- You cannot copy a log with checksums into a log without checksums.

### Storage location and storage medium

You can save the log data to a file on a data carrier, e.g. MMC, SD, or CF cards. If you are using a PC as your HMI device, you may store your information in a database. You can further process the saved data in other programs for analysis purposes, for example.

### Displaying logged data

On the HMI device, the logged data is displayed in an alarm view that is configured for this purpose.

### See also

Configuring alarm buffer overflow (Page 3635)

## 10.3.3.2 Storage locations for log files

### Introduction

The alarm log is stored in an ODBC database or in a file. Select "Database" or "File" as the storage location.

---

#### Note

An "ODBC database" storage location is only available on a PC.

---

### Log file

Depending on the configuration of the HMI device, select one of the following storage locations for the log file:

- Local hard disk of the PC
- Storage card of the Panel
- Network drive

---

#### Note

##### Logging on network drives

Do not log alarms, tags and Audit Trail directly on a network drive. Power supply can be interrupted at any time. This means there is no guarantee for a reliable operation of logs and audit trails.

Save the logs on your local hard drive or a local storage card. Use the system function "ArchiveLogFile" to save the logs long-term on a network drive. This step ensures reliable operation.

---

### File - CSV (ASCII)

Data is saved to a "\*.csv" file in standard ASCII format.

Use the "File - CSV (ASCII)" storage location if you are going to read logged data without using WinCC Runtime.

---

#### Note

Double quotation marks or several characters are not permitted as list separator for the storage site "File - CSV (ASCII)." You can find the settings for list separators under "Start > Settings > Control Panel > Regional and Language Options."

---

### File - TXT (Unicode)

The log data are saved in Unicode.

This file format supports all characters that can be used in WinCC and WinCC Runtime. For editing, use software that can save files in Unicode, such as Notepad.

---

#### Note

Use "File - TXT (Unicode)" as the storage location to log Asian languages.

---

### File - RDB

Data will be saved with quick access to a proprietary database.

Use the "File - RDB" storage location if you require maximum read performance in Runtime.

Data logs of this format can only be read and displayed using WinCC Runtime.

Convert the RDB file to CSV format using the "CopyLog" function to make the data available for applications outside WinCC Runtime.

### Files of logs with checksums

- \*.keep  
This file is created in the following cases:
  - A log is started without checksum and will be continued with a checksum.
  - You update WinCC with a Service Pack or a new version. Writing of the Audit Trail or the log with checksum is continued.The content of the "\*.keep" file remains the same when compared with the original "\*.csv" or \*.txt" file.
- \*.bak  
This file is created when WinCC Runtime has determined a serious, irregular problem in the file.

## Database

Data is saved to a database which is set up for ODBC access by the PC administrator.

If you have selected an ODBC database as storage location, select one of the following options for naming:

- "User-defined name of data source"  
You define the name of the data source.
- "System-defined name of data source",  
The system defines the name.  
You will need a special instance of Microsoft SQL Server on the target system in order to do this. Download the free SQL Server 2005 Express from the Internet for this purpose.

---

### **Note**

#### **Device dependency**

This setting is not available on the Panel PC 477.

---

### 10.3.3.3 Creating an alarm log

#### Introduction

In Runtime, you save alarms to the alarm logs. Specify the alarm log in the alarm class. An alarm log contains the alarms of several alarm classes. Create the alarm log in the "Logs" editor. When creating an alarm log, define the following parameters:

- Name
- Size
- Storage location
- Runtime start characteristics
- Log type
- Advanced content
- Checksum

You can also enter comments for each log.

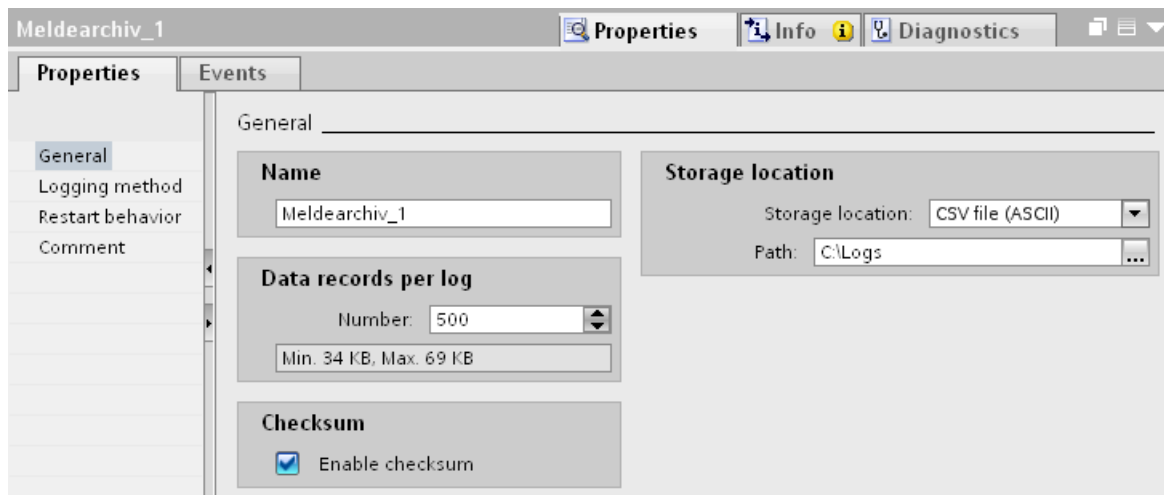

#### Requirement

- The "Alarm log" tab is open in the "Log" editor.
- The Inspector window is open.

## Procedure

To create an alarm log, proceed as follows:

1. Double-click "<Add>" in the table.  
A new alarm log is created.
2. Under "Properties > Properties > General" in the Inspector window, enter a unique name for the alarm log.

---

### Note

The log names must be unambiguous in a project. The name of a log must always be unique, regardless of whether different storage locations are selected for the log.

---

### Note

The characters which can be used in the name of the data source depend on the storage location.

The characters \ / \* ? : " < > | are not permitted for the following storage locations:

- File - RDB
- File - CSV (ASCII)
- File - TXT (Unicode)

If the "Database" storage location is used, the following characters may be used: a-z A-Z 0-9 \_ @ # \$

The characters \_ @ # \$ cannot be used as the first character of a name.

---

1. Under "Number of data records per log", define the number of alarms to be saved to a log file.  
The approximate space required on the storage medium is displayed. Memory space requirements will increase accordingly if you log alarm texts with tag values.
2. Under "Storage location", select a file, or an ODBC database.
  - If you select a file, enter the corresponding path. Depending on the HMI device, save the log files to the hard disk of the PC, to the memory card of a panel, or to a network drive.  
Different file formats are supported, depending on the HMI device.
  - If you select a "Database" storage location, specify the following:  
Specify whether the name of the data source is accepted by the system.  
Specify whether to select the name of the data source yourself.  
Enter a name for the database.

1. To determine if audit trail data were changed at a later time, activate "Properties > Properties > General > Checksum".

---

**Note**

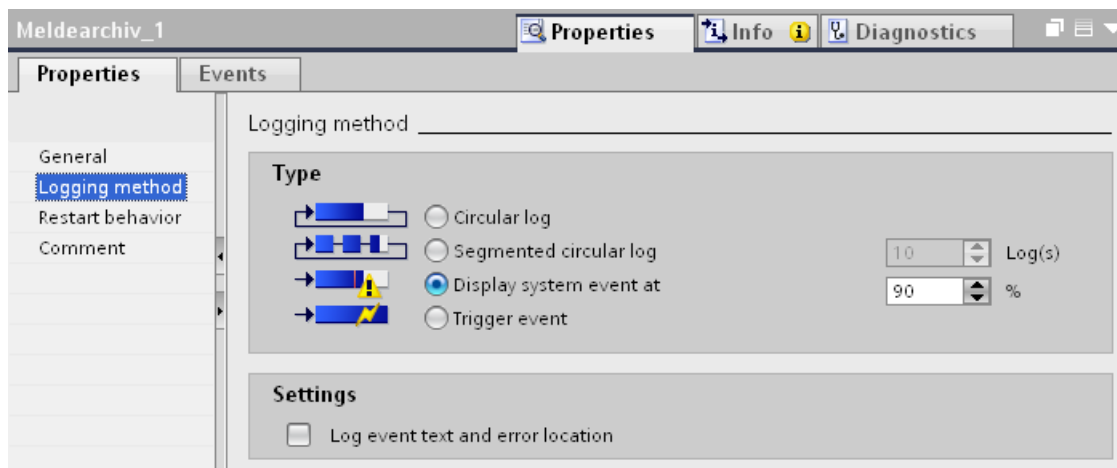

**Device dependency**

The "Checksum" option is only available for display and HMI devices which support logs.

---

### Configuring the behavior of the log when it reaches a specific fill level

1. Define how the log should behave when it is full under "Properties > Properties > Logging method".
  - Specify the number of logs for the "Segmented circular log" log type.
  - For the "Display system event on" log type, specify the fill level triggering the system event.

- If you selected the "Trigger event" log version, configure a function list under "Properties > Events > Overflow". The function list will be processed when the log is full.
2. Under "Properties > Properties > Archiving method > Settings", specify whether to log the alarm text and fault location.

Logged alarms that contain alarm text and the fault location exceed the estimated size of the configured alarms. Check to see whether the specified storage location still has sufficient space.

### Configuring the behavior of the log when Runtime starts

1. Select "Properties > Properties > Start behavior> Type".
  - Define whether to start the log automatically at the start of Runtime.
  - To overwrite logged data with new data, activate "Reset log".
  - To add the logged data to an existing log, activate "Continue log".

---

**Note**

Use system functions to control the restart of a log in Runtime.

---

### Configuring a comment

To record a text to document your configuration of a log, follow these steps:

1. Enter your text under "Properties > Properties > Comment".

### Result

The alarm log is created. You can assign one or several alarm classes to this alarm log.

### See also

Managing logging behavior when Runtime starts (Page 3652)

Controlling the Logging in relation to the Fill Level (Page 3653)

## 10.3.3.4 Logging Alarms

### Overview

To log alarms, follow these steps:

- Create an alarm log.
- Assign the created alarm log to an alarm class.
- Assign the alarm class with the created alarm log to an alarm.

- In the Runtime settings specify the language in which you want to write the logs.
- You evaluate logged alarms.  
You can analyze the logged alarms directly in your WinCC project, such as in an alarm view, or in another user program, such as Microsoft Excel.

---

**Note**

**Tag fields in the alarm text**

The sequence of tag fields in the alarm text is language dependent. The sequence of the Runtime language is used for logging alarms to a "\*.csv" log file.

Changing the tag of an output field in one language causes the modified output field to appear at the end of the alarm text in all other languages. This means the sequence of the output fields in the log file can change.

---

## Requirements

- You have created an alarm log.
- The "HMI alarms" editor is open.

## Assigning an alarm log to an alarm class

To assign the alarm log to an alarm class, proceed as follows:

1. Open the "Alarm classes" tab in the "HMI alarms" editor.
2. Select the required alarm class.
3. Under "Properties > Properties > General > Log" in the Inspector window, select the alarm log.

## Assign alarm to an alarm class

To assign an alarm to the alarm class, proceed as follows:

1. In the "HMI alarms" editor, open the "Analog alarms" tab, or the "Discrete alarms" tab.
2. Select the required alarm.
3. Under "Properties > Properties > General > Alarm class" in the Inspection window, select the alarm class for which the alarm log was configured.

## Result

The alarm is saved to the configured alarm log.

### 10.3.3.5 Configuring an alarm view for logged alarms

#### Introduction

In Runtime, logged alarms are displayed in an alarm view or alarm window.

## Requirements

- An alarm view or alarm window is configured in the "Screens" editor
- An alarm log was created in the "Log" editor.
- The alarms are assigned the "loggable" attribute in the "HMI alarms" editor.

## Configuring an alarm view for logged alarms

To configure an alarm view for logged alarms, proceed as follows:

1. Open the screen with the alarm view and select the alarm view.
2. In the Inspector window, select "Properties > Properties > General > Alarm log".
3. Click the "... " button and select the alarm log.
4. Continue to configure the alarm view as for the display of current alarms.

## Result

In Runtime, the logged alarms are output in the alarm view.

### 10.3.3.6 Direct access to the ODBC log database

#### Overview

The storage location of a log can be a database or a file.

The database is addressed by means of its "Data source name" (DSN). Select the database to be used in WinCC as follows:

Select the database from the Windows Start menu under "Settings > Control panel > ODBC Data Sources".

In your configuration, specify the "Data source name" (DSN) instead of a directory name as storage path for log data. With the DSN, you are referencing the database and the storage location.

The entire functional scope of the database is available for additional processing and evaluation of log data.

#### Application

The data source sets up the connection to the database. Create the data source on the same PC on which the Runtime software is stored. Then enter the DSN configured on this PC when you create a log in WinCC.

The ODBC interface allows you to use other programs, such as MS Access or MS SQL Server, to access the database directly.

In addition, you can use the "StartProgram" system function to configure program calls, e.g. MS Access, on the HMI device. Runtime is not interrupted while you configure such calls.

### 10.3.3.7 Setting up the ODBC data source

#### Introduction

To store process values or alarms in the log database in Runtime, set up the ODBC data source.

#### Requirement

- A log database has been created.  
You create the log database using the SQL Enterprise Manager. You can find more detailed information on how to do this from Microsoft.

#### Procedure

To set up an ODBC data source, follow these steps:

1. In Control Panel, open "Administrative Tools" and select "Data Sources (ODBC)".  
The "ODBC Data Source Administrator" dialog is opened.
2. Click "User DSN > Add".
3. Select the "SQL-Server" and click on "Finish".
4. In the dialog that follows, enter a name for the User DSN and the SQL-Server and click on "Next".
5. In the dialog that follows, define the logon procedure for the SQL database and click on "Next".
6. Activate "Change the default database to".
7. Select the database you have created and click on "Next".
8. In the dialog that follows, click "Finish".

### 10.3.3.8 Configuring a checksum for a log

#### Introduction

In a regulated project, you have the option of assigning a checksum to the log data of an data log or alarm log. This checksum can be used during plant operation to determine if the data of this log has subsequently changed.

#### Requirement

- GMP compliant configuration is enabled.
- A data log or alarm log has been created.

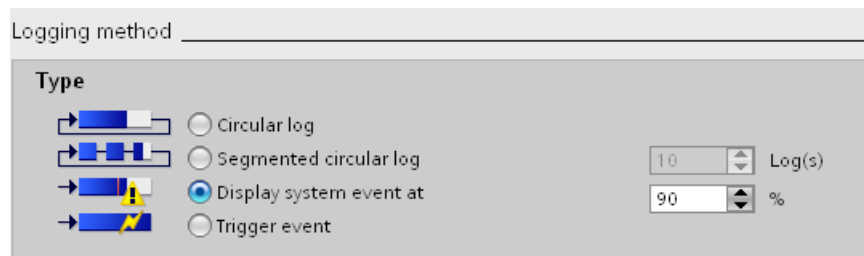

## Procedure

Proceed as follows to configure a data log or alarm log for the use of a checksum:

1. Open the data log or alarm log in the corresponding log editor.
2. In the "Storage location" box, select "File - CSV (ASCII)" or "File - TXT (Unicode)".

3. Under "Properties > Properties > Logging method" in the Inspector window, select the option "Display system event at" or "Trigger event".

4. In the editor table activate the option "Activate checksum".  
Columns that are not displayed are activated with the shortcut menu of the column title.

5. Save the project.

## Result

The log data of the log is assigned a checksum in runtime.

## See also

- GMP-compliant configuration (Page 6139)
- Enabling GMP compliant configuration (Page 6143)

### 10.3.3.9 Evaluating the checksum of log data

#### Introduction

If you have configured a data log or alarm log with generation of a checksum, you can check if the log data has subsequently changed.

The DOS program "HmiCheckLogIntegrity" is available for checking the integrity of the log data.

The "HmiCheckLogIntegrity" program supports verification of the following files:

- Log files of alarm logs, data logs, and Audit in CSV format
- Log files of alarm logs, data logs, and Audit in TXT format
- Recipe data records in CSV format
- Recipe data records in TXT format

You can find the "HmiCheckLogIntegrity.exe" program in the installation directory of WinCC under the folder "WinCC Runtime Advanced", for example <C:\Program Files\Siemens\Automation WinCC Runtime Advanced>.

---

#### Note

##### Audit Trail and Log with Checksum

Before you update WinCC with a Service Pack or a new version, exit and save the Audit Trail or the logs using checksum. After WinCC is updated, the audit trail or logs will be continued with new files using checksum.

Make sure that the logs are started at a defined state with the new version.

---

#### Procedure

1. Copy the file to be checked from the HMI device to your configuration computer.
2. Open a command line prompt with "Start > Programs > Accessories > Command Prompt".
3. Enter the path to "HmiCheckLogIntegrity.exe" followed by a space in the command line prompt. After the space, enter the storage location of the file to be checked within quotation marks.

4. Press <Enter>.
5. The check is performed.  
When the checked data are consistent, the "Consistency check succeeded" message appears.

```
C:\> C:\WINDOWS\system32\cmd.exe

C:\>"D:\Program Files\Siemens\SIMATIC WinCC flexible\WinCC flexible 2008 Runtime
\HmiCheckLogIntegrity.exe" "C:\Logs\TagLog\Data_log_10.csv"

HmiCheckLogIntegrity utility
-----
Checking file "C:\Logs\TagLog\Data_log_10.csv" for consistency...
Consistency check succeeded.

C:\>_
```

When the checked data are inconsistent, the "Consistency check failed" message appears. Information about the first inconsistent line in the file is also displayed.

```
C:\> C:\WINDOWS\system32\cmd.exe

C:\>"D:\Program Files\Siemens\SIMATIC WinCC flexible\WinCC flexible 2008 Runtime
\HmiCheckLogIntegrity.exe" "C:\Logs\TagLog\Data_log_10.csv"

HmiCheckLogIntegrity utility
-----
Checking file "C:\Logs\TagLog\Data_log_10.csv" for consistency...
Consistency check failed, inconsistency detected at line 4!

C:\>_
```

---

#### Note

If there are spaces in the path to the "HmiCheckLogIntegrity.exe" program, you need to specify the path in quotation marks.

---

You can also check the integrity of the log data with the AuditViewer.

#### See also

- Enabling GMP compliant configuration (Page 6143)
- Evaluating Audit Trails in AuditViewer (Page 6161)

### 10.3.3.10 Log response to language switching in runtime

#### Introduction

In the Runtime settings of your HMI device, select the language to be used for writing to logs in runtime.

## Requirement

- The languages used in your project are activated in the "Project languages" editor, for example, "German (Germany)" and "English (USA)" .

## Procedure

To determine the startup language, follow these steps:

1. Select "Runtime settings > Language and fonts" in the project navigation.
2. Activate the runtime language, for example, "German (Germany)" and "English (USA)".
3. Set the "Language switch order". Use 0 to determine the startup language, for example:
  - German 0.
  - English 1With "0", German is specified as the "Startup language".
4. Select "Runtime settings > General" in the project navigation.
5. Select the "Logs > Logging language > Startup language".

## Result

The project starts after it is transferred. German is specified as the "Startup language" with "Language switch order". The logs are now written in German. During runtime, the operator switches the runtime language to English. The logs will still to be written in German.

The operator closes runtime. Due to the previously performed language switch, the next time the system starts the "startup language" is English. Since English is the startup language, the logs are now written in English.

The logging language remains English even when the language is switched again in runtime until runtime is closed once again.

If you use another option instead of "Startup language" to select the language, the logs are always written in the same language. This is true regardless of the language selected by the operator in runtime.

### 10.3.3.11 Managing logging behavior when Runtime starts

#### Introduction

When you configure a data log, you define the restart characteristics of the log when Runtime is started. You define whether the logging should start when Runtime starts in the log properties. You can also define whether an existing log will be continued or overwritten.

You define the restart characteristics separately for each log.

## Requirement

- A data log has been created.
- The "Data log" editor is open.
- The Inspector window with the log properties is open.

## Procedure

To configure the restart characteristics of a data log, proceed as follows:

1. Select the log for which you want to define the restart characteristics in the "Data Log" editor.
2. In the Inspector window select "Properties > Properties > Restart behavior."
3. If you want logging to start when Runtime starts, enable the "Enable logging at runtime start" option in the "Logging" area.  
You can also start logging in Runtime using the "StartLogging" system function, for example.
4. Select the restart behavior of the log in the "Log handling at restart" area.
  - The logged values are deleted and logging is started again with the option "Reset log".
  - The option "Append data to existing log" is used to append the values to be logged to the existing log.

Alternatively you can configure the restart characteristics of a log directly in the "Data log" editor table. To view hidden columns, activate the column titles using the shortcut menu.

## Result

Logging will start in runtime according to your settings.

### 10.3.3.12 Controlling the Logging in relation to the Fill Level

#### Introduction

The size of a log is determined by the number of entries. You use the logging method to determine how the log responds when it is full.

#### Logging methods

The following logging methods are available:

-  Circular log  
When the configured log size has been reached, the oldest entries are deleted. When the configured log size has been reached, approx. 20% of the oldest entries are deleted. It is therefore not possible to display all the configured entries. During configuration, select an appropriate size for the circulation log. Alternatively, configure a segmented circular log.
-  Segmented circular log  
In a segmented circular log, multiple log segments of the same size are filled in succession. When all logs are completely full, the oldest log is overwritten.

-  Log that sends a system alarm when it is full  
When a defined level is reached, such as 90 %, a system alarm is triggered. When the log is 100% full, new tag values are not logged.
-  Log with level-dependent triggering of an event.  
When the log is completely full, the "Overflow" event is triggered. Configure a function list for the event that will be carried out when the "Overflow" event occurs. When the configured size of the log is reached, new tag values are not logged.  
The following system functions are available for further processing of full logs: For further details, refer to Auto-Hotspot.

## Requirement

- A data log has been created.
- The "Data log" editor is open.
- The Inspector window with the log properties is open.

## Procedure

1. Select the log for which you want to define the logging method in the "Data Log" editor.
2. Select "Properties > Properties > Logging method" in the Inspector window and select the required logging method.
3. If you have selected the "Segmented circular log" type, enter the number of log segments. If you selected a log with the "Display system alarm on" setting, specify the level as a percentage at which a system alarm is to be triggered. If you selected the "Trigger event" setting, configure the function list in the "Events" group.

Alternatively you can configure the logging method directly in the "Data log" editor table. To view hidden columns, activate the column titles using the shortcut menu.

The "Overflow" event is not available in the editor table. You must therefore configure the function list in the Inspector window.

## Result

The selected log responds according to the settings in Runtime.

## 10.3.4 Using Alarms in Runtime

### 10.3.4.1 Alarms in Runtime

#### Alarms

Alarms indicate events and states on the HMI device which have occurred in the system, in the process or on the HMI device itself. A status is reported when it is received.

An alarm could trigger one of the following alarm events:

- Incoming
- Outgoing
- Acknowledge
- Loop-in-alarm

The configuration engineer defines which alarms must be acknowledged by the user.

An alarm may contain the following information:

- Date
- Time
- Alarm text
- Location of fault
- Status
- Alarm class
- Alarm number
- Alarm group

## Alarm classes

Alarms are assigned to various alarm classes.

- "Warnings"  
Alarms of this class usually indicate states of a plant such as "Motor switched on". Alarms in this class do not require acknowledgement.
- "Errors"  
Alarms in this class must always be acknowledged. Error alarms normally indicate critical errors within the plant such as "Motor temperature too high".
- "System"  
System alarms indicate states or events which occur on the HMI device. System alarms provide information on occurrences such as operator errors or communication faults.
- Custom alarm classes  
The properties of this alarm class must be defined in the configuration.

## Alarm buffer

Alarm events are saved to an internal buffer. The size of this alarm buffer depends on the HMI device type.

## Alarm view

The alarm view shows selected alarms or alarm events from the alarm buffer. Whether alarm events have to be acknowledged or not is specified in your configuration.

## Alarm window

The alarm window is not assigned to any screen. Depending on the configuration the alarm window is opened when an alarm that belongs to a specific alarm class is active.

You can configure the order in which the alarms are displayed. You can choose to display the alarms in ascending or descending order of their occurrence. The alarm window can also be set to indicate the exact location of the fault, including the date and time of the alarm event. By means of configuration, the display can be filtered in such a way that only alarms that contain a specific character string will be shown.

## Alarm indicator

The alarm indicator is a graphic symbol that is displayed on the screen when an alarm of the specified alarm class is activated.

The alarm indicator can have one of two states:

- Flashing: At least one unacknowledged alarm is pending.
- Static: The alarms are acknowledged but at least one of them is not yet deactivated. The number indicates the number of queued alarms.

### 10.3.4.2 Alarms in Runtime

## Alarms

Alarms indicate events and states on the HMI device which have occurred in the system, in the process or on the HMI device itself. A status is reported when it is received.

An alarm could trigger one of the following alarm events:

- Incoming
- Outgoing
- Acknowledge

The configuration engineer defines which alarms must be acknowledged by the user.

An alarm may contain the following information:

- Date
- Time
- Alarm text
- Location of fault
- Status
- Alarm class
- Alarm number
- Alarm group

## Alarm classes

Alarms are assigned to various alarm classes.

- "Warnings"  
Alarms of this class usually indicate states of a plant such as "Motor switched on". Alarms in this class do not require acknowledgement.
- "Errors"  
Alarms in this class must always be acknowledged. Error alarms normally indicate critical errors within the plant such as "Motor temperature too high".
- "System"  
System alarms indicate states or events which occur on the HMI device. System events provide information on occurrences such as operator errors or communication faults.
- "Diagnosis Events"  
SIMATIC diagnostic alarms show states and events in the SIMATIC S7 controller.
- STEP 7 alarm classes  
The alarm classes configured in STEP 7 are also available to the HMI device.
- Custom alarm classes  
The properties of this alarm class are defined in the configuration.

## Alarm buffer

Alarm events are saved to an internal buffer. The size of this alarm buffer depends on the HMI device type.

## Alarm report

When alarm logging is enabled in the project, alarms are output directly to the printer.

You can set the logging function separately for each alarm. Printing of such an alarm is initiated when the "incoming" and "outgoing" alarm events are generated.

The output of alarms of the "System" alarm class to a printer must be initiated by means of the corresponding alarm buffer. This outputs the content of the alarm buffer to the printer. To be able to initiate this print function, you need to configure a corresponding control object in the project.

## Alarm log

Alarm events are stored in an alarm log, provided this log file is configured. The capacity of the log file is limited by the storage medium and system limits.

## Alarm view

The alarm view shows selected alarms or events from the alarm buffer or alarm log. Whether alarm events have to be acknowledged or not is specified in your configuration. By means of configuration, the display can be filtered in such a way that only alarms that contain a specific character string will be shown.

## Alarm window

The alarm window is not assigned to any screen. Depending on the configuration the alarm window is opened when an alarm that belongs to a specific alarm class is active. Depending on the configuration, it is not closed until the alarm is acknowledged.

You can configure the order in which the alarms are displayed. At the first position, the current, or the oldest alarm will be displayed. The alarm window can also be set to indicate the exact location of the fault, including the date and time of the alarm event. By means of configuration, the display can be filtered in such a way that only alarms that contain a specific character string will be shown.

## Alarm indicator

The alarm indicator is a graphic symbol that is displayed on the screen when an alarm of the specified alarm class is activated.

The alarm indicator can have one of two states:

- Flashing: At least one unacknowledged alarm is pending.
- Static: The alarms are acknowledged but at least one of them is not yet deactivated. The number indicates the number of queued alarms.

### 10.3.4.3 Using the Alarm Window or Alarm View

#### Alarm window, alarm view in Runtime

#### Application

Alarms are indicated in the alarm view or in the alarm window on the HMI device. The layout and operation of the alarm window correspond to that of the alarm view.

The alarm window is not assigned to any screen. Depending on the configuration the alarm window is opened when an alarm that belongs to a specific alarm class is active. Depending on the configuration, it is not closed until the alarm is acknowledged.

#### Layout

Depending on the configuration, in the alarm view different columns with information regarding an alarm or an alarm event are displayed. If a filter is configured, only alarms that contain a specific string in the alarm text will be displayed.

To differentiate between the different alarm classes, the first column in the alarm view contains an icon:

Symbol	Alarm class
!	"Errors"
Empty	"Warnings"
depends on the configuration	Custom alarm classes
\$	"System"
S7	"Diagnosis Event"

## Operation

You use the alarm view as follows, depending on how it is configured:

- Change the order of the columns.
- Change the order in which the alarms are displayed.
- Acknowledging alarms
- Editing alarms

## Control elements

The buttons have the following functions:

Button	Function
	Displaying a tooltip for an alarm
	Editing alarms
	Acknowledge alarm

## Operation behavior

### Linked alarm window for touch panels

When configuring the alarm window for keyboard units, enable the "Modal" property under "Properties > Mode". This ensures that the alarm window does not defocus during screen changes. Switching back and forth between the screen and different windows with <Ctrl+TAB> is not supported. If the linked alarm window has the focus, then the buttons in the screen behind it cannot be operated. The functions configured on a function key are carried out.

## Changing the order of the displayed alarms

When you click on the column, first of all alarms requiring acknowledgement are sorted according to date and time. Then those alarms that do not require acknowledgement are sorted according to date and time.

## Using the Alarm Window, Alarm View

### Introduction

As an alternative to using the mouse, you can operate the alarm view and the alarm window using the <TAB> key on your HMI device. This allows you to select the button and the most recently selected alarm in the alarm view. Depending on the configuration, you can also operate the alarm view via the function keys.

### Operation using the mouse

1. Select the alarm to be edited.
2. Click the button whose function you want to run.

### Operation using the keyboard

1. Press the <Tab> key until the list of displayed alarms is selected in the alarm view.
2. Click on the alarm to be edited. Use the <Up> and <Down> keys accordingly.
3. Press the <Tab> key until the button whose function you wish to use is selected.
4. Press <Enter>.

### Change the order of the columns

1. Select the column header, such as the "Date" column header.
2. While holding down the mouse button, drag the column header to the column header "Time". The "Date" column is in front of the "Time" column.

### Change the sorting

You can sort the list according to date or time.

1. Click on the corresponding column header.  
The list is sorted in descending or ascending order according to this criterion.
2. Click the same column header again to reverse the sort order.

### Acknowledge alarm

1. Click on the alarm to be edited.
2. Click the  button.

### Loop-In-Alarm trigger

1. Click on the alarm to be edited.
2. Click the  button.  
The screen containing information about the alarm is displayed.

---

#### Note

If you trigger a Loop-In-Alarm during an unacknowledged alarm, it is acknowledged automatically.

---

### Displaying configured tooltip

1. Click on the alarm concerned.
2. Click the  button.  
The tooltip configured for the alarm is displayed.

#### 10.3.4.4 Using the Simple Alarm Window, Alarm View

### Basic alarm view, alarm window in Runtime

#### Application

The simple alarm view shows selected alarms or alarm events from the alarm buffer. The layout and operation of the simple alarm window correspond to that of the simple alarm view.

---

#### Note

The "Single alarm view" object is not assigned dynamic functions by means of scripting.

In the Engineering System, for example, dynamize the visibility of an object in the "Animations" tab of the Inspector window. In Runtime, the "Simple alarm view" does not support animations. If you configured an animation and, for example, run a consistency check on the project, an error alarm is displayed in the output window.

---

### Layout

Depending on the configuration, in the alarm view different columns with information regarding an alarm or an alarm event are displayed.

To differentiate between the different alarm classes, the first column in the alarm view contains an icon:

Icon	Alarm class
!	"Errors"
empty	"Warnings"
depends on the configuration	Custom alarm classes
\$	"System"

### Operation

You use the alarm view as follows, depending on how it is configured:

- Acknowledging alarms
- Editing alarms

### Control elements

The buttons have the following functions:

Button	Function
	Acknowledge alarm
	Loop-In-Alarm Changes to the screen that contains information about the error event

Button	Function
	Displaying a tooltip for an alarm
	Displays the full text of the selected alarm in a separate window, namely the alarm text window In the alarm text window, you can view alarm texts that exceed the space available in the Alarm view. Close the alarm text window with the  button.
	Scrolls one alarm up.
	Scrolls one page up in the alarm view.
	Scrolls one page down in the alarm view.
	Scrolls one alarm down.

### Format of the control elements

The display of the buttons for using the simple alarm view depends on the configured size. You should therefore check on the HMI device whether all the required buttons are available.

### Basic alarm view, using the alarm window

#### Introduction

As an alternative to using the mouse, you can operate the simple alarm view using the <TAB> key on your HMI device. This allows you to select the button and the most recently selected alarm in the alarm view. Depending on the configuration, you can also operate the alarm view via the function keys.

#### Operation using the mouse

1. Select the alarm to be edited.
2. Click the button whose function you want to run.

#### Operation using the keyboard

1. Press the <Tab> key until the list of displayed alarms is selected in the alarm view.
2. Click on the alarm to be edited. Use the <Up> and <Down> keys accordingly.
3. Press the <Tab> key until the button whose function you wish to use is selected.
4. Press <Enter>.

#### Acknowledge alarm

1. Select the alarm to be acknowledged.
2. Click the  button.

### Loop-In-Alarm trigger

1. Select the alarm to be edited.
2. Click the  button.  
The screen containing information about the alarm is displayed.

### Calling the infotext

1. Select the alarm to be edited.
2. Click the  button.
3. To close the window for displaying the operator note, press the  button or use the key combination <Alt+F4>.

### 10.3.4.5 Using the Alarm Indicator

#### Alarm indicator in Runtime

#### Application

The alarm indicator is displayed if alarms of the specified alarm class are pending or require acknowledgment.

#### Layout

The alarm indicator can have one of two states:

- Flashing: At least one unacknowledged alarm is pending.
- Static: The alarms are acknowledged but at least one of them is not yet deactivated. The number indicates the number of queued alarms.

#### Operation

Depending on the configuration, when operating the alarm indicator an alarm window is opened. The icons from the symbol library can only be operated with a mouse or touch screen.

---

#### Note

##### Device dependency

Operation with mouse is not available for all HMI devices.

---

## Operating the alarm indicator using the mouse

### Operation using the mouse

1. Click on the alarm indicator with the mouse pointer. Depending on the configuration, the Alarm window is open.
2. Click  to close the alarm window. The Alarm window can be opened again by clicking on the alarm indicator.

### 10.3.4.6 Acknowledging alarms

#### Introduction

You can acknowledge alarms in Runtime according to your project configuration settings. You can acknowledge alarms as follows:

- Using the display and control object buttons
- Using the "ACK" key on your HMI device
- Using individually-configured function keys or buttons

If an operator authorization is configured for an individual control, the alarms can only be acknowledged by authorized users.

To automatically acknowledge alarms in Runtime, use the system functions and scripts, plus the "Acknowledgment by the PLC" option.

---

#### **Note**

##### **Device dependency**

Scripts are not available for all HMI devices.

---

#### Acknowledgment variants

You acknowledge individual alarms or multiple alarms together in Runtime. They are distinguished as follows:

- Single acknowledgment  
Acknowledgment of an alarm using a button or a function key.
- Acknowledge alarm groups  
Acknowledgment of all the alarms of an alarm group using a button or a function key.

## Requirement

- An alarm is displayed on the HMI device.

## Procedure

To acknowledge an alarm, proceed as follows:

1. Select the alarm.
2. If you are using an alarm view or an alarm window, click the  button.
3. If you are using a simple alarm view or a simple alarm window, click the  button.
4. Press the "ACK" button on your HMI device to acknowledge an alarm in an alarm line.

---

### Note

#### Device dependency

The extended alarm view or alarm window and the alarm line are not available for all HMI devices.

---

## Result

The alarm status changes to "Acknowledged". If the condition for triggering an alarm no longer applies, the alarm status also changes to "Outgoing", and it is no longer displayed on the HMI device.

### 10.3.4.7 Filtering Alarms

#### Introduction

The alarm view in Runtime does not contain a control element for entering filter criteria. To provide this functionality, configure an I/O field using the "Screens" editor.

#### Requirements

- A filter has been configured for the alarm view.
- An I/O field for entering the criterion is displayed.
- Alarms are displayed in Runtime.

#### Enable filter

1. Enter the filter string in the I/O field.
2. Confirm your input.  
The alarm view displays only those alarms that are contained in the specified character string. Thereby this distinguishes between upper and lower case letters.

## Disable filter

1. Delete the string from the I/O field that is used to filter the alarm view.
2. Confirm your input.  
All alarms are displayed in the alarm view once more.

## 10.3.5 Reference

### 10.3.5.1 System functions for alarms

#### System functions

System functions are predefined functions you can use to implement many tasks in runtime, even with no programming knowledge. You use system functions in a function list or in a script.

---

#### Note

##### Device dependency

Scripts are not available for all HMI devices.

---

The table shows all the system functions available for displaying and editing alarms.

System function	Effect
EditAlarm	Triggers the Loop-In-Alarm event for all selected alarms.
ClearAlarmBuffer	Deletes alarms from the alarm buffer on the HMI device.
ClearAlarmBufferProtoolLegacy	Function such as "ClearAlarmBuffer". This system function has been retained to ensure compatibility and uses the old ProTool numbering.
AlarmViewUpdate	Updates the alarm view.
AlarmViewEditAlarm	Triggers the event Loop-In-Alarm for all alarms selected in the specified alarm view.
AlarmViewAcknowledgeAlarm	Acknowledges the alarms that are selected in the specified alarm view.
AlarmViewShowOperatorNotes	Displays the configured tooltip for the alarm selected in the specified alarm view.
AcknowledgeAlarm	Acknowledges all selected alarms.
SetAlarmReportMode	Switches the automatic reporting of alarms on the printer on or off.
ShowAlarmWindow	Hides or shows the alarm window on the HMI device.
ShowSystemEvent	Displays the value of the delivered parameter as a system event on the HMI device.

**Note**

**Device dependency**

The following system functions are not available for all HMI devices:

- SetAlarmReportMode
- AlarmViewUpdate
- ShowSystemEvent

### 10.3.5.2 Alarm events

#### Alarm events and their display and control objects

In Runtime, the following alarm events are triggered by their display and control objects. You can configure a function list for every event.

Object	Configurable events
Alarms	Incoming Outgoing Acknowledge Loop-In-Alarm
Alarm view	Enabling Disable Selection changed
Alarm indicator	Click Click when flashing

**Note**

**Device dependency**

The following events in the alarm view are not available for all HMI devices:

- Enabling
- Disable
- Selection changed
- Click
- Click when flashing

### 10.3.5.3 System functions for logs

#### System functions

The following system functions are available for logging:

Function name	Function method
ArchiveLogFile	This function moves or copies a log to another storage location for long-term archiving. Use the system function, for example, to move the audit trail from a local storage medium to the server. When handling audit trails, always use the "Move log (hmiMove)" mode in order to avoid noncompliance with FDA guidelines as a result of redundant data storage.
LogTag	Saves the value of the given tags in the given data log. Use the system function to log a process values at a specific time.
StartLogging	Starts the logging process in the specified log. You can interrupt logging in Runtime by calling the "StopLogging" system function.
StopLogging	Stops the logging process in the specified log. To resume logging in Runtime, select the "StartLogging" system function.
ClearLog	Deletes all entries in the specified log.
StartNextLog	Stops the logging process in the specified log. Logging is continued in the sequential log that has been configured for the specified log file.
CloseAllLogs	Closes all logs. The connection between WinCC and the log files or log database is terminated. You can use this system function, for example, to enable hot-swapping of the storage medium on the HMI device without exiting the Runtime software.
OpenAllLogs	Opens all logs to resume logging. The connection between WinCC and the log files or log database is recovered.
CopyLog	Copies the contents of the specified log to another log.

### 10.3.5.4 Structure of \*.csv files that contain alarms

#### Introduction

You can save an alarm log as a file in "\*.csv" format. CSV stands for **C**omma **S**eparated **V**alue. In this format, the table columns that contain the names and the value of the entry are separated by semicolons. Each table row terminates with a line break.

#### Example of a log file in \*.csv format

This example shows a file with logged alarms:

```
"Time_ms";"MsgProc";"StateAfter";"MsgClass";"MsgNumber";"Var1";...;"Var8";"TimeString";"MsgText";"PLC"37986550590,27;1;1;3;110001;"";...;"";"30.06.99 13:12:51";"Change to operating mode 'online'";37986550682,87;1;1;3;140010;"";...;"";"30.06.99 13:12:59";"Connection established: PLC_1, Station 2, Rack 0, Position 2";
```

### Structure of a log file in \*.csv format

The following values are entered in the log file columns:

Parameters	Description
Time_ms	Specify a time stamp as a decimal value ( see below for conversion)
Msg_Proc	Alarm procedures: 0 = Unknown alarm procedure 1 = System event 2 = Alarm bit procedure (operating alarms) 3 = Alarm number procedure ALARM_S 4 = Diagnostic event 7 = Analog alarm procedure 100 = Alarm bit procedure (fault alarms)
State after	Alarm event: 0 = Incoming/Outgoing 1 = Incoming 2 = Incoming/Acknowledged/Outgoing 3 = Incoming/Acknowledged 4 = All alarms in the PLC were deleted with SFC106 or after PLC STOP/RUN an alarm is pending 6 = Incoming/Outgoing/Acknowledged
Msg_Class	Alarm class: 0 = No alarm class 1 = "Errors" 2 = "Warnings" 3 = "System" 4 = "Diagnostic Events" 64 ... = user-configured alarm classes
Msg Number	Alarm number
Var1 to Var8	Value of the trigger tag as a STRING
Time string	Time stamp, as STRING in legible data format
Msg text	Alarm in a readable STRING
PLC	Alarm localization (relevant PLC)

### Conversion of the time stamp decimal value

To further process the time stamp value using a different program, proceed as follows:

1. Divide Time\_ms by 1,000,000.  
Example: 37986476928 : 1,000,000 = 37986.476928
2. The whole number portion (37986) is the date calculated from 12/31/1899.  
In Excel you can now convert the time stamp into days. To do this, assign to the cell that contains the time stamp, a respective format from the "Date" group.  
Result: 37986 results in 12/31/2003
3. The value after the point (0.476928) indicates the time:
  - Multiply the value (0.476928) by 24 to obtain the hours (11.446272).
  - Multiply the remainder (0.446272) by 60 results in the minutes (26.77632).
  - Multiply the remainder (0.77632) by 60 results in the seconds (46.5792).Result 11:26:46.579  
This conversion is supported by Microsoft Excel, for example.

#### 10.3.5.5 System events

### Basics on system events

#### System events

System events on the HMI device provide information about internal states of the HMI device and PLC.

The following overview illustrates when a system event occurs and how to eliminate the cause of error.

---

**Note****HMI device dependency**

Some of the system events described in this section apply to the individual HMI devices based on their scope of functions.

---

---

**Note**

System events are output in an alarm view. System events are output in the language currently set on your HMI device.

---

### System event parameters

System events may contain encrypted parameters. The parameters are of relevance when troubleshooting because they provide a reference to the source code of the Runtime software. These parameters are output after the "Error code:" text.

### 10000 - Printer alarms

#### Meaning of the system alarms

All system alarms that can be displayed are listed below.

Table 10-2 10000 - Printer alarms

Number	Effect/cause	Remedy
10000	The print job could not be started or was canceled due to an unknown error. Faulty printer setup. Or: No authorization is available for accessing the network printer. Power supply failure during data transfer.	Check the printer settings, cable connections and the power supply. Set up the printer once again. Obtain a network printer authorization. If the error persists, contact the Hotline!
10001	No printer is installed or a default printer has not been set up.	Install a printer and/or select it as the default printer.
10002	Overflow of the graphics buffer for printing. Up to two graphics are buffered.	Allow sufficient intervals between successive print jobs.
10003	Graphics can now be buffered again.	--
10004	Overflow of the buffer for printing lines in text mode (e.g. alarms). Up to 1000 lines are buffered.	Allow sufficient intervals between successive print jobs.
10005	Text lines can now be buffered again.	--
10006	The Windows printing system reports an error. Refer to the output text and the error ID to determine the possible causes. Nothing is printed or the print is faulty.	Repeat the action if necessary.

### 20000 - Global script alarms

#### Meaning of the system events

All system events that can be displayed are listed below. The system events are divided into different ranges.

Table 10-3 20000 - Global script alarms

Number	Effect/causes	Remedy
20010	An error has occurred in the specified script line. Execution of the script was therefore aborted. Note the system event that may have occurred prior to this.	Select the specified script line in the configuration. Ensure that the tags used are of the allowed types. For system functions, verify the correct number of parameters and the parameter types.
20011	An error has occurred in a script that was called by the specified script. Execution of the script was therefore aborted in the called script. Note the system event that may have occurred prior to this.	In the configuration, select the script that has been called directly or indirectly by the specified script. Ensure that the tags used are of the allowed types. For system functions, verify the correct number of parameters and the parameter types.
20012	Inconsistent configuration data. The script could therefore not be generated.	Recompile the configuration data.
20013	Incorrect installation of the scripting component of WinCC Runtime. Therefore, no scripts can be executed.	Reinstall WinCC Runtime on your PC. Recompile your project using the "Compile > Software (compile all)" command from the context-sensitive menu and then download the project to the HMI device.
20014	The system function returns a value that is not written in any return tag.	Select the specified script in the configuration. Check whether the script name has been assigned a value.
20015	Too many successive scripts have been triggered in short intervals. When more than 20 scripts are queued for processing, any subsequent scripts are rejected. In this case, the script indicated in the alarm is not executed.	Check what is triggering the scripts. Extend the times, e.g. the acquisition cycle of the tag initiating the script.

### 30000 - Alarms errors when using system functions

#### Meaning of the system events

All system events that can be displayed are listed below. The system events are divided into different ranges.

Table 10-4 30000 - Alarms errors when using system functions

Number	Effect/causes	Remedy
30010	The tag could not accept the function result, e.g. when it has exceeded the value range.	Check the tag types of the system function parameters.
30011	A system function could not be executed because the function was assigned an invalid value or type in the parameter.	Check the parameter value and tag type of the invalid parameter. If a tag is used as a parameter, check its value.
30012	A system function could not be executed because the function was assigned an invalid value or type in the parameter.	Check the parameter value and tag type of the invalid parameter. If a tag is used as a parameter, check its value.

## 40000 - Linear scaling alarms

### Meaning of the system alarms

All system alarms that can be displayed are listed below. The system alarms are divided into different ranges:

Table 10-5 40000 - Linear scaling alarms

Number	Effect/causes	Remedy
40010	The system function could not be executed since the parameters could not be converted to a common tag type.	Check the parameter types in the configuration.
40011	The system function could not be executed since the parameters could not be converted to a common tag type.	Check the parameter types in the configuration.

## 50000 - Data server alarms

### Meaning of the system alarms

All system alarms that can be displayed are listed below. The system alarms are divided into different ranges:

Table 10-6 50000 - Data server alarms

Number	Effect/causes	Remedy
50000	The HMI device is receiving data faster than it is capable of processing. Therefore, no further data is accepted until all current data have been processed. Data exchange then resumes.	--
50001	Data exchange has been resumed.	--

## 60000 - Win32 function alarms

### Meaning of the system events

All system events that can be displayed are listed below.

Table 10-7 60000 - Win32 function alarms

Number	Effect/causes	Remedy
60000	This alarm is generated by the "ShowSystemEvent" system function. The text to be displayed is transferred to the function as a parameter.	--
60010	The file could not be copied in the direction defined because one of the two files is currently open or the source/target path is not available. It is possible that the Windows user has no access rights to one of the two files.	Restart the system function or check the paths of the source/target files. In Windows NT/XP: Users executing WinCC Runtime must be granted access to the files.
60011	An attempt was made to copy a file to itself. It is possible that the Windows user has no access rights to one of the two files.	Check the path of the source/target file. In Windows NT//XP and NTFS file system: Users executing WinCC Runtime must be granted access to the files.

## 70000 - Win32 function alarms

### Meaning of the system events

All system events that can be displayed are listed below.

Table 10-8 70000 - Win32 function alarms

Number	Effect/causes	Remedy
70010	The application could not be started because it could not be found in the path specified or there is insufficient memory space.	Check whether the application exists in the specified path or close other applications.
70011	The system time could not be modified. The error alarm only appears in connection with area pointer "Date/time PLC". Possible causes: <ul style="list-style-type: none"> <li>An invalid time was transferred in the job mailbox.</li> <li>The Windows user has no right to modify the system time.</li> </ul> If the first parameter in the system event is displayed with the value 13, the second parameter indicates the byte containing the incorrect value.	Check the time which is to be set. Using Windows NT/XP: Users running WinCC Runtime must be granted the right to set the system time of the operating system.
70012	Error when executing the function "StopRuntime" with the "Runtime and operating system" option. Windows and WinCC Runtime are not closed. The error was possibly generated because other programs cannot be closed.	Close all programs currently running. Then close Windows.
70013	The system time could not be modified because an invalid value was entered. Incorrect separators may have been used.	Check the time which is to be set.

10.3 Working with alarms

Number	Effect/causes	Remedy
70014	The system time could not be modified. Possible causes: <ul style="list-style-type: none"> <li>An invalid time was transferred.</li> <li>The Windows user has no right to modify the system time.</li> </ul> Windows rejects the setting request.	Check the time which is to be set. Using Windows NT/XP: Users running WinCC Runtime must be granted the right to set the system time of the operating system.
70015	The system time could not be read because Windows rejects the reading function.	--
70016	An attempt was made to select a screen by means of a system function or job. This is not possible because the screen number specified does not exist. Or: A screen could not be generated due to insufficient system memory. Or: The screen is blocked. Or: Screen call has not been executed correctly.	Check the screen number in the function or job with the screen numbers configured. Assign the number to a screen if necessary. Check the details for the screen call and whether the screen is blocked for specific users.
70017	Date/time is not read from the area pointer because the address set in the PLC is either not available or has not been set up.	Change the address or set up the address in the PLC.
70018	Acknowledgment that the password list has been successfully imported.	--
70019	Acknowledgment that the password list has been successfully exported.	--
70020	Acknowledgment for activation of alarm reporting.	--
70021	Acknowledgment for deactivation of alarm reporting.	--
70022	Acknowledgment to starting the Import Password List action.	--
70023	Acknowledgment to starting the Export Password List action.	--
70024	The range of values of the tag was exceeded in the system function. No calculation of the system function.	Check and correct the calculation.
70025	The range of values of the tag was exceeded in the system function. No calculation of the system function.	Check and correct the calculation.
70026	No other screens are stored in the internal screen memory. No other screens can be selected.	--
70027	The backup of the RAM file system has been started.	--
70028	The files from the RAM have been copied in the Flash memory. The files from the RAM have been copied in the Flash memory. Following a restart, these saved files are copied back to the RAM file system.	--
70029	Backup of the RAM file system has failed. No backup copy of the RAM file system has been made.	Check the settings in the "Control Panel > OP" dialog and save the RAM file system using the "Save Files" button in the "Persistent Storage" tab.
70030	The parameters configured for the system function are faulty. The connection to the new PLC was not established.	Compare the parameters configured for the system function with the parameters configured for the PLCs and correct them as necessary.

Number	Effect/causes	Remedy
70031	The PLC configured in the system function is not an S7 PLC. The connection to the new PLC was not established.	Compare the S7 PLC name parameter configured for the system function with the parameters configured for the PLC and correct them as necessary.
70032	The object configured with this number in the tab sequence is not available in the selected screen. The screen changes but the focus is set to the first object.	Check the number of the tab sequence and correct it if necessary.
70033	An e-mail cannot be sent because a TCP/IP connection to the SMTP server no longer exists. This system event is generated only at the first attempt. All subsequent unsuccessful attempts to send an e-mail will no longer generate a system event. The event is regenerated when an e-mail has been successfully sent in the meantime. The central e-mail component in WinCC Runtime attempts to connect to the SMTP server at cyclic intervals (1 minute) in order to transmit the remaining e-mails.	Check the network connection to the SMTP server and re-establish it if necessary.
70034	Following a disruption, the TCP/IP connection to the SMTP server could be re-established. The queued e-mails are then sent.	--
70036	No SMTP server for sending e-mails is configured. An attempt to connect to an SMTP server has failed and it is not possible to send e-mails. WinCC Runtime generates the system event after the first attempt was made to send an e-mail.	Configure an SMTP server: In the WinCC Engineering System using "Device settings > Device settings" In the Windows CE operating system using "Control Panel > Internet Settings > E-mail > SMTP Server"
70037	An e-mail cannot be sent for unknown reasons. The contents of the e-mail are lost.	Check the e-mail parameters (recipient etc.).
70038	The SMTP server has rejected sending or forwarding an e-mail because the domain of the recipient is unknown to the server or because the SMTP server requires authentication. The contents of the e-mail are lost.	Check the domain of the recipient address or disable the authentication on the SMTP server if possible. SMTP authentication is currently not used in WinCC Runtime.
70039	The syntax of the e-mail address is incorrect or contains illegal characters. The contents of the e-mail are discarded.	Check the e-mail address of the recipient.
70040	The syntax of the e-mail address is incorrect or contains illegal characters.	--
70041	The import of the user management was aborted due to an error. Nothing was imported.	Check your user administration or download it again to the panel.
70042	The range of values of the tag was exceeded while executing the system function. The system function was not calculated.	Check and correct the calculation.
70043	The range of values of the tag was exceeded while executing the system function. The system function was not calculated.	Check and correct the calculation.
70044	An error occurred while sending the e-mails. The e-mails were not sent.	Check the SMTP settings and the error message in the system event.

Number	Effect/causes	Remedy
70045	Cannot load a file required for encrypting the e-mail.	Update the operating system and Runtime.
70046	The server does not support encryption.	Select an SMTP server that supports encryption.
70047	The SSL versions of the HMI device and SMTP server may not be compatible.	Contact your network administrator or the operator of the SMTP server.

## 80000 - Log alarms

### Meaning of the system events

All system events that can be displayed are listed below.

Table 10-9 80000 - Log alarms

Number	Effect/causes	Remedy
80001	The log specified is filled to the size defined (in percent) and must be stored elsewhere.	You swap out the file or table by executing a 'move' or 'copy' function.
80002	A line is missing in the specified log.	--
80003	The copying process for logging was not successful. In this case, it is advisable to check any subsequent system events, too.	--
80006	Since logging is not possible, this causes a permanent loss of the functionality.	In the case of databases, check whether the corresponding data source exists and start up the system again.
80009	A copying action has been completed successfully.	--
80010	An incorrect storage location was entered in WinCC and causes permanent loss of functionality.	Configure the storage location for the respective log again and restart the system when the full functionality is required.
80012	Log entries are stored in a buffer. If the values are read to the buffer faster than they can be physically written (using a hard disk, for example), overloading may occur and recording is then stopped.	Archive fewer values. Or: Increase the logging cycle.
80013	The overload status no longer exists. Archiving resumes the recording of all values.	--
80014	The same action was triggered twice in quick succession. Since the process is already in operation, the action is only carried out once.	--
80015	This system event is used to report DOS or database errors to the user.	--
80016	The logs are separated by system function "CloseAllLogs" and the incoming entries exceed the defined buffer size. All buffer entries are deleted.	Reconnect the logs.
80017	The number of incoming entries cause a buffer overflow. This can be caused, for example, by several copying actions being activated at the same time. All copy jobs in the buffer are deleted.	Stop the copy action.

Number	Effect/causes	Remedy
80019	The connection between WinCC and all log files was shut down, for example, after execution of the "CloseAllLogs" system function. Entries are written to the buffer and written to the logs when the connection is recovered. There is no connection to the storage location and the storage medium can be changed.	--
80020	The maximum number of simultaneously copy operations has been exceeded. Copying is not executed.	Wait until the current copying actions have been completed, then restart the last copy action.
80021	An attempt was made to delete a log which is still busy with a copy action. Deletion has not been executed.	Wait until the current copying actions have been completed, then restart the last action.
80022	An attempt was made to use system function "StartSequenceLog" to start a sequence log for a log which is not configured as sequence log. No sequence log file is created.	In the project, check <ul style="list-style-type: none"> <li>• whether the "StartSequenceLog" system function was properly configured.</li> <li>• if the tag parameters are properly provided with data on the HMI device.</li> </ul>
80023	An attempt was made to copy a log to itself. The log is not copied.	In the project, check <ul style="list-style-type: none"> <li>• whether the "CopyLog" system function was properly configured.</li> <li>• if the tag parameters are properly provided with data on the HMI device.</li> </ul>
80024	In your configuration, you specified that the "CopyLog" system function should not allow copying if the destination log already contains data ("Mode" parameter). The log is not copied.	Edit the "CopyLog" system function in your configuration, if necessary. Before you initiate the system function, delete the destination log file.
80025	You have canceled the copy operation. Data written up to this point are retained. The target log file (if configured) was not deleted. The cancellation is reported by an error entry \$RT_ERR\$ at the end of the target log.	--
80026	This alarm is output after all logs are initialized. Values are written to the logs from then on. No entries are written to the logs before this time has expired, irrespective of the active state of WinCC Runtime.	--
80027	The internal Flash memory has been specified as the storage location for a log. This is not permissible. No values are written to this log and the log file is not created.	Configure "Storage Card" or network path as the storage location.
80028	The alarm serves as status report indicating that the logs are currently being initialized. No values are logged until the alarm 80026 is output.	--
80029	The number of logs specified in the alarm could not be initialized. Initialization of logs was finished. The faulty log files are not available for logging jobs.	Evaluate the additional system events related to this alarm. Check the configuration, the ODBC (Open Database Connectivity), and the specified drive.
80030	The structure of the existing log file does not match the expected structure. Logging is stopped for this log.	Delete the existing log data manually, in advance.

Number	Effect/causes	Remedy
80031	The log in CSV format is corrupted. The log cannot be used.	Delete the faulty file.
80032	Logs can be configured with events. These are triggered as soon as the log is full. Assuming WinCC Runtime is started and the log is already full, the event would never be triggered. The specified log is full and no longer accepts data.	Close WinCC Runtime, delete the log, and restart WinCC Runtime. Or: Configure a button which contains the same actions as the event and press it.
80033	"System Defined" is set in the data log file as the data source name. This causes an error. No data is written to the database logs, whereas the logging to the CSV logs works.	Reinstall SQL Sever 2005 Express.
80034	An error has occurred in the initialization of the logs. An attempt has been made to create the tables as a backup. This action was successful. A backup copy of the tables of the corrupted log file was generated and the cleared log restarted.	No action is necessary. However, it is recommended to save the backup files or delete them in order to make the space available again.
80035	An error has occurred in the initialization of the logs. An attempt has been made to create backups of the tables and this has failed. No logging or backup has been performed.	It is recommended to save the backups or to delete them in order to release memory.
80044	The export of a log was interrupted because Runtime was closed or due to a power failure. At the restart of Runtime, it was detected that the export must be resumed.	The export resumes automatically.
80045	The export of a log was interrupted due to an error in the connection to the server or at the server itself.	The export is repeated automatically. Check: <ul style="list-style-type: none"> <li>• The connection to the server.</li> <li>• If the server is running.</li> <li>• If there is enough free space on the server.</li> </ul>
80046	The destination file or the associated directory could not be created on the server.	Check whether there is enough space on the server and if you have permission to create the log file.
80047	The log could not be read while exporting it.	Check whether the storage medium is correctly inserted.
80049	The log could not be renamed while preparing to export it. The job can not be completed."	Check whether the storage medium is correctly inserted and if there is sufficient space on the medium.
80050	The log which shall be exported is not closed. The job can not be completed.	Make sure to call the "CloseAllLogs" system function before using the "ExportLog" system function. Change the configuration as required.
80051	The log to be copied contains an invalid checksum. The log was not copied.	Select a log with a valid checksum. The selected log may have been manipulated.
80052	The log cannot be read.	Check the log and the specified path.
80053	The closed log cannot be read.	Open the log.

## 90000 - FDA alarms

### Meaning of the system events

All system events that can be displayed are listed below.

Table 10-10 90000 - FDA alarms

Number	Effect/causes	Remedy
90024	No operator actions can be logged due to lack of space on the storage medium for log. The operator action will therefore not be executed.	Provide more storage space by inserting a blank storage medium, or backup the log files to the server using the "ExportLog" function.
90025	No user actions can be logged because of error state of the archive. Therefore the user action will not be executed.	Check whether the storage medium is correctly inserted.
90026	No operator actions can be logged because the log is closed. The operator action will therefore not be executed.	Before further operator actions are carried out, the log must be reopened with the help of system function "OpenAllLogs". Change the configuration as required.
90028	The password you entered is incorrect.	Enter the correct password.
90029	Runtime was closed during ongoing operation (perhaps due to a power failure) or a storage medium in use is incompatible with Audit Trail. An Audit Trail is not suitable if it belongs to another project or has already been logged.  It could also be that archiving was not stopped before automatic execution of the "CloseAllArchives" function was started (e.g. by the task scheduler).	Ensure that you are using the correct storage medium.
90030	Runtime was closed during ongoing operation (perhaps due to a power failure).	--
90031	Runtime was closed during ongoing operation (perhaps due to a power failure).	--
90032	Running out of space on the storage medium for log.	Provide more storage space by inserting a blank storage medium, or backup the log files to the server using the "ExportLog" function.
90033	No more space on the storage medium for log. As of now, no more operator actions requiring logging will be executed.	Provide more storage space by inserting a blank storage medium, or backup the log files to the server using the "ExportLog" function.
90039	You do not have the necessary authorization to perform this action.	Adapt or upgrade your authorizations.
90040	Audit Trail is switched off because of a forced user action.	Reactivate the "Audit Trail" with the help of system function "StartLog".
90041	A user action which has to be logged has been executed without a logged on user.	A user action requiring logging should only be possible with permission. Change the configuration by setting a required authorization for the input object.
90044	A user action which has to be confirmed was blocked, because there is another user action pending.	Repeat the user action if necessary.
90048	The Audit Trail cannot be printed while data relevant to the audit is being logged.	Stop logging by calling system function "StopLogging".
90049	Access to required file is not possible.	Check the network connection or the storage medium.
90056	The recipe was not imported because the file contains no checksum.	Select a file with a checksum.  You can also disable checksum verification by calling system function "ImportDataRecords".
90057	The recipe was not imported because the file contains an invalid checksum. The selected file may have been manipulated.	Select a file with a valid checksum.

**110000 - Offline function alarms****Meaning of the system events**

All system events that can be displayed are listed below.

Table 10-11 110000 - Offline function alarms

Number	Effect/causes	Remedy
110000	The operating mode was changed. "Offline" mode is now set.	--
110001	The operating mode was changed. "Online" mode is now set.	--
110002	The operating mode was not changed.	Check the connection to the PLCs. Check whether the address range for the "Coordination" area pointer is present in the PLC.
110003	The operating mode of the specified PLC was changed by the "SetConnectionMode" system function. The "offline" operating mode is now set.	--
110004	The operating mode of the specified PLC was changed by the "SetConnectionMode" system function. The "online" operating mode is now set.	--
110005	An attempt was made to use the "SetConnectionMode" system function to set the specified PLC to "online" mode, although the entire system is in "offline" mode. This changeover is not allowed. The PLC remains in "offline" mode.	Switch the complete system to "online" mode and repeat execution of the system function.
110006	The content of the "project ID" area pointer does not match the project ID configured in WinCC. The WinCC Runtime is therefore terminated.	Check: <ul style="list-style-type: none"> <li>the project ID entered on the PLC.</li> <li>the project ID entered in WinCC.</li> </ul>

**120000 - Trend alarms****Meaning of the system alarms**

All system alarms that can be displayed are listed below.

Table 10-12 120000 - Trend alarms

Number	Effect/causes	Remedy
120000	The trend is not displayed because you configured an incorrect axis to the trend or an incorrect trend.	Change the configuration.
120001	The trend is not displayed because you configured an incorrect axis to the trend or an incorrect trend.	Change the configuration.
120002	The trend is not displayed because the tag assigned attempts to access an invalid PLC address.	Check whether the data area for the tag exists in the PLC, the configured address is correct and the value range for the tag is correct.

## 130000 - System information alarms

### Meaning of the system events

All system events that can be displayed are listed below.

Table 10-13 130000 - System information alarms

Number	Effect/causes	Remedy
130000	The action was not executed.	Close all other programs. Delete files no longer required from the hard disk.
130001	The action was not executed.	Delete files no longer required from the hard disk.
130002	The action was not executed.	Close all other programs. Delete files no longer required from the hard disk.
130003	No data medium found. The operation is canceled.	Check the following conditions, for example: <ul style="list-style-type: none"> <li>• Access to the correct data carrier?</li> <li>• Is a data carrier inserted?</li> </ul>
130004	The data carrier is write-protected. The operation is canceled.	Check whether the correct data medium is being accessed. Remove the write-protection if necessary.
130005	The file is read only. The operation is canceled.	Check whether the correct file is being accessed. Change the file attributes.
130006	No access to the file. The operation is canceled.	Check the following conditions, for example: <ul style="list-style-type: none"> <li>• Is the correct file being accessed?</li> <li>• Does the file exist?</li> <li>• Is another action preventing concurrent access to the file?</li> </ul>
130007	The network connection is interrupted. Records cannot be saved or read via the network connection.	Check the network connection and eliminate the cause of error.
130008	No storage card available. The specified records cannot be saved to or read from Storage Card.	Insert the storage card.
130009	The specified folder does not exist on the storage card. The files stored in this directory are not backed up after switching off the HMI device.	Insert the storage card.
130010	The maximum nesting depth can be exhausted when, for example, value changes in a script initiate the call of an infinite number of further scripts. The configured functionality is not provided.	Check the configuration.
130013	No storage card available. The specified records cannot be saved to or read from Storage Card.	Insert the storage card.

**140000 - Connection alarms: Connection + device**

**Meaning of the system events**

All system events that can be displayed are listed below.

Table 10-14 140000 - Connection alarms: Connection + device

Number	Effect/causes	Remedy
140000	An online connection to the PLC is established.	--
140001	The online connection to the PLC was shut down.	--
140003	No tag update or write operations are executed.	Check whether the connection is up and the PLC is switched on. In the Control Panel, check the set parameters using the "Set PG/PC interface" function. Restart the system.
140004	No tag update or write operations are executed due to an incorrect access point, or incorrect module configuration.	Check the connection and whether the PLC is switched on. Check the access point or the module configuration (MPI, PPI, PROFIBUS) in the Control Panel with "Set PG/PC interface". Restart the system.
140005	No tag update or write operations are executed due to an incorrect HMI device address (possibly too high).	Use a different address for the HMI device. Check the connection and whether the PLC is switched on. Check the parameters set in the "Set PG/PC interface" dialog of the Control Panel. Restart the system.
140006	No tag update or write operations are executed due to an incorrect baud rate setting.	Select a different baud rate in WinCC (according to module, profile, communication peer, etc.).
140007	An incorrect bus profile prevents tag updates or write operations (see %1). The following parameters could not be written to the registry database: 1: Tslot 2: Tqui 3: Tset 4: MinTsdr 5: MaxTsdr 6: Trdy 7: Tid1 8: Tid2 9: Gap Factor 10: Retry Limit	Check the custom bus profile. Check the connection and whether the PLC is switched on. Check the parameters set in the "Set PG/PC interface" dialog of the Control Panel. Restart the system.

Number	Effect/causes	Remedy
140008	An incorrect baud rate prevents tag updates or write operations. The following parameters could not be written to the registry database: 0: General error 1: Wrong version 2: Profile cannot be written to the registry database. 3: The subnet type cannot be written to the registry database. 4: The Target Rotation Time cannot be written to the registry database. 5: Incorrect Highest Station Address (HSA).	Check whether the connection is up and the PLC is switched on. In the Control Panel, check the set parameters using the "Set PG/PC interface" function. Restart the system.
140009	No tag updates or write operations because the S7 communication module was not found.	To reinstall the module, open the Control Panel and select "Set PG/PC interface".
140010	No S7 communication partner found because the PLC is shut down. DP/T: The option "PG/PC is the only master" is not set in the Control Panel under "Set PG/PC interface".	Switch on the PLC. DP/T: If only one master is connected to the network, disable "PG/PC is the only master" in "Set PG/PC interface". If several masters are connected to the network, enable these. Do not change any settings, for this will cause bus errors.
140011	No tag updates or write operations because communication is down.	Check the connection and whether the communication partner is switched on.
140012	Initialization error (e.g. if WinCC Runtime was closed in Task Manager). Or: Another application (e.g. STEP 7) with different bus parameters is active and the driver cannot be started with the new bus parameters (baud rate, for example).	Restart the HMI device. Or: Start WinCC Runtime and then start your other applications.
140013	The MPI cable is disconnected and, therefore, there is no power supply.	Check the connections.
140014	The configured bus address is in use by another application.	Change the HMI device address in the PLC configuration.
140015	Incorrect baud rate Or: Incorrect bus parameters (e.g. HSA) Or: OP address > HSA or: Incorrect interrupt vector (interrupt not registered by the driver)	Correct the parameters.
140016	The hardware does not support the configured interrupt.	Change the interrupt number.
140017	The set interrupt is in use by another driver.	Change the interrupt number.
140018	SIMOTION Scout disabled the consistency check. Only a corresponding note appears.	In SIMOTION Scout, reactivate the consistency check and once again download the project to the PLC.
140019	SIMOTION Scout is downloading a new project to the PLC. Connection to the PLC is canceled.	Wait until the end of the reconfiguration.
140020	Mismatch of the PLC and project (FWX file) versions. The connection to the PLC is canceled.	The following remedies are available: Download the current version to the PLC using SIMOTION Scout. Recompile the project using WinCC ES, close WinCC Runtime, and restart with the new configuration.

Number	Effect/causes	Remedy
140021	Setup of the connection to the PLC failed. Incorrect configuration of the "Access password" for the connection to the PLC.	Select the "Access password" area in the "Connections" editor to check the password entered for the connection to the PLC. Assign the correct password. The "Password" for the connection to the PLC is assigned in the "Security" area of the PLC properties.
140022	Setup of the connection to the PLC failed. Incorrect configuration of the access password for the connection to the PLC.	Select the "Access password" area in the "Connections" editor to check the password entered for the connection to the PLC. The "Password" for the connection to the PLC is assigned in the "Security" area of the PLC properties.
140025	Setup of the connection to the PLC failed. The access password of the PLC is disabled in the PLC display.	Enable the access password in the PLC display.

## 160000 - Connection alarms: OPC: Connection

### Meaning of the system events

All system events that can be displayed are listed below.

Table 10-15 160000 - Connection alarms: OPC: Connection

Number	Effect/causes	Remedy
160000	No more data is read or written. Possible causes: <ul style="list-style-type: none"> <li>• The cable connection is interrupted.</li> <li>• The PLC does not respond or has failed, etc.</li> <li>• The wrong port is used for the connection.</li> <li>• System overload</li> </ul>	Check whether the cable is plugged in and the PLC is OK, and whether the correct port is used. Restart the system if the system event persists.
160001	The connection is recovered because the cause of the interruption has been eliminated.	--
160010	No connection to the server because the server ID (CLS-ID) cannot be determined. Values cannot be read or written.	Check access rights.
160011	No connection to the server because the server ID (CLS-ID) cannot be determined. Values cannot be read or written.	Check the following conditions, for example: <ul style="list-style-type: none"> <li>• Correct server name?</li> <li>• Correct station name?</li> <li>• Is the server registered?</li> </ul>
160012	No connection to the server because the server ID (CLS-ID) cannot be determined. Values cannot be read or written.	Check the following conditions, for example: <ul style="list-style-type: none"> <li>• Correct server name?</li> <li>• Correct station name?</li> <li>• Is the server registered?</li> </ul> Note for advanced users: Interpret the value from HRESULT.

Number	Effect/causes	Remedy
160013	The specified server was started as InProc server. This has not been released and may lead to undefined behavior because the server is running in the same process area as WinCC Runtime.	Configure the server as OutProc Server or Local Server.
160014	Only one OPC server project can be started on a PC/MP. An alarm is output after an attempt was made to start a second project.  The second project has no OPC server functionality and cannot be located as an OPC server by external sources.	Do not start a second project with OPC server functionality on the computer.

## 170000 - S7 dialog alarms

### Meaning of the system alarms

All system alarms that can be displayed are listed below.

Table 10-16 170000 - S7 dialog alarms

Number	Effect/causes	Remedy
170000	S7 diagnostics events are not indicated because it is not possible to log on to the S7 diagnostics functions at this device. The service is not supported.	--
170001	The S7 diagnostics buffer cannot be viewed because communication with the PLC is shut down.	Set the PLC to online mode.
170002	The S7 diagnostics buffer cannot be viewed because reading of the diagnostics buffer (SSL) was canceled with error.	--
170003	An S7 diagnostics event cannot be visualized. The system returns internal error %2.	--
170004	An S7 diagnostics event cannot be visualized. The system returns an internal error of error class %2, error number %3.	--
170007	It is not possible to read the S7 diagnostics buffer (SSL) because this operation was canceled with an internal error of class %2 and error code %3.	--

## 180000 - General alarms

### Meaning of the system events

All system events that can be displayed are listed below.

Table 10-17 180000 - General alarms

Number	Effect/causes	Remedy
180000	A component/OCX received configuration data with a version ID which is not supported.	Install a newer component.
180001	System overload because too many actions are running in parallel. Certain actions can be executed, while others are discarded.	Several remedies are available: <ul style="list-style-type: none"> <li>• Generate alarms at a slower rate (polling).</li> <li>• Initiate scripts and functions at greater intervals.</li> </ul> If the alarm appears more frequently: Restart the HMI device.
180002	The screen keyboard could not be activated. Possible causes: "TouchInputPC.exe" was not registered due to faulty Setup.	Reinstall WinCC Runtime.

### 190000 - Tag alarms

#### Meaning of the system events

All system events that can be displayed are listed below.

Table 10-18 190000 - Tag alarms

Number	Effect/causes	Remedy
190000	It is possible that the tag is not updated.	--
190001	The tag is updated after the cause of the last error state has been eliminated (recovery of normal operation).	--
190002	The tag is not updated because communication with the PLC is down.	Select system function "SetOnline" to enable communication.
190004	The tag is not updated because the address configured for this tag does not exist.	Check the configuration.
190005	The tag is not updated because the configured PLC type does not exist for this tag.	Check the configuration.
190006	The tag is not updated because it is not possible to map the PLC type in the data type of the tag.	Check the configuration.
190007	The tag value is not modified because the connection to the PLC is interrupted or the tag is offline.	Set online mode or reconnect to the PLC.
190008	The configured tag limits were violated due to one of the following events: <ul style="list-style-type: none"> <li>• Value input</li> <li>• System function</li> <li>• Script</li> </ul>	Observe the configured or current tag limits.
190009	An attempt was made to assign this tag a value that is outside the valid range of values for this data type. For example, input of the value 260 for a byte tag, or input of the value -3 for an unsigned word tag.	Observe the range of values for the data type of the tags.

Number	Effect/causes	Remedy
190010	The rate at which values are written to the tag is too high (e.g. initiated in a script loop). Values will be lost because buffer capacity is limited to 100 operations.	The following remedies are available: <ul style="list-style-type: none"> <li>• Extend the interval between multiple write actions.</li> <li>• Do not use an array tag longer than 6 words when configuring an acknowledgment on the HMI device using "HMI acknowledgment tag".</li> </ul>
190011	Possible cause 1: The value entered could not be written to the configured PLC tag because the high or low limit was exceeded. The system discarded the entry and restored the original value. Possible cause 2: The connection to the PLC was interrupted.	Note that the value entered must be within the range of values of the control tag.  Check the connection to the PLC.
190012	It is not possible to convert a value from a source format to a target format, for example: An attempt is being made to write a counter value that is outside the valid, PLC-specific range of values. A tag of the type Integer should be assigned a value of the type string.	Check the range of values, or the data type of the tag.
190013	You entered a string that exceeds the tag length. The string is truncated automatically to a valid length.	Always enter strings that do not exceed the valid tag length.

**190100 - Area pointer alarms**

**190100 - Area pointer alarms**

Number	Effect/causes	Remedy
190100	The area pointer is not updated because the address configured for this pointer does not exist. Type 1 Warnings 2 Errors 3 PLC acknowledgment 4 HMI device acknowledgment 5 LED image 6 Trend request 7 Trend transfer 1 8 Trend transfer 2 No.: Consecutive number displayed in WinCC ES.	Check the configuration.
190101	The area pointer is not updated because it is not possible to map the PLC type to the area pointer type. Parameter type and no.: see alarm 190100	--
190102	The area pointer is updated after the cause of the last error state has been eliminated (recovery of normal operation). Parameter type and no.: See alarm 190100.	--

**200000 - PLC coordination alarms**

**200000 - PLC coordination alarms**

Number	Effect/causes	Remedy
200000	Coordination is not executed because the address configured in the PLC does not exist/is not set.	Change the address or set up the address in the PLC.
200001	Coordination is canceled because the write access to the address configured in the PLC is not possible.	Change the address or set the address in the PLC at an area which allows write access.
200002	Coordination is not carried out at the moment because the address format of the area pointer does not match the internal storage format.	Internal error
200003	Coordination can be executed again because the last error state is eliminated (return to normal operation).	--
200004	The coordination may not be executed.	--
200005	No more data is read or written. Possible causes: <ul style="list-style-type: none"> <li>• The cable is defective.</li> <li>• The PLC does not respond, is defective, etc.</li> <li>• System overload</li> </ul>	Ensure that the cable is plugged in and the PLC is operational. Restart the system if the system alarm persists.

**210000 - PLC job alarms****210000 - PLC job alarms**

Number	Effect/causes	Remedy
210000	Jobs are not processed because the configured address does not exist/has not been set up in the PLC.	Change the address or set up the address in the PLC.
210001	Jobs are not processed because read/write access to the configured address is not possible in the PLC.	Change the address, or set up the address in a PLC area at which read/write access is possible.
210002	Jobs are not executed because the address format of the area pointer does not match the internal storage format.	Internal error
210003	The job buffer is processed again because the last error status has been eliminated (recovery of normal operation).	--
210004	The job buffer is possibly not going to be processed.	--
210005	A job mailbox with invalid number was initiated.	Check the PLC program.
210006	An error occurred while executing the job mailbox. As a result, the control job is not executed. Observe the next/previous system event.	Check the parameters of the control job. Recompile the configuration data.

**220000 - WinCC communication driver alarms****220000 - WinCC communication driver alarms**

Number	Effect/causes	Remedy
220001	The tag is not downloaded because write access to data type Bool/Bit is not supported by the sublevel communication driver/HMI device.	Change the configuration.
220002	The tag is not downloaded because write access to data type Byte is not supported by the sublevel communication driver/HMI device.	Change the configuration.
220003	The communication driver cannot be loaded as it is possibly not installed.	Install the driver by reinstalling WinCC Runtime.
220004	Communication is down and no update data is transferred because the cable is not connected or defective etc.	Check the connection.
220005	Communication is up.	--
220006	The connection between the specified PLC and the specified port is active.	--

10.3 Working with alarms

Number	Effect/causes	Remedy
220007	The connection to the specified PLC is interrupted at the specified port.	<p>Check the following:</p> <ul style="list-style-type: none"> <li>• Is the cable plugged in?</li> <li>• Is the PLC OK?</li> <li>• Is the right port being used?</li> <li>• Is your configuration OK (port parameters, protocol settings, PLC address)?</li> </ul> <p>Restart the system if the system event persists.</p>
220008	<p>The communication driver cannot access or open the specified port. This port might be in use by another application, or a port that does not exist on the target device is being used.</p> <p>No communication with the PLC.</p>	<p>Close all applications that access the port and restart the computer.</p> <p>Use another port that exists in the system.</p>

230000 - Screen object alarms

230000 - Screen object alarms

Number	Effect/causes	Remedy
230000	<p>The value entered could not be used. The system discards this entry and restores the previous value.</p> <p>Possible causes:</p> <ul style="list-style-type: none"> <li>• The range of values is exceeded.</li> <li>• You entered invalid characters</li> <li>• The valid maximum number of users has been exceeded.</li> </ul>	Enter a practical value, or delete a user that is no longer required.
230002	The user currently logged on does not have the necessary authorization, so the system discards the entry and restores the previous value.	Log on as user with appropriate authorization.
230003	Change to the specified screen failed because this screen is not available/configured. The current screen remains selected.	Configure the screen and check the selection function.
230005	<p>The range of values of the tag has been exceeded in the I/O field.</p> <p>The original tag value is retained.</p>	Observe the range of values for the tag when entering a value.
230100	<p>During navigation in the Web browser, the system returned a message which may be of interest to the user.</p> <p>The Web browser continues to run but may not (fully) show the new page.</p>	Navigate to another page.
230200	The HTTP channel connection was interrupted due to an error. This error is explained in detail by another system event. Data is no longer exchanged.	<p>Check the network connection.</p> <p>Check the server configuration.</p>
230201	<p>The HTTP channel connection is set up.</p> <p>Data is exchanged.</p>	--

Number	Effect/causes	Remedy
230202	<p>WININET.DLL has detected an error. Usually, this error occurs if it is not possible to connect to the server, or the server denies a connection because the client lacks proper authorization. An unknown server certificate may also be the cause if the connection is encrypted by means of SSL.</p> <p>The alarm text provides details. This text is always in the language of the Windows installation because it is returned by the Windows OS.</p> <p>Process values are no longer exchanged. The part of the alarm returned by the Windows OS might not be displayed, e.g. "An error has occurred". WININET.DLL returns the following error: Number: 12055 Text:HTTP: &lt;no error text available&gt;."</p>	<p>Depending on the cause:</p> <p>When an attempt to connect fails, or a timeout occurs:</p> <ul style="list-style-type: none"> <li>• Check the network connection and the network.</li> <li>• Check the server address.</li> <li>• Check whether the WebServer is actually running on the target station.</li> </ul> <p>Incorrect authorization:</p> <ul style="list-style-type: none"> <li>• The configured user name and/or password do not match the entries on the server. Set consistent data.</li> </ul> <p>If the server certificate is rejected: Certificate signed by an unknown CA ( ):</p> <ul style="list-style-type: none"> <li>• Ignore this point, or install a certificate that has been signed with one of the root certificates known to the client station.</li> </ul> <p>The date of the certificate is invalid:</p> <ul style="list-style-type: none"> <li>• Ignore this point, or install a certificate with valid date on the server.</li> </ul> <p>Invalid CN (Common Name or Computer Name):</p> <ul style="list-style-type: none"> <li>• Ignore this point, or install a certificate with a name that corresponds to the server address.</li> </ul>
230203	<p>Although a connection can be made to the server, the HTTP server refused to connect. Possible causes:</p> <ul style="list-style-type: none"> <li>• WinCC Runtime does not run on the server</li> <li>• The HTTP channel is not supported (503 Service unavailable).</li> </ul> <p>Other errors can only occur if the Webserver does not support the HTTP channel. The language of the alarm text depends on the Webserver.</p> <p>Data is not exchanged.</p>	<p>On 503 Service unavailable error:</p> <p>Check whether WinCC Runtime is running on the server and whether the HTTP channel is supported.</p>
230301	<p>Internal error. An English text explains the error in more detail. The error may be caused by insufficient memory.</p> <p>OCX does not work.</p>	--
230302	<p>The name of the remote server cannot be resolved.</p> <p>An attempt to connect has failed.</p>	<p>Check the configured server address.</p> <p>Check whether the DNS service is available on the network.</p>
230303	<p>The remote server is not running on the addressed computer.</p> <p>incorrect server address.</p> <p>An attempt to connect has failed.</p>	<p>Check the configured server address.</p> <p>Check whether the remote server is running on the target computer.</p>
230304	<p>The remote server on the addressed computer is incompatible with VNCOCX.</p> <p>An attempt to connect failed.</p>	<p>Use a compatible remote server.</p>
230305	<p>Authentication has failed due to incorrect password.</p> <p>An attempt to connect failed.</p>	<p>Configure the correct password.</p>

Number	Effect/causes	Remedy
230306	Error in the connection to the remote server. This may occur as a result of network problems. An attempt to connect failed.	Check whether the network cable is plugged in, or whether there are network problems.
230307	The connection to the remote server was shut down. Possible causes: <ul style="list-style-type: none"> <li>• The remote server was shut down</li> <li>• The user instructed the server to close all connections.</li> </ul> The connection is cancelled.	--
230308	This alarm provides information on the connection status. An attempt is made to connect.	--

### 240000 - Authorization alarms

### 240000 - Authorization alarms

Number	Effect/causes	Remedy
240000	WinCC Runtime is running in demo mode. You have no authorization, or your authorization is corrupted.	Install the authorization.
240001	WinCC Runtime is running in demo mode. You configured too many tags for the installed version.	Load an adequate authorization / powerpack.
240002	WinCC Runtime is running with time-limited emergency authorization.	Restore the full authorization.
240004	Error when reading the emergency authorization. WinCC Runtime is running in demo mode.	Restart WinCC Runtime. Install or repair the authorization (see Commissioning Instructions for Software Protection).
240005	Automation License Manager has detected an internal system error. Possible causes: <ul style="list-style-type: none"> <li>• Corrupted file</li> <li>• Faulty installation</li> <li>• No free memory space for Automation License Manager, or similar.</li> </ul>	Restart the HMI device/PC. If this procedure does not solve the problem, remove and then reinstall Automation License Manager.

**250000 - S7 Status/Force alarms****250000 - S7 Status/Force alarms**

Number	Effect/causes	Remedy
250000	The tag in the specified line in "Status Force" is not updated because the address configured for this tag is not available.	Check the set address and then verify that the address is set up in the PLC.
250001	The tag in the specified line in "Status Force" is not updated because the PLC type configured for this tag does not exist.	Check the set address.
250002	The tag in the specified line in "Status Force" is not updated because it is not possible to map the PLC type in the tag type.	Check the set address.
250003	An attempt to connect to the PLC failed. The tags are not updated.	Check the connection to the PLC. Check that the PLC is switched on and is online.

**260000 - Password system alarms****260000 - Password system alarms**

Number	Effect/causes	Remedy
260000	An unknown user or an unknown password has been entered in the system. The current user is logged off from the system.	Log on to the system as a user with a valid password.
260001	The logged in user does not have sufficient authorization to execute the protected functions on the system.	Log on to the system as a user with sufficient authorization.
260002	This alarm output when the "TrackUserChange" system function is triggered.	--
260003	The user has logged off from the system.	--
260004	The user name entered into the user view already exists in the user management.	Select another user name because user names have to be unique in the user management.
260005	The entry is discarded.	Enter a shorter user name.
260006	The entry is discarded.	Use a shorter or longer password.
260007	The logoff time entered is outside the valid range from 0 to 60 minutes. The new value entered is discarded and the original value is retained.	Enter a logon timeout value between 0 and 60 minutes.
260008	An attempt was made in WinCC to read a PTPProRun.pwl file created with ProTool V 6.0. Reading of the file was canceled due to incompatibility of the format.	--
260009	You have attempted to delete the user "Administrator" or "PLC User". These users are fixed components of the user management and cannot be deleted.	If you need to delete a user, because perhaps you have exceeded the maximum number permitted, delete another user.

Number	Effect/causes	Remedy
260012	The password entries in the "Change Password" dialog and in the confirmation field do not match. The password is not changed. User will be logged off.	You have to log on to the system again. Then enter the identical password twice to be able to change the password.
260013	The password entered in the "Change Password" dialog is invalid because it is already in use. The password is not changed. User will be logged off.	You have to log on to the system again. Then enter a new password that has not been used before.
260014	You have tried to log on with an incorrect password three times in a row. You will be locked out and assigned to group no. 0.	You can log on to the system with your correct password. Only an administrator can change the assignment to a group.
260024	The password you entered does not meet the necessary security guidelines.	Enter a password that contains at least one number.
260025	The password you entered does not meet the necessary security guidelines.	Enter a password that comprises at least three characters.
260028	Upon system start-up, an attempt to log on, or when trying to change the password of a SIMATIC log-on user, the system attempts to access the SIMATIC Logon Server.  If attempting to log on, the new user is not logged in. If a different user was logged on before, then this user is logged off.	Check the connection to the SIMATIC Logon Server and its configuration; for example: 1. Port number 2. IP address 3. Server name 4. Functional transfer cable Or use a local user.
260030	The SIMATIC Logon user could not change his password on the SIMATIC Logon Server. The new password is possibly noncompliant with password rules set on the server, or the user is not authorized to change his password.  The old password remains and the user is logged off.	Log in again and choose a different password. Check the password rules on the SIMATIC Logon Server.
260033	The action change password or log on user could not be carried out.	Check the connection to the SIMATIC Logon Server and its configuration; for example: 1. Port number 2. IP address 3. Server name 4. Functional transfer cable Or use a local user.
260034	The last logon operation has not yet ended. A user action or a logon dialog can therefore not be called.  The logon dialog is not opened. The user action is not executed.	Wait until the logon operation is complete.
260035	The last attempt to change the password was not completed. A user action or a logon dialog can therefore not be called.  The logon dialog is not opened. The user action is not executed.	Wait until the procedure is complete.

Number	Effect/causes	Remedy
260036	There are insufficient licenses on the SIMATIC Logon Sever. The logon is not authorized.	Check the licensing on the SIMATIC Logon Server.
260037	There is no license on the SIMATIC Logon Sever. A logon is not possible. It is not possible to log on via the SIMATIC Logon Server, only via a local user.	Check the licensing on the SIMATIC Logon Server.
260040	The system attempts to access the SIMATIC Logon Server upon system start-up or when trying to change the password. If attempting to log on, the new user is not logged in. If a different user was logged on before, then this user is logged off.	Check connection to the domain and its configuration in the Runtime security settings editor. Or use a local user.
260043	It was not possible to log the user on to the SIMATIC Logon Server. The user name or the password could be incorrect or the user does not have sufficient rights to log on. The new user is not logged in. If a different user was logged on before, then this user is logged off.	Try again. If necessary, check the password data on the SIMATIC Logon Server.
260044	It was not possible to log the user on to the SIMATIC Logon Server as his account is blocked. The new user is not logged in. If a different user was logged on before, then this user is logged off.	Check the user data on the SIMATIC Logon Server.
260045	The SIMATIC Logon user is not associated to any or several groups. The new user is not logged in. If a different user was logged on before, then this user is logged off.	Check user data on the SIMATIC Logon Server and the configuration in your WinCC project. A user may only be assigned to one group.

## 270000 - System alarms

### 270000 - System Alarms

Number	Effect/causes	Remedy
270000	The alarm does not indicate the tag because it is accessing an invalid address in the PLC.	Check whether the data area for the tag exists on the PLC, whether the configured address is correct, and whether the value range for the tag is correct.
270001	There is a device-specific limit as to how many alarms may be queued for viewing (see the operating instructions). This limit has been exceeded. The view no longer contains all the alarms. However, all alarms are written to the alarm buffer.	--

Number	Effect/causes	Remedy
270002	The view shows alarms of a log for which there is no data in the current project. Placeholders are output for the alarms.	Delete old log data, if necessary.
270003	The service cannot be set up because too many devices want to access this service. A maximum of four devices can execute this action.	Reduce the number of HMI devices which want to use the service.
270004	Access to the persistent alarm buffer is not possible. Alarms cannot be restored or backed up.	If the problems persist at the next restart, contact Customer Support (delete Flash).
270005	Persistent alarm buffer corrupted: Alarms cannot be restored.	If the problems persist at the next restart, contact Customer Support (delete Flash).
270006	Project modified: Alarms cannot be restored from the persistent alarm buffer.	The project was compiled and downloaded again to the HMI device. The error should no longer occur at the next restart of the HMI device.
270007	A configuration problem is preventing you from the restoring the data (e.g. a DLL was deleted, or unknown directory).	Update the operating system and download your project again to the HMI device.

### 290000 - Recipe system alarms

### 290000 - Recipe system alarms

Number	Effect/causes	Remedy
290000	The recipe tag could not be read or written. It is assigned the start value. The alarm can be entered in the alarm buffer for up to four more faulty tags. After that, alarm 290003 is output.	Check the configuration to see whether the address has been set up in the PLC.
290001	An attempt was made to assign the recipe tag a value that is outside the valid range of values for this type. The alarm can be entered in the alarm buffer for up to four more faulty tags if necessary. After that, alarm 290004 is output.	Observe the range of values for the tag type.
290002	It is not possible to convert a value from a source format to a target format. The alarm can be entered in the alarm buffer for up to four more faulty recipe tags if necessary. After that, alarm 290005 is output.	Check the range of values or type of the tag.
290003	This alarm is output after alarm 290000 was triggered more than five times. In this case, no further separate alarms are generated.	Check the configuration to see whether the tag addresses have been set up in the PLC.
290004	This alarm is output after alarm 290001 was triggered more than five times. In this case, no further separate alarms are generated.	Observe the range of values for the tag type.

Number	Effect/causes	Remedy
290005	This alarm is output after alarm 290002 was triggered more than five times. In this case, no further separate alarms are generated.	Check the range of values or type of the tag.
290006	The limits configured for the tag have been exceeded by the values entered.	Observe the configured or current tag limits.
290007	There is a difference between the source and target structure in the recipe currently being processed. The target structure contains an additional recipe tag that is not available in the source structure. The recipe tag specified is assigned its start value.	Insert the specified recipe tag into the source structure.
290008	There is a difference between the source and target structure in the recipe currently being processed. The source structure contains an additional recipe tag that is not available in the target structure and cannot be assigned. The value is discarded.	Remove the specified recipe tag in the specified recipe from the project.
290010	The storage location configured for the recipe is invalid. Possible causes: Invalid characters, write protection, data carrier out of space or not available.	Check the configured storage location.
290011	A data record of the specified number does not exist.	Check the source for the number (constant or tag value).
290012	A recipe of the specified number does not exist.	Check the source for the number (constant or tag value).
290013	An attempt was made to save a data record under a data record number that already exists. The operation is not executed.	The following remedies are available: <ul style="list-style-type: none"> <li>• Check the source for the number (constant or tag value).</li> <li>• First, delete the data record.</li> <li>• Modify the "Overwrite" function parameter.</li> </ul>
290014	The specified import file was not found.	Check the following: <ul style="list-style-type: none"> <li>• The file name</li> <li>• Ensure that the file is in the specified directory.</li> </ul>
290020	Check back to verify that the download of data records from the HMI device to the PLC has started.	--
290021	Check back to verify that the download of records from the HMI device to the PLC was completed.	--
290022	Check back to indicate that the download of data records from the HMI device to the PLC was canceled due to an error.	Check the following conditions in the configuration: <ul style="list-style-type: none"> <li>• Are the tag addresses configured in the PLC?</li> <li>• Does the recipe number exist?</li> <li>• Does the data record number exist?</li> <li>• Is the "Overwrite" function parameter set?</li> </ul>

Number	Effect/causes	Remedy
290023	Check back to verify that the download of data records from the PLC to the HMI device has started.	--
290024	Check back to verify that the download of data records from the PLC to the HMI device was completed.	---
290025	Check back to indicate that the download of data records from the PLC to the HMI device was canceled due to an error.	Check the following conditions in the configuration: <ul style="list-style-type: none"> <li>• Are the tag addresses configured in the PLC?</li> <li>• Does the recipe number exist?</li> <li>• Does the data record number exist?</li> <li>• Is the "Overwrite" function parameter set?</li> </ul>
290026	An attempt was made to read/write a data record that is not free at present. This error can occur if recipes were configured for download with synchronization.	Set the mailbox status to zero.
290027	Unable to connect to the PLC at present. As a result, the data record cannot be read or written. Possible causes: No hardware connection to the PLC (no cable plugged in, cable is defect), or the PLC is switched off.	Check the connection to the PLC.
290030	This alarm is output after you selected screen which contains a recipe view in which a data record is already selected.	Reload the data record from the storage location, or retain the current values.
290031	While saving, it was detected that a data record with the specified number already exists.	Overwrite the data record, or cancel the action.
290032	During the export of data records, a file with the specified name was found.	Overwrite the file, or cancel the process.
290033	Confirmation prompt before deleting data records.	--
290040	A data record error with error code %1 that cannot be described in more detail occurred. The action is canceled. It is possible that the mailbox was not installed correctly on the PLC.	Check the storage location, the data record, the "Data record" area pointer, and the connection to the PLC. Restart the action after a short waiting time. If the error persists, contact Customer Support. Forward the relevant error code to Customer Support.
290041	A data record or file cannot be saved because the storage location is out of sufficient space.	Delete files no longer required.
290042	An attempt was made to execute several recipe actions simultaneously. The last action is not executed.	Retrigger the action after a short waiting time.
290043	Confirmation prompt before saving data records.	--
290044	The database for the recipe was corrupted and will be deleted.	--
290050	A check back indicates that the export of data records was started.	--
290051	A check back indicates successful completion of the export of data records.	--

Number	Effect/causes	Remedy
290052	A check back indicates that the export of data records was canceled due to an error.	Ensure that the structure of the data records at the storage location and the current recipe structure on the HMI device are identical.
290053	A check back indicates that the import of records was started.	--
290054	A check back indicates successful completion of the import of data records.	--
290055	A check back indicates that the import of data records was canceled due to an error.	Ensure that the structure of the data records at the storage location and the current recipe structure on the HMI device are identical.
290056	Error when reading/writing the value in the specified row/column. The action was canceled.	Check the specified row/column.
290057	The tags of the recipe specified were toggled from "offline" to "online" mode. Each change of a tag in this recipe is now immediately transferred to the PLC.	--
290058	The tags of the specified recipe were toggled from "online" to "offline" mode. Modifications to tags in this recipe are no longer immediately transferred to the PLC but must be transferred there explicitly by downloading a data record.	--
290059	A check back indicates that the specified record was successfully saved.	--
290060	A check back indicates that the specified data record memory was cleared.	--
290061	A check back indicates that deletion of the data record memory was canceled due to an error.	--
290062	The data record number exceeds the maximum of 65536. This data record cannot be created.	Select another number.
290063	This occurs when you execute system function "ExportDataRecords" while the "Overwrite" parameter is set to "No". An attempt was made to save a recipe under a file name that already exists. The export is canceled.	Check the parameters of the "ExportDataRecords" system function.
290064	A check back indicates that the deletion of data records was started.	--
290065	A check back indicates successful completion of the deletion of data records.	--
290066	Confirmation prompt before deleting data records.	--
290068	Confirmation prompt for deletion of all recipe data records.	--
290069	Confirmation prompt for deletion of all recipe data records.	--
290070	The data record specified was not found in the import file.	Check the source of the data record number, or the data record name (constant, or tag value).

Number	Effect/causes	Remedy
290071	When the editing data record values, you entered a value that is below the low limit of the recipe tag. The entry is discarded.	Enter a value within the recipe tag limits.
290072	When editing data record values, you entered a value that exceeds the high limit of the recipe tag. The entry is discarded.	Enter a value within the recipe tag limits.
290073	An action (e.g. saving a record) failed for an unknown reason. The error corresponds to status alarm IDS_OUT_CMD_EXE_ERR in the large recipe view.	--
290074	While saving, a data record with the specified number but with different name was found.	Overwrite the record, change the record number or cancel the action.
290075	A data record of this name already exists. The data record is not saved.	Select a different data record name.
290110	The default values could not be set due to an error.	--
290111	The recipes subsystem cannot be used. Recipe views have no content and recipe-specific functions will not be executed. Possible causes: <ul style="list-style-type: none"> <li>• Error when loading the recipes.</li> <li>• The recipe structure was changed in the ES. The recipes were not included in the latest project download. This means that the new configuration data no longer matches the old recipes on the device.</li> </ul>	Download the project to the device again, including the recipes (the corresponding check box in the download dialog must be check marked).

### 300000 - Alarm\_S alarms

### 300000 - Alarm\_S alarms

Number	Effect/causes	Remedy
300000	Faulty configuration of process monitoring (e.g. using PDiag or S7 Graph): More alarms are queued than specified in the specifications of the CPU. No further ALARM_S alarms can be managed by the PLC and reported to the HMI devices.	Change the PLC configuration.
300001	ALARM_S is not registered on this PLC.	Select a controller that supports the ALARM_S service.

### 310000 - Reporting alarms

### 310000 - Reporting alarms

Number	Effect/causes	Remedy
310000	An attempt is being made to print too many reports in parallel. Only one log file can be output to the printer at a given time; the print job is therefore rejected.	Wait until the previous active log was printed. Repeat the print job if necessary.
310001	An error occurred on triggering the printer. The report is either not printed or printed with errors.	Evaluate the additional system alarms related to this alarm. Repeat the print job if necessary.

### 330000 - Interaction alarms

### 330000 - Interaction alarms

Number	Effect/causes	Remedy
330022	Too many open dialogs on the HMI device.	Close all dialogs you do not require on the HMI device.

### 350000 - PROFIsafe alarms

### 350000 - PROFIsafe alarms

Number	Effect/causes	Remedy
350000	PROFIsafe packets were not received within the specified time. There is a communication problem with the F-CPU. RT is terminated.	Check the WLAN connection.
350001	PROFIsafe packets were not received within the specified time. There is a communication problem with the F-CPU. The PROFIsafe connection is set up again.	Check the WLAN connection.
350002	Internal error. Runtime is terminated.	Internal error
350003	Check back for indicating the connection setup to the F-CPU. The Emergency-Off buttons are active immediately.	--

Number	Effect/causes	Remedy
350004	PROFIsafe communication was set up and the connection was shut down. Runtime can be terminated. The Emergency-Off buttons are deactivated immediately.	--
350005	Incorrect address configured for the F-Device. A PROFIsafe connection cannot be set up.	Check and modify the address of the F-Device in WinCC ES.
350006	The project was started. At the start of the project, check the proper function of the ACK buttons.	Press the two ACK buttons successively in the "Acknowledge" and "Panic" positions.
350008	You configured an incorrect number of failsafe buttons. A PROFIsafe connection cannot be set up.	Modify the number of failsafe buttons in the project.
350009	The device is in Override mode. It may no longer be possible to detect the location because transponder detection fails.	Exit the override mode.
350010	Internal error: The device has no failsafe buttons.	Return the device to Siemens. Worldwide contact partners

## 10.3.6 Configuring system diagnostics

### 10.3.6.1 System diagnostics basics

#### Introduction

You use system diagnostics to detect problems and errors in any part of your plant. WinCC has two display and operating elements for quick error localization.

#### System diagnostics view

The alarm view shows the status of a PLC while the system diagnostics view gives you an overview of all devices available in your plant: You navigate directly to the cause of the error and to the relevant device. You have access to all diagnostics-capable devices which you have configured in the "Devices & networks" editor.

#### System diagnostics window

The system diagnostics window is an operating and display element that you can only use in the global screen.

The functions of the system diagnostics window are no different than those of the system diagnostics view. Because the system diagnostics window is configured in the global screen, you can, for example, also specify if the object is closable in Runtime.

---

**Note**

**System diagnostics on Basic Panels**

The "System--Diagnostics window" object is not available for Basic Panels.

---

**See also**

System diagnostics views (Page 3705)

### 10.3.6.2 System diagnostics views

#### Introduction

There are four different views available in the system diagnostics view and the system diagnostics window.

- Device view
- Diagnostic buffer view
- Detail view
- Matrix view (for master systems, PROFIBUS, PROFINET only)

#### Device view

The device view shows all the available devices of a layer in a table. Double-clicking on a device opens either the child devices or the detail view. Symbols in the first column provide information about the current status of the device.

Status	Name	Operatin Slot	Type

**Diagnostic buffer view**

In the diagnostic buffer view, the current data from the diagnostic buffer of the device is displayed. The diagnostic buffer view can only be opened up in the device view.

To update the diagnostic buffer view, you click .

1516-11 \ 1516-11 \ Diagnostic buffer view

19	12/11/2012	2:27:01 AM	IO station failure - (outgoing) -	✓
20	12/11/2012	2:27:01 AM	IO station failure - (outgoing) -	✓

## Detail view

The detail view gives detailed information about the selected device and the pending errors. Check whether the data is correct in the detail view. You cannot sort error texts in the detail view.

**1516-11 \ 1516-11**

> Status	✓
> Name	1516-11
> Operating state	🟢
> Rack	0
> Slot	1
> Type	CPU 1516-3 PN/DP
> Order number	6ES7 516-3AN00-0AB0
> Address	49*
> Plant designation	PL CPU1516-11
> Location identifier	LI CPU1516-11
> Manufacturer ID	SIEMENS AG
> Hardware version	81
> Profile ID	
> Specific profile data	
> I&M data version	1.1

Navigation icons: Home, Back, Forward, Mail.

### Note

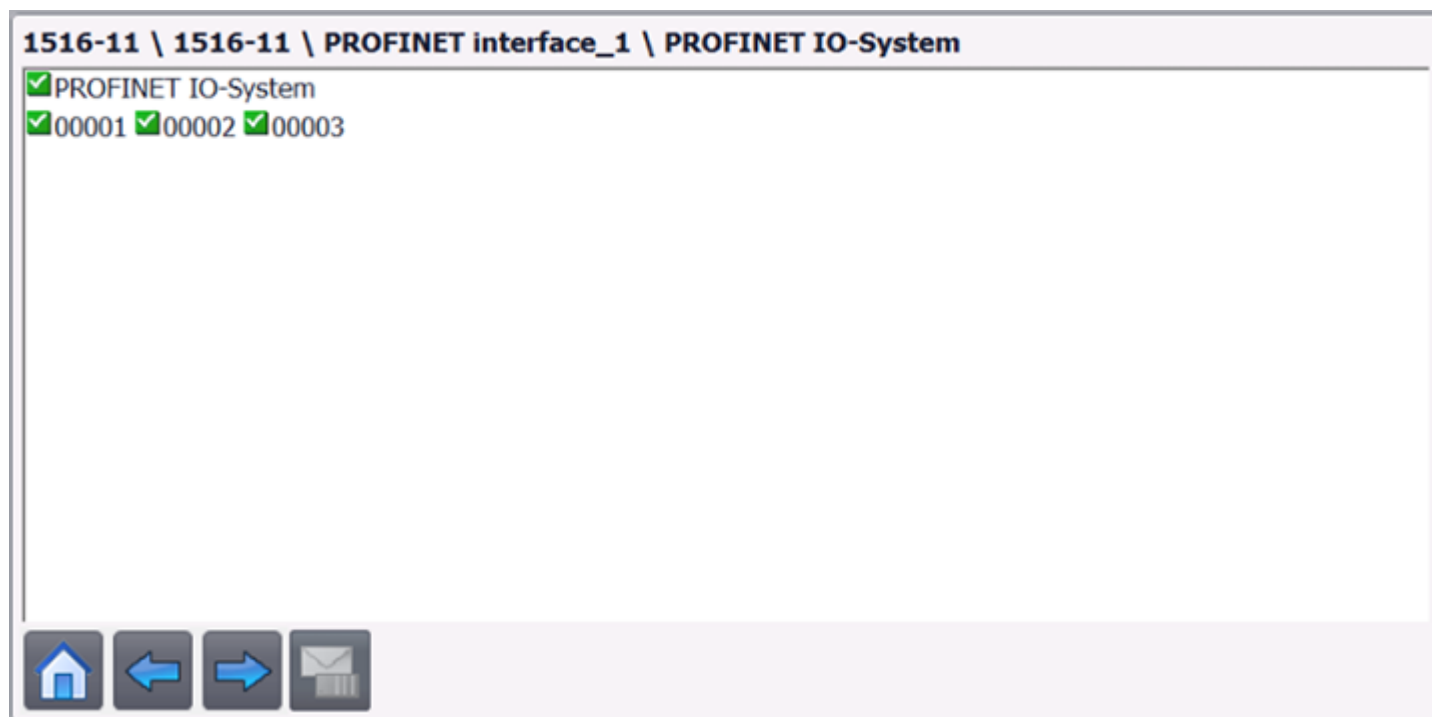

#### Contents of the detail view

The contents of the detail view are only available for integrated connections with S7 1200 and S7 1500 PLCs.

### Matrix view

The matrix view is only available for master systems. In the matrix view you can see the status of the subdevices of the master system.

- In PROFIBUS, the numbers assigned by PROFIBUS are used as identification (DP station number).
- The IO devices are numbered consecutively beginning with 1 in PROFINET.

### Navigation buttons

Button	Key	Function
	Enter key	Opens the child devices or the detail view if there are no child devices.
	Esc key	Opens the parent device or the device view if there is no parent device.
	Home key	Opens the device view.
	Configured function key, e.g. F1.	Opens the diagnostic buffer view. Only visible in the device view.
	Configured function key, e.g. F2.	Updates the diagnostic buffer view.

---

**Note**

**Navigation in the matrix view of Comfort Panels with function keys**

The Shift key is additionally used to select PNIO or PROFIBUS slaves in the matrix view.

---

### Language switching in runtime

Switch over the language in runtime before you open the details view.

If you switch over the runtime language while the details view is opened, you change back to the diagnostic buffer view.

Open the details view again. The selected runtime language is now displayed correctly.

System diagnostics basics (Page 3704)

### 10.3.6.3 Basic Panel basics

#### System diagnostics basics

##### Introduction

Using system diagnostics, you can display the messages from the diagnostic buffer of all integrated connections.

##### System diagnostics view

The system diagnostics display is an operating and display object that you use in a screen.

You navigate directly to the cause of the error and the associated connection. You have access to all integrated connections that you have configured in the "Devices & networks" editor.

#### System diagnostics views

##### Introduction

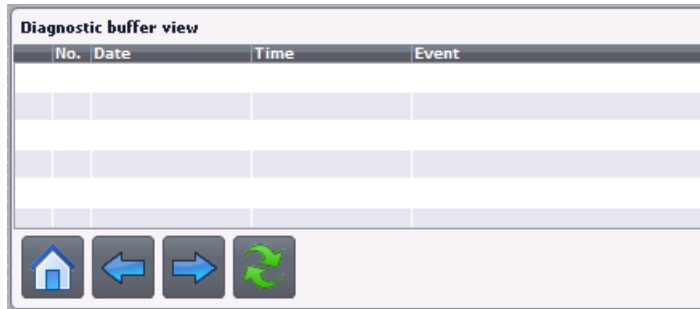

Three different views are available in the simple system diagnostic view.

- Device view
- Diagnostic buffer view
- Detail view

### Device view

The device view is only displayed if more than one integrated connection has been configured.

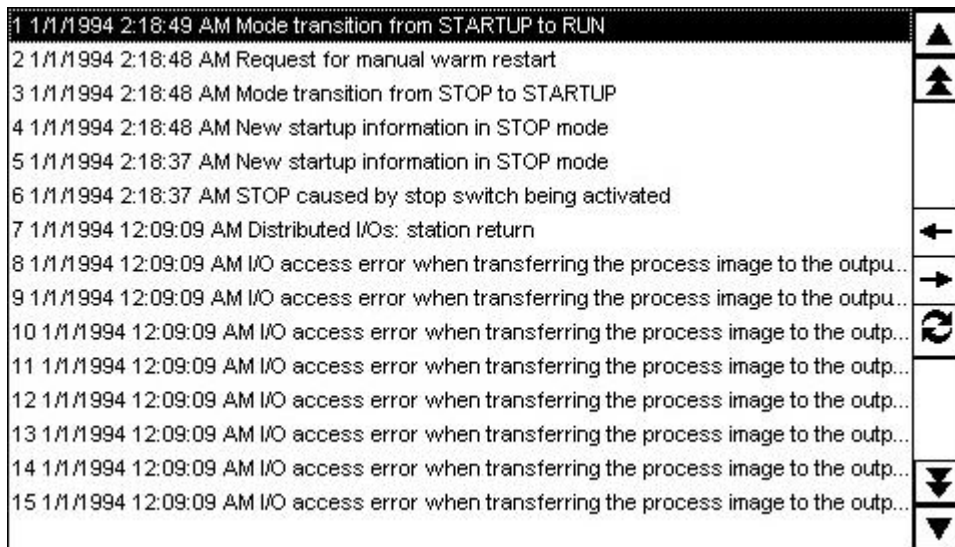

The device view shows all available connections in a table. Double-clicking a connection opens the diagnostic buffer view.

### Diagnostic buffer view

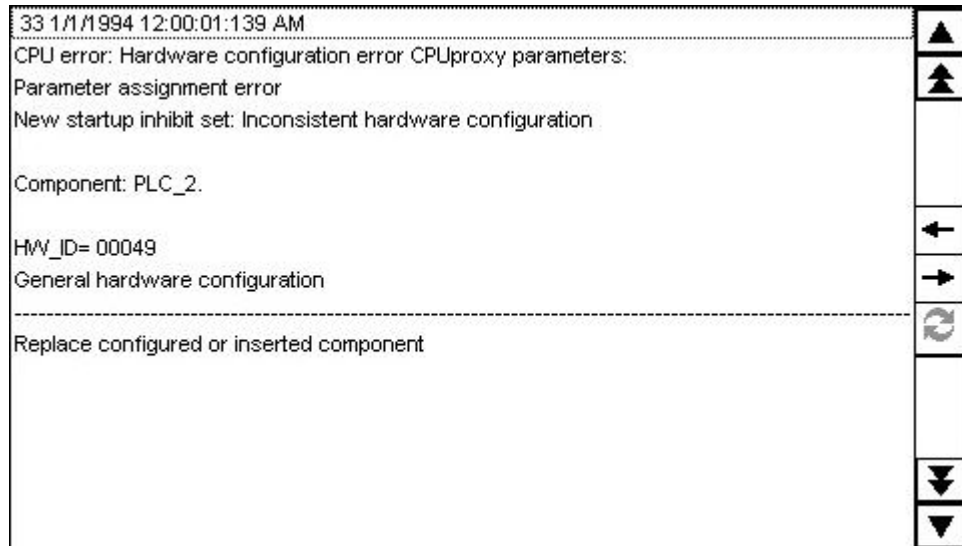

The diagnostic buffer view shows the current data from the diagnostic buffer.

To update the diagnostic buffer view, you click .

## Detail view

The detail view gives detailed information about the selected connection and any pending errors. Check whether the data is correct in the detail view.

### Note

#### Contents of the detail view

The contents of the detail view are only available for integrated connections with S7 1200 and S7 1500 PLCs.

## Navigation buttons

Button	Key	Function
	Enter key	In the device view: Opens the diagnostic buffer view of the selected device.  In the diagnostic buffer view: Opens the detail view.
	Esc key	In the diagnostic buffer view: Opens the device view.  In the detail view: Opens the diagnostic buffer view.
	Configured function key, e.g. F1.	Updates the diagnostic buffer view.

### 10.3.6.4 Configuring system diagnostics objects

#### Enabling system diagnostics in the PLC

##### Introduction

During communication with the SIMATIC S7-1500 and SIMATIC S7-1200 PLCs, system diagnostics is automatically activated.

For other PLCs, the following settings must be implemented in the PLC to enable the PLC to transfer error messages to the system diagnostics view.

##### Requirements

- A PLC such as SIMATIC S7-300/400 or ET 200 has been created.
- The "Devices & Networks" editor is open in the "Device view".

##### Procedure

1. Select the PLC in the selection list.
2. Click on the PLC and select "Properties" in the shortcut menu. The properties of the PLC are displayed in the Inspector window.
3. Select "Properties > General > System diagnostics" in the Inspector window.
4. Enable "Activate system diagnostics for this CPU".
5. Select the PLC and then "Compile > Hardware configuration" in the shortcut menu.

##### Result

The settings will be effective following the next compilation. The PLC can now transfer error messages to the system diagnostics display.

#### Adding a system diagnostics indicator

##### Introduction

The system diagnostics indicator is a predefined graphic symbol of the library which alerts you to errors in your system.

If an error occurs, the appearance of the object changes. The library object can display two states:

- No error
- Error

## **Requirement**

- The "Libraries" task card is opened.
- The global library "Buttons and Switches > Master copies > DiagnosticsButtons" is open.
- A screen is open.
- A system diagnostics window has been created in the global screen.

