359)

Configure system function on the "Click" event (Page 3358)

## Configure system function on the "Click" event

### Introduction

You configure a function list on an object event. The linked system function is executed when the event occurs in runtime.

### Requirements

A screen is open.

A button has been created in the screen.

The inspector window is open.

### Procedure

1. Select the button.
2. Click "Properties> Events" in the Inspector window.
3. Select the "Click" event.
4. Click "Add function" in the table.
5. Select the "ShowAlarmWindow" system function.

### Result

The alarm window opens in the screen if the operator clicks the button in runtime.

### See also

Basic on events (Page 3357)

## Example: Configuring a button for language switching

### Introduction

In this example, you configure a button that can be used to toggle between multiple runtime languages during runtime.

### Requirements

- You have completed the "Configuring a button in multiple languages" example.
- The "Screen\_1" screen is open.
- The button on the screen has been selected.

### Procedure

1. In the Inspector window, select "Properties > Events > Press".
2. Click on "Add function" in the table.
3. Select the "SetLanguage" system function and the "Switch" setting.

### Result

You have assigned the button the function "SetLanguage". Pressing the button during runtime will switch the runtime language. The runtime languages are switched in the order specified by the number sequence in the "Languages and fonts" editor.

### See also

Basic on events (Page 3357)  
Button (Page 3462)

## 10.1.5 Working with function keys

### 10.1.5.1 Working with function keys

#### Introduction

The function key is a physical key on your HMI device and its functions can be configured. A function list can be configured for the events "Key pressed" and "Release key".

A function key can be assigned global or local functions.

---

**Note**

**Availability for specific HMI devices**

Function keys are not available on all HMI devices.

---

## Global function keys

Global function keys always trigger the same action, regardless of the displayed screen.

Global function keys are configured in the "Global Screen" editor. The global assignment applies for all the screens of the set HMI device.

Global function keys reduce programming considerably, because there is no need to assign these global keys to each individual screen.

## Local function keys in screens

Local function keys in screens can trigger a different action in each screen. This assignment applies only to the screen in which you have defined the function key.

Within a screen, a function key has only one function assignment, either a global or local one. The project planner specifies which assignment has priority.

---

**Note**

If a screen with local function keys is overlapped by an alarm view or an alarm window, then the function keys are still active in runtime. This may happen in particular on HMI devices with a small display.

---

## Local function keys in templates

Local functions keys that are assigned in templates are valid for all the screens based on this template. They can trigger a different action in every screen. Function keys for templates are assigned in the template of the "Screens" editor. Within a template, a function key has only one function assignment, either a global or local one. The project planner specifies which assignment has priority.

## Hotkey assignment

You can assign hotkeys, such as buttons, to control objects. The available hotkeys depend on the HMI device.

---

**Note**

The function key has a local or global action assigned to it. If the function key also has a hotkey assigned to it, then the hotkey function will be executed in Runtime.

---

## Graphics

When a function key is placed directly next to the display, you can assign a graphic to it to make the function of the function key more clear.

## Display of assignment

Table 10-1 The following table shows which symbols display the assignment of the function keys:

Function key	Description
	Not assigned
	Global assignment
	Assigned locally in the template
	Local assignment
	Local assignment (local assignment of the template overwrites global assignment)
	Local assignment (local assignment overwrites global assignment)
	Local assignment (local assignment overwrites local assignment of the template)
	Local assignment (local assignment overwrites local assignment of the template, which already overwrites global assignment)
	Assigning buttons with screen navigation

### Note

#### Basic Panels

The "Screen Navigation" editor is not available for Basic Panels.

### 10.1.5.2 Assigning function keys globally

#### Introduction

You define the global assignment of a function key in the "Global Screen" editor. The global assignment applies to all screens of the set HMI device.

---

#### Note

##### Availability for specific HMI devices

Function keys are not available on all HMI devices.

---

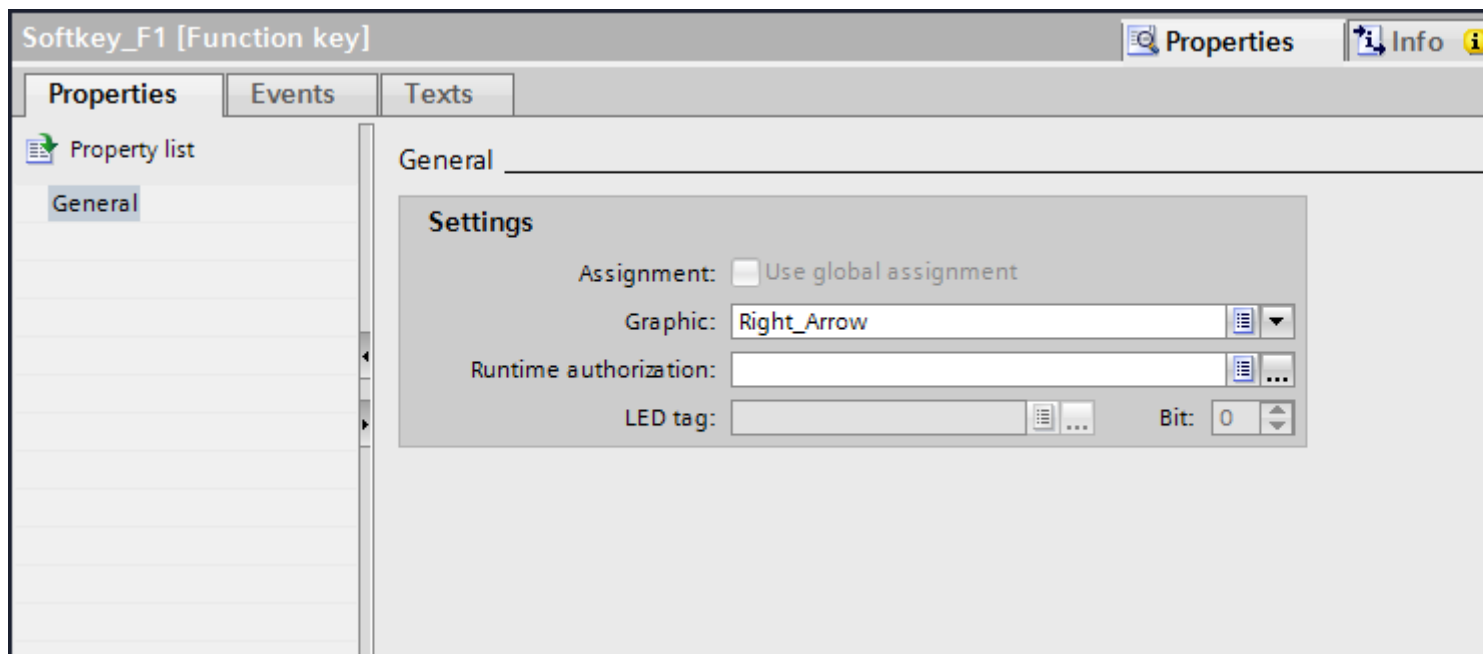

#### Requirement

- You have opened the project.
- The Inspector window is open.

#### Procedure

Proceed as follows to assign a screen-based function to a function key:

1. To open the "Global Screen" editor, double-click "Global Screen" in the "Screen management" group of the Project window.
2. Select the desired function key.  
The properties of the function key are shown in the Inspector window.

3. Under "General", configure a graphic and an operator authorization for the function key.
4. Configure a function list for the required event under "Events".

## Result

If a local assignment does not overwrite the global assignment, the assignment of the function key changes in all the screens of the set HMI device in accordance with your entry.

### 10.1.5.3 Local assignment of function keys

#### Introduction

Function keys are assigned globally and locally. A local assignment of the function keys is only valid for the screen or the template in which it was defined. The following local function keys are available:

- Local function keys of a screen  
Different functions are assigned to the function key for each screen. This assignment applies only to the screen in which you have defined the function key.
- Local function keys of a template  
You assign the function keys in a template. The assignment applies to all the screens that are based on this template and are not overwritten by a local assignment in a screen.

A local assignment overwrites the global assignment of a function key.

---

#### Note

##### Availability for specific HMI devices

Function keys are not available on all HMI devices.

---

#### Using existing assignments

The option for using existing assignments is referred to as follows in the Inspector window:

- In a template: "Use global assignment"
- In a screen:
  - Screen based on a template: "Use local template"
  - Screen not based on a template: "Use global assignment"

The "Use local template" option includes the use of the local assignment in the template and the global assignment.

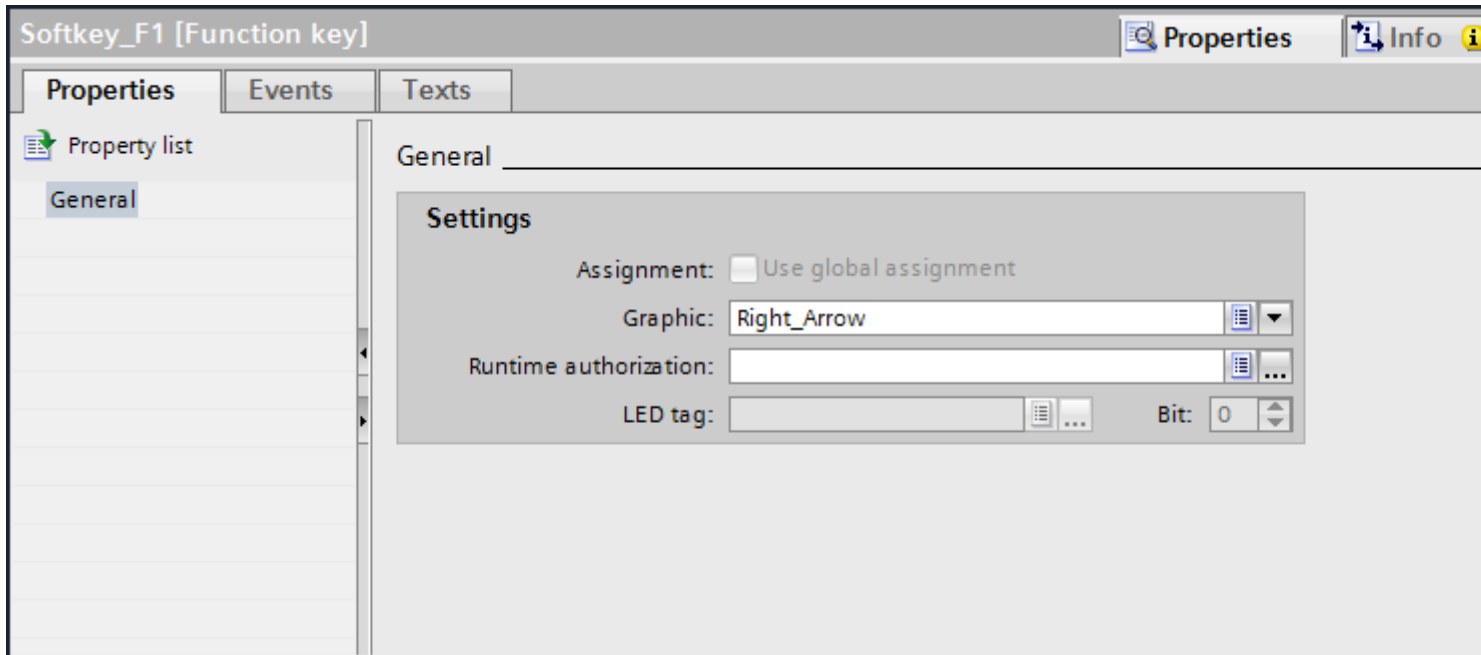

#### Requirement

- You have opened the screen or the template in which you want to assign a function key locally.
- The Inspector window is open.

## Procedure

Proceed as follows:

1. Select the desired function key in the screen or in the template.  
The properties of the function key are shown in the Inspector window.
2. Click "General" in the Inspector window.

3. Disable the "Use local template" or "Use global assignment" option.
4. Under "General", configure a graphic and an operator authorization for the function key.
5. Configure a function list for the required event under "Events".

## Result

The function key is assigned the configured function in the screen or in the template.

### 10.1.5.4 Assigning a function key to a function

#### Introduction

A function key can have two states:

- Pressed: Defined by the "Key pressed" event.
- Released: Defined by the "Release key" event.

Both of these events are configured in the Inspector window of the function key. You can assign any event a function list which contains system functions or scripts. Execution of this function list is event-driven in runtime.

---

**Note****Availability for specific HMI devices**

Function keys are not available on all HMI devices.

---

**Note****Basic Panels**

Scripts are not available for Basic Panels.

---

## Requirement

To assign the function key a global function:

- The "Global Screen" editor is open.

To assign the function key a local function:

- The screen in which you want to assign a function key is open.

If you want to assign a function key locally in a template:

- The template in which you want to assign a function key is open.
- The Inspector window is open.

## Procedure

Proceed as follows:

1. Select the function key you want to define.  
The properties of the function key are shown in the Inspector window.
2. Configure the function list for the desired result in the Inspector window under "Properties" in the "General" group.

## Result

The function list is executed in runtime when the operator presses or releases the function key.

### 10.1.5.5 Assigning operator authorization for a function key

#### Introduction

In WinCC you can assign an operator authorization for a function key in runtime. This allows you to restrict access to the function keys to specific persons or operator groups when you

configure your project. Only authorized personnel can then change important parameters and settings in runtime.

You configure access protection in order to avoid operator errors and increase plant or machine security.

---

**Note**

**Availability for specific HMI devices**

Function keys are not available on all HMI devices.

---

**Requirement**

- The user groups have been defined.

To protect a global function key:

- The "Global Screen" editor is open.

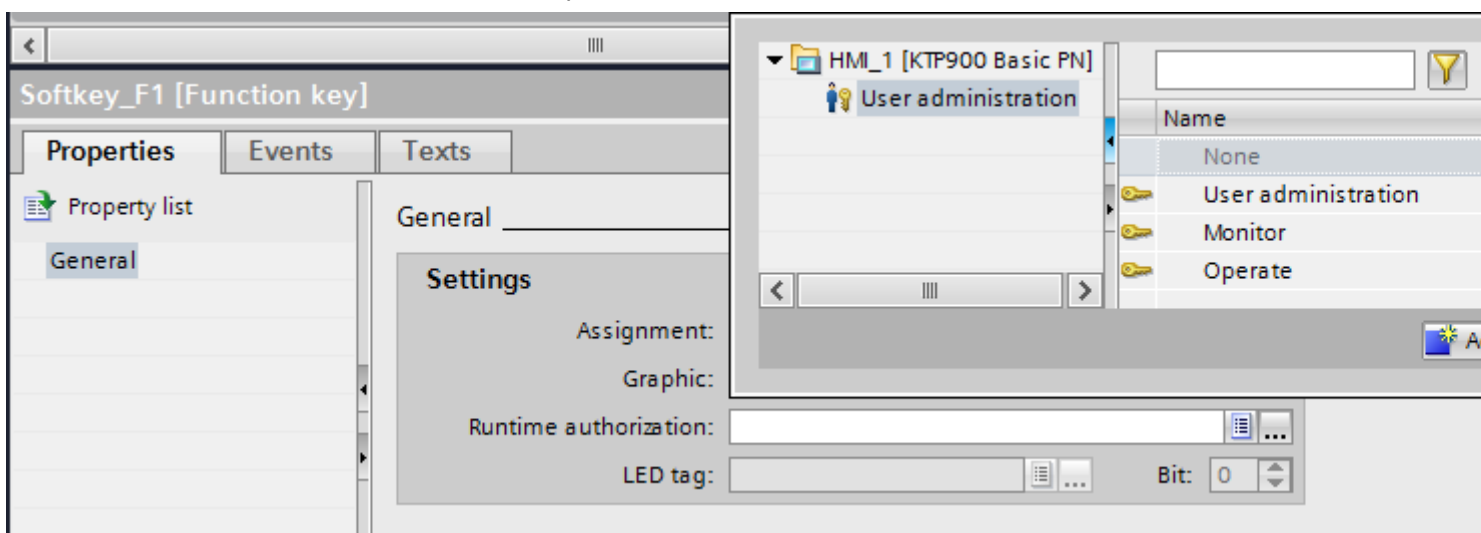

If you want to protect a local function key of a screen or of a template:

- The screen or the template which contains the function key is open.
- The Inspector window is open.

**Procedure**

Proceed as follows:

1. Select the relevant function key.  
The properties of the function key are shown in the Inspector window.
2. Click "General" in the Inspector window.

3. In the "Authorization" list, select the user group you want to allow runtime access to the function key.

## Result

The operator authorization is configured.

### 10.1.5.6 Assigning a function key to a graphic

#### Introduction

In order to make the function of a key more clear, you can insert a graphic in the screen alongside the function key. Graphics can only be assigned to function keys that border the screen margin of the HMI device.

---

#### Note

##### Availability for specific HMI devices

Function keys are not available on all HMI devices.

---

#### Requirement

To assign a graphic to a global function key:

- The "Global Screen" editor is open.

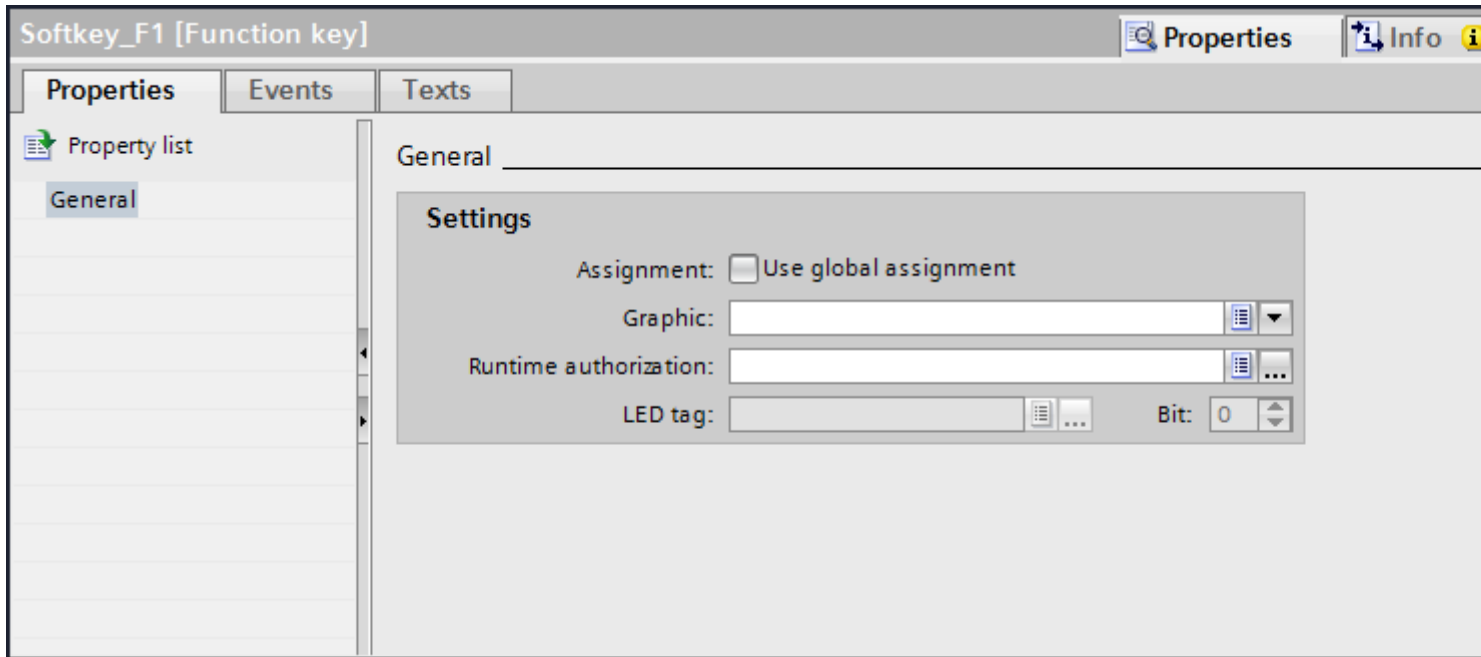

If you want to assign a graphic to a local function key in a screen or template:

- The screen or the template that contains the corresponding function key is open.
- The Inspector window is open.
- You have created the graphic for the function key.

## Procedure

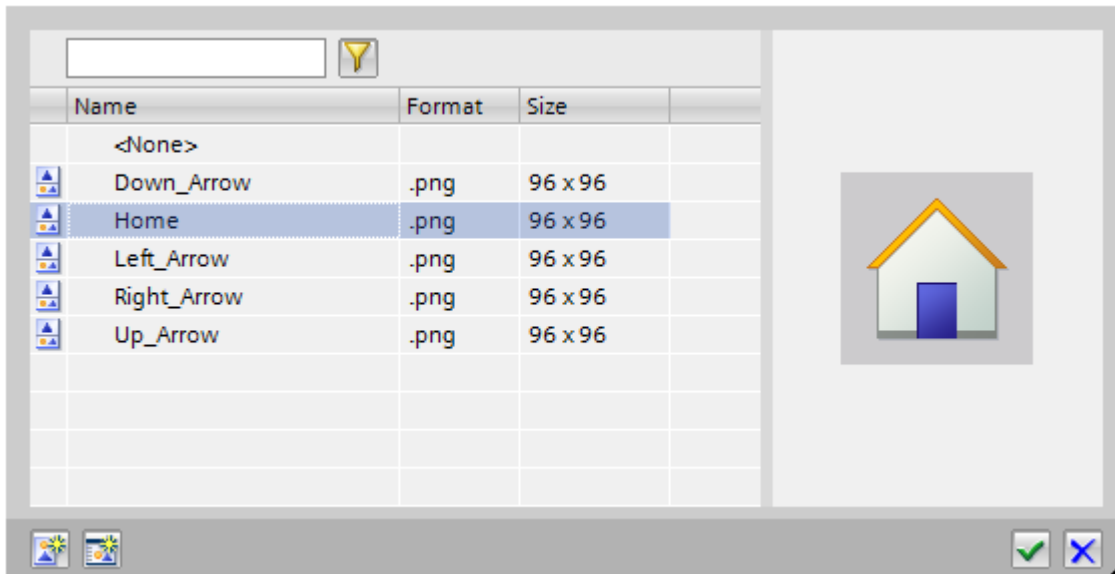

Proceed as follows:

1. Select the relevant function key.  
The properties of the function key are shown in the Inspector window.
2. Click "General" in the Inspector window.

- Click in the "Graphic" area of the list.  
The graphic browser of your WinCC project appears. The pane on the left side shows the external graphics which are stored in the browser. The pane on the right side shows you a preview of the graphic you have selected in the browser.

Using the  and  icons, you can display the collection either in form of thumbnails or as a list.

In order to open and edit OLE objects with the associated graphics program, double-click on the object.

- In the browser click the desired graphic or store the relevant graphic in the graphic browser. The graphic preview is shown in the right pane.
- Click "Select" to add the graphic to the screen.  
Click "Clear" to remove the graphic from the screen.

## Result

The graphic is displayed next to the function key.

### 10.1.5.7 Configuring LED tags

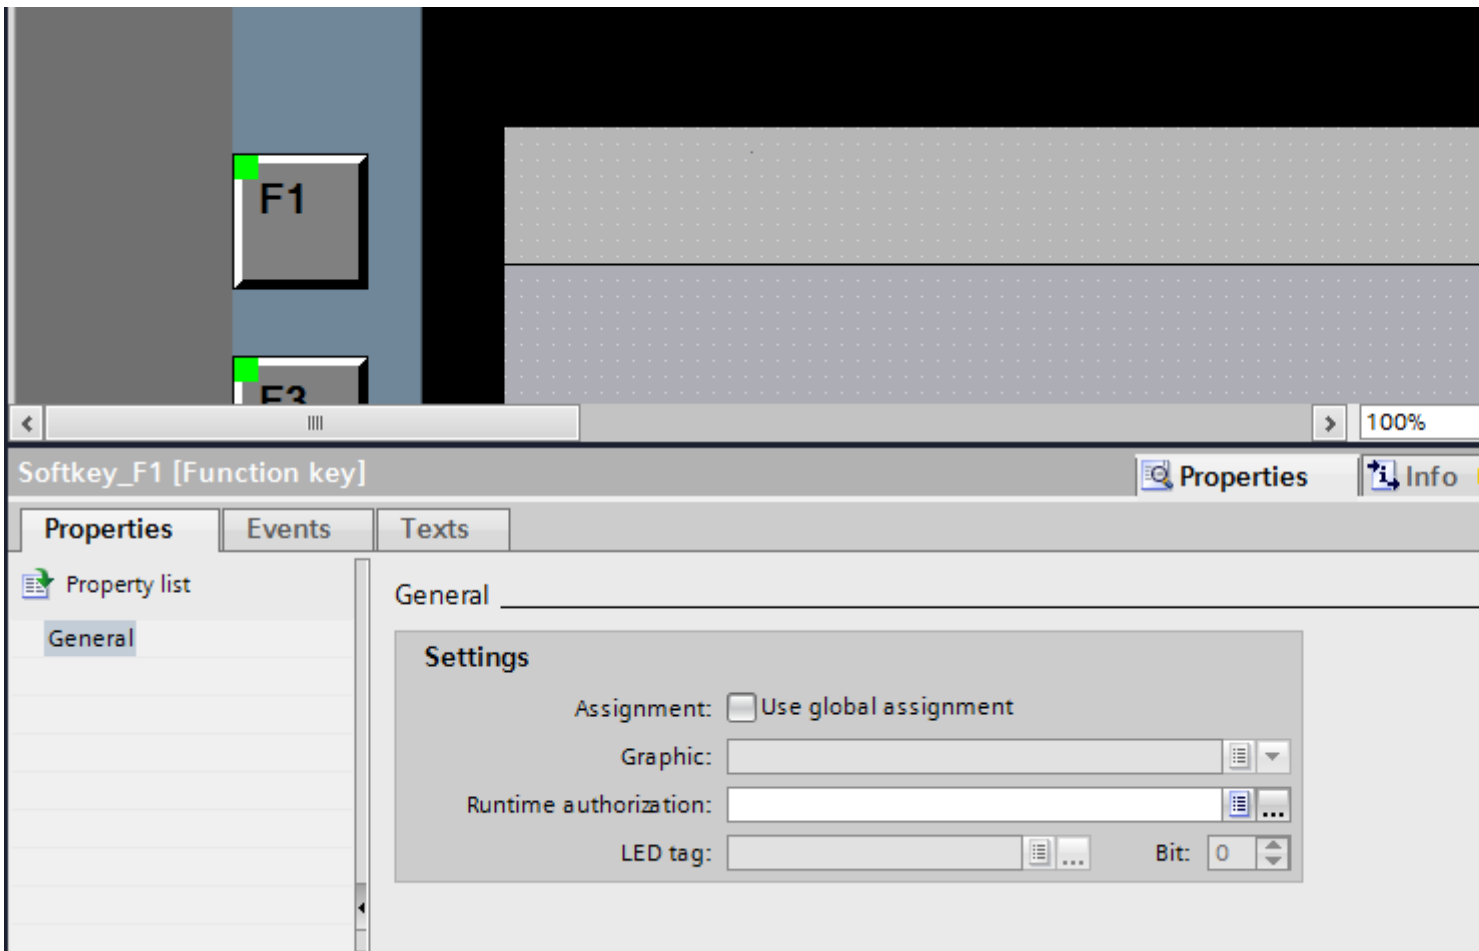

#### Requirements

- An HMI device with key operation has been created.
- You have created an LED tag.

#### Procedure

- Create a new screen.
- Click an F-key of the HMI device.

3. In the Inspector window, click "Properties > Properties > General".

4. Select a tag under "LED tag" in the "General > Settings" area.
5. Under "Bit" enter the correct bit number.  
The correct bit number depends on the HMI device and the input and output assignments on the HMI device.

### Assignment of inputs and outputs

The exact assignment of inputs and outputs can be found under:

- PROFINET IO direct keys: Auto-Hotspot
- PROFIBUS DP direct keys: Auto-Hotspot

### 10.1.5.8 Example: Using function keys for screen navigation

#### Task

In this example you create a local function key in a screen. When the operator presses this function key, a screen change to a predefined screen is triggered, for example "Boiler 2".

---

#### Note

##### Availability for specific HMI devices

Function keys are not available on all HMI devices.

---

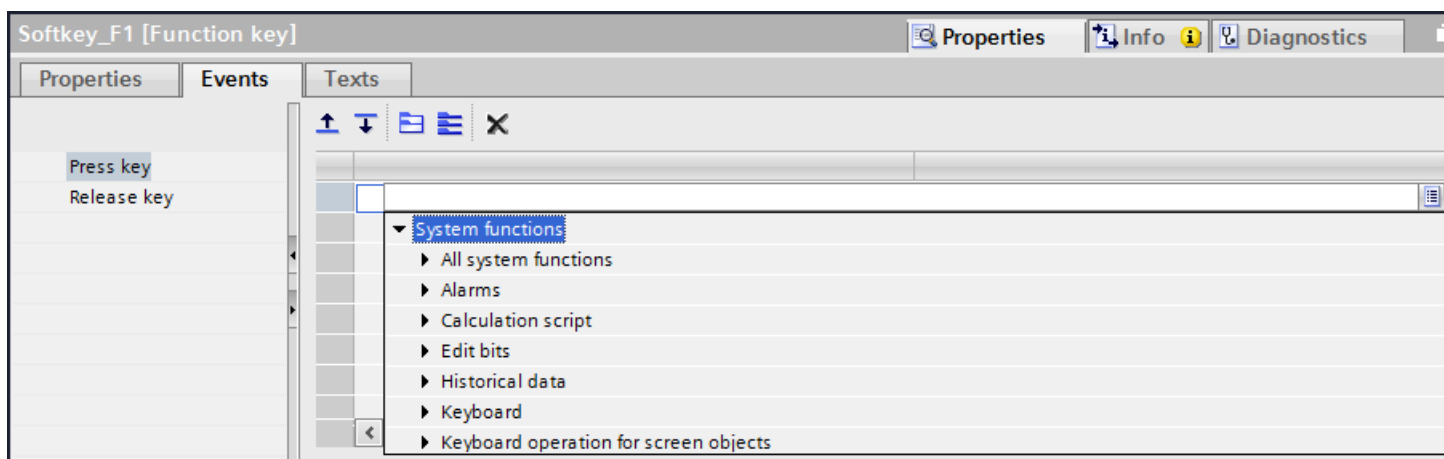

#### Requirement

- The screen in which you want to assign the function key is open.
- You have created the "Boiler 2" screen.
- The Inspector window is open.

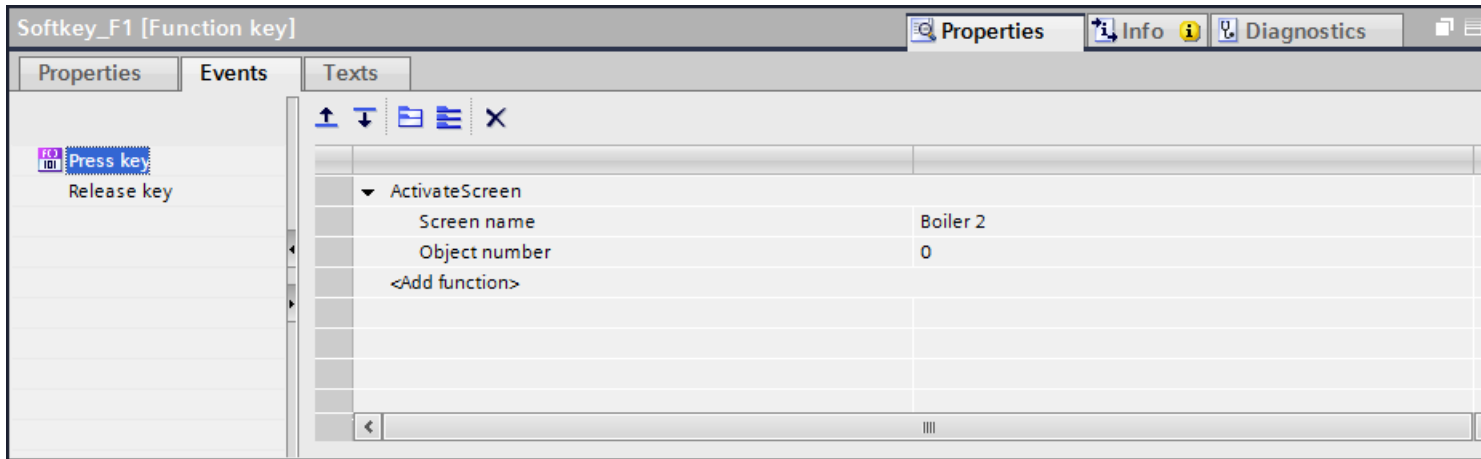

#### Procedure

Proceed as follows to use the "ActivateScreen" function:

1. Select the desired function key.  
The properties of the function key are shown in the Inspector window.
2. Click "General."
3. To overwrite a global assignment, disable the "Use local template" option.
4. Click "Key pressed" under "Events".

5. Select the "ActivateScreen" system function from the list.  
The "ActivateScreen" function appears in the "Function list" dialog box, including the "Screen name" and "Object number" parameters.

6. Select the "Boiler 2" screen from the "Screen name" list.

## Result

The operator changes to the "Boiler 2" screen in runtime by pressing the selected function key.

## 10.1.6 Working with layers

### 10.1.6.1 Basics on working with layers

## Layers

Use layers in order to achieve differentiated editing of the objects in a screen. A screen consists of 32 layers that you can give any names. If you assign objects to the layers, you thereby define

the screen depth. Objects of layer 0 are located at the screen background, while objects of layer 31 are located in the foreground.

The objects of a single layer are also arranged hierarchically. When you create a screen, the object inserted first is located at the rear within the layer. Each further object is placed one position towards the front. You can shift objects forwards and backwards within a layer.

### Principle of the layer technique

Always one layer of the 32 layers is active. New objects you add to the screen are always assigned to the active layer. The number of the active level is displayed in the inspector window of the screen and in the "Layout > Layers" task card.

When you open a screen, all 32 layers of the screen are displayed. You can hide all the layers except for the active layer in the inspector window of the screen and in the "Layout > Layers" task card. You then explicitly edit objects of the active layer.

In the tree view of the "Layers" palette in the "Layout" task card, you administer layers and objects with drag-and-drop and the context menu.

### Application examples

Use layers, for example, in the following cases:

- To hide the labeling of objects when editing,
- To hide objects, e.g. alarm windows, while configuring other objects

### See also

Screen basics (Page 3241)

Renaming layers (Page 3377)

Show and hide layers (Page 3376)

Setting the active layer (Page 3374)

Moving objects between layers (Page 3374)

### 10.1.6.2 Moving objects between layers

#### Introduction

By default, a new object is inserted on the active layer. You can, however, assign an object to another layer at a later time.

#### Requirement

- A screen with an object is open.
- The Inspector window is open.

#### Procedure

1. Select the object in the screen.  
The object properties are displayed in the Inspector window.
2. Enter the layer to which you want to move the object in "Properties > Properties > Miscellaneous > Layer" in the Inspector window.

Alternatively, select the object from the "Layout" task card and drag it to the required layer.

#### Changing the order of objects

1. Select the object in the screen.  
The object properties are displayed in the Inspector window.
2. To move the object to the front or back, select the "Order" > "Move backward" or "Move forward" command from the shortcut menu.  
Alternatively, use the  or  button in the toolbar.

#### Result

The object is assigned to the selected layer, and positioned at the top of the layer.

#### See also

Basics on working with layers (Page 3372)

### 10.1.6.3 Setting the active layer

#### Introduction

The screen objects are always assigned to one of the 32 layers. There is always an active layer in the screen. New objects you add to the screen are always assigned to the active layer.

The number of the active layer is indicated in the "Layer" toolbar. The active layer is indicated by the  icon in the "Layout > Layers" task card.

Layer 0 is the active layer when you start programming. You can activate a different layer during configuration, if necessary.

### **Requirement**

- You have opened a screen which contains at least one object.
- The Inspector window of the active screen is open.

### **Procedure**

1. Click "Properties > Properties > Layers" in the Inspector window of the current screen.
2. Enter the layer number in "Settings > Active layer".

### **Alternative procedure**

1. Select "Layout > Layers" in the "Layout" task card.
2. Select the "Set to active" command from the shortcut menu of a layer.

### **Result**

The layer with the specified number is now active.

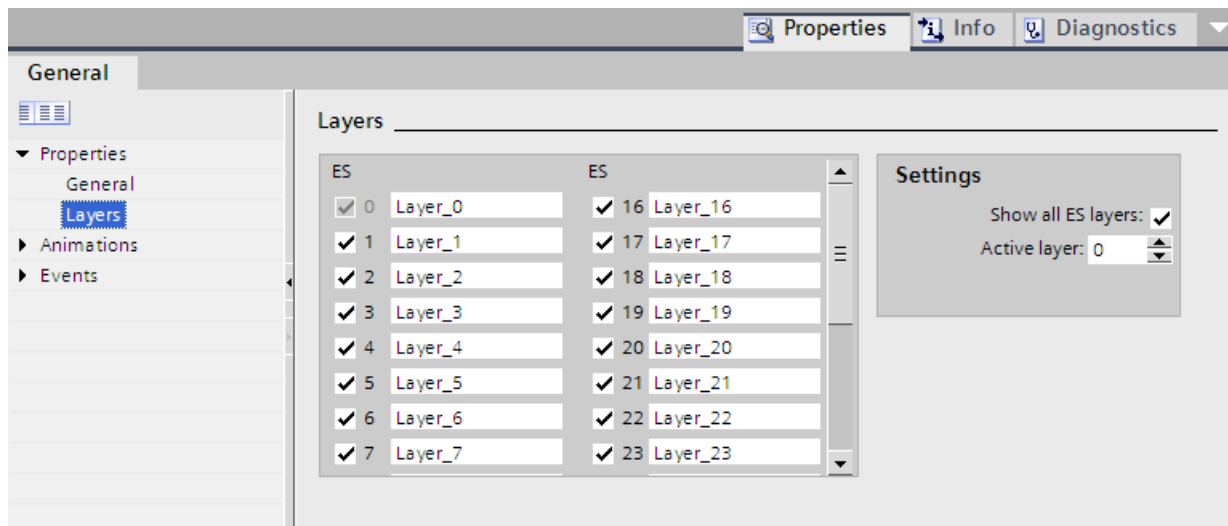

### **See also**

Basics on working with layers (Page 3372)

### 10.1.6.4 Show and hide layers

#### Introduction

You can show or hide the layers of a screen as required. You specify the layers that are shown in the Engineering System. When you open a screen, all the layers are always shown.

#### Requirement

- The screen is opened.
- The "Layout" task card is open.

#### Procedure

1. Select the layer that you want to hide or show in the "Layout > Layers" task card.
2. Click one of the icons next to the corresponding layer:
  -  A shown layer is hidden
  -  A hidden layer is shown

---

#### Note

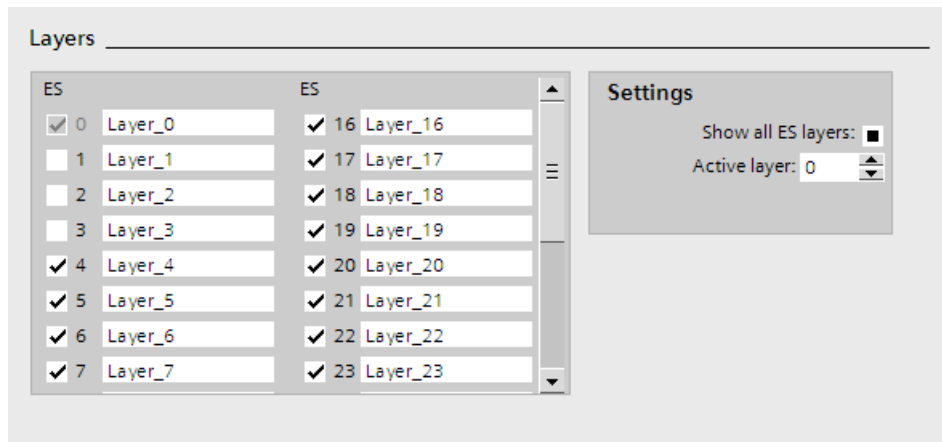

The active layer cannot be hidden.

---

### Alternative procedure

1. Click in an area of the screen that does not contain an object.  
The screen properties are shown in the Inspector window.
2. In the Inspector window, select "Properties > Properties > Layers":

3. In the list, disable the levels you wish to hide.  
If you activate "All ES layers" for a layer, the objects in this layer will be shown in the Engineering System.

### Result

The layers are shown according to your settings.

### See also

Basics on working with layers (Page 3372)

#### 10.1.6.5 Renaming layers

### Introduction

When you create a screen, the 32 layers are numbered consecutively by default. To improve clarity, you can rename the layers to suit your requirements.

## Requirement

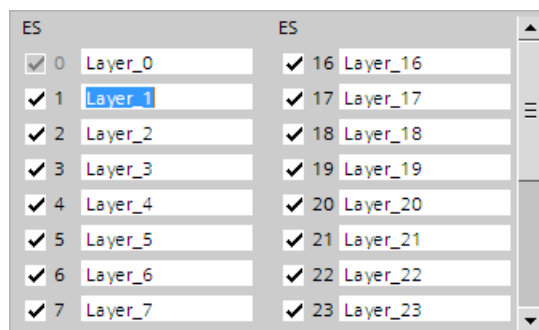

- The screen is opened.

## Procedure

1. Click in an area of the screen that does not contain an object.  
The screen properties are shown in the Inspector window.
2. In the Inspector window, select "Properties > Properties > Layers".

3. Enter the new layer name.

## Result

The layer is displayed with the new name.

## See also

Basics on working with layers (Page 3372)

## 10.1.7 Working with faceplates

### 10.1.7.1 Basics on faceplates

#### Introduction

Faceplates are a configured group of display and operating objects that you manage and change centrally in a library. You can use a faceplate in several projects as required. The faceplates are stored in the project library.

#### Use

You use faceplates to create individually configured display and operating objects. You can use faceplates several times in the project or in different projects. All instances of a faceplate in the project are changed centrally. This reduces the configuration effort.

#### Types and instances

Faceplates are based on a type-instance model to support the central changeability. You create central properties for an object in types. The instances represent local points of use of the types.

- **Faceplate type**  
You create a display and operating object according to your requirements and store it in the project library. The instances are bound to the respective faceplate type. If you change a property of a faceplate type, the property is saved centrally and also changed in all instances. In the faceplate type, you define the properties that can be changed on the faceplate. You edit a faceplate type in the "Faceplates" editor.
- **Faceplate**  
The faceplate is an instance of the faceplate type. You use a faceplate in screens as a display and operating object. You configure the variable properties of the faceplate type on the instance. You assign the tags of your project to the faceplate, for example. If you configure properties on the faceplate, you overwrite the properties of the faceplate type. The changes on the faceplate are saved at the point of use and have no effect on the faceplate type.

The figure below shows the relationships between the faceplate type and the faceplate. The background color of the I/O field is configured in the faceplate type in such a way that every instance can change the property. Blue is used as the background color in the faceplate type. You use yellow as the background color in the faceplate.

When you change the background color in the faceplate type, this has no effect on the faceplate because the "Background color" property is assigned on an instance-specific basis.

### 10.1.7.2 Device dependency of faceplates

#### Device dependency of faceplates

Not all HMI devices support every display and operating object. The screen objects that are not available in the respective HMI device are not displayed when using the faceplate.

The following devices support faceplates:

#### Runtimes

- WinCC Runtime Advanced
- WinCC Runtime Professional

#### Comfort Panels

- KTP 400
- KP 400
- TP 700
- KP 700
- TP 900
- KP 900
- TP 1200
- KP 1200
- TP 1500
- KP 1500
- TP 1900
- TP 2200

## **Panels**

- TP 277
- OP 277

## **Mobile Panels**

- Mobile Panel 277
- Mobile Panel 277 IWLAN V2
- Mobile Panel 277F IWLAN V2
- Mobile Panel 277F IWLAN (RFID Tag)

## **Multi Panels**

- MP 277
- MP 377

### **10.1.7.3 Faceplate editor**

#### **Open**

Create faceplate types and edit them in the library view.

## Layout

The library view for faceplate types consists of several editors, e.g. "Screens" and "Tags" which are arranged in the work area and the configuration area.

The screenshot displays the WinCC configuration environment for a faceplate type. The top navigation pane shows the path: Project library > Types > Faceplate\_1(1) > V 0.0.2. Below this is a standard toolbar with various editing tools. The main workspace is a grid-based area where a yellow callout box instructs the user to 'Configure a connection with drag-and-drop.' To the left of the workspace is a 'Contained objects' panel listing 'Gauge\_1'. To the right is a 'Properties' panel with a table:

Name	Type
Properties_Faceplate	

Below the workspace is a 'Face...' panel with buttons for 'Properties', 'Info', and 'Diagnostics'. At the bottom, another 'Properties' panel is visible with a table:

Name	Static value	Dynamization
Layout		
Auto-size		<input checked="" type="checkbox"/>
Height	480	
Resizing	None	
Width	640	
Misc		

## Work area

In the work area, place the objects contained in the faceplate type as you usually do in the "Screens" editor. You can remove objects, or use the "Toolbox" task card to add new objects.

## Configuration section

- Properties

The static and dynamic properties are identified as follows:

- The  symbol identifies a dynamic property. Dynamic implementation of this property, using tags or text and graphic lists.
- The  symbol identifies a static property. You change only the values of a static property.

---

### Note

#### Device dependency of static properties

Static properties are only available for panels and RT Advanced.

---

You define the faceplate type properties in the "Properties" tab.

You use the following two lists for this:

- The "Contained objects" list  
This list includes the properties of the objects contained in the faceplate type. These properties can only be configured in the faceplate type in the "Faceplate" editor.
- The "Interface" list contains the properties and tags of the faceplate type. The "Interface" list consists of the pre-defined category "Dynamic properties" and user-defined categories.

- Events

You define the faceplate type events in the "Events" tab. You use the following two lists for this:

- The "Contained objects" list contains the events of the objects embedded in the faceplate type.
- The "Interface" list contains the events of the faceplate.  
You create links between the two lists using a drag and drop operation.

- Tags

You can also create faceplate tags on the "Tags" tab. The tags are only available within the faceplate type. You can interconnect the faceplate type tags directly with an object contained in the faceplate type.

- **Scripts**  
In the "Scripts" tab, you can configure scripts for the faceplate type. In the script, you can call up system functions or program new functions, for example to convert values. The scripts are only available within the faceplate type. They work with VB Script code.

---

**Note**

The "Scripts" tab is not available for Runtime Professional.

---

- **Text lists**  
You can also create and edit text lists for the faceplate type in the "Text lists" tab. These text lists are only available within the faceplate type. You can interconnect the text lists of the faceplate type directly with an object contained in the faceplate type, such as a symbolic I/O field.
- **Graphics lists**  
If necessary, you can also create graphics lists for the faceplate type in the "Graphics lists" tab. These graphic lists are only available within the faceplate type. You can interconnect the graphic lists of the faceplate type directly with an object contained in the faceplate type, e.g. a graphic I/O field.
- **User texts**  
The "User text" tab shows the contained user text of the opened faceplate type, for example entries from text lists. You can enter the compilations for the individual project languages directly in the "User text" tab.

Example: Configuring a faceplate (Page 3401)

#### 10.1.7.4 Creating and managing faceplates

##### Creating a faceplate type

###### Introduction

Faceplate types are display and operating objects which are made up of several objects, e.g. controller modules.

###### Requirement

You have opened a screen which contains multiple objects.

### **Procedure in the project view**

1. Select all the objects that you need for the faceplate type.
2. Select the "Create faceplate type" command in the shortcut menu of the multiple selection. A dialog opens.
3. Enter a name for the faceplate.
4. If necessary, add a comment or change the version number.

#### **Result**

The library view opens. Two versions of the type are displayed in the "types" folder. Version 0.0.1 has been released and contains the currently selected objects.

The 0.0.2 version has the status "in progress". Edit the faceplate type in version 0.0.2 as required.

### **Procedure in the library view**

1. The library view is open.
2. Select the "Add new type" command in the shortcut menu of the project library. A dialog opens.
3. Select the runtime for which the faceplate type is to be available. An empty faceplate type is created.
4. Drag-and-drop the objects from the "Toolbox" task card to the work area of the faceplate type.

#### **Result**

The new faceplate type is created and displayed under the selected name in the project library. The faceplate type is assigned the status "in progress" and the version 0.0.1.

- Configuring text lists in the faceplate type (Page 3392)

Removing faceplate object from faceplate (Page 3399)

Resizing a faceplate (Page 3397)

## Configuring a faceplate type

### Introduction

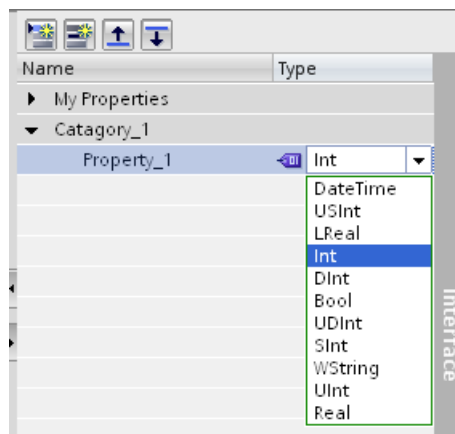

In the configuration area of the "Faceplates" editor you define which properties and process values of the objects contained in the faceplate can be configured in the "Properties" tab.

### Requirement

- The faceplate is generated and is displayed in the "Faceplate" editor.
- The "Properties" tab is open in the configuration area.

### Procedure

1. To create a new property, click the "Add property"  button in the interface list. A new property is displayed in the "Interface" list.
2. To create a new category, click the "Add category"  button in the interface list. A new category including a new property is displayed in the "Interface" list.
3. Click the name of the property and assign a name, for example, "Color".
4. Select the data type.

### Interim result

You have created a new property.

1. Click an object in the "Contained objects" list.
2. Select a property, e.g. "Appearance > Background color".

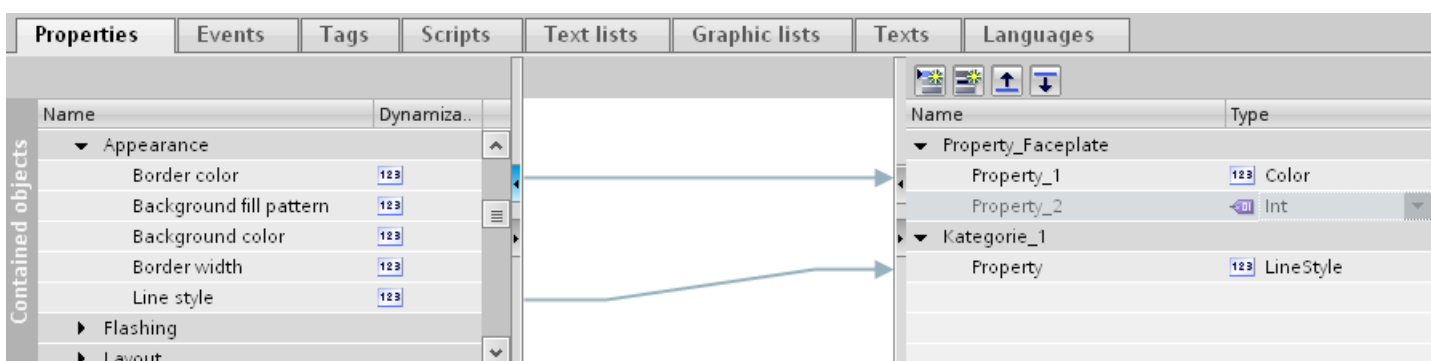

3. Move the property from the "Contained objects" list to the desired property in the "Interface" list by drag&drop.  
The connection is displayed as a colored line.  
The system assigns the same data type to the property in the "Interface" list as that of the property in the "Contained objects" list.  
To change the data type, select the data type from the data types of the connected property.
4. Repeat step 3 to connect other properties of the contained properties with the interface.

---

### Note

The property from the "Contained objects" list must be in concordance with the data type of the already connected property of the "Interface" list.

---

### Deleting a connection

1. Click the connection that you wish to delete.
2. In the shortcut menu select the "Delete" command or use the <DEL> key.  
The connection is deleted.

### Result

You have created a new property or a new category with a property. You have connected the property of the interface with a property of the contained objects. If you use an instance of the faceplate type in a screen, you configure the properties of the faceplate which you have created in the "Interface" list.

---

### Note

#### Device dependency of static properties

Static properties are only available for panels and RT Advanced. You work with dynamic properties in RT Professional.

---

## See also

Creating a faceplate type (Page 3384)

Example: Configuring a faceplate (Page 3401)

## Editing the category and property of a faceplate type

### Deleting a property in the "Interface" list

1. Select "Edit faceplate" in the shortcut menu. The "Faceplates" editor is open.
2. Select the property which you want to delete in the "Interface" list.
3. Select "Delete" in the shortcut menu.

The property is deleted from the "Interface" list. Existing connections to the contained objects are deleted. All linked faceplates lose their instance-specific property.

### Deleting a category in the "Interface" list

1. Select "Edit faceplate" in the shortcut menu. The "Faceplates" editor is open.
2. Select the category which you want to delete in the "Interface" list.
3. Select "Delete" in the shortcut menu.

The category including the properties is deleted from the "Interface" list. Existing connections to the contained objects are deleted. All linked faceplates lose their instance-specific properties.

### Moving a property to another category

1. Select a property in the "Interface" list.
2. Move the property to a new category by "drag&drop".

You have moved the property to a new category.

### Changing the data type of a property

1. Select a property in the "Interface" list.
2. Click the second column of the drop-down list.
3. Select a data type.

You have changed the data type of the property in the "Interface" list.

## See also

Creating a faceplate type (Page 3384)

## Configuring a tag in the faceplate type

### Introduction

You connect a tag in the faceplate type directly with the properties of the objects contained in the faceplate type. The tags in the faceplate type are a central means of defining dynamic properties in the faceplate type.

The tags of a faceplate type have limited functionality. The "Tags" tab of the configuration area has the same structure as the "Tags" editor.

### Array elements for faceplates

In the following situations you may not assign an array element or a multiplex tag that is interconnected with a faceplate to the property of a screen object.

- The property is configured in a faceplate as parameter of a system function.
- System functions or scripts are assigned in the faceplate to events of the property.

### Requirements

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- The "Tags" tab is open in the configuration area.

### Procedure

1. Click "Add" in the "HMI tags" table. A new tag is created in the faceplate type.
2. Open "Properties > Events" in the inspector window if necessary. You configure the "Value change" event on the tag for example.
3. In the work area, select the object to which you want to assign this tag, e.g. an I/O field.
4. Select the tag in the inspector window of the I/O field "Properties > Properties > General > Process > Tag".

---

#### Note

Only tags of the faceplate type are displayed in the object list in the "Faceplates" editor.

---

### Result

You have created a tag in the faceplate type. You are using the tag in the faceplate for scripting, for example.

### See also

Creating a faceplate type (Page 3384)

Example: Configuring a faceplate (Page 3401)

## Configuring an event in the faceplate type

### Introduction

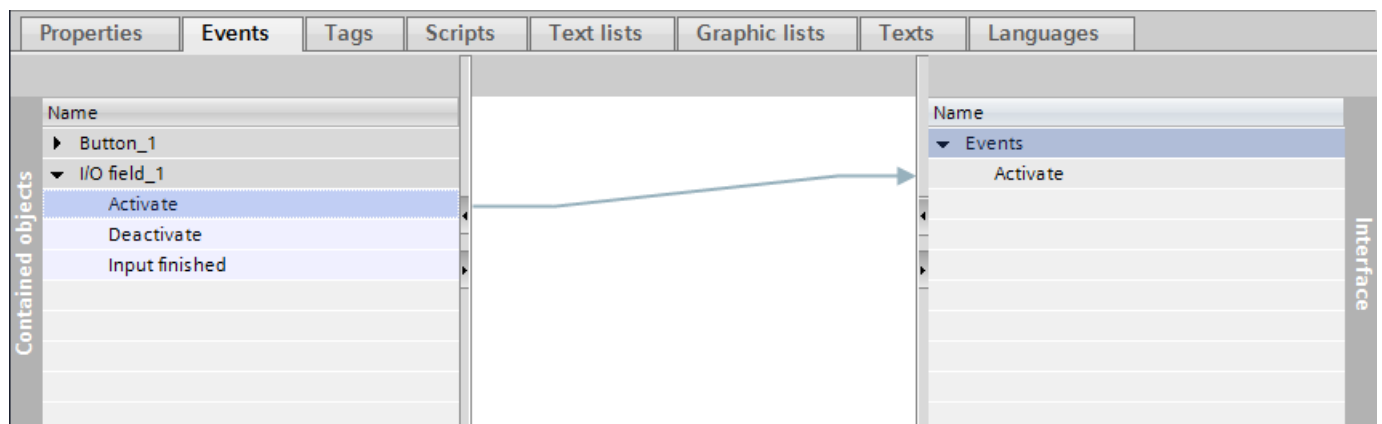

In the configuration area of the "Faceplates" editor you define which events of the objects contained in the faceplate can be configured in the "Events" tab. You configure a function list on the events of the faceplate in the "Screens" editor.

### Requirement

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- The "Events" tab of the configuration area is open.

### Procedure

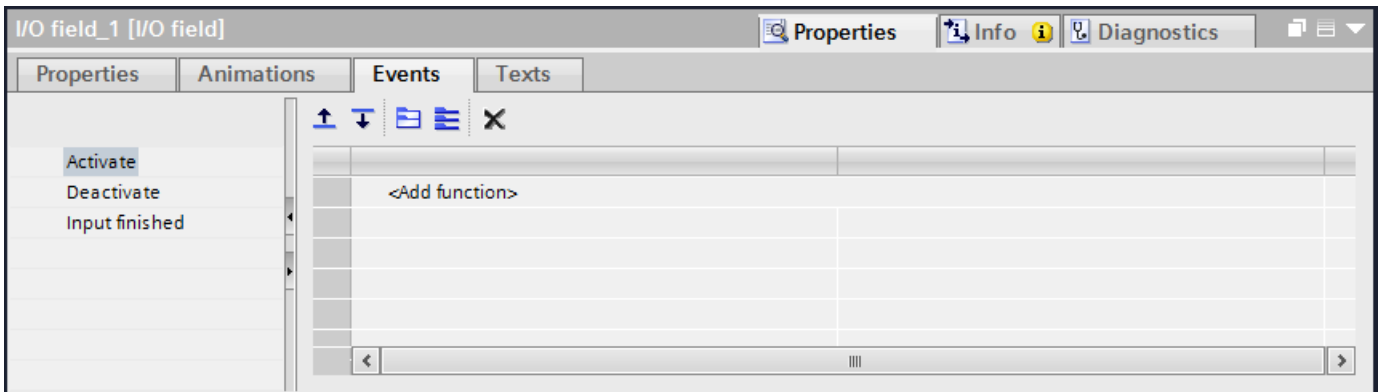

1. Click an object in the "Contained objects" list.
2. Select an event, e.g. "Activate".
3. Move the event from the "Contained objects" list to a new category in the "Interface" list. The new event is displayed in the "Interface" list. The connection appears as a colored line.

4. Double-click the event and, if required, change the name of the event.

## Result

You have created an event in the faceplate type. if you use an instance of the faceplate type, you will only be offered the configured events in the inspector window. You configure a function list on the event in the faceplate.

## See also

- Creating a faceplate type (Page 3384)
- Example: Configuring a faceplate (Page 3401)

## Configuring scripts in the faceplate type

### Introduction

In the configuration area of the "Faceplates" editor you create scripts which you only use within a faceplate type. You can only refer to tags of the faceplate type or properties of the contained objects within the script. The script is used as a copy in the instance of the faceplate type.

### Requirement

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- Faceplate tags or dynamic properties have been created.

### Procedure

1. Click the "Scripts" tab in the configuration area of the faceplate.
2. Double click "Faceplate scripts > Add VB script".
3. Write the program code.
4. Press the shortcut keys <CTRL+J> to Include tags of the faceplate type in the script. The object list opens.

5. Click "HMI tags".  
All tags of the faceplate type are displayed in the object list.
6. Select a tag and confirm the selection.
7. Press the shortcut keys <CTRL+J> to use properties of the faceplate type in the script. The object list opens.
8. Click "Properties".  
All dynamic properties of the "Interface" list for the faceplate type are displayed in the object list.

## Result

You have created a script in the faceplate type. The instance of the faceplate type uses a copy of the script. The script is executed in runtime depending on the configuration.

## See also

Creating a faceplate type (Page 3384)

Example: Configuring a faceplate (Page 3401)

## Configuring text lists in the faceplate type

### Introduction

In a faceplate type, you connect a text list with an object included in the faceplate type. Text is assigned to the values of a tag in a text list. The text list is used, for example, to display a selection list in a symbolic I/O field contained in the faceplate type. The interface between the text list and a tag of the faceplate type is configured at the object that uses the text list.

### Requirements

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- The "Text list" tab is open in the configuration range.
- A tag has been created in the faceplate type.

### Procedure

1. Click "Add" in the "Text lists" table. A new text list is created in the faceplate type.
2. Assign a name to the text list that indicates its function.
3. Select the text list type, e.g. "Value/Range" under "Select".
4. Click "Add" in the "Text list entries" table.
5. Define the values or range of values for the text list.

6. Enter a text for every value range which is displayed in Runtime when the tag is within the specified value range.
7. Select an object, for example a button in the work area of the faceplate type.
8. In the Inspector window of the object, enable "Properties > Properties > General > Label > Text list".
9. Select the "Text list" from the selection list.
10. Select a tag of the faceplate type under "Process > Tag".

## Result

You have created a text list in the faceplate type. This text list is linked to an object contained in the faceplate type. You have configured a faceplate type tag at the object.

## See also

Creating a faceplate type (Page 3384)

## Configuring a graphics list in the faceplate type

### Introduction

In a graphics list, specific graphics are assigned to possible values of a tag. In a faceplate type, you connect a graphics list with an object included in the faceplate type. Graphics are assigned to the values of a tag in a graphics list. For example, the graphics list is used to display a selection list in a graphic I/O field contained in the faceplate type. The interface between the graphics list and a tag of the faceplate type is configured at the object that uses the graphics list.

### Requirements

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- The "Graphics list" tab is open in the configuration range.
- A tag has been created in the faceplate type.

### Procedure

1. Click "Add" in the "Graphics lists" table. A new graphics list is created in the faceplate type.
2. Assign a functional name to the graphics list.
3. Select a graphics list type, e.g. "Range (... - ...)", under "Selection".
4. Click "Add" in the "Graphics list entries" table. A new entry is created in the list.
5. Define the values or range of values for the graphics list.

## 10.1 Creating screens

6. Select a graphic for every value or value range which is displayed in runtime when the tag is within the specified value range.
7. Select an object, e.g. a graphic I/O field, in the work area of the faceplate type.
8. Activate "Properties > Properties > General > Contents > Graphics list" in the object's Inspector window.
9. Select the "Graphics list" from the selection list.
10. Select a tag of the faceplate type in "Process > Tag".

### Result

You have created a graphics list in the faceplate type. This graphics list is linked to an object contained in the faceplate type. You have configured a faceplate type tag at the object.

### See also

Creating a faceplate type (Page 3384)

## Translating texts directly in the faceplate type

### Translating texts

If you use several languages in your project, you can translate individual texts directly. As soon as you change the language of the software user interface, the translated texts are available in the selected language.

### Requirements

- A project is open.
- You have opened the "Faceplates" editor.
- You have created a faceplate type.
- The faceplate type contains at least one object with text, e.g. a text field.

### Procedure

Proceed as follows to translate individual texts:

1. Open the "Tasks" task card.
2. Click the  button under "Languages & Resources > Editing language". The "Project languages" editor opens.
3. Activate at least two project languages.

- Open the "Texts" tab in the "Faceplates" editor.  
A list with the texts in the project is displayed in the work area. There is a separate column for each project language.

Properties	Events	Tags	Scripts	Text lists	Graphic lists	Texts	Languages
Device filter: (All objects selected)							
English ...	German...	Category ▲	Italian (Italy)	Spanish (Spain)	Reference		
		Alarm Text			Bildbaustein_1\V 0.0.2\ModuleDevic		
\$	\$	Alarm Text	\$	\$	Bildbaustein_1\V 0.0.2\ModuleDevic		
S7	S7	Alarm Text	S7	S7	Bildbaustein_1\V 0.0.2\ModuleDevic		
QGR	QGR	Alarm Text	QGR	QGR	Bildbaustein_1\V 0.0.2\ModuleDevic		
Text	Text	HMI screen	Text	Text	Bildbaustein_1\V 0.0.2\ModuleDevic		
Text	Text	HMI screen	Text	Text	Bildbaustein_1\V 0.0.2\ModuleDevic		
Text	Text	HMI screen	Text	Text	Bildbaustein_1\V 0.0.2\ModuleDevic		
new Text	Text	HMI screen	Text	Text	Bildbaustein_1\V 0.0.2\ModuleDevic		

- Click on the  button in the toolbar to group identical texts together.
- To hide texts that do not have a translation, click on the  button in the toolbar.
- Click on an empty column and enter the translation.

## Result

You have translated individual texts in the "Texts" tab of the faceplate type. The texts will then be displayed in the runtime language.

## Editing the faceplate type

### Introduction

All faceplate types in the project library have a status. You create a faceplate type in the "in progress" status. You can edit the faceplate types as required in this status. When editing is complete, release the faceplate type.

### Requirement

- A faceplate type has been created.
- The faceplate type has the version 0.0.1. and the status "in progress".
- The "Library" task card or the library view is open.

### Enable faceplate type

- Select version 0.01 of the faceplate type in the project library.
- Select "Enable faceplate type" in the shortcut menu.

You have released version 0.0.1 of the faceplate type.

### Edit faceplate type

1. Select, for example, the released version 0.0.1 of a faceplate type in the project library.
2. Select "Edit faceplate type" in the shortcut menu.

The library view opens. The new version 0.0.2 of the faceplate type has been created.

The faceplate type has the "In progress" status.

### Restoring the last version of the faceplate type

The last released version of the faceplate type is version 0.0.2.

Edit the faceplate type. A new version 0.0.3 is created and the "in progress" status is assigned to it.

1. Select the faceplate type from the project library.
2. Select "Discard changes and restore type" in the shortcut menu.

All changes to the faceplate type since the last enabling operation are rejected. The faceplate type is enabled again and has the version 0.0.2.

### See also

Creating a faceplate type (Page 3384)

Example: Configuring a faceplate (Page 3401)

### Duplicating faceplate type

#### Introduction

You can duplicate a released faceplate type and a released version of the faceplate type in the project library.

#### Requirement

- A faceplate type has been created.
- The faceplate type is released and no version of the faceplate type has the "in progress" status.
- The "Libraries" task card or the library view is open.

### Duplicating faceplate type

1. Select a released faceplate type from the project library.
2. Select "Duplicate faceplate type" in the shortcut menu.  
A dialog opens.

3. Enter a name for the new faceplate type.
4. If necessary, add a comment or change the version number.  
The new faceplate type is in the same folder as the original.

### Duplicating a version of a faceplate type

1. Select a released version of a faceplate type in the project library.
2. Select "Duplicate faceplate type" in the shortcut menu.  
A dialog opens.
3. Enter a name for the new faceplate type.
4. If necessary, add a comment or change the version number.  
The new faceplate type is in the same folder as the original.

### See also

Editing the faceplate type (Page 3395)

Creating a faceplate type (Page 3384)

### Resizing a faceplate

#### Introduction

In the faceplate type, specify the response of the faceplate when it is resized.

#### Requirements

- A faceplate type has been created.
- You have opened the "Faceplates" editor.
- The Inspector window is open.

#### Specifying the response to resizing

1. Activate "Properties > Properties > Layout > Fit to size > Auto-size".
2. Select the "Fixed aspect ratio" setting, for example.  
This setting retains the aspect ratio when you resize the faceplate.
3. Click the faceplate in the "Libraries" task card.
4. Select "Release version" in the shortcut menu.

#### Result

You have specified how the faceplate responds when its size in a screen is changed. You can change the response for a particular faceplate.

Select a faceplate in the screen. Select the required setting in "Properties > Properties > Layout > Characteristics" in the Inspector window.

## See also

Creating a faceplate type (Page 3384)

## Creating an instance of the faceplate type

### Introduction

The faceplate type is stored in the project library. If you use the faceplate type in a screen, you create an instance of the faceplate type.

---

#### Note

Note that a faceplate is always configured for a particular class of HMI devices. For example, you cannot use a faceplate type that is configured for "RT Professional" in a screen on an "RT Advanced" HMI device.

---

---

#### Note

The number of faceplate instances per screen is not limited. However, you should be aware of the fact that the number of faceplate instances used, or the use of scripts in the faceplate instances, will have an impact on performance.

---

### Requirement

- A screen is open.
- The "Libraries" task card is opened.
- The project library is open and it contains at least one faceplate type.

---

#### Note

Faceplate types are also stored in global libraries. When you add a faceplate type from the global library to the screen, the system automatically saves a copy of it to the project library.

---

- The Inspector window is open.

## Procedure

1. Move the desired faceplate type from a library to the screen by drag&drop.

## Result

You have created an instance of the faceplate type. The instance is given the version number of the most recently released type.

Configure the properties of the faceplate in the Inspector window as required. To dynamize the faceplate, open the interface in the Inspector window.

## See also

Creating a faceplate type (Page 3384)

Example: Configuring a faceplate (Page 3401)

## Removing faceplate object from faceplate

### Introduction

Cancel application, to remove specified instances from the update of the faceplate type.

### Requirement

- A faceplate type has been created.
- The faceplate must be used in a minimum of one screen.

### Disconnect the faceplate object from faceplate type.

1. Select a faceplate on the screen.
2. In the shortcut menu, select "Disconnect faceplate object from faceplate type".

## Result

The faceplate is independent of the associated faceplate type. Changes to the faceplate type are not updated in the faceplate.

## See also

Creating a faceplate type (Page 3384)

### 10.1.7.5 Dynamizing faceplates

#### Basics of dynamizing faceplates

##### Application

You can dynamically control events and properties of faceplates in two ways:

- **Dynamically controlling faceplates**  
You configure the events or dynamic properties individually for the application point on the faceplate. To do this, define in the "Faceplates" editor that these properties and events are configurable in the faceplate. To dynamize the faceplates in the "Screens" editor, use the scripts and tags that are created in the project.
- **Dynamizing the faceplate type**  
You dynamize the objects which are contained in the faceplate type in the "Faceplates" editor. You configure the individual objects as in the "Screens" editor. Tags and scripts are available in the "Faceplates" editor to dynamize properties and events. You do not have access to the tags and scripts of the project within the faceplate.  
Every faceplate created with the faceplate type has the same preconfigured dynamization. You can edit this dynamic control only in the "Faceplates" editor.

##### Animation

WinCC provides preconfigured dynamic control in the "Animations" task card. You use animations to dynamize faceplates and faceplate types.

##### See also

Basics on faceplates (Page 3379)

Example: Configuring a faceplate (Page 3401)

#### Dynamizing faceplates

##### Introduction

You dynamize a faceplate in exactly the same way as you dynamize an object from the "Tools" task card.

You connect the dynamic properties of the faceplate in the "Screens" editor with a tag or a script which supplies values to the property in runtime.

You Include tags and scripts which you have created in the project for the faceplate.

## Requirement

- A faceplate is inserted in the screen.

## Procedure

1. Select the faceplate.
2. In the Inspector window, open "Properties > Animation".  
The animations available for the selected object are displayed.
3. Select "Horizontal movement" and click the  button.  
The parameters of the animation are displayed.  
A transparent copy of the object is shown in the work area, which is connected to the source object by means of an arrow.
4. Select a tag for control of movement.
5. Move the object copy to the relevant destination. The system automatically enters the pixel values of the final position in the Inspector window.
6. Customize the range of values for the tag as required.

## Result

In Runtime, the object moves in response to every change in value of the tag that is used to control the movement. The direction of movement corresponds to the configured type of movement "horizontal".

### 10.1.7.6 Examples of faceplates

#### Example: Configuring a faceplate

##### Introduction

In this example you create a faceplate in which you can convert the value of a length measuring system from kilometers into meters. The length in meters is displayed in an output field.

##### Procedures overview

The example is divided into the following steps:

1. Creating a faceplate type
2. Configuring a faceplate type
3. Creating a script in the faceplate type
4. Connecting a script with the contained objects of the faceplate type
5. Creating a faceplate and connecting with a tag

### See also

- Basics on faceplates (Page 3379)
- Example: Creating an instance of the faceplate type (Page 3406)
- Example: Configuring included objects (Page 3406)
- Example: Creating a script in the faceplate type (Page 3404)
- Example: Configuring a faceplate type (Page 3403)
- Example: Creating a faceplate type (Page 3402)

### Example: Creating a faceplate type

#### Task

You create a faceplate type.

#### Requirement

- A screen is open.
- The toolbox window is displayed.

#### Settings

For the example you require objects with the following settings:

Object	Object name	Properties
Text field	Label_Meter	Text: Meter
I/O field	Output_Meter	Mode: Output
Button	KM_to_Meter	Text OFF: Convert

#### Procedure

1. In the toolbox, click the individual objects and drag&drop the objects into the screen.
2. Set the properties as shown above.
3. Select all objects.
4. Select the "Create faceplate type" command in the shortcut menu of the multiple selection. The library view opens.
5. In the Inspector window, click "Properties > Properties > Miscellaneous".
6. Enter "KMtoMeter" as the name.

## Result

The faceplate types appears in the project library under the name "KMtoMeter". The faceplate type is assigned the "in progress" status.

## See also

Example: Configuring a faceplate (Page 3401)

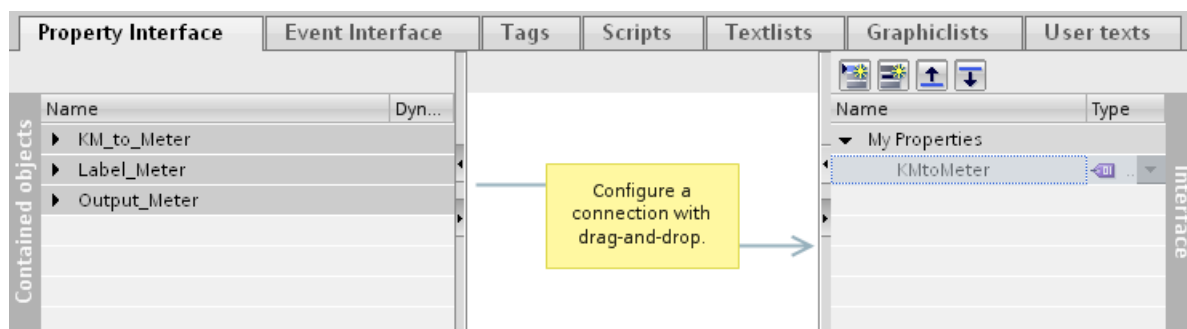

## Example: Configuring a faceplate type

### Job

You create the dynamic property and tag of the faceplate type.

### Creating a new property

1. Click "Properties" in the configuration area of the faceplate.
2. In the "Interface" list, click the  icon "Add property". A new property is added to the "Interface" list.
3. Double click the name of the property and enter "KMToMeter".
4. Click the selection list and select the data type "Int".

### Interim result

The "KMToMeter" property is displayed in the "Interface" list. The symbol identifies the dynamic property. The property will be linked to a tag in the next step.

### Creating a tag in the faceplate type

1. Click "Tags" in the configuration area.
2. Click "Add" in the "HMI tags" table. A new tag is added to the table. The inspector window of the tag is opened.
3. In the Inspector window, select "Properties > Properties > General":
4. Enter "BB\_Tag" as the name. Select the "Int" data type.

## Result

The "KMTtoMeter" property and the "BB\_Tag" of the faceplate type are created in the configuration area of the "Faceplates" editor.

## See also

Example: Configuring a faceplate (Page 3401)

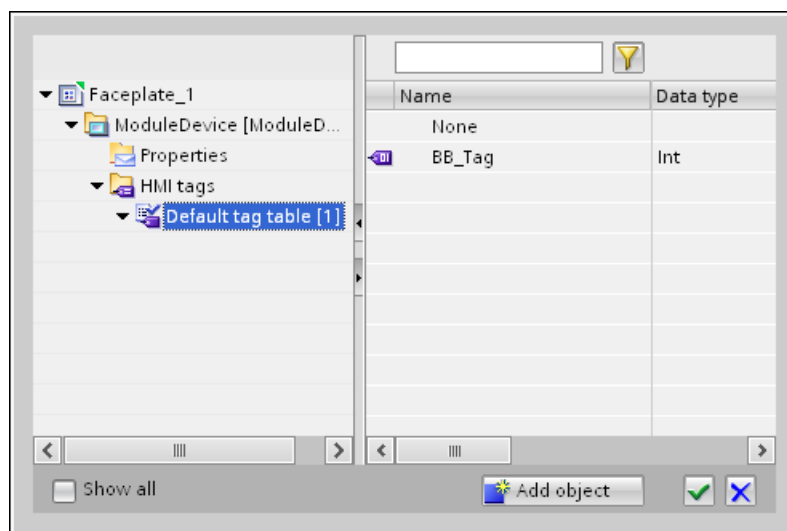

## Example: Creating a script in the faceplate type

## Task

You create a script that converts the value of a length measuring system from kilometers to meters.

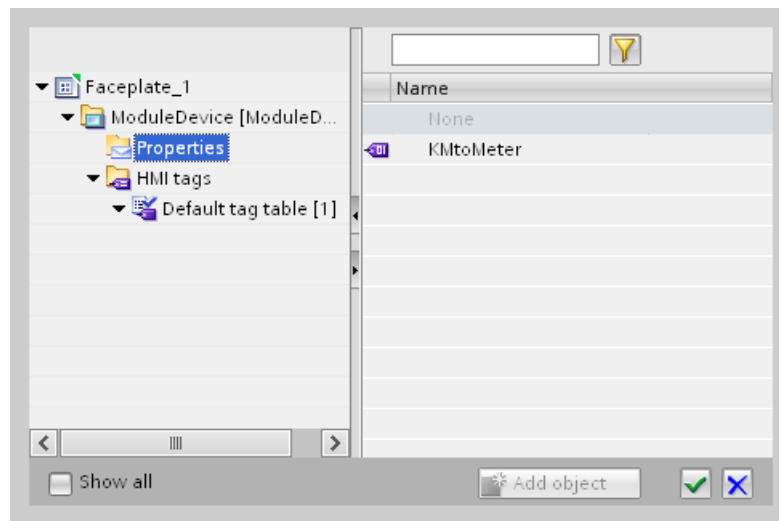

## Procedure

1. Click "Scripts > Faceplate scripts" in the configuration area.
2. Double click "Add VB script".
3. Press the shortcut keys <CTRL+J>. The object list opens.
4. Click "HMI tags". The faceplate tag "BB\_Tag" is displayed in the object list.

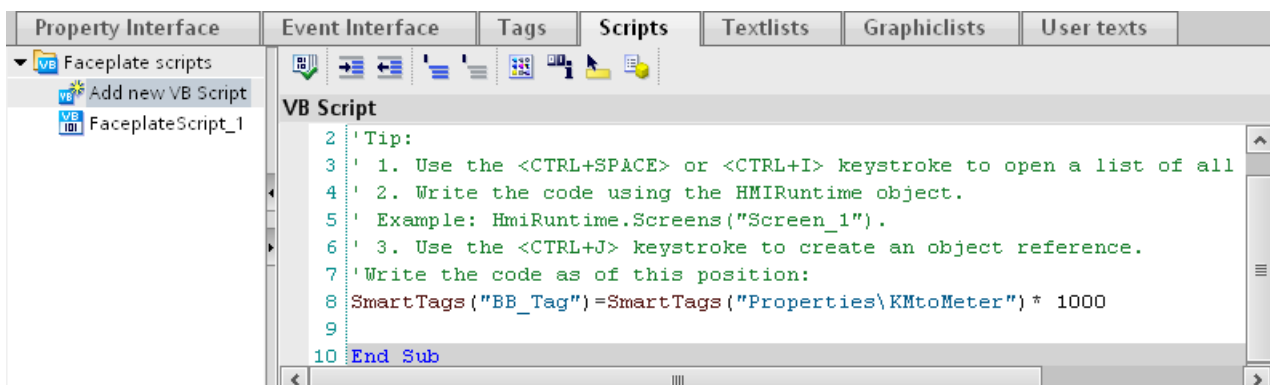

5. Select the faceplate type tag "BB\_Tag". Confirm the selection.
6. Insert an "=" sign.
7. Press the shortcut keys <CTRL+J>. The object list is opened.

8. Click "Properties."  
The dynamic property "KMtoMeter" is displayed in the object list.

9. Select the "KMToMeter" dynamic property. Confirm the selection.
10. Enter `"*1000"` at the end of the code. This corresponds to the conversion factor from kilometers to meters.
11. Enter the name "Script\_1" under "Properties > Properties > General >Setting > Name" in the Inspector window.

## Result

The script has been created in the faceplate type. If you use the "KMtoMeter" faceplate type in a screen, you assign a tag to the "KMtoMeter" property. The value of this tag is multiplied by factor 1000 and assigned to the tag of the faceplate type "BB\_Tag" as a new value. In this way you supply values to the tags of the faceplate type.

## See also

Example: Configuring a faceplate (Page 3401)

## Example: Configuring included objects

### Task

You connect the included objects in the faceplate "KMtoMeter" to a faceplate tag and a faceplate script.

You connect the I/O field with the "BB\_Var" tag of the faceplate type. You connect the "Click" event for a button to the script "Script\_1".

### Requirement

The faceplate is displayed in the "Faceplates" editor.

### Interconnecting I/O field with a tag

1. Select the "Output\_Meter" I/O field in the faceplate.
2. Connect the I/O field with the faceplate tag "BB\_Tag" in the "General > Process > Tag" inspector window.

### Connecting an event to a faceplate script

1. Select the "KM\_to\_Meter" button in the faceplate.
2. Select "Script\_1" in the inspector window under "Events > Click".

### Result

The I/O field is connected with the tag of the faceplate type. The button is connected with the script of the faceplate type.

If you click the button of the faceplate during runtime, the script is executed. The value of the tag of the faceplate is output in the I/O field.

### See also

Example: Configuring a faceplate (Page 3401)

## Example: Creating an instance of the faceplate type

### Task

You insert the faceplate type "KMtoMeter" in a screen and assign a tag to the dynamic property "KMtoMeter".

## Requirement

- The "Screens" editor is open.
- A new screen has been created.

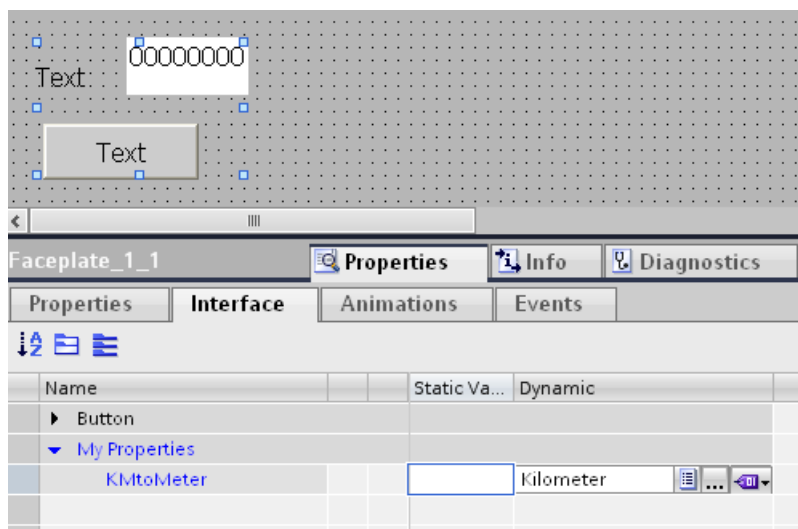

## Settings

For the example you require a tag with the following settings:

Name	PLC connection	Type
Kilometer	No	ULong

## Procedure

1. Create the HMI tag "Kilometer" with the settings named above.
2. Open the "project library" in the "Libraries" task card.
3. Move the "KMtoMeter" faceplate type into the screen by drag&drop.
4. Click "Properties > Properties > Interface" in the Inspector window. The table shows all the properties which you can dynamize in the faceplate.

5. Click the "Dynamization" column in the "KMtoMeter" line.
6. Select "HMI tag".
7. Click the "..." button.
8. Select the tag "Kilometer" from the object list.
9. Confirm the selection.

## Result

The dynamic property "KMtoMeter" is linked with the "Kilometer" tag. During runtime the dynamic property is supplied with values of the "Kilometer" tag. The values are multiplied by

factor 1000 in the script of the faceplate type and assigned to the tag in the faceplate as a new value.

### 10.1.8.2 Object

#### Bar

#### Application

is displayed graphically using the "Bar" object. The bar graph can be labeled with values.

## Layout

In the Inspector window, you customize the settings for the position, shape, style, color, and font types of the object. You can adapt the following properties in particular:

- Color transition: Specifies the change in color display when limit values are exceeded.
- Displaying the limit lines / limit markers: Shows the configured limit as a line or marker.
- Define bar segments: Defines the gradations on the bar scale.
- Define scale gradation: Defines the subdivisions, scale markings and intervals of a bar scale.

## Color transition

You define how the color change is represented in "Properties > Properties > Appearance" in the Inspector window.

Color transition	Description
"Segmented"	If a particular limit was reached, the bar changes color segment by segment. With segment by segment representation, you visualize, for example, which limits are exceeded by the displayed value.
"Entire bar"	If a particular limit was reached, the entire bar changes color.

## Displaying limit lines and limit markers

You display the configured limit in the bar as a line or marking in Runtime using the "Lines" and "Markings" property:

1. In the Inspector window, select "Properties > Properties > Appearance":
2. Activate "Lines" and "Markings".

## Define bar segments

Use the "Subdivisions" property to define the number of segments into which the bar is divided by the main gradations on the scale.

Use the "Interval" property to divide the distance between the main gradations. The value appears as the difference in value between two adjacent main gradations:

1. In the Inspector window, select "Properties > Properties > Scales":
2. Activate "Show scale."
3. Select the corresponding value for "Settings > Subdivisions".
4. Select the corresponding value for "Settings > Marks label".
5. Select the corresponding value for "Large interval > Interval".

## See also

Device-Specific Nature of the Objects (Page 3408)

## User view

## Application

The "User view" object is used to set up and administer users and authorizations. The user view is used, for example, to create new users in runtime and assign them to a user group.

---

**Note**

Configure only one user view at a time in one screen on the HMI devices TP 177A 6", TP 177A 6" (Portrait), OP 73 and OP 77A. Otherwise, a corresponding error message appears during generation.

---

### Complex user view

The complex or simple user view is available for administration of users and authorizations depending on the HMI devices.

A table with four columns: User, Password, Group, and Logoff time. The Password column is highlighted in blue. Below the table is a large empty rectangular area.

User	Password	Group	Logoff time

### Simple user view

A table with two columns: Administrator and Administrator group. The first row is highlighted in blue. Below the table is a large empty rectangular area.

Administrator	Administrator group
Meister	Group_2
Operator_1	Operator
PLC User	Unauthorized
<New user >	

Proceed as follows to configure the appropriate user view:

1. Click "Properties > Properties > Layout > Mode" in the inspector window.
2. Select "Simple" or "Complex".

### Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Number of lines: Specifies the maximum number of visible entries.
- Columns moveable: Specifies whether the operator can change the sequence of columns in Runtime.

## Number of lines

The number of lines in the user view displayed in Runtime is specified in the Inspector window. The setting for the number of lines is only effective if "Fit object to contents" is active.

1. Click "Properties > Properties > View" in the Inspector window.
2. Enter an integer value under "Number of lines".
3. In the Inspector window, select "Properties > Properties > Layout".
4. Activate "Fit object to contents."

## Columns moveable

The operator can change the sequence of columns in Runtime with the "Columns moveable" property.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Activate "Columns moveable".

This option is only available at the complex user view.

## Date/time field

### Use

The "Date/time field" object shows the system time and the system date. The appearance of the "Date/time field" depends on the language set on the HMI device.

12/31/2000 10:59:59 AM

### Layout

In the Inspector window, you customize the position, style, colors and font types of the object. You can adapt the following properties in particular:

- Display system time: Specifies that the system time is displayed.
- Include tag: Specifies that the time of the connected tag is displayed.
- Long date/time format: This setting defines the format displayed for the data and time.

## Display system time

The time displayed in the "Date/time field" on the HMI device is specified in the inspector window.

1. In the Inspector window, select "Properties > Properties > General".
2. Activate "Format > System time".

## Using tags

The time of the interconnected tag is displayed in the date/time field.

1. In the Inspector window, select "Properties > Properties > General".
2. In the "Format" area, select a tag with the "DateTime" data type, e.g. an internal tag.

## Long date/time format

Visualization of the date and time is specified in the "Format" area under "General" in the inspector window.

Option	Description
"Enabled"	Date and time are displayed in full, e.g. "Sunday, December 31, 2000 10:59:59 AM"
"Disabled"	Date and time are displayed in short form, e.g. "12/31/2000 10:59:59 AM"

## See also

Device-Specific Nature of the Objects (Page 3408)

Example: 2. Configuring a Date/time field (Page 5233)

## I/O field

## Application

The "I/O field" object is used to enter and display process values.

## Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- **Mode:** Specifies the response of the object in Runtime.
- **Display format:** Specifies the display format in the I/O field for input and output of values.
- **Hidden input:** Specifies whether the input value is displayed normally or encrypted during input.

---

### Note

#### Reports

In reports, I/O fields only output data. "Output" mode is preset. Properties for configuring input are not available, e.g. "hidden input".

---

## Mode

The response of the I/O field is specified in the Inspector window in "Properties > Properties > General > Type".

Mode	Description
"Input"	Values can only be input into the I/O field in runtime.
"Input/output"	Values can be input and output in the I/O field in runtime.
"Output"	The I/O field is used for the output of values only.

## Layout

The "display format" for the input and output of values is specified in "Properties > Properties > General > Format" in the Inspector window.

Layout	
"Binary"	Input and output of values in binary form
"Date"	Input and output of date information. The format depends on the language setting on the HMI device.
"Date/time"	Input and output of date and time information. The format depends on the language setting on the HMI device.
"Decimal"	Input and output of values in decimal form
"Hexadecimal"	Input and output of values in hexadecimal form
"Time"	Input and output of times. The format depends on the language setting on the HMI device.
"Character string"	Input and output of character strings.

---

**Note****Data formats**

Not all data formats are available for selection for Runtime Professional.

---

## Hidden input

In Runtime the input can be displayed normally or encrypted, for example for hidden input of a password. A "\*" is displayed for every character during hidden input. The data format of the value entered cannot be recognized.

1. In the Inspector window, select "Properties > Properties > Response":
2. Activate "Hidden input".

## Avoid overlaps in output fields

If several I/O fields are configured as output fields with a transparent background in a screen, these I/O fields may overlap. The transparent part of the one field covers the digits of the other field. This may cause display problems in Runtime. In order to avoid such overlaps, set the margins of the I/O fields to zero in the object properties under "Properties > Properties > Appearance". Activate "Properties > Properties > Layout > Fit object to contents."

## Limits

Under "Properties > Properties > Limits" in the Inspector window, set the colors for the values that violate the high or low limits.

You define the limits via the properties of a tag.

In Runtime Professional, you can also define the limit range for the entry in the I/O field via "Properties > Properties > Limits".

## See also

Using multiple tags simultaneously in a screen (Page 3512)

Device-Specific Nature of the Objects (Page 3408)

## Ellipse

### Application

The "Ellipse" is an enclosed object that can be filled with a color or pattern.

## Layout

In the Inspector window you can customize the settings for the object position, geometry, style, frame and color. You can adapt the following properties in particular:

- Horizontal radius: Specifies the horizontal radius of the elliptical object.
- Vertical radius: Specifies the vertical radius of the elliptical object.

### Horizontal radius

The horizontal radius of the "Ellipse" object is specified in the Inspector window. The value is entered in pixels.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter a value between 0 and 2500 under "Horizontal."

### Vertical radius

The vertical radius of the "Ellipse" object is specified in the Inspector window. The value is entered in pixels.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter a value between 0 and 2500 at "Vertical."

Flipping objects (Page 3281)

## f(x) trend view

### Application

You use the "f(x) trend view" object to represent the values of a tag as a function of another tag. This means that you can present temperature trends as a function of the pressure, for example. You can also compare the trend to a setpoint trend.

### Layout

In the Inspector window, you customize the position, shape, style, colors and font types of the object. You can adapt the following properties in particular:

- Adding and configuring trends
- Configuring a diagram
- Window settings
- Persistence
- Toolbar

### Configuring trends

You create and configure trends in the Inspector window "Properties > Properties > Properties > Trend".

1. Select the data supply for the trend in the "Data source" column.
  - "Log tag": The trend window is supplied with values from a data log.
  - "Tags": The trend view is supplied with current values from the PLC. The values are constantly updated.
2. Configure the area of the trend display under "Data area".
  - "Time span": You define the time range using a starting time and a following time span.
  - "End time": You define the time range using a starting time and an end time.
  - "Measuring points": You define the time range using a starting time and a number of measuring points.
3. Configure the value range of the trend display under "X axis" and "Y axis".
4. Under "Limits", configure the colored marking of specific values, .e.g.. high and low limit, uncertain status.

### Configuring a diagram

Configure the display of several trends under "Properties > Properties > Appearance":

- Common diagram or separate diagrams
- Common or separate axes
- Writing direction of all trends

### Toolbar

The control elements of the f(x) trend display are defined in the "Properties > Properties > Toolbar" inspector window. The following control elements are available for the f(x) trend view:

Button	Name	Function
	Zoom +/-	Increases or decreases the size of the trends in the trend window. Increase the size of the trends by left-clicking with the mouse. Hold down <Shift> and left-click to decrease the size of the trends.
	Zoom area	Increases the size of any section of the trend window. Specify an area in the trend window by using the mouse. This area of the trend window is enlarged.
	Zoom X axis	Increases or decreases the size of the X axis in the trend window. Enlarge the X axis by left-clicking with the mouse. Hold down <Shift> and left-click to decrease the size of the X axis.
	Zoom Y axis	Increases or decreases the size of the Y axis in the trend window. Enlarge the Y axis by left-clicking with the mouse. Hold down <Shift> and left-click to decrease the size of the Y axis.
	Trend area	Shift the trends in the trend window along the X axis and Y axis by using this button.

Button	Name	Function
	Axis area	Shift the trends in the trend window along the value axis by using this button.
	Original view	Switches from the magnified trend view back to the normal view
	Start/stop	Stops and starts the trend update. The values are buffered and updated as soon as you start trend update again.
	Ruler	Determines the coordination of a point of the trend.

The order of the buttons is fixed. The operator can set up individual key assignments, and shortcuts for every button on the toolbar.

### See also

Bar (Page 3417)

Device-Specific Nature of the Objects (Page 3408)

Trend view (Page 3436)

### Graphic view

### Application

The "Graphic view" object is used to display graphics.

### Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Graphic: Specifies the graphic file that is displayed in the object.
- Stretch graphic: Specifies the automatic size stretching for objects with graphics.
- Transparent color: Specify whether or not the transparent color is used for the graphic.

## Inserting graphics

The following graphic format is used in the "Graphic view" object: \*.bmp, \*.tif, \*.png, \*.ico, \*.emf, \*.wmf, \*.gif, \*.jpg or \*.jpeg. You may also use graphics as OLE objects in the Graphic view .

1. In the Inspector window, select "Properties > Properties > General":
2. Select the graphic that you wish to insert.  
The graphic preview is shown in the right pane.
3. Click "Apply" to insert the graphic in the Graphic view .

## Stretch graphic

Whether a graphic displayed in a Graphic view is stretched to the size of the Graphic view in runtime is specified in the Inspector window.

1. Click "Properties > Properties > Layout" in the inspector window.
2. Select the required size adjustment for the graphic.

## Transparent color

This property defines whether the transparent color is used for the graphic to be displayed.