**Procedure**

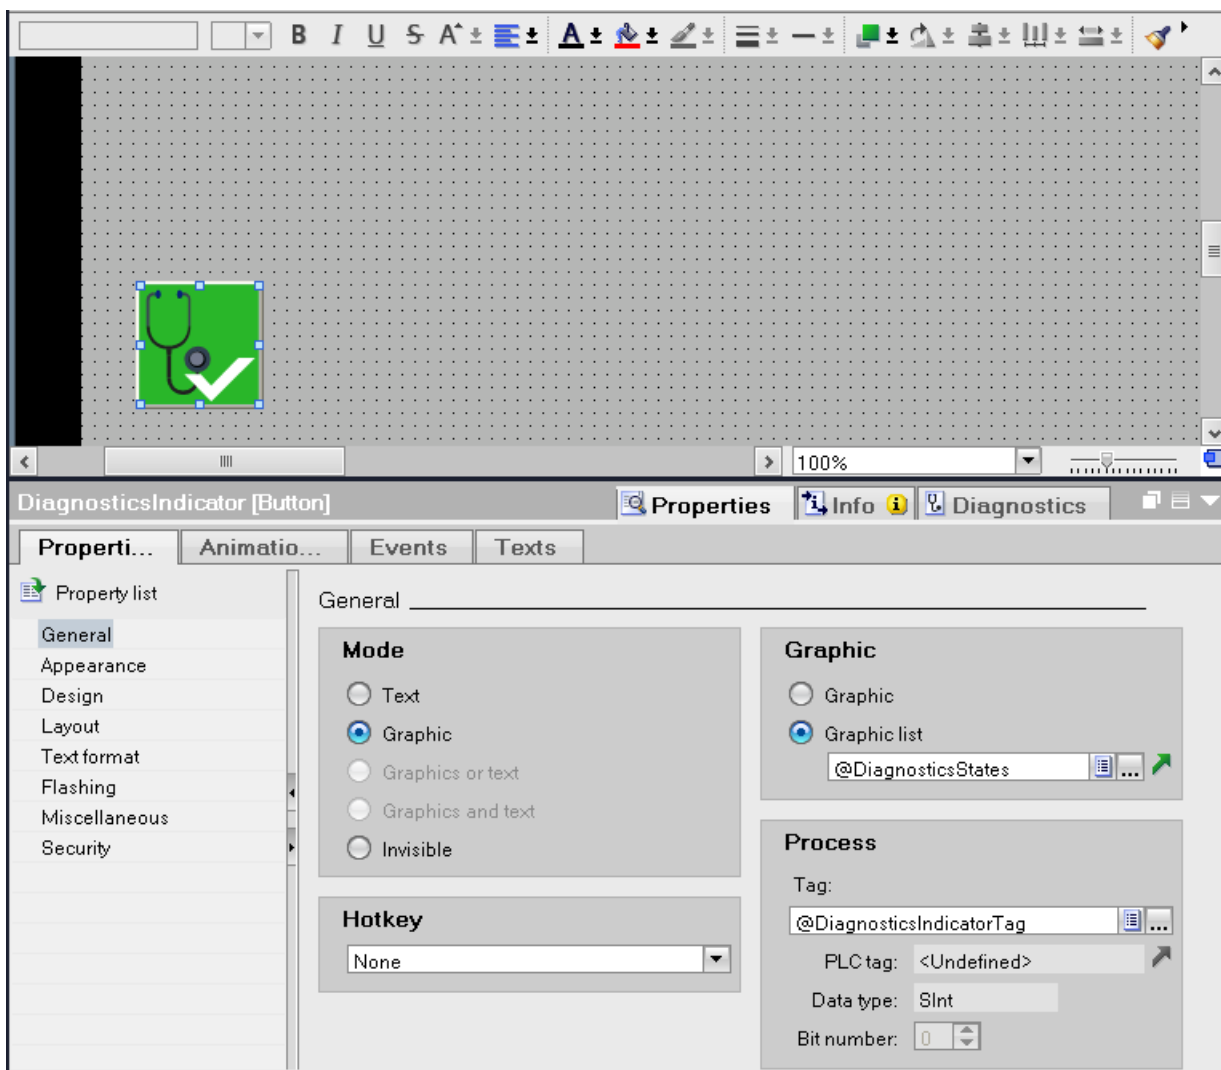

1. Select the "DiagnosticsIndicator" object in the library.

**Note**

**System diagnostics indicator for different device types**

When selecting the object ensure that you use the correct object for the device type used in the project.

2. Drag-and-drop the library object to the position in the work area where you want to insert the object.  
The library object is inserted.

3. Select the library object.
4. Click "Properties > Events" in the Inspector window.  
The system function "ShowSystemDiagnosticsWindow" is preset for the event "Click".

## Result

The status diagnostics indicator has been added to the project and connected with the system diagnostics window.

The system diagnostics indicator changes its appearance if an error message is output in Runtime. The system diagnostics window opens when you click on the system diagnostics indicator. The system diagnostics window shows the detail view of the affected device.

## Configuring access protection for the system diagnostics window

Configure access protection for the system diagnostics indicator to prevent unauthorized access to the system diagnostics window.

1. Select the "DiagnosticsIndicator" object in the screen.
2. Select an authorization in "Properties > Properties > Security in Runtime" in the Inspector window.

A logon dialog opens when you click on the system diagnostics indicator in Runtime. The system diagnostics window does not open unless you have the required authorization.

## Configuring a system diagnostics window in the global screen

### Introduction

The system diagnostics window gives you an overview of all devices available in your plant. The system diagnostics window operates like the system diagnostics view, but it is only available in the global screen.

### Requirements

- At least one PLC has been created.
- The option "Activate system diagnostics for this CPU" is activated on each PLC.
- A Comfort Panel or WinCC RT Advanced has been created.
- The global screen is open.
- The Inspector window is open.

### Procedure

1. Double-click the "System diagnostics window" object in the "Tools" task card. The object is added to the global screen.
2. Select "Properties > Properties > Columns > Devices/Detail view" in the Inspector window.
3. Enable the columns that you require in the device view for Runtime, for example: status, name, address.
4. Enable the properties which you require in the detail view for Runtime, for example: status, name, plant designation.

5. Activate the columns that you require in the diagnostic buffer view, for example, status, name.
6. Customize the column headers, if necessary.
7. Enable "Properties > Properties > Layout > Column settings > Columns moveable" to move the columns in Runtime.
8. Enable "Properties > Properties > Window > Closable" to allow the system diagnostics window to be closed in Runtime.

## Result

The system diagnostics window has been added to the global screen. The system diagnostics window will respond to error messages in the plant and display the device affected.

Configure a system diagnostics indicator in a screen to open the system diagnostics window.

## Configuring button as system diagnostics indicator

### Introduction

Instead of using the object "DiagnosticsIndicator" from the library, you can configure a button, for example, to indicate errors in your plant.

### Requirements

- At least one PLC has been created.
- The option "Activate system diagnostics for this CPU" is activated on each PLC.
- The "Tools" task card is open.
- A bit graphics list has been created with two different graphics for the statuses.
- A screen is open.
- You have created a system diagnostics view.

### Procedure

1. Double-click the "Button" object in the "Tools" task card. A button will be added to the screen.
2. In the Inspector window, select "Properties > Properties > General > Mode > Graphic".
3. Select the bit graphics list under "Graphic > Graphics list".
4. Select the "@DiagnosticsIndicatorTag" tag under "Properties > Properties > General > Tag" in the Inspector window.

### Configuring system function to the button

1. Click "Properties > Events" in the Inspector window.
2. Select the "Click" event.

3. Click on "Add function" in the table.
4. Select the "ActivateSystemDiagnosticsView" system function.
5. Select the system diagnostics view.

## Result

You have now configured a button which will respond to error messages from the PLC. The button changes its appearance if an error message is output in Runtime.

The button has two states:

- Error  
The system diagnostics view opens when you click the button. The system diagnostics view shows the detail view of the device concerned.
- No error  
The system diagnostics view opens when you click the button. The system diagnostics view shows the device view.

## Configuring the system diagnostic view

### Introduction

You add a system diagnostics view to your project to get an overview of all devices available in your plant.

### Requirements

- At least one PLC has been created.
- The option "Activate system diagnostics for this CPU" is activated on each PLC.
- A Comfort Panel or WinCC RT Advanced has been created.
- You have created a screen.
- The Inspector window is open.

### Procedure

1. Double-click the "System diagnostics view" object in the "Tools" task card. The object is added to the screen.
2. Select "Properties > Properties > Columns > Devices/Detail view" in the Inspector window.
3. Activate the columns that you require in the device view for Runtime, e.g. Status, Name, Slot.
4. Activate the columns that you require in the detail view for Runtime, e.g. Status, Name, Plant designation.
5. Activate the columns that you require in the diagnostic buffer view, for example, Status, Name.

6. Enable "Properties > Properties > Layout > Column settings > Columns moveable" to move the columns in Runtime.
7. You can change the column headers under "Properties > Properties > Column headers", if necessary.

## Result

The system diagnostics view has been added to the screen. Error for the entire plant are now displayed in the system diagnostics view in Runtime.

## Configuring the system diagnostic view

### Introduction

For an overview of all integrated connections, you insert a system diagnostics view in your project.

### Requirements

- A PLC has been created.
- A Basic Panel has been created.
- An integrated connection has been created in the "Devices & Networks" editor.
- You have created a screen.
- The Inspector window is open.

### Procedure

1. Double-click the "System diagnostics view" object in the "Tools" task card. The object is added to the screen.
2. In the Inspector window, select "Properties > Layout".
3. Enter a number under "Lines per entry", i.e. 5.

## Result

The system diagnostics view has been added to the screen.

To obtain the latest alarms, update the diagnostic buffer.

## Splitting the view in system diagnostics view

### Introduction

The system diagnostics view also offers a split view of the display. You have the option to see the devices and the associated details at a glance.

## Requirements

- At least one PLC has been created.
- The option "Activate system diagnostics for this CPU" is activated on each PLC.
- An HMI device has been created, for example, a Comfort Panel.
- You have created a screen.
- The Inspector window is open.

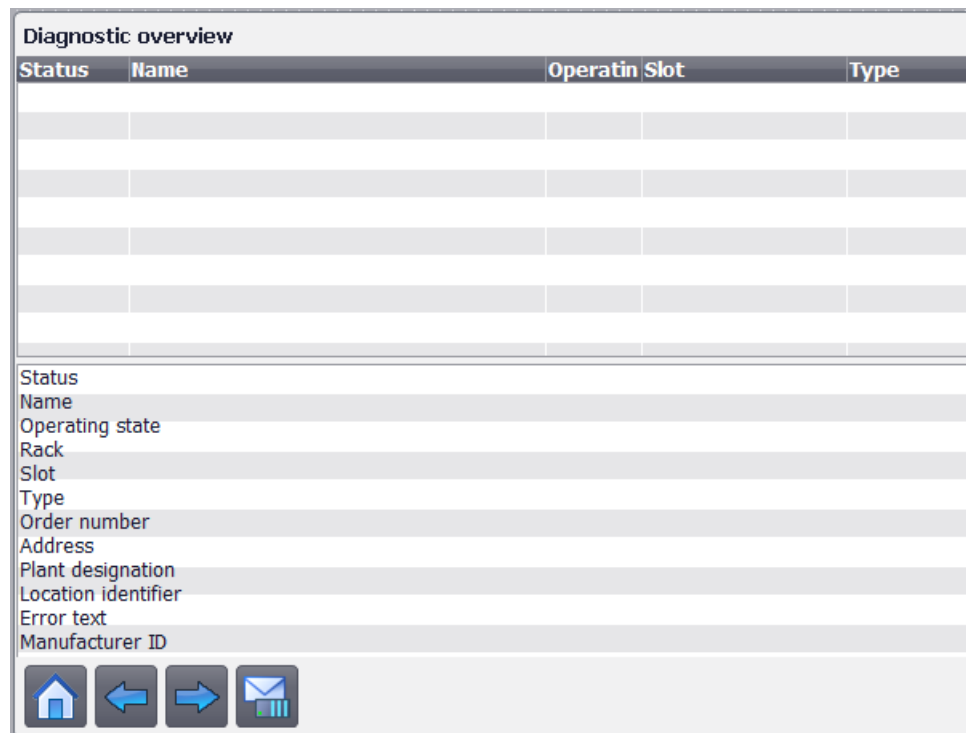

## Procedure

1. Double-click the "System diagnostics view" object in the "Tools" task card. The object is added to the screen.
2. In the Inspector window, click "Properties > Properties > Layout".
3. Activate "Show split view".
4. Activate "Sizing > Auto-size"
5. You may also change the number of lines for the "Device view" and the "Detail view" if required.

## Result

The system diagnostics view has been added to the screen. The system diagnostics view is split into two areas.

The top area shows the device view. The bottom view shows the detail view.

If you open the diagnostic buffer view, the top area displays an overview of the diagnostic buffer and the bottom area displays the details.

The contents of the detail view are only available for integrated connections with S7 1200 and S7 1500 PLCs.

## 10.4 Working with logs

### 10.4.1 Working with logs for Runtime Advanced and Panels

#### 10.4.1.1 Log Basics

##### Introduction

WinCC provides the following types of log for logging process data for HMI Runtime:

- Data logs
- Alarm logs

A data log is used to log process data from an industrial plant.

An alarm log is used to log alarms that occur in the monitored process.

##### Principle

The two types of log both have roughly the same structure and largely work in the same way. They are very clear and easy to configure. With both types of log you define the same properties for the log. The same logging methods are also available for both types of log.

The following logging methods are available:

- Circular log  
If a circular log is totally full, the oldest entries are overwritten.
- Segmented circular log  
In a segmented circular log, multiple single logs of the same size are filled in succession. When all log segments are filled, the oldest log segment is overwritten.
- Log with level-dependent system alarm  
A system alarm is triggered when a defined level is reached.
- Log with level-dependent triggering of an event  
The "Overflow" event is triggered when the log is full. The "Overflow" event triggers a system function.

#### 10.4.1.2 Properties of Logs

##### Introduction

You define the properties of a data log in the "Data logs" editor.

You define the properties of an alarm log in the "Alarm log" editor.

The properties of the data log and alarm log are configured in the same way. You configure the properties either directly in the table of the respective editor or in the log properties of the Inspector window.

### General properties

- **Name**  
You can assign any name to the log. The name must contain at least one letter or one number.
- **Storage location**  
The log is stored in a file or a database. You can only save to a database on a PC. Select "File" or "Database" as the storage location.  
You can specify a folder on the local PC hard disk or a folder on a network drive as the storage location, depending on how the HMI device is configured. The following storage locations are available for an HMI device:
  - Memory card
  - USB storage medium
  - Network driveThe selection available depends on the HMI device in use.
- **Size**  
The size of a log depends on the type of log and the selected settings.
  - **Size of a data log**  
The size of a data log is calculated as follows:  
The number of items \* the length of each tag value to be logged.  
In the "Properties" window, the maximum size that the log accepts for retention of the currently selected number of data records is displayed in the input field "Number of data records". The maximum log size is limited by the volume of the storage medium.
  - **Size of an alarm log**  
The size of an alarm log is calculated from the number of data records and the approximate size of an entry. The size of an entry depends on whether the alarm text and the associated tag values are to be logged as well.
- **Restart characteristics**  
Under Restart characteristics you can specify that the logging starts when Runtime starts. Check the "Enable logging at runtime start" check box.  
You can also control the behavior when Runtime starts. Enable "Reset log" if you want to overwrite existing logged data with the new data. Select the "Append data to existing log" option if you want to retain the existing logged data. This setting adds the data to be logged to an existing log.

See "Auto-Hotspot" and "Auto-Hotspot" for more details.

---

#### Note

You can use system functions to control the restarting of a log in Runtime.

---

## Automatic log entries

In Runtime, the following log entries are created as standard:

Entry	File format	Log type	Meaning
\$RT_DIS\$	Any	Data log	Indicates that the connection to the log was interrupted at this point in time. (A bold line is shown in the trend display for this time period.)
\$RT_OFF\$	Any	Data log	Indicates that Runtime was shut down at this point in time. (No line is shown in the trend display for this time period.)
\$RT_ERR\$	Any	Data log Alarm log AuditTrail	Indicates in the target log that a copy operation was not successful or was interrupted. (The log copy was not fully created.)
\$RT_COUNT	*.CSV *.TXT	Data log Alarm log AuditTrail	This entry was created at the end of the log and serves to increase the system performance when Runtime starts.

## 10.5 Working with recipes

### 10.5.1 Basics

#### 10.5.1.1 Definition and applications

##### Introduction

Recipes are collections of related data, for example, machine parameterizations or production data.

---

##### Note

##### Restrictions for recipes

Recipes are not available on the HMI device OP 73:

---

Examples:

- Machine parameter settings that are needed to convert production to a different product variant.
- Product components that result in different compositions for different end products.

A recipe has a fixed data structure. The structure of a recipe is defined during configuration. A recipe contains recipe data records. These differ in terms of their values, but not their structure.

Recipes are stored on the HMI device or on an external storage medium. Recipe data records are always transferred complete and in a single pass between the HMI device and the PLC. In addition, production data can be imported in runtime, in the form of a CSV file.

---

**Note**

**Restrictions for Import / Export**

It is not possible to export or import the recipes for the following HMI devices:

- Basic Panels
- OP 77A
- OP 177A
- TP 177A (Portrait)

Complete recipe data, but not single recipe data records, can be exported and imported using ProSave in CSV format and transferred to the HMI device. Thereby, Runtime is interrupted.

---

## Using recipes

Recipes can be used in the following situations:

- **Manual production**  
You select the required recipe data and display it on the HMI device. You modify the recipe data as required and save it on the HMI device. You transfer the recipe data to the PLC.
- **Automatic production**  
The control program starts transfer of the recipe data between the PLC and HMI device. You can also start the transfer from the HMI device. Production is then implemented automatically. It is not essential to display or modify the data.
- **Teach-in mode**  
You optimize production data that was optimized manually on the system, e.g. axis positions or filling volumes. The values thus determined are transferred to the HMI device and saved in a recipe data record. You can then transfer the saved recipe data back to the PLC at a later date.

## Entering and modifying the recipe data

You enter the data in the individual recipe data records and modify it as required. The following options are available:

- **Data entry during configuration**  
If the production data exists already, you enter the data in the "Recipes" editor during recipe configuration.
- **Entering the data in Runtime**  
If you have to frequently modify production data, you can do this directly in Runtime as follows:
  - Enter the data directly on the HMI device.
  - Set the parameters directly on the machine. You then transfer the data from the PLC to the HMI device and save it in the recipe.

### 10.5.1.2 Examples for using recipes

Recipes are used in the manufacturing industry and mechanical engineering, for example. The following recipes show typical applications which you can implement with the recipe function of WinCC:

- **Machine parameter assignment**  
One field of application for recipes is the assignment of machine parameters in the manufacturing industry: A machine cuts wooden boards to a certain size and drills holes. The guide rails and drill have to be moved to new positions according to the board size. The required position data are stored as data records in a recipe. You reassign the machine parameters using "Teach in" mode if, for example, a new board size is to be processed. You transfer the new position data directly from the PLC to the HMI device and save it as a new data record.
- **Batch production**  
Batch production in the food processing industry represents another field of application for recipes: A filling station in a fruit juice plant produces juice, nectar, and fruit drinks in a variety of flavors. The ingredients are always the same, differing only in their mixing ratios. Each flavor corresponds to a recipe. Each mixing ratio corresponds to a data record. All of the required data for a mixing ratio can be transferred to the machine control at the touch of a button.

### 10.5.1.3 Recipe structure

#### Introduction

The basic structure of a recipe is illustrated with reference to the filling station in a fruit juice plant.

There may be several different recipes in an HMI device. A recipe can be compared to an index card box that contains several index cards. The index card box contains several variants for manufacturing a product family. All the data for each manufacturing variant is contained on a single index card.

Example:

In a soft drinks production plant, a recipe is needed for different flavors. Drink variants include fruit juice drink, juice and nectar.

## Recipe

The recipe contains all the recipe data records for the different drink variants.

## Recipe data records

Each index card represents a recipe data record needed to manufacture a product variant.

## Recipe entries

Each index card in a drawer has the same structure. All the index cards contain fields for the different ingredients. Each field corresponds to a recipe entry. All the records of a recipe thus contain the same entries. The records differ, however, in the value of the individual entries.

Example:

All the drinks contain the following ingredients:

- Water
- Concentrate
- Sugar
- Flavoring

The records for juice drink, fruit juice or nectar differ, however, in the quantity of sugar used in production.

#### 10.5.1.4 Display of recipes

##### Introduction

You can display recipes in the following ways:

- Recipe view
- Recipe screen

##### Input in the recipe view and recipe screen

You change the values of a recipe in the recipe screen or recipe view and thus modify the manufacturing process or a machine.

The recipe view and recipe screen can perform the same functions when using recipes. They differ in the following respects:

- Display options
- Operation
- Possibility of transferring data between the PLC and the HMI device

##### Recipe view

The recipe view is suitable for viewing simple recipes.

The recipe view is an off-the-shelf WinCC display and operator control object for managing recipe data records. The recipe view is always part of a screen. The recipe view shows recipe data records in tabular form. You adapt the appearance and the possible operations to suit your specific needs.

Recipe Name:	No.:
Recipe_1	1
Data Record Name:	No.:
Recipe data_1	1
Entry Name	Value
Recipe element_1	0

If you are editing recipes with a recipe view in your project, the values are saved in recipe data records. The values are not transferred between the HMI device and PLC until you use the relevant operator control object.

## Recipe screen

The recipe screen is an individual screen that contains:

- Input fields for recipe variables
- Operator control objects for using the recipes, e.g. "SaveDataRecord"

Water	40	l	Recipe name:	No.:
Concentrate	70	l	Orange	1
Sugar	30	kg	Data record name:	No.:
Flavoring	30	l	Nectar	2
			Save	Data from the PLC
			Load	Data to PLC

The recipe screen is suitable in the following situations:

- Large recipes
- Allocation of recipe fields to the graphic display of the relevant plant area
- Breakdown of the recipe data into several screens

### Note

The values of recipe variables are transferred between the PLC and recipe screen at the following times depending on the configuration:

- Immediately after modification
- When a relevant operator control object is used

## Synchronizing recipe view and recipe screen

There may be differences in Runtime between the values displayed in the recipe view and the values saved in the associated tags when you edit recipes in both a recipe view and a recipe screen. To prevent this, you must synchronize the recipe data record values with the values of the recipe tags.

A complete recipe data record will always be saved or synchronized.

### Note

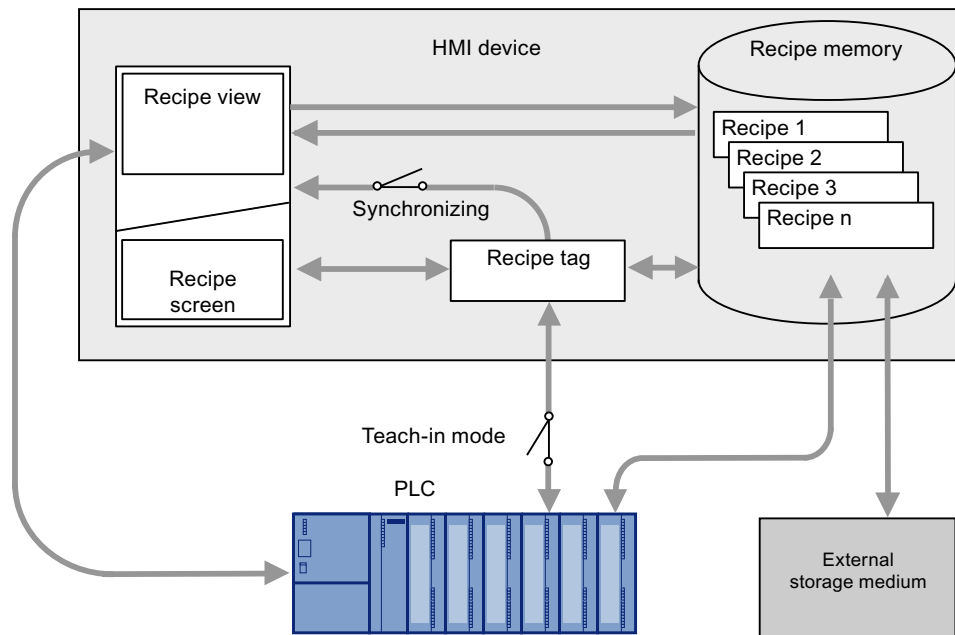

Recipe tags can only be synchronized in the advanced recipe view. Synchronization only takes place if the "Synchronize recipe view and recipe tags" setting is activated for the recipe.

### 10.5.1.5 Transferring recipe data records

#### Flow of data in recipes

The following picture illustrates the flow of data in recipes:

#### Interaction between the components

There is interaction between the following components at runtime:

- Recipe view / recipe screen  
On the HMI device, recipes are displayed and edited in the recipe view or in a recipe screen:
  - The recipe data records from the internal memory of the HMI device are displayed and edited in the recipe view.
  - The values of the recipe tags are displayed and edited in the recipe screen.You synchronize the values displayed in the recipe view with the values of recipe tags according to the configuration.
- HMI device recipe memory  
Recipes are saved in the form of recipe data records in the HMI device's recipe memory.
- Recipe tags  
The recipe tags contain recipe data. When you edit recipes in a recipe screen, the recipe values are stored in recipe tags. The point at which the values of the recipe tags are exchanged with the PLC depends on the configuration.

---

#### Note

You can synchronize the recipe tags with the recipe data records so that the same values are saved in both.

---

### Loading and saving recipe data

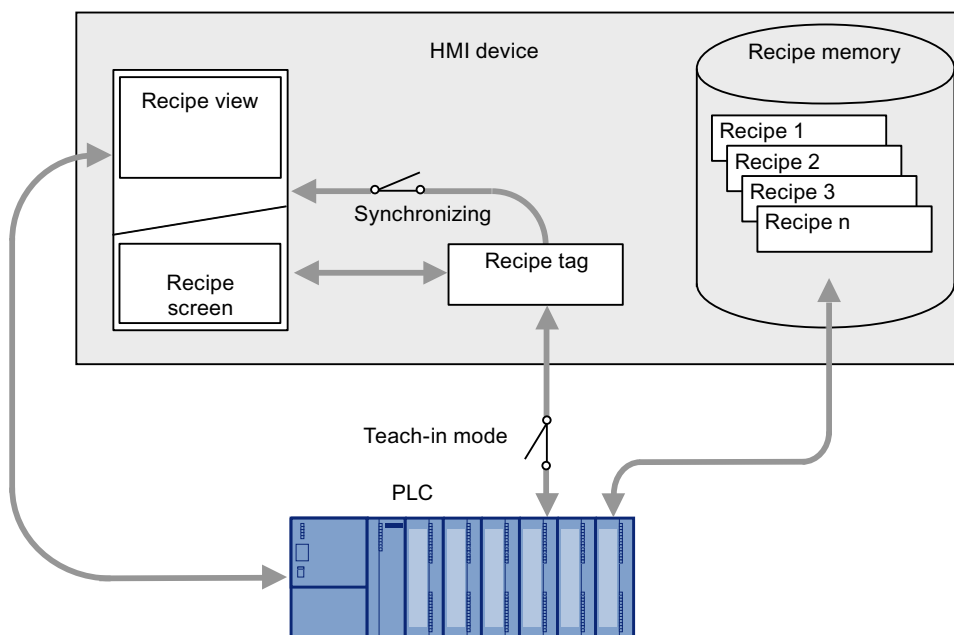

Complete recipe data records are loaded from or saved to the recipe memory on the HMI device in the recipe view.

The values of the recipe data record are loaded from the recipe memory to the recipe tags in the recipe screen. When they are saved, the values of the recipe tags are saved to a recipe data record in the recipe memory.

### Transferring the recipe values between the HMI device and the PLC

Complete recipe data records are transferred between the recipe view and PLC.

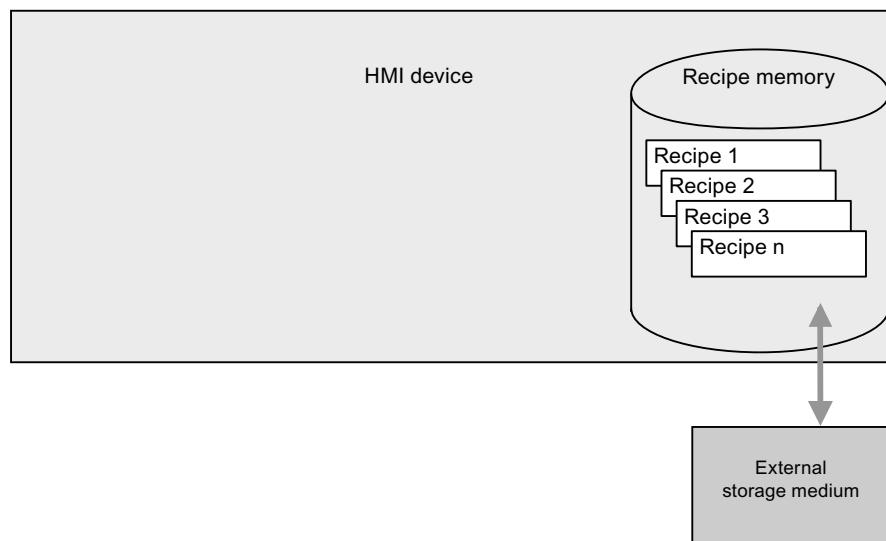

The following transfers are possible between the recipe screen and PLC, depending on the configuration:

- Transferring recipe data records between recipe view and recipe tags
- Immediate transfer of individual modified values between the recipe tags and PLC. The following settings are needed in the recipe in order to do this:
  - "Synchronizing recipe view and recipe tags" is activated.
  - "Manual transfer of individual modified values (teach-in mode)" is deactivated.

Recipe data records can be transferred directly between the HMI device and PLC. In these situations, the display on the HMI device is not essential.

### Exporting and importing recipe data records

Recipe data records are exported from the HMI device recipe memory and are saved to a CSV file on the external storage medium. The records can be reimported from the storage medium to the recipe memory.

The following external storage media may be used, depending on the HMI device:

- No storage medium, for example, for basic panels
- Memory card
- USB stick
- Hard disk

### 10.5.1.6 Configuration of recipes

#### Introduction

Recipes are configured differently according to the intended use:

- If you are editing recipes with a recipe view in your project, the values are only saved in recipe data records.
- If you are editing recipes in a recipe screen in your project, the values are saved in recipe tags.

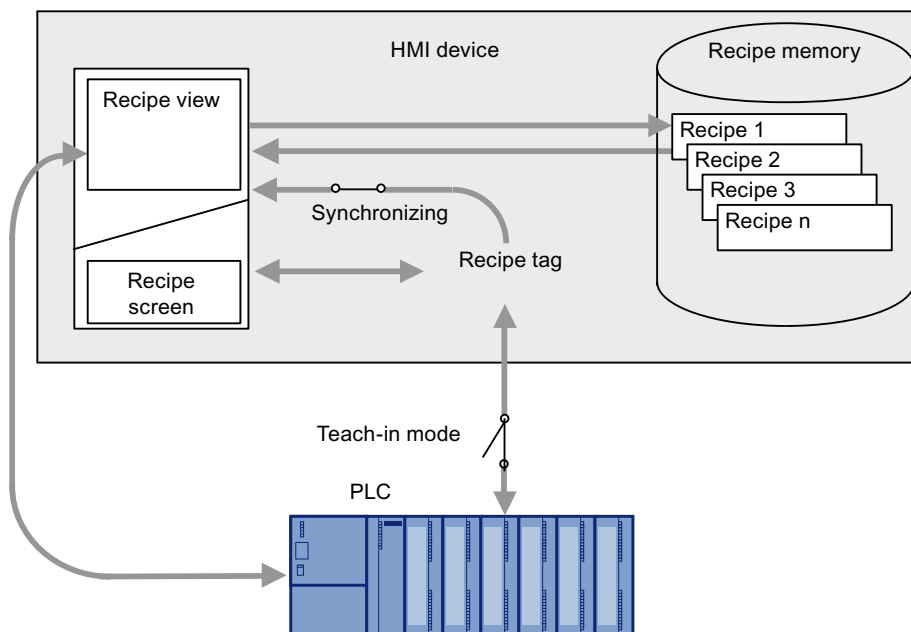

The following possible settings determine how the recipe data records, recipe tags and PLC all interact.

#### "Synchronizing recipe view and recipe tags" deactivated

The data in a data record is only displayed and can only be edited in the recipe view. If you use data outside the recipe view, they are not synchronized with the recipe view.

#### "Synchronizing recipe view and recipe tags" activated

There may be differences in Runtime between the values displayed in the recipe view and the values saved in the associated tags when you edit recipes in both a recipe view and a recipe screen. To prevent this, you must synchronize the recipe data record values with the values of the recipe tags.

#### Note

Recipe tags can only be synchronized in the advanced recipe view.

The values of the recipe view and the associated recipe tags are not synchronized automatically. The recipe tags and the recipe view are not synchronized until you use the operating element with the "RecipeViewSynchronizeDataRecordWithTags" function.

### "Synchronize recipe view and recipe tags" activated and "Manual transfer of individual modified values (teach-in mode)" activated

With this setting, modified recipe values are not synchronized immediately between the recipe tags in the recipe screen of the HMI device, and PLC.

There must be an operating element with the "SetDataRecordToPLC" and "GetDataRecordFromPLC" functions present in order to synchronize the values.

If recipe values are changed in the controller, the modified values are displayed immediately in the recipe screen if you use the operating element with the "GetDataRecordFromPLC" function.

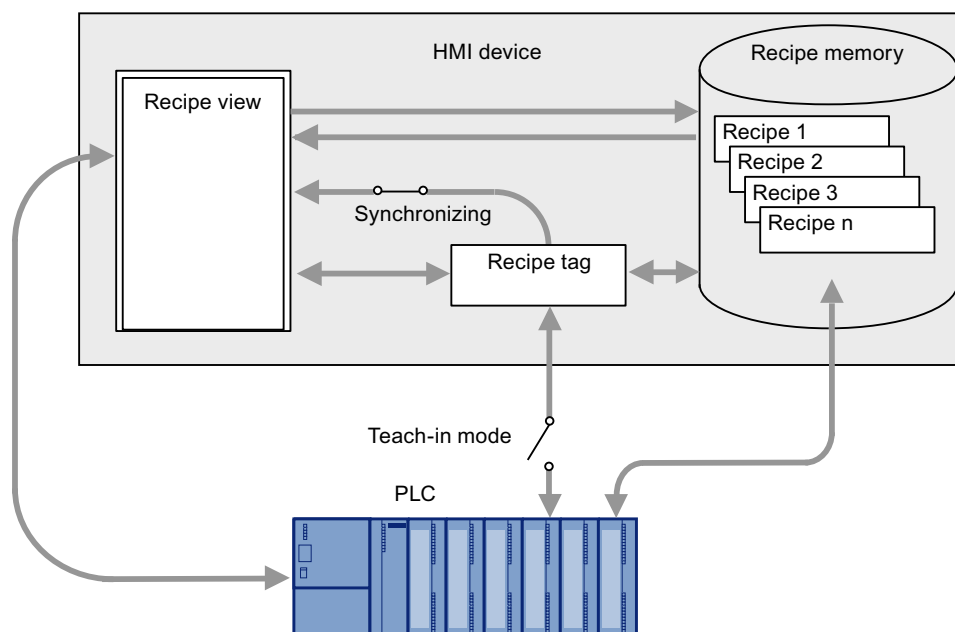

### "Synchronize recipe view and recipe tags" activated and "Manual transfer of individual modified values (teach-in mode)" deactivated

With this setting, modified recipe values are synchronized immediately between the recipe tags on the HMI device and PLC.

When you change recipe values in the recipe screen, these changes are applied immediately by the PLC and immediately influence the process.

If recipe values are changed in the PLC, the changed values are displayed immediately in the recipe screen.

#### 10.5.1.7 Special features of some devices

Basic panels, OP 77A, TP 177A and TP 177A (Portrait) respond differently to the other HMI devices in the following respects:

- Only the simple recipe view is supported.
- Recipe tags are always synchronized with the recipe view (see figure above): When the operator changes a value of the recipe element in recipe view, the value of the associated recipe tag will also change.
- Recipe tags are not automatically transferred between the PLC and HMI device when they are modified. Recipe tags are always transferred manually in teach-in mode. There must be an operator control object with the "SetDataRecordToPLC" and "GetDataRecordFromPLC" functions present in order to synchronize the values with the PLC.

---

**Note**

**Restrictions for recipe tags**

Generally, in Basic Panels and OP77A, TP177A (Portrait) recipe tags cannot be used, except in a recipe.

---

**Note**

**Restrictions for Import / Export**

It is not possible to export or import the recipes for the following HMI devices:

- Basic Panels
- OP 77A
- OP 177A
- TP 177A (Portrait)

Complete recipe data, but not single recipe data records, can be exported and imported using ProSave in CSV format and transferred to the HMI device. Thereby, Runtime is interrupted.

---

<b>NOTICE</b>
<b>Data loss with several recipe views in the screen</b>
Applies only to Basic Panels, OP73, OP77A, TP177A and TP177A (Portrait): If two or more recipe views show the same recipe in a screen, you have a conflict when accessing the data.
The result is data loss and unpredictable status of recipe data.
Make sure the operators do not select and edit the same recipe in different recipe views.
<ul style="list-style-type: none"><li>• Display only one recipe in a recipe view.</li><li>• Display a different recipe in each recipe view.</li></ul>

## Interaction between the components

There is interaction between the following components at runtime:

- **Recipe view**  
Recipes are displayed and edited in the recipe view on the HMI device.  
The recipe data records from the internal memory of the HMI device are displayed and edited in the recipe view.
- **HMI device recipe memory**  
Recipes are saved in the form of recipe data records in the HMI device's recipe memory.
- **Recipe tags**  
The recipe tags contain the values of recipe elements.

### 10.5.1.8 Synchronization of recipe data records with the PLC

#### Overview

When recipe data records are transferred between the HMI device and PLC, both communication peers access common communication areas on the other peer.

Recipe data records are always transferred directly. The values of the tags are written directly to or read directly from the configured addresses without being placed on the clipboard.

#### Data transfer types

There are two ways to transfer recipe data records between the HMI device and PLC:

- Transfer without coordination
- Coordinated transfer via the "Data record" area pointer.

---

#### Note

##### Coordinated transfer

Transfer with coordinated transfer is used to prevent the uncontrolled overwriting of data in either direction in your control program.

---

#### Requirements for coordinated transfer

The following requirements apply to coordinated transfer:

- The "Data record" area pointer must be set up for the required connection in the "Communication > Connections" editor.
- In the properties of the recipe "Coordinated transfer of data records" is activated.
- The connection to the PLC is specified in the properties of the recipe with which the HMI device coordinates the transfer.

### Coordinated transfer

In the case of coordinated transfer, both the PLC and the HMI device set the status bits in the shared data compartment.

Coordinated transfer of recipe data records can be a useful solution in the following cases:

- The PLC is the "active partner" for the transfer of recipe data records.
- The PLC evaluates information about the recipe number and name, as well as the recipe data record number and name.
- The transfer of recipe data records is started by the following PLC jobs:
  - "Set\_data\_record\_in\_PLC"
  - "Get\_data\_record\_from\_PLC"

#### 10.5.1.9 "Recipes" editor

##### Introduction

You can create, configure and edit recipes, recipe entries and recipe data records in the "Recipes" editor. The "Recipes" editor also allows you to enter values in recipe data records.

##### Structure of the "Recipes" editor

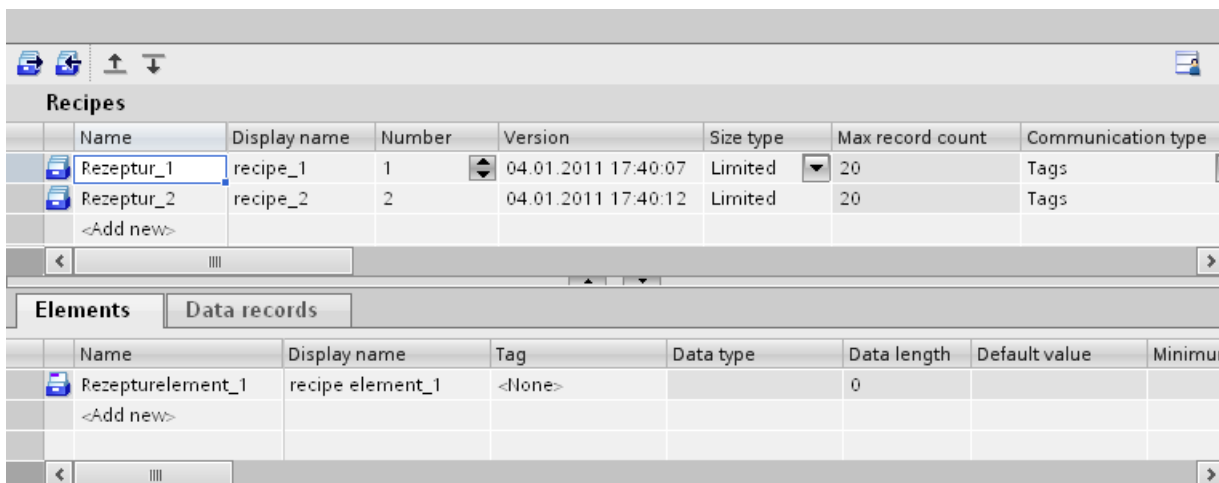

You create recipes in the top part of the table editor. You can also configure them there or in the Inspector window.

The bottom part of the table editor has the following tabs:

- Elements
 

Define the recipe elements of the selected recipe using the table cells provided here. You can move recipe elements within the table with the shortcut menu commands, "Up" and "Down".
- Data records
 

Define the values of the data records of the selected recipe using the table cells provided here.

You can then configure the selected recipe, the recipe element or the recipe data record in the Inspector window. You will find further notes on configuring the components of a recipe under "Configuring Recipes".

## Recipe settings

The following settings are available for recipes:

Setting	Description
Name of the recipe	This is a unique identification for the recipe within the HMI device.
Display name	Appears in the recipe view, for example, in Runtime. You can configure display names in multiple languages. Assign descriptive names or designations which the operator can associate directly with a recipe, e.g. "fruit juice drink".
Recipe number	This is a unique identification for the recipe within the HMI device.
Version	Information about the recipe. The date and time of the last change to the recipe is set by default.
Path	Defines the storage location for recipes. The recipes are stored as a file.
Size type [fixed]	The recipe data records are limited to a predetermined number by default.
Number of data records [fixed]	Maximum number of data records in a recipe in Runtime. The number is limited by the recipe memory of the HMI device.
Communication type [fixed]	The recipe data records are written directly to the addresses of the recipe tags and read from there.
Tooltip	Tooltip for the recipe which is shown to the operator in Runtime.

### Note

#### Path

The storage location depends on the storage media available on the HMI device.

Basic Panels and OP77A, TP177A (Portrait)

These HMI devices have no external memory. Recipes are always saved in the internal Flash memory. The "Path" setting is therefore not available.

## Recipe element settings

You can make the following settings on the "Elements" tab:

Setting	Description
Name of the recipe element	Identifies a recipe element uniquely within the recipe. Enter meaningful names or labels that you can allocate uniquely, such as axis labels on a machine or ingredients such as "Flavoring".
Display name	Appears in the recipe view, for example, in Runtime. You can configure display names in multiple languages. Assign meaningful names or designations which the operator can associate directly, e.g. "fruit juice flavoring".

Setting	Description
Recipe tag	An assigned tag in Runtime stores the current value of the recipe element in the recipe data record.
Data type	Data type of the recipe tag.
Data length [fixed]	Data length of the recipe tag, depending on the data type.
Text list	Text is assigned to a value or range of values in a text list. You can display this text in an output field, for example. The assigned recipe tag must have the data type of a number. The tag value must be within the range of values of the text list.
Default value	This is used as the default entry when you create a new recipe data record.
Minimum value [fixed]	The smallest representable value of a number-based recipe tag, depending on the type of data.
Maximum value [fixed]	The largest representable value of a number-based recipe tag, depending on the type of data.
Decimal places	Determines how many places a decimal number is rounded to, e.g. 3 decimal places and vice versa by what power of ten an integer value is multiplied, e.g. 1,000.
Tooltip	Tooltip about the recipe element which is shown to the operator in Runtime.

### Recipe data record settings

You can make the following settings on the "Data records" tab:

Setting	Description
Name of the recipe data record	Identifies a recipe data record uniquely within the recipe.
Display name	Appears in the recipe view, for example, in Runtime. You can configure display names in multiple languages. Assign meaningful names or product numbers which the operator can associate directly with a product, e.g. "yellow fruit juice E231".
Recipe data record number	Identifies a recipe data record uniquely within the recipe.
Recipe elements 1 to n	You can store various values for each recipe element even during configuration. Together with the values of the other recipe elements, a value always forms a recipe data record. You can store multiple recipe data records.  If enabled in the transfer settings, the recipe data records are transferred to the HMI device when downloading the project and existing data records on the HMI device are overwritten.
Comment	Comment about the recipe data record

## 10.5.2 Displaying and Editing Recipes in Runtime

### 10.5.2.1 Recipe screen and recipe view

You can display and edit recipes on the HMI device with a recipe view or recipe screen.

#### Recipe view

The recipe view is an off-the-shelf WinCC display and operator control object.

The recipe view is available in the following views:

- As advanced recipe view
- As simple recipe view

---

**Note****Availability**

In basic panels and OP77A, TP177A, only the simple recipe view is available.

---

#### Recipe screen

The recipe screen contains an individual screen form for entering the recipes. The screen form contains I/O fields and other display and operator control objects. The recipe functionality is implemented with system functions, e.g. for saving recipe data records.

---

**Note****Availability**

In basic panels and OP73, OP77A, TP177A (Portrait), the recipe screens are not available.

---

### 10.5.2.2 Simple recipe view

#### Recipe view

The simple recipe view is a ready-made display element and operator control that is used to manage recipe data records. The recipe view shows recipe data records in tabular form.

The displayed buttons and information in the columns are adjustable.

The values displayed or entered in the recipe view are saved in recipe data records. The displayed recipe data record can be written into the PLC by buttons or values can be read in from the PLC.

## Layout of the display

The simple recipe view consists of three areas:

- Recipe list
- Data record list
- Element list

In the simple recipe view, each area is shown separately on the HMI device. Depending on the configuration, the simple recipe view starts with the recipe list.

The figure below shows an example of the data record list.

## Display of values

---

### Note

#### Processed recipe data record is changed in the background

Only applies for Basic Panels: if an operator has changed a recipe data record and a PLC job wants to read or write any recipe data record of this recipe, the PLC job is stopped and a system alarm is output. On the other hand, the changed value is displayed immediately if only the PLC job and no operator has changed recipe data.

Does not apply for Basic Panels: If an operator has changed a recipe data record and a PLC job has changed the values of the recipe data record concerned, the recipe view is not updated automatically. To update the recipe view, reselect the respective recipe data record.

---

## See also

Recipe view (Page 3457)

### 10.5.2.3 Configuration options of the simple recipe view

The response of the simple recipe view can be defined in the recipe view inspector window.

#### Note

#### Validity

Some devices, for example basic panels, only support the simple recipe view.

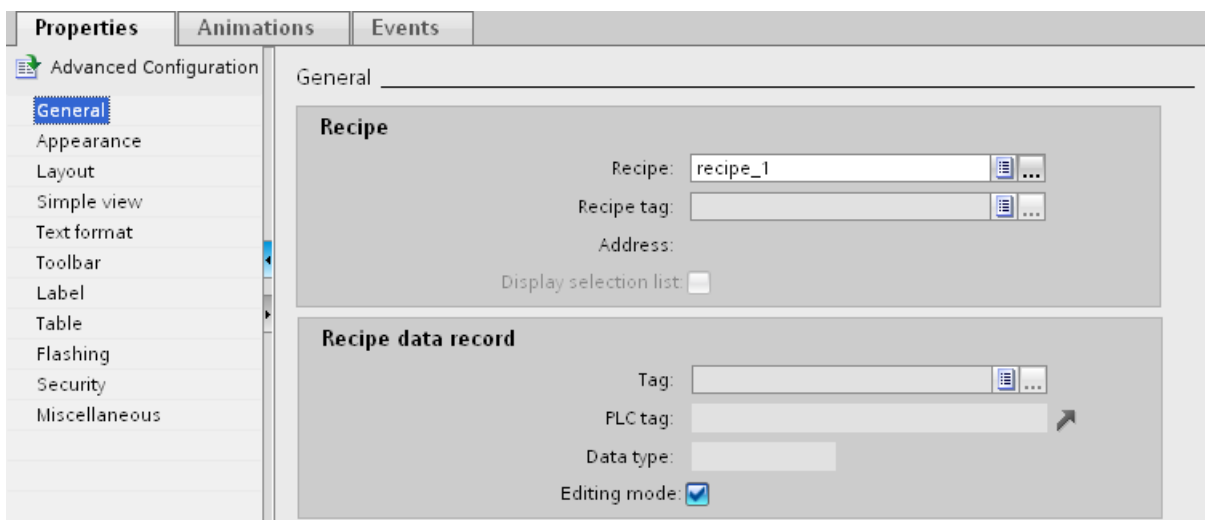

For all other devices, observe the following:

- In the Inspector window, under "Properties > Display > Mode", select "Simple view" as "View type".
- The "Properties > Simple view" area contains additional properties only applicable to the simple recipe view.
- All other properties are also applicable to the advanced recipe view.

### Displaying recipe data record values only

To display the recipe data in a recipe view for checking only, proceed as follows:

1. Deselect "Edit mode" in the "General" group.

You cannot create, rename, edit or delete recipe data.

### Writing a recipe data record number or name to a tag

A tag to each recipe data record can be configured in the advanced recipe view. Depending on the "String" or "Int" data type of the tag, the name or number of the recipe data record is stored in the tag. Conversely, the tag can also be used to select a recipe data record by entering the corresponding value. For example, the tag can be transferred as a parameter for a system function.

Proceed as follows:

1. Enter a tag of the "Int" type in the field "Tag", under "Properties > General > Recipe data record".

The number of the recipe data record is stored in a tag.

## Configuring an event on the recipe view

---

### Note

#### Events and buttons

The "Events" register is faded out when a minimum of one button is enabled.

---

To configure an event for the recipe view, proceed as follows:

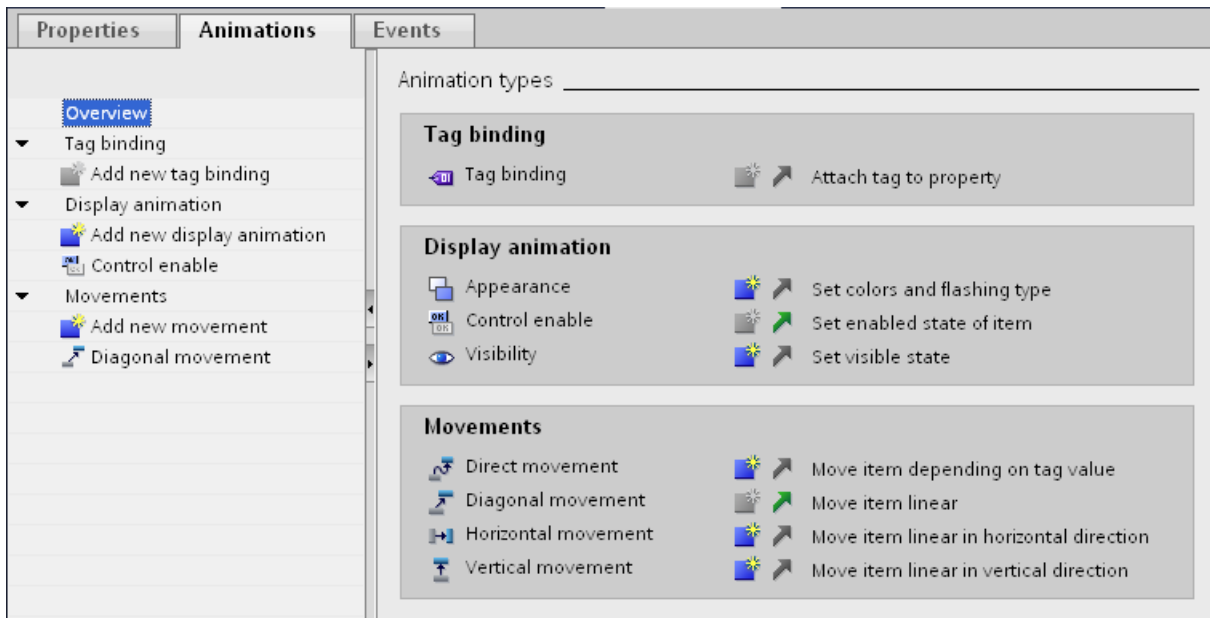

1. Select the recipe view that was added to the screen in the "Screens" editor.  
The properties of the recipe view are shown in the Inspector window.
2. Deactivate all buttons under "Properties > Toolbar" and "Properties > Simple view".
3. In the Inspector window, under "Properties > Events", click the event to be configured, e.g. "Enable".
4. Configure a function list for the event.

The function list is processed when the operator enables the recipe view.

## Animation properties of the recipe view

To configure an animation of a recipe view, proceed as follows:

1. Select the recipe view that was added to the screen in the "Screens" editor.  
The properties of the recipe view are shown in the Inspector window.
2. Click under "Properties > Animations" in the Inspector window.

3. Link a tag to one or more of the following properties.

- X-Position and y-Position
- Design: Colors, flashing
- Operability
- Visibility

In the "Animations> Overview" area, all animations are summarized in tabular form. Under "Animations> Tag links > Tag linkage", as well as visibility and position a tag can also be linked to height and width.

---

### Note

#### Animations and buttons

If all buttons are not disabled, an error message appears whilst compiling the project for windows-CE HMI devices.

---

## Constraints on the simple recipe view

The following functions are not possible in the simple recipe view:

- Synchronizing recipe view and recipe tags
- Writing a recipe number / name to a tag
- Display status bar

- Display data record number
- Display label
- Display table

### 10.5.2.4 Advanced recipe view

#### Recipe view

The advanced recipe view is an off-the-shelf display and operator control object that is used to manage recipe data records. The recipe view shows recipe data records in tabular form.

The buttons, headers and information displayed in the columns are variable.

The values displayed or entered in the recipe view are saved in recipe data records.

#### Layout of the display

The picture below contains an example of the advanced recipe view:

Entry Name	Value
Recipe element_1	0

#### Display of values

##### Note

##### Changing the recipe data record in the background

Applies to the processing of a recipe data record:

If values of the corresponding recipe data record are changed by a control job, the recipe view is not updated automatically.

To update the recipe view, reselect the respective recipe data record.

## See also

Recipe view (Page 3457)

### 10.5.2.5 Configuration options of the advanced recipe view

The response of the advanced recipe view in the recipe view inspector window can be determined.

#### Note

##### Validity

The following description also applies to the advanced recipe view. In the Inspector window, under "Properties > Display > Mode", select "Advanced view" as "View type".

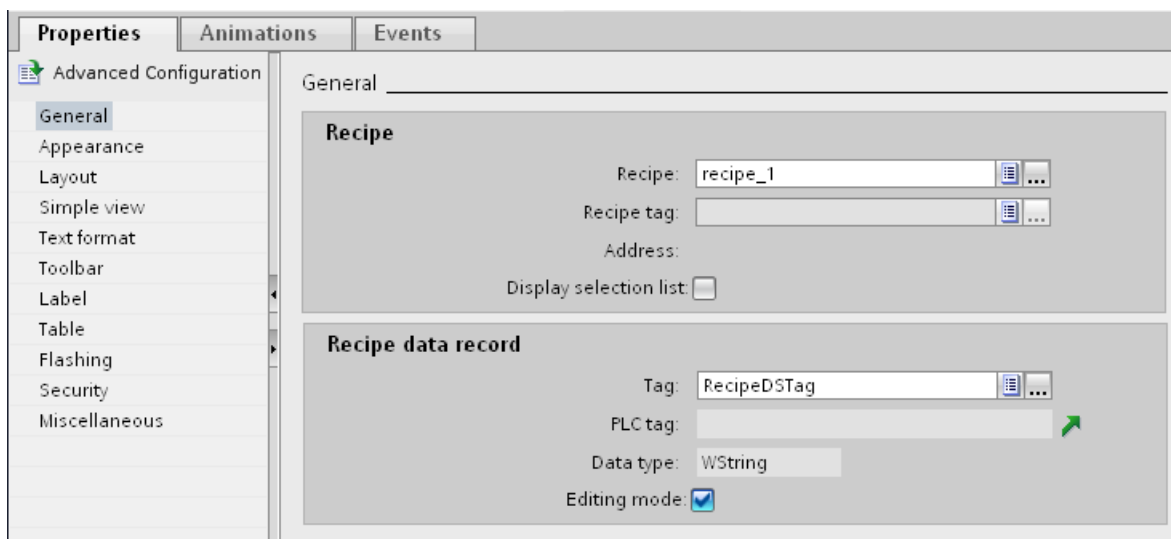

All properties described for the simple recipe view are also applicable in the advanced recipe view, except "Properties > Simple view". The "Simple view" area contains additional properties only applicable to the simple recipe view.

Basic Panels, OP77A and TP177A (Portrait) do not support any advanced recipe view.

## Displaying a recipe

To allow access to the recipe data records of a specific recipe only in a screen, proceed as follows:

1. Enter the recipe or select an existing recipe in the "Recipe" field, under "Properties > General".
2. When a recipe is entered in the "Recipe" field, you will have to enable the "Selection list" if you want to display the recipe name in Runtime.

The selected recipe appears in the recipe view.

### Writing a recipe number or name and recipe data record number or name to a tag

Both the recipe and the recipe data record can each be configured to a tag in the recipe view. Depending on the "String" or "Int" data type of the tag, the name or number of the recipe or recipe data record is stored in the tag. Conversely, the tag can be used to select the recipe or recipe data record by entering the corresponding value. For example, the tag can be transferred as a parameter for a system function.

Proceed as follows:

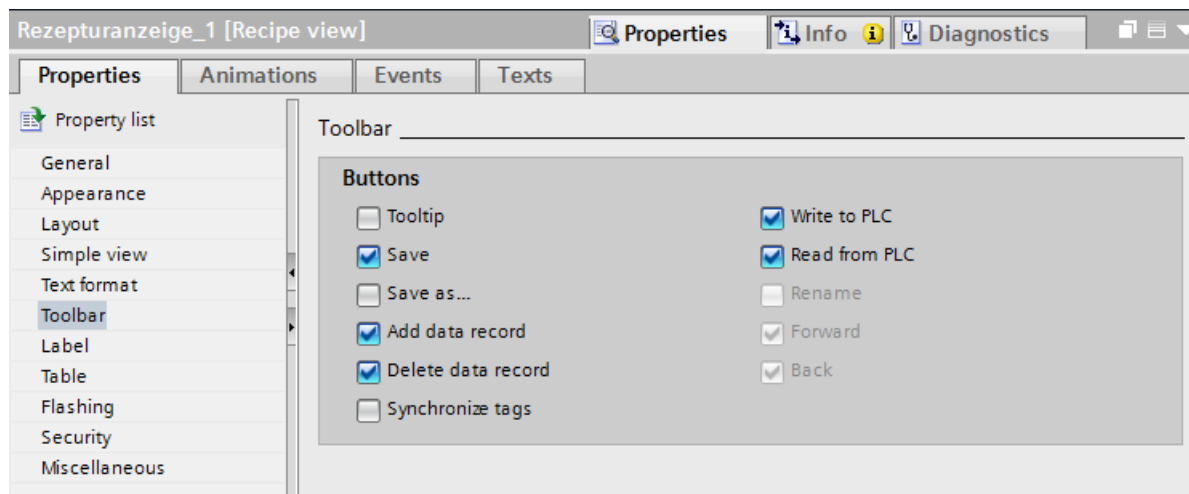

1. Enter a tag of the "String" type in the field "Recipe tag", under "Properties > General > Recipe".
2. Enter a tag of the "Int" type in the field "Tag", under "Properties > General > Recipe data record".

The name of the recipe and the number of the recipe data record are each stored in a tag.

### Using the recipe view as a drop-down list

To use the recipe view as a selection field for recipes and recipe data records in a recipe screen, proceed as follows:

1. Select the tag for the recipe name under "General > Recipe > Recipe tag".
2. Select the tag for the recipe data record name under "General > Recipe data record > Tag".
3. Disable the "Edit mode". You cannot create, rename, edit or delete recipe data.
4. In order to select recipes, enable "Show selection list" and make sure that no recipe is selected under "Properties > General > Recipe".
5. Deactivate all buttons under "Properties > Toolbar".

### Configuring an event on the recipe view

To configure an event on the recipe view, proceed as follows:

1. Select the recipe view that was added to the screen in the "Screens" editor.  
The properties of the recipe view are shown in the Inspector window.
2. In the Inspector window, click the event you want to configure under "Properties > Events".
3. Configure a function list for the selected event.

The function list is processed when the configured event occurs.

### 10.5.2.6 Response of the recipe view in Runtime

#### Screen change

If you change to another screen and have not yet saved changes to the recipe data in the recipe view, you will be prompted to save the recipe data. The recipe name and the name of the recipe data record are displayed to show which recipe data have not been saved yet.

#### Create, change, copy or delete recipe data records

If you attempt to create a new recipe data record and a recipe data record already exists, a system alarm will appear on screen.

#### Operating the recipe view with function keys

The Recipe view can be operated with function keys, e.g. if the HMI device does not have touch functionality. You can assign functions such as "SaveDataRecord" to the function keys on the HMI device.

#### Display after import of recipe data

---

**Note****Availability**

Import and export of recipe data is not available for Basic Panels and OP77A, TP177A (Portrait).

---

If you open the recipe view during the import of recipe data, only the recipe data that is already completely imported will be displayed. The recipe view is not automatically updated with a data import. In order to have a complete view of all the recipe data, do not open the recipe view until the system prompts you that the recipe data has been imported successfully. Alternatively, update the recipe view after successful completion of the import procedure.

## Updating tag for recipes and recipe data records

### Note

#### Availability

Tags for recipes and recipe data records are not available for Basic Panels and OP77A, TP177A (Portrait).

The current recipe data record or its number can be saved to a tag, depending on the configuration. The tag will be updated under the following conditions:

- The recipe data record has been loaded.
- The screen with the recipe view was not exited during loading.

This operation may take some time.

### 10.5.2.7 Basics on the recipe screen

#### Introduction

The recipe screen contains an individual screen form for entering the recipes. The screen form contains I/O fields and other display and operator control objects. The recipe functionality is implemented with system functions, e.g. for saving recipe data records.

The picture below contains an example of a recipe screen:

The screenshot shows a recipe screen interface. On the left, there is a table of ingredients with their respective amounts and units:

Water	40	l
Concentrate	70	l
Sugar	30	kg
Flavoring	30	l

On the right, there are two dropdown menus for selecting recipe and data record names, each with a corresponding number field:

Recipe name:	Orange	No.:	1
Data record name:	Nectar	No.:	2

At the bottom, there are four buttons: "Save", "Data from the PLC", "Load", and "Data to PLC".

### Note

#### Availability of recipe screens

Basic Panels and OP73A, OP77A, TP177A (Portrait) do not support any recipe screens.

## Principle

Configuring a recipe screen allows you to customize the display. You can spread large recipes over several screens according to topic and display them clearly using features such as graphical display and operator control objects.

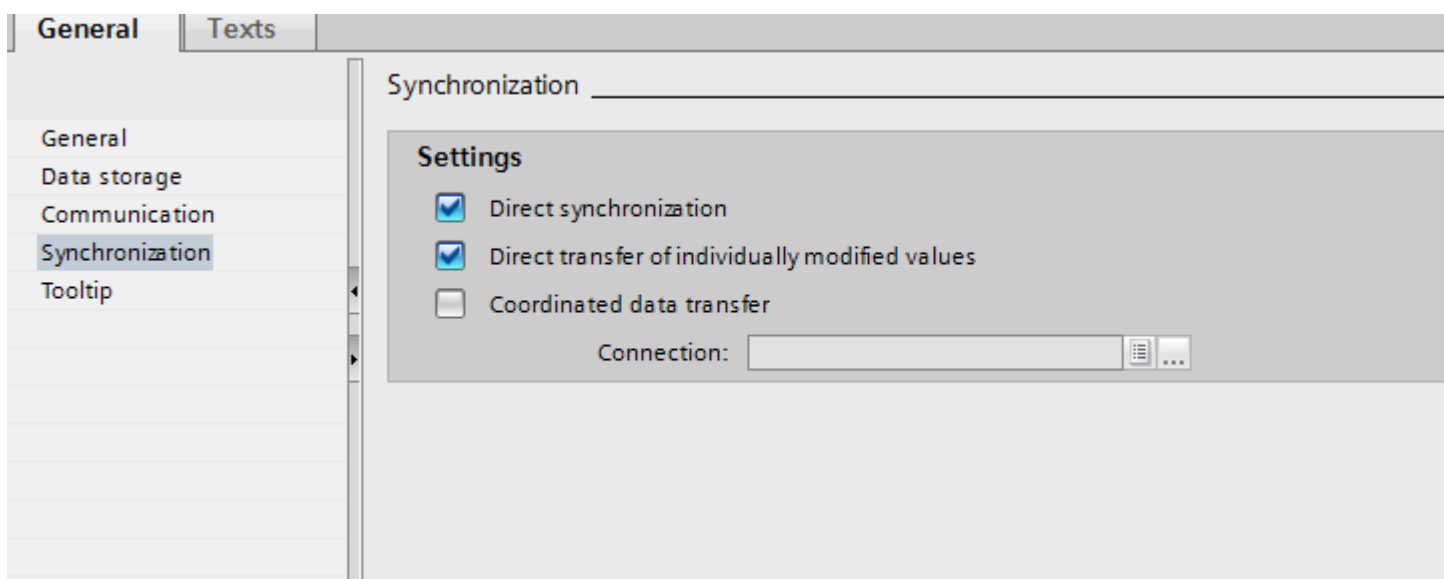

- Spreading recipes over several screens according to topic
  - You can distribute recipe data records with multiple entries across several screens. For example, for each plant area you can configure a screen containing the associated screen forms for the recipe data records.

Spreading recipes over several screens is useful for HMI devices with small displays as they avoid having to scroll through tables in Runtime.

- Visual machine simulation  
You can visually simulate your machine in a screen using graphical screen objects. This enables you to display parameter settings more clearly by positioning I/O fields immediately next to machine elements such as axes or guide rails, which produces a direct relationship between the values and the machine.

## Synchronizing recipe values

To enter recipe data record values outside the advanced recipe view in the configured I/O fields, activate "Synchronize recipe view and recipe tags" under "Properties > Synchronization" in the recipe properties.

The "Synchronize recipe view and recipe tags" option is not available for the simple recipe view.

## Transferring recipe values automatically

If the entered recipe values must be immediately transferred to the connected PLC in Runtime, deactivate "Manual transfer of individual modified values (teach-in mode)" under "Properties > Options".

Configure the "SetRecipeTags" system function if you want to enable and disable the immediate transfer of entered recipe values in Runtime.

### System functions

The following system functions are available for operator control of a recipe screen:

- ImportDataRecords
- ExportDataRecords
- LoadDataRecord
- SaveDataRecord
- SetDataRecordTagsToPLC
- GetDataRecordTagsFromPLC

The following system functions are available for operator control of the recipe view when it is being used in the recipe screen:

- RecipeViewSaveDataRecord
- RecipeViewSaveAsDataRecord
- RecipeViewSynchronizeDataRecordWithTags
- RecipeViewDeleteDataRecord
- RecipeViewNewDataRecord
- RecipeViewGetDataRecordFromPLC
- RecipeViewRenameDataRecord (for simple recipe view only)
- RecipeViewShowOperatorNotes
- RecipeViewMenu (for simple recipe view only)
- RecipeViewOpen (for simple recipe view only)
- RecipeViewBack (for simple recipe view only)

The system functions for loading, saving and transferring recipe data records and recipes are located in the "Recipes" group.

## 10.5.3 Configuring Recipes

### 10.5.3.1 General configuration procedure

Carry out the following configuration steps when you create a new recipe:

Step	Description
1	Define the structure of the recipe.
2	Create tags according to the recipe structure. Assign process names to these tags.

Step	Description
3	Create the recipe.
4	Enter the required properties for the recipe: <ul style="list-style-type: none"> <li>• Language-dependent view name of the recipe</li> <li>• "Coordinated transfer of data records" option</li> </ul> Not for Basic Panels: <ul style="list-style-type: none"> <li>• Recipe storage location</li> <li>• "Synchronize recipe view and recipe tags" option</li> <li>• "Manual transfer of individual modified values (teach-in mode)" option</li> </ul>
5	Create the recipe elements and enter the required properties: <ul style="list-style-type: none"> <li>• Language-dependent view name of the recipe elements</li> <li>• Tag binding of the recipe elements</li> <li>• Standard values and decimal places (power of ten) for the recipe elements</li> </ul>
6	Create the recipe data records. Enter the language-specific display names for the recipe data records.
7	Configure a screen with recipe view or a recipe screen.

**Note****Basic Panels and OP77A, TP177A (Portrait)**

The selection of the storage location is not available for these devices. The recipes are always saved in the internal Flash memory.

Recipe tags cannot be used outside a recipe, e.g. not in I/O fields, not in alarms as trigger tags, not in systems functions as parameters, etc.

**Note****Restrictions recipe view and recipe image**

Only the simple recipe view is available in Basic Panels and OP77A, TP177A. Recipe images are not available in Basic Panels and OP73, OP77A, TP177A (Portrait).

**10.5.3.2 Creating and Editing Recipes****Creating a new recipe****Introduction**

To create a complete recipe, start by creating a new recipe, assign the corresponding recipe elements and then define the associated values in a recipe data record.

**Requirement**

- The tags for the recipe have been created.
- The "Recipes" editor is open.

## Create recipe

Create a recipe as follows:

1. Click "Add" in the first free row of the table in the "Recipes" editor.  
The new recipe is created and displayed on a line.

The screenshot shows the 'Recipes' editor interface. On the left is a navigation pane with categories: General, Data storage, Communication, Control tags, Security, System fields, and Tooltip. The 'General' category is selected. The main area is titled 'General' and contains two sections: 'Settings' and 'Size'. In the 'Settings' section, there are four fields: 'Name' (text box with 'Recette\_1'), 'Display name' (text box with 'Recette\_1'), 'Version' (text box with '03/07/2013 09:29:14'), and 'Number' (spin box with '3'). In the 'Size' section, there is a 'Type' dropdown menu set to 'Unlimited'.

2. Enter a descriptive name for the recipe under "Name" in the "General" area.  
This name identifies the recipe unambiguously within the project.
3. Select "Display name" to enter the language-specific name to be displayed in runtime.
4. Select a recipe number in "Number".  
The number identifies the recipe unambiguously within the HMI device.  
The recipe is automatically assigned a version that indicates the date and time of the last change. As an alternative, you can enter specific information relating to the recipe.
5. Specify the storage location for recipe data records in "Data medium". The options offered depend on the specific HMI device used.

### Note

#### Basic Panels and OP77A, TP177A (Portrait)

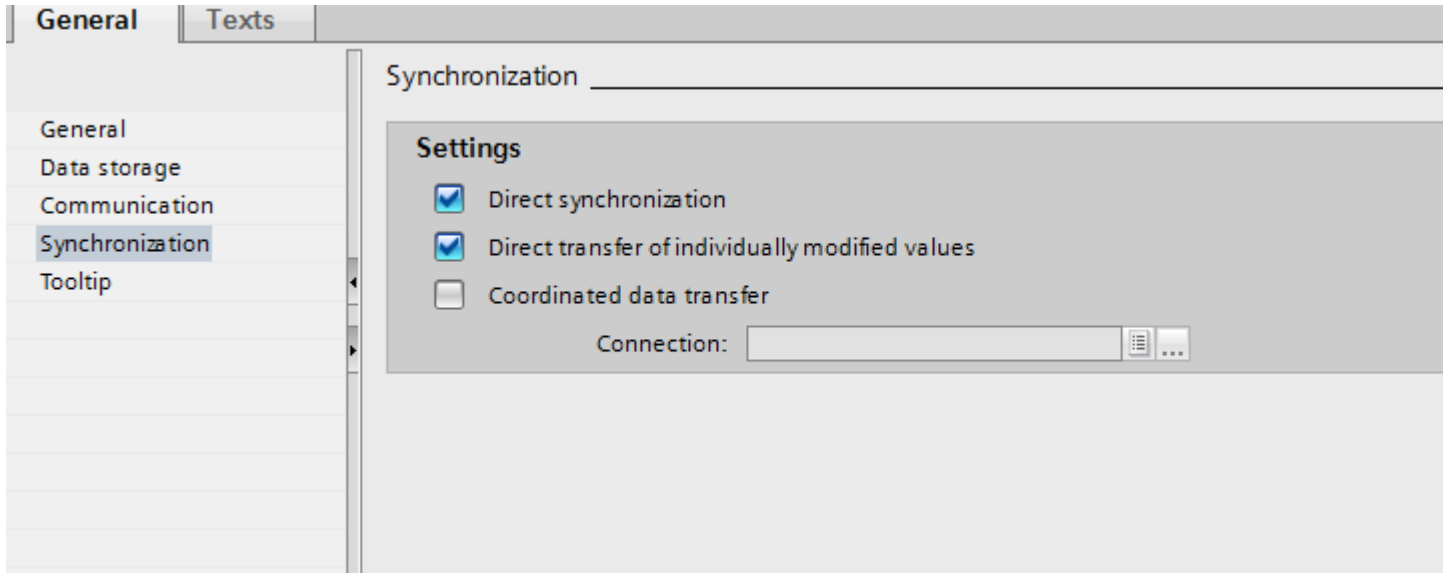

The selection of the storage location is not available for these devices. The recipes are always saved in the internal Flash memory.

Recipe tags cannot be used outside a recipe, e.g. not in I/O fields, not in alarms as trigger tags, not in systems functions as parameters, etc.

6. Enter a tooltip that is shown to the operator in runtime.

7. To compare recipe tags which are configured in I/O fields with the recipe view in Runtime, activate "Synchronize recipe view and recipe tags" in the Inspector window under "Properties > Synchronization".

---

#### Note

##### Basic Panels and OP77A, TP177A (Portrait)

Because the recipe tags cannot be additionally used in I/O fields in screens for Basic Panels, the "Synchronize recipe view and recipe tags" is not available; you will also not be able to use the "Manual transfer of individual modified values (teach-in mode)" option.

8. Deactivate "Manual transfer of individual modified values (teach-in mode)" to specify that the recipe tags are automatically transferred to the PLC when editing the I/O fields.
9. Activate "Coordinated transfer of data records" to monitor the transfer of recipe data in Runtime using area pointers.
10. Select the appropriate connection to the PLC for coordinated transfer under "Synchronize with".

### Create recipe element

To create recipe elements, proceed as follows:

1. Click the "Elements" tab.
2. Click "Add" in the first free line of the table editor.  
A new recipe element is created.
3. Enter a descriptive name for the element under "Name".  
The name identifies the element uniquely within the recipe.
4. Enter a language-specific display name for the element under "Display name".  
The display name appears in the recipe view, for example, in runtime.

- Select the tag you want to link to the recipe element under "Tag".  
The value of the recipe data element is saved in Runtime in this tag, which is stored in a recipe data record.

Elements		Data records				
	Name	Display name	Tag	Default value	Decimal places	Infotext
	Water	Water	LitreWater	0	0	
	<Add new>					

- Enter a tooltip.  
The tooltip is shown to the operator in Runtime.
- Under "Default value", enter the value that you want to use as the default entry when you create a new recipe data record.
- To assign text to a value or range of values, select the relevant text list here. The assigned recipe tag must have the data type of a number. The tag value must be within the range of values of the text list.  
The text stored in the text list is displayed in an output field, for example, in Runtime.
- Determine exactly how many places a decimal number is rounded to in the "Decimal places" column, e.g. 3 decimal places and vice versa by what power of ten an integer value is multiplied, e.g. 1,000.  
Examples for 3 decimal places: Entering "5" for a recipe element with the "Integer" data type gives the value "5000". Entering "5.6789" for a recipe element with the "Real" data type gives the value "5.679".
- Create as many recipe entries as needed for the recipe. The maximum number of recipe entries possible depends on the HMI device being used.

Elements		Data records				
	Name	Display name	Tag	Default value	Decimal places	Infotext
	Water	Water	LitreWater	0	0	
	Concentrat	Concentrat	LitreConcentrat	0	0	
	Sugar	Sugar	KiloSugar	0	0	
	Aroma	Aroma	GramAroma	0	0	
	<Add new>					

### Create recipe data record with known recipe values

To create recipe elements, proceed as follows:

1. Click the "Data records" tab.
2. Click "Add" in the first free line of the table editor.  
A new recipe data record is created. The recipe data record has a separate column for every recipe element created in the recipe.

Elements		Data records							
	Name	Display name	Number	Water	Concentrat	Sugar	Aroma	Comment	
	Recipe_data_record_1	Recipe_data_record_1	1	0	0	0	0		
	<Add new>								

3. Enter a descriptive name under "Name".  
The name identifies the data record uniquely within the recipe.
4. Enter a language-specific name under "Display name".  
The display name appears in the recipe view, for example, in runtime.
5. Enter a recipe data record number under "Number".  
The recipe data record number identifies the recipe data record uniquely within the recipe.
6. If you already know the recipe values at the configuration stage, you can enter the relevant value for each recipe element.

Elements		Data records							
	Name	Display name	Number	Water	Concentrat	Sugar	Aroma	Comment	
	Beverage	Beverage	1	30	70	45	600		
	<Add new>								

7. Create as many data records as you need for the recipe.

Elements		Data records							
	Name	Display name	Number	Water	Concentrat	Sugar	Aroma	Comment	
	Beverage	Beverage	1	30	70	45	600		
	Nectar	Nectar	2	50	50	10	300		
	Juice	Juice	3	5	95	3	100		
	<Add new>								

### Enter the values in runtime

The following options are available for entering values in the recipe data records at runtime:

- Transfer data directly from the PLC (Teach-in mode)
- Import of values from a CSV file
- Input values on the HMI device

---

#### Note

##### Basic Panels and OP77A, TP177A (Portrait)

The import of values is not available for these devices.

---

### Result

The complete recipe is configured.

### Recipe data records with date or time stamp

If you use date or time data, make sure that the system setting for time and date on the configuring computer match those on the target system. Example: You load a recipe data record on the target system at 13:55 in which 14 h is stored as the processing time. If it is already 14:05 on the target computer, the recipe will not be processed. If an operator processes the recipe, change information will not be written back correctly into the database.

After loading to the target system, check the recipes with date or time stamps on the target system.

### Editing a recipe

#### Purpose

You want to modify, extend or delete parts of a recipe.

#### Requirement

- You have created at least one recipe.
- The "Recipes" editor is open.

### Changing recipe settings

To change the recipe settings, proceed as follows:

1. Select the recipe that you want to change in the "Recipes" editor.  
The Inspector window opens.
2. Change the recipe configuration in the Inspector window.

You change recipe elements and recipe data records in the same way.

## Change recipe values

To change recipe values, proceed as follows:

1. Select the recipe whose values you want to change.
2. Click the "Data records" tab.
3. Enter the new values in the value columns.

## Adding a recipe element

To add more recipe elements to a recipe, proceed as follows:

1. Select the recipe to which you want to add more elements in the "Recipes" editor.
2. Click the "Elements" tab.
3. Click "Add" in the first free line.  
The recipe element is created.
4. Configure the recipe element.

You add recipe data records in the same way.

## Managing recipes

### Requirement

- You have created a recipe with recipe elements and recipe data record.
- The "Recipes" editor is open.

### Renaming recipes

We distinguish between internal names and display names for recipes, recipe entries and recipe data records.

To rename recipe elements, proceed as follows:

1. Select the recipe that you want to rename.  
The Inspector window opens.
2. Select the "Rename" command from the shortcut menu.
3. Enter the new name.  
You rename recipe elements and recipe data records on the relevant tab in the same way.

---

#### **Note**

The view names in the "Recipes" editor can also be renamed under "Languages & Resources > Project Texts". This possibility is useful when you have already configured in several languages for example.

---

### Copying and pasting recipes

To copy and paste recipes, proceed as follows:

1. Select the recipe that you want to copy.
2. Select the "Copy" command from the shortcut menu.
3. Select the "Paste" command from the shortcut menu in the first free table row.

The copied recipe is pasted into the table. The recipe elements and recipe data records are also copied in the appropriate tab with the recipe.

You also copy the recipe elements and recipe data records on the appropriate tab in the same way.

If a recipe data record of the same name already exists, the name of the copied recipe data record is extended by one digit. This ensures that the name is unique. Recipe data records can only be copied or pasted within the same recipe.

### Deleting a recipe

To delete a recipe, proceed as follows:

1. Select the recipe that you want to delete.
2. Select the "Delete" command from the shortcut menu.  
The recipe is deleted.

You delete recipe elements and recipe data records on the relevant tab in the same way.

---

#### Note

When a recipe is deleted, the recipe data records contained in the recipe are also deleted.

---

#### Note

When you delete a recipe element, the associated values in the recipe data records are also deleted. The assigned tags are retained.

---

### 10.5.3.3 Configuring the display of recipes

#### Configuring the simple recipe view

##### Requirement

- The recipe has been created.
- The "Screens" editor is open.
- The screen has been created and opened.

##### NOTICE

##### Data loss with several recipe views in the screen

Applies only to Basic Panels, OP73, OP77A, TP177A and TP177A (Portrait): If two or more recipe views show the same recipe in a screen, you have a conflict when accessing the data.

The result is data loss and unpredictable status of recipe data.

Make sure the operators do not select and edit the same recipe in different recipe views.

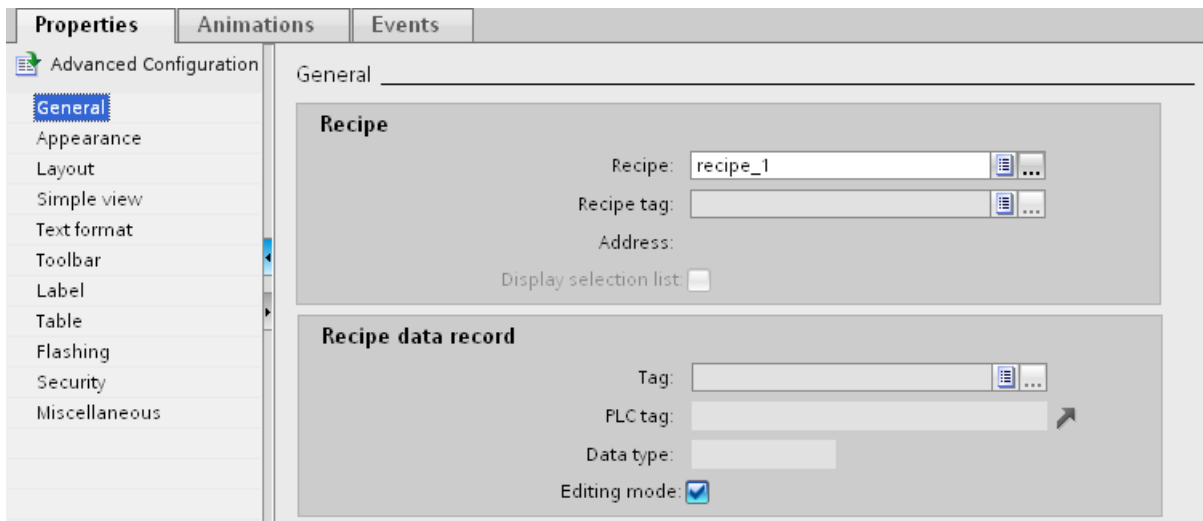

- Display only one recipe in a recipe view.
- Display a different recipe in each recipe view.

##### Procedure

To configure a simple recipe view, proceed as follows:

1. Paste the recipe view into the screen. You will find the recipe view under "Controls" in the "Tools" task card.
2. Only in devices which also support the extended recipe view: Activate "Simple view" under "Properties > Display > Mode".

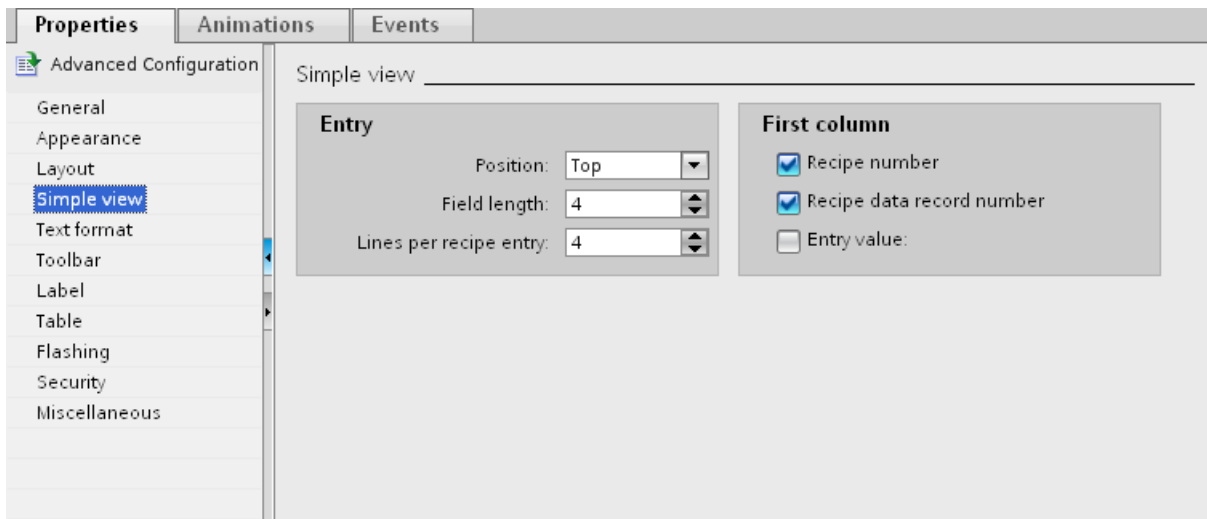

3. If you want to display only the recipe data records of a specific recipe in the recipe view, select the specific recipe under "Properties > General > Recipe".

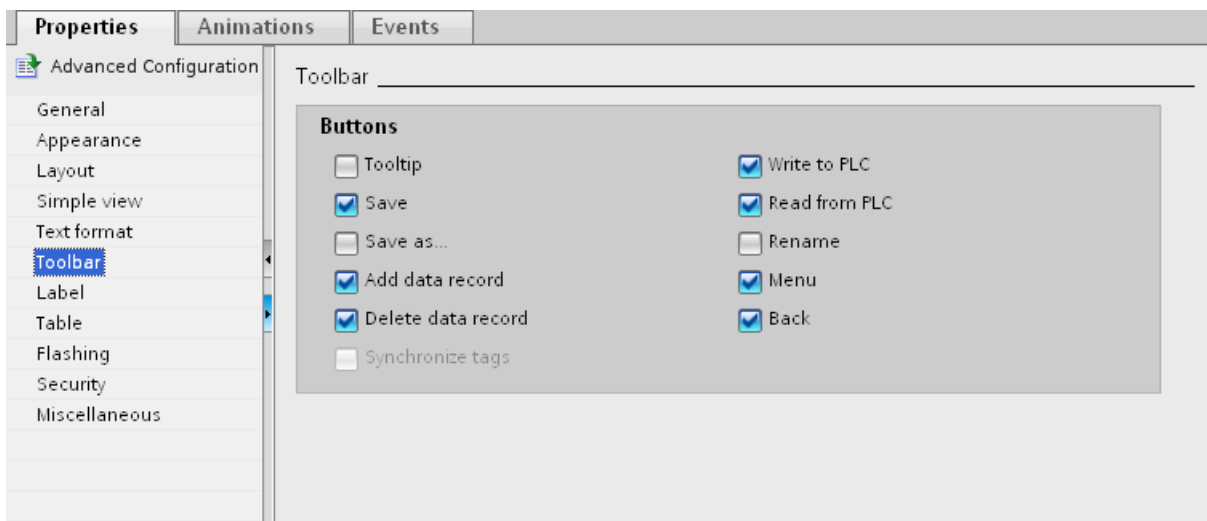

4. If you only want to display the recipe data in the recipe view, deactivate "Processing mode" in the "Recipe data record" area.
5. You can define additional options for the recipe view under "Properties > Appearance" and "Properties > Layout".

6. Select "Properties > Simple view" to select the position, the field length, and the number of lines required.  
Select "Position > Top" to display the recipe value in the first line of the recipe entry.  
Select "Position > Bottom" to display the recipe value in the last line of the recipe entry.

7. Under "Properties" > "Toolbar" specify which menu commands are available in the recipe view in Runtime.

## Result

The simple recipe view is configured. You can use the recipe view to display and edit recipe data during runtime.

Deactivation of the editing mode in "Properties > Properties > General" has no impact on the toolbar icons. The buttons you activated in "Properties > Toolbar" can still be used even if editing mode is disabled.

## Configuring the Advanced Recipe View

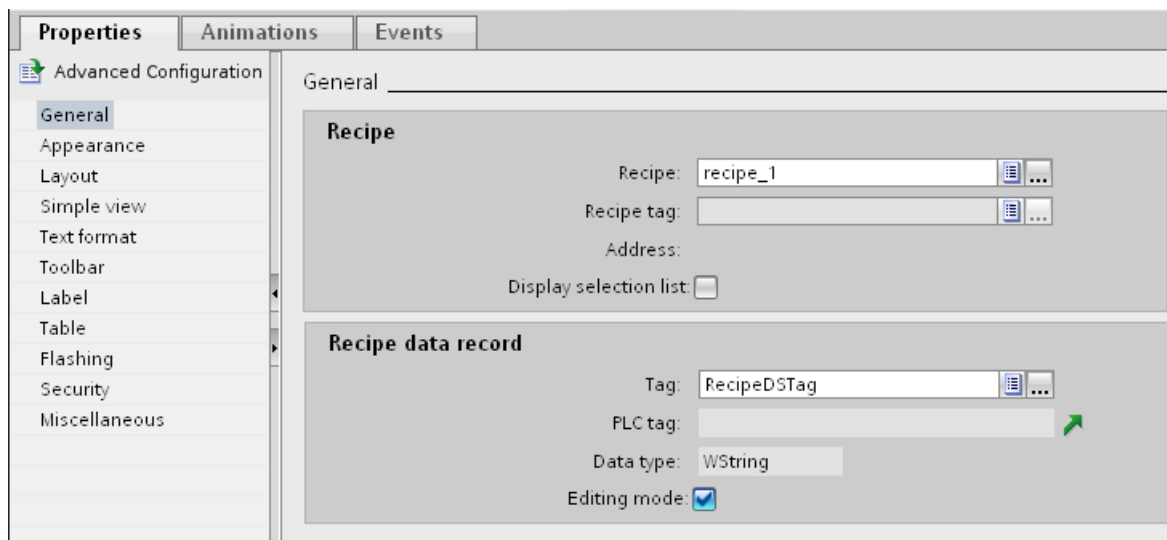

### Requirement

- The recipe has been created.
- The "Screens" editor is open.
- The screen has been created and opened.

### Procedure

To configure an advanced recipe view, proceed as follows:

1. Paste the recipe view into the screen. The recipe view is found in the task card "Tools" > "Controls".
2. Select "Properties > Display > Mode > Advanced view" in the Inspector window.

3. Select the required settings from the "General" group in the Inspector window.
  - If you want to display only the recipe data records for a particular recipe in the recipe view, select the recipe under "Recipe" in the "Recipes" area.
  - If you want to save the recipe name or the recipe number in a tag, select the tag under "Recipe tag" in the "Recipe" area.
  - If you want to save the recipe data record name or number in a tag, select the tag under "Tag" in the "Recipe data record" area.
  - If you only want to display the recipe data in the recipe view, deselect "Edit mode".
  - If you only want to use the recipe view to select recipes, disable "Display table" under "Properties > Table".
4. You can define additional options for the recipe view under "Properties > Appearance" and "Properties > Layout".

5. If you want to change the label in the recipe view, enter a suitable text under "Properties" > "Label".
6. Under "Properties" > "Toolbar" specify which buttons are available in the recipe view in Runtime.

---

#### Note

If you select the "Edit" command in the context menu of the recipe view, the recipe view becomes active. To activate the recipe view, the zoom factor must be set to 100%.

You can set the column width and the position of the "Entry name" and "Value" columns in active mode.

---

#### Result

The recipe view is configured. You can use the recipe view to display and edit recipe data during runtime.

Deactivation of the editing mode in "Properties > Properties > General" has no impact on the toolbar icons. The buttons you activated in "Properties > Toolbar" can still be used even if editing mode is disabled.

#### Configuring a recipe screen

##### Introduction

The recipe screen is a screen in which you configure a customized screen form in the "Screens" editor. You create the screen form from input/output fields and other display and operator

control objects. System functions are used to configure the recipe functionality, such as saving recipe data records.

---

**Note**

**Availability**

Recipe screens cannot be created for basic panels and OP73, OP77A and TP177A (Portrait).

---

## Application

You can spread recipe data records containing lots of entries across several screens. For example, for each plant you can configure a screen containing the associated screen forms for the recipe data records.

You can visually simulate your machine in a screen using graphical screen objects. This enables you to display parameter settings more clearly by positioning I/O fields immediately next to machine elements, such as axes or guide rails. You can use this to produce a direct reference between the values and the machine.

## Requirement

- You have created the recipe.
- The "Screens" editor is open.

## Procedure

To configure a recipe screen, proceed as follows:

1. Configure the screen and create the I/O fields for the input mask of the recipe.  
You can create multiple screens to suit the size and complexity of the recipe.
2. Configure the I/O fields with the tags you have linked to the recipe element.
3. Configure I/O fields for selecting recipes and recipe data records.

Alternatively:

1. Configure a recipe view as a selection list for recipe data records and recipes.
2. Hide the buttons that are not required in the recipe view.
3. Configure the system functions for editing recipe data records on the configured control elements.  
Control elements are configured buttons in the screen or function keys on the HMI device. You will find the system functions for editing recipe data records under "Recipes" and "Keyboard operation for screen objects".

## Result

The recipe screen is created.

### 10.5.3.4 Importing recipes into the configuration and exporting them

#### Introduction

You can export recipes as a CSV file and import them again into the configuration.

#### Application case

Recipe data is exported for long-term storage and backup on a computer.

In order to unify and distribute recipe data, export the recipe data to an HMI device. Change the CSV file in Microsoft Excel and import the CSV file to all HMI devices that require the same recipe data.

You want to exchange recipe data between different projects. You change the recipe data in Runtime. To transfer the modified recipe data to WinCC ES, export the recipe data records in Runtime and copy the CSV file to the configuring computer. There you import the CSV file containing the recipe data records into the recipe. And in the opposite direction, you transfer the modified recipe data records to the HMI device in WinCC ES in Runtime.

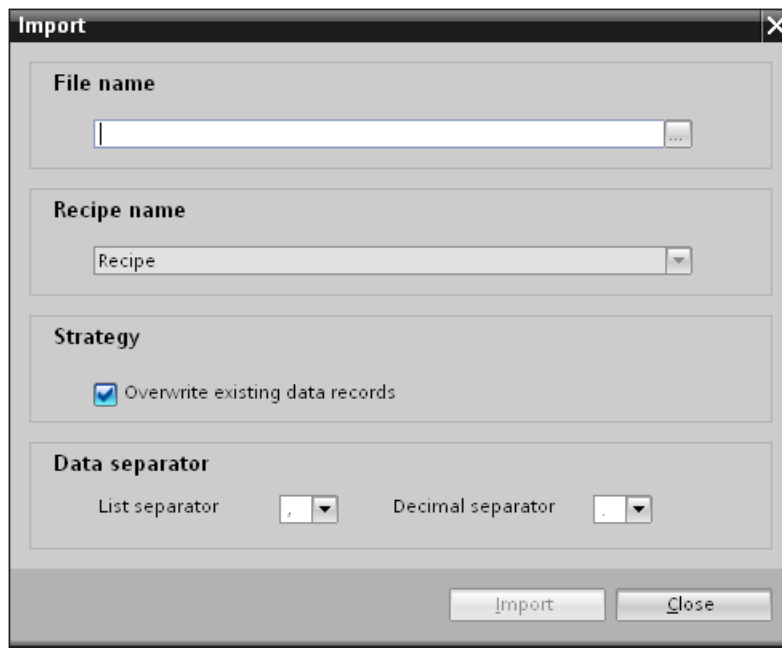

#### Requirement

- You have created the recipe.
- The structures of the exported CSV file and the recipe in WinCC ES match; name, number and data type of the recipe elements are identical.
- The "Recipes" editor is open.

## Importing CSV files

To import recipe data records into a recipe, proceed as follows:

1. Select the row which contains the desired recipe in the "Recipes" tab.
2. Select the "Import recipe data" command from the shortcut menu.  
The "Import" dialog box opens.

3. To select the desired CSV file, go to "File name".
4. Under "Strategy", specify whether a recipe data record with the same recipe number in WinCC ES should be overwritten.
5. Specify the list separator and decimal separator under "Data separation". The list separator separates individual recipe elements in the CSV file. The decimal separator separates integers and decimal places.

---

### Note

Use the same list separator for import as in the CSV file for export.

---

6. Click "Import" to start the operation.

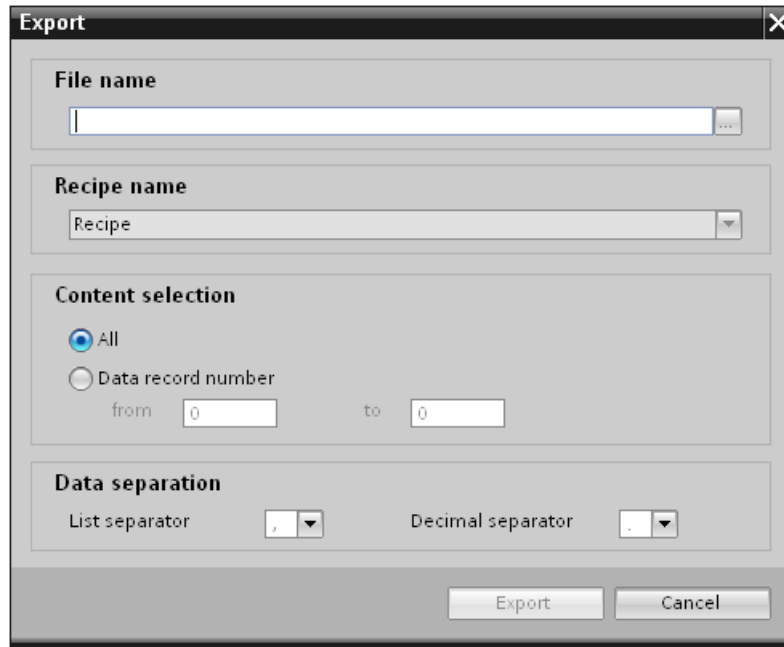

## Result

The recipe will be amended by recipe data records from the CSV file that have not yet been entered. If the option is selected, existing recipe data records will be overwritten.

An error message is shown in the "Info" of the Inspector window if the structure of the recipe does not match the structure of the CSV file.

## Exporting CSV files

1. Select the row which contains the recipe to export in the "Recipes" tab.
2. Select the "Export recipe data" command from the shortcut menu.  
The "Export" dialog box opens.

3. Under "File name", specify the path of the CSV file.
4. Select all recipe data records under "Selection content", or restrict the selection to specific record numbers of the recipe data.
5. Specify the list separator and decimal separator under "Data separation". The list separator separates individual recipe elements in the CSV file. The decimal separator separates integers and decimal places.
6. Click "Export" to start the operation.

## Result

The configuration is exported as a CSV file.

## 10.5.4 Using Recipes in Runtime

### 10.5.4.1 Simple recipe view

#### Description of the simple recipe view

##### Layout

The simple recipe view consists of the following display areas:

- Recipe list
- Data record list
- Element list

This application is illustrated below:

In the simple recipe view, each area is shown separately on the HMI device. You can use the shortcut menu to operate each of these display areas.

The simple recipe view always begins with the recipe list.

##### Operation

You have the following options for using the simple recipe view, according to the configuration:

- Create, change, copy or delete recipe data records
- Read recipe data records from the PLC or transfer to the PLC

#### Using the display area and shortcut menu

Toggle between the display areas and the shortcut menus to operate the simple recipe views.

The table below shows the operation of the display area.

Button	Key	Function
	<Enter>	The next lowest display area is opened, i.e. the data record list or the element list.
	<Esc>	The previous display area opens.

Button	Key	Function
	<INS>	Creates a new data record for the selected recipe if the list of recipes or recipe data records is displayed. Then changes to the list of recipe element. Requirement: "Properties >General > Processing mode" is activated. The button can be simulated with the "Key SimulateSystemKey" function even on devices without keys.
	<DEL>	Deletes the selected recipe data record in the list of recipe data records. Requirement: "Properties >General > Processing mode" is activated.
	<Up>/<Down>	Selects the previous/next entry.
	<Pg Up>/<Pg Down>	Moves the display up or down one page.
	<Home>/<End>	Selects the first/last entry. The first/last entry is selected.

The table below shows the operation of the shortcut menu:

Button	Key	Function
	<Right>	The shortcut menu of the display area opens.
	<Esc>	The menu is closed. The display area opens.
	Input of the number of the menu command	The menu command is executed.

### Shortcut menus of the simple recipe view

You can click the  button in each display area to call up a selection of commands. The command selection lists those commands that are available in the current display area. A number is assigned to each command. The command is executed when you enter this number. Alternatively select the command and press the <Return> key.

### Shortcut menus in the recipe list

Menu command	Function
New	A new recipe data record is created for the selected recipe. If a start value is configured, it is displayed in the input field.
Display tooltip	The tooltip configured for the recipe is displayed.
Open	The record list of the selected recipe opens.

### Shortcut menus of the recipe data record list

Menu command	Function
New	Creates a new recipe data record. If a start value is configured, it is displayed in the input field.
Deleting	The displayed record is deleted.
Save as	The selected data record is saved under a different name. A dialog box opens where you can enter the name.
Rename	Renames the selected data record. A dialog box opens where you can enter the name.
Open	The element list of the selected data record opens.
Previous	The recipe list opens.

### Shortcut menus of the recipe element list

Menu command	Function
Save	The selected data record with the recipe element is saved.
To PLC	The displayed values of the selected data record are transferred from the HMI device to the PLC.
From PLC	The recipe values from the PLC are displayed in the recipe view of the HMI device.
Save as	The data record is saved under a new name. A dialog box opens where you can enter the name.
Display tooltip	The tooltip configured for the recipe element is displayed.
Rename	The selected recipe element is renamed. A dialog box opens where you can enter the name.
Previous	The data record list opens.

### Shortcut menus in the data record list

#### Note

#### HMI device dependency

The following menu commands are configured in Basic Panels and in OP 77A, TP 177A, TP 177A (Portrait) and TB 177B.

Menu command	Function
To PLC	The displayed values of the selected data record are transferred from the HMI device to the PLC.
From PLC	The recipe values from the PLC are displayed in the recipe view of the HMI device.

## Using the simple recipe view

### Controlling the simple recipe view with mouse or touchpad

To control the simple recipe view with mouse or touchpad, proceed as follows:

1. Select the desired recipe from the recipe view.
2. Click the  button.  
The shortcut menu is opened.
3. Select the desired menu command.  
The menu command is executed.

### Controlling the simple recipe view with the keyboard

To control the simple recipe view with the keyboard, proceed as follows:

1. Press the <Tab> key until the simple recipe view is selected.
2. Select the desired recipe with the cursor keys.
3. Press <Right>.  
The shortcut menu is opened.
4. Press the <Down> key until the desired menu command is selected.
5. Press <Enter> to confirm the command.

### Key shortcuts for the simple recipe view

The following key shortcuts are activated for the simple recipe view in Runtime if "Activate keyboard operation" is enabled in the ES.

Key shortcut	Effect	Menu command
<Insert>	Generates a new recipe data record	New
<Del>	Deletes the recipe data record displayed.	Delete

## Managing recipe data records

### Recipe data record administration

You have the following options for managing the simple recipe view, according to the configuration:

- Creating new recipe data records
- Copy recipe data records
- Edit recipe data records
- Delete recipe data records

### Creating new recipe data records

To create a new recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to create a new recipe data record.
2. Select the "New" command from the shortcut menu for the recipe list.  
A new data record with the next available number will be created.  
The element list of the new recipe data record opens.
3. Enter values for the elements of the recipe data record.  
The configuration data may already contain default values for the recipe data record.
4. Select the "Save" command from the shortcut menu for the element list.  
The dialog "Save as" opens.
5. Enter the name and number of the recipe data record.
6. Click the "OK" button.

### Result

The new recipe data records will be saved to the selected recipe. If the recipe data records already exists, a system event will be output to the screen.

### Copying a recipe data record

To copy a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to copy an existing recipe data record.
2. On the HMI device, select the recipe data record of which you want to save a copy.
3. Select the "Save As" command from the shortcut menu for the data record list.  
The dialog "Save as" opens. The recipe data record is automatically given the next free recipe data record number.
4. Under name, enter the name of the record.
5. Click the "OK" button.

### Result

The recipe data record is stored under the new name.

### Modify recipe data record

To change a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to edit an existing recipe data record.
2. Select the recipe data record that you want to edit on the HMI device.
3. Select the recipe data record.  
The element list of the recipe data record is displayed.
4. Replace the old values with new ones.
5. Select the "Save" command from the shortcut menu for the element list.

## Result

The modified values are applied to the recipe data record.

## Deleting a recipe data record

To delete a recipe data record, proceed as follows:

1. Select the recipe on the HMI device from which you want to delete an existing recipe data record.
2. Select the recipe data record that you want to delete on the HMI device.
3. Select the "Delete" command from the shortcut menu for the data record list.
4. Confirm this security prompt to delete the data record.

## Result

The recipe data record is deleted.

## Read recipe data record from PLC

### Introduction

In Runtime, you can change values directly in the plant that are also stored in recipes in the HMI device. This applies if a valve was opened further directly in the plant than was specified in the recipe. The values of the recipe data records saved in the HMI device possibly no longer match the values in the PLC.

You can read the values of the recipe tags from the PLC and write them to a recipe data record.

The read values are written to the recipe data record that is currently displayed on the HMI device.

### Procedure

To read a recipe data record from the PLC, proceed as follows:

1. Open the recipe on the HMI device.  
The data record list opens.
2. Select the element list of the recipe data record to which you want to apply the values from the PLC.
3. Select the "From PLC" command from the shortcut menu for the element list.  
The values are read from the PLC and displayed in the current recipe data record.
4. If you want to save the values, select the "Save" or "Save As" command.

## Result

The values are read from the PLC, visualized on the HMI device and saved to the recipe data record.

## Transferring a recipe data record to the PLC

### Introduction

For the values of a data record that was changed in the recipe view to take effect, you must transfer the values to the PLC.

The values displayed in the recipe view are always transferred to the PLC.

### Procedure

To transfer a recipe data record to the PLC, proceed as follows:

1. Open the recipe you want to use.  
The data record list opens.
2. Select the element list of the recipe data record whose values you want to transfer to the PLC.
3. Select the "To PLC" command from the shortcut menu for the element list.

### Result

The values of the recipe data record are transferred to the PLC.

#### 10.5.4.2 Advanced recipe view

### Description of the advanced recipe view

### Application

The recipe view is used to display, edit and manage data records.

The screenshot shows a software interface for managing recipes. It features two dropdown menus for selecting a recipe and a data record, each with a corresponding number field. Below these is a table with two columns: 'Entry Name' and 'Value'. The table contains two rows: 'Water' with a value of 50 and 'Concentrat' with a value of 50. At the bottom of the interface are several icons for actions like refresh, save, delete, and transfer to PLC, along with a status bar showing 'Ready'.

Entry Name	Value
Water	50
Concentrat	50

## Operation

Depending on the configuration you can:

- Create, change, copy or delete recipe data records
- Synchronizing recipe data records with the associated recipe tags
- Read recipe data records from or transfer to the PLC

## Operating elements

The following operating elements can be configured in the recipe view:

Operating element	Key combination	Function
		The configured tooltip is displayed.
	<Ctrl+Space Bar>	Creates a new recipe data record. If a start value is configured, it is shown in the input field.
	<Ctrl+Enter>	Saves the displayed values of the recipe data record. The storage location is predefined by the project.
	<Ctrl+*>	The recipe data record is saved under a different name regardless of the recipe view. A dialog box opens where you can enter the name.
	<Ctrl+Del>	The displayed recipe data record is deleted.
	<Ctrl+=>	The system always updates the current value of the recipe view with the up-to-date recipe tag value.  When the value shown in the recipe view is more recent than the current recipe tag value, the system writes this value to the recipe tag.  "Synchronize recipe view and recipe tags" must be activated in the recipe properties before this function can be used.
	<Ctrl+Down>	The values of the set recipe data record displayed in the recipe view are transferred to the PLC.
	<Ctrl+Up>	The recipe values from the PLC are displayed in the recipe view.

## Using the advanced recipe view

### Introduction

You can control the recipe view using both mouse or touchpad or with the keyboard.

### Controlling the recipe view with mouse or touchpad

To control the recipe view with mouse or touchpad, proceed as follows:

1. Select the recipe you want to use.  
The records for the recipe are displayed.
2. Click on the data record you wish to edit.
3. Click the button whose function you want to run.

### Controlling the recipe view with the keyboard

To control the recipe view with the keyboard, proceed as follows:

1. Press the <Tab> key until the cursor reaches the field for selecting the recipe.
2. Press <Enter>.  
The drop-down list box for the recipes opens.
3. Select a recipe. You navigate between the next or previous entry in the list by using the cursor keys <Left>, <Right>, <Up> and <Down>.
4. Select a data record.
5. Press the <Tab> key until the operator control object you wish to use is selected.

Alternatively you can control the recipe view using certain key combinations.

### Key shortcuts for the advanced recipe view

The following key shortcuts are activated for the advanced recipe view in Runtime if "Activate keyboard operation" is enabled in the ES.

Keys shortcut	Effect	Menu command	Button
<Ctrl+Space>	Generates a new recipe data record. Any configured start value is displayed in the input field.	Add data record	
<Ctrl+Del>	Deletes the recipe data record displayed.	Delete data record"	
<Ctrl+Enter>	Saves the edited data record by its current name.	Save	
<Ctrl+*>	Saves the edited data record by a new name.	Save as	
<Ctrl+=>	Compares the values of the selected data record with the values on the PLC. Any value in the recipe view which is more recent compared to the current recipe tag value is written to the recipe tag. This function is only available if enabled in the ES.	Synchronizing recipe tags	
<Ctrl+Down>	Transfers the current value to the PLC.	Write to PLC	
<Ctrl+Up>	Reads the actual value from the PLC.	Read from PLC	

## Managing recipe data records

### Administration of recipe data records

You have the following options for managing recipe data records, according to the configuration:

- Create new recipe data records
- Copy recipe data records
- Edit recipe data records
- Delete recipe data records

### Creating new recipe data records

To create a new recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to create a new recipe data record.
2. Click the  button or press the <Ctrl + Spacebar> keys.  
A new recipe data record with the next available number is created.  
If you change the new data record number to an existing data record number, the existing data record is overwritten.
3. Enter values for the elements of the data record.  
The elements of the recipe data record can be assigned default values depending on the configuration.
4. Click the  button or press the <Ctrl + \*> keys.  
The dialog "Save as" opens.
5. Enter a name for the data record.
6. Click on "OK" to confirm your input.  
The data record is saved under the new name.  
If the recipe data record already exists, a dialog is opened. In this dialog, specify whether the existing data record is to be overwritten.

## Result

The new recipe data records will be saved to the selected recipe. If the recipe data records already exists, a system alarm will be output to the screen.

### Copying a recipe data record

To copy a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to copy an existing recipe data record.
2. Select the recipe data record that you want to copy on the HMI device.
3. Click the  button in the recipe view or press the <Ctrl + \*> keys.  
The dialog "Save as" opens.

4. Enter a name for the data record.
5. Click on "OK" to confirm your input.

## Result

The recipe data record is stored under the new name.

## Modify recipe data record

To change a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to edit an existing recipe data record.
2. Select the recipe data record that you want to edit on the HMI device.
3. Replace the old values with new ones.
4. Click the  button in the recipe view or press the <Ctrl + Enter> keys.

## Result

The modified values are applied to the recipe data record.

## Delete recipe data record

To delete a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to delete an existing recipe data record.
2. Select the recipe data record that you want to delete on the HMI device.
3. Click the  button in the recipe view or press the <Ctrl + Del> keys.

## Result

The recipe data record is deleted.

## Synchronizing recipe data record

### Introduction

Differences between the following values may occur during runtime:

- The values displayed in the recipe view
- The actual values of the recipe tags

Depending on the configuration, the values displayed in the recipe view are synchronized with the recipe tags. Synchronization encompasses all tags of a recipe data record.

---

**Note**

**Changed tag name**

The tag and the value of the recipe data record cannot be associated if you have renamed the tag you want to synchronize. The tags in question are not synchronized.

---

**Note**

Recipe tags can only be synchronized in the advanced recipe view.

---

## Requirement

- A recipe data record is displayed in the recipe view.
- The values of recipe tags were modified by teaching, for example.

## Procedure

To synchronize a recipe data record, proceed as follows:

1. Click the  button in the recipe view or press the <Ctrl + => keys.

## Result

The system always updates the current value of the recipe view with the up-to-date recipe tag value.

When the value shown in the recipe view is more recent than the current recipe tag value, the system writes this value to the recipe tag.

## Read recipe data record from PLC

### Introduction

In Runtime, you can change values directly in the plant which are also stored in recipes in the HMI device. This applies if a valve was opened further directly in the plant than was specified in the recipe. The values of the recipe data records saved in the HMI device possibly no longer match the values in the PLC.

You can read the values of the recipe tags from the PLC and write them to a recipe data record.

The read values are written to the recipe data record that is currently displayed on the HMI device.

## Procedure

To read a recipe data record from the PLC, proceed as follows:

1. Select the recipe on the HMI device.
2. On the HMI device, select the recipe data record of which you want to fetch the values from the PLC.
3. Click the  button in the recipe view or press the <Ctrl + Up> keys.

## Result

The values are read from the PLC and displayed on the HMI device.

## Transferring recipe data records to the PLC

### Introduction

For the values of a data record that was changed in the recipe view to take effect, you must transfer the values to the PLC.

The values displayed in the recipe view are always transferred to the PLC.

## Procedure

To transfer a recipe data record to the PLC, proceed as follows:

1. Select the recipe on the HMI device.
2. On the HMI device, select the recipe data record of which you want to transfer the values to PLC.
3. Click the  button in the recipe view, or press the <CTRL+DOWN> shortcut key.

## Result

The values of the recipe data record are transferred to the PLC.

### 10.5.4.3 Exporting and importing recipe data records

#### Introduction

Depending on configuration and the HMI device, either export recipe data records to a CSV file, e.g. for editing in MS Excel, or import these from a CSV file. The extent to which you can influence these processes is determined by the project configuration.

---

#### Note

##### Restrictions for Import / Export

It is not possible to export or import the recipes for the following HMI devices:

- Basic Panels
- OP 77A
- OP 177A
- TP 177A (Portrait)

Complete recipe data, but not single recipe data records, can be exported and imported using ProSave in CSV format and transferred to the HMI device. Thereby, Runtime is interrupted.

---

A list separator is used to separate the data records during importing and exporting.

---

#### Note

The list separator used as the default depends on the setting for formats and numbers in the operating system. Select "Start > Settings > Control Panel > Regional and Language Options". If you want to import or export recipe data records, do not use this list separator in the display name of the recipe data records.

---

The following fields can be configured on the user interface, for example, in order to use the export/import function:

- Selection field for the recipe
- Selection field for the recipe data record
- Operating element with the "ExportDataRecords" functionality
- Operating element with the "ImportDataRecords" functionality

#### Export recipe data record

To export a recipe data record, proceed as follows:

1. Select the relevant recipe and recipe data record from the selection boxes.
2. Click the control element with the "ExportDataRecords" functionality.

## Result

The recipe data record are exported to a CSV file.

---

### Note

New data records created in runtime can be exported to an external file.

---

## Importing recipe data records

To import a recipe data record, proceed as follows:

1. Select the relevant recipe and recipe data record from the selection boxes.
2. Click the control element with the "ImportDataRecords" functionality.

## Result

The recipe data record are imported.

### 10.5.4.4 Reactions to modifications of the recipe structure

#### Introduction

Different recipe structures can occur in the following situations:

- In the event of changes during commissioning
- When work is carried out on the machine by the machine manufacturer (retrofit)
- When CSV files are imported, the structure of the CSV file can differ from the recipe structure.

Nevertheless, you can still use any recipe data records already created.

<b>NOTICE</b>
---------------

When a tag is renamed, the assignment is lost.
--

## Effects

Handle any structural differences as follows:

- If the old recipe data record or the CSV file contains additional values, these values will be discarded.
- If the old recipe data record or the CSV file contains values of the wrong data type, the configured default value will be used in the recipe data record.  
Example: The recipe data record contains values that show the tank contents and were input as floating point numbers. However, the corresponding recipe tag expects an integer value. In this case, the system discards the transferred value and the configured default value is used.
- If the old recipe data record or the CSV file contains too few values, the configured default value will also be used in the recipe data record.

## 10.5.5 Examples

### 10.5.5.1 Example of creating a recipe

#### Task

In this example, you create three recipes for a fruit juice mixing machine. The fruit juice mixing machine produces drinks with "orange", "apple" and "tropical" flavors. You create a recipe for each flavor.

Each recipe contains a recipe data record for the following mixing ratios:

- Beverage
- Nectar
- Juice

#### Settings

The settings relate to an HMI device which is connected to a SIMATIC S7-300 or SIMATIC S7-400.

In this example, you will need the following tags, recipes, recipe entries and recipe data records:

##### Tags:

Name	PLC connection	Address	Type
Liter water	Yes	DB 120, DBW 0	Integer
Liter concentrate	Yes	DB 120, DBW 4	Integer
Kilo sugar	Yes	DB 120, DBW 8	Integer
Gram flavoring	Yes	DB 120, DBW 12	Integer

##### Recipes:

- Orange
- Apple
- Tropical

**Recipe entries:**

Recipe element	Associated tag
Liter water	Liter water
Liter concentrate	Liter concentrate
Kilo sugar	Kilo sugar
Gram flavoring	Gram flavoring

**Recipe data records for drink, nectar and juice:**

Data record name	Liter water	Liter concentrate	Kilo sugar	Gram flavoring
Beverage	30	70	45	600
Nectar	50	50	10	300
Juice	5	95	3	100

**Procedure**

To create a recipe, proceed as follows:

1. Create the following tags with the settings specified above: "LiterWater", "LiterConcentrate", "KiloSugar" and "GramFlavoring".
2. Create the "Orange", "Apple" and "Tropical" recipes with the settings indicated above. Create the recipe entries in each recipe.