1. Click "Properties > Properties > Appearance" in the inspector window:
2. Activate "Background > Transparent".
3. Select a transparent color.

---

### Note

When using bitmaps in WinCC screens the "Transparent color" setting demands a high character performance in the layout on the panel. Visualization performance is enhanced by disabling the "Transparent" setting in the properties of the relevant display object. This restriction applies in particular when bitmaps are used as background image.

---

### Note

#### Basic Panels

The "Transparent" property is not available for Basic Panels.

---

## See also

Device-Specific Nature of the Objects (Page 3408)

Options for Editing Objects (Page 3269)

Storing an external image in the graphics library. (Page 3303)

## Graphic I/O field

### Application

The "Graphic I/O field" object can be used to configure a list for display and selection of graphic files.

### Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Mode: Specifies the response of the object in Runtime.
- Scroll bar type: Specifies the graphic layout of the scroll bar.

---

#### Note

##### Basic Panels

The scroll bar is not available for Basic Panels.

---

#### Note

##### Reports

Graphic I/O fields output exclusively graphics in reports. "Output" mode is preset. Properties for configuring the selection of graphics are not available, e.g. "scroll bar".

---

### Mode

The response of the "Graphic I/O field" object is specified under "Properties > Properties > General > Type > Mode" in the Inspector window.

Mode	Description
"Input"	The "Graphic I/O field" object is only used to select graphics.
"Input/output"	The "Graphic I/O field" object is used to select and display graphics.
"Output"	The "Graphic I/O field" object is used to display graphics only.
"Two states"	The "Graphic I/O field" object is only used to display graphics and can have a maximum of two states. You use no graphics list but insert one graphic each for the "ON" and "OFF" state.

### Stretch graphic

Whether a graphic displayed in a graphic I/O field is stretched to the size of the view in runtime is specified in the Inspector window.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Select the required size adjustment for the graphic.

### Scroll bar type

The response for the graphic representation of the scroll bar is specified under "Properties > Properties > Appearance > Scroll Bar > Type" in the Inspector window.

Type	Description
"Permanent"	The scroll bar is always visible.
"No scrollbar"	The scroll bar is not visible.
"Visible after clicking"	The scroll bar is made visible by a mouse click.

### See also

Device-Specific Nature of the Objects (Page 3408)

Symbolic I/O field (Page 3474)

### Handwheel

#### Application

The object "Handwheel" is a control element for some SIMATIC Mobile Panels. You can enter incremental values in Runtime using the "HandWheel" object.

## Layout

You can set the following property in the Inspector window:

- Tag: Specifies the tags to which the "HandWheel" object is linked.

## Tag

### Global assignment

The "Tag" property is specified in the template for the global assignment of the "HandWheel" object. There is only one template for each HMI device.

1. In the Inspector window, select "Properties > Properties > General":
2. Select a tag from the selection list under "Settings > Tag".

### Local assignment

The "HandWheel" object is assigned to another tag. To do so you configure a function that assigns the tag to the handwheel in Runtime.

Example for configuration to a button:

1. Open the screen in which the "HandWheel" object is assigned to another tag.
2. Drag the "Button" object from the toolbox to the screen. Select the button on your screen.
3. Click "Properties > Events > Click" in the Inspector window.
4. The "Function list" dialog box opens. Click the first line of the function list. The list of system functions and scripts available in the project appears.
5. Select the system function "SetTagToHandWheel" from the "Other functions" group. Select a tag from the combo box at "Value".

---

#### Note

The Mobile Panel may ignore the change of the value in the PLC made at another location while the handwheel is being operated. The value in the PLC is overwritten again.

---

## See also

Device-Specific Nature of the Objects (Page 3408)

Illuminated pushbutton (Page 3439)

## Help indicator

### Application

The object "help indicator" is available for the HMI devices OP 73 and KP300 Basic. If a tooltip exists for the selected object, the help indicator is displayed during runtime. If a tooltip was configured for the opened screen, the help indicator always remains visible.

You configure the object "help indicator" exclusively in the global screen.

### Layout

You can adapt the following properties in the Inspector window:

- Position: Determines the position of the object "Help indicator."

### Position

You can use this property to set the position of the object "Help indicator."

1. Select the object "Help indicator" in the template.
2. In the Inspector window, select "Properties > Properties > Layout".
3. Enter a value for X and Y. You can also use the cursor keys to position the selected object.

If you have configured a screen object at this position, the visible help indicator covers the screen object. The help indicator is covered only by incoming system alarms and dialogs.

### See also

Device-Specific Nature of the Objects (Page 3408)

## HTML browser

### Application

The "HTML Browser" object is designed for the visualization of simple HTML pages. This function allows you to draw up machine-specific descriptions which are stored centrally and which can then be displayed from different HMI devices.

---

### Note

Changing the functionality of the HTML Browser to that of a file explorer by one of the following methods, for example, is not authorized in the context of WinCC:

- Entering a folder or drive, for example "\" or "C:" or
- Connecting to an FTP server, for example "ftp://"

One reason this function is not implemented is to prevent inadvertent changes to files, their deletion or execution.

When configuring, ensure that the operator can only enter valid Internet addresses, for example, by using symbolic I/O fields. Configure a password-protected input for service purposes.

---

### Layout

Customize the object position and size in the Inspector window. In particular, you can customize the following property:

- URL: Specifies which Internet address is opened in the HTML Browser.

### Address

The internet address is specified in "Properties > Properties > General >URL" in the Inspector window.

## Basic procedure

1. Create an internal tag of the "String" data type, for example InternetAddress, in the "Tag" editor.
2. Insert the "HTML Browser" object in the screen in the "Screens" editor.
3. In the Inspector window, select "Properties > Properties > General".
4. At "Tag for the URL", select the "InternetAddress" tag from the selection list.
5. Insert an I/O field in the screen in the "Screens" editor.
6. Select "Properties > Properties > General > Tag for URL" in the Inspector window and then select the "InternetAddress" tag at "URL tag" from the selection list.

The HTML Browser opens the relevant page after the operator has entered an address.

## Control elements

Control elements are configured buttons in the process screen or softkeys on the HMI device.

The "HTML Browser" object does not have its own operator control components. Assign the system functions used to control the "HTML Browser" object to your configured control elements, such as buttons.

1. For example, drag the "Button" object to the screen from the toolbox.
2. Input a text of any length or select a graphic, for example Update.
3. In the Inspector window, select "Properties > Events > Click".  
The "Function list" dialog box is opened.
4. The system functions for controlling the "HTML Browser" object can be found in the list of system functions in the "Keyboard online operation for screen objects".  
Select a function from the list, for example, HTMLBrowserRefreshName.
5. Select the object name of the HTML Browser in which the command will be executed from the "Screen object" list.

## Comments

The functional scope of the HTML Browser is limited in comparison to the Internet Explorer:

- The HTML Browser will only show pure HTML pages. VBScript, Java, JavaScript, Flash and ActiveX controls are not supported. Set up the HTML pages for display in the HTML Browser by using a text editor or using a simple HTML editor.
- Links to embedded files, for example \*.pdf or \*.xls, are not supported.
- Queries and dialogs that are conducted during the access of, for example protected pages are not supported. When accessing protected pages enter your user name and password in the URL: <http://User\_Name:Password@Server\_Name> (for example, "http://Administrator:Admin123@192.168.0.199").

## Circle

### Application

The "Circle" object is a closed object which can be filled with a color or pattern.

### Layout

In the Inspector window you can customize the settings for the object position, geometry, style, frame and color. You can adapt the following properties in particular:

- Radius: Specifies the size of the circle.

### Radius

The radius of the "Circle" object is specified in the Inspector window. The value is entered in pixels.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter a value between 0 and 2500 in the "Radius" area.

### See also

Device-Specific Nature of the Objects (Page 3408)

## Trend view

### Application

The trend view is meant for the graphical representation of tag values from the current process or from a log in form of trends.

### Layout

In the Inspector window, you customize the position, geometry, style, color, and font types of the object. You can adapt the following properties in particular:

- Display value table, ruler and grid: Specifies whether a value table, a ruler or a grid is displayed in addition to the coordinate system to improve legibility.
- Toolbars: Defines the display of the control elements.

### Display value table, ruler and grid

For improved legibility a value table, a ruler and a grid can be displayed in Runtime.

1. Activate "Properties > Properties > Appearance > Show ruler".
2. Activate "Properties > Properties > Table > Show table".
3. Activate "Properties > Properties > Table > Show grid".

## Toolbars

The layout of the control elements is defined in the "Properties > Properties > Toolbar" inspector window.

### Note

#### Basic Panels

As archiving is not possible for Basic Panels, the control elements are not available.

Toolbar button	Brief description	Description
	"Go to start"	Scrolls back to the beginning of the trend recording. The start values with which the trend recording started are displayed.
	"Zoom in"	Zooms out of the displayed time section
	"Zoom out"	Zooms into the displayed time section.
	"Ruler backward"	Moves the ruler back.
	"Ruler forward"	Moves the ruler forward.
	"Backward"	Scrolls back one display width.
	"Forward"	Scrolls forward one display width.
	"Ruler"	Shows or hides the ruler. The ruler displays the X-value associated with a Y-value.
	"Start/stop"	Stops trend recording or continues trend recording.

## Configuration behavior

### Displaying column headers

The layout of the table in the trend view depends on the view settings in the Control Panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Appearance" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

### Consistency test

If warnings or errors are displayed in the output window during a consistency check in connection with trend views, clicking "Go to Error/Tag" on the shortcut menu will not always take you to the exact error position. In some cases only the trend view is shown as cause of error.

### Adding, configuring, and removing trends

The trends of the trend view are managed in the Inspector window under "Properties > Properties > Trend". You can copy trends between different trend views.

### See also

- Device-Specific Nature of the Objects (Page 3408)
- Configuring trend displays for values from the PLC (Page 3572)
- Trends (Page 3569)
- Outputting tag values in screens (Page 3571)
- Configuring trend display for values from the PLC (Basic) (Page 3568)

### Charging status

#### Application

The object "Charging condition" is a control element for some SIMATIC Mobile Panels. The "Charging condition" object indicates the charging status of the battery. Charge the battery in good time. Alternatively, you can replace the battery with a spare battery.

#### Layout

Symbol	Description	Charging condition
	Battery is charged	>20 %
	Battery must be charged	<20 % and >6 %
	Battery is weak	< 6 %

#### Operation

The object is for display only and cannot be controlled by the operator.

- Effective range name (RFID) (Page 3486)
- Effective range signal (Page 3487)
- WLAN reception (Page 3489)

Zone name (Page 3492)

Zone signal (Page 3493)

## Illuminated pushbutton

### Application

The object "Illuminated pushbutton" is a control element for some SIMATIC Mobile Panels. The LEDs can be activated by the PLC. The illuminated LED signals the operator in Runtime that the illuminated pushbutton has to be pressed. The illuminated pushbutton is configured in the global screen.

### Layout

You can adapt the following properties in the Inspector window:

- Tag: Specifies the tag in which the status of the illuminated pushbutton is written.
- LED assignment: Specifies the assignment of the LED to the bit in the LED tag.

## Tag

The "Tag" property is used to specify the global assignment of the "Illuminated pushbutton" object in the global screen.

### Note

#### Information for configuring

The current status of the illuminated pushbutton is written to the tag when Runtime is started and whenever the button is pressed. This may cause inconsistencies between the status of the illuminated pushbutton and the illuminated pushbutton tags.

1. If the tag has a connection to the PLC, the current value is transferred from the PLC to the tag after establishment of communication. The tag that contains the current status of the key is overwritten by this process. The illuminated pushbutton tag may therefore no longer reflect the current value of the illuminated pushbutton, for example if the Mobile Panel is switched off while the illuminated pushbutton is pressed.
2. If the illuminated pushbutton is pushed before communication to the PLC could be established (for example after a device start-up), it may not be possible to send the value of the illuminated pushbutton tag to the PLC. In this case the value of the tag in the PLC is different from the current status of the key.

Carry out the following configuration steps so that the illuminated pushbutton always reflects the actual state.

## Basic procedure

1. Specify the connection to the PLC in the "Connections" editor. Activate the "Coordination" area pointer to ensure that the life bit is available to the PLC side.

Parameter		Area pointer					
Active	Display name	PLC tag	Access mode	Address	Length	Acquisition mode	Acquisition cycle
<input checked="" type="checkbox"/>	Coordination	<undefined>	<absolute access>	%DB1.DBW0	1	Cyclic continuous	<Undefined>
<input type="checkbox"/>	Date/time	<undefined>	<symbolic access>		6	Cyclic continuous	<Undefined>
<input type="checkbox"/>	Job mailbox	<undefined>	<symbolic access>		4	Cyclic continuous	<Undefined>
<input type="checkbox"/>	Data record	<undefined>	<symbolic access>		5	Cyclic continuous	<Undefined>

  

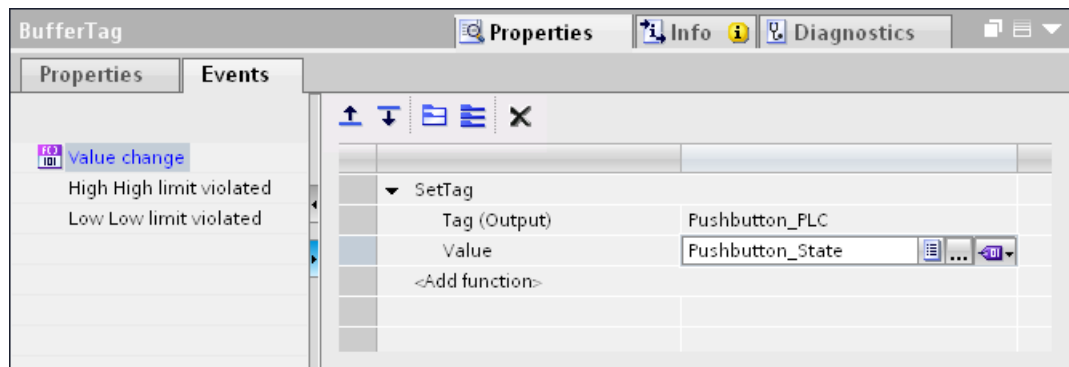

Global area pointer of HMI device							
Connection	Display name	PLC tag	Access mode	Address	Length	Acquisition mode	Acquisition cycle
<Undefined>	Project ID	<undefined>	<symbolic access>		1	Cyclic continuous	<Undefined>
<Undefined>	Screen number	<undefined>	<symbolic access>		5	Cyclic continuous	<Undefined>
<Undefined>	Date/time PLC	<undefined>	<symbolic access>		6	Cyclic continuous	<Undefined>

2. Open the "HMI tags" editor and create three tags.
  - Internal tag: Pushbutton\_State
  - External tag: BufferTag
  - External tag: Pushbutton\_PLC

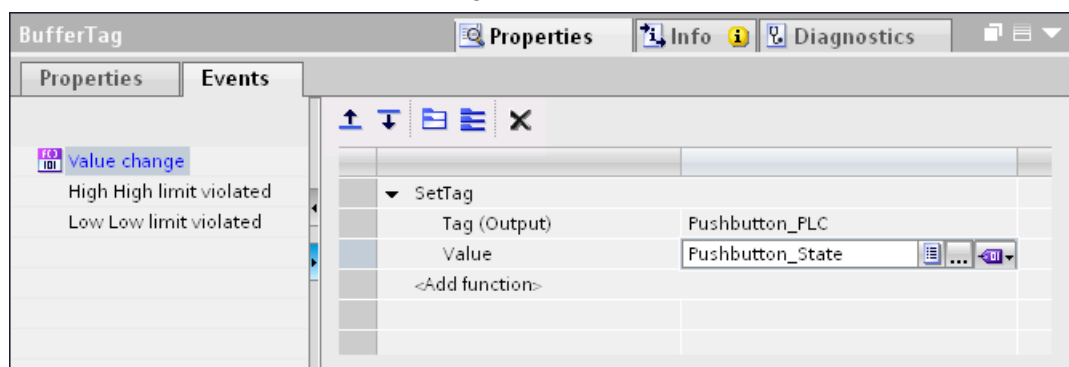

3. Open the Inspector window of the "Pushbutton\_State" tag.
4. In the Inspector window, select "Properties > Events > Value change". Click the first line of the function list. The list opens, showing the system functions available in the project.
5. Select the "SetTag" system function.
  - Select the "Pushbutton\_PLC" tag at "Tag (output)".
  - Select the "Pushbutton\_State" tag at "Value".

The value of the "Pushbutton\_PLC" tag is written to the PLC with the "Pushbutton\_PLC" tag. A program in the PLC evaluates the life bit. If communication is established, the current value is written to the "Pushbutton\_PLC" tag from the PLC. The "BufferTag" is required to transfer the current position of the pushbutton to the PLC.

6. Open the Inspector window of the "BufferTag" tag.
7. In the Inspector window, select "Properties > Events > Value change".
8. Click the first line of the function list. The list opens, showing the system functions available in the project.
9. Select the "SetTag" system function.
  - Select the "Pushbutton\_PLC" tag at "Tag (output)".
  - Select the "Pushbutton\_State" tag at "Value".

After establishing communication the current value is written to the "BufferTag" from the PLC. The "SetTag" system function is executed by the value change in the auxiliary tag. The system function re-allocates the value of the "Pushbutton\_State" tag to the "Pushbutton\_PLC" tag.

10. Open the global screen in the "Screen navigation" editor.
11. Select the illuminated key on the global screen.
12. Select the tag "Pushbutton\_State" in "Properties > Properties > General > Settings > Tag" in the Inspector window.  
If you press the illuminated pushbutton, the value is written to the "Pushbutton\_PL" tag.

### LED assignment

To actuate the LED an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration. The LED tag is specified at "LED tag" in the "Settings" area in the "General" group. With "LED bit" the allocated bit is given. When the bit is set the following states of the LED can be realized in runtime.

Bit n+1	Bit n	LED function
0	0	Off
0	1	Fast flash
1	0	Slow flash
1	1	On permanently

Device-Specific Nature of the Objects (Page 3408)

Handwheel (Page 3430)

### Line

#### Application

The "Line" object is an open object. The line length and gradient slope are defined by the height and width of the rectangle enclosing the object.

### Layout

In the Inspector window, you customize the settings for the object position, shape, style, and color. You can adapt the following properties in particular:

- Line style
- Line start and end

## Line style

The representation of the line is specified under "Properties > Properties > Appearance" in the Inspector window. The line is shown without interruption if you select "Solid", for example.

---

### Note

The line styles available depend on the selected HMI device.

---

## Line start and end

The start and end points of the line are specified under "Properties > Properties > Appearance > Line ends" in the Inspector window.

Use arrow point, for example, as start and end point. The available start and end points depend on the device.

## See also

Device-Specific Nature of the Objects (Page 3408)

## Media Player

### Application

The Media Player is used in Runtime to play back video or audio files.

The Media Player is only available for the following devices:

- MP 377
- Comfort Panels

## Layout

You can set the following properties in the Inspector window:

- Display status bar: Determines whether to display the status bar.
- Display control elements: specifies the control elements during runtime.
- Show seek: establishes, whether a slider is available for the operation.

## Control elements

The control elements that can be used to control the Media Player in Runtime are specified in the Inspector window under "Properties > Properties > Appearance > Elements".

## Supported file formats

The following audio formats are supported by Media Player:

- Moving Picture Experts Group standard 1, Layer 1,2, 3 (.mpa, .mp2, .mp3)
- Windows Media Audio (.wma)
- Waveform Audio (.wav)

The following video formats are supported by Media Player:

- Moving Picture Experts Group standard 1 (.mpg, .mpeg, .mpv, .mpe)
- Advanced Streaming Format (.asf)
- Windows Media Video Format (.wmv)
- Audio-Video Interleaved (.avi)

---

### Note

Media Player does not support the creation and management of favorites. If you create favorites before closing the Media Player, they will not reappear when you open it again.

---

## See also

Device-Specific Nature of the Objects (Page 3408)

## Alarm view

### Use

Alarms are indicated in the Alarm view or in the Alarm window of the HMI device. The following screen contains an alarm view with no content:

No.	Time	Date	Status	Text
-----	------	------	--------	------

## Alarm view

The following figure shows an alarm view:

## Alarm line

The alarm line allows display of the most current pending alarm in Runtime. The following figure shows an alarm line:

How to configure the alarm line:

1. In the Inspector window, select "Properties > Properties > Layout".
2. Select "Mode > Alarm line".

## Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object.

---

### Note

The fonts available for selection depend on the "Language and fonts" you have configured in the device settings and the fonts your HMI device supports.

---

You can adapt the following properties in particular:

- Control elements: Defines the operator controls of the alarm view.
- Alarm classes: This setting defines which alarm classes are displayed in the alarm view.
- Columns: Specifies the displayed columns in Runtime.
- Sequence of columns: Specifies whether the sequence of columns can be changed in Runtime.
- Identification of alarm classes: To be able to distinguish various alarm classes, they are identified in the first column of the alarm view.
- Filter: Defines that only alarms that contain a specific character string will be displayed in the alarm text.
- Enable sorting: Specifies whether the alarms can be sorted in runtime by date and time.
- Defining display area This setting specifies from which date on alarms are displayed in the alarm view.

---

### Note

If you have different alarm classes output, these will be initially sorted into alarm classes in runtime, and then by when the alarm occurred.

---

## Control elements

The control elements that can be used to control the alarm view in Runtime are specified in the Inspector window under "Properties > Properties > Display > Settings". The following table shows the control elements in the alarm view, and what they do:

Button		Function
"Tooltip"		Displays a tooltip for an alarm.
"Acknowledge"		Acknowledges an alarm.
"Loop-In-Alarm"		If a screen change is configured, the display switches to a screen containing information about the alarm.

### Select alarm classes

1. Click "Properties > Properties > General" in the Inspector window.
2. Under "Alarm classes" activate the alarm classes to be displayed in the alarm view in Runtime .

### Access protection in Runtime

Configure access protection in the "Properties > Security" group in the properties of the alarm view. If a logged-on user has the required authorization, he can acknowledge and edit alarms using the operator controls in the alarm view. If the logged-in user does not have the required authorization, or if no user is logged in, pressing the "Acknowledge" or "Edit" buttons or double-clicking an alarm line opens the login dialog.

### Define columns

Define the columns to be displayed in the alarm view in Runtime in the Inspector window.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Activate the columns that are to be displayed in Runtime under "Columns".

### Sequence of columns

If this property is enabled, the column sequence in the alarm view can be changed in Runtime.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Activate "Column properties > Column order".

### Enable sorting

If this property is enabled, the alarms displayed in the alarm view in Runtime can be sorted by date and time.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Activate "Column properties > Sorting by date/time possible".

### Filtering alarms

This property is used to define that only alarms that contain a configured string will be displayed in the alarm text in runtime for the extended alarm view.

1. In the Inspector window, select "Properties > Properties > Filter".
2. Enter the required term for filtering in the field "Filter string".  
Alternatively, you configure a filter tag using the field "Filter tag". The contents of the filter tag serve as the filter criterion in runtime.

## Identify alarm classes

An icon is displayed in the first column of the alarm view. This symbol allows the alarm to be allocated to an alarm class.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Activate "Columns > Alarm class".
3. Open the "Alarms" editor, and click the "Alarm Classes" tab.
4. Specify an icon for use to identify the alarms of this alarm class for an alarm class in the "Display name" column.

---

### Note

The "alarm view" object cannot be grouped.

---

## Defining display area

You select a tag which defines the time from which alarms should be displayed. The following data types are permitted:

- External tags: Date, Date\_and\_Time, Time\_of\_Day
- Internal Tags: DateTime

To define the display area, proceed as follows:

1. Click "Properties > Properties > Display" in the Inspector window.
2. Define the tag in which the time is specified under "Control tag for the display area".

## Configuration behavior

### Displaying column headers

The layout of the alarm view is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Layout tab" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

## Displaying the buttons for operation

The alarm view in the HMI devices OP 73, OP 77A and TP 177A has a button which displays the alarm text in a separate window. This button is not shown during configuration.

The display of the buttons for using the alarm view depends on the configured size. You should check on the HMI device whether all necessary buttons are available.

## See also

- Device-Specific Nature of the Objects (Page 3408)
- Alarm window (Page 3449)
- Alarm indicator (Page 3451)
- Configuring an alarm view for active alarms (Page 3618)

## Alarm window

### Use

Alarms are indicated in the Alarm view or in the Alarm window of the HMI device. The layout and operation of the Alarm window are similar to that of the Alarm view. The Alarm window has the following characteristics that are the same as in the Alarm view:

- Alarm window
- Alarm line: The alarm line is not available on Basic Panels.

The Alarm window is configured in the "Global screen" editor.

The alarm window is not assigned to any screen. Depending on the configuration the alarm window is opened when an alarm that belongs to a specific alarm class is active. Depending on the configuration, it is not closed until the alarm is acknowledged.

---

### Note

In the engineering system you dynamize, for example, the visibility of an object in "Properties > Animations" in the Inspector window. In runtime, the "Simple alarm window" object does not support animations. If you have configured an animation and, for example, wish to perform a consistency check of the project, then an error alarm is issued in the Output window.

---

## Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You configure the Alarm window in the same way as the Alarm view. In addition you adapt the following properties:

- Fixed alarm window: Specifies that the Alarm window retains the focus after a screen change.
- Window: You define the operator input and response of the Alarm window in runtime.

---

### Note

If you have different alarm classes output, these will be initially sorted into alarm classes in runtime, and then by when the alarm occurred.

---

## Operator controls

The control elements that can be used to control the alarm view in runtime are specified in the Inspector window under "Properties > Display > Settings". The following table shows the control elements in the Alarm window, and what they do:

Button		Function
"Tooltip"		Displays a tooltip for an alarm.
"Acknowledge"		Acknowledges an alarm.
"Loop-In-Alarm"		If a screen change is configured, the display switches to a screen containing information about the alarm.

## Access protection in Runtime

Configure access protection under "Properties > Properties > Security" in the Inspector window of the alarm view. If a logged-on user has the required authorization, he can acknowledge and edit alarms using the operator controls in the alarm view. If the logged-in user does not have the required authorization, or if no user is logged in, clicking the "Acknowledge" or "Edit" buttons or double-clicking an alarm line opens the login dialog box.

---

### Note

#### Basic Panels

Access protection is not available for Basic Panels.

---

## Activating the focus of the Alarm window

Select the following option so that the Alarm window does not lose the focus after a screen change:

1. In the Inspector window, select "Properties > Properties > Mode".
2. Enable "Label".

## Window

Define the response of the Alarm window under "Properties > Properties > Mode > Window" in the Inspector window. The following table shows the possible properties:

Option	Function
Automatic display	The Alarm window is automatically displayed when a system alarm occurs, for example.
Closable	The window closes again after a set time has elapsed. You define the display duration in the alarm settings.
Modal	The Alarm window is linked to a confirmation, such as: Alarm must be acknowledged. If the modal alarm window has the focus, the buttons in the screen behind it cannot be used. The functions configured on a function key are carried out.
Sizeable	You can change the size of the Alarm window in runtime.

Device-Specific Nature of the Objects (Page 3408)

Alarm view (Page 3445)

Alarm indicator (Page 3451)

Configuring an alarm window (Page 3623)

## Alarm indicator

### Application

The alarm indicator is a graphic symbol that shows current errors or errors that need to be acknowledged, depending on the configuration. The alarm indicator is configured in the "Global screen" editor. The following figure shows an alarm indicator:

## Alarm indicator OP 73

A "simple" alarm indicator is available for the HMI OP 73. The following diagram shows the alarm indicator for the OP 73 HMI devices:

The "simple" alarm indicator shows alarms to be acknowledged or alarms which have already been acknowledged and have not yet gone. Only the position can be defined for the "simple" alarm indicator. The alarm indicator is displayed on the device at the selected position. If you have configured a screen object at this position, the visible alarm indicator covers the screen object. The alarm indicator is covered by system dialogs, such as the login dialog, Help dialog, and alarm windows.

## Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Alarm classes: Establishes the alarm classes where the alarm indicator is displayed.
- Operator control in Runtime: Defines the operator actions in Runtime that cause the Alarm window to open.

## Alarm classes

You define which alarm classes are shown with an alarm indicator in "General > Alarm classes" in the Inspector window. Alarm classes, such as "Warnings" or "Errors".

## Define operator control in Runtime

1. Select the alarm indicator in the screen.
2. Click "Events > Click" or "Click when flashing" in the Inspector window.
3. The "function list" opens. Click the first line of the function list. The list of system functions, and scripts available in the project opens.
4. Select the "ShowAlarmWindow". system function under "Alarms."
5. Under "object name" select the name of the Alarm window from the selection list. Under "Layout", define whether the Alarm window should be visible, hidden, or should toggle between the two states.

## See also

Alarm window (Page 3449)

Configuring an alarm indicator (Page 3624)

## Polygon

### Application

The "Polygon" is a closed object which you can fill with a background color.

### Layout

In the Inspector window, you customize the settings for the object position, shape, style, and color. In particular, you can customize the following property:

Geometry: Modifies, deletes or adds corners.

### Geometry

The corner points are numbered in the order of their creation. You can change, delete, or add more corner points:

1. In the Inspector window, select "Properties > Properties > Layout".
2. Select the required corner point in the "Geometry" area. Input a value at "X position " and "Y position ".
3. To add a corner point, click the  button.
4. To delete a corner point, click the  button.

### Alternative procedure

You can also change, delete, or add new corner points using the mouse:

1. Select the object. Position the mouse cursor on the desired corner. The mouse cursor changes to a crosshair.
2. Drag the corner to the desired position while holding down the mouse button.
3. Right-click the position at which you want to insert the corner point. Select "Add point" from the shortcut menu.

### Configuring Rotation in runtime

You configure the "Polygon" object so that it rotates about a reference point in runtime. The rotation in runtime is only possible for devices with Runtime Professional.

Enter the values for the angle of rotation using Degrees as the unit.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter values for the following attributes in the "Rotation" area.
  - X
  - Y
  - Angle

### See also

Device-Specific Nature of the Objects (Page 3408)

Polyline (Page 3454)

### Polyline

#### Application

The "Polyline" is an open object. Use the "Polygon" object if you want to fill the object with color.

### Layout

In the Inspector window, you customize the settings for the object position, shape, style, and color. You can adapt the following properties in particular:

- Line start and end: Specifies the type of line start and line end.
- Geometry: Modifies, deletes or adds corners.

### Line start and end

You define the start point and the end point of the line under "Properties > Properties > Appearance" in the Inspector window. Use arrow point, for example, as start and end point. The available start and end points depend on the device.

## Geometry

The corner points are numbered in the order of their creation. You can change, delete, or add more corner points:

1. In the Inspector window, select "Properties > Properties > Layout".
2. Select the required corner point in the "Geometry" area. Input a value at "X position" and "Y position".
3. To add a corner point, click the  button.
4. To delete a corner point, click the  button.

## Alternative procedure

You can also change, delete, or add new corner points using the mouse:

1. Select the object. Position the mouse cursor on the desired corner. The mouse cursor changes to a crosshair.
2. Drag the corner to the desired position while holding down the mouse button.

## Configuring rotation in Runtime

You configure the "Polyline" object so that it rotates about a reference point in Runtime. The rotation in Runtime is only possible for devices with Runtime Professional.

Enter the values for the angle of rotation using Degrees as the unit.

1. Click "Layout" in the Inspector window.
2. Enter values for the following attributes in the "Rotation" area.
  - X
  - Y
  - Angle

Further information can be found in "Device-Specific Nature of the Objects (Page 3408)".

## See also

Polygon (Page 3453)

## Rectangle

## Application

The "Rectangle" is a closed object which you can fill with a color.

## Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- **Corner radius:** Specifies the horizontal and vertical distance between the corner of the rectangle and the start point of a rounded corner.

## Corner radius

The corners of the "Rectangle" object can be rounded to suit your requirements. When the properties "X" and "Y" are set to the 100 % value, the rectangle is displayed as an ellipse. As soon as one of the properties has the value 0%, a normal rectangle without a rounded corner is shown.

1. Click "Properties > Properties > Layout" in the inspector window.
2. Enter a value for "X" in the "Corner radius" area.  
The input value is the percentage proportion of half the width of the rectangle.
3. Enter a value for "Y" in the "Corner radius" area.  
The input value is the percentage proportion of half the height of the rectangle.

Rotating objects (Page 3279)

Flipping objects (Page 3281)

## Recipe view

### Application

The "Recipe view" object is used to display and modify recipes.

Entry Name	Value

### Advanced recipe view

Both the advanced and the "Simple recipe view" can be used to administer and process recipes on HMI devices with a display larger than 6".

Configuring the advanced recipe view:

1. Click "Properties > Properties > General" in the Inspector window.
2. Activate "Format > Advanced view" in the "Display type" area.

### Simple recipe view

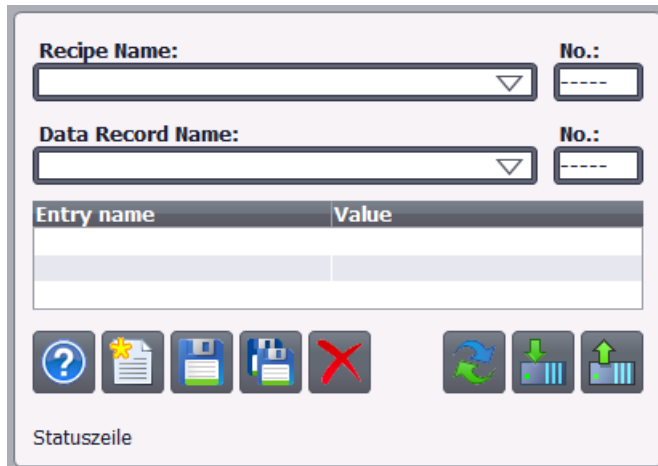

The "Simple recipe view" is used for display and processing of recipes on HMI devices with a display size less than 6".

---

#### Note

Do not use the simple recipe view in a group.

---

Configuring the simple recipe view:

1. In the Inspector window, select "Properties > Properties > General".
2. Activate ""Display type" > Basic view".

**Note**

**Behavior for Runtime Professional, Runtime Advanced and Panels**

In the Engineering System you can dynamically control the visibility of an object, for example, in the "Animations" tab of the Inspector window. In Runtime, the "Simple recipe view" does not support animations. If you have configured an animation and, for example, want to check the consistency of the project, an error alarm is displayed in the Output window.

**Layout**

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Control elements: Defines the control elements of the recipe view.
- Display number: establishes if the number of the recipe and the number of the recipe data record is displayed.

**Control elements**

The control elements with which the recipe view is operated in runtime are configured under "Properties > Buttons" in the inspector window. In the simple recipe view the operating elements are based on the functions of the menu.

Control element		Description
	"Tooltip"	Calls up the configured tooltip for the selected recipe.
	"New record"	Creates a new recipe data record in the recipe.
	"Delete record"	Deletes the selected record.

Control element		Description
	"Saving"	Saves the modified record with its current name.
	"Save as"	Saves the modified record with a new name.
	"Write to PLC"	Sends the current value to the PLC.
	"Read from PLC"	Reads the current value from the PLC.
	"Synchronizing recipe tags"	Compares the values of the selected record with the values on the PLC.

## Display number

Specifies whether the number of the recipe and the number of the recipe data record are displayed during runtime. The number of the recipe uniquely identifies the recipe in the project.

1. Click "Properties > Properties > View" in the Inspector window.
2. Activate "Display > Display numbers".

## Configuration behavior

### Displaying column headers

The layout of the recipe view is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Appearance" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

Simple recipe view (Page 3739)

Advanced recipe view (Page 3744)

Display of recipes (Page 3727)

Configuring the Advanced Recipe View (Page 3762)

## Recipe view

### Application

The "Recipe view" object is used to display and modify recipes.

### Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- **Toolbar:** Specifies the menu commands of the recipe view.

### Toolbar

The menu items with which the recipe view is operated in Runtime are configured under "Properties > Properties > Toolbar" in the Inspector window.

Menu command	Description
"Tooltip"	Calls up the configured tooltip for the selected recipe.
"New record"	Creates a new recipe record in the recipe.
"Delete record"	Deletes the selected record.
"Saving"	Saves the modified record with its current name.
"Save as"	Saves the modified record with a new name.
"Write to PLC"	Sends the current value to the PLC.
"Read from PLC"	Reads the current value from the PLC.
"Rename"	Specifies that the "Rename" button is shown.
"Forward"	Specifies that the menu buttons are visible.
"Back"	Specifies that the "Back" button is shown.

### See also

Objects for Basic Panels (Page 3408)

## Switch

### Application

The "Switch" object is used to configure a switch that is used to switch between two predefined states in runtime. The current state of the "Switch" object can be visualized with either a label or a graphic.

The following figure shows a "Switch" type switch.

### Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. In particular, you can customize the following property:

- Type: Defines the graphic representation of the object.

### Type

Button visualization is specified at "Properties > Properties > General >Type" in the Inspector window.

Type	Description
"Switch"	The two states of the "Switch" are displayed in the form of a switch. The position of the switch indicates the current state. The state is changed in runtime by sliding the switch. You specify the direction of movement of the switch in "Switch orientation" with this type.
"Switch with text"	The switch is shown as a button. The current state is visualized with a label. In runtime click on the button to actuate the switch.
"Switch with graphic"	The switch is shown as a button. The current state is visualized with a graphic. In runtime click on the button to actuate the switch.

#### Note

##### Basic Panels

The "Switch" type is not available for Basic Panels.

### See also

Device-Specific Nature of the Objects (Page 3408)

Overview of objects (Page 3266)

## Button

### Application

The "Button" object allows you to configure an object that the operator can use in runtime to execute any configurable function.

### Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Mode: Defines the graphic representation of the object.
- Text / Graphic: Defines whether the Graphic view is static or dynamic.
- Define hotkey: Defines a key, or shortcut that the operator can use to actuate the button.

---

#### Note

You can only define a hotkey for HMI devices with keys.

---

### Mode

The button display is defined in "Properties > Properties > General > Mode" in the Inspector window.

Mode	Description
"Invisible"	The button is not visible in runtime.
"Text"	The button is displayed with text. This text explains the function of the button.
"Graphic"	The button is displayed with a graphic. This graphics represents the function of the button.

Depending on the device, further options are available.

### Text / Graphic

The "Mode" property settings are used to define whether the display is static or dynamic. The display is defined in "Properties > Properties > General > Text" or "Graphic" in the Inspector window.

You can, for example, select the following options for the "Graphic" or "Text" type.

Type	Option	Description
"Graphic"	"Graphic"	Use "Graphic when button is "not pressed"" to specify a graphic displayed in the button for the "OFF" state. Use "Graphic when button is "pressed"" to specify a graphic for the "ON" state.
	"Graphics list"	The graphic in the button depends on the state. The corresponding entry from the graphics list is displayed depending on the state.
"Text"	"Text"	Use "Text when button is "not pressed"" to specify the text displayed in the button for the "OFF" state. Use "Text when button is "pressed"" to specify text for the "ON" state.
	"Text list"	The text in the button depends on the state. The entry from the text list corresponding to the state is displayed.

## Define hotkey

In the Inspector window, a key or key combination is defined that the operator can use to control the button in runtime.

1. In the Inspector window, select "Properties > Properties > General".
2. Select a key or key combination from the selection list in the "Hotkey" area.

## See also

Example: Configuring a button for language switching (Page 3359)

Example: Configuring a button with logon dialog box (Page 3858)

Example: Configuring a button with access protection (Page 3863)

## Slider

## Application

Process values are monitored and adapted within a defined range with the "Slider" object. The monitored range is visualized in the form of a slider. By adjusting the slider, you intervene in the process and correct the displayed process value.

---

### Note

Do not configure a system function at the "Change" event for a regulated project if it is used to execute a GMP-relevant action.

Instead configure the system functions at the "Value change" event of the tags in order to reduce the number of user actions.

---

## Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can, in particular, adapt the following properties as required:

- Maximum Value and Minimum Value: Specifies the top and bottom values of the scale.
- Display current value: Specifies whether the current position of the controller appears below the slider.
- Display of bars: The sliders above and below the bar can be hidden.

## Maximum Value and Minimum Value

The top and bottom end values of the scale are specified in the Inspector window.

1. In the Inspector window, activate "Properties > Properties > General".
2. Enter a number at "Maximum value" and "Minimum value". If you select a tag as the end value of the scale, the number will be no longer available.

## Display current value

Specify that the value of the current position is displayed below the slider in the Inspector window.

1. In the Inspector window, activate "Properties > Properties > Layout".
2. Activate "Show current value."

## Display bar

The bar can be hidden.

1. In the Inspector window, activate "Properties > Properties > Layout".
2. Deactivate "Display bar".

## See also

Device-Specific Nature of the Objects (Page 3408)

## KeySwitch

### Application

The object "KeySwitch" is an optional control element for the SIMATIC Mobile Panel. The key switch is used to lock functions that can be triggered from the Mobile Panel.

You configure the object "key switch" object in the "global screen" or in a template.

### Layout

You can set the following properties in the Properties view:

- Tag: Specifies the tag in which the position of the key switch is written.

### Tag

The "Tag" property is used to specify the "Key switch" object assignment in the global screen or template.

---

#### Note

##### Notes on configuring

When starting runtime and every time the key is pressed the current position of the key switch is written to the tag. In doing so it can cause inconsistencies between the position of the key switch and the key switch tags.

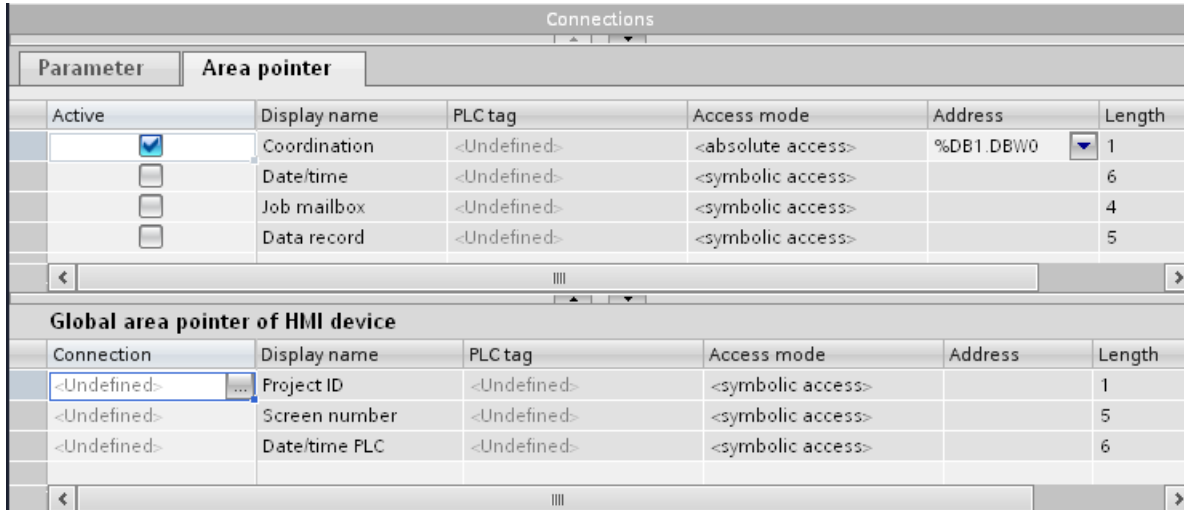

1. If the tag has a process connection, the current value is transferred from the PLC to the tag after establishment of communication. The tag that contains the current position of the key is overwritten by this process. It can be that the key switch tag no longer reflects the current value of the key switch, e.g. if the Mobile Panel is switched off while the key is being turned.
2. If the key switch is pressed before communication with the PLC has been established (e.g. after a device start-up), it may not be possible to send the value of the key switch tag to the PLC. In this case the value of the tag in the PLC is different from the current position of the key.

A specific configuration is required to make sure that the key switch tag reflects the actual position of the key switch at all times. See the instructions below for the basic procedure.

---

**Basic procedure**

1. Specify the connection to the PLC in the "Connections" editor. Activate the "Coordination" area pointer to ensure that the life bit is available to the PLC side.

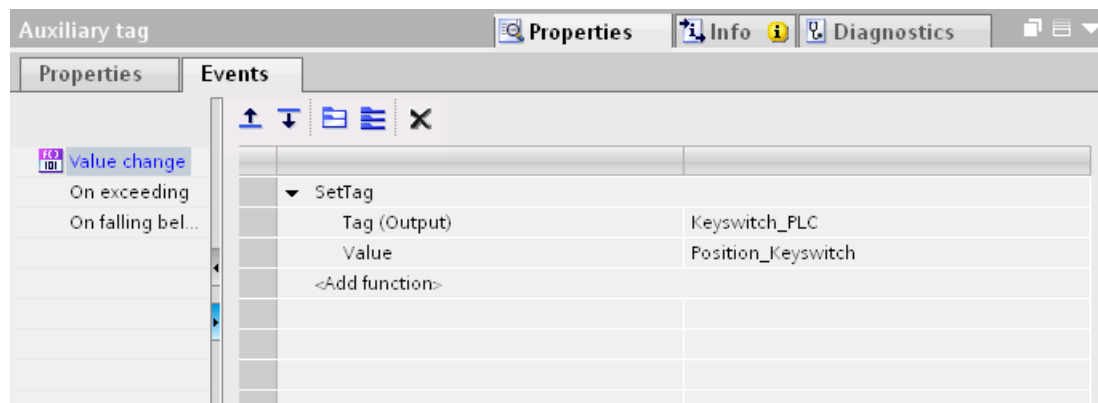

2. Create three tags in the "Tag" editor.
  - Internal tag: Position\_Keyswitch
  - External tag: Auxiliary tag
  - External tag: Keyswitch\_PLC
3. Open the Inspector window of the "Position\_KeySwitch" tag.
4. In the Inspector window, select "Properties > Events > Value change".
5. Click the first line of the function list. The list of system functions available in the project appears.
6. Select the "SetTag" system function.
  - Select the "Keyswitch\_PLC" tag at "Tag (output)".
  - Select the "Position\_Keyswitch" tag at "Value".

The value of the "Keyswitch\_PLC" tag is written to the PLC with the "Position\_Keyswitch" tag. A program in the PLC evaluates the life bit. If communication is established, the current value is written to the "Keyswitch\_PLC" tag from the PLC.

7. Open the Inspector window of the "Auxiliary tag" tags.
8. In the Inspector window, select "Properties > Events > Value change".
9. Click the first line of the function list. The list of system functions available in the project appears.
10. Select the "SetTag" system function.
  - Select the "Keyswitch\_PLC" tag at "Tag (output)".
  - Select the "Position\_Keyswitch" tag at "Value".

After establishing communication the current value is written to the "Auxiliary Tag" from the PLC. The "SetTag" system function is executed by the value change in the auxiliary tags. The system function re-allocates the value of the "Position\_Keyswitch" tag to the "Keyswitch\_PLC".

11. Open the global screen or a template in the "Screen navigation" editor.
12. Select the key switch in the screen.
13. Select the "Position\_KeySwitch" tag in the Inspector window under "Properties > Properties > General > Settings > Tag".
  - If you press the illuminated pushbutton, the value is written to the "Position\_KeySwitch" tag.

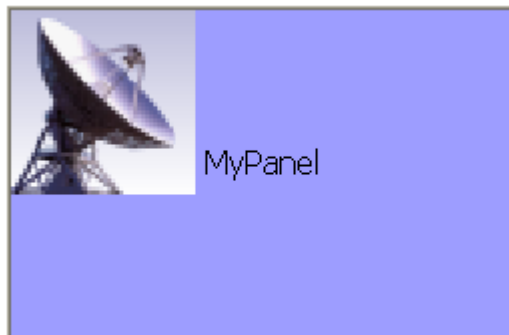

## See also

Field of application of the Mobile Panel Wireless (Page 5188)

## Sm@rtClient view

### Application

The "Sm@rtClient View" object is used to configure a network connection to the remote monitoring and remote maintenance of a connected unit.

### Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- **Connect on start:** Establishes whether when opening the Sm@rtClient view the connection to the HMI device is automatically created which should be remote-controlled.
- **Shared use\_** Specifies that an HMI device is shared by several Sm@rtClient Views.
- **Local cursor:** Specifies whether the cursor data is transferred separately in order to increase the performance.
- **Use cursor key scroll:** For keyboard devices places the control of the horizontal and vertical scroll with the cursor keys.
- **Show controls:** Establishes whether additional fields exist for entering the address and password.
- **Allow menu:** Specifies whether the shortcut menu is enabled to control the Sm@rtClient view.
- **Connection type:** Establishes the expected transfer speed for the remote monitoring.
- **Scaling:** Specifies whether the Sm@rtClient view can be zoomed in or out.

### Connect on start

Establishes whether when opening the Sm@rtClient view the connection to the HMI device is automatically created which is remote-controlled.

1. In the Inspector window, select "Properties > Properties > General".
2. Activate "View > Connect on start".

## Shared use

Define whether the HMI device can be used by several Sm@rtClient views under "Properties > Properties > General > View > Shared".

Shared use	
Enabled	HMI devices on which remote control is activated can access the remote HMI device and control the process. Only one HMI device can be active at a time in this case. A different HMI device can only assume control when there has been no activity on the active HMI device for a specified period of time.
Disabled	<p>Only one HMI device can use the remote control at any given time. The activities can be followed on the other HMI devices.</p> <p>Depending on the settings on the Sm@rtServer the following options are available if another HMI device logs on:</p> <ul style="list-style-type: none"> <li>• The HMI device is rejected.</li> <li>• The active HMI device is disconnected and the new HMI device is connected.</li> </ul>

## Local cursor

If this property is set, then the cursor data is transferred separately.

1. In the Inspector window, select "Properties > Properties > General".
2. Activate "View > Local cursor".

## Display extended objects

If this property is set then there are additional fields for inputting the address and password. For the fields to be shown the "Connect on start" option is not activated.

1. In the Inspector window, select "Properties > Properties > General".
2. Activate "View > Show enhanced objects".

## Allow menu

If this property is set, then a shortcut menu to control the Sm@rtClient view is opened in runtime.

When operating using the mouse, the left mouse key must remain depressed for a few seconds for the shortcut menu to open.

1. In the Inspector window, select "Properties > Properties > General".
2. Activate "View > Allow Menu".

## Connection type

The "Connection type" property establishes the expected transfer speed for the remote monitoring.

Set the connection type at "Connection type" under "Properties > Properties > General > Connection type" in the Inspector window.

Connection type	
LAN	Connection via network
Slow	Connection with a low transfer speed
Medium	Connection with a medium transfer speed
Modem	Connection via an analog modem
Very slow	Connection with a very low transfer speed

### Scaling

If this property is set, then via "Client scale factor" and "Server scale" you can reduce or enlarge the Sm@rtClient view on the HMI device.

1. In the Inspector window, select "Properties > Properties > Scaling".
2. Activate "Scaling > Scaling".
3. Enter the values for the scaling under "Client scale factor" and "Server scale factor".

### Operation behavior

If the program cannot resolve the dynamic address of a Sm@rtClient view after a screen change, the system connects to the configured server using the static address of the server. If a tag is now set using the dynamic address, you can make a second connection to this server. As a remedy preset the tags of the dynamic address for example by means of a script.

### See also

Device-Specific Nature of the Objects (Page 3408)

### Status/Force

### Application

The "Status/Force" object is used to configure an editor that will allow you to process single address areas of a SIMATIC S7 in runtime.

Connection	Type	DB No.	Width	Bit	Specifies the data type	Format	Status value	Con

### Note

The "Status/Force" object is enabled for the following controllers:

- SIMATIC S7-300
- SIMATIC S7-400

## Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- PLC type: Specifies the PLC type in the object for which the address area is output in runtime.
- Control elements: Specifies the controls of the object.
- Visible columns: Specifies the displayed columns in runtime.
- Columns moveable: Specifies whether the operator can change the sequence of columns in runtime.

## Control elements

Set the control elements that you can use to control the "Status/Force" object in runtime at "Properties > Properties > Display" in the "Settings" area of the Inspector window.

	Function
	This button refreshes the display in the status value column.
	Use this button to accept the new value in the control value column. The control value is then written to the PLC.

## Visible columns

The columns that are displayed in runtime are specified in the Inspector window in the "General" group in the "Visible columns" area.

Column	Description
"Connection"	The PLC of which the address areas are displayed.
"Type" "DB number" "Offset" "Bit"	The address area of the operand.
"Data type" "Format"	The data type of the operand.
"Status value"	The value that was read from the specified address of the operand.
"Control value"	The value written to the specified address of the operand.

## Sequence of columns

The operator can use the "Column ordering" property to change the sequence of columns in runtime.

1. Select "Properties > Properties > Columns" in the Inspector window.
2. Activate "Properties of columns > Sequence of columns".

## Display of the column headers and buttons

The layout of the "Status/Force" object is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Appearance" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style. This behavior only occurs during configuration. The column headers are displayed correctly in runtime.

If you change the layout, for example from "Windows Classic" to "Windows XP Style", the button in the "Status/Force" object may no longer be displayed. Change the size of the object to make the buttons in the engineering system visible again.

## See also

Device-Specific Nature of the Objects (Page 3408)

## Symbol library

### Application

The "Symbol library" object contains a large collection of ready-to-use icons. These icons are used to represent systems and plant areas in screens.

## Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Select icon: Specifies which library object will be used.
- Fill style: Specifies the graphic design of the object.
- Flip: Specifies the flip type of the library object.

- Rotate: Specifies the angle around which the library object is rotated.
- Fixed aspect ratio Defines whether the aspect ratio is maintained if the size is changed.

## Select symbol

Select the icon at "Properties > Properties > General" in the Inspector window.

## Fill style

Specify the design of the library object at "Properties > Properties > Appearance > Style" in the Inspector window.

- |   |            |  |
|---|------------|--|
| 1 | "Hollow"   | The library object is displayed in outline.  |
| 2 | "Solid"    | Black lines remain as outlines. Elements of the icon with a different color are displayed as a main color.                 |
| 3 | "Original" | The screen object will not be changed.   |
| 4 | "Shaded"   | Black lines remain as outlines. Elements of the symbol in other colors are displayed as brightness levels of a main color. |

At the TP 177B mono and OP 177B mono HMI devices the library object is displayed as an outline. "Hollow" is set as the default value for the fill style.

If you change the setting from "hollow" to "original" or "shaded" then the color of the display on the configuration computer will deviate from that on the HMI device. This deviation is caused by the different color resolutions. You may also use a graphic object from the "Graphics" object group. The graphic objects are structured by topic and by depth of color in the "WinCC graphics folder."

## Flip and rotate

The content of the screen flips around the horizontal or vertical central axis of the icon. The icon can be flipped horizontally, vertically or simultaneously horizontally and vertically.

The screen content rotates around the central point of the icon. The symbol is rotated clockwise in increments of 90, 180, or 270 degrees.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Select the mirroring mode at "Orientation > Mirror image".
3. Select the angle of rotation at "Orientation > Rotate".

## Fixed aspect ratio

The smaller page of the library object defines the maximum size of the symbol. If you change the size of the library object unproportionally, the symbol is still scaled proportionally. Proceed as follows to configure a fixed aspect ratio:

1. In the Inspector window, select "Properties > Properties > Layout".
2. Activate "Form > Fixed aspect ratio".

## See also

Device-Specific Nature of the Objects (Page 3408)

## Symbolic I/O field

### Application

The "Symbolic I/O field" object can be used to configure a selection list for input and output of texts in runtime.

### Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Mode: Specifies the response of the object in runtime.
- Text list: Specifies the text list that is linked to the object.
- Button for selection list: Specifies that the object has a button to open the selection list.

---

#### Note

#### Reports

In reports, symbolic I/O fields only output data. "Output" mode is preset. Properties for configuring the selection of graphics are not available, e.g. "button for selection list".

---

### Mode

The response of the symbolic I/O field is specified in the Inspector window in "Properties > Properties > General > Type".

Mode	Description
"Output"	The symbolic I/O field is used to output values.
"Input"	The symbolic I/O field is used to input values.

Mode	Description
"Input/output"	The symbolic I/O field is used for the input and output of values.
"Two states"	The symbolic I/O field is used only to output values and has a maximum of two states. The field switches between two predefined texts. This is used, for example, to visualize the two states of a valve: closed or open.

---

**Note**

The behavior possible for the symbolic I/O field depends on the Runtime.

---

**Text list**

In the Inspector window, you specify which text list is linked to the symbolic I/O field.

1. In the Inspector window, select "Properties > Properties > General".
2. Under "Contents" open the selection list for "Text list".
3. Select a text list.

**Button for selection list**

The "Button for selection list" property is used to display a button for opening the selection list.

1. Select "Properties > Properties > Layout" in the Inspector window.
2. Activate "Response > Button for selection list".

---

**Note****Basic Panels**

The "Button for selection list" option is not available for Basic Panels.

---

**System diagnostics view****Introduction**

The system diagnostics view offers you an overview of all the available devices in your plant. You navigate directly to the cause of the error and to the relevant device. You have access to all diagnostics-capable devices which you have configured in the "Devices & networks" editor.

## Use

The system diagnostics view enables you to achieve the maximum level of detail of the diagnostics data. A precise diagnosis is possible, as all the available data is displayed. You have the system status of the entire plant at one glance.

Three different views are available in the system diagnostics view.

- Device view
- Diagnostic buffer view
- Detail view

## Device view

The device view of the system diagnostics view shows all the available connections in tabular form. Double-clicking a connection opens the detail view. The device view is only displayed if more than one connection has been created in the "Devices & Networks" editor.

## Diagnostic buffer view

In the diagnostic buffer view, the current data from the diagnostic buffer is displayed.

## Detail view

The detail view shows detailed information on the selected connection. You cannot sort error texts in the detail view. The detail view is only available if there is an integrated connection to an S7 1200 or S7 1500.

## Layout

You change the settings for the position, geometry, style, color, and font of the object in the Inspector window. You can adapt the following properties in particular:

- Lines per entry: Specifies the number of lines that are shown for an entry.

## Configuring the system diagnostics view

1. Drag-and-drop the system diagnostics view from the toolbox.
2. In the Inspector window, select "Properties > Layout".

3. Enter a number under "Lines per entry", i.e. 5.
4. Select an authorization for operation in "Properties > Properties > Security".

System diagnostics display (Page 3477)

## System diagnostics display

### Introduction

The system diagnostics view offers you an overview of all the available devices in your plant. You navigate directly to the cause of the error and to the relevant device. You have access to all diagnostics-capable devices which you have configured in the "Devices & networks" editor.

### Use

The system diagnostics view enables you to achieve the maximum level of detail of the diagnostics data. A precise diagnosis is possible, as all the available data is displayed. You have the system status of the entire plant at one glance.

Status	Name	Operatin Slot	Type

Three different views are available in the system diagnostics view.

- Device view
- Detail view
- Diagnostic buffer view
- Matrix view (only for master systems, PROFIBUS)

## Layout

You change the settings for the position, geometry, style, color, and font of the object in the Inspector window. You can adapt the following properties in particular:

- Columns: Defines the elements of the device view and detail view.
- Show split view: Specifies that the device view and the detail view are shown simultaneously.

## Configuring the system diagnostics view

1. Drag-and-drop the system diagnostics view from the toolbox.
2. In the Inspector window, select "Properties > Properties > Columns".
3. Select the columns that you require in the device view for Runtime, e.g., Operating mode, Name, Slot.
4. Select the columns which you need in the detail view for runtime, e.g., Operating mode, Name, Address.
5. Select the columns that you require in the diagnostic buffer view, e.g., Status, Name, Rack.
6. Customize the column headers, if necessary.
7. Enter "IP" for "Address", for example.  
The column header "IP" is displayed in the device view in runtime.
8. Rename other elements if necessary.
9. Select an authorization for operation in "Properties > Properties > Security".

## Showing device view and detail view in a single display

You can split the system diagnostic view and allow the device and detail view to be shown in the same window.

1. In the Inspector window, click "Properties > Properties > Layout".
2. Activate "Show split view".

## Symbols in the system diagnostic view

Icon	Function
	Device in operation
	Device cannot be accessed
	Errors in device
	Device deactivated
	Maintenance required
	Maintenance recommended

Icon	Function
	Superimposed symbol Shows the subordinate status
	Current configuration
	Stop e.g. Update, Boot, Own initialization
	Stop

System diagnostics window (Page 3479)

System diagnostics view (Page 3475)

## System diagnostics window

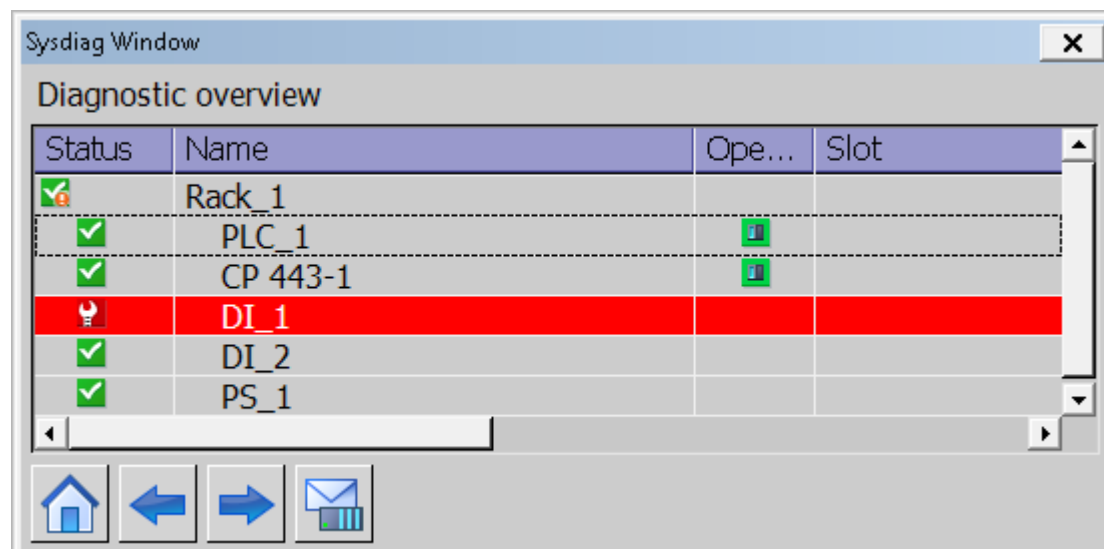

### Introduction

The system diagnostics window offers you an overview of all the available devices in your plant. You navigate directly to the cause of the error and to the relevant device. You have access to all diagnostics-capable devices which you have configured in the "Devices & networks" editor.

The system diagnostics window is only available in the global screen.

## Use

The system diagnostics window enables you to achieve the maximum level of detail of the diagnostics data. A precise diagnosis is possible, as all the available data is displayed. You have the system status of the entire plant at one glance.

Three different views are available in the system diagnostics window.

- Device view
- Detail view
- Diagnostic buffer view
- Matrix view (only for master systems, PROFIBUS)

## Layout

You change the settings for the position, geometry, style, color, and font of the object in the Inspector window. You can adapt the following properties in particular:

- Columns: Defines the elements of the device view and detail view.
- Table headers: Specifies the table headers of the view.
- Window: Specifies whether the system diagnostics window can be closed, for example.

## Configuring the system diagnostics window

1. Drag and drop the system diagnostics view from the toolbox into the global screen.
2. In the Inspector window, select "Properties > Properties > Columns".
3. Select the columns that you require in the device view for Runtime, e.g., Operating mode, Name, Slot.
4. Select the columns that you require in the detail view for Runtime, e.g., Operating mode, Name, Plant designation.

5. To change a column heading, click in the field and (for example) enter "IP" for "Address". The column header "IP" is displayed in the device view in runtime.
6. Rename other elements if necessary.
7. To be able to close the system diagnostics window in runtime, select "Properties > Properties > Window > Closable" in the Inspector window.

### Icons in the system diagnostics window

Button	Function
	Device in operation
	Device cannot be accessed
	Errors in device
	Device deactivated
	Maintenance required
	Maintenance recommended
	Superimposed symbol Shows the subordinate status
	Current configuration
	Stop e.g. Update, Boot, Own initialization
	Stop

### See also

### Text field

### Application

The "Text field" is a closed object which you can fill with a color.

## Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Text: Specifies the text for the text field.
- Size of text field: Defines whether the size of the object is adapted to the space required by the largest list entry.

## Text

Specify the text for the text field in the Inspector window.

1. In the Inspector window, select "Properties > Properties > General".
2. Enter a text.  
For texts over several lines you can set a line break by pressing the key combination <Shift + Enter>.

## Size of text field

In the Inspector window, you can define whether the size of the object is adapted to the space required by the largest list entry.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Activate "Resize > Fit to contents".

## See also

Device-Specific Nature of the Objects (Page 3408)

## Clock

### Application

The "Clock" object displays the date and time.

## Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Analog display: Specifies whether the clock is shown as an analog clock or digital clock.
- Display clock dial: Specifies whether hour marks of the analog clock will be displayed.
- Width and length of hands: Specifies the width and length of the hands.

## Analog display

In the Inspector window you can specify whether the clock is displayed as an analog or digital clock. The digital clock shows both the time and the date. The display format depends on the language set on the HMI device.

1. In the Inspector window, select "Properties > Properties > General":
2. Activate "Analog".

## Display dial

In the Inspector window you can specify whether hour marks will be displayed.

1. In the Inspector window, select "Properties > Properties > General":
2. Activate "Analog".
3. Activate "Show dial".

## Width and length of hands

The width of the second hand, minute hand and hour hand is set for the analog display.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter values for "width" and "length".  
The values for the length are interpreted as a percentage of the size of the clock. The value for the length of the second hand influences the radius of the dial at the same time.

## See also

Device-Specific Nature of the Objects (Page 3408)

## Effective range name

## Application

The "Effective range name" object is a control element for some SIMATIC Mobile Panels. The "Effective range name" object shows the names of the effective range in which the HMI device is located and also the logon status.

## Layout

Symbol	Meaning	Description	Logon status
	Acknowledgement button has no effect	Within the "MixingAxisControl" effective range	It is not possible to log on to the effective range
	Acknowledgement button functions	Within the "MixingAxisControl" effective range	Logged on to effective range
	Acknowledgement button has no effect	Within the "MixingAxisControl" effective range	Logon to the effective range is rejected because a different HMI device is already logged on. Note: When using the "Override" mode: Although no other HMI device is still logged on to the effective range, logon is rejected because the override switch is still set.
	Acknowledgement button has no effect	Outside of each effective range	Note: You can only log on within the effective range

In the Inspector window "Properties > Properties > Security", assign an authorization to log on to a machine in runtime.

## Logon requirements

- The HMI device is located within the effective range.
- No HMI device is logged on to this effective range.

## Logon procedure

1. Click on the "Effective range name" object.  
The "Effective range logon" dialog box opens.
2. Read the ID from the machine or plant to be operated.
3. Enter the ID you read.
4. Confirm your entries by clicking "OK".

## Result

If the ID and effective range match, the HMI device is logged on to the effective range. Successful logon is signaled by an icon on green background. No other HMI device can log on to this effective range.

### **Requirement for logging off**

The HMI device is logged on to this effective range.

### **Logoff procedure**

Before you leave the effective range or runtime, you must log off from the effective range first. If you leave the effective range without logging off, a warning appears.

1. Click on the "Effective range name" object. The "Effective range logoff" dialog box opens.
2. Confirm logoff with "Yes".

### **Result**

The HMI device is no longer logged into the effective range. Other HMI devices can now log on to this effective range.

---

#### **Note**

Do not deactivate the "Override" mode again unless you logon a different HMI device.

---

## Effective range name (RFID)

### Application

The "Effective range name (RFID)" object is a control element for some SIMATIC Mobile Panels. The "Effective range name (RFID)" object shows the name of the effective range (RFID) in which the HMI device is located and also the logon status.

#### Note

##### RFID tags in the plant area

RFID tags may only be attached in demarcated areas which are secured by additional protective measures, e.g. protective fencing.

### Layout

Symbol	Description	Description	Logon status
	Acknowledgement button has no effect	Within the effective range (RFID) "MixingAxisControl"	It is not possible to log on to the effective range (RFID)
	Acknowledgement button functions	Within the effective range (RFID) "MixingAxisControl"	Logon to effective range (RFID) running
	Acknowledgement button functions	Within the effective range (RFID) "MixingAxisControl"	Logged on to the effective range (RFID)

In the "Properties > Properties > Security" category of the Inspector window, you can assign an authorization for the user group that logs on to the effective range (RFID) during runtime.

### Logon requirements

- The HMI device is located within the effective range (RFID).
- The machine is demarcated by additional protective measures.
- No HMI device is logged on to this effective range (RFID).

### Logon procedure

1. Click on the "Effective range name (RFID)" object.  
The "Effective range logon" dialog box opens.
2. Read the ID from the machine or plant to be operated.
3. Enter the ID you read.
4. Confirm your entries by clicking "OK".

**Result**

If the ID and effective range (RFID) match, the HMI device is logged on to the machine. Successful logon is signaled by an icon on green background. No other HMI device can log on to this effective range (RFID) or the machine.

**Logoff requirements**

The HMI device is logged on to this effective range (RFID).

**Logoff procedure**

Before you exit the effective range (RFID) or runtime, you must first log off from the effective range (RFID). If you exit the effective range (RFID) without logging off, a local rampdown is executed.

1. Click on the "Effective range name (RFID)" object. The "Effective range (RFID) - logoff" dialog box opens.
2. Confirm logoff with "Yes".

**Result**

The HMI device is no longer logged into the effective range (RFID) or machine. Other HMI devices can now log on to this effective range (RFID).

**See also**

Charging status (Page 3438)

WLAN reception (Page 3489)

Configuring the effective range name (RFID) (Page 5214)

**Effective range signal****Application**

The "Effective range signal" object is a control element for some SIMATIC Mobile Panels. The "Effective range signal" object indicates how accurately the Mobile Panel Wireless is positioned within an effective range.

## Layout

Symbol	Description
	Within an effective range
	When leaving an effective range When entering an effective range
	Outside of each effective range
	Override function is activated: Within a special security range of the effective range

The "Effective range name" object indicates which effective range this concerns.

## Override function

An effective range, e.g. "robots" is formed outwardly through transponders. However, within a special protection zone, e.g. "robot cells", the effective range is not formed by transponders, but by alternative restrictions e.g. by railings and a door.

The operator initially logs on to the effective range. An operator who enters the restricted and secure zone "robot cells" must press an additional switch to activate the override function:

- The effective range is allocated and can no longer be established by the transponder.
- Therefore, the quality does not play a role and is no longer displayed.
- The HMI device remains logged into the effective range.
- Other HMI devices can no longer logon to this effective range.

## Calculating the signal quality

The quality within an effective range depends, as follows, on the measured distance:

- In the center of the effective range the quality is 100%.
- On the transponder and on the border of the effective range, the quality is 0%.

## Operation

The object is for display only and cannot be controlled by the operator.

## See also

Device-Specific Nature of the Objects (Page 3408)

Charging status (Page 3438)

Effective range name (Page 3483)

WLAN reception (Page 3489)

Zone name (Page 3492)

Zone signal (Page 3493)

Configuring additional Mobile Wireless objects (Page 5212)

## WLAN reception

### Application

The "WLAN reception" object is a control element for some SIMATIC Mobile Panels. The "WLAN reception" object displays the signal strength of the WLAN wireless connection. In addition, the signal strength is measured and displayed by means of 5 bars.

### Layout

Symbol	Meaning	Signal strength
	No wireless connection	No signal
	Very poor wireless connection	=<20 %
	Poor wireless connection	>20 % =<40 %
	Wireless connection OK	>40 % =<60 %
	Good wireless connection	>60 % =<80 %
	Very good wireless connection	>80 %

### Operation

The object is for display only and cannot be controlled by the operator.

### See also

Effective range signal (Page 3487)

Zone name (Page 3492)

Zone signal (Page 3493)

Configuring additional Mobile Wireless objects (Page 5212)

## Gauge

### Use

The "Gauge" object shows numeric values in the form of an analog gauge. For example, a glance during Runtime is enough to note that the boiler pressure is in the normal range.

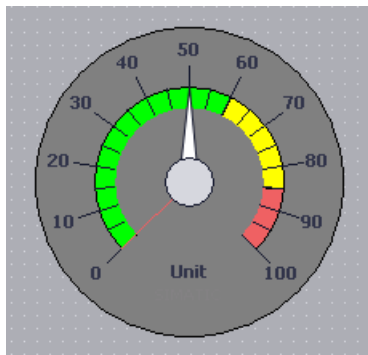

---

#### Note

The gauge is for display only and cannot be controlled by the operator.

Configure system functions that are performed at value changes in the tag properties at the "Value change" event and not at the "Change" event of the gauge. If your project is to comply with Good Manufacturing Practices, and the system function performs a GMP-relevant action. e.g. increasing a GMP-relevant tag, every value change of the tag used at the gauge is interpreted as a user action.

---

### Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Display peak value pointer: Specifies whether the actual measurement range is indicated with a slave pointer.
- Maximum Value and Minimum Value: Specifies the top and bottom values of the scale.
- Start value of the danger range and start value of the warning range: Specifies the scale value from which the danger range and the warning range start.
- Display normal range: Specifies whether the normal range is shown in color on the scale.
- Color of individual ranges: Different operating modes, such as normal range, warning range and danger range, are shown in different colors so that the operator can distinguish them easily.

## Display peak value

The "Display peak value" property can be used to activate a marker function for the maximum and minimum pointer movement in Runtime. The actual measurement range is shown with a slave pointer.

1. In the Inspector window, activate "Properties > Properties > Appearance > Show peak values".

## Maximum Value and Minimum Value

You can set the top and bottom end values of the scale in the Inspector window.

1. In the Inspector window, select "Properties > Properties > General":
2. Enter a number under "Scale > Maximum value" and at "Minimum value".  
If you select a tag as the end value of the scale, the number will be no longer available.

---

### Note

Ensure that the minimum value is always less than the maximum value, especially if you make the minimum value or maximum value dynamic through a tag. If the minimum value is greater than the maximum value, no adjustment is made to the scale end values.

---

## Start value of the danger range and start value of the warning range

Define the scale value at which the danger range and the warning range start in the inspector window.

1. Click "Properties > Properties > Areas" in the inspector window.
2. Input the start value at "start value of danger range" and "start value of warning range".
3. Activate "start value of danger range" and "start value of warning range" to display the ranges on the scale.

## Normal range visible

In the inspector window, define whether to show the normal range in color.

1. Click "Properties > Properties > Areas" in the inspector window.
2. Activate "Normal".

### Color of individual ranges

You can display the normal range, the danger range and the warning range in different colors. Define the color in the inspector window.

1. In the Inspector window, select "Properties > Properties > Areas".
2. Select a color from the color palette for the three areas.

---

#### Note

The following restrictions apply for HMI devices with Windows CE:

- The three ranges (normal / warning / danger) are not visualized in different colors in Runtime.
- 

### See also

Device-Specific Nature of the Objects (Page 3408)

### Zone name

### Application

The "Zone name" object is a control element for some SIMATIC Mobile Panels. The "Zone name" object shows the names of the zone in which the HMI device is located.

### Layout

Symbol	Meaning	Description
	The "On entry" and "On exit" events of the zone and the zone ID can be used in the configuration.	Within the "MixingPlant" zone
	-	Outside of each zone

### Procedure for "On entry" event

1. In the "Zones" or "Zones and effective ranges" editor, configure the function "ActivateScreen" on the "On entry" event.

### Procedure with zone ID

1. Select an internal tag as the "Zone ID / Connection point ID" in the "Runtime settings > General" editor.
2. Animate the visibility of an object, e.g. "I/O field" via the internal tag.

## Operation

The object is for display only and cannot be operated.

## See also

Device-Specific Nature of the Objects (Page 3408)

Charging status (Page 3438)

Effective range name (Page 3483)

Effective range signal (Page 3487)

WLAN reception (Page 3489)

Zone signal (Page 3493)

## Zone signal

## Application

The "Zone signal" object is a control element for some SIMATIC Mobile Panels. The "Zone signal" object indicates how well the Mobile Panel is still in a zone. Compared to the "WLAN reception" object, it is not the signal strength that is measured, it is calculated from the distance.

## Layout

Symbol	Meaning	Quality
	Within one zone	$\geq 15\%$
	When leaving a zone When entering a zone	$< 15\%$ and $> 0\%$
	Outside of each zone	$= 0\%$

The "Zone name" object indicates which zone this concerns.

## Calculating the signal quality

The quality of the signal within a zone depends, as follows, on the measured distance:

- In the centre of the zone the quality is 100%.
- To the rear towards the transponder and to the front away from the transponder, the quality starts to diminish linearly.
- On the transponder and on the border of the zone, the quality is 0%.

## Operation

The object is for display only and cannot be operated.

## 10.1.9 Configuring screen navigation

### 10.1.9.1 Basics on screen navigation

#### Types of navigation for the screen change

For a production process consisting of multiple subprocesses, you will configure multiple screens. You have the following options to enable the operator to switch from one screen to the next in Runtime:

- Assign buttons to screen changes
- Configuring screen changes at local function keys

#### Procedure

Before you create a screen change, define the plant structure and derive from it the screen changes that you want to configure.

Create the start screen under "Runtime Settings > General > Start screen".

#### See also

Screen basics (Page 3241)

Assigning screen change to function key (Page 3496)

Assigning button with screen change (Page 3495)

### 10.1.9.2 Assigning button with screen change

#### Introduction

Configure a button in the screen to switch between the screens on the HMI device during operation.

#### Note

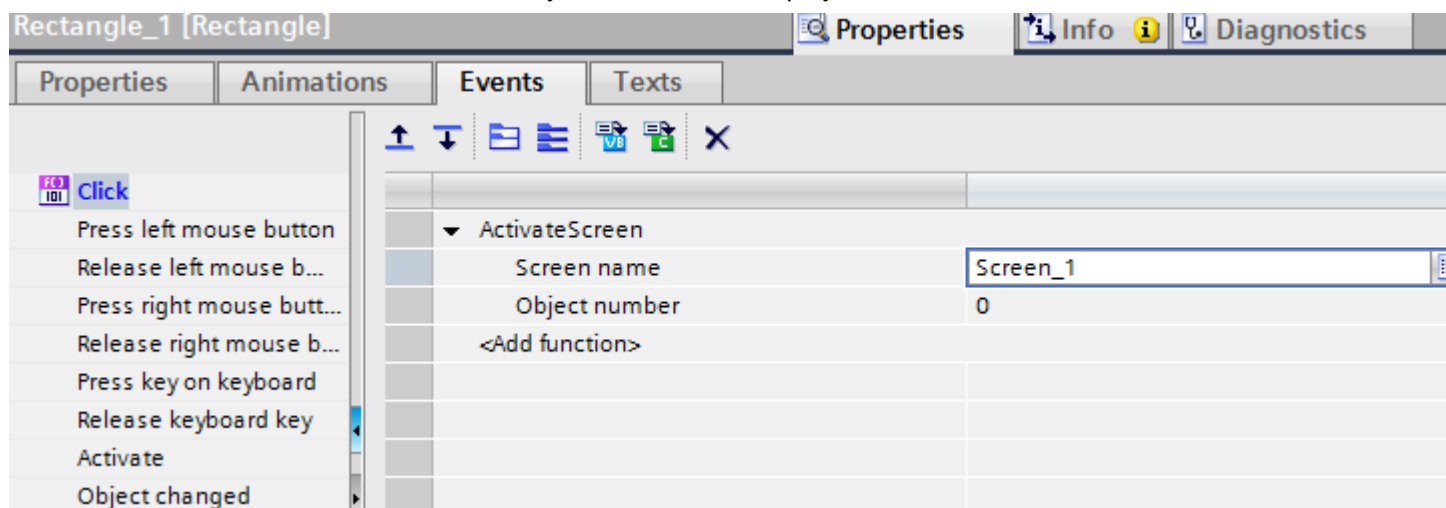

If you have set the "Visibility" of animations to "Hidden" in the Inspector window of a screen, this screen cannot be called up in Runtime.

#### Requirements

- You have created the project.
- You have created the "Screen\_2" screen.
- "Screen\_1" is created.

#### Procedure

1. Double-click "Screen\_1" in the project navigation. The screen is displayed in the work area.
2. Move "Screen\_2" from the project tree to the open screen by drag&drop. A button with the name "Screen\_1" is inserted.
3. In the Inspector window, select "Properties > Events > Click".  
The "ActivateScreen" system function is displayed in the "Function list".

4. At the "Object number" attribute, define, if required, the tab sequence number of the object on which the focus is to be set after a screen change. You can also specify a tag that contains the object number.

### Alternative procedure

1. Move a button from the "Tools" task card to "Screen2" by drag&drop.
2. In the Inspector window, select "Properties > Events > Click".
3. Select the "ActivateScreen" system function.
4. Select "Screen\_2" for the "Screen number".

### Result

The operator goes to "Screen\_1" with the button in Runtime. If you have specified an object number, the object with this object number has the focus following a screen change.

Basics on screen navigation (Page 3494)

## 10.1.9.3 Assigning screen change to function key

### Introduction

Configure a screen change function key in the screen to switch between the screens on the HMI device during operation.

---

#### Note

If you have set the "Visibility" of animations to "Hidden" in the inspector window of a screen, this screen cannot be called up in Runtime.

---

### Requirements

- You have created a project.
- You have created the "Screen\_2" screen.
- You have created the "Screen\_1" screen.

### Procedure

1. Double click "Screen\_1" in the project tree. The screen is displayed in the work area.
2. Move "Screen\_2" from the project tree to a function key, e.g. "F2".  
The configured function key displays a yellow triangle.
3. Click "Properties > Events > Press key" in the inspector window.  
The "ActivateScreen" system function is displayed.

## Result

The operator goes to the specified "Screen\_2" with function key "F2" in Runtime.

## See also

Basics on screen navigation (Page 3494)

## 10.2 Working with Tags

### 10.2.1 Basics

#### 10.2.1.1 Basics of tags

## Introduction

Process values are forwarded in runtime using tags. Process values are data which is stored in the memory of one of the connected automation systems. They represent the status of a plant in the form of temperatures, fill levels or switching states, for example. Define external tags for processing the process values in WinCC.

WinCC works with two types of tag:

- External tags
- Internal tags

The external tags form the link between WinCC and the automation systems. The values of external tags correspond to the process values from the memory of an automation system. The value of an external tag is determined by reading the process value from the memory of the automation system. It is also possible to rewrite a process value in the memory of the automation system.

Internal tags do not have a process link and only convey values within the WinCC. The tag values are only available as long as runtime is running.

## Tags in WinCC

For external tags, the properties of the tag are used to define the connection that the WinCC uses to communicate with the automation system and form of data exchange.

Tags that are not supplied with values by the process - the internal tags - are not connected to the automation system. In the tag's "Connection" property, this is identified by the "Internal tag" entry.

You can create tags in different tag tables for greater clarity. You then directly access the individual tag tables in the "HMI tags" node in the project tree. The tags from all tag tables can be displayed with the help of the table "Show all tags".

With structures you bundle a number of different tags that form one logical unit. Structures are project-associated data and are available for all HMI devices of the project. You use the "Types" editor in the project library to create and edit a structure.

### 10.2.1.2 Overview of HMI tag tables

#### Introduction

HMI tag tables contain the definitions of the HMI tags that apply across all devices. A tag table is created automatically for each HMI device created in the project.

In the project tree there is an "HMI tags" folder for each HMI device. The following tables can be contained in this folder:

- Default tag table
- User-defined tag tables
- Table of all tags

In the project tree you can create additional tag tables in the HMI tags folder and use these to sort and group tags and constants. You can move tags to a different tag table using a drag-and-drop operation or with the help of the "Tag table" field. Activate the "Tags table" field using the shortcut menu of the column headings.

### Default tag table

There is one default tag table for each HMI device of the project. It cannot be deleted or moved. The default tag table contains HMI tags and, depending on the HMI device, also system tags. You can declare all HMI tags in the standard tags table or, as necessary, additional user-defined tables of tags.

### User-defined tag tables

You can create multiple user-defined tag tables for each HMI device in order to group tags according to your requirements. You can rename, gather into groups, or delete user-defined tag tables. To group tag tables, create additional subfolders in the HMI tags folder.

### All tags

The "All tags" table shows an overview of all HMI tags and system tags of the HMI device in question. This table cannot be deleted, renamed or moved. This table also contains the "Tags table" column, which indicates the tag table of where a tag is included. Using the "Tags table" field, the assignment of a tag to a tags table can be changed.

With devices for Runtime Professional, the table "All tags" contain an additional tab "System tags". The system tags are created by the system and used for internal management of the project. The names of the system tags begin with the "@" character. System tags cannot be deleted or renamed. You can evaluate the value of a system tag, but cannot modify it.

### Additional tables

The following tables are also available in an HMI tag table:

- Discrete alarms
- Analog alarms
- Logging tags

With the help of these tables you configure alarms and logging tags for the currently selected HMI tag.

### Discrete alarms table

In the "Discrete alarms" table, you configure discrete alarms to the HMI tag selected in the HMI tag table. When you configure a discrete alarm, multiple selection in the HMI tag table is not possible. You configure the discrete alarms for each HMI tag separately.

### Analog alarms table

In the "Analog alarms" table, you configure analog alarms to the HMI tag selected in the HMI tag table. When you configure an analog alarm, multiple selection in the HMI tag table is not possible. You configure the analog alarms for each HMI tag separately.

### Logging tags table

In the "Logging tags" table, you configure logging tags to the HMI tag selected in the HMI tag table. When you configure a logging tag, multiple selection in the HMI tag table is not possible. You configure the logging tags for each HMI tag separately. The "Logging tags" table is only available if the HMI device used supports logging.

If WinCC Runtime Professional is used, you can also assign several log tags to a tag. With the other HMI devices, you can only assign one log tag to a tag.

### See also

Basics of tags (Page 3497)

## 10.2.1.3 External tags

### Introduction

External tags allow communication (data exchange) between the components of an automation system, for example, between an HMI device and a PLC.

### Principle

An external tag is the image of a defined memory location in the PLC. You have read and write access to this storage location from both the HMI device and from the PLC.

Since external tags are the image of a storage location in the PLC, the applicable data types depend on the PLC which is connected to the HMI device.

If you write a PLC control program in STEP 7, the PLC tags created in the control program will be added to the PLC tag table. If you want to connect an external tag to a PLC tag, access the PLC tags directly via the PLC tag table and connect them to the external tag.

### Data types

All the data types which are available at the connected PLC are available at an external tag in WinCC. Information about data types which are available for connection to other PLCs can be found in the documentation about the respective communication drivers.

See "Auto-Hotspot" for additional information.

---

#### Note

As well as external tags, area pointers are also available for communication between the HMI device and PLC. You can set up and enable the area indicators in the "Connections" editor.

---

## Synchronization with PLC tags

A variety of options for synchronizing external tags with the PLC tags are available in the Runtime settings under "Settings for tags".

When you perform synchronization, you have the option of automatically applying the tag names of the PLC to external tags and reconnecting the existing tags.

The generated tag name is derived from the position of the data value in the hierarchical structure of the data block.

## Update of tag values

For external tags, the current tag values are transmitted in runtime via the communication connection between WinCC and the connected automation systems and then saved in the runtime memory. Next, the tag value will be updated to the set cycle time. For use in the runtime project, WinCC accesses tag values in the runtime memory that were read from the PLC at the previous cycle time. As a result, the value in the PLC can already change whilst the value from the runtime memory is being processed.

---

### Note

#### PLC array elements in conjunction with S7-1200 or S7-1500

The index of the PLC array elements can begin with any number. In WinCC, indexing always starts with 0.

A PLC tag "Array [1..3] of Int", for example, is mapped to "Array [0..2] of Int" in WinCC.

When you access an array in a script, pay attention to the correct indexing.

---

## See also

Basics of tags (Page 3497)

### 10.2.1.4 Addressing external tags

#### Introduction

The options for addressing external tags depend on the type of connection between WinCC and the PLC in question. A distinction must be made between the following connection types:

- **Integrated connection**  
Connections of devices which are within a project and were created with the "Devices & Networks" editor are referred to as integrated connections.
- **Non-integrated connection**  
Connections of devices which were created with the "Connections" editor are referred to as non-integrated connections. It is not necessary that all of the devices be within a single project.

The connection type can also be recognized by its icon.

	Integrated connection
	Non-integrated connection

You can find additional information in the section "Basics of communication (Page 5236)".

## Addressing with integrated connections

An integrated connection offers the advantage that you can address a tag both symbolically and absolutely.

For symbolic addressing, you select the PLC tag via its name and connect it to the HMI tag. The valid data type for the HMI tag is automatically selected by the system. You have to distinguish between the following cases when you address elements in data blocks:

### Symbolic addressing of data blocks with optimized access and standard access:

During the symbolic addressing of a data block with optimized access and standard access, the address of an element in the data block is dynamically assigned and is automatically adopted in the HMI tag in the event of a change. You do not need to compile the connected data block or the WinCC project for this step.

For data blocks with optimized access, only symbolic addressing is available.

For symbolic addressing of elements in a data block, you only need to recompile and reload the WinCC project in case of the following changes:

- If the name or the data type of the linked data block element or global PLC tag has changed.
- If the name or the data type of the higher level structure node of a linked element in the data block element or global PLC tag has changed.
- If the name of the connected data block has changed.

Symbolic addressing is currently available with the following PLCs:

- SIMATIC S7 1200
- SIMATIC S7 1500

Symbolic addressing is also available if you have an integrated link.

---

### Note

Symbolic addressing is not possible if you are using the "Date/Time" area pointer.

---

You can also use absolute addressing with an integrated connection. You have to use absolute addressing for PLC tags from a SIMATIC S7 300/400 PLC. If you have connected an HMI tag with a PLC tag and the address of the PLC tag changes, you only have to recompile the control program to update the new address in WinCC. Then you recompile the WinCC project and load it onto the HMI device.

In WinCC, symbolic addressing is the default method. To change the default setting, select the menu command "Options > Settings". Select "Visualization > Tags" in the "Settings" dialog. If required, disable the "Symbolic access" option.

The availability of an integrated connection depends on the PLC used. The following table shows the availability:

PLC	Integrated connection	Comments
S7 300/400	Yes	The linking of tags is not checked in Runtime. If the tag address changes in the PLC and the HMI device is not compiled again and loaded, the change is not registered in runtime.
S7 1200	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the following behavior applies to the S7 300/400.
S7 1500	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the following behavior applies to the S7 300/400.

Create an integrated connection in the "Devices & Networks" editor. If the PLC is contained in the project and integrated connections are supported, you can then also have the connection created automatically. To do this, when configuring the HMI tag, simply select an existing PLC tag to which you want to connect the HMI tag. The integrated connection is then automatically created by the system.

### Addressing with non-integrated connections

In the case of a project with a non-integrated connection, you always configure a tag connection with absolute addressing. Select the valid data type yourself. If the address of a PLC tag changes in a project with a non-integrated connection during the course of the project, you also have to make the change in WinCC. The tag connection cannot be checked for validity in Runtime, an error message is not issued.

A non-integrated connection is available for all supported PLCs.

Symbolic addressing is not available in a non-integrated connection.

With a non-integrated connection, the control program does not need to be part of the WinCC project. You can perform the configuration of the PLC and the WinCC project independently of each other. For configuration in WinCC, only the addresses used in the PLC and their function have to be known.

### See also

Basics of communication (Page 5236)

Basics of tags (Page 3497)

### 10.2.1.5 Internal Tags

#### Introduction

Internal tags do not have any connection to the PLC. Internal tags transport values within the HMI device. The tag values are only available as long as runtime is running.

#### Principle

Internal tags are stored in the memory of the HMI device. Therefore, only this HMI device has read and write access to the internal tags. You can create internal tags to perform local calculations, for example.

You can use the HMI data types for internal tags. Availability depends on the HMI device being used.

The following HMI data types are available:

HMI data type	Data format
Array	One-dimensional array
Bool	Binary tag
DateTime	Date/time format
DInt	Signed 32-bit value
Int	Signed 16-bit value
LReal	Floating-point number 64-bit IEEE 754
Real	Floating-point number 32-bit IEEE 754
SInt	Signed 8-bit value
UDnt	Unsigned 32-bit value
UInt	Unsigned 16-bit value
USInt	Unsigned 8-bit value
WString	Text tag, 16-bit character set

#### See also

Basics of tags (Page 3497)

## 10.2.2 Working with Tags

### 10.2.2.1 Creating tags

#### Creating external tags

##### Introduction

You can access an address in the PLC via a PLC tag using an external tag. The following options are available for addressing:

- Symbolic addressing
- Absolute Addressing

You can find further details on symbolic addressing in section "Addressing external tags (Page 3501)". If possible, use symbolic addressing when configuring a tag. You create tags either in the standard tag table or in a tag table you defined yourself.

##### Requirement

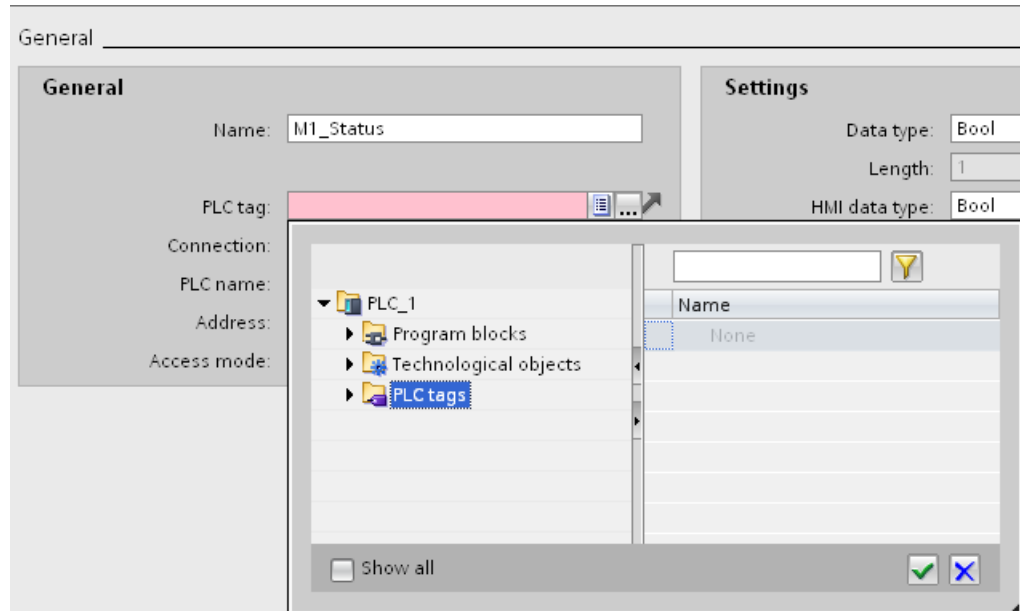

- You have opened the project.
- A connection to the PLC is configured.
- The Inspector window is open.

##### Procedure

To create an external tag, proceed as follows:

1. Open the "HMI tags" folder in the project tree and double-click the standard tag table. The tag table opens.  
Alternatively, create a new tag table and then open it.
2. In the "Name" column, double-click "Add" in the tag table. A new tag is created.
3. Select the "Properties > Properties > General" category in the Inspector window and, if required, enter a unique tag name in the "Name" field. The tag name must be unique throughout the device.
4. If required, select the "Display name" field to enter a name to be displayed in Runtime. The name to be displayed is language-specific and can be translated for the required Runtime languages. The display name is available for Basic Panels, Panels and Runtime Advanced.
5. Select the connection to the required PLC in the "Connection" box. If the connection you require is not displayed, you must first create the connection to the PLC. You create the connection to a SIMATIC S7 PLC in the "Devices & Networks" editor. You create the connection to external PLCs in the "Connections" editor.  
If the project contains the PLC and supports integrated connections, you can also have the connection created automatically. To do this, when configuring the HMI tag, simply select an existing PLC tag to which you want to connect the HMI tag. The integrated connection is then automatically created by the system.

- If you are working with an integrated connection, click the  button in the "PLC tag" field and select an already created PLC tag in the object list. Click the  button to confirm the selection.

- If you are working with a non-integrated connection, enter the address from the PLC in the "Address" field. The "PLC tag" field remains empty.
- Configure the other properties of the tag in the inspector window.