Elements		Data records				
	Name	Display name	Tag	Default value	Decimal places	Infotext
	Water	Water	LitreWater	0	0	
	Concentrat	Concentrat	LitreConcentrat	0	0	
	Sugar	Sugar	KiloSugar	0	0	
	Aroma	Aroma	GramAroma	0	0	
	<Add new>					

3. Not for Basic Panels: Configure each recipe so that you can synchronize the recipe data records between the recipe screen and recipe view. The values of the recipe tags should not be transferred automatically to the PLC.  
You will have to make the following settings in the Properties dialog for the recipe concerned:  
Under "Properties > Options":
  - Activate the "Synchronize recipe view and recipe tags" option.
  - Activate the "Manual transfer of individual modified values (teach-in mode)" option.
4. Create the data records indicated above in each recipe. Enter the values indicated above in each of the data records.

Elements		Data records							
	Name	Display name	Number	Water	Concentrat	Sugar	Aroma	Comment	
	Beverage	Beverage	1	30	70	45	600		
	Nectar	Nectar	2	50	50	10	300		
	Juice	Juice	3	5	95	3	100		
	<Add new>								

## Result

The "Orange", "Apple" and "Tropical" recipes have been created.

### 10.5.5.2 Example of configuring a recipe screen

## Task

In this example, you create a recipe screen for the visualization of values of the fruit juice mixing machine. You use a recipe view to select the recipes and their associated recipe data records.

You should be able to use the following functions with the buttons:

- "Load" Button  
The selected recipe data record is loaded from the recipe memory on the HMI device and displayed in the recipe screen.
- "Save" Button  
The displayed recipe tags are saved in the recipe memory of the HMI device.

- "Data to PLC" button  
The displayed tags are transferred to the PLC.
- "Data from PLC" button  
The current recipe data record in the PLC is transferred to the recipe variables and displayed on the HMI device.

### Requirement

- The "Creating a recipe" sample application has been carried out.
- You have created and opened the "Fruit juice mixing plant" screen.

### Settings

In this example, you need the following tags and buttons with the indicated settings:

#### Tags:

Name	PLC connection	Type
RecipeNumber	No	Integer
Data record number	No	Integer

#### Buttons:

Labeling	Configured event	System function
Load	Click	LoadDataRecord
Save	Click	SaveDataRecord
Data to PLC	Click	SetDataRecordTagsToPLC
Data from PLC	Click	GetDataRecordTagsFromPLC

## Procedure

To configure a recipe screen, proceed as follows:

1. Drag-and-drop the "Liter water", "Liter concentrate", "Kilo sugar" and "Gram flavoring" tags from the object view to the "Fruit juice mixing machine" process screen. Four IO fields are created and linked by the specified tags.
2. Add a recipe view containing selection fields for the recipe name and data record name only.  
Make the following settings in the Inspector window for the recipe view:
  - Select the "Advanced view" display type under "General".
  - Deselect "Edit mode" under "Properties > General" and "Display table" under "Properties > Table".
  - Connect the "Recipe tag" field to the "RecipeNumber" tag.
  - Connect the "Tag" field to the "DataRecordNumber" tag.
  - Disable all the buttons under "Properties > Buttons".
3. Assign the above settings to four buttons. Transfer each "Recipe number" and "Data record number" tag as a parameter for the recipe number and recipe data record number.

## Result

You can select the recipe and the associated recipe data record from the recipe view and modify the recipe values at runtime. You can load, save and transfer the recipe data records using the buttons.

### 10.5.5.3 Scenario for Entering Recipe Data Records in Runtime

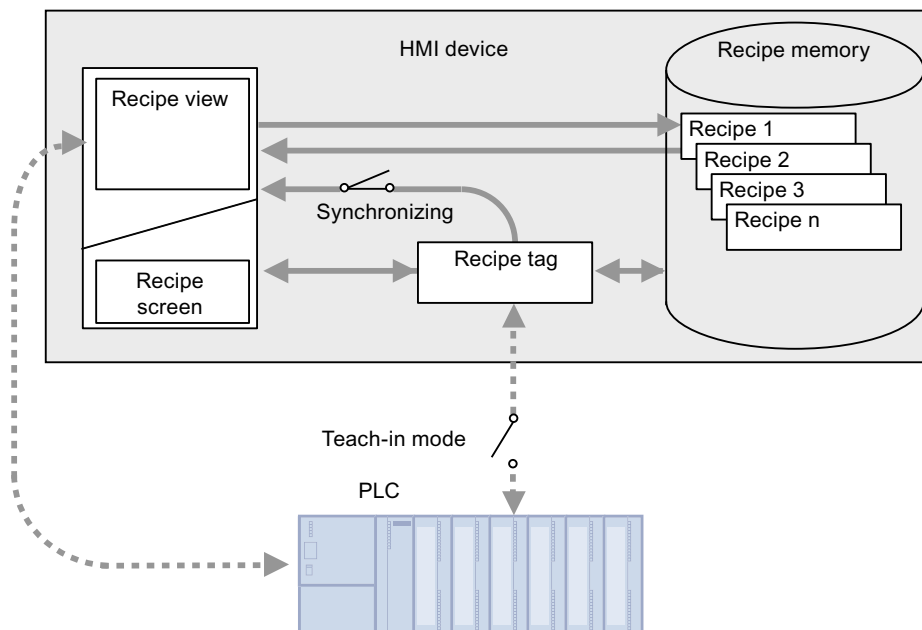

#### Objective

You want to enter production data on the HMI device without disturbing the process that is currently underway. Therefore, the production data should not be transferred to the PLC.

#### Requirement

- The recipe has been created.
- The recipe has the following settings:
  - "Synchronizing recipe view and recipe tags" is activated or deactivated.
  - If "Synchronize recipe view and recipe tags" is activated, "Manual transfer of individual modified values (teach-in mode)" has to be activated.  
This will prevent the recipe tags being transferred automatically between the HMI device and PLC.
- A recipe screen or a screen with recipe view is available.
- There is an operating element for saving the recipe data records.

## Sequence

1. Enter the production data in the recipe view or recipe screen.
2. Save the modified recipe data record.

## Transfer the recipe data to the PLC

The configuration may provide operating elements for transferring recipe data to the PLC.

### 10.5.5.4 Scenario for a manual production sequence

#### Objective

A reading device connected to the PLC reads a bar code on the work piece to be processed. The recipe data record names correspond to the respective bar code names. This will enable the PLC to load the necessary recipe data record from the storage medium of the HMI device. The recipe data record is displayed for inspection on screen.

You want to be able to correct the transferred production data online, if necessary.

## Requirement

- You have created the recipe.
- The recipe has the following settings:
  - "Synchronizing recipe view and recipe tags" is activated.
  - "Manual transfer of individual modified values (teach-in mode)" is deactivated.

---

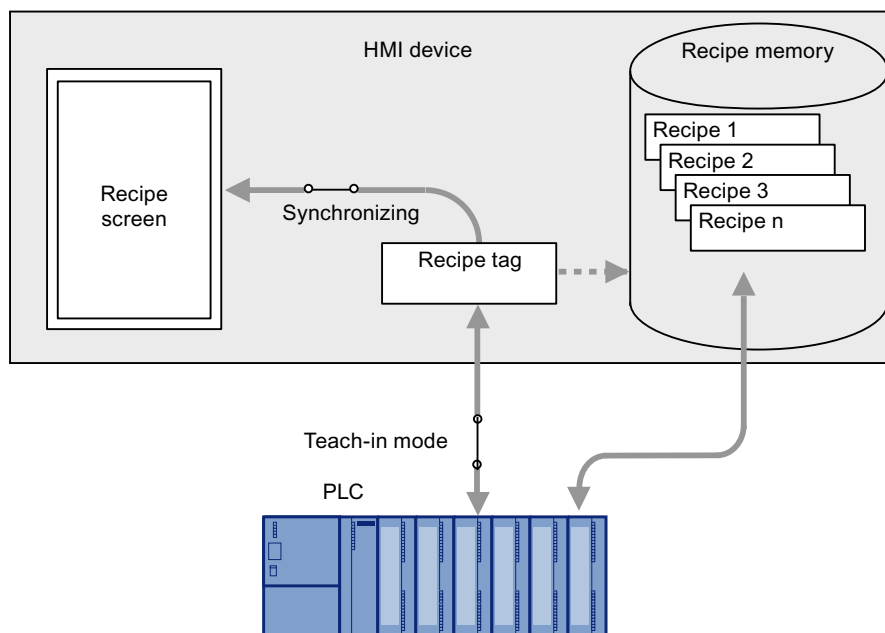

### Note

The changes are immediately transferred to the PLC

---

- There is a recipe screen available.  
There may also be an operating element for saving the recipe data records in the recipe screen.

## Sequence

## Behavior when the recipe view is used

If the recipe view is used, it is not possible to transfer changes immediately. You must use the operating element to transfer the recipe data record to the PLC.

### 10.5.5.5 Scenario for an Automatic Production Sequence

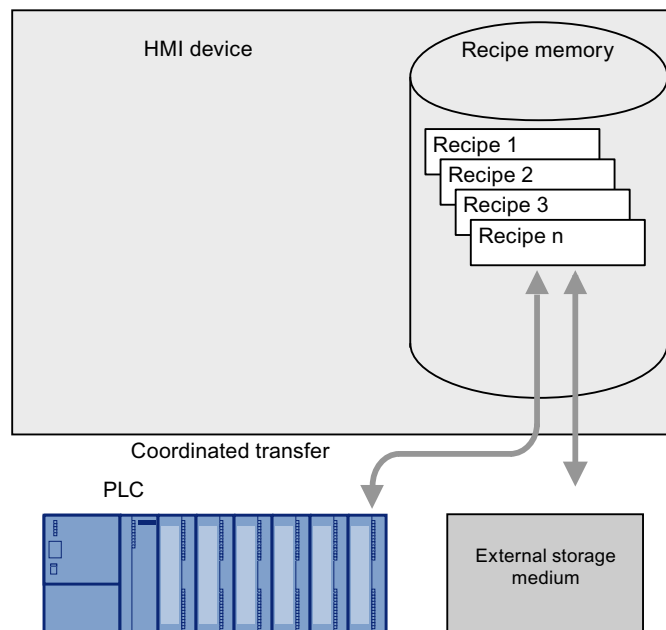

#### Objective

You want production to be executed automatically. The production data is to be transferred directly to the PLC, either from the recipe memory in the HMI device or from an external storage medium. The screen display is not necessary.

#### Requirement

- You have created the recipe.
- The recipe has the following settings:
  - "Coordinated transfer of data records" is activated.  
The production data is transferred to the PLC, so a coordinated transfer with the PLC is necessary to prevent the data from being accidentally overwritten.

#### Sequence

#### Implementation

You can control the flow of data in the following ways:

- The control program controls the automatic transfer via control jobs or via WinCC system functions, if necessary.  
The sequence is controlled via the status information in the mailbox and via return values from the functions used.
- One or more scripts control the automatic transfer via WinCC system functions.  
The sequence can be checked using the values returned by the functions used.

You can implement the automatic production sequence with available system functions:

- "ImportDataRecords"  
This function loads data records from a \*.CSV file into the recipe memory of the HMI device.
- "SetDataRecordToPLC"  
This function transfers a data record from the HMI device's recipe memory to the PLC.

## 10.6 Working with reports

### 10.6.1 Basics

#### 10.6.1.1 Reports

##### Introduction

Reports are used to record process data and processed production cycles. You have the opportunity, for example, to create regular shift reports, output batch data, or record the production process for quality control (QC).

##### Creating reports

A report is created and edited in the "Reports" editor. In this editor, you configure the following report items:

- Formal appearance  
Specify the formal layout of the report in the Inspector window. In this window, for example, you specify the page format, page margins, title page, back page, headers, or footers for the report.
- Content  
In the work area, specify the content of the report, for example, the alarms of a shift. To this purpose you insert the corresponding objects into the report.

The modular structure lets you configure reports that suit all of your applications.

---

##### **Note**

The "Reports" editor is not available at HMI devices that do not support reporting.

---

##### Report output

In runtime, the configured reports are printed on the default printer of the HMI device.

In runtime, report output is event or time-controlled.

- Time-controlled: Automatic print at specific dates, times or intervals.
- Event-driven: Printing is initiated by specific events, e.g. click on a button, or when a limit is exceeded.

Printing reports (Page 3799)

Structure of reports (Page 3792)

Inserting an object (Page 3800)

Printing reports (Page 3815)

Audit report (Page 3815)

### 10.6.1.2 Structure of reports

#### Introduction

A report in WinCC consists of several sections that can be enabled or disabled, as required.

## Sections of a report

The following figure shows an example of the different sections of a report in the "Reports" editor.

## Title page and back page

The title page contains important information about the report content. The back page is used, for example, as Impressum, on which you provide contact information of shift managers or service technicians. The title page and back page are output separately on a single page. Each of them consist of exactly one page and page breaks are not used.

### Detail page

Configure the output of runtime data such as recipe or alarm reports on the detail pages of the report.

Use the shortcut menu on the detail page to insert additional detail pages or change their order.

### Header and footer

The header and footer are output on each detail page of the report. You typically insert the page numbers or the date in the header or footer.

### See also

Reports (Page 3791)

Principles for preparation of reports (Page 3794)

## 10.6.2 Working with reports

### 10.6.2.1 Creating reports

#### Principles for preparation of reports

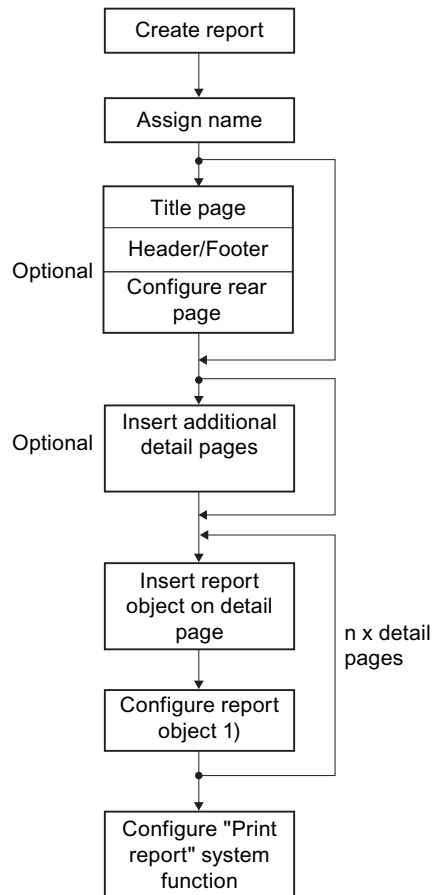

##### Introduction

A report in WinCC consists of several sections that can be enabled or disabled, as required.

- Title page
- Back page
- Detail pages
- Headers and footers for the detail pages

## Procedure

The following figure shows the general procedure for creating a report:

- 1) Settings depend on the report object used.

## Tools for the design of reports

The tools that you can use to design reports are available in the "Tools" task card.

- For *graphic design* insert "basic objects", "elements" and "graphics" in the different sections of the report. For example, for a Logo in the header, separation lines and a page number in the footer.
- Using the "Controls" in the detail pages, configure the *output of runtime data*.

---

### Note

The "Screens" editor provides many objects for designing a report – however, with restricted functionality. Data input properties are not available. The I/O fields in the reports, for example, serve only to output data.

---

### Position and size of objects

Insert the objects at the position where you want them to be output in the report. The objects are output in their configured size and with the following special features:

On the detail pages, configure "recipe reports" or "alarm reports" that serve to output runtime data in tabular format.

- The *width* of the table is set up automatically to fit the width of the detail page. You cannot modify the width.
- WinCC automatically wraps the *height* of the table to fit the data content for output in the report. The table can be continued on the next page.  
In the detail page, WinCC automatically extends tables of dynamic length to the bottom margin.

The following figure shows an example of a detail page in the report and its output in Runtime:

Detail page in the report

Report output in Runtime

### Additional detail pages

Use the shortcut menu on the detail page to insert additional detail pages or change their order.

### See also

Objects in reports (Page 3815)

Structure of reports (Page 3792)

Administration of detail pages (Page 3798)

### Create a report

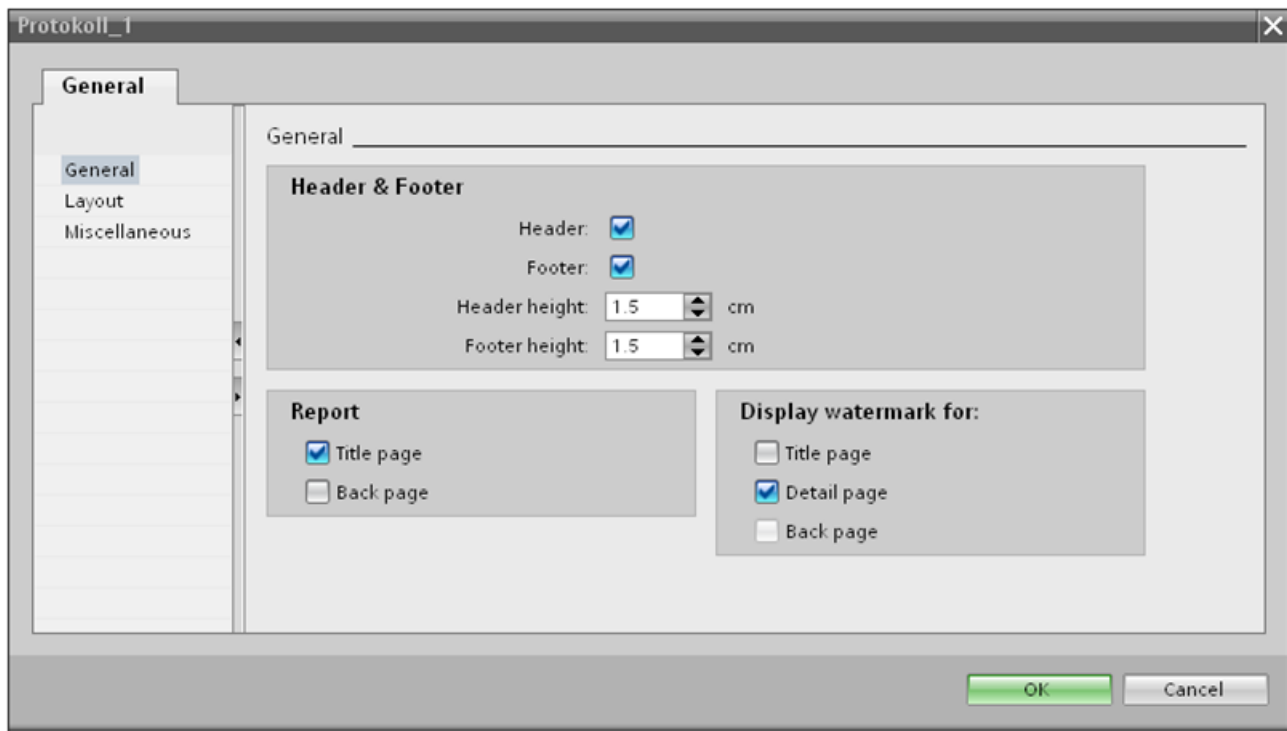

### Requirement

A project with an HMI device is open.

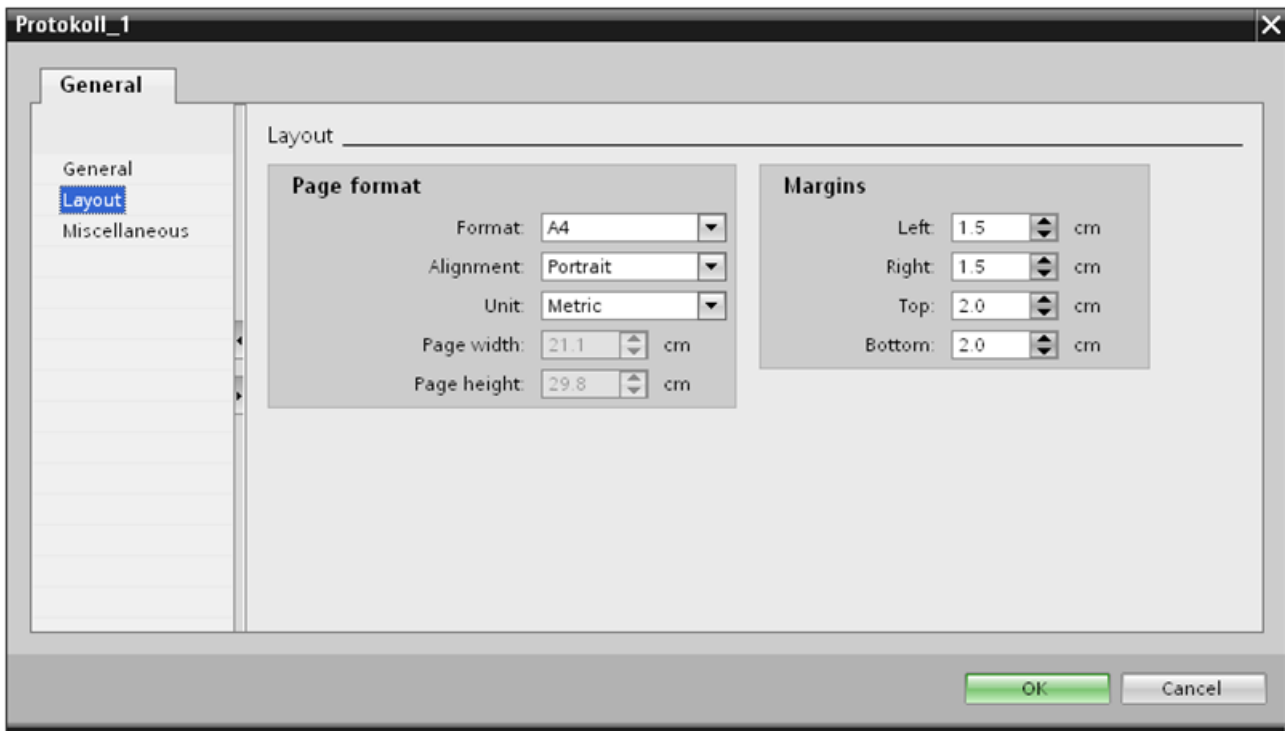

## Procedure

To create a report, proceed as follows:

1. Double-click "Add new report" under "Reports" in the project navigation.  
A new blank report is displayed in the "Reports" editor.
2. Select the "Report properties" command in the shortcut menu of the report.
3. In the "Properties > Properties > General" area of the Inspector window, specify whether you want to configure the "Title page", "Back page", "Header" and "Footer" in the report.  
The report sections are updated accordingly.

4. Configure the format, the page layout, and the page margins of the report under "Properties > Properties > Layout."

5. Enter a meaningful report name under "Properties > Properties > Miscellaneous."
6. Design the report sections as required.  
Drag and drop the necessary basic objects, elements, graphic images and controls from the "Tools" task card to the required position.  
Alternatively, you can also copy or move objects already configured from a screen to the report.
7. Configure the objects in the Inspector window:

## See also

Objects in reports (Page 3815)

## Administration of detail pages

### Adding a detail page

1. Open the shortcut menu of a detail page.
2. Select the command "Pages > Insert page before" or "Pages > Insert page after."  
Depending on the selected command, the new detail page is inserted either before or after the existing detail page.

### Deleting a detail page

1. Open the shortcut menu of the detail page that you want to remove.
2. Select the command "Pages > Delete detail page".  
The detail page is deleted.

### Sorting detail pages

1. Open the shortcut menu of the detail page that you want to move.
2. Select the "Pages > Move one page up" or "Pages > Move one page down" command.  
Depending on the selected command, the detail page is moved either upward or downward.

### Showing and hiding sections

1. To show or hide a specific section, click on the plus or minus sign in the title bar of the section in the working area.
2. If you want to show or hide all sections of a report, select the command "Show all pages" or "Hide all pages" in the report shortcut menu.

### See also

Structure of reports (Page 3792)

Principles for preparation of reports (Page 3794)

## 10.6.2.2 Printing reports

### Introduction

In Runtime, report output is event-driven or time-driven.

### Event-driven output

The report is output after an event was generated.

Examples:

- A tag value changes or exceeds a limit.
- Alarm is incoming, outgoing or acknowledged
- Action by the operator, for example, clicking a button

### Time-driven output

The report is output automatically.

Examples:

- Once at a specified date, e.g. on December 31, 2010
- At intervals, e.g. daily at 8 am, or on Mondays at 6 pm

### Configuration steps

Configuring event-driven output:

- An event is configured on a button or tag with the "PrintReport" system function.

Configuring time-driven output:

- In the scheduled tasks, configure a "Print job" task and assign it to the desired report. In the task properties, specify the time and frequency of report output.

### Output in Runtime

On the control panel of the HMI device, the report is output to the printer that is specified as the default printer.

The default printer enabled for a HMI device can be found in the "Printer list". For further information about the "Printer list", refer to the Internet page of Siemens Customer Support and the Article ID "11376409".

Planning jobs (Page 5224)

Printing reports (Page 3815)

### 10.6.2.3 Working with objects

#### Inserting an object

#### Introduction

In the "Screens" or "Reports" editor, insert the objects to the "Toolbox" task card. Use the mouse to drag the objects into the work area. You either keep the objects in their original size, or scale them up or down when you paste them.

In addition, you can copy or move objects via the clipboard from one editor to another, for example to transfer a screen object to a report. Alternatively, you can also use the mouse instead of the clipboard for copying and moving:

- Copying: <Ctrl + Drag&Drop>
- Moving: Drag&drop

---

#### Note

#### Basic Panels

The "Reports" editor is not available for Basic Panels.

---

## Requirement

The "Tools" task card is open.

## Inserting objects in their standard size

1. In the "Toolbox" task card, select the desired graphic object or the desired graphic in the WinCC graphics folder.  
When you move the cursor across the work area, it turns into a crosshair with an appended object icon.
2. Click the location in the work area where you want to insert the object or graphic.  
The object is inserted with its standard size at the desired position in the work area.

Alternatively, double-click the object in the "Toolbox" task card.

## Copying an object

1. Select the desired object.
2. Select "Copy" in the shortcut menu.
3. Click the desired location and select "Paste" in the shortcut menu.

WinCC inserts a copy of the object at the desired location. You can only change the properties that are appropriate for the relevant context.

Example: In the "Screens" editor, you can set for I/O fields and the mode for input and output. In the "Reports" editor, the mode is set to "Output".

Original and copy are not interconnected and are configured independently from one another.

## Inserting lines

1. Select the desired graphic object in the "Tools" task card.
2. Click on a location in the work area. A line in the standard size is inserted.

## Inserting a polygon or polyline

1. Select the desired object "Polyline" or "Polygon" in the "Tools" task card.
2. Click on a location in the work area. This fixes the starting point of the object.
3. Click another location in the work area. A corner point is set.
4. For every additional corner point, click on the corresponding location in the work area.
5. Double-click on a location in the work area. The last corner point is set.  
This fixes all the points of the polygon or polyline.

---

### Note

#### Basic Panels

The "Polyline" and "Polygon" objects are not available for Basic Panels.

---

---

### Note

If you want to insert several objects of the same type, use the "Stamp" function. This avoids having to reselect the object in the "Tools" task card every time before inserting it. To do so, select the  icon in the toolbar of the "Tools" task card.

---

### See also

Deleting an object (Page 3802)

Inserting multiple objects of the same type (stamping tool) (Page 3803)

Positioning objects (Page 3804)

Resizing objects (Page 3807)

Storing an object in a library (Page 5853)

Inserting a library object (Page 5853)

Moving an object forwards or backwards (Page 3806)

Flipping objects (Page 3814)

Reports (Page 3791)

## Deleting an object

### Introduction

You can delete objects individually or with a multiple selection.

### Requirement

You have opened the work area containing at least one object.

### Procedure

1. Select the object that you want to delete.  
To delete multiple objects, keep the <Shift> key pressed and select the objects to be deleted one after the other. Alternatively, drag and maximize an area around the desired objects with the mouse.
2. Select "Delete" from the shortcut menu.

### Result

The selected objects are deleted.

## Inserting multiple objects of the same type (stamping tool)

### Introduction

WinCC offers the possibility to "stamp" several objects of the same type directly one after the other, i.e. paste without having to reselect the object every time. In addition you have the possibility of multiplying an object that has already been inserted.

### Requirement

The "Tools" task card is open.

### Inserting several objects of one type

1. Select the object that you want to insert in the "Tools" task card.
2. Click the  icon in the toolbar of the "Tools" task card.  
The "Stamp" function is activated.
3. To insert the object with its standard size, click the relevant insertion position in the work area.  
To insert the object with another size, position the mouse pointer at the desired location in the work area. Press the left mouse button and drag the object to the required size.  
The object is inserted in the work area as soon as you release the mouse button.
4. Repeat step 3 to insert further objects of the same type.
5. Click the  icon again.  
The "Stamp" function is deactivated.

---

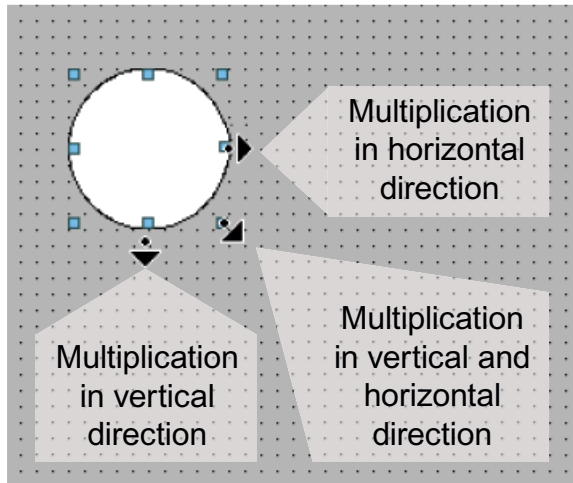

#### Note

You can copy existing objects using the drag-and-drop +<CTRL> function. The existing object is not moved in this case. You paste a copy of this object into the new position instead.

---

### Inserting and multiplying an object

1. Insert the desired object from the "Tools" task card.
2. Press the <Ctrl> key and position the cursor on one of the handles displayed in the figure shown below.

3. Drag the handles to the right and/or down while keeping the left mouse button pressed.
4. The object is multiplied depending on available space if you keep moving the cursor.

### Result

You have pasted and stamped an object in a screen.

### Positioning objects

#### Introduction

When you select an object, it is enclosed by a rectangle with resizing handles. This rectangle is the rectangle which surrounds the object. The position of an object is defined by the coordinates of the top left corner of the rectangle surrounding the object.

### Note

If the position is outside the work area the object is not displayed in Runtime.

---

## Position and align

You have the possibility of having a grid displayed in the work area. You have three options for easier positioning of objects:

- "Snap to grid" When you reposition objects, they are automatically snapped and pasted to the grid. If you hold down the <Alt> key, the object is no longer snapped to the grid.
- "Snap to objects" When you reposition objects, they are displayed with help lines. You can use other objects for orientation during positioning.
- "None": You position the objects in any position.

You activate and deactivate the grid and options as follows:

- In the "Options > Settings > Visualization > Screens" menu
- In the "Layout > Grid" task card

## Requirement

You have opened the work area containing at least one object.

## Procedure

1. Select the object you want to move.  
The selected object is framed by a rectangle with resizing handles.

2. Left-click the object and keep the mouse button pressed.
3. Move the mouse pointer onto the new position.  
The contour of the object moves with the mouse and displays the new position for the object.

The object initially remains at its original position.

4. Now release the mouse button.  
The object is moved into the position indicated by the contour of the selection rectangle.

### Alternative procedure

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the X and Y values for the position under "Position & Size".

### Result

The object appears at its new position.

### See also

Rotating objects (Page 3812)

## Moving an object forwards or backwards

### Introduction

You can use the "Order" functions in the shortcut menu of a selected object or in the toolbar to move a selected object in front of or behind other objects within an object layer.

---

#### Note

ActiveX controls are always positioned in front of an object layer (.NET property).

---

### Requirement

You have opened a screen which contains a layer with multiple objects.

### Procedure

1. Select the object you want to move forward or backward.
2. Select the "Sort" command and one of the following commands from the shortcut menu:

Icon	Description
	Moves the selected object before all the other objects of the same layer
	Moves the selected object to the lowest position in the same layer
	Moves the selected object up by one position
	Moves the selected object down by one position

### Alternative procedure

1. Open the "Layers" palette of the "Layout" task card.
2. Navigate to the required object.

3. Hold down the mouse button, and drag the object in the tree topology to the required position in the layer.
4. Now release the mouse button.

## Result

The object is moved up or down.

## See also

Inserting an object (Page 3800)

## Resizing objects

### Introduction

When you select an object, it is enclosed by a rectangle with handles. You have the following options of resizing an object:

- Drag the handles using the mouse.
- Modify the "Size" property in the Inspector window.

### Requirement

You have opened the work area containing at least one object.

### Procedure

1. Select the object you want to resize.  
The selection rectangle appears. The following figure shows a selected object:

2. Drag a resizing contact of the rectangle to a new position.  
The size of the object changes.
  - The size of the object is aligned to the grid pattern, provided the "Snap to grid" function is set.
  - Press <ALT> to disable this function while you drag the object.  
In order to scale the object proportionally, keep the <Shift> key pressed while changing the size with the mouse.

### Alternative procedure

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the size of the object under "Position & Size".

### Harmonizing the object size

1. Select the objects.
2. Now, click one of the following buttons:  or  or   
The size of the selected objects is matched to each other.

The following screen shows how the selected objects are adapted to the height of the reference object:

Icon	Description
	Aligns the selected objects to the width of the reference object.
	Aligns the selected objects to the height of the reference object.
	Aligns the selected objects to the width and height of the reference object.

### Result

The object now appears with its new size.

### Selecting multiple objects

#### Introduction

Select all objects you want to align with each other or to change global properties. This procedure is called "multiple selection."

The Inspector window shows all the properties of the selected objects.

You now have several options of selecting multiple objects:

- Draw a selection frame around the objects.
- Hold down the <Shift> key, and click the required objects.

### Selection frame of a multiple selection

The selection frame surrounds all objects of a multiple selection. The selection frame is comparable with the rectangle that surrounds an individual object.

The selection frame is not visible. When you have made your multiple selection, the following frame is displayed:

- The reference object is indicated by the rectangle around it.
- The other selected objects are indicated by a dashed-line frame.

### Specifying a reference object

The reference object is the object upon which the other objects are oriented. The reference object is framed by a rectangle with handles. The following figure shows a reference object with two other selected objects:

You have the following options to specify the reference object:

- Select the objects via multiple selection. The object selected first is then the reference object.
- Draw a selection frame around the objects. The reference object compiled automatically. If you wish to specify a different object within the selection as the reference object, click on the desired object. This action does not cancel your multiple selection.

### Requirement

You have opened the work area containing at least two objects.

### Selecting multiple objects with a selection frame

1. Position the mouse pointer in the work area close to one of the objects to be selected.
2. Hold down the mouse button, and draw a selection frame around the objects to be selected.

Or:

1. Hold down the <Shift> key.
  2. Click the relevant objects, working in succession.  
All the selected objects are identified by frames.  
The object selected first is identified as reference object.
- 

**Note**

To remove an object from the multiple selection, press <SHIFT>, hold it down and then click the relevant object once again.

---

**Result**

Multiple objects are selected. One of those is identified as the reference object. You can now perform the following steps:

- Changing the object properties of all the objects
- Resizing all the objects by the same ratio, by dragging the selection frame to increase or reduce the size
- Moving all the objects in one group
- Aligning the objects to the reference object

**Repositioning and resizing multiple objects**

**Possible modifications**

After you have selected multiple objects, you edit them:

- Shift using the mouse
  - To change the absolute position of the marked objects, position the mouse pointer over an object, and shift the multiple selection with the mouse button pressed.
  - To resize all the objects by the same ratio, grab the resizing handles of the reference object.
- Move over the work area with the icons of the toolbar
  - Change the position of the marked objects with respect to each other
  - Align the height and width of the marked objects
- Moving with the shortcut menu commands of the work area
  - Change the position of the marked objects with respect to each other
  - Align the height and width of the marked objects

## Aligning objects

### Procedure

1. Select the objects via multiple selection.
2. Specify an object as the reference object.
3. Select the desired command in the toolbar or the shortcut menu - see table below.  
The selected objects will be aligned.

### Aligning objects flush

The selected objects will be aligned flush to the reference object.

Icon	Description
	Aligns the selected objects to the left edge of the reference object.
	Aligns the selected objects to the vertical center axis of the reference object.
	Aligns the selected objects to the right edge of the reference object.
	Aligns the selected objects to the upper edge of the reference object.
	Aligns the selected objects to the horizontal center axis of the reference object.
	Aligns the selected objects to the lower edge of the reference object.
	Centers the selected objects to the center points of the reference object.
	Centers the selected objects vertically in the screen.

### Snap to object

When you reposition objects, they are displayed with help lines. You can use other objects for orientation during positioning.

If you are working with the keyboard, press the Alt key. When you move the selected object with the arrow keys, the next anchor point is displayed.

### Distributing objects evenly

You need at least three selected objects. A reference object is not required.

1. Select the objects.
2. Click one of the buttons "Distribute horizontally equal" or "Distribute vertically equal".  
The selected objects are distributed at equal distances.

The following screen shows how you align the vertical spacing of the selected objects:

Icon	Description
	Aligns the horizontal distance between the objects. The position of the objects on the extreme left and right side remains unchanged. All other objects are distributed evenly between them.
	Aligns the vertical distance between the objects. The position of the objects at the extreme top and bottom (right and left) remains unchanged. All other objects are distributed evenly between them.

## Rotating objects

### Introduction

You can rotate a suitable object clockwise or counterclockwise around its center axis in steps of 90°.

#### Note

Not all the objects can be rotated. Some objects that can be rotated in screens cannot be rotated in reports.

You can also rotate multiple objects using the multiple selection function. Certain WinCC objects such as buttons cannot be rotated.

The alignment of elements in an object will change in a rotated object. The following figure shows how a rectangle and an ellipse behave under the different commands for rotating an object:

## Requirement

You have opened the work area containing at least one object.

## Procedure

1. Select the object that you want to rotate.
2. Click one of the following toolbar icons:
  - , to rotate the object clockwise around its center point. The angle of rotation is 90°.
  - , to rotate the object counterclockwise around its center point. The angle of rotation is 90°.
  - , to rotate the object clockwise by 180°.

## Result

The object is shown at its new angle.

## Flipping objects

### Introduction

You can flip an object along its vertical or horizontal center axis. The alignment of elements in an object will change when you flip an object. The following figure shows how a rectangle and an ellipse behave under the different commands for flipping an object.

### Requirement

You have opened a screen which contains at least one object.

### Procedure

1. Select the object that you want to flip.
2. Click the "Flip" command in the shortcut menu and select one of the options displayed:
  - , to flip the selected object along its vertical center axis.
  - , to flip the selected object along its horizontal center axis.

### Result

The object is shown at its flipped position.

## 10.6.3 Operation in Runtime

### 10.6.3.1 Printing reports

#### Printing a report in Runtime

If you have configured an object with the "PrintReport" system function, the operator can print out a report in Runtime. To do this, the operator uses the "Print report" button on a screen. The operator can set or change further settings for the report. The report is output to the default printer.

#### See also

Printing reports (Page 3799)

Principles for preparation of reports (Page 3794)

Reports (Page 3791)

## 10.6.4 Objects in reports

### 10.6.4.1 Audit report

#### Application

With the audit report, the content of the audit trail of a HMI device is output as a report.

RecordID	Timestamp	DeltaToUTC	UserID
0	18.11.2007 23:00 ObjectID: Application Description: This is an example description. It may not be cut and will be printed out completely.	-1:00	System

#### Requirements

The "audit report" object is available only if the following requirements are met:

- The HMI device supports a GMP-compliant configuration.
- GMP-compliant configuration is active in the Runtime settings of the HMI device.

Note that operator actions and system operations are only recorded if a corresponding log is configured.

## Layout

In the Inspector window the position, shape, style, color and font types of the object are customized. In particular, the following can be adjusted:

- Visibility of the comment

### 10.6.4.2 Date/time field

#### Application

The "Date/time field" object shows the system time of the HMI device or the date and / or time of a connected tag. The layout depends on the language setting on the HMI device.

## Layout

In the Inspector window, you customize the position, shape, style, color, and font types of the object. In the "Properties > Properties > General" dialog, you can adapt the following properties in particular:

- Long date/time format: This setting defines the format displayed for the data and / or time.
- System time: Specifies whether to use the system time of the HMI device, or the data and / or time of a connected tag.

### Long date/time format

Option	Description
"Enabled"	Date and / or time is fully displayed, for example "Sunday, December 31, 2000 10:59:59 AM"
"Disabled"	Date and / or time is displayed in abbreviated form, e.g. "12/31/2000 10:59:59 AM"

### System time

Option	Description
"Enabled"	The system time of the HMI device is displayed
"Disabled"	The date and / or time of the connected tag is displayed Select a tag of the "DateTime" data type, e.g. an internal tag. Information about data types which are available for connection to other PLCs can be found in the documentation about the respective communication drivers.

### See also

Create a report (Page 3796)

Principles for preparation of reports (Page 3794)

Audit report (Page 3815)

#### 10.6.4.3 I/O field

### Application

The "I/O field" object is used to enter process values.

## Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Display format: Specifies the format in which the values in the I/O field are output.

---

### Note

The "I/O field" object is also available in "Screens" editor. In reports, the object only outputs data. Accordingly only configure the output of data for application in reports.

---

## Display format

The "display format" for the output of values is specified in "Properties > Properties > General > Format", in the Inspector window.

Layout	
"Binary"	Output of values in binary form
"Date" *	Output of date specifications. The format depends on the language setting on the HMI device.
"Date/time" *	Output of date and time specifications. The format depends on the language setting on the HMI device.
"Decimal" *	Output of values in decimal form.
"Hexadecimal"	Output of values in hexadecimal form.
"Time" *	Output of time specifications. The format depends on the language setting on the HMI device.
"Character string"	Output of strings.
*: not in Runtime Professional	

## Avoid overlaps with output fields

If several I/O fields are configured as output fields with a transparent background in a report, these I/O fields may overlap. The transparent part of the one field covers the digits of the other field. This may cause display problems in the report. In order to avoid such overlaps, set the margins of the I/O fields to zero in the object properties under "Properties > Properties > Appearance". Activate "Properties > Properties > Layout > Fit object to contents."

#### 10.6.4.4 Graphic view

##### application

The "Graphic view" object is used to display graphics.

##### Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Graphic: Specifies the graphic file that is displayed in the object.
- Stretch graphic: Specifies the automatic size stretching for objects with graphics.

##### Inserting graphics

The following graphic format is used in the "Graphic view" object: \*.bmp, \*.tif, \*.png, \*.ico, \*.emf, \*.wmf, \*.gif, \*.jpg or \*.jpeg. You may also use graphics as OLE objects in the Graphic view .

1. In the Inspector window, select "Properties > Properties > General":
2. Select the graphic you want to add in the drop-down list under "Graphic".  
The graphic preview is shown in the right pane.
3. Click "Assign" to insert the graphic in the Graphic view .

##### Stretch graphic

Whether a graphic displayed in a Graphic view is stretched to the size of the Graphic view in runtime is specified in the Inspector window.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Select one of the following options from the "Fit to size" area:
  - Fit object size to content
  - Fit content to object size

##### See also

Audit report (Page 3815)

### 10.6.4.5 Graphic I/O field

#### Application

With the "Graphic I/O field" object, the graphics of a graphics list are displayed, depending on the tag value. In the Inspector window, the tag and graphics list are configured, under "Properties > Properties > General":

---

#### Note

The "Graphic I/O field" object is also available in "Screens" editor. In reports, the object only outputs data. Accordingly only configure the output of data for application in reports.

---

#### Layout

Customize settings for color, frame, position and object size in the inspector window. In particular, the "Fit to size" is defined by specifying whether the object is adjusted to the graphics during output in the report or the graphic is adjusted in the object.

#### See also

Create a report (Page 3796)  
Audit report (Page 3815)  
Objects in reports (Page 3815)

### 10.6.4.6 Alarm report

#### Application

Use the "Alarm report" object to output alarms of the selected alarm classes from the alarm buffer or alarm log to the report.

No.	Time	Status	Date		GR	PLC
0	12:00:00 PM	KGQ	1/1/1999	Class name	0	* Device
	normal <i>kursiv</i>	normal				
1	12:00:00 PM	KGQ	1/1/1999	Class name	1	* Device
	normal <b>blinken</b>	normal				
2	12:00:00 PM	KGQ	1/1/1999	Class name	2	* Device
	Message Text					
3	12:00:00 PM	KGQ	1/1/1999	Class name	3	* Device
	normal <b>bold</b>	normal				
4	12:00:00 PM	KGQ	1/1/1999	Class name	4	* Device
	normal <u>underline</u>	normal				

## Layout

In the Inspector window, you customize the position, shape, style, color, and font types of the object. You can adapt the following properties in particular:

- Source
- Alarm classes
- Time range
- Additional settings for the display
- Visible columns

### Specifying the source

Under "Properties > Properties > General > Settings > Source", specify whether to display alarms from the alarm buffer, or from the alarm log. Select the alarm log in the "Alarm log" dialog.

### Specifying alarm classes

Under "Properties > Properties > General > Alarm classes, enable the alarm classes for the alarms output to the report.

### Specifying the time range

If you want to restrict alarm output to a specific time range, select the start and end tags for the time range in the "Properties > Properties > General > Time range" dialog. The tag must be of the "DateTime" type.

### Additional settings for the display

Under "Properties > Properties > General > Settings, specify the following settings for the display in the alarm report:

- Under "Sorting", specify whether to start the display with the oldest or most recent alarm.
- Under "Lines per entry", specify the number of lines to be available for each alarm. The required number of lines depends on the following factors:
  - Number and width of the selected columns for the output
  - Font size used
  - Paper format of the printer
- Select "Visible heading" to enable the display of column headers.
- Select "Display milliseconds" to enable the display of milliseconds for time data.

### Visible columns

Under ""Properties > Properties > Layout > Visible columns", enable the columns to be displayed in the alarm report.

### See also

Create a report (Page 3796)

Principles for preparation of reports (Page 3794)

Audit report (Page 3815)

### 10.6.4.7 Recipe report

#### application

Use the "Recipe report" object to output the elements of recipe data records in the report.

Recipe Number:1 Name:STRUCT_1			
Data record Number:1 Name:DATA_1			
Tag:	Name:	Type:	Value:
Variable_Number_0	Entry_Number_01	ULONG	689874030
Variable_Number_0	Entry_Number_02	LONG	-99253259
Variable_Number_0	Entry_Number_01	INT	-9
Variable_Number_0	Entry_Number_03	UINT	8172
Variable_Flag_05	Entry_Flag_05	BOOL	False
Variable_String_06	Entry_String_06	STRING	WinCC flexible RT
Variable_Date_07	Entry_Date_07	DATETIME	12/30/1899 12:00:00 AM
Variable_Number_0	Entry_Number_08	LONG	6968192
Variable_Number_0	Entry_Number_09	ULONG	9903155
Variable_Flag_10	Entry_Flag_10	BOOL	True

#### Layout

In the Inspector window, you customize the position, shape, style, color, and font types of the object. You can adapt the following properties in particular:

- Recipe
- Data record
- Format
- Visible entries

#### Selecting a recipe

Specify the recipes to be output in the recipe report under "Properties > Properties > General > Recipe". You can define the recipes based on their recipe name, or on a range of recipe numbers. Under "First recipe" and "Last recipe", enter a value or select a tag.

You can also choose to display all recipes.

#### Selecting a data record

Under "Properties > Properties > General > Data record", specify which data records of the selected recipes are to be output in the recipe report. You can define the data records based on the data record name, or on a range of data record numbers. Under "First recipe" and "Last recipe", enter a value or select a tag.

You can also choose to display all data records of the selected recipes.

## Format

In the "Format" field of the "Properties > Properties > Layout > Settings" dialog, specify whether to output the data records as a table in column format or line report format.

WinCC updates the preview in the detail page accordingly.

## Visible entries

Under "Properties > Properties > Layout > Visible entries", enable the columns to be displayed in the recipe report. Select "Show headings" to enable the display of column headers.

## See also

Create a report (Page 3796)

Principles for preparation of reports (Page 3794)

Audit report (Page 3815)

### 10.6.4.8 Page number

#### application

Use the "Page number" object to output the current page number in the report.

#### Layout

In the inspector window, change the settings for color, font, position and object size. In particular, specify "Size adaptation":

#### Fit to size

Under "Properties > Properties > Layout > Fit to size", the "Fit object to content" option is used to specify whether WinCC adjusts to the object size of the field content:

- Enabled "Fit object to contents" option:  
WinCC automatically adjusts the size of the object to the configured format. The font size and field length are defined under "Properties > Properties > General > Text".  
The object can be moved in the working area, however, the size cannot be changed. During report output, the entire field content is output at the time of report output.
- Disabled "Fit object to contents" option:  
Customize the field size by yourself. WinCC does not resize the field for report output. It can be possible that not all content of the field is output in the report. Therefore, configure a field of sufficient size.

## See also

Create a report (Page 3796)

Principles for preparation of reports (Page 3794)

Audit report (Page 3815)

### 10.6.4.9 Symbolic I/O field

#### application

With the "Symbolic I/O field" object, the content of a text list in reports is displayed, depending on the tag value. In the inspector window, the tag and text list is configured under "Properties > Properties > General":

#### Layout

In the inspector window, change the settings for color, frame, font, position and object size. In particular, the "Fit to size" is defined, by specifying whether the object size is adjusted to the text during output in the report or not.

---

#### Note

The "Symbolic I/O field" object is also available in "Screens" editor. In reports, the object only outputs data. Accordingly only configure the output of data for application in reports.

---

## See also

Create a report (Page 3796)

Principles for preparation of reports (Page 3794)

Audit report (Page 3815)

### 10.6.4.10 Text field

#### Application

The "Text field" is a closed object which you can fill with a color.

## Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Text: Specifies the text for the text field.
- Size of text field: Defines whether the size of the object is adapted to the space required by the largest list entry.

## Text

Specify the text for the text field in the Inspector window.

1. In the Inspector window, select "Properties > Properties > General".
2. Enter a text.  
For texts over several lines you can set a line break by pressing the key combination <Shift + Enter>.

## Size of text field

In the Inspector window, you can define whether the size of the object is adapted to the space required by the largest list entry.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Activate "Resize > Fit to contents".

## See also

Audit report (Page 3815)

## 10.7 Configuring user administration

### 10.7.1 Field of application of the user administration

#### Principle

The access protection controls access to data and functions in Runtime. This feature protects your applications against unauthorized operation. Safety-related operations are already limited to specific user groups when a project is being created. To this purpose you set up users and user groups that you equip with characteristic access rights, so-called authorizations. You then configure the authorizations required for operation of safety-related objects. Operators only have access, for example, to specific operator controls. Commissioners, for example, have unlimited access in Runtime.

## Definition

You administer users, user groups and authorizations centrally in the user administration of WinCC. You transfer users and user groups together with the project to the HMI device. The users and passwords are managed on the HMI device in the User view.

## Application example

You configure the "Service" authorization so that only service technicians have access to the configuration parameters. You assign the authorization to the "Service technician" user group. This allows all members of this group to set the protected configuration parameters.

### NOTICE

Access protection does not protect against incorrect operations. It is your job to ensure that only authorized personnel with appropriate training will design, commission, operate and maintain plants and machines.

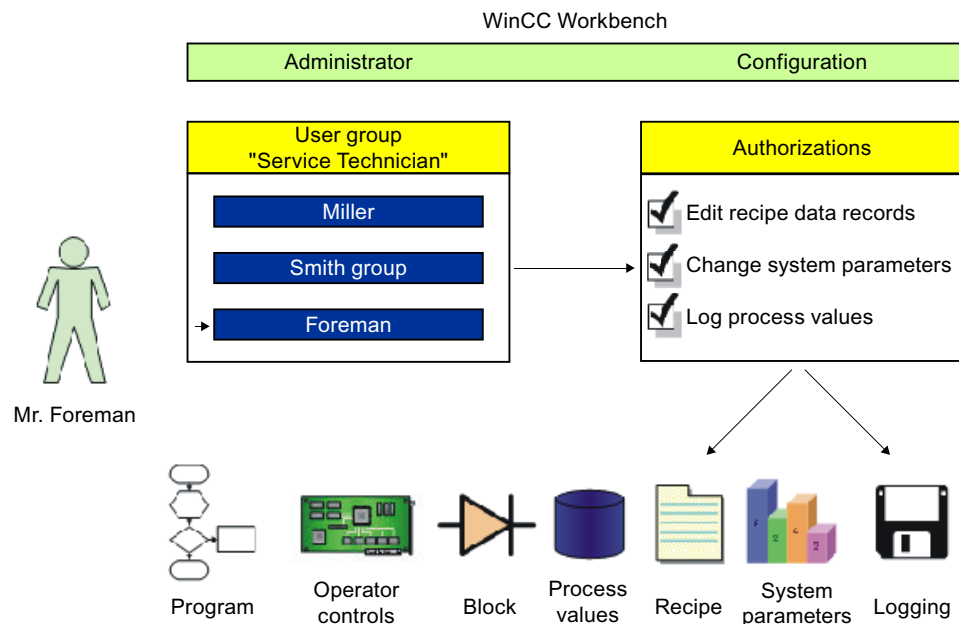

Access protection is not suitable for defining work routines and monitoring their observance.

## 10.7.2 Form of the user administration

### Introduction

In case of a project in manufacturing engineering, the environment at the equipment manufacturer has to be differentiated from the environment at the end customer as plant operator.

The equipment manufacturer allows users, for example Mr. Foreman, a specific access within the application or HMI device. However, a user Foreman does not exist at the end customer. The machine manufacturer cannot know the end users and the tasks they have to perform for configuration. The final users are usually set after commissioning at the end customer.

## Principle

To minimize the work required for management, authorizations are assigned via user groups and not directly to individual users.

A user group assembles configured authorizations according to common jobs. For example, all permissions required for a service job are collected in a "Service technician" group. When you create a user who should be responsible for servicing, you simply assign him to the "Service technician" group.

The user view enables user administration in Runtime. Use user view to create, delete and assign an authorization to users in Runtime.

The user administration separates the administration of the users from the configuration of the authorizations. This ensures flexibility at the access protection.

Defaults can be set for the user administration during the configuration phase in the Engineering System.

## 10.7.3 Basics

### 10.7.3.1 Users

#### Introduction

You can create users in the "Users" tab of the "User administration" editor and assign them to user groups. The "Users" tab is part of the user administration in WinCC.

## Open

To open the "Users" tab, double-click "User administration" in the project window.

## Work area

The users are managed in the work area:

- You create or delete users.
- You assign users to user groups.

---

### Note

You can assign a user to exactly one user group.

---

## Inspector window

When you select a user, you can change the password in the "General" group. Under "Automatic logoff" you can specify if the user is to be automatically logged off by the HMI device when there is no operator activity after the specified time.

### 10.7.3.2 Users work area

#### Introduction

The "Users" work area lists the users and user groups in table form. You administrate the users and assign them to a user group.

#### Principle

The work area consists of the "Users" and "Groups" tables.

Users								
	Name	Dynamic logon	User ID	Password	Automatic logoff	Logoff time	Web start screen	Web language
	Administrator	<input type="checkbox"/>	1	*****	<input checked="" type="checkbox"/>	5		English (US)
	<Add new>							

Groups						
	Member of	Name	Web start screen	Web language	Web access f...	Comment
	<input checked="" type="radio"/>	Administrator group		English (USA)	<input type="checkbox"/>	The 'Ad...
	<input type="radio"/>	Users		English (USA)	<input type="checkbox"/>	The 'Users'
	<Add new>	<input type="text"/>				

The "Users" table shows the existing users. When you select a user in this table, the "Groups" table shows the user group to which the user belongs.

---

**Note**

For the user "Administrator", the default password is "administrator". For security reasons, you should change the password of this user.

---

### 10.7.3.3 User groups

#### Introduction

You can create users and authorizations in the "User groups" tab of the "User Administration" editor. The "User groups" tab is part of the user administration in WinCC.

#### Open

Double-click the "User administration" in the project window. Open the "User groups" tab.

#### Work area

The user groups and authorizations are managed in the work area:

- You create new user groups and authorizations or delete them.
- You assign the authorizations to the user groups.

#### Inspector window

When a user group or an authorization is selected, you can edit the name in the "General" group. You can also enter a brief description in the "Comment" group.

### 10.7.3.4 User groups work area

#### Introduction

The "User groups" work area shows a table of the groups and their authorizations. You administer the user groups and assign authorizations to them.

## Principle

The work area consists of the "Groups" and "Authorizations" tables.

Groups					
	Name	Number	Display name	Password aging	Comment
	Administrator group	1	Administrator group	<input type="checkbox"/>	The 'Administrator' group is i..
	Users	2	Users	<input type="checkbox"/>	The 'Users' group is initially g..
	<Add new>				
Authorizations					
	Active	Name	Number	Comment	
	<input checked="" type="checkbox"/>	User administration	1	Authorize 'User administratio..	
	<input checked="" type="checkbox"/>	Monitor	2	'Monitor' authorization.	
	<input checked="" type="checkbox"/>	Operate	3	'Operate' authorization.	
		<Add new>			

The "Groups" table shows the existing user groups. When you select a user group in this table, the "Active" column of the "Authorizations" table shows the authorizations which were assigned to the user group.

The number of the user group and of the authorization is assigned by the user administration. The designations and descriptions are assigned by you.

The number of predefined authorizations are fixed. Authorizations that you create can be freely edited. Ensure that the assigned numbers are unique.

### 10.7.3.5 Settings for the user administration

#### Introduction

In the "Runtime settings > User administration" editor, configure the security settings for users and their passwords in runtime.

#### Open

Double-click the "Runtime settings" editor in the project window. Click "User administration".

## Work area

You carry out the settings for the validity of passwords in runtime in the work area. You determine the complexity of the password, for example.

## Effects in Runtime

The security settings have the following effects in runtime, depending on the configuration.

- "General" group
  - "Enable limit for logon attempts" check box selected  
The number entered in the "Number of incorrect logon attempts" box defines the number of logon attempts a user is allowed before being assigned to the "Unauthorized" group.  
"Enable limit for logon attempts" check box not selected  
The user has an unlimited number of logon attempts in runtime.
  - "Number of incorrect logon attempts" field  
If you enter "4" in the field, for example, and the fourth logon attempt fails, the user is automatically assigned to the "Unauthorized" group.  
You can specify 1 to 9 attempts.
  - "Logon only with password" check box  
When the check box is selected, the user will be authenticated by the password. The user name is not required.  
To match users to passwords, you cannot configure passwords more than once.
- "Hierarchy level" group
  - "Group-specific rights for user administration" check box  
When this check box is selected, administrators only manage users whose group number is less than or equal to their own.  
For example, an administrator whose group number is 5 can only manage users whose group number is less than or equal to 5. This means that the administrator can assign users only to groups with a group number less than or equal to 5.

- "Password" group
  - "Enable password aging" checkbox selected  
The password expires after the number of days set in the "Validity of the password (days)" field.  
The "Password aging" column is selected in the "User groups" editor. This enables you to specify group-by-group, if the passwords should expire or if the password generations should be saved. Passwords never expire for groups for which password aging is not enabled.
  - "Prewarning time (days)" field  
The user is informed that the password will expire the specified number of days before the password expires.
  - "Password generations" field  
If the user changes the password, the new password must be different from the specified number of previous passwords. The number of password generations ranges from 1 to 5.
- "Password complexity" group
  - "Must include special characters" check box selected  
The user must enter a password containing at least one special character at any position.
  - "Must include number" check box selected  
The user must enter a password containing at least one number at any position.
  - "Minimum password length" field  
The user must enter a password with a minimum length, as specified in the "Minimum password length" field.  
The minimum length of the password is 3 characters.

### 10.7.3.6 Settings for the user administration

#### Introduction

In the "Runtime settings > User administration" editor, configure the security settings for users and their passwords in runtime.

#### Open

Double-click the "Runtime settings" editor in the project window. Click "User administration".

#### Work area

You carry out the settings for the validity of passwords in runtime in the work area. You determine the complexity of the password, for example.

## Effects in Runtime

The security settings have the following effects in runtime, depending on the configuration.

- "General" group
  - "Change initial password" check box selected  
The user must change the administrator-assigned password when logging on for the first time.
  - "Change logoff time" checkbox selected  
Simple user rights are sufficient for changing the logoff time.  
The logoff time is the period after which the user administration automatically logs off a user when no operator activity is detected in the system.  
The logoff time for the SIMATIC Logon user corresponds to the logoff time of the default user "Administrator".  
Any user changes of the logoff time are logged in the Audit Trail.
  - "Enable limit for logon attempts" check box selected  
The number entered in the "Number of incorrect logon attempts" box defines the number of logon attempts a user is allowed before being assigned to the "Unauthorized" group.  
"Enable limit for logon attempts" check box not selected  
The user has an unlimited number of logon attempts in runtime.
  - "Number of incorrect logon attempts" field  
If you enter "4" in the field, for example, and the fourth logon attempt fails, the user is automatically assigned to the "Unauthorized" group.  
You can specify 1 to 9 attempts.
  - "Logon only with password" check box  
When the check box is selected, the user will be authenticated by the password. The user name is not required.  
To match users to passwords, you cannot configure passwords more than once.
- "Hierarchy level" group
  - "Group-specific rights for user administration" check box  
When this check box is selected, administrators only manage users whose group number is less than or equal to their own.  
For example, an administrator whose group number is 5 can only manage users whose group number is less than or equal to 5. This means that the administrator can assign users only to groups with a group number less than or equal to 5.

- "Password" group
  - "Enable password aging" checkbox selected  
The password expires after the number of days set in the "Validity of the password (days)" field.  
The "Password aging" column is selected in the "User groups" editor. This enables you to specify group-by-group, if the passwords should expire or if the password generations should be saved. Passwords never expire for groups for which password aging is not enabled.
  - "Prewarning time (days)" field  
The user is informed that the password will expire the specified number of days before the password expires.
  - "Password generations" field  
If the user changes the password, the new password must be different from the specified number of previous passwords. The number of password generations ranges from 1 to 5.
- "Password complexity" group
  - "Must include special characters" check box selected  
The user must enter a password containing at least one special character at any position.
  - "Must include number" check box selected  
The user must enter a password containing at least one number at any position.
  - "Minimum password length" field  
The user must enter a password with a minimum length, as specified in the "Minimum password length" field.  
The minimum length of the password is 3 characters.
- "SIMATIC Logon" group
  - "Activate SIMATIC Logon" check box selected  
A connection is established to the server. Authorization is performed via SIMATIC Logon.
  - "Encrypted transfer" checkbox selected  
The data is encrypted before it is transferred to the server.

## 10.7.4 Building up and structuring a user administration

### 10.7.4.1 Basics of user administration

#### Principle

This section addresses four target groups. The topics are organized correspondingly. The target groups serve as examples for different groups of persons who use the user administration.

1. Administrator OEM
2. Administrator RT

3. Planners

4. Operator

As Administrator OEM you create the user groups, users and authorizations for Runtime in the Engineering System of, for example, an equipment manufacturer.

As Administrator RT you administer users in Runtime by means of the "User view."

As the project engineer you assign the authorizations to the user groups in the Engineering System. In addition, you configure the authorizations for objects.

As Operator you log on in runtime. You can only access a protected object if you have the required authorization.

---

**Note**

The Administrator RT target group already exists in the Runtime user administration as the predefined user group "Administrator group." For a better understanding the predefined user groups and authorizations are not used below.

---

## 10.7.4.2 Administering users for Runtime

### Creating an authorization

#### Introduction

You create an authorization and assign it to one or more user groups.

#### Requirements

The "User groups" work area is open.

#### Procedure

1. Double-click "Add" in the "Authorizations" table.
2. Enter "Stop runtime" as the name of the authorization.
3. Enter a brief description as the "Comment".

#### See also

Creating a user group (Page 3837)

## Creating a user group

### Introduction

User groups are created so that you do not have to assign an authorization to every single user. You create a user group, assign authorizations and then assign users to it.

---

**Note**

The name of the user group has to be unique within the project. Otherwise the input is not accepted.

---

---

**Note****Using SIMATIC Logon**

Ensure that the names of the user groups in Windows and WinCC are identical.

---

### Requirements

The "User groups" work area is open.

### Procedure

1. Double-click "Add" in the "Groups" table.
2. Enter "Operators" as the "Name" of the user group.
3. Change the "Number" of the user group as required.
4. Enter "Display name" of the "Operators" user group.
5. Enter a brief description as the "Comment".

In runtime, the user view shows the display name of the user group. The display name of the user group depends on the language. You can specify the name in several languages and switch between languages in runtime.

### See also

Creating an authorization (Page 3836)

Example: Configuring a button with logon dialog box (Page 3858)

Example: Logging the logon and logoff events (Page 3859)

## Assigning an authorization

### Introduction

When you allocate an authorization to a user group, all assigned users have this authorization.

### Requirements

- A "Stop runtime" authorization has been created.
- An "Operators" user group has been created.
- The "User groups" work area is open.

### Procedure

1. Click on the "Operators" user group in the "Groups" table. The "Authorizations" table shows all authorizations.
2. Enable the "Stop runtime" authorization in the "Authorizations" table.

---

#### Note

The "Stop runtime" authorization is only a designation and does not have any relation to the function "StopRuntime". You have to establish this relation yourself. To do so, configure the "StopRuntime" system functions at a button and select "Stop runtime" as the "Authorization".

---

## Creating users

### Introduction

You create a user so that users can log on with their user names in runtime after loading to the device.

As an alternative, you can create and change users by means of the "User view" in Runtime.

In order for a created user to have authorizations you have to assign him to a user group and allocate authorizations to the user group.

The logon is successful when the user name entered during the logon matches a user in Runtime. In addition, the entered password must agree with the stored password of the user.

---

#### Note

Note that the entry is case-sensitive.

---

### Requirements

The "Users" work area is open.

## Procedure

1. Double-click "Add" in the "Users" table.
2. Enter "Foreman" as the user name.

---

**Note**

The user name must be unique within the project. Otherwise the input is not accepted.

---

---

**Note**

Do not use special characters such as / " § \$ % ? when you enter a user name and a password. ' &.

---

3. Click the  button in the "Password" column. A dialog box for entering the password is displayed.
4. Enter the password of the user.
5. To confirm the password enter it a second time in the lower field.
6. Close the dialog box using the  icon.
7. If a user is to be logged off after a specific time period, activate "Automatic logoff".
8. Click in the "Logoff time" column. The preset value for "Logoff time" is 5 minutes.
9. Enter a brief description as the "Comment".

## Assigning a user to a user group

### Introduction

When you assign a user to a user group, the user has the authorizations of the user group.

---

**Note**

You have to assign a user to exactly one user group. The assignment is checked during the consistency check and generation of the project.

---

### Requirements

- The user "Foreman" has been created.
- An "Operators" user group has been created.
- The "Users" work area is open.

## Procedure

1. Click on the "Foreman" user in the "Users" table. The "Groups" table shows all user groups.
2. Activate the "Operators" user group in the "Groups" table.

## Managing users

### Introduction

In the work area, you can administer users and assign them to user groups.

### Requirements

The "Users" work area is open.

### Changing the user name

1. In the "Users" table, double-click the field in the "Name" column to change the user name.
2. Change the user name.
3. Confirm your entry with <Return>.

Alternatively, select the user in the work area. Change the user name under "Properties > Properties > General" in the Inspector window.

### Changing the password of the user

1. Click the  button in the "Password" column of the "Users" table. A dialog for entering the password opens.
2. In the "Enter password" field, enter the new password.
3. Reenter the new password in the "Confirm password" field.
4. Confirm your entry with <Return>.

Alternatively, select the user in the work area. Change the password under "Properties > Properties > General" in the Inspector window.

### Displaying invisible columns

1. Position the mouse cursor on the title of the "Users" table.
2. Right-click to open the shortcut menu and enable the display of the "Logoff time" column, for example.

### Changing the logoff time of the user

1. In the "Users" area, double-click on the field in the "Logoff time" column to change the logoff time.
2. Change the logoff time.
3. Confirm your entry with <Return>.

Alternatively, select the user in the work area. Change the logoff time under "Properties > Properties > Automatic logoff" in the Inspector window.

### Deleting a user

1. Select the line of the user to be deleted.
2. Open the shortcut menu with the right mouse button and select the "Delete" command.

---

**Note**

Predefined users cannot be deleted.

---

### Managing user groups

#### Introduction

In the workplace you administer user groups and assign authorizations for use in runtime.

#### Requirements

The "User groups" work area is open.

### Changing the name of the user group

1. In the "Groups" table, double-click the field in the "Name" column to change the name of the user group.
2. Change the name of the user group.
3. Confirm your entry with <Return>.

Alternatively, select the user group in the work area. Change the name under "Properties > Properties > General" in the Inspector window.

---

**Note**

Predefined user groups cannot be deleted.

---

### Displaying invisible columns

1. Position the mouse cursor on the title of the "Users" table.
2. Right-click to open the shortcut menu and enable the display of the "Display name" column, for example.

### Changing the displayed name of the user group

1. In the "Groups" table, double-click the field in the "Display name" column to change the display name of the user group.
2. Change the displayed name of the user group.
3. Confirm your entry with <Return>.

Alternatively, select the user group in the work area. Change the display name under "Properties > Properties > General" in the Inspector window.

### Deleting a user group

1. Mark the line of the user group to be deleted.
2. Open the shortcut menu with the right mouse button and select the "Delete" command.

---

#### Note

Predefined user groups cannot be deleted.

---

### Changing the name of the authorization

1. In the "Authorizations" table, double-click the field in the "Name" column to change the name of the authorization.
2. Change the name of the authorization.
3. Confirm your entry with <Return>.

Alternatively, select the authorization in the work area. Change the name under "Properties > Properties > General" in the Inspector window.

### Deleting authorizations

1. Mark the line of the authorization to be deleted.
2. Open the shortcut menu with the right mouse button and select the "Delete" command.

---

#### Note

Predefined authorizations cannot be deleted.

---

### 10.7.4.3 Managing users on the server

#### Central user administration using SIMATIC Logon

##### Introduction

To manage users and user groups for several applications or HMI devices, activate SIMATIC Logon.

##### Principle

SIMATIC Logon is a tool for system-wide user administration. If you use SIMATIC Logon, the users are centrally managed outside the application or HMI device.

You configure the user groups and their permissions as you usually do with the local user administration in WinCC. You assign identical names to the user groups on the server and in WinCC. Authorizations are assigned in runtime to a user group when the names are identical.

You do not have to create users in WinCC because they are taken dynamically from Windows user management during the logon process. The application or HMI device forwards each logon or password change to SIMATIC Logon for processing.

---

**Note**

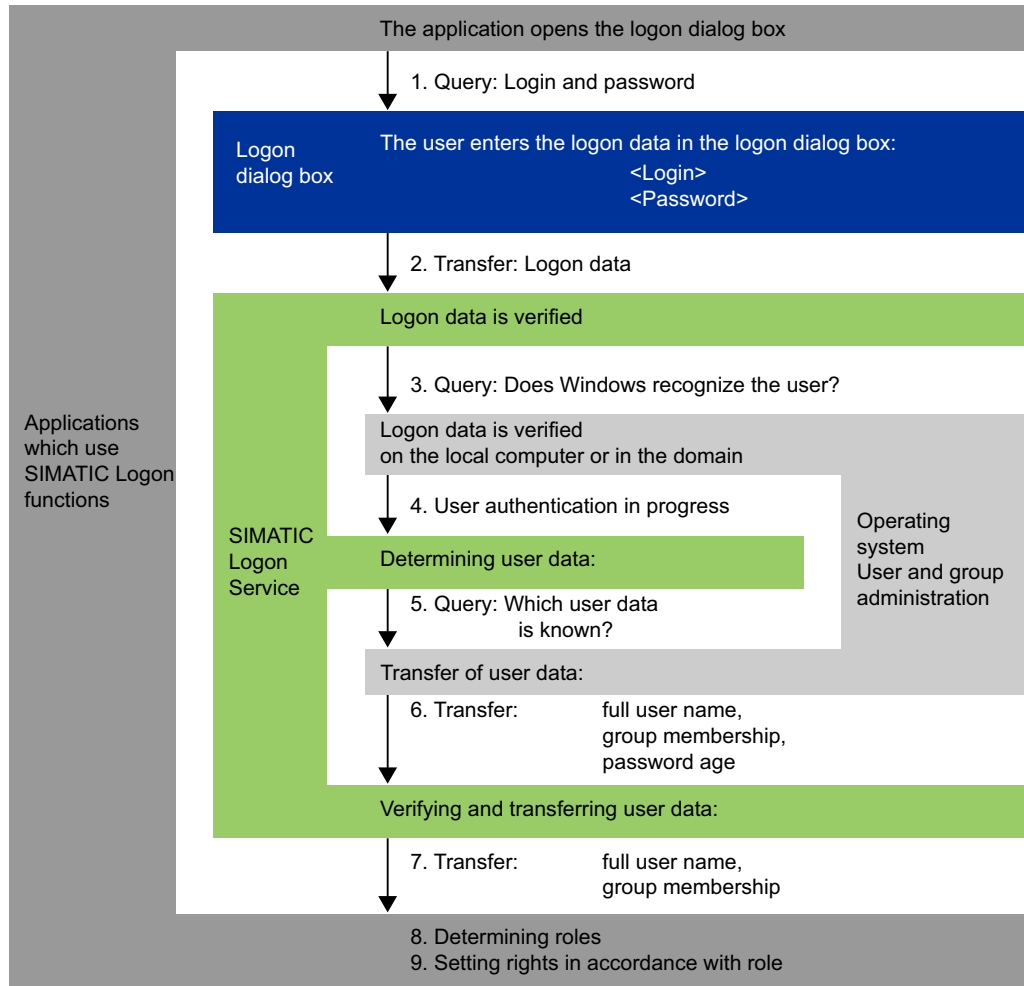

SIMATIC Logon is a product requiring a license. For more information on SIMATIC Logon go to <http://support.automation.siemens.com>.

Enter the ID "34519648" in the search field and start searching. The "SIMATIC Logon - Electronic Signature" manual is available to download.

---

### Log on process via SIMATIC Logon Service

The following diagram illustrates the process that runs automatically when a user logs onto Runtime.

Results: The user can implement the role functions.

### Making settings on the server

#### Introduction

Perform the following steps on your sever to ensure correct operation of SIMATIC Logon.

#### Procedure

1. Install SIMATIC Logon Services.
2. Create the user group in the user administration of the operating system.

3. Create the users in the user administration of the operating system.

---

**Note**

Users of SIMATIC Logon must be members of a user group of the operating system. Members of a subgroup cannot be logged on.

---

4. Assign the new users to a group.
5. Transfer the licenses for each HMI device on the server.

---

**Note**

You can find more detailed information in the documentation supplied with SIMATIC Logon.

---

---

**Note**

The password policies stored on the server are valid if users are authorized by means of SIMATIC Logon.

---

---

**Note**

You can configure the logoff time of the SIMATIC Logon user with "Configure SIMATIC Logon" on the server.

---

## Logging on using SIMATIC Logon

### Requirements

- User administration exists.
- The groups created in WinCC agree with the Windows groups on the server.
- There is a server with SIMATIC Logon Service installed.

---

**Note**

A user may only be a member of one user group in WinCC. When a user is a member of several user groups on the server, only one of these user groups can be made known in WinCC.

"Administrators" and "Users" are predefined groups in both Windows and WinCC. Any new user created in Windows is automatically a member of the "Users" group. A user will be a member of two groups if assigned to a new group, for example, to the "SL user" group.

Remove this user from the "Users" group of the operating system to enable logon of this user using SIMATIC Logon.

A system message in runtime always confirms the successful logon of a user on the server.

---

---

**Note**

When you use SIMATIC Logon to manage access to a panel or a device with WinCC Runtime Advanced, you must note that the characters '/' and '\' cannot be used in the names of Windows user groups or Windows users.

---

**Procedure**

1. Open the "Runtime settings > User administration" editor in the Project window.
2. Select "Enable SIMATIC Logon".
3. Select "Windows domain" or "Windows computer", depending on where you administer your users.
4. Enter the name or IP address of the SIMATIC Logon server in the "Server name" text box.

---

**Note**

Make sure your SIMATIC Logon Server always has the same IP address if you use IP addresses.

---

5. Enter the port number for TCP/IP communication in the "Port number" text box. The valid range of values lies between 1024 and 49151. The preset port number is "16389" and used by SIMATIC Logon as the default.
6. Enter the Windows domain or the logon server with the user data in the "Windows domain" text box.  
Enter the name of the sever to access users on the logon server.  
Enter the name of the domain if the logon sever is in a domain and you wish to access users of the domain.

---

**Note**

Local Windows users are not accepted when the logon server is in a domain.

---

7. Activate the "Encrypted transfer" check box in order to encrypt the data before sending it to the server.

**Emergency user**

If the server cannot be accessed, all local users that were created in WinCC user administration can also be used as emergency users.

Emergency users have the rights of the user group to which they were assigned.

---

**Note**

For additional information, refer to the included SIMATIC Logon documentation.

This documentation is available at: [SIMATIC Logon installation directory] \manuals

---

#### 10.7.4.4 Administering users in Runtime

##### Users in runtime

##### Principle

You create users and user groups and assign authorizations to them. You configure objects with authorizations. After download to the HMI device, all objects which were configured with an authorization are protected against unauthorized access in Runtime.

##### User view

When you configure a user view in the Engineering System, you administer users in this user view following download to the HMI device.

NOTICE
Changes in the user view are effective immediately in Runtime. Changes in runtime are not updated in the engineering system. When downloading the user administration to the HMI device, all changes in the user view are overwritten after a security prompt and based on the settings.

Users who have a "User administration" authorization have unlimited access to the user view. This allows them to administer all users. Any other user has only limited access to the user view for self administration.

##### See also

User view (Page 3847)

##### User view

##### Purpose

You configure a user view in the engineering system to also administer the users in Runtime.

##### Structure

The user view shows the following in each line:

- The user
- The encrypted password
- The corresponding user group
- The logoff time

If no user is logged on, the user view is empty. The content of the individual fields is displayed after logon.

### User view of an administrator

User	Password	Group	Logoff time	
Administrator	*****	Admini...	5	▲
Meier	*****	Inbetri...	5	
Meister	*****	Bediener	5	
Mueller	*****	Progra...	5	▼
◀       ▶				

When an administrator is logged on, the user view shows all the users. The administrator changes the user name and the password. The administrator creates new users and assigns them to an existing user group.

### User view of a user

Benutzer	Kenwort	Gruppe	Abmeldezeit
Mueller	*****	Progra...	5
◀       ▶			

When no administrator is logged on, the user view shows only the logged-on user. Users can change their own passwords and logoff time.

### See also

Users in runtime (Page 3847)

### Configuring a user view

#### Introduction

You configure a user view in the Engineering System to also administer users in Runtime.

#### Requirements

A screen has been created.

## Procedure

1. Select the "User view" object from the "Controls" category in the toolbox.
2. Drag-and-drop the "User view" object into the screen.
3. Click on "Properties > Properties" in the Inspector window.
4. Specify the appearance of the "User view".
5. You can, for example, select "Display mode > Fit to size > Fit object to contents".

## Result

You have created a user view in the screen.

## Creating users

### Introduction

You create a user so that users can log on under their user name in runtime.

As an alternative, you can create users in the engineering system and download them to the HMI device.

The logon is successful only when the user name entered during the logon matches a user in runtime. In addition, the password entered at logon has to match that of the user.

---

#### Note

Note that the entry is case-sensitive.

---

---

#### Note

Do not use special characters such as / " \$ % ? when you enter a user name and a password. ' &.

---

You assign the user to a user group. The user then has the authorizations of the user group.

---

#### Note

Runtime users must be assigned to a user group. The user group is created in the engineering system. The designation of the user group is language-dependent.

---

## Requirements

- The user view is open.
- A "Group 2" user group has been created.

**Procedure**

1. Click "<New User>" in the user view. A dialog opens.
2. Enter "Foreman" as the user name.
3. Press the <Return> button.
4. Click "Password."
5. Enter the password of the user.
6. Press the <Return> button. The password is hidden.
7. Click in the "Group" column.
8. Select "Group 2" as the "Group".

User	Password	Group	Logoff time
Administrator	*****	Administ..	5
Johnson	*****	Administ..	5
Meister	*****	Group 2 ▾	5
PLC User	*****	Unautho...	5

9. Press the <Return> button.
10. Click in the "Logoff time" column.
11. Enter the time after which the user is logged off automatically.

**Managing users in the user view**

**Introduction**

If you have configured a user view in the engineering system, the users and user groups can be managed in runtime.

**NOTICE**

Changes in the user view are effective immediately in runtime. Changes in runtime are not updated in the engineering system. When downloading the user administration to the HMI device, all changes in the user view are overwritten after a security prompt and based on the settings.

**Requirements**

- Runtime is enabled.
- A complex user view has been created.

- The screen with the user view is open.
- You have the default "User administration" authorization.

---

**Note**

If you do not have a "User administration" authorization, you can only change your own password and your logoff time.

---

### Changing the user name

1. Enter a new user name in the "Users" column in the user display.
2. Confirm your entry with <Return>.

---

**Note**

The user can then no longer log on with his previous password in runtime. If you delete the name and press <Return>, the user is deleted.

---

### Changing the password of the user

Availability of complex user display in selected devices only.

1. Enter a new password in the "Password" column in the user display.
2. Confirm your entry with <Return>.

---

**Note**

The user can then no longer log on with his previous password in runtime.

If you delete the password in the complex user view and press <Return>, the user will be deleted.

---

### Changing the logoff time of the user

1. Enter a new logoff time in the "Logoff time" column in the user display.
2. Confirm your entry with <Return>.

### Deleting a user

1. Click the name of the user to be deleted.
2. Delete the name.
3. Press the <Return> button.

---

**Note**

The user can no longer log on in runtime.

---

### Assigning a user to a different user group

1. Activate the user group field for the corresponding user.
2. Select a user group.
3. Confirm your selection with <Return>.

### Unlock locked out users

#### Unlock locked out users

The check box "Activate limit for login attempts" is activated in the "Runtime settings > User administration".

The number 3 is entered in the field "Number of invalid login attempts".

If users have three failed attempts at login, e.g. by entering an incorrect password, they are assigned to the "Unauthorized" group. The user loses all authorizations. The user can still log on, but no longer has any authorizations. Only a user with administrator rights re-assigns the unauthorized user to a user group.

### Exporting the user administration

#### Introduction

The users and user groups are transferred to the HMI device from the Engineering System. If you have configured a user view, you can administer the users at the HMI device via the user view.

If a user has access to several HMI devices, the same user and the same password must be configured on each HMI device. Create a standard for user administration of the different HMI devices. Export the users and passwords on an HMI device to a storage medium, such as a floppy, memory card or a network drive. You import the users and passwords from this storage medium at all the other HMI devices.

You program a function which exports the user data at a button.

The system function "ExportImportUserAdministration" is not available on all HMI devices.

<b>NOTICE</b>
---------------

When exporting, the user data are encrypted and written from the HMI device to the target file. The target file is overwritten
--

#### Requirements

- An HMI device has been created.
- A screen has been created.
- A button has been created in the screen.
- The Inspector window is open.

## Procedure

1. Click the button in the screen.
2. Click "Properties > Events > Click" in the Inspector window.
3. Click the entry "Add function" in the function list.
4. Select the "ExportImportUserAdministration" system function.
5. Select "Export" as the "Direction". When exporting, the target file is overwritten with the user data.
6. Enter the full path of the destination file as the "File name", for example "a:\test\usersview.txt".

---

### Note

Ensure that the file name is written correctly. If the directory, for example "\test\", does not exist, it will be created without a prompt.

---

## Importing the user administration

### Introduction

If a user has access to several HMI devices, the same user and the same password must be configured on each HMI device. Create a standard for user administration of the different HMI devices. Export the users and passwords on an HMI device to a storage medium, such as a floppy, memory card or a network drive. You import the users and passwords from this storage medium at all the other HMI devices.

You configure a function which imports the user data at a command button.

The system function "ExportImportUserAdministration" is not available on all HMI devices.

NOTICE
When importing, the user data are read in from the source file and written into the HMI device. The users and passwords currently valid in the HMI device are overwritten. The imported users and passwords are valid immediately.

## Requirements

- A screen has been created.
- A command button has been created in the screen.
- The Inspector window is open.

## Procedure

1. Click the button in the screen.
2. Click "Properties > Events > Click" in the Inspector window.

3. Click the entry "Add function" in the function list.
4. Select the "ExportImportUserAdministration" system function.
5. Select "Import" as the "Direction." When importing, the user data in the HMI device are overwritten.
6. Enter the full path of the source file as the "File name", for example "a:\test\usersview.txt".

---

**Note**

Ensure that the file name is written correctly. If the folder, for example "\test\", or the file does not exist, an error message will be displayed.

---

## Logging on as a user

### Introduction

As a rule you log-on as a user by means of a special button. The logon dialog box is displayed to this purpose.

The logon dialog box is displayed by default during access to a protected object if

- No user is logged on in runtime.
- The logged-on user does not have the required authorization.

---

**Note**

The system always opens the logon dialog on the OP 73, OP 77A, TP 177A and Basic Panels HMI devices when you press an access-protected button:

---

### Requirements

- Under "Runtime settings > User administration" the
  - "Enable limit for logon attempts" check box has been selected.
  - The number 3 is entered in the field "Number of incorrect login attempts".
- The "ShowLogonDialog" system function is configured on a button called "Logon".

## Procedure

1. Click the "Logon" button. The logon dialog box is displayed.

2. Enter your user name as it was specified in the user administration, for example "Foreman". If someone has logged on before you, the name of the user will be displayed.
3. Enter the corresponding password. The input is concealed.
4. Click "OK" to close the dialog box.

## Logon was successful

If you have entered the user name "Foreman" and the entered password corresponds with the stored password, you are logged on as the user "Foreman" in runtime. You have the authorizations of the user "Foreman".

When the user "Foreman" accesses a protected object such as the "Logging" button, access to this protected object will only be authorized if the user "Foreman" has the required authorization. The programmed function is executed immediately.

If you do not have the required authorization after the successful log-on, a corresponding error message is displayed. However, you remain logged on in runtime.

## Logon was unsuccessful

An error message is displayed.

In order to maintain security, you or the user logged-on before you no longer has any authorizations. However, access to unprotected objects remains possible. The user view does not, however, show any entries. The user view and the authorizations change after the next successful log-on.

If the third login attempt has failed, the user will be assigned to the "Unauthorized" group. For this reason, do not configure a user group with this display name.

If the "Log off" function is called up or the logoff time of the user has expired, the user is logged off.

### 10.7.4.5 Configuring access protection

#### Access protection

##### Introduction

You configure an authorization at an object in order to protect it against access. All logged-on users who have this authorization can then access the object. If a user does not have authorization to operate an object, the logon dialog is displayed automatically.

---

##### Note

Several system functions are available under "User administration" so that user, password, and user group can be edited, for example, in the PLC.

---

#### Configuring operating authorizations

##### Introduction

You configure the "Stop runtime" authorization on a button. Then only those users who have the appropriate authorization have access to this button, for example all the users of the "Operators" user group.

This ensures that access to the command button is protected. If a logged-on user who belongs to the "Operators" user group and has the required authorizations clicks the button, runtime is stopped.

An example describes in detail how to configure a command button with access protection.

##### Requirements

- The "Operators" user group has been created.
- The "Stop runtime" authorization has been created.
- A screen has been created and opened.
- The screen contains a button.

##### Procedure

1. Click the button in the screen.
2. Click "Properties > Properties > Security" in the Inspector window.
3. Select "Stop runtime" as the "Authorization".

4. In the Inspector window, select "Properties > Events > Click".
5. Select a system function from the function list, for example, "StopRuntime".

---

**Note**

The "Enable" and "Disable" events are only used to detect whether an object was selected or deselected. The events do not, however, trigger a password prompt.

Do not use the "Enable" or "Disable" event if you want to configure access protection at the function call of the object.

---

## 10.7.5 Reference

### 10.7.5.1 Objects with access protection

#### Introduction

The following objects can be configured with an authorization:

- Date/time field
- I/O field
- Graphic I/O field
- Recipe view
- Switch
- Button
- Symbolic I/O field
- System diagnostic view

### 10.7.5.2 Objects with access protection

#### Introduction

The following objects can be configured with an authorization:

- Date/time field
- I/O field
- f(x) trend view
- Graphic I/O field
- HTML Browser
- Alarm view

- Alarm window
- Recipe view
- Switch
- Button
- Slider
- Symbol library
- Symbolic I/O field
- System diagnostic view
- System diagnostic window

### 10.7.5.3 Default user groups and authorizations

#### Principle

The predefined user groups and authorizations have the following numbers:

User group	Number
"Administrator group"	1
"Users"	2

Authorization	Number
"User administration"	1
"Monitor"	2
"Operate"	3

### 10.7.6 Examples

#### 10.7.6.1 Example: Configuring a button with logon dialog box

#### Task

In the following example, you configure the function "ShowLogonDialog" for a button. A different user can then log on in runtime when the shift changes, for example. In the process the user previously logged on is logged off.

---

#### Note

In runtime the logon dialog box is not displayed by default until you access a protected object. Either no user is logged on or the logged-on user does not have the required authorization.

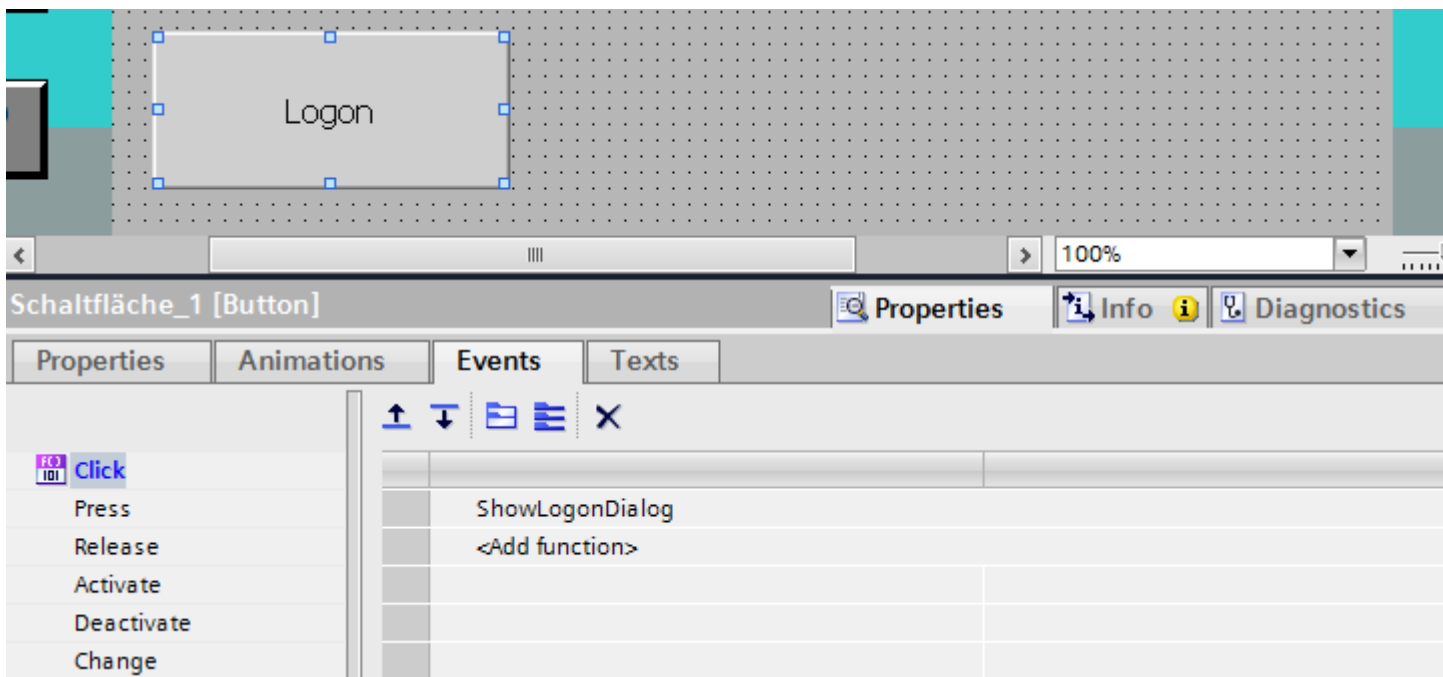

---

## Requirements

- A screen has been created.
- A button has been created in the screen.

## Procedure

1. Click the button in the screen.
2. Click "Properties > Events > Release" in the Inspector window.
3. Click the entry "Add function" in the "Function list" table.
4. Select the system function "ShowLogonDialog" from the "User administration" group.

## Result

If the user clicks on the button in runtime, the function "ShowLogonDialog" is called up. When the function "ShowLogonDialog" is called up, the logon dialog box is displayed. The user logs on with his user name and password.

### 10.7.6.2 Example: Logging the logon and logoff events

## Task

In the following example, you configure the function "TraceUserChange" to the event "User change".

## Principle

The "TraceUserChange" function is called when a user logs on or off. When a function is called up, a system message with information about the corresponding user is output.

This system message can be archived. When archiving, the system message is provided with a date stamp and time stamp. This ensures that you can track which user was logged on at the HMI device at which time and for how long.

## Requirements

- You have created an HMI device with Runtime Advanced.
- The Inspector window is open.

## Procedure

1. Double-click the "Scheduler" in the Project view.
2. Double-click "Add" in the table of the tasks.
3. Enter "Logon-Protocol" as the "Name".
4. Select "User change" as the "Trigger".
5. Open "Properties > Events" in the Inspector window.
6. Click the entry "Add function" in the "Function list" table.
7. Select the "TraceUserChange" system function.

## Result

A system message is output when a user logs on or logs off.

### 10.7.6.3 Example of a user administration

#### Example: Structure of user administration

## Task

In the following example you set up a user administration for different users and user groups. The example orientates itself to a typical requirement profile from manufacturing engineering.

## Principle

Completely different groups of persons are involved in a plant or project. Each group of persons protects its respective data and functions against access by others. For this purpose, users are created and assigned to a user group.

You can reproduce different views through user groups.

Example:

- Organizational view: Commissioners, Operators, Shift I, Shift II
- Technological view: Axis control, Tool changers, Plant North, Plant South

The following example orientates itself to the organizational view.

Every user group has characteristic requirements regarding access protection: A user group has operating authorizations for specific application cases. A programmer changes, for example, recipe data records.

In the example the users Miller, Group Smith and Foreman are created and assigned to different user groups.

Ms. Miller works as a programmer in the engineering system. The Group Smith are commissioners. Mr. Foreman is an operator.

### Requirements

- A new project has been created.
- The "User administration" editor is open.

### Procedures overview

Working with user administration has the following procedure in the example:

1. Creating authorizations The planner specifies which authorizations are required for access protection.
2. Configuring authorizations: The planner specifies which objects may be operated and which functions may be executed.
3. Creating user groups and allocating authorizations: The administrator creates the user groups together with the planner. The planner uses the authorizations to specify who may operate objects and change parameters.
4. Creating users and assigning them to a user group: The administrator administers the users.

### Result

The aim is the following structure of the user administration of users, user groups and authorizations:

Users			User groups	Authorizations			
Miller	Smith	Foreman	Roles	Changing recipe records	Changing system parameters	Changing process parameters	Managing
			Administrator group				x
X			Programmer	X			
	X		Commissioning engineers	X	X	X	
		X	Operators	x			

The user "Foreman" who belongs to the "Operators" user group has access to the configured "To Recipe view" button.

**Note**

Alternatively, you can create several users as operators with different operating authorizations, for example, Operator Level 1, Operator Level 2.

**Example: Creating and configuring authorizations**

**Task**

The following example shows you how to create the authorizations

**Procedure**

1. Open the "User groups" work area.
2. Double-click "Add" in the "Authorizations" table.
3. Enter "Change recipe data records" as the "Name" of the authorization.
4. Repeat steps 2 and 3 to create additional authorizations: "Change system parameters", "Change process parameters".

**Result**

The screenshot shows a software interface with two main sections: 'Groups' and 'Authorizations'. At the top right, there are tabs for 'Users' and 'User groups'. The 'Groups' section contains a table with columns: Name, Number, Display name, Password aging, and Comment. It lists 'Administrator group' (Number 1) and 'Users' (Number 2), with an '<Add new>' button below. The 'Authorizations' section contains a table with columns: Active, Name, Number, and Comment. It lists three entries: 'User administration' (Number 1, Active checkbox unchecked), 'Monitor' (Number 2, Active checkbox checked), and 'Operate' (Number 3, Active checkbox unchecked), with an '<Add new>' button below.

Groups				
Name	Number	Display name	Password aging	Comment
Administrator group	1	Administrator group	<input type="checkbox"/>	The 'Administrator' group is i...
Users	2	Users	<input type="checkbox"/>	The 'Users' group is initially g..
<Add new>				

Authorizations			
Active	Name	Number	Comment
<input type="checkbox"/>	User administration	1	Authorize 'User administratio..
<input checked="" type="checkbox"/>	Monitor	2	'Monitor' authorization.
<input type="checkbox"/>	Operate	3	'Operate' authorization.
<Add new>			

## Example: Configuring a button with access protection

### Task

In the following example you use a system function to create a button for a screen change. You protect the "To Recipe view" button against unauthorized operation. To do so, you configure the "Change recipe data records" authorization at the "To Recipe view" button.

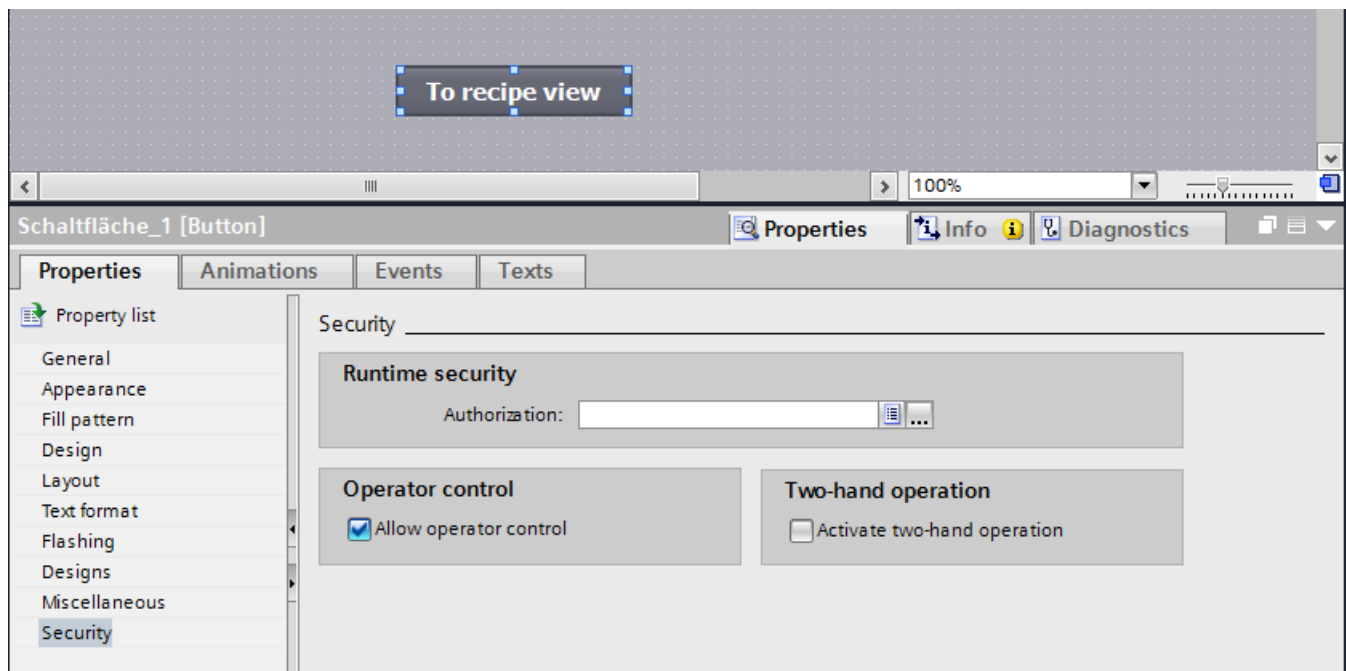

### Requirements

- A "Change recipe data records" authorization has been created.
- A "Recipes" screen has been created.
- A "Start" screen has been created and opened.
- A button has been created and marked in the "Start" screen.

### Procedure

1. Click "Properties > Properties > General" in the Inspector window.
2. Enter "To Recipe view" as the text.
3. Click "Properties > Events > Click" in the Inspector window.
4. Click the "Add function" entry in the first line of the "Function list" table.
5. Select the "ActivateScreen" system function in the "Screens" group.
6. Click the  button in the "Screen name" field. A dialog box for selecting the screen opens.
7. Select the "Recipes" screen and use the  button to close the dialog box.
8. Click "Properties > Properties > Security" in the Inspector window.
9. Select "Change recipe data records" as the "Authorization."

## Result

Access to the "To Recipe view" button is protected. If, for example, the user "Smith" clicks the button in Runtime, the function "Recipe view" screen is called up. Prerequisite is that the user "Smith" has logged on correctly and has the required authorization. The "Recipes" screen contains a recipe view and other screen objects.

If the logged-on user does not have the required authorization or if no user is logged on, the "Logon dialog box" is displayed.

### Example: Creating user groups and assigning authorizations:

#### Task

In the following example you create the user groups and assign authorizations to them.

#### Procedure

1. Open the "User groups" work area.
2. Double-click "Add" in the "Groups" table.
3. Enter "Programmer" as the "Name".
4. Repeat steps 2 and 3 to create the "Commissioner" and "Operator" user groups.
5. Click "Administrator" in the "Groups" table.
6. Activate the "Change system parameters" authorization in the "Authorizations" table.

## Interim result

2. Enter "Smith" as the user name.
3. Click the button in the "Password" column. The dialog box for entering the password is displayed.
4. Enter "smith" as the password.
5. To confirm the password enter it a second time in the lower field.
6. Close the dialog box by using the icon.
7. Activate the "Commissioner" user group in the "Groups" table.
8. Repeat steps 2 to 6 for the user "Foreman."
9. Activate the "Operators" user group in the "Groups" table.

**Result**

## 10.8 Working with system functions and Runtime scripting

### 10.8.1 Basics

#### 10.8.1.1 Runtime scripting

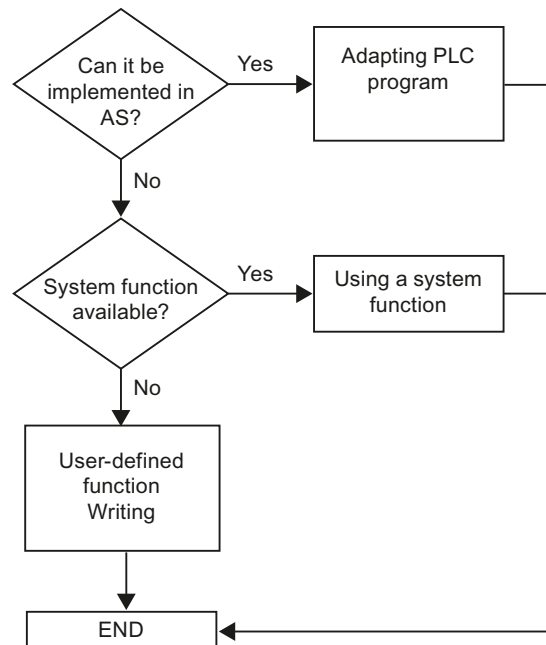

#### Term definition

The following terms are used in the documentation:

Term	
Runtime scripting	Generic term for all activities in user-defined functions.
Function	Generic term for system functions and user-defined functions.
System functions	System functions are all functions supplied with WinCC. The system functions are used either in function lists or user-defined functions.
User-defined functions	User-defined functions are functions written in the "Scripts" editor. For more precise specification, the term "User-defined VB function" is used in the documentation.
VBS / VBScript	Abbreviation for Visual Basic Script

## Applying Runtime scripting

The following figure serves as a decision guide for programming tasks at hand:

### 10.8.1.2 System functions

#### Applications

You use system functions for the following:

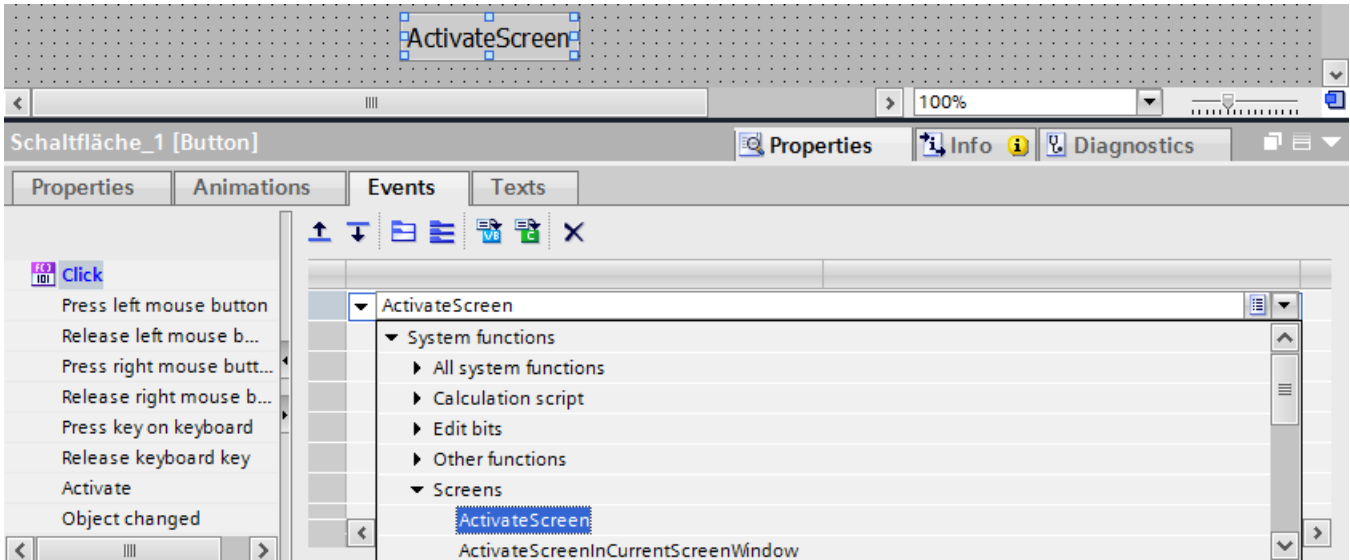

- **Function lists**  
A function list is executed from top to bottom in Runtime. If a function list includes system functions with longer runtime, these are processed asynchronously. For additional information, refer to "Runtime characteristics".
- **User-defined functions**  
If the HMI device supports customized functions, you use system functions in combination with instructions and conditions in the code of a customized function. In this way you execute a customized function depending on a specific system state. In addition, you can evaluate return values of system functions, for example. Depending on the return value, you then perform test functions, for example, that in turn affect the user-defined function flow.

#### Application examples of system functions

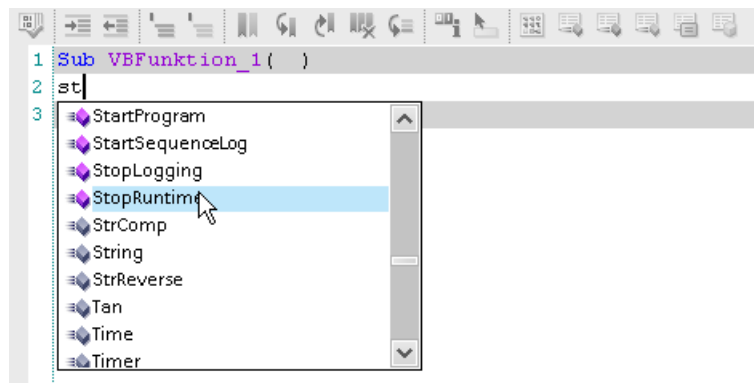

- Calculations, increase tag value by a defined or variable amount.
- Log function, e.g. to start a process value log.
- Settings, e.g. to switch the PLC or set a bit in the PLC.
- Alarms, e.g. after changing the user.

## Application

- Function list  
When configuring a function list, you select the system functions from a selection list that is sorted by categories:

- User-defined function  
If you are using a system function in a user-defined function, you choose it from a selection list. To open the selection list, use the key shortcut <Ctrl+Space> or click .

## Language dependency

In the function list, the names of the system functions are dependent on the set project language. The functionality can then be recognized immediately by the project planner.

You use the English name of the system function in user-defined functions. You will find the English name of the system function in the reference.

## Availability

Which system functions are available depends on the selected HMI device.

## HMI device replacement

If you use system functions in a function list that are not available on the set HMI device, these system functions are marked in color.

If you use a system function in a user-defined function which is not available on the set HMI device, a warning is issued. In addition, the respective system function will be underlined with a wavy blue line.

## See also

System functions for logs (Page 3559)

### 10.8.1.3 User-defined functions

## Applications

You use customized functions for the following for example :

- Configuring an extended function list  
In a customized function you have the option to have customized functions and system functions executed depending on conditions or executed repeatedly. You then add the customized function to a function list.
- Programming new functions  
Customized functions are only valid in the project in which they are defined. For user-defined functions you define transfer parameters and return values, for example, for conversion of values.

## Properties of customized functions

A customized function has the following properties:

- Name
- Parameter (optional)
- Return value and type (optional)
- Can be modified centrally
- has no trigger. You have to call the customized function explicitly, e.g. in a function list.
- behaves like a system function

## Usage

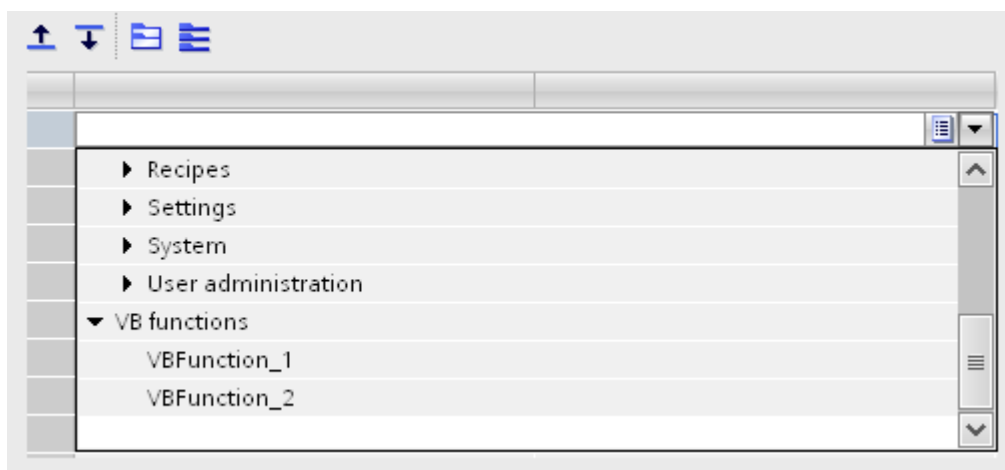

You create customized functions with the "Scripts" editor. See "Scripts" editor (Page 3877) for additional information.

Customized functions are saved in the project. To protect user-defined functions, set up know-how protection. See Auto-Hotspot for additional information.

- **Project tree**  
The user-defined functions are listed in the project tree under "VB scripts".

- **Function list**  
The user-defined functions are listed in a function list under "VB functions".

- **User-defined function**  
If you are using a system function in a user-defined function, you choose it from a selection list. To open the selection list, use the key shortcut <Ctrl+Space> or click .

### Recursion level

The recursion level in user-defined functions is limited by the stack size of the HMI device. If the number is exceeded, a system error message is output in Runtime. This means you should limit the number of recursions in a user-defined function.

## 10.8.2 Working with function lists

### 10.8.2.1 Basics of the function list

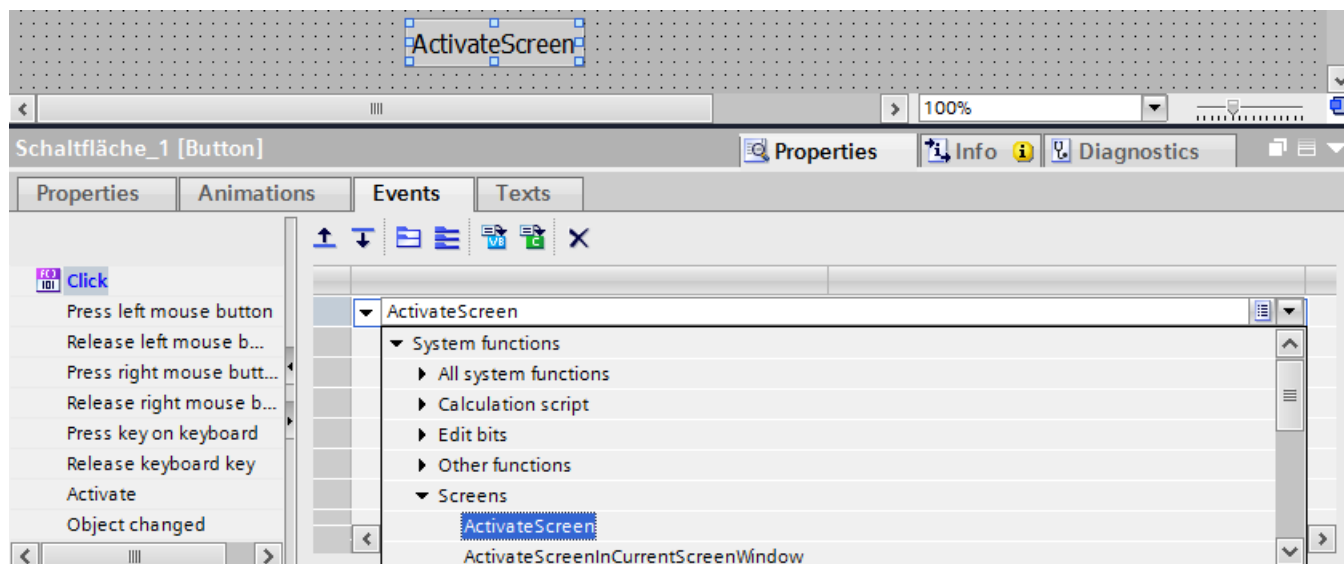

#### Introduction

A function list performs one or more system functions and user-defined functions when the configured event occurs.

## Principle

The function list is configured for an event of an object, for example, for a screen object or a task. You can configure a function list precisely on every event. The events which are available depend on the selected object and the HMI device.

Events occur only when the project is in Runtime. Events include:

- Execution of a task
- Pressing of a button
- Acknowledging an alarm

---

### Note

The choice of configurable system functions in a function list is dependent on the selected HMI device. For additional information, refer to "Availability for specific devices of system functions".

---

### 10.8.2.2 Properties of a function list

#### Status information

During configuration the project data is tested in the background.

With the following causes the function list is not executed in Runtime and the incorrect entries are marked red:

- At least one system function or one user-defined function is not completely supplied with parameters.
- At least one system function or one user-defined function is contained which is not supported by the selected HMI device, e.g. by changing the device type.

## Processing of system functions and user-defined functions (WinCC Runtime Advanced and Panels)

A function list is executed from top to bottom in Runtime. If a function list includes system functions with longer runtime, these are processed asynchronously. You can find additional information about this in the sections "Calling system functions" and "Calling user-defined functions".

### See also

Executing a function list in Runtime (Page 3900)

Processing sequence for user-defined functions and system functions (Page 3901)

### 10.8.2.3 Configuring a function list

#### Introduction

You configure a function list by selecting the system functions and customized functions from a drop-down list. The system functions are arranged in the selection list according to categories.

You only use customized functions of a programming language in a function list. Your selection of the first user-defined function determines whether user-defined VB functions or user-defined C functions can be selected in the function list. Which programming languages are available depends on the selected HMI device.

If you have created a user-defined VB function, for example, the user-defined function is available under the entry "VB functions".

#### Requirement

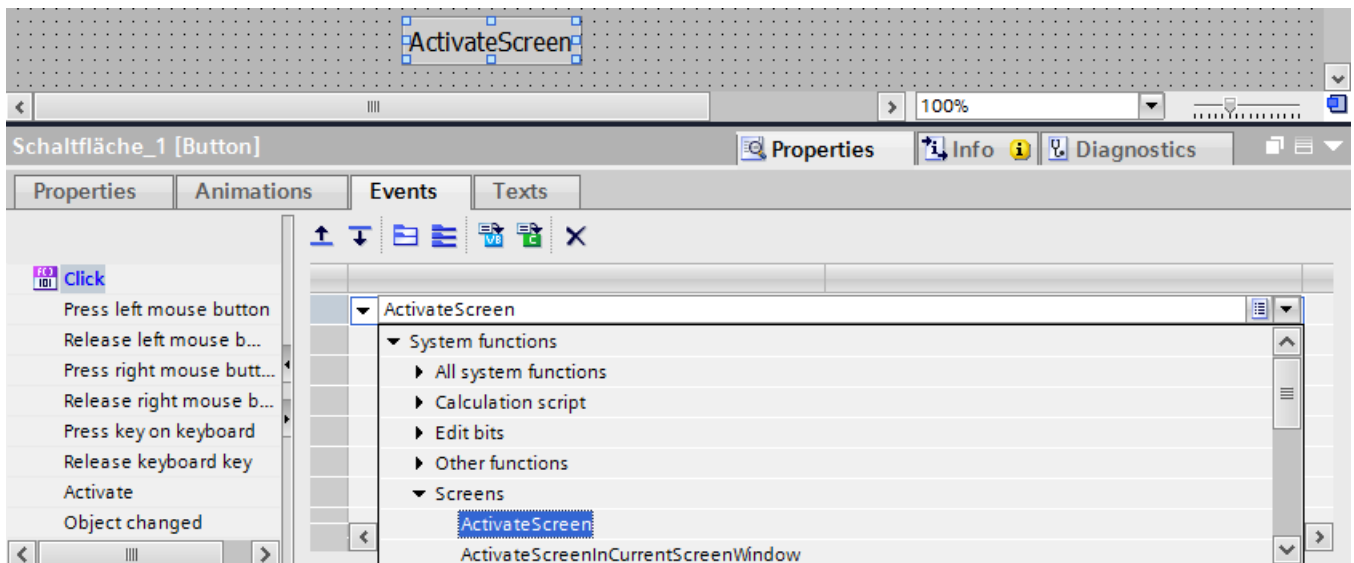

Object has at least one configurable event.