You can also configure all tag properties directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.

You can also create new tags alternatively directly at the application point, e.g. on an I/O field. To do this, click the  button in the object list. You then configure the new tag in the Inspector window.

## Result

An external tag has been created and linked to a PLC tag or an address in the PLC.

## Alternative procedure

You can also create external HMI tags by dragging and dropping data block elements or global PLC tags in an HMI tag table.

## See also

- Creating internal tags (Page 3507)
- Creating multiple tags (Page 3508)
- Basics of tags (Page 3497)

Addressing external tags (Page 3501)  
Editing a Tag (Page 3509)  
Tag Limits (Page 3515)  
Indirect addressing of tags (Page 3529)

## Creating internal tags

### Introduction

You must at least set the name and data type for internal tags. Select the "Internal tag" item, rather than a connection to a PLC.

For documentation purposes, it is a good idea to enter a comment for every tag.

### Requirement

You have opened the project.

### Procedure

1. Open the "HMI tags" folder in the project tree and double-click the entry "Standard tag table". The tag table opens.  
Alternatively, create and then open a new tag table.
2. Double-click "Add" in the "Name" column of the tag table. A new tag is created.
3. If the Inspector window is not open, select the "Inspector window" option in the "View" menu.
4. Select the "Properties > Properties > General" category in the Inspector window and, if required, enter a unique tag name in the "Name" field. This tag name must be unique throughout the project.
5. If required, select the "Display name" field to enter a name to be displayed in Runtime. The name to be displayed is language-specific and can be translated for the required Runtime languages. The display name is available for Basic Panels, Panels and Runtime Advanced.
6. Select "Internal tag" as the connection in the "Connection" field.
7. Select the required data type in the "Data type" field.
8. In the "Length" field, you must specify the maximum number of characters to be stored in the tag according to the selected data type. The length is automatically defined by the data type for numerical tags.
9. As an option, you can enter a comment regarding the use of the tag. To do so, click "Properties > Properties > Comment" in the Inspector window and enter a text.

You can also configure all tag properties directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.

You can also create new tags alternatively directly at the application point, e.g. on an I/O field. Click the  button in the object list. You can then configure the new tag in the Properties window that opens.

## Result

An internal tag is created. You can now use this in your project.

In additional steps you can configure the tag, for example, by setting the start value and limits.

## See also

Creating external tags (Page 3505)

## Creating multiple tags

### Introduction

In a tag table, you create additional identical tags by automatically filling the rows of the table below a tag.

The tag names are incremented automatically when filling in automatically.

You can also use the auto fill function to fill table cells below a tag with a single tag property and thus modify the corresponding tags.

If you apply the automatic filling in to already filled cells of a tag table, you will be asked whether you want to overwrite the cells or insert new tags.

If you do not want to overwrite already configured tags, activate insert mode. Activate insert mode by keeping the <Ctrl> key pressed during insertion. Already existing entries in the tag table are moved down if insert mode is activated.

### Requirement

- You have opened the project.
- A tag table is open.
- The tag which is to serve as a template for other tags is configured.

## Procedure

1. If you want to create new tags, mark in the "Name" column the tag that should be used as a template for the new tags.

Tags		
	Name ▲	Connection
	<01 Motor	<Internal tag> ...
	<Add new>	

drag a tag to the tags below it, select the cell which contains the tag name. The cell will be highlighted in color and a small blue square will appear in its bottom right corner. Over this square, the cursor will change to a black cross.

2. drag this square over the cells below that you wish to fill

Tags		
	Name ▲	Connection
	<01 Motor	<Internal tag> ...
	<01 Motor_1	<Internal tag>
	<01 Motor_2	<Internal tag>
	<01 Motor_3	<Internal tag>
	<01 Motor_4	<Internal tag>
	<01 Motor_5	<Internal tag>

drag this square over this area.

3. All of the marked cells will be filled automatically. Empty cells in the marked area.

## Result

Depending on which cells were selected, the function may automatically fill individual properties or create new tags.

## See also

Creating external tags (Page 3505)

### 10.2.2.2 Editing tags

#### Editing a Tag

#### Introduction

You can always rename, copy or delete tags.

When a tag is renamed, the new name must be unique for the whole device.

If you use the "Copy" command to copy a tag to the clipboard, the objects and references linked to the tag are copied as well.

If you use the "Insert" command to add a tag to another device, the tag will be added without the connected references. Only the object name of the reference will be inserted. If a reference of the same name and valid properties exists in the target system, the existing reference will then be connected to the copied tag.

If you copy a tag, some of the objects linked to the tag are copied as well. The following objects are copied:

- Logging tags
- Cycles
- Alarms

If you add the copied tag to another device, the tag is added together with the linked objects.

## Requirement

- The tag which you wish to rename, copy or delete must exist.
- The tag table containing the tag is open.

## Renaming tags

1. In the "Name" field, select the tag in the tag table.
2. Select "Rename" from the shortcut menu.
3. Type in a new name.  
The tag appears under its new name.

## Copying tags

1. Mark one or more tags in the tags table.
2. Select "Copy" from the shortcut menu.
3. Click on the point at which you want to insert the tag. For example, click another tag table in the same device or the tag table in a second device.
4. Select "Paste" from the shortcut menu. The tag is inserted as described above.

## Deleting a tag

1. Select one or more tags in the tag table.
2. Select the "Cross-reference" command from the "Tools" menu. In the "Cross-reference" editor, check to see where the tags are used. In this manner, you can see what impact the deletion of the tag will have on your project.
3. Select "Delete" in the pop-up menu of the tag.  
All marked tags will be deleted.

## Export and import of tags

WinCC gives you the option to export and import tags. With Export and Import, you have the option to export tags from one project and import them into another project. There is also the option to create larger numbers of tags outside of WinCC, edit them and subsequently import into any WinCC project. For further details, refer to Importing and exporting tags (Page 5882).

## See also

Changing the tag configuration (Page 3511)

Configuring multiple tags simultaneously (Page 3511)

Using multiple tags simultaneously in a screen (Page 3512)

Basics of tags (Page 3497)

- Synchronizing tags (Page 3514)
- Creating external tags (Page 3505)
- Importing and exporting tags (Page 5882)

## Changing the tag configuration

### Introduction

You can modify tags at any time to adapt them to changed requirements in the project.

### Changing the tag configuration

if you want to change the configuration of a tag, open the tag table in which the tag is contained. Open the "Show all tags" tag table alternatively.

In the tag tables, you can perform such tasks as comparing and adjusting the properties of multiple tags or sorting the tags by their properties.

Change the properties either directly in the table or in the inspector window.

If you change a tag property and this change causes a conflict with another property, it will be highlighted in color to draw your attention to this fact. This could happen, for example, if you connect the tag to another PLC which does not support this data type.

### See also

- Editing a Tag (Page 3509)

## Configuring multiple tags simultaneously

### Introduction

In WinCC, you can assign the same properties to multiple tags in a single operation. This facilitates efficient programming.

### Requirement

- You created the tags you want to configure.
- The tag table is open.
- The Inspector window is open.

## Procedure

1. In the tag table, select all the tags that you want to configure at the same time.  
If the selected property is identical for all the tags, the setting for this property will appear in the Inspector window. The associated field will remain blank otherwise.
2. You can define the shared properties in the Inspector window or directly in the tag table.  
if you change a property commonly on several tags, only this one property is changed. The other properties of the tag remain unchanged.

## Result

All marked tags will be reconfigured.

To edit tag properties which differ from one tag to the other, simply clear the multiple selection.

## See also

Editing a Tag (Page 3509)

## Using multiple tags simultaneously in a screen

### Introduction

In WinCC, you can create multiple I/O fields that are linked with tags in one screen in a single operation. This facilitates efficient programming.

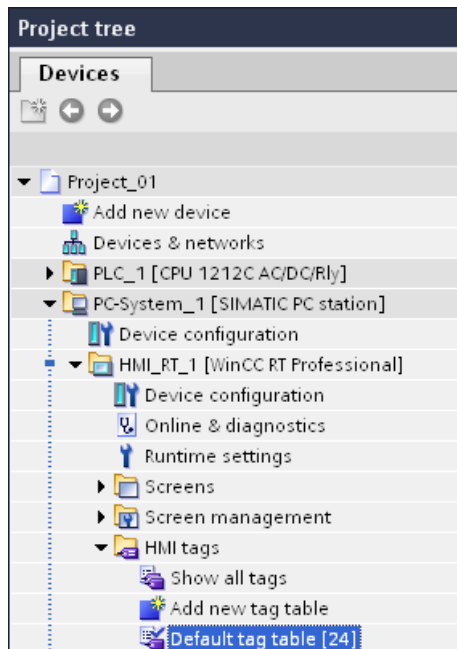

### Requirement

- Several tags are set up.
- A screen is open.

## Procedure

1. In the project tree, select the required tag table under "HMI tags".

2. Select the detail view at the bottom of the project tree. The detail view shows the tags that exist in the selected tag group.

The screenshot shows the 'Details view' window. It contains a table with the following data:

Name	Data type
Tag_1	Bool
Tag_2	Bool
Tag_3	Bool
Tag_4	Bool
Tag_5	Bool
Tag_6	Bool

3. Mark the tags in the detail window.
4. Drag the tags to the screen. For each tag, this creates an I/O field that is connected to the tag.

---

### Note

When you move a PLC tag from the detail window to the work area by drag&drop, a network and a connection are created additionally in the "Devices & Networks" editor.

---

## See also

Editing a Tag (Page 3509)

## Synchronizing tags

### Introduction

To synchronize the PLC and HMI tags, WinCC offers the following options:

- Synchronizing tags with or without name matching between PLC and WinCC  
The following options are available for this:
- Link tags with addresses in the PLC  
This procedure is suitable, for example, if changes were made to the connection between the HMI device and the PLC and the tag connections were lost. The function can also be used if you have configured the control program and HMI project separately.

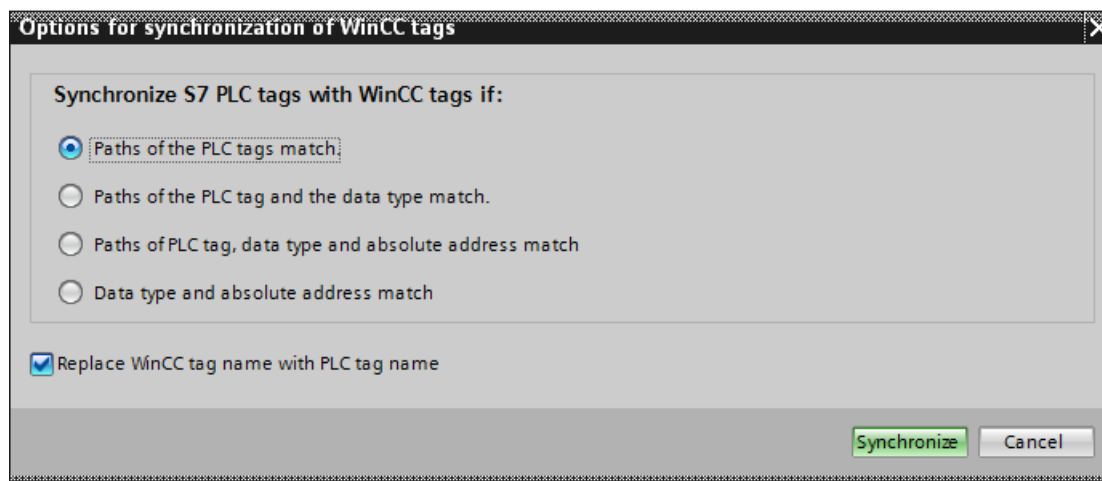

### Requirement

- External HMI tags have been created.
- PLC tags have been created.
- An HMI connection to a PLC in the project has been established.

### Procedure

To synchronize HMI tags with PLC tags, follow these steps:

1. In the project tree, select the directory that contains the tags in question.
2. Select "Connect HMI tags to matching PLC tags" from the shortcut menu.  
A dialog opens.

3. Select the option you want to use.  
If you want to synchronize the tags without name matching, disable "Replace WinCC tag name with PLC tag name".  
If you want to connect HMI tags new with absolute access, select "Data type and absolute address match".
4. Confirm with "Synchronize".  
The system searches for a suitable PLC tag according to the selected option.

## Result

The external HMI tags are synchronized with the PLC tags.

If you have selected the option "Data type and absolute address match", the tag connection is established as soon as a suitable PLC tag is found.

If you have selected a different option, the WinCC tags are updated accordingly and the PLC tag names are applied in WinCC.

## See also

Editing a Tag (Page 3509)

### 10.2.2.3 Configuring Tags

## Tag Configuration Basics

## Tag Limits

### Introduction

You can restrict the value range with limits for numerical tags.

### Principle

You can specify a value range defined by a high limit and a low limit for numerical tags.

If the operator enters a value for the tag that is outside the configured value range, the input is rejected. The value is not accepted. You configure a function list when configuring for Runtime Advanced and Panels. When the tag value leaves the value range, the function list is processed.

---

#### Note

If you want to output an analog alarm when a limit is violated, configure the respective tag in the "Analog alarms" tab. You can also configure the analog alarm in the "HMI alarms" editor. The values for output of an analog alarm depend on the configured tag limits.

---

### Application example

Use the limits to warn the operator when the value of a tag enters a critical range, for example.

## See also

Defining Limits for a Tag (Page 3516)

## Defining Limits for a Tag

### Introduction

For numerical tags, you can specify a value range by defining a low and high limit.

For Runtime Advanced and Panels you can configure the system to process a function list whenever a tag value drops below or exceeds its configured value range.

### Requirement

- The tag for which you want to set the limits is created.
- The Inspector window with the properties for this tag is open.

### Procedure

To define limits for a tag, proceed as follows:

1. In the Inspector window select "Properties > Properties > Limits." If you want to define one of the limits as a constant value, select "Constant" using the  button. Enter a number in the relevant field.  
If you want to define one of the limits as a tag value, select "HMI tag" using the  button. Use the object list to define the tag for the limit.
2. To set additional limits for the tag, repeat step 1 with the appropriate settings.

### Alternative procedure

You can also configure the high and low limit directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.

## Configuring a function list for Runtime Advanced and Panels

When you configure Runtime Advanced and Panels, you can have a function list called up if a high or low limit is violated.

1. If you want to start a function list when the value drops below the value range, click "Properties > Events > Minimum violated" in the Inspector window. Create a function list in this dialog.
2. If you want to start a function list when the value exceeds the value range, click "Properties > Events > Maximum violated" in the Inspector window. Create a function list in this dialog.

## Result

You have set a value range defined by a high and low limit for the selected tag. If the value range is exceeded or undershot, a function list may be carried out.

## See also

Tag Limits (Page 3515)

## Start value of a tag

### Value of a tag at start of Runtime

You can configure a start value for numeric tags and tags for date/time values. The tag will be preset to this value when Runtime starts. In this way, you can ensure that the tag has a defined status when Runtime starts.

For external tags, the start value will be displayed on the HMI device until it is overwritten by the PLC or by input.

If no start value was configured, the tag contains the value "0" when starting Runtime.

In WinCC Runtime Professional you can enter a tag value in place of the start value on a tag with the "String" data type. The tag value is saved in the "Project texts" editor and is multilingual. After the text has been translated, it is displayed in Runtime as a language-dependent start value.

## Application example

You can assign a default value to an I/O field. Enter the desired default value as start value for the tag that is linked to the I/O field.

## See also

Tag Limits (Page 3515)

## Defining the start value of a tag

### Introduction

In WinCC you can configure a start value for a numeric tag and a tag for date/time values which this adopts at Runtime start.

### Requirement

- You have created the tag for which you want to define a start value.
- The Inspector window with the tag properties is open.

### Procedure

To configure a start value, proceed as follows:

1. In the Inspector window select "Properties > Properties > Values."
2. Enter the desired "Start value."

### Alternative procedure

You can also configure the start value directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.

### Result

The start value you selected for the tag is transferred to the project.

### See also

Tag Limits (Page 3515)

## Updating the Tag Value in Runtime

### Introduction

Tags contain process values which change while Runtime is running. Value changes are handled differently at internal and external tags.

### Principle

When Runtime starts, the value of a tag is equal to its start value. Tag values change in Runtime.

In Runtime, you have the following options for changing the value of a tag:

- A value change in an external tag in the PLC.
- By input, for example, in an I/O field.
- By running a system function, such as "SetValue."
- A value assignment in a script.

## Updating the Value of External Tags

The value of an external tag is updated as follows:

- **Cyclic in operation**  
If you select the "Cyclic in operation" acquisition mode, the tag is updated in Runtime while it is displayed in a screen or is logged. The acquisition cycle determines the update cycle for tag value updates on the HMI device. You can either choose a default acquisition cycle or define a user-specific cycle.
- **Cyclic continuous**  
If you select the "Cyclic continuous" acquisition mode, the tag will be updated continuously in Runtime, even if it is not in the currently-open screen. This setting is activated for tags that are configured to trigger a function list when their value changes, for example. Only use the "Cyclic continuous" setting for tags that must truly be updated. Frequent read operations increase communication load.
- **On demand**  
If you select the "On demand" acquisition mode, the tag is not updated cyclically. It will only be updated on demand using the "UpdateTag" system function, for example, or by a script.

## See also

Tag Limits (Page 3515)

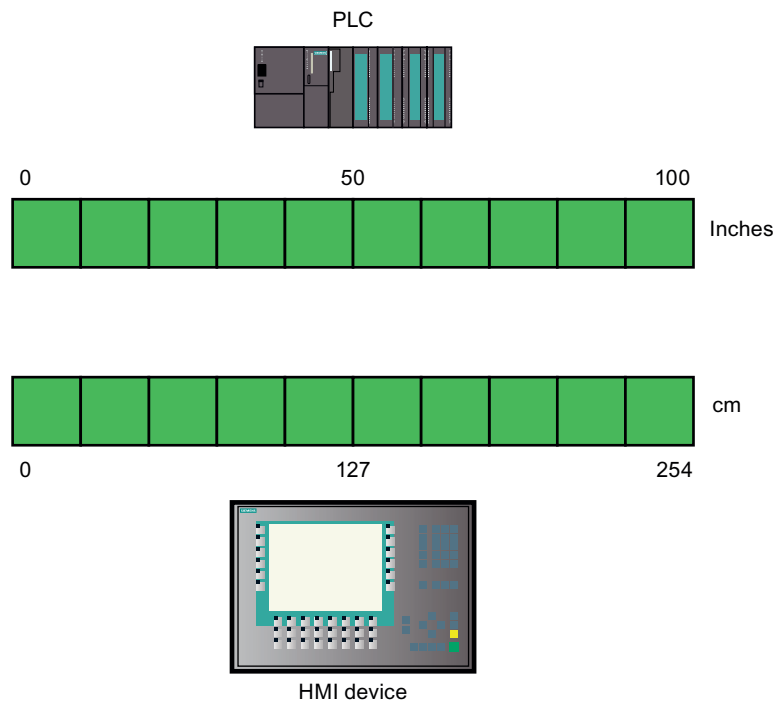

## Linear scaling of a tag

### Introduction

Numeric data types can be processed with linear scaling. The process values in the PLC for an external tag can be mapped onto a specific value range in the project.

## Principle

To apply linear scaling to a tag, you must specify one value range on the HMI device and one on the PLC. The value ranges will be mapped to each other linearly.

As soon as data from the HMI device is written to an external tag, it will be automatically mapped to the value range of the PLC. As soon as data from the HMI device is read from the external tag, a corresponding transformation will be performed in the other direction.

### Note

You can also use the system functions "LinearScaling" and "InvertLinearScaling" to automatically convert process values.

## Application example

The user enters length dimensions in centimeters but the PLC is expecting inches. The entered values are automatically converted before they are forwarded to the controller. Using linear scaling, the value range [0 to 100] on the PLC can be mapped onto the value range [0 to 254] on the HMI device.

## See also

Tag Limits (Page 3515)

## Applying linear scaling to a tag

### Introduction

To apply linear scaling to a tag, you must specify one value range on the HMI device and one on the PLC. The value ranges will be mapped to each other linearly.

### Requirement

- The external tag to which linear scaling is to be applied must exist.
- The Inspector window with the properties for this tag is open.

### Procedure

To apply linear scaling to a tag, follow these steps:

1. In the Inspector window select "Properties > Properties > Linear scaling."
2. Click on "Enable" to switch on linear scaling.  
Using this option, you can temporarily switch off linear scaling for testing purposes, for example. Settings which were made earlier for linear scaling remain unchanged.
3. In the "PLC" area, enter the start and end values of the value range to be applied to the process values on the PLC.
4. In the "HMI device" area, enter the end and start values of the value range to be applied to the process values on the HMI device.

### Result

In Runtime the data will be automatically mapped from one value range to the other.

---

#### Note

You can also use the "LinearScaling" and "InvertLinearScaling" system functions to automatically convert process values.

---

### See also

Tag Limits (Page 3515)

## Connecting a tag to another PLC

### Introduction

In WinCC, you can change the PLC connection of a tag at any time. This is needed when you change the configuration of your plant, for example.

Depending on the PLC selected, you may need to modify the configuration of the tag. The tag properties which must be changed will be highlighted in color.

## Requirement

- The external tag, whose connection you wish to change, must already exist.
- The connection to the PLC must already exist.
- The Properties window for this tag is open.

## Procedure

To change the PLC connection of a tag, proceed as follows:

1. In the Inspector window select "Properties > Properties > General."
2. Select the new connection in the "Connection" field.  
The tag properties that you must change will be highlighted in color in the tag table and in the Inspector window.
3. Change all highlighted properties of the tag to suit the requirements of the new PLC.

## Result

The external tag is connected to the new PLC.

## See also

Tag Limits (Page 3515)

## Address multiplexing

### Introduction

Using address multiplexing, you can use a single tag to access a multitude of memory locations within the PLC's address range. You read and write to the addresses without defining a tag for each individual address.

### Multiplexing with absolute addressing

When using multiplexing with absolute addressing, you configure tags as placeholders for the address in the PLC to be addressed.

If you want to access, for example, an address of the format "%DBx.DBWy", the expression for multiplexing is as follows:

```
"%DB[HMITag1].DBW[HMITag2]"
```

In Runtime, you supply the tag "HMITag1" with the required value for the data block you want to address.

In Runtime, you supply the tag "HMITag2" with the required address from the data block.

Tags are supplied with values, for example, with the help of values from the PLC or via a script.

Multiplexing with absolute addresses is supported for the following PLCs and communication drivers.

- SIMATIC S7-300/400
- SIMATIC S7-1200
- SIMATIC S7-1500

Multiplexing with absolute addresses is not available for data blocks with optimized access.

### Multiplexing with symbolic addressing

When multiplexing with symbolic addressing, you access an array element of an array tag in a data block of the connected PLC by means of a multiplex tag and an index tag. The multiplex tag contains the symbolic address of the data block which you want to access. The symbolic address also contains the index tag via which you access the index of the array tag.

If you want to access, for example, the array tag "Arraytag\_1" in the data block "Datablock\_1", the expression for symbolic addressing is as follows:

```
"Datablock_1.Arraytag_1["HMITag_1"]
```

You control the access to the index of the array elements with the HMI-Variable "HMITag\_1". In Runtime, you supply the tag with the index of the array element that you want to access.

Multiplexing with symbolic addressing is only available if the following components support symbolic addressing:

- the HMI device
- PLC
- Communication driver

Symbolic addressing is supported by communication drivers:

- SIMATIC S7-1200
- SIMATIC S7-1500

### See also

Tag Limits (Page 3515)

### Configuring address multiplexing with absolute addressing

#### Introduction

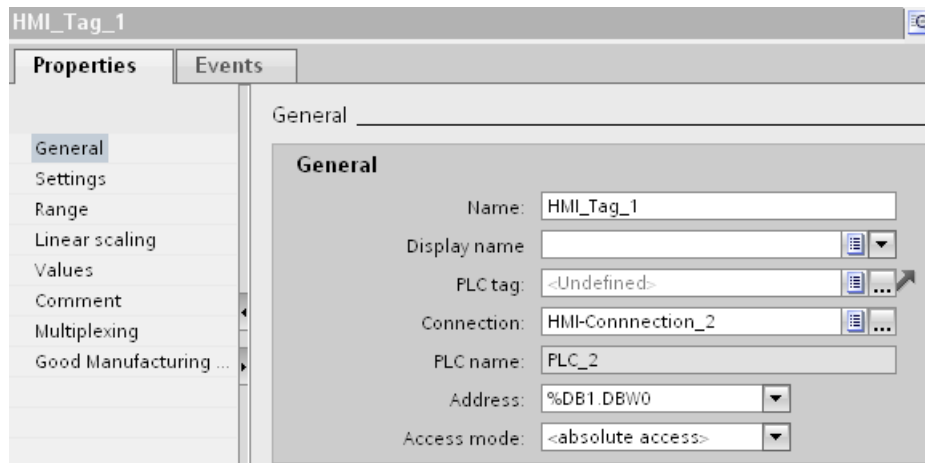

When using address multiplexing, you can efficiently access different addresses in the PLC with the help of a small number of tags. Instead of the absolute address in the PLC, you use tags in order to be able to change the address in Runtime.

### Requirement

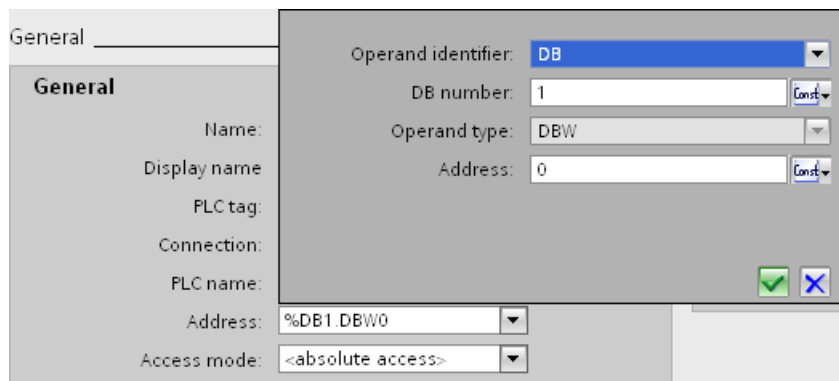

- The tag for address multiplexing is created and connected to the PLC.
- The Properties window for this tag is open.

### Procedure

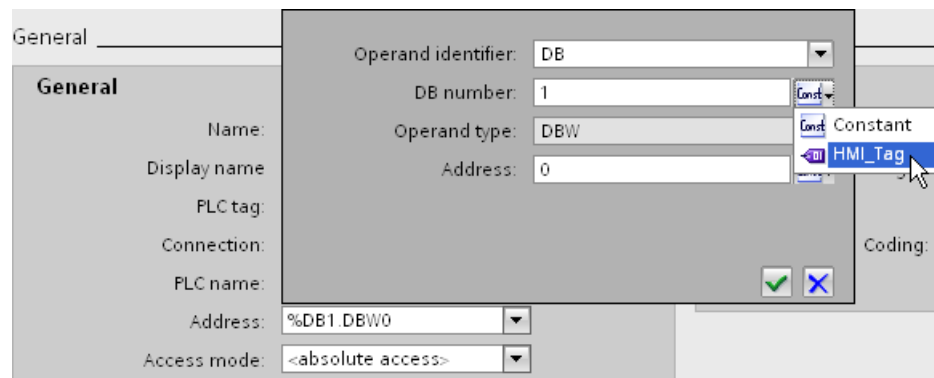

1. Select the tag for address multiplexing in the tag table, and select "Properties > Properties > General" in the Inspector window. The general properties of the tag are displayed.

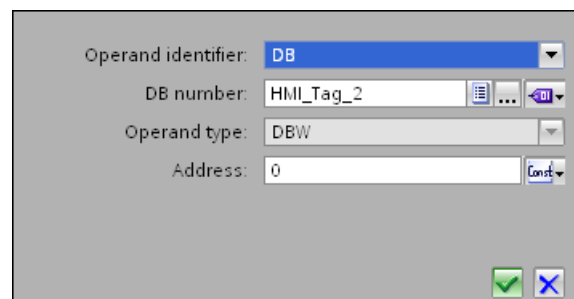

2. Select the "Int" data type for this example.
3. Select the access type "Absolute addressing".
4. Click the selection button in the "Address" field. The address dialog opens.

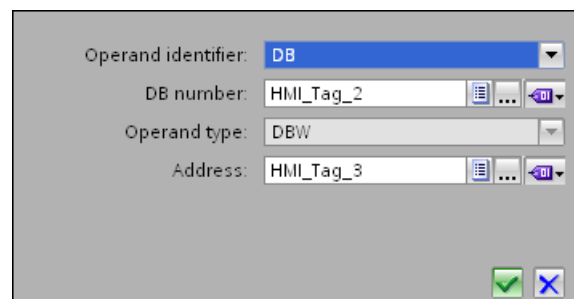

- Click the selection button in the "DB number" field and select the entry "HMI tag".

- In the "DB number" field, click the  button and select a tag for the DB number in the object list. Or create a new tag with the help of the object list. Accept the tag by clicking the  button.

- Repeat steps 3 and 4 for the "Address" field and configure a further tag for calling the address area in the data block.

The selection options in the Address dialog depend on the selected data type of the multiplex tag. The Address dialog offers only address settings that can be configured with the selected data type.

## Result

In runtime, the multiplex tag is used to access the memory location corresponding to the address currently found in the tag. You control access to the data block with the tag in the DB

number field. You control access to the address in the selected data block with the tag in the "Address" field.

---

**Note**

The value in the memory location will only be read at the next update cycle for the addressed tag.

If, for example, you use a multiplex tag in a script, do not attempt to access contents of the memory location directly after changing it.

---

Tag Limits (Page 3515)

**Configuring address multiplexing with symbolic addressing**

**Introduction**

When using address multiplexing, you can efficiently access different addresses in the PLC with the help of a small number of tags. Instead of the symbolic address in the PLC, you use tags in order to be able to change the address in Runtime.

**Requirement**

- The tag for address multiplexing is created.
- The Properties window for this tag is open.
- A data block with an array tag is created in the connected PLC.
- The data block was compiled.

## Procedure

1. Select the tag for address multiplexing in the tag table, and select "Properties > Properties > General" in the Inspector window. The general properties of the tag are displayed.

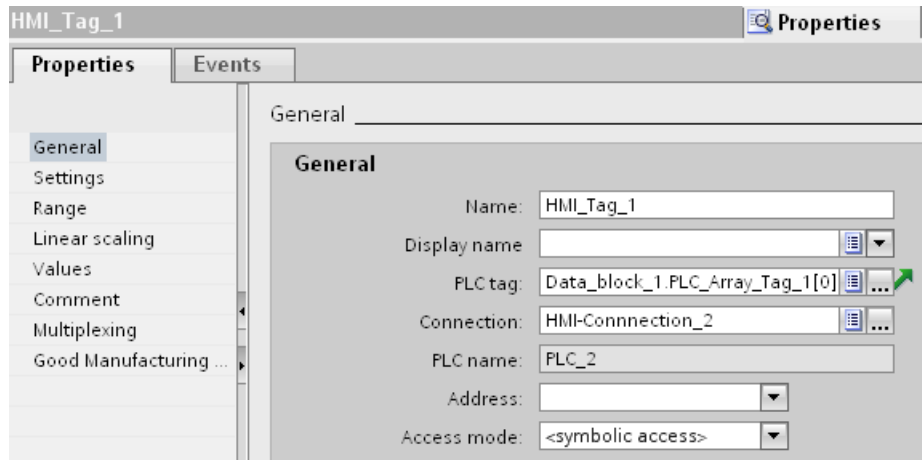

2. Select the connection to the PLC via the "Connection" field.

3. Select the access type "Symbolic addressing".

4. Navigate to the data block of the PLC via the "PLC tag" field and select an array element of the array tag.

5. Click the selection button in the "Address" field. The address dialog opens.
6. Click the selection button in the "Index tag" field and select the entry "HMI tag".

7. In the "Index tag" field, click the ... button and select a tag for the array index in the object list. Or create a new tag with the help of the object list. Accept the tag by clicking the ✓ button.

## Result

In Runtime, the array element whose index value is contained in the index tag is accessed.

## See also

Indirect addressing of tags (Page 3529)  
Tag Limits (Page 3515)

## Special configuration options

### Indirect addressing of tags

#### Principle

In multiplexes, a type of indirect addressing, the tag used is first determined at runtime. A list of tags is defined for the multiplex tag. The relevant tag is selected from the list of tags in runtime. The selection of the tag depends on the value of the index tag.

In Runtime, the system first reads the value of the index tag. Then the tag which is specified in the corresponding place in the tag list is accessed.

#### Application example

Using indirect addressing, you could configure the following scenario:

The operator selects one of several machines from a selection list. Depending on the operator's selection, data from the selected machine will be displayed in an output field.

To configure such a scenario, configure the index tag for a symbolic I/O field. Configure the multiplex tag at an I/O field. Configure the tag list of the multiplex tag to reflect the structure of the selection list.

If the operator selects another machine, the value of the index tag will change. The selection field then displays the content of the tag that is pointed to in the tag list in the multiplex tag by the new index value.

Basics of tags (Page 3497)  
Configuring address multiplexing with symbolic addressing (Page 3526)  
Creating external tags (Page 3505)

## Addressing tags indirectly

### Introduction

With indirect addressing, the tag used is first determined at runtime. Instead of a single tag, a list of tags is defined. The list entries consist of an index value and the name of the tag to be used. Using an index tag, you can control which entry in the tag list will be accessed.

### Requirement

- The tag which you wish to address indirectly must already exist.
- The index tag must exist.
- The tags which will be contained in the tag list must already exist.
- The Inspector window with the tag properties is open.

### Procedure

To address tags indirectly, proceed as follows:

1. In the Inspector window select "Properties > Properties > Multiplexing".
2. Select the "Multiplexing" option to activate indirect addressing.  
Using this option, you can temporarily switch off indirect addressing for testing purposes, for example. Settings which were made earlier for indirect addressing remain unchanged.
3. Select an "Index tag" or define a new tag using the object list.
4. Click the first entry in the "Tags" column in the tag list.
5. Select a tag as a list entry or define a new tag using the object list.  
The entry in the "Index" column will be generated automatically.
6. Repeat step 5 for all tags that you wish to add to the tag list.
7. If necessary, you can use drag-and-drop to change the order of the entries in the list.

### Result

In runtime, the system will dynamically access the tag in the tag list which has the same index value as the value currently in the index tag.

### See also

Indirect addressing of tags (Page 3529)

## Using tags to trigger functions

### Introduction

You can use the values of variables as the triggering event for an action in runtime. To start an action in Runtime, configure a function list for a tag. Include one or more system functions or VB scripts in the function list. The function list is processed when the configured event occurs.

The following events are available for a tag:

- Change in value of the tag  
Function list processing is triggered by each change in the value of the variable. When the tag is defined as an array tag, the function list is processed whenever an array element changes.
- Violation of the tag's high limit  
The function list is processed when the high limit is violated.
- Violation of the tag's low limit  
The function list is processed when the low limit is violated.

### Requirement

- The tag whose value you wish to use as an event already exists.
- The Inspector window with the properties for this tag is open.

### Procedure

To configure a tag with a function list, proceed as follows:

1. Under "Properties > Events >" in the Inspector window, select the event for which you want to create a function list.  
The function list associated with the selected event is shown.
2. Click "<Add function>". The second table column contains a selection button.
3. Click the selection button and select a system function.
4. Define the parameter values.

Alternatively, select a script to run in the function list, rather than a system function. The "VB scripts" entry is only displayed if there is a script available in the project.

### Result

If the configured event occurs in Runtime, the function list or the script is processed.

### See also

Indirect addressing of tags (Page 3529)

## Defining the acquisition cycle for a tag

### Introduction

The value of an external tag can be changed in Runtime by the PLC to which the tag is linked. To ensure that the HMI device is informed of any changes in tag values by the PLC, the values must be updated on the HMI. The value is updated at regular intervals while the tag is displayed in the process screen or is logged. The interval for regular updates is set with the acquisition cycle. The update can also be made continuous.

### Requirement

- You have created the tag for which you want to define an acquisition cycle.
- The Inspector window with the tag properties is open.

### Procedure

To configure an acquisition cycle for a tag, follow these steps:

1. In the Inspector window select "Properties > Properties > General."
2. If you want to update the tag at regular intervals as long as it is being displayed on the screen or logged, select "Cyclic in operation" as the acquisition mode.  
Or:  
If you want to update the tag at regular intervals even though it is not being displayed on the screen or logged, select "Cyclic continuous" as the acquisition mode.  
The "Cyclic continuous" setting is selected for a tag, for example, that has a function list configured for a change of its value and that is not directly visible in a screen.
3. Select the required cycle time in the "Acquisition cycle" field or define a new acquisition cycle using the object list.

Alternatively, you can configure the acquisition cycle directly in the work area of the tag table. To view hidden columns, activate the column titles using the shortcut menu.

---

#### Note

Only use the "Cyclic continuous" acquisition mode for tags that really have to be continuously updated. Frequent read operations generate a heavy communication load.

---

### Result

The configured tag is updated in Runtime with the selected acquisition cycle.

### See also

Indirect addressing of tags (Page 3529)

## 10.2.3 Working with arrays

### 10.2.3.1 Basics on arrays

#### Definition

Array data of a uniform data type is successively arranged and is addressed within the address space to allow access to these data by means of an index. The individual array elements are addressed by means of an integer index. Each array element is assigned the same properties which are configured at the array tag.

Default tag table			
Name ▲	Tag table	Data type	Connection
▼ HMI_Tag_1	Default tag table	Array [0..4] of Int	<Internal tag>
■ [0]	Default tag table	Int	<Internal tag>
■ [1]	Default tag table	Int	<Internal tag>
■ [2]	Default tag table	Int	<Internal tag>
■ [3]	Default tag table	Int	<Internal tag>
■ [4]	Default tag table	Int	<Internal tag>

#### Advantages

You can configure numerous array elements with the same properties all at once with a single array tag. You can then use each array element as any other tag in your configuration.

#### Restrictions

The following restrictions apply to the use of arrays:

- An array may contain only one dimension.
- The lower index of an array must begin with "0".

#### Application examples

Array tags can be used in the following situations:

- To group process values in profile trends: You map process values to trends which are acquired at different points in time, for example.
- To access specific values which are grouped in trends: For example, display all recorded values of the profile trend by gradually increasing the index tag.
- To configure discrete alarms with successive bit number.
- To save the complete machine data records in a recipe.

#### License rule for runtime

An array tag is counted in WinCC Runtime as 1 PowerTag, regardless of the number of array elements.

## Special features

 **WARNING**

**Increased system load and performance losses**

Read or write access to a single array element always includes read or write access to all array elements of the array tag. Transfer of the data of large arrays from and to the PLC usually takes longer compared to the transfer of a basic data type. This may cause communication overload and disruption as a result.

### Example:

- An array tag which consists of 100 array elements of data type "Real" was configured.
- If an array element with a length of 4 bytes changes, 100 x 4 bytes are written to the PLC.

### Use in scripts

To maintain performance, always use internal arrays to change arrays in scripts.

1. Copy the PLC array to the internal array at the start of the script.
2. Load on data transfer to the PLC is avoided while the script processes the internal array.

 **CAUTION**

**Data inconsistency at array tags**

If the value of a single element must be changed in an array tag, the whole array is read, changed and rewritten as a complete array. Changes carried out in the meantime to other array elements in the PLC are overwritten during rewriting.

You should always prevent the HMI device and the PLC from concurrently writing values to the same array tag. Use synchronous transfer of recipe data records to synchronize an array tag with the PLC.

### See also

Basics of tags (Page 3497)

Creating array tags (Page 3534)

Examples of arrays (Page 3536)

### 10.2.3.2 Creating array tags

#### Introduction

Create an array tag to configure a large number of tags of the same data type. The array elements are saved to a consecutive address space.

You can create an array tag as an internal tag or as an external tag.

If you want to create an array tag as an external tag, first configure an array tag in a data block of the connected PLC. You then connect the array tag to an HMI tag.

## Requirement

- The HMI tag table is open.

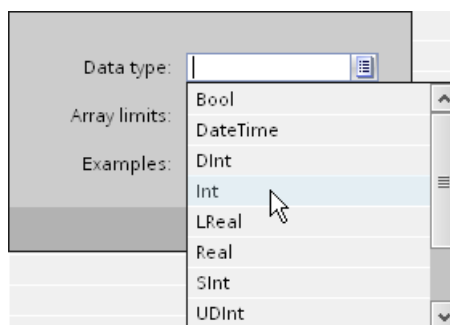

## Procedure

To create an array tag, follow these steps:

1. Double click <Add> in the "Name" column of the HMI tag table.  
A new HMI tag is created.
2. Click  in the Data type column and select the "Array" data type.
3. Click  in the data type column. The dialog box for configuring the array is opened.

4. Select the desired data type for the array tag in the "Date type" field.

5. Define the number of array elements in the "Array limits" field. The lower limit must begin with "0".
6. Click . The settings for the array are saved.
7. Save the project.

## Result

An array tag is created. The properties of the array elements are inherited from the parent array tag.

## See also

Basics on arrays (Page 3533)

### 10.2.3.3 Examples of arrays

#### Introduction

Array tags combine a number of tags, e.g. 100 array elements. You use array tags as complete arrays in the following places:

- In the "Alarms" editor
- In the "Recipes" editor
- For address multiplexing
- In the trend view

You use individual array elements everywhere in the configuration like HMI tags.

#### Examples

You can configure an array tag with the corresponding number of array elements to handle multiple tags of the same data type.

- The individual array elements can be accessed indirectly by means of a multiplex index tag, for example.
- Use these index tags to operate and monitor the array elements.

## See also

Basics on arrays (Page 3533)

### 10.2.4 Working with user data types

#### 10.2.4.1 Basics on user data types

#### Introduction

With user data types you bundle a number of different tags that form one logical unit. You create a user data type as a type and use instances of this type in the project. User data types are project-associated data and are available for all HMI devices of the project.

User data types differ in their association to a family of devices. User data types are available for the following families of devices:

- WinCC Runtime Advanced and Panels
- WinCC Runtime Professional  
WinCC Runtime Professional also supports the connection of PLC data types (UDTs) and user data types to HMITags.

User data types also differ in their applicability with a specific communication driver. User data types are available for the following communication drivers:

- SIMATIC S7-300/400
- SIMATIC S7-1200
- SIMATIC S7-1500

Create user data types and user data type elements in the project library.

## Principle

For example, the different conditions of a motor can be described using 6 unique Boolean tags.

Default tag table			
	Name	Data type	Connection
	Motor off	Bool	<Internal tag>
	slow forward	Bool	<Internal tag>
	fast forward	Bool	<Internal tag>
	slow backward	Bool	<Internal tag>
	fast backward	Bool	<Internal tag>
	error	Bool	<Internal tag>
	<Add new>		

If the overall condition should be described with a single tag, this tag can be created based on a user data type. For each of the individual Boolean tags you create a user data type element in the user data type.

This user data type can then be assigned complete to a faceplate for the motor. The created and released version of user data type is displayed at the tag in the "Data type" selection field.

The configured properties of a user data type are used in the instances of the user data type. If required, you change individual properties directly at the point of use, e.g. at a tag. Changing a property at the tag does not affect the user data type created.

### NOTICE

#### Availability of user data types

The connection of user data types to faceplates is only supported in WinCC Runtime Advanced and Panels.

## License regulation in Runtime

If you use external tags of the "User data type" data type in a faceplate instance, each user data type element is counted as a tag in Runtime.

## Example

You have created two screens in the "Screens" editor: Screen\_1 and Screen\_2.

3 instances of a faceplate type are inserted in Screen\_1. 4 instances of a faceplate type are inserted in Screen\_2.

Each faceplate instance is connected to an external tag of the "User data type" data type. The user data type includes 10 user data type elements.

Screen 1: 3 faceplate instances \* 10 user data type elements corresponds to 30 external tags = 30 PowerTags.

Screen 2: 4 faceplate instances \* 10 user data type elements corresponds to 40 external tags = 40 PowerTags.

In Runtime, 70 PowerTags are counted together for both screens. This also applies to the user data type elements that are not required.

## See also

Basics of tags (Page 3497)

Creating tags with a user data type data type (Page 3542)

Managing versions of user data types (Page 3541)

Creating user data type elements (Page 3540)

Creating a user data type (Page 3538)

### 10.2.4.2 Creating a user data type

#### Introduction

You create a user data type in the project library.

#### Requirement

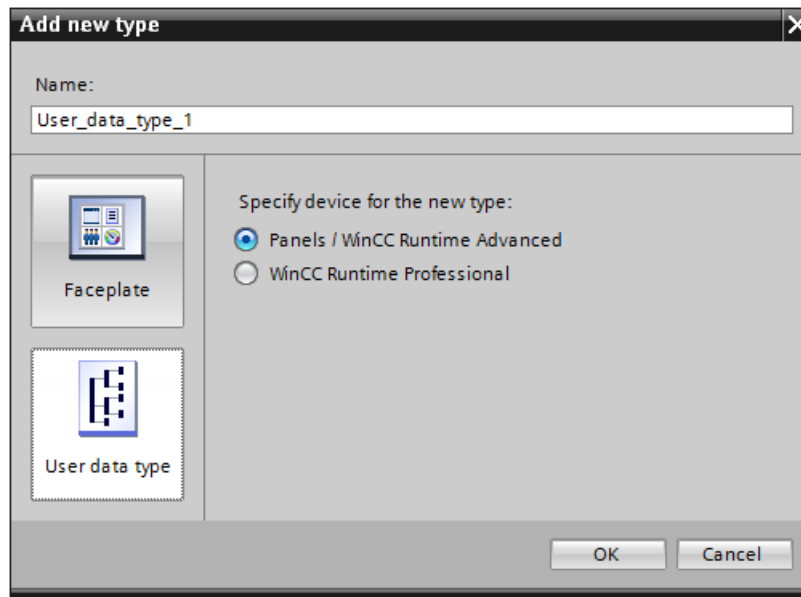

- A project is open.
- The "Libraries" task card is displayed or the library view is open.

#### Procedure

To create a user data type, follow these steps:

1. Click the "Libraries" task card.
2. Double-click the "Project library" item. The folder structure of the project library is open.

3. Click the "Create new type" button.  
A dialog opens.

4. Click the "HMI UDT" button in the dialog.
5. In the "Specify device for the new type" area select the HMI device on which the user data type is used.
6. Enter a descriptive name in the "Name" field.
7. Click "OK" to apply your settings. The user data type is created. The library view opens.

## Result

A user data type with the configured properties is created. Version 0.0.1 of the user data type is created and receives the status "in progress".

Create the required user data type elements in the next step.

Before you use the version of user data types, for example at a tag, the version must be released.

## See also

Basics on user data types (Page 3536)

Managing versions of user data types (Page 3541)

### 10.2.4.3 Creating user data type elements

#### Introduction

You define user data type elements in the library view. You add or delete elements in the "HMI user data types" table in the work area.

#### Requirement

- The library view is open.
- A user data type is created and opened in the editor.

#### Procedure

1. Select a communication driver for the user data type.
  - If you select the <Internal communication> entry, you can only assign the user data type to the internal tags as the data type.
  - If a connection to a PLC is selected as the communication driver, the user data type can only be assigned to tags with a connection to this PLC as the data type.
  - The communication type set applies to all user data type elements of a user data type. In a user data type for the "WinCC Runtime Professional" family of devices, you can define for each user data type element whether the configured driver is used for control or internal communication.
1. Double-click "Add" in the "Name" column of the table. A new user data type element is added to the user data type.
2. Assign a name.
3. Select the required data type in the "Data Type" field.
4. Create as many user data type elements as you need.
5. You configure the user data type elements in the "Properties" group in the Inspector window. Alternatively, you can configure the properties of the user data type elements directly in the table. To view hidden columns, activate the column titles using the shortcut menu.

#### Result

You have added elements to version 0.0.1 of the user data type. The version 0.0.1 has the status "in progress".

To use the version in the project, release the version in the next step.