#### Procedure

Proceed as follows to configure a function list:

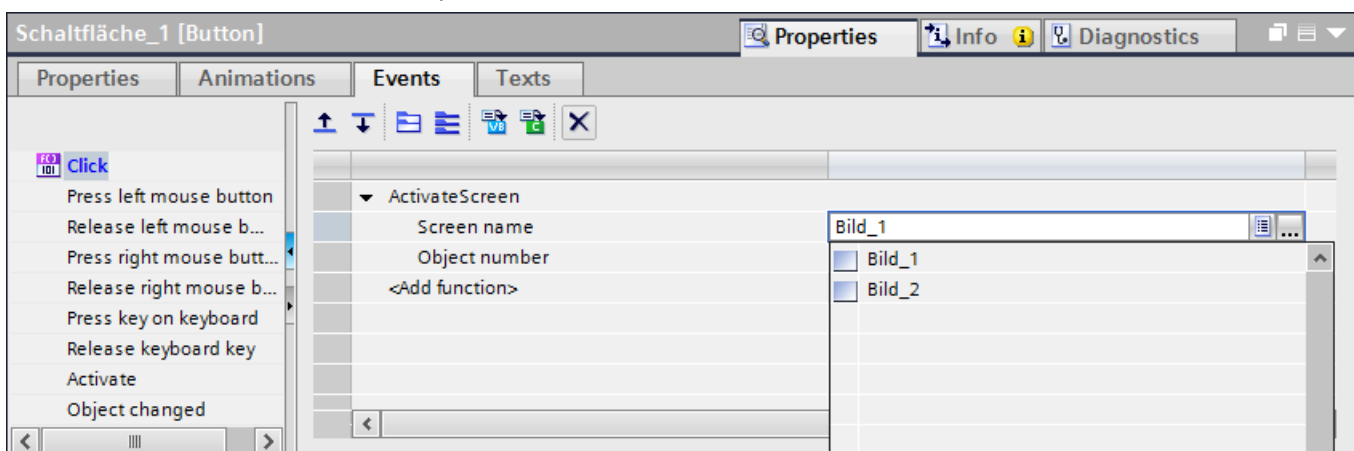

1. Open the editor in which the object is located.
2. Select the object.
3. Click "Properties > Events" in the Inspector window. Choose the event for which you want to configure the function list.
4. Mark the "<Add function>" entry in the inspector window in the drop-down list.

5. Select the desired system function or the desired user-defined function from the selection list. You can also enter the name of the system function or the user-defined function.

The system function or the customized function is entered in the function list.

6. If the system function or the customized function has parameters, select the appropriate values for the parameters.

7. If you want to add other system functions or user-defined functions to the function list, repeat steps 4) to 6).

## Result

The function list is configured. In addition, to the configured event, the status of the function list is displayed in the Inspector window. When the configured event occurs in Runtime, the function list is completed from top to bottom.

### 10.8.2.4 Editing a function list

#### Introduction

A function list can be edited as follows:

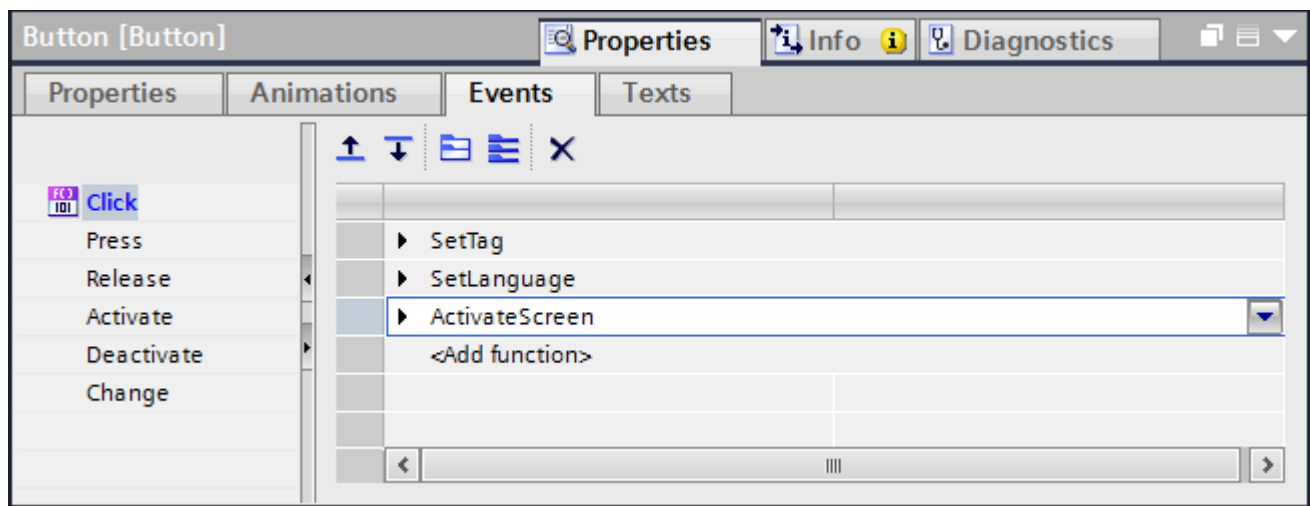

- Change the order of system functions and user-defined functions.
- Remove system functions or user-defined functions.

#### Requirement

The function list is configured and opened.

#### Changing the order of a system function or a customized function

1. Select the desired system function or customized function in the function list.
2. Then click the appropriate direction arrow in the inspector window until the system function or customized function is in the desired position.

#### Changing the order of several system functions and customized functions

1. Hold down the <Shift> key.
2. Click desired system functions or customized functions one after another with the mouse.
3. Move the selection to the desired position by drag&drop.

#### Removing a system function or customized function

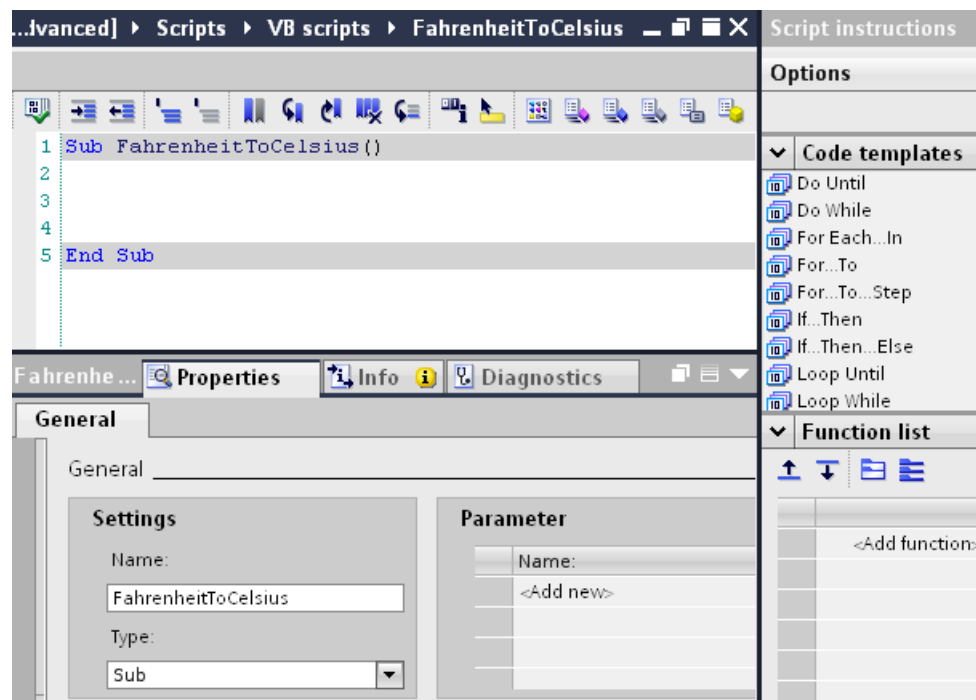

1. Select the desired system function or customized function in the function list.
2. Select "Delete" in the shortcut menu.

## 10.8.3 Working with user-defined VB functions

### 10.8.3.1 "Scripts" editor

#### Introduction

The "Scripts" editor supports you in the creating of user-defined functions with functionalities such as auto-completion and syntax highlighting. You can insert code templates for frequently used instructions with the "Instructions" task card for example.

#### Autocompletion and parameter entry

The "Scripts" editor provides you context-dependent programming support with autocompletion parameter entry support.

When you use system functions, the parameters of the function are shown as a tooltip.

#### <Ctrl+J>

The object list can be called context-specifically by using the shortcut <Ctrl+J>. Use the object list to supply values to system functions, methods, and properties: For example, you select

screens, screen objects, tags, or colors. You transfer a selected object from the object list into the code by double-clicking it.

---

**Note**

Tags and screens can also be inserted using a drag-and-drop operation. Use, for example, drag-and-drop to assign values to parameters.

---

### <Ctrl+Space>

With the key combination <Ctrl+Space> you call a list with the following contents:

- Constants and functions of the programming language used in the "Scripts" editor.
- User-defined functions
- System functions

### "Instructions" task card

The "Instructions" task card contains the "Code templates" and "Function list" palettes.

- Code templates  
To insert frequently used instructions, double click the desired instruction in the "Code templates" palette. Replace the space holders with the used expressions.
- Function list  
In the function list you select the system functions and user-defined functions from a drop-down list. Proceed as for configuring a function list. To transfer the function list to the code, click the "Transfer" button. The function list is automatically converted into the correct syntax.

---

**Note**

Not all system functions are available in the "Scripts" editor. For additional information, refer to the reference.

---

### Edit functions

Use the buttons of the toolbar "Advanced Edit" to make the code more readable by means of indentation and the use of comments.

Bookmarks help you keep an overview, even of many lines of code.

Further information regarding each button can be obtained in the accompanying direct help.

### Synchronization of tags and objects

If you change tag names or object names in the project which you use in a user-defined function, the names are adapted automatically in the user-defined function.

If you change the tag name or object name in the function, the tag names or object names are not adapted in the project. An appropriate error message is output when executing the user-defined function.

## Syntax highlighting

Keywords in the "Scripts" editor are highlighted using different colors. Unknown words are underlined with a red wavy line.

The table shows the preset colors for the most important keywords:

Color	Meaning	Example
Blue	Keyword	If, Then
Dark violet	Function	FahrenheitToCelsius
Chocolate	System function	SetTag
Orange	HMI tag	Tag_1
Green	Comment	'This is a comment'

## Adapting display properties

When you have opened a user-defined function, you can customize the display properties in the editor. Select the "Options > Settings" menu command. Click "General > Text editors" in the "Settings" editor. For example, you can change the colors for syntax highlighting or adapt the indents for code in the work area.

## See also

Create customized VB functions (Page 3885)

### 10.8.3.2 Access to HMI tags

#### Introduction

In user-defined VB functions, you have access to HMI tags which you have created in the project. Change or read the tag value with a user-defined VB function in Runtime.

In addition, you can create local tags as counters or buffers in the user-defined VB function. You must declare each tag to avoid errors due to misspelled tags.

#### HMI tags

The user-defined VB function accesses the tag value which is saved in Runtime memory. Next, the tag value will be updated to the set cycle time. The user-defined VB function first accesses the tag values which were read at the previous cycle time.

If the tag name matches the VBS name conventions in the project, you can use the HMI tag directly in the function.

```
'VBS_Example_03
```

```
If BeltDriveOilTemperature > 100 Then [instruction]
```

If the tag name in the project does not match the VBS name conventions, you must reference the HMI tag using the "SmartTags list". In the following example the tag name contains the "&" character that is not permitted in accordance with the VBS name conventions:

```
'VBS_Example_04  
SmartTags("Test&Trial")= 2005
```

## Local tags

You define local tags with the Dim instruction. You can only use local tags within user-defined VB functions. They therefore do not appear in the "HMI Tags" editor. You use a local tag in the user-defined VB function, for example, as a counter in a For instruction.

```
'VBS_Example_05  
Dim intCount  
For intCount = 1 To 10 [instruction] Next
```

## Access to HMI tags with a dynamic name

The user-defined VB function accesses the tag value using the tag name. You can specify the tag name in such a way that the tag name is composed at the runtime of the user-defined function.

If you only call the user-defined VB function in a screen in which the HMI tag is also used elsewhere, for example in an I/O field, you should for performance reasons configure the HMI tag with "Cyclic in operation" acquisition mode.

If the user-defined VB function is accessed and the HMI tag is not being used in the screen currently displayed, configure the HMI tag with "Cyclic continuous" acquisition mode. This ensures that the current value of the tag is always available.

SmartTags (Page 4237)

### 10.8.3.3 Access to objects

#### Introduction

The objects of the VBS object model with the appropriate properties and methods are available in user-defined VB functions.

The object properties can be read and changed in Runtime.

#### Referencing objects

In customized VB functions you reference the objects by the corresponding list. To identify the object, use its name or the position number within the list.

If you access the properties of an object more often, create an object reference. You can access object properties with and without object reference.

With the following instruction the first object is referenced in the "MainScreen":

```
'VBS_Example_01
Dim objObject
'Change to Screen "MainScreen"
HMIRuntime.BaseScreenName = "MainScreen"
Set objObject = HMIRuntime.Screens(1).ScreenItems(1)
```

With the following instruction an object is referenced by its name and an object property is changed. You must have created the object with this name in the screen.

```
'VBS_Example_02
Dim objCircle
HMIRuntime.BaseScreenName = "MainScreen"
Set objCircle = HMIRuntime.Screens(1).ScreenItems("Circle_01")
objCircle.BackColor = vbGreen
```

### 10.8.3.4 Calling system functions

#### Introduction

You can insert system functions in a user-defined VB function.

This can be done in the following ways:

- With <Ctrl+Space> or with 
- Direct input
- With the "Function list" palette

#### With <Ctrl+Space> or with

Open the list of system functions with <Ctrl+Space> or with  and select the desired system function.

#### Direct input

You enter the system functions directly into the code. You use the English name of the system function. You can find the English name of the system function in the system function reference under "Syntax". The editing language setting is not taken into consideration.

References to objects, e.g. screens, connections and logs are transferred in inverted commas:

## Calling system functions without return value in VBS

```
SetTag "Tag1", 64
```

## Calling system functions with return value in VBS

```
InverseLinearScaling "XValue", "Tag1", 0, 1
```

### With the "Function list" palette

Select the system functions from a selection list that is sorted by categories in the "Function list" palette. Proceed as for configuring a function list.

To transfer the list to the code, click the "Transfer" button. The list is automatically converted into the correct syntax.

### HMI device replacement

The code of a customized function depends on the selected HMI device. If you use system functions in the customized function which are not supported by the selected HMI device, you receive an error message in the output window. You will find additional information under "Device dependency of system functions".

### See also

Configuring a function list (Page 3874)

## 10.8.3.5 Calling user-defined VB functions

### Introduction

You can only insert user-defined VB functions in a user-defined VB function.

This can be done in the following ways:

- With <Ctrl+Space> or with 
- Direct input
- With the "Function list" palette

### With <Ctrl+Space> or with

Open the list of user-defined VB functions with <Ctrl+Space> or with  and select the desired user-defined VB function.

## Direct input

You enter the user-defined VB function directly into the code. References to objects, e.g. screens, connections and logs are transferred in inverted commas.

```
Function Average(ByVal Var1, ByVal Var2)
  Average = (Var1+Var2)*(1/2)
End Function
```

## Calling user-defined VB functions without return value in VBS

```
Average 4,10
```

## Calling user-defined VB functions with return value in VBS

```
Dim ValueA
ValueA = Average (4,10)
```

If you do not want to evaluate the return value, use the call as for a user-defined VB function without return value.

## With the "Function list" palette

Select the desired user-defined VB function from a selection list in the "Function list" palette.

Proceed as for configuring a function list. You will find additional information under "Configuring a function list".

To transfer the list to the code, click the "Transfer" button. The list is automatically converted into the correct syntax.

### 10.8.3.6 Transfer and return of values in VBS

#### Transfer of a value

The following options are available for transferring parameters.

- "Call by Value" - ByVal  
ByVal transfers the parameter value. If you transfer a tag as a parameter, the tag value is transferred to the user-defined function when the user-defined function is executed.
- "Call by Reference" - ByRef  
ByRef transfers the address of the parameter. If you transfer a tag as a parameter, the tag address is transferred to the user-defined function when the user-defined function is executed.  
When user-defined functions and system functions are called in user-defined functions, the parameter is transferred as ByRef.

#### Return of a value

Return values can return the result of a calculation (e.g., average value of two numbers). But a return value can also give information about whether an instruction was executed correctly.

Therefore, the system functions that perform file operations such as "Delete" also have return values.

For a user-defined function to return a value, you must set the "Function" type. You assign the function name to the return value in the user-defined function:

```

1 Function Average( Value1 , Value2 )
2 'Check if Parameters are not numeric:
3 If IsNumeric (Value1) = False Then Value1 = 1
4 If IsNumeric (Value2) = False Then Value2 = 1
5 Average = (Value1+Value2)/2
6
7 End Function

```

To form an average value of two numbers, call the user-defined VB function Average and transfer the result to the HMI tag for example AverageValue.

- In a customized VB function

```
SmartTags("AverageValue") = Average ("4", "10")
```

- In the function list

Average	
Return value	AverageValue
Value1	10
Value2	4

You can output the value of the HMI tag AverageValue in an I/O field.

## See also

Create customized VB functions (Page 3885)

### 10.8.3.7 Create customized VB functions

#### Introduction

When you create a customized VB function, you define the following settings:

- The name with which you call the user-defined VB function.
- The type of user-defined VB function.
- The parameters which are transferred to the user-defined VB function in Runtime.

Use only the following characters for the name:

- "A" to "Z"
- "a" to "z"
- "0" to "9"
- "\_" as a separator

---

#### Note

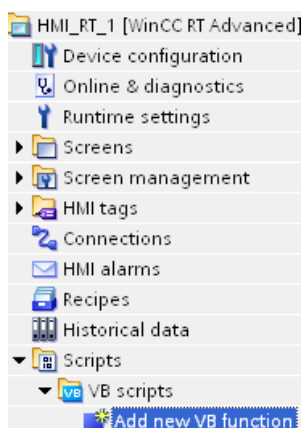

When you change the parameters or the function type, the change is color marked at the application point, e.g. in the function list.

---

#### Procedure

To create a user-defined VB function, follow these steps:

1. Open "Scripts" in the project tree.
2. Double click "Add new VB function" in the project tree under "VB scripts".

The user-defined VB function is created as a new tab in the work area. The input mask for the configuration settings of the user-defined VB function opens in the Inspector window.

3. Configure the user-defined VB function in the Inspector window "Properties > General > General".
4. Enter a descriptive "Name" for the user-defined VB function.
5. Select the "Type" of the user-defined VB function.
  - "Function" have a return value.
  - "Sub" have no return value.
6. Click "<Add>" in the "Parameters" list to add parameters. Enter the parameter name and specify the parameter type.
 

Further information can be found in "Transfer and return of values in VBS (Page 3884)".

  - "ByVal" transfers the parameter value.
  - "ByRef" transfers the address of the parameter.
7. Enter its code in the work area.
 

You will find further information about this in ""Scripts" Editor" (Page 3877)".

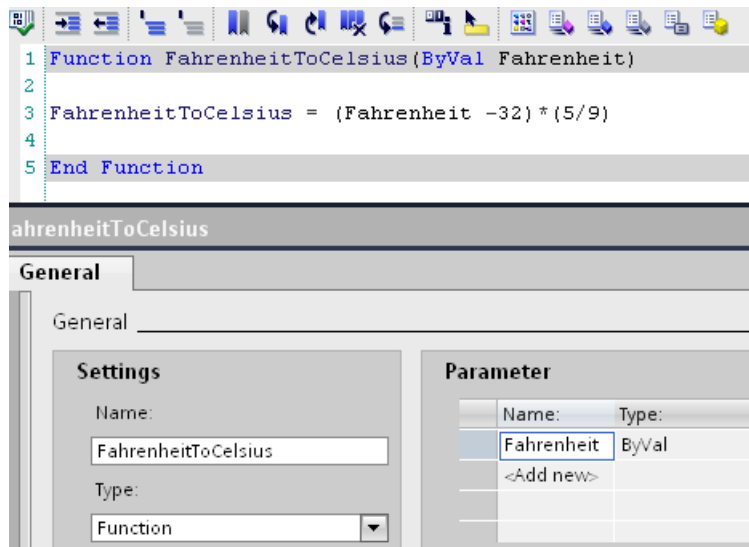

## Result

The user-defined VB function has been created. The type, name, and function parameters are displayed in the title bar.

The start and end are inserted automatically when the user-defined function is created.

If you have protected the user-defined VB functions by a password, it is saved encrypted in the project. For additional information, refer to "Protecting user-defined functions".

The figure below shows a user-defined VB function which converts the temperature from "Fahrenheit" to "Degrees Celsius":

### 10.8.3.8 Testing the syntax of customized functions

#### Introduction

During programming, the code is tested in the background. Syntactical errors are marked with a wavy red line. The customized function is checked for correct syntax and valid object references.

Check the syntax in the "Scripts" editor to identify all the errors in the code and output the appropriate error messages. In this case, error messages generated by the script parser are output.

Use a separate debugger to check customized VB functions for logical programming errors.

#### Error types

The following error types are detected in the syntax test and output in the "output window":

- Unknown string (e.g., not a keyword)
- Assignment of value to a constant
- The name of a local tag created with the Dim instruction is already known, e.g.: as a parameter, object, or component of the object model
- Syntax error

#### Requirements

- Customized function is open.

#### Procedure

Proceed as follows to check the syntax:

1. Click  to start the syntax check.  
The syntax is checked. The result of the syntax check is displayed in the Inspector window under "Info > Compilation." Syntax errors are output with the line number.
2. Correct the errors in the customized function if necessary.

#### Special consideration in the syntax checking of customized functions

Customized functions are not interpreted until in Runtime. When an HMI device is being compiled, the system checks its user-defined functions for correct syntax. However, runtime errors may occur in certain circumstances.

#### See also

Configuring a function list (Page 3874)

### 10.8.3.9 Renaming customized VB functions

#### Renaming a user-defined VB function in the project tree

Proceed as follows to rename a user-defined VB function in the project tree:

1. Select the desired user-defined VB function in the project tree.
2. Select the "Rename" (F2) command in the shortcut menu of the user-defined VB function.
3. Enter a new name for the user-defined VB function.

#### Renaming a user-defined VB function in the Inspector window

Proceed as follows to rename a user-defined VB function in the Inspector window:

1. Open the user-defined VB function in the "Scripts" editor.
2. In the Inspector window, click "Properties > Properties > General".
3. Enter the new function name.

#### Result

The user-defined VB function is renamed. The application points are adapted automatically.

### 10.8.3.10 Executing customized VB functions

#### Introduction

In WinCC you have the following options to execute a customized function:

- Function list
- Customized VB function

#### Calling a customized VB function in a function list

1. Add the user-defined VB function to a function list like a system function. You will find the customized VB functions in the drop-down list under "VB functions". You will find further information in "Configuring a function list (Page 3874)".
2. If the VB function has parameters, supply the parameters with static values or HMI tags.
3. If the VB function has a return value, select an HMI tag. The value to be processed is transferred to the HMI tag.

### Calling a customized VB function in a customized VB function

1. Open the user-defined VB function in which you want to call the user-defined VB function.
2. Call the customized VB function in the syntax of the programming language. You will find further information in "Calling user-defined VB functions (Page 3882)".
3. If the VB function has a return value, assign an expression, e.g. a local tag, to the VB function.

### See also

- Configuring a function list (Page 3874)
- Calling system functions (Page 3881)
- Calling user-defined VB functions (Page 3882)

### 10.8.3.11 Protecting user-defined functions

#### Setting up know-how protection

#### Procedure

To set up know-how protection for user-defined functions, follow these steps:

1. Select the user-defined function without know-how protection that you want to protect.
2. Select the command "Know-how protection" in the "Edit" menu.  
The "Know-how protection" dialog will open.
3. Click "Define".  
The "Define password" dialog box opens.
4. Enter a password in the "New" field.
5. Enter the same password in the "Confirm" field.
6. Confirm your entries with "OK".
7. Close the "Know-how protection" dialog by clicking on "OK".

#### Result

The user-defined function receives know-how protection. User-defined functions with know-how protection are marked with a lock in the project tree. The password entered is valid for all user-defined functions selected.

#### Opening user-defined functions with know-how protection

You can only open multiple user-defined functions with know-how protection at once if they are protected with the same password.

## Procedure

To create a user-defined function with know-how protection, follow these steps:

1. Double-click the user-defined function you want to open.  
The "Access protection" dialog will open.
2. Enter the password for the user-defined function with know-how protection.
3. Confirm your entry with "OK".

## Result

The user-defined function with know-how protection will open provided you have entered the correct password. However, the function will remain know-how protected.

Once you have opened the user-defined function, you can edit it for as long as the user-defined function or TIA portal is open. You must enter the password again the next time you open the user-defined function. If you close the "Access protection" dialog with "Cancel" or "Close", the user-defined function is opened but the code is not displayed. You cannot edit the user-defined function.

## Removing know-how protection

### Procedure

To remove the know-how protection of a user-defined function, follow these steps:

1. Select the user-defined function for which you want to remove know-how protection.

---

#### Note

To remove know-how protection for several user-defined functions at once, all selected user-defined functions must have the same password.

---

2. Select the command "Know-how protection" in the "Edit" menu.  
The "Know-how protection" dialog will open.
3. Deactivate the check box "Hide code (know-how protection)".
4. Enter the password.
5. Confirm your entries with "OK".

## Result

Know-how protection will be disabled for the selected user-defined function.

## Changing a password

### Procedure

To change the password, follow these steps:

1. Select the user-defined function with know-how protection for which you want to change the password.

---

**Note**

To change the password for several user-defined functions at once, all selected user-defined functions must have the same password.

---

2. Select the command "Know-how protection" in the "Edit" menu.  
The "Know-how protection" dialog will open.
3. Click the "Change" button.
4. Enter the old password in the "Old" field.
5. Enter the new password in the "New" field.
6. Enter the new password again in the "Confirm" field.
7. Confirm your entries with "OK".
8. Close the "Know-how protection" dialog by clicking on "OK".

## 10.8.4 Debugging user-defined VB functions

### 10.8.4.1 Debugging user-defined VB functions

#### Introduction

Debugging allows you to test the user-defined VB functions for logical programming errors in Runtime. For example, you can test whether the proper values were transferred to the tags, and whether cancellation terms are realized correctly.

The following VBScript-capable debuggers have been tested and approved:

- "Microsoft Script Debugger"
- "Microsoft Script Editor": The debugger is included in Microsoft Office XP.

"Microsoft Script Debugger" provides the following functionality:

- Viewing the source code of the function you are debugging
- Checking the step-by-step execution of the functions
- Viewing and editing tags and property values

---

**Note**

**Difference with regard to VBScript for Windows and Windows CE**

The debugger checks the syntax for VBScript for Windows. If the function contains a VBScript function for Windows CE, a corresponding error message is output. Some VBScript functions are different, e.g., CreateObject. You can find a list of these VBScript functions under "VBScript for Windows CE (Page 4208)".

---

## Microsoft Script Debugger

If you want to use the Microsoft Script Debugger for debugging, the English version "scd10en.exe" must be used. The German version "scd10de.exe" may not be installed.

"Microsoft Script Debugger" provides the following functionality:

- Viewing the source code of the function you are debugging
- Checking the step-by-step execution of the functions
- Viewing and editing tags and property values

---

**Note**

For tips and tricks on debugging, common sources of errors, and additional information, refer to the online help for the Microsoft Script Debugger.

---

The Microsoft Script Debugger is located in the Microsoft Download Center under the following URL:

- <http://www.microsoft.com/downloads/Search.aspx?displaylang=en833a6a92-961e-4ce1-9069-528d22605127>

Use the "Search" field to search for "Script Debugger" and select the required download.

## Basic procedure

The debugger is only intended for identifying error locations in the user-defined VB function. For this purpose, for example, you use break points or execute the user-defined VB function step-by-step. For detailed information, refer to the documentation of the debugger you are using. In order to correct errors, you change to the "Scripts" editor in WinCC. After having recompiled and reloaded the script, you test the user-defined VB function once again using the debugger.

---

**Note**

Your code is displayed in the debugger, but is write-protected. You cannot edit the code directly in the debugger; you can only test the required changes.

---

## Error types

The following error types are distinguished when debugging:

- **Logical error**  
A logical error occurs when the event you are expecting does not take place, e.g., because a condition was checked incorrectly. To debug logical errors, you go through the user-defined VB function step by step. This way, you identify the portion of the user-defined VB function that is not working.
- **Runtime error**  
A runtime error is generated if an attempt is made to execute an invalid or faulty instruction, e.g., if a tag is not defined.  
To intercept runtime errors, use the "On Error Resume Next" instruction in the user-defined VB function. With this instruction, the next instruction is executed after a runtime error. You check the error code with the Err object in the next line. To stop the handling of runtime errors in the user-defined VB function again, use the "On Error Goto 0" instruction.  
Example for error handling

```
Sub OnClick(ByVal Item)
'VBS27
  Dim objScreenItem
  '
  'Activation of errorhandling:
  On Error Resume Next
  For Each objScreenItem In ScreenItems
    If "HMIRectangle" = objScreenItem.Type Then
      '
      '=== Property "RoundCornerHeight" only available for RoundedRectangle
      objScreenItem.RoundCornerHeight = objScreenItem.RoundCornerHeight * 2
      If 0 <> Err.Number Then
        HMIRuntime.Trace objScreenItem.Name & ": no RoundedRectangle" & vbCrLf
        '
        'Delete error message
        Err.Clear
      End If
    End If
  Next
  On Error Goto 0 'Deactivation of errorhandling
End Sub
```

## Screen change while debugging

If you change to another screen while debugging, the user-defined VB function of the previous screen stays open but is no longer valid. The debugger could return invalid error messages in this case, as the objects called will no longer exist after the screen change.

## 10.8.4.2 Integrating the Debugger

### Installing a script debugger for WinCC

A VBScript-capable debugger must be installed to search for errors in user-defined VB functions.

The following VBScript-capable debuggers have been tested and released:

- Microsoft Script Editor by Office XP
- Microsoft Script Debugger: The English version "scd10en.exe" must be used. The German version "scd10de.exe" may not be installed.

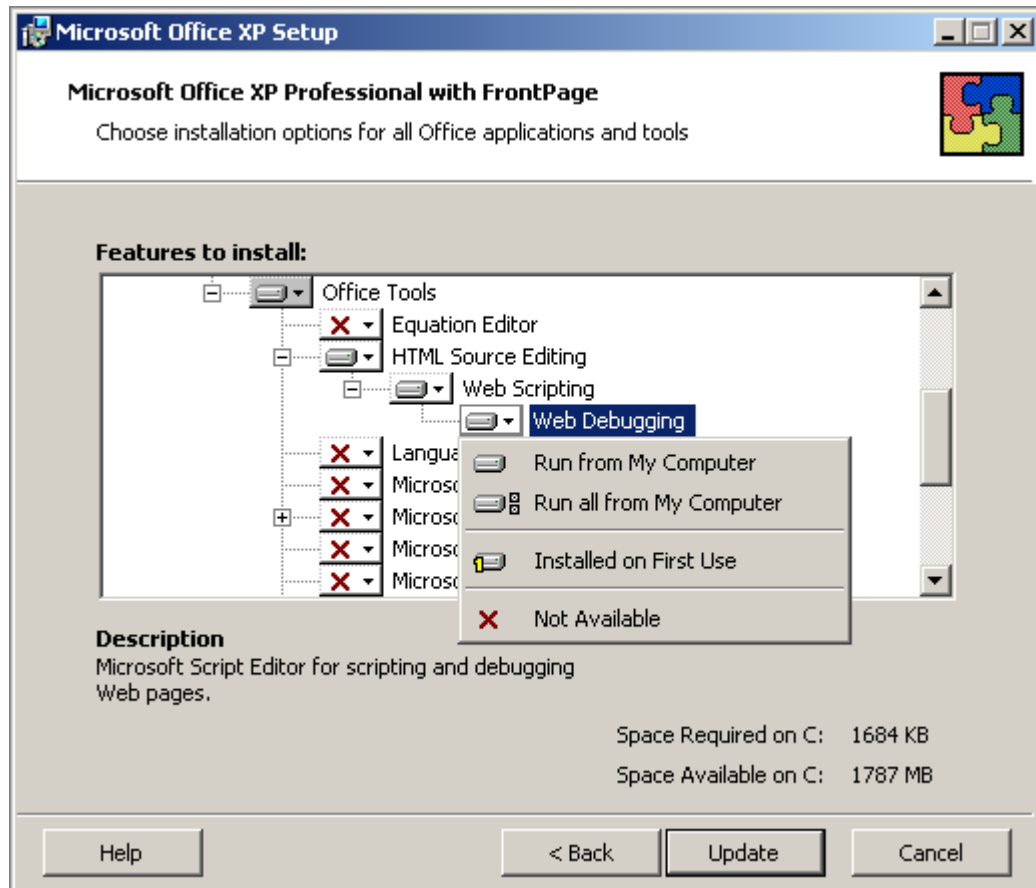

An installed debugger is started as follows:

- If a runtime error occurs during execution
- Via "Online > Simulate Runtime > With script debugger"

### Microsoft Script Editor

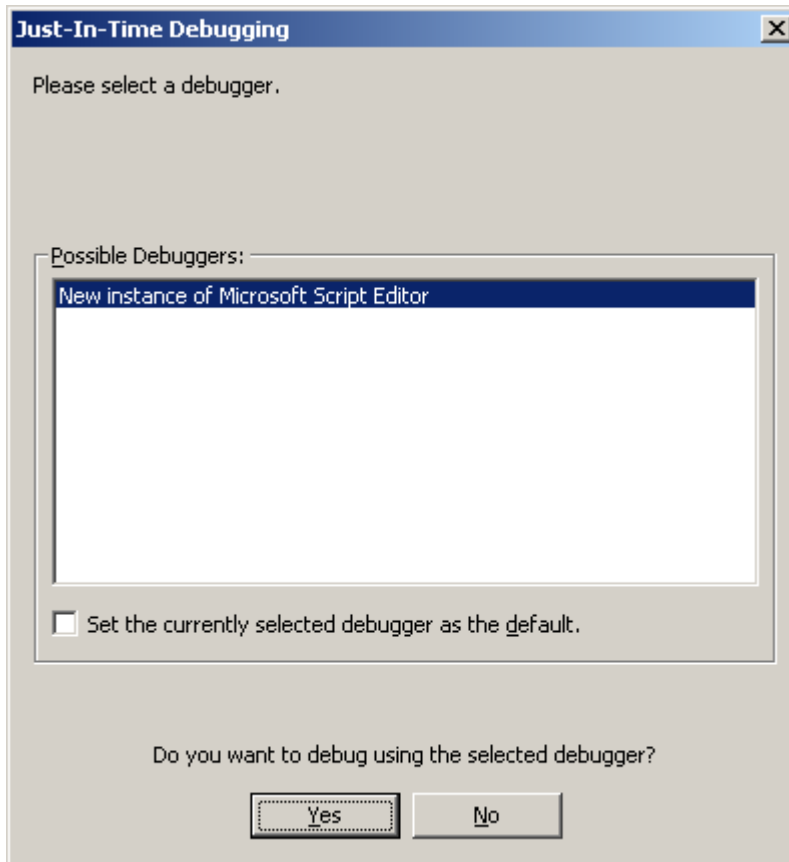

The Microsoft Office XP component "Microsoft Script Editor" contains a Script Debugger. If the default configuration was installed by Microsoft Office Setup, the "Microsoft Script Editor" component is not installed until called the first time ("Installed on First Use"). If you wish to explicitly install these components, you must specify it in the Microsoft Office setup. Select the

component selection menu, click "Web Debugging" component and then select the "Run from My Computer" option.

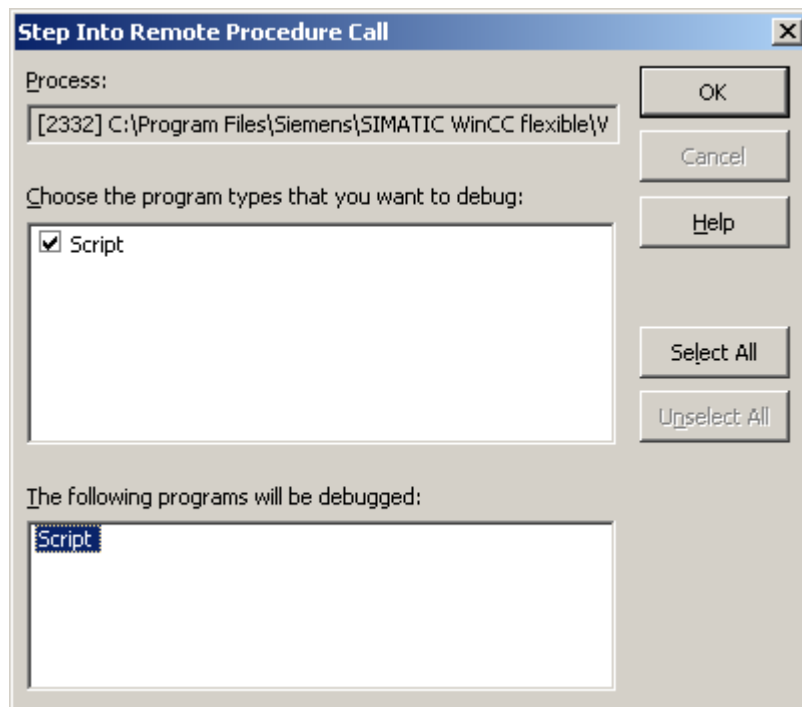

If a project is activated in WinCC via "Online > Simulate Runtime > With script debugger", a dialog containing the list of available script debuggers appears when the first user-defined function is run.

Other installed script debuggers such as "Microsoft Visual Interdev" or "Microsoft Visual Studio .NET" may also appear in the list. Select "Microsoft Script Editor" and confirm your selection with "Yes".

Activate the "Script" program object in the "Step Into Remote Procedure Call" dialog and confirm your selection with "OK".

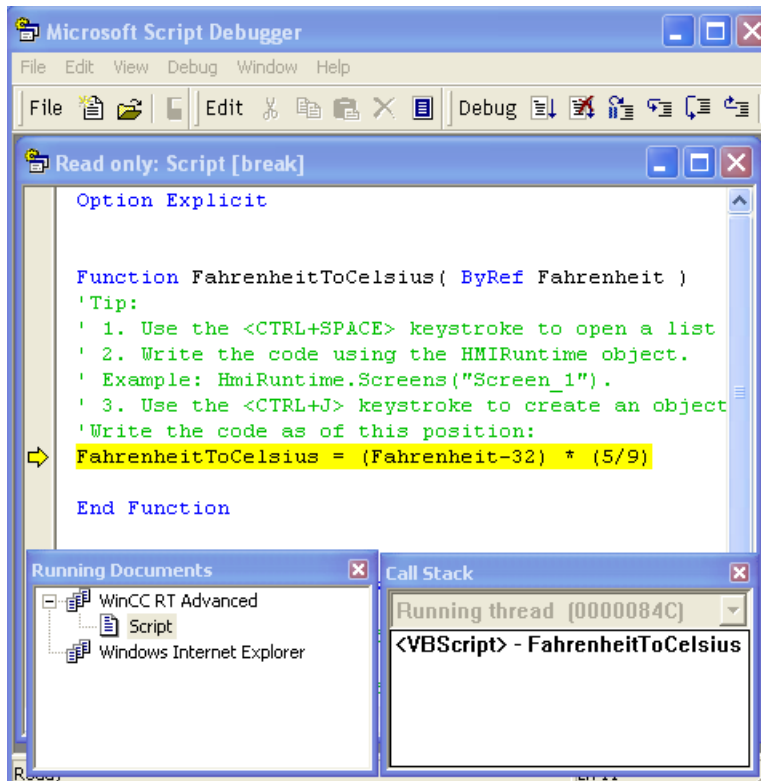

The "Microsoft Script Editor" is launched. The execution pauses at the first line of the first function.

## Microsoft Script Debugger

If a script debugger is not available, download "Microsoft Script Debugger" (scd10en.exe) free of charge from Microsoft (www.microsoft.com). It will be started automatically in WinCC once it is installed.

### Note

The "Microsoft Script Debugger" can no longer be called or installed when another VBScript-capable script debugger is available on your computer.

## Script Debugger is not started at the start of Runtime

If you installed a script debugger and the "Start Runtime with Script Debugger" command still fails to start it, make the following settings in the Windows registry to set Microsoft Script Debugger as default Just-In-Time (JIT) Debugger:

- "HKEY\_CLASSES\_ROOT\CLSID\{834128A2-51F4-11D0-8F20-00805F2CD064}"  
(Default)="ScriptDebugSvc Class"  
"AppID"="{A87F84D0-7A74-11D0-B216-080000185165}"
- [HKEY\_CLASSES\_ROOT\CLSID  
\{834128A2-51F4-11D0-8F20-00805F2CD064}\LocalServer32]  
(Default)="c:\\Program Files\\Microsoft Script Debugger\\msscldb.exe"

- [HKEY\_CLASSES\_ROOT\CLSID\{834128A2-51F4-11D0-8F20-00805F2CD064}\ProgID] (Default)="ScriptDebugSvc.ScriptDebugSvc.1"
- [HKEY\_CLASSES\_ROOT\CLSID\{834128A2-51F4-11D0-8F2000805F2CD064}\VersionIndependentProgID] (Default)="ScriptDebugSvc.ScriptDebugSvc"

The "LocalServer32" file path must point to the installation folder of Microsoft Script Debugger. If you have installed Microsoft Script Debugger in a different folder, adapt the path information.

### 10.8.4.3 Starting and stopping the debugger

#### Requirement

- VBScript-capable debugger (e.g., MS Script Debugger) and WinCC Runtime are installed on the configuration PC.
- Project is open.

#### Starting the debugger

To start the debugger, proceed as follows:

1. Select the HMI device and then select the "Online > Simulation > With script debugger" menu command.  
The Runtime software searches for debuggers installed on the configuration PC.

2. If several debuggers are found click on the one required.

Or:

1. Click "Start > Run".
2. Enter the following command: "HmiRtm /ScriptDebug /<ProjectFile>".  
Further information about the project file can be found in "Starting Runtime Advanced and Panels (Page 5988)".

Or:

1. Select the "debug" command in the project file shortcut menu in the Windows Explorer.

#### Result

The debugger is connected automatically with the runtime software.

#### Stopping the debugger

The debugger is not closed automatically when you close the Runtime software. Therefore, close the debugger separately.

## 10.8.5 Runtime behavior in Runtime

### 10.8.5.1 Executing a function list in Runtime

#### Principle

A function list is executed from top to bottom in Runtime. A distinction is made between synchronous and asynchronous execution, so that no waiting periods ensue during execution. The distinction is made by the system by evaluating the different runtimes of the system functions. User-defined functions are always executed synchronously independent of the runtime. If a system function returns an error status, the execution of the function list is cancelled.

#### Synchronous execution

During synchronous execution, the system functions in a function list are executed one after the other. The previous system function must be finished before the next system function can be executed.

#### Asynchronous execution

System functions that perform file operations such as saving and reading have a longer runtime than system functions that, for example, set a tag value.

Therefore, system functions with longer runtimes are executed asynchronously. For example, while a system function is writing a recipe data record to a storage medium, the next system function is already being executed. Due to the parallel execution of system functions, waiting periods at the HMI device are avoided.

### 10.8.5.2 Executing user-defined functions in Runtime

#### Principle

Only one user-defined function at a time is executed in Runtime. If several user-defined functions are waiting to be executed, they are lined up in a queue and executed one after the other.

---

#### Note

A loop in a user-defined function therefore blocks the execution of the other functions in the queue even if the functions were initiated asynchronously.

---

WinCC supports a maximum nesting depth of eight user-defined functions. Note that the nesting depth is not checked.

---

**Note**

If a user-defined function is configured for the "Runtime stop" event, the only system functions that may be used in this user-defined function are those which are available at the "Runtime stop" event.

Ensure that the ending of the Runtime is not interfered with by the execution of the user-defined function.

---

**Note****Configuration of user-defined functions**

During configuration make sure that not too many user-defined functions are activated at the same time. Avoid a continuous system load of 100%.

User-defined functions are processed at a lower priority so as not to interfere with the display of values and operability. If system utilization is extreme, the user-defined functions to be executed are therefore first only reserved for execution. The maximum size of the reservation list is dependent on the HMI device and is limited by the maximum permitted number of user-defined functions. For additional information, see the performance features. If more user-defined functions are activated at one time than can be reserved, excess calls are discarded and a system alarm displayed.

---

### HMI device changeover

If you use system functions in a customized function which are not available on the set HMI device, you get a warning. In addition, the corresponding system function in the user-defined function will be underlined with a wavy blue line.

### See also

Runtime Stop (Page 4122)

### 10.8.5.3 Processing sequence for user-defined functions and system functions

 **WARNING**

Adherence to the expected processing sequence for user-defined functions and system functions in Runtime cannot always be guaranteed. This fact may lead to unexpected operating states.

Please note the following description in which the correlations are explained. Instructions for a solution are available under "Remedy".

### Use of user-defined functions for events

It is not always possible to adhere to the processing sequence for user-defined functions and system functions expected in the configuration, for example, when the processing of a user-defined function lasts beyond the trigger time of a subsequent event. In this case, system functions that are configured for the following event may be executed before the system functions that were configured with the user-defined function for the same event.

### Background

User-defined functions are arranged in a low-priority queue. The queue is processed in sequence. If system functions and user-defined functions are configured for an event, all system functions and user-defined functions configured for this event are executed in this queue.

### Example

On a button, you have configured:

	Event	Functions
	Press	User-defined function (1) SetBit(Tag) (2)
	Release	ResetBit(Tag) (3)

- (1) Execution time of the user-defined function
- (2) Execution time of system function SetBit(Tag)
- (3) Execution time of system function ResetBit(Tag)

A: Expected execution of the user-defined function and system functions in the configuration.

When you press the button, user-defined function (1) and then system function SetBit(Tag) (2) are executed. When you release the key, system function ResetBit(Tag) (3) is then executed.

B: Processing of the user-defined function is not yet complete when you release the key.

When you press the key, the user-defined function (1) is then executed. The execution of the user-defined function (1) is not yet complete and you have already released the key. System function ResetBit(Tag) (3) interrupts the execution of the function. In this case, system function ResetBit(Tag) (3) is executed before system function SetBit(Tag) (2). As a result, the bit remains placed.

System function "SetBitWhileKeyPressed" shows the same behavior, if the system function is configured together with user-defined functions.

## Remedy

The processing sequence of the previous Example A is adhered to, if you additionally configure a user-defined function for the "Release" event. The user-defined function does not require functionality for this purpose.

	Event	Functions
	Press	User-defined function (1) SetBit(Tag) (2)
	Release	User-defined function_2 (3) ResetBit(Tag) (4)

### Note

Make sure that the user-defined function queue does not overflow; otherwise the system function for the following event may not be executed.

An overflow is recognizable by "Overload: Script <name> is rejected" or "Adherence to the expected processing order for user-defined functions and system functions in Runtime cannot always be ensured".

## 10.8.5.4 Making object properties dynamic in Runtime

### Introduction

You can use user-defined functions to access object properties of screen objects as well as tags in Runtime. If you use a user-defined function to change values of object properties, this will not affect the project data.

### Changes to object properties

If you use a user-defined function in Runtime to change an object property of a screen element, this change will only remain effective while the screen is active. If you change to the screen, or reload the screen, the configured object properties are displayed once more.

### Language switching

If you switch the language in Runtime, the foreign language labels are loaded from the project data. If you use a user-defined function to change texts, the texts changed by the user-defined function are overwritten again.

## 10.8.6 Examples

### 10.8.6.1 Example: Converting Fahrenheit into degrees Celsius

#### Scheduled task

In this example, create a user-defined VB function which converts the values of a temperature sensor from Fahrenheit to degrees Celsius. The temperature is displayed in an output field on the HMI device.

#### Settings

For the example you need two HMI tags and a user-defined VB function with the following settings:

HMI tags:

Name	PLC connection	Type
Fahrenheit	Yes	Real
Centigrade	No	Real

User-defined VB function:

Name	Type	Parameters
FahrenheitToCelsius	Function	Fahrenheit

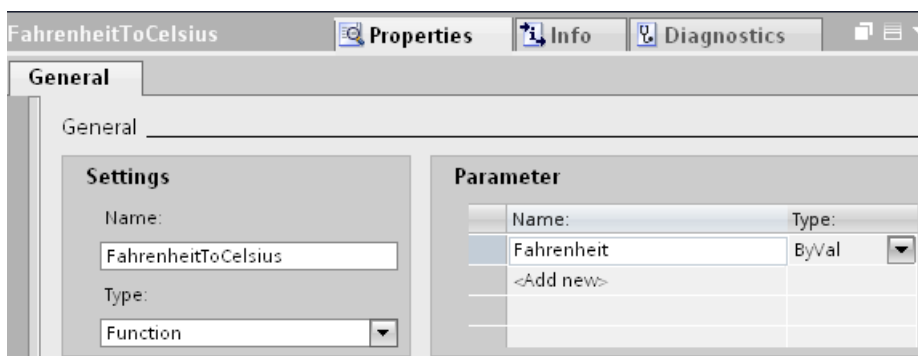

## Procedure

1. Create the two HMI-tags "Fahrenheit" and "Celsius" with the settings named above.

HMI tags			
	Name	Data type	Connection
<BI>	Fahrenheit	Real	Connection_1
<BI>	Celsius	Real	<Internal tag>

2. Create the user-defined VB function "FahrenheitToCelsius" with the settings given above.

3. Write the following VBS code:

```
FahrenheitToCelsius = (Fahrenheit-32) * (5/9)
```

```

1 Function FahrenheitToCelsius( ByVal Fahrenheit )
2     FahrenheitToCelsius = (Fahrenheit-32) * (5/9)
3 End Function

```

## Interim result

The HMI tags and the VB user-defined function are created.

## Procedure

1. Open the "HMI Tag" editor and click on the "Fahrenheit" tag.
2. Click the "Properties > Events" tab in the Inspector window. Select the "Value change" event.
3. Configure the user-defined VB function "FahrenheitToCelsius" to the "Value change" event.
4. Select the tag "Fahrenheit" for the parameter "Fahrenheit".
5. Select the HMI-tag "Celsius" for the return value "Fahrenheit to Celsius".
6. Configure an output field in a screen and connect it with the tag "Celsius".

## Alternative procedure

Instead of using a user-defined VB function of the "Function" type, you can also use the "Sub" type. In this case, assign the converted value directly to the HMI-tag "Celsius".

```
SmartTags("Celsius") = (Fahrenheit-32) * (5/9)
```

In this case the return value of the user-defined VB function is not applicable.

## Result

When the tag value of "Fahrenheit" changes in Runtime, the user-defined VB function "Fahrenheit to Celsius" is performed. The converted temperature value is returned to the HMI-tag "Celsius" and displayed in the output field.

### 10.8.6.2 Example: Converting inches into meters

#### Scheduled task

In this example you create a user-defined VB function that converts the value of a length measuring system from inches into meters. The length in meters is displayed on the HMI device in an output field.

#### Settings

For the example you need two HMI tags and a user-defined VB function with the following settings:

HMI tags:

Name	PLC connection	Type
VarInch	Yes	Real
VarMeter	No	Real

Customized VB function

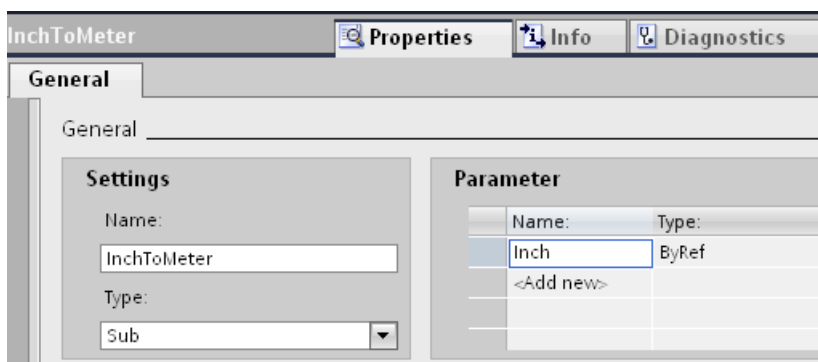

Name	Type	Parameters
InchToMeter	Sub	Inch

## Procedure

1. Create the two HMI tags "VarInch" and "VarMeter" with the above settings.

HMI tags		
Name	Data type	Connection
VarMeter	Real	<Internal tag>
VarInch	Real	Connection_1

2. Create the user-defined VB function "InchToMeter" with the settings given above.

3. Write the following VBS code:

```
VarMeter = Inch*0.0254
```

```
1 Sub InchToMeter (ByRef Inch)
2 VarMeter = Inch*0.0254
3 End Sub
```

## Interim result

The tags and the user-defined VB function are created.

## Procedure

1. Open the "HMI tags" editor and click the "VarInch" tag.
2. Click "Properties> Events" in the Inspector window. Select the "Value change" event.
3. Configure the user-defined VB function "InchToMeter" to the "Value change" event.
4. Select the "VarInch" HMI tag for the "Inch" parameter.
5. Configure an output field in a screen and connect it with the "VarMeter" HMI tag.

## Result

When the tag value of "VarInch" changes in Runtime, the "InchToMeter" user-defined VB function is performed. The calculated value is written into the "VarMeter" HMI tag and displayed in the output field.

### 10.8.6.3 Example: Changing the operating mode on the HMI device with the current display

#### Scheduled task

In this example, you use the "SetDeviceMode" system function to switch between the "online" and "offline" modes on the HMI device. You also display the current set operating mode on the HMI device.

#### Requirements

A screen has been created.

#### Settings

For this example you require a HMI-tag and a text list with the following settings:

HMI tag:

Name	PLC connection	Type
OperatingMode	No	Bool

Text list:

Name	Contains	Values
ShowOperatingMode	Bit (0/1)	1: Operating mode: "Online" 0: Operating mode: "Offline"

#### Procedure

1. Create the "OperatingMode" HMI-tag indicated above.

HMI tags		
Name	Data type	Connection
OperationMode	Bool	<Internal tag>

2. Create the "ShowOperatingMode" text list indicated above.

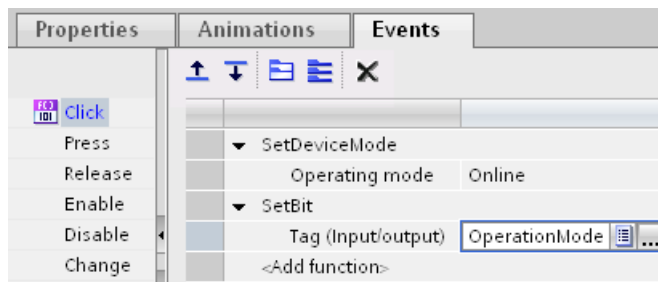

Text lists	
Name	Selection
ShowOperatingMode	Bit (0, 1)
<Add new>	

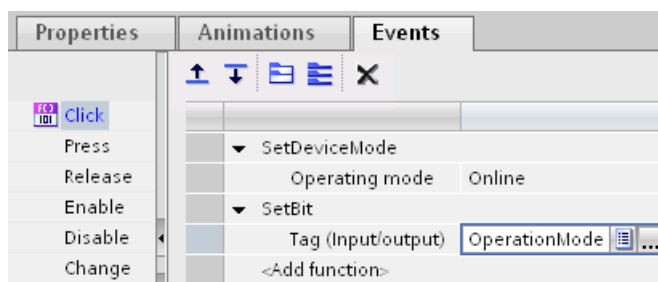

Text list entries	
Value	Text
0	Operating mode: "Offline"
1	Operating mode: "Online"

3. Open the screen and insert a button for which you configure the operating mode change to "online".
4. Click "Properties> Events" in the Inspector window. Select the "Press" event.

5. Configure the "SetDeviceMode" system function for the "Press" event. The system function is found in the selection list under "Settings".
6. For the "Mode" parameter, select the "Online" entry.
7. Configure the system function "SetBit" on the event "Press". The system function is found in the selection list under "Bit processing".
8. Select the HMI-tag "Operating mode" from the selection list for the parameter "Tag".

9. Add a button in the process screen for which you configure the operating mode change to "offline".
10. Repeat steps four to seven. For the "Mode" parameter, select the "Offline" entry. Configure the system function "ResetBit" in place of the system function "SetBit."

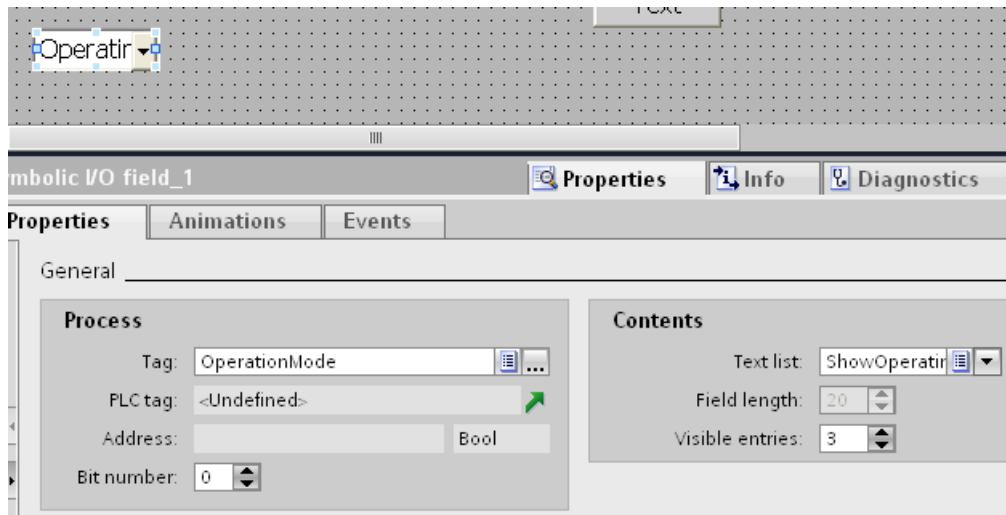

### Interim result

You can toggle the operating mode of the HMI device with the two buttons in Runtime.

You want to display the current set operating mode in an output field on the HMI device.

## Procedure

1. Create a "Symbolic I/O field" in the process image. Click "Properties > Properties" in the Inspector window.
2. Make the following settings in the "General" group:
  - Select "Output" as the "Mode".
  - Select the text list "Show operating mode" as "Text list".
  - Select "Operating mode" as "Tag".

## Result

When you change the operating mode with the buttons, the currently set operating mode on the HMI device is always shown.

## 10.8.7 Reference

### 10.8.7.1 Function list

#### Availability for specific devices of system functions

#### System functions for Basic Panels

#### Availability of system functions

The following table shows the availability of the system functions on the Basic Panels.

Technical data subject to change.

- 1) only with keyboard units
- 2) only with touch screen devices
- 3) only with PROFINET Bus (PN devices)

- 4) only with TP 177B
- 5) Only for TP 177B 4" PN/DP

## System functions for Multi Panels

### Availability of system functions

The following table shows the availability of the system functions on the Multi Panels.

Technical data subject to change.

### Overview

	MP 177	MP 277	MP 377
User-defined functions	No	Yes	Yes
Logoff (Page 3946)	Yes	Yes	Yes

## System functions for Runtime Advanced

### Availability of system functions

The following table shows the availability of the system functions for WinCC RT Advanced.

Technical data subject to change.

### Overview

	WinCC RT Advanced
User-defined functions	Yes
Logoff (Page 3946)	Yes
ActivateScreen (Page 3947)	Yes
ActivateScreenByNumber (Page 3948)	Yes
ActivateCleanScreen (Page 3949)	Yes
ActivateSystemDiagnosticsView (Page 4067)	No
ActivatePreviousScreen (Page 3950)	Yes
UpdateTag (Page 3951)	Yes
AdjustContrast (Page 3951)	No
Logon (Page 3952)	Yes
ArchiveLogFile (Page 3953)	Yes
LogTag (Page 3955)	Yes
EditAlarm (Page 3955)	Yes
ScreenObjectCursorDown (Page 3956)	Yes
ScreenObjectCursorUp (Page 3957)	Yes
ScreenObjectPageDown (Page 3957)	Yes
ScreenObjectPageUp (Page 3958)	Yes
Encode (Page 3959)	Yes
EncodeEx (Page 3960)	Yes
DirectKey (Page 3961)	No
DirectKeyScreenNumber (Page 3963)	No
PrintScreen (Page 3964)	Yes
PrintReport (Page 3965)	Yes

	WinCC RT Advanced
NotifyUserAction (Page 3965)	Yes
IncreaseFocusedValue (Page 3967)	Yes
IncreaseTag (Page 3967)	Yes
ExportDataRecords (Page 3968)	Yes
ExportDataRecordsWithChecksum (Page 3970)	No
ExportImportUserAdministration (Page 3973)	Yes
GoToHome (Page 3974)	Yes

ShowSystemAlarm (Page 4080)	Yes

## System functions

### Logoff

#### Description

Logs off the current user on the HMI device.

### Use in the function list

Logoff

### Use in user-defined functions

Logoff

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

--

### See also

Availability for specific devices of system functions (Page 3910)

## ActivateScreen

### Description

Performs a screen change to the given screen.

Use the "ActivateScreenByNumber" system function to change from the root screen to the permanent window or vice versa.

### Use in the function list

ActivateScreen (Screen name, Object number)

### Use in user-defined functions

ActivateScreen (Screen\_name, Object\_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### Screen name

Name of the screen to which you change.

#### Object number

The operator control element which receives the focus in the given screen after the screen change. The number of the operator control element is to be determined using the tabulator sequence during configuration.

When "0" is specified:

- If the focus is in the permanent window when the system function is called up, the permanent window maintains the focus.
- If the focus is in the root screen when the system function is called up, the first operator control element in the given screen receives the focus.

---

**Note**

If the "Reach margin" event is assigned to the "ActivateScreen" system function, only the value "0" is valid for the "Object number" parameter. The active object is not defined by the object number, but rather by the X position it had prior to the screen change.

---

## Example

The ActivateScreen function is used in the following program code to activate the "Screen\_2" screen when you click a button.

```
{  
  
// User defined code  
// i.e. when pressing a button  
ActivateScreen ("Screen_2", 0);  
...  
}
```

## See also

[ActivateScreenByNumber \(Page 3948\)](#)

[Availability for specific devices of system functions \(Page 3910\)](#)

## ActivateScreenByNumber

### Description

Performs a screen change to a screen depending on a tag value.

The screen is identified by its screen number.

### Use in the function list

[ActivateScreenByNumber \(Screen number, Object number\)](#)

### Use in user-defined functions

[ActivateScreenByNumber \(Screen\\_number, Object\\_number\)](#)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Screen number

Tag which contains the screen number of the destination screen.

When a change from the root screen to the permanent window is desired, "0" or "-1" is specified:

0 = Change from root screen to permanent window

-1 = Change from permanent window to root screen

### Object number

The number of the screen object which receives the focus in the given screen after the screen change. The number of the operator control element is to be determined using the tabulator sequence during configuration.

When "0" is specified:

- If the focus is in the permanent window when the system function is called up, the permanent window maintains the focus.
- If the focus is in the root screen when the system function is called up, the first operator control element in the given screen receives the focus.

## See also

ActivateScreen (Page 3946)

Availability for specific devices of system functions (Page 3910)

## ActivateCleanScreen

### Description

Activates the clean screen on the HMI device. The display of the HMI device is disabled for the given time period.

When the display of the HMI device is deactivated, it can be cleaned without triggering touch functions by mistake.

### Use in the function list

ActivateCleanScreen (Time period)

### Use in user-defined functions

--

## Parameters

### Time period

Time period for which the display is disabled. The time remaining is displayed as a progress bar.

Value range in seconds from 10 through 300.

---

### Note

The system function ActivateCleanScreen cannot be simulated.

---

## See also

Logoff (Page 3945)

Availability for specific devices of system functions (Page 3910)

## ActivatePreviousScreen

### Description

Performs a screen change to the screen which was activated before the current screen. The screen change is not performed if no screen was activated beforehand.

The last 10 screens that were called up are saved. A system alarm is output when you change to a screen which is no longer saved.

---

### Note

If you want to use the system function, the screen to which you change has to be used in the navigation structure.

---

## Use in the function list

ActivatePreviousScreen

## Use in user-defined functions

ActivatePreviousScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

--

## See also

Availability for specific devices of system functions (Page 3910)

## UpdateTag

## Description

Reads the current value of the tag with the specified Update ID from the PLC.

## Use in the function list

UpdateTag (Update ID)

## Use in user-defined functions

-

## Parameters

### Update ID

Update ID assigned to the tag that will be updated.

## See also

Availability for specific devices of system functions (Page 3910)

Logoff (Page 3945)

## AdjustContrast

## Description

Changes the contrast of the display one level on the HMI device.

## Use in the function list

AdjustContrast (Adjust)

## Use in user-defined functions

-

## Parameters

### Adjust

Specifies how the contrast is changed:

0 (hmiDecrease) = Decrease: Decreases the contrast one level.

1 (hmiIncrease) = Increase: Increases the contrast one level.

## Application example

### Objective

One button each for increasing and decreasing the screen contrast is desired.

### Notes on configuring

Configure two buttons and configure the "AdjustContrast" system function on the "Press" event. The parameters "Increase" and "Decrease" are allocated.

### Procedure on HMI device

When one of the two buttons is pressed in runtime, the contrast is increased or decreased one level.

## See also

Logoff (Page 3945)

Availability for specific devices of system functions (Page 3910)

## Logon

### Description

Logs on the current user on the HMI device.

### Use in the function list

Logon (Password, User name)

### Use in user-defined functions

Logon (Password, User\_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Password

The tag from which the password for the user logging on is read.

If the user is logged on, the password in the tag is deleted.

### User name

The tag from which the user name for the user logging on is read.

## See also

Availability for specific devices of system functions (Page 3910)

## ArchiveLogFile

### Description

This system function moves or copies a log to another storage location for long-term logging.

With Audit Trails, always use the "Move" (hmiMove) mode, otherwise you will be violating the FDA guideline by duplicating the data stored.

Prior to "ArchiveLogFile" always run the system function "CloseAllLogs".

After this system function, run the "OpenAllLogs" system function.

In "Copy log" mode, the logs are not reopened until the log has been successfully copied, or unless a timeout occurs during the copy process. In "Move log" mode, the logs to be moved are renamed and the new logs are opened immediately. To move the renamed logs, a job is submitted which attempts to move them every 300 seconds if the server cannot be reached. The job is also retained after Runtime is restarted until it is executed.

### Use in the function list

ArchiveLogFile (Log type, Log, Directory name, Mode)

### Use in user-defined functions

ArchiveLogFile (Log\_type, Log, Directory\_name, Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (miAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail log available for GMP compliant projects. Additional information is available under "Activating GMP-compliant configuration".

### Log

Name of the log being archived.

### Directory name

Path for saving the log.

### Mode

0 (hmiCopy) = Copy log

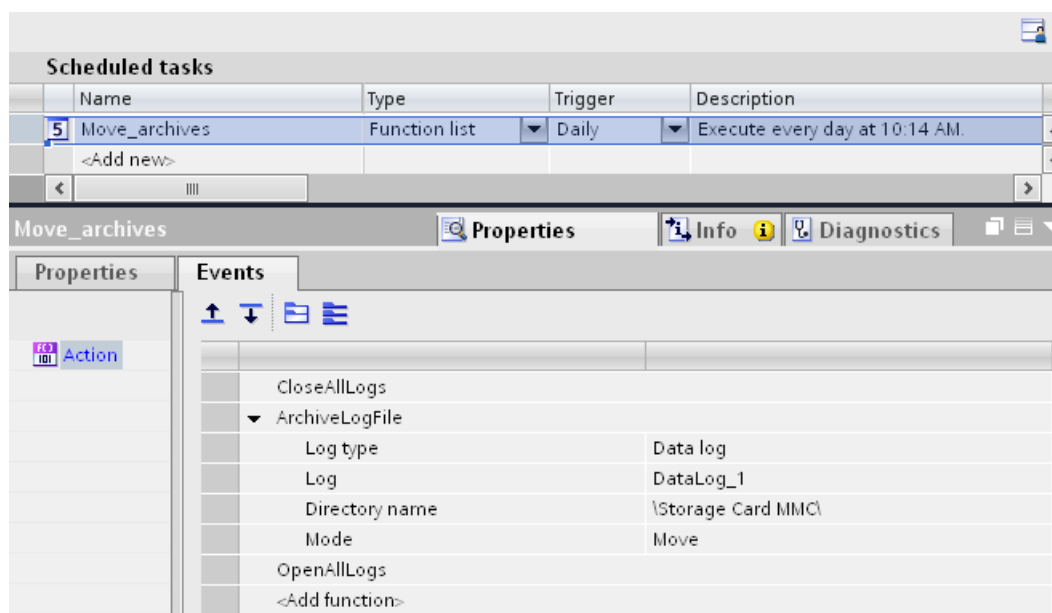

1 (hmiMove) = Move log

## Application example

You want to move a log file from a local storage medium to the server in order to generate a backup copy of this file at cyclic intervals.

### Notes on configuring

Set up a task in the scheduler which is executed at a specific time on a daily basis. Configure the following function list for the task:

### Procedure on HMI device

- All log files will be closed.
- The log file you specified is moved to the server.
- All closed log files will be opened again.

### See also

Availability for specific devices of system functions (Page 3910)

## LogTag

### Description

Saves the value of the given tags in the given data log.

This system function is used to archive a process value at a certain point in time.

### Use in the function list

LogTag (Tag)

### Use in user-defined functions

-

### Parameters

#### Tag

The tag whose value is logged. The tag is stored in the log which is configured for the specified tag.

### See also

Availability for specific devices of system functions (Page 3910)

## EditAlarm

### Description

Triggers the "Edit" event for all selected alarms.

If the alarms to be edited have not yet been acknowledged, the acknowledgment takes place automatically when this system function is called up.

This system function can only be used for function keys.

### Use in the function list

EditAlarm

### Use in user-defined functions

EditAlarm

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

--

### See also

Availability for specific devices of system functions (Page 3910)

## ScreenObjectCursorDown

### Description

Results in a line-by-line, downward cursor movement in the specified screen object.

The system function can be used for the following screen objects:

- User view
- Alarm view
- Recipe view

### Use in the function list

ScreenObjectCursorDown (Screen object)

### Use in user-defined functions

-

### Parameters

#### Screen object

Name of the screen object in which the key function is triggered.

### See also

Availability for specific devices of system functions (Page 3910)

## ScreenObjectCursorUp

### Description

Results in a line-by-line, upward cursor movement in the specified screen object.

The system function can be used for the following screen objects:

- User view
- Alarm view
- Recipe view

### Use in the function list

ScreenObjectCursorUp (Screen object)

### Use in user-defined functions

-

### Parameters

#### Screen object

Name of the screen object in which the key function is triggered.

### See also

Availability for specific devices of system functions (Page 3910)

## ScreenObjectPageDown

### Description

Results in a page-by-page, downward cursor movement in the specified screen object.

The system function can be used for the following screen objects:

- User view
- Alarm view
- Recipe view

### Use in the function list

ScreenObjectPageDown (Screen object)

**Use in user-defined functions**

-

**Parameters****Screen object**

Name of the screen object in which the key function is triggered.

**See also**

Availability for specific devices of system functions (Page 3910)

**ScreenObjectPageUp****Description**

Results in a page-by-page, upward cursor movement in the specified screen object.

The system function can be used for the following screen objects:

- User view
- Alarm view
- Recipe view

**Use in the function list**

ScreenObjectPageUp (Screen object)

**Use in user-defined functions**

-

**Parameters****Screen object**

Name of the screen object in which the key function is triggered.

**See also**

Availability for specific devices of system functions (Page 3910)

## Encode

### Description

Adapts the "String" data type of a tag for transfer to the automation system (AS). The tag of WinCC data type "String" is converted into the AS data type "Array of byte". The result is written to a tag.

### Use in the function list

Encode (Byte array, String, Coding)

### Use in user-defined functions

Encode (Byte\_array, String, Encoding)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Byte array

The tag that contains the converted value.

---

#### Note

The Byte array must be twice the size of the string length + 2. The Byte array must contain 242 array elements if the string has a length of 120 characters.

Characters are either truncated or not converted if the size is insufficient.

---

#### String

The tag of data type "String" that is converted.

#### Encode

0 (hmiEncodeUTF16LE) - String is encoded in UTF16LE (Unicode 16 Little Endian).

### See also

Availability for specific devices of system functions (Page 3910)

## EncodeEx

### Description

Adapts the "String" data type of a tag for transfer to the automation system (AS). The tag of WinCC data type "String" is converted into the AS data type "Array of byte". The result is written to a tag.

By contrast to the Encode system function, you can define the Line break parameter. Using the Line break parameter you can delete line breaks or replace these with predefined characters.

### Use in the function list

EncodeEx (Byte array, String , Encode , Line break)

### Use in user-defined functions

EncodeEx (Byte\_array, String, Encoding, Line\_break)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Byte array

The tag that contains the converted value.

---

#### Note

The byte array must be twice the size of the string length +2. If the string has a length of 120 characters, the byte array must contain 242 array elements.

Characters are either truncated or not converted if the size is insufficient.

---

#### String

The tag of data type "String" that is converted.

#### Code

0 (hmiEncodeUTF16LE) - String is encoded in UTF16LE (Unicode 16 Little Endian).

#### Line break

All line breaks are either deleted or replaced with predefined characters. Do not replace line breaks if set as the default value.

0 (replace with "\r\n" (0x000D, 0x000A)) - the line break is replaced with "\r\n".

1 (replace with "\n" (0x000A)) - the line break is replaced with "\n".

2 (do not replace) - the line break is not replaced.

3 (remove line breaks) - the line breaks are removed.

## See also

Availability for specific devices of system functions (Page 3910)

## DirectKey

## Description

Allows rapid operation of keys on an HMI device without having communication caused delays occur.

Use this system function, for example, to set bits in the I/O area of a SIMATIC S7 directly from the HMI device.

---

### Note

If you have integrated WinCC in SIMATIC STEP 7 and have configured a DP area in SIMATIC STEP 7: When the button on which the system function was configured is activated, a bit is set in the IO area of the CPU. Releasing the button resets the bit.

---

## Notes on configuring the system function

When a button is configured with the "DirectKey" system function, a fixed area of the touch display is reserved for DirectKey operation.

Screen objects that are above the button with the "DirectKey" system function in this area in runtime will hide the button visually. However, the screen objects do not interfere with the triggering of the "DirectKey" system function.

---

### Note

If an external application, such as Pocket Internet Explorer or Control Panel is started, it will run in the foreground and Runtime is placed in the background. The bit for the "DirectKeyScreenNumber" function is no longer set and the keys or buttons which are assigned the "DirectKey" function no longer to trigger the associated bit in the PLC.

---

### WARNING

Triggering the "DirectKey" system function by mistake will endanger personnel or result in damage to the machine.

In order to avoid this danger, the following must be observed:

- When the process screen is configured, the button with the "DirectKey" system function must not be covered by a screen object.
- The dynamic positioning or display (release) of a screen object in relation to process values must not cover the button with the "DirectKey" system function in runtime.

---

**Note**

Please observe this guideline during configuration. Check also existing configurations and adjust them immediately.

---

In the following cases, the covering of a button with the "DirectKey" system function does not lead to the problems described above:

- Operation of the alarm window
- Operation of the Recipe view
- Cancellation of the screen saver
- Use of the screen keyboard
- Running the "ActivateCleanScreen" system function

### Actions of DP direct-keys in offline operation

When the "ChangeConnection" system function is performed with the "Offline" parameter on the HMI device, the connection to the specified PLC is disconnected.

---

**Note**

Please note the following on the SIMATIC STEP 7 side as well as the WinCC side:

The DP DirectKeys are still active in this case. If you activate a button with the "DirectKey" system function in "Offline" operating mode or activate the DirectKey on a keyboard device, the corresponding bit is set in the PLC.

---

### Use in the function list

DirectKey (Bit)

### Use in user-defined functions

-

### Parameters

**Bit**

Specifies the bit which is set. Depending on the HMI device, the bit numbers 0 to 31 or 0 to 39 are possible.

## Application example

### Objective

You want to set bits in the IO area of a SIMATIC S7 directly from the HMI device using a button.

### Requirement

WinCC integrated in SIMATIC STEP 7 is installed.

During operation, the HMI device is coupled to a SIMATIC S7 through PROFIBUS-DP.

WinCC integrated was installed when you compiled your project.

The bit area for DirectKeys is determined in SIMATIC STEP 7. For configuration see the "Communication" user's manual.

### Notes on configuring

Configure the button to be used as the DirectKey. Assign the "DirectKey" system function to the button. As a parameter, enter the number of the bit which is set when the key is pressed.

### Procedure on HMI device

When the DirectKey is touched, the bit is set, and reset when the key is released or the screen is exited.

## See also

Availability for specific devices of system functions (Page 3910)

## DirectKeyScreenNumber

### Description

Sets the bit within the given bit area of a DirectKey and transfers it to the S7 controller to which the HMI device is connected. This ensures unambiguous allocation of a control bit to screen number at all times.

Without the use of the system function, the S7 controller must distinguish the respective functionality by means of the screen number. This delays the updating of the screen number after a screen change.

---

### Note

If an external application, such as Pocket Internet Explorer or Control Panel is started, it will run in the foreground and Runtime is placed in the background. Nevertheless, the bit for the "DirectKeyScreenNumber" function is set and the keys or buttons with the configured "DirectKey" function continue to trigger the associated bit in the PLC.

---

## Use in the function list

DirectKeyScreenNumber (Bit)

**Use in user-defined functions**

-

**Parameters****Bit**

Specifies the bit which is set. Depending on the HMI device, the bit numbers 0 to 31 or 0 to 39 are possible.

**See also**

Availability for specific devices of system functions (Page 3910)

**PrintScreen****Description**

Prints the screen currently being displayed on the HMI device from the printer which is connected to the HMI device.

Opened windows are also printed.

---

**Note**

The printer settings are taken over from the current settings in the Windows operation system.

---

**Use in the function list**

PrintScreen

**Use in user-defined functions**

PrintScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

--

**See also**

Availability for specific devices of system functions (Page 3910)

## PrintReport

### Description

Prints the given report from the printer which is connected to the HMI device. The report is printed in the language which is set on the HMI device.

---

#### Note

If runtime is closed whilst log data are being printed using the system function, the report will cease to be supplied with data as soon as runtime stops.

---

### Use in the function list

PrintReport (Report)

### Use in user-defined functions

PrintReport (Report)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Report

Name of the report to be printed.

---

#### Note

If you have set up via the "Function list" dialog box a new report for the "PrintReport" function, when compiling, the following warning appears: "The report "Report\_1" has no printed pages."

In order to remedy the warning, open the "Report\_1" via the project view and recompile the project.

---

### See also

Availability for specific devices of system functions (Page 3910)

## NotifyUserAction

### Description

This system function is used to log user actions that are not automatically logged in the audit trail. You can also use this system function to require the user to enter an acknowledgment or an electronic signature and a comment for the operator action. Requirement for the use of the system function is that the GMP-compliant configuration is activated under "Runtime settings".

If you use the "NotifyUserAction" system function in a function, the debugger may open if you cancel your input by clicking "Cancel". To compensate for this reaction, you can use the "On Error Resume Next" statement in a function. With this instruction, the next instruction is executed after a runtime error. If you use the "On Error Resume Next" statement, output of system events is also suppressed.

### Use in the function list

NotifyUserAction (Confirmation type, Mandatory commenting, Category, Object name, Description)

### Use in user-defined functions

NotifyUserAction (Confirmation\_type, Mandatory\_commenting, Category, Object\_name, Description)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Confirmation type

Establishes how the action must be confirmed

0 = (None): No confirmation required, an entry is created in the audit trail

1 = (Acknowledgement): Acknowledgment, the user must acknowledge the action; an entry is created in the audit trail

2 = (Digital Signature): Electronic signature, a dialog window opens in which the user must enter his electronic signature - an entry is created in the audit trail

#### Mandatory commenting

Establishes if the user has to enter a comment. The comment is logged in the audit trail.

0 = (True): True; a dialog window opens in which the user must enter a comment

1 = (False): False; no mandatory commenting

#### Category

Category or class name of the modified object

#### Object name

Name of the modified object

#### Description

Text which describes the archiving user action.

## See also

Availability for specific devices of system functions (Page 3910)

## IncreaseFocusedValue

### Description

Adds the given value to the value of the tag which is connected to the input field (drop-down list, graphic selection list, slider bar) which has the current focus.

This system function can only be used for function keys.

### Use in the function list

IncreaseFocusedValue (Value)

### Use in user-defined functions

-

### Parameters

#### Value

The value which is added to the tag value.

## See also

Availability for specific devices of system functions (Page 3910)

## IncreaseTag

### Description

Adds the given value to the value of the tags.

$X = X + a$

---

#### Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, help tags must be used. You can use the "SetTag" system function to assign the tag value to the auxiliary tags.

---

If you configure the system function on the events of an alarm and the tag is not being used in the current screen, it is not ensured that the actual value of the tags is being used in the PLC. You can improve the situation by setting the "Cyclic continuous" acquisition mode.

**Use in the function list**

IncreaseTag (Tag, Value)

**Use in user-defined functions**

IncreaseTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Tag**

The tag to which the given value is added.

**Value**

The value that is added.

**See also**

Availability for specific devices of system functions (Page 3910)

SetTag (Page 4049)

**ExportDataRecords****Description**

Exports one or all data records of a recipe to a CSV file.

One file is created per recipe.

**Use in the function list**

ExportDataRecords (Recipe number/name, Data record number/name, File name, Overwrite, Output status message, Processing status)

**Use in user-defined functions**

ExportDataRecords (Recipe\_number/name,Data\_record number/name, File\_name, Overwrite, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Recipe number/name

Number or name of the recipe from which the data records are exported. Specify "0" if recipe data records are to be exported from all available recipes.

### File name

Name of the CSV file to which the recipe data records are exported. Enter the file location and the file extension (\*.csv), for example, "C:\TEMP\Orange.csv".

---

### Note

#### Storage of the CSV file

- If a storage card is used as storage location, specify the storage location as follows: "\StorageCard\".
  - If you only enter one file name and no path, the file will be saved in a system directory, for example, "C:\Documents and Settings\[User]".
  - When only one path for the export is specified, the file name is automatically created from the respective recipe name. It is a requirement that the folder "D:\Temp", for example, has been created. If the folder "D:\Temp" has not been created, the folder name will be used as the prefix of the file name, Temp\_Recipe names.csv.
- 

### Data record number/name

Number or name of the recipe data record to be exported. Specify "0" if all recipe data records are to be exported.

### Overwrite

Determines whether an existing CSV file with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: CSV file will not be overwritten. The export process will not be carried out.

1 (hmiOverwriteAlways) = Yes: CSV file is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithPrompting) = With confirmation: CSV file is not overwritten until confirmed.

### Output status message

Determines whether a status message is output after the export:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

## Export format of the recipe data records

If ".csv" is chosen as a file extension for the export file, then only valid characters from the ANSI character set will be supported. This also applies to separators in decimal numbers and list elements. The separators used are defined in the country/regional settings of the operating system of the exporting computer.

You may also set "Unicode text" (".txt") format for the export file. This file format supports the WinCC and WinCC Runtime character set. Again, the separators used are specified in the country/regional settings of the operating system of the exporting computer. This file format always uses tab separators in list elements.

The corresponding file import function also supports the ".csv" and ".txt" (Unicode) file formats.

## Application example

You want to export all data records using a key.

### Notes on configuring

Configure the "ExportDataRecords" system function on the "Press" event for the desired key. Transfer the following parameters:

- Recipe number/name = 1
- Data record number/name = 0
- File name = c:\temp\orange.csv
- Overwrite = 1
- Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data records are exported.

### Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated. All data records of Recipe 1 are exported to the orange.csv file. If the file already exists, it will be overwritten.

After exporting the data records, a system message is output.

## See also

Availability for specific devices of system functions (Page 3910)

## ExportDataRecordsWithChecksum

### Description

Exports one or all data records of a recipe to a CSV file and generates a checksum for each line in the file.

One file is created per recipe.

### Use in the function list

ExportDataRecordsWithChecksum (Recipe number/name, Data record number/name, File name, Overwrite, Output status message, Processing status)

### Use in user-defined functions

ExportDataRecordsWithChecksum (Recipe\_number/name, Data\_record number/name, File\_name, Overwrite, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Recipe number/name

Number or name of the recipe from which the data records are exported. Specify "0" if recipe data records are to be exported from all available recipes.

#### Data record number/name

Number or name of the recipe data record to be exported. Specify "0" if all recipe data records are to be exported.

#### File name

Name of the CSV file to which the recipe data records are exported. Enter the path and the file extension e.g. "C:\TEMP\Orange.CSV".

If a storage card is used as storage location, specify the storage location as follows: "\StorageCard\".

If you define only a file name without specifying a path, the file is saved to the directory from which Runtime was started. If write access to this directory is not enabled in the Windows 7 operating system, the file is saved to the "VirtualStore" folder of the user directory.

When only one path for the export is specified, the file name is automatically created from the respective recipe name. This requires, for example, that the directory "D:\Temp\" has been created. If the directory "D:\Temp" does not exist, the directory name is used as the prefix for the file name, Temp\_Recipe names.csv.

#### Overwrite

Determines whether an existing CSV file with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: CSV file will not be overwritten. The export process will not be carried out.

1 (hmiOverwriteAlways) = Yes: CSV file is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithConfirmation) = With confirmation: CSV file is not overwritten until confirmed.

**Output status message**

Determines whether a status message is output after the export:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

**Processing status**

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

**Export format of the recipe data records**

If ".csv" is chosen as a file extension for the export file, then only valid characters from the ANSI character set will be supported. This also applies to separators in decimal numbers and list elements. The separators used are defined in the country/regional settings of the operating system of the exporting computer.

You may also set "Unicode text" (".txt") format for the export file. This file format supports the WinCC and WinCC Runtime character set. Again, the separators used are specified in the country/regional settings of the operating system of the exporting computer. This file format always uses tab separators in list elements.

The corresponding file import function also supports the ".csv" and ".txt" (Unicode) file formats.

**Application example**

Using a key, you want to export all data records and assign a checksum.

**Notes on configuring**

Configure the "ExportDataRecordsWithChecksum" system function on the "Press" event for the desired key. Transfer the following parameters:

- Recipe number/name = 1
- Data record number/name = 0
- File name = c:\temp\orange.csv
- Overwrite = 1
- Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data records are exported.

**Procedure on HMI device**

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated. All data records of Recipe 1 are exported to the orange.csv file and assigned checksums. If the file already exists, it will be overwritten.

After exporting the data records, a system message is output.

### See also

Availability for specific devices of system functions (Page 3910)

## ExportImportUserAdministration

### Description

Exports all users of the user administration of the currently active project to the given file or imports the users from the given file into the currently active project.

Users, their passwords and rights are saved in the user administration.

All users are overwritten when importing. The imported users are valid immediately.

### Use in the function list

ExportImportUserAdministration (File name, Direction)

### Use in user-defined functions

ExportImportUserAdministration (File\_name, Direction)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### File name

Name of the file which contains the passwords or to which the passwords are written. Enter the file location and the file extension (\*.txt), for example, "C:\TEMP\Passwords.txt".

---

#### Note

If a storage card is used as file location, specify the file location as follows: "\\StorageCard \<File name>".

---

#### Direction

Specifies whether passwords are exported or imported:

0 (hmiExport) = Export: Passwords are exported.

1 (hmiImport) = Import: Passwords are imported.

Availability for specific devices of system functions (Page 3910)

**GoToHome****Description**

Executes the key function <Home> on the HMI device.

This system function is used when the HMI device does not have this functionality by default.

The system function can only be used for the following function keys.

**Use in the function list**

GoToHome

**Use in user-defined functions**

GoToHome

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

--

**See also**

Availability for specific devices of system functions (Page 3910)

**GoToEnd****Description**

Executes the key function <End> on the HMI device.

This system function is used when the HMI device does not have this functionality by default.

The system function can only be used for the following function keys.

**Use in the function list**

GoToEnd

### Use in user-defined functions

GoToEnd

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

--

### See also

Availability for specific devices of system functions (Page 3910)

## SafelyRemoveHardware

### Description

Checks whether there is read or write access to the external storage medium. If there is no access, the external storage medium can be removed without data loss.

### Use in the function list

SafelyRemoveHardware(Path, Result)

### Use in user-defined functions

SafelyRemoveHardware(Path, Result)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Path

Path of storage medium , e.g. \Storage Card USB\

#### Result

The tag in which the result is entered.

TRUE : The storage medium can be removed safely. A corresponding system message will be issued.

FALSE : The storage medium can be removed safely. A corresponding system message will be issued.

**HTMLBrowserStop**

**Description**

Performs the function "Stop" the HTML browser.

**Use in the function list**

HTMLBrowserStop (Screen object)

**Use in user-defined functions**

-

**Parameters**

**Screen object**

Object name of the HTML browser in which the command is performed.

**See also**

Availability for specific devices of system functions (Page 3910)

**HTMLBrowserRefresh**

**Description**

Performs the function "Refresh" of the HTML browser.

**Use in the function list**

HTMLBrowserRefresh (Screen object)

**Use in user-defined functions**

-

**Parameters**

**Screen object**

Object name of the HTML browser in which the command is performed.

### See also

Availability for specific devices of system functions (Page 3910)

## HTMLBrowserForward

### Description

Performs the function "Forward" of the HTML browser.

### Use in the function list

HTMLBrowserForward (Screen object)

### Use in user-defined functions

-

### Parameters

#### Screen object

Object name of the HTML browser in which the command is performed.

### See also

Availability for specific devices of system functions (Page 3910)

## HTMLBrowserBack

### Description

Performs the "Back" function of the HTML browser.

### Use in the function list

HTMLBrowserBack (Screen object)

### Use in user-defined functions

-

### Parameters

#### Screen object

Object name of the HTML browser in which the command is performed.

**See also**

Availability for specific devices of system functions (Page 3910)

**ImportDataRecords****Description**

Imports one or all data records of a recipe from a CSV file.

When a path is specified, all records of the given directory are imported.

**Use in the function list**

ImportDataRecords (File name, Data record number/name, Overwrite, Output status message, Processing status)

**Use in user-defined functions**

ImportDataRecords (File\_name, Data\_record number/name, Overwrite, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****File name**

Name of the CSV file from which the recipe data records are imported. Enter the file location and the file extension (\*.csv), for example "C:\TEMP\Orange.csv".

---

**Note**

If a storage card is used as file location, specify the file location as follows: "\StorageCard \<File name>".

---

**Data record number/name**

Number or name of the recipe data record to be imported. Specify "0" if all recipe data records are to be imported.

**Overwrite**

Determines whether existing recipe data records are to be overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data records are not overwritten. The import process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data records are overwritten without prompting.

2 (hmiOverwriteWithPrompting) = With confirmation: Recipe data records are not overwritten until confirmed.

**Output status message**

Determines whether a status message is output after the import:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

**Processing status**

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

**Configurable objects**

Object	Event
Tag	Value change High limit violated Low limit violated
Function key (global)	Release Press
Function key (local)	Release Press
Screen	Loaded Cleared
Screen object	Press Release Click Change (or toggle for switch) Switch on Switch off Enable Disable
Scheduler	Time expired

**See also**

Availability for specific devices of system functions (Page 3910)

## ImportDataRecordsWithChecksum

### Description

Imports one or all data records of a recipe from a CSV file with a checksum and verifies the checksum.

### Use in the function list

ImportDataRecordsWithChecksum (File name, Data record number/name, Overwrite, Output status message, Processing status, verify checksum)

### Use in user-defined functions

ImportDataRecordsWithChecksum (File\_name, Data\_record number/name, Overwrite, Output\_status\_message, Processing\_status, Verify\_Checksum)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### File name

Name of the CSV file from which the recipe data records are imported. Enter the path and the file extension, for example, "C:\TEMP\Orange.CSV".

If a storage card is used as storage medium, specify the storage location as follows: "\\StorageCard\".

If you specify a directory instead of an individual CSV file, all files in the specified directory will be imported.

#### Data record number/name

Number or name of the recipe data record to be imported. Specify "0" if all recipe data records are to be imported.

#### Overwrite

Determines whether existing recipe data records are to be overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data records are not overwritten. The import process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data records are overwritten without prompting.

2 (hmiOverwriteWithConfirmation) = With confirmation: Recipe data records are not overwritten until confirmed.

#### Output status message

Determines whether a status message is output after the import:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

#### Processing status

Returns the processing status of the system function. You can use the return value, for example to delay execution of other system functions, until this system function has been successfully completed.

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

#### Verify checksum

Determines if the checksum should be verified during import:

0 (hmiFalse) = No: Checksum is not verified.

1 (hmiTrue) = Yes: Checksum is verified.

#### See also

Availability for specific devices of system functions (Page 3910)

#### InvertBit

#### Description

Inverts the value of the given tag of the "Bool" type:

- If the tag has the value of 1 (TRUE), it will be set to 0 (FALSE).
- If the tag has the value of 0 (FALSE), it will be set to 1 (TRUE).

#### Use in the function list

InvertBit (Tag)

#### Use in user-defined functions

InvertBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

#### Parameters

##### Tag

The tag whose bit is set.

## Example

The following program code inverts the value of the boolean tag `b_value` and outputs the result along with the original `b_saved` value.

```
{
BOOL b_value = 0;
BOOL b_saved = b_value;

//Invert variable
invertBit(b_value);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
...
}
```

## See also

Availability for specific devices of system functions (Page 3910)

## InvertBitInTag

### Description

Inverts a bit in the given tag:

- If the bit in the tag has the value of 1 (TRUE), it will be set to 0 (FALSE).
- If the bit in the tag has the value of 0 (FALSE), it will be set to 1 (TRUE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

---

### Note

If the PLC supports BOOL tags, do not use this system function. Use the "InvertBit" system function instead.

---

### Use in the function list

InvertBitInTag (Tag, Bit)

### Use in user-defined functions

InvertBitInTag (Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameters

### Tag

The tag in which the given bit is set.

### Bit

The number of the bit that is set.

When this system function is used in a user-defined function, the bits in a tag are counted from right to left. The counting begins with 0.

## Example

The following program code inverts a bit at the specified bitposition in the bvalue tag and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Invert bit in bitposition
InvertBitInTag (bvalue, bitposition);
//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
...
}
```

## See also

Availability for specific devices of system functions (Page 3910)

## InvertLinearScaling

### Description

Assigns a value to the tag X, which is calculated from the value of the given tag Y using the linear function  $X = (Y - b) / a$ .

The tags X and Y must not be identical. This system function is the inverse of the "LinearScaling" system function.

---

### Note

The tags X and Y must not be identical. If a tag is to be converted into itself, an auxiliary tag must be used.

The "SetTag" system function can be used to assign the value of the tags to be converted to the auxiliary tags.

---

## Use in the function list

InvertLinearScaling (X, Y, b, a)

## Use in user-defined functions

InverseLinearScaling (X, Y, b, a)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameters

### X

The tag which is assigned the value calculated from the linear equation.

### Y

The tag that contains the value used for calculation.

### b

The value which is subtracted.

### a

The value through which is divided.

## Example

The following program code assigns a value to the varX tag by means of the InverseLinearScaling function.

```
{
BYTE varX;
BYTE Yvalue = 10;
BYTE bvalue = 3;
BYTE avalue = 4;

//Inverse linear scaling
InverseLinearScaling (varX, Yvalue, bvalue, avalue);

printf ("varX = %d\r\n", varX);
...
}
```

The saved return value can be processed in the following code.

## See also

Availability for specific devices of system functions (Page 3910)

## CalibrateTouchScreen

### Description

Calls a program for calibrating the touch screen.

During the calibration process, there is a prompt to touch five positions on the screen display. Touch the screen display within 30 seconds, to confirm the calibration process. If the calibration is not completed within this time span, the calibration settings are discarded. The user prompt is in English.

Use this system function the first time you start the HMI device.

### Use in the function list

CalibrateTouchScreen

### Use in user-defined functions

CalibrateTouchScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

--

---

#### Note

The CalibrateTouchScreen system function cannot be simulated.

---

### See also

Availability for specific devices of system functions (Page 3910)

## CopyLog

### Description

Copies the contents of a log to another log. Tag values can only be copied to other data logs and alarms only to other alarm logs, however.

---

#### Note

If you copy a log using the "CopyLog" system function, it is possible that external applications will be unable to read certain country-specific special characters in the logged message text of the log copy. This does not apply to WinCC Runtime. WinCC Runtime can read the copied log files without errors.

---

### Use in the function list

CopyLog (Log type, Destination log, Source log, Mode, Delete source log)

### Use in user-defined functions

CopyLog (Log\_type, Destination log, Source\_log, Mode, Delete\_source\_log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

#### Destination log

Name of the log into which the entries are copied (Destination log).

#### Source log

Name of the log from which the entries are copied (Source log).

#### Mode

Determines what is done with copied entries in the destination log:

0 (hmiOverwrite) = Overwrite: Existing entries are overwritten.

2 (hmiAppend) = Append: The entries are inserted at the end of the destination log. When the configured size of the log has been reached, the destination log is treated like a circular log.

#### Delete source log

Determines whether the source log is deleted after copying.

0 (hmiNo) = No: Is not deleted.

1 (hmiYes) = Yes: Is deleted.

### See also

Storage locations of logs (Page 3548)

Availability for specific devices of system functions (Page 3910)

## TrendViewScrollForward

### Description

Scrolls forward one display width in the Trend view.

### Use in the function list

TrendViewScrollForward (Screen object)

### Use in user-defined functions

-

### Parameters

#### Screen object

Name of the trend view in which is scrolled forward.

### See also

Availability for specific devices of system functions (Page 3910)

## TrendViewScrollBack

### Description

Scrolls back one display width to the left in the trend view.

### Use in the function list

TrendViewScrollBack (Screen object)

### Use in user-defined functions

-

**Parameters****Screen object**

Name of the trend view in which is scrolled back.

**See also**

Availability for specific devices of system functions (Page 3910)

**TrendViewExtend****Description**

Reduces the time period which is displayed in the trend view.

**Use in the function list**

TrendViewExtend (Screen object)

**Use in user-defined functions**

-

**Parameters****Screen object**

Name of the trend view in which the displayed time period is reduced.

**See also**

Availability for specific devices of system functions (Page 3910)

**TrendViewCompress****Description**

Increases the time period which is displayed in the trend view.

**Use in the function list**

TrendViewCompress (Screen object)

**Use in user-defined functions**

-

## Parameters

### Screen object

Name of the trend view in which the displayed time period is increased.

## See also

Availability for specific devices of system functions (Page 3910)

## TrendViewRulerLeft

## Description

Moves the read-line backwards (to the left) in the trend view.

---

### Note

In order to be able to move the read-line, the read-line must have been switched on. This is done using the "TrendViewSetRulerMode" system function.

---

## Use in the function list

TrendViewRulerLeft (Screen object)

## Use in user-defined functions

-

## Parameters

### Screen object

Name of the trend view in which the read-line is moved backwards.

## See also

TrendViewSetRulerMode (Page 3990)

Availability for specific devices of system functions (Page 3910)

## TrendViewRulerRight

### Description

Moves the read-line forwards (to the right) in the trend view.

---

#### Note

In order to be able to move the read-line, the read-line must have been switched on. This is done using the "TrendViewSetRulerMode" system function.

---

### Use in the function list

TrendViewRulerRight (Screen object)

### Use in user-defined functions

-

### Parameters

#### Screen object

Name of the trend view in which the read-line is moved forward.

### See also

TrendViewSetRulerMode (Page 3990)

Availability for specific devices of system functions (Page 3910)

## TrendViewSetRulerMode

### Description

Hides or shows the read-line in the trend view. The read-line displays the Y value belonging to the X value.

---

#### Note

To ensure that the ruler is displayed, you have to activate the setting "Show ruler" in the trend view properties.

---

### Use in the function list

TrendViewSetRulerMode (Screen object)

## Use in user-defined functions

-

## Parameters

### Screen object

Name of the trend view in which the read-line is hidden or shown.

## See also

TrendViewRulerRight (Page 3989)

TrendViewRulerLeft (Page 3988)

Availability for specific devices of system functions (Page 3910)

## TrendViewStartStop

### Description

Stops the trend recording or continues the trend recording in the trend view.

### Use in the function list

TrendViewStartStop (Screen object)

## Use in user-defined functions

-

## Parameters

### Screen object

Name of the trend view in which the recording of the trend is started or stopped.

## See also

Availability for specific devices of system functions (Page 3910)

## TrendViewBackToBeginning

### Description

Scrolls back to the beginning of the display range in the trend view.

**Use in the function list**

TrendViewBackToBeginning (Screen object)

**Use in user-defined functions**

-

**Parameters****Screen object**

Name of the trend view in which you scroll to the beginning of the display range.

**See also**

Availability for specific devices of system functions (Page 3910)

**LoadDataRecord****Description**

Loads the given recipe data record from the memory medium of the HMI device in the recipe tags. This system function is used, for example, to display a recipe data record in the recipe screen.

Activate the "Synchronize recipe view and recipe tags" option in the synchronization settings of the recipe. If this option is deactivated, the system function has no effect.

**Use in the function list**

LoadDataRecord (Recipe number/name, Data record number/name, Processing status)

**Use in user-defined functions**

LoadDataRecord (Recipe\_number/name, Data\_record\_number/name, Confirmation, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Recipe number/name**

Number or name of the recipe from which a recipe data record is loaded.

**Data record number/name**

Number or name of the recipe data record to be loaded.

### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

### See also

Availability for specific devices of system functions (Page 3910)

## GetUserName

### Description

Writes the user name of the user currently logged on to the HMI device in the given tag.

If the given tag has a control connection, the user name is also available in the PLC connection. This system function makes it possible, for example, to implement a user-dependent release of certain functionalities.

### Use in the function list

GetUserName (Tag)

### Use in user-defined functions

GetUserName (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Tag

The tag to which the user name is written.

### See also

Availability for specific devices of system functions (Page 3910)

## GetDataRecordFromPLC

### Description

Transfers the selected recipe data record from the PLC to the storage medium of the HMI device.

### Use in the function list

GetDataRecordFromPLC (Recipe number/name, Data record number/name, Overwrite, Output status message, Processing status)

### Use in user-defined functions

GetDataRecordFromPLC (Recipe\_number/name, Data\_record\_number/name, Overwrite, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Recipe number/name

Number or name of the recipe from which recipe data records are transferred.

#### Data record number/name

Number or name of the recipe data record which is transferred from the PLC to the data medium of the HMI device.

#### Overwrite

Determines whether an existing recipe data record with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data record is not overwritten. The transfer process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data record is overwritten without prompting.

2 (hmiOverwriteWithPrompting) = With confirmation: Recipe data record is not overwritten until confirmed.

#### Output status message

Determines whether a status message is output after the transfer:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

#### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

### Application example

You want to transfer a data record from the PLC to the data medium of the HMI device using a key.

#### Notes on configuring

Configure the "GetDataRecordFromPLC" system function on the "Press" event for the desired key. Transfer the following parameters:

Recipe number/name = 1

Data record number/name = 1

Overwrite = 1

Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data record is transferred from the PLC.

#### Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated and the first data record of Recipe 1 is transferred from the PLC to the data medium of the HMI device. If the recipe data record already exists, it will be overwritten.

A system message is output after the transfer.

### See also

Availability for specific devices of system functions (Page 3910)

## GetDataRecordName

### Description

Writes the name of the given recipe and recipe data record to the given tags.

---

#### Note

If the recipe or the recipe data record do not exist, wildcards ("###") are written to the tags.

---

### Use in the function list

GetDataRecordName (Recipe number, Data record number, Recipe name, Data record name, Processing status)

## Use in user-defined functions

GetDataRecordName (Recipe\_number, Data\_record\_number, Recipe\_name, Data\_record\_name, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Recipe number

Number of the recipe whose name is written to the given tag.

### Data record number

Number of the recipe data record whose name is written to the given tag.

### Recipe name

The tag to which the recipe name is written. The tag must be of the STRING type.

### Data record name

The tag to which the name of the recipe data record is written. The tag must be of the STRING type.

### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

## Application example

You want to output the names of the displayed recipes and the name of the displayed recipe data record on the HMI device.

Configure the following tags:

- "RecNumber" of type INTEGER
- "RecDataNumber" of type INTEGER
- "RecName" of type STRING
- "RecDataName" of type STRING

Configure a recipe view with the tags "RecNumber" for the recipe number and "RecDataNumber" for the data record number.

Configure the "GetDataRecordName" system function on the "Press" event for a button and pass the following parameters:

- Recipe number: RecNumber
- Data record number: RecDataNumber
- Recipe name: RecName
- Data record name: RecDataName

Configure two output fields and connect these to the "RecName" and "RecDataName" tags.

Select a recipe and a data record number from the recipe view. As soon as the button is activated, the system function is triggered and the name of the recipe and the recipe data record are displayed in both output fields.

### See also

Availability for specific devices of system functions (Page 3910)

## GetDataRecordTagsFromPLC

### Description

Transfers the values of the recipe data record loaded in the PLC to the corresponding recipe tags.

This system function is used, for example, during teach-in mode on a machine.

### Use in the function list

GetDataRecordTagsFromPLC (Recipe number/name, Processing status)

### Use in user-defined functions

GetDataRecordTagsFromPLC (Recipe\_number/name, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Recipe number/name

Number or name of the recipe data record whose values are written from the PLC to the tags.

#### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

**See also**

Availability for specific devices of system functions (Page 3910)

**GetGroupNumber****Description**

Reads the number of the group to which the user logged on to the HMI device belongs, and writes it to the given tag.

**Use in the function list**

GetGroupNumber (Tag)

**Use in user-defined functions**

GetGroupNumber (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Tag**

The tag to which the number of the group is written.

**See also**

Availability for specific devices of system functions (Page 3910)

**GetBrightness****Description**

Reads the value of the brightness.

**Use in the function list**

GetBrightness (Brightness)

**Use in user-defined functions**

GetBrightness (Brightness)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### **Brightness**

The tag to which the value is written.

### See also

Availability for specific devices of system functions (Page 3910)

### GetPassword

### Description

Writes the password of the user currently logged on to the HMI device in the given tag.

---

#### **Note**

Make sure that the value of the given tag is not displayed in another place in the project.

---

#### **Note**

The passwords of SIMATIC Logon users cannot be read.

---

### Use in the function list

GetPassword (Tag)

### Use in user-defined functions

GetPassword (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### **Tag**

The tag to which the password is written.

**See also**

Availability for specific devices of system functions (Page 3910)

System functions for Runtime Advanced (Page 3941)

**ReadPLCMode****Description**

Evaluates the current state of the connected PLC.

The system function "ReadPLCMode" can only be configured for the following PLCs:

- SIMATIC S7-1200
- SIMATIC S7-1500

**Use in the function list**

ReadPLCMode (connection, mode)

**Use in user-defined functions**

GetPLCMode (Connection, Mode)

**Parameters****Connection**

Connection of PLC and HMI device.

**Mode**

Evaluates the mode of the connected PLC.

8: RUN = The PLC program is being executed.

4: STOP = The PLC program has been interrupted.

Select a suitable user variable for the evaluation.

**LinearScaling****Description**

Assigns a value to the tag Y, which is calculated from the value of the given tag X using the linear function  $Y = (a * X) + b$ .

The inverse of this function is the "InvertLinearScaling" system function.

---

**Note**

The tags X and Y must not be identical. If a tag is to be converted into itself, a auxiliary tag must be used.

The "SetTag" system function can be used to assign the value of the tags to be converted to the auxiliary tags.

---

**Use in the function list**

LinearScaling (Y, a, X, b)

**Use in user-defined functions**

LinearScaling (Y, a, X, b)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameters**

**Y**

The tag which is assigned the value calculated from the linear equation.

**a**

The value with which is multiplied.

**X**

The tag that contains the value used for calculation.

**b**

The value that is added.

**Example**

The following program code uses the LinearScaling function to assign a value to the Yvar tag.

```
{  
BYTE Yvar;  
BYTE Xvalue = 10;  
BYTE bvalue = 3;  
BYTE avalue = 4;  
  
// linear scaling  
LinearScaling ( Yvar, avalue, Xvalue, bvalue);  
}
```

```
printf ("Yvar = %d\r\n, Yvar);  
...  
}
```

The saved return value can be processed in the following code.

### ClearLog

#### Description

Deletes all data records in the given log.

#### Use in the function list

ClearLog (Log type, Log)

#### Use in user-defined functions

ClearLog (Log\_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

#### Parameter

##### Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail log Available for GMP-compliant projects Additional information is available under "Activating GMP-compliant configuration".

##### Log

Name of the log from which all entries are deleted.

### See also

Availability for specific devices of system functions (Page 3910)

## ClearDataRecord

### Description

Deletes a recipe data record.

Several data records can be deleted from one or more recipes.

### Use in the function list

ClearDataRecord (Recipe number/name, Data record number/name, Confirmation, Output status message, Processing status)

### Use in user-defined functions

ClearDataRecord

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Recipe number/name

Number or name of the recipe from which recipe data records are deleted. "0" is specified if you want to delete recipe data records from all available recipes.

#### Data record number/name

Number or name of the recipe data record to be deleted. "0" is specified if you want to delete all recipe data records.

#### Confirmation

Determines whether the operator should confirm the deletion:

0 (hmiOff) = Off: Deletion is begun without confirmation.

1 (hmiOn) = On: The starting of the deletion process must be confirmed.

#### Output status message

Determines whether a status message is output after the deletion:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

#### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

## See also

Availability for specific devices of system functions (Page 3910)

## ClearDataRecordMemory

### Description

Deletes all recipes data records from the specified storage medium.

### Use in the function list

ClearDataRecordMemory (Storage location, Confirmation, Output status message, Processing status)

### Use in user-defined functions

ClearDataRecordMemory (Storage\_location, Confirmation, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Storage location

Determines the storage location:

0 (hmiFlashMemory) = Flash memory: Internal flash memory of the HMI device

1 (hmiStorageCard) = Storage card

2 (hmiStorageCard2) = Storage card 2

3 (hmiStorageCard3) = Storage card MultiMediaCard

4 (hmiStorageCard4) = Storage card USB

### Confirmation

Determines whether the operator should confirm the deletion:

0 (hmiOff) = Off: Deletion is begun without confirmation.

1 (hmiOn) = On: The starting of the deletion process must be confirmed.

### Output status message

Determines whether a status message is output after the deletion:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

#### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

#### See also

Availability for specific devices of system functions (Page 3910)

### ClearAlarmBuffer

#### Description

Deletes alarms from the alarm buffer on the HMI device.

---

#### Note

Alarms which have not yet been acknowledged are also deleted.

---

#### Use in the function list

ClearAlarmBuffer (Alarm class number)

#### Use in user-defined functions

ClearAlarmBuffer (Alarm\_class\_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

#### Parameter

##### Alarm class number

Determines which alarms are to be deleted from the alarm buffer:

0 (hmiAll) = All alarms/events

1 (hmiAlarms) = Alarms of alarm class "Errors"

2 (hmiEvents) = Alarms of alarm class "Warnings"

3 (hmiSystem) = Alarms of alarm class "System"

4 (hmiS7Diagnosis) = Alarms of alarm class "Diagnosis Events"

---

**Note****Device dependency**

Alarms of alarm class "Diagnosis Events" are not available on Basic Panels.

---

**See also**

Availability for specific devices of system functions (Page 3910)

**ClearAlarmBufferProTool****Description**

The system function exists to ensure compatibility.

It has the same functionality as the "ClearAlarmBuffer" system function, but uses the old ProTool numbering.

**Use in the function list**

ClearAlarmBufferProTool (Alarm class number)

**Use in user-defined functions**

ClearAlarmBufferProtoolLegacy (Alarm\_class\_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Alarm class number**

Alarm class number whose messages are to be deleted:

-1 (hmiAllProtoolLegacy) = All alarms/events

0 (hmiAlarmsProtoolLegacy) = Alarms of alarm class "Errors"

1 (hmiEventsProtoolLegacy) = Alarms of alarm class "Warnings"

2 (hmiSystemProtoolLegacy) = Alarms of alarm class "System"

3 (hmiS7DiagnosisProtoolLegacy) = Alarms of alarm class "Diagnosis Events"

---

**Note**

**Device dependency**

Alarms of alarm class "Diagnosis Events" are not available on Basic Panels.

---

**See also**

Availability for specific devices of system functions (Page 3910)

**AlarmViewUpdate**

**Description**

Updates the enhanced alarm view.

**Use in the function list**

AlarmViewUpdate (Screen object)

**Use in user-defined functions**

-

**Parameters**

**Screen object**

Name of the alarm view which is updated.

**See also**

Availability for specific devices of system functions (Page 3910)

**AlarmViewEditAlarm**

**Description**

Triggers the event "Edit" for all alarms selected in the given alarm view.

This system function is used when the integrated button of the ActiveX control should not be used.

A system function can in turn be configured on the "Edit" event. For example, it is possible to change to the process screen in which the alarm appeared.

---

**Note**

If the alarms to be edited have not yet been acknowledged, the acknowledgment takes place automatically when this system function is called up.

---

**Use in the function list**

AlarmViewEditAlarm (Screen object)

**Use in user-defined functions**

-

**Parameters****Screen object**

Name of the alarm view in which the event is triggered.

---

**Note**

The HMI devices listed below do not support this system function for the "screen" object: OP 73, OP 77A, TP 177A.

---

**See also**

Availability for specific devices of system functions (Page 3910)

**AlarmViewAcknowledgeAlarm****Description**

Acknowledges the alarms selected in the given alarm view.

This system function is used when the integrated button of the ActiveX control should not be used.

**Use in the function list**

AlarmViewAcknowledgeAlarm (Screen object)

### Use in user-defined functions

-

### Parameters

#### Screen object

Name of the alarm view in which the event is triggered.

---

#### Note

The HMI devices listed below do not support this system function for the "screen" object: OP 73, OP 77A, TP 177A.

---

### See also

Availability for specific devices of system functions (Page 3910)

## AlarmViewShowOperatorNotes

### Description

Displays the configured tooltip of the alarm selected in the given alarm view.

### Use in the function list

AlarmViewShowOperatorNotes (Screen object)

### Use in user-defined functions

-

### Parameters

#### Screen object

Name of the alarm view in which the event is triggered.

---

#### Note

The HMI devices listed below do not support this system function for the "screen" object: OP 73, OP 77A, TP 177A.

---

### See also

Availability for specific devices of system functions (Page 3910)

## OpenAllLogs

### Description

Reestablishes the connection between WinCC and the logs. Logging can be continued.

---

#### Note

Run the "StartLogging" system function in order to restart logging.

---

### Use in the function list

OpenAllLogs

### Use in user-defined functions

OpenAllLogs

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

--

### Application example

You are in runtime and want to change the data medium on which the process values are logged.

#### Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

#### Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. You open all logs with the "Open Archive" button. Logging will be continued in the specified log.

### See also

Availability for specific devices of system functions (Page 3910)

## OpenScreenKeyboard

### Description

Hides or shows the screen keyboard.

The screen keyboard remains open until the screen keyboard is explicitly closed. In this way, the screen keyboard can also be used in other applications.

### Use in the function list

OpenScreenKeyboard (Layout)

### Use in user-defined functions

OpenScreenKeyboard (Display\_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Layout

Specifies whether the window is opened minimized or maximized with the screen keyboard:

0 (hmiScreenKeyboardMinimized) = Minimized

1 (hmiScreenKeyboardMaximized) = Maximized

### See also

Availability for specific devices of system functions (Page 3910)

## OpenFileBrowser

### Description

Opens a file browser dialog.

Depending on the mode the user can select a file or a folder.

### Use in the function list

OpenFileBrowser (Mask, Output Folder, File, Navigation Back, Navigation Up, New folder, Path, Status)

### Use in user-defined functions

-

## Parameters

### Mask

Sets a mask for filtering the displayed files. This parameter is only evaluated in "File" mode. The filter criteria must be delimited by ; semicolon. Example: \*.htm;\*.html

### Start folder

Specifies the folder with which the file selection dialog starts.

### File

Specifies the mode in which the dialog is opened.

0 = folder search mode

1 = file search mode

### Navigation Back

Specifies whether or not the "Back" button is activated. This button offers simple navigation to the last folder you opened.

### Navigation Up

Specifies whether or not the "Up" button is activated. This button offers simple navigation to the parent folder.

### New folder

Specifies whether or not the button can be used to create a new folder.

### Path

Contains the path name of the last folder opened after you close the dialog.

### Status

Returns information about the dialog closing mode

-1 = dialog was canceled

0 = dialog was closed with "OK".

## OpenControlPanelDialog

### Description

Opens a dialog that you can use to edit selected Control Panel settings.

This system function lets you set the following on the HMI device:

- Properties and value of the IP address
- User identification on the network
- WinCC Internet settings

---

**Note**

**Project security**

The "OpenControlPanelDialog" system function is used to bypass the SecureMode on the HMI device. Take the corresponding precautions to ensure the security of your project.

---

**Use in the function list**

OpenControlPanelDialog (Dialog)

**Use in user-defined functions**

-

**Parameters**

**Dialog**

Sets the Control Panel dialog to be opened.

- PROFINET\_X1: Setting of the IP address and Ethernet parameters
- PROFINET\_X3: Setting of the IP address and Ethernet parameters; only for Comfort Panel KP 1500, TP 1500; TP1900, TP2200
- WinCC Internet settings: Setting for Web Server, e-mail notification, provided the HMI device supports these functions
- Network ID: Setting for identification on the network, provided the HMI device supports these functions

**See also**

Availability for specific devices of system functions (Page 3910)

**OpenCommandPrompt**

**Description**

Opens a Windows system prompt.

This function is used, e.g., to copy files or to call up another application.

**Use in the function list**

OpenCommandPrompt

**Use in user-defined functions**

OpenCommandPrompt

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

--

**See also**

Availability for specific devices of system functions (Page 3910)

**OpenInternetExplorer****Description**

Opens the Internet Explorer on the HMI device.

If the Internet Explorer is already open, it will be closed and reopened when you call the system function.

---

**Note**

The Internet Explorer saves data temporarily in the DRAM file system of the HMI device, e.g. the last web sites that were be called up.

This data can be saved using the "BackupRAMFileSystem" system function so that it is still available when the HMI device is restarted.

---

**Use in the function list**

OpenInternetExplorer (Start page)

**Use in user-defined functions**

OpenInternetExplorer (Start\_page)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Start page**

The page which is loaded when Internet Explorer is started, e.g. "www.siemens.com".

## See also

Availability for specific devices of system functions (Page 3910)

## OpenControlPanel

### Description

Opens the window that displays the Windows CE control panel. You cannot use this system function on a PC.

This system function enables you to set the following on the Windows CE-based HMI device:

- Select printer
- Select transfer properties
- Configure screen saver
- Configure flash memory

---

#### Note

##### No backup or restore during Runtime

Backup and restore functions may only be executed if Runtime has been terminated. Otherwise, this could result in undesired effects, such as display errors.

---

### Use in the function list

OpenControlPanel

### Use in user-defined functions

OpenControlPanel

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

--

## OpenTaskManager

### Description

Shows the task manager.

The task manager allows changing to other open applications on the HMI device.

---

**Note**

The appearance of the task manager depends on the operating system installed.

---

**Use in the function list**

OpenTaskManager

**Use in user-defined functions**

OpenTaskManager

Can be used if the configured device supports user-defined scripts. For additional information, refer to "Device dependency".

**Parameter**

--

**See also**

Availability for specific devices of system functions (Page 3910)

**AcknowledgeAlarm****Description**

Acknowledges all selected alarms.

This system function is used when the HMI device does not have an ACK key or when the integrated key of the alarm view should not be used.

This system function can only be used for function keys.

**Use in the function list**

AcknowledgeAlarm

**Use in user-defined functions**

AcknowledgeAlarm

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

--

## See also

Availability for specific devices of system functions (Page 3910)

## RecipeViewNewDataRecord

### Description

Creates a new data record in the given recipe view.

### Use in the function list

RecipeViewNewDataRecord (Screen object)

### Use in user-defined functions

-

## Parameters

### Screen object

Name of the recipe view in which the new recipe data record is created.

## See also

Availability for specific devices of system functions (Page 3910)

## RecipeViewGetDataRecordFromPLC

### Description

Transfers the data record that is currently loaded in the PLC to the HMI device and displays it in the recipe view.

### Use in the function list

RecipeViewGetDataRecordFromPLC (Screen object)

### Use in user-defined functions

-

**Parameters****Screen object**

Name of the recipe view in which the recipe data record from the PLC is displayed.

**See also**

Availability for specific devices of system functions (Page 3910)

**RecipeViewClearDataRecord****Description**

Deletes the data record which is currently displayed in the recipe view.

**Use in the function list**

RecipeViewClearDataRecord (Screen object)

**Use in user-defined functions**

-

**Parameters****Screen object**

Name of the recipe view in which the displayed recipe data record is deleted.

**See also**

Availability for specific devices of system functions (Page 3910)

**RecipeViewMenu****Description**

Opens the menu of the specified simple recipe view.

Only use this system function at a simple recipe view.

**Use in the function list**

RecipeViewMenu (Screen object)

## Use in user-defined functions

-

## Parameters

### Screen object

Name of the recipe view in which the menu is to be opened.

## See also

Availability for specific devices of system functions (Page 3910)

## RecipeViewOpen

## Description

Displays the data record values in the given recipe view or changes to the next selection field. The system function has no effect if the selection field for the recipe data record values is displayed on the HMI device.

Operation sequence of the selection lists in runtime:

- Recipe name
- Data record name
- RecipeDataRecordValues

This system function is used when a simple recipe view has been configured. In the simple recipe view, only one selection list is displayed at a time on the HMI device. Use the "RecipeViewBack" system function to display the previous selection list.

## Use in the function list

RecipeViewOpen (Screen object)

## Use in user-defined functions

-

## Parameters

### Screen object

Name of the recipe view in which the command is triggered.

### See also

Availability for specific devices of system functions (Page 3910)

RecipeViewBack (Page 4023)

## RecipeViewSetDataRecordToPLC

### Description

Transfers the recipe data record which is currently displayed in the recipe view to the PLC.

### Use in the function list

RecipeViewSetDataRecordToPLC (Screen object)

### Use in user-defined functions

-

### Parameters

#### Screen object

Name of the recipe view from which the recipe data record is transferred to the connected PLC.

### See also

Availability for specific devices of system functions (Page 3910)

## RecipeViewSaveDataRecord

### Description

Saves the recipe data record which is currently displayed in the recipe view.

### Use in the function list

RecipeViewSaveDataRecord (Screen object)

### Use in user-defined functions

-

## Parameters

### Screen object

Name of the recipe view in which the recipe data record is saved.

## See also

Availability for specific devices of system functions (Page 3910)

## RecipeViewSaveAsDataRecord

### Description

Saves the data record currently being displayed in the recipe view under a new name.

### Use in the function list

RecipeViewSaveAsDataRecord (Screen object)

### Use in user-defined functions

-

## Parameters

### Screen object

Saves the data record currently being displayed in the recipe view under a new name and/or new number.

## See also

Availability for specific devices of system functions (Page 3910)

## RecipeViewSynchronizeDataRecordWithTags

### Description

Synchronizes the values of the data record which is currently displayed in the recipe view with their recipe tags. Only use this system function at an advanced recipe view.

During synchronization, all values of the data record are written to their recipe tags.

### Use in the function list

RecipeViewSynchronizeDataRecordWithTags (Screen object)

**Use in user-defined functions**

-

**Parameters****Screen object**

Name of the recipe view in which the values are synchronized with their tags.

---

**Note**

The OP 77A and TP 177A HMI devices do not support this function for the screen object.

---

**See also**

Availability for specific devices of system functions (Page 3910)

**RecipeViewRenameDataRecord****Description**

Renames the selected data record in the given recipe view.

Only use this system function at a simple recipe view.

**Use in the function list**

RecipeViewRenameDataRecord (Screen object)

**Use in user-defined functions**

-

**Parameters****Screen object**

Name of the recipe view in which the recipe data record is renamed.

**See also**

Availability for specific devices of system functions (Page 3910)

## RecipeViewShowOperatorNotes

### Description

Displays the configured tooltip of the specified recipe view.

### Use in the function list

RecipeViewShowOperatorNotes (Screen object)

### Use in user-defined functions

-

### Parameters

#### Screen object

Name of the recipe view whose configured tooltip is displayed.

### See also

Availability for specific devices of system functions (Page 3910)

## RecipeViewBack

### Description

Returns to the previous selection list in the given recipe view.

The system function has no effect if the selection field for the recipe is displayed on the HMI device. Operation sequence of the selection lists in runtime:

- Recipe name
- Data record name
- RecipeDataRecordValues

This system function is used when a simple recipe view has been configured. In the simple recipe view, only one selection list is displayed at a time on the HMI device. Use the "RecipeViewOpen" system function to display the recipe data record values or the next selection field.

### Use in the function list

RecipeViewBack (Screen object)

## Use in user-defined functions

-

## Parameters

### Screen object

Name of the recipe view in which the command is triggered.

## See also

Availability for specific devices of system functions (Page 3910)

## ResetBit

## Description

Sets the value of a "Bool" type tag to 0 (FALSE).

## Use in the function list

ResetBit (Tag)

## Use in user-defined functions

ResetBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameters

### Tag

The BOOL type tag which is set to 0 (FALSE).

## Example

The following program code resets the value of the boolean tag b\_value to 0 by means of the ResetBit function and outputs the result along with the original b\_saved value.

```
{  
BOOL b_value = 1;  
BOOL b_saved = b_value;  
  
//Reset bit  
ResetBit (b_value);
```

```
//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
...
}
```

## See also

ResetBitInTag (Page 4025)

Availability for specific devices of system functions (Page 3910)

## ResetBitInTag

### Description

Sets a bit in the specified tag to 0 (FALSE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

---

#### Note

If the PLC supports BOOL tags, do not use this system function. Use the "ResetBit" system function instead.

---

### Use in the function list

ResetBitInTag (Tag, Bit)

### Use in user-defined functions

ResetBitInTag (Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### Tag

The tag in which a bit is set to 0 (FALSE).

#### Bit

The number of the bit that is set to 0 (FALSE).

When this system function is used in a user-defined function, the bits in the specified tag will be counted from right to left independent of the PLC used. The counting begins with 0.

## Example

The following program code sets a bit at the specified bitposition in the bvalue tag to 0 and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Reset bit in bitposition
ResetBitInTag (bvalue, bitposition);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
...
}
```

## See also

ResetBit (Page 4023)

## PressButton

### Description

The system function can only be configured on the function keys of an HMI device and triggers the "Press key" event at the specified screen object.

Use this system function when you want to operate a button in a screen with a function key of the HMI device, for example.

---

#### Note

The "PressButton" and "ReleaseButton" system functions must always be configured together. If you configure the "PressButton" system function on the "Press key" event for a function key, the "ReleaseButton" system function is configured on the "Release" event for the same function key.

---

### Use in the function list

PressButton (Screen object)

### Use in user-defined functions

-

## Parameters

### Screen object

Name of the screen object on which the event is triggered.

## See also

Availability for specific devices of system functions (Page 3910)

## ReleaseButton

## Description

The system function can only be configured on the function keys of an HMI device and triggers the "Release button" event at the specified screen object.

Use this system function when you want to operate a button in a screen with a function key of the HMI device, for example.

---

### Note

The "PressButton" and "ReleaseButton" system functions must always be configured together. If you configure the "PressButton" system function on the "Press key" event for a function key, then the "ReleaseButton" system function is configured on the "Release key" event for the same function key.

---

## Use in the function list

ReleaseButton (Screen object)

## Use in user-defined functions

-

## Parameters

### Screen object

Name of the screen object on which the event is triggered.

## See also

Availability for specific devices of system functions (Page 3910)

## ShiftAndMask

### Description

This system function converts the input bit pattern of the source tags into an output bit pattern of the target tags. This involves bit shifting and masking.

---

#### Note

If the source and target tag have a different number of bits, using the system function in the target tag can result in a violation of the value range.

---

### Use in the function list

ShiftAndMask (Source tag, Target tag, Bits to shift, Bits to mask)

### Use in user-defined functions

ShiftAndMask (Source\_tag, Target\_tag, Bits\_to\_shift, Bits\_to\_mask)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Source tag

The tag includes the input bit pattern. Integer-type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong" are permitted.

Example: The actual value 72 is set at the 16-bit integer source tag: 0000000001001000.

#### Target tag

The output bit pattern is saved in the tag. Integer type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong" are permitted.

Example: The shifted input bit pattern is multiplied by the bit mask, with bit-by-bit logical AND operation: 0000000000001001. The resultant decimal value "8" is saved to the target tag.

Please note the following:

- The source and target tags have the same number of bits.
- The number of bits to shift is less than the number of bits in the source tag and target tag.
- Bits to mask does not have more bits than the source tag and the target tag.

#### Bits to shift

Number of bits by which the input bit pattern is shifted right. A negative value shifts the input bit pattern to the left.

Example: "Bits to shift" has the value "+3". The input bit pattern is shifted right by three bits when the system function is called: 0000000000001001.

Bits to the left are padded with "0". Three bits are truncated on the right. The new decimal value is "9".

---

**Note**

The left bit is "1" in a source tag of the data type with negative signed integer. This sign bit is padded with "0" when the bits are shifted right. The sign changes to "+".

---

**Bits to mask**

An integer serves as bit mask. The bit pattern is used to multiply the shifted input bit pattern. Example: Integer "2478" with the bit pattern "0000100110101110".

You can enter the bit mask in three different ways:

- Hexadecimal: First enter the prefix "0h" or "0H", followed by an optional space for better readability. Then group the bit pattern in blocks of four (0000)(1001)(1010)(1110) and set each block in hexadecimal code: (0)(9)(A)(E). Only the characters 0-9, A-F, a-f are allowed: "0h 09AE".
- Binary: First enter the prefix "0b" or "0B", followed by an optional space for better readability. Then group the binary bit pattern into blocks of four 0000 1001 1010 1110 with spaces in between as a check. Only the characters "0" or "1" are allowed: "0b 0000 1001 1010 1110".
- Decimal: Enter the value "2478" directly, without a prefix.

**See also**

Availability for specific devices of system functions (Page 3910)

**CloseAllLogs**

**Description**

Disconnects the connection between WinCC and all logs.

---

**Note**

Before you close a log, the logging function must first be stopped in the log. Use the "StopLogging" system function.

---

**Use in the function list**

CloseAllLogs

**Use in user-defined functions**

CloseAllLogs

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

--

### Application example

You are in runtime and want to change the data medium on which the process values are logged.

#### Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

#### Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. You open all logs with the "Open Archive" button. The logging process will continue in the specified log.

### See also

Availability for specific devices of system functions (Page 3910)

## SetDataRecordToPLC

### Description

Transfers the given recipe data record directly from the data medium of the HMI device to the PLC with which the HMI device is connected.

---

#### Note

The values of the recipe data record don't need to be displayed on the HMI device.

---

### Use in the function list

SetDataRecordToPLC (Recipe number/name, Data record number/name, Output status message, Processing status)

### Use in user-defined functions

SetDataRecordToPLC (Recipe\_number/name, Data\_record\_number/name, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Recipe number/name

Number or name of the recipe from which recipe data record is transferred to the PLC.

#### Data record number/name

Number or name of the recipe data record to be transferred to the PLC.

#### Output status message

Determines whether a status message is output after the transfer:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

#### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

### See also

Availability for specific devices of system functions (Page 3910)

## SetDataRecordTagsToPLC

### Description

Transfers the values of the recipe tags to the PLC. The recipe tags contain the values of the data record which is displayed on the HMI device.

### Use in the function list

SetDataRecordTagsToPLC (Recipe number/name, Processing status)

**Use in user-defined functions**

SetDataRecordTagsToPLC (Recipe\_ number/name, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Recipe number/name**

Number or name of the recipe from which recipe data record is transferred to the PLC.

**Processing status**

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

**See also**

Availability for specific devices of system functions (Page 3910)

**PageDown****Description**

Executes the key function <Pagedown> on the HMI device.

This system function can only be used for function keys.

**Use in the function list**

PageDown

**Use in user-defined functions**

PageDown

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

-

**See also**

Availability for specific devices of system functions (Page 3910)

**PageUp**

**Description**

Executes the key function <PageUp> on the HMI device.

This system function can only be used for function keys and tasks with a time trigger.

**Use in the function list**

PageUp

**Use in user-defined functions**

PageUp

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

-

**See also**

Availability for specific devices of system functions (Page 3910)

**SendEMail**

**Description**

Sends an e-mail from the HMI device to the given addressee.

This system function is used, for example, when, in the case of service, the alarm is to be passed on directly to the service technician.

---

**Note**

To send alarms as e-mails, the HMI system must have an e-mail client at its disposal.

---

**Use in the function list**

SendEMail (Address, Subject, Text, Return address)

**Use in user-defined functions**

SendEMail (Address, Subject, Text, Return\_address)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Address**

The e-mail address of the addressee.

**Subject**

The subject line of the e-mail.

**Text**

The text sent in the e-mail.

**Return address**

The e-mail address to which the addressee of this e-mail should send the reply.

**See also**

Availability for specific devices of system functions (Page 3910)

**SetAcousticSignal****Description**

Configures the acoustic feedback of touch screen operation on the HMI device.

---

**Note**

The configuration that was set at Switch off is reestablished when restarting the HMI device.

---

**Use in the function list**

SetAcousticSignal (Volume)

**Use in user-defined functions**

SetAcousticSignal (Volume)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Volume

Determines whether and how loud an acoustic signal is emitted:

-1 (hmiToggle) = Toggle: Toggles the emission of the acoustic signal as follows: Muted > Quiet > Loud.

0 (hmiMuted) = Mute: no acoustic signal

1 (hmiQuiet) = Quiet: quiet acoustic signal

2 (hmiLoud) = Loud: loud acoustic signal

## See also

Availability for specific devices of system functions (Page 3910)

## SetDisplayMode

### Description

Changes the settings of the screen in which the runtime software runs.

The runtime software runs in full-screen mode as default. The Windows task switch is disabled.

### Use in the function list

SetDisplayMode (Layout)

### Use in user-defined functions

SetDisplayMode (Display mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Display mode

Determines the settings for the screen in which the runtime software runs.

1 (hmiScreenFull): Full-screen: Title bar of the screen is not visible

2 (hmiScreenMaximized): Maximized

3 (hmiScreenRestore): Restore: The last used screen setting is used. This layout can only be used when the window is displayed minimized or maximized.

4 (hmiScreenMinimized): Minimized

5 (hmiScreenAutoAdjust): Automatic: The size of the window is set so that all screen objects in it will be visible.

6 (hmiScreenOnTop): Foreground; either the window appears in the foreground or the program icon associated with the window flashes on the taskbar depending on the Windows setting. The setting can be changed in the Windows configuration and applies to all Windows applications.

### See also

Availability for specific devices of system functions (Page 3910)

## SetDeviceMode

### Description

Toggles the operating mode on the HMI device. The following types of operation are possible: "Online", "Offline" and "Load".

### Use in the function list

SetDeviceMode (Operating mode)

### Use in user-defined functions

SetDeviceMode (Operating\_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Operating mode

Determines the operating mode of the HMI device:

0 (hmiOnline) = Online: The connection to the PLC is established. The configured connection status is always set in this process. The states that were last used in Runtime are not considered.

1 (hmiOffline) = Offline: The connection to the PLC is disconnected.

2 (hmiTransfer) = load: A project can be transferred from the configuration computer to the HMI device.

---

#### Note

If you use a PC as an HMI device, the runtime software will be exited when you change operating mode after "Load".

---

## See also

Availability for specific devices of system functions (Page 3910)

SetConnectionMode (Page 4050)

## SetBit

### Description

Sets the value of a "Bool" type tag to 1 (TRUE).

### Use in the function list

SetBit (Tag)

### Use in user-defined functions

SetBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### Tag

The BOOL type tag which is set to 1 (TRUE).

### Example

The following program code sets the value of the boolean tag `b_value` to 1 by means of the `SetBit` function and outputs the result along with the original `b_saved` value.

```
{
  BOOL b_value = 0;
  BOOL b_saved = b_value;

  //Set bit
  SetBit (b_value);

  //print current and saved value
  printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
  ...
}
```

## See also

Availability for specific devices of system functions (Page 3910)

## SetBitInTag

### Description

Sets a bit in the given tag to 1 (TRUE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

---

#### Note

If the PLC supports BOOL tags, do not use this system function. Use the "SetBit" system function instead.

---

### Use in the function list

SetBitInTag (Tag, Bit)

### Use in user-defined functions

SetBitInTag(Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### Tag

The tag in which a bit is set to 1 (TRUE).

#### Bit

The number of the bit that is set to 1 (TRUE).

When this system function is used in a user-defined function, the bits in the specified tag will be counted from right to left independent of the PLC used. The counting begins with 0.

---

#### Note

The guaranteed update of the tags used with actual process values is absolutely conditional in terms of reliable functionality. You should therefore configure the tag in an I/O field or assign the system function to a screen object, such as a button.

If you have configured a short event such as the activation of an alarm for the system function you can only access the actual process values by setting the tag for continuous reading.

---

## Example

The following program code sets a bit to 1 at the specified bitposition in the bvalue tag and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Reset bit in bitposition
SetBitInTag (bvalue, bitposition);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
    ...
}
```

## See also

SetBit (Page 4036)

Availability for specific devices of system functions (Page 3910)

## SetBitWhileKeyPressed

### Description

Sets the bit of the given tag to 1 (TRUE) as long as the user keeps the configured key pressed.

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC. You should only access tags of the BOOL type with this system function to avoid problems with overlapping access to the same tag.

---

### Note

All functions on the event "Release" are performed immediately by means of a screen change configured for a key, even if the key is kept pressed.

If the "SetBitWhileKeyPressed" system function is configured for a function key, the bit will be reset immediately following a screen change. This action is necessary since the key assignments change after the screen change.

If the PLC supports BOOL tags, do not use this system function. Use the "SetBit" system function instead.

---

**Use in the function list**

SetBitWhileKeyPressed (Tag, Bit)

**Use in user-defined functions**

-

**Parameters****Tag**

The tag in which a bit is temporarily set to 1 (TRUE). Use only tags of the type BOOL, as far as allowed by the PLC.

**Bit**

The number of the bit that is temporarily set to 1 (TRUE).

---

**Note**

The guaranteed update of the tags used with actual process values is absolutely conditional in terms of reliable functionality. You should therefore configure the tag in an IO field, or assign the function to a screen element such as a button.

If you configured a short event such as the activation of an alarm for the function you can only access the actual process values by setting the tag for continuous reading.

---

**See also**

SetBit (Page 4036)

Availability for specific devices of system functions (Page 3910)

**SetBacklightColor****Description**

Defines the background lighting of the button.

---

**Note**

The configuration that was set at Switch off is reestablished when restarting the HMI device.

---

**Use in the function list**

SetBacklightColor (Value)

## Use in user-defined functions

-

## Parameters

### Value

Defines the background lighting of the button:

0 (hmiWhite) = White: No color

1 (hmiGreen) = Green: Green color

2 (hmiYellow) = Yellow: Yellow color

3 (hmiRed) = Red: Red color

## See also

Availability for specific devices of system functions (Page 3910)

## SetBrightness

### Description

Determines the brightness of the display.

---

### Note

The configuration that is set in the Control Panel will be reestablished when you restart the HMI device.

---

## Use in the function list

SetBrightness (value)

## Use in user-defined functions

SetBrightness (Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Value

New value for the brightness.

**See also**

Availability for specific devices of system functions (Page 3910)

**SetScreenKeyboardMode****Description**

Enables or disables the automatic display of the screen keyboard on the HMI device.

This system function is also used to prevent the display of the screen keyboard, e.g. because an external keyboard is connected to the HMI device.

---

**Note**

To enable the "SetScreenKeyboardMode" ("SetScreenKeyboardMode") system function on an HMI other than a Touch Panel device, set the "Use on-screen keyboard" check box in the "Runtime settings" dialog of the device settings.

---

**Use in the function list**

SetScreenKeyboardMode (Mode)

**Use in user-defined functions**

SetScreenKeyboardMode (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Mode**

Determines whether the screen keyboard is hidden or shown:

0 (hmiOff) = Off: Screen keyboard is hidden

1 (hmiOn) = On: Screen keyboard is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes.

**See also**

Availability for specific devices of system functions (Page 3910)

## SetPLCDateTime

### Description

Changes the data and the time of the linked PLC

The system function "SetPLCDateTime" can only be configured for the following PLCs:

- SIMATIC S7 1200
- SIMATIC S7 1500

### Use in the function list

SetPLCDateTime (connection, time)

### Use in user-defined functions

SetPLCDateTime (Connection, Time)

### Parameters

#### Connection

Connection of PLC and HMI device.

#### Time

Transfers the date and the time of the HMI device to the PLC. The PLC applies the date and the time of the HMI device.

## SetPLCMode

### Description

Switches the operating mode of the PLC to one of the following states:

- RUN
- STOP

The system function "SetPLCMode" can only be configured for the following PLCs:

- SIMATIC S7 1200
- SIMATIC S7 1500

### Use in the function list

SetPLCMode (connection, mode)

**Use in user-defined functions**

SetPLCMode (Connection, Mode)

**Parameters****Connection**

Connection of PLC and HMI device.

**Mode**

Specifies the operating mode of the PLC:

RUN = the PLC is switched to the RUN state. The PLC program is executed.

STOP = the PLC is switched to the STOP state. The PLC program is interrupted.

**SetAlarmReportMode****Description**

Switches the automatic reporting of alarms on the printer on or off.

**Use in the function list**

SetAlarmReportMode (Mode)

**Use in user-defined functions**

SetAlarmReportMode (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Mode**

Determines whether alarms are reported automatically on the printer:

0 (hmiDisablePrinting) = Reporting off: Alarms are not printed automatically.

1 (hmiEnablePrinting) = Reporting On: Alarms are printed automatically.

-1 (hmiToggle) = Toggle: Toggles between the two modes.

**See also**

Availability for specific devices of system functions (Page 3910)

## SetRecipeTags

### Description

Changes the status of the recipe tags from "Online" to "Offline" and vice versa.

This system function is used, for example, when recipe data record values are fine tuned when starting up a machine.

### Use in the function list

SetRecipeTags (Recipe number/name, Status, Output status message, Processing status)

### Use in user-defined functions

SetRecipeTags (Recipe\_number/name, Status, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Recipe number/name

Number or name of the recipe in which the recipe data record is saved.

#### Status

Determines the status of the recipe tags:

0 (hmiOnline) = Online: Value changes of the recipe tags are transferred immediately to the PLC connected to the HMI device.

1 (hmiOffline) = Offline: Value changes to the recipe tags are only transferred to the PLC connected to the HMI device when, for example, the "SetDataRecordTagsToPLC" system function is executed.

#### Output status message

Determines whether a status message is output after saving:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

#### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

**See also**

Availability for specific devices of system functions (Page 3910)

**SetDaylightSavingTime****Description**

The system function "SetDaylightSavingTime" changes the setting of the HMI device from daylight saving to standard time and vice versa.

Time settings will take place immediately following system function.

---

**Note**

The "SetDaylightSavingTime" system function does not support time zones without daylight saving time.

---

**Note****Windows 7**

The system function "SetDaylightSavingTime" is not supported for PC-based HMI devices under Windows 7.

---

**Use in the function list**

SetDaylightSavingTime(DaylightSavingTime)

**Use in user-defined functions**

SetDaylightSavingTime (Daylight\_saving\_time)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameters****Daylight Saving Time**

Determines whether Daylight Saving Time is set on the HMI device:

0 = Daylight Saving Time is not activated

1 = Daylight Saving Time is activated

**See also**

Availability for specific devices of system functions (Page 3910)

## SetLanguage

### Description

Toggles the language on the HMI device. All configured text and system events are displayed on the HMI device in the newly set language.

### Use in the function list

SetLanguage (Language)

### Use in user-defined functions

SetLanguage (Language)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Language

Determines which language is set on the HMI device. The following specifications are possible:

- -1 (hmiToggle) = Toggle: Changes to the next language. The sequence is determined during configuration in the "Project languages" editor.
- Number you have defined under "Languages and fonts" in the "Runtime Settings" editor. Changes to the language with the given number.
- Language you have defined under "Languages and fonts" in the "Runtime Settings" editor.
- Language abbreviation in accordance with the VBScript5 reference: This changes to the language corresponding to the specified language code, e.g. "de-DE" for German (Germany) or "en-US" for English (United States).  
An overview of the language abbreviations is available in the basic information of VBScript under the topic "Area diagram-ID (LCID) Diagram".

### See also

Availability for specific devices of system functions (Page 3910)

## SetAndGetBrightness

### Description

Determines the brightness of the MP 377 Touch daylight readable display. The brightness value can be interpreted as absolute or relative to the current value.

---

**Note**

The configuration that is set in the Control Panel will be reestablished when you restart the HMI device.

---

### Use in the function list

SetAndGetBrightness (Brightness, Mode, Current value)

### Use in user-defined functions

SetAndGetBrightness (Brightness, Mode, Actual brightness)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

**Brightness**

New value for the brightness.

**Mode**

Specifies if the new brightness value is set as absolute or relative to the current value.

**Current value**

Tag in which the current brightness value is stored.

### See also

Availability for specific devices of system functions (Page 3910)

## SetTag

### Description

Assigns a new value to the given tag.

---

#### Note

This system function can be used to assign strings and numbers, depending on the type of tag.

---

### Use in the function list

SetTag (Tag, Value)

### Use in user-defined functions

SetTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### Tag

The tag to which the given value is assigned.

#### Value

The value which the given tag is assigned.

---

#### Note

The "SetTag" system function is only executed after a connection has been established.

---

### Example

The following program code uses the SetTag function to set the value of the gs\_tag\_bit tag to TRUE and saves the return value to the ok tag.

```
{
BOOL ok;
BOOL bvalue;

//Set the tag to true
ok = SetTag("gs_tag_bit", TRUE);
//error handling
```

```
if(ok)
{
    // succeeded
    printf ( "Function has run through.\r\n" );
    bvalue = GetTagBit("gs_tag_bit");
    printf ("Value of gs_tag_bit: %d\r\n", bvalue);
}
else
{
    // failed
    printf ( "Error - function failed." );
}
...
}
```

The saved return value can be processed in the following code.

### See also

Availability for specific devices of system functions (Page 3910)

## SetConnectionMode

### Description

Connects or disconnects the given connection.

---

#### Note

A connection to the PLC cannot be established until the operating mode ONLINE has been set on the HMI device. Use the "SetDeviceMode" system function for this purpose.

---

### Use in the function list

SetConnectionMode (Mode, Connection)

### Use in user-defined functions

SetConnectionMode (Mode, Connection)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Mode

Determines whether a connection to the PLC is established or disconnected:

0 (hmiOnline) = Online: Connection is established.

1 (hmiOffline) = Offline: Connection is disconnected.

### Connection

The PLC to which the HMI device is connected. You specify the name of the PLC in the connection editor.

### Multiple use of the system function in a user-defined function

If you use the "SetConnectionMode" system function for different connections, it may be possible that not all system functions are executed correctly. Proceed as follows to prevent this situation:

1. Create a "BOOL" type tag with the start value "0".
2. Configure the "SetConnectionMode" system function on the "Value change" event of the HMI tags. If you want to disconnect three connections, for example, you must configure the system function three times.
3. In the user-defined function, apply the "InvertBit" system function to the HMI tag.

### Application example

Two typical application examples for this system function are as follows:

- Test  
As long as no PLC is connected to the HMI device, no error messages will be output during the test on the HMI device. If the HMI device is connected to a PLC, the connection to the PLC can be established by pressing a key.
- Commissioning  
Several PLCs are to be configured for a system. At first, all PLCs except one are configured "Offline". After commissioning of the first PLC, the connection to each of the other PLCs is established by pressing a key. In this way, the other PLCs are started up one after another.

### See also

Availability for specific devices of system functions (Page 3910)

### SetWebAccess

#### Description

Determines the access mode to the runtime application using the Internet.

#### Use in the function list

SetWebAccess (Access mode)

## Use in user-defined functions

-

## Parameters

### Access mode

Determines the access mode to the runtime application:

-1 (hmiToggle) = Toggle: Toggles between the two modes.

0 (hmiReadOnly) = Read-only.

1 (hmiReadWrite) = Read-write.

## See also

Availability for specific devices of system functions (Page 3910)

## BackupRAMFileSystem

### Description

Backs up the RAM file system in the memory medium of the HMI device.

After restarting the HMI device, the data is automatically reloaded in the RAM file system.

Applications such as the Internet Explorer save data (e.g. the last web sites called up) temporarily to the DRAM file system of the HMI device.

### Use in the function list

BackupRAMFileSystem

### Use in user-defined functions

BackupRAMFileSystem

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

--

## See also

Availability for specific devices of system functions (Page 3910)

## SimulateSystemKey

### Description

Simulates the behavior of a System Key. Use this system function if a system key, such as the "ACK" key, "Input" key or the number pad is not available on the HMI device.

### Use in the function list

SimulateSystemKey (System key)

### Use in user-defined functions

-

### Parameters

#### System key

System Key, the behavior for which is to be simulated.

### System key "+/-"

With the SimulateSystemKey system function, the system key "+/-" is only supported for the following HMI devices:

- KP300 Basic
- KP400 Basic
- KTP400 Basic mono PN
- KTP400 Basic color PN
- KTP400 Basic color PN Portrait
- KTP600 Basic mono PN
- KTP600 Basic color PN
- KTP600 Basic color DP
- KTP1000 Basic PN
- KTP1000 Basic DP

Use the system keys "+" and "-" separately for all other HMI devices.

### See also

Availability for specific devices of system functions (Page 3910)

## SimulateTag

### Description

Simulates the behavior of tags and dynamic objects such as text lists, without having the HMI device connected to a PLC. You can, for example, configure the system function to the "Loaded" event of a screen.

This system function is used, for example, to demonstrate the functionality of a project.

Only tags of the data type Integer can be used for simulation. Tags of the data types Integer and Double Integer, however, can be used with OP 73, OP 77A, TP 177A.

---

#### Note

If you use the system function "SimulateTag" with a short cycle time on a Basic Panel, the HMI device may be overloaded.

---

### Use in the function list

SimulateTag (Tag, Cycle, Maximum value, Minimum value, Value)

### Use in user-defined functions

-

### Parameter

#### Tag

The tag whose value is changed.

#### Cycle

The factor by which the basic cycle of 200 milliseconds is multiplied. The cycle defines when the tag value is changed by the specified value. Possible cycles between 1 and 32767.

#### Maximum value

The maximum value that the tag can assume during simulation. The maximum value must be greater than the minimum value but less than / equal to 32767.

#### Minimum value

The minimum value that the tag can assume during simulation. The minimum value must be lower than the maximum value but greater than / equal to -32768.

#### Value

The value by which the tag value is changed during each cycle. Possible values between -32768 and 32767.

- A positive value increases the tag value. When the maximum value is reached, the tag value is set to the minimum value after the next update cycle.
- A negative value reduces the tag value. When the minimum value is reached, the tag value is set to the maximum value after the next update cycle.

Availability for specific devices of system functions (Page 3910)

## SmartClientViewRefresh

### Description

Updates the contents displayed in the Sm@rtClient view.

### Use in the function list

SmartClientViewRefresh (Screen object)

### Use in user-defined functions

-

### Parameters

#### Screen object

Name of the Sm@rtClient view in which the command is triggered.

### See also

Availability for specific devices of system functions (Page 3910)

## SmartClientViewReadOnlyOff

### Description

Sets read-only access to "Off" in the Sm@rtClient view.

This setting allows a distant HMI device to be operated. The "SmartClientViewReadOnlyOn" system function is used to switch read-only access on again.

### Use in the function list

SmartClientViewReadOnlyOff (Screen object)

**Use in user-defined functions**

-

**Parameters****Screen object**

Name of the Sm@rtClient view in which the command is triggered.

**See also**

Availability for specific devices of system functions (Page 3910)

**SmartClientViewReadOnlyOn****Description**

Sets read-only access to "On" in the Sm@rtClient view.

This setting allows a distant HMI device to be monitored only. The "SmartClientViewReadOnlyOff" system function is used to switch read-only access off again.

**Use in the function list**

SmartClientViewReadOnlyOn (Screen object)

**Use in user-defined functions**

-

**Parameters****Screen object**

Name of the Sm@rtClient view in which the command is triggered.

**See also**

Availability for specific devices of system functions (Page 3910)

**SmartClientViewDisconnect****Description**

Executes the "Disconnect" command in the Sm@rtClient view.

This system function is used when the integrated button of the screen object should not be used.

#### Use in the function list

SmartClientViewDisconnect (Screen object)

#### Use in user-defined functions

-

#### Parameters

##### Screen object

Name of the Sm@rtClient view in which the command is triggered.

#### See also

Availability for specific devices of system functions (Page 3910)

### SmartClientViewConnect

#### Description

Executes the "Connect" command in the Sm@rtClient view.

This system function is used when the integrated button of the screen object should not be used. The Sm@rtClient view establishes a connection with the configured HMI device.

#### Use in the function list

SmartClientViewConnect (Screen object)

#### Use in user-defined functions

-

#### Parameters

##### Screen object

Name of the Sm@rtClient view in which the command is triggered.

#### See also

Availability for specific devices of system functions (Page 3910)

## SmartClientViewLeave

### Description

Exits the Sm@rtClient view and returns to operation of the HMI device.  
The connection to the HMI device configured in the smart client view is retained.

### Use in the function list

SmartClientViewLeave (Screen object)

### Use in user-defined functions

-

### Parameters

#### Screen object

Name of the Sm@rtClient view in which the command is triggered.

### See also

Availability for specific devices of system functions (Page 3910)

## SaveDataRecord

### Description

Saves the current values of the recipe tags as data record to the memory medium of the HMI device.

This system function is used, for example, to save a recipe data record in the recipe screen.

### Use in the function list

SaveDataRecord (Recipe number/name, Data record number/name, Overwrite, Output status message, Processing status)

### Use in user-defined functions

SaveDataRecord (Recipe\_number/name, Data\_record\_number/name, Overwrite, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameters

### Recipe number/name

Number or name of the recipe to which a recipe data record is saved.

### Data record number/name

Number or name of the recipe data record to be saved. A new data record will be created if no record of this name or number was found in the recipe, independent of the value at the "Overwrite" parameter.

### Overwrite

Specifies whether an existing data record is overwritten:

0 (hmiOverwriteForbidden) = No: The recipe data record is not overwritten, the data record is not saved.

1 (hmiOverwriteAlways) = Yes: The recipe data record is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithPrompting) = With confirmation: The recipe data record is overwritten only with confirmation by the user.

### Output status message

Determines whether a status message is output after saving:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

## See also

Availability for specific devices of system functions (Page 3910)

## StartLogging

### Description

Starts the logging of data or alarms in the specified log. The function can also be applied to audit trails.

You can interrupt logging at runtime using the "StopLogging" system function.

**Use in the function list**

StartLogging (Log type, Log)

**Use in user-defined functions**

StartLogging (Log\_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Log type**

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail

**Log**

Name of the log which is started.

**See also**

Managing logging behavior when Runtime starts (Page 3554)

Availability for specific devices of system functions (Page 3910)

**StartNextLog****Description**

Stops the logging of data or alarms for the given log.

Logging is continued in the next log of the segmented circular log you configured for the specified log.

If you did not configure a segmented circular log for the specified log, the system function has no effect.

**Use in the function list**

StartNextLog (Log type, Log)

**Use in user-defined functions**

StartNextLog (Log\_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

### Log

Name of the log for which the logging is stopped and continued in the next log.

## See also

Availability for specific devices of system functions (Page 3910)

## StartProgram

### Description

Starts the specified program on the HMI device.

The runtime software continues running in the background. Alarms continue to be output and data continues to be updated.

When the given application is exited, the screen which was active during the performance of the system function is displayed on the HMI device.

This system function is used, for example, to edit recipe data records in MS Excel on the HMI device.

---

### Note

If Windows CE is installed on the HMI device, during the configuration it must be checked whether the desired application can be started with this system function.

This system function allows all applications to be started which can be started in the "Execute" dialog of Windows CE.

The application to be started must be installed on the HMI device.

---

## Use in the function list

StartProgram (Program name, Program parameters, Layout, Wait for program to end)

## Use in user-defined functions

StartProgram (Program\_name, Program\_parameters, Display\_mode, Wait\_for\_program\_to\_end)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Program name

Name and path of the program which is started. Upper and lower case are taken into account in this parameter.

---

### Note

If the path contains spaces, the program can only be started correctly if the path is specified in inverted commas, e.g. "C:\Program Files\START\start.exe".

---

### Program parameters

The parameters you transfer at the start of the program, for example a file that is opened after the start of the program.

The description of the necessary parameters is found in the documentation of the program to be started.

### Layout

Determines how the program window is displayed on the HMI device:

0 (hmiShowNormal) = Normal

1 (hmiShowMinimized) = Minimized

2 (hmiShowMaximized) = Maximized

3 (ShowMinimizedAndInactive) = Minimized and inactive

### Wait for program to end

Determines whether there is a change back to the project after the called up program has ended:

0 (hmiNo) = No: No change to project

1 (hmiYes) = Yes: Change to project

---

### Note

The "Wait for program to end" parameter is only available for Runtime Advanced and Panels.

---

## See also

Availability for specific devices of system functions (Page 3910)

## StatusForceGetValues

### Description

Starts or stops the updating of values in the Status/Force display. The values are read from the PLC connected to the HMI device until the update is stopped.

---

#### Note

As long as the values are updated, no entries are possible in the input fields of the Status/Force display.

---

### Use in the function list

StatusForceGetValues (Screen object)

### Use in user-defined functions

-

### Parameters

#### Screen object

Name of the Status/Force display to which data from the PLC is written.

### See also

Availability for specific devices of system functions (Page 3910)

## StatusForceSetValues

### Description

Writes the values from the Status/Force display to the PLC to which the HMI device is connected.

### Use in the function list

StatusForceSetValues (Screen object)

### Use in user-defined functions

-

## Parameters

### Screen object

Name of the Status/Force display from which data is written to the PLC.

## See also

Availability for specific devices of system functions (Page 3910)

## ControlSmartServer

### Description

Starts or stops the Sm@rtServer.

### Use in the function list

ControlSmartServer (Mode)

### Use in user-defined functions

ControlSmartServer (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Mode

Specifies whether the Sm@rtServer is started or stopped.

-1 (hmiToggle) = Toggle: Toggles between the two modes

0 (hmiStop) = Stop: Sm@rtServer is stopped

1 (hmiStart) = Start: Sm@rtServer is started

## See also

Availability for specific devices of system functions (Page 3910)

## ControlWebServer

### Description

Starts or stops the Web server.

### Use in the function list

ControlWebServer (Mode)

### Use in user-defined functions

ControlWebServer (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Mode

Specifies whether the Web server is started or stopped.

-1 (hmiToggle) = Toggle: Toggles between the two modes

0 (hmiStop) = Stop: The Web server is stopped.

1 (hmiStart) = Start: The Web server is started.

### See also

Availability for specific devices of system functions (Page 3910)

### StopLogging

#### Description

Stops the logging of process values or alarms in the specified log. The function can also be applied to audit trails.

The "StartLogging" system function is used to resume logging at runtime.

---

#### Note

When logging is stopped, a connection between WinCC and the log files or log database still exists. Use the "CloseAllLogs" system function to disconnect this connection.

---

### Use in the function list

StopLogging (Log type, Log)

### Use in user-defined functions

StopLogging (Log\_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail

### Log

Name of the log that is stopped.

## Application example

You are in runtime and want to change the data medium on which the process values are logged.

### Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

### Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. The "Open Archive" button opens all logs and continues logging in the specified log.

## See also

Availability for specific devices of system functions (Page 3910)

## StopRuntime

### Description

Exits the runtime software and thereby the project running on the HMI device.

### Use in the function list

StopRuntime (Mode)

### Use in user-defined functions

StopRuntime (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameters

### Mode

Determines whether the operating system is shut down after exiting runtime.

0 (hmiStopRuntime) = Runtime: Operating system is not shut down

1 (hmiStopRuntimeAndOperatingSystem) = Runtime and operating system: The operating system is shut down (not possible with WinCE)

## Example

The following program code shuts down Runtime and the operating system.

```
{  
  
//Stop runtime and shutdown  
StopRuntime (hmiStopRuntimeAndOperationSystem);  
  
}
```

The saved return value can be processed in the following code.

## See also

Availability for specific devices of system functions (Page 3910)

## ActivateSystemDiagnosticsView

### Description

Activates the system diagnostics view. The system diagnostics view shows the detail view of the device concerned.

### Use in the function list

ActivateSystemDiagnosticsView (Screen name, Object name)

### Use in user-defined functions

ActivateSystemDiagnosticsView (Screen\_name, Object\_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Screen name**

Name of the screen contained in the system diagnostics view.

**Object name**

Object name of the system diagnostics view.

**See also**

Availability for specific devices of system functions (Page 3910)

**SystemDiagnosticsViewRefreshPLCBuffer****Description**

Refreshes the data from the diagnostics buffer of the PLC in the system diagnostics view.

**Use in the function list**

SystemDiagnosticsViewRefreshPLCBuffer (Object name)

**Use in user-defined functions**

-

**Parameters****Object name**

Name of the system diagnostics view.

**SystemDiagnosticsViewDetailView****Description**

The detail view returns detailed information about the selected connection and errors pending.

**Use in the function list**

SystemDiagnosticsViewDetailView (Object name)

**Use in user-defined functions**

-

## Parameters

### Object name

Name of the system diagnostics view that is switched to the detail view.

## SystemDiagnosticsViewDiagnosticsBuffer

### Description

Opens a view in a system diagnostics for displaying the current data of the diagnostics buffer.

### Use in the function list

SystemDiagnosticsViewDiagnosticsBuffer (Object name)

### Use in user-defined functions

-

## Parameters

### Object name

Name of the system diagnostics view that is switched to the detail view.

## SystemDiagnosticsViewDeviceView

### Description

Opens a view in a system diagnostics for displaying all available connections.

### Use in the function list

SystemDiagnosticsViewDeviceView (Object name)

### Use in user-defined functions

-

## Parameters

### Object name

Name of the system diagnostics view.

## SystemDiagnosticsViewBack

### Description

Changes in a system diagnostics to the higher-level view.

- The function opens the device view if the diagnostics buffer view is set in the system diagnostics view.
- The function opens the diagnostics buffer view if the detail view is displayed in the system diagnostics view.

### Use in the function list

SystemDiagnosticsViewBack (Object name)

### Use in user-defined functions

-

### Parameters

#### Object name

Name of the system diagnostics view.

### LookupText

### Description

Identifies an entry from a text list. The result depends on the value and on the selected runtime language. The result is saved to a tag of data type "String".

### Use in the function list

LookupText (Output text, Value, Language, Text list)

### Use in user-defined functions

LookupText (Output\_text, Index, Language, Text\_list)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### Output text

The tag to which the result is written.

**Value**

The tag that defines the value of the list entry.

**Language**

Defines the runtime language in which the list entry is identified.

- **Runtime language**  
Language code as per VBScript reference, for example, "de-DE" for German (Germany) or "en-US" for English (United States of America). The selection depends on the activated runtime languages.
- **Tag**  
The tag that contains the language. Enter the runtime language as decimal value of the country ID, for example, 1031 for German - Standard, 1033 for English - USA. Details are available in the VBScript basics, "Locale identifier (LCID) diagram".
- **Integer**  
The number that corresponds to the order of runtime languages for language switching. The selection depends on the activated runtime languages, for example, "0" for the language that appears when you first start runtime. You can find more information under the topic of "Languages in Runtime".

**Text list**

Defines the text list. The list entry is read from the text list.

**See also**

- Availability for specific devices of system functions (Page 3910)
- Languages in runtime (Page 5916)

**ResetTagToHandWheel**

**Description**

Separates the tag that is connected with the operating element handwheel, and reconnects the handwheel with the global tags.

**Use in the function list**

ResetTagToHandWheel

**Use in user-defined functions**

-

**Parameters**

--

**See also**

Availability for specific devices of system functions (Page 3910)

**SetTagToHandWheel****Description**

Connect the tag with the operating device handwheel. If the handwheel is operated, the tag value changes. The connection can be reset using the "ResetTagToHandWheel" system function.

**Use in the function list**

SetTagToHandWheel (Value)

**Use in user-defined functions**

-

**Parameters****Value**

Tag names which are connected to the operating device handwheel.

**See also**

Availability for specific devices of system functions (Page 3910)

**TraceUserChange****Description**

Outputs a system event that shows which user is currently logged in on the HMI device. This system function can only be used in the Scheduler.

**Use in the function list**

TraceUserChange

**Use in user-defined functions**

-

## Parameters

--

## See also

Availability for specific devices of system functions (Page 3910)

## DecreaseFocusedValue

### Description

Subtracts the specified value from the value of the tag which is connected to the screen object and currently has the focus.

This system function can only be used for function keys.

### Use in the function list

DecreaseFocusedValue (Value)

### Use in user-defined functions

-

## Parameters

### Value

The value which is subtracted from the tag value.

## See also

Availability for specific devices of system functions (Page 3910)

## DecreaseTag

### Description

Subtracts the given value from the tag value.

$X = X - a$

---

**Note**

The system function uses the same tag as input and output values. When this system function is used to convert a value, auxiliary tags must be used. The auxiliary tags are assigned to the tag value with the "SetTag" system function.

---

If you configure the system function on the events of an alarm and the tag is not being used in the current screen, it is not ensured that the actual value of the tags is being used in the PLC. You can improve the situation by setting the "Cyclic continuous" acquisition mode.

**Use in the function list**

DecreaseTag (Tag, Value)

**Use in user-defined functions**

DecreaseTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Tag**

The tag from which the given value is subtracted.

**Value**

The value which is subtracted.

**See also**

Availability for specific devices of system functions (Page 3910)

**ChangeConnection****Description**

Disconnects the connection to the currently used PLC in use and establishes a connection to a PLC with another address. The newly connected PLC must belong to the same device class (S7-1200, S7-300, ...etc). With S7-1200, the use of the function is also only permitted for absolute addressing.

---

**Note**

When changing to another address, ensure that the address is not already being used by another HMI device.

---

The follows address types are supported:

- IP address
- MPI address

The follows PLC types are supported:

- SIMATIC S7 300/400
- SIMATIC S7-NC
- SIMOTION

**Use in the function list**

ChangeConnection (Connection, Address, Slot, Rack)

**Use in user-defined functions**

ChangeConnection (Connection, Address, Slot, Rack)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

**Connection**

Name of the connection that is disconnected. The name is set during configuration, for example, in the "Connections" editor.

**Address**

MPI/PROFIBUS or IP address of the PLC to which the connection will be established.

---

**Note**

Set the address by means of a tag. The objects list displays the tags of all data types. Select only tags of the following data types:

- Ethernet connection: "String" data type
  - MPI connection: "Int" data type
- 

**Slot**

Slot of the PLC to which the connection will be established.

**Rack**

Rack of the PLC to which the connection will be established.

**Application example**

You want to operate one HMI device on several machines. Configure the necessary PLCs in the project, to which you want to change by pressing a key. When changing the PLC, the connection to the PLC in use is disconnected. Then the connection to the new PLC with other address parameters is reestablished. To access the values of the new PLC, configure the same tags for the PLC used.

The PLC which you have indicated when creating the project will be used as default.

1. Enter the name and address of the PLC in the "Connections" editor.
2. Configure a button in the process screen.
3. Configure the "ChangeConnection" system function on the "Press" event.
4. Enter the name of the connection and address of the PLC as parameters.

**See also**

Availability for specific devices of system functions (Page 3910)

**ShowLogonDialog****Description**

Opens a dialog on the HMI device with which the user can log on to the HMI device.

**Use in the function list**

ShowLogonDialog

**Use in user-defined functions**

-

**Parameters**

--

**See also**

Availability for specific devices of system functions (Page 3910)

## ShowOperatorNotes

### Application

Displays the tooltip configured for the selected object.

If the system function is configured on a function key, the tooltip for the screen object that currently has the focus is displayed. If a tooltip is configured for the screen itself, you can switch to this text by pressing <Enter> or by double-clicking on the help window.

If the system function is configured on a button, only the tooltip for the current screen is displayed. If a tooltip is configured on the button itself, initially only the tooltip for the button is displayed. You can press <Enter> or double-click on the help window to switch to the tooltip for the current screen.

---

#### Note

No other screen object can be used while the help window is open. To use the screen object, close the help window.

---

### Closing the help window

You can close the help window in the following ways:

Using the keys:

- By pressing the <HELP> key again
- By pressing the <ESC> key

Using the touch screen:

- By pressing the  button

### Use in the function list

ShowOperatorNotes (Layout)

### Use in user-defined functions

ShowOperatorNotes (Display\_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Display mode

Determines whether the configured tooltip is hidden or shown:

0 (hmiOff) = Off: Configured tooltip is hidden

1 (hmiOn) = On: Configured tooltip is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

### See also

Availability for specific devices of system functions (Page 3910)

## ShowAlarmWindow

### Description

Hides or shows the alarm window on the HMI device.

### Use in the function list

ShowAlarmWindow (Object name, Layout)

### Use in user-defined functions

ShowAlarmWindow (Object\_name, Display\_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Object name

Name of the alarm view which is hidden or shown.

#### Layout

Determines whether the alarm window is hidden or shown:

0 (hmiOff) = Off: Alarm view is hidden

1 (hmiOn) = On: Alarm view is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

### See also

Availability for specific devices of system functions (Page 3910)

## ShowSoftwareVersion

### Description

Hides or shows the version number of the runtime software.

Use this system function if during servicing, for example, you required the version of the runtime software used.

### Use in the function list

ShowSoftwareVersion (Layout)

### Use in user-defined functions

ShowSoftwareVersion (Display\_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Layout

Determines whether the version number is shown:

0 (hmiOff) = Off: Version number is not shown

1 (hmiOn) = On: Version number is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

### See also

Availability for specific devices of system functions (Page 3910)

## ShowSystemDiagnosticsWindow

### Description

Hides or shows the system diagnostic window on the HMI device. The system diagnostic view is only available in the global screen for Comfort Panels and for WinCC Runtime Advanced.

### Use in the function list

ShowSystemDiagnosticsWindow (Screen object)

### Use in user-defined functions

ShowSystemDiagnosticsWindow (Target\_Object\_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameters

### Screen object

Name of the system diagnostic window which is hidden or shown.

## See also

Availability for specific devices of system functions (Page 3910)

## ShowSystemAlarm

### Description

Displays the value of the parameter passed as a system event to the HMI device.

### Use in the function list

ShowSystemAlarm (Text/value)

### Use in user-defined functions

ShowSystemAlarm (Text/value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Text/Value

The text or the value, which was output as a system alarm.

## See also

Availability for specific devices of system functions (Page 3910)

## Functions for WinAC MP

### WinACMPUpdateControllerForStartAtBoot

### Description

Reads whether WinAC MP is automatically started after startup of the HMI device. The LED display of the "StartAtBoot" button is updated.

### Use in the function list

WinACMPUpdateControllerForStartAtBoot(Start at boot, Action)

### Use in user-defined functions

-

### Parameters

#### Start at boot

The tag that contains the value.

#### Action

Determines whether the display is updated:

0 (SwitchOff) = Off: LED display is gray. WinAC MP is not started on startup of the HMI device.

1 (SwitchOn) = On: LED display has the color "cyan". WinAC MP is started automatically on startup of the HMI device.

### Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

### WinACMPUpdateKeySwitchSetting

#### Description

Updates the status display of the position of the mode selector switch.

### Use in the function list

WinACMPUpdateKeySwitchSetting (Key switch, Action)

## Use in user-defined functions

-

## Parameters

### Key switch

The tag that contains the value of the key switch:

0 (MRES) = MRES: PLC memory reset

1 (STOP) = STOP: STOP mode

3 (RUN) = RUN: RUN mode

### Action

Determines whether the status display will be updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

## Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

## WinACMPUpdateBUSF1LED

### Description

Updates the status display of the BUSF1 LED tag.

### Use in the function list

WinACMPUpdateBUSF1LED(BUSF1, Update)

## Use in user-defined functions

-

## Parameters

### **BUSF1**

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

### **Update**

Defines whether the status display of the BUSF1 LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

## Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

## WinACMPUpdateBUSF2LED

### Description

Updates the status display of the BUSF2 LED tag.

### Use in the function list

WinACMPUpdateBUSF2LED(BUSF2, Update)

### Use in user-defined functions

-

## Parameters

### **BUSF2**

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

### **Update**

Defines whether the status display of the BUSF2 LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

## Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

## WinACMPUpdateAverageExecTime

### Description

Updates the display of the average OB 1 execution time. The OB 1 execution time will be displayed in milliseconds.

### Use in the function list

WinACMPUpdateAverageExecTime(Cycle time, Update)

### Use in user-defined functions

-

## Parameters

### Cycle time

Tag that contains the value of the average OB 1 execution time.

### Action

Determines whether the display is updated:

0 (SwitchOff) = Off: Display is not updated.

1 (SwitchOn) = On: Display is updated.

## Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

## WinACMPUpdateAverageCycleTime

### Description

Updates the display of the average cycle time. The cycle time is displayed in milliseconds.

### Use in the function list

WinACMPUpdateAverageCycleTime(Cycle time, Action)

### Use in user-defined functions

-

## Parameters

### Cycle time

The tag that contains the value of the average cycle time.

**Action**

Determines whether the display is updated:

0 (SwitchOff) = Off: Display is not updated.

1 (SwitchOn) = On: Display is updated.

**Notes on configuring**

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

**WinACMPUpdateEXTFLED****Description**

Updates the status display of the EXTF LED tag.

**Use in the function list**

WinACMPUpdateEXTFLED(EXTF, Update)

**Use in user-defined functions**

-

**Parameters****EXTF**

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

### Update

Defines whether the status display of the EXTF LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

### Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

### WinACMPUpdateHMIEnableTime

#### Description

Updates the value of the HMI Enable Time from WinAC MP (in ms).

#### Use in the function list

WinACMPUpdateHMIEnableTime(Enable Time, Update)

#### Use in user-defined functions

-

#### Parameters

##### HMI Enable time

The tag that contains the value of the HMI Enable Time.

##### Action

Determines whether the value is updated:

0 (SwitchOff) = Off: Value is not updated.

1 (SwitchOn) = On: Value is updated.

## Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

## WinACMPUpdateINTFLED

### Description

Updates the status display of the INTF LED tag.

### Use in the function list

WinACMPUpdateINTFLED(INTF, Update)

### Use in user-defined functions

-

### Parameters

#### INTF

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

#### Update

Defines whether the status display of the INTF LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

### Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

### WinACMPUpdateLastCycleTime

#### Description

Updates the display of the last cycle time. The cycle time is displayed in milliseconds.

#### Use in the function list

WinACMPUpdateLastCycleTime (Cycle time , Update)

#### Use in user-defined functions

-

#### Parameters

##### Cycle time

The tag that contains the value of the last cycle time.

##### Action

Determines whether the display is updated:

0 (SwitchOff) = Off: Display is not updated.

1 (SwitchOn) = On: Display is updated.

### Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

## WinACMPUpdateMaximumCycleTime

### Description

Updates the display of the longest cycle time. The cycle time is displayed in milliseconds.

### Use in the function list

WinACMPUpdateMaximumCycleTime(Cycle time, Update)

### Use in user-defined functions

-

### Parameters

#### Cycle time

The tag that contains the value of the longest cycle time.

#### Action

Determines whether the display is updated:

0 (SwitchOff) = Off: Display is not updated.

1 (SwitchOn) = On: Display is updated.

### Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".

- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

## WinACMPUpdateMinimumCycleTime

### Description

Updates the display of the shortest cycle time. The cycle time is displayed in milliseconds.

### Use in the function list

WinACMPUpdateMinimumCycleTime (Cycle Time, Update)

### Use in user-defined functions

-

### Parameters

#### Cycle time

The tag that contains the value of the shortest cycle time.

#### Action

Determines whether the display is updated:

0 (SwitchOff) = Off: The display is not updated.

1 (SwitchOn) = On: The display is updated.

### Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

## WinACMPUpdatePowerLED

### Description

Updates the status display ON/OFF of the Power LED tag.

### Use in the function list

WinACMPUpdatePowerLED (Power, Update)

### Use in user-defined functions

-

### Parameters

#### Power

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

#### Update

Determines whether the status display ON/OFF is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

### Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

## WinACMPUpdateSleepTime

### Description

Updates the value of the HMI Execution Time from WinAC MP (in ms).

### Use in the function list

WinACMPUpdateSleepTime(SleepTime, Update)

### Use in user-defined functions

-

### Parameters

#### SleepTime

The tag that contains the value.

#### Update

Determines whether the value is updated:

0 (SwitchOff) = Off: Value is not updated.

1 (SwitchOn) = On: Value is updated.

### Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

## WinACMPUpdateRUNLED

### Description

Updates the status display of the RUN LED tag.

### Use in the function list

WinACMPUpdateRUNLED(RUN, Update)

### Use in user-defined functions

-

### Parameters

#### **RUN**

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

#### **Update**

Defines whether the status display of the RUN LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

### Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

### WinACMPUpdateSTOPLED

#### Description

Updates the status display of the STOP LED tag.

### Use in the function list

WinACMPUpdateSTOPLED (STOP, Update)

### Use in user-defined functions

-

### Parameters

#### STOP

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

#### Update

Defines whether the status display of the STOP LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

### Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event  
Set the "Update" parameter to "On".
- System function on the "Cleared" event  
Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

### WinACMPArchive

#### Description

Saves the current STEP 7 user program, the current system configuration and the current values of the DBs in a log file.

**Use in the function list**

WinACMPArchive (File name)

**Use in user-defined functions**

-

**Parameters****File name**

Name of the log file in which the data is saved. Enter the file location and the file extension (\*.wld), for example, "\\flash\AddOn\WinACMP\Default.wld".

**WinACMPGetStartMode****Description**

Reads in the 'desired' operating state after startup of the HMI device of WinAC MP.

**Use in the function list**

WinACMPGetStartMode (Operating state, Update)

**Use in user-defined functions**

-

**Parameters****Start mode**

The tag that defines the value of the operating mode.

**Action**

Determines whether the operating mode is read out:

0 (SwitchOff) = Off: Operating mode is not read out.

1 (SwitchOn) = On: Operating mode is read out.

**WinACMPGetVersion****Description**

Reads out the value of the version number of WinAC MP.

### Use in the function list

WinACMPGetVersion (Version, Action)

### Use in user-defined functions

WinACMPGetVersion (Version, Action)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

### Parameters

#### Version

The tag that contains the value.

#### Action

Determines whether the version number is read out:

0 (SwitchOff) = Off: Version number is not read out.

1 (SwitchOn) = On: Version number is read out.

## WinACMPClearCycleTimeBuffer

### Description

Clears the cycle time data of the histogram.

### Use in the function list

WinACMPClearCycleTimeBuffer

### Use in user-defined functions

-

### Parameters

--

## WinACMPSetStartAtBoot

### Description

Determines whether or not WinAC MP is started automatically after startup of the HMI device.

**Use in the function list**

WinACMPSetStart at boot(Start at boot)

**Use in user-defined functions**

WinACMPSetStartAtBoot (Start at boot)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

**Parameters****StartAtBoot**

Defines whether WinAC MP is started automatically.

0 (StartAtBootOff) = Off: WinAC MP is not started on startup of the HMI device.

1 (StartAtBootOn) = On: WinAC MP is started automatically on startup of the HMI device.

**WinACMPSetKeySwitch****Description**

Sets the mode selector switch to RUN or STOP and is also used for memory reset.

**Use in the function list**

WinACMPSetKeySwitch(Key switch)

**Use in user-defined functions**

-

**Parameters****Key switch**

Defines the position of the key switch:

0 (MRES) = MRES: PLC memory reset

1 (STOP) = STOP: STOP mode

3 (RUN) = RUN: RUN mode

## WinACMPSetHMIEnableTime

### Description

Sets the value of the HMI Execution Time of WinAC MP.

### Use in the function list

WinACMPSetHMIEnableTime(Execution Time)

### Use in user-defined functions

-

### Parameters

#### Execution time

The tag that contains the value.

## WinACMPSetRestartMethod

### Description

Sets the restart method, either cold restart (CRST) or warm restart (WRST).

### Use in the function list

WinACMPSetRestartMethod (Action)

### Use in user-defined functions

-

### Parameters

#### Action

Defines the restart action:

0 (WarmRestart) = Warm restart: A warm restart is performed.

1 (ColdRestart) = Cold restart: A cold restart is performed.

## WinACMPSetSleepTime

### Description

Sets the value of the HMI Execution Time of WinAC MP.

### Use in the function list

WinACMPSetSleeptime (SleepTime)

### Use in user-defined functions

-

### Parameters

#### Sleep time

The tag that contains the value.

## WinACMPSetStartMode

### Description

Sets the operating mode of WinAC MP after startup of the HMI device.

### Use in the function list

WinACSetStartMode (Autostart)

### Use in user-defined functions

WinACSetStartMode (Autostart)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

### Parameters

#### Action

Defines whether the Autostart function of WinAC MP is activated.

0 (AutoStartOff) = Off: After startup, WinAC MP remains in the STOP operating mode.

1 (AutoStartOn) = On: After startup, WinAC MP changes to the operating mode it was in before it was closed.

## WinACMPStartHistogram

### Description

Starts the cyclic sending of histogram values and updates the display. The histogram shows the percentual distribution of the measured cycle times.

### Use in the function list

WinACMPStartHistogram (Update, Percentage, Cycle time, Y axis, ID)

### Use in user-defined functions

-

### Parameters

#### Action

Defines whether WinAC returns histogram values:

0 (SwitchOff) = Off: The cyclic sending of the histogram values is not started. The display is not updated.

1 (SwitchOn) = On: The cyclic sending of the histogram values is started. The display is updated.

#### Percent

Percentage of the cycles which are performed during the recorded cycle times.

#### Cycle time

Histogram of cycle times.

#### Y-axis bounds

Maximum value of Y axis

#### ID

Histogram ID

## WinACMPControl

### Description

Starts or stops WinAC MP.

### Use in the function list

WinACMPControl (WinAC)

**Use in user-defined functions**

-

**Parameters****WinAC**

Determines whether WinAC MP is started or stopped.

0 (ShutdownWinACMP) = Stop: WinAC MP is stopped.

1 (StartWinACMP) = Start: WinAC MP is started.

**WinACMPStopHistogram****Description**

Stops the cyclic sending of histogram data and deletes the history data.

**Use in the function list**

WinACMPStopHistogram (ID)

**Use in user-defined functions**

-

**Parameters****ID**

Histogram ID

**WinACMPRestore****Description**

Loads the STEP 7 user program, the system configuration and the DBs from a log file.

**Use in the function list**

WinACMPRestore (File name)

**Use in user-defined functions**

-

## Parameters

### File name

Name of the log file in which the data is saved. Enter the file location and the log file, for example, ""\flash\AddOn\WinACMP\Default.wld "".

## 10.8.7.2 Events

### Overview

### Editors

### Introduction

The following table shows which events occur in which editor.

Technical data subject to change.

33	Switch ON (Page 4123)	--	--	--	--	--	--	--	--	--	--	--

												
34	Low free storage space (Page 4124)	--	--	--	--	--	--	--	--	--	--	--
35	Free space critically low (Page 4124)	--	--	--	--	--	--	--	--	--	--	--
36	Value change (Page 4124)	--	--	--	--	--	--	--	--	--	--	--
37	Time expired (Page 4124)	--	--	--	--	--	--	--	--	--	--	--

## Events

### Cleared

#### Description

Occurs when the active screen on the HMI device is cleared.

---

#### Note

Please note that the availability of the event is dependent upon the HMI device and object type.

---

### Activate

#### Description

Occurs when the user selects a display or operating object using the configured tab sequence.

---

#### Note

Note that the availability of the event depends on the HMI device and object type.

---

#### Note

If the user e.g. clicks a button with the mouse, the "Click" event is triggered. Users wishing to trigger the "Enable" event must select the button using the tab key.

---

The "Enable" event is only used to detect whether an object was selected. The event does not trigger a password prompt.

For this reason, do not use the "Enable" event if you want to configure access protection on the function call of the object.

## Change

### Description

Occurs if the status of a display and operator control object changes.  
The status of an object changes if, for example, the user presses the key.

---

#### Note

Note that the availability of the event depends on the HMI device and object type.

---

## Loaded

### Description

Occurs when all configured display and operating objects are loaded in the active screen after a screen change.

---

#### Note

Please note that the availability of the event is dependent upon the HMI device and object type.

---

---

#### Note

Enable a screen change to ensure that the connection with the control is established after switch-on.

---

## Execute

### Description

Occurs when the scheduled task has been executed.

## Selection changed

### Description

Occurs when the user changes the selection.

---

#### Note

Please note that the availability of the event is dependent upon the HMI device and object type.

---

### In the event of high limit violation

#### Description

Occurs when the high limit of a tag is exceeded.

---

#### Note

Note that the availability of the event depends on the HMI device and object type.

---

### In the event of low limit violation

#### Description

Occurs when the low limit of a tag is undershot.

---

#### Note

Note that the availability of the event depends on the HMI device and object type.

---

### When dialog is opened

#### Description

The event is triggered when a modal dialog opens.

---

#### Note

Please note that the availability of the event depends on the HMI device and object type.

---

### When dialog is closed

#### Description

The event is triggered when a modal dialog closes.

---

#### Note

Please note that the availability of the event depends on the HMI device and object type.

---

## User change

### Description

Occurs when a user logs off at an HMI device or another user logs on at the HMI device.

---

#### Note

Please note that the availability of the event is dependent upon the HMI device and object type.

---

## Screen change

### Description

Occurs when all configured display and operating objects are loaded in the screen after a screen change.

Use the "Loaded" event if you want to perform other system functions during a screen change to a certain screen.

---

#### Note

Please note that the availability of the event is dependent upon the HMI device and object type.

---

## Deactivate

### Description

Occurs when the user takes the focus from a display and operating object.

A screen object can be disabled using the configured tab order or by performing another action with the mouse.

---

#### Note

Please note that the availability of the event is dependent upon the HMI device and object type.

---

---

#### Note

System functions or user-defined functions on the "Deactivate" event of a screen are not executed when a screen is being closed.

---

The "Deactivate" event is only used to detect whether an object was deselected. The event does not trigger a password prompt.

For this reason, do not use the "Deactivate" event if you want to configure access protection on the function call of the object.

## Double-click

### Description

Occurs when the user double-clicks on an object from the symbol library.

---

#### Note

Please note that the availability of the event is dependent upon the HMI device and object type.

---

## Press

### Description

Occurs when the user clicks on a button with the left mouse button, presses <RETURN> or <SPACE>.

Also occurs when the user right-clicks on an object of the symbol library.

---

#### Note

Please note that the availability of the event is dependent upon the HMI device and object type.

---

## On Finish Input

### Description

Triggered when you confirm input at an I/O field by pressing ENTER, or by mouse click, or by touch screen operation.

The "On Finish Input" event is also started if the value of a tag does not change, for example, if a value is exceeded, or if a user cancels the dialog to acknowledge a tag (Audit option package) that has to be acknowledged.

The event is not triggered, on the other hand, by user logon or by input fields configured with an authorization.

---

#### Note

Note that the availability of the event depends on the HMI device and object type.

---

## Press ESC twice

### Description

Occurs when the user presses the <ESC> key twice at the HMI device.

---

#### Note

Note that the availability of the event depends on the HMI device and object type.

---

## Outgoing

### Description

Occurs when an alarm is deactivated.

---

#### Note

Please note that the availability of the event depends on the HMI device and object type.

---

## Incoming

### Description

Occurs when an alarm is triggered and displayed in the alarm view.

---

#### Note

Please note that the availability of the event depends on the HMI device and object type.

---

## Click

### Description

Occurs if the user clicks a display and operating object with the mouse or touches the touch display with a finger.

In case you click the incorrect object, prevent processing of configured function list as follows:

- Move the mouse pointer away from the object while keeping the mouse button pressed. Release the mouse button as soon as the mouse pointer leaves the object. The function list will then not be processed.
- On touch displays, the display must be touched with the finger until a reaction occurs, e.g., a screen change.

---

**Note**

Please note that the availability of the event is dependent upon the HMI device and object type.

---

## Click when flashing

### Description

Occurs when the user clicks a flashing alarm indicator with the mouse or touches it with a finger.

---

**Note**

Note that the availability of the event depends on the HMI device and object type.

---

## Loop-in alarm

### Description

Occurs as soon as the user selects an alarm in the alarm view and then clicks on the "Loop-In-Alarm" button or double clicks on the alarm.

For the "Loop-In-Alarm" event, you configure system functions, such as a change to the screen in which the alarm occurred.

You cannot configure local scripts for the "Loop-In-Alarm" event in Runtime Professional.

---

**Note**

Please note that the availability of the event is dependent upon the HMI device and object type.

---

## Release

### Description

Occurs when the user releases a button.

This even does not occur, as long as the button remains pressed.

---

**Note**

Please note that the availability of the event is dependent upon the HMI device and object type.

---

## Alarm buffer overflow

### Description

Occurs when the configured size of the alarm buffer is reached.

---

**Note**

Please note that the availability of the event is dependent upon the HMI device and object type.

---

## Acknowledge

### Description

Occurs when the user acknowledges an alarm.

---

**Note**

Please note that the availability of the event is dependent upon the HMI device and object type.

---

## Reach margin

### Description

Occurs when the user reaches the beginning or the end of a scrollable area.

---

**Note**

Note that the availability of the event depends on the HMI device and object type.

---

**Note**

A user-defined function must not be configured for the "Boundary reached" event.

---

**Configurable objects**

The event can only be configured on the <Up> and <Down> keys, or on the keys on which you have configured the "ScreenObjectPageUp" or "ScreenObjectPageDown" system functions.

**Runtime Stop****Description**

Occurs when the user exits the Runtime software on the HMI device.

---

**Note**

Please note that the availability of the event is dependent upon the HMI device and object type.

---

**Note**

A user-defined function must not be configured for the "Runtime stop" event.

---

**Press key****Description**

Occurs when the user presses a function key.

---

**Note**

Please note that the availability of the event is dependent upon the HMI device and object type.

---

**Release key****Description**

Occurs when the user releases a function key.

---

**Note**

Note that the availability of the event depends on the HMI device and object type.

---

## Overflow

### Description

Occurs when the configured size of the log is reached. You use the log type "Trigger event".

---

#### Note

Please note that the availability of the event is dependent upon the HMI device and object type.

---

## Switching

### Description

Occurs when the user toggles a display and operating object, e.g. a switch from "ON" to "OFF".

---

#### Note

Please note that the availability of the event is dependent upon the HMI device and object type.

---

## Switch OFF

### Description

Occurs when the user moves the display and operating object "Switch" to the OFF position.

---

#### Note

Note that the availability of the event depends on the HMI device and object type.

---

## Switch ON

### Description

Occurs when the user moves the display and operating object "Switch" to the ON position.

---

#### Note

Note that the availability of the event depends on the HMI device and object type.

---

## Low free storage space

### Description

This event is triggered if the storage space available on the medium to which the Audit Trail is less than the configured minimum.

## Free space critically low

### Description

This event is triggered if the storage medium to which an Audit Trail is saved provides insufficient storage space due to hardware restrictions.

## Value change

### Description

Occurs when the value of a tag or the value of an array element changes.

The value change of a tag is triggered by the PLC or by the user, e.g. when a new value is entered. No event is output if a system function changes the value.

---

#### Note

Please note that the availability of the event depends on the HMI device and object type.

---

## Time expired

### Description

Occurs when the time configured in the scheduler expires.

---

#### Note

Please note that the availability of the event is dependent upon the HMI device and object type.

---

### 10.8.7.3 VB scripts

#### System functions

##### AcknowledgeAlarm

###### Description

Acknowledges all selected alarms.

This system function is used when the HMI device does not have an ACK key or when the integrated key of the alarm view should not be used.

This system function can only be used for function keys.

###### Use in the function list

AcknowledgeAlarm

###### Use in user-defined functions

AcknowledgeAlarm

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

###### Parameter

--

##### ActivatePreviousScreen

###### Description

Performs a screen change to the screen which was activated before the current screen. The screen change is not performed if no screen was activated beforehand.

The last 10 screens that were called up are saved. A system alarm is output when you change to a screen which is no longer saved.

---

**Note**

If you want to use the system function, the screen to which you change has to be used in the navigation structure.

---

**Use in the function list**

ActivatePreviousScreen

**Use in user-defined functions**

ActivatePreviousScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

--

**ActivateScreen****Description**

Performs a screen change to the given screen.

Use the "ActivateScreenByNumber" system function to change from the root screen to the permanent window or vice versa.

**Use in the function list**

ActivateScreen (Screen name, Object number)

**Use in user-defined functions**

ActivateScreen (Screen\_name, Object\_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameters****Screen name**

Name of the screen to which you change.

**Object number**

The operator control element which receives the focus in the given screen after the screen change. The number of the operator control element is to be determined using the tabulator sequence during configuration.

When "0" is specified:

- If the focus is in the permanent window when the system function is called up, the permanent window maintains the focus.
- If the focus is in the root screen when the system function is called up, the first operator control element in the given screen receives the focus.

---

**Note**

If the "Reach margin" event is assigned to the "ActivateScreen" system function, only the value "0" is valid for the "Object number" parameter. The active object is not defined by the object number, but rather by the X position it had prior to the screen change.

---

### Example

The ActivateScreen function is used in the following program code to activate the "Screen\_2" screen when you click a button.

```
{  
  
// User defined code  
// i.e. when pressing a button  
ActivateScreen ("Screen_2", 0);  
...  
}
```

### ActivateScreenByNumber

#### Description

Performs a screen change to a screen depending on a tag value.  
The screen is identified by its screen number.

#### Use in the function list

ActivateScreenByNumber (Screen number, Object number)

#### Use in user-defined functions

ActivateScreenByNumber (Screen\_number, Object\_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Screen number

Tag which contains the screen number of the destination screen.

When a change from the root screen to the permanent window is desired, "0" or "-1" is specified:

0 = Change from root screen to permanent window

-1 = Change from permanent window to root screen

### Object number

The number of the screen object which receives the focus in the given screen after the screen change. The number of the operator control element is to be determined using the tabulator sequence during configuration.

When "0" is specified:

- If the focus is in the permanent window when the system function is called up, the permanent window maintains the focus.
- If the focus is in the root screen when the system function is called up, the first operator control element in the given screen receives the focus.

## ActivateSystemDiagnosticsView

### Description

Activates the system diagnostics view. The system diagnostics view shows the detail view of the device concerned.

### Use in the function list

ActivateSystemDiagnosticsView (Screen name, Object name)

### Use in user-defined functions

ActivateSystemDiagnosticsView (Screen\_name, Object\_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Screen name

Name of the screen contained in the system diagnostics view.

### Object name

Object name of the system diagnostics view.

## ArchiveLogFile

### Description

This system function moves or copies a log to another storage location for long-term logging. With Audit Trails, always use the "Move" (hmiMove)" mode, otherwise you will be violating the FDA guideline by duplicating the data stored.

Prior to "ArchiveLogFile" always run the system function "CloseAllLogs".

After this system function, run the "OpenAllLogs" system function.

In "Copy log" mode, the logs are not reopened until the log has been successfully copied, or unless a timeout occurs during the copy process. In "Move log" mode, the logs to be moved are renamed and the new logs are opened immediately. To move the renamed logs, a job is submitted which attempts to move them every 300 seconds if the server cannot be reached. The job is also retained after Runtime is restarted until it is executed.

### Use in the function list

ArchiveLogFile (Log type, Log, Directory name, Mode)

### Use in user-defined functions

ArchiveLogFile (Log\_type, Log, Directory\_name, Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (miAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail log available for GMP compliant projects. Additional information is available under "Activating GMP-compliant configuration".

#### Log

Name of the log being archived.

#### Directory name

Path for saving the log.

#### Mode

0 (hmiCopy) = Copy log

1 (hmiMove) = Move log

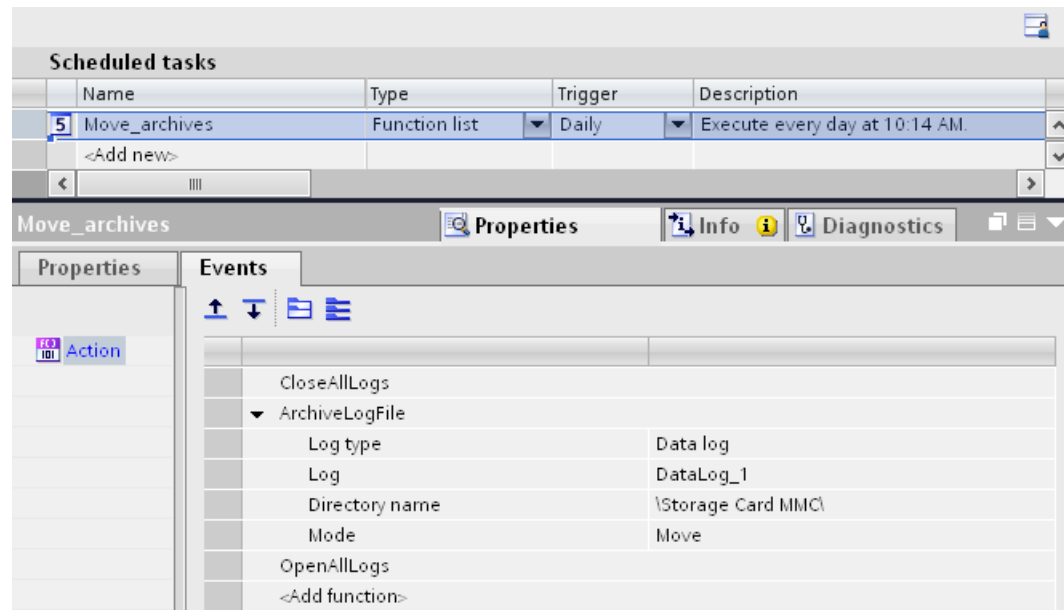

## Application example

You want to move a log file from a local storage medium to the server in order to generate a backup copy of this file at cyclic intervals.

### Notes on configuring

Set up a task in the scheduler which is executed at a specific time on a daily basis. Configure the following function list for the task:

### Procedure on HMI device

- All log files will be closed.
- The log file you specified is moved to the server.
- All closed log files will be opened again.

## Back up RAM file system

### Description

Backs up the RAM file system in the memory medium of the HMI device.

After restarting the HMI device, the data is automatically reloaded in the RAM file system.

Applications such as the Internet Explorer save data (e.g. the last web sites called up) temporarily to the DRAM file system of the HMI device.

### Use in the function list

BackupRAMFileSystem

### Use in user-defined functions

BackupRAMFileSystem

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

--

### CalibrateTouchScreen

#### Description

Calls a program for calibrating the touch screen.

During the calibration process, there is a prompt to touch five positions on the screen display. Touch the screen display within 30 seconds, to confirm the calibration process. If the calibration is not completed within this time span, the calibration settings are discarded. The user prompt is in English.

Use this system function the first time you start the HMI device.

#### Use in the function list

CalibrateTouchScreen

### Use in user-defined functions

CalibrateTouchScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

--

---

#### Note

The CalibrateTouchScreen system function cannot be simulated.

---

### ChangeConnection

#### Description

Disconnects the connection to the currently used PLC in use and establishes a connection to a PLC with another address. The newly connected PLC must belong to the same device class

(S7-1200, S7-300, ...etc). With S7-1200, the use of the function is also only permitted for absolute addressing.

---

**Note**

When changing to another address, ensure that the address is not already being used by another HMI device.

---

The follows address types are supported:

- IP address
- MPI address

The follows PLC types are supported:

- SIMATIC S7 300/400
- SIMATIC S7-NC
- SIMOTION

**Use in the function list**

ChangeConnection (Connection, Address, Slot, Rack)

**Use in user-defined functions**

ChangeConnection (Connection, Address, Slot, Rack)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Connection**

Name of the connection that is disconnected. The name is set during configuration, for example, in the "Connections" editor.

**Address**

MPI/PROFIBUS or IP address of the PLC to which the connection will be established.

---

**Note**

Set the address by means of a tag. The objects list displays the tags of all data types. Select only tags of the following data types:

- Ethernet connection: "String" data type
  - MPI connection: "Int" data type
-

**Slot**

Slot of the PLC to which the connection will be established.

**Rack**

Rack of the PLC to which the connection will be established.

**Application example**

You want to operate one HMI device on several machines. Configure the necessary PLCs in the project, to which you want to change by pressing a key. When changing the PLC, the connection to the PLC in use is disconnected. Then the connection to the new PLC with other address parameters is reestablished. To access the values of the new PLC, configure the same tags for the PLC used.

The PLC which you have indicated when creating the project will be used as default.

1. Enter the name and address of the PLC in the "Connections" editor.
2. Configure a button in the process screen.
3. Configure the "ChangeConnection" system function on the "Press" event.
4. Enter the name of the connection and address of the PLC as parameters.

**ClearAlarmBuffer**

**Description**

Deletes alarms from the alarm buffer on the HMI device.

---

**Note**

Alarms which have not yet been acknowledged are also deleted.

---

**Use in the function list**

ClearAlarmBuffer (Alarm class number)

**Use in user-defined functions**

ClearAlarmBuffer (Alarm\_class\_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

**Alarm class number**

Determines which alarms are to be deleted from the alarm buffer:

- 0 (hmiAll) = All alarms/events
  - 1 (hmiAlarms) = Alarms of alarm class "Errors"
  - 2 (hmiEvents) = Alarms of alarm class "Warnings"
  - 3 (hmiSystem) = Alarms of alarm class "System"
  - 4 (hmiS7Diagnosis) = Alarms of alarm class "Diagnosis Events"
- 

**Note****Device dependency**

Alarms of alarm class "Diagnosis Events" are not available on Basic Panels.

---

## ClearAlarmBufferProtool

### Description

The system function exists to ensure compatibility.

It has the same functionality as the "ClearAlarmBuffer" system function, but uses the old ProTool numbering.

### Use in the function list

ClearAlarmBufferProTool (Alarm class number)

### Use in user-defined functions

ClearAlarmBufferProtoolLegacy (Alarm\_class\_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

**Alarm class number**

Alarm class number whose messages are to be deleted:

- 1 (hmiAllProtoolLegacy) = All alarms/events
- 0 (hmiAlarmsProtoolLegacy) = Alarms of alarm class "Errors"
- 1 (hmiEventsProtoolLegacy) = Alarms of alarm class "Warnings"
- 2 (hmiSystemProtoolLegacy) = Alarms of alarm class "System"

3 (hmiS7DiagnosisProtoolLegacy) = Alarms of alarm class "Diagnosis Events"

---

**Note**

**Device dependency**

Alarms of alarm class "Diagnosis Events" are not available on Basic Panels.

---

## ClearDataRecord

### Description

Deletes a recipe data record.

Several data records can be deleted from one or more recipes.

### Use in the function list

ClearDataRecord (Recipe number/name, Data record number/name, Confirmation, Output status message, Processing status)

### Use in user-defined functions

ClearDataRecord

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

**Recipe number/name**

Number or name of the recipe from which recipe data records are deleted. "0" is specified if you want to delete recipe data records from all available recipes.

**Data record number/name**

Number or name of the recipe data record to be deleted. "0" is specified if you want to delete all recipe data records.

**Confirmation**

Determines whether the operator should confirm the deletion:

0 (hmiOff) = Off: Deletion is begun without confirmation.

1 (hmiOn) = On: The starting of the deletion process must be confirmed.

**Output status message**

Determines whether a status message is output after the deletion:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

## ClearDataRecordMemory

### Description

Deletes all recipes data records from the specified storage medium.

### Use in the function list

ClearDataRecordMemory (Storage location, Confirmation, Output status message, Processing status)

### Use in user-defined functions

ClearDataRecordMemory (Storage\_location, Confirmation, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Storage location

Determines the storage location:

0 (hmiFlashMemory) = Flash memory: Internal flash memory of the HMI device

1 (hmiStorageCard) = Storage card

2 (hmiStorageCard2) = Storage card 2

3 (hmiStorageCard3) = Storage card MultiMediaCard

4 (hmiStorageCard4) = Storage card USB

#### Confirmation

Determines whether the operator should confirm the deletion:

0 (hmiOff) = Off: Deletion is begun without confirmation.

1 (hmiOn) = On: The starting of the deletion process must be confirmed.

### Output status message

Determines whether a status message is output after the deletion:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

## ClearLog

### Description

Deletes all data records in the given log.

### Use in the function list

ClearLog (Log type, Log)

### Use in user-defined functions

ClearLog (Log\_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail log Available for GMP-compliant projects Additional information is available under "Activating GMP-compliant configuration".

#### Log

Name of the log from which all entries are deleted.

## CloseAllLogs

### Description

Disconnects the connection between WinCC and all logs.

---

#### Note

Before you close a log, the logging function must first be stopped in the log. Use the "StopLogging" system function.

---

### Use in the function list

CloseAllLogs

### Use in user-defined functions

CloseAllLogs

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

--

### Application example

You are in runtime and want to change the data medium on which the process values are logged.

#### Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

#### Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. You open all logs with the "Open Archive" button. The logging process will continue in the specified log.

## ControlSmartServer

### Description

Starts or stops the Sm@rtServer.

### Use in the function list

ControlSmartServer (Mode)

### Use in user-defined functions

ControlSmartServer (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Mode

Specifies whether the Sm@rtServer is started or stopped.

-1 (hmiToggle) = Toggle: Toggles between the two modes

0 (hmiStop) = Stop: Sm@rtServer is stopped

1 (hmiStart) = Start: Sm@rtServer is started

## ControlWebServer

### Description

Starts or stops the Web server.

### Use in the function list

ControlWebServer (Mode)

### Use in user-defined functions

ControlWebServer (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Mode**

Specifies whether the Web server is started or stopped.

-1 (hmiToggle) = Toggle: Toggles between the two modes

0 (hmiStop) = Stop: The Web server is stopped.

1 (hmiStart) = Start: The Web server is started.

**CopyLog****Description**

Copies the contents of a log to another log. Tag values can only be copied to other data logs and alarms only to other alarm logs, however.

---

**Note**

If you copy a log using the "CopyLog" system function, it is possible that external applications will be unable to read certain country-specific special characters in the logged message text of the log copy. This does not apply to WinCC Runtime. WinCC Runtime can read the copied log files without errors.

---

**Use in the function list**

CopyLog (Log type, Destination log, Source log, Mode, Delete source log)

**Use in user-defined functions**

CopyLog (Log\_type, Destination log, Source\_log, Mode, Delete\_source\_log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Log type**

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

**Destination log**

Name of the log into which the entries are copied (Destination log).

**Source log**

Name of the log from which the entries are copied (Source log).

**Mode**

Determines what is done with copied entries in the destination log:

0 (hmiOverwrite) = Overwrite: Existing entries are overwritten.

2 (hmiAppend) = Append: The entries are inserted at the end of the destination log. When the configured size of the log has been reached, the destination log is treated like a circular log.

**Delete source log**

Determines whether the source log is deleted after copying.

0 (hmiNo) = No: Is not deleted.

1 (hmiYes) = Yes: Is deleted.

**DecreaseTag**

**Description**

Subtracts the given value from the tag value.

$$X = X - a$$

---

**Note**

The system function uses the same tag as input and output values. When this system function is used to convert a value, auxiliary tags must be used. The auxiliary tags are assigned to the tag value with the "SetTag" system function.

---

If you configure the system function on the events of an alarm and the tag is not being used in the current screen, it is not ensured that the actual value of the tags is being used in the PLC. You can improve the situation by setting the "Cyclic continuous" acquisition mode.

**Use in the function list**

DecreaseTag (Tag, Value)

**Use in user-defined functions**

DecreaseTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Tag**

The tag from which the given value is subtracted.

**Value**

The value which is subtracted.

**EditAlarm****Description**

Triggers the "Edit" event for all selected alarms.

If the alarms to be edited have not yet been acknowledged, the acknowledgment takes place automatically when this system function is called up.

This system function can only be used for function keys.

**Use in the function list**

EditAlarm

**Use in user-defined functions**

EditAlarm

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

--

**Encode****Description**

Adapts the "String" data type of a tag for transfer to the automation system (AS). The tag of WinCC data type "String" is converted into the AS data type "Array of byte". The result is written to a tag.

**Use in the function list**

Encode (Byte array, String, Coding)

### Use in user-defined functions

Encode (Byte\_array, String, Encoding)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Byte array

The tag that contains the converted value.

---

#### Note

The Byte array must be twice the size of the string length + 2. The Byte array must contain 242 array elements if the string has a length of 120 characters.

Characters are either truncated or not converted if the size is insufficient.

---

#### String

The tag of data type "String" that is converted.

#### Encode

0 (hmiEncodeUTF16LE) - String is encoded in UTF16LE (Unicode 16 Little Endian).

### EncodeEx

### Description

Adapts the "String" data type of a tag for transfer to the automation system (AS). The tag of WinCC data type "String" is converted into the AS data type "Array of byte". The result is written to a tag.

By contrast to the Encode system function, you can define the Line break parameter. Using the Line break parameter you can delete line breaks or replace these with predefined characters.

### Use in the function list

EncodeEx (Byte array, String , Encode , Line break)

### Use in user-defined functions

EncodeEx (Byte\_array, String, Encoding, Line\_break)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Byte array

The tag that contains the converted value.

---

### Note

The byte array must be twice the size of the string length +2. If the string has a length of 120 characters, the byte array must contain 242 array elements.

Characters are either truncated or not converted if the size is insufficient.

---

### String

The tag of data type "String" that is converted.

### Code

0 (hmiEncodeUTF16LE) - String is encoded in UTF16LE (Unicode 16 Little Endian).

### Line break

All line breaks are either deleted or replaced with predefined characters. Do not replace line breaks if set as the default value.

0 (replace with "\r\n" (0x000D, 0x000A)) - the line break is replaced with "\r\n".

1 (replace with "\n" (0x000A)) - the line break is replaced with "\n".

2 (do not replace) - the line break is not replaced.

3 (remove line breaks) - the line breaks are removed.

## ExportDataRecords

### Description

Exports one or all data records of a recipe to a CSV file.

One file is created per recipe.

### Use in the function list

ExportDataRecords (Recipe number/name, Data record number/name, File name, Overwrite, Output status message, Processing status)

### Use in user-defined functions

ExportDataRecords (Recipe\_number/name, Data\_record number/name, File\_name, Overwrite, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Recipe number/name

Number or name of the recipe from which the data records are exported. Specify "0" if recipe data records are to be exported from all available recipes.

### File name

Name of the CSV file to which the recipe data records are exported. Enter the file location and the file extension (\*.csv), for example, "C:\TEMP\Orange.csv".

---

### Note

#### Storage of the CSV file

- If a storage card is used as storage location, specify the storage location as follows: "\StorageCard\".
  - If you only enter one file name and no path, the file will be saved in a system directory, for example, "C:\Documents and Settings\[User]".
  - When only one path for the export is specified, the file name is automatically created from the respective recipe name. It is a requirement that the folder "D:\Temp", for example, has been created. If the folder "D:\Temp" has not been created, the folder name will be used as the prefix of the file name, Temp\_Recipe names.csv.
- 

### Data record number/name

Number or name of the recipe data record to be exported. Specify "0" if all recipe data records are to be exported.

### Overwrite

Determines whether an existing CSV file with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: CSV file will not be overwritten. The export process will not be carried out.

1 (hmiOverwriteAlways) = Yes: CSV file is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithPrompting) = With confirmation: CSV file is not overwritten until confirmed.

### Output status message

Determines whether a status message is output after the export:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

## Export format of the recipe data records

If ".csv" is chosen as a file extension for the export file, then only valid characters from the ANSI character set will be supported. This also applies to separators in decimal numbers and list elements. The separators used are defined in the country/regional settings of the operating system of the exporting computer.

You may also set "Unicode text" (".txt") format for the export file. This file format supports the WinCC and WinCC Runtime character set. Again, the separators used are specified in the country/regional settings of the operating system of the exporting computer. This file format always uses tab separators in list elements.

The corresponding file import function also supports the ".csv" and ".txt" (Unicode) file formats.

## Application example

You want to export all data records using a key.

### Notes on configuring

Configure the "ExportDataRecords" system function on the "Press" event for the desired key. Transfer the following parameters:

- Recipe number/name = 1
- Data record number/name = 0
- File name = c:\temp\orange.csv
- Overwrite = 1
- Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data records are exported.

### Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated. All data records of Recipe 1 are exported to the orange.csv file. If the file already exists, it will be overwritten.

After exporting the data records, a system message is output.

## ExportDataRecordsWithChecksum

### Description

Exports one or all data records of a recipe to a CSV file and generates a checksum for each line in the file.

One file is created per recipe.

### Use in the function list

ExportDataRecordsWithChecksum (Recipe number/name, Data record number/name, File name, Overwrite, Output status message, Processing status)

### Use in user-defined functions

ExportDataRecordsWithChecksum (Recipe\_number/name, Data\_record number/name, File\_name, Overwrite, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Recipe number/name

Number or name of the recipe from which the data records are exported. Specify "0" if recipe data records are to be exported from all available recipes.

#### Data record number/name

Number or name of the recipe data record to be exported. Specify "0" if all recipe data records are to be exported.

#### File name

Name of the CSV file to which the recipe data records are exported. Enter the path and the file extension e.g. "C:\TEMP\Orange.CSV".

If a storage card is used as storage location, specify the storage location as follows: "\StorageCard\".

If you define only a file name without specifying a path, the file is saved to the directory from which Runtime was started. If write access to this directory is not enabled in the Windows 7 operating system, the file is saved to the "VirtualStore" folder of the user directory.

When only one path for the export is specified, the file name is automatically created from the respective recipe name. This requires, for example, that the directory "D:\Temp\" has been created. If the directory "D:\Temp" does not exist, the directory name is used as the prefix for the file name, Temp\_Recipe names.csv.

#### Overwrite

Determines whether an existing CSV file with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: CSV file will not be overwritten. The export process will not be carried out.

1 (hmiOverwriteAlways) = Yes: CSV file is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithConfirmation) = With confirmation: CSV file is not overwritten until confirmed.

#### Output status message

Determines whether a status message is output after the export:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

### Export format of the recipe data records

If ".csv" is chosen as a file extension for the export file, then only valid characters from the ANSI character set will be supported. This also applies to separators in decimal numbers and list elements. The separators used are defined in the country/regional settings of the operating system of the exporting computer.

You may also set "Unicode text" (".txt") format for the export file. This file format supports the WinCC and WinCC Runtime character set. Again, the separators used are specified in the country/regional settings of the operating system of the exporting computer. This file format always uses tab separators in list elements.

The corresponding file import function also supports the ".csv" and ".txt" (Unicode) file formats.

### Application example

Using a key, you want to export all data records and assign a checksum.

#### Notes on configuring

Configure the "ExportDataRecordsWithChecksum" system function on the "Press" event for the desired key. Transfer the following parameters:

- Recipe number/name = 1
- Data record number/name = 0
- File name = c:\temp\orange.csv
- Overwrite = 1
- Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data records are exported.

#### Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated. All data records of Recipe 1 are exported to the orange.csv file and assigned checksums. If the file already exists, it will be overwritten.

After exporting the data records, a system message is output.

## ExportImportUserAdministration

### Description

Exports all users of the user administration of the currently active project to the given file or imports the users from the given file into the currently active project.

Users, their passwords and rights are saved in the user administration.

All users are overwritten when importing. The imported users are valid immediately.

### Use in the function list

ExportImportUserAdministration (File name, Direction)

### Use in user-defined functions

ExportImportUserAdministration (File\_name, Direction)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### File name

Name of the file which contains the passwords or to which the passwords are written. Enter the file location and the file extension (\*.txt), for example, "C:\TEMP\Passwords.txt".

---

#### Note

If a storage card is used as file location, specify the file location as follows: "\\StorageCard \<File name>".

---

#### Direction

Specifies whether passwords are exported or imported:

0 (hmiExport) = Export: Passwords are exported.

1 (hmiImport) = Import: Passwords are imported.

## GetBrightness

### Description

Reads the value of the brightness.

**Use in the function list**

GetBrightness (Brightness)

**Use in user-defined functions**

GetBrightness (Brightness)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Brightness**

The tag to which the value is written.

**GetDataRecordFromPLC****Description**

Transfers the selected recipe data record from the PLC to the storage medium of the HMI device.

**Use in the function list**

GetDataRecordFromPLC (Recipe number/name, Data record number/name, Overwrite, Output status message, Processing status)

**Use in user-defined functions**

GetDataRecordFromPLC (Recipe\_number/name, Data\_record\_number/name, Overwrite, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Recipe number/name**

Number or name of the recipe from which recipe data records are transferred.

**Data record number/name**

Number or name of the recipe data record which is transferred from the PLC to the data medium of the HMI device.

**Overwrite**

Determines whether an existing recipe data record with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data record is not overwritten. The transfer process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data record is overwritten without prompting.

2 (hmiOverwriteWithPrompting) = With confirmation: Recipe data record is not overwritten until confirmed.

#### **Output status message**

Determines whether a status message is output after the transfer:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

#### **Processing status**

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

### **Application example**

You want to transfer a data record from the PLC to the data medium of the HMI device using a key.

#### **Notes on configuring**

Configure the "GetDataRecordFromPLC" system function on the "Press" event for the desired key. Transfer the following parameters:

Recipe number/name = 1

Data record number/name = 1

Overwrite = 1

Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data record is transferred from the PLC.

#### **Procedure on HMI device**

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated and the first data record of Recipe 1 is transferred from the PLC to the data medium of the HMI device. If the recipe data record already exists, it will be overwritten.

A system message is output after the transfer.

## GetDataRecordName

### Description

Writes the name of the given recipe and recipe data record to the given tags.

---

#### Note

If the recipe or the recipe data record do not exist, wildcards ("###") are written to the tags.

---

### Use in the function list

GetDataRecordName (Recipe number, Data record number, Recipe name, Data record name, Processing status)

### Use in user-defined functions

GetDataRecordName (Recipe\_number, Data\_record\_number, Recipe\_name, Data\_record\_name, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Recipe number

Number of the recipe whose name is written to the given tag.

#### Data record number

Number of the recipe data record whose name is written to the given tag.

#### Recipe name

The tag to which the recipe name is written. The tag must be of the STRING type.

#### Data record name

The tag to which the name of the recipe data record is written. The tag must be of the STRING type.

#### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

### Application example

You want to output the names of the displayed recipes and the name of the displayed recipe data record on the HMI device.

Configure the following tags:

- "RecNumber" of type INTEGER
- "RecDataNumber" of type INTEGER
- "RecName" of type STRING
- "RecDataName" of type STRING

Configure a recipe view with the tags "RecNumber" for the recipe number and "RecDataNumber" for the data record number.

Configure the "GetDataRecordName" system function on the "Press" event for a button and pass the following parameters:

- Recipe number: RecNumber
- Data record number: RecDataNumber
- Recipe name: RecName
- Data record name: RecDataName

Configure two output fields and connect these to the "RecName" and "RecDataName" tags.

Select a recipe and a data record number from the recipe view. As soon as the button is activated, the system function is triggered and the name of the recipe and the recipe data record are displayed in both output fields.

### GetDataRecordTagsFromPLC

#### Description

Transfers the values of the recipe data record loaded in the PLC to the corresponding recipe tags.

This system function is used, for example, during teach-in mode on a machine.

#### Use in the function list

GetDataRecordTagsFromPLC (Recipe number/name, Processing status)

#### Use in user-defined functions

GetDataRecordTagsFromPLC (Recipe\_number/name, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Recipe number/name**

Number or name of the recipe data record whose values are written from the PLC to the tags.

**Processing status**

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

**GetGroupNumber****Description**

Reads the number of the group to which the user logged on to the HMI device belongs, and writes it to the given tag.

**Use in the function list**

GetGroupNumber (Tag)

**Use in user-defined functions**

GetGroupNumber (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Tag**

The tag to which the number of the group is written.

## GetPassword

### Description

Writes the password of the user currently logged on to the HMI device in the given tag.

---

#### Note

Make sure that the value of the given tag is not displayed in another place in the project.

---

#### Note

The passwords of SIMATIC Logon users cannot be read.

---

### Use in the function list

GetPassword (Tag)

### Use in user-defined functions

GetPassword (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Tag

The tag to which the password is written.

## GetUserName

### Description

Writes the user name of the user currently logged on to the HMI device in the given tag.

If the given tag has a control connection, the user name is also available in the PLC connection. This system function makes it possible, for example, to implement a user-dependent release of certain functionalities.

### Use in the function list

GetUserName (Tag)

### Use in user-defined functions

GetUserName (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Tag**

The tag to which the user name is written.

**GoToEnd****Description**

Executes the key function <End> on the HMI device.

This system function is used when the HMI device does not have this functionality by default.

The system function can only be used for the following function keys.

**Use in the function list**

GoToEnd

**Use in user-defined functions**

GoToEnd

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

--

**GoToHome****Description**

Executes the key function <Home> on the HMI device.

This system function is used when the HMI device does not have this functionality by default.

The system function can only be used for the following function keys.

**Use in the function list**

GoToHome

### Use in user-defined functions

GoToHome

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

--

### ImportDataRecords

#### Description

Imports one or all data records of a recipe from a CSV file.

When a path is specified, all records of the given directory are imported.

#### Use in the function list

ImportDataRecords (File name, Data record number/name, Overwrite, Output status message, Processing status)

### Use in user-defined functions

ImportDataRecords (File\_name, Data\_record number/name, Overwrite, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### File name

Name of the CSV file from which the recipe data records are imported. Enter the file location and the file extension (\*.csv), for example "C:\TEMP\Orange.csv".

---

#### Note

If a storage card is used as file location, specify the file location as follows: "\\StorageCard \<File name>".

---

#### Data record number/name

Number or name of the recipe data record to be imported. Specify "0" if all recipe data records are to be imported.

**Overwrite**

Determines whether existing recipe data records are to be overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data records are not overwritten. The import process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data records are overwritten without prompting.

2 (hmiOverwriteWithPrompting) = With confirmation: Recipe data records are not overwritten until confirmed.

**Output status message**

Determines whether a status message is output after the import:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

**Processing status**

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

**Configurable objects**

Object	Event
Tag	Value change High limit violated Low limit violated
Function key (global)	Release Press
Function key (local)	Release Press
Screen	Loaded Cleared
Screen object	Press Release Click Change (or toggle for switch) Switch on Switch off Enable Disable
Scheduler	Time expired

## ImportDataRecordsWithChecksum

### Description

Imports one or all data records of a recipe from a CSV file with a checksum and verifies the checksum.

### Use in the function list

ImportDataRecordsWithChecksum (File name, Data record number/name, Overwrite, Output status message, Processing status, verify checksum)

### Use in user-defined functions

ImportDataRecordsWithChecksum (File\_name, Data\_record number/name, Overwrite, Output\_status\_message, Processing\_status, Verify\_Checksum)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### File name

Name of the CSV file from which the recipe data records are imported. Enter the path and the file extension, for example, "C:\TEMP\Orange.CSV".

If a storage card is used as storage medium, specify the storage location as follows: "\StorageCard\".

If you specify a directory instead of an individual CSV file, all files in the specified directory will be imported.

#### Data record number/name

Number or name of the recipe data record to be imported. Specify "0" if all recipe data records are to be imported.

#### Overwrite

Determines whether existing recipe data records are to be overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data records are not overwritten. The import process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data records are overwritten without prompting.

2 (hmiOverwriteWithConfirmation) = With confirmation: Recipe data records are not overwritten until confirmed.

**Output status message**

Determines whether a status message is output after the import:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

**Processing status**

Returns the processing status of the system function. You can use the return value, for example to delay execution of other system functions, until this system function has been successfully completed.

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

**Verify checksum**

Determines if the checksum should be verified during import:

0 (hmiFalse) = No: Checksum is not verified.

1 (hmiTrue) = Yes: Checksum is verified.

**IncreaseTag****Description**

Adds the given value to the value of the tags.

$X = X + a$

---

**Note**

The system function uses the same tag as input and output values. When this system function is used to convert a value, help tags must be used. You can use the "SetTag" system function to assign the tag value to the auxiliary tags.

---

If you configure the system function on the events of an alarm and the tag is not being used in the current screen, it is not ensured that the actual value of the tags is being used in the PLC. You can improve the situation by setting the "Cyclic continuous" acquisition mode.

**Use in the function list**

IncreaseTag (Tag, Value)

**Use in user-defined functions**

IncreaseTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Tag

The tag to which the given value is added.

### Value

The value that is added.

## InverseLinearScaling

### Description

Assigns a value to the tag X, which is calculated from the value of the given tag Y using the linear function  $X = (Y - b) / a$ .

The tags X and Y must not be identical. This system function is the inverse of the "LinearScaling" system function.

---

### Note

The tags X and Y must not be identical. If a tag is to be converted into itself, an auxiliary tag must be used.

The "SetTag" system function can be used to assign the value of the tags to be converted to the auxiliary tags.

---

### Use in the function list

InvertLinearScaling (X, Y, b, a)

### Use in user-defined functions

InverseLinearScaling (X, Y, b, a)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### X

The tag which is assigned the value calculated from the linear equation.

#### Y

The tag that contains the value used for calculation.

#### b

The value which is subtracted.

**a**

The value through which is divided.

**Example**

The following program code assigns a value to the varX tag by means of the InverseLinearScaling function.

```
{
BYTE varX;
BYTE Yvalue = 10;
BYTE bvalue = 3;
BYTE avalue = 4;

//Inverse linear scaling
InverseLinearScaling (varX, Yvalue, bvalue, avalue);

printf ("varX = %d\r\n, varX);
...
}
```

The saved return value can be processed in the following code.

**InvertBit****Description**

Inverts the value of the given tag of the "Bool" type:

- If the tag has the value of 1 (TRUE), it will be set to 0 (FALSE).
- If the tag has the value of 0 (FALSE), it will be set to 1 (TRUE).

**Use in the function list**

InvertBit (Tag)

**Use in user-defined functions**

InvertBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameters****Tag**

The tag whose bit is set.

## Example

The following program code inverts the value of the boolean tag `b_value` and outputs the result along with the original `b_saved` value.

```
{
BOOL b_value = 0;
BOOL b_saved = b_value;

//Invert variable
invertBit(b_value);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
    ...
}
```

## InvertBitInTag

### Description

Inverts a bit in the given tag:

- If the bit in the tag has the value of 1 (TRUE), it will be set to 0 (FALSE).
- If the bit in the tag has the value of 0 (FALSE), it will be set to 1 (TRUE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

---

#### Note

If the PLC supports BOOL tags, do not use this system function. Use the "InvertBit" system function instead.

---

### Use in the function list

InvertBitInTag (Tag, Bit)

### Use in user-defined functions

InvertBitInTag (Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameters

### Tag

The tag in which the given bit is set.

### Bit

The number of the bit that is set.

When this system function is used in a user-defined function, the bits in a tag are counted from right to left. The counting begins with 0.

## Example

The following program code inverts a bit at the specified bitposition in the bvalue tag and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Invert bit in bitposition
InvertBitInTag (bvalue, bitposition);
//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
...
}
```

## LinearScaling

### Description

Assigns a value to the tag Y, which is calculated from the value of the given tag X using the linear function  $Y = (a * X) + b$ .

The inverse of this function is the "InvertLinearScaling" system function.

---

#### Note

The tags X and Y must not be identical. If a tag is to be converted into itself, an auxiliary tag must be used.

The "SetTag" system function can be used to assign the value of the tags to be converted to the auxiliary tags.

---

## Use in the function list

LinearScaling (Y, a, X, b)

## Use in user-defined functions

LinearScaling (Y, a, X, b)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameters

**Y**

The tag which is assigned the value calculated from the linear equation.

**a**

The value with which is multiplied.

**X**

The tag that contains the value used for calculation.

**b**

The value that is added.

## Example

The following program code uses the LinearScaling function to assign a value to the Yvar tag.

```
{
BYTE Yvar;
BYTE Xvalue = 10;
BYTE bvalue = 3;
BYTE avalue = 4;

// linear scaling
LinearScaling ( Yvar, avalue, Xvalue, bvalue);

printf ("Yvar = %d\r\n, Yvar);
...
}
```

The saved return value can be processed in the following code.

## LoadDataRecord

### Description

Loads the given recipe data record from the memory medium of the HMI device in the recipe tags. This system function is used, for example, to display a recipe data record in the recipe screen.

Activate the "Synchronize recipe view and recipe tags" option in the synchronization settings of the recipe. If this option is deactivated, the system function has no effect.

### Use in the function list

LoadDataRecord (Recipe number/name, Data record number/name, Processing status)

### Use in user-defined functions

LoadDataRecord (Recipe\_number/name, Data\_record\_number/name, Confirmation, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Recipe number/name

Number or name of the recipe from which a recipe data record is loaded.

#### Data record number/name

Number or name of the recipe data record to be loaded.

#### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

### LogOff

### Description

Logs off the current user on the HMI device.

### Use in the function list

Logoff

### Use in user-defined functions

Logoff

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

--

**Logon**

**Description**

Logs on the current user on the HMI device.

**Use in the function list**

Logon (Password, User name)

**Use in user-defined functions**

Logon (Password, User\_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

**Password**

The tag from which the password for the user logging on is read.

If the user is logged on, the password in the tag is deleted.

**User name**

The tag from which the user name for the user logging on is read.

**LookupText**

**Description**

Identifies an entry from a text list. The result depends on the value and on the selected runtime language. The result is saved to a tag of data type "String".

**Use in the function list**

LookupText (Output text, Value, Language, Text list)

## Use in user-defined functions

LookupText (Output\_text, Index, Language, Text\_list)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameters

### Output text

The tag to which the result is written.

### Value

The tag that defines the value of the list entry.

### Language

Defines the runtime language in which the list entry is identified.

- Runtime language  
Language code as per VBScript reference, for example, "de-DE" for German (Germany) or "en-US" for English (United States of America). The selection depends on the activated runtime languages.
- Tag  
The tag that contains the language. Enter the runtime language as decimal value of the country ID, for example, 1031 for German - Standard, 1033 for English - USA. Details are available in the VBScript basics, "Locale identifier (LCID) diagram".
- Integer  
The number that corresponds to the order of runtime languages for language switching. The selection depends on the activated runtime languages, for example, "0" for the language that appears when you first start runtime. You can find more information under the topic of "Languages in Runtime".

### Text list

Defines the text list. The list entry is read from the text list.

## NotifyUserAction

### Description

This system function is used to log user actions that are not automatically logged in the audit trail. You can also use this system function to require the user to enter an acknowledgment or an electronic signature and a comment for the operator action. Requirement for the use of the system function is that the GMP-compliant configuration is activated under "Runtime settings".

If you use the "NotifyUserAction" system function in a function, the debugger may open if you cancel your input by clicking "Cancel". To compensate for this reaction, you can use the "On Error Resume Next" statement in a function. With this instruction, the next instruction is

executed after a runtime error. If you use the "On Error Resume Next" statement, output of system events is also suppressed.

### Use in the function list

NotifyUserAction (Confirmation type, Mandatory commenting, Category, Object name, Description)

### Use in user-defined functions

NotifyUserAction (Confirmation\_type, Mandatory\_commenting, Category, Object\_name, Description)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Confirmation type

Establishes how the action must be confirmed

0 = (None): No confirmation required, an entry is created in the audit trail

1 = (Acknowledgement): Acknowledgment, the user must acknowledge the action; an entry is created in the audit trail

2 = (Digital Signature): Electronic signature, a dialog window opens in which the user must enter his electronic signature - an entry is created in the audit trail

#### Mandatory commenting

Establishes if the user has to enter a comment. The comment is logged in the audit trail.

0 = (True): True; a dialog window opens in which the user must enter a comment

1 = (False): False; no mandatory commenting

#### Category

Category or class name of the modified object

#### Object name

Name of the modified object

#### Description

Text which describes the archiving user action.

## OpenAllLogs

### Description

Reestablishes the connection between WinCC and the logs. Logging can be continued.

---

#### Note

Run the "StartLogging" system function in order to restart logging.

---

### Use in the function list

OpenAllLogs

### Use in user-defined functions

OpenAllLogs

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

--

### Application example

You are in runtime and want to change the data medium on which the process values are logged.

#### Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

#### Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. You open all logs with the "Open Archive" button. Logging will be continued in the specified log.

## OpenCommandPrompt

### Description

Opens a Windows system prompt.

This function is used, e.g., to copy files or to call up another application.

### Use in the function list

OpenCommandPrompt

### Use in user-defined functions

OpenCommandPrompt

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

--

## OpenControlPanel

### Description

Opens a dialog that you can use to edit selected Control Panel settings.

This system function lets you set the following on the HMI device:

- Properties and value of the IP address
- User identification on the network
- WinCC Internet settings

---

#### Note

##### Project security

The "OpenControlPanelDialog" system function is used to bypass the SecureMode on the HMI device. Take the corresponding precautions to ensure the security of your project.

---

### Use in the function list

OpenControlPanelDialog (Dialog)

### Use in user-defined functions

-

## Parameters

### Dialog

Sets the Control Panel dialog to be opened.