#### See also

Basics on user data types (Page 3536)

#### 10.2.4.4 Managing versions of user data types

##### Introduction

All user data types have at least one version. When a user data type is created, a version is created at the same time and this version has the status "in progress". You can edit the user data type in this status as required. When the editing is complete, you release the version of the user data type.

##### Requirements

- You have created a user data type.
- The user data type has the version 0.0.1. and the status "In progress".
- The "Libraries" task card or the library view is open.

##### Releasing a version

1. Select the version 0.0.1 of the user data type in the project library.
2. Select "Release version" in the shortcut menu.  
A dialog opens.
3. If necessary, change the properties of the version:
  - Enter a name for the type in the "Name" field.
  - In the "Version" field, define a main and an intermediate version number for the version to be released.
1. Select the options for the release:
  - Select the check box "Delete all unused versions of the affected type" to delete all versions of the same type from the library if these are not assigned any instance in the project and no other dependencies exist.

You have released version 0.0.1 of the user data type.

##### Editing a version

1. Select, for example, the released version 0.0.1 of a user data type in the project library.
  2. Select "Edit type" in the shortcut menu.
- The library view opens. The new version 0.0.2 of the user data type is created.  
The version has the status "in progress".

##### Restoring the last version of a user data type

The last released version of the user data type is version 0.0.2.

You edit the user data type. A new version of the user data type, 0.0.3, is generated and receives the status "In progress".

1. Select the version of the user data type in the project library.
2. Select "Discard changes and restore version" in the shortcut menu.

Alternatively

1. If you have opened a version for editing, click "Discard version" in the toolbar.  
The version is deleted.

All changes to the user data type since the last release operation are discarded. The user data type is released again and has version 0.0.2.

### Deleting user data type

To delete a user data type, follow these steps:

1. In the project library, under "Types", select the user data type you want to delete.
2. Select "Delete" from the shortcut menu. If the user data type is being used in a faceplate, a request will be made to confirm deletion of the user data type.

If you delete a user data type, you also delete all user data type elements contained therein. The entry remains in the allocated tag. In the "Tags" editor, a colored background appears to draw your attention to the fact that an invalid data type has occurred by the deletion.

If you delete a user data type, all instances and copy templates of this user data type are deleted as well. You are informed by a warning message that the deletion action will delete existing instances or copy templates. Deletion starts after confirmation of the warning message with "OK".

### See also

Basics on user data types (Page 3536)

Creating a user data type (Page 3538)

### 10.2.4.5 Creating tags with a user data type data type

#### Introduction

When a tag is created, you assign the version of user data type as a data type. In the "Tag" editor you can create internal tags or tags with a link to a PLC. A tag has access to all user data type versions that use the same communication driver as the tag itself. In connection with a PLC, a user data type can only be used if the absolute addressing is selected.

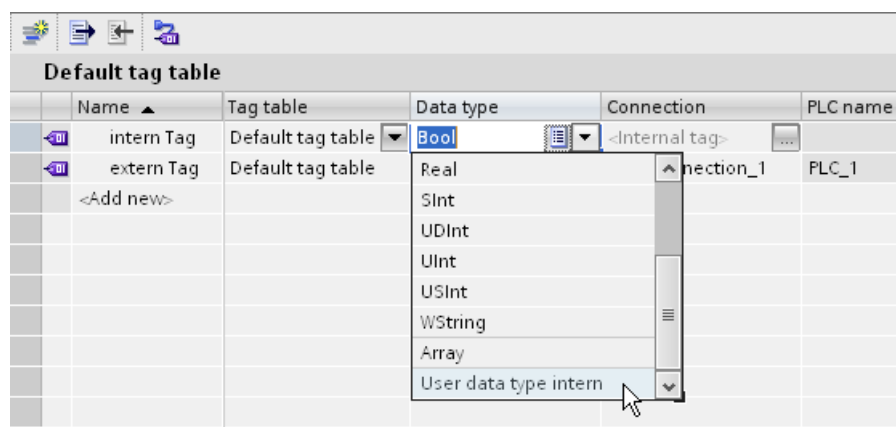

#### Requirement

- A user data type with a user data type element is created.
- The user data type is enabled.
- The tag table is open.
- The Inspector window with the tag properties is open.

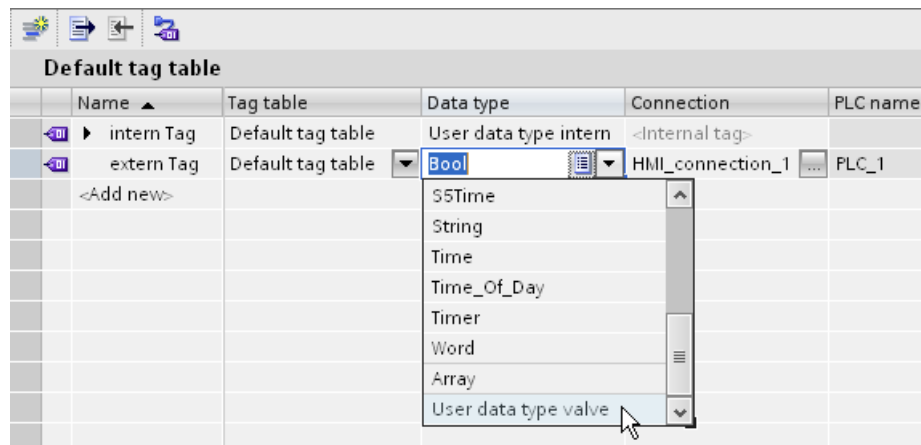

## Procedure

To create a tag of the "User data type" data type, follow these steps:

1. In the "Name" column, double-click "Add" in the tag table. A new tag is created.
2. In the Inspector window select "Properties > Properties > General".
3. Enter a unique tag name in the "Name" field.
4. Select the connection to the required PLC in the "Connection" box.
5. Select the desired version of the user data type in the "Data type" field.  
The selected connection determines which user data types will be displayed.  
For internal tags, only user data type versions of the <Internal user data type> type are available.

For tags with a connection to a PLC, only those user data types that have a link to a PLC can be accessed.

6. Enter the address of the PLC that you want to access with the external tags in the "Address" field of the "Settings" area. The specified address must always point to the start data bit, for example, <DB1.DBX0.0>.

## Result

You have created a tag of the "User data type" data type. In additional steps you can configure the tag, for example, by setting the start value and limits.

With tags of the "User data type" data type, you can connect the dynamic properties of a faceplate instance, which then supplies these properties with values in Runtime.

If you wish to change the properties of a user data type tag, you must change the properties of the user data type element.

Properties such as "Start value", "Use substitute value" or "Linear scaling" can be changed in the employed instances of the user data type.

Basics on user data types (Page 3536)

## 10.2.5 Working with cycles

### 10.2.5.1 Cycle basics

#### Introduction

Cycles are used to control actions that regularly occur in runtime. Common applications are the acquisition cycle, the logging cycle and the update cycle. You can also define your own cycles in addition to those already provided in WinCC.

#### Principle

In Runtime, actions that are performed regularly are controlled by cycles. Typical applications for cycles:

- Acquisition of external tags  
The acquisition cycle determines when the HMI device will read the process value of an external tag from the PLC. Set the acquisition cycle to suit the rate of change of the process values. The temperature of an oven, for example, changes much more slowly than the speed of an electrical drive.  
Do not set the acquisition cycle too low, since this will unnecessarily increase the communication load of the process.
- Logging process values  
The logging cycle determines when a process value is saved in the logging database. The logging cycle is always an integer multiple of the acquisition cycle.

The smallest possible value for the cycle depends on the HMI device that will be used in your project. For most HMIs, this value is 100 ms. The values of all other cycles are always an integer multiple of the smallest value.

If the cycles provided in WinCC do not meet the needs of your project, you can define your own cycles using the "Cycles" editor. User-defined cycles must always be an integer multiple of the smallest value.

---

**Note**

**Device dependency**

You cannot configure self-defined cycle times for Basic Panels.

---

### Application example

You can use cycles for the following tasks:

- To regularly log a process.
- To draw attention to maintenance intervals.

### See also

Basics of tags (Page 3497)

Defining cycles (Page 3545)

## 10.2.5.2 Defining cycles

### Introduction

Use cycles to control actions that are run at regular intervals in Runtime. You can also define your own cycles in addition to those already provided in WinCC.

### Requirement

You have opened the project.

### Procedure

1. Double-click the "Cycles" entry in the project navigation.  
The "Cycles" editor opens.
2. In the "Name" column of the "Cycles" editor, double-click "Add".  
A new cycle time is created.
3. Enter a unique name in the "Name" field.
4. Select the desired cycle unit.

5. Select the desired value for the cycle time.  
The available selection of values varies depending on the cycle unit selected. The smallest possible value for the cycle depends on the HMI device that will be used in your project. For most HMIs, this value is 100 ms. The available values are always an integer multiple of this value.
6. As an option, you can enter a comment regarding the use of the cycle.

## Result

The cycle you configured is created and beside the default cycles in WinCC for use during configuration.

## See also

Cycle basics (Page 3544)

## 10.2.6 Logging tags

### 10.2.6.1 Basic principles for data logging

#### Introduction

Data logging is used to collect, process and log process data from an industrial system.

When you analyze the logged process data, you can extract important business and technical information regarding the operational state of the system.

#### Application of the data logging

You can use data logging to analyze error statuses and to document the process. By analyzing data logs, you can extract the information necessary to allow you to optimize maintenance cycles, increase product quality and ensure that quality standards are met.

## See also

Data logging (Page 3547)

Logging Tags (Page 3550)

Basics of tags (Page 3497)

## 10.2.6.2 Data logging in Runtime Advanced and Panels

### Basics

### Data logging

### Introduction

Data is information that is collected during the process and saved in the memory of one of the connected automation systems. They represent the status of a plant in the form of temperatures, fill levels or switching states, for example. You define tags for acquiring and editing the process values in WinCC.

External tags are used in WinCC to collect process values and to access a memory address in the connected automation system. Internal tags are not connected to any process and are only available to the associated HMI device.

### Principle

The values of external and internal tags can be saved in data logs. Create a log tag for every tag and specify the log in which it is saved.

Data logging is controlled via cycles and events. Logging cycles are used to ensure continuous acquisition and storage of the tag values. You can also trigger tag logging in response to events, such as the change in value of a tag. Define these settings independently for each log tag.

In runtime, the tag values which are to be logged are captured, processed and stored in an ODBC database or a file.

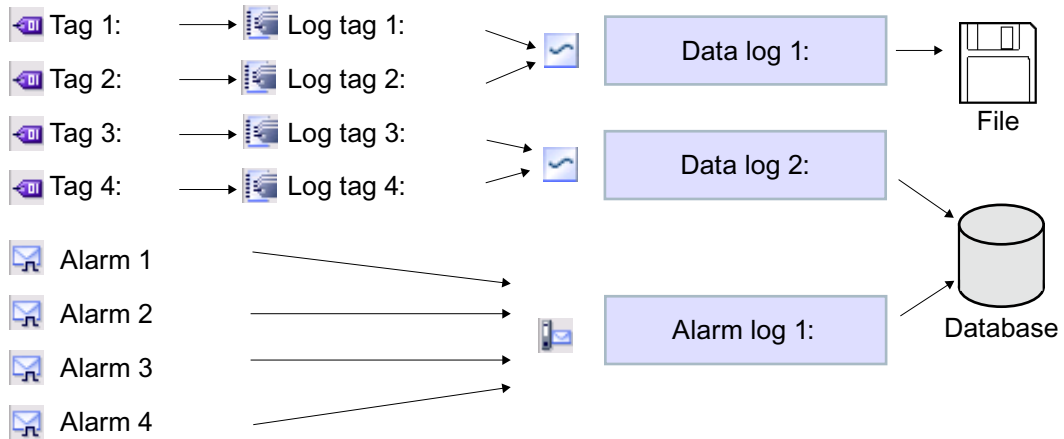

### Logging methods

In WinCC, you have access to the following logging methods:

- Circular log
- Segmented circular log
- Circular log which sends a system alarm message when it is full
- Circular log which executes system functions when it is full.

### Storage media and storage location

The logged data is stored in an ODBC database or in a file. An ODBC database is only available on a PC.

Depending on the hardware configuration of the HMI device, the data logs and alarm logs can be saved locally (on the hard disk of the PC or on the memory card on a panel) or, if available, on a network drive.

You can further process the saved data in other programs for analysis purposes, for example.

### Outputting logged data

In runtime, you can output the logged tag values as trends in the process screens.

### See also

Basic principles for data logging (Page 3546)

Storage locations of logs (Page 3548)

### Storage locations of logs

#### Storage location of a log

Depending on the HMI device used, you have several options of setting up the storage location for a data log you may be using in WinCC flexible.

#### File - CSV (ASCII)

Data is saved to a CSV file in standard ASCII format.

If you want to read or evaluate logged data without using WinCC Runtime, use the "CSV file" storage location.

---

**Note**

Double quotation marks or several characters are not permitted as list separators for the "CSV file" storage location. You can find the settings for list separators under "Start > Settings > Control Panel > Regional and Language Options".

---

### File - TXT (Unicode)

Data is stored in Unicode.

This file format supports all characters that can be used in WinCC and WinCC Runtime. For editing, you will need software that can save files in Unicode, such as Notepad.

---

**Note**

Use "File - TXT (Unicode)" as the storage location to log Asian languages.

---

### File - RDB

Data is saved with quick access in a proprietary database.

If you require maximum read performance in Runtime, use the "RDB file" storage location.

### Logs with checksum

The following files are generated under special circumstances:

**\*.keep**

1. If a log is started without checksum and will be continued with a checksum.
2. If you update WinCC with a service pack or a new version and the Audit Trail or the log is continued with the checksum.

The content of the keep file will remain the same when compared with the original csv file or txt file.

**\*.bak**

If WinCC Runtime has determined a serious, irregular problem in the file.

### Database

Data is saved to a database which is set up for ODBC access by the PC administrator.

### See also

Data logging (Page 3547)

## Working with Data Logs

### Logging Tags

#### Introduction

In Runtime, you store tag values in logs. You can then analyze the logged data at a later date. You define the following conditions for logging a tag:

- The log tag, through which the values of the connected tag are logged.
- The data log in which the tag is stored.
- The cycle or the event with which the tag is stored.
- The value range within which the tag is stored.

---

#### **Note**

You use data logging mainly to log the values of external tags. You can also log the values of internal tags.

---

## Principle

Several steps come together during data logging:

- Creating and configuring the data log  
When you create a data log, you define the following settings:
  - General settings, such as name, size and storage location
  - Runtime start characteristics
  - Behavior when the log is full
- Configuring the logging of tags  
For every log tag, specify a data log in which the values of the connected tags and other information are logged, such as the time of logging.  
When and how often the values of a log tag are logged are also defined. You have the following options:
  - "On demand":  
The tag values are logged by calling the "LogTag" system function.
  - "On change":  
The tag values are logged as soon as the HMI device detects a change in the value of the tag.
  - "Cyclic":  
The tag values are logged at regular intervals. You can supplement the default cycles in WinCC with your own cycles based on the default cycles. The smallest value that can be set is 1 s. All other values are integer multiples of this value.  
You can also restrict the logging of values within or outside a tolerance band. In this way, the logging of values within a relevant range of values is restricted.

Note the following points if you want to log a tag on demand:

- Do not log this type of tag in a segmented circular log in which tags are logged in a continuous cycle or in response to changes.

Background:

- If logging takes place on demand only rarely, the log segment will be filled by cyclically-logged values, for example, and the next log segment will be created. If you then attempt to access the tag that was logged on demand, it will not be possible to display the tag since it is the current log segment that is accessed in Runtime. To remedy this, you should create a separate data log for tags that are logged only rarely.
- Further processing logged tag values  
You can analyze the logged tag values directly in your project, such as in a trend view, or in another user program, such as Excel.

Evaluating the checksum of log data (Page 3561)

## Creating a data log

### Introduction

Data logs are used to store values from external and internal tags in runtime. When you create a log, you must give it a name and define its size and storage location. In addition you can enter comments for each log.

### Requirement

- A project is open.
- The Inspector window is open.

### Procedure

To create a data log, proceed as follows:

1. Double-click on the "Historical Data" entry in the project tree.  
The editor for data logs and alarm logs opens.
2. Open the "Data logs" tab and double-click "Add" in the "Name" column of the "Data logs" editor.  
A new data log is created.
3. In the Inspector window select "Properties > Properties > General."
4. Enter a unique name for the log in the "Name" field.
5. Define the number of data records to be logged in each log in the "Number of data records per log" field.  
The size of a log is calculated as follows: The number of items \* the length of each tag value to be logged.  
In the Inspector window, the maximum size that the log can reach if the currently selected number of data records is observed is displayed beneath the "Number of data records" input field.
6. In the "Storage location" field, select whether the logged data should be stored in a file or in a database. The log can only be stored in a database on a PC.

7. If you selected "File" as the storage location, select the storage location for the file in the "Path" field.

On PC HMI devices, you save the log on the hard disk or on a network drive, if there is one. The syntax for path specification is as follows:

- For hard disk: <C:\My\_File\_Folder\My\_Archives\Machine\_1>
- For network drive: <\\My\_Fileservername\My\_File\_Folder\My\_Archives\Machine\_1>

Select one the following storage location for Panel HMI devices:

- Memory card  
Select the path <\Storage Card MMC>. Here, as required, a sub-folder can be specified, for example <\Storage Card MMC\My\_Archives\TagLogs>
- USB memory  
Select the path <\Storage Card USB>. Here, as required, a sub-folder can be specified, for example <\Storage Card USB\My\_Archives\TagLogs>
- Network drive  
The syntax to specify the path is as follows: <\\My\_Fileservername\My\_File\_Folder\My\_Archives\Machine\_1>

The selection available depends on the HMI device in use.

8. If you selected "Database" as the storage location, specify whether the data source name from the system should be used or whether you want to enter one yourself. In the latter case, enter a name for the data source.

9. If necessary, enter a descriptive text under "Comment" to document your project.

Alternatively you can configure log properties directly in the "Data log" editor. To view hidden columns, activate the column titles using the shortcut menu.

---

### Note

The characters which can be used in the name of the data source depend on the storage location.

If the "File" storage location is used, the following characters must not be used: \ / \* ? : " < > |

If the "Database" storage location is used, the following characters may be used: a-z A-Z 0-9 \_ @ # \$

However, the characters \_ @ # \$ may not be used as the first character of the name.

The names of logs must be unique in a project. Log names must also be unique if different storage locations are selected for different logs. You must also assign different names for alarm logs and data logs.

---

## Result

The data log is created.

You can now configure tags so that their values are stored in this log.

To continue the log configuration, perform the following steps:

- Define the restart characteristics of the log when Runtime is started.
- Define how the log should behave when it is full.
- Configure a function list for the "Overflow" event.

## See also

Logging Tags (Page 3550)

## Managing logging behavior when Runtime starts

### Introduction

When you configure a data log, you define the restart characteristics of the log when Runtime is started. You define whether the logging should start when Runtime starts in the log properties. You can also define whether an existing log will be continued or overwritten.

You define the restart characteristics separately for each log.

### Requirement

- A data log has been created.
- The "Data log" editor is open.
- The Inspector window with the log properties is open.

### Procedure

To configure the restart characteristics of a data log, proceed as follows:

1. Select the log for which you want to define the restart characteristics in the "Data Log" editor.
2. In the Inspector window select "Properties > Properties > Restart behavior."
3. If you want logging to start when Runtime starts, enable the "Enable logging at runtime start" option in the "Logging" area.  
You can also start logging in Runtime using the "StartLogging" system function, for example.
4. Select the restart behavior of the log in the "Log handling at restart" area.
  - The logged values are deleted and logging is started again with the option "Reset log".
  - The option "Append data to existing log" is used to append the values to be logged to the existing log.

Alternatively you can configure the restart characteristics of a log directly in the "Data log" editor table. To view hidden columns, activate the column titles using the shortcut menu.

### Result

Logging will start in runtime according to your settings.

## See also

Logging Tags (Page 3550)

## Controlling the Logging in relation to the Fill Level

### Introduction

The size of a log is determined by the number of entries. You use the logging method to determine how the log responds when it is full.

### Logging methods

The following logging methods are available:

-  Circular log  
When the configured log size has been reached, the oldest entries are deleted. When the configured log size has been reached, approx. 20% of the oldest entries are deleted. It is therefore not possible to display all the configured entries. During configuration, select an appropriate size for the circulation log. Alternatively, configure a segmented circular log.
-  Segmented circular log  
In a segmented circular log, multiple log segments of the same size are filled in succession. When all logs are completely full, the oldest log is overwritten.
-  Log that sends a system alarm when it is full  
When a defined level is reached, such as 90 %, a system alarm is triggered. When the log is 100% full, new tag values are not logged.
-  Log with level-dependent triggering of an event.  
When the log is completely full, the "Overflow" event is triggered. Configure a function list for the event that will be carried out when the "Overflow" event occurs. When the configured size of the log is reached, new tag values are not logged.  
The following system functions are available for further processing of full logs: For further details, refer to System functions for logs (Page 3559).

### Requirement

- A data log has been created.
- The "Data log" editor is open.
- The Inspector window with the log properties is open.

## Procedure

1. Select the log for which you want to define the logging method in the "Data Log" editor.
2. Select "Properties > Properties > Logging method" in the Inspector window and select the required logging method.
3. If you have selected the "Segmented circular log" type, enter the number of log segments. If you selected a log with the "Display system alarm on" setting, specify the level as a percentage at which a system alarm is to be triggered. If you selected the "Trigger event" setting, configure the function list in the "Events" group.

Alternatively you can configure the logging method directly in the "Data log" editor table. To view hidden columns, activate the column titles using the shortcut menu.

The "Overflow" event is not available in the editor table. You must therefore configure the function list in the Inspector window.

## Result

The selected log responds according to the settings in Runtime.

## See also

Logging Tags (Page 3550)

System functions for logs (Page 3559)

## Logging process values

### Introduction

You can save the process values of a tag in a data log in Runtime. You define the following conditions for logging a tag:

- The log tag, through which the values of the connected tag are logged.
- In which log the values are stored
- The conditions under which the values are stored
- If only process values for a certain range of values are stored

To log the tag values, assign a logging tag to an HMI tag. The logging tag is stored in the data log and logs the values of the connected HMI tag. You can configure logging tags directly in the "HMI tags" editor. The "HMI tags" editor contains the "Logging tags" editing table.

HMI tags		
Name ▲	Data type	Connection
HMI_Tag_5	SInt	<Internal tag>
HMI_Tag_6	DInt	<Internal tag>
HMI_Tag_7	DInt	<Internal tag>

Discrete alarms			Analog alarms			Logging tags		
Discrete alarms			Analog alarms			Logging tags		
Name ▲	Assigned data log	Logging me	Name ▲	Assigned data log	Logging me	Name ▲	Assigned data log	Logging me
			Archive_Tag_5	Tag_Archive_2	Cyclic			

If the view of the "Logging tags" table is minimized, click the arrow button below the tag table.

HMI tags		
Name	Data type	Connection
HMI_Tag_1	Int	<Internal tag>
<Add new>		

Figure 10-3 The "Logging tags" table is displayed.

## Requirement

- The data log has been created.
- The tag for which you wish to configure the logging must already exist.
- The "Tags" editor is open.
- The "Logging tags" table is displayed.
- The Inspector window with the tag properties is open.

## Procedure

To log process values in a tag, proceed as follows:

1. Select a tag in the tag table.
2. Double-click "Add" in the "Name" field in the "Logging tags" table.  
A new logging tag is created; it is given the same name as the associated HMI tag.
3. Select the data log in which the values of the tags are to be logged under "Properties > Properties > General" in the Inspector window.
4. Select "Properties > Properties > Logging type" in the Inspector window and select the log type for logging.
  - "Cyclic": The tag values are logged in accordance with the set logging cycle.
  - "On change": The tag values are logged, as soon as the operator device detects a change in value.
  - "On demand": The tag values are logged by calling the "LogTag" system function.

5. If you want to log tag values cyclically, select a cycle time in the "Logging cycle" area. Alternatively, you can define your own cycle using the object list. The smallest value that can be set is 1 s. All other values are integer multiples of this value.
6. If you only want to log tag values outside or inside a defined value range, select "Properties > Properties > Deadband for logging" in the Inspector window. Define the values for the high and low limits.  
If you want to configure a dynamic limit, select "HMI tag" using the selection button. In the second field, select the tag that contains the limit.  
If you want to configure a fixed limit, select "Constant." Enter the limit value in the second field.  
If you want to leave a limit undefined, select "None".
7. Under "Scope", specify whether tag values are to be logged only if they are within the defined limits or only if they are outside the defined limits.

Alternatively, you can configure the logging of a tag directly in the "Logging tags" editor table. To view hidden columns, activate the column titles using the shortcut menu.

You can also fully configure a logging tag in the "Historical Data" editor.

## Result

The process values of the configured tag are logged in Runtime according to the selected settings.

---

### Note

To have the tag values actually logged in runtime, you must ensure that the data log is started. Logging can be started automatically at start up or by means of a system function. To automatically start the log, use the setting in the log Properties window.

---

Logging Tags (Page 3550)

## Triggering a system function when log is full

### Introduction

You can select a logging method that executes a function list as soon as the log is full.

### Application example

You can use system functions, for example, to swap the data from a full log file out to another log before the full log is overwritten. You can then continue to process the transferred data in another program. Assign the "CopyLog" system function to the "Overflow" event accordingly.

## Requirement

- A log with the "Trigger event" logging method is created.
- The "Data log" editor is open.
- The Inspector window with the data log properties is open.

## Procedure

To configure a system function for the "Overflow" event, proceed as follows:

1. Select the required log in the table in the "Data Log" editor.
2. In the Inspector window select "Properties > Events > Overflow."  
The function list will open.
3. Double-click "Add function" and select the desired system function.
4. Configure the required parameters of the selected system function.

## Result

During runtime, the function list will be executed as soon as the log is full.

## See also

Logging Tags (Page 3550)

## System functions for logs

### System functions

The following system functions are available for logging:

Function name	How it works
ArchiveLogFile	This function moves or copies a log to another storage location for long-term archiving. Use the system function if you want to move the Audit Trail, for example, from a local storage medium to the server.  With Audit Trails, always use the "Move log (hmiMove)" mode, otherwise you will be violating the FDA guideline by duplicating the data stored.
LogTag	Saves the value of the given tags in the given data log. Use the system function to log a process values at a specific time.
StartLogging	Starts the logging process in the specified log. You can interrupt logging in Runtime by calling the "StopLogging" system function.
StopLogging	Stops the logging process in the specified log. To resume logging in Runtime, select the "StartLogging" system function.
ClearLog	Deletes all entries in the specified log.
StartNextLog	Stops the logging process in the specified log. Logging is continued in the log segment that has been configured for the given log.

Function name	How it works
CloseAllLogs	Closes all logs. The connection between WinCC and the log files or log database is terminated. You can use this system function, for example, to enable hot-swapping of the storage medium on the HMI device without exiting the Runtime software.
OpenAllLogs	Opens all logs to resume logging. The connection between WinCC and the log files or log database is restored.
CopyLog	Copies the contents of the specified log to another log.

Logging Tags (Page 3550)

**Configuring a checksum for a log**

**Introduction**

In a regulated project, you have the option of assigning a checksum to the log data of an data log or alarm log. This checksum can be used during plant operation to determine if the data of this log has subsequently changed.

**Requirement**

- GMP compliant configuration is enabled.
- A data log or alarm log has been created.

**Procedure**

Proceed as follows to configure a data log or alarm log for the use of a checksum:

1. Open the data log or alarm log in the corresponding log editor.
2. In the "Storage location" box, select "File - CSV (ASCII)" or "File - TXT (Unicode)".

- Under "Properties > Properties > Logging method" in the Inspector window, select the option "Display system event at" or "Trigger event".

- In the editor table activate the option "Activate checksum". Columns that are not displayed are activated with the shortcut menu of the column title.

Name ▲	Storage location	Enable checksum
Tagarchive_1	CSV file (ASCII) ▼	<input checked="" type="checkbox"/>
<Add new>		

- Save the project.

## Result

The log data of the log is assigned a checksum in runtime.

- Logging Tags (Page 3550)
- Enabling GMP compliant configuration (Page 6143)
- GMP-compliant configuration (Page 6139)
- Evaluating the checksum of log data (Page 3561)

## Evaluating the checksum of log data

### Introduction

If you have configured a data log or alarm log with generation of a checksum, you can check if the log data has subsequently changed.

The DOS program "HmiCheckLogIntegrity" is available for checking the integrity of the log data.

The "HmiCheckLogIntegrity" program supports verification of the following files:

- Log files of alarm logs, data logs, and Audit in CSV format
- Log files of alarm logs, data logs, and Audit in TXT format
- Recipe data records in CSV format
- Recipe data records in TXT format

You can find the "HmiCheckLogIntegrity.exe" program in the installation directory of WinCC under the folder "WinCC Runtime Advanced", for example <C:\Program Files\Siemens\Automation WinCC Runtime Advanced>.

### Note

#### Audit Trail and Log with Checksum

Before you update WinCC with a Service Pack or a new version, exit and save the Audit Trail or the logs using checksum. After WinCC is updated, the audit trail or logs will be continued with new files using checksum.

Make sure that the logs are started at a defined state with the new version.

### Procedure

1. Copy the file to be checked from the HMI device to your configuration computer.
2. Open a command line prompt with "Start > Programs > Accessories > Command Prompt".
3. Enter the path to "HmiCheckLogIntegrity.exe" followed by a space in the command line prompt. After the space, enter the storage location of the file to be checked within quotation marks.
4. Press <Enter>.
5. The check is performed.  
When the checked data are consistent, the "Consistency check succeeded" message appears.

```
C:\WINDOWS\system32\cmd.exe

C:\>"D:\Program Files\Siemens\SIMATIC WinCC flexible\WinCC flexible 2008 Runtime
\HmiCheckLogIntegrity.exe" "C:\Logs\TagLog\Data_log_10.csv"

HmiCheckLogIntegrity utility

Checking file "C:\Logs\TagLog\Data_log_10.csv" for consistency...
Consistency check succeeded.

C:\>_
```

When the checked data are inconsistent, the "Consistency check failed" message appears. Information about the first inconsistent line in the file is also displayed.

```
C:\WINDOWS\system32\cmd.exe

C:\>"D:\Program Files\Siemens\SIMATIC WinCC flexible\WinCC flexible 2008 Runtime
\HmiCheckLogIntegrity.exe" "C:\Logs\TagLog\Data_log_10.csv"

HmiCheckLogIntegrity utility

Checking file "C:\Logs\TagLog\Data_log_10.csv" for consistency...
Consistency check failed, inconsistency detected at line 4!

C:\>_
```

---

**Note**

If there are spaces in the path to the "HmiCheckLogIntegrity.exe" program, you need to specify the path in quotation marks.

---

You can also check the integrity of the log data with the AuditViewer.

**Log response to language switching in runtime****Introduction**

In the "Device Settings" editor, select the language to be used for writing to logs in runtime.

**Requirements**

- The languages used in your project are activated in the "Project languages" editor, for example, "German (Germany)" and "English (USA)".

**Procedure**

1. Open the "Languages and fonts" editor.
2. Activate the runtime language, for example, "German (Germany)" and "English (USA)".
3. Set the "Language switch order":
  - German 0
  - English 1With "0", German is specified as the "Startup language".
4. Open the "Device settings" editor.
5. Select "Startup language" in the "Settings for Runtime" area.

**Result**

The project starts after it is transferred. German is specified as the "Startup language" with "Language switch order". The logs are now written in German. During runtime, the operator switches the runtime language to English. The logs will still to be written in German.

The operator closes runtime. Due to the previously performed language switch, the next time the system starts the "startup language" is English. Since English is the startup language, the logs are now written in English.

The logging language remains English even when the language is switched again in runtime until runtime is closed once again.

If you use another option instead of "Startup language" to select the language, the logs are always written in the same language. This is true regardless of the language selected by the operator in runtime.

## Direct access to the ODBC log database (Advanced)

### Overview

The storage location of a log can be a database or a file.

The database is addressed by means of its "Data source name" (DSN). Select the database to be used in WinCC as follows:

Select the database from the Windows Start menu under "Settings > Control panel > ODBC Data Sources".

In your configuration, specify the "Data source name" (DSN) instead of a directory name as storage path for log data. With the DSN, you are referencing the database and the storage location.

The entire functional scope of the database is available for additional processing and evaluation of log data.

### Application

The data source sets up the connection to the database. Create the data source on the same PC on which the Runtime software is stored. Then enter the DSN configured on this PC when you create a log in WinCC.

The ODBC interface allows you to use other programs, such as MS Access or MS SQL Server, to access the database directly.

In addition, you can use the "StartProgram" system function to configure program calls, e.g. MS Access, on the HMI device. Runtime is not interrupted while you configure such calls.

## Setting up the ODBC data source

### Introduction

To store process values or alarms in the log database in Runtime, set up the ODBC data source.

## Requirement

- A log database has been created.  
You create the log database using the SQL Enterprise Manager. You can find more detailed information on how to do this from Microsoft.

## Procedure

To set up an ODBC data source, follow these steps:

1. In Control Panel, open "Administrative Tools" and select "Data Sources (ODBC)".  
The "ODBC Data Source Administrator" dialog is opened.
2. Click "User DSN > Add".
3. Select the "SQL-Server" and click on "Finish".
4. In the dialog that follows, enter a name for the User DSN and the SQL-Server and click on "Next".
5. In the dialog that follows, define the logon procedure for the SQL database and click on "Next".
6. Activate "Change the default database to".
7. Select the database you have created and click on "Next".
8. In the dialog that follows, click "Finish".

## Logging tags in the "Historical Data" editor

### Configuring logging tags

#### Introduction

You can also create and edit logging tags in the "Historical Data" editor in WinCC. You also directly edit the properties of logging tags in the "Historical Data" editor.

---

#### Note

If you delete, move or copy in the "Historical Data" editor, the changes also take effect in the tag table.

---

## Requirement

- The "Data logs" tab is open in the "Historical Data" editor.
- A data log has been created.

**Procedure**

Proceed as follows to configure a logging tag in the "Historical Data" editor:

1. Select an existing data log in the "Data logs" table of the editor.  
Alternatively, double-click on "Add..." in the "Name" column to create a new data log.

Data logs				
Name	Storage loc...	Number of data re...	Path	Logging method
Tag_Log_1	File - RDB	500	\Storage Card MMC\Log	Circular log
<Add new>				

2. Double-click "Add ..." in the "Name" column of the editor "Logging tags" table.

Logging tags			
Name	Process tag	Acquisition mode	Logging cycle
Logging_Tag_1	<None>	Cyclic	5 s
<Add new>			

3. Enter a unique name for the logging tag in the "Name" field.
4. In the "Process tag" field, click on the selection button and select the process tag for logging in the object list.

Logging tags				
Name	Process tag	Acquisition mo..	Logging cycle	High limit
Logging_Tag_1	<None>	Cyclic	5 s	
<Add new>				

Name	Data type	Address
None		
Tag_1	Int	
Tag_2	Int	

5. Select the desired trigger mode in the "Log type" field:
  - "Cyclic": The tag values are logged in accordance with the set logging cycle.
  - "On change": The tag values are logged, as soon as the operator device detects a change in value.
  - "On demand": The tag values are logged by calling the "LogTag" system function.

6. If you want to log tag values cyclically, select the desired cycle time in the "Logging cycle" area. Alternatively, you can define your own cycle using the object list. The smallest value that can be set is 1 s. All other values are integer multiples of this value.
7. Configure additional parameters for logging in the table of the editor or in the Inspector window.

## Result

The configured logging tag is created in the "Historical Data" editor and is also displayed in the tag table.

## 10.2.7 Displaying Tags

### 10.2.7.1 Displaying tags with Basic Panels

## Outputting tag values in screens (Basic)

### Introduction

In runtime you can output tag values in the screens of the operator device in the form of a trend. A trend is a graphic representation of the values that a tag takes during runtime. Use the "Trend display" graphic object to represent it. Process values for the trend display are loaded by the PLC from the ongoing process.

The values to be displayed are determined individually within a fixed, configurable cycle. Cyclically-triggered trends are suitable for representing continuous curves, such as the changes in the operating temperature of a motor.

### Displayed values

You will need to configure a trend view in a screen so that tag values are displayed on the HMI device. When configuring the trend view, specify which tag values are to be displayed.

You can control the updating of the trend display by defining the cycle time.

## See also

Configuring trend display for values from the PLC (Basic) (Page 3568)

Basics of tags (Page 3497)

## Configuring trend display for values from the PLC (Basic)

### Introduction

You use a trend view to graphically represent values that a tag assumes during the process.

### Requirement

- A screen is open.
- The Inspector window with the trend view properties is open.

### Procedure

To configure a trend view, follow these steps:

1. Add the "Trend view" object from the toolbox in the "Control" group to the screen.

2. Select the "Trend" category from the "Properties" group in the Inspector window and double-click "<Add>" in the "Name" column.

3. Assign a name to the trend in the "Name" column.
4. In the "Style" column, use the selection button to open the "Style" dialog and select the style of the line.
5. Select the number of trend values in the "Trend values" column.

- In the "Settings" column, use the selection button to open the "Data source" dialog and select the tags to supply the trend with values. Specify the cycle for reading the tags from the PLC.

- You can make other settings in the dialogs of the Inspector window. For example, you can select the "Display table" option in the "Table" category to display a value table beneath the trend view.

---

#### Note

If you hold down the <CTRL> key and double-click the trend view, the trend view is activated. You set the column width and the position of the columns in the table header of the values table in active mode. In order to activate the trend view the zoom factor has to be set to 100 %.

---

## Result

In runtime, the values of the selected tags are displayed in the configured trend view.

## See also

Outputting tag values in screens (Basic) (Page 3567)

### 10.2.7.2 Displaying tags with Runtime Advanced and Panels

## Trends

### Introduction

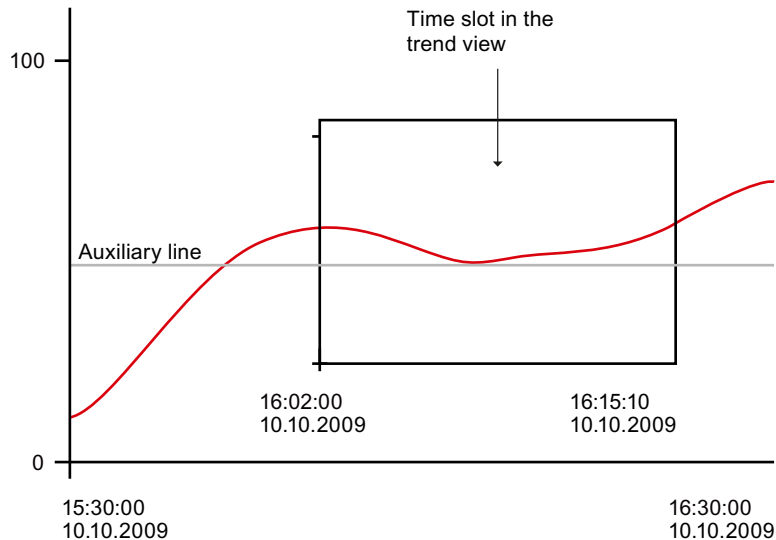

A trend is a graphic representation of the values that a tag takes during runtime. In order to display trends, configure a trend view in a screen of your project.

To configure the trend view, specify a trend type for the values to be displayed.

- Log: For displaying the logged values of a tag
- Cyclical real time: For time-triggered display of values
- Bit-triggered real time: For event-triggered display of values
- Bit-triggered buffer: For event-triggered display with buffered data acquisition

## Displaying logged values

In Runtime, the trend view displays the values of a tag from a data log. The trend shows the logged values in a particular window in time. The operator can move the time window in Runtime to view the desired information from the log.

## Pulse-triggered trends

The values to be displayed are determined individually with a definable time pattern. Cyclically-triggered trends are suitable for representing continuous curves, such as the changes in the operating temperature of a motor.

## Bit-triggered trends

The values to be displayed are event-driven by setting a defined bit in "Trend transfer" tags. The bit is reset after reading has been completed. Bit-triggered trends are useful for displaying fast-changing values, such as the injection pressure for producing plastic parts.

## Bit-triggered trends with buffered data acquisition

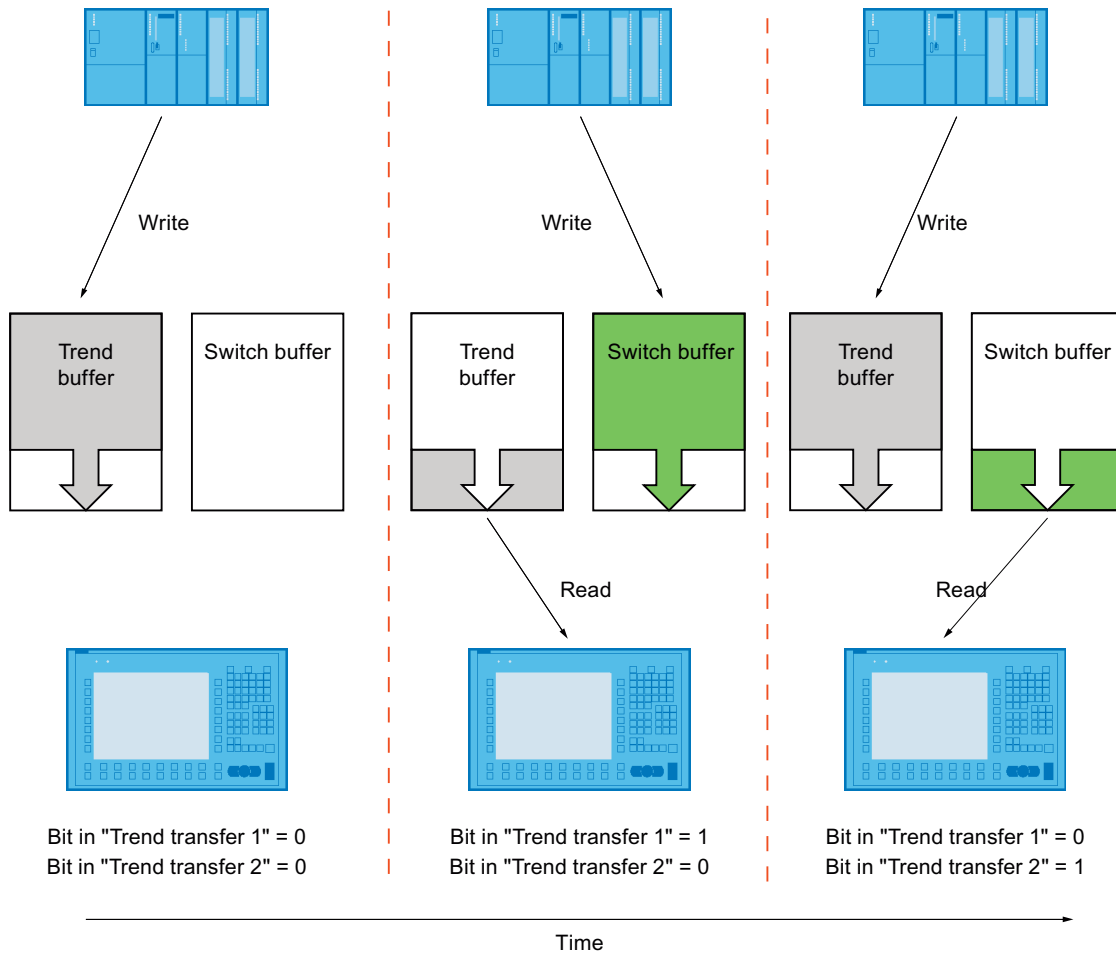

When you set buffered data acquisition, the values to be displayed are buffered in the PLC and read in bit-triggered as a block. These trends are suitable for displaying rapid changes when the course of the trend as a whole is interesting and not so much the individual values.

You configure a switch buffer in the PLC so it can continue to write the new values while the trend buffer is being read. The switch buffer ensures that the PLC does not overwrite values while the operator devices reads the values for the trend.

The switch between the trend buffer and the switch buffer functions as follows:

Whenever the bit assigned to the trend is set in the "Trend transfer 1" tag, all the values are read simultaneously from the trend buffer and are displayed as a trend on the HMI device. The bit in "Trend Transfer 1" is reset after reading has been completed.

While the operator device is reading the tag values from the trend buffer, the PLC writes the new tag values into the switch buffer. When the bit which is assigned to the trend is set in the "Trend transfer 2" tag, all the trend values are read from the switch buffer and displayed at the operator device. While the operating device is reading the switch buffer, the PLC writes again to the trend buffer.

## Outputting tag values in screens

### Introduction

In runtime you can output tag values in the screens of the operator device in the form of a trend. The process values are loaded by the PLC from the current process or from a log database.

### Displayed values

You will need to configure a trend view in a screen so that tag values are displayed on the HMI device. When configuring the trend view, specify which tag values are to be displayed.

The following options are available:

- Current values from the PLC  
Writing of the trend is continued with individual values from the PLC. The following trigger types are available for display in real time:
  - Bit-triggered real time: The time of the update can be controlled by setting a bit. Bit-triggered trends are normally used to visualize rapidly changing values. One example might be the injection pressure in the production of plastic parts.
  - Cyclical real time: You control the update time with a cycle. Cyclically-triggered trends are suitable for representing continuous curves, such as the changes in the operating temperature of a motor.
  - Bit-triggered buffer: The trend contains values that were stored in a buffer in the period between two reads from the PLC. Use this format pattern if the course of the trend as a whole is more interesting than the individual values.
- Logged tag values  
In runtime, the trend view displays the values of a tag from a data log. The following trigger type is available to display logged tag values:
  - Data log: The trend shows the logged values in a particular window in time. To obtain the requested information from the archive, the operator uses the corresponding operator controls in the screen or in the trend view.

## Configuring trend displays for values from the PLC

### Introduction

You use a trend view to graphically represent values that a tag assumes during the process.

### Requirement

- A screen is open.

### Procedure

To configure a trend view, follow these steps:

1. Add the "Trend view" object from the toolbox in the "Controls" group to the screen.
2. Select "Properties . Properties > Trend" in the Inspector window and double-click "Add" in the "Name" field. A new trend is created.
3. If required, enter a unique name for the trend in the "Name" field.
4. In the "Style" column, use the selection button to open the "Style" dialog and select the style of the line.
5. Select the number of trend values in the "Trend values" column.

6. In the "Trend type" column, select the required trend type. The following entries are available:
  - "Bit-triggered real time"
  - "Cyclical real time"
  - "Bit-triggered buffer"
  - "Data log"
7. In the "Settings source" column, use the selection button to open the "Data source" dialog and select the tags to supply the trend with values.  
If you selected the "Cyclical real time" trend type, specify a cycle for reading the tags from the PLC.  
Only for bit-triggered trends:
  - Under "Bit", specify which bit of the "Trend request" tag and of the "Trend transfer" tags are to be assigned to the trend. Select a different value for each trend.
  - Enter a tag under "Trend request" which contains at least as many bits as trends are to be displayed in the trend view. The status of the bits of these tags specifies which trend is currently being displayed at the operator device.Only for the trend type "Bit-triggered real time":
  - Enter a tag under "Trend transfer" which contains at least as many bits as trends are to be displayed in the trend view. The status of the bits of these tags specifies for which trend values are to be read from the PLC.Only for the trend type "Bit-triggered buffer":
  - Enter a buffer tag for the switch buffer. The tags have to be of the same type and of the same length as the trend tag.
  - Enter a tag each under "Trend transfer 1" and "Trend transfer 2" which contains at least as many bits as trends are to be displayed in the trend view. The status of these tag bits specifies the trend for which values will be read from the PLC. "Trend transfer 1" controls reading from the trend buffer; "Trend transfer 2" controls reading from the switch buffer.
8. You can make other settings in the dialogs of the Inspector window. For example, you can select the "Display table" option in the "Table" category to display a value table beneath the trend view.

---

#### Note

If you hold down the <CTRL> key and double-click the trend view, the trend view is activated. You can set the column width and the position of the columns in active mode in the values table. In order to activate the trend view the zoom factor has to be set to 100 %.

---

## Result

In runtime, the values of the selected tags are displayed in the configured trend view.

## Configuring a trend view for a data log

### Introduction

You can use a trend view to display logged tag values in Runtime. The trend view shows the logged tag values in a particular window in time. To obtain the requested information from the archive, the operator uses the corresponding operator controls in the screen or in the trend view.

### Application example

At the end of a shift, for example, an operator wants information about the process carried out during the shift.

### Requirement

- A data log has been created.
- A screen is open.
- The Inspector window with the trend view properties is open.

### Procedure

To configure a trend view to display values from a data log, follow these steps:

1. Add the "Trend view" object from the toolbox in the "Controls" group to the screen.
2. Select "Properties . Properties > Trend" in the Inspector window and double-click "Add" in the "Name" field. A new trend is created.
3. If required, enter a unique name for the trend in the "Name" field.
4. In the "Style" column, use the selection button to open the "Style" dialog and select the style of the line.
5. In the "Trend type" column, select the trend type "Data log".
6. In the "Settings" column, use the selection button to open the "Data source" dialog; select the data log and the tags to supply the trend with values.
7. You can make other settings in the dialogs of the Inspector window. For example, you can select the "Display table" option in the "Table" category to display a value table beneath the trend view.

---

#### Note

If you hold down the <CTRL> key and double-click the trend view, the trend view is activated. You can set the column width and the position of the columns in active mode in the values table. In order to activate the trend view the zoom factor has to be set to 100 %.

---

## Result

In runtime, the logged values of the selected tags are displayed in the configured trend view.

## The structure of a \*.CSV file with tags

### Introduction

In the \*.csv (comma-separated value) file format, the "Name" and "Value" table columns of the entry are separated by semicolons. Each table row ends with a line break.

### Example of a \*.CSV file

The example shows a file with logged tag values:

```
"VarName";"TimeString";"VarValue";"Validity";"Time_ms"
```

```
"Var_107";"01.04.98 11:02:52";66,00;1;35886460322,81
```

```
"Var_108";"01.04.98 11:02:55 AM";60.00;1;35886460358.73
```

```
"Var_109";"01.04.98 11:02:57 AM";59.00;1;35886460381.22
```

### Structure of a log file in \*.csv format

The following values are entered in the individual columns of a log file:

Parameters	Description
VarName	Name of the tag from WinCC
Time string	Time stamp as a STRING, e.g. readable data format
VarValue	Value of the tag
Validity	Validity: 1 = value is valid 0 = an error occurred (e.g. interrupted connection)
Time_ms	Specify a time stamp as a decimal value (see below for conversion). Only needed to display the tag values in a trend.

## Conversion of the time stamp decimal value

If the value needs to be processed using a different program, proceed as follows:

1. Divide Time\_ms by 1,000,000.  
Example: : 36343476928:1 000 000 = 36343,476928
2. The whole number portion (36344) is the date calculated from 31.12.1899.  
Example: 36343 results in 02.07.1999  
You can now convert the time stamp value to days in Excel by assigning a corresponding format from the "Date" group to the cells, which contain the time stamp.  
Result: 37986 results in 31.12.2003
3. The value after the comma (0,476928) indicates the time:
  - Multiply the value (0.476928) by 24 to obtain the hours (11.446272).
  - Multiply the remainder (0.446272) by 60 results in the minutes (26.77632).
  - Multiply the remainder (0.77632) by 60 results in the seconds (46.5792).Result 11:26:46.579  
This conversion is supported by Microsoft Excel, for example.

## Accessing the ODBC log database directly

### Introduction

The storage location of a log can be a database or a file.

The database is addressed by means of its "Data source name" (DSN). Select the database you want to use in WinCC from the Windows Start menu under "Settings > Control panel > ODBC Data Sources".

To store log data, specify the DSN, rather than a directory name during configuration. With the DSN, you are referencing the database and the storage location.

### Application

The entire functional scope of the database is available for additional processing and evaluation of log data.

### Principle

The data source establishes the connection to the database. You create the data source on the same computer that contains the Runtime software. Then enter the DSN configured here when you create a log in WinCC.

The ODBC interface allows you to use other programs, such as MS Access or MS SQL Server, to access the database directly.

With the "StartProgram" system function, you can also configure a program call (to MS Access, for example) on the HMI device. This does not interrupt Runtime.

## 10.3 Working with alarms

### 10.3.1 Basics

#### 10.3.1.1 Alarm Logging in WinCC

##### Introduction

The alarm system allows you to display and record operating states and faults on the HMI device that are present or occur in a plant.

An alarm may have the following content:

N o.	Time	Date	Alarm text	Status	Alarm class
5	12:50:24 :590	24.02. 2007	Boiler pressure above high limit.	Incoming Outgoing	Warning: Color Red

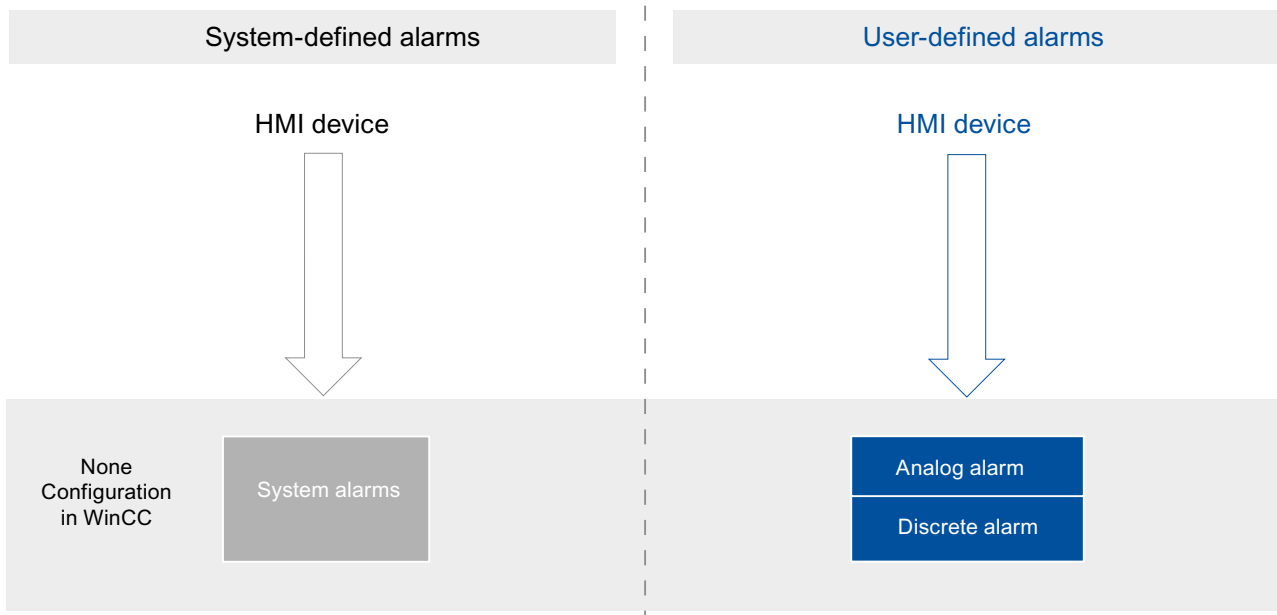

##### Alarm system in WinCC

The alarm system processes a variety of alarm types. The alarm procedures can be broken down into system-defined alarms and user-defined alarms:

- User-defined alarms are used to monitor the plant process.
- System-defined alarms monitor the HMI device.

The detected alarm events are displayed on the HMI device. Targeted access to the alarms combined with supplementary information about individual alarms ensures that faults are localized and cleared quickly. This reduces stoppages or even prevents them altogether.

The following figure shows the alarm system structure:

### 10.3.1.2 Alarm Logging in WinCC

#### Introduction

Alarm logging allows you to display and record operating states and faults on the HMI device that are present or occur in a plant.

An alarm may have the following content:

N o.	Time of day	Date	Alarm text	Status	Alarm class
5	12:50:24 :590	24.02. 2007	Boiler pressure above high limit.	Incoming Outgoing	Warning: Color Red

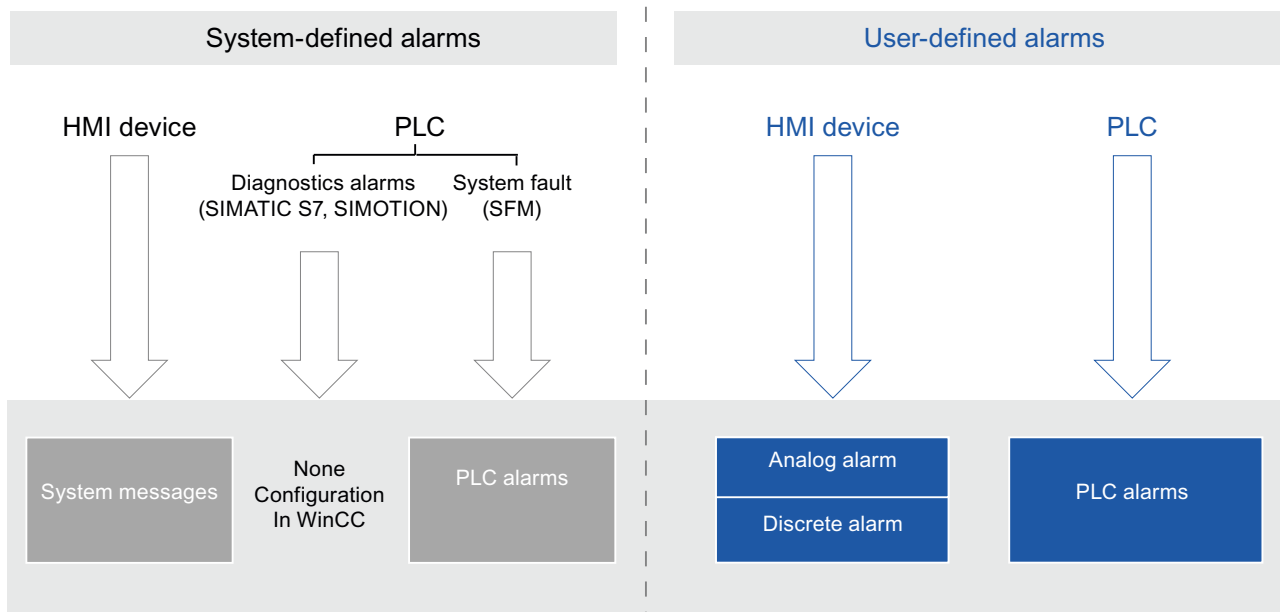

#### Alarm Logging in WinCC

Alarm logging processes various alarm procedures used by the PLC and the HMI device. The alarm procedures can be broken down into system-defined alarms and user-defined alarms:

- User-defined alarms serve to monitor the plant.
- System-defined alarms are used to monitor the HMI device or the PLC.

The detected alarm events are displayed on the HMI device. You can use the alarm logging system to log alarms from the ongoing process. Targeted access to the alarms combined with supplementary information about individual alarms ensures that faults are localized and cleared quickly. This reduces stoppages or even prevents them altogether.

The following figure shows the alarm logging structure:

### 10.3.1.3 Alarm Procedures

#### Overview of the alarm types

##### Introduction

The alarm types serve various purposes for monitoring the plant. The alarms from the individual alarm types are configured and triggered in different ways.

Select the relevant tab in the "HMI alarms" editor to configure alarms based on the individual alarm types.

## Alarm types in WinCC

WinCC supports the following alarm types:

### User-defined alarms

- **Analog alarms**
  - Analog alarms are used to monitor limit violations.
- **Discrete alarms**
  - Discrete alarms are used to monitor states.

### System-defined alarms

- **System events**
  - System events belong to the HMI device and are imported into the project.
  - System events monitor the HMI device.

## Overview of the alarm types

### Introduction

The alarm types serve various purposes for monitoring the plant. The alarms from the individual alarm types are configured and triggered in different ways.

Select the relevant tab in the "HMI alarms" editor to configure alarms based on the individual alarm types.

## Alarm types in WinCC

WinCC supports the following alarm types:

## User-defined alarms

- **Analog alarms**
  - Analog alarms are used to monitor limit violations.
- **Discrete alarms**
  - Discrete alarms are used to monitor states.
- **Controller alarms**
  - You configure controller alarms in STEP 7.
  - You continue to process the controller alarms in WinCC.

---

### Note

#### Device dependency

The controller alarm is not supported on all HMI devices.

---

## System-defined alarms

- **System-defined controller alarms**
  - System-defined controller alarms consist of diagnostic alarms (SIMATIC S7) and system errors (SFM)
  - System-defined controller alarms are used to monitor the PLC.

---

### Note

#### Device dependency

System-defined controller alarms are not supported on all HMI devices.

---

- **System events**
  - System events belong to the HMI device and are imported into the project.
  - System events monitor the HMI device.

## User-defined alarms

### Analog alarms

#### Description

Analog alarms signal limit violations during the process.

#### Example

The speed of the mixer in a fruit juice mixing plant must not be too high or too low. You can configure analog alarms to monitor the speed of the mixer. If the high or low limit for the speed

of the mixer is violated, an alarm is output on the HMI device containing the following alarm text, for example: "Mixer speed is too low".

## Discrete alarms

### Description

Discrete alarms indicate a status in the current process.

### Example

A fruit juice mixing plant consists of several tanks containing the ingredients. To ensure the correct mixing ratio of water, fruit concentrate, sugar, and flavoring, the valves in the intakes open and close at the right moment. This operation should be monitored.

You configure a suitable discrete alarm for all the valve states. If a valve on one of the four tanks opens or closes, an alarm is displayed, such as "Water valve closed".

The operator can thus monitor whether the plant is producing correctly.

## PLC alarms

### Example of an alarm

CPU operating mode switch to Stop

### Description

The custom controller alarms are created by the control system engineer in STEP 7. The status values, such as time stamp and process values, are mapped in the controller alarm. If controller alarms are configured in STEP 7, accept them into the integrated WinCC operation as soon as a connection is established to the PLC.

In STEP 7, the controller alarm is assigned to an alarm class. You can import this alarm class with the controller alarm as a common alarm class.

## Types of controller alarms

SIMATIC S7 supports different types of controller alarms. WinCC supports different types of controller alarms according to which Runtime is used.

## Controller alarms for multiple HMI devices

If a PLC is connected to multiple HMI devices, the project engineer assigns display classes to the controller alarms in STEP7. The display classes determine the allocation to the HMI device. You can activate the display classes for your HMI device that are to be displayed on it. In this case, only the controller alarms from this display class will be displayed on the HMI device. Up to 17 display classes are possible.

## See also

Editing controller alarms (Page 3609)

## System-defined Alarms

### System events

### Examples for alarms

- "An online connection to the PLC is established."

### Description

A system alarm indicates the status of the system, plus communication errors between the HMI device and system.

Under "Runtime settings > Alarms" you specify how long a system alarm is shown on the HMI device.

### Support

The reference contains a list of the possible system events, along with the cause and possible remedies. If you contact online support because of a system alarm on the HMI device, you will need the alarm number and tags used in the system alarm.

### System events

### Examples of alarms

- "Overflow of the buffer for printing lines in text mode"
- "No printer is installed or a default printer has not been set up."

### Description

A system event indicates the system status, including errors in the communication between the HMI device and system.

The system events depend on the HMI device.

You can load system events in the "HMI alarms" editor from an \*.xml file.

### Support

The reference contains a list of the possible system events, along with the cause and possible remedies. When contacting Online Support because of a system event on the HMI device, you need the event number and tags used in the system event.

## System-defined controller alarms

### Example of an alarm

Valve open due to overpressure

### Description

System-defined controller alarms are installed with STEP 7 and are only available if WinCC is operated in the STEP 7 environment.

WinCC processes system-defined controller alarms of the type "SIMATIC S7 diagnostic alarm".

S7 diagnostic alarms show states and events in the SIMATIC S7 controllers. You only have read access to S7 diagnostic alarms. They are assigned to the "Diagnostics" alarm class by the system. S7 diagnostic alarms are not acknowledged or reported. They are for signaling purposes only.

### See also

Enabling system-defined controller alarms (Page 3611)

#### 10.3.1.4 Alarm states

### Introduction

An alarm assumes various alarm states in Runtime. The user analyzes and reports on the process execution with reference to the alarm states.

---

#### Note

Device dependency

Reporting and logging are not available for all HMI devices.

---

### Description

Every alarm has an alarm status. The alarm states are made up of the following events:

- **Incoming**  
The condition for triggering an alarm is satisfied. The alarm is displayed, such as "Boiler pressure too high".
- **Outgoing**  
The condition for triggering an alarm is no longer satisfied. The alarm is no longer displayed as the boiler was vented.
- **Acknowledge**  
The operator acknowledges the alarm.

### Alarms without acknowledgment

The following table shows the alarm states for alarms that do not have to be acknowledged:

Status	Description
Incoming	The condition for an alarm is satisfied.
Outgoing	The condition for an alarm is no longer satisfied.

### Alarms with acknowledgment

The following table shows the alarm states for alarms that have to be acknowledged:

Status	Description
Incoming	The condition for an alarm is satisfied
Outgoing, not acknowledged	The condition for an alarm is no longer satisfied. The operator has not acknowledged the alarm.
Outgoing, and subsequently acknowledged	The condition for an alarm is no longer satisfied. The operator has acknowledged the alarm after this time.
Incoming, acknowledged	The condition for an alarm is satisfied. The operator has acknowledged the alarm.
Outgoing, but acknowledged first	The condition for an alarm is no longer satisfied. The operator acknowledged the alarm while the condition was still satisfied.

Each occurrence of these states can be displayed and logged on the HMI device and a protocol printed.

---

#### Note

The display text for the states of an alarm is language-specific and configuration-specific.

---

## 10.3.1.5 Alarm classes

### Basics on alarm classes

#### Introduction

Many alarms occur in a plant. These are all of different importance. You can assign the alarms of your project to alarm classes to clearly show the user which of the alarms are most important.

#### Description

The alarm class defines how an alarm is displayed. The alarm class specifies if and how the user has to acknowledge alarms of this alarm class.

A new alarm class with mandatory acknowledgment is generated in WinCC.

---

**Note**

The choice of display modes for alarm classes depends on the options on your HMI device.

---

**Examples of how to use alarm classes**

- The alarm "Speed of fan 1 in upper tolerance range" has alarm class "Warnings". The alarm is displayed with a white background. The alarm does not have to be acknowledged.
- The alarm "Speed of fan 2 has exceeded upper warning range" is assigned to the "Errors" alarm class. The alarm is displayed with a red background and flashes at high frequency in runtime. The alarm is displayed until the user acknowledges it.

**Using alarm classes**

Use the following alarm classes to define the acknowledgment model and display of alarms for your project:

- **Predefined alarm classes**  
You cannot delete predefined alarm classes and edit them only to a limited extent. Predefined alarm classes have been created for each HMI device under "HMI alarms > Alarm classes".
- **Custom alarm classes**  
You can create new alarm classes under "HMI alarms > Alarm classes", configure how you want the alarms to be displayed, and define an acknowledgment model for alarms of this alarm class. The possible number of custom alarm classes depends on which runtime is used in your project.

**See also**

Predefined alarm classes (Page 3587)

Creating alarm classes (Page 3595)

Using project-wide alarm classes (Page 3596)

**Basics on alarm classes**

**Introduction**

Many alarms occur in a plant. These are all of different importance. You can assign the alarms of your project to alarm classes to clearly show the user which of the alarms are most important.

**Description**

The alarm class defines how an alarm is displayed. The alarm class specifies if and how the user has to acknowledge alarms of this alarm class.

A new alarm class with mandatory acknowledgment is generated in WinCC.

---

**Note**

The choice of display modes for alarm classes depends on the options on your HMI device.

---

### Examples of how to use alarm classes

- The "Speed of fan 1 in upper tolerance range" alarm has "Warnings" alarm class. The alarm is displayed with a white background. The alarm does not have to be acknowledged.
- The "Speed of fan 2 has exceeded upper warning range" alarm is assigned to the "Errors" alarm class. The alarm is displayed with a red background and flashes at high frequency in runtime. The alarm is displayed until the user acknowledges it.

### Using alarm classes

Use the following alarm classes to define the acknowledgment model and display of alarms for your project:

- **Predefined alarm classes**  
You cannot delete predefined alarm classes and edit them only to a limited extent. Predefined alarm classes have been created for each HMI device under "HMI alarms > Alarm classes".
- **Custom alarm classes**  
You can create new alarm classes under "HMI alarms > Alarm classes", configure how you want the alarms to be displayed, and define an acknowledgment model for alarms of this alarm class. The possible number of custom alarm classes depends on which runtime is used in your project.
- **Common alarm classes**  
Common alarm classes are displayed under "Shared data > Alarm classes" in the project tree and can be used for the alarms of an HMI device. Common alarm classes originate in the alarm configuration of STEP 7. If needed, you can create additional common alarm classes in WinCC.

### See also

Predefined alarm classes (Page 3587)

Creating alarm classes (Page 3595)

Using project-wide alarm classes (Page 3596)

### Predefined alarm classes

#### Predefined alarm classes

The following alarm classes already created in WinCC for every HMI device:

### Alarm classes for user-defined alarms

- "Warnings"  
The "Warnings" alarm class is designed to show irregular statuses and routines in the process. Users do not acknowledge alarms from this alarm class.
- "Errors"  
The "Errors" alarm class is intended to show critical or dangerous states or limit violations in the process. The user must acknowledge alarms from this alarm class.

### Alarm classes for system-defined alarms

- "System"  
The "System" alarm class contains alarms that display states of the HMI device and the PLCs.
- "Diagnosis Events"  
The "Diagnosis Events" alarm class contains alarms that display states and events in SIMATIC S7 controllers. Users do not acknowledge alarms from this alarm class.

---

**Note****Device dependency**

The "Diagnosis Events" alarm class is not available for all HMI devices.

---

Creating alarm classes (Page 3595)

Using project-wide alarm classes (Page 3596)

### 10.3.1.6 Acknowledgement

#### Acknowledging alarms

##### Introduction

To make sure that an alarm was registered by the plant operator, configure this alarm so that it is displayed until acknowledged by the operator. Alarms that display critical or hazardous states in the process have to be acknowledged.

##### Description

The acknowledgment of an alarm is an event that is logged and reported. Acknowledging an alarm changes the alarm status from "Incoming" to "Acknowledged". When the operator

acknowledges an alarm, the operator confirms that he or she has processed the status that triggered the alarm.

---

**Note**

**HMI device dependency**

Reporting and logging are not available for all HMI devices.

---

### Triggering acknowledgment of an alarm

In Runtime, you trigger alarm acknowledgments in various ways:

- Acknowledgement by the authorized user at the HMI device
- Automatic acknowledgment by the system without operator action, e.g. by means of
  - Tags
  - PLC
  - System functions in function lists or scripts

---

**Note**

**HMI device dependency**

Scripts are not available for all HMI devices.

---

### Acknowledging alarms that belong together

To make the alarm system clearer and easier to use in Runtime, you can configure an alarm group. You can acknowledge all alarms belonging to this alarm group in a single pass.

### Acknowledgment by the PLC

Discrete alarms will be automatically acknowledged by the PLC, if necessary. The acknowledgment is triggered by a bit in the "Acknowledgment tag PLC". You define the bit and tag at the configuration stage.

### Acknowledgment of an alarm on the HMI device

In Runtime, the user acknowledges an alarm in one of the following ways, depending on the configuration:

- Using the acknowledgment button <ACK> on the HMI device
- Using the button in the alarm view
- Using configured function keys or buttons in screens

---

#### Note

##### Acknowledgment button <ACK> on the HMI device

To ensure that critical alarms are processed only by authorized users, protect the "ACK" button on the HMI devices, including the operating controls and display objects of the alarms. Use the appropriate operator authorization for this.

---

#### Note

##### HMI device dependency

The acknowledgement key <ACK> is not available on all HMI devices.

---

### Reaction to the acknowledgment of alarms of an alarm group

- Alarm acknowledgment by the operator  
You acknowledge the alarm of an alarm group, for example, using the <ACK> acknowledgment key or a function key. All alarms of the alarm group are acknowledged.
- Alarm acknowledgment by the controller  
The controller sets a tag bit to acknowledge the alarm of an alarm group. The respective alarm is acknowledged.

### Acknowledgement Model

#### Overview

You define the acknowledgment model for an alarm class. Alarms that are assigned to this alarm class will be acknowledged on the basis of this acknowledgment model. The following acknowledgment model is used in WinCC:

- Alarm without acknowledgment  
This alarm comes and goes without having to be acknowledged. There is no visible response from the system.
- Alarm with simple acknowledgment  
This alarm must be acknowledged as soon as the event that triggers the alarm occurs. The alarm remains pending until it is acknowledged.

### 10.3.1.7 Alarm groups

#### Introduction

Many alarms from different areas and processes occur in a plant. You can compile associated alarms into alarm groups.

#### Alarm groups

You can use the alarm groups to monitor the parts of the plant and to acknowledge the associated alarms together as required.

Alarm groups can contain alarms from different alarm classes. You only assign alarms that require acknowledgment to alarm groups.

#### Using alarm groups

It is a good idea to compile alarm groups for alarms such as the following:

- Alarms that are caused by the same fault.
- Alarms of the same type
- Alarms from a machine unit, such as "Fault in drive XY"
- Alarms from an associated part of the process, such as "Fault in cooling water supply"

#### Display in Runtime

In Runtime, the "Alarm group" column displays the number of the alarm group to which the alarm belongs.

#### See also

Configuring Alarm Groups (Page 3599)

### 10.3.1.8 Alarm number

#### Assigning alarm numbers

The system assigns unique alarm numbers within an alarm type.

---

**Note**

When adapting alarm numbers, observe the uniqueness of the alarm number within an alarm type.

---

## 10.3.2 Working with Alarms

### 10.3.2.1 Alarm components and properties

#### Overview

You configure the components of alarms in WinCC. The following table shows the basic components of alarms:

Alarm class	Alarm number	Time of day	Date	Alarm status	Alarm text	Alarm group	Tooltip	Trigger tag	Limit value
Warning	1	11:09:14	06.08.2007	IO	Maximum speed reached	2	This alarm is ...	speed_1	27
System	110001	11:25:58	06.08.2007	I	Switch to "Online" mode	0	This alarm is ...	PLC-Variable_1	–

#### Alarm class

Alarm classes, such as "Warnings" or "Errors". The alarm class defines the following for an alarm:

- Acknowledgment model
- Appearance in Runtime (e.g. color)
- Logging

---

#### Note

##### Device dependency

Logging is not available for all HMI devices.

---

#### Alarm number

An alarm is identified by a unique alarm number. The alarm number is assigned by the system. You can change the alarm number to a sequential alarm number, if necessary, to identify alarms associated in your project.

#### Time and date

Every alarm has a time stamp that shows the time and date at which the alarm was triggered.

#### Alarm status

An alarm has the events "Incoming," "Outgoing," "Acknowledge." For each event, a new alarm is output with the current status of the alarm.

### **Alarm text**

The alarm text describes the cause of the alarm.

The alarm text can contain output fields for current values. The values you can insert depend on the Runtime in use. The value is retained at the time at which the alarm status changes.

### **Alarm group**

The alarm group bundles individual alarms.

### **Tooltip**

You can configure a separate tooltip for each alarm; the user can display this tooltip in Runtime.

### **Trigger tag**

Each alarm is assigned a tag as trigger. The alarm is output when this trigger tag meets the defined condition, e.g. when its state changes or it exceeds a limit.

### **Limit value**

Analog alarms indicate limit violations. Depending on the configuration, WinCC outputs the analog alarm as soon as the trigger tag exceeds or undershoots the limit value.

### **See also**

Output of a tag value in the alarm text (Page 3606)

Alarm states (Page 3584)

Basics on alarm classes (Page 3586)

Alarm groups (Page 3591)

## **10.3.2.2 Configuring Alarms**

### **Overview of alarm configuration tasks**

#### **Steps to configure alarms**

Configuring alarms in WinCC involves the following steps:

1. Edit and create alarm classes  
You use the alarm class to define how an alarm will be displayed in runtime and to define the acknowledgment model for it.
2. Creating tags in the "HMI tags" editor
  - Configure the tags for your project.
  - You create range values for the tags.

3. Creating tags in the "HMI alarms " editor
  - Create custom alarms and assign these the tag to be monitored, alarm classes, alarm groups, and other properties.
  - You can also assign system functions or scripts to the alarm events.
4. Output of configured alarms  
To output configured alarms, configure an alarm view or an alarm window in the "Screens" editor.

### Additional configuration tasks

Additional tasks may be necessary for configuring alarms, depending on the requirements of your project:

1. Creating alarm groups  
You assign the alarms of your project to alarm groups according to their association, such as by the cause of the problem (power failure) or source of the error (Motor 1).
2. Configuring Loop-In-Alarm  
A Loop-In-Alarm is configured in order to change to a screen containing relevant information on an alarm received.

### Overview of alarm configuration tasks

#### Steps to configure alarms

Configuring alarms in WinCC involves the following steps:

1. Edit and create alarm classes  
You use the alarm class to define how an alarm will be displayed in runtime and to define the acknowledgment model for it.
2. Creating tags in the "HMI tags" editor
  - Configure the tags for your project.
  - You create range values for the tags.
1. Creating tags in the "HMI alarms " editor
  - Create custom alarms and assign these the tag to be monitored, alarm classes, alarm groups, and other properties.
  - You can also assign system functions or scripts to the alarm events.
2. Output of configured alarms  
To output configured alarms, configure an alarm view or an alarm window in the "Screens" editor.

## Additional configuration tasks

Additional tasks may be necessary for configuring alarms, depending on the requirements of your project:

- **Activating and editing system events**  
You can import system events when you initially open the "System events" tab in the "HMI alarms" editor. On completion of the import, you can edit the system events.
- **Activating and editing controller alarms**  
For integrated operation of a project in STEP 7, specify the controller alarms to be displayed on your HMI device in the alarm settings.
- **Creating alarm groups**  
Assign the alarms of your project to alarm groups based on their relation, e.g. by error cause (e.g. "power failure"), or by error source (e.g. "Motor 1").
- **Configuring Loop-In-Alarm**  
Configure a Loop-In-Alarm in order to change to a screen that contains information about an incoming alarm.

## Configuring Alarm Classes

### Creating alarm classes

#### Introduction

Create alarm classes in the "Alarm classes" tab of the "HMI alarms" editor. Some default alarm classes are already created for every project. You can create additional custom alarm classes. You can create up to 32 alarm classes.

#### Requirement

- The "HMI alarms" editor is open.
- The Inspector window is open.

10.3 Working with alarms Alarm classes

Procedure

	Display name	Name ▲	Acknowledgment model	Log	E-mail address
To	S7	Diagnosis events	Alarm without acknowledgment	<No log>	
	!	Errors	Alarm with single acknowledgment	<No log>	
1.	↓	System	Alarm without acknowledgment	<No log>	
		Warnings	Alarm without acknowledgment	<No log>	
	<Add new>				

1. Double-click "<Add>" in the table.  
A new alarm class is created. Each new alarm is automatically assigned a static ID. The properties of the new alarm class are shown in the Inspector window.
2. Configure the alarm class under "Properties > Properties > General" in the Inspector window.
  - Enter a "Name" and the "Display name".
  - Depending on the HMI device, you can also activate logging, or automatic sending of e-mails.
3. Define the acknowledgment model for the alarm class under "Properties > Properties > Acknowledgment" in the Inspector window.
4. Change the default text under "Properties > Properties > Status" in the Inspector window. This text indicates the status of an alarm in Runtime.
5. Change the default colors under "Properties > Properties > Colors" in the Inspector window. Depending on the HMI device, also change the flashing characteristics.

These settings define how alarms from this alarm class are displayed in Runtime.

**Note**

To display the alarm classes in color in Runtime, the "Use alarm class colors" option must be activated. In the project navigation, enable "Runtime settings > Alarms > General > Use alarm class colors" accordingly. This option is selected in a new project in WinCC.

**See also**

- Predefined alarm classes (Page 3587)
- Basics on alarm classes (Page 3586)

**Using project-wide alarm classes**

**Introduction**

Project-wide alarm classes are displayed under "Shared data > Alarm classes" in the project navigation. Create additional common alarm classes in WinCC.

Controller alarms are assigned to common alarm classes. If you work with controller alarms, common alarm classes are automatically loaded in WinCC.

## Requirements

- You have created a project.

## Creating project-wide alarm class

To create a project-wide alarm class, proceed as follows:

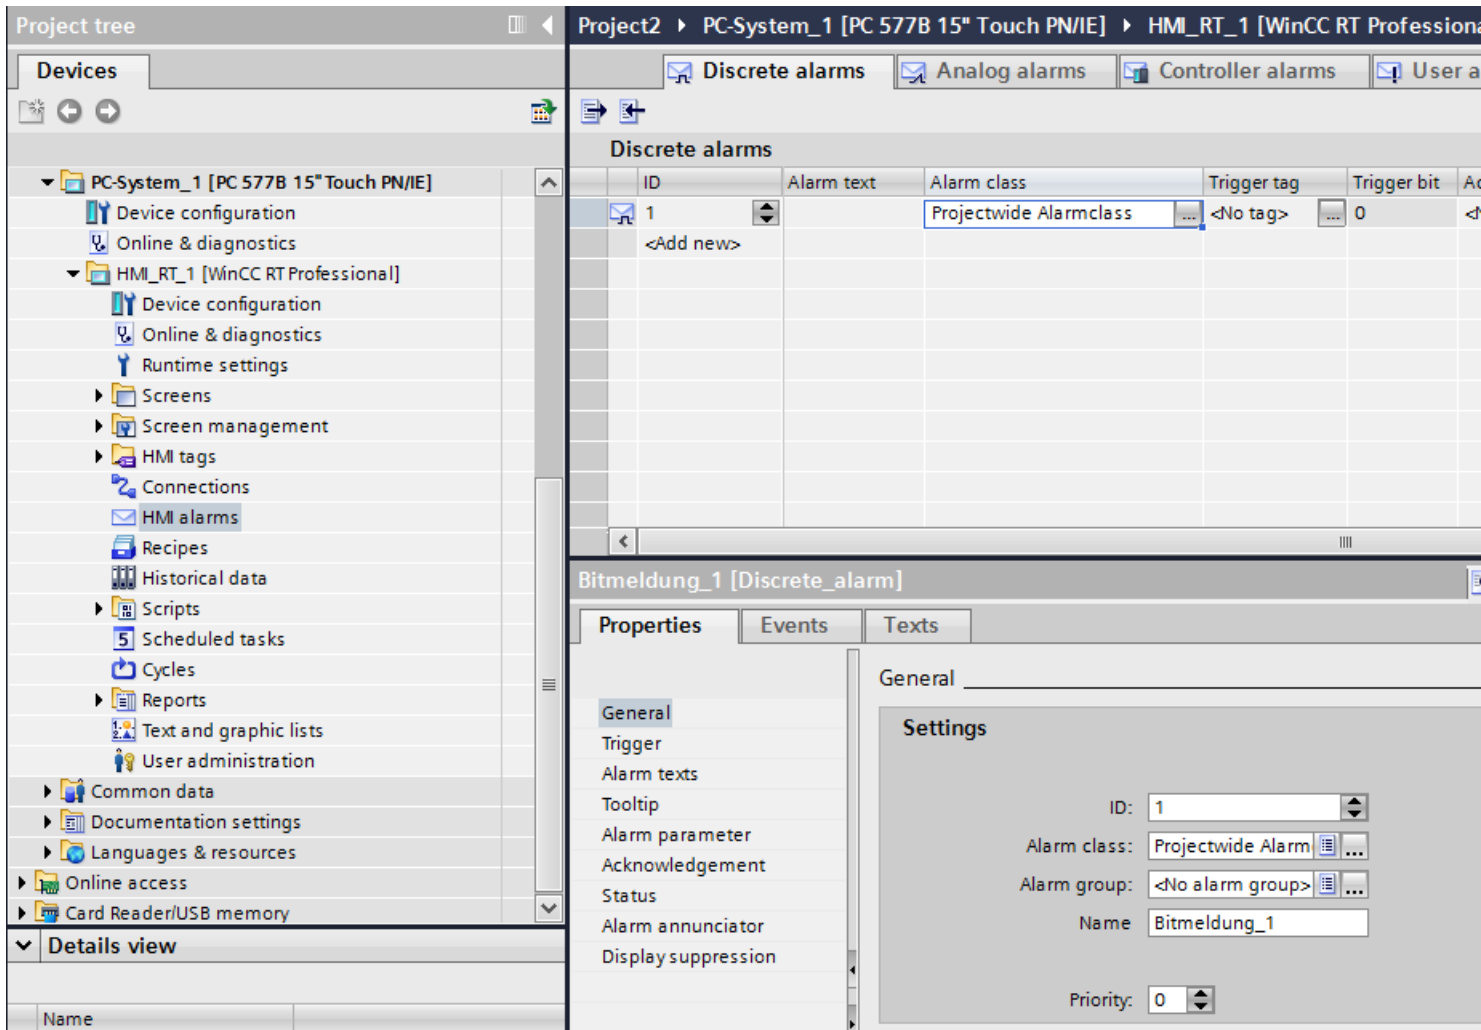

1. Double-click "Shared data > Alarm classes" in the project navigation.  
The "Project-wide message classes" editor opens in the work area.
2. To create a project-wide message class, double-click in the first empty line of the table editor.
3. Specify the name and display name of the alarm class.
4. Select "With acknowledgment" if the alarm class requires acknowledgment.

## Assign alarms to a common alarm class

Proceed as follows to assign an analog or discrete alarm to a common alarm class:

1. In the "HMI alarms" editor, select the alarm that you want to assign to the common alarm class.
2. Click "General" in the Inspector window.
3. Click "Shared data > Alarm classes" in the project navigation.
4. Select the common alarm class in the detail view.

5. Drag-and-drop the alarm class to the "Alarm class" selection box or "Alarm class" column in the work area of the Inspector window of the alarm.

The system creates a new alarm class that is linked to the common alarm class. The new name of the common alarm class is displayed in the "Alarm class" area of the Inspector window of the alarm. The display name of the common alarm class is activated for the alarm class in your project.

6. Click the "Alarm Class" tab.
7. Check to see whether the display name of the common alarm class is displayed in WinCC.
8. You can change the object name of the alarm class.

## Alternative procedure

To assign an alarm to a common alarm class, proceed as follows:

1. Click the "Alarm Classes" tab.  
The alarm classes are displayed.
2. Click "Shared data > Alarm classes" in the project navigation. The following table shows the common alarm classes:

Project4 > Common data > Alarm classes			
Alarm classes			
	Name	Display name	With acknowledgment
1	Projectwide Alarmclass_1	Error	<input type="checkbox"/>
2	Projectwide Alarmclass_2	Status	<input checked="" type="checkbox"/>
3			<input type="checkbox"/>

3. Select the common alarm class in the detail view.
4. Drag-and-drop the alarm class to the "Alarm classes" tab of the "HMI alarms" editor  
The system creates a new alarm class that is linked to the common alarm class. The new name of the new alarm class in your project is displayed in the "Alarm class" tab.
5. Open the tab with the alarm procedure for the required alarm.
6. Under "General" in the Inspector window, select the alarm and the alarm class linked to the common alarm class.

---

### Note

#### Deleting a common alarm class

If you delete a common alarm class, the linked alarm class is maintained. If necessary, link the alarm class with another common alarm class or use it as WinCC alarm class.

---

## See also

Predefined alarm classes (Page 3587)

Basics on alarm classes (Page 3586)

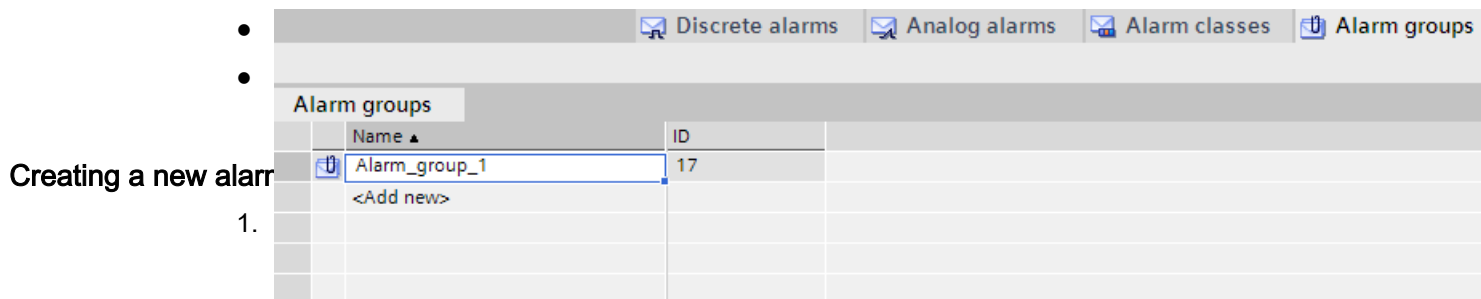

## Configuring Alarm Groups

### Introduction

Create alarm groups on the "Alarm Groups" tab in the "HMI alarms" editor. An alarm group is a compilation of single alarms. You assign alarms in an alarm group by association, such as cause of the problem or source of the error. If you acknowledge an alarm from this alarm group in Runtime, all other alarms in the alarm group are acknowledged automatically.

## Requirement

- You have created a project.

## Creating a new alarm

1. In the work area of the table, double-click "<Add>" in the first free row. A new alarm group is created.
2. You can overwrite the proposed "Name".

## Result

An alarm group is created. For the group acknowledgment of alarms in Runtime, assign the associated alarms that require acknowledgment to an alarm group.

## Configuring discrete alarms

### Introduction

Discrete alarms triggered by the PLC indicate status changes in a plant. They indicate the opened or closed state of a valve, for example.

The following sections describes the configuration procedures in the "HMI alarms" editor. You can also configure discrete alarms in the "HMI tags" editor.

### Requirements

- The "HMI alarms" editor is open.
- The Inspector window is open.
- You have created the required alarm classes and alarm groups.

### Procedure

To configure a discrete alarm, proceed as follows:

1. Open the "Discrete alarms" tab.
2. To create a new discrete alarm, double-click in the work area on "<Add>". A new discrete alarm is created.

3. To configure the alarm, select "Properties > Properties > General" in the Inspector window:
  - Enter an alarm text as event text.  
Use the functions of the shortcut menu to format the text on a character-by-character basis, or to insert output fields for HMI tags, or texts from the text lists.
  - You can renumber the alarm.
  - Select the alarm class and the alarm group, if necessary.
4. In the Inspector window, select the tag and the bit that triggers the alarm under "Properties > Properties > Trigger". Note the following information:
  - Use the data types "Int" or "UInt" to select an HMI tag.
  - When you select a PLC tag, use the data types "Int" or "Word". The input and output area of a PLC tag is unsuitable as trigger.
  - Use trigger tag bits only for alarms.
  - Do not use trigger tags for anything else.
  - If you want to acknowledge the alarm via the PLC, use this tag also as PLC acknowledgment tag.

---

**Note**

Note the method used to count bits in the utilized PLC when specifying the bit. For more information, refer to the "Communication" section in the PLC Online Help.

---

**Note**

If the object does not yet exist in the selection list, create it directly in the object list and change its properties later.

---

### Status-dependent alarm texts

To display a different text independent of the alarm status, link a text list to the alarm text. You control the text list with a tag.

### Additional settings for discrete alarms

### Creating a tooltip

To configure a tooltip for the alarm, follow these steps:

- Enter your text under "Properties > Properties > Tooltip".

### Configuring event-driven tasks

To configure event-driven tasks, such as a loop-in alarm, follow these steps:

1. Select the discrete alarm.
2. Select "Properties > Events" in the Inspector window and configure a new function list for the relevant event.

### See also

Configuring trigger for alarm acknowledgment (Page 3633)

Output of a tag value in the alarm text (Page 3606)

Formatting alarm text (Page 3605)

Configuring loop-in alarm (Page 3611)

### Configuring analog alarms

#### Introduction

Analog alarms indicate limit violations. For example, if the speed of a motor drops below a certain value, an analog alarm is triggered.

#### Requirements

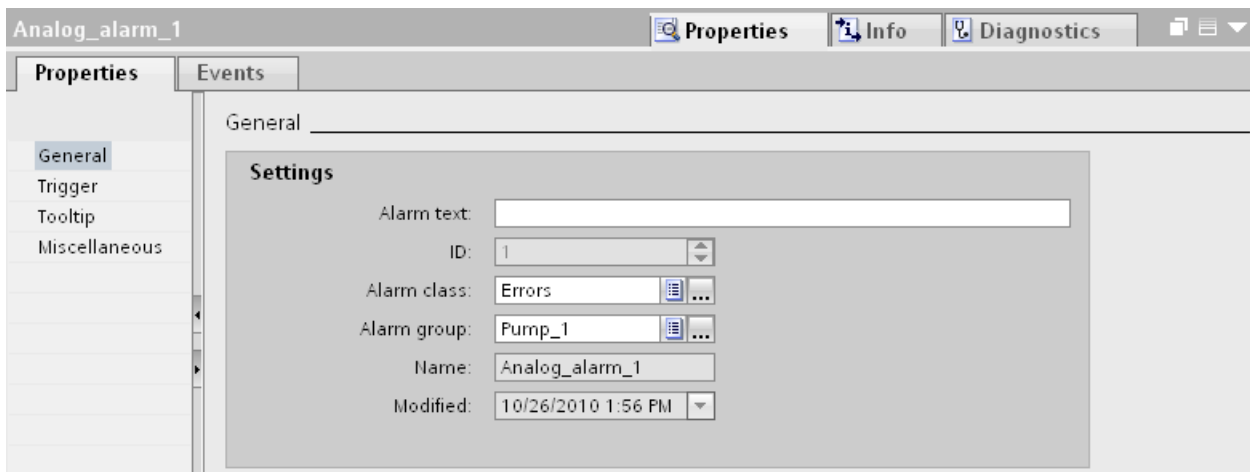

- The "HMI alarms" editor is open.
- The Inspector window is open.
- You have created the required alarm classes and alarm groups.

#### Procedure

To configure an analog alarm, proceed as follows:

1. Click the "Analog alarms" tab.
2. To create a new analog alarm, double-click in the table on "<Add>".  
A new analog alarm is created.

3. To configure the alarm, select "Properties > Properties > General" in the Inspector window:
  - Enter an alarm text as event text.  
Format the text character-for-character using the shortcut menu.  
Using the shortcut menu, you can insert output fields for HMI tags, or text from text lists.
  - You can renumber the alarm.
  - Select the alarm class and the alarm group, if necessary.

4. Configure the tag that triggers the alarm under "Properties > Properties > Trigger > Settings".  
Do not use trigger tags for anything else.

### Configure limit values for an analog alarm

1. In the Inspector window, click the button  under "Properties > Properties > Trigger > Limit > Value".
  - To use a constant as limit value, select "Constant".  
Enter the required limit value.
  - To use a tag as limit value, select "HMI tag".  
The  button is shown. Use this button to select the tag you want to use.

---

#### Note

If the required tag does not exist in the selection list yet, create it in the object list and change its properties later.

---

2. Select the mode:
  - "High limit violation": The alarm is triggered when the limit is exceeded.
  - "Low limit violation": The alarm is triggered when the limit is undershot.

## Optional settings for analog alarms

### Setting the delay time

To set the delay time, proceed as follows:

- Enter a time period in the Inspector window under "Properties > Properties> Trigger > Settings > Delay".  
The alarm is only triggered when the trigger condition is still present after the delay time has elapsed.

### Setting the deadband

---

#### Note

If a process value fluctuates around the limit, the alarm associated with this fault may be triggered multiple times. To prevent this from happening, configure a deadband or delay time.

---

To enter the deadband, follow these steps:

1. Under "Properties > Properties> Trigger > Deadband > Mode", select the change in alarm status for which the deadband is to be taken into account.
2. Enter a constant value under "Value".
3. To define the deadband value as a percentage of the limit, set the "in %" check box.

## Automatic reporting

To print the alarms continuously:

- Select the "Activate" option under "Properties > Properties > Miscellaneous > Report."

---

### Note

Device dependency

Reporting is not available for all HMI devices.

---

## Creating a tooltip

To configure a tooltip for the alarm, follow these steps:

- Select "Properties > Properties > Tooltip" in the Inspector window and enter your text.