- PROFINET\_X1: Setting of the IP address and Ethernet parameters
- PROFINET\_X3: Setting of the IP address and Ethernet parameters; only for Comfort Panel KP 1500, TP 1500; TP1900, TP2200
- WinCC Internet settings: Setting for Web Server, e-mail notification, provided the HMI device supports these functions
- Network ID: Setting for identification on the network, provided the HMI device supports these functions

## OpenInternetExplorer

### Description

Opens the Internet Explorer on the HMI device.

If the Internet Explorer is already open, it will be closed and reopened when you call the system function.

---

### Note

The Internet Explorer saves data temporarily in the DRAM file system of the HMI device, e.g. the last web sites that were be called up.

This data can be saved using the "BackupRAMFileSystem" system function so that it is still available when the HMI device is restarted.

---

### Use in the function list

OpenInternetExplorer (Start page)

### Use in user-defined functions

OpenInternetExplorer (Start\_page)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Start page

The page which is loaded when Internet Explorer is started, e.g. "www.siemens.com".

## OpenScreenKeyboard

### Description

Hides or shows the screen keyboard.

The screen keyboard remains open until the screen keyboard is explicitly closed. In this way, the screen keyboard can also be used in other applications.

### Use in the function list

OpenScreenKeyboard (Layout)

### Use in user-defined functions

OpenScreenKeyboard (Display\_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Layout

Specifies whether the window is opened minimized or maximized with the screen keyboard:

0 (hmiScreenKeyboardMinimized) = Minimized

1 (hmiScreenKeyboardMaximized) = Maximized

## OpenTaskManager

### Description

Shows the task manager.

The task manager allows changing to other open applications on the HMI device.

---

#### Note

The appearance of the task manager depends on the operating system installed.

---

### Use in the function list

OpenTaskManager

### Use in user-defined functions

OpenTaskManager

Can be used if the configured device supports user-defined scripts. For additional information, refer to "Device dependency".

**Parameter**

--

**PageDown****Description**

Executes the key function <Pagedown> on the HMI device.

This system function can only be used for function keys.

**Use in the function list**

PageDown

**Use in user-defined functions**

PageDown

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

-

**PageUp****Description**

Executes the key function <PageUp> on the HMI device.

This system function can only be used for function keys and tasks with a time trigger.

**Use in the function list**

PageUp

**Use in user-defined functions**

PageUp

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

-

**PrintReport**

**Description**

Prints the given report from the printer which is connected to the HMI device. The report is printed in the language which is set on the HMI device.

---

**Note**

If runtime is closed whilst log data are being printed using the system function, the report will cease to be supplied with data as soon as runtime stops.

---

**Use in the function list**

PrintReport (Report)

**Use in user-defined functions**

PrintReport (Report)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

**Report**

Name of the report to be printed.

---

**Note**

If you have set up via the "Function list" dialog box a new report for the "PrintReport" function, when compiling, the following warning appears: "The report "Report\_1" has no printed pages."

In order to remedy the warning, open the "Report\_1" via the project view and recompile the project.

---

**PrintScreen**

**Description**

Prints the screen currently being displayed on the HMI device from the printer which is connected to the HMI device.

Opened windows are also printed.

---

**Note**

The printer settings are taken over from the current settings in the Windows operation system.

---

**Use in the function list**

PrintScreen

**Use in user-defined functions**

PrintScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter**

--

**ResetBit****Description**

Sets the value of a "Bool" type tag to 0 (FALSE).

**Use in the function list**

ResetBit (Tag)

**Use in user-defined functions**

ResetBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameters****Tag**

The BOOL type tag which is set to 0 (FALSE).

## Example

The following program code resets the value of the boolean tag `b_value` to 0 by means of the `ResetBit` function and outputs the result along with the original `b_saved` value.

```
{
BOOL b_value = 1;
BOOL b_saved = b_value;

//Reset bit
ResetBit (b_value);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
...
}
```

## ResetBitInTag

### Description

Sets a bit in the specified tag to 0 (FALSE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

---

#### Note

If the PLC supports BOOL tags, do not use this system function. Use the "ResetBit" system function instead.

---

### Use in the function list

ResetBitInTag (Tag, Bit)

### Use in user-defined functions

ResetBitInTag (Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### Tag

The tag in which a bit is set to 0 (FALSE).

### Bit

The number of the bit that is set to 0 (FALSE).

When this system function is used in a user-defined function, the bits in the specified tag will be counted from right to left independent of the PLC used. The counting begins with 0.

### Example

The following program code sets a bit at the specified bitposition in the bvalue tag to 0 and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Reset bit in bitposition
ResetBitInTag (bvalue, bitposition);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
...
}
```

### SafelyRemoveHardware

#### Description

Checks whether there is read or write access to the external storage medium. If there is no access, the external storage medium can be removed without data loss.

#### Use in the function list

SafelyRemoveHardware(Path, Result)

#### Use in user-defined functions

SafelyRemoveHardware(Path, Result)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

#### Parameter

##### Path

Path of storage medium , e.g. \Storage Card USB\

### Result

The tag in which the result is entered.

TRUE : The storage medium can be removed safely. A corresponding system message will be issued.

FALSE : The storage medium can be removed safely. A corresponding system message will be issued.

## SaveDataRecord

### Description

Saves the current values of the recipe tags as data record to the memory medium of the HMI device.

This system function is used, for example, to save a recipe data record in the recipe screen.

### Use in the function list

SaveDataRecord (Recipe number/name, Data record number/name, Overwrite, Output status message, Processing status)

### Use in user-defined functions

SaveDataRecord (Recipe\_number/name, Data\_record\_number/name, Overwrite, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### Recipe number/name

Number or name of the recipe to which a recipe data record is saved.

#### Data record number/name

Number or name of the recipe data record to be saved. A new data record will be created if no record of this name or number was found in the recipe, independent of the value at the "Overwrite" parameter.

#### Overwrite

Specifies whether an existing data record is overwritten:

0 (hmiOverwriteForbidden) = No: The recipe data record is not overwritten, the data record is not saved.

1 (hmiOverwriteAlways) = Yes: The recipe data record is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithPrompting) = With confirmation: The recipe data record is overwritten only with confirmation by the user.

#### **Output status message**

Determines whether a status message is output after saving:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

#### **Processing status**

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

## **SendEMail**

### **Description**

Sends an e-mail from the HMI device to the given addressee.

This system function is used, for example, when, in the case of service, the alarm is to be passed on directly to the service technician.

---

#### **Note**

To send alarms as e-mails, the HMI system must have an e-mail client at its disposal.

---

### **Use in the function list**

SendEMail (Address, Subject, Text, Return address)

### **Use in user-defined functions**

SendEMail (Address, Subject, Text, Return\_address)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### **Parameter**

#### **Address**

The e-mail address of the addressee.

**Subject**

The subject line of the e-mail.

**Text**

The text sent in the e-mail.

**Return address**

The e-mail address to which the addressee of this e-mail should send the reply.

## SetAcousticSignal

### Description

Configures the acoustic feedback of touch screen operation on the HMI device.

---

**Note**

The configuration that was set at Switch off is reestablished when restarting the HMI device.

---

### Use in the function list

SetAcousticSignal (Volume)

### Use in user-defined functions

SetAcousticSignal (Volume)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

**Volume**

Determines whether and how loud an acoustic signal is emitted:

-1 (hmiToggle) = Toggle: Toggles the emission of the acoustic signal as follows: Muted > Quiet > Loud.

0 (hmiMuted) = Mute: no acoustic signal

1 (hmiQuiet) = Quiet: quiet acoustic signal

2 (hmiLoud) = Loud: loud acoustic signal

## SetAlarmReportMode

### Description

Switches the automatic reporting of alarms on the printer on or off.

### Use in the function list

SetAlarmReportMode (Mode)

### Use in user-defined functions

SetAlarmReportMode (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Mode

Determines whether alarms are reported automatically on the printer:

0 (hmiDisablePrinting) = Reporting off: Alarms are not printed automatically.

1 (hmiEnablePrinting) = Reporting On: Alarms are printed automatically.

-1 (hmiToggle) = Toggle: Toggles between the two modes.

## SetAndGetBrightness

### Description

Determines the brightness of the MP 377 Touch daylight readable display. The brightness value can be interpreted as absolute or relative to the current value.

---

#### Note

The configuration that is set in the Control Panel will be reestablished when you restart the HMI device.

---

### Use in the function list

SetAndGetBrightness (Brightness, Mode, Current value)

### Use in user-defined functions

SetAndGetBrightness (Brightness, Mode, Actual brightness)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Brightness

New value for the brightness.

### Mode

Specifies if the new brightness value is set as absolute or relative to the current value.

### Current value

Tag in which the current brightness value is stored.

## SetBit

### Description

Sets the value of a "Bool" type tag to 1 (TRUE).

### Use in the function list

SetBit (Tag)

### Use in user-defined functions

SetBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameters

### Tag

The BOOL type tag which is set to 1 (TRUE).

## Example

The following program code sets the value of the boolean tag b\_value to 1 by means of the SetBit function and outputs the result along with the original b\_saved value.

```
{  
  BOOL b_value = 0;  
  BOOL b_saved = b_value;
```

```
//Set bit
SetBit (b_value);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
...
}
```

## SetBitInTag

### Description

Sets a bit in the given tag to 1 (TRUE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

---

#### Note

If the PLC supports BOOL tags, do not use this system function. Use the "SetBit" system function instead.

---

### Use in the function list

SetBitInTag (Tag, Bit)

### Use in user-defined functions

SetBitInTag(Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### Tag

The tag in which a bit is set to 1 (TRUE).

#### Bit

The number of the bit that is set to 1 (TRUE).

When this system function is used in a user-defined function, the bits in the specified tag will be counted from right to left independent of the PLC used. The counting begins with 0.

---

**Note**

The guaranteed update of the tags used with actual process values is absolutely conditional in terms of reliable functionality. You should therefore configure the tag in an I/O field or assign the system function to a screen object, such as a button.

If you have configured a short event such as the activation of an alarm for the system function you can only access the actual process values by setting the tag for continuous reading.

---

**Example**

The following program code sets a bit to 1 at the specified bitposition in the bvalue tag and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Reset bit in bitposition
SetBitInTag (bvalue, bitposition);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
...
}
```

**SetBrightness**

**Description**

Determines the brightness of the display.

---

**Note**

The configuration that is set in the Control Panel will be reestablished when you restart the HMI device.

---

**Use in the function list**

SetBrightness (value)

### Use in user-defined functions

SetBrightness (Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Value

New value for the brightness.

### SetConnectionMode

### Description

Connects or disconnects the given connection.

---

#### Note

A connection to the PLC cannot be established until the operating mode ONLINE has been set on the HMI device. Use the "SetDeviceMode" system function for this purpose.

---

### Use in the function list

SetConnectionMode (Mode, Connection)

### Use in user-defined functions

SetConnectionMode (Mode, Connection)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Mode

Determines whether a connection to the PLC is established or disconnected:

0 (hmiOnline) = Online: Connection is established.

1 (hmiOffline) = Offline: Connection is disconnected.

#### Connection

The PLC to which the HMI device is connected. You specify the name of the PLC in the connection editor.

### Multiple use of the system function in a user-defined function

If you use the "SetConnectionMode" system function for different connections, it may be possible that not all system functions are executed correctly. Proceed as follows to prevent this situation:

1. Create a "BOOL" type tag with the start value "0".
2. Configure the "SetConnectionMode" system function on the "Value change" event of the HMI tags. If you want to disconnect three connections, for example, you must configure the system function three times.
3. In the user-defined function, apply the "InvertBit" system function to the HMI tag.

### Application example

Two typical application examples for this system function are as follows:

- Test  
As long as no PLC is connected to the HMI device, no error messages will be output during the test on the HMI device. If the HMI device is connected to a PLC, the connection to the PLC can be established by pressing a key.
- Commissioning  
Several PLCs are to be configured for a system. At first, all PLCs except one are configured "Offline". After commissioning of the first PLC, the connection to each of the other PLCs is established by pressing a key. In this way, the other PLCs are started up one after another.

### SetDataRecordTagsToPLC

#### Description

Transfers the values of the recipe tags to the PLC. The recipe tags contain the values of the data record which is displayed on the HMI device.

#### Use in the function list

SetDataRecordTagsToPLC (Recipe number/name, Processing status)

#### Use in user-defined functions

SetDataRecordTagsToPLC (Recipe\_ number/name, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

#### Parameter

##### Recipe number/name

Number or name of the recipe from which recipe data record is transferred to the PLC.

**Processing status**

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

**SetDataRecordToPLC****Description**

Transfers the given recipe data record directly from the data medium of the HMI device to the PLC with which the HMI device is connected.

---

**Note**

The values of the recipe data record don't need to be displayed on the HMI device.

---

**Use in the function list**

SetDataRecordToPLC (Recipe number/name, Data record number/name, Output status message, Processing status)

**Use in user-defined functions**

SetDataRecordToPLC (Recipe\_number/name, Data\_record\_number/name, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Recipe number/name**

Number or name of the recipe from which recipe data record is transferred to the PLC.

**Data record number/name**

Number or name of the recipe data record to be transferred to the PLC.

**Output status message**

Determines whether a status message is output after the transfer:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

## SetDaylightSavingTime

### Description

The system function "SetDaylightSavingTime" changes the setting of the HMI device from daylight saving to standard time and vice versa.

Time settings will take place immediately following system function.

---

#### Note

The "SetDaylightSavingTime" system function does not support time zones without daylight saving time.

---

#### Note

##### Windows 7

The system function "SetDaylightSavingTime" is not supported for PC-based HMI devices under Windows 7.

---

### Use in the function list

SetDaylightSavingTime(DaylightSavingTime)

### Use in user-defined functions

SetDaylightSavingTime (Daylight\_saving\_time)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### Daylight Saving Time

Determines whether Daylight Saving Time is set on the HMI device:

0 = Daylight Saving Time is not activated

1 = Daylight Saving Time is activated

## SetDeviceMode

### Description

Toggles the operating mode on the HMI device. The following types of operation are possible: "Online", "Offline" and "Load".

### Use in the function list

SetDeviceMode (Operating mode)

### Use in user-defined functions

SetDeviceMode (Operating\_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Operating mode

Determines the operating mode of the HMI device:

0 (hmiOnline) = Online: The connection to the PLC is established. The configured connection status is always set in this process. The states that were last used in Runtime are not considered.

1 (hmiOffline) = Offline: The connection to the PLC is disconnected.

2 (hmiTransfer) = load: A project can be transferred from the configuration computer to the HMI device.

---

#### Note

If you use a PC as an HMI device, the runtime software will be exited when you change operating mode after "Load".

---

## SetDisplayMode

### Description

Changes the settings of the screen in which the runtime software runs.

The runtime software runs in full-screen mode as default. The Windows task switch is disabled.

### Use in the function list

SetDisplayMode (Layout)

### Use in user-defined functions

SetDisplayMode (Display mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Display mode

Determines the settings for the screen in which the runtime software runs.

1 (hmiScreenFull): Full-screen: Title bar of the screen is not visible

2 (hmiScreenMaximized): Maximized

3 (hmiScreenRestore): Restore: The last used screen setting is used. This layout can only be used when the window is displayed minimized or maximized.

4 (hmiScreenMinimized): Minimized

5 (hmiScreenAutoAdjust): Automatic: The size of the window is set so that all screen objects in it will be visible.

6 (hmiScreenOnTop): Foreground; either the window appears in the foreground or the program icon associated with the window flashes on the taskbar depending on the Windows setting. The setting can be changed in the Windows configuration and applies to all Windows applications.

### SetLanguage

#### Description

Toggles the language on the HMI device. All configured text and system events are displayed on the HMI device in the newly set language.

#### Use in the function list

SetLanguage (Language)

### Use in user-defined functions

SetLanguage (Language)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Language

Determines which language is set on the HMI device. The following specifications are possible:

- -1 (hmiToggle) = Toggle: Changes to the next language. The sequence is determined during configuration in the "Project languages" editor.
- Number you have defined under "Languages and fonts" in the "Runtime Settings" editor. Changes to the language with the given number.
- Language you have defined under "Languages and fonts" in the "Runtime Settings" editor.
- Language abbreviation in accordance with the VBScript5 reference: This changes to the language corresponding to the specified language code, e.g. "de-DE" for German (Germany) or "en-US" for English (United States).  
An overview of the language abbreviations is available in the basic information of VBScript under the topic "Area diagram-ID (LCID) Diagram".

## SetPLCDateTime

### Description

Changes the data and the time of the linked PLC

The system function "SetPLCDateTime" can only be configured for the following PLCs:

- SIMATIC S7 1200
- SIMATIC S7 1500

### Use in the function list

SetPLCDateTime (connection, time)

### Use in user-defined functions

SetPLCDateTime (Connection, Time)

### Parameters

#### Connection

Connection of PLC and HMI device.

#### Time

Transfers the date and the time of the HMI device to the PLC. The PLC applies the date and the time of the HMI device.

## SetRecipeTags

### Description

Changes the status of the recipe tags from "Online" to "Offline" and vice versa.

This system function is used, for example, when recipe data record values are fine tuned when starting up a machine.

### Use in the function list

SetRecipeTags (Recipe number/name, Status, Output status message, Processing status)

### Use in user-defined functions

SetRecipeTags (Recipe\_number/name, Status, Output\_status\_message, Processing\_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Recipe number/name

Number or name of the recipe in which the recipe data record is saved.

#### Status

Determines the status of the recipe tags:

0 (hmiOnline) = Online: Value changes of the recipe tags are transferred immediately to the PLC connected to the HMI device.

1 (hmiOffline) = Offline: Value changes to the recipe tags are only transferred to the PLC connected to the HMI device when, for example, the "SetDataRecordTagsToPLC" system function is executed.

#### Output status message

Determines whether a status message is output after saving:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

#### Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

## SetScreenKeyboardMode

### Description

Enables or disables the automatic display of the screen keyboard on the HMI device.

This system function is also used to prevent the display of the screen keyboard, e.g. because an external keyboard is connected to the HMI device.

---

#### Note

To enable the "SetScreenKeyboardMode" ("SetScreenKeyboardMode") system function on an HMI other than a Touch Panel device, set the "Use on-screen keyboard" check box in the "Runtime settings" dialog of the device settings.

---

### Use in the function list

SetScreenKeyboardMode (Mode)

### Use in user-defined functions

SetScreenKeyboardMode (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Mode

Determines whether the screen keyboard is hidden or shown:

0 (hmiOff) = Off: Screen keyboard is hidden

1 (hmiOn) = On: Screen keyboard is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes.

## SetTag

### Description

Assigns a new value to the given tag.

---

#### Note

This system function can be used to assign strings and numbers, depending on the type of tag.

---

### Use in the function list

SetTag (Tag, Value)

### Use in user-defined functions

SetTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### Tag

The tag to which the given value is assigned.

#### Value

The value which the given tag is assigned.

---

#### Note

The "SetTag" system function is only executed after a connection has been established.

---

### Example

The following program code uses the SetTag function to set the value of the gs\_tag\_bit tag to TRUE and saves the return value to the ok tag.

```
{
BOOL ok;
BOOL bvalue;

//Set the tag to true
ok = SetTag("gs_tag_bit", TRUE);
//error handling
if(ok)
{
    // succeeded
    printf ( "Function has run through.\r\n" );
    bvalue = GetTagBit("gs_tag_bit");
    printf ("Value of gs_tag_bit: %d\r\n", bvalue);
}
else
{
    // failed
    printf ( "Error - function failed." );
}
...
}
```

The saved return value can be processed in the following code.

## ShiftAndMask

### Description

This system function converts the input bit pattern of the source tags into an output bit pattern of the target tags. This involves bit shifting and masking.

---

#### Note

If the source and target tag have a different number of bits, using the system function in the target tag can result in a violation of the value range.

---

### Use in the function list

ShiftAndMask (Source tag, Target tag, Bits to shift, Bits to mask)

### Use in user-defined functions

ShiftAndMask (Source\_tag, Target\_tag, Bits\_to\_shift, Bits\_to\_mask)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Source tag

The tag includes the input bit pattern. Integer-type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong" are permitted.

Example: The actual value 72 is set at the 16-bit integer source tag: 0000000001001000.

#### Target tag

The output bit pattern is saved in the tag. Integer type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong" are permitted.

Example: The shifted input bit pattern is multiplied by the bit mask, with bit-by-bit logical AND operation: 0000000000001001. The resultant decimal value "8" is saved to the target tag.

Please note the following:

- The source and target tags have the same number of bits.
- The number of bits to shift is less than the number of bits in the source tag and target tag.
- Bits to mask does not have more bits than the source tag and the target tag.

### Bits to shift

Number of bits by which the input bit pattern is shifted right. A negative value shifts the input bit pattern to the left.

Example: "Bits to shift" has the value "+3". The input bit pattern is shifted right by three bits when the system function is called: 000000000001001.

Bits to the left are padded with "0". Three bits are truncated on the right. The new decimal value is "9".

---

### Note

The left bit is "1" in a source tag of the data type with negative signed integer. This sign bit is padded with "0" when the bits are shifted right. The sign changes to "+".

---

### Bits to mask

An integer serves as bit mask. The bit pattern is used to multiply the shifted input bit pattern. Example: Integer "2478" with the bit pattern "0000100110101110".

You can enter the bit mask in three different ways:

- Hexadecimal: First enter the prefix "0h" or "0H", followed by an optional space for better readability. Then group the bit pattern in blocks of four (0000)(1001)(1010)(1110) and set each block in hexadecimal code: (0)(9)(A)(E). Only the characters 0-9, A-F, a-f are allowed: "0h 09AE".
- Binary: First enter the prefix "0b" or "0B", followed by an optional space for better readability. Then group the binary bit pattern into blocks of four 0000 1001 1010 1110 with spaces in between as a check. Only the characters "0" or "1" are allowed: "0b 0000 1001 1010 1110".
- Decimal: Enter the value "2478" directly, without a prefix.

## ShowAlarmWindow

### Description

Hides or shows the alarm window on the HMI device.

### Use in the function list

ShowAlarmWindow (Object name, Layout)

### Use in user-defined functions

ShowAlarmWindow (Object\_name, Display\_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Object name

Name of the alarm view which is hidden or shown.

### Layout

Determines whether the alarm window is hidden or shown:

0 (hmiOff) = Off: Alarm view is hidden

1 (hmiOn) = On: Alarm view is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

## ShowOperatorNotes

### Application

Displays the tooltip configured for the selected object.

If the system function is configured on a function key, the tooltip for the screen object that currently has the focus is displayed. If a tooltip is configured for the screen itself, you can switch to this text by pressing <Enter> or by double-clicking on the help window.

If the system function is configured on a button, only the tooltip for the current screen is displayed. If a tooltip is configured on the button itself, initially only the tooltip for the button is displayed. You can press <Enter> or double-click on the help window to switch to the tooltip for the current screen.

---

### Note

No other screen object can be used while the help window is open. To use the screen object, close the help window.

---

## Closing the help window

You can close the help window in the following ways:

Using the keys:

- By pressing the <HELP> key again
- By pressing the <ESC> key

Using the touch screen:

- By pressing the  button

## Use in the function list

ShowOperatorNotes (Layout)

### Use in user-defined functions

ShowOperatorNotes (Display\_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Display mode

Determines whether the configured tooltip is hidden or shown:

0 (hmiOff) = Off: Configured tooltip is hidden

1 (hmiOn) = On: Configured tooltip is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

### ShowSoftwareVersion

#### Description

Hides or shows the version number of the runtime software.

Use this system function if during servicing, for example, you required the version of the runtime software used.

#### Use in the function list

ShowSoftwareVersion (Layout)

### Use in user-defined functions

ShowSoftwareVersion (Display\_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Layout

Determines whether the version number is shown:

0 (hmiOff) = Off: Version number is not shown

1 (hmiOn) = On: Version number is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

## ShowSystemAlarm

### Description

Displays the value of the parameter passed as a system event to the HMI device.

### Use in the function list

ShowSystemAlarm (Text/value)

### Use in user-defined functions

ShowSystemAlarm (Text/value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Text/Value

The text or the value, which was output as a system alarm.

## ShowSystemDiagnosticsWindow

### Description

Hides or shows the system diagnostic window on the HMI device. The system diagnostic view is only available in the global screen for Comfort Panels and for WinCC Runtime Advanced.

### Use in the function list

ShowSystemDiagnosticsWindow (Screen object)

### Use in user-defined functions

ShowSystemDiagnosticsWindow (Target\_Object\_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### Screen object

Name of the system diagnostic window which is hidden or shown.

## StartLogging

### Description

Starts the logging of data or alarms in the specified log. The function can also be applied to audit trails.

You can interrupt logging at runtime using the "StopLogging" system function.

### Use in the function list

StartLogging (Log type, Log)

### Use in user-defined functions

StartLogging (Log\_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail

#### Log

Name of the log which is started.

## StartNextLog

### Description

Stops the logging of data or alarms for the given log.

Logging is continued in the next log of the segmented circular log you configured for the specified log.

If you did not configure a segmented circular log for the specified log, the system function has no effect.

### Use in the function list

StartNextLog (Log type, Log)

### Use in user-defined functions

StartNextLog (Log\_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameter

#### Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

#### Log

Name of the log for which the logging is stopped and continued in the next log.

### StartProgram

#### Description

Starts the specified program on the HMI device.

The runtime software continues running in the background. Alarms continue to be output and data continues to be updated.

When the given application is exited, the screen which was active during the performance of the system function is displayed on the HMI device.

This system function is used, for example, to edit recipe data records in MS Excel on the HMI device.

---

#### Note

If Windows CE is installed on the HMI device, during the configuration it must be checked whether the desired application can be started with this system function.

This system function allows all applications to be started which can be started in the "Execute" dialog of Windows CE.

The application to be started must be installed on the HMI device.

---

### Use in the function list

StartProgram (Program name, Program parameters, Layout, Wait for program to end)

### Use in user-defined functions

StartProgram (Program\_name, Program\_parameters, Display\_mode, Wait\_for\_program\_to\_end)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

## Parameter

### Program name

Name and path of the program which is started. Upper and lower case are taken into account in this parameter.

---

### Note

If the path contains spaces, the program can only be started correctly if the path is specified in inverted commas, e.g. "C:\Program Files\START\start.exe".

---

### Program parameters

The parameters you transfer at the start of the program, for example a file that is opened after the start of the program.

The description of the necessary parameters is found in the documentation of the program to be started.

### Layout

Determines how the program window is displayed on the HMI device:

0 (hmiShowNormal) = Normal

1 (hmiShowMinimized) = Minimized

2 (hmiShowMaximized) = Maximized

3 (ShowMinimizedAndInactive) = Minimized and inactive

### Wait for program to end

Determines whether there is a change back to the project after the called up program has ended:

0 (hmiNo) = No: No change to project

1 (hmiYes) = Yes: Change to project

---

### Note

The "Wait for program to end" parameter is only available for Runtime Advanced and Panels.

---

## StopLogging

### Description

Stops the logging of process values or alarms in the specified log. The function can also be applied to audit trails.

The "StartLogging" system function is used to resume logging at runtime.

---

**Note**

When logging is stopped, a connection between WinCC and the log files or log database still exists. Use the "CloseAllLogs" system function to disconnect this connection.

---

**Use in the function list**

StopLogging (Log type, Log)

**Use in user-defined functions**

StopLogging (Log\_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

**Parameter****Log type**

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail

**Log**

Name of the log that is stopped.

**Application example**

You are in runtime and want to change the data medium on which the process values are logged.

**Notes on configuring**

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

**Procedure on HMI device**

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. The "Open Archive" button opens all logs and continues logging in the specified log.

## StopRuntime

### Description

Exits the runtime software and thereby the project running on the HMI device.

### Use in the function list

StopRuntime (Mode)

### Use in user-defined functions

StopRuntime (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

### Parameters

#### Mode

Determines whether the operating system is shut down after exiting runtime.

0 (hmiStopRuntime) = Runtime: Operating system is not shut down

1 (hmiStopRuntimeAndOperatingSystem) = Runtime and operating system: The operating system is shut down (not possible with WinCE)

### Example

The following program code shuts down Runtime and the operating system.

```
{  
  
//Stop runtime and shutdown  
StopRuntime (hmiStopRuntimeAndOperationSystem);  
  
}
```

The saved return value can be processed in the following code.

## WinACMPGetVersion

### Description

Reads out the value of the version number of WinAC MP.

**Use in the function list**

WinACMPGetVersion (Version, Action)

**Use in user-defined functions**

WinACMPGetVersion (Version, Action)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

**Parameters****Version**

The tag that contains the value.

**Action**

Determines whether the version number is read out:

0 (SwitchOff) = Off: Version number is not read out.

1 (SwitchOn) = On: Version number is read out.

**WinACMPSetStartAtBoot****Description**

Determines whether or not WinAC MP is started automatically after startup of the HMI device.

**Use in the function list**

WinACMPSetStart at boot(Start at boot)

**Use in user-defined functions**

WinACMPSetStartAtBoot (Start at boot)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

**Parameters****StartAtBoot**

Defines whether WinAC MP is started automatically.

0 (StartAtBootOff) = Off: WinAC MP is not started on startup of the HMI device.

1 (StartAtBootOn) = On: WinAC MP is started automatically on startup of the HMI device.

## WinACSetStartMode

### Description

Sets the operating mode of WinAC MP after startup of the HMI device.

### Use in the function list

WinACSetStartMode (Autostart)

### Use in user-defined functions

WinACSetStartMode (Autostart)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

### Parameters

#### Action

Defines whether the Autostart function of WinAC MP is activated.

0 (AutoStartOff) = Off: After startup, WinAC MP remains in the STOP operating mode.

1 (AutoStartOn) = On: After startup, WinAC MP changes to the operating mode it was in before it was closed.

### VBScript for Windows

### VBScript for Windows

### VBScript

If you have worked with Visual Basic or Visual Basic for applications, then VBScript will seem familiar to you. If you do not know Visual Basic and are getting familiar with it, then you will learn all Visual Basic programming languages at once. The step-by-step guides from Microsoft Press are a good introduction to programming.

You will find fundamental information on VBScript language elements on the Microsoft homepage:

<http://msdn.microsoft.com/en-us/library/t0aew7h6.aspx>

### Local ID (LCID)

An overview of all language codes can be found on the Microsoft homepage:

<http://msdn.microsoft.com/en-us/goglobal/bb964664>

## VBScript for Windows CE

## VBScript for Windows CE

### Attr

### Function

This property of the File control returns a number indicating the file mode that was used to open the file.

### Syntax

file.Attr

### Parameters

#### File

Reference to a File control.

### Return values

The return values listed in the following table indicate the file access mode. If the return value is 0, the file is closed.

Constant	Value
None	0
fsModeInput	1
fsModeOutput	2
fsModeRandom	4
fsModeAppend	8
fsModeBinary	32

### Remarks

The Attr property is read-only. Use the Open method of the File control to set the file mode.

### Close

### Function

This method closes an open File control.

### Syntax

file.Close

### Parameters

#### File

Name of a File control.

### Return Values

None.

### Remarks

Use the Open method to open a file.

### CreateObject

### Function

This function creates a reference to an Automation object.

### Syntax

CreateObject (Object)

### Parameters

#### Object

A string containing the ProgID of the object to create.

### Return values

Returns a reference to an Automation object.

### Remarks

Use CreateObject to create non-visible ActiveX controls at runtime. You cannot use CreateObject to create graphical objects such as a TreeView control or a ListView control. CreateObject produces objects that cannot respond to events. To produce objects that can

respond to events, use the CreateObjectWithEvents function. The following table lists the ProgIDs for the ActiveX controls without events.

Control	ProgID
Microsoft CE File control 6.0	.file
Microsoft CE FileSystem control 6.0	.filesystem
Microsoft CE ImageList control 6.0	CEImageList.imagelistctrl

## Example

```
Dim f, fwModeAppend
Set f = CreateObject("FileCtl.File")
fwModeAppend=8
f.Open "\Storage Card\testfile.txt", fwModeAppend
f.Close
```

## Dir

## Function

This method returns the name of a file, directory, or folder that matches a specified pattern or file attribute.

## Syntax

File.Dir (Pathname,[Attributes])

## Parameters

### File

Reference to a FileSystem control.

### Pathname

Optional. String expression that specifies a file name or path.

### Attributes

Optional. Numeric expression whose sum specifies file attributes. If omitted, all files that match pathname are returned.

The following table describes the parameter settings of attributes.

Constant	Value	Description
fsAttrNormal	0	Normal
fsAttrReadOnly	1	Read only

Constant	Value	Description
fsAttrHidden	2	Hidden
fsAttrSystem	4	System file
fsAttrVolume	8	Volume label. If specified, all other attributes are ignored.
fsAttrDirectory	16	Directory or folder
fsAttrArchive	32	Logs

### Return values

String. File name that matches pathname and attributes. Dir returns a zero-length string ("") if pathname is not found.

### Remarks

Dir supports the use of multiple-character (\*) and single-character (?) wildcards to specify multiple files. You must specify pathname the first time you call the Dir method. In addition, if you specify file attributes you must include pathname.

The Dir method returns the first file name that matches pathname. To get any additional file names that match pathname, call Dir again with no parameters. When no more file names match, Dir returns a zero-length string (""). Once a zero-length string is returned, you must specify pathname in subsequent calls.

### EOF

### Function

This property returns True when the end of a file opened for random or sequential input is reached.

### Syntax

File.EOF

### Parameters

#### File

Reference to a File control.

### Remarks

Use the EOF property to avoid the error generated by attempting to read past the end of a file.

The EOF property returns False until the end of the file has been reached. For files opened with a fsModeRandom or fsModeBinary file mode, EOF returns False until the last executed Get statement is unable to read an entire record.

For files opened with a fsModeBinary file mode, an attempt to read through the file using the Input function until EOF returns True generates an error. Use the LOF and LOC properties instead of EOF when reading binary files with Input, or use Get when using the EOF property. For files opened with a fsModeOutput file mode, EOF always returns True.

## FileCopy

### Function

This method copies an existing file to a new file.

### Syntax

Filesystem.FileCopy PathName, NewPathName

### Parameters

#### Filesystem

Reference to a FileSystem object.

#### PathName

String that contains the path and file name.

#### NewPathName

String that contains the file name and path of the new file.

### Return Values

None.

### Remarks

FileCopy returns an error if the new file does not exist.

## FileLen

### Function

This method returns a value specifying the length, in bytes, of a file.

### Syntax

Filesystem.FileLen(pathname)

## Parameters

### Filesystem

Reference to a FileSystem control.

### Pathname

Required. String expression that specifies a file. The pathname can include a directory or folder.

## Return Values

Returns the number of bytes in a file.

## Remarks

If the specified file is open when the FileLen method is called, the value returned represents the size of the file immediately before it was opened.

## FileDateTime

## Function

This method returns a variant (Date) that indicates the date and time when a file was created or last modified.

## Syntax

```
filesystem.FileDateTime(pathname)
```

## Parameters

### Filesystem

Reference to a FileSystem control.

### Pathname

Required. String expression that specifies a file name. The pathname can include a directory or folder.

## Return Values

Returns the date the file was last modified.

## Remarks

FileDateTime returns an error if the new file does not exist.

## Get

### Function

This method reads data from an open disk file into a variable.

### Syntax

```
file.Get Data, [Recnumber]
```

### Parameters

#### File

Reference to a File control.

#### Data

Required. Variant variable into which data is read.

#### Recnumber

Optional. Variant. Record number at which reading begins. For files opened in binary mode, Recnumber specifies the byte position.

### Return Values

None

### Remarks

Data read with the Get method usually is written to a file with the Put method. The first record or byte in a file is at position 1, the second record or byte is at position 2, and so on. If you omit Recnumber, the next record or byte following the last Get or Put method (or pointed to by the last Seek function) is read.

For files opened in Random mode, the following rules apply:

- If the length of the data being read is less than the length specified in the Len clause of the Open method, Get reads subsequent records on record-length boundaries. The space between the end of one record and the beginning of the next record is padded with the existing contents of the file buffer. Because the amount of padding data cannot be determined with any certainty, it is generally advisable to match the record length with the length of the data being read.
- If Data is a Variant of numeric type, Get reads 2 bytes identifying the VarType of the Variant and then reads the data that goes into the variable. For example, when reading a Variant of VarType 3, Get reads 6 bytes: 2 bytes identifying the Variant as VarType 3 (Long) and 4 bytes containing the Long data. The record length specified by the Len clause in the Open method must be at least 2 bytes greater than the actual number of bytes required to store the variable.

- You can use the Get method to read a Variant array from a disk, but you cannot use Get to read a scalar Variant containing an array. You also cannot use Get to read objects from a disk.
- If the variable being read into is a Variant of VarType 8 (String), Get reads 2 bytes identifying the VarType and 2 bytes indicating the length of the string. Then it reads the string data. The record length specified by the Len clause in the Open method must be at least 4 bytes greater than the actual length of the string.
- If the variable being read into is a dynamic array, Get reads a descriptor whose length equals 2 plus 8 times the number of dimensions, that is,  $2 + 8 * \text{NumberOfDimensions}$ . The record length specified by the Len clause in the Open method must be greater than or equal to the sum of all the bytes required to read the array data and the array descriptor.

For files opened in Binary mode, the Len clause in the Open method has no effect. Get reads all variables from a disk contiguously; that is, with no padding between records.

## GetAttr

### Function

This method returns a number representing the attributes of a file, directory, or folder.

### Syntax

```
filesystem.GetAttr(pathname)
```

### Parameters

#### File system

Reference to a FileSystem control.

#### Pathname

Required. String expression that specifies a file name or directory or a folder name. The pathname can include the directory or folder.

### Return values

Sum of attribute values. The following table shows the sums that can be returned.

Constant	Value	Description
vbNormal	0	Normal
VbReadOnly	1	Read only
VbHidden	2	Hidden
VbSystem	4	System

Constant	Value	Description
VbDirectory	16	Directory or folder
VbArchive	32	File has changed since last backup

## Remarks

To determine which attributes are set, use the And operator to perform a bitwise comparison of the value returned by the GetAttr method and the value of the individual file attribute you want. If the result is not zero, that attribute is set for the named file.

## Input

## Function

This method returns a string containing characters from a file opened in Input or Binary mode.

## Syntax

```
file.Input(number)
```

## Parameters

### File

Reference to a File control.

### Number

Any valid numeric expression that specifies the number of characters to return.

## Return Values

String containing characters read from file.

## Remarks

Data read with the Input method usually is written to a file with the LinePrint or Put functions. Use this method only with files opened in Input or Binary mode.

Unlike the LineInputString method, the Input method returns all the characters it reads, including commas, carriage returns, line feeds, quotation marks, and leading spaces.

With files opened for Binary access, an attempt to read through the file using the Input method until the EOF function returns True generates an error. To avoid an error, use the LOF and Loc functions instead of EOF when reading binary files with the Input method or use Get when using the EOF function.

## InputFields

### Function

This method reads data from an open sequential file and returns a single dimension Variant array.

### Syntax

file.InputFields(number)

### Parameters

#### File

Reference to a File control.

#### Number

Number of comma-delimited fields to read from the file.

### Return values

Array containing the fields read from the file.

### Remarks

Data read with the InputFields method usually is written to a file with WriteFields. Use this method only with files opened in Input or Binary mode.

InputFields reads standard string or numeric data without modification. The following table shows how InputFields reads other input data.

Data	Value Assigned to Variable
Delimiting comma or blank line	Empty
#ZERO#	Zero
#TRUE# or #FALSE#	True or False
#yyyy-mm-dd hh:mm:ss#	The date and/or time represented by the expression

Double quotation marks ("" ) within input data are discarded.

If you reach the end of the file while you are inputting a data item, the input is terminated and an error occurs.

To correctly read data from a file into variables using InputFields, use the WriteFields method instead of the LinePrint method to write the data to the files. Using WriteFields ensures each separate data field is properly delimited.

## InputB

### Function

This method returns bytes from a file opened in Input or Binary mode.

### Syntax

```
file.InputB(number)
```

### Parameters

**File**

Reference to a File control.

**Number**

Any valid numeric expression that specifies the number of bytes to return.

### Return Values

Array containing bytes read from file.

### Remarks

Data read with the InputB method usually is written to a file with the LinePrint or Put functions. Use this method only with files opened in Input or Binary mode.

## Kill

### Function

This method deletes files from a disk.

### Syntax

```
filesystem.Kill pathname
```

### Parameters

**Filesystem**

Reference to a FileSystem control.

**Pathname**

Required. String expression that specifies one or more file names to be deleted. The pathname can include the directory or folder.

**Return Values**

None.

**Remarks**

The Kill method supports the use of multiple-character (\*) and single-character (?) wildcards to specify multiple files.  
An error occurs if you try to use Kill to delete an open file.

**LineInputString**

**Function**

This method reads a single line from an open sequential file and assigns it to a string variable.

**Syntax**

file.LineInputString

**Parameters**

**File**

Reference to a File control.

**Return Values**

None.

**Remarks**

Data read with LineInputString usually is written from a file with LinePrint.  
The LineInputString method reads from a file one character at a time until it encounters a carriage return (Chr(13)) or carriage return/line feed (Chr(13) + Chr(10)) sequence. Carriage return/line feed sequences are skipped rather than appended to the character string.

**LinePrint**

**Function**

This method writes a single line to an open sequential file.

**Syntax**

file.LinePrint output

**Parameters****File**

Reference to a File control.

**Output**

String expression to write to a file.

**Return Values**

None.

**Remarks**

Data written with LinePrint is usually read from a file with LineInputString.  
A carriage return/line feed (Chr(13) + Chr(10)) sequence is appended to the end of the string.

**Loc****Function**

This property returns a number specifying the current read/write position.

**Syntax**

file.Loc

**Parameters****File**

Reference to a File control.

**Remarks**

For files opened with the fsModeRandom file mode, Loc returns the number of the last record read or written. For files opened with all other modes, Loc returns the position of the last byte read or written.

## LOF

### Function

This property returns a number representing the size, in bytes, of a file.

### Syntax

file.LOF

### Parameters

#### File

Reference to a File control.

### Remarks

The LOF property can be used with the Loc property to guarantee that a read operation does not continue past the end of a file.

## MkDir

### Function

This method creates a new directory.

### Syntax

filesystem.MkDir PathName

### Parameters

#### Filesystem

Reference to a FileSystem control.

#### Pathname

String expression that contains the directory name.

### Return Values

None.

**Remarks**

MkDir generates an error if the directory already exists.

**MoveFile****Function**

This method renames an existing file or a directory, including all its subdirectories.

**Syntax**

filesystem.MoveFile PathName, NewPathName

**Parameters****Filesystem**

Reference to a FileSystem control.

**PathName**

String that contains the file name.

**NewPathName**

String that contains the file name to copy to.

**Return Values**

None.

**Open****Function**

This method opens a file in either the Input (1), Output (2), Random (4), Append (8), or Binary mode (32).

**Syntax**

file.Open pathname, mode, [access], [lock], [reclength]

**Parameters****File**

Reference to a File control.

**Pathname**

String expression that specifies a file name.

**Mode**

Specifies the file mode: Input (1), Output (2), Random (4) , Append (8), or Binary (32).

**Access**

Operation permitted on the open file: Read, Write, or ReadWrite [Default]. (1, 2, 3)

**Lock**

Operations permitted on the open file by other processes: Shared, LockRead, LockWrite [Default], and LockReadWrite. (1, 2, 3, 0)

**Reclength**

Number, in bytes, that is less than 32,767. For files opened for random access, this value is the record length. For sequential files, this value is the number of characters buffered.

**Return Values**

None.

**Remarks**

The reclength parameter is ignored if the mode is Binary. When opening a file in Random mode, you must specify a record size of greater than zero or an error will occur.

**Put**

**Function**

This method writes data from a variable to a disk file.

**Syntax**

file.Put data, [recnumber]

**Parameters**

**Data**

Required. Variant variable that contains data to be written to disk.

**Recnumber**

Optional. Variant (Long). Record number (Random mode files) or byte number (Binary mode files) at which writing begins.

## Return Values

None.

## Remarks

Data written with Put usually is read from a file with Get.

The first record or byte in a file is at position 1, the second record or byte is at position 2, and so on. If you omit recnumber, the next record or byte after the last Get or Put method or pointed to by the last Seek function is written.

For files opened in Random mode, the following rules apply:

- If the length of the data being written is less than the length specified in the Len clause of the Open method, Put writes subsequent records on record-length boundaries. The space between the end of one record and the beginning of the next record is padded with the existing contents of the file buffer. Because the amount of padding data cannot be determined with any certainty, it generally is a good idea to have the record length match the length of the data being written. If the length of the data being written is greater than the length specified in the Len clause of the Open method, an error occurs.
- If the variable being written is a Variant of a numeric type, Put writes 2 bytes identifying the VarType of the Variant and then writes the variable. For example, when writing a Variant of VarType 3, Put writes 6 bytes: 2 bytes identifying the Variant as VarType 3 (Long) and 4 bytes containing the Long data. The record length specified by the Len clause in the Open method must be at least 2 bytes greater than the actual number of bytes required to store the variable.

You can use the Put method to write a Variant array to disk, but you cannot use Put to write a scalar Variant containing an array to disk. You also cannot use Put to write objects to disk. If the variable being written is a Variant of VarType 8 (String), Put writes 2 bytes identifying the VarType and 2 bytes indicating the length of the string. It then writes the string data. The record length specified by the Len clause in the Open method must be at least 4 bytes greater than the actual length of the string.

If the variable being written is a dynamic array, Put writes a descriptor whose length equals 2 plus 8 times the number of dimensions, that is,  $2 + 8 * \text{NumberOfDimensions}$ . The record length specified by the Len clause in the Open method must be greater than or equal to the sum of all the bytes required to write the array data and the array descriptor. For example, the following array declaration requires 118 bytes when the array is written to disk.

For files opened in Binary mode, the Len clause in the Open method has no effect. Put writes all variables to disk contiguously; that is, with no padding between records.

## Rmdir

### Function

This method deletes an existing empty directory.

### Syntax

filesystem.Rmdir PathName

## Parameters

### Filesystem

Reference to a FileSystem control.

### PathName

String that contains the directory name.

## Return Values

None.

## Remarks

The directory must be empty before it can be removed. You must specify a complete file path.

## Seek

## Function

This property returns and sets the next position in a file that will be read or written.

## Syntax

```
file.Seek [= position]
```

## Parameters

### File

Reference to a File control.

### Position

Numeric expression that specifies a position within a file.

## Remarks

The Seek property specifies the next file position, whereas the Loc property specifies the current position. Seek always will be one more than Loc, except when a file is first opened and Seek and Loc are both 1.

Negative Seek or 0 causes an error.

## SetAttr

### Function

This method sets attribute data for a file.

### Syntax

filesystem.SetAttr pathname, attributes

### Parameters

#### File system

Reference to a FileSystem control.

#### Pathname

Required. String expression that specifies a file name.

#### Attributes

Required. Numeric expression whose sum specifies file attributes. The following table shows the parameter settings of attributes.

Constant	Value	Description
vbNormal	0	Normal (default)
vbReadOnly	1	Read only
vbHidden	2	Hidden
VbSystem	4	System file
VbArchive	32	File has changed since last backup

### Return values

None.

### Remarks

A run-time error occurs if you try to set the attributes of an open file.

### WriteFields

### Function

This method writes data to a sequential file.

## Syntax

file.WriteFields [data]

## Parameters

### File

Reference to a File control.

### Data

Variant or Variant array of numeric or string expressions to write to a file.

Prinzip

## Return Values

None.

## Remarks

Data written with WriteFields is usually read from a file with InputFields. If you omit data, a blank line is printed to the file.

- Numeric data is always written using the period as the decimal separator.
- For Boolean data, either #TRUE# or #FALSE# is printed. The True and False keywords are not translated, regardless of locale.
- Date data is written to the file using the universal date format. When either the date or the time component is missing or is zero, only the component provided gets written to the file.
- Nothing is written to the file if Data is Empty. However, for Null data, #NULL# is written.
- If data is Null, #NULL# is written to the file.

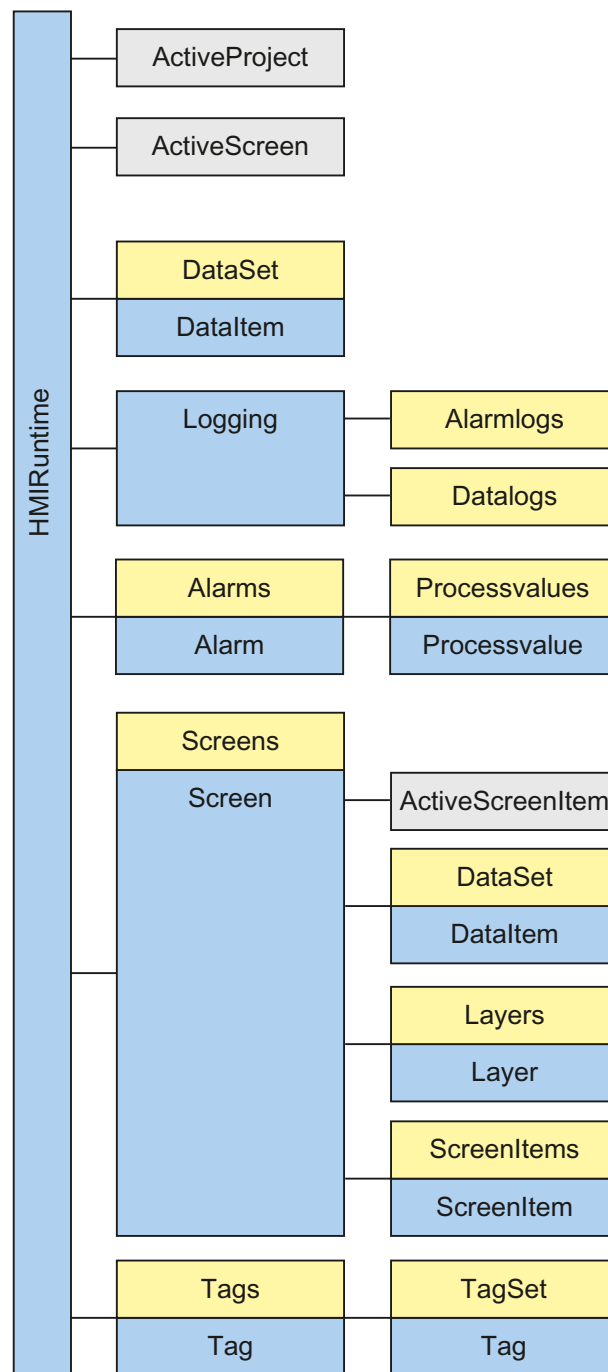

The WriteFields method inserts commas between items and quotation marks around strings as they are written to the file. You do not have to put explicit delimiters in the list. WriteFields inserts a newline character—that is, a carriage return/line feed (Chr(13) + Chr(10))—after it has written the final character in data to the file.

## VBS object model

## VBS object model

## VBS object model in WinCC

The following screen shows the VBS object model in WinCC:

Use the WinCC object model of the graphic Runtime system to access objects and tags in Runtime.

## Objects

Objects and lists are provided for access to all the objects in the graphic Runtime systems:

- Display and operating objects
- Screens
- Layers
- Tags

## Properties

You can specifically change the display and operating elements and tags in Runtime via the properties of the individual objects. For example, you can enable a button with a click or trigger a color change by changing a tag value.

## Methods

Methods which are applied to individual objects can be used to read out tag values for further processing or displaying alarms in Runtime.

Screen object (list) (Page 4263)

## Objects

### HMIRuntime

#### Description

Portrays the graphic runtime system.

The HMIRuntime object contains properties and methods which return the objects to the main layer, e.g. returns the ActiveScreen property of a screen object.

#### Application

You use the "HMIRuntime" object, e.g. as follows:

- Read or set the current Runtime language ("Language" property).
- Read name of current base screen or trigger a base screen change by setting a new screen name (property "BaseScreenName")
- Access tags (List "SmartTags")
- End runtime (Method "Stop")
- Output information on sequence tracing output (Method "Trace")
- Access the screens displayed during runtime (List "Screens")

## See also

ActiveScreen (Page 4481)

Screen (Page 4232)

## Screen object (list)

### Description

A list of screen objects.

The list contains the following two elements:

- The first element with the index 0 represents the permanent window.
- The second element with the index 1 represents the root screen.

Alternatively, the two elements can be addressed with their their names as follows:

- Permanent window: "Overview"
- Root screen: Name of the screen displayed in the root screen

If the named screen is not displayed, an error occurs during access.

Permanent window "Overview" is displayed in the objects list and in Auto complete.

---

### Note

The alarm window and the alarm indicator are not contained in the screens list, even if they have the focus in Runtime.

---

## Application

Use the screen property to return the screen list. In the following example, the background color is changed from black to green:

Use the object name as an index.

```
'VBS_Example_BackColor  
HMIRuntime.Screens("Rootscreen").BackColor = vbGreen
```

---

### Note

If you perform a screen change, the open references to the screen that is no longer available will become invalid. As a result, it is no longer possible to work with these references.

---

## See also

[Screen \(Page 4232\)](#)

[ScreenItems \(Page 4236\)](#)

## Screen

## Description

Represents the process screen which is being displayed on the HMI device at the moment or the permanent window in runtime. The screen object is returned to you as a result of accessing the screen list.

The screen object also contains a list of all graphic objects in the screen that can be addressed through the list "ScreenItems".

## Application

You can also use the screen object to do the following:

- Read the height and width of a screen (properties "Height" and "Width").
- Change the background color (property "BackColor").

Use the object name as an index.

In the following example, the background color is changed from black to green:

```
'VBS example background color
HMIRuntime.Screens("Rootscreen").BackColor = vbGreen
```

## See also

[ScreenItem \(Page 4234\)](#)

[ScreenItems \(Page 4236\)](#)

[HMIRuntime \(Page 4229\)](#)

[Screen object \(list\) \(Page 4230\)](#)

## ScreenItem

### Description

Represents an object in the specified screen. The ScreenItem object is an element of the ScreenItems list.

### Application

You can use the ScreenItem object to access the properties of graphic objects within a screen, depending on certain events.

You use the "ScreenItem" object as follows, for example:

- "Visible" property  
Switch the visibility of an object on or off.
- "Height" and "Width" properties  
Query the width and height of an object.
- "Top" and "Left" properties  
Change the position of an object.
- "ObjectName" property  
Read the name of a graphic object
- "Parent" property  
Set a reference to the parent screen

Use the ScreenItems property to return an object to the screen. Use the object name as an index.

## Example

In the following example, the background color of the "RootScreen" circle in the "myCircle" screen is set to green.

```
'VBS_Example_ScreenItems  
  
Dim objCircle  
Set objCircle = HMIRuntime.Screens("RootScreen").ScreenItems("myCircle")  
objCircle.BackColor = vbGreen
```

---

### Note

To save memory space in the HMI device, no object names are loaded during transfer of the project. If you still want to transfer object names, call up the Runtime settings for the respective HMI device in WinCC. You can change the setting under "General". The object name is required when the object should be accessed via the object name or for debugging a project.

---

The "ScreenItem" object has different properties depending on its features. The following properties are provided for every "ScreenItem" object:

- Enabled
- Height
- Left
- ObjectName
- Parent
- Top
- Type
- Visible
- Width

If a specific object type is addressed, further properties are added to the standard properties. The additional properties are provided in the descriptions of the individual object types.

## See also

Screen (Page 4231)

Screen object (list) (Page 4230)

ScreenItems (Page 4236)

## ScreenItems

### Description

A list of screen item objects with all screen objects of the given process screen. The list has a parent property. This property provides a reference to the process screen in which the screen object is located.

### Application

By means of the "ScreenItems" list you are able

- To edit or output all objects within the list (that is, all objects within a screen)
- To count the objects of a screen (property "Count").
- To work on a particular object in the list (method "Item").

Use the screen items property to return an object from the process screen. Use the object name as an index.

In the following example, the background color of the "RootScreen" circle in the "myCircle" screen is set to green.

```
Dim objCircle
Set objCircle = HMIRuntime.Screens("RootScreen").ScreenItems("myCircle")
objCircle.BackColor = vbGreen
```

## See also

Screen (Page 4231)

HMIRuntime (Page 4229)

Screen object (list) (Page 4230)

## SmartTags

### Description

A list of SmartTag objects which represent all of the tags in WinCC Runtime.

---

#### Note

The SmartTags list has a limited range of functions. You can only use the tag names to access a SmartTag object. Access via the index or by using "For each" instruction is not supported.

---

#### Note

In order to access a tag, which has still not been created in the project, using the SmartTags list, no value is returned. Assignment to a non-existing tag is not executed:

```
Dim intVar  
intVar = SmartTags("FillLevel")
```

"intVar" remains empty when the "FillLevel" tag has not been created.

---

## Application

Use the SmartTags list to return a SmartTag object. Use the tag name to reference the SmartTag object.

```
'VBS_Example_SmartTags
'Writes tag value to local tag and returns a user-defined text through the
operating system channel for debug alarms.
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(SmartTags("AirPressure"))
HMIRuntime.Trace strAirPressure
```

In Runtime Advanced and Panels you address the tag directly using its name. If the tag name corresponds to the VBS name conventions, you do not need to use the SmartTags list. Follow the example below:

```
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(AirPressure)
HMIRuntime.Trace strAirPressure
```

## See also

[Access to HMI tags \(Page 3879\)](#)

## SmartTag

## Description

Represents the value of the specified process tag. The SmartTag object is an element of the SmartTag list.

## Application

The SmartTag object provides read and write access to the value of the specified process tag. The SmartTag object does not return an object reference. Use the SmartTags list to return the value of a process tag. Use the tag name as an index.

---

### Note

With the "SmartTags reads values from the cache" setting, values are read from the process image (cache) instead of directly from the controller.

The SmartTag object can also read values directly from the controller. However, you can then expect a substantially higher communication load between the HMI device and the controller.

---

## Example

```
'VBS_Example_SmartTags
'Writes tag value to local tag and returns a user-defined text through the
operating system channel for debug alarms.
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(SmartTags("AirPressure"))
HMIRuntime.Trace strAirPressure
```

---

### Note

In order to access a tag, which has still not been created in the project, using the SmartTags list, no value is returned. Assignment to a non-existing tag is not executed:

```
Dim intVar
intVar = SmartTags("FillLevel")
```

"intVar" remains empty when the "FillLevel" tag has not been created.

---

### Note

If you want to return the "TypeName" of a SmartTag object data type with the VBS function "TypeName", use the following syntax:

```
TypeName(SmartTags("FillLevel").value)
```

---

Use "SmartTags("<tag>")(index)" to access the value of an array element. Set the number of the desired array element for "index", for example, "SmartTags("AirPressure")(2)".

## Objects

### Alarm

#### Description

The alarm object is used to access the Alarms object list.

---

**Note**

The properties of the alarm object are not automatically updated when the values of the properties change.

---

#### See also

Alarms (list) (Page 4241)

HMIRuntime (Page 4249)

Processvalue (Page 4789)

## Alarms (list)

### Description

Use the alarm object to trigger existing messages.

### Usage

Using the "Alarms" list you can:

- Access a message in the list (Item method)
- Create a new alarm object (Create method)
- Read the alarm ID of the message (AlarmID attribute)
- Read the status of a message (State property)
- Read the time stamp of the message (Timestamp property)
- Generate an instance of the alarm object (Instance property)
- Read the name of the computer on which the message came (ComputerName property)
- Read or set the name of the user who triggered the message (UserName property)
- Read or set the name of the process value blocks (ProcessValues property)
- Read or set the message commentary (Comment property)
- Read or set the message server prefix (Context property)

## Example

In the following example the alarm with the alarm number "1" configured in the "HMI alarms" editor is activated.

```
'VBS360
Dim MyAlarm
Set MyAlarm = HMIRuntime.Alarms(1)
MyAlarm.State = 5 'hmiAlarmStateCome + hmiAlarmStateComment
MyAlarm.Comment = "MyComment"
MyAlarm.UserName = "Hans-Peter"
MyAlarm.ProcessValues(1) = "Process Value 1"
MyAlarm.ProcessValues(4) = "Process Value 4"
MyAlarm.Create "MyApplication"
```

## See also

[AlarmID \(Page 4490\)](#)

[Processvalue \(Page 4789\)](#)

[Alarm \(Page 4239\)](#)

[HMIRuntime \(Page 4249\)](#)

## AlarmLogs (list)

## Description

You can use the object to reconnect swapped-out log segments of the alarm log to Runtime or to remove previously swapped-in log segments of the alarm log. The log segments to be

## 10.8 Working with system functions and Runtime scripting

swapped in are copied to the "Common logging" folder of the WinCC project. The previously swapped-in log segments are removed from the "Common logging" folder.

You use parameters to control the location from which log segments are to be swapped in. You specify the time period over which the log segments are to be swapped in or removed.

If an error occurs during the operation with log segments, the applied method returns an error alarm.

### Usage

- "Restore" method  
Previously swapped-out log segments of the alarm log are connected to Runtime.
- "Remove" method  
Previously swapped-in log segments of the alarm log are removed from the Runtime project.

### Example

In the following example, log segments from the alarm log are swapped in and the return value is output as a trace.

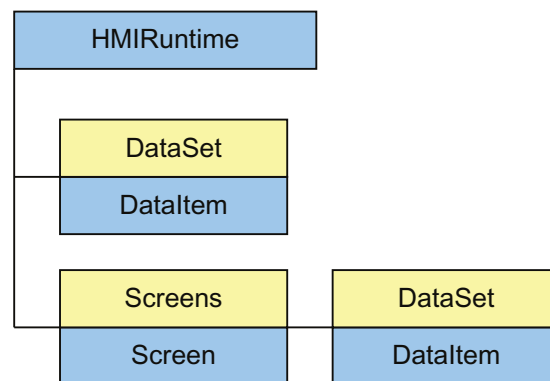

```
'VBS187
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.AlarmLogs.Restore("D:
\Folder","2004-09-14","2004-09-20",-1) & vbNewLine
```

### See also

- Restore (Page 5158)
- Remove (Page 5153)
- DataLogs (list) (Page 4245)
- Logging (Page 4254)

## Dataltem

### Description

You can use the Dataltem object to access the contents of the DataSet list. Values or object references are stored in the list as Dataltem.

Access uses the name under which the value was added to the list. Single access using an index is not recommended since the index changes during adding or deleting of values. You can use the index to output the complete contents of the list. The output is in alphabetical order.

---

#### Note

For object references, ensure that the objects are capable of multi-threading.

---

### Example

The example shows how the value of 'Motor1' is output as a trace.

```
'VBS163
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
```

The following example enumerates all Dataltem objects of the DataSet list. Name and value are output as a trace.

```
'VBS164
Dim data
For Each data In HMIRuntime.DataSet
```

```
HMIRuntime.Trace data.Name & ": " & data.Value & vbNewLine  
Next
```

---

**Note**

The value may not be output directly for objects.

---

**See also**

- Screen (Page 4257)
- HMIRuntime (Page 4249)
- DataSet (list) (Page 4247)
- Value (Page 5014)
- Name (Page 4744)
- Screen object (list) (Page 4263)

**DataLogs (list)**

**Description**

You can use the object to reconnect swapped-out log segments of the data log to Runtime or to delete previously swapped-in log segments of the data log. The log segments to be swapped in are copied to the "Common logging" folder of the WinCC project. The previously swapped-in log segments are removed from the "Common logging" folder.

You use parameters to control the location from which log segments are to be swapped in. You specify the time period over which the log segments are to be swapped in or removed. You also set the type of log ("Fast data log", "Slow data log", "Fast data log and Slow data log").

If an error occurs during the operation with log segments, the applied method returns an error alarm.

## Usage

- "Restore" method  
Previously swapped out log segments of the data log are connected to Runtime.
- "Remove" method  
Previously swapped-in log segments of the data log are removed from the Runtime project.

## Example

In the following example, log segments from the Fast data log are swapped in and the return value is output as a trace.

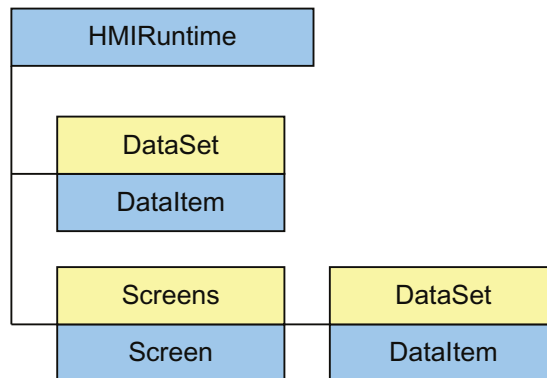

```
'VBS188  
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.DataLogs.Restore("D:  
\Folder", "2004-09-14", "2004-09-20", -1, 1) & vbNewLine
```

## See also

[Logging \(Page 4254\)](#)

## DataSet (list)

### Description

Using the DataSet object, you can exchange data throughout several actions.

A DataSet object is global and defined by the screen object. You can access the data from any VBS action.

You address the screen object according to the screen hierarchy . The DataSet object persists as long as the screen is displayed. The global object persists over the entire runtime time period.

Access uses the Dataltem object.

---

#### Note

You cannot include objects with the types Screen, Screens, ScreenItem, ScreenItems, Tag and TagSet in the DataSet list.

The DataSet object does not support any classes.

---

### Usage

Use the "DataSet" list as follows:

- Enumeration  
Output or process all objects in the list
- "Count" property  
Output the number of elements contained

- "Item" method  
Work on a particular object in the list
- "Add" method  
Add an object to the list
- "Remove" method  
Remove a particular object from the list
- "RemoveAll" method  
Remove all objects from the list

Access to list elements is made as follows:

```
HMIRuntime.DataSet("Itemname")
```

For a picture-specific list, access is performed as follows:

```
HMIRuntime.Screens("Screenname").DataSet("Itemname")
```

You access the DataSet object of the screen as follows:

```
DataSet("Itemname")
```

If upon access the stated name does not exist in the list, VT\_Empty is returned and an Exception is triggered.

## Example

The example shows how a value can be entered in the list, read and removed from the list throughout various actions.

```
'VBS162  
HMIRuntime.DataSet.Add "motor1", 23  
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine  
HMIRuntime.DataSet.Remove("motor1")
```

Screen object (list) (Page 4263)

## HMIRuntime

### Description

The HMIRuntime object represents the graphic Runtime environment.

## Usage

You can use the "HMIRuntime" object as follows:

- "Language" property  
Read or set the current Runtime language
- "BaseScreenName" property  
Read or set the name of the current root screen
- "ActiveProject" property  
Read the path of the active Runtime project
- "Tags" property  
Accessing tags
- "DataSet" property  
Accessing tags in a list
- "Stop" method  
Stop Runtime
- "Trace" method  
Display messages in a diagnostics window

## Example

The following command closes WinCC Runtime:

```
'VBS3  
HMIRuntime.Stop
```

## See also

- DatalItem (Page 4243)
- Screen (Page 4257)
- Screen object (list) (Page 4263)
- ActiveScreen (Page 4480)

## Item

### Description

The Item object provides a reference to the current object.

### Usage

Use the Item object, for example, to address the properties of the object currently selected in the screen.

### Example

In the following example, you set the background color of the object selected in the screen to red:

```
'VBS195  
Item.BackColor = RGB(255,0,0)
```

## Layer

### Description

The Layer object returns the result of access to the layers list.

### Parent object

Screen in which the screen layer is located

### Usage

Depending on certain events, you can use the Layer object to obtain access to the properties of a complete layer to hide or display a layer with operating elements according to the operator authorization.

You can use the "Layer" object as follows:

- "Visible" property  
Activate or deactivate visibility of a layer
- "Name" property  
Read the name of a layer

---

#### Note

The layer property specifies the layer in which the object is located. The layer "0" is output as layer "0".

When accessed, the layers are counted up from 1 in VBS. Therefore, address level "1" with "Layers(2)".

---

### Example

In the following example, Layer 1 is set to "invisible":

```
'VBS4  
Layers(2).Visible = vbFalse
```

### See also

- Name (Page 4744)
- Layers (list) (Page 4253)
- Screen (Page 4257)
- Screen object (list) (Page 4263)

### Layers (list)

### Description

Use the layers list to access all 32 layers of the graphical Runtime system.

### Parent object

Screen in which the screen layer is located

## Usage

You use the "Layers" list as follows:

- "\_NewEnum" property  
Process all layers in the list
- "Count" property  
Count all layers contained in the list
- "Item" method  
Process a layer from the list

The properties represent default properties and methods of a list and are not described in detail in the WinCC documentation.

## See also

Item (Page 5134)

Layer (Page 4251)

Screen (Page 4257)

Screen object (list) (Page 4263)

## Logging

## Description

You can use the object to reconnect swapped-out log segments to Runtime or to remove previously swapped-in log segments. The log segments to be swapped in are copied to the "Common logging" folder of the WinCC project. The previously swapped-in log segments are removed from the "Common logging" folder.

## 10.8 Working with system functions and Runtime scripting

You use parameters to control the location from which log segments are to be swapped in. You specify the time period over which the log segments are to be swapped in or removed.

If an error occurs during the operation with log segments, the applied method returns an error alarm.

### Usage

- "Restore" method  
Previously swapped out log segments of the alarm log and the data log are connected to Runtime.
- "Remove" method  
Previously swapped-in log segments of the alarm log and data log are removed from the Runtime project.

### Example

In the following example, log segments from the alarm log and data log are swapped in and the return value is output as a trace.

```
'VBS189
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Restore("D:
\Folder", "2004-09-14", "2004-09-20", -1) & vbNewLine
```

## Project

## Description

Using the object, you can query information from the current Runtime project.  
The project object is returned as the result of ActiveProject.

## Usage

You can read the following using the "Project" object:

- The path of the current Runtime project ("Path" property)
- The name of the current Runtime project, without path or file extension ("Name" property)

## Example

The following example returns name and path of the current Runtime project as a trace:

```
'VBS159
HMIRuntime.Trace "Name: " & HMIRuntime.ActiveProject.Name & vbNewLine
HMIRuntime.Trace "Path: " & HMIRuntime.ActiveProject.Path & vbNewLine
```

## See also

[ActiveProject \(Page 4480\)](#)

[Name \(Page 4744\)](#)

[Path \(Page 4774\)](#)

## Screen

### Description

Represents the screen which is being displayed on the HMI device at the moment or the permanent window in Runtime. The screen object is returned as a result of accessing the screen list.

The screen object also contains the following lists:

- You can address all the graphic objects in the addressed screen using the "ScreenItems" list.
- You can address all the layers in the addressed screen using the "Layers" object.

### Application

You can use the screen object for the following actions, for example:

- "Width" and "Height" properties  
Reading the width and height of a screen
- "BackColor" property  
Changing the background color

Use the object name as an index.

### Example

In the following example, the background color is changed from black to green:

```
'VBS_Example_BackColor
```

```
HMIRuntime.Screens("Rootscreen").BackColor = vbGreen
```

## Parent object

Screen window in which the screen object is embedded.

If the screen object is the root screen, the parent object is not defined and set to zero.

---

### Note

If you perform a screen change, the open references to screens that are no longer available will become invalid. As a result, it is no longer possible to work with these references.

---

## Example

In the following example, the width of the first screen is increased by 20 pixels in Runtime:

```
'VBS7
Dim objScreen
Set objScreen = HMIRuntime.Screens(1)
MsgBox "Screen width before changing: " & objScreen.Width
objScreen.Width = objScreen.Width + 20
MsgBox "Screen width after changing: " & objScreen.Width
```

## Notes on Cross References

All the screens you address with the standard formulation are automatically compiled by the CrossReference of WinCC and then listed in the screen properties.

```
HMIRuntime.BaseScreenName = "Screenname"
```

If you call screens with different formulations in the code, you make them known by the following section of the CrossReference:

```
' ' WINCC:SCREENNAME_SECTION_START
Const ScreenNameInAction = "ScreenName"
' WINCC:SCREENNAME_SECTION_END
The section can be inserted in VBS actions as often as required.
```

## See also

- Layers (Page 4691)
- DataSet (Page 4591)
- ExtendedZoomingEnable (Page 4620)
- AccessPath (Page 4478)
- HMIRuntime (Page 4248)
- ScreenItems (list) (Page 4261)
- Screen object (list) (Page 4263)

## ScreenItem

### Description

Represents an object in the specified screen. The ScreenItem object is an element of the ScreenItems list.

### Application

You can use the ScreenItem object to access the properties of graphic objects within a screen, depending on certain events.

You use the "ScreenItem" object as follows, for example:

- "Visible" property  
Switch the visibility of an object on or off.
- "Height" and "Width" properties  
Query the width and height of an object.
- "Top" and "Left" properties  
Change the position of an object.
- "ObjectName" property  
Read the name of a graphic object
- "Parent" property  
Set a reference to the parent screen

Use the ScreenItems property to return an object to the screen. Use the object name as an index.

## Example

In the following example, the background color of the "RootScreen" circle in the "myCircle" screen is set to green.

```
'VBS_Example_ScreenItems  
  
Dim objCircle  
Set objCircle = HMIRuntime.Screens("RootScreen").ScreenItems("myCircle")  
objCircle.BackColor = vbGreen
```

---

### Note

To save memory space in the HMI device, no object names are loaded during transfer of the project. If you still want to transfer object names, call up the Runtime settings for the respective HMI device in WinCC. You can change the setting under "General". The object name is required when the object should be accessed via the object name or for debugging a project.

---

The "ScreenItem" object has different properties depending on its features. The following properties are provided for every "ScreenItem" object:

- Enabled
- Height
- Left
- ObjectName
- Parent
- Top
- Type

- Visible
- Width

If a specific object type is addressed, further properties are added to the standard properties. The additional properties are provided in the descriptions of the individual object types.

### See also

Activate (Page 5068)

Layer (Page 4681)

Screen (Page 4256)

ScreenItems (list) (Page 4261)

Screen object (list) (Page 4263)

### ScreenItems (list)

#### Description

A list of ScreenItem objects with all screen objects of the specified screen. The list has a "Parent" property. This "Parent" property provides a reference to the screen in which the screen object is located.

## Usage

You use the "ScreenItems" list as follows:

- To edit or output all objects within the list (that is, all objects within a screen)
- "Count" property  
Count the objects of a screen
- "Item" method  
Work on a particular object in the list

Use the screen items property to return an object from the screen. Use the object name as an index.

## Example

In the following example, the background color of the "RootScreen" circle in the "myCircle" screen is set to green.

```
Dim objCircle
Set objCircle = HMIRuntime.Screens("RootScreen").ScreenItems("myCircle")
objCircle.BackColor = vbGreen
```

## Peculiarities of the ScreenItem object

If you embed an external control (ActiveX control or OLE object) in WinCC, the properties of the embedded control may have the same names as the general properties of the ScreenItem object. In this case, the ScreenItem properties take priority.

You can address the properties of the embedded controls, however, via the "object" property. The "object" property is only available in ActiveX controls and OLE objects.

Example:

```
'Controll is an embedded ActiveX-Control with property "type"
'VBS196
Dim Control
Set Control=ScreenItems("Controll")
Control.object.type

'Controll is a WinCC-Control
'VBS197
Dim Control
Set Control=ScreenItems("Controll")
Control.type
```

## Example

In the following example, you output the name of the objects in the current screen in a message box:

```
Sub OnClick(ByVal Item)
  'VBS6
  Dim lngAnswer
  Dim lngIndex
  lngIndex = 1
  For lngIndex = 1 To ScreenItems.Count
    lngAnswer = MsgBox(ScreenItems(lngIndex).Objectname, vbOKCancel)
    If vbCancel = lngAnswer Then Exit For
  Next
End Sub
```

## See also

- [Item \(Page 5134\)](#)
- [ScreenItem \(Page 4258\)](#)
- [Screen \(Page 4256\)](#)
- [Screen object \(list\) \(Page 4263\)](#)

## Screen object (list)

### Description

Several screens can be opened simultaneously in WinCC Runtime by means of the screen window technique, whereby there is only one main screen. The "Screens" list allows access to all open screens in Runtime using the screen name. The screen list contains all hidden screens.

The access key required in the VBS environment in the HMIRuntime.Screens(<access key>) instruction must conform to the following syntax description:

```
[<Root screen name>.]<Screen window name>[:<Screen name>] ...  
.<Screen window name>[:<Screen name>]
```

- The access key represents the screen hierarchy.
- You can omit the screen name at all locations in the key.
- The "AccessPath" property of the "Screen" object corresponds to the full access key.
- The root screen can be addressed via the "" access key.

## Examples

The screens are addressed by specifying the hierarchy in the list. You can address the screens with or without using the screen names. In the following example, a "BaseScreenName" root screen is configured with a "ScreenWindow". The screen window contains a "ScreenName" screen.

### Addressing using the screen name

```
'VBS8  
Set objScreen = HMIRuntime.Screens("BaseScreenName.ScreenWindow:ScreenName")
```

### Addressing without using the screen name

```
'VBS9  
Set objScreen = HMIRuntime.Screens("ScreenWindow")
```

### Referencing the root screen in various ways

```
'VBS10  
Set objScreen = HMIRuntime.Screens(1)
```

```
'VBS11  
Set objScreen = HMIRuntime.Screens("")
```

```
'VBS12  
Set objScreen = HMIRuntime.Screens("BaseScreenName")
```

### See also

HMIRuntime (Page 4248)

Screen (Page 4256)

ScreenItem (Page 4258)

### SmartTag

### Description

Represents the value of the specified process tag. The SmartTag object is an element of the SmartTag list.

### Application

The SmartTag object provides read and write access to the value of the specified process tag. The SmartTag object does not return an object reference. Use the SmartTags list to return the value of a process tag. Use the tag name as an index.

---

#### Note

With the "SmartTags reads values from the cache" setting, values are read from the process image (cache) instead of directly from the controller.

The SmartTag object can also read values directly from the controller. However, you can then expect a substantially higher communication load between the HMI device and the controller.

---

## Example

```
'VBS_Example_SmartTags
'Writes tag value to local tag and returns a user-defined text through the
operating system channel for debug alarms.
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(SmartTags("AirPressure"))
HMIRuntime.Trace strAirPressure
```

---

### Note

In order to access a tag, which has still not been created in the project, using the SmartTags list, no value is returned. Assignment to a non-existing tag is not executed:

```
Dim intVar
intVar = SmartTags("FillLevel")
```

"intVar" remains empty when the "FillLevel" tag has not been created.

---

### Note

If you want to return the "TypeName" of a SmartTag object data type with the VBS function "TypeName", use the following syntax:

```
TypeName(SmartTags("FillLevel").value)
```

---

Use "SmartTags("<tag>")(index)" to access the value of an array element. Set the number of the desired array element for "index", for example, "SmartTags("AirPressure")(2)".

## See also

[HMIRuntime \(Page 4248\)](#)

[SmartTags \(Page 4267\)](#)

## SmartTags

### Description

A list of SmartTag objects which represent all of the tags in WinCC Runtime.

---

#### Note

The SmartTags list has a limited range of functions. You can only use the tag names to access a SmartTag object. Access via the index or by using "For each" instruction is not supported.

---

#### Note

In order to access a tag, which has still not been created in the project, using the SmartTags list, no value is returned. Assignment to a non-existing tag is not executed:

```
Dim intVar  
intVar = SmartTags("FillLevel")
```

"intVar" remains empty when the "FillLevel" tag has not been created.

---

### Application

Use the SmartTags list to return a SmartTag object. Use the tag name to reference the SmartTag object.

```
'VBS_Example_SmartTags  
'Writes tag value to local tag and returns a user-defined text through the  
operating system channel for debug alarms.
```

```
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(SmartTags("AirPressure"))
HMIRuntime.Trace strAirPressure
```

In Runtime Advanced and Panels you address the tag directly using its name. If the tag name corresponds to the VBS name conventions, you do not need to use the SmartTags list. Follow the example below:

```
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(AirPressure)
HMIRuntime.Trace strAirPressure
```

## See also

HMIRuntime (Page 4248)

SmartTag (Page 4264)

## Tag

## Description

A tag object is returned via the "Tags" list. A tag object can be used to address all the properties and methods of a tag.

When creating a tag object, all the properties are initialized with the following values:

- Value = VT\_EMPTY
- Name = Tag name

- QualityCode = BAD NON-SPECIFIC
- TimeStamp = 0
- LastError = 0
- ErrorDescription = " "

---

**Note**

A summary of possible Quality Codes can be found in WinCC Information System under key word "Communication" > "Diagnostics" or "Communication" > "Quality Codes".

---

## Usage

Use the "Tag" object as follows:

- "Name", "QualityCode", "TimeStamp", "LastError" and "ErrorDescription" properties  
Read information on the tag
- "Write" method, "Value" property  
Set a value for a tag
- "Read" method, "Value" property  
Read a value for a tag

## Example

The following example reads the value in the "Tag1" tag:

```
'VBS13
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read()
MsgBox objTag.Value
```

## Declaration of tags in WinCC

Always define internal tags in VB script using the "Dim" instruction in order to prevent writing tags wrongly.

When creating a new action, the "Option explicit" instruction is automatically entered in the declaration area and cannot be deleted.

Do not use the "Option explicit" statement in your code as it can lead to Runtime errors.

## Example

The following example reads the declaration value in the "IngVar" VB Script tag:

```
'VBS14
```

```
Dim lngVar  
lngVar = 5  
MsgBox lngVar
```

---

**Note**

Tag names must not contain any special characters.

When creating a tag, ensure it does not contain a value (Value = VT\_EMPTY). Initialize the tags after declaration with the corresponding value.

---

**Notes on Cross References**

All the pictures which are addressed with the standard formulation

```
HMIRuntime.Tags("Tagname")
```

are automatically compiled by the CrossReference of WinCC and then listed in the picture properties.

If you address tags with different formulations in the code, you can make them known by the following section of the CrossReference:

```
' ' WINCC:TAGNAME_SECTION_START  
Const TagNameInAction = "TagName"  
' WINCC:TAGNAME_SECTION_END
```

The section can be inserted in VBS actions as often as required.

---

**Note**

Composed tag names may not be recognized by the CrossReference.

Tags (list) (Page 4271)

TagSet (list) (Page 4272)

## Tags (list)

### Description

The "Tags" list enables access to tags in WinCC Runtime. The result of access to the "Tags" list is returned by an object of the type "Tag". The Tag object can be used to access all the tag properties and methods.

---

#### Note

"Tags" is a list with a restricted functional scope. The tags in the list cannot be accessed via the index but only by using the tag names. The standard methods `get_Count` and `get_NewEnum` cannot be used in the Tags list.

---

### Application

Tags in the list are accessed via:

```
HMIRuntime.Tags ("Tagname")
```

The Tags list is used to declare tags (tag objects) for read and write access. The appropriate HMI tags must exist in order for the write and read access to be executed without error.

You can address HMI tags directly in VBScript and set and read values. If you wish to inquire about additional tag properties, such as quality code or time stamp, or wish to execute error processing, you must address the tag through tags list. The tag object returned enables access to all tag properties and methods.

Using the "CreateTagSet" method, you may generate a TagSet object which allows simultaneous access to several tags.

## Example

You use tag names when you set tags.

```
'VBS16
Dim objTag
Set objTag = HMIRuntime.Tags("Tagname")
If you only use the tag name, the "TagPrefix" property is assigned the values from the
current context (the current screen window).
```

[Tag \(Page 4267\)](#)

[TagSet \(list\) \(Page 4272\)](#)

## TagSet (list)

### Description

The "TagSet" object enables simultaneous access to several tags in one call. Simultaneous access demonstrates better performance and lower communication load than single access to multiple tags.

### Usage

You can use the TagSet object as follows:

- "Add" method  
Add tags to the list
- "Item" method  
Access tag objects contained in the list and their properties
- "Write" method  
Write all tags of the list
- "Read" method  
Read all tags of the list

- "Remove" method  
Remove single tags from the list
- "RemoveAll" method  
Remove all tags from the list

Tags in the list are accessed via:

```
'VBS169
Dim myTags
myTags = HMIRuntime.Tags.CreateTagSet
myTags("Tagname")
```

In order to have error-free read/write access to tags (tag objects) of the list, the respective tags must exist in WinCC.

If a read/write access error has occurred, the method used will return an error message using the "LastError" and "ErrorDescription" properties.

## Example

The following example shows how to generate a TagSet object, how to add tags, and how to write values.

```
'VBS168
'Build a Reference to the TagSet Object
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
'Add Tags to the Collection
group.Add "Motor1"
group.Add "Motor2"
'Set the Values of the Tags
group("Motor1").Value = 3
group("Motor2").Value = 9
'Write the Values to the DataManager
group.Write
```

## Object types

### Objects A-I

#### AlarmControl

### Description

Represents the "Alarm view" object. The AlarmControl object is an element of the ScreenItems list.

### Type identifier in VBS

HMIAlarmControl

### Example

In the following example, the object with the name "Control1" is moved 10 pixels to the right:

```
'VBS54
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left + 10
```

P	RT Professional

Table 10-19 Properties

Properties	Read	Write	Description
Activate (Page 4478)	P	P	Specifies whether the data to be visualized is requested by the alarm server.
AlarmListType	P	P	Specifies the alarm classes to be reported in runtime.
AllServer	P	P	Sets the display of the alarms of all available servers.
ApplyProjectSettings (Page 4501)	P	P	Specifies whether the project settings from the "HMI alarms" editor are applied.
ApplyProjectSettingsForDesignMode	P	P	Specifies that the project settings are used for the design.
AutoCompleteColumns (Page 4505)	P	P	Specifies whether empty columns are shown if the control is wider than the configured columns.
AutoCompleteRows (Page 4506)	P	P	Specifies whether empty rows are shown if the control is longer than the number of configured rows.
AutoSelectionColors (Page 4507)	P	P	Specifies whether the colors defined by the system are used as the selection colors for cells and rows.
AutoSelectionRectColor (Page 4508)	P	P	Specifies whether the selection frame is shown with the color defined by the system.
BackColor (Page 4510)	P	P	Specifies the background color of the selected object.
Blocks	P	P	Sets the alarm blocks.
BorderColor (Page 4530)	P	P	Specifies the line color of the object.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
Caption (Page 4549)	P	P	Specifies the text that is displayed in the header of the selected object.
CellCut (Page 4553)	P	P	Specifies whether the contents of the cells are abbreviated if the cells are too narrow.
CellSpaceBottom (Page 4554)	P	P	Specifies the bottom margin of the table cells.
CellSpaceLeft (Page 4555)	P	P	Sets the left indent for the table cells.
CellSpaceRight (Page 4555)	P	P	Specifies the right indent of the table cells.
CellSpaceTop (Page 4556)	P	P	Specifies the top margin of the table cells.
Closeable (Page 4564)	P	P	Specifies that the control can be closed in runtime.
ColumnResize (Page 4570)	P	P	Enables changes to the width of columns.
ColumnScrollbar (Page 4572)	P	P	Specifies the scroll bar type.
ColumnTitleAlignment (Page 4573)	P	P	Specifies the type of column title alignment.
ColumnTitles (Page 4573)	P	P	Specifies whether the column title is displayed.
ControlDesignMode (Page 4865)	P	P	Specifies the design.
DefaultMsgFilterSQL	P	P	Specifies an SQL statement as default for alarm filters.
DefaultSort	P	P	Specifies the sorting order.

Properties	Read	Write	Description
DefaultSort2	P	P	Specifies the sorting order.
DefaultSort2Column	P	P	Specifies the sorting order.
DisplayOptions (Page 4596)	P	P	Specifies the alarms to be displayed.
DoubleClickAction (Page 4597)	P	P	Specifies the action to be executed in runtime by double-clicking an alarm row.
ExportDirectoryChangeable (Page 4614)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 4614)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 4615)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 4615)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 4616)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 4617)	P	P	Default assignment of the ID number and export provider.
ExportFormatName (Page 4617)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 4618)	P	P	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 4618)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportShowDialog (Page 4619)	P	P	Specifies whether the data export dialog is shown in runtime.
Filters	P	P	Specifies database criteria in SQL syntax.
Font (Page 4639)	P	P	Specifies or returns the font.
GridLineColor (Page 4651)	P	P	Specifies the color for the grid lines.
GridLineWidth (Page 4652)	P	P	Specifies the width of the separation lines in pixels.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HitlistColumnAdd (Page 4658) *	P	P	Transfers the selected alarm block from the list of available alarm blocks to the list of selected alarm blocks.
HitlistColumnCount (Page 4659) *	P	P	Sets the number of selected alarm blocks to be displayed in the hitlist in runtime.
HitlistColumnIndex (Page 4659)	P	P	References an alarm block that is selected for the hitlist.
HitlistColumnName (Page 4660) *	P	P	Displays the name of the alarm block of the hitlist that is referenced by means of the "HitlistColumnIndex" attribute.
HitlistColumnRemove (Page 4660) *	P	P	Cuts the marked alarm block from the list of selected alarm blocks and pastes it into the list of existing alarm blocks.
HitlistColumnRepos (Page 4660) *	P	P	Changes the sorting order of the alarm blocks. The "Up" and "Down" commands move the selected alarm block accordingly in the list.
HitlistColumnSort (Page 4661) *	P	P	Specifies the sorting order in the hitlist for the alarm block that is referenced in "MessageColumnIndex".
HitlistColumnSortIndex (Page 4661) *	P	P	Specifies the sorting order in the hitlist for the alarm block that is referenced in "HitlistColumnIndex".
HitlistColumnVisible (Page 4662) *	P	P	The list displays the selected alarm blocks from the alarm list or hitlist that are to be used in the control in runtime.

10.8 Working with system functions and Runtime scripting

Properties	Read	Write	Description
HitListDefaultSort (Page 4662)	P	P	Sets the default sorting order in the table columns of the hitlist.
HitListMaxSourceItems (Page 4663)	P	P	Sets the maximum number of data records from the alarm log that are to be used to create the hit list.
HitListMaxSourceItemsWarn (Page 4663)	P	P	Sets the output of a warning on reaching the maximum number of data records that was specified in "HitlistMaxSourceItems".
HitListRelTime (Page 4665)	P	P	Sets a time range for the statistics.
HitListRelTimeFactor	P	P	Sets the time factor that is used in combination with the "HitlistRelativeTimeFactorType" to calculate the period for creating the hitlist statistics.
HitListRelTimeFactorType	P	P	Sets the time type that is used in combination with the "HitlistRelativeTimeFactor" to calculate the period for creating the hitlist statistics.
HorizontalGridLines (Page 4667)	P	P	Specifies whether horizontal separation lines are displayed.
IconSpace (Page 4670)	P	P	Specifies the spacing between icons and text in the table cells.
Layer (Page 4681)	P	P	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 4706)	P	P	Sets the color of the window separation lines.
LineWidth (Page 4708)	P	P	Specifies the line thickness of the selected object.
LongTermArchiveConsistency (Page 4714)	P	P	If "LongTimeArchiveConsistency" is set to "No", 1000 alarms will be displayed in the historical alarm list (long-term) on the single station, on the server, or on the client for each server or redundant server pair.
MessageBlockAlign (Page 4723) *	P	P	Sets the mode of alignment for the table contents of the selected alarm block.
MessageBlockAutoPrecisions (Page 4724) *	P	P	Enables automatic setting of the number of decimal places.
MessageBlockCaption (Page 4725) *	P	P	Specifies the caption of the column header in the alarm view for the selected alarm block.
MessageBlockCount (Page 4725)	P	P	Specifies the number of alarm blocks that are available for the alarm list and hitlist.
MessageBlockDateFormat (Page 4725) *	P	P	Specifies the date format for displaying the alarms.
MessageBlockExponentialFormat (Page 4726) *	P	P	Specifies the exponential notation for visualization of the values of a selected alarm block.
MessageBlockFlashOn (Page 4727) *	P	P	Enables flashing of the selected alarm block in runtime when an alarm appears.
MessageBlockHideText (Page 4727) *	P	P	Enables the textual display of the content of the selected alarm block.
MessageBlockHideTitleText (Page 4728) *	P	P	Specifies textual display of the caption of the selected alarm block.
MessageBlockId (Page 4728)	P	P	Specified assignment of ID number and alarm block in the alarm view.
MessageBlockIndex (Page 4729)	P	P	References an existing alarm block.
MessageBlockLeadingZeros (Page 4729) *	P	P	Enables the display of the selected alarm block with leading zeroes.
MessageBlockLength (Page 4730) *	P	P	Specifies the length of the selected alarm block based on the number of characters.

Properties	Read	Write	Description
MessageBlockName (Page 4730)	P	P	Displays the name of the selected alarm block.
MessageBlockPrecision (Page 4731) *	P	P	Specifies the number of decimal places for the values of the selected alarm block.
MessageBlockSelected (Page 4731) *	P	P	Existing alarm blocks are blocks that are available for use in the control in runtime for the alarm list or hitlist.
MessageBlockShowDate (Page 4732) *	P	P	Specifies whether to display both the date and time in the "Time" alarm block.
MessageBlockShowIcon (Page 4732) *	P	P	Enables the display of the content of the selected alarm block as icon.
MessageBlockShowTitleIcon (Page 4733) *	P	P	Specifies textual display of the caption of the selected alarm block.
MessageBlockTextId (Page 4733)	P	P	Specifies naming of the selected alarm block by means of a text ID that was taken from the text library.
MessageBlockTimeFormat (Page 4734) *	P	P	Specifies the format for the time or period used to display the alarms.
MessageColumnAdd (Page 4735) *	P	P	Adds the selected alarm block from the list of available alarm blocks to the list of selected alarm blocks.
MessageColumnCount (Page 4736) *	P	P	Specifies the number of alarm blocks to be displayed in the alarm list in runtime.
MessageColumnIndex (Page 4736)	P	P	References an alarm block selected for the alarm list.
MessageColumnName (Page 4737) *	P	P	Shows the name of the alarm block from the alarm list, which is referenced by means of the "MessageColumnIndex" property.
MessageColumnRemove (Page 4737) *	P	P	Cuts the marked alarm block from the list of selected alarm blocks and pastes it into the list of existing alarm blocks.
MessageColumnRepos (Page 4738) *	P	P	Changes the sorting order of the alarm blocks. The "Up" and "Down" commands move the selected alarm block accordingly in the list.
MessageColumnSort (Page 4738) *	P	P	Specifies the sorting order for the alarm block that is referenced in "MessageColumnIndex" .
MessageColumnSortIndex (Page 4739) *	P	P	Specifies the sorting order for the alarm block that is referenced in "MessageColumnIndex".
MessageColumnVisible (Page 4739) *	P	P	The list shows the selected alarm blocks of the alarm list or hitlist that are used in the alarm view in runtime.
Moveable (Page 4743)	P	P	Specifies whether the window can be moved in runtime.
MsgFilterSQL (Page 4744)	P	P	Specifies one or several SQL statements for user-defined selection of the alarms.
Name (Page 4744)	P	P	Returns the object name as STRING.
OperatorAlarms	P	P	Specifies the operator message settings.
OperatorMessageId (Page 4757) *	P	P	Default assignment of the ID number and trigger event in the alarm view.
OperatorMessageIndex (Page 4758) *	P	P	References the operator message event.
OperatorMessageName (Page 4759) *	P	P	On alarm events, this displays the name that is referenced by means of "OperatorMessageIndex" for operator alarms.
OperatorMessageNumber (Page 4759) *	P	P	Specify an alarm number for the operator message of the selected alarm event if you do not use the operator message of WinCC.

Properties	Read	Write	Description
OperatorMessageSelected (Page 4760) *	P	P	Activate the alarm events of the list that trigger operator messages.
OperatorMessageSource1 (Page 4760) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 1" of the operator message configured in Source.
OperatorMessageSource10 (Page 4765) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 10" of the operator message configured in Source.
OperatorMessageSource2 (Page 4761) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 2" of the operator message configured in Source.
OperatorMessageSource3 (Page 4761) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 3" of the operator message configured in Source.
OperatorMessageSource4 (Page 4762) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 4" of the operator message configured in Source.
OperatorMessageSource5 (Page 4762) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 5" of the operator message configured in Source.
OperatorMessageSource6 (Page 4763) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 6" of the operator message configured in Source.
OperatorMessageSource7 (Page 4763) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 7" of the operator message configured in Source.
OperatorMessageSource8 (Page 4764) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 8" of the operator message configured in Source.
OperatorMessageSource9 (Page 4764) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 9" of the operator message configured in Source.
OperatorMessageSourceType1 (Page 4765) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType10 (Page 4770) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType2 (Page 4766) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType3 (Page 4766) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType4 (Page 4767) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType5 (Page 4767) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType6 (Page 4768) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType7 (Page 4768) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType8 (Page 4769) *	P	P	Specifies the format of the source content to be transferred.

Properties	Read	Write	Description
OperatorMessageSourceType9 (Page 4769) *	P	P	Specifies the format of the source content to be transferred.
PageMode (Page 4771)	P	P	Sets the page orientation (portrait / landscape).
PageModeMessageNumber (Page 4772)	P	P	Defines the number of alarm shown per page when paging the historical alarm list (long-term).
PrintJob	P	P	Specifies a print job
RowScrollbar (Page 4802)	P	P	Specifies whether row scroll bars are displayed.
RowTitleAlignment	P	P	Specifies the type of row title alignment.
RowTitles	P	P	Specifies that row headers will be displayed.
RTPersistence (Page 4804)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistenceAuthorization (Page 4805)	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 4805)	-	-	Specifies how online configurations of WinCC are retained.
SelectedCellColor (Page 4820)	P	P	Specifies the background color of the selected cell.
SelectedCellForeColor (Page 4821)	P	P	Specifies the font color of the selected cell.
SelectedRowColor (Page 4822)	P	P	Specifies the background color of the selected row.
SelectedRowForeColor (Page 4822)	P	P	Specifies the font color of the selected row.
SelectedTitleColor (Page 4823)	P	P	Specifies the background color of a selected table header.
SelectedTitleForeColor (Page 4824)	P	P	Specifies the font color of the selected table header.
SelectionColoring (Page 4826)	P	P	Specifies whether selection colors are used for cells or rows.
SelectionRect (Page 4829)	P	P	Specifies whether a selection frame is used for the selected cells or rows.
SelectionRectColor (Page 4830)	P	P	Specifies the color of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionRectWidth (Page 4831)	P	P	Specifies the line width of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionType (Page 4831)	P	P	Specifies the number of lines you can mark.
ServerNames (Page 4835)	P	P	Specifies the servers of a distributed system that form the data source for the alarm view.
ShowSortButton (Page 4855)	P	P	Specifies whether the sorting button is shown above the vertical scroll bar.
ShowSortIcon (Page 4856)	P	P	Specifies whether the sorting icon is displayed.
ShowSortIndex (Page 4857)	P	P	Specifies whether the sorting icon is displayed.
ShowTitle (Page 4861)	P	P	Specifies the representation of the control's window title.
Sizeable (Page 4865)	P	P	Specifies that the size of an object can be changed in runtime.
SortSequence (Page 4869)	P	P	Specifies how the sorting order can be changed by mouse click.
StatusbarBackColor (Page 4874)	P	P	Specifies the background color of the status bar.
StatusbarElementAdd (Page 4874) *	P	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 4875) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 4875) *	P	P	Specifies the number of configurable status bar elements.

Properties	Read	Write	Description
StatusbarElementIconId (Page 4876) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 4876) *	P	P	Unique ID of the selected status bar element.
StatusbarElementIndex (Page 4877)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.
StatusbarElementName (Page 4877) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 4877) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 4878) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 4878)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText *	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 4879) *	P	P	Specifies the tooltip text for the user-defined status bar element.
StatusbarElementUserDefined (Page 4879) *	P	P	Indicates whether the project engineer has added the toolbar button as a new user-defined element.
StatusbarElementVisible (Page 4880) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.
StatusbarElementWidth (Page 4880) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 4881)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 4883)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 4884)	P	P	Default text in the status bar.
StatusbarUseBackColor (Page 4884)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 4885)	P	P	Specifies whether the status bar of the control is displayed.
TableColor	P	P	Specifies the background color of the rows. Use this to open the color selection dialog.
TableColor2	P	P	Specifies the background color of "Row color 2".
TableForeColor	P	P	Specifies the font color of "Row color".
TableForeColor2	P	P	Specifies the font color of "Row color 2".
TimeBase (Page 4910)	P	P	Sets the timebase.
TitleColor	P	P	Specifies the color of the header.
TitleCut	P	P	Specifies whether the contents of the fields of a header should be abbreviated if the column is too narrow.
TitleDarkShadowColor	P	P	Specifies the color of the dark side of shading.
TitleForeColor	P	P	Specifies the font color of the table header for the selected status.
TitleGridLineColor	P	P	Specifies the color of separation lines in the table header.
TitleLightShadowColor	P	P	Specifies the color of the bright side of shading.
TitleSort	P	P	Specifies how sorting by column title is triggered.

Properties	Read	Write	Description
TitleStyle	P	P	Specifies whether a shading color is used for the table header.
ToolBarAlignment	P	P	Specifies or returns the position of the toolbar.
ToolBarBackColor	P	P	Specifies the background color of the toolbar.
ToolBarButtonActive *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolBarButtonAdd *	P	P	Creates a new, user-defined button function.
ToolBarButtonBeginGroup *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolBarButtonClick	P	P	Clicks a toolbar button.
ToolBarButtonCount *	P	P	Specifies the number of configurable button functions.
ToolBarButtonEnabled *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolBarButtonHotKey *	P	P	Shows the hotkey for the selected button function.
ToolBarButtonId *	P	P	Unique ID number for the selected button function.
ToolBarButtonIndex	P	P	References a button function.
ToolBarButtonLocked *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolBarButtonName *	P	P	Shows the name of the selected button function.
ToolBarButtonPasswordLevel *	P	P	Shows the authorization for the selected button function.
ToolBarButtonRemove *	P	P	Removes the selected button function from the list.
ToolBarButtonRename *	P	P	Renames the user-defined toolbar element that is referenced by means of the "ToolBarButtonIndex" property.
ToolBarButtonRepos *	P	P	Changes the sequence of button functions.
ToolBarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolBarButtonTooltipText *	P	P	Specifies the tooltip text for the button.
ToolBarButtonUserDefined *	P	P	Indicates whether the project engineer has added the toolbar button as a new user-defined button.
ToolBarButtonVisible *	P	P	Specifies that the button is visible.
ToolBarShowTooltips	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolBarUseBackColor	P	P	Specifies whether the background color for the toolbar is shown.
ToolBarUseHotKeys	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolBarVisible	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
UseMessageColor (Page 5003)	P	P	Specifies whether scrolling is enabled.
UseSelectedTitleColor (Page 5005)	P	P	Specifies whether a selection color is used for the headers of selected table cells.
UseTableColor2 (Page 5006)	P	P	Specifies whether a second row color is used for the representation of the table.
VerticalGridLines (Page 5025)	P	P	Specifies whether vertical separation lines are displayed.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-20 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
AttachDB (Page 5074)	P, A	Executes the "Connect backup" button function of the control.
CopyRows (Page 5075)	P	Executes the "Copy rows" button function of the control.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
DetachDB (Page 5080)	P, A	Executes the "Disconnect backup" button function of the control.
Export (Page 5081)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetHistlistColumnCollection (Page 5084)	P	Returns the list of all column objects of the alarm view hitlist as "ICCAxCollection" type.
GetHitlistColumn (Page 5085)	P	Returns the column object of the alarm view hitlist designated by name or index as "ICCAxMessageColumn" type.
GetMessageBlock (Page 5086)	P	Returns the alarm block object of the alarm view designated by name or index as "ICCAxMessageBlock" type.
GetMessageBlockCollection (Page 5087)	P	Returns the list of all alarm block objects of the alarm view as "ICCAxCollection" type.
GetMessageColumn (Page 5088)	P	Returns the column object of the alarm view designated by name or index as "ICCAxMessageColumn" type.
GetOperatorMessage (Page 5089)	P	Returns the operator message object of the alarm view designated by name or index as "ICCAxOperatorMessage" type.
GetMessageColumnCollection (Page 5090)	P	Returns the list of all column objects of the message view as "ICCAxCollection" type.
GetOperatorMessageCollection (Page 5091)	P	Returns the list of all operator message objects of the alarm view as "ICCAxCollection" type.
GetRow (Page 5093)	P	Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.
GetRowCollection (Page 5094)	P	Returns the list of all row objects of the table-based controls as "ICCAxDataRowCollection" type.
GetSelectedRow (Page 5101)	P	Returns the selected row object of a table-based control as "ICCAxDataRow" type.
GetSelectedRows (Page 5102)	P	Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.
GetStatusbarElement (Page 5108)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 5109)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetToolBarButton (Page 5116)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolBarButton" type.
GetToolBarButtonCollection (Page 5117)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
HideAlarm (Page 5133)	P	Executes the "Hide alarm" button function of the alarm view.
LockAlarm (Page 5136)	P	Executes the "Disable alarm" button function of the alarm view.
LoopInAlarm (Page 5136)	P	Executes the "Loop in alarm" button function of the alarm view.
MoveToFirstLine (Page 5138)	P	Executes the "First alarm" button function of the alarm view.
MoveToFirstPage (Page 5138)	P	Executes the "First page" button function of the alarm view.

Methods	Valid	Description
MoveToLastLine (Page 5139)	P	Executes the "Last alarm" button function of the alarm view.
MoveToLastPage (Page 5140)	P	Executes the "Last page" button function of the alarm view.
MoveToNextLine (Page 5141)	P	Executes the "Next alarm" button function of the alarm view.
MoveToNextPage (Page 5141)	P	Executes the "Next page" button function of the alarm view.
MoveToPreviousLine (Page 5142)	P	Executes the "Previous alarm" button function of the alarm view.
MoveToPreviousPage (Page 5143)	P	Executes the "Previous page" button function of the alarm view.
Print (Page 5146)	P, A	Executes the "Print" button function of the control.
QuitHorn (Page 5147)	P	Executes the "Acknowledge central alarm generator" button function of the alarm view.
QuitSelected (Page 5147)	P	Executes the "Single acknowledgment" button function of the alarm view.
QuitVisible (Page 5148)	P	Executes the "Group acknowledgment" button function of the alarm view.
SelectAll (Page 5161)	P	Selects all rows in a table-based control.
SelectRow (Page 5162)	P	Selects a specific row in a table-based control.
ShowComment (Page 5165)	P	Executes the "Comment dialog" button function of the recipe view.
ShowDisplayOptionsDialog (Page 5165)	P	Executes the "Display options dialog" button function of the alarm view.
ShowEmergencyQuitDialog (Page 5166)	P	Executes the "Single acknowledgment" button function of the alarm view.
ShowHelp (Page 5166)	P, A	Executes the "Help" button function of the control.
ShowHideList (Page 5167)	P	Executes the "List of alarm to hide" button function of the alarm view.
ShowHitList (Page 5167)	P	Executes the "Hitlist" button function of the alarm view.
ShowInfoText (Page 5168)	P	Executes the "About dialog" button function of the alarm view.
ShowLockDialog (Page 5168)	P	Executes the "Lock dialog" button function of the alarm view.
ShowLockList (Page 5169)	P	Executes the "Lock list" button function of the alarm view.
ShowLongTermArchiveList (Page 5169)	P	Executes the "Historical alarm list (long-term)" button function of the alarm view.
ShowMessageList (Page 5170)	P	Executes the "Alarm list" button function of the alarm view.
ShowPropertyDialog (Page 5171)	P, A	Executes the "Configuration dialog" button function of the control.
ShowSelectionDialog (Page 5172)	P	Executes the "Selection dialog" button function of the alarm view.
ShowShortTermArchiveList (Page 5173)	P	Executes the "Historical alarm list (short-term)" button function of the alarm view.
ShowSortDialog (Page 5174)	P	Executes the "Sorting dialog" button function of the alarm view.
ShowTimebaseDialog (Page 5175)	P	Executes the "Timebase dialog" button function of the alarm view.
UnhideAlarm (Page 5178)	P	Executes the "Unhide alarm" button function of the alarm view.
UnlockAlarm (Page 5179)	P	Executes the "Unlock alarm" button function of the alarm view.
UnselectAll (Page 5179)	P	Removes all selections from the cells of a table-based control.
UnselectRow (Page 5180)	P	Removes the selections from a specific cell of a table-based control.

Screen object (list) (Page 4262)

## AlarmView

### Description

Represents the "Alarm view" object. The MessageView object is an element of the ScreenItems list.

If you change the settings for this object with a user-defined function, the changed settings are retained even after the screen is called again.

---

#### Note

The object "Simple AlarmView" cannot be dynamized with a user-defined function.

Table 10-21 Properties

Properties	Read	Write	Description
AlarmAreaHeight **			
AlarmAreaWidth **			
AlarmClasses	-	-	Specifies the alarm classes to be reported in runtime.
AlarmLog	-	-	Specifies the alarm types to be displayed in the alarm view.

Properties	Read	Write	Description
AlarmSource	-	-	Specifies that alarms should be displayed.
Authorization (Page 4504)	-	-	Specifies the operating rights of the selected object in runtime.
BackColor	A	A	Specifies the background color of the selected object.
ButtonBarElements **			Specifies that the buttons will be displayed.
ButtonBarStyle	-	-	
Columns	-	-	Specifies the columns to be displayed.
ColumnsMoveable	-	-	Specifies that the columns can be moved.
ColumnTextAckGroup	-	-	Specifies the header for the "AckGroup" column.
ColumnTextAlarmState	-	-	Specifies the header for the "State" column.
ColumnTextAlarmText	-	-	Specifies the header for the "Text" column.
ColumnTextClassName	-	-	Specifies the header for the "Class Name" column.
ColumnTextDate	-	-	Specifies the header for the "Date" column.
ColumnTextDevice	-	-	Specifies the header for the "Device" column.
ColumnTextDiagnosable	-	-	Specifies the header for the "Diagnosable" column.
ColumnTextNumber	-	-	Specifies the header for the "Number" column.
ColumnTextTime	-	-	Specifies the header of the "Time" column.
CountOfLinesPerAlarms	-	-	
CountOfVisibleAlarms	-	-	
Enabled (Page 4606)	A	A	Specifies whether the selected object can be operated in runtime.
FilterTag **			Specifies a tag of the string type for filtering alarm texts.
FilterText **			Specifies the text for filtering the alarm text.
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
Flashing	-	-	Specifies that the text block flashes.
FocusColor (Page 4636)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4638)	A	A	Specifies the border width of the specified object when the object is in focus.
ForeColor (Page 4645)	-	-	Specifies the font color of the text for the selected object.
GridlineColor (Page 4652)	A	A	Specifies the color for the grid lines.
Height (Page 4653)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalScrollingEnabled	-	-	
IsRunningUnderCE *	-	-	
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	A	A	Specifies the value of the X coordinate of the object.
LineAlarmView **			
Name (Page 4744)	A	A	Returns the object name as STRING.
PreferredUseOnAck	-	-	
S7Device	-	-	
SecurityForSimpleViewEnabled **			
SelectionBackColor (Page 4826)	A	A	Specifies the background color of the selected cells.
SelectionForeColor (Page 4828)	A	A	Specifies the foreground color of the selected cells.

Properties	Read	Write	Description
SeparateLineForAlarmText	-	-	
ShowAcknowledgeButton	-	-	
ShowAlarmsFromDate (Page 4842)	A	A	Specifies that only those message events are displayed that are saved in this tag.
ShowAlarmsToAcknowledge	-	-	Specifies that unacknowledged alarms should be displayed.
ShowColumnHeaders	-	-	
ShowHelpButton	-	-	
ShowHorizontalGridlines	-	-	
ShowLoopInAlarmButton	-	-	Specifies that the "Loop-In-Alarm" button will be displayed.
ShowMilliseconds	-	-	Display time in milliseconds.
ShowPendingAlarms	-	-	
SortByTimeDirection (Page 4867)	-	-	Specifies whether the last incoming alarm is displayed at the top of the "AlarmControl" object.
SortByTimeEnabled (Page 4867)	A	A	Specifies whether the sorting order of alarms based on the time in the "AlarmControl" object can be changed.
TableBackColor (Page 4889)	A	A	Specifies the background color of the table cells for the selected object.
TableFont	-	-	Specifies the font in the table.
TableForeColor (Page 4892)	A	A	Specifies the font color of "Row color".
TableHeaderBackColor (Page 4894)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderFont	-	-	Specifies the text color of the header.
TableHeaderForeColor (Page 4895)	A	A	Specifies the text color in the header of the table of the selected object.
Top (Page 4954)	A	A	Specifies the value of the Y coordinate of the object.
VerticalScrollbarEnabled	-	-	
VerticalScrollingEnabled	-	-	
ViewType	-	-	Specifies the alarm view type.
ViewTypeForSaveStream **			Specifies the display type for the Save Stream.
Visible (Page 5026) *	A	A	Specifies whether the selected object is visible.
Width (Page 5037)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

\* not visible in the ES, \*\* no relevant information available

Table 10-23 Properties

Properties	Read	Write	Description
AlarmLowerLimit (Page 4492)	P	P	Specifies the low limit at which the interrupt is triggered.
AlarmLowerLimitColor (Page 4492)	P	P	Specifies the bar color of the "AlarmLowerLimit" limit.
AlarmLowerLimitEnabled (Page 4493)	P	P	Specifies whether the "AlarmLowerLimit" limit is monitored.
AlarmLowerLimitRelative (Page 4493)	P	P	Specifies whether the low limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.
AlarmUpperLimit (Page 4494)	P	P	Specifies the high limit that triggers the interrupt.
AlarmUpperLimitColor (Page 4494)	P	P	Specifies the bar color of the "AlarmUpperLimit" limit.
AlarmUpperLimitEnabled (Page 4495)	P	P	Specifies whether the "AlarmUpperLimit" limit is monitored.
AlarmUpperLimitRelative (Page 4496)	P	P	Specifies whether the high limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
AverageLast15Values	P	P	Specifies that the average of the last 15 values is shown.
BackColor (Page 4510)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4516) *	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4517) *	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4518) *	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4518) *	P	P	Specifies the flash rate of the background for the selected object.
BarBackColor (Page 4519)	P, A	P, A	Specifies the color of the bar background for the selected object.
BarBackFillStyle (Page 4520)	P	P	Specifies the fill style for the bar.
BarBackFlashingColorOff	-	-	Specifies the border background color of the object for the "OFF" state.
BarBackFlashingColorOn	-	-	Specifies the border background color of the object for the "ON" state.
BarBackFlashingEnabled	-	-	
BarBackFlashingRate	-	-	Specifies the flash rate of the background.
BarEdgeStyle	-	-	Specifies the style of the border line.

Properties	Read	Write	Description
BarOrientation	P	P	Specifies the alignment of the bar.
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4530)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4534)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D (Page 4543)	-	-	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
ColorChangeHysteresis (Page 4566)	P	P	Specifies the hysteresis as a percentage of the display value.
ColorChangeHysteresisEnabled (Page 4567)	P	P	Specifies whether the object is displayed with hysteresis.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
CountDivisions (Page 4580)	P	P	Specifies the number of segments into which the bar will be split by means of the large scale tick marks.
CountSubDivisions (Page 4581)	A	A	Specifies the number of scale tick marks between two main tick marks of the "Bar" object.
DrawInsideFrame (Page 4599)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4602)	P	P	Specifies the line style of the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628) *	-	-	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630) *	-	-	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631) *	-	-	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 4632) *	-	-	Specifies the flash rate of the border line for the selected object.
Font (Page 4639)	-	-	Specifies or returns the font.
FontBold (Page 4640)	P	P	Specifies whether the text of the selected object is shown in bold.
FontName (Page 4642)	P	P	Specifies the font of the selected object.
FontSize (Page 4643)	P	P	Specifies the font size of the text for the selected object.
ForeColor (Page 4644)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Properties	Read	Write	Description
IntegerDigits (Page 4674)	P	P, A	Specifies the number of digits to the left of the decimal point (0 to 20).
LargeTickLabelingStep	-	-	Specifies which scale sections are labeled.
LargeTicksBold (Page 4678)	P	P	Specifies whether the long tick marks of a scale are shown in bold.
LargeTicksSize (Page 4678)	P	P	Specifies the length of the long tick marks of a scale.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
Limit4LowerLimit (Page 4696)	P	P	Specifies the low limit for "Reserve4".
Limit4LowerLimitColor (Page 4697)	P	P	Specifies the color for the "Reserve4" low limit.
Limit4LowerLimitEnabled (Page 4697)	P	P	Specifies whether the "Reserve4" low limit is monitored.
Limit4LowerLimitRelative (Page 4698)	P	P	Specifies whether the "Reserve4" low limit is evaluated as a percentage or an absolute value.
Limit4UpperLimit (Page 4698)	P	P	Specifies the high limit for "Reserve4".
Limit4UpperLimitColor (Page 4699)	P	P	Specifies the color for the "Reserve4" high limit.
Limit4UpperLimitEnabled (Page 4699)	P	P	Specifies whether the "Reserve4" high limit is monitored.
Limit4UpperLimitRelative (Page 4700)	P	P	Specifies whether the "Reserve4" high limit is evaluated as a percentage or an absolute value.
Limit5LowerLimit (Page 4701)	P	P	Specifies the low limit for "Reserve5".
Limit5LowerLimitColor (Page 4701)	P	P	Sets the color for the "Reserve5" low limit.
Limit5LowerLimitEnabled (Page 4702)	P	P	Specifies whether the "Reserve5" low limit is monitored.
Limit5LowerLimitRelative (Page 4702)	P	P	Specifies whether the "Reserve5" low limit is evaluated as a percentage or an absolute value.
Limit5UpperLimit (Page 4703)	P	P	Specifies the high limit for "Reserve5".
Limit5UpperLimitColor (Page 4704)	P	P	Specifies the color for the "Reserve5" high limit.
Limit5UpperLimitEnabled (Page 4704)	P	P	Specifies whether the "Reserve5" high limit is monitored.
Limit5UpperLimitRelative (Page 4705)	P	P	Specifies whether the "Reserve5" high limit is evaluated as a percentage or an absolute value.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line ends.
MaximumValue (Page 4719)	P, A	P, A	Specifies the maximum value of the scale in the selected object.
MinimumValue (Page 4740)	P, A	P, A	Specifies the minimum value of the scale in the selected object.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
Precision (Page 4786)	P	P	Specifies the number of decimal places (0 to 20).
ProcessValue (Page 4789)	P, A	P, A	Specifies the default for the value to be displayed.
ScaleColor (Page 4808)	P, A	P, A	Specifies the color of the scale of the selected object.
ScaleGradation (Page 4809)	P, A	P, A	Specifies the distance between two large tick marks of the scale.
ScaleLabelFieldLength *	-	-	Distance to the position of the axis label.