## Configuring event-driven tasks

To configure event-driven tasks, such as a loop-in alarm, follow these steps:

1. Select the analog alarm.
2. Select "Properties > Events" in the Inspector window and configure a new function list for the relevant event.

## See also

Configuring trigger for alarm acknowledgment (Page 3633)

Output of a tag value in the alarm text (Page 3606)

Formatting alarm text (Page 3605)

Configuring loop-in alarm (Page 3611)

## Formatting alarm text

### Requirement

- The "HMI alarms" editor is open.
- An alarm has been created.

### Procedure

To format an alarm text, proceed as follows:

1. Select the alarm to edit.
2. In the Inspector window, select the characters to format under "Properties > Properties > General > Alarm text".
3. Select the formatting from the shortcut menu, e.g. "Underscored" or "Uppercase".

---

**Note**

It is not possible to underline tags and text list entries.

---

**Result**

The selected characters are displayed in Runtime with the selected formatting.

**Removing format settings**

To remove all text formats, proceed as follows:

1. In the Inspector window, select the characters whose formatting you want to remove in the alarm text.
2. Select "Delete formatting characters" from the shortcut menu.

**Result**

The selected characters are displayed in unformatted notation in Runtime.

**Output of a tag value in the alarm text**

**Introduction**

In WinCC, you can insert output fields into the alarm text which display the content of tags.

**Requirements**

- The "HMI alarms" editor is open.
- The alarm is selected.

**Output of a tag value in the alarm text**

To insert an output field for a tag value in the alarm text, proceed as follows:

1. Place the cursor onto the required position in the event text.
2. Select "Insert tag output field" in the shortcut menu.
3. Open the object list under "Tag" and select a tag.  
You can also create the tag in the object list.

4. Under "Format", specify the length of the output field and the format for tag value output in the alarm text.

Configure an output field of sufficient size. Otherwise, the tag content is not output to the full extent in the alarm.

5. Click  to save your entries.

WinCC inserts a placeholder for the output field into the alarm text: "<tag: n, [tag name]>" whereby n = text string length.

### Editing output field properties

To edit the properties of an output field, proceed as follows:

- Double-click on the output field in the alarm text and edit the settings.

### Deleting an output field from the alarm text

To delete an output field from the alarm text, proceed as follows:

- Select the output field in the alarm text and then select the "Delete" command from the shortcut menu.

---

#### Note

The sequence of the tag output fields in the alarm text depends on the language. The sequence of the Runtime language is used for logging alarms to a CSV log file.

Changing the tag of an output field in one language causes the modified output field to appear at the end of the alarm text in all other languages. This changes the sequence of the output fields in the log.

Device dependency

Logging is not available for all HMI devices.

---

## Output of texts from a text list in an alarm

### Introduction

Text lists are used to create dynamic alarm texts. For example, you can configure the output of both states of a discrete alarm in an alarm text.

Insert a corresponding output field in the alarm text and specify the tag that returns the search key for the text list.

### Requirements

- A text list is created.
- The "HMI alarms" editor is open
- The alarm is selected

### Output of a text list value in an alarm text

To insert an output field for a value from a text list in the alarm text, proceed as follows:

1. Place the cursor at the required position in the alarm text.
2. Select "Insert text list output field" command from the shortcut menu.
3. Select the text list under "Text list".
4. Open the object list under "Tag" and select the tag that returns the search key for the text list.  
You can also create the tag in the object list.
5. Define the length of the output field under "Format".  
Configure an output field of sufficient size so that the complete text from the text list is displayed in the alarm.
6. Click on the  icon to save your entries.  
WinCC inserts a placeholder for the output field into the alarm text:  
""<textlist: n, [textlist name]>" whereby n = text string length.

### Editing output field properties

To edit the properties of an output field, proceed as follows:

- Double-click on the output field in the alarm text and edit the settings.

### Deleting text list from the alarm text

To delete an output field from the alarm text, proceed as follows:

- Select the output field in the alarm text and then select the "Delete" command from the shortcut menu.

### Editing System Events

#### Editing system events

When you open the "System events" tab in the "HMI alarms" editor, WinCC prompts you to import or update the system events. Import the system events and specify the display period. You cannot delete or create new system events. You can only edit the alarm text with system events.

## Requirements

- You have imported the system events.

## Specifying the display period

To determine the display period, proceed as follows:

1. Double-click "Runtime settings" in the project navigation.
2. Enter a value under "Alarms > System events > Display period".  
This value specifies a time in seconds during which the system events are displayed on the HMI device. If you want to display system events permanently, enter "0".

## Changing the alarm text

To change the alarm text of a system event, follow these steps:

1. Open the "HMI alarms" editor and then click the "System events" tab.
2. Select the system event that you want to edit.
  1. Change the alarm text under "Properties > Properties > Properties > General" in the Inspector window.

---

### Note

If you change an alarm text for a system event that contains a placeholder, leave the number of placeholders unchanged. A placeholder may be a "%1".

---

## Configuring event-driven tasks

The "Incoming" event is available for certain system events, depending on the HMI device. To configure event-driven tasks, proceed as follows:

1. Select the system event.
2. Select "Properties > Properties > Incoming" in the inspector window and configure a function list.

## Editing controller alarms

### Introduction

Controller alarms are configured in STEP 7. Controller alarms are available in WinCC running in a STEP 7 environment.

In WinCC you only edit the properties of controller alarms that are specific to an HMI device. Different properties of a controller alarm can be edited, depending on the HMI device and PLC.

You can filter the displayed controller alarms for your project using the display classes that were configured on the PLC for controller alarms.

## Requirements

- The connection was established to the PLC.
- Alarms were configured in STEP 7.

## Editing controller alarms

Proceed as follows to edit controller alarms:

1. Double-click "HMI alarms" in the project navigation.  
The "HMI alarms" editor is opened.
2. Open the "Controller alarms" tab.
3. Select the alarm that you want to change in the work area.
4. Make your changes. Depending on the HMI device, it may not be possible to display or enable some of the controller alarm properties.

## Editing SIMATIC S7 alarms

You can edit these controller alarms in the STEP 7 alarm configuration system. To do this, proceed as follows:

1. Select the alarm that you want to change in the work area.
2. Select "Open in alarm editor of the PLC" from the shortcut menu.  
The STEP 7 alarm configuration system is opened.
3. Make your changes.

## Filtering the controller alarm using display classes

To filter controller alarms by display classes, proceed as follows:

1. Click "Runtime settings > Alarms" in the project navigation under your HMI device.  
One or several connections to a PLC are shown in "Controller alarms".
2. Select the display classes whose controller alarms you want to display for the connection.

## Result

Only those controller alarms whose display class you have enabled for your HMI device will be displayed on the "Controller alarms" tab of the "HMI alarms" editor.

## See also

PLC alarms (Page 3582)

## Enabling system-defined controller alarms

### Enabling system-defined controller alarms

To activate system-defined controller alarms for your HMI device, proceed as follows:

1. Select "Runtime settings > Alarms" in the project navigation.  
The alarm settings open.
2. Under "System events" activate the system-defined controller alarms.
3. To display the system events with alarm text, activate "With text".
4. To display these alarms in Runtime, configure an alarm view that displays alarms from the "Diagnosis Events" alarm class.

---

#### **Note**

For HMI devices with small display units, specify to display only the alarm number for system-defined controller alarms.

---

### See also

System-defined controller alarms (Page 3584)

## Configuring loop-in alarm

### Introduction

A Loop-In-Alarm is configured in order to change to a screen containing relevant information on an alarm received.

### Requirement

- The screen called by the Loop-In-Alarm has been created.
- The "HMI alarms" editor is open.

### Procedure

To configure a Loop-In-Alarm for an alarm, proceed as follows:

1. Click the tab that contains the alarm for which you want to configure the Loop-In-Alarm.
2. Select the alarm.
3. In the Inspector window, select "Properties > Events > Loop-In-Alarm".

4. Select the "ActivateScreen" system function.
5. Select the screen called by the Loop-In-Alarm as parameter.

---

#### Note

To configure the Loop-In-Alarm for an alarm view with an "alarm line" format, use a button with the following system functions:

- "EditAlarm" for HMI devices with keys
- "AlarmViewEditAlarm" for HMI devices without keys

The system functions trigger the "Loop-In-Alarm" event. The alarm line has no buttons.

---

#### Result

If you click on the "Loop-In-Alarm" button of the alarm view in Runtime, a screen is opened with information on the selected alarm.

#### See also

Configuring discrete alarms (Page 3600)

Configuring analog alarms (Page 3602)

## Alarms in the "HMI tags" Editor

### Configuring discrete alarms

#### Introduction

In WinCC, you can create and edit discrete and analog alarms, including the trigger tags, in the "HMI tags" editor.

---

#### Note

If you delete, move or copy objects in the "HMI tags" editor, the changes also take effect in the "HMI alarms" editor.

---

#### Requirements

The "HMI tags" editor is open.

#### Procedure

To configure a discrete alarm, proceed as follows:

1. To create a tag, click on "<Add>" in the table at the top of the work area.  
A new tag is created.
2. Configure an internal or external tag as required.
  - Use the data types "Int" or "UInt" to select an HMI tag.
  - When you select a PLC tag, use the data types "Int" or "Word". The input and output area of a PLC tag is unsuitable as trigger.
3. Select the tag at the top of the work area.
4. Click on "<Add>" in the table on the "Discrete alarms" tab at the bottom of the work area.  
A new discrete alarm is created for the tag. If you have selected the incorrect data type, the tag will be marked in the discrete alarm.
5. Configure the discrete alarm in the Inspector window:
  - Enter the alarm text under "Properties > Properties > General > Alarm text".  
You can also insert output fields into the alarm text.
  - Select an alarm class.
  - Select the trigger bit of the tag that triggers the discrete alarm under "Properties > Trigger".
6. You can create additional discrete alarms to monitor the tags.

---

#### Note

A tag is monitored using only one alarm type. You should therefore create either analog alarms **or** discrete alarms for a tag.

---

## Result

The configured discrete alarms are created in the "HMI tags" editor and displayed in the "HMI alarms" and "HMI tags" editors.

## Configuring analog alarms

### Introduction

In WinCC, create the discrete and analog alarms, including the trigger tags, in the "HMI tags" editor. You can also edit the alarms as in the "HMI alarms" editor. You can create up to two range values for a tag. You monitor these limits with analog alarms.

### Requirements

The "HMI tags" editor is open.

### Procedure

To configure an analog alarm in the "HMI tags" editor, proceed as follows:

1. To create a tag, click on "<Add>" in the table at the top of the work area.  
A new tag is created.
2. Configure an internal or external tag as required.
3. In the Inspector window, configure the range values of the tags under "Properties > Properties > Range":
  - Select whether to use a "Constant" or an "HMI tag" as limit value for your range values. The object list opens when you select "HMI tag". Select the tag you want to use.

1. Click the "Analog Alarms" tab at the bottom of the work area.  
Create an analog alarm for both range values.
2. Select an analog alarm and configure it in the Inspector window:
  - Enter the alarm text under "Properties > Properties > General > Alarm text".
  - You can also insert output fields into the alarm text.
  - You can change the default alarm class.
3. Configure the analog alarms as in the "HMI alarms" editor.
4. Complete the configuration of all analog alarms.

---

**Note**

A tag is monitored using only one alarm type. You should therefore create either analog alarms **or** discrete alarms for a tag.

---

**Result**

The configured analog alarms are created in the "HMI tags" editor and displayed in the "HMI alarms" and "HMI tags" editors.

### 10.3.2.3 Configuring the Outputting of Alarms

#### Overview of configuring alarm output

#### Steps to complete when configuring alarm output

You configure the alarm output in WinCC in the following steps:

1. Create alarm view  
Use the display and control objects in the "Screens" editor to display alarms in Runtime.  
You can also configure an alarm view for logged alarms.
2. Configure acknowledgment  
In the "Screens" editor, you can set the operator action that will trigger the acknowledgment.
3. Configure reporting  
You can create reports in the "Reports" editor to print alarms in Runtime. In the "Scheduler", "Screens", "HMI alarms" or "HMI tags" editors, you define when and how the printing of a report is triggered.

---

**Note**

Device dependency

Reporting and logging are not available for all HMI devices.

---

### Additional configuration tasks

Additional tasks may be necessary for configuring alarm views, depending on the requirements of your project:

1. Setting up authorizations  
To make sure only authorized operators process the alarms, assign authorizations for the alarm view and the function keys of the HMI device.
2. Configuring the filtering of the alarm view  
You configure the filtering of the alarms in Runtime in the "Screens" editor. You can also configure alarm views that only display selected alarms.
3. Configure operator input alarms  
Configure the operator input alarms on the operator controls of the HMI device in the "Screens" editor. A preconfigured operator input alarm is output for an operator action. An operator input is, e.g. the acknowledgment of an alarm.

### Displaying alarms

#### Options for displaying alarms on the HMI device

WinCC offers the following options for displaying alarms on the HMI device:

- Alarm view  
The alarm view is configured in a screen. More than one alarm can be displayed simultaneously, depending on the configured size. You can configure multiple alarm views with different contents.
- Alarm window  
The Alarm window is configured in the "Global screen" editor. The alarm window can display multiple alarms at the same time, depending on the configured size. An event can trigger closing and reopening of the alarm window. To hide it during configuration, create an alarm window on its own level.

## Additional signals

- **Alarm indicator**  
The alarm indicator is a configurable, graphical icon. When an alarm comes in, the alarm indicator is displayed on the HMI device. You configure the alarm indicator in the "Global screen" editor.  
The alarm indicator has two states:
  - **Flashing:** At least one alarm that requires acknowledgment is pending.
  - **Static:** The alarms are acknowledged but at least one of them has not gone out yet.  
The alarm indicator also displays the number of pending alarms according to the HMI device.
- **E-mail notification**  
To inform someone other than the operator, such as an engineer, when an alarm with a specific alarm class arrives, assign the alarm class to an e-mail address.

---

### Note

#### Device dependency

E-mail notification is not available for all HMI devices.

---

- **System functions**  
You can configure a list of functions for the event associated with an alarm. These functions must be executed in Runtime when the event occurs.  
Use system functions for alarms in WinCC to control the alarm view or the alarm window other than via the toolbar.

## Displaying the predefined alarm classes in Runtime

The following table shows the symbols used to display the predefined alarm classes in the alarm view:

Alarm class	Displayed icon
"Diagnosis Events"	S7
"Errors"	!
"System"	\$
"Warnings"	<No symbol>

## See also

- Configuring an alarm view for active alarms (Page 3618)

- Configuring alarm filtering (Page 3626)
- Displaying Logged Alarms (Page 3629)
- System functions for alarms (Page 3667)

## **Configuring an alarm view**

### **Configuring an alarm view for active alarms**

#### **Introduction**

Current alarms are displayed in Runtime in an alarm view or alarm window.

#### **Requirement**

- A screen is open in the "Screen" editor.
- The "Tools" task card is open.

## Configuring alarms for the alarm view

To specify the alarms that will be shown in the alarm view, proceed as follows:

1. Insert an "Alarm view" object from the "Tools" task card into the screen.
2. Select the alarm view.
  - In the Inspector window, select "Properties > Properties > General > View > Current alarm states".  
Set whether to display alarms with and/or without mandatory acknowledgment.

- To display all alarms in the alarm buffer, enable "Alarm buffer".

3. In the table, activate the alarm classes to be displayed in the alarm view.
4. Under ""Properties > Properties > View > Control tag for display area", define the tag that returns the date as of which the alarms will be displayed.

**Note**

**Device dependency**

The "Control tag for display area" property is not available for all HMI devices.

## Configuring the layout of the alarm view

To specify how the alarms are shown in the alarm view, proceed as follows.

1. Under "Properties > Properties > Layout > Settings > Lines per alarm" in the Inspection window, specify the number of lines to display for each alarm.
2. In "Properties > Properties > View", select the control elements that are available on the HMI device.
3. Configure the columns under "Properties > Properties > Columns":
  - Under "Visible columns" select the columns to be output in the alarm view.
  - Under "Properties Column", define the properties of the columns.
  - Under "Sort", select the sorting order of the alarms.

### Note

Select the "Edit" command in the shortcut menu for the alarm view to activate the alarm view. You can set the column width and position in active mode. To enable the alarm view, set the zoom factor to 100 %.

The alarm view is deactivated as soon as you deselect the object in the screen.

## Result

Alarms of various alarm classes are output in the alarm view during runtime.

## See also

Creating alarm classes (Page 3595)

Configuring an alarm window (Page 3623)

Alarm view (Page 3445)

## Configuring an alarm view for the S7 diagnostic alarms

### Introduction

To display S7 diagnostic alarms, configure an alarm view or alarm window for the predefined "Diagnosis Events alarm class. Activate the diagnostic alarms accordingly in the Runtime settings of your HMI device.

#### Note

##### HMI device dependency

The "Diagnosis Events" alarm class is not available for all HMI devices.

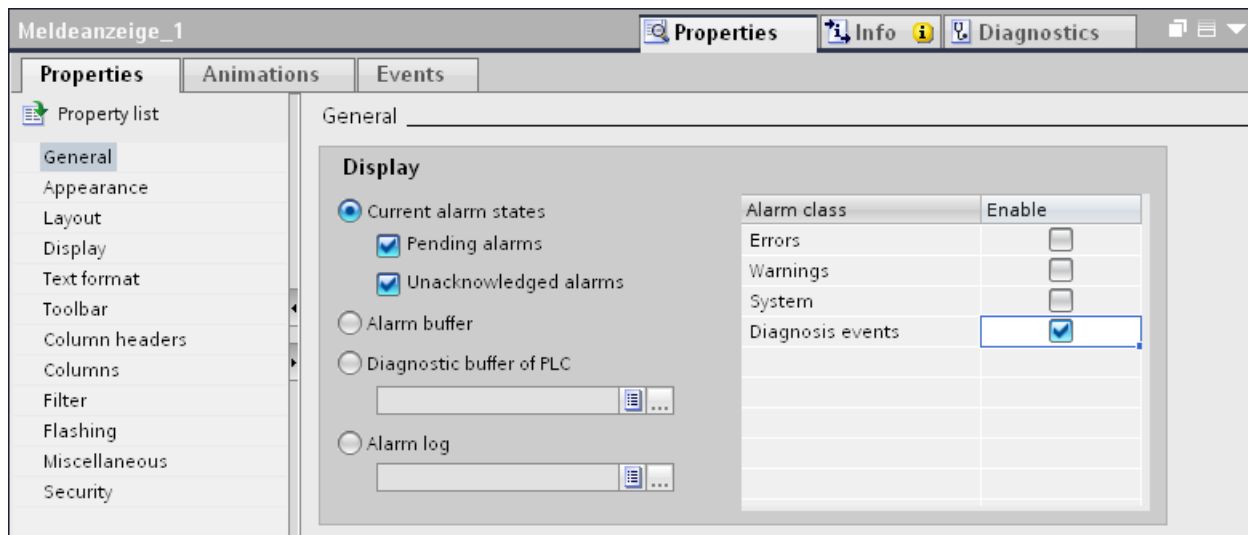

### Requirements

- An alarm view or alarm window is configured in the "Screens" editor
- A connection to the PLC is set up.

### Configuring the display of S7 diagnostic alarms

To configure the display of S7 diagnostic alarms, follow these steps:

1. Select "Runtime settings > Alarms > System events > S7 diagnostics alarms" in the project navigation.
2. To display the S7 diagnostics alarms with text, activate "With text".
3. Open the screen with the alarm view and select the alarm view.
4. In the Inspector window, select "Properties > Properties > General > Display > Alarm class "Diagnosis Events".

5. Continue to configure the alarm view as for the display of current alarms.

## Result

In Runtime the alarm view displays the S7 diagnostic alarms of the controller.

## Configuring an alarm view for logged alarms

### Introduction

In Runtime, logged alarms are displayed in an alarm view or alarm window.

### Requirements

- An alarm view or alarm window is configured in the "Screens" editor
- An alarm log was created in the "Log" editor.
- The alarms are assigned the "loggable" attribute in the "HMI alarms" editor.

## Configuring an alarm view for logged alarms

To configure an alarm view for logged alarms, proceed as follows:

1. Open the screen with the alarm view and select the alarm view.
2. In the Inspector window, select "Properties > Properties > General > Alarm log".
3. Click the "... " button and select the alarm log.
4. Continue to configure the alarm view as for the display of current alarms.

## Result

In Runtime, the logged alarms are output in the alarm view.

## Configuring an alarm window

### Introduction

The alarm window displays current alarms. The alarm window is configured in the "Global screen" editor. The alarm window is not assigned to any screen. Depending on the configuration the alarm window is opened when an alarm that belongs to a specific alarm class is active. Depending on the configuration, it is not closed until the alarm is acknowledged. The HMI device can still be used, even if alarms are pending and displayed. An alarm window is displayed and configured like an alarm view.

To hide an alarm window during configuration, create it on its own level.

## Requirement

- The "Global Screen" editor is open.
- The "Tools" task card is displayed.
- The Inspector window is open.

## Procedure

Proceed as follows to configure an alarm window:

1. Insert an "Alarm window" object from the "Tools" task card into the global screen.
2. Configure the alarm window like an alarm view.
3. Under "Properties > Properties > Mode > Window" in the Inspector window, select how the alarm window reacts and is operated in Runtime.
  - Activate "Modal" if the alarm window is to retain the focus in Runtime after a screen change.  
This option is important, as switching back and forth between the screen and different windows with <Ctrl+TAB> is not supported.

## Result

During runtime, the alarms of the selected alarm class are displayed in the alarm window.

## See also

Configuring an alarm view for active alarms (Page 3618)

Creating alarm classes (Page 3595)

Alarm window (Page 3449)

## Configuring an alarm indicator

### Introduction

The alarm indicator uses a warning triangle to indicate that alarms are pending or require acknowledgement. If an alarm of the configured alarm class occurs, the alarm indicator is displayed.

The alarm indicator has two states:

- Flashing: At least one alarm that requires acknowledgment is pending.
- Static: At least one of the acknowledged alarms has not gone out yet.

During configuration, specify whether Runtime has to open an alarm window when you operate the alarm indicator.

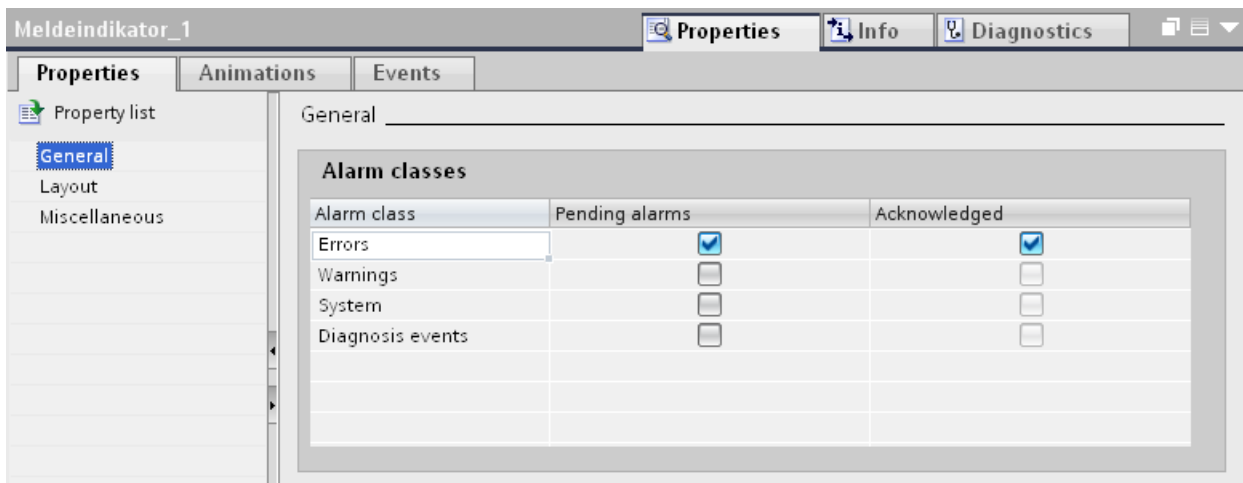

## Requirement

- The "Global Screen" editor is open.
- The "Tools" task card is open.
- The Inspector window is open.

## Procedure

Proceed as follows to configure the alarm indicator:

1. Insert the "Alarm indicator" object from the "Tools" task card into the work area.
2. Select the alarm indicator.
3. Under "Properties > Properties > General" in the Inspector window, select the alarm classes to be displayed by the alarm indicator.  
Specify whether to display pending and/or acknowledged alarms in the alarm indicator.

4. Under "Properties > Event", assign system function "ShowAlarmWindow" to an event of the alarm indicator.

### Note

If you have configured a permanent window in the screen or template, do not position the alarm window and alarm indicator in the vicinity of the permanent window. Otherwise the alarm window and the alarm indicator are not displayed in Runtime. However, the permanent window is not visible in the "Global screen" editor.

## Result

The alarm indicator is displayed if alarms from the selected alarm class are pending or need to be acknowledged in Runtime. The alarm window opens when the user operates the alarm indicator.

## See also

Alarm indicator (Page 3451)

## Configuring alarm filtering

### Introduction

You can filter the display of alarms in the enhanced alarm view. The criterion is always a character string. There are two ways to filter the alarm view:

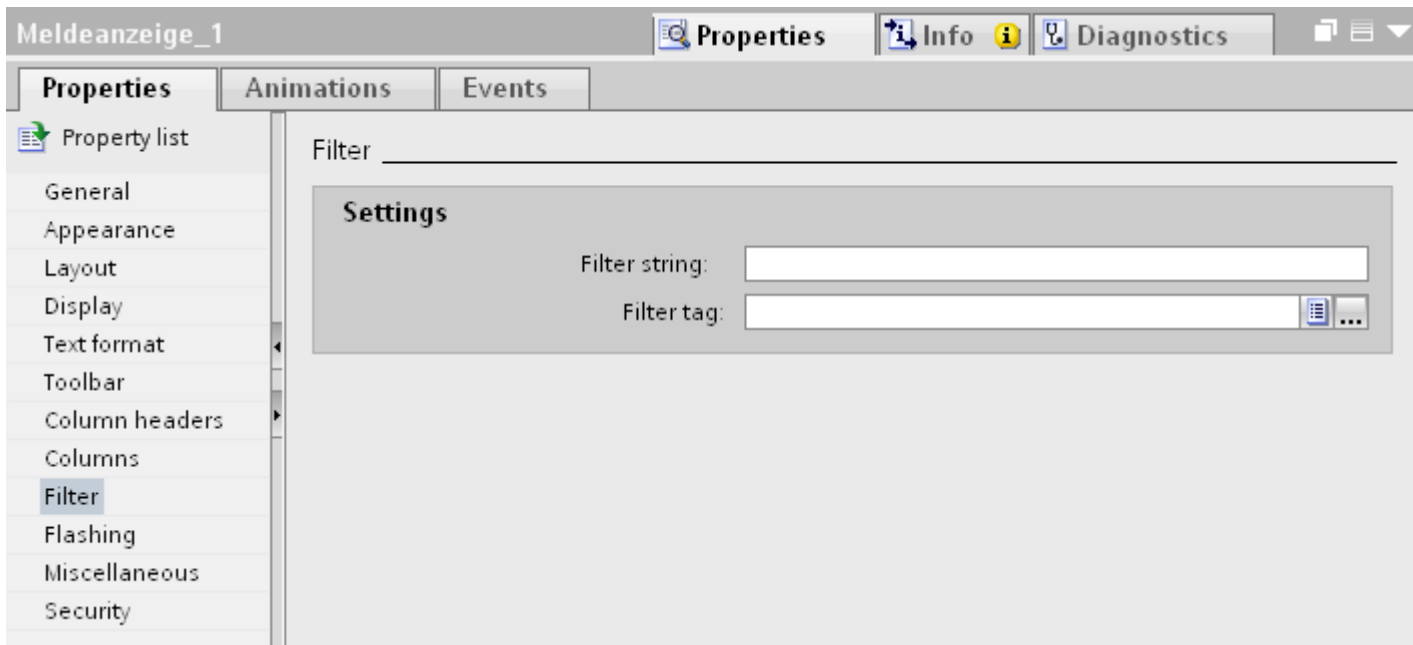

- A fixed criterion is configured in WinCC.  
In Runtime, all alarms that contain the complete character string in the alarm text are displayed.
- You filter the alarm view in Runtime.  
In Runtime, a filter tag sets the relevant character string in the alarm view by means of an I/O field, e.g. as described below.  
The filter affects the display in the alarm view. All alarms in the alarm buffer are retained.

### Requirement

- The alarm view has been configured.
- The screen with the alarm view is open.
- The Inspector window is open.

### Configuring filters for a fixed character string

1. Select the alarm view.
2. In the Inspector window, select "Properties > Properties > Filter".
3. Enter a filter string in "Filter string".

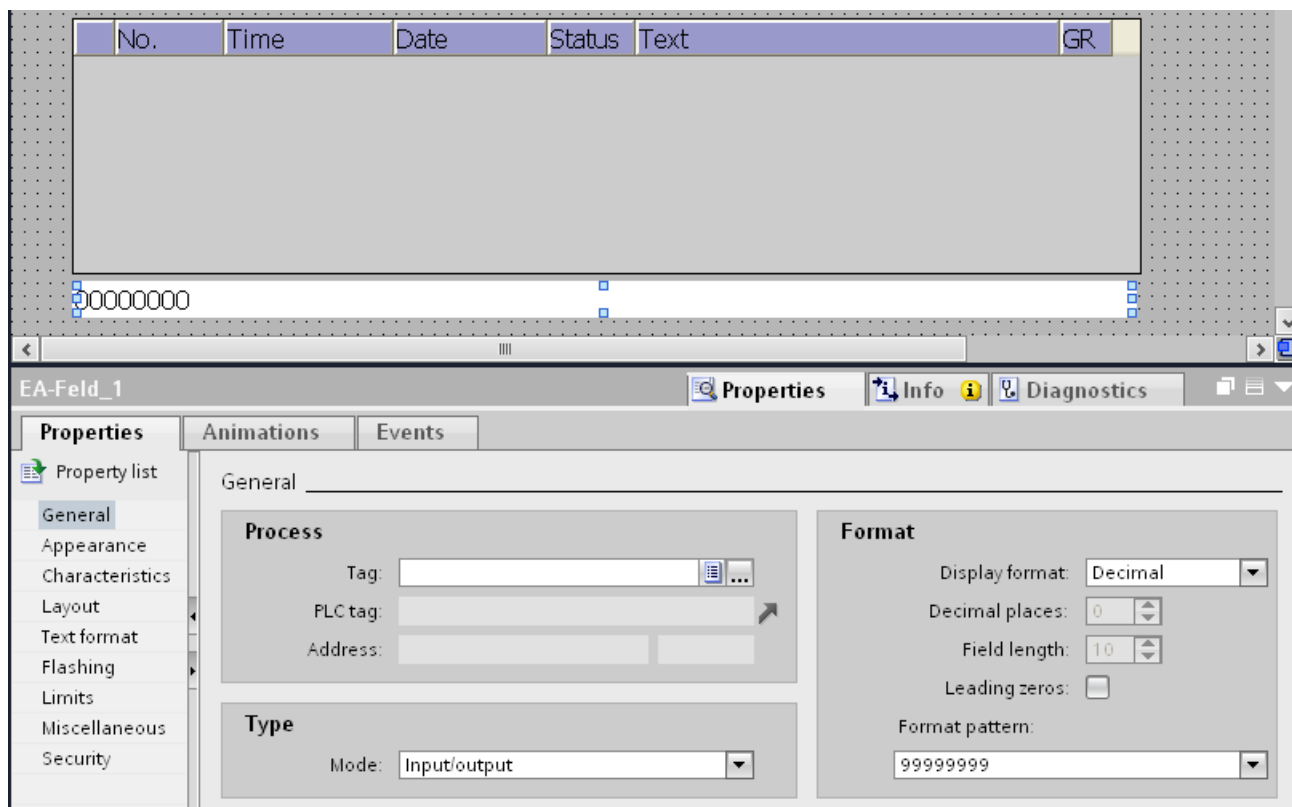

### Result

Only those alarms are displayed in Runtime that contain the complete character string from the filter in the alarm text.

### Configuring filters for a variable character string

1. Select the alarm view.
2. In the Inspector window, select "Properties > Properties > Filter".

3. Select a tag from "Filter tag". The tag must be of the "String" type.
4. In the screen, configure an I/O field for entering the filter string in Runtime.
  - In the Inspector window, select "Properties > Properties > General > Format > Display format > String".
  - To link the I/O field to the alarm view, select "Process" to set the filter tag you selected for the alarm view.

## Result

If you enter a string in the I/O field in Runtime, the alarm view only displays alarms that contain the complete string in their alarm text.

If a permanently configured character string and a filter tag were configured, the alarms will be filtered in Runtime according to the content of the filter tag. If the filter tag is blank, the permanently configured character string is used as the filter.

### Note

Filtering is not possible for the following alarm views:

- Simple alarm view
- Alarm line
- Alarm window
- Alarm view for logged alarms

## Displaying Logged Alarms

### Introduction

You display logged alarms in Runtime in an alarm view. The alarm view shows the content of an alarm log.

### Application

For example, you want to view information about the process at the end of a shift.

### Requirements

- An alarm log has been created.
- A screen is open.
- The Inspector window is open.

### Procedure

Proceed as follows to configure an alarm view to output an alarm log:

1. Configure an alarm view in a screen.
2. Under "Properties > Properties > General > Display > Alarm log" in the Inspector window, select the required alarm log.  
You can always create a new alarm log.

### Result

During runtime, the alarms logged in the selected alarm log appear in the Alarm view.

---

#### **Note**

In runtime, the alarm texts logged are not displayed but rather the alarm texts in the current project. The logged alarm texts are only intended for external evaluation of the log file.

If the alarm log displayed was configured differently, the alarm texts displayed may not correspond with those logged.

---

## Reporting Alarms

### Overview

WinCC can report on all alarms that occur in the system. The following options are available:

- Output an alarm sequence report  
In Runtime, the standard printer of the HMI device will continuously print each alarm and any changes in its status.
- Output of an alarm report  
You configure an alarm report in the "Reports" editor and specify when it is output in Runtime:
  - For event-driven output, configure an object that is assigned the "PrintReport" system function. The object can be a button or tag.
  - For time-driven output, create a "Print job" in the scheduler. Assign an alarm report to the job.

---

#### Note

In the alarm report, specify whether to output current or logged alarms.

---

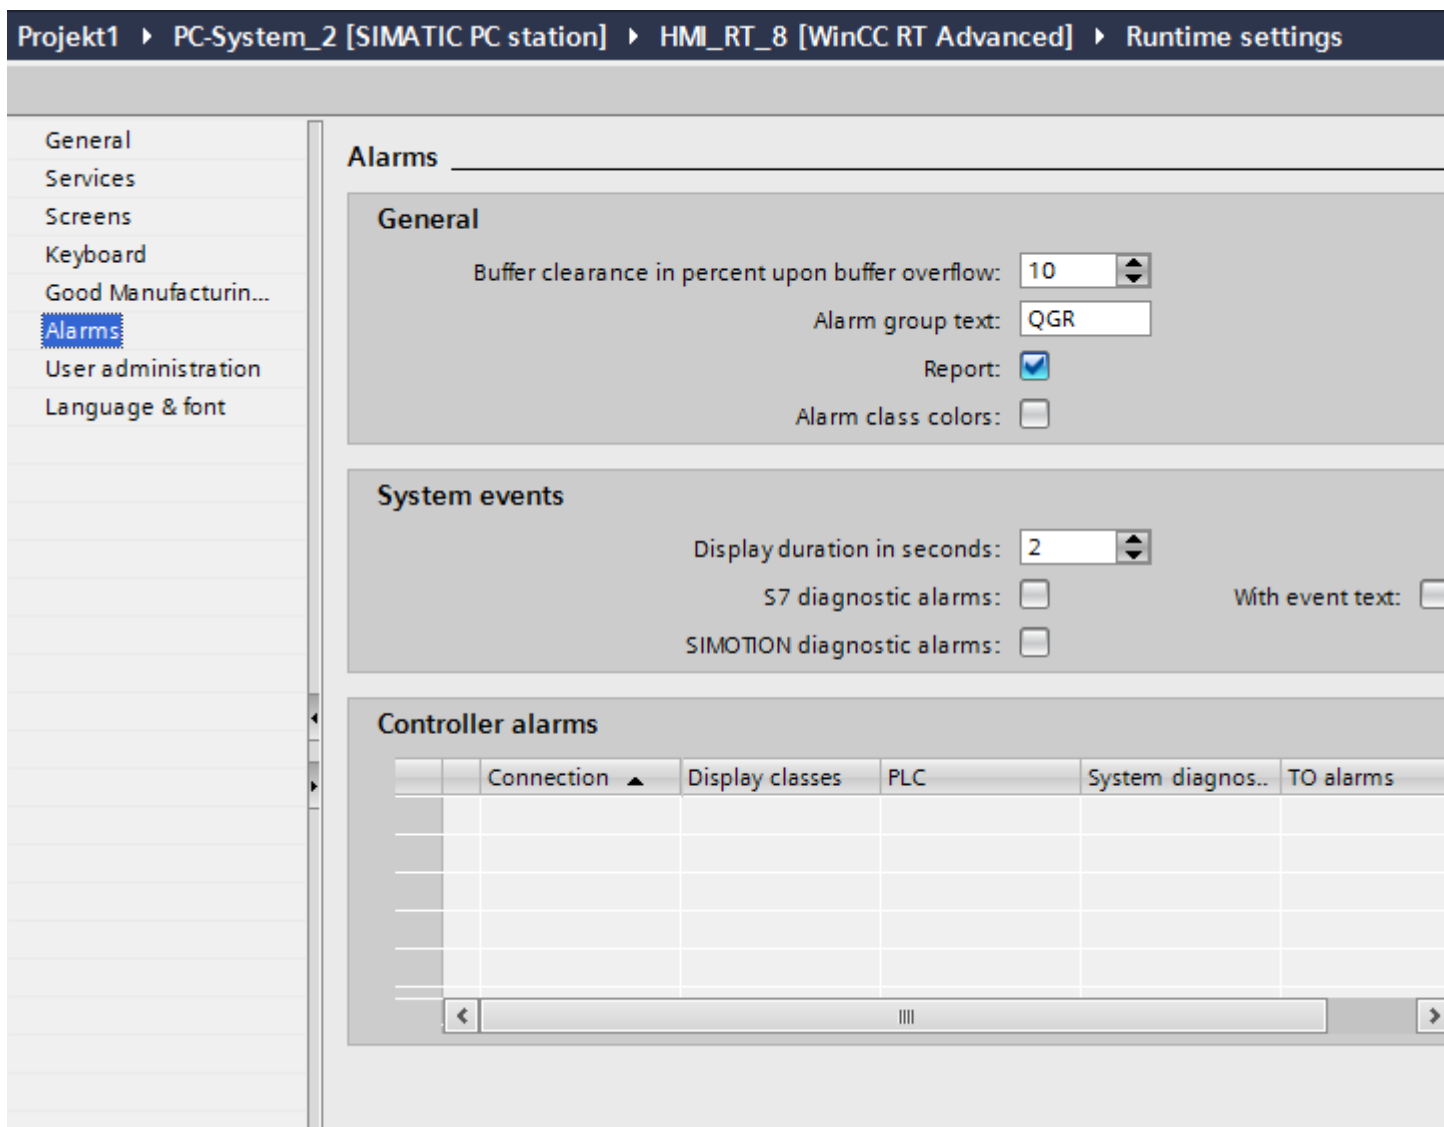

## Requirements

- A printer was configured on the HMI device.

## Activating continuous alarm reporting

To activate continuous reporting of alarms, follow these steps:

1. Double-click "Runtime settings" in the project navigation.
2. Select "Alarms > General > Report".

## Result

The latest alarms are output at the printer of the HMI device.

### Excluding an alarm from reporting

To exclude specific alarms from reporting, proceed as follows:

1. Open the "HMI alarms" editor.
2. Select the alarm to exclude from reporting on the tab of the selected alarm type.
3. In the Inspector window, disable "Properties > Properties > Miscellaneous > Report".

### Result

WinCC does not output these alarms currently on the connected printer.

### See also

Working with reports (Page 3794)

#### 10.3.2.4 Acknowledging alarms

### Configuring alarm acknowledgment by means of alarm class

#### Introduction

To configure an alarm with alarm acknowledgment, assign it to an alarm class with the "Alarm with single acknowledgment" acknowledgment model.

#### Requirement

- The "HMI alarms" editor is open.
- The required alarm class has been created.
- The required alarm has been created.

### Selecting the acknowledgment model for an alarm class

The acknowledgment model for a predefined alarm class has already been set. You can only set the acknowledgment model for user-defined alarm classes. Proceed as follows:

1. In the "HMI alarms" editor, click the "Alarm class" tab and select the alarm class.
2. Select the required acknowledgment model under "Properties > Properties > Acknowledgment" in the Inspector window.

### Assign alarms to an alarm class requiring acknowledgment

Proceed as follows to assign an alarm to an alarm class requiring acknowledgment.

1. In the "HMI alarms" editor, click the tab for the alarm type and select the alarm.
2. Under "Properties > Properties > General" in the Inspector window, select the alarm class of the alarm.

### Result

The alarm will not disappear in Runtime until it is acknowledged by the operator.

### Configuring trigger for alarm acknowledgment

#### Introduction

You always specify the acknowledgment requirement for an alarm using the alarm class. Then the operator acknowledges the alarm using the "ACK" function key of the HMI device or the "Acknowledgment" button of the alarm view.

The following options are also available to trigger acknowledgment:

- Configuring a button to acknowledge an alarm
- Acknowledgment of a Discrete Alarm by the PLC

#### Requirements

- The "HMI alarms" editor is open.
- The required alarm class has been created.
- The required alarm has been created.
- An alarm view and a button are created in the "Screens" editor.

### Configuring a button to acknowledge an alarm

To configure a button for acknowledging an alarm, proceed as follows:

1. Select the button in the "Screens" editor.
2. Under "Properties > Events" in the Inspector window, assign the "AlarmViewAcknowledgeAlarm" system function to the "Click" event.
3. Select the alarm view as parameter.

### Acknowledgment of a Discrete Alarm by the PLC

1. In the "HMI alarms" editor, click the "Discrete alarm" tab and select the discrete alarm.
2. In the Inspector window, select the tag and the bit that acknowledges the PLC alarm under "Properties > Properties > Acknowledgment > PLC".

### Acknowledging alarms in an alarm group

The various acknowledgment options have the following effect in alarm groups:

- Operator acknowledges the alarm  
You acknowledge the alarm of an alarm group, for example, using the <ACK> acknowledgment key or a function key. All alarms of the alarm group are acknowledged.
- The PLC acknowledges the alarm  
The alarm of an alarm group is acknowledged by setting a bit in the tag. Only the alarm to be acknowledged is acknowledged.

## **Sending alarm acknowledgments to the PLC**

### **Requirement**

- The "HMI alarms" editor is open.
- The required alarm has been created and assigned to an alarm class requiring acknowledgment.

---

#### **Note**

You cannot send the acknowledgment of analog alarms to the PLC.

---

## **Sending alarm acknowledgments to the PLC**

To configure that acknowledgment of an alarm is sent to the PLC, follow these steps:

1. In the "HMI alarms" editor, click the "Discrete alarm" tab and select the discrete alarm.
2. In the Inspector window, select "Properties > Properties > Acknowledgment".
3. Under "HMI", select the tag and the bit set by the alarm acknowledgment function.

---

#### **Note**

The HMI device and PLC only have read access to the acknowledgment tag memory area.

---

### **Result**

If the operator acknowledges the alarm in Runtime, the operating step is forwarded to the PLC.

### **10.3.2.5 Configuring alarm buffer overflow**

#### **Introduction**

The size of the alarm buffer depends on the type of HMI device. In WinCC, specify the percentage of the alarm buffer to be deleted on alarm buffer overflow.

## Requirements

- You have created a project.

## Procedure

To configure the response to an alarm buffer overflow, follow these steps:

1. Double-click "Runtime settings" in the project navigation under your HMI device.
2. Under "Alarms > General > Buffer clearance in percent upon buffer overflow", enter a value between 1 and 100.  
This value specifies the percentage of the alarm buffer that is deleted on alarm buffer overflow.

## Result

If data in the alarm buffer exceeds the resources of alarm buffer memory, the configured percentage of data will be deleted from the oldest alarms in the alarm buffer.

---

### Note

You cannot check the alarm buffer overflow separately by alarm method. You can use the "ClearAlarmBuffer" system function to delete specific alarms of specific alarm classes from the alarm buffer.

---

## See also

Alarm Logging Basics (Page 3636)

## 10.3.3 Logging Alarms

### 10.3.3.1 Alarm Logging Basics

#### Introduction

An alarm log is used to record project alarms.

---

### Note

Alarm logging is not available for every HMI device.

---

## Configuration steps

To log an alarm, follow these configuration steps:

1. Creating an alarm log  
You define the following properties for the alarm log:
  - Logging method  
Behavior of the log when reaching a specific fill level
  - Storage location and file format
  - Log size
  - Runtime start characteristics
  - Checksum
2. Assigning an alarm log to an alarm class  
You can log the alarms from multiple alarm classes in an alarm log.
3. Assigning an alarm to a loggable alarm class
4. Configure display of logged alarms in an alarm view

## Content of the alarm log

All states are logged for configured alarms. The following three entries, for example, are stored in the log for an alarm that requires acknowledgment:

- 04.08.2007 10:00:25:520, analog alarm, ID5, **K**, error, fill level exceeded by 10 %
- 04.08.2007 10:01:20:442, analog alarm, ID5, **Q**, error, fill level exceeded by 10 %
- 04.08.2007 10:01:30:112, analog alarm, ID5, **G**, error, fill level exceeded by 10 %

In the example, the alarm states are identified by the following letters:

**K** = Incoming

**Q** = Acknowledged

**G** = Outgoing

All data belonging to an alarm is stored in the alarm log, including configuration data such as the alarm class, time stamp, and alarm text.

The potential number of logged alarms depends on the data medium used.

---

### Note

Alarm text and error location are only logged if you have configured such a setting in the log properties.

---

### Note

The time stamp of a logged alarm is always specified in standard UTC format (Universal Time Coordinated).

---

## Logging methods

The logging method determines how the alarm log responds when the configured size is reached. WinCC supports the following logging methods:

- **Circular log**  
When the configured log size has been reached, the oldest entries are deleted. When the configured log size has been reached, approximately 20% of the oldest entries are deleted. It is therefore not possible to display all the configured entries. During configuration, select an appropriate size for the circulation log. Alternatively, configure a segmented circular log.
- **Segmented circular log**  
In a segmented circular log, multiple single logs of the same size are filled in succession. When all logs are completely full, the oldest log is overwritten.
- **Log with level-dependent system alarm**  
When a defined level is reached, such as 90 %, a system alarm is triggered. When the configured size of the log has been reached, new alarm events are not logged.
- **Log with level-dependent execution of system functions**  
When the log is completely full, the "Overflow" event is triggered. You configure a function list for the event.  
When the configured size of the log has been reached, new alarm events are not logged.

## Checksums in regulated projects

With WinCC you configure regulated projects as required by FDA guidelines, if necessary. Use the "Audit" option to create regulated projects.

In regulated projects you supply a checksum for the logged data of an alarm log. The operator will use this checksum during operation of the plant to see if the data of an alarm log have been changed.

For the checksum to be clear, it starts with the first line of an alarm log and integrates the previous lines when continuously generating the checksum. This means a checksum can only be generated for the following logs:

- Log that sends a system alarm when it is full
- Log with execution of system functions when log is full.

Generation of a checksum is also available for alarm logs that are saved as files of the "\*.csv" or "\*.txt" (Unicode) format.

If you want to continue an existing log without checksum as one with checksum, a backup copy of the existing log is created in the "\*.keep" file format. A new log with checksums is created.

To maintain the validity of checksums, the following limitations apply when using the system function "CopyLog":

- You cannot copy a log without checksums into a log with checksums.