Properties	Read	Write	Description
ScaleLabelingDoubleLined	-	-	Specifies that the horizontal bar orientation of the scale has two lines.
ScalePosition (Page 4811)	P	P	Specifies the position of the scale of the selected object.
ScaleStart	-	-	Specifies the minimum of the scale.
ScalingType (Page 4815)	P	P	Specifies the type of bar scaling.
SegmentColoring (Page 4819)	P, A	P, A	Specifies the type of color change to be displayed in the "Bar" object if limits are exceeded.
ShowBadTagState (Page 4843)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowLargeTicksOnly (Page 4848)	P	P	Specifies or returns the length of axis sections in pixels.
ShowLimitLines	-	-	Specifies the display of a line at the limits.
ShowLimitMarkers (Page 4848)	P	P	Specifies whether the limit values are shown as a scale value.
ShowScale (Page 4854)	P	P	Specifies whether the values are also shown in a scale.
ShowSignForPositiveLabel	-	-	Specifies that a "+" is displayed for positive labels.
ShowTickLabels (Page 4859)	-	-	Specifies whether the label is shown in the scale.
ShowTrendIndicator (Page 4863)	P	P	Specifies whether the trend (rising or falling) of the measured value to be monitored is indicated by means of a small arrow.
StartValue (Page 4873)	P	P	Specifies the zero point value for the scale display.
ToleranceLowerLimit (Page 4937)	P	P	Specifies whether the "ToleranceLowerLimit" limit is monitored.
ToleranceLowerLimitColor (Page 4937)	P	P	Specifies the color for the "ToleranceLowerLimit" low limit.
ToleranceLowerLimitEnabled (Page 4938)	P	P	Specifies whether the "ToleranceLowerLimit" limit is monitored.
ToleranceUpperLimit (Page 4939)	P	P	Specifies whether the "ToleranceUpperLimit" limit is monitored.
ToleranceUpperLimitColor (Page 4940)	P	P	Specifies the color for the "ToleranceUpperLimit" high limit.
ToleranceUpperLimitEnabled (Page 4940)	P	P	Specifies whether the "ToleranceUpperLimit" limit is monitored.
ToleranceUpperLimitRelative (Page 4941)	P	P	Specifies whether the "ToleranceHigh" low limit is evaluated as a percentage or an absolute value.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
TrendIndicatorColor (Page 4965)	P	P	Specifies the color for the trend view.
Unit (Page 4991)	P, A	P, A	Specifies the unit of measurement in the "IOField" object.
UseAutoScaling	-	-	Specifies auto-scaling.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseExponentialFormat (Page 5001)	P	P	Specifies whether the numbers are displayed with exponentials (e.g. "1.00e+000").

Properties	Read	Write	Description
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
WarningLowerLimit (Page 5030)	P	P	Specifies the "WarningLowerLimit" low limit.
WarningLowerLimitColor (Page 5031)	P	P	Specifies the color for the "WarningLowerLimit" low limit.
WarningLowerLimitEnabled (Page 5031)	P	P	Specifies whether the "WarningLowerLimit" limit is monitored.
WarningLowerLimitRelative (Page 5032)	P	P	Specifies whether the "WarningLowerLimit" low limit is evaluated as a percentage or an absolute value.
WarningUpperLimit (Page 5035)	P	P	Specifies the "WarningUpperLimit" high limit.
WarningUpperLimitColor (Page 5035)	P	P	Specifies the color for the "WarningUpperLimit" high limit.
WarningUpperLimitEnabled (Page 5036)	P	P	Specifies whether the "WarningUpperLimit" limit is monitored.
WarningUpperLimitRelative (Page 5036)	P	P	Specifies whether the "WarningUpperLimit" high limit is evaluated as a percentage or an absolute value.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
ZeroPoint (Page 5066)	P	P	Specifies the position of the zero point as a percentage of the bar height.

\* not visible in the ES

Table 10-27 Properties

Properties	Read	Write	Description
AdaptBorder (Page 4485)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4516)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4517)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4518)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4518)	P	P	Specifies the flash rate of the background for the selected object.
BitNumber (Page 4525)	-	-	Specifies the bit whose status must change to trigger a value change.
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderBrightColor3D (Page 4529)	P	P	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderColor (Page 4530)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4534)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537)	P	P	Specifies the flash rate of the border line for the selected object.
BorderShadeColor3D (Page 4540)	P	P	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D (Page 4543)	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
BorderWidth3D (Page 4546)	P	P	Specifies the width of the border for 3D display of the selected object.

Properties	Read	Write	Description
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4599)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4602)	P	P	Specifies the line style of the selected object.
Enabled (Page 4605)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
FocusColor (Page 4636)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4637)	A	A	Specifies the border width of the specified object when the object is in focus.
Font (Page 4639)	-	-	Specifies or returns the font.
FontBold (Page 4640)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4641)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4642)	P	P	Specifies the font of the selected object.
FontSize (Page 4643)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4643)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4644)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4656)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HorizontalAlignment (Page 4666)	P, A	P, A	Specifies the horizontal alignment of the text within the selected object.
HotKey (Page 4668)	-	-	Specifies the hotkey.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line ends.
Mode (Page 4742)	P	P	Specifies the field type of the selected object.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
PictureAlignment (Page 4781)	P	P	Specifies or returns the display type of the background image in the process picture.
PictureList	-	-	Specifies the graphic list that supplies the object with values.
PictureOff (Page 4782)	P	P	Specifies the screen to be displayed in the "Off" state.
PictureOn (Page 4783)	P	P	Specifies the screen to be displayed in the "On" state.

Properties	Read	Write	Description
Pressed (Page 4787)	P	P	Specifies whether the selected object is displayed in a pressed state.
ProcessValue (Page 4790)	-	-	Specifies the default for the value to be displayed.
RelativeFillLevel (Page 4797)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 4846)	P	P	Specifies whether the selected object is filled.
StyleSettings (Page 4887)	P	P	Specifies the display style for the object:
TextList (Page 4899)	-	-	A list that contains the assignments between the output value and the output text to be actually output.
TextOff (Page 4900)	P, A	P, A	Specifies the text to be displayed in the "Off" state of the selected object.
TextOn (Page 4901)	A	A	Specifies the text to be displayed in the "On" state of the selected object.
TextOrientation (Page 4902)	P	P	Specifies the text orientation of the selected object.
Toggle (Page 4935)	P	P	Specifies whether the selected object engages after it has been operated in runtime.
ToolTipText (Page 4953)	P	P, A	Specifies the tooltip text.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
TransparentColorPictureOff (Page 4960)	P	P	Specifies the color to be set to "transparent" for the "Off" state of the assigned bitmap object.
TransparentColorPictureOn (Page 4961)	P	P	Specifies the color to be set to "transparent" for the "On" state of the assigned bitmap object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseTransparentColorPictureOff (Page 5009)	P	P	Specifies whether the transparent color defined in the "TransparentColorPictureOff" property is used for the "Off" state.
UseTransparentColorPictureOn (Page 5009)	P	P	Specifies whether the transparent color defined in the "TransparentColorPictureOn" property is used for the "On" state.
VerticalAlignment (Page 5024)	P, A	P, A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
WindowsStyle (Page 5041)	P	P	Specifies whether the object is displayed in the general Windows style.

Table 10-28 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-31 Properties

Properties	Read	Write	Description
AdaptBorder (Page 4485)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.

Properties	Read	Write	Description
BackFlashingColorOff (Page 4516)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4517)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4518)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4518)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4530)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4534)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
CheckmarkAlignment (Page 4561)	P	P	Specifies whether the fields are right aligned.
CheckmarkCount (Page 4561)	P	P	Specifies the number of fields.
CornerStyle (Page 4578)	-	-	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4599)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4602)	-	-	Specifies the line style of the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 4639)	-	-	Specifies or returns the font.
FontBold (Page 4640)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4641)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4642)	P	P	Specifies the font of the selected object.
FontSize (Page 4643)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4643)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4644)	P	P	Specifies the font color of the text for the selected object.

Properties	Read	Write	Description
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 4666)	P	P	Specifies the horizontal alignment of the text within the selected object.
Index (Page 4670)	P	P	Specifies the background for grid control elements.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	-	-	Specifies the shape of the line ends.
LogOperation (Page 4712)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
Name (Page 4744)	P	P	Returns the object name as STRING.
ProcessValue (Page 4789)	P	P	Specifies the default for the value to be displayed.
RelativeFillLevel (Page 4797)	P	P	Specifies the fill percentage for the object.
ShowBadTagState (Page 4843)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowFillLevel (Page 4846)	P	P	Specifies whether the selected object is filled.
Text (Page 4898)	P	P	Specifies the label for the text field.
TextOrientation (Page 4902)	P	P	Specifies the text orientation of the selected object.
Texts	-	-	Specifies the texts for the check boxes.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
VerticalAlignment (Page 5024)	P	P	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-32 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-33 Properties

Properties	Read	Write	Description
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P, A	P, A	Defines the fill pattern of the specified object.
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4530)	P, A	P, A	Specifies the line color of the object.

Properties	Read	Write	Description
BorderFlashingColorOff (Page 4534)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4544)	P, A	P, A	Specifies the line thickness of the object.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4599)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4602)	A	A	Specifies the line style of the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipse", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line end.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
Radius (Page 4793)	P	P, A	Specifies the radius of the selected object "Circle".
RelativeFillLevel (Page 4797)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 4846)	P	P	Specifies whether the selected object is filled.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipse", "Circle" and "Rectangle" objects.

Table 10-34 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-37 Properties

Properties	Read	Write	Description
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P	P	Specifies the background color of the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
Color (Page 4564)	P	P	Specifies the line color of the selected object.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.

Properties	Read	Write	Description
DrawInsideFrame (Page 4599)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
EndAngle (Page 4608)	P	P	Specifies the angle at which the end point of the selected object deviates from the zero position (0°).
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line end.
LineWidth (Page 4708)	P	P	Specifies the line thickness of the selected object.
Name (Page 4744)	P	-	Returns the object name as STRING.
Radius (Page 4793)	P	P	Specifies the radius of the selected object "Circle".
StartAngle (Page 4870)	P	P	Specifies the SQL statement.
Style (Page 4886)	P	P	Specifies the line style of the selected object.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-38 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

A	Runtime Advanced
P	Runtime Professional

Table 10-39 Properties

Properties	Read	Write	Description
Analog (Page 4499)	P	P	Specifies whether the clock is displayed as an analog clock.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.

Properties	Read	Write	Description
DialColor (Page 4594)	P, A	P, A	Specifies the color of the dial in the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
Flashing	-	-	Specifies that the text block flashes.
Font (Page 4639)	-	-	Specifies or returns the font.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HourNeedleHeight (Page 4668)	P, A	P, A	Specifies the length of the hour hand in the "Clock" object.
HourNeedleWidth (Page 4669)	P, A	P, A	Specifies the width of the hour hand in the "Clock" object.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
LockSquaredExtent (Page 4711)	P	P	Specifies whether the tag values are downloaded from the logs for the time range to be displayed when you call a screen.
MinuteNeedleHeight (Page 4741)	P, A	P, A	Specifies the length of the minute hand in the "Clock" object.
MinuteNeedleWidth (Page 4742)	P, A	P, A	Specifies the width of the minute hand in the "Clock" object.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
NeedleBorderColor (Page 4747)	P, A	P, A	Specifies the name of the data source.
NeedleColor (Page 4748)	P, A	P, A	Specifies the hand color in the "Clock" object.
NeedleFillStyle (Page 4748)	P	P	Specifies the fill style for the clock hand.
Picture (Page 4780)	-	-	Specifies the screen to be displayed in the graphics object in runtime.
SecondNeedleHeight (Page 4818)	P, A	P, A	Specifies the length of the seconds hand in the "Clock" object.
SecondNeedleWidth (Page 4818)	P, A	P, A	Specifies the width of the seconds hand in the "Clock" object.
ShowFocusRectangle (Page 4847)	P	P	Specifies whether the button receives a selection border when it is activated in runtime.
ShowTicks (Page 4860)	P, A	P, A	Specifies whether the tick marks are displayed in the scale of the object.
TicksColor (Page 4904)	P, A	P, A	Specifies the scale display.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-40 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-41 Properties

Properties	Read	Write	Description
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P	P	Specifies the background color of the selected object.
BorderEndStyle (Page 4533)	P	P	Specifies the type of line ends for the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
Color (Page 4564)	P	P	Specifies the line color of the selected object.
ConnectionType (Page 4576)	P	P	Specifies the type of connector. You can select one of two connection types.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
EndStyle (Page 4610)	-	-	Specifies how the line end of the selected object is displayed.
FirstConnectedObjectIndex (Page 4626)	P	P	Specifies the index number of the upper connector point.
FirstConnectedObjectName (Page 4627)	P	P	Specifies the name of the object that is docked to the upper connector point.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipse", "Circle" and "Rectangle" objects.
LastConnectedObjectIndex (Page 4679)	P	P	Specifies the index number of the connection point to the last connected object.
LastConnectedObjectName (Page 4679)	P	P	Specifies the name of the object that is docked to the lower connector point.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line end.
LineWidth (Page 4708)	P	P	Specifies the line thickness of the selected object.
Name (Page 4744)	P	P	Returns the object name as STRING.
Points *	-	-	Specifies the corner points.
StartStyle (Page 4872)	-	-	Specifies how the line start of the selected object is displayed.
Style (Page 4886)	P	P	Specifies the line style of the selected object.

Properties	Read	Write	Description
SwapFirstWithLastConnection (Page 4888)	P	P	Specifies whether the text in the object is shown horizontally.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies that the font size from the data source should be used.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-42 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-43 Properties

Properties	Read	Write	Description
Authorization (Page 4504)	-	-	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4511)	A	A	Specifies the background color of the selected object.
BackFillStyle (Page 4515)	-	-	Defines the fill pattern of the specified object.
BorderBackColor (Page 4528) *	-	-	Specifies the background color of the broken border line for the selected object.

Properties	Read	Write	Description
BorderColor (Page 4531)	A	A	Specifies the line color of the object.
BorderStyle3D (Page 4543)	A	A	Specifies whether the object has a 3D border shading.
DisplaySystemTime	-	-	Specifies that the system time is displayed.
EdgeStyle (Page 4601)	-	-	Specifies the line style of the selected object.
Enabled (Page 4606)	A	A	Specifies whether the selected object can be operated in runtime.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
Font (Page 4639) *	-	-	Specifies or returns the font.
ForeColor (Page 4645)	A	A	Specifies the font color of the text for the selected object.
Format	-	-	Specifies that the format of the text block is displayed.
Height (Page 4653)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4656)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HorizontalAlignment (Page 4667)	A	A	Specifies the horizontal alignment of the text within the selected object.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	A	A	Specifies the value of the X coordinate of the object.
LineWrap *	-	-	Specifies the line break within the object.
LongDateTimeFormat	-	-	Specifies that the date and time are displayed in long format.
Mode (Page 4742)	-	-	Specifies the field type of the selected object.
Name (Page 4744)	A	-	Returns the object name as STRING.
ProcessValue (Page 4789)	A	A	Specifies the default for the value to be displayed.
ShowDate	-	-	Specifies that the date is to be displayed.
ShowTime	-	-	Specifies that only the time is displayed.
Top (Page 4954)	A	A	Specifies the value of the Y coordinate of the object.
VerticalAlignment (Page 5024)	A	A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5026) *	A	A	Specifies whether the selected object is visible.
Width (Page 5037)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-45 Properties

Properties	Read	Write	Description
Alarm (Page 4488)	P	P	Specifies the limit for the memory space view from which an alarm is output.
AlarmColor (Page 4489)	P	P	Specifies the alarm types to be displayed in the alarm view.
Drive (Page 4600)	P	P	Specifies the characters of the drive that is to be monitored.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
Free (Page 4648)	P	P	Returns the size of the free memory space.
FreePercent (Page 4648)	P	P	Returns the measured values for the free disk space as a percentage.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Interval (Page 4674)	P	P	Specifies the time interval for updating the displayed measured values.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
Name (Page 4744)	P	-	Returns the object name as STRING.
NormalColor	P	P	Specifies the color of the object in the normal range.
Tolerance (Page 4935)	P	P	Specifies the limit for the storage space display as of which a deviation will be reported.
ToleranceColor (Page 4936)	P	P	Specifies the colors in which the bars of the memory space display are shown as soon as the tolerance range is exceeded.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
Total (Page 4957)	P	P	Returns the storage capacity.
Used (Page 5010)	P	P	Specifies whether scrolling is enabled.
UsedPercent (Page 5011)	P	P	Returns the measured values for the occupied memory space as a percentage.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Warning (Page 5029)	P	P	Specifies the limit for the memory space view from which a warning is output.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-46 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
FillColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line end.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
RadiusHeight (Page 4794)	P	P	Specifies the minor axis of the "Ellipsis" object.
RadiusWidth (Page 4795)	P	P	Specifies the major axis of the "Ellipsis" object.
RelativeFillLevel (Page 4797)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 4846)	P	P	Specifies whether the selected object is filled.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-48 Method

Method	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.

Properties	Read	Write	Description
DrawInsideFrame (Page 4599)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
EndAngle (Page 4608)	P	P	Specifies the angle at which the end point of the selected object deviates from the zero position (0°).
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	-	-	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	-	-	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	-	-	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	-	-	Specifies the flash rate of the border line for the selected object.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line end.
LineWidth (Page 4708)	P	P	Specifies the line thickness of the selected object.
Name (Page 4744)	P	-	Returns the object name as STRING.
RadiusHeight (Page 4794)	P	P	Specifies the minor axis of the "Ellipsis" object.
RadiusWidth (Page 4795)	P	P	Specifies the major axis of the "Ellipsis" object.
StartAngle (Page 4870)	P	P	Specifies the SQL statement.
Style (Page 4886)	P	P	Specifies the line style of the selected object.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-52 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

## See also

Screen object (list) (Page 4262)

## ForeignControl

## Description

Object Type of ScreenItem Object. Represents the graphic object "Control"

The control object type always assumes the properties of the control type selected. In the case of controls provided by WinCC, the properties are indicated under the description of the corresponding control.

In the case of controls from external suppliers, the control properties are supplied and thus not a part of this description. However, the control properties can be queried using the "Item" property.

## Type Identifier in VBS

Special WinCC type descriptions or version-independent ProgID

## Use

In the following example, the object with the name "Control1" is moved 10 pixels to the right:

```
'VBS36  
Dim objControl  
Set objControl = ScreenItems("Control1")
```

```
objControl.Left = objControl.Left + 10
```

## Special feature

The controls provided by WinCC return a special ID as the type. It can be found under the topic "Type Identification in VBS" in the individual descriptions of the WinCC controls.

## Access to specific properties instead of event parameters of the third-party controls

The parameter list of an event with third-party control is not read in WinCC. To have access to custom parameters of control events, you need to implement properties in the control instead of parameters.

The following code example shows the source code of the "UserControlTestModify" control, in which the "Title" and "Description" properties are defined instead of parameters.

```
public partial class UserControlTestModify : UserControl
{
    public event MyEventHandler MyEvent = null;

    public string Title
    {
        get;
        private set;
    }

    public string Description
    {
        get;
        set;
    }

    public UserControlTestModify()
    {
        InitializeComponent();
    }

    private void OnMyEvent(Exception e)
    {
        if (this.MyEvent!= null)
        {
            // Place place data in Properties before invoking event.
            Title = "title";
            Description = "description";
            this.MyEvent.Invoke();
        }
    }

    private void button1_Click(object sender, EventArgs e)
    {
        this.OnMyEvent (null);
    }
}
```

The specific properties of a third-party control are not displayed in WinCC with IntelliSense.

The following example shows how to access the specific "Title" property of the third-party control "FControl" in WinCC :

```
HMIRuntime.Screens("StartScreen").ScreenItems("FControl").Title = "MyForeignControl"
```

### ProgID and UserfriendlyName of third-party controls

The version-independent ProgID is returned as the type if non-WinCC controls are used.

It is possible to determine the version-dependent ProgID or "UserfriendlyName" from the ProgID: In the following example, "Control1" is a control embedded in the picture which already returns the version-independent ProgID as a result of the Type property.

---

#### Note

Since not every control has a version-dependent ProgID, an error handling measure should be integrated to query the version-dependent ProgID or UserFriendlyName. If no error handling is used, the code is terminated immediately without any result when no ProgID is found.

---

Determine the version-dependent ProgID as follows:

```
'VBS37
Dim objControl
Dim strCurrentVersion
Set objControl = ScreenItems("Control1")
strCurrentVersion = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type &
"\CurVer\")
MsgBox strCurrentVersion
```

---

#### Note

In order that example above works, a multimedia control should be inserted in the picture.

---

Determine the UserFriendlyName as follows:

```
'VBS38
Dim objControl
Dim strFriendlyName
Set objControl = ScreenItems("Control1")
strFriendlyName = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type & "\")
MsgBox strFriendlyName
```

**Note**

In order that example above works, a multimedia control should be inserted in the picture.

If a non-WinCC control is used, it is possible that the properties provided by the control have the same names as the general ScreenItem properties. In such cases, the ScreenItem properties have priority. The "hidden" properties of an external control supplier can be accessed using the additional "object" property. Address the properties of an external control supplier as follows:

```
Control.object.type
```

The properties of the ScreenItem object are used in the case of identical names, if you use the following form:

```
Control.type
```

Table 10-55 Properties

Properties	Read	Write	Description
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
Height (Page 4653)	P	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
ObjectName (Page 4752)	P	-	Returns the object name as STRING.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
Type (Page 4988)	P	-	Returns the type of the specified object as STRING.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-56 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
AttachDB (Page 5074)	P, A	Executes the "Connect backup" button function of the control.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
DetachDB (Page 5080)	P, A	Executes the "Disconnect backup" button function of the control.
Export (Page 5081)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetStatusBarElement (Page 5108)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusBarElement" type.
GetStatusBarElementCollection (Page 5109)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetToolBarButton (Page 5116)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolBarButton" type.
GetToolBarButtonCollection (Page 5117)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
GetTrend (Page 5118)	P, A	Returns the f(t) or f(x) trend view designated by name or index as "ICCAxTrend" or "ICCAxFunctionTrend" type.
GetTrendCollection (Page 5119)	P, A	Returns the list of all trends of the f(t) or f(x) trend view as "ICCAxCollection" type.
GetTrendWindow (Page 5121)	P, A	Returns the trend window object of the f(t) or f(x) trend view designated by name or index as "ICCAxTrendWindow" type.

Methods	Valid	Description
GetTrendWindowCollection (Page 5122)	P, A	Returns the list of all trend window objects of the f(t) or f(x) trend views as "ICCAxCollection" type.
GetXAxis (Page 5128)	P, A	Returns the X axis object of the f(x) trend view designated by name or index as "ICCAxValueAxis" type.
GetXAxisCollection (Page 5129)	P, A	Returns the list of all X axis objects of the f(x) trend view as "ICCAxCollection" type.
GetYAxis (Page 5130)	P, A	Returns the Y axis object of the f(x) trend view designated by name or index as "ICCAxValueAxis" type.
GetYAxisCollection (Page 5131)	P, A	Returns the list of all Y axis objects of the f(x) trend view as "ICCAxCollection" type.
MoveAxis (Page 5137)	P, A	Executes the "Move axes area" button function of the f(t) and f(x) trend views.
NextTrend (Page 5144)	P, A	Executes the "Next trend" button function of the f(t) and f(x) trend views.
OneToOneView (Page 5144)	P, A	Executes the "Original view" button function of the f(t) and f(x) trend views.
PreviousTrend (Page 5146)	P, A	Executes the "Previous trend" button function of the f(t) and f(x) trend views.
Print (Page 5146)	P, A	Executes the "Print" button function of the control.
ShowHelp (Page 5166)	P, A	Executes the "Help" button function of the control.
ShowPropertyDialog (Page 5171)	P, A	Executes the "Configuration dialog" button function of the control.
ShowTagSelection (Page 5175)	P, A	Executes the "Select data connection" button function of the control.
ShowTimeSelection (Page 5176)	P, A	Executes the "Select time range" button function of the control.
ShowTrendSelection (Page 5176)	P, A	Executes the "Select trends" button function of the f(t) and f(x) trend views.
StartStopUpdate (Page 5177)	P, A	Executes the "Start" or "Stop" button function of the control.
ZoomArea (Page 5184)	P, A	Executes the "Zoom area" button function of the f(t) and f(x) trend views.
ZoomInOut (Page 5185)	P, A	Executes the "Zoom +/-" button function of the f(t) and f(x) trend views.
ZoomInOutX (Page 5186)	P, A	Executes the "Zoom X axis +/-" button function of the f(x) trend view.
ZoomInOutY (Page 5187)	P, A	Executes the "Zoom Y axis +/-" button function of the f(x) trend view.
ZoomMove (Page 5187)	P, A	Executes the "Move trend area" button function of the f(t) and f(x) trend views.

## Gauge

### Description

Represents the "Gauge" object. The Gauge object is an element of the ScreenItems list.

### Type identifier in VBS

HMI Gauge

Abbreviation	Validity
Pa	Panels
A	Runtime Advanced
P	Runtime Professional

Table 10-57 Properties

Properties	Read	Write	Description
AngleMax (Page 4499)	P, A	P, A	Specifies the angle for the scale end of the "Gauge" object.
AngleMin (Page 4500)	P, A	P, A	Specifies the angle for the scale start of the "Gauge" object.
BackColor (Page 4510)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.
BackPicture	-	-	Specifies a graphic for the background.
BorderInnerStyle3D (Page 4538)	P	P	Specifies the representation of the inner part of the object border.

Properties	Read	Write	Description
BorderOuterStyle3D (Page 4539)	P	P	Specifies the representation of the outer part of the object border.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
BorderWidth3D (Page 4546)	P	P	Specifies the width of the border for 3D display of the selected object.
CaptionColor (Page 4551)	P, A	P, A	Specifies the color of the text that is displayed in the header of the selected object.
CaptionFont	-	-	Specifies the character set for the caption.
CaptionText (Page 4552)	P, A	P, A	Specifies the text that is displayed in the header of the selected object.
CaptionTop (Page 4553)	P	P	Specifies the distance of the instrument label from the top edge of the selected object.
CenterColor (Page 4556)	P, A	P, A	Sets the color for the center point of the "Gauge" object.
CenterSize (Page 4557)	P	P	Sets the diameter of the round scale center point.
DangerRangeColor (Page 4587)	P, A	P, A	Sets the color of the danger range on the scale of the "Gauge" object.
DangerRangeStart (Page 4588)	P, A	P, A	Specifies the scale value at which the danger range of the "Gauge" object begins.
DangerRangeVisible (Page 4588)	P, A	P, A	Specifies whether the danger range is displayed in the scale of the "Gauge" object. {
DialColor (Page 4594)	P, A	P, A	Specifies the color of the dial in the selected object.
DialFillStyle (Page 4594)	P	P	Specifies the type of background for the selected object.
DialPicture	-	-	Specifies a graphic for the dial.
DialSize (Page 4595)	P	P	Specifies the diameter of the scale disc based on the smaller value of the "Width" and "Height" geometry attributes.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
Flashing *	-	-	Specifies that the text block flashes.
Gradation (Page 4649)	P, A	P, A	Specifies the value difference between two main tick marks of the "Gauge" object.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
LockSquaredExtent (Page 4711)	P	P	Specifies whether the tag values are downloaded from the logs for the time range to be displayed when you call a screen.
MaximumValue (Page 4719)	P, A	P, A	Specifies the maximum value of the scale in the selected object.
MinimumValue (Page 4740)	P, A	P, A	Specifies the minimum value of the scale in the selected object.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
NormalRangeColor (Page 4749)	P, A	P, A	Specifies the color of the normal range on the scale of the "Gauge" object. "
NormalRangeVisible (Page 4750)	P, A	P, A	Specifies whether the normal range in the scale of the "Gauge" object will be displayed.
PointerColor (Page 4785)	P, A	P, A	Specifies the pointer color of the "Gauge" object.
ProcessValue (Page 4789)	P, A	P, A	Specifies the default for the value to be displayed.

Properties	Read	Write	Description
ScaleLabelColor (Page 4810)	P, A	P, A	Specifies the color of the label for the scale tick marks of the "Gauge" object.
ScaleLabelFont	-	-	Specifies the font of the scale label.
ScaleTickColor (Page 4811)	P, A	P, A	Specifies the color of the scale tick marks of the "Gauge" object.
ScaleTickLabelPosition (Page 4812)	P	P	Specifies the diameter of the imaginary circle on which the scale tick label is located.
ScaleTickLength (Page 4812)	P	P	Specifies the length of the main scale ticks.
ScaleTickPosition (Page 4813)	P	P	Specifies the diameter of the assumed circle on which the scale divisions are located.
ShowDecimalPoint (Page 4846)	P	P	Specifies whether the scale is labeled with decimal figures (decimal point and one decimal place) or with whole integers.
ShowPeakValuePointer (Page 4850)	P, A	P, A	Specifies whether a slave pointer will be used for the selected object.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UnitColor (Page 4991)	P, A	P, A	Specifies the text color for the label of the measurement unit in the "Gauge" object.
UnitFont	-	-	Specifies the font for the unit.
UnitText (Page 4992)	P, A	P, A	Specifies the text for the measurement unit of the selected object.
UnitTop (Page 4993)	P	P	Specifies the distance of the measurement unit from the upper edge of the selected object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
WarningRangeColor (Page 5033)	P, A	P, A	Specifies the color of the warning range on the scale of the "Gauge" object.
WarningRangeStart (Page 5033)	P, A	P, A	Specifies the scale value from which the warning range of the "Gauge" object begins.
WarningRangeVisible (Page 5034)	P, A	P, A	Specifies whether the warning range is displayed in the scale of the "Gauge" object.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-58 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-59 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 4476)	-	-	Sets the color of the specified object for the "High limit violated" event.
AdaptPicture	-	-	Specifies that the size of the object is automatically adjusted in runtime.
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
AutoSizing	-	-	Specifies that the size of the object should be automatically adapted to the content.
BackColor (Page 4510)	A	A	Specifies the background color of the selected object.
BelowLowerLimitColor (Page 4525)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BitNumber (Page 4525)	-	-	Specifies the bit whose status must change to trigger a value change.
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4530)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4534)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D (Page 4543)	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4599)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4602)	P	P	Specifies the line style of the selected object.
Enabled (Page 4605)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.

Properties	Read	Write	Description
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
FlashTransparentColor (Page 4635)	P	P	Specifies the color of the bitmap object of a flashing graphic that is set to "transparent".
FocusColor (Page 4636)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4637)	A	A	Specifies the border width of the specified object when the object is in focus.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4656)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line ends.
Mode (Page 4742)	-	-	Specifies the field type of the selected object.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
OnValue	-	-	Specifies the value for the "ON" state in "two-state" mode.
PictureList	-	-	Specifies the graphic list that supplies the object with values.
PictureOff (Page 4782)	-	-	Specifies the screen to be displayed in the "Off" state.
PictureOn (Page 4783)	-	-	Specifies the screen to be displayed in the "On" state.
ProcessValue (Page 4789)	P	P	Specifies the default for the value to be displayed.
ScrollBarOrientation	-	-	Specifies the orientation of the scroll bar.
ShowScrollBar	-	-	Specifies the scroll bar type.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
TransparentColor (Page 4959)	P, A	P, A	Specifies which color of the allocated graphic (*.bmp, *.dib) of the specified object is set to "transparent".
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseFlashTransparentColor (Page 5001)	P	P	Specifies whether the color of the bitmap object of a flashing graphic is set to "transparent".
UseTransparentColor (Page 5008)	P, A	P, A	Specifies whether the color defined with the property "TransparentColor" is shown as transparent for the selected object.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-60 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Properties	Read	Write	Description
AdaptPicture	A	-	Specifies that the size of the object is automatically adjusted in runtime.
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
AutoSizing	-	-	Specifies that the size of the object should be automatically adapted to the content.
BackColor (Page 4510)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4517)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4516)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4518)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4518)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4530)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4534)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D (Page 4543)	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4599)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4602)	P	P	Specifies the line style of the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.

Properties	Read	Write	Description
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line ends.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
Picture (Page 4780)	P	P	Specifies the screen to be displayed in the graphics object in runtime.
RelativeFillLevel (Page 4797)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 4846)	P	P	Specifies whether the selected object is filled.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
TransparentColor (Page 4959)	P, A	P, A	Specifies which color of the allocated graphic (*.bmp, *dib) of the specified object is set to "transparent".
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseTransparentColor (Page 5008)	P, A	P, A	Specifies whether the color defined with the property "TransparentColor" is shown as transparent for the selected object.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-62 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Properties	Read	Write	Description
AboveUpperLimitColor (Page 4476)	-	-	Sets the color of the specified object for the "High limit violated" event.
AcceptOnExit (Page 4477)	P	P	Specifies whether the input field is confirmed automatically when it is left.
AcceptOnFull (Page 4477)	P	P	Specifies whether the input field will be left and confirmed automatically when the defined number of values has been entered.

Properties	Read	Write	Description
AdaptBorder (Page 4485)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
AskOperationMotive (Page 4502)	P	P	Specifies whether the reason for operating this object is logged.
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4516)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4517)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4518)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4518)	P	P	Specifies the flash rate of the background for the selected object.
BelowLowerLimitColor (Page 4525)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4530)	P, A	P, A	Specifies the line color of the object.
BorderFlashingColorOff (Page 4534)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D (Page 4543)	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
BottomMargin	-	-	Sets the margin between the text and the bottom edge of the object.
ClearOnError (Page 4562)	P	P	Specifies whether an invalid input in this object is deleted automatically.
ClearOnFocus (Page 4563)	P	P	Specifies whether the field entry is deleted as soon as the I/O field is activated.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
CursorControl (Page 4584)	P	P	Specifies whether the mouse cursor jumps to the next field of the TAB sequence after leaving a field.
DataFormat (Page 4589)	P	P	Returns the data type of the IOField object.
EdgeStyle (Page 4602)	A	A	Specifies the line style of the selected object.
EditOnFocus (Page 4604)	P	P	Specifies whether data input is immediately possible if the input field is selected using the "Tab" key.
Enabled (Page 4605)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FieldLength (Page 4621)	-	-	Specifies that the "Field length string" field is read-only.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.

Properties	Read	Write	Description
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 4639)	-	-	Specifies or returns the font.
FontBold (Page 4640)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4641)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4642)	P	P	Specifies the font of the selected object.
FontSize (Page 4643)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4643)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4644)	P, A	P, A	Specifies the font color of the text for the selected object.
FormatPattern (Page 4646)	P	P	Specifies the format of the output value.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4656)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HiddenInput (Page 4657)	P	P	Specifies whether the input value or a * for each character is shown during the input.
HorizontalAlignment (Page 4666)	P, A	P, A	Specifies the horizontal alignment of the text within the selected object.
InputValue (Page 4672)	P	P	Defines the value entered by the user in the IO field.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
LeftMargin	-	A	Sets the margin between the text and the left edge of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line end.
LogOperation (Page 4712)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
LowerLimit (Page 4714)	P	P	Specifies the low limit for input values.
Mode (Page 4742)	P	P	Specifies the field type of the selected object.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
ProcessValue (Page 4789)	P, A	P, A	Specifies the default for the value to be displayed.
RightMargin	-	-	Sets the margin between the text and the right edge of the object.
ShiftDecimalPoint (Page 4841)	-	-	Specifies that the "Shift decimal point" field is read-only.
ShowBadTagState (Page 4843)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowLeadingZeros	-	-	Specifies that leading zeros should be displayed.
TextOrientation (Page 4902)	P	P	Specifies the text orientation of the selected object.

Properties	Read	Write	Description
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
TopMargin	-	-	Sets the margin between the text and the top edge of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
Unit (Page 4991)	P	P	Specifies the unit of measurement in the "IOField" object.
UpperLimit (Page 4994)	P	P	Specifies the high limit for input values.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseTagLimitColors	P	P	Specifies whether the configured colors are used when limits are violated.
VerticalAlignment (Page 5024)	P, A	P, A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-68 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
EndLeft	-	-	Specifies the X position of the end point.
EndStyle (Page 4610)	P, A	P, A	Specifies how the line end of the selected object is displayed.
EndTop	-	-	Sets the Y position of the end point.
FillStyle (Page 4625)	A	A	Defines the fill pattern of the specified object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line end.
LineWidth (Page 4708)	P, A	P, A	Specifies the line thickness of the selected object.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
RotationAngle (Page 4799)	P	P	Specifies the angle of rotation in degrees.
RotationCenterLeft (Page 4800)	P	P	Specifies the X coordinate of the pivot point for the object in runtime.
RotationCenterTop (Page 4801)	P	P	Specifies the Y coordinate of the pivot point for the object in runtime.
StartLeft	-	-	Specifies the X position of the starting point.
StartStyle (Page 4872)	A	A	Specifies how the line start of the selected object is displayed.
StartTop (Page 4873)	-	-	Specifies the vertical distance in pixels between the start point and the top edge of the screen.
Style (Page 4886)	P, A	P, A	Specifies the line style of the selected object.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-70 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Screen object (list) (Page 4262)

**Listbox****Description**

Represents the "Listbox" object. The Listbox object is an element of the ScreenItems list.

**Type identifier in VBS**

HMIListBox

### Application

In the following example, the object with the name "ListBox1" is moved 10 pixels to the right:

```
'VBS21
Dim objListBox
Set objListBox = ScreenItems("ListBox1")
objListBox.Left = objListBox.Left + 10
```

Table 10-71 Properties

Properties	Read	Write	Description
AskOperationMotive (Page 4502)	P	P	Specifies whether the reason for operating this object is logged.
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4530)	P	P	Specifies the line color of the object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
CountVisibleItems (Page 4582)	P	P	Specifies the number of lines contained in the selection list.
EdgeStyle (Page 4602)	-	-	Specifies the line style of the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Font (Page 4639)	-	-	Specifies or returns the font.
FontBold (Page 4640)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4641)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4642)	P	P	Specifies the font of the selected object.
FontSize (Page 4643)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4643)	P	P	Specifies whether the text of the selected object is underlined.

Properties	Read	Write	Description
ForeColor (Page 4644)	P	P	Specifies the font color of the text for the selected object.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 4666)	P	P	Specifies the horizontal alignment of the text within the selected object.
Index (Page 4670)	P	P	Specifies the background for grid control elements.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line end.
LogOperation (Page 4712)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
Name (Page 4744)	P	-	Returns the object name as STRING.
SelectedIndex (Page 4822)	P	P	Specifies and returns the index whose associated text is highlighted in the combo or list box.
SelectedText (Page 4820)	P	P	Displays the text that is defined with the "Selected field" (SelIndex) attribute and highlighted in the combo box or list box.
Text (Page 4898)	P	P	Specifies the label for the text field.
Texts	-	-	Specifies the texts for the check boxes.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-72 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-73 Properties

Properties	Read	Write	Description
AspectRatio	P	P	Specifies whether the aspect ratio is maintained when the size is changed.
AutoStart	P	P	Specifies that the Media Player should start automatically.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
FileName	P, A	P, A	Specifies the name of the file to be loaded.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
PictureSizeMode	P	P	Specifies that the status bar is displayed.
PlayCount	A	A	Plays the files several times.
PlayEndless	P	P	Specifies that the media file should play endlessly.
PopupMenuEnabled	P	P	Specifies that the shortcut menu can be used.
ShowControls	P, A	P, A	Specifies that a toolbar is displayed.
ShowFeatureBackward	P	P	Specifies that the "Backward" button is displayed in runtime.
ShowFeatureForward	P	P	Specifies that the "Forward" button is displayed in runtime.
ShowFeatureFullScreen	P	P	Specifies that the Media Player can be displayed as a full screen.
ShowFeaturePause	P	P	Specifies that the Media Player can be displayed as a full screen
ShowFeaturePlay	P	P	Specifies that the "Play" button is displayed in runtime.
ShowFeatureStop	P	P	Specifies that the "Stop" button is displayed in runtime.
ShowFeatureVolume	P	P	Sets the volume.
ShowStatusBar (Page 4857)	A	A	Specifies whether the status bar is shown.
ShowTracker	A	A	Specifies that the tracker is displayed.
StepSeconds	P	P	Specifies a time in seconds that is to be skipped when the "Forward" or "Backward" button is pressed.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-74 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-79 Properties

Properties	Read	Write	Description
ApplyProjectSettingsForDesignMode (Page 4501)	-	-	Specifies that the project settings are used for the design.
AutoCompleteColumns (Page 4505)	P	P	Specifies whether empty columns are shown if the control is wider than the configured columns.
AutoCompleteRows (Page 4506)	P	P	Specifies whether empty rows are shown if the control is longer than the number of configured rows.

Properties	Read	Write	Description
AutoSelectionColors (Page 4507)	P	P	Specifies whether the colors defined by the system are used as the selection colors for cells and rows.
AutoSelectionRectColor (Page 4508)	P	P	Specifies whether the selection frame is shown with the color defined by the system.
BackColor (Page 4510)	P	P	Specifies the background color of the selected object.
BorderColor (Page 4530)	P	P	Specifies the line color of the object.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
Caption (Page 4549)	P	P	Specifies the text that is displayed in the header of the selected object.
CellCut (Page 4553)	P	P	Specifies whether the contents of the cells are abbreviated if the cells are too narrow.
CellSpaceBottom (Page 4554)	P	P	Specifies the bottom margin of the table cells.
CellSpaceLeft (Page 4555)	P	P	Sets the left indent for the table cells.
CellSpaceRight (Page 4555)	P	P	Specifies the right indent of the table cells.
CellSpaceTop (Page 4556)	P	P	Specifies the top margin of the table cells.
Closeable (Page 4564)	P	P	Specifies that the control can be closed in runtime.
ColumnResize (Page 4570)	P	P	Enables changes to the width of columns.
ColumnScrollbar (Page 4572)	P	P	Specifies the scroll bar type.
ColumnTitleAlignment	P	P	Specifies the type of column title alignment.
ColumnTitles (Page 4573)	P	P	Specifies whether the column header is displayed.
ControlDesignMode (Page 4865)	P	P	Specifies the design.
EnableEdit (Page 4607)	P	P	Specifies whether the data shown can be edited in Runtime.
ExportDirectoryChangeable (Page 4614)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 4614)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 4615)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 4615)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 4616)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 4617)	P	P	Default assignment of the ID number and export provider.
ExportFormatName (Page 4617)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 4618)	P	P	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 4618)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportShowDialog (Page 4619)	P	P	Specifies whether the data export dialog is shown in runtime.
Font (Page 4639)	-	-	Specifies or returns the font.
GridLineColor (Page 4651)	P	P	Specifies the color for the grid lines.
GridLineWidth (Page 4652)	P	P	Specifies the width of the separation lines in pixels.
Height (Page 4653)	P	-	Sets the height of the specified "Ellipse", "Circle" and "Rectangle" objects.
HorizontalGridLines (Page 4667)	P	P	Specifies whether horizontal separation lines are displayed.

Properties	Read	Write	Description
IconSpace (Page 4670)	P	P	Specifies the spacing between icons and text in the table cells.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 4706)	P	P	Sets the color of the window separation lines.
LineWidth (Page 4708)	P	P	Specifies the line thickness of the selected object.
LoadDataImmediately (Page 4709)	P	P	Specifies whether the tag values are downloaded from the logs for the time range to be displayed when you call a screen.
Moveable (Page 4743)	P	P	Specifies whether the window can be moved in runtime.
Name (Page 4744)	P	-	Returns the object name as STRING.
Online (Page 4755)	P	P	Specifies the name of the data source.
PrintJob	P	P	Specifies a print job
RowScrollbar (Page 4802)	P	P	Specifies whether row scroll bars are displayed.
RowTitleAlignment	P	P	Specifies the type of row title alignment.
RowTitles	P	P	Specifies that row headers will be displayed.
RTPersistence (Page 4804)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistencePasswordLevel (Page 4805)	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 4805)	-	-	Specifies how online configurations of WinCC are retained.
SelectedCellColor (Page 4820)	P	P	Specifies the background color of the selected cell.
SelectedCellForeColor (Page 4821)	P	P	Specifies the font color of the selected cell.
SelectedRowColor (Page 4822)	P	P	Specifies the background color of the selected row.
SelectedRowForeColor (Page 4822)	P	P	Specifies the font color of the selected row.
SelectedTitleColor (Page 4823)	P	P	Specifies the background color of a selected table header.
SelectedTitleForeColor (Page 4824)	P	P	Specifies the font color of the selected table header.
SelectionColoring (Page 4826)	P	P	Specifies whether selection colors are used for cells or rows.
SelectionRect (Page 4829)	P	P	Specifies whether a selection frame is used for the selected cells or rows.
SelectionRectColor (Page 4830)	P	P	Specifies the color of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionRectWidth (Page 4831)	P	P	Specifies the line width of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionType (Page 4831)	P	P	Specifies the number of lines you can mark.
ShowSortButton (Page 4855)	P	P	Specifies whether the sorting button is shown above the vertical scroll bar.
ShowSortIcon (Page 4856)	P	P	Specifies whether the sorting icon is displayed.
ShowSortIndex (Page 4857)	P	P	Specifies whether the sorting icon is displayed.
ShowTitle (Page 4861)	P	P	Specifies the layout of the control window's header.
Sizeable (Page 4865)	P	P	Specifies that the size of an object can be changed in runtime.
SortSequence (Page 4869)	P	P	Specifies how the sorting order can be changed by mouse click.
StatusbarBackColor (Page 4874)	P	P	Specifies the background color of the status bar.

Properties	Read	Write	Description
StatusbarElementAdd (Page 4874) *	P	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 4875) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 4875) *	P	P	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 4876) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 4876) *	P	P	Unique ID of the selected status bar element.
StatusbarElementIndex (Page 4877)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.
StatusbarElementName (Page 4877) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 4877) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 4878) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 4878)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText *	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 4879) *	P	P	Specifies the tooltip text for the user-defined status bar element.
StatusbarElementUserDefined (Page 4879) *	P	P	Indicates whether the configuration engineer has added the status bar element as a new user-defined element.
StatusbarElementVisible (Page 4880) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.
StatusbarElementWidth (Page 4880) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 4881)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 4883)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 4884)	P	P	Default text in the status bar.
StatusbarUseBackColor (Page 4884)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 4885)	P	P	Specifies whether the status bar of the control is displayed.
TableColor (Page 4890)	P	P	Specifies the background color of the rows. Use this to open the color selection dialog.
TableColor2 (Page 4890)	P	P	Specifies the background color of "Row color 2".
TableForeColor (Page 4891)	P	P	
TableForeColor2 (Page 4892)	P	P	Specifies the font color of "Row color 2".
TimeBase (Page 4910)	P	P	Sets the time zone that forms the basis for the display of time values.
TimeColumnActualize (Page 4911) *	P	P	Specifies whether the values of the selected column are updated.
TimeColumnAdd (Page 4911) *	P	P	Creates a new time column.
TimeColumnAlign (Page 4912) *	P	P	Specifies how the selected time column is aligned.

Properties	Read	Write	Description
TimeColumnBackColor (Page 4913) *	P	P	Specifies the background color of the time column selected.
TimeColumnBeginTime (Page 4913) *	P	P	Specifies the starting time of the time range for a selected time column.
TimeColumnCaption (Page 4914) *	P	P	Specifies the label of the time column.
TimeColumnCount (Page 4914) *	P	P	Specifies the number of configured time columns.
TimeColumnDateFormat (Page 4915) *	P	P	Specifies which date format is used to display the selected time column.
TimeColumnEndTime (Page 4915) *	P	P	Specifies the end point of the time range for the selected time column.
TimeColumnForeColor (Page 4916) *	P	P	Specifies the font color of the time column selected.
TimeColumnHideText (Page 4917) *	P	P	Sets text format for displaying the content of a time column.
TimeColumnHideTitleText (Page 4917) *	P	P	Sets text format for displaying the time column header.
TimeColumnIndex (Page 4918)	P	P	References a configured time column.
TimeColumnLength (Page 4918) *	P	P	Specifies the width of a selected time column.
TimeColumnMeasurePoints (Page 4919) *	P	P	Specifies the number of measuring points to be displayed in the selected time column.
TimeColumnName (Page 4919) *	P	P	Specifies the name of the selected time column.
TimeColumnRangeType (Page 4919) *	P	P	Specifies the time range used for the selected time column.
TimeColumnRemove (Page 4920) *	P	P	Removes the selected time column from the list.
TimeColumnRename (Page 4920) *	P	P	Renames the time column that is referenced by means of the "TimeColumnIndex" property.
TimeColumnRepos (Page 4921) *	P	P	Changes the sorting order of the time columns, including the corresponding value columns.
TimeColumnShowDate (Page 4921) *	P	P	Specifies whether the selected time column is displayed with date and time.
TimeColumnShowIcon (Page 4922) *	P	P	Specifies whether the contents of the time column are shown as an icon.
TimeColumnShowTitleIcon (Page 4922) *	P	P	Specifies whether the values of the selected column are updated.
TimeColumnSort (Page 4923) *	P	P	Specifies how the time column referenced in "TimeColumnIndex" is sorted.
TimeColumnSortIndex (Page 4923) *	P	P	Specifies the sorting order of the time column referenced in "TimeColumnIndex".
TimeColumnTimeFormat (Page 4924) *	P	P	Defines the time format used to display a selected time column.
TimeColumnTimeRangeBase (Page 4924) *	P	P	Specifies the unit of time for calculating the time range.
TimeColumnTimeRangeFactor (Page 4925) *	P	P	Specifies the factor for calculating the time range.
TimeColumnUseValueColumnColors (Page 4925) *	P	P	Specifies whether the selected time column is displayed in the value column colors.
TimeColumnVisible (Page 4926) *	P	P	The list shows the time columns you have created.
TimeStepBase	P	P	A time range is set via a base and a factor.
TimeStepFactor	P	P	A time range is set via a base and a factor.
TitleColor	P	P	Specifies the color of the header.

Properties	Read	Write	Description
TitleCut (Page 4932)	P	P	Specifies whether the contents of the fields of a header should be abbreviated if the column is too narrow.
TitleDarkShadowColor (Page 4932)	P	P	Specifies the color of the dark side of shading.
TitleForeColor (Page 4932)	P	P	Specifies the font color of the table header for the selected status.
TitleGridLineColor (Page 4933)	P	P	Specifies the color of separation lines in the table header.
TitleLightShadowColor (Page 4933)	P	P	Specifies the color of the bright side of shading.
TitleSort (Page 4934)	P	P	Specifies how sorting by column header is triggered.
TitleStyle (Page 4934)	P	P	Specifies whether a shading color is used for the table header.
ToolBarAlignment (Page 4941)	P	P	Specifies or returns the position of the toolbar.
ToolBarBackColor (Page 4942)	P	P	Specifies the background color of the toolbar.
ToolBarButtonActive (Page 4942) *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolBarButtonAdd (Page 4943) *	P	P	Creates a new, user-defined button function.
ToolBarButtonBeginGroup (Page 4943) *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolBarButtonClick	P	P	Clicks a toolbar button.
ToolBarButtonCount (Page 4944) *	P	P	Specifies the number of configurable button functions.
ToolBarButtonEnabled (Page 4944) *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolBarButtonHotKey (Page 4945) *	P	P	Shows the hotkey for the selected button function.
ToolBarButtonId (Page 4945) *	P	P	Unique ID number for the selected button function.
ToolBarButtonIndex (Page 4946)	P	P	References a button function.
ToolBarButtonLocked (Page 4946) *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolBarButtonName (Page 4946) *	P	P	Shows the name of the selected button function.
ToolBarButtonPasswordLevel (Page 4947) *	P	P	Shows the authorization for the selected button function.
ToolBarButtonRemove (Page 4947) *	P	P	Removes the selected button function from the list.
ToolBarButtonRename (Page 4948) *	P	P	Renames the user-defined toolbar element that is referenced by means of the "ToolBarButtonIndex" property.
ToolBarButtonRepos (Page 4948) *	P	P	Changes the sequence of button functions.
ToolBarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolBarButtonTooltipText (Page 4948) *	P	P	Specifies the tooltip text for the button.
ToolBarButtonUserDefined (Page 4949) *	P	P	Indicates whether the configuration engineer has added the toolbar button as a new user-defined button.
ToolBarButtonVisible *	P	P	Specifies that the button is visible.
ToolBarShowTooltips (Page 4949)	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolBarUseBackColor (Page 4950)	P	P	Specifies whether the background color for the toolbar is shown.
ToolBarUseHotKeys (Page 4951)	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolBarVisible (Page 4951)	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.

Properties	Read	Write	Description
UseColumnBackColor	P	P	Specifies whether scrolling is enabled.
UseColumnForeColor	P	P	Specifies the font used for printing.
UseSelectedTitleColor (Page 5005)	P	P	Specifies whether a selection color is used for the headers of selected table cells.
UseTableColor2 (Page 5006)	P	P	Specifies whether a second row color is used for the representation of the table.
ValueColumnAdd *	P	P	Adds a value column.
ValueColumnAlign *	P	P	Specifies the alignment of a column.
ValueColumnAutoPrecisions *	P	P	Specifies whether the number of decimal places to be displayed is determined automatically.
ValueColumnBackColor *	P	P	Specifies the background color.
ValueColumnCaption *	P	P	Specifies a header.
ValueColumnCount *	P	P	Displays the number of value columns.
ValueColumnExponentialFormat *	P	P	Specifies that exponential notation is used in a column.
ValueColumnForeColor *	P	P	Specifies the foreground color for a value column.
ValueColumnHideText *	P	P	Specifies whether the text is displayed.
ValueColumnHideTitleText *	P	P	Specifies whether the text is displayed.
ValueColumnIndex	P	P	The index specifies on which column other properties, e.g. initial value are based.
ValueColumnLength *	P	P	Specifies the number of displayed characters.
ValueColumnName *	P	P	Specifies the name of a column.
ValueColumnPrecisions *	P	P	Specifies the number of decimal places.
ValueColumnProvider *	P	P	
ValueColumnProviderCLSID *	P	P	Specifies the provider CLSID of the data for a column.
ValueColumnRemove *	P	P	Deletes a value column.
ValueColumnRename *	P	P	Renames a value column.
ValueColumnRepos *	P	P	Specifies that a value column is repositioned.
ValueColumnSelectTagName *	P	P	Specifies a tag.
ValueColumnShowIcon *	P	P	Specifies whether an icon is shown.
ValueColumnShowTitleIcon *	P	P	Specifies whether an icon is shown in the title.
ValueColumnSort *	P	P	Specifies the sorting type of a column.
ValueColumnSortIndex *	P	P	Specifies the sorting order.
ValueColumnTagName *	P	P	Specifies the names of the tags whose values are displayed in a column.
ValueColumnTimeColumn *	P	P	Specifies the corresponding time column.
ValueColumnVisible *	P	P	Specifies the visibility of a value column.
VerticalGridLines (Page 5025)	P	P	Specifies whether vertical separation lines are displayed.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	-	Sets the width of the specified "Ellipse", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-80 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
AttachDB (Page 5074)	P	Executes the "Connect backup" button function of the control.
CalculateStatistic (Page 5074)	P	Executes the "Calculate statistics" button function of the f(t) trend view and table view.
CopyRows (Page 5075)	P	Executes the "Copy rows" button function of the control.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
DetachDB (Page 5080)	P, A	Executes the "Disconnect backup" button function of the control.
Edit (Page 5080)	P	Executes the "Edit" button function of the table view.
Export (Page 5081)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetRow (Page 5093)	P	Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.
GetRowCollection (Page 5094)	P	Returns the list of all row objects of the table-based controls as "ICCAxDataRowCollection" type.
GetSelectedRow (Page 5101)	P	Returns the selected row object of a table-based control as "ICCAxDataRow" type.
GetSelectedRows (Page 5102)	P	Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.
GetStatusBarElement (Page 5108)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusBarElement" type.
GetStatusBarElementCollection (Page 5109)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetTimeColumn (Page 5113)	P	Returns the time column object of the table view designated by name or index as "ICCAxTime Column" type.
GetTimeColumnCollection (Page 5114)	P	Returns the list of all time column objects of the table view as "ICCAxCollection" type.
GetToolBarButton (Page 5116)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolBarButton" type.
GetToolBarButtonCollection (Page 5117)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
GetValueColumn (Page 5125)	P	Returns the value column object of the f(t) trend view designated by name or index as "ICCAxValueColumn" type.
GetValueColumnCollection (Page 5126)	P	Returns the list of all value column objects of the f(t) trend view as "ICCAxCollection" type.
MoveToFirst (Page 5137)	P	Executes the "First line" button function of the control.
MoveToLast (Page 5139)	P	Executes the "Last data record" button function of the control.
MoveToNext (Page 5140)	P	Executes the "Next data record" button function of the control.
MoveToPrevious (Page 5142)	P	Executes the "Previous data record" button function of the control.
NextColumn (Page 5143)	P	Executes the "Next column" button function of the table view.
PreviousColumn (Page 5145)	P	Executes the "Previous column" button function of the table view.
Print (Page 5146)	P, A	Executes the "Print" button function of the control.
SelectAll (Page 5161)	P	Selects all rows in a table-based control.
SelectRow (Page 5162)	P	Selects a specific row in a table-based control.

Methods	Valid	Description
SelectStatisticArea (Page 5162)	P	Executes the "Set statistics range" button function of the table view.
ShowColumnSelection (Page 5164)	P	Executes the "Select columns" button function of the table view.
ShowHelp (Page 5166)	P, A	Executes the "Help" button function of the control.
ShowPropertyDialog (Page 5171)	P, A	Executes the "Configuration dialog" button function of the control.
ShowTagSelection (Page 5175)	P, A	Executes the "Select data connection" button function of the control.
ShowTimeSelection (Page 5176)	P, A	Executes the "Select time range" button function of the control.
StartStopUpdate (Page 5177)	P, A	Executes the "Start" or "Stop" button function of the control.
UnselectAll (Page 5179)	P	Removes all selections from the cells of a table-based control.
UnselectRow (Page 5180)	P	Removes the selections from a specific cell of a table-based control.

A	Runtime Advanced
P	Runtime Professional

Table 10-81 Properties

Properties	Read	Write	Description
ApplyProjectSettingsForDesignMode (Page 4501)	-	-	Specifies that the project settings are used for the design.
BackColor (Page 4510)	P	P	Specifies the background color of the selected object.
BorderColor (Page 4530)	P	P	Specifies the line color of the object.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
Caption (Page 4549)	P	P	Specifies the text that is displayed in the header of the selected object.
Closeable (Page 4564)	P	P	Specifies that the control can be closed in runtime.
ConnectTrendWindows (Page 4577)	P	P	Specifies whether the configured trend views are connected.
ControlDesignMode (Page 4865)	P	P	Specifies the design.
ExportDirectoryChangeable (Page 4614)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 4614)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 4615)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 4615)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 4616)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 4617)	P	P	Default assignment of the ID number and export provider.
ExportFormatName (Page 4617)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 4618)	P	P	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 4618)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportShowDialog (Page 4619)	P	P	Specifies whether the data export dialog is shown in runtime.
Font (Page 4639)	-	-	Specifies or returns the font.
GraphDirection (Page 4650)	P	P	Specifies at which border of the trend window the current values are displayed.
Height (Page 4653)	P	-	Sets the height of the specified "Ellipse", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 4706)	P	P	Sets the color of the window separation lines.

Properties	Read	Write	Description
LineWidth (Page 4709)	P	P	Specifies the line thickness of the selected object.
LoadDataImmediately (Page 4709)	P	P	Specifies whether the tag values are downloaded from the logs for the time range to be displayed when you call a screen.
Moveable (Page 4743)	P	P	Specifies whether the window can be moved in runtime.
Name (Page 4744)	P	-	Returns the object name as STRING.
Online (Page 4755)	P	P	Specifies the name of the data source.
PercentageAxis	P	P	Specifies that an axis with percentage scaling is shown.
PercentageAxisAlign	P	P	
PercentageAxisColor	P	P	Specifies the color of the percentage axis.
PrintJob	P	P	Specifies a print job
RTPersistence (Page 4804)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistencePasswordLevel (Page 4805)	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 4805)	-	-	Specifies how online configurations of WinCC are retained.
ShowRuler (Page 4852)	P	P	Specifies whether a scale gradation (auxiliary line) is shown for the axis label of the "OnlineTrendControl" object.
ShowRulerInAxis (Page 4853)	P	P	Specifies whether rulers are also displayed in the time axes.
ShowScrollbars (Page 4854)	P	P	Specifies the scroll bar type.
ShowStatisticRuler	P	P	Specifies the SQL statement.
ShowTitle (Page 4861)	P	P	Specifies the layout of the control window's header.
ShowTrendIcon (Page 4862)	P	P	Specifies whether an icon is displayed below the value axes.
Sizeable (Page 4865)	P	P	Specifies that the size of an object can be changed in runtime.
StatusbarBackColor (Page 4874)	P	P	Specifies the background color of the status bar.
StatusbarElementAdd (Page 4874) *	P	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 4875) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 4875) *	P	P	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 4876) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 4876) *	P	P	Unique ID of the selected status bar element.
StatusbarElementIndex (Page 4877)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.
StatusbarElementName (Page 4877) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 4877) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 4878) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 4878)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText *	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 4879) *	P	P	Specifies the tooltip text for the user-defined status bar element.

Properties	Read	Write	Description
StatusbarElementUserDefined (Page 4879) *	P	P	Indicates whether the configuration engineer has added the status bar element as a new user-defined element.
StatusbarElementVisible (Page 4880) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.
StatusbarElementWidth (Page 4880) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 4881)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 4883)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 4884)	P	P	Default text in the status bar.
StatusbarUseBackColor (Page 4884)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 4885)	P	P	Specifies whether the status bar of the control is displayed.
TimeAxes	-	-	Specifies the settings for the time axes.
TimeAxisActualize *	P	P	
TimeAxisAdd *	P	P	Inserts an axis.
TimeAxisAlignment *	P	P	Specifies the alignment of an axis.
TimeAxisBeginTime (Page 4905) *	P	P	Specifies the starting time for the display of the selected trend.
TimeAxisColor *	P	P	Specifies the color of an axis.
TimeAxisCount *	P	P	Displays the number of time axes.
TimeAxisDateFormat *	P	P	Specifies the date format.
TimeAxisEndTime (Page 4906) *	P	P	Specifies the end time for the display of the selected trend.
TimeAxisIndex	P	P	The index specifies on which axis other properties, e.g. initial value are based.
TimeAxisInTrendColor *	P	P	Specifies that the color of the trend is used for an axis.
TimeAxisLabel (Page 4906) *	P	P	Specifies the header for the time axis. Whether or not the information is evaluated depends on the "ConfigureTimeAxis(i)" property.
TimeAxisMeasurePoints *	P	P	Specifies the measuring points.
TimeAxisName *	P	P	Specifies the name of an axis.
TimeAxisRangeType *	P	P	Specifies the type of time range.
TimeAxisRemove *	P	P	Deletes a time axis
TimeAxisRename *	P	P	Renames a time axis.
TimeAxisRepos *	P	P	Specifies that the time axis is repositioned
TimeAxisShowDate *	P	P	Specifies that the date is to be displayed.
TimeAxisTimeFormat (Page 4909) *	P	P	Specifies the time format.
TimeAxisTimeRangeBase *	P	P	A time range is set via a base and a factor.
TimeAxisTimeRangeFactor *	P	P	A time range is set via a base and a factor.
TimeAxisTrendWindow *	P	P	Specifies the trend view.
TimeAxisVisible *	P	P	Specifies that the time axis is visible.
TimeBase (Page 4910)	P	P	Sets the time zone that forms the basis for the display of time values.
ToolbarAlignment (Page 4941)	P	P	Specifies or returns the position of the toolbar.

## 10.8 Working with system functions and Runtime scripting

Properties	Read	Write	Description
ToolBarBackColor (Page 4942)	P	P	Specifies the background color of the toolbar.
ToolBarButtonActive (Page 4942) *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolBarButtonAdd (Page 4943) *	P	P	Creates a new, user-defined button function.
ToolBarButtonBeginGroup (Page 4943) *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolBarButtonClick	P	P	Clicks a toolbar button.
ToolBarButtonCount (Page 4944) *	P	P	Specifies the number of configurable button functions.
ToolBarButtonEnabled (Page 4944) *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolBarButtonHotKey (Page 4945) *	P	P	Shows the hotkey for the selected button function.
ToolBarButtonId (Page 4945) *	P	P	Unique ID number for the selected button function.
ToolBarButtonIndex (Page 4946)	P	P	References a button function.
ToolBarButtonLocked (Page 4946) *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolBarButtonName (Page 4946) *	P	P	Shows the name of the selected button function.
ToolBarButtonPasswordLevel (Page 4947) *	P	P	Shows the authorization for the selected button function.
ToolBarButtonRemove (Page 4947) *	P	P	Removes the selected button function from the list.
ToolBarButtonRename (Page 4948) *	P	P	Renames the user-defined toolbar element that is referenced by means of the "ToolBarButtonIndex" property.
ToolBarButtonRepos (Page 4948) *	P	P	Changes the sequence of button functions.
ToolBarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolBarButtonTooltipText (Page 4948) *	P	P	Specifies the tooltip text for the button.
ToolBarButtonUserDefined (Page 4949) *	P	P	Indicates whether the configuration engineer has added the toolbar button as a new user-defined button.
ToolBarButtonVisible *	P	P	Specifies that the button is visible.
ToolBarShowTooltips (Page 4949)	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolBarUseBackColor (Page 4950)	P	P	Specifies whether the background color for the toolbar is shown.
ToolBarUseHotKeys (Page 4951)	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolBarVisible (Page 4951)	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
TrendAdd (Page 4962) *	P	P	Creates a new trend.
TrendAutoRangeBeginTagName *	P	P	Specifies a tag that defines the initial value.
TrendAutoRangeBeginValue *	P	P	Specifies the initial value for the automatically adjusted display range.
TrendAutoRangeEndTagName *	P	P	Specifies a tag that defines the end value.
TrendAutoRangeEndValue *	P	P	Specifies a tag that defines the end value.
TrendAutoRangeSource *	P	P	Specifies the source of the display range.
TrendColor (Page 4963) *	P	P	Specifies or returns the trend view color.
TrendCount (Page 4963) *	P	P	Specifies the number of configured trends.

Properties	Read	Write	Description
TrendExtendedColorSet (Page 4963) *	P	P	Specifies whether you can configure the point color and the fill color and whether the colors are shown in runtime.
TrendFill (Page 4964) *	P	P	Specifies whether the area below the trend is shown filled.
TrendFillColor (Page 4965) *	P	P	Sets the fill color of the trend.
TrendIndex (Page 4965)	P	P	References a configured trend.
TrendLabel (Page 4966) *	P	P	Specifies the label of the selected trend.
TrendLineStyle (Page 4966) *	P	P	Specifies which line type is used for display of the trend.
TrendLineType (Page 4967) *	P	P	Specifies how the trend is displayed.
TrendLineWidth (Page 4967) *	P	P	Specifies the line thickness of the line displayed.
TrendLowerLimit (Page 4968) *	P	P	Specifies the low limit of a tag.
TrendLowerLimitColor (Page 4968) *	P	P	Specifies the color which indicates tag values below the value of "TrendLowerLimit".
TrendLowerLimitColoring (Page 4968) *	P	P	Specifies whether the selection frame is shown with the color defined by the system.
TrendName (Page 4969) *	P	P	Displays the name of the selected trend.
TrendPointColor (Page 4969) *	P	P	Specifies the color of trend points.
TrendPointStyle (Page 4970) *	P	P	Specifies how the points are displayed on the trend.
TrendPointWidth (Page 4970) *	P	P	Specifies the point width in pixels.
TrendProvider (Page 4971) *	P	P	Specifies the data supply for the selected trend.
TrendProviderCLSID *	P	P	Specifies the provider CLSID of the data for a trend.
TrendRemove (Page 4972) *	P	P	Removes selected trends from the list.
TrendRename (Page 4972) *	P	P	Renames the trend that is referenced by means of the "TrendIndex" property.
TrendRepos (Page 4973) *	P	P	Repositions the selected trend in the sequence in the trend window.
TrendSelectTagName *	P	P	Specifies a tag.
TrendTagName *	P	P	Specifies the name of the tag for the Y direction.
TrendTimeAxis *	P	P	Specifies the time axis.
TrendTrendWindow (Page 4976) *	P	P	Specifies the trend window in which the selected trend is shown.
TrendUncertainColor (Page 4976) *	P	P	Values have an uncertain status if the initial value is unknown after Runtime has been activated, or if a substitute value is used.
TrendUncertainColoring (Page 4977) *	P	P	Values have an uncertain status if the initial value is unknown after Runtime has been activated, or if a substitute value is used.
TrendUpperLimit (Page 4977) *	P	P	Specifies the high limit of a tag. If the tag drops below the value of "TrendLowerLimit", the values are marked with the color set in "TrendUpperLimitColor".
TrendUpperLimitColor (Page 4978) *	P	P	Specifies the color which indicates tag values below the value of "TrendLowerLimit".
TrendUpperLimitColoring (Page 4978) *	P	P	Specifies whether the selection frame is shown with the color defined by the system.
TrendValueAxis *	P	P	Specifies the value axis.
TrendVisible (Page 4978) *	P	P	The list contains all the trends that you have created.
TrendWindowAdd (Page 4979) *	P	P	Creates a new trend view.

Properties	Read	Write	Description
TrendWindowCoarseGrid (Page 4979) *	P	P	Specifies whether grid lines are displayed for the main scaling.
TrendWindowCoarseGridColor (Page 4980) *	P	P	Specifies the color of the grid lines for the main scaling.
TrendWindowCount *	P	P	Displays the number of trend views.
TrendWindowFineGrid (Page 4980) *	P	P	Specifies whether grid lines are displayed for the secondary scaling.
TrendWindowFineGridColor (Page 4981) *	P	P	Specifies the grid color of the main scaling.
TrendWindowForegroundTrendGrid (Page 4981) *	P	P	Specifies whether only the grid lines for the foreground trend are displayed in the selected trend window.
TrendWindowGridInTrendColor (Page 4981) *	P	P	Specifies whether the grid lines for the main scaling are displayed in the trend color.
TrendWindowHorizontalGrid (Page 4982) *	P	P	Specifies whether the horizontal grid lines are shown.
TrendWindowIndex (Page 4983)	P	P	References a configured trend window.
TrendWindowName (Page 4983) *	P	P	Specifies the name of the selected trend window.
TrendWindowRemove (Page 4983) *	P	P	Removes the selected trend view from the list.
TrendWindowRename (Page 4983) *	P	P	Changes the name of the trend window which is referenced by the "TrendWindowIndex" property.
TrendWindowRepos (Page 4984) *	P	P	Changes the order of the trend view.
TrendWindowRulerColor (Page 4984) *	P	P	Specifies the ruler color.
TrendWindowRulerLayer (Page 4984) *	P	P	Specifies the display layer of the ruler in the trend view.
TrendWindowRulerStyle (Page 4985) *	P	P	Specifies the representation of the ruler.
TrendWindowRulerWidth (Page 4986) *	P	P	Specifies the ruler width in pixels.
TrendWindows	-	-	Specifies the settings for trend views.
TrendWindowSpacePortion (Page 4986) *	P	P	Specifies the proportion of the selected trend window for display in the control.
TrendWindowStatisticRulerColor *	P	P	Specifies the color of the statistics ruler.
TrendWindowStatisticRulerStyle *	P	P	Specifies the style of the statistics ruler.
TrendWindowStatisticRulerWidth *	P	P	Specifies the width of the statistics ruler.
TrendWindowVerticalGrid (Page 4986) *	P	P	Specifies whether the vertical grid lines are displayed.
TrendWindowVisible (Page 4987) *	P	P	The list contains the trend views that you have created.
UseTrendNameAsLabel (Page 5010)	P	P	Specifies whether the "Name" or "Label" property is used as a designation for the trend in runtime.
ValueAxes	-	-	Specifies the settings for the value axes.
ValueAxisAdd *	P	P	Inserts an axis.
ValueAxisAlignment *	P	P	Specifies the alignment of an axis.
ValueAxisAutoPrecisions *	P	P	Specifies that the number of decimal places displayed for an axis is adjusted automatically.
ValueAxisAutoRange *	P	P	Specifies that the value range is determined automatically.

Properties	Read	Write	Description
ValueAxisBeginValue *	P	P	Specifies the initial value of an axis.
ValueAxisColor *	P	P	Specifies the color of a value axis.
ValueAxisCount *	P	P	Shows the number of value axes.
ValueAxisEndValue *	P	P	Specifies the end value of an axis.
ValueAxisExponentialFormat *	P	P	Specifies that the label of an axis uses exponential notation.
ValueAxisIndex	P	P	The index specifies on which axis other properties, e.g. initial value are based.
ValueAxisInTrendColor *	P	P	Specifies that the color of the trend is used for an axis.
ValueAxisLabel (Page 5018) *	P	P	Specifies the label of the value axis.
ValueAxisName *	P	P	Specifies the name of an axis.
ValueAxisPrecisions *	P	P	Specifies the number of displayed decimal places.
ValueAxisRemove *	P	P	Renames an axis.
ValueAxisRename *	P	P	Renames an axis.
ValueAxisRepos *	P	P	Specifies that the value axis is repositioned.
ValueAxisScalingType (Page 5019) *	P	P	Specifies the type of axis scaling.
ValueAxisTrendWindow *	P	P	Specifies the trend view.
ValueAxisVisible *	P	P	Specifies whether a value axis is visible.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	-	Sets the width of the specified "Ellipse", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-82 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
AttachDB (Page 5074)	P, A	Executes the "Connect backup" button function of the control.
CalculateStatistic (Page 5074)	P	Executes the "Calculate statistics" button function of the f(t) trend view and table view.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
DetachDB (Page 5080)	P, A	Executes the "Disconnect backup" button function of the control.
Export (Page 5081)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetRulerData (Page 5100)	P	Returns the value of the called trend at the ruler position.
GetStatusbarElement (Page 5108)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 5114)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetTimeAxis (Page 5110)	P	Returns the time axis object of the f(t) trend view designated by name or index as "ICCAxTimeAxis" type.
GetTimeAxisCollection (Page 5112)	P	Returns the list of all time axis objects of the f(t) trend view as "ICCAxCollection" type.

## 10.8 Working with system functions and Runtime scripting

Methods	Valid	Description
GetToolBarButton (Page 5116)	P	Returns the button function designated by name or index on the control toolbar as "ICCAxToolBarButton" type.
GetToolBarButtonCollection (Page 5117)	P	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
GetTrend (Page 5118)	P, A	Returns the f(t) or f(x) trend view designated by name or index as "ICCAxTrend" or "ICCAxFunctionTrend" type.
GetTrendCollection (Page 5119)	P, A	Returns the list of all trends of the f(t) or f(x) trend view as "ICCAxCollection" type.
GetTrendWindow (Page 5121)	P, A	Returns the trend window object of the f(t) or f(x) trend view designated by name or index as "ICCAxTrendWindow" type.
GetTrendWindowCollection (Page 5122)	P, A	Returns the list of all trend window objects of the f(t) or f(x) trend views as "ICCAxCollection" type.
GetValueAxis (Page 5123)	P	Returns the value axis object of the f(t) trend view designated by name or index as "ICCAxValueAxis" type.
GetValueAxisCollection (Page 5124)	P	Returns the list of all value axis objects of the f(t) trend view as "ICCAxCollection" type.
MoveAxis (Page 5137)	P, A	Executes the "Move axes area" button function of the f(t) and f(x) trend views.
MoveToFirst (Page 5137)	P	Executes the "First line" button function of the control.
MoveToLast (Page 5139)	P	Executes the "Last data record" button function of the control.
MoveToNext (Page 5140)	P	Executes the "Next data record" button function of the control.
MoveToPrevious (Page 5142)	P	Executes the "Previous data record" button function of the control.
NextTrend (Page 5144)	P, A	Executes the "Next trend" button function of the f(t) and f(x) trend views.
OneToOneView (Page 5144)	P, A	Executes the "Original view" button function of the f(t) and f(x) trend views.
PreviousTrend (Page 5146)	P, A	Executes the "Previous trend" button function of the f(t) and f(x) trend views.
Print (Page 5146)	P, A	Executes the "Print" button function of the control.
ShowHelp (Page 5166)	P, A	Executes the "Help" button function of the control.
ShowPercentageAxis (Page 5170)	P	Executes the "Relative axis" button function of the f(t) trend view.
ShowPropertyDialog (Page 5171)	P, A	Executes the "Configuration dialog" button function of the control.
ShowTagSelection (Page 5175)	P, A	Executes the "Select data connection" button function of the control.
ShowTimeSelection (Page 5176)	P, A	Executes the "Select time range" button function of the control.
ShowTrendSelection (Page 5176)	P, A	Executes the "Select trends" button function of the f(t) and f(x) trend views.
StartStopUpdate (Page 5177)	P, A	Executes the "Start" or "Stop" button function of the control.
ZoomArea (Page 5184)	P, A	Executes the "Zoom area" button function of the f(t) and f(x) trend views.
ZoomInOut (Page 5185)	P, A	Executes the "Zoom +/-" button function of the f(t) and f(x) trend views.
ZoomInOutTime (Page 5185)	P	Executes the "Zoom time axis +/-" button function of the f(t) trend view.
ZoomInOutValues (Page 5186)	P	Executes the "Zoom value axis +/-" button function of the f(t) trend view.
ZoomMove (Page 5187)	P, A	Executes the "Move trend area" button function of the f(t) and f(x) trend views.

Table 10-83 Properties

Properties	Read	Write	Description
AdaptBorder (Page 4485)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4516)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4517)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4518)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4518)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4530)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4534)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
CheckmarkAlignment (Page 4561)	P	P	Specifies whether the fields are right aligned.
CheckmarkCount (Page 4561)	P	P	Specifies the number of fields.
CornerStyle (Page 4578)	-	-	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4599)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4602)	-	-	Specifies the line style of the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 4639)	-	-	Specifies or returns the font.

Properties	Read	Write	Description
FontBold (Page 4640)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4641)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4642)	P	P	Specifies the font of the selected object.
FontSize (Page 4643)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4643)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4644)	P	P	Specifies the font color of the text for the selected object.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 4666)	P	P	Specifies the horizontal alignment of the text within the selected object.
Index (Page 4670)	P	P	Specifies the background for grid control elements.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	-	-	Specifies the shape of the line ends.
LogOperation (Page 4712)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
Name (Page 4744)	P	-	Returns the object name as STRING.
ProcessValue (Page 4789)	P	P	Specifies the default for the value to be displayed.
RelativeFillLevel (Page 4797)	P	P	Specifies the fill percentage for the object.
ShowBadTagState (Page 4843)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowFillLevel (Page 4846)	P	P	Specifies whether the selected object is filled.
Text (Page 4898)	P	P	Specifies the label for the text field.
TextOrientation (Page 4902)	P	P	Specifies the text orientation of the selected object.
Texts	-	-	Specifies the texts for the check boxes.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
VerticalAlignment (Page 5024)	P	P	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-84 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-85 Properties

Properties	Read	Write	Description
ActualPointIndex (Page 4483)	P	P	Specifies the number of the current corner point of the selected object.
ActualPointLeft (Page 4483)	P	P	Specifies the X coordinate of the current corner point with reference to the screen origin.
ActualPointTop (Page 4484)	P	P	Specifies the Y coordinate of the current corner point with reference to the screen origin.
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P, A	P, A	Defines the fill pattern of the specified object.
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4530)	P, A	P, A	Specifies the line color of the object.
BorderFlashingColorOff (Page 4534)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4544)	P, A	P, A	Specifies the line thickness of the object.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
EdgeStyle (Page 4602)	A	A	Specifies the line style of the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.

Properties	Read	Write	Description
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line end.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
Points	-	-	Specifies the corner points.
PointsCount (Page 4785)	P	-	Specifies the number of corner points of the polyline or of the polygon.
RelativeFillLevel (Page 4797)	P	P	Specifies the fill percentage for the object.
RotationAngle (Page 4799)	P	P	Specifies the angle of rotation in degrees.
RotationCenterLeft (Page 4800)	P	P	Specifies the X coordinate of the pivot point for the object in runtime.
RotationCenterTop (Page 4801)	P	P	Specifies the Y coordinate of the pivot point for the object in runtime.
ShowFillLevel (Page 4846)	P	P	Specifies whether the selected object is filled.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-86 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-87 Properties

Properties	Read	Write	Description
ActualPointIndex (Page 4483)	P	P	Specifies the number of the current corner point of the selected object.
ActualPointLeft (Page 4483)	P	P	Specifies the X coordinate of the current corner point with reference to the screen origin.
ActualPointTop (Page 4484)	P	P	Specifies the Y coordinate of the current corner point with reference to the screen origin.

Properties	Read	Write	Description
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P, A	P, A	Specifies the background color of the selected object.
BorderEndStyle (Page 4533)	P; A	P	Specifies the type of line ends for the selected object.
BorderStyle (Page 4541)	P, A	P	Specifies the type of border lines for the selected object.
Color (Page 4564)	P, A	P, A	Specifies the line color of the selected object.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
EndStyle (Page 4610)	A	A	Specifies how the line end of the selected object is displayed.
FillStyle (Page 4625)	A	A	Defines the fill pattern of the specified object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line end.
LineWidth (Page 4708)	P, A	P, A	Specifies the line thickness of the selected object.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
Points	-	-	Specifies the corner points.
PointsCount (Page 4785)	P	-	Specifies the number of corner points of the polyline or of the polygon.
RotationAngle (Page 4799)	P	P	Specifies the angle of rotation in degrees.
RotationCenterLeft (Page 4800)	P	P	Specifies the X coordinate of the pivot point for the object in runtime.
RotationCenterTop (Page 4801)	P	P	Specifies the Y coordinate of the pivot point for the object in runtime.
StartStyle (Page 4872)	A	A	Specifies how the line start of the selected object is displayed.
Style (Page 4886)	A	A	Specifies the line style of the selected object.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-88 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-89 Properties

Properties	Read	Write	Description
BackColor (Page 4511)	-	-	Specifies the background color of the selected object.
BackFillStyle (Page 4515)	-	-	Defines the fill pattern of the specified object.
BorderBackColor (Page 4528)	-	-	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4531)	-	-	Specifies the line color of the object.
BorderWidth (Page 4545)	-	-	Specifies the line thickness of the object.
EdgeStyle (Page 4602)		-	Specifies the line style of the selected object.
FillPatternColor (Page 4624)	-	-	Specifies the color of the fill pattern for the selected object.
Font (Page 4639)	-	-	Specifies or returns the font.
FontBold (Page 4640)	-	-	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4641)	-	-	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4642)	-	-	Specifies the font of the selected object.
FontSize (Page 4643)	-	-	Specifies the font size of the text for the selected object.
FontUnderline (Page 4643)	-	-	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4645)	-	-	Specifies the font color of the text for the selected object.
Format	-	-	Specifies that the format of the text block is displayed.
Height (Page 4653)	-	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 4667)	-	-	Specifies the horizontal alignment of the text within the selected object.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	-	-	Specifies the value of the X coordinate of the object.
LineWrap	-	-	Specifies the line break within the object.
Name (Page 4744)	-	-	Returns the object name as STRING.
Top (Page 4954)	-	-	Specifies the value of the Y coordinate of the object.
VerticalAlignment (Page 5024)	-	-	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5026)	-	-	Specifies whether the selected object is visible.
Width (Page 5037)	-	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

None of the properties are visible in the ES.

Table 10-97 Properties

Properties	Read	Write	Description
AllowEdit	-	-	Enables editing.
Authorization (Page 4504)	-	-	Specifies the operating rights of the selected object in runtime.
BackButtonVisible	-	-	Enables display of the "Back" button.
BackColor (Page 4511)	A	A	Specifies the background color of the selected object.
ComboBoxFont	-	-	Sets the font type for selection list.
DataRecordNameCaption	-	-	Sets the caption for the name of the data record.
DataRecordNrCaption	-	-	Sets the caption for the number of the data record.
Display3D	-	-	Sets the 3D view.
DisplayButton2Plc	-	-	Enables the display of the "Write to PLC" button.
DisplayButtonComparison	-	-	Enables the display of the "Synchronization" button.
DisplayButtonDelete	-	-	Enables the display of the "Delete data record" button.
DisplayButtonFromPlc	-	-	Enables the display of the "Read from PLC" button.
DisplayButtonHelp	-	-	Enables the display of the "Tooltip" button.
DisplayButtonNew	-	-	Enables the display of the "Add data record" button.
DisplayButtonSave	-	-	Enables the display of the "Save" button.
DisplayButtonSaveAs	-	-	Enables the display of the "Save As" button.
DisplayComboBox	-	-	Enables the display of the selection list.
DisplayGridlines	-	-	Enables the display of grid lines.
DisplayLabeling	-	-	Enables the display labelings.
DisplayNumbers	-	-	Enables the display of numbers.
DisplaySize *	-	-	
DisplayStatusBar	-	-	Specifies that the status bar is displayed.
DisplayTable	-	-	Enablers the display of the table.
Enabled (Page 4606)	A	A	Specifies whether the selected object can be operated in runtime.
EntryNameCaption	-	-	Sets the caption for the name of the recipe element.
EntryValueColFirst	-	-	Sets the "Entry value" column to first place.
EntryValueFieldLength	-	-	Sets the field length for the element value.
EntryValuePos	-	-	Sets the position of the first value.
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
FixedRecipeNumber *	-	-	
Flashing	-	-	Specifies that the text block flashes.

Properties	Read	Write	Description
FocusColor (Page 4636)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4638)	A	A	Specifies the border width of the specified object when the object is in focus.
Font (Page 4639)	-	-	Specifies or returns the font.
ForeColor (Page 4645)	A	A	Specifies the font color of the text for the selected object.
HeaderFont	-	-	Sets the header font.
Height (Page 4653)	A	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
KeyboardOnline	-	-	Enables the use of key combinations.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	A	A	Specifies the value of the X coordinate of the object.
ListAreaHeight	-	-	
ListAreaWidth	-	-	
MenuButtonVisible	-	-	Enables visibility of the menu buttons.
Name (Page 4744)	A	-	Returns the object name as STRING.
NameColumnWidth	-	-	
NumberOfLines	-	-	Sets the number of rows of the selection list for the text list object, or returns the value.
Recipe	-	-	Sets the recipe.
RecipeNameCaption	-	-	Sets the caption for the name of the recipe.
RecipeNameSelected *	-	-	
RecipeNrCaption	-	-	Specifies that the "Recipe number" column is in first place.
RecipeNrColFirst	-	-	Specifies that the "Recipe number" column is in first place.
RecipeVarSelected *	-	-	
Record *	-	-	
RecordNameSelected *	-	-	
RecordNrColFirst	-	-	Specifies that the "Data record number" column is in first place.
RecordVarSelected *	-	-	
RenameButtonVisible	-	-	Enables the display of the "Rename" button.
SelectionBackColor (Page 4826)	A	A	Specifies the background color of the selected cells.
SelectionForeColor (Page 4828)	A	A	Specifies the foreground color of the selected cells.
StatusFont	-	-	
TableBackColor (Page 4889)	A	A	Specifies the background color of the table cells for the selected object.
TableForeColor (Page 4892)	A	A	
TableGridlineColor (Page 4893)	A	A	Specifies the color for the grid lines.
TableHeaderBackColor (Page 4894)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderForeColor (Page 4895)	A	A	Specifies the text color in the header of the table of the selected object.
Top (Page 4954)	A	A	Specifies the value of the Y coordinate of the object.
ValueCaption	-	-	Sets the labeling for values.
ValueColumnWidth	-	-	

Properties	Read	Write	Description
VerticalScrolling	-	-	Sets the display of a scroll bar for the selected object.
ViewType	-	-	Specifies the alarm view type.
ViewTypeForSaveStream *	-	-	Specifies the display type for the Save Stream.
Visible (Page 5026)	A	A	Specifies whether the selected object is visible.
VisibleItems	-	-	Sets the maximum number of visible entries.
Width (Page 5037)	A	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

\* not visible in the ES

Properties	Read	Write	Description
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P, A	P, A	Defines the fill pattern of the specified object.
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4530)	P, A	P, A	Specifies the line color of the object.

Properties	Read	Write	Description
BorderFlashingColorOff (Page 4534)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4544)	P, A	P, A	Specifies the line thickness of the object.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4599)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4602)	A	A	Specifies the line style of the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line end.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
RelativeFillLevel (Page 4797)	P	P	Specifies the fill percentage for the object.
RoundCornerHeight (Page 4801)	P	P	Sets or returns the corner radius.
RoundCornerWidth (Page 4802)	P	P	Sets or returns the corner radius.
ShowFillLevel (Page 4846)	P	P	Specifies whether the selected object is filled.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-100 Methods

Methods	Validity	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

BorderShadeColor3D (Page 4540)	P	P	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
BorderWidth3D (Page 4546)	P	P	Specifies the width of the border for 3D display of the selected object.
CornerStyle (Page 4578) *	-	-	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4599)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4602)	P	P	Specifies the line style of the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.

Properties	Read	Write	Description
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 4639)	-	-	Specifies or returns the font.
FontBold (Page 4640)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4641)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4642)	P	P	Specifies the font of the selected object.
FontSize (Page 4643)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4643)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4644)	P	P	Specifies the font color of the text for the selected object.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 4666)	P	P	Specifies the horizontal alignment of the text within the selected object.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707) *	-	-	Specifies the shape of the line ends.
Mode (Page 4742)	P	P	Specifies the field type of the selected object.
Name (Page 4744)	P	-	Returns the object name as STRING.
PictureAlignment (Page 4781)	P	P	Specifies or returns the display type of the background image in the process picture.
PictureDeactivated (Page 4781)	P	P	Specifies the picture that is displayed in the "Disabled" state.
PictureOff (Page 4782)	P	P	Specifies the screen to be displayed in the "Off" state.
PictureOn (Page 4783)	P	P	Specifies the screen to be displayed in the "On" state.
Pressed (Page 4787)	P	P	Specifies whether the selected object is displayed in a pressed state.
Radius (Page 4793)	P	P	Sets the radius of the specified "Circle" object.
RelativeFillLevel (Page 4797)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 4846)	P	P	Specifies whether the selected object is filled.
StyleSettings (Page 4887)	P	P	Specifies the display style for the object:
Text (Page 4898)	P	P	Specifies the label for the text field.
TextOrientation (Page 4902)	P	P	Specifies the text orientation of the selected object.
Toggle (Page 4935)	P	P	Specifies whether the selected object engages after it has been operated in runtime.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.

Properties	Read	Write	Description
TransparentColorDeactivatedPicture (Page 4960)	P	P	Specifies the color to be set to "transparent" for the "Off" state of the assigned bitmap object.
TransparentColorPictureOff (Page 4960)	P	P	Specifies the color to be set to "transparent" for the "Off" state of the assigned bitmap object.
TransparentColorPictureOn (Page 4961)	P	P	Specifies the color to be set to "transparent" for the "On" state of the assigned bitmap object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseTransparentColorDeactivatedPicture (Page 5008)	P	P	Enables the use of the transparency color specified with the "TransparentColorDeactivatedPicture" property for the "Disabled" state.
UseTransparentColorPictureOff (Page 5009)	P	P	Specifies whether the transparent color defined in the "TransparentColorPictureOff" property is used for the "Off" state.
UseTransparentColorPictureOn (Page 5009)	P	P	Specifies whether the transparent color defined in the "TransparentColorPictureOn" property is used for the "On" state.
VerticalAlignment (Page 5024)	P	P	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-102 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-103 Properties

Properties	Read	Write	Description
AdaptScreenToWindow (Page 4486)	-	-	Specifies whether or not the screen visualized in a screen window is adapted to fit the size of the screen window in runtime.
AdaptWindowToScreen (Page 4486)	-	-	Specifies whether or not the screen window is adapted to fit the screen it visualizes in runtime.
BorderEnabled (Page 4532)	-	-	TRUE, if the window is visualized with a border in runtime.

Properties	Read	Write	Description
CaptionText (Page 4552)	P	P	Specifies the text that is displayed in the header of the selected object.
Flashing *	-	-	Specifies that the text block flashes.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalScrollbarPosition (Page 4668)	P	P	Sets horizontal positioning of the scroll bar in a screen window with slider, or returns its value.
IndependentWindow	-	-	Specifies whether the screen window is embedded in a screen or displayed as independent screen window.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LeftOffset (Page 4695)	P	P	Sets horizontal shift of the display of a graphic object that is larger than the screen window.
MenuToolBarConfig (Page 4723)	-	-	Loads the specified configuration file with configured menu and toolbars, or returns the name of the configuration file.
MonitorNumber	-	-	Sets the monitor number.
Name (Page 4744)	P	-	Returns the object name as STRING.
ScreenName (Page 4816)	P	P	Specifies the screen to be displayed in the screen window, or returns the screen name.
ShowCaption (Page 4844)	-	-	Hides or shows the caption.
ShowScrollBars (Page 4854)	-	-	Enables the display of scroll bars.
TagPrefix (Page 4896)	P	P	Sets the prefix for all tags that exist in the screen.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
TopOffset (Page 4957)	P	P	Sets or returns the offset of the screen from the top edge of the screen window.
VerticalScrollbarPosition (Page 5026)	P	P	Specifies the vertical positioning of the scroll bar in a screen window with slider, or returns its value.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
WindowCloseEnabled (Page 5039)	-	-	Enables closing of the window in runtime.
WindowMaximizeEnabled (Page 5040)	-	-	TRUE, if the window can be maximized in runtime.
WindowMovingEnabled (Page 5040)	-	-	TRUE, if the window can be moved in runtime.
WindowOnTop (Page 5040)	-	-	TRUE, if the object is always in the foreground in runtime.
WindowSizingEnabled (Page 5041)	-	-	Enables resizing of the specified object in runtime.
WindowStartupPosition	-	-	??
ZoomFactor (Page 5066)	P	P	Sets or reads the zoom factor of a screen or screen window.

\* not visible in the ES

Table 10-104 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Properties	Read	Write	Description
BorderEnabled (Page 4532)	-	-	TRUE, if the window is visualized with a border in runtime.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
Name (Page 4744)	P	P	Returns the object name as STRING.
ShowCaption (Page 4844)	-	-	Hides or shows the caption.
Template (Page 4897)	-	-	Returns the template for displaying the window content of the "Application window" object.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
WindowCloseEnabled (Page 5039)	-	-	Enables closing of the window in runtime.
WindowMaximizeEnabled (Page 5040)	-	-	TRUE, if the window can be maximized in runtime.
WindowMovingEnabled (Page 5040)	-	-	TRUE, if the window can be moved in runtime.
WindowOnTop (Page 5040)	-	-	TRUE, if the object is always in the foreground in runtime.
WindowsContents (Page 5041)	-	-	Returns the content of the application window
WindowSizingEnabled (Page 5041)	-	-	Enables resizing of the specified object in runtime.

Table 10-106 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-107 Properties

Properties	Read	Write	Description
Authorization (Page 4504)	-	-	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.
BackPicture	-	-	Specifies a graphic for the background.

## 10.8 Working with system functions and Runtime scripting

Properties	Read	Write	Description
BarBackColor (Page 4519)	P, A	P, A	Specifies the color of the bar background for the selected object.
BarColor (Page 4522)	P, A	P, A	Sets the color of the slider in the "Slider" object.
BorderBrightColor3D (Page 4529)	P, A	P, A	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderInnerStyle3D (Page 4538)	P	P	Specifies the representation of the inner part of the object border.
BorderInnerWidth3D (Page 4538)	P, A	P, A	Specifies the width of the inner border for 3D presentation of the selected object.
BorderOuterStyle3D (Page 4539)	P	P	Specifies the representation of the outer part of the object border.
BorderOuterWidth3D (Page 4539)	P, A	P, A	Sets the width of the outer border for 3D presentation of the selected object.
BorderShadeColor3D (Page 4540)	P, A	P, A	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderWidth (Page 4544)	P, A	P, A	Specifies the line thickness of the object.
Caption (Page 4549)	P, A	P, A	Specifies the text that is displayed in the header of the selected object.
ContinousChange (Page 4578)	P	P	Specifies whether to transfer the value of the "ProcessValue" when the mouse button is released, or immediately on a change of the slider position in runtime.
Enabled (Page 4605)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
Flashing	-	-	Specifies that the text block flashes.
FocusColor (Page 4636)	P, A	P, A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4637)	P, A	P, A	Specifies the border width of the specified object when the object is in focus.
Font	-	-	Specifies or returns the font.
ForeColor (Page 4644)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
LabelColor (Page 4676)	P, A	P, A	Sets the color of the scale labeling in the "Slider" object.
Layer (Page 4681)	-	-	Specifies the value of the X coordinate of the object.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
MaximumValue (Page 4719)	P, A	P, A	Specifies the maximum value of the scale in the selected object.
MinimumValue (Page 4740)	P, A	P, A	Specifies the minimum value of the scale in the selected object.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
PositionFont	-	-	Sets the font type for the labeling.
ProcessValue (Page 4789)	P, A	P, A	Specifies the default for the value to be displayed.
ShowBar (Page 4843)	P, A	P, A	Specifies whether to display the process value along with a filled bar in the "Slider" object.
ShowPosition (Page 4851)	P, A	P, A	Adds a numerical display of the value of the slider position.
ShowThumb (Page 4859)	P, A	P, A	Displays the slider of the "Slider" object.
ShowTickLabels (Page 4859)	P, A	P, A	Specifies whether the label is shown in the scale.

Properties	Read	Write	Description
ShowTicks (Page 4860)	P, A	P, A	Specifies whether the tick marks are displayed in the scale of the object.
ThumbBackColor (Page 4903)	P, A	P, A	Specifies the background color of the slider in the "Slider" object.
ThumbPicture	-	-	Specifies a graphic object for the slider.
TickStyle (Page 4904)	P	P	Specifies the scale display.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipse", "Circle" and "Rectangle" objects.

Table 10-108 Methods

Methods	Validity	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

## SmartClientView

### Description

Represents the "Sm@rtClient View" object. The SmartClientView object is an element of the ScreenItems list.

### Type identifier in VBS

HMISmartClientView

Abbreviation	Validity
Pa	Panels
A	Runtime Advanced
P	Runtime Professional

Table 10-109 Properties

Properties	Read	Write	Description
AllowMenu (Page 4498)	-	-	Specifies whether the shortcut menu is enabled to control the Sm@rtClient view.
ConnectionType (Page 4576)	-	-	Specifies the type of connector. You can select one of two connection types.
ConnectOnStart	-	-	Sets up the connection at startup.

Properties	Read	Write	Description
Enabled (Page 4606)	A	A	Specifies whether the selected object can be operated in runtime.
Flashing	-	-	Specifies that the text block flashes.
Font (Page 4639)	-	-	Specifies or returns the font.
Height (Page 4653)	A	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	A	A	Specifies the value of the X coordinate of the object.
LocalCursor (Page 4711)	-	-	Specifies whether the cursor data is transferred separately in order to increase the performance.
MachineName (Page 4717)	A	A	Sets the network ID of the device that is to be monitored.
Name (Page 4744)	A	-	Returns the object name as STRING.
Password (Page 4774)	A	A	Sets the password for remote monitoring.
ScaleDenominator (Page 4814)	-	-	Sets the scaling numerator on the client.
ScaleNumerator (Page 4810)	-	-	Sets the scaling numerator on the client.
Scaling (Page 4814)	-	-	TRUE, if an additional scale is used to visualize the values.
ServerScale (Page 4834)	-	-	Specifies whether the Sm@rtClient view can be zoomed in or out.
Shared (Page 4840)	-	-	Specifies that an HMI device is shared by several Sm@rtClient Views.
ShowControls	-	-	Specifies that a toolbar is displayed.
Top (Page 4954)	A	A	Specifies the value of the Y coordinate of the object.
UseCursorKeyScroll	-	-	Sets the use of the background color of the object for printing.
ViewOnly (Page 5026)	A	A	Enables the use of the Sm@rtClient view for remote monitoring or remote maintenance.
Visible (Page 5026) *	A	A	Specifies whether the selected object is visible.
Width (Page 5037)	A	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-111 Properties

Properties	Read	Write	Description
Appearance	-	-	Specifies the layout for this NC subroutine.
BackColor (Page 4511)	A	A	Specifies the background color of the selected object.
ColumnsMoveable	-	-	Specifies that the columns can be moved.
CountVisibleItems (Page 4582) *	-	-	Specifies the number of lines contained in the selection list.
Enabled (Page 4606)	A	A	Specifies whether the selected object can be operated in runtime.

Properties	Read	Write	Description
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
Flashing	-	-	Specifies that the text block flashes.
FocusColor (Page 4636)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4638)	A	A	Specifies the border width of the specified object when the object is in focus.
Height (Page 4653)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	A	A	Specifies the value of the X coordinate of the object.
Name (Page 4744)	A	-	Returns the object name as STRING.
PLCFilter	-	-	Sets the controller type.
SelectionBackColor (Page 4826)	A	A	Specifies the background color of the selected cells.
SelectionForeColor (Page 4828)	A	A	Specifies the foreground color of the selected cells.
SetOfVisibleColumns	-	-	Sets the visible columns.
ShowReadButton	-	-	Enables the display of the "Read" button.
ShowTableGridlines (Page 4858)	A	A	Enables the display of gridlines in the table of the specified object.
ShowWriteButton	-	-	Enables the display of the "Write" button.
TableBackColor (Page 4889)	A	A	Specifies the background color of the table cells for the selected object.
TableFont	-	-	Specifies the font in the table.
TableForeColor (Page 4892)	A	A	??
TableHeaderBackColor (Page 4894)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderFont	-	-	Specifies the text color of the header.
TableHeaderForeColor (Page 4895)	A	A	Specifies the text color in the header of the table of the selected object.
Top (Page 4954)	A	A	Specifies the value of the Y coordinate of the object.
Visible (Page 5026) *	A	A	Specifies whether the selected object is visible.
Width (Page 5037)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-113 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 4476)	-	-	Sets the color of the specified object for the "High limit violated" event.
Authorization (Page 4504)	-	-	Specifies the operating rights of the selected object in runtime.
AutoSizing	-	-	Specifies that the size of the object should be automatically adapted to the content.
BackColor (Page 4510)	A	A	Specifies the background color of the selected object.
BackFlashingColorOff (Page 4516) *	-	-	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4517) *	-	-	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4518) *	-	-	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4518) *	-	-	Specifies the flash rate of the background for the selected object.
BelowLowerLimitColor (Page 4525)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BorderColor (Page 4530) *	-	-	Specifies the line color of the object.
BorderFlashingColorOff (Page 4534) *	-	-	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535) *	-	-	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536) *	-	-	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537) *	-	-	Specifies the flash rate of the border line for the selected object.
BorderStyle3D (Page 4543)	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4544) *	-	-	Specifies the line thickness of the object.
BorderWidth3D (Page 4546) *	-	-	Specifies the width of the border for 3D display of the selected object.
CaptionColor (Page 4551)	A	A	Specifies the color of the text that is displayed in the header of the selected object.
CaptionFont	-	-	Specifies the character set for the caption.
CaptionText (Page 4552)	A	A	Specifies the text that is displayed in the header of the selected object.
CornerStyle (Page 4578) *	-	-	Specifies the type of border lines for the selected object.
EdgeStyle (Page 4601) *	-	-	Specifies the line style of the selected object.
Enabled (Page 4605)	A	A	Specifies whether the selected object can be operated in runtime.

Properties	Read	Write	Description
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628) *	-	-	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630) *	-	-	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631) *	-	-	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 4632) *	-	-	Specifies the flash rate of the border line for the selected object.
FocusColor (Page 4636)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4637)	A	A	Specifies the border width of the specified object when the object is in focus.
Font (Page 4639)	-	-	Specifies or returns the font.
ForeColor (Page 4644)	A	A	Specifies the font color of the text for the selected object.
Height (Page 4653)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4656)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HorizontalAlignment (Page 4666)	A	A	Specifies the horizontal alignment of the text within the selected object.
InnerBackColorOff (Page 4671)	A	A	Sets the color underneath the slider of the "Switch" object for the object in OFF state.
InnerBackColorOn (Page 4672)	A	A	Sets the color underneath the slider of the "Switch" object for the object in ON state.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	A	A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707) *	-	-	Specifies the shape of the line end.
Mode (Page 4742)	-	-	Specifies the field type of the selected object.
Name (Page 4744)	A	-	Returns the object name as STRING.
OnValue	-	-	Specifies the value for the "ON" state in "two-state" mode.
PictureOff (Page 4782)	-	-	Specifies the screen to be displayed in the "Off" state.
PictureOn (Page 4783)	-	-	Specifies the screen to be displayed in the "On" state.
ProcessValue (Page 4790)	-	-	Specifies the default for the value to be displayed.
SwitchOrientation	-	-	Specifies the line color of the object.
TextOff (Page 4900)	A	A	Specifies the text to be displayed in the "Off" state of the selected object.
TextOn (Page 4901)	A	A	Specifies the text to be displayed in the "On" state of the selected object.
TextOrientation (Page 4902) *	-	-	Specifies the text orientation of the selected object.
Top (Page 4954)	A	A	Specifies the value of the Y coordinate of the object.

Properties	Read	Write	Description
VerticalAlignment (Page 5024)	A	A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5026) *	A	A	Specifies whether the selected object is visible.
Width (Page 5037)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-115 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 4476)	-	-	Sets the color of the specified object for the "High limit violated" event.
AcceptOnExit (Page 4477)	P	P	Specifies whether the input field is confirmed automatically when it is left.
AdaptBorder (Page 4485)	-	-	Specifies whether the border of the specified object is dynamically adapted to the text size.
AskOperationMotive (Page 4502)	P	P	Specifies whether the reason for operating this object is logged.
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4516)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4517)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4518)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4518)	P	P	Specifies the flash rate of the background for the selected object.
BelowLowerLimitColor (Page 4525)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BitNumber (Page 4525)	P	P	Specifies the bit whose status must change to trigger a value change.

Properties	Read	Write	Description
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4530)	P, A	P, A	Specifies the line color of the object.
BorderFlashingColorOff (Page 4534)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D (Page 4543)	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4544)	P, A	P, A	Specifies the line thickness of the object.
BottomMargin	-	-	Sets the margin between the text and the bottom edge of the object.
CaptionBackColor (Page 4550)	P	P	Specifies the background color of the caption for the selected object.
CaptionColor (Page 4551)	P	P	Specifies the color of the text that is displayed in the header of the selected object.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
CountVisibleItems (Page 4582)	P	P	Specifies the number of lines contained in the selection list.
CursorControl (Page 4584)	P	P	Specifies whether the mouse cursor jumps to the next field of the TAB sequence after leaving a field.
DrawInsideFrame (Page 4599)	-	-	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4602)	P	P	Specifies the line style of the selected object.
EditOnFocus (Page 4604)	P	P	Specifies whether data input is immediately possible if the input field is selected using the "Tab" key.
Enabled (Page 4605)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FieldLength	-	-	Specifies that the "field length string" field is read-only.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.

## 10.8 Working with system functions and Runtime scripting

Properties	Read	Write	Description
FocusColor (Page 4636)	-	-	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4637)	-	-	Specifies the border width of the specified object when the object is in focus.
Font (Page 4639)	-	-	Specifies or returns the font.
FontBold (Page 4640)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4641)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4642)	P	P	Specifies the font of the selected object.
FontSize (Page 4643)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4643)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4644)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4656)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HorizontalAlignment (Page 4666)	P, A	P, A	Specifies the horizontal alignment of the text within the selected object.
InputValue (Page 4672)	-	-	Defines the value entered by the user in the IO field.
ItemBorderStyle (Page 4675)	P	P	Sets the separation line style in the selection list of the specified object.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
LeftMargin	-	-	Sets the margin between the text and the left edge of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line end.
LogOperation (Page 4712)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
Mode (Page 4742)	P	P	Specifies the field type of the selected object.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
OnValue	-	-	Specifies the value for the "ON" state in "two-state" mode.
ProcessValue (Page 4789)	P	P	Specifies the default for the value to be displayed.
RightMargin	-	-	Sets the margin between the text and the right edge of the object.
SelectBackColor (Page 4820)	P	P	Specifies the background color of the selected cells.
SelectForeColor (Page 4824)	P	P	Specifies the foreground color of the selected cells.
SeparatorBackColor (Page 4832)	P	P	Specifies the background color of the broken separation lines in the selection list of the specified object.
SeparatorColor (Page 4832)	P	P	Sets the color of the separation lines in the selection list of the specified object.
SeparatorCornerStyle (Page 4833)	P	P	Sets the shape of corners for the object of the type "ScreenItem" with "SymbolicIOField" format.
SeparatorLineEndShapeStyle (Page 4834)	P	P	Sets the shape of line ends for the object of the type "ScreenItem" with "SymbolicIOField" format.

Properties	Read	Write	Description
SeparatorStyle (Page 4833)	P	P	Sets the separation line style in the selection list of the specified object.
SeparatorWidth (Page 4834)	P	P	Sets the width separation lines in the selection list of the specified object.
ShowBadTagState (Page 4843)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowDropDownButton	-	-	Sets the display of a button for the selection list.
ShowDropDownList	-	-	Specifies selection of the entry from a selection list.
TextList (Page 4899)	-	-	Specifies the label for the text field.
TextOff (Page 4900)	-	-	Specifies the text to be displayed in the "Off" state of the selected object.
TextOn (Page 4901)	-	-	Specifies the text to be displayed in the "On" state of the selected object.
TextOrientation (Page 4902)	P	P	Specifies the text orientation of the selected object.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
TopMargin	-	-	Sets the margin between the text and the top edge of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
VerticalAlignment (Page 5024)	P, A	P, A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-116 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

## SymbolLibrary

### Description

Represents the "SymbolLibrary" object. The SymbolLibrary object is an element of the ScreenItems list.

### Type identifier in VBS

HMISymbolLibrary

Abbreviation	Validity
Pa	Panels
A	Runtime Advanced
P	Runtime Professional

Table 10-117 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 4476)	-	-	Sets the color of the specified object for the "High limit violated" event.
Authorization (Page 4504)	-	-	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.

Properties	Read	Write	Description
BelowLowerLimitColor (Page 4525)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BlinkColor (Page 4526)	P, A	P, A	Sets the flashing color for the "SymbolLibrary" object.
BlinkMode (Page 4526)	P	P	Sets the type of flashing graphic for the specified object.
BlinkSpeed (Page 4527)	P	P	Sets the flash rate.
ChangeMouseCursor (Page 4559)	P	P	Specifies the appearance of the cursor after its transformation in mouse over icon mode in runtime.
Enabled (Page 4605)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FillColorMode (Page 4623)	P	P	Sets the type of foreground for the specified object.
FixedAspectRatio (Page 4627)	P	P	Specifies whether the aspect ratio should be retained on changes of the icon size, or follow the change dynamically.
Flashing	-	-	Specifies that the text block flashes.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
Flip (Page 4635)	P	P	Flips the symbol on the vertical and / or horizontal center axis of the icon.
ForeColor (Page 4644)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
ProcessValue (Page 4790)	-	-	Specifies the default for the value to be displayed.
Rotation (Page 4799)	P	P	Specifies the angle of rotation in degrees of the selected object.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-118 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

P	Runtime Professional

Table 10-119 Properties

Properties	Read	Write	Description
Authorization (Page 4504)	A	A	Specifies the operating rights of the selected object in runtime.
BackgroundColor	A	A	Specifies the background color.
ComponentInfoText	A	A	Specifies the tooltip of the system diagnostics view in runtime.

10.8 Working with system functions and Runtime scripting

Properties	Read	Write	Description
Enabled (Page 4606)	A	A	Specifies whether the selected object can be operated in runtime.
Height (Page 4653)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
InfoArea_BackgroundColor	A	A	Specifies the background for grid control elements.
InfoArea_ColumnsMovable	A	A	Specifies the mobility of columns.
InfoArea_DefaultTextColor	A	A	Sets the text color.
InfoArea_ErrorTextBackgroundColor	A	A	Specifies the background color of a cell in error case.
InfoArea_ErrorTextColor	A	A	Sets the text color of a cell in error case.
InfoArea_FocusFrameColor	A	A	Sets the color of the focus frame.
InfoArea_FocusFrameWidth	A	A	Sets the line thickness of the focus rectangle.
InfoArea_Font	A	A	Sets the fonts of the grid views.
InfoArea_ShowGridLines	A	A	Sets the grid lines.
InfoArea_TableHeaderBackgroundColor	A	A	Specifies the background color of the table header.
InfoArea_TableHeaderTextColor	A	A	Sets the text color of the table header.
InputAddressText	A	A	Sets the input address.
ItemText_AKZ	A	A	Specifies the header for the "AKZ" column.
ItemText_Descriptor	A	A	Specifies the header for the "Descriptor" column.
ItemText_ErrorText	A	A	Specifies the header for the "ErrorText" column.
ItemText_InstallationDate	A	A	Specifies the header for the "InstallationDate" column.
ItemText_LADDR	A	A	Specifies the header for the "LADDR" column.
ItemText_Name	A	A	Sets the labeling of the "Name" column.
ItemText_OKZ	A	A	Specifies the header for the "OKZ" column.
ItemText_OperationState	A	A	Specifies the header for the "OperationState" column.
ItemText_OrderID	A	A	Specifies the header for the "OrderID" column.
ItemText_Rack	A	A	Specifies the header for the "Rack" column.
ItemText_Slot	A	A	Specifies the header for the "Slot" column.
ItemText_SoftwareRevision	A	A	Specifies the header for the "SoftwareRevision" column.
ItemText_State	A	A	Specifies the header for the "State" column.
ItemText_Station	A	A	Specifies the header for the "Station" column.
ItemText_SubAddress	A	A	Specifies the header for the "SubAddress" column.
ItemText_SubSlot	A	A	Specifies the header for the "SubSlot" column.
ItemText_SubSystem	A	A	Specifies the header for the "SubSystem" column.
ItemText_Type	A	A	Specifies the header for the "Type" column.
IV_ShowItem_AKZ	A	A	Enables the display of the "AKZ" column.
IV_ShowItem_Descriptor	A	A	Enables the display of the "Descriptor" column.
IV_ShowItem_ErrorText	A	A	Enables the display of the "ErrorText" column.
IV_ShowItem_InstallationDate	A	A	Enables the display of the "InstallationDate" column.
IV_ShowItem_LADDR	A	A	Enables the display of the "LADDR" column.
IV_ShowItem_Name	A	A	Enables the display of the "Name" column.
IV_ShowItem_OKZ	A	A	Enables the display of the "OKZ" column.
IV_ShowItem_OperationState	A	A	Enables the display of the "OperationState" column.

Properties	Read	Write	Description
IV_ShowItem_OrderID	A	A	Enables the display of the "OrderID" column.
IV_ShowItem_Rack	A	A	Enables the display of the "Rack" column.
IV_ShowItem_Slot	A	A	Enables the display of the "Slot" column.
IV_ShowItem_SoftwareRevision	A	A	Enables the display of the "SoftwareRevision" column.
IV_ShowItem_State	A	A	Enables the display of the "State" column.
IV_ShowItem_Station	A	A	Enables the display of the "Station" column.
IV_ShowItem_SubAddress	A	A	Enables the display of the "SubAddress" column.
IV_ShowItem_SubSlot	A	A	Enables the display of the "SubSlot" column.
IV_ShowItem_SubSystem	A	A	Enables the display of the "SubSystem" column.
IV_ShowItem_Type	A	A	Enables the display of the "Type" column.
Layer (Page 4681)	A	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	A	A	Specifies the value of the X coordinate of the object.
NavigationPath_Font	A	A	Sets the font type of the navigation path.
NavigationPath_TextColor	A	A	Sets the text color of the navigation path.
ObjectName (Page 4752)	A	-	Returns the object name as STRING.
OutputAddressText	A	A	Specifies the text for the output address.
ShowNavigationButtons	A	A	Enables the display of navigation buttons.
ShowPathInformation	A	A	Enables the display of the navigation path.
ShowSplittedView	A	A	Enables a split view.
TableHeaderFont	A	A	Specifies the text color of the header.
Top (Page 4954)	A	A	Specifies the value of the Y coordinate of the object.
Type (Page 4988)	A	-	Returns the type of the specified object as STRING.
Parent (Page 4772)	A	-	Returns the screen in which the specified object is embedded.
UV_ShowItem_AKZ	A	A	Enables the display of the "AKZ" column.
UV_ShowItem_Descriptor	A	A	Enables the display of the "Descriptor" column.
UV_ShowItem_InstallationDate	A	A	Enables the display of the "InstallationDate" column.
UV_ShowItem_LADDR	A	A	Enables the display of the "LADDR" column.
UV_ShowItem_Name	A	A	Enables the display of the "Name" column.
UV_ShowItem_OKZ	A	A	Enables the display of the "OKZ" column.
UV_ShowItem_OperationState	A	A	Enables the display of the "OperationState" column.
UV_ShowItem_OrderID	A	A	Enables the display of the "OrderID" column.
UV_ShowItem_Rack	A	A	Enables the display of the "Rack" column.
UV_ShowItem_Slot	A	A	Enables the display of the "Slot" column.
UV_ShowItem_SoftwareRevision	A	A	Enables the display of the "SoftwareRevision" column.
UV_ShowItem_State	A	A	Enables the display of the "State" column.
UV_ShowItem_Station	A	A	Enables the display of the "Station" column.
UV_ShowItem_SubAddress	A	A	Enables the display of the "SubAddress" column.
UV_ShowItem_SubSlot	A	A	Enables the display of the "SubSlot" column.
UV_ShowItem_SubSystem	A	A	Enables the display of the "SubSystem" column.
UV_ShowItem_Type	A	A	Enables the display of the "Type" column.

Properties	Read	Write	Description
Visible (Page 5026)	A	A	Specifies whether the selected object is visible.
Width (Page 5037)	A	A	Enables the display of the "Slot" column.

Table 10-121 Properties

Properties	Read	Write	Description
Authorization (Page 4504)	A	A	Specifies the operating rights of the selected object in runtime.
BackgroundColor	A	A	Specifies the background color.
Caption (Page 4549)	A	A	Specifies the text that is displayed in the header of the selected object.
CaptionActive	A	A	Enables display of the caption.
Closable (Page 4564)	A	A	Specifies that the control can be closed in runtime.
ComponentInfoText	A	A	Specifies the tooltip of the system diagnostics view in runtime.
Enabled (Page 4606)	A	A	Specifies whether the selected object can be operated in runtime.
Height (Page 4653)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
InfoArea_BackgroundColor	A	A	Specifies the background for grid control elements.
InfoArea_ColumnsMovable	A	A	Specifies the mobility of columns.
InfoArea_DefaultTextColor	A	A	Sets the text color.
InfoArea_ErrorTextBackgroundColor	A	A	Specifies the background color of a cell in error case.
InfoArea_ErrorTextColor	A	A	Sets the text color of a cell in error case.
InfoArea_FocusFrameColor	A	A	Sets the color of the focus frame.
InfoArea_FocusFrameWidth	A	A	Sets the line thickness of the focus rectangle.
InfoArea_Font	A	A	Sets the fonts of the grid views.
InfoArea_ShowGridLines	A	A	Sets the grid lines.
InfoArea_TableHeaderBackgroundColor	A	A	Specifies the background color of the table header.
InfoArea_TableHeaderTextColor	A	A	Sets the text color of the table header.
InputAddressText	A	A	Sets the input address.
ItemText_AKZ	A	A	Specifies the header for the "AKZ" column.
ItemText_Descriptor	A	A	Specifies the header for the "Descriptor" column.
ItemText_ErrorText	A	A	Specifies the header for the "ErrorText" column.
ItemText_InstallationDate	A	A	Specifies the header for the "InstallationDate" column.
ItemText_LADDR	A	A	Specifies the header for the "LADDR" column.

Properties	Read	Write	Description
ItemText_Name	A	A	Sets the labeling of the "Name" column.
ItemText_OKZ	A	A	Specifies the header for the "OKZ" column.
ItemText_OperationState	A	A	Specifies the header for the "OperationState" column.
ItemText_OrderID	A	A	Specifies the header for the "OrderID" column.
ItemText_Rack	A	A	Specifies the header for the "Rack" column.
ItemText_Slot	A	A	Specifies the header for the "Slot" column.
ItemText_SoftwareRevision	A	A	Specifies the header for the "SoftwareRevision" column.
ItemText_State	A	A	Specifies the header for the "State" column.
ItemText_Station	A	A	Specifies the header for the "Station" column.
ItemText_SubAddress	A	A	Specifies the header for the "SubAddress" column.
ItemText_SubSlot	A	A	Specifies the header for the "SubSlot" column.
ItemText_SubSystem	A	A	Specifies the header for the "SubSystem" column.
ItemText_Type	A	A	Specifies the header for the "Type" column.
IV_ShowItem_AKZ	A	A	Enables the display of the "AKZ" column.
IV_ShowItem_Descriptor	A	A	Enables the display of the "Descriptor" column.
IV_ShowItem_ErrorText	A	A	Enables the display of the "ErrorText" column.
IV_ShowItem_InstallationDate	A	A	Enables the display of the "InstallationDate" column.
IV_ShowItem_LADDR	A	A	Enables the display of the "LADDR" column.
IV_ShowItem_Name	A	A	Enables the display of the "Name" column.
IV_ShowItem_OKZ	A	A	Enables the display of the "OKZ" column.
IV_ShowItem_OperationState	A	A	Enables the display of the "OperationState" column.
IV_ShowItem_OrderID	A	A	Enables the display of the "OrderID" column.
IV_ShowItem_Rack	A	A	Enables the display of the "Rack" column.
IV_ShowItem_Slot	A	A	Enables the display of the "Slot" column.
IV_ShowItem_SoftwareRevision	A	A	Enables the display of the "SoftwareRevision" column.
IV_ShowItem_State	A	A	Enables the display of the "State" column.
IV_ShowItem_Station	A	A	Enables the display of the "Station" column.
IV_ShowItem_SubAddress	A	A	Enables the display of the "SubAddress" column.
IV_ShowItem_SubSlot	A	A	Enables the display of the "SubSlot" column.
IV_ShowItem_SubSystem	A	A	Enables the display of the "SubSystem" column.
IV_ShowItem_Type	A	A	Enables the display of the "Type" column.
Layer (Page 4681)	A	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	A	A	Specifies the value of the X coordinate of the object.
Modal	A	A	Specifies that you must acknowledge the alarm view before continuing with your work.
NavigationPath_Font	A	A	Sets the font type of the navigation path.
NavigationPath_TextColor	A	A	Sets the text color of the navigation path.
ObjectName (Page 4752)	A	-	Returns the object name as STRING.
OutputAddressText	A	A	Specifies the text for the output address.
Resizable	A	A	Enables resizing of the window.
ShowNavigationButtons	A	A	Enables the display of navigation buttons.
ShowPathInformation	A	A	Enables the display of the navigation path.

Properties	Read	Write	Description
ShowSplittedView	A	A	Enables a split view.
TableHeaderFont	A	A	Specifies the text color of the header.
Top (Page 4954)	A	A	Specifies the value of the Y coordinate of the object.
Type (Page 4988)	A	-	Returns the type of the specified object as STRING.
Parent (Page 4772)	A	-	Returns the screen in which the specified object is embedded.
UV_ShowItem_AKZ	A	A	Enables the display of the "AKZ" column.
UV_ShowItem_Descriptor	A	A	Enables the display of the "Descriptor" column.
UV_ShowItem_InstallationDate	A	A	Enables the display of the "InstallationDate" column.
UV_ShowItem_LADDR	A	A	Enables the display of the "LADDR" column.
UV_ShowItem_Name	A	A	Enables the display of the "Name" column.
UV_ShowItem_OKZ	A	A	Enables the display of the "OKZ" column.
UV_ShowItem_OperationState	A	A	Enables the display of the "OperationState" column.
UV_ShowItem_OrderID	A	A	Enables the display of the "OrderID" column.
UV_ShowItem_Rack	A	A	Enables the display of the "Rack" column.
UV_ShowItem_Slot	A	A	Enables the display of the "Slot" column.
UV_ShowItem_SoftwareRevision	A	A	Enables the display of the "SoftwareRevision" column.
UV_ShowItem_State	A	A	Enables the display of the "State" column.
UV_ShowItem_Station	A	A	Enables the display of the "Station" column.
UV_ShowItem_SubAddress	A	A	Enables the display of the "SubAddress" column.
UV_ShowItem_SubSlot	A	A	Enables the display of the "SubSlot" column.
UV_ShowItem_SubSystem	A	A	Enables the display of the "SubSystem" column.
UV_ShowItem_Type	A	A	Enables the display of the "Type" column.
Visible (Page 5026)	A	A	Specifies whether the selected object is visible.
Width (Page 5037)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
WindowMode	A	A	Sets the window mode.

Table 10-123 Properties

Properties	Read	Write	Description
AdaptBorder (Page 4485)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4516)	P	P	Specifies the background color for flash state "Off".

Properties	Read	Write	Description
BackFlashingColorOn (Page 4517)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4518)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4518)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4530)	P, A	P, A	Specifies the line color of the object.
BorderFlashingColorOff (Page 4534)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D (Page 4543)	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4544)	P, A	P, A	Specifies the line thickness of the object.
BottomMargin	-	-	Sets the margin between the text and the bottom edge of the object.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4599)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4602)	A	A	Specifies the line style of the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4628)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4630)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4631)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4632)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 4639)	-	-	Specifies or returns the font.
FontBold (Page 4640)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4641)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4642)	P	P	Specifies the font of the selected object.
FontSize (Page 4643)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4643)	P	P	Specifies whether the text of the selected object is underlined.

Properties	Read	Write	Description
ForeColor (Page 4644)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 4653)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 4666)	P, A	P, A	Specifies the horizontal alignment of the text within the selected object.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P, A	P, A	Specifies the value of the X coordinate of the object.
LeftMargin	-	-	Sets the margin between the text and the left edge of the object.
LineEndShapeStyle (Page 4707)	P	P	Specifies the shape of the line end.
LineWrap *	-	-	Specifies the line break within the object.
Name (Page 4744)	P, A	-	Returns the object name as STRING.
RelativeFillLevel (Page 4797)	P	P	Specifies the fill percentage for the object.
RightMargin	-	-	Sets the margin between the text and the right edge of the object.
RotationAngle (Page 4799)	P	P	Specifies the angle of rotation in degrees.
RotationCenterLeft (Page 4800)	P	P	Specifies the X coordinate of the pivot point for the object in runtime.
RotationCenterTop (Page 4801)	P	P	Specifies the Y coordinate of the pivot point for the object in runtime.
ShowFillLevel (Page 4846)	P	P	Specifies whether the selected object is filled.
Text (Page 4898)	P, A	P, A	Specifies the label for the text field.
TextOrientation (Page 4902)	P	P	Specifies the text orientation of the selected object.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P, A	P, A	Specifies the value of the Y coordinate of the object.
TopMargin	-	-	Sets the margin between the text and the top edge of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
VerticalAlignment (Page 5024)	P, A	P, A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 5026)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 5037)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-124 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Screen object (list) (Page 4262)

**TrendRulerControl****Description**

Represents the "Value table" object. The TrendRulerControl object is an element of the ScreenItems list.

**Type identifier in VBS**

HMITrendRulerControl

**Example**

In the following example, the object with the name "Control1" is moved 16 pixels to the right:

```
'VBS60
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left + 16
```

Table 10-125 Properties

Properties	Read	Write	Description
ApplyProjectSettingsForDesignMode	-	-	Specifies that the project settings are used for the design.
AutoCompleteColumns (Page 4505)	P	P	Specifies whether empty columns are shown if the control is wider than the configured columns.
AutoCompleteRows (Page 4506)	P	P	Specifies whether empty rows are shown if the control is longer than the number of configured rows.
AutoPosition	P	P	Sets the automatic repositioning mode.
AutoSelectionColors (Page 4507)	P	P	Specifies whether the colors defined by the system are used as the selection colors for cells and rows.
AutoSelectionRectColor (Page 4508)	P	P	Specifies whether the selection frame is shown with the color defined by the system.
AutoShow	P	P	Specifies the automatic display of the value table.
BackColor (Page 4510)	P	P	Specifies the background color of the selected object.
BlockAlign *	P	P	Sets the alignment.
BlockAutoPrecisions *	P	P	Specifies that the number of decimal places displayed for an axis is adjusted automatically.
BlockCaption *	P	P	Sets the caption.
BlockCount *	P	P	Sets the number of blocks.
BlockDateFormat *	P	P	Specifies the date format.
BlockExponentialFormat *	P	P	Enables the use of the exponential notation.
BlockHideText *	P	P	Specifies whether the text is displayed.
BlockHideTitleText *	P	P	Specifies whether the text is displayed.
BlockId *	P	P	Sets the ID.
BlockIndex	P	P	The index specifies the block to which other properties such as names are referenced.
BlockLength *	P	P	Specifies the number of displayed characters.
BlockName *	P	P	Sets the name of a block.

Properties	Read	Write	Description
BlockPrecisions *	P	P	Specifies the number of displayed decimal places.
Blocks	-	-	Sets the alarm blocks.
BlockShowDate *	P	P	Specifies that the date is to be displayed.
BlockShowIcon *	P	P	Specifies the tooltip text.
BlockShowTitleIcon *	P	P	Enables the display of title as icon.
BlockTimeFormat *	P	P	Specifies the time format.
BlockUseSourceFormat *	P	P	Enables the use of the source format.
BorderColor (Page 4530)	P	P	Specifies the line color of the object.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
Caption (Page 4549)	P	P	Specifies the text that is displayed in the header of the selected object.
CellCut (Page 4553)	P	P	Specifies whether the contents of the cells are abbreviated if the cells are too narrow.
CellSpaceBottom (Page 4554)	P	P	Specifies the bottom margin of the table cells.
CellSpaceLeft (Page 4555)	P	P	Sets the left indent for the table cells.
CellSpaceRight (Page 4555)	P	P	Specifies the right indent of the table cells.
CellSpaceTop (Page 4556)	P	P	Specifies the top margin of the table cells.
Closeable (Page 4564)	P	P	Specifies that the control can be closed in runtime.
ColumnAdd *	P	P	Adds a column.
ColumnCount *	P	P	Displays the number of columns.
ColumnIndex	P	P	The index specifies on which column other properties, e.g. initial value are based.
ColumnName *	P	P	Specifies the name of a column.
ColumnRemove *	P	P	Removes a column.
ColumnRepos *	P	P	Repositions the column.
ColumnResize (Page 4570)	P	P	Enables changes to the width of columns.
ColumnScrollbar (Page 4572)	P	P	Specifies the scroll bar type.
ColumnSort *	P	P	Sets the type of sorting.
ColumnSortIndex *	P	P	Specifies the sorting order.
ColumnTitleAlignment	P	P	Specifies the type of column title alignment.
ColumnTitles (Page 4573)	P	P	Specifies whether the column header is displayed.
ColumnVisible *	P	P	Enables the visibility of a column.
ControlDesignMode (Page 4865)	P	P	Specifies the design.
ExportDirectoryChangeable (Page 4614)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 4614)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 4615)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 4615)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 4616)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 4617)	P	P	Default assignment of the ID number and export provider.

Properties	Read	Write	Description
ExportFormatName (Page 4617)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 4618)	P	P	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 4618)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportShowDialog (Page 4619)	P	P	Specifies whether the data export dialog is shown in runtime.
Font (Page 4639)	-	-	Specifies or returns the font.
GridLineColor (Page 4651)	P	P	Specifies the color for the grid lines.
GridLineWidth (Page 4652)	P	P	Specifies the width of the separation lines in pixels.
Height (Page 4653)	P	-	Sets the height of the specified "Ellipse", "Circle" and "Rectangle" objects.
HorizontalGridLines (Page 4667)	P	P	Specifies whether horizontal separation lines are displayed.
IconSpace (Page 4670)	P	P	Specifies the spacing between icons and text in the table cells.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 4706)	P	P	Sets the color of the window separation lines.
LineWidth (Page 4708)	P	P	Specifies the line thickness of the selected object.
Moveable (Page 4743)	P	P	Specifies whether the window can be moved in runtime.
Name (Page 4744)	P	-	Returns the object name as STRING.
PrintJob	P	P	Specifies a print job
RowScrollbar (Page 4802)	P	P	Specifies whether row scroll bars are displayed.
RowTitleAlignment	P	P	Specifies the type of row title alignment.
RowTitles	P	P	Specifies that row headers will be displayed.
RTPersistence (Page 4804)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistencePasswordLevel (Page 4805)	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 4805)	-	-	Specifies how online configurations of WinCC are retained.
RulerType	P	P	Sets the ruler type.
SelectedCellColor (Page 4820)	P	P	Specifies the background color of the selected cell.
SelectedCellForeColor (Page 4821)	P	P	Specifies the font color of the selected cell.
SelectedRowColor (Page 4822)	P	P	Specifies the background color of the selected row.
SelectedRowForeColor (Page 4822)	P	P	Specifies the font color of the selected row.
SelectedTitleColor (Page 4823)	P	P	Specifies the background color of a selected table header.
SelectedTitleForeColor (Page 4824)	P	P	Specifies the font color of the selected table header.
SelectionColoring (Page 4826)	P	P	Specifies whether selection colors are used for cells or rows.
SelectionRect (Page 4829)	P	P	Specifies whether a selection frame is used for the selected cells or rows.

Properties	Read	Write	Description
SelectionRectColor (Page 4830)	P	P	Specifies the color of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionRectWidth (Page 4831)	P	P	Specifies the line width of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionType (Page 4831)	P	P	Specifies the number of lines you can mark.
ShareSpaceWithSourceControl	P	P	Enables the display of the value table in the visualization range of the data source.
ShowSortButton (Page 4855)	P	P	Specifies whether the sorting button is shown above the vertical scroll bar.
ShowSortIcon (Page 4856)	P	P	Specifies whether the sorting icon is displayed.
ShowSortIndex (Page 4857)	P	P	
ShowTitle (Page 4861)	P	P	Specifies the layout of the control window's header.
Sizeable (Page 4865)	P	P	Specifies that the size of an object can be changed in runtime.
SortSequence (Page 4869)	P	P	Specifies how the sorting order can be changed by mouse click.
SourceControl	P	P	Sets the data source.
SourceControlType	P	P	Sets the data source type.
StatusbarBackColor (Page 4874)	P	P	Specifies the background color of the status bar.
StatusbarElementAdd (Page 4874) *	P	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 4875) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 4875) *	P	P	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 4876) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 4876) *	P	P	Unique ID of the selected status bar element.
StatusbarElementIndex (Page 4877)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.
StatusbarElementName (Page 4877) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 4877) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 4878) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 4878)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 4879) *	P	P	Specifies the tooltip text for the user-defined status bar element.
StatusbarElementUserDefined (Page 4879) *	P	P	Indicates whether the configuration engineer has added the status bar element as a new user-defined element.
StatusbarElementVisible (Page 4880) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.

Properties	Read	Write	Description
StatusbarElementWidth (Page 4880) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 4881)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 4883)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 4884)	P	P	Default text in the status bar.
StatusbarUseBackColor (Page 4884)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 4885)	P	P	Specifies whether the status bar of the control is displayed.
TableColor (Page 4890)	P	P	Specifies the background color of the rows. Use this to open the color selection dialog.
TableColor2 (Page 4890)	P	P	Specifies the background color of "Row color 2".
TableForeColor (Page 4891)	P	P	
TableForeColor2 (Page 4892)	P	P	Specifies the font color of "Row color 2".
TimeBase (Page 4910)	P	P	Sets the timebase.
TitleColor	P	P	Specifies the color of the header.
TitleCut (Page 4932)	P	P	Specifies whether the contents of the fields of a header should be abbreviated if the column is too narrow.
TitleDarkShadowColor (Page 4932)	P	P	Specifies the color of the dark side of shading.
TitleForeColor (Page 4932)	P	P	Specifies the font color of the table header for the selected status.
TitleGridLineColor (Page 4933)	P	P	Specifies the color of separation lines in the table header.
TitleLightShadowColor (Page 4933)	P	P	Specifies the color of the bright side of shading.
TitleSort (Page 4934)	P	P	Specifies how sorting by column header is triggered.
TitleStyle (Page 4934)	P	P	Specifies whether a shading color is used for the table header.
ToolbarAlignment (Page 4941)	P	P	Specifies or returns the position of the toolbar.
ToolbarBackColor (Page 4942)	P	P	Specifies the background color of the toolbar.
ToolbarButtonActive (Page 4942) *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolbarButtonAdd (Page 4943) *	P	P	Creates a new, user-defined button function.
ToolbarButtonBeginGroup (Page 4943) *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolbarButtonClick	P	P	Clicks a toolbar button.
ToolbarButtonCount (Page 4944) *	P	P	Specifies the number of configurable button functions.
ToolbarButtonEnabled (Page 4944) *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolbarButtonHotKey (Page 4945) *	P	P	Shows the hotkey for the selected button function.
ToolbarButtonId (Page 4945) *	P	P	Unique ID number for the selected button function.
ToolbarButtonIndex (Page 4946)	P	P	References a button function.
ToolbarButtonLocked (Page 4946) *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolbarButtonName (Page 4946) *	P	P	Shows the name of the selected button function.

Properties	Read	Write	Description
ToolBarButtonPasswordLevel (Page 4947) *	P	P	Shows the authorization for the selected button function.
ToolBarButtonRemove (Page 4947) *	P	P	Removes the selected button function from the list.
ToolBarButtonRename (Page 4948) *	P	P	Renames the user-defined toolbar element that is referenced by means of the "ToolBarButtonIndex" property.
ToolBarButtonRepos (Page 4948) *	P	P	Changes the sequence of button functions.
ToolBarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolBarButtonTooltipText (Page 4948) *	P	P	Specifies the tooltip text for the button.
ToolBarButtonUserDefined (Page 4949) *	P	P	Indicates whether the configuration engineer has added the toolbar button as a new user-defined button.
ToolBarButtonVisible *	P	P	Specifies that the button is visible.
ToolBarShowTooltips (Page 4949)	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolBarUseBackColor (Page 4950)	P	P	Specifies whether the background color for the toolbar is shown.
ToolBarUseHotKeys (Page 4951)	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolBarVisible (Page 4951)	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
UseSelectedTitleColor (Page 5005)	P	P	Specifies whether a selection color is used for the headers of selected table cells.
UseSourceBackColors	P	P	Specifies the use of the background color of the data source.
UseSourceForeColor	P	P	Specifies the use of the foreground color of the data source.
UseTableColor2 (Page 5006)	P	P	Specifies whether a second row color is used for the representation of the table.
VerticalGridLines (Page 5025)	P	P	Specifies whether vertical separation lines are displayed.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	-	Sets the width of the specified "Ellipse", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-126 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
Export (Page 5081)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetRow (Page 5093)	P	Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.

Methods	Valid	Description
GetRowCollection (Page 5094)	P	Returns the list of all row objects of the table-based controls as "ICCAxDataRowCollection" type.
GetRulerBlock (Page 5095)	P	Returns the block object of the evaluation table designated by name or index as "ICCAxRulerBlock" type.
GetRulerBlockCollection (Page 5096)	P	Returns the list of all block objects of the evaluation table as "ICCAxCollection" type.
GetRulerColumn (Page 5098)	P	Returns the column object of the evaluation table designated by name or index as "ICCAxRulerColumn" type.
GetRulerColumnCollection (Page 5099)	P	Returns the list of all column objects of the evaluation table as "ICCAxCollection" type.
GetSelectedRow (Page 5101)	P	Returns the selected row object of a table-based control as "ICCAxDataRow" type.
GetSelectedRows (Page 5102)	P	Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.
GetStatisticAreaColumn (Page 5103)	P	Returns the column object of the statistic area window of the evaluation table designated by name or index as "ICCAxRulerColumn" type.
GetStatisticAreaColumnCollection (Page 5105)	P	Returns the list of all column objects of the statistic area window of the evaluation table as "ICCAxCollection" type.
GetStatisticResultColumn (Page 5106)	P	Returns the column object of the statistic window of the evaluation table designated by name or index as "ICCAxRulerColumn" type.
GetStatisticResultColumnCollection (Page 5107)	P	Returns the list of all column objects of the statistic window of the evaluation table as "ICCAxCollection" type.
GetStatusbarElement (Page 5108)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 5109)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetToolbarButton (Page 5116)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.
GetToolbarButtonCollection (Page 5117)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
Print (Page 5146)	P, A	Executes the "Print" button function of the control.
SelectAll (Page 5161)	P	Selects all rows in a table-based control.
SelectRow (Page 5162)	P	Selects a specific row in a table-based control.
ShowHelp (Page 5166)	P, A	Executes the "Help" button function of the control.
ShowPropertyDialog (Page 5171)	P, A	Executes the "Configuration dialog" button function of the control.
UnselectAll (Page 5179)	P	Removes all selections from the cells of a table-based control.
UnselectRow (Page 5180)	P	Removes the selections from a specific cell of a table-based control.

Table 10-127 Properties

Properties	Read	Write	Description
Authorization (Page 4504)	-	-	Specifies the operating rights of the selected object in runtime.
AxisXBunchCount	-	-	Sets the step width of the large ticks for the X axis.
AxisXMarkCount	-	-	Sets the step width of the ticks for the X axis.
AxisXNoOfDigits	-	-	

Properties	Read	Write	Description
AxisXShowBunchValues	-	-	Enables scale labeling of the interim values for the X axis.
AxisXStyle *	-	-	
AxisY1BunchCount	-	-	Sets the step width of the large ticks for the Y axis.
AxisY1MarkCount	-	-	Sets the step width of the large ticks for the left Y axis.
AxisY1ShowBunchValues	-	-	Enables scale labeling of the interim values for the left Y axis.
AxisY2BunchCount	-	-	Sets the step width of the large ticks for the right Y axis.
AxisY2MarkCount	-	-	Sets the step width of the ticks for the right Y axis.
AxisY2ShowBunchValues	-	-	Enables scale labeling of the interim values for the right Y axis.
BackColor (Page 4511)	A	A	Specifies the background color of the selected object.
ColumnsMoveable	-	-	Specifies that the columns can be moved.
CountVisibleItems (Page 4582)	-	-	Specifies the number of lines contained in the selection list.
Enabled (Page 4606)	A	A	Specifies whether the selected object can be operated in runtime.
EnableNavigateButtons	-	-	
EnableNavigateKeys	-	-	Specifies keyboard operation.
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
Flashing	-	-	Specifies that the text block flashes.
FocusColor (Page 4636)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4638)	A	A	Specifies the border width of the specified object when the object is in focus.
Font (Page 4639)	-	-	Specifies or returns the font.
Height (Page 4653)	A	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4656)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	A	A	Specifies the value of the X coordinate of the object.
Look3D	-	-	Activates 3D visualization.
Name (Page 4744)	A	-	Returns the object name as STRING.
RulerColor (Page 4806)	A	A	Specifies the color of the scale gradation (auxiliary line) of the axis labelling in the "OnlineTrendControl" object.
ScaleColor (Page 4808)	A	A	Specifies the color of the scale of the selected object.
SelectionBackColor (Page 4825) *	-	-	Specifies the background color of the selected cells.
SelectionForeColor (Page 4827) *	-	-	Specifies the foreground color of the selected cells.
ShowRuler (Page 4853)	A	A	Specifies whether a scale gradation (auxiliary line) is shown for the axis label of the "OnlineTrendControl" object.
ShowTableGridLines (Page 4858)	-	--	Enables the display of grid lines in the table.
ShowTimeAxis	-	-	Enables the display of the X axis.
ShowTimeAxisLabeling	-	-	Enables the display of the X axis labeling.
ShowValueAxis1	-	-	Enables the display of the left Y axis.
ShowValueAxis1Label	-	-	Enables the display of the labeling for left Y axis.

Properties	Read	Write	Description
ShowValueAxis2	-	-	Enables the display of the right Y axis.
ShowValueAxis2Label	-	-	Sets the window title.
ShowValueTable	-	-	Enables the display of the table of values.
ShowY1HlpLine	-	-	Enables the display of the auxiliary line.
ShowY2HlpLine	-	-	Enables the display of the auxiliary line.
TableBackColor (Page 4889)	A	A	Specifies the background color of the table cells for the selected object.
TableFont	-	-	Specifies the font in the table.
TableGridLineColor (Page 4893)	A	A	Sets the color of the gridlines in the table of the specified object.
TableHeaderBackColor (Page 4894)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderFont	-	-	Specifies the text color of the header.
TableHeaderForeColor (Page 4895)	A	A	Specifies the text color in the header of the table of the selected object.
TagForExternalTime	-	-	Sets the tag for the external time.
TimeAxisBegin	-	-	Sets the start value for the time axis.
TimeAxisBeginTime	-	-	Specifies the starting time for the display of the selected trend.
TimeAxisCountPoints	-	-	Sets the number of values for the time axis.
TimeAxisEnd	-	-	Sets the end value for the time axis.
TimeAxisMode	-	-	Sets the time axis mode.
TimeAxisRange (Page 4907)	-	-	Period displayed by the time axis.
TimeAxisSide	-	-	Sets the page for new values on the time axis.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarEnabled *	-	-	Enables the use of a toolbar in the trend view.
ToolbarStyle	-	-	Sets the appearance of the toolbar.
Top (Page 4954)	A	A	Specifies the value of the Y coordinate of the object.
TrendsForPrinting *	-	-	
ValueAxis1AutoRange *	-	-	Sets the automatic adaptation of the data area.
ValueAxis1Begin	-	-	Sets the start value for the axis.
ValueAxis1End	-	-	Sets the end value for the axis.
ValueAxis1LabelLength	-	-	Sets the length of axis labeling.
ValueAxis1Style *	-	-	
ValueAxis2AutoRange *	-	-	Sets the automatic adaptation of the data area.
ValueAxis2Begin	-	-	Sets the start value for the axis.
ValueAxis2End	-	-	Sets the end value for the axis.
ValueAxis2LabelLength	-	-	Sets the length of axis labeling.
ValueAxis2Style *	-	-	Sets the automatic adaptation of the data area.
ValueY1HlpLine	-	-	Sets the value for the auxiliary line.
ValueY2HlpLine	-	-	Value for the auxiliary line on the right Y axis.
Visible (Page 5026)	A	A	Specifies whether the selected object is visible.
Width (Page 5037)	A	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

\* not visible in the ES

### TubeArcObject

#### Description

Represents the "TubeArc" object. The TubeArcObject is an element of the ScreenItems list.

#### Type identifier in VBS

HMITubeArcObject

## Application

In the following example, the object with the name "TubeArcObject1" is moved 10 pixels to the right:

```
'VBS24
Dim objTubeArcObject
Set objTubeArcObject = ScreenItems("TubeArcObject1")
objTubeArcObject.Left = objTubeArcObject.Left + 10
```

Table 10-129 Properties

Properties	Read	Write	Description
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
Color (Page 4564)	P	P	Specifies the line color of the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
EndAngle (Page 4608)	P	P	Specifies the angle at which the end point of the selected object deviates from the zero position (0°).
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineWidth (Page 4708)	P	P	Specifies the line thickness of the selected object.
Name (Page 4744)	P	-	Returns the object name as STRING.
RadiusHeight (Page 4794)	P	P	Specifies the minor axis of the "Ellipsis" object.
RadiusWidth (Page 4795)	P	P	Specifies the major axis of the "Ellipsis" object.
StartAngle (Page 4870)	P	P	Specifies the SQL statement.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-130 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

**TubeDoubleTeeObject**

**Description**

Represents the "DoubleTee" object. The TubeDoubleTeeObject is an element of the ScreenItems list.

## Type identifier in VBS

HMITubeDoubleTeeObject

## Application

In the following example, the object with the name "TubeDoubleTeeObject1" is moved 10 pixels to the right:

```
'VBS21
Dim objTubeDoubleTeeObject
Set objTubeDoubleTeeObject = ScreenItems("TubeDoubleTeeObject1")
objTubeDoubleTeeObject.Left = objTubeDoubleTeeObject.Left + 10
```

Table 10-133 Properties

Properties	Read	Write	Description
ActualPointIndex (Page 4483)	P	P	Specifies the number of the current corner point of the selected object.
ActualPointLeft (Page 4483)	P	P	Specifies the X coordinate of the current corner point with reference to the screen origin.
ActualPointTop (Page 4484)	P	P	Specifies the Y coordinate of the current corner point with reference to the screen origin.
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
Color (Page 4564)	P	P	Specifies the line color of the selected object.
CornerStyle (Page 4578)	P	P	Specifies the type of border lines for the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineWidth (Page 4708)	P	P	Specifies the line thickness of the selected object.
Name (Page 4744)	P	-	Returns the object name as STRING.
Points	-	-	Specifies the corner points.
PointsCount (Page 4785)	P	P	Specifies the number of corner points of the polyline or of the polygon.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.

Properties	Read	Write	Description
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

## UserArchiveControl

### Description

Displays the "Recipe view" object. The UserArchiveControl object is an element of the ScreenItems list.

### Type identifier in VBS

HMIUserArchiveControl

Abbreviation	Validity
Pa	Panels
A	Runtime Advanced
P	Runtime Professional

Table 10-137 Properties

Properties	Read	Write	Description
ApplyProjectSettingsForDesignMode	-	-	Specifies that the project settings are used for the design.
ArchiveName *	P	P	Sets the log name.
ArchiveType	P	-	Sets the log type.
AutoCompleteColumns (Page 4505)	P	P	Specifies whether empty columns are shown if the control is wider than the configured columns.
AutoCompleteRows (Page 4506)	P	P	Specifies whether empty rows are shown if the control is longer than the number of configured rows.

Properties	Read	Write	Description
AutoSelectionColors (Page 4507)	P	P	Specifies whether the colors defined by the system are used as the selection colors for cells and rows.
AutoSelectionRectColor (Page 4508)	P	P	Specifies whether the selection frame is shown with the color defined by the system.
BackColor (Page 4510)	P	P	Specifies the background color of the selected object.
Blocks	-	-	Sets the alarm blocks.
BorderColor (Page 4530)	P	P	Specifies the line color of the object.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
Caption (Page 4549)	P	P	Specifies the text that is displayed in the header of the selected object.
CellCut (Page 4553)	P	P	Specifies whether the contents of the cells are abbreviated if the cells are too narrow.
CellSpaceBottom (Page 4554)	P	P	Specifies the bottom margin of the table cells.
CellSpaceLeft (Page 4555)	P	P	Sets the left indent for the table cells.
CellSpaceRight (Page 4555)	P	P	Specifies the right indent of the table cells.
CellSpaceTop (Page 4556)	P	P	Specifies the top margin of the table cells.
Closeable (Page 4564)	P	P	Specifies that the control can be closed in runtime.
ColumnAlign (Page 4569) *	P	P	Specifies how the selected column is aligned.
ColumnAutoPrecisions *	P	P	Specifies that the number of decimal places displayed for an axis is adjusted automatically.
ColumnCaption *	P	P	Sets the caption.
ColumnCount *	P	-	Displays the number of columns.
ColumnDateFormat *	-	P	Sets the display format for date information.
ColumnExponentialFormat *	P	P	Specifies that exponential notation is used in a column.
ColumnHideText *	P	P	Specifies whether the text is displayed.
ColumnHideTitleText *	P	P	Specifies whether the text is displayed.
ColumnIndex	P	P	The index specifies on which column other properties, e.g. initial value are based.
ColumnLeadingZeros *	P	P	Specifies that leading zeros should be displayed.
ColumnLength *	P	P	Specifies the number of displayed characters.
ColumnName *	P	-	Displays the name of the selected column.
ColumnPrecisions *	P	P	Sets the number of decimal places.
ColumnReadOnly *	P	P	Sets the read-only mode for the values in the column.
ColumnRepos *	P	P	Repositions the column.
ColumnResize (Page 4570)	P	P	Enables changes to the width of columns.
ColumnScrollbar (Page 4572)	P	P	Specifies the scroll bar type.
ColumnShowDate *	P	P	Specifies that the date is to be displayed.
ColumnShowIcon *	P	P	Enables the display of an icon.
ColumnShowTitleIcon *	P	P	Enables the display of an icon.
ColumnSort *	P	P	Sets the type of sorting.
ColumnSortIndex *	P	P	Specifies the sorting order.
ColumnTimeFormat *	-	P	Sets the display format for time information.
ColumnTitleAlignment	P	P	Specifies the type of column title alignment.

Properties	Read	Write	Description
ColumnTitles (Page 4573)	P	P	Specifies whether the column header is displayed.
ColumnVisible *	P	P	Enables the visibility of a column.
ControlDesignMode (Page 4865)	-	P	Specifies the design.
DataSource	-	-	Sets the data source.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
EnableDelete	P	P	Enables the deletion of data.
EnableEdit (Page 4607)	P	P	Specifies whether the data shown can be edited in runtime.
EnableInsert	P	P	Enables insertion of data.
ExportDirectoryChangeable (Page 4614)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 4614)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 4615)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 4615)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 4616)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 4617)	P	P	Default assignment of the ID number and export provider.
ExportFormatName (Page 4617)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 4618)	P	-	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 4618)	P	P	Specifies which runtime data of the control is exported.
ExportShowDialog (Page 4619)	P	P	Specifies whether the data export dialog is shown in runtime.
Filters	-	-	Specifies database criteria in SQL syntax.
FilterSQL	P	-	Sets an SQL statement for the filter criterion.
Font (Page 4639)	-	-	Specifies or returns the font.
GridLineColor (Page 4651)	P	P	Specifies the color for the grid lines.
GridLineWidth (Page 4652)	P	P	Specifies the width of the separation lines in pixels.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipse", "Circle" and "Rectangle" objects.
HorizontalGridLines (Page 4667)	P	P	Specifies whether horizontal separation lines are displayed.
IconSpace (Page 4670)	P	P	Specifies the spacing between icons and text in the table cells.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 4706)	P	P	Sets the color of the window separation lines.
LineWidth (Page 4708)	P	P	Specifies the line thickness of the selected object.
Moveable (Page 4743)	P	P	Specifies whether the window can be moved in runtime.
ObjectName (Page 4752)	P	-	Returns the object name as STRING.
PrintJobName (Page 4788)	P	P	Specifies a print job.

Properties	Read	Write	Description
RowScrollbar (Page 4802)	P	P	Specifies whether row scroll bars are displayed.
RowTitleAlignment	P	P	Specifies the type of row title alignment.
RowTitles	P	P	Specifies that row headers will be displayed.
RTPersistence (Page 4804)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistencePasswordLevel (Page 4805)	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 4805)	-	-	Specifies how online configurations of WinCC are retained.
SelectArchiveName *	P	P	Specifies definition of the log by name.
SelectedCellColor (Page 4820)	P	P	Specifies the background color of the selected cell.
SelectedCellForeColor (Page 4821)	P	P	Specifies the font color of the selected cell.
SelectedRowColor (Page 4822)	P	P	Specifies the background color of the selected row.
SelectedRowForeColor (Page 4822)	P	P	Specifies the font color of the selected row.
SelectedTitleColor (Page 4823)	P	P	Specifies the background color of a selected table header.
SelectedTitleForeColor (Page 4824)	P	P	Specifies the font color of the selected table header.
SelectionColoring (Page 4826)	P	P	Specifies whether selection colors are used for cells or rows.
SelectionRect (Page 4829)	P	P	Specifies whether a selection frame is used for the selected cells or rows.
SelectionRectColor (Page 4830)	P	P	Specifies the color of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionRectWidth (Page 4831)	P	P	Specifies the line width of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionType (Page 4831)	P	P	Specifies the number of lines you can mark.
ShowSortButton (Page 4855)	P	P	Specifies whether the sorting button is shown above the vertical scroll bar.
ShowSortIcon (Page 4856)	P	P	Specifies whether the sorting icon is displayed.
ShowSortIndex (Page 4857)	P	P	Specifies whether a sort index is displayed.
ShowTitle (Page 4861)	P	P	Specifies the layout of the control window's header.
Sizeable	P	P	Specifies that the size of an object can be changed in runtime.
SortSequence	P	P	Specifies how the sorting order can be changed by mouse click.
StatusbarBackColor (Page 4874)	P	P	Specifies the background color of the status bar.
StatusbarElementAdd (Page 4874) *	-	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 4875) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 4875) *	P	-	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 4876) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 4876) *	P	-	Returns the ID number of the selected status bar element.
StatusbarElementIndex (Page 4877)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.

Properties	Read	Write	Description
StatusbarElementName (Page 4877) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 4877) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 4878) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 4878)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText *	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 4879) *	P	P	Specifies the tooltip text for the user-defined status bar element.
StatusbarElementUserDefined (Page 4879) *	P	-	Indicates whether the configuration engineer has added the status bar element as a new user-defined element.
StatusbarElementVisible (Page 4880) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.
StatusbarElementWidth (Page 4880) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 4881)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 4883)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 4884)	P	-	Returns the standard text of the status bar.
StatusbarUseBackColor (Page 4884)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 4885)	P	P	Specifies whether the status bar of the control is displayed.
TableColor (Page 4890)	P	P	Specifies the background color of the rows. Use this to open the color selection dialog.
TableColor2 (Page 4890)	P	P	Specifies the background color of "Row color 2".
TableForeColor (Page 4891)	P	P	
TableForeColor2 (Page 4892)	P	P	Specifies the font color of "Row color 2".
TimeBase (Page 4910)	P	P	Sets the timebase.
TitleColor	P	P	Specifies the color of the header.
TitleCut (Page 4932)	P	P	Specifies whether the contents of the fields of a header should be abbreviated if the column is too narrow.
TitleDarkShadowColor (Page 4932)	P	P	Specifies the color of the dark side of shading.
TitleForeColor (Page 4932)	P	P	Specifies the font color of the table header for the selected status.
TitleGridLineColor (Page 4933)	P	P	Specifies the color of separation lines in the table header.
TitleLightShadowColor (Page 4933)	P	P	Specifies the color of the bright side of shading.
TitleSort (Page 4934)	P	P	Specifies how sorting by column header is triggered.
TitleStyle (Page 4934)	P	P	Specifies whether a shading color is used for the table header.
ToolbarAlignment (Page 4941)	P	P	Specifies or returns the position of the toolbar.

Properties	Read	Write	Description
ToolbarBackColor (Page 4942)	P	P	Specifies the background color of the toolbar.
ToolbarButtonActive (Page 4942) *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolbarButtonAdd (Page 4943) *	P	P	Creates a new, user-defined button function.
ToolbarButtonBeginGroup (Page 4943) *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolbarButtonClick	P	P	Clicks a toolbar button.
ToolbarButtonCount (Page 4944) *	P	-	Returns the number of buttons contained in the toolbar.
ToolbarButtonEnabled (Page 4944) *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolbarButtonHotKey (Page 4945) *	P	P	Shows the hotkey for the selected button function.
ToolbarButtonId (Page 4945) *	P	P	Unique ID number for the selected button function.
ToolbarButtonIndex (Page 4946)	P	P	References a button function.
ToolbarButtonLocked (Page 4946) *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolbarButtonName (Page 4946) *	P	-	Displays the name of the selected button of the toolbar.
ToolbarButtonPasswordLevel (Page 4947) *	P	P	Shows the authorization for the selected button function.
ToolbarButtonRemove (Page 4947) *	-	P	Removes the selected button function from the list.
ToolbarButtonRename (Page 4948) *	-	P	Renames the user-defined toolbar element that is referenced by means of the "ToolbarButtonIndex" property.
ToolbarButtonRepos (Page 4948) *	P	P	Changes the sequence of button functions.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarButtonTooltipText (Page 4948) *	P	P	Specifies the tooltip text for the button.
ToolbarButtonUserDefined (Page 4949) *	P	-	Indicates whether the configuration engineer has added the toolbar button as a new user-defined button.
ToolbarButtonVisible *	P	P	Specifies that the button is visible.
ToolbarShowTooltips (Page 4949)	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolbarUseBackColor (Page 4950)	P	P	Specifies whether the background color for the toolbar is shown.
ToolbarUseHotKeys (Page 4951)	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolbarVisible (Page 4951)	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
UseSelectedTitleColor (Page 5005)	P	P	Specifies whether a selection color is used for the headers of selected table cells.
UseTableColor2 (Page 5006)	P	P	Specifies whether a second row color is used for the representation of the table.
VerticalGridLines (Page 5025)	P	P	Specifies whether vertical separation lines are displayed.
Visibility	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipse", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-138 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property with VBScript during runtime.
CopyRows (Page 5075)	P	Executes the "Copy rows" button function of the control.
CutRows (Page 5077)	P	Executes the "Cut rows" button function of the recipe view.
DeleteRows (Page 5079)	P	Executes the "Delete rows" button function of the recipe view.
Export (Page 5081)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetColumn (Page 5081)	P	Returns the column object of the recipe view designated by name or index as "ICCAxUAColumn" type.
GetColumnCollection (Page 5082)	P	Returns the list of all column objects of the recipe view as "ICCAxCollection" type.
GetRow (Page 5093)	P	Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.
GetRowCollection (Page 5094)	P	Returns the list of all row objects of the table-based controls as "ICCAxDataRowCollection" type.
GetSelectedRow (Page 5101)	P	Returns the selected row object of a table-based control as "ICCAxDataRow" type.
GetSelectedRows (Page 5102)	P	Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.
GetStatusBarElement (Page 5108)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusBarElement" type.
GetStatusBarElementCollection (Page 5109)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetToolBarButton (Page 5116)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolBarButton" type.
GetToolBarButtonCollection (Page 5117)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
MoveToFirst (Page 5137)	P	Executes the "First line" button function of the control.
MoveToLast (Page 5139)	P	Executes the "Last data record" button function of the control.
MoveToNext (Page 5140)	P	Executes the "Next data record" button function of the control.
MoveToPrevious (Page 5142)	P	Executes the "Previous data record" button function of the control.
PasteRows (Page 5145)	P	Executes the "Insert rows" button function of the recipe view.
Print (Page 5146)	P, A	Executes the "Print" button function of the control.
ReadTags (Page 5148)	P	Executes the "Read tags" button function of the recipe view.
SelectAll (Page 5161)	P	Selects all rows in a table-based control.
SelectRow (Page 5162)	P	Selects a specific row in a table-based control.
ServerExport (Page 5163)	P	Executes the "Export log" button function of the recipe view.
ServerImport (Page 5164)	P	Executes the "Import log" button function of the recipe view.
ShowHelp (Page 5166)	P, A	Executes the "Help" button function of the control.
ShowPropertyDialog (Page 5171)	P, A	Executes the "Configuration dialog" button function of the control.
ShowSelectArchive (Page 5171)	P	Executes the "Select data connection" button function of the recipe view.
ShowSelection (Page 5172)	P	Executes the "Selection dialog" button function of the recipe view.

Methods	Valid	Description
ShowSelectTimeBase (Page 5173)	P	Executes the "Timebase dialog" button function of the recipe view.
ShowSort (Page 5174)	P	Executes the "Sorting dialog" button function of the recipe view.
UnselectAll (Page 5179)	P	Removes all selections from the cells of a table-based control.
UnselectRow (Page 5180)	P	Removes the selections from a specific cell of a table-based control.
WriteTags (Page 5184)	P	Executes the "Write tags" button function of the recipe view.

Table 10-139 Properties

Properties	Read	Write	Description
Appearance (Page 4256)	-	-	Specifies the layout for this NC subroutine.
Authorization (Page 4504) *	-	-	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4511)	A	A	Specifies the background color of the selected object.
Columns	-	-	Specifies the columns to be displayed.
ColumnsMoveable	-	-	Specifies that the columns can be moved.
CountVisibleItems (Page 4582)	-	-	Specifies the number of lines contained in the selection list.
Enabled (Page 4606)	A	A	Specifies whether the selected object can be operated in runtime.
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
Flashing	-	-	Specifies that the text block flashes.
Height (Page 4653)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	A	A	Specifies the value of the X coordinate of the object.
Name (Page 4744)	A	-	Returns the object name as STRING.
SelectionBackColor (Page 4826)	A	A	Specifies the background color of the selected cells.
SelectionForeColor (Page 4828)	A	A	Specifies the foreground color of the selected cells.
ShowTableGridlines (Page 4858)	-	-	Enables the display of gridlines in the table of the specified object.
TableBackColor (Page 4889)	A	A	Specifies the background color of the table cells for the selected object.
TableFont	-	-	Specifies the font in the table.
TableForeColor (Page 4892)	A	A	
TableGridlineColor (Page 4893)	A	A	Specifies the color for the grid lines.
TableHeaderBackColor (Page 4894)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderFont	-	-	Specifies the text color of the header.
TableHeaderForeColor (Page 4895)	A	A	Specifies the text color in the header of the table of the selected object.

Properties	Read	Write	Description
Top (Page 4954)	A	A	Specifies the value of the Y coordinate of the object.
Visible (Page 5026) *	A	A	Specifies whether the selected object is visible.
Width (Page 5037)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

\* not visible in the ES

Table 10-140 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-141 Properties

Properties	Read	Write	Description
AskOperationMotive (Page 4502)	P	P	Specifies whether the reason for operating this object is logged.
Authorization (Page 4504)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4510)	P	P	Specifies the background color of the selected object.
BackColorBottom (Page 4513)	P	P	Specifies the color for the lower / right part of the .
BackColorTop (Page 4513)	P	P	Sets the color for the upper / left part of the slider.
BackFillStyle (Page 4514)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4516)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4517)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4518)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4518)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 4528)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4530)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4534)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4535)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4536)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4537)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4541)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4544)	P	P	Specifies the line thickness of the object.
CornerStyle (Page 4578)	-	-	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4599)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.

Properties	Read	Write	Description
EdgeStyle (Page 4602)	-	-	Specifies the line style of the selected object.
Enabled (Page 4605)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4624)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
Height (Page 4653)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HighLimitColor (Page 4658)	P	P	Specifies the color of the top or right scroll button in a scroll bar.
JumpToLimitsAfterMouseClicked (Page 4676)	P	P	Specifies the length of the long tick marks of a scale.
Layer (Page 4681)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4693)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4707)	-	-	Specifies the shape of the line end.
LogOperation (Page 4712)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
LowLimitColor (Page 4717)	P	P	Specifies the color of the bottom or left scroll button in a scroll bar.
MarginToBorder (Page 4718)	P	P	Specifies the width of the 3D border in pixels.
MaximumValue (Page 4719)	P	P	Specifies the maximum value of the scale in the selected object.
MinimumValue (Page 4740)	P	P	Specifies the minimum value of the scale in the selected object.
Name (Page 4744)	P	-	Returns the object name as STRING.
OperationSteps (Page 4757)	P	P	Specifies by how many steps the slider of the scrollbar is moved with one mouseclick.
ProcessValue (Page 4789)	P	P	Specifies the default for the value to be displayed.
RelativeFillLevel (Page 4797)	P	P	Specifies the fill percentage for the object.
ShowBadTagState (Page 4843)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowFillLevel (Page 4846)	P	P	Specifies whether the selected object is filled.
StyleSettings (Page 4887)	P	P	Specifies the display style for the object:
TextOrientation (Page 4902)	P	P	Specifies the text orientation of the selected object.
ThumbBackColor (Page 4903)	P	P	Specifies the background color of the slider in the "Slider" object.
ToolTipText (Page 4953)	P	P	Specifies the tooltip text.
Top (Page 4954)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4958)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4998)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4999)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 5026)	P	P	Specifies whether the selected object is visible.
Width (Page 5037)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
WindowsStyle (Page 5041)	P	P	Specifies whether the object is displayed in the general Windows style.

Table 10-142 Methods

Methods	Valid	Description
Activate (Page 5068)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 5070)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 5077)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Switch (Page 4419)  
SymbolicIOField (Page 4422)  
IOField (Page 4351)

**AcceptOnExit****Description**

Specifies whether the input field will be confirmed automatically when it is left.  
Access in Runtime: Read and write

**Syntax**

Object.**AcceptOnExit**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the formats "IOField" or "SymbolicIOField".

**BOOLEAN**

Optional TRUE, if the input field will be confirmed automatically when it is left.

**See also**

IOField (Page 4351)  
SymbolicIOField (Page 4422)

**AcceptOnFull****Description**

Specifies whether the input field will be left and confirmed automatically when the set number of values have been entered.

Access in Runtime: Read and write

**Syntax**

Object.**AcceptOnFull**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "IOField".

## **BOOLEAN**

Optional TRUE, if the input field will be left and confirmed automatically when the set number of values have been entered.

### **See also**

IOField (Page 4351)

### **AccessPath**

### **Description**

Returns the storage path of a screen.

Access during runtime: Read

### **Syntax**

Object.**AccessPath**

#### **Object**

Necessary. A "Screen" object.

### **Example**

In the following example, the path of the picture "ScreenWindow1" is issued:

```
'VBS67
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
MsgBox objScreen.AccessPath
```

### **See also**

Screen (Page 4256)

### **Activate**

### **Description**

Determines whether the data to be displayed are requested by the alarm server.

Access in Runtime: Read and write

## Syntax

Object.**Activate**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "AlarmControl".

### BOOLEAN

Optional TRUE, if the data to be displayed are requested by the alarm server.

## See also

AlarmControl (Page 4273)

## Active

## Description

Specifies whether the data that is to be shown is requested by the log server.

Access in Runtime: Read and write

## Syntax

Object.**Active**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl," or "OnlineTableControl".

### BOOLEAN

Optional TRUE, if the data that is to be shown is requested by the log server.

## Comments

The screen opening times are reduced if you do not set this attribute. You can change the value dynamically.

To differentiate between the "Activate" property and the "Activate" methods, the property is addressed via "Object".

## See also

OnlineTrendControl (Page 4375)

OnlineTableControl (Page 4367)

## ActiveProject

### Description

Returns the specified project.

Access in Runtime: Read

### Syntax

Object.**ActiveProject**

#### Object

Required A "HMIRuntime" object.

### See also

HMIRuntime (Page 4248)

Project (Page 4255)

## ActiveScreen

### Description

Returns an object of type "Screen" which shows the screen that currently has the focus.

---

#### Note

If you query the "ActiveScreen" property in a function, it may be due to a ScreenSavers that the property does not return a valid "Screen" object but "Nothing" and a system alarm is displayed.

---

Access during runtime: Read

### Syntax

Object.ActiveScreen

#### Object

Necessary. An object of the "HMIRuntime" type.

### Comments

Which screen is returned depends on whether the root screen or the permanent window has the focus.

The ActiveScreen property returns NOTHING if no screen has the focus. This is the case, for example, if a different window has the focus. With the instruction "If not [printout] Is Nothing" you can query whether a screen is going to be returned:

```
'VBS_Example_ActiveScreen
Dim objActiveScreen
Set objActiveScreen = HmiRuntime.ActiveScreen
If Not objActiveScreen Is Nothing Then
'found an active screen
HmiRuntime.Trace("There is an active screen." & vbCrLf)
Else
'found NO active screen
HmiRuntime.Trace("There is NO active screen." & vbCrLf)
End If
```

## ActiveScreen

### Description

Returns a "Screen" type object, which represents the screen which has the focus at the moment.

---

#### Note

If you query the "ActiveScreen" property in a user-defined function, it may be due to a screen saver that the property does not return a valid "screen" object but "Nothing". A system message will be issued.

---

Access in Runtime: Read

### Syntax

Object.ActiveScreen

#### Object

Required An object of the "HMIRuntime" type.

### Comments

Which screen is returned depends on whether the root screen or the permanent window has the focus.

The ActiveScreen property returns NOTHING if no screen has the focus. That is the case, for example, when another window has the focus. With the statement "If not [expression] is nothing" you are able to interrogate whether a screen is to be returned:

```
VBS example ActiveScreen
```

```
Dim objActiveScreen
Set objActiveScreen = HmiRuntime.ActiveScreen
If not objActiveScreen is nothing then
'found an active screen
HmiRuntime.Trace("There is an active screen." & vbCrLf)
Else
'found NO active screen
HmiRuntime.Trace("There is NO active screen." & vbCrLf)
End if
```

## ActiveScreenItem

### Description

References the screen object that currently has the focus.

It is only if the screen of the respective "Screen" object is currently selected and has an input field that the "ActiveScreenItem" property of the "Screen" object will be occupied with a valid "ScreenItem" object. In all other cases if, for example, another screen from the "Screens" list, an independent window within WinCC or another application is selected, this property is not supplied on the screens, i.e. assigned "Nothing".

### Application

You use the "ActiveScreenItem" object to address the properties of the object that has the focus in Runtime.

## ActiveScreenItem

### Description

References the screen object which currently has the focus.

The "ActiveScreenItem" property of the "Screen" object is only assigned a valid "ScreenItem" object if the screen of the corresponding "Screen" object is active and has an input field. In all other cases, for example, with a different screen from the "Screens" list, an independent window within WinCC or a different application will be selected, this property will not apply to the screens and will be occupied with "Nothing".

### Application

The "ActiveScreenItem" object is used to address the object property which has the focus in runtime.

## ActualPointIndex

### Description

Specifies the number of the current corner point of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**ActualPointIndex**[=Int]

#### Object

Required A "ScreenItem" object with the formats "Polyline" or "Polygon".

#### Int

Optional A value or a constant that specifies the number of the current corner point of the selected object.

### See also

Polyline (Page 4390)

Polygon (Page 4387)

TubePolyline (Page 4454)

## ActualPointLeft

### Description

Specifies the X coordinate of the current corner point with reference to the screen origin. The screen source is at the top left of the object. Every corner is identified by an index which is derived from the number ("PointCount") of the existing corners.

Access in Runtime: Read and write

### Syntax

Object.**ActualPointLeft**[=Int]

#### Object

Required An object of the "ScreenItem" type with the format "Polyline," or "Polygon".

#### Int

Optional A value or a constant that specifies the X coordinate of the current corner point with reference to the screen origin.

## Comments

Changing the value can have an effect on the properties "Width" (object width) and "Left" (X coordinate of the object position).

## See also

Polyline (Page 4390)

Polygon (Page 4387)

TubePolyline (Page 4454)

## ActualPointTop

### Description

Specifies the Y coordinate of the current corner point with reference to the screen origin. The screen source is at the top left of the object.

Access in Runtime: Read and write

### Syntax

Object.**ActualPointTop**[=Int]

#### Object

Required An object of the "ScreenItem" type with the format "Polyline," or "Polygon".

#### Int

Optional A value or a constant that specifies the Y coordinate of the current corner point with reference to the screen origin.

## Comments

Changing the value can have an effect on the properties "Height" (object height) and "Top" (X coordinate of the object position).

## See also

Polyline (Page 4390)

Polygon (Page 4387)

TubePolyline (Page 4454)

## AdaptBorder

### Description

Specifies whether the border of the selected object will be dynamically adapted to the text size.

Access in Runtime: Read and write

### Syntax

Object.**AdaptBorder**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "Button", "Checkbox" or "OptionGroup".

#### BOOLEAN

Optional TRUE, if the border of the selected object will be dynamically adapted to the text size.

### See also

TextField (Page 4436)

IOField (Page 4351)

SymbolicIOField (Page 4422)

Button (Page 4294)

CheckBox (Page 4300)

OptionGroup (Page 4384)

## AdaptFontSizeToLineHeight

### Description

Specifies whether the font size will be adapted to the line height.

Access in Runtime: Read and write

### Syntax

Object.**AdaptFontSizeToLineHeight**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

Optional TRUE, if the font size will be adapted to the line height.

## See also

AlarmControl (Page 4273)

## AdaptScreenToWindow

### Description

Specifies whether or not the screen displayed in a screen window adapts to the size of the screen window in Runtime. .

Access in Runtime: Read

### Syntax

Object.**AdaptScreenToWindow**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

TRUE, if the screen adapts to the screen window size.

FALSE, if the screen does not adapt to the screen window size.

## See also

AlarmControl (Page 4273)

ScreenWindow (Page 4408)

## AdaptWindowToScreen

### Description

Specifies whether or not the screen window adapts to the screen it displays in Runtime.

Access in Runtime: Read

### Syntax

Object.**AdaptWindowtoScreen**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Screenwindow".

#### BOOLEAN

TRUE, if the screen window size adapts to the screen.

FALSE, if the screen window size does not adapt to the screen.

**See also**

ScreenWindow (Page 4408)

**AddAssignment****Description**

Adds an entry.

**Address****Description**

Specifies the web address that will be opened in the HTML browser.

Access in Runtime: Read and write

**Syntax**

Object.**Address**[=STRING]

**Object**

Required A "ScreenItem" object with the format "HTMLBrowser".

**STRING**

Optional A value or a constant that contains the web address.

**See also**

HTMLBrowser (Page 4349)

**AdjustBorder3DWithStyle****Description**

Specifies whether the 3D border width will be displayed in the general Windows style.

Access in Runtime: Read and write

**Syntax**

Object.**AdjustBorder3DWithStyle**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "Button".

**BOOLEAN**

Optional TRUE, if the 3D border width will be displayed in the general Windows style.

**See also**

Button (Page 4294)

**AdjustRulerWindow**

**Description**

Specifies whether the ruler window is adapted every time the trend view is displayed.

Access in Runtime: Read and write

**Syntax**

Object.**AdjustRulerWindow**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "OnlineTrendControl".

**BOOLEAN**

Optional TRUE, if the ruler window is adapted every time the trend view is displayed.

**Comments**

TRUE, if the ruler window will be moved and then shown and hidden, it will be displayed at the original position in the original size.

**See also**

OnlineTrendControl (Page 4375)

**Alarm**

**Description**

Specifies the limit for the storage space display as of which an alarm will be reported.

Access in Runtime: Read and write

## Syntax

Object.**Alarm**[=Int]

### Object

Required A "ScreenItem" object with the format "DiskSpaceView".

### Int

Optional A value or a constant that specifies the limit for the storage space display as of which an alarm will be reported.

## See also

DiskSpaceView (Page 4317)

## AlarmColor

## Description

Specifies the color in which the bars will be shown as soon as the alarm area is reached.

Access in Runtime: Read and write

## Syntax

Object.**AlarmColor**[=Color]

### Object

Required A "ScreenItem" object with the format "DiskSpaceView".

### Color

Optional A value or a constant that specifies the color in which the bar will be shown as soon as the warning area is exceeded.

## See also

DiskSpaceView (Page 4317)

## AlarmFilter

## Description

Specifies a SQL-Statement for selecting the alarms that will be shown in the alarm window.

Alarm list and hit list filtering and sorting settings

Access in Runtime: Read and write

## Syntax

Object.**AlarmFilter**[=String]

### Object

Required A "ScreenItem" object with the format "AlarmControl".

### String

Optional A value or a constant that specifies a SQL-Statement for selecting the alarms that will be shown in the alarm window.

## See also

AlarmControl (Page 4273)

## AlarmHigh

### Description

Defines the top limit value at which an alarm should be triggered or returned. The type of evaluation (percentage or absolute) is specified with the "TypeAlarmHigh" property.

Access in Runtime: Write and read

## Syntax

Object.**AlarmHigh**[=REAL]

### Object

Required A "ScreenItem" object with the format "Bar".

### REAL

Value for the upper limit

## See also

Bar (Page 4287)

## AlarmID

### Description

Returns the AlarmID of the Alarm object. The AlarmID is unique and is assigned by the system.

AlarmID (readonly)

**See also**

Alarms (list) (Page 4240)

**AlarmLogs****Description**

Returns an object of type "AlarmLogs".

Access in Runtime: Read

**Syntax**

Object.**AlarmLogs**

**Object**

Required A "Logging" object.

**See also**

Logging (Page 4253)

**AlarmLow****Description**

Defines the bottom limit value at which an alarm should be triggered or returned. The type of evaluation (percentage or absolute) is specified with the "TypeAlarmLow" property.

Access in Runtime: Write and read

**Syntax**

Object.AlarmLow[=REAL]

**Object**

Required A "ScreenItem" object with the format "Bar".

**REAL**

Value for the lower limit

**See also**

Bar (Page 4287)

## AlarmLowerLimit

### Description

Specifies the upper limit at which the alarm will be triggered.

Access in Runtime: Read and write

### Syntax

Object.**AlarmLowerLimit**[=Double]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### Double

Optional A value or a constant that specifies the lower limit at which the alarm will be triggered.

### Comments

The type of evaluation (percentage or absolute) is established using the "AlarmLowerLimitRelative" property.

The "AlarmLowerLimitEnable" property establishes whether the monitoring of this limit is enabled.

### See also

Bar (Page 4287)

## AlarmLowerLimitColor

### Description

Specifies the bar color of the "AlarmLowerLimit" limit.

The "AlarmLowerLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

### Syntax

Object.**AlarmLowerLimitColor**[=Color]

#### Object

Required A "ScreenItem" object with the format "Bar".

**Color**

Optional A value or a constant that specifies the bar color for the "AlarmLowerLimit" limit.

**See also**

Bar (Page 4287)

**AlarmLowerLimitEnabled****Description**

Specifies whether the "AlarmLowerLimit" limit is to be monitored.

Access in Runtime: Read and write

**Syntax**

Object.**AlarmLowerLimitEnabled**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "Bar".

**BOOLEAN**

Optional TRUE, if the "AlarmLowerLimit" limit is to be monitored.

**Comments**

The following values will be established via the properties "AlarmLowerLimit", "AlarmLowerLimitColor" and "AlarmLowerLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

**See also**

Bar (Page 4287)

**AlarmLowerLimitRelative****Description**

Establish whether the lower limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.

Access in Runtime: Read and write

## Syntax

Object.**AlarmLowerLimitRelative**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Bar".

### BOOLEAN

Optional TRUE, if the lower limit at which the interrupt is triggered is evaluated as a percentage.

## See also

Bar (Page 4287)

## AlarmUpperLimit

### Description

Establishes the upper limit at which the interrupt will be triggered.

Access in Runtime: Read and write

Syntax

Object.**AlarmUpperLimit**[=Double]

### Object

Required A "ScreenItem" object with the format "Bar".

### Double

Optional A value or a constant that defines the upper limit at which an interrupt will be triggered.

## Comments

The type of evaluation (percentage or absolute) is defined using the "AlarmUpperLimitRelative" property.

The "AlarmUpperLimitEnable" property defines whether or not monitoring of this limit is enabled.

## See also

Bar (Page 4287)

## AlarmUpperLimitColor

### Description

Defines the bar color for the "AlarmUpperLimit" limit.

The "AlarmUpperLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

## Syntax

Object.**AlarmUpperLimitColor**[=Color]

### Object

Required A "ScreenItem" object with the format "Bar".

### Color

Optional A value or a constant that defines the bar color for the "AlarmUpperLimit" limit.

## See also

Bar (Page 4287)

## AlarmUpperLimitEnabled

### Description

Specifies whether the "AlarmUpperLimit" value is to be monitored.

Access in Runtime: Read and write

### Syntax

Object.**AlarmUpperLimitEnabled**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Bar".

### BOOLEAN

Optional TRUE, if the "AlarmUpperLimit" value is monitored.

### Comments

The following values will be defined using the properties "AlarmUpperLimit", "AlarmUpperLimitColor" and "AlarmUpperLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

## See also

Bar (Page 4287)

## AlarmUpperLimitRelative

### Description

Establish whether the upper limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.

Access in Runtime: Read and write

### Syntax

Object.**AlarmUpperLimitRelative**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### BOOLEAN

Optional TRUE, if the upper limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.

## See also

Bar (Page 4287)

## Alignment

### Description

Determines the layout of the scale (left/right or top/bottom) depending on the position of the bar object or returns it.

Access in Runtime: Read and write

### Syntax

Object.**Alignment**[=ScalePosition]

#### Object

Required An object of the "ScreenItem" type with the format "Bar".

#### ScalePosition

1: Right or bottom .

0: Left or top.

**See also**

Bar (Page 4287)

**AlignmentLeft****Description**

Defines or returns the horizontal alignment of the text. Value range from 0 to 2.

Access in Runtime: Read and write

**Syntax**

Object.**AlignmentLeft**[=HorizontalAlignment]

**Object**

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "RoundButton", "CheckBox", "OptionGroup", "MultilineEdit", "ComboBox", "ListBox".

**HorizontalAlignment**

0: Alignment left

1: Alignment centered

2: Alignment right

**AlignmentTop****Description**

Defines or returns the vertical alignment of the text. Value range from 0 to 2.

Access in Runtime: Read and write

**Syntax**

Object.**AlignmentTop**[=VerticalAlignment]

**Object**

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "RoundButton", "CheckBox", "OptionGroup".

**VerticalAlignment**

0: Alignment left

1: Alignment centered

2: Alignment right

## AllowMenu

### Description

Establishes whether the shortcut menu should be enabled to control the Sm@rtClient view.

### Syntax

Object.**AllowMenu**

#### Object

Required A "ScreenItem" object with the format "SmartClientView".

### See also

SmartClientView (Page 4415)

## AllowPersistence

### Description

Specifies whether the persistence is adjustable.

Access in Runtime: Read and write

### Syntax

Object.**AllowPersistence**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

#### BOOLEAN

Optional TRUE, if the persistence is adjustable.

### See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

## Analog

### Description

Specifies whether the clock should be shown as an analog clock.

Access in Runtime: Read and write

### Syntax

Object.**Analog**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Clock".

#### BOOLEAN

Optional TRUE, if the clock should be shown as an analog clock.

### See also

Clock (Page 4310)

## AngleAlpha

### Description

Defines or returns depth angle a for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.

## AngleBeta

### Description

Defines or returns depth angle b for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.

## AngleMax

### Description

Specifies the angle of the scale end of the "Gauge" object.

Access in Runtime: Read and write

## Syntax

Object.**AngleMax**[= DOUBLE]

### Object

Required A "ScreenItem" object with the format "Gauge".

### DOUBLE

Optional A value or a constant that specifies the angle in degrees.

## Comments

The start and end of the scale gradations are described with the properties "AngleMin" and "AngleMax" in angle degrees.

The value of the AngleMin property must always be less than the value of the AngleMax property. The zero degree angle is located at the 3 o'clock position on the scale. Positive angle values are counted clockwise.

## See also

Gauge (Page 4338)

## AngleMin

## Description

Specifies the angle of the scale start of the "Gauge" object.

Access in Runtime: Read and write

## Syntax

Object.**AngleMin**[= DOUBLE]

### Object

Required A "ScreenItem" object with the format "Gauge".

### DOUBLE

Optional A value or a constant that specifies the angle in degrees.

## Comments

The start and end of the scale gradations are described with the properties "AngleMin" and "AngleMax" in angle degrees.

The value of the AngleMin property must always be less than the value of the AngleMax property.

The zero degree angle is located at the 3 o'clock position on the scale. Positive angle values are counted clockwise.

**See also**

Gauge (Page 4338)

**Application****Description**

Supplies the content of the application window Read only access.

**See also**

ScriptDiagnostics (Page 4410)

**ApplyProjectSettings****Description**

Specifies whether the project settings are applied from the "HMI alarms" editor.

Access in Runtime: Read and write

**Syntax**

Object.**ApplyProjectSettings**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl".

**BOOLEAN**

TRUE: The message blocks configured in the "HMI messages" editor are applied to the message view with their properties. The message blocks are displayed with these properties in the message view.

FALSE: The properties are not applied.

**See also**

AlarmControl (Page 4273)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

OnlineTrendControl (Page 4375)

## AskOperationMotive

### Description

Specifies whether the reason for operating this object will be logged. When operating the specified object in Runtime, a dialog opens in which the operator enters the reason for the operation in text format.

Access in Runtime: Read and write

### Syntax

Object.**AskOperationMotive**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the formats "IOField", "SymbolicIOField" or "WindowSlider".

#### BOOLEAN

Optional TRUE, if the reason for operating this object will be logged.

### See also

IOField (Page 4351)

SymbolicIOField (Page 4422)

WindowSlider (Page 4468)

Listbox (Page 4357)

## Assignments

### Description

A list which contains the assignments between the output value and the output text actually to be output. The assignments are dependent on the set list type. You determine the list type with the ListType property.

Access in Runtime: Read

### Syntax

Object.**Assignments**

#### Object

Required A "ScreenItem" object with the format "SymbolicIOField".

**See also**

SymbolicIOField (Page 4422)

**AssumeOnExit****Description**

Specifies whether the entered text is applied after leaving the input field, e.g. with the <TAB> key or a mouseclick.

Access in Runtime: Read and write

**Syntax**

Object.**AssumeOnExit**

**Object**

Required An object of the "ScreenItem" type with the format "IOField", "SymbolicIOField".

**See also**

IOField (Page 4351)

SymbolicIOField (Page 4422)

**AssumeOnFull****Description**

Specifies whether the input field is left automatically after a complete input (the specified number of characters was entered) and the input is applied.

Access in Runtime: Read and write

**Syntax**

Object.AssumeOnFull[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "IOField", "SymbolicIOField".

**BOOLEAN**

TRUE: is applied.

FALSE: is not applied.

## See also

[IOField \(Page 4351\)](#)

[SymbolicIOField \(Page 4422\)](#)

## Authorization

### Description

Specifies the operating rights of the selected object in Runtime.

Access in Runtime: Read and write

### Syntax

Object.**Authorization**[=HMIRTAuthorization]

#### Object

Required An object of the "ScreenItem" type with the format "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", IOField, "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "UserArchiveControl", "StatusForce", "Slider", "SymbolLibrary", "OnlineTrendControl", "AlarmControl", "UserView", "Checkbox", "OptionGroup", "WindowSlider", "OleView", "Connector" oder "SoftKey".

#### HMIRTAuthorization

Optional A value or a constant that establishes the operating rights of the specified object in Runtime.

## AutoCompleteColumns

### Description

Adds empty columns if the Control width is greater than the width of columns configured.

Access in Runtime: Read and write

## Syntax

Object.**AutoCompleteColumns**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

### BOOLEAN

TRUE: The empty columns are displayed.

FALSE: The empty columns are not displayed.

## See also

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## AutoCompleteRows

### Description

Enables the insertion of empty rows if the Control length is greater than the number of rows configured.

Access in Runtime: Read and write

### Syntax

Object.**AutoCompleteRows**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

### BOOLEAN

TRUE: The empty rows are displayed.

FALSE: The empty rows are not displayed.

## See also

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## AutoScroll

### Description

Specifies how the alarm view behaves when new alarms appear.

The specific choice of alarm lines is only possible if "AutoScroll" is not enabled.

The "AutoScroll" property is disabled if the "MsgCtrlFlag" = "-1" attribute is set. The most up-to-date alarm is then shown at the top of the alarm view.

Access in Runtime: Read and write

### Syntax

Object.**AutoScroll**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmView".

#### BOOLEAN

Optional TRUE, if a new alarm is appended to and chosen from the list shown in the alarm window. If necessary, the visible area of the alarm window can be moved.

FALSE, if a new alarm is not selected. The visible area of the alarm window is not altered.

### See also

AlarmControl (Page 4273)

## AutoSelectionColors

### Description

Enables the display of default system colors as selection color for cells and rows.

Access in Runtime: Read and write

### Syntax

Object.**AutoSelectionColors**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

**BOOLEAN**

TRUE: The system color is used.

FALSE: The customized color is used.

**See also**

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

**AutoSelectionRectColor**

**Description**

Defines a system color for the selection border.

Access in Runtime: Read and write

**Syntax**

Object.**AutoSelectionRectColors** [=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

**BOOLEAN**

TRUE: The system color is used.

FALSE: The customized color is used.

**See also**

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## Average

### Description

Specifies whether a mean value is shown from the last 15 values.

Access in Runtime: Read and write

### Syntax

Object.**Average**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### BOOLEAN

Optional TRUE, if a mean value is shown from the last 15 values.

## Axe property

### Description

Defines or returns the position of the 3D bar in the coordinate system. Value range from 0 to 2.

0: The 3D-bar is displayed on the X-axis.

1: The 3D-bar is displayed on the Y-axis.

2: The 3D-bar is displayed on the Z-axis.

## AxisSection

### Description

Defines or returns the distance between two long axis sections. The information on the distance is given in scale units and is dependent on the minimum and maximum values configured.

## Properties B

### BackBorderWidth

### Description

Defines or returns the width of the 3D border in pixels. The value for the width is dependent on the size of the object.

## BackColor

### Description

Specifies the background color of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**BackColor**[= Color]

#### Object

Required An object of the "ScreenItem" type with the format "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "Switch", "GraphicIOField", "GraphicView", "Bar", "UserArchivControl", "StatusForce", "Gauge", "Slider", "SymbolLibrary", "RulerTrendControl", "OnlineTrendControl", "FunctionTrendControl", "OnlineTableControl", "AlarmControl", "UserView", "Checkbox", "OptionGroup", "WindowSlider", "Connector", "Group" or an object of the "Screen" type.

#### Color

Optional A value or a constant that specifies the background color.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

The background color is not visible if the "BorderStyle" property has the value "0".

## BackColor

### Description

Determines the background color of the given object.

Access during runtime: Read and Write

### Syntax

Object.**BackColor** [= Color]

### Object

Required An object of type "ScreenItem" with the characteristic "Line", "Polyline", "Ellipse", "Circle", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField", "GraphicView", "Bar", "RecipeView", "StatusForce", "Gauge", "Slider", "SymbolLibrary", "TrendView", "MessageView" or "UserView" or an object of type "Screen".

### Color

Optional A value or constant which determines the background color.

### Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

The background color is not visible if the "BorderStyle" property has the value of "0."

ProjectName (Page 4392)

### BackColor2

#### Description

Defines or returns the bar color for the display of the current value. LONG write-read access.

### BackColor3 property

#### Description

Defines or returns the color of the bar background. LONG write-read access.

## BackColorBottom

### Description

Specifies the color for the lower / right part of the Sliders.

Access in Runtime: Read and write

### Syntax

Object.**BackColorBottom**[=Color]

#### Object

Required A "ScreenItem" object with the format "WindowSlider".

#### Color

Optional A value or a constant that specifies the color for the lower / right part of the Sliders.

### See also

WindowSlider (Page 4468)

## BackColorTop

### Description

Specifies the color for the upper / left part of the Sliders.

Access in Runtime: Read and write

### Syntax

Object.**BackColorTop**[=Color]

#### Object

Required A "ScreenItem" object with the format "WindowSlider".

#### Color

Optional A value or a constant that specifies the color for the upper / left part of the Sliders.

### See also

WindowSlider (Page 4468)

## BackFillStyle

### Description

Specifies the fill style of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**BackFillStyle**[= THmiFillStyle]

#### Object

Required An object of the "ScreenItem" type with the format "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "GraphicView", "Bar", "Clock", "Gauge", "Slider", "SymbolLibrary", "CheckBox", "OptionGroup" or "WindowSlider".

#### THmiFillStyle

Optional A value or a constant that specifies the fill style.

hmiFillStyleTransparent (65536): Transparent fill

hmiFillStyleSolid (0): Object is filled with the specified color

Default setting: Solid

## BackFillStyle

### Description

Determines the fill style of the specified object.  
Access during runtime: Read and Write

### Syntax

Object.BackFillStyle [= THmiFillStyle]

#### Object

Required. An object of the "ScreenItem" type with the characteristic "Ellipse," "Circle", "Rectangle" or "Polygon".

#### THmiFillStyle

Optional. A value or constant which determines the fill style.

hmiFillStyleTransparent (65536): Transparent fill

hmiFillStyleTransparent (0): Object is filled with the specified color

Default setting: Solid

### See also

DateTimeField (Page 4315)  
ProjectName (Page 4392)

## BackFillStyleReadOnlySpecial

### Description

Specifies that the "Background fill style" can only be read.  
Access in Runtime: Read and write

### Syntax

Object.BackFillStyleReadOnlySpecial[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "IOField".

**BOOLEAN**

Optional TRUE, if the "Background fill style" can only be read.

**See also**

IOField (Page 4351)

**BackFlashColorOff**

**Description**

Defines or returns the color of the object background for the flash status "Off". LONG write-read access.

**BackFlashColorOn**

**Description**

Defines or returns the color of the object background for the flash status "On". LONG write-read access.

**BackFlashingColorOff**

**Description**

Specifies the color of the background for the flashing status "off".

Access in Runtime: Read and write

**Syntax**

Object.**BackFlashingColorOff**[=Color]

**Object**

Required A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField" or "Bar".

**Color**

Optional A value or a constant that specifies the color of the background for the flashing status "off".

**BackFlashingColorOn****Description**

Specifies the color of the background for the flashing status "on".

Access in Runtime: Read and write

**Syntax**

Object.**BackFlashingColorOn**[=Color]

**Object**

Required A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField" or "Bar".

**Color**

Optional A value or a constant that specifies the color of the background for the flashing status "on".

**See also**

## BackFlashingEnabled

### Description

Specifies whether the background of the specified object will flash in Runtime.

Access in Runtime: Read and write

### Syntax

Object.**BackFlashingEnabled**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField" or "Bar".

#### BOOLEAN

Optional TRUE, if the background of the specified object is flashing in Runtime.

### See also

Bar (Page 4287)

## BackFlashingRate

### Description

Specifies the flash rate of the background for the specified object.

Access in Runtime: Read and write

### Syntax

Object.**BackFlashingRate**[=FlashingRate]

**Object**

Required A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField" or "Bar".

**FlashingRate**

hmiFlashingRateSlow ( 0): The length of the flashing rate is 250 ms.

hmiFlashingRateMedium ( 1): The length of the flashing rate is 500 ms.

hmiFlashingRateFast ( 2): The length of the flashing rate is 1000 ms.

**Background****Description**

TRUE, when the background of the 3D-bar graph object should be visible. BOOLEAN write-read access.

**BarBackColor****Description**

Specifies the color of the bar background for the selected object.

Access during runtime: Read and write

**Syntax**

Object.**BarBackColor**[= Color]

**Object**

Required An object of the "ScreenItem" type with the characteristics "Bar," or "Slider".

### Color

Optional A value or a constant that specifies the color of the bar background.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

### See also

### BarBackFillStyle

#### Description

Specifies the fill style for the bar.

Access in Runtime: Read and write

#### Syntax

Object.**BarBackFillStyle**[=FillStyle]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### FillStyle

hmiFillStyleTransparent ( 65536): Transparent fill style

hmiFillStyleSolid ( 0): Solid fill style

hmiFillStyleBackwardDiagonal ( 131075): Diagonal fill style striped towards the top right

hmiFillStyleCross ( 131076): Checked fill style

hmiFillStyleDiagonalCross ( 131077): Diagonal checked fill style

hmiFillStyleForwardDiagonal ( 131074): Diagonal fill style striped towards the top left

hmiFillStyleHorizontal ( 131072): Horizontal striped fill style

hmiFillStyleVertical ( 131073): Vertical striped fill style

hmiFillStylePattern1 ( 196608): Default fill style

hmiFillStylePattern2 ( 196609): Default fill style

hmiFillStylePattern3 ( 196610): Default fill style

hmiFillStylePattern4 ( 196611): Default fill style

hmiFillStylePattern5 ( 196612): Default fill style  
hmiFillStylePattern6 ( 196613): Default fill style

hmiFillStylePattern35 ( 196642): Default fill style  
hmiFillStylePattern36 ( 196643): Default fill style  
hmiFillStylePattern37 ( 196644): Default fill style

## See also

Bar (Page 4287)

## BarColor

### Description

Specifies the color of the slider in the "Slider" object.

Access during runtime: Read and Write

### Syntax

Object.**BarColor**[= Color]

#### Object

Required An object of the "ScreenItem" type with the characteristic "Slider".

#### Color

Optional A value or a constant that specifies the color of the slider.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

The range extends from "RangeMin" to the position of the controller.

## See also

Slider (Page 4412)

## BarDepth

### Description

Defines or returns the depth of the bar in pixels.

## BarHeight property

### Description

Defines or returns the height of the bar in pixels.

## BarStartValue

### Description

Specifies the value of the zero point of the scale.

Access in Runtime: Read and write

### Syntax

Object.**BarStartValue**[=Double]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### Double

Optional A value or a constant that specifies the value of the zero point for the scale.

### See also

Bar (Page 4287)

## BarWidth

### Description

Defines or returns the width of the bar in pixels.

## BaseScreenName

### Description

Reads the name of the current root screen or triggers a root screen change by setting a new screen name.

Access in Runtime: Read and write

### Syntax

Object.**BaseScreenName**[= STRING]

#### Object

Required An "HMIRuntime" object.

#### STRING

Optional A value or a constant that contains the screen name.

## Comments

You can also use the property to establish which screen is currently being displayed.

## BaseX property

### Description

Defines or returns the horizontal distance of the right bar edge to the left edge of the object field in pixels.

## BaseY property

### Description

Defines or returns the vertical distance of the bottom bar edge to the top edge of the object field.

## BeginTime(i)

### Description

Specifies the start time of the time range to be shown in the trend view. The property "TagProviderType(i)" must have the value -1.

Access in Runtime: Read and write

## Syntax

Object.**BeginTime(i)**[=Time]

### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl" oder "OnlineTableControl".

### Time

Optional A value or a constant which determines the start time of the time range to be shown in the trend view.

## Comments

The parameter i indicates the number of the trend.

If "BeginTime(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent an immediate acceptance of the change with "FreezeProviderConnections" before changing "BeginTime(i)".

**See also**

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

**BelowLowerLimitColor****Description**

Defines the color of the specified object for the case "Low limit exceeded".

**See also**

Switch (Page 4419)

SymbolicIOField (Page 4422)

IOField (Page 4351)

**BitNumber****Description**

Specifies the bit whose status must change to trigger a value change.

Access in Runtime: Read and write

**Syntax**

Object.**BitNumber**[=Int]

**Object**

Required A "ScreenItem" object with the formats "SymbolicIOField", "Button" or "GraphicIOField".

**Int**

Optional Specifies the bit whose status must change to trigger a value change.

**Comments**

The tag being used must be of type BYTE, WORD or DWORD.

## See also

SymbolicIOField (Page 4422)

Button (Page 4294)

GraphicIOField (Page 4341)

## BlinkColor

### Description

Specifies the color in which the "SymbolLibrary" object will flash.

Access during runtime: Read and Write

### Syntax

Object.**BlinkColor**[= Color]

#### Object

Required An object of the "ScreenItem" type with the characteristic "SymbolLibrary".

#### Color

Optional A value or a constant that specifies the flash color.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

## See also

SymbolLibrary (Page 4427)

## BlinkMode

### Description

Sets the type of flash picture for the specified object.

Access during runtime: Read and write

### Syntax

Object.**BlinkMode**[=SymbolLibBlinkMode]

**Object**

Required A "ScreenItem" object with the format "SymbolLibrary".

**SymbolLibBlinkMode**

hmiSymbolLibraryFlashingNone ( 0): Flashing is switched off.

hmiSymbolLibraryFlashingInvisible ( 1): The flash picture is invisible.

hmiSymbolLibraryFlashingShaded ( 2): The flash picture is given a colored, shaded surface. The color of the surface corresponds to the settings in the property "BlinkColor".

hmiSymbolLibraryFlashingSolid ( 3): The flash picture is given a colored, unshaded surface. The color of the surface corresponds to the settings in the property "BlinkColor".

**See also**

SymbolLibrary (Page 4427)

**BlinkSpeed****Description**

Specifies the flash rate.

Fast - 250: The length of the flashing rate is 250 ms. Medium - 500: The length of the flashing rate is 500 ms.

Slow - 1000: The length of the flashing rate is 1000 ms. The default value is medium - 500.

Access in Runtime: Read and write

**Syntax**

Object.**BlinkSpeed**[=FlashingRate]

**Object**

Required A "ScreenItem" object with the format "SymbolLibrary".

**FlashingRate**

hmiFlashingRateSlow ( 0): The length of the flashing rate is 250 ms.

hmiFlashingRateMedium ( 1): The length of the flashing rate is 500 ms.

hmiFlashingRateFast ( 2): The length of the flashing rate is 1000 ms.

**See also**

SymbolLibrary (Page 4427)

## BorderBackColor

### Description

Specifies the background color of the broken border line for the specified object.

Access in Runtime: Read and write

### Syntax

Object.**BorderBackColor**[=Color]

#### Object

Required An object of the "ScreenItem" type with the format "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "GraphicView", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

#### Color

Optional A value or a constant that specifies the background color of the broken border line for the specified object.

## BorderBrightColor3D

### Description

Specifies the frame color of the following frame parts in case of a 3D display of the specified object:

- External frame parts at the top and bottom
- Internal frame parts at the top and right

Access in Runtime: Read and write

### Syntax

Object.**BorderBrightColor3D**[= Color]

#### Object

Required A "ScreenItem" object with the formats "Button", "Roundbutton" or "Slider".

#### Color

Optional A value or a constant that specifies the frame color. Default setting is white.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

### See also

Button (Page 4294)

Slider (Page 4412)

BorderShadeColor3D (Page 4540)

## BorderBrightColor3D

### Description

Determines the frame color of the following frame parts in the 3D display of the given object:

- Outer frame parts above and below
- Inner frame parts below and right

Access during runtime: Read and Write

## Syntax

Object.BorderBrightColor3D [= Color]

### Object

Required An object of the "ScreenItem" type with the characteristic "Slider".

### Color

Optional A value or constant which determines the frame color. Default setting is white.

## Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

## BorderColor

### Description

Specifies the line color of the specified object.

Access in Runtime: Read and write

### Syntax

Object.**BorderColor**[= Color]

### Object

Required An object of the "ScreenItem" type with the format "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

### Color

Optional A value or a constant that specifies the line color.

## Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

**BorderColor****Description**

Specifies the line color of the selected object.  
Access during runtime: Read and Write

**Syntax**

Object.BorderColor [= Color]

**Object**

Necessary. An object of the "ScreenItem" type with the characteristics "Ellipse", "Circle", "Rectangle", "Polygon", "TextField", "IOField" or "SymbolicIOField".

**Color**

Optional A value or constant which determines the line color.

**Comments**

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

**Used for the following object types:**

Rectangle

**See also**

DateTimeField (Page 4315)

ProjectName (Page 4392)

**BorderColorBottom**

**Description**

Defines or returns the border color for the bottom/right part of the object. LONG write-read access.

**BorderColorTop**

**Description**

Defines or returns the border color for the top/left part of the object. LONG write-read access.

**BorderEnabled**

**Description**

TRUE, when the window is displayed with borders in Runtime. Read only access.

**See also**

ScreenWindow (Page 4408)  
ScriptDiagnostics (Page 4410)

**BorderEndStyle****Description**

Specifies the type of line-end shapes for the specified object.  
Access in Runtime: Read and write

**Syntax**

Object.**BorderEndStyle**[=Int]

**Object**

Required A "ScreenItem" object with the formats "Line", "Polyline" or "Connector".

**Int**

Optional A value or a constant that specifies the type of line-end shapes for the specified object.

**See also**

Line (Page 4355)  
Polyline (Page 4390)  
Connector (Page 4312)

**BorderFlashColorOff****Description**

Defines or returns the color of the object lines for the flashing status "Off". LONG write-read access.

**BorderFlashColorOn****Description**

Defines or returns the color of the object lines for the flashing status "On". LONG write-read access.

## BorderFlashingColorOff

### Description

Specifies the color of the border line for the selected object for the flashing status "off".

Access in Runtime: Read and write

### Syntax

Object.**BorderFlashingColorOff**[=Color]

#### Object

Required A "ScreenItem" object with the formats "Ellipse", "Kreis", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

#### Color

Optional A value or a constant that specifies the color of the border line of the selected object for the flashing status "off".

## BorderFlashingColorOn

### Description

Specifies the color of the border line for the selected object for the flashing status "on".

Access in Runtime: Read and write

### Syntax

Object.**BorderFlashingColorOn**[=Color]

#### Object

Required A "ScreenItem" object with the formats "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

#### Color

Optional A value or a constant that specifies the color of the border line of the selected object for the flashing status "on".

CheckBox (Page 4300)  
OptionGroup (Page 4384)  
WindowSlider (Page 4468)

## BorderFlashingEnable

### Description

Specifies whether the border line of the selected object will flash in runtime.

Access in Runtime: Read and write

### Syntax

Object.**BorderFlashingEnable**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the formats "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

#### BOOLEAN

Optional TRUE, if the border line of the object is flashing.

### See also

RoundButton (Page 4404)

## BorderFlashingRate

### Description

Specifies the flash rate of the border line for the selected object.

Access in Runtime: Read and write

### Syntax

Object.**BorderFlashingRate**[=FlashingRate]

#### Object

Required A "ScreenItem" object with the formats "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

#### FlashingRate

hmiFlashingRateSlow ( 0): The length of the flashing rate is 250 ms.

hmiFlashingRateMedium ( 1): The length of the flashing rate is 500 ms.

hmiFlashingRateFast ( 2): The length of the flashing rate is 1000 ms.

## BorderInnerStyle3D

### Description

Specifies the display of the internal part of the object border.

Access in Runtime: Read and write

### Syntax

Object.**BorderInnerStyle3D**[=GaugeBorder3DStyle]

#### Object

Required A "ScreenItem" object with the formats "Gauge" or "Slider".

#### GaugeBorder3DStyle

hmiGaugeBorder3DStyleNone ( 0): There is no internal part of the object border.

hmiGaugeBorder3DStyleRecessed ( 1): The object border is shown in relief.

hmiGaugeBorder3DStyleRaised ( 2): The object border is shown raised.

hmiGaugeBorder3DStyleGray ( 3): The object border has a uniform gray border.

hmiGaugeBorder3DStyleColored ( 4): The object border has a uniform colored border. The border color corresponds to the background color.

### See also

Gauge (Page 4338)

Slider (Page 4412)

## BorderInnerWidth3D

### Description

Specifies the width of the inner border for the 3D presentation of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**BorderInnerWidth3D**[= LONG]

#### Object

Required A "ScreenItem" object with the format "Slider".

#### LONG

Optional A value or a constant that specifies the width in pixels of the inner border.

**See also**

Slider (Page 4412)

**BorderOuterStyle3D****Description**

Specifies the display of the external part of the object border.

Access in Runtime: Read and write

**Syntax**

Object.**BorderOuterStyle3D**[=GaugeBorder3DStyle]

**Object**

Required A "ScreenItem" object with the formats "Gauge" or "Slider".

**GaugeBorder3DStyle**

hmiGaugeBorder3DStyleNone ( 0): There is no internal part of the object border.

hmiGaugeBorder3DStyleRecessed ( 1): The object border is shown in relief.

hmiGaugeBorder3DStyleRaised ( 2): The object border is shown raised.

hmiGaugeBorder3DStyleGray ( 3): The object border has a uniform gray border.

hmiGaugeBorder3DStyleColored ( 4): The object border has a uniform colored border. The border color corresponds to the background color.

**See also**

Gauge (Page 4338)

Slider (Page 4412)

**BorderOuterWidth3D****Description**

Specifies the width of the outer border for the 3D presentation of the selected object.

Access in Runtime: Read and write

**Syntax**

Object.**BorderOuterWidth3D**[= LONG]

**Object**

Required A "ScreenItem" object with the format "Slider".

### **LONG**

Optional A value or a constant that specifies the width in pixels of the outer border.

### **See also**

Slider (Page 4412)

## **BorderShadeColor3D**

### **Description**

Specifies the frame color of the following frame parts in case of a 3D display of the specified object:

- Internal frame parts at the top and bottom
- External frame parts at the bottom and right

Access in Runtime: Read and write

### **Syntax**

Object.**BorderShadeColor3D**[= Color]

#### **Object**

Required A "ScreenItem" object with the formats "Button", "Roundbutton" or "Slider".

#### **Color**

Optional A value or a constant that specifies the color of the shading. Default setting is

### **Comments**

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

### **See also**

Button (Page 4294)

Slider (Page 4412)

## BorderShadeColor3D

### Description

Determines the frame color of the following frame parts in the 3D display of the given object:

- Inner frame parts above and below
- Outer frame parts below and right

Access during runtime: Read and Write

### Syntax

Object.BorderShadeColor3D [= Color]

#### Object

Required. An object of the "ScreenItem" type with the characteristic "Slider."

#### Color

Optional. A value or constant which determines the shade color. Default setting is

### Remarks

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the corresponding decimal values (value range from 0 to 255) for each of the three RGB values. For example, the color "red" is represented as follows: RGB(255, 0, 0). Furthermore, you can use the VBS color constants such as vbRed or vbGreen.

## BorderStyle

### Description

Specifies the type of border lines for the specified object.

Access in Runtime: Read-only

### Syntax

Object.**BorderStyle**[=Int]

#### Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup", "WindowSlider", "Connector", "PrintRecipe" or "PrintMessage".

### **Int**

Optional A value or a constant that specifies the type of border lines for the specified object.

0 = filled line

1 = broken line

2 = dotted line

3 = dashed and dotted line

4 = dash - dot - dot line

### **See also**

Listbox (Page 4357)

## BorderStyle3D

### Description

Specifies whether the selected object has a 3D border shadow.

Access during runtime: Read and write

### Syntax

Object.**BorderStyle3D**[= BOOLEAN]

#### Object

Necessary. A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch", "GraphicView", "GraphicIOField" or "Bar".

#### BOOLEAN

Optional TRUE, if the object has a 3D border shadow.

#### Used for the following object types:

Auto-Hotspot

### See also

## BorderStyle3D

### Description

Determines whether the given object has 3D border shading.

Access during runtime: Read and Write

## Syntax

Object.BorderStyle3D [= BOOLEAN]

### Object

Required. An object of the type "ScreenItem" with the characteristic "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "GraphicView", "GraphicIOField" or "Bar".

### BOOLEAN

Optional. TRUE, if the object has 3D border shading.

## See also

DateTimeField (Page 4315)

## BorderWidth

## Description

Specifies the line thickness of the selected object.

Access during runtime: Read and write

## Syntax

Object.BorderWidth[= LONG]

### Object

Necessary. An object of the "ScreenItem" type with the format "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Gauge", "Slider", "Checkbox", "OptionGroup" or "WindowSlider".

### LONG

Optional A value or a constant that specifies the line weight in pixels.

### Used for the following object types:

Rectangle

## BorderWidth

### Description

Determines the LineWidth of the given object.  
Access during runtime: Read and Write

### Syntax

Object.BorderWidth [= LONG]

**Object**

Required. An object of the type "ScreenItem" with the characteristic "Ellipse", "Circle", "Gauge", "Rectangle", "Polygon" or "TextField".

**LONG**

Optional. A value or constant which determines the line width in pixels.

**See also**

ProjectName (Page 4392)

**BorderWidth3D**

**Description**

Specifies the width of the border for the 3D representation of the selected object.

Access in Runtime: Read and write

**Syntax**

Object.BorderWidth3D [= LONG]

**Object**

Required A "ScreenItem" object with the format "Roundbutton".

**LONG**

Optional A value or constant which determines the width of the inner border in pixels.

**See also**

Switch (Page 4419)

Gauge (Page 4338)

RoundButton (Page 4404)

**BottomConnectedConnectionPointIndex**

**Description**

Specifies or sets the index number of the bottom connecting point.

LONG write-read access.

**BottomConnectedObjectName****Description**

Specifies or sets the object name of the object which is docked on at the bottom connecting point.

LONG write-read access.

**BoxAlignment****Description**

TRUE, when the fields are arranged aligned to the right. BOOLEAN write-read access.

**BoxCount****Description**

Defines or returns the number of fields. Value range from 0 to 31.

**BoxType****Description**

Defines or returns the field type. Value range from 0 to 2:

- 0: Edition
- 1: Input
- 2: I/O field

**Button1Width****Description**

Defines or returns the width of the Button 1 in pixels.

When the SameSize property is set to TRUE, all the buttons are specified the same width.

**Button2Width****Description**

Defines or returns the width of the Button 2 in pixels.

When the SameSize property is set to TRUE, all the buttons are specified the same width.

### Button3Width

#### Description

Defines or returns the width of the Button 3 in pixels.  
When the SameSize property is set to TRUE, all the buttons are specified the same width.

### Button4Width

#### Description

Defines or returns the width of the Button 4 in pixels.  
When the SameSize property is set to TRUE, all the buttons are specified the same width.

### ButtonColor

#### Description

Defines or returns the color of the slider. LONG write-read access.

### ButtonCommand

#### Description

Specifies the display in the message view.  
Access in Runtime: Read and write

#### Syntax

Object.**ButtonCommand**[=Long]

##### Object

Required A "ScreenItem" object with the format "AlarmControl".

##### Long

Optional A value or a constant which specifies the display in the message view.

AlarmControl (Page 4273)

### Properties C

### Caption

### Description

Specifies the text that will be displayed in the title line of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**Caption**[= STRING]

### Object

Required An object of the "ScreenItem" type with the format "Slider", "FunctionTrendControl", "OnlineTableControl", "AlarmControl", "ScreenWindow" or "UserArchiveControl".

### **STRING**

Optional A value or a constant that contains the text that will be shown in the title line.

### **See also**

Slider (Page 4412)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

ScreenWindow (Page 4408)

UserArchiveControl (Page 4459)

SystemDiagnoseWindow (Page 4432)

TrendRulerControl (Page 4439)

### **Caption**

#### **Description**

Determines the text which is displayed in the caption line of the given object.

Access during runtime: Read and Write

#### **Syntax**

Object.Caption [= STRING]

#### **Object**

Required. An object of the "ScreenItem" type with the characteristic "Slider."

#### **STRING**

Optional. A value or a constant which contains the text which is displayed in the caption.

### **CaptionBackColor**

#### **Description**

Specifies the background color of the title line for the selected object.

Access in Runtime: Read and write

#### **Syntax**

Object.**CaptionBackColor**[=Color]

**Object**

Required A "ScreenItem" object with the format "SymbolicIOField".

**Color**

Optional A value or a constant that specifies the background color of the title line for the selected object.

**See also**

SymbolicIOField (Page 4422)

**CaptionColor****Description**

Specifies the color of the text that will be displayed in the title line of the selected object.

Access in Runtime: Read and write

**Syntax**

Object.**CaptionColor**[= Color]

**Object**

Required A "ScreenItem" object with the formats "SymbolicIOField", "Switch" or "Gauge".

**Color**

Optional A value or a constant that specifies the text color.

**Comments**

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

**See also**

SymbolicIOField (Page 4422)

Switch (Page 4419)

Gauge (Page 4338)

## CaptionColor

### Description

Determines the color of the text which is displayed in the title bar of the given object.

Access during runtime: Read and Write

### Syntax

Object.CaptionColor [= Color]

#### Object

Required An object of the "ScreenItem" type with the characteristics "Switch," or "Gauge".

#### Color

Optional A value or constant which determines the text color.

### Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

## CaptionText

### Description

Specifies the text that will be displayed in the title line of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**CaptionText**[= STRING]

#### Object

Required A "ScreenItem" object with the formats "Switch" or "Gauge".

#### STRING

Optional A value or a constant that contains the text that will be shown in the title line.

**See also**

Switch (Page 4419)  
Gauge (Page 4338)  
ScreenWindow (Page 4408)

**CaptionTop****Description**

Specifies the distance of the instrument labels to the upper edge of the selected object. You can position the instrument labels only in line with the vertical diameter of the scale. The value of the attribute refers to the height of the specified object. The height establishes the upper edge of the specified object and the lower edge of the lettering.

Access in Runtime: Read and write

**Syntax**

Object.**CaptionTop**[=Double]

**Object**

Required A "ScreenItem" object with the format "Gauge".

**Double**

Optional A value or a constant that specifies the distance of the instrument labels to the upper edge of the selected object.

Value range from 0 to 1

0: The lower edge of the lettering is positioned on the upper limit of the selected object. The text is no longer visible as it is positioned outside of the selected object.

1: The lower edge of the lettering is positioned on the lower limit of the selected object.

**See also**

Gauge (Page 4338)

**CellCut****Description**

Specifies whether the contents of the cells are abbreviated if the cells are too narrow.

Access in Runtime: Read and write

## Syntax

Object.**CellCut** [=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

### BOOLEAN

TRUE, if the contents are abbreviated.

## See also

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## CellSpaceBottom

### Description

Defines the bottom margin of the table cells.

Access in Runtime: Read

### Syntax

Object.**CellSpaceBottom**

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

## See also

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## CellSpaceLeft

### Description

Specifies the cell space left which is used in the table cells.

Access in Runtime: Read

### Syntax

Object.**CellSpaceLeft**

#### Object

Required An object of the "ScreenItem" type with the format "MessageView", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

### See also

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## CellSpaceRight

### Description

Defines the right indent of the table cells.

Access in Runtime: Read

### Syntax

Object.**CellSpaceRight**

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchiveControl".

### See also

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## CellSpaceTop

### Description

Defines the top margin of the table cells.

Access in Runtime: Read

### Syntax

Object.**CellSpaceTop**

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchiveControl".

### See also

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## CenterColor

### Description

Specifies the color of the center of the "Gauge" object.

Access during runtime: Read and Write

### Syntax

Object.**CenterColor**[= Color]

#### Object

Required An object of the "ScreenItem" type with the characteristic "Gauge".

#### Color

Optional A value or a constant that specifies the color of the center.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

**See also**

Gauge (Page 4338)

**CenterSize****Description**

Specifies the diameter of the round scale center point.

Access in Runtime: Read and write

**Syntax**

Object.**CenterSize**[=Single]

**Object**

Required A "ScreenItem" object with the format "Gauge".

**Single**

Optional A value or a constant that specifies the diameter of the round scale center point.

Value range from 0.03 to 1

1: The diameter corresponds to the smaller value of the geometry attribute "Width" or "Height".

**See also**

Gauge (Page 4338)

**CentrePoint****Description**

Specifies the position of the center point.

Access in Runtime: Read and write

**Syntax**

Object.**CentrePoint**[=Point]

**Object**

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

**Point**

Optional A value that specifies the position of the center point.

## See also

EllipseSegment (Page 4321)

CircleSegment (Page 4305)

EllipticalArc (Page 4324)

CircularArc (Page 4308)

## CentrePointLeft

### Description

Specifies the horizontal distance in pixels of the center point from the left edge of the screen.

Access in Runtime: Read and write

### Syntax

Object.**CentrePointLeft**[=Int]

#### Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

#### Int

Optional A value that specifies the horizontal distance in pixels of the center point from the left edge of the screen.

## See also

EllipseSegment (Page 4321)

CircleSegment (Page 4305)

EllipticalArc (Page 4324)

CircularArc (Page 4308)

## CentrePointTop

### Description

Specifies the vertical distance in pixels of the center point from the upper edge of the screen.

Access in Runtime: Read and write

### Syntax

Object.**CentrePointTop**[=Int]

**Object**

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

**Int**

Optional A value that specifies the vertical distance in pixels of the center point from the upper edge of the screen.

**See also**

EllipseSegment (Page 4321)

CircleSegment (Page 4305)

EllipticalArc (Page 4324)

CircularArc (Page 4308)

**ChangeMouseCursor****Description**

Specifies how the appearance of the mouse cursor changes in Runtime when it is above the icon.

Access in Runtime: Read and write

**Syntax**

Object.**ChangeMouseCursor**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "SymbolLibrary".

**BOOLEAN**

Optional TRUE, if the mouse cursor has the appearance of an arrow even when it is positioned above the icon.

FALSE, if the mouse cursor has the appearance of a 3D arrow with a green lightning symbol. This indicates in Runtime that the respective objective can be operated.

**See also**

SymbolLibrary (Page 4427)

## CheckAlarmHigh

### Description

TRUE, when the "AlarmHigh" limit value is to be monitored. BOOLEAN write/read access.  
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "AlarmHigh", "ColorAlarmHigh" and "TypeAlarmHigh" properties.

## CheckAlarmLow

### Description

TRUE, when the "AlarmLow" limit value is to be monitored. BOOLEAN write/read access.  
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "AlarmLow", "ColorAlarmLow" and "TypeAlarmLow" properties.

## CheckLimitHigh4

### Description

TRUE, when the "Reserve 4" upper limit value should be monitored. BOOLEAN write/read access.  
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitHigh4", "ColorLimitHigh4" and "TypeLimitHigh4" properties.

## CheckLimitHigh5

### Description

TRUE, when the "Reserve 5" upper limit value should be monitored. BOOLEAN write/read access.  
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitHigh5", "ColorLimitHigh5" and "TypeLimitHigh5" properties.

## CheckLimitLow4

### Description

TRUE, when the "Reserve 4" lower limit value should be monitored. BOOLEAN write/read access.  
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitLow4", "ColorLimitLow4" and "TypeLimitLow4" properties.

## CheckLimitLow5

### Description

TRUE, when the "Reserve 5" lower limit value should be monitored. BOOLEAN write/read access.  
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitLow5", "ColorLimitLow5" and "TypeLimitLow5" properties.

## CheckMarkAlignment

### Description

Specifies whether the fields are right aligned.  
Access in Runtime: Read and write

### Syntax

Object.**CheckMarkAlignment**[=ContentAlignment]

#### Object

Required A "ScreenItem" object with the formats "Checkbox" or "OptionGroup".

#### ContentAlignment

- ( 0): The fields are arranged left aligned.
- ( 1): The fields are arranged right aligned.

### See also

OptionGroup (Page 4384)

## CheckMarkCount

### Description

Specifies the number of fields.  
Access in Runtime: Read and write

### Syntax

Object.**CheckMarkCount**[=Int]

#### Object

Required A "ScreenItem" object with the formats "Checkbox" or "OptionGroup".

### **Int**

Optional A value or a constant that specifies the number of fields. Value range from 0 to 31

### **See also**

OptionGroup (Page 4384)

### **CheckToleranceHigh**

#### **Description**

TRUE, when the "ToleranceHigh" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "ToleranceHigh", "ColorToleranceHigh" and "TypeToleranceHigh" properties.

### **CheckToleranceLow**

#### **Description**

TRUE, when the "ToleranceLow" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "ToleranceLow", "ColorToleranceLow" and "TypeToleranceLow" properties.

### **CheckWarningHigh**

#### **Description**

TRUE, when the "WarningHigh" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "WarningHigh", "ColorWarningHigh" and "TypeWarningHigh" properties.

### **CheckWarningLow**

#### **Description**

TRUE, when the "WarningLow" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "WarningLow", "ColorWarningLow" and "TypeWarningLow" properties.

### **ClearOnError**

#### **Description**

Specifies whether an invalid input in this object will be deleted automatically.

Access in Runtime: Read and write

## Syntax

Object.**ClearOnError**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "IOField".

### BOOLEAN

Optional TRUE, if an invalid input in this object will be deleted automatically.

## See also

IOField (Page 4351)

## ClearOnFocus

### Description

Specifies whether the field entry will be deleted as soon as the I/O field is activated.

Access in Runtime: Read and write

## Syntax

Object.**ClearOnFocus**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "IOField".

### BOOLEAN

Optional TRUE, if the field entry is deleted as soon as the I/O field is activated.

## See also

IOField (Page 4351)

## ClearOnNew

### Description

TRUE, when the field entry is deleted as soon as the I/O field has the focus. BOOLEAN write-read access.

## Closable

### Description

Specifies whether the window can be closed in Runtime.

Access in Runtime: Read and write

### Syntax

Object.**Closable**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "UserArchiveControl".

#### BOOLEAN

Optional TRUE, if the window can be closed in Runtime.

### See also

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

SystemDiagnoseWindow (Page 4432)

TrendRulerControl (Page 4439)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

OnlineTrendControl (Page 4375)

## CloseButton

### Description

TRUE, when the window is provided with a "Close" button. Read only access.

## Color

### Description

Specifies the line color of the specified object.

Access in Runtime: Read and write

### Syntax

Object.**Color**[= Color]

**Object**

Required A "ScreenItem" object with the formats "Line", "Polyline", "EllipticalArc" or "CircularArc".

**Color**

Optional A value or a constant that specifies the line color.

**Comments**

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

**See also**

Line (Page 4355)

Polyline (Page 4390)

EllipticalArc (Page 4324)

TubeArcObject (Page 4450)

TubeDoubleTeeObject (Page 4452)

TubePolyline (Page 4454)

TubeTeeObject (Page 4457)

**Color****Description**

Determines the line color of the given object.

Access during runtime: Read and Write

**Syntax**

Object.Color [= Color]

**Object**

Required An object of the "ScreenItem" type with the characteristics "Line," or "Polyline".

**Color**

Optional A value or constant which determines the line color.

## Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

## ColorAlarmHigh

### Description

Defines or returns the bar color for the "AlarmHigh" limit value. LONG write/read access. The "CheckAlarmHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

## ColorAlarmLow

### Description

Defines or returns the bar color for the "AlarmLow" limit value. LONG write/read access. The "CheckAlarmLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

## ColorBottom

### Description

Defines or returns the color for the bottom/right stop of the slider object. LONG write-read access.

## ColorChangeHysteresis

### Description

Specifies hysteresis as a percentage of the display value.

The "ColorChangeHysteresisEnable" property must have the value TRUE so that the hysteresis can be calculated.

Access in Runtime: Read and write

### Syntax

Object.**ColorChangeHysteresis**[=Double]

#### Object

Required A "ScreenItem" object with the format "Bar".

**Double**

Optional A value or a constant that specifies the hysteresis as a percentage of the display value.

**See also**

Bar (Page 4287)

**ColorChangeHysteresisEnabled****Description**

Determines whether the object will be displayed with a hysteresis.

Access in Runtime: Read and write

**Syntax**

Object.**ColorChangeHysteresisEnabled**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "Bar".

**BOOLEAN**

Optional TRUE, if the object will be displayed with a hysteresis.

**See also**

Bar (Page 4287)

**ColorChangeType****Description**

TRUE, if the change of color should occur segment by segment in the case of a color change (e.g. on reaching a limit value). If set to FALSE, it defines the change of color for the entire bar. BOOLEAN write-read access.

**ColorLimitHigh4****Description**

Defines or returns the color for the "Reserve 4" upper limit value. LONG write/read access. The "CheckLimitHigh4" property must have been set to TRUE if the bar color should change on reaching the limit value.

## ColorLimitHigh5

### Description

Defines or returns the color for the "Reserve 5" upper limit value. LONG write/read access. The "CheckLimitHigh5" property must have been set to TRUE if the bar color should change on reaching the limit value.

## ColorLimitLow4

### Description

Defines or returns the color for the "Reserve 4" lower limit value. LONG write/read access. The "CheckLimitLow4" property must have been set to TRUE if the bar color should change on reaching the limit value.

## ColorLimitLow5

### Description

Defines or returns the color for the "Reserve 5" lower limit value. LONG write/read access. The "CheckLimitLow5" property must have been set to TRUE if the bar color should change on reaching the limit value.

## ColorToleranceHigh

### Description

Defines or returns the color for the "ToleranceHigh" upper limit value. LONG write/read access. The "CheckToleranceHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

## ColorToleranceLow

### Description

Defines or returns the color for the "ToleranceLow" lower limit value. LONG write/read access. The "CheckToleranceLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

**ColorTop****Description**

Defines or returns the color for the top/left stop of the slider object. LONG write-read access.

**ColorWarningHigh****Description**

Defines or returns the color for the "WarningHigh" upper limit value. LONG write/read access. The "CheckWarningHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

**ColorWarningLow****Description**

Defines or returns the color for the "WarningLow" lower limit value. LONG write/read access. The "CheckWarningLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

**ColumnAlign****Description**

Specifies how the selected column is aligned.

The following settings are possible:

Value	Description	Explanation
0	Left	The column selected is displayed left-justified.
1	Centered	The column selected is displayed centered.
2	Right	The column selected is displayed right-justified.

The attribute can be made dynamic with the name **ColumnAlign**. The data type is LONG.

**ColumnColor(i)****Description**

Determines the color of the i column pair. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

## Syntax

Object.**ColumnColor(i)**[=Color]

### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

### Color

Optional A value or a constant that specifies the color of the i column pair.

## See also

OnlineTableControl (Page 4367)

## ColumnDisplayName(i)

### Description

Specifies the name for the selected column pair. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

## Syntax

Object.**ColumnDisplayName(i)**[=String]

### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

### String

Optional A value or a constant that specifies the name for the selected column pair.

## See also

OnlineTableControl (Page 4367)

## ColumnResize

### Description

Enables changes to the width of columns.

Access in Runtime: Read and write

## Syntax

Object.**ColumnResize**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

### BOOLEAN

TRUE: You can change the width of the columns.

FALSE: You cannot change the width of the columns.

## See also

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## ColumnSizingEnable

### Description

Specifies whether the width of the columns in the alarm window can be changed. The width of the columns can be changed only if the "AutoScroll" property is not enabled.

Access in Runtime: Read and write

### Syntax

Object.**ColumnSizingEnable**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "AlarmControl".

### BOOLEAN

Optional TRUE if the width of the columns in the alarm window can be changed.

## See also

AlarmControl (Page 4273)

## ColumnScrollbar

### Description

Enables the display of column scroll bars.

Access in Runtime: Read

### Syntax

Object.**ColumnScrollbar**[=Scrollbar]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

#### Scrollbar

0 = (No) The column scrollbars are not displayed.

1 = (if required) The column scrollbars are displayed if the space requirement of the control is greater in vertical direction than the available display area.

2 = (always) The column scrollbars are always displayed.

### See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

## ColumnTimeFormat (Professional)

### Description

Defines the time format to be used for visualization. The "ColumnIndex" property is used to reference the time column of the recipe view. The attribute can be assigned dynamic properties by means of the name **ColumnTimeFormat**.

Access in Runtime: Read and write

### Syntax

Object.**ColumnTimeFormat**(=String)

### Object

Required. An object of the "ScreenItem" type with the characteristic "UserArchiveControl".

## String

The following time formats are available:

Value	Explanation
HH:mm:ss.ms	Hours:Minutes:Seconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

## Comments

The time format can be accessed with read access after the first modification only.

## ColumnTitleAlign

### Description

Specifies the type of column title alignment.

Access in Runtime: Read

### Syntax

Object.**ColumnTitleAlign**[=Align]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

#### Align

0 = The column headers are shown left aligned.

1 = The column headers are shown centered.

2 = The column headers are shown right aligned.

3 = The column headers are aligned as the corresponding content.

### See also

AlarmControl (Page 4273)

## ColumnTitles

### Description

Enables the display of the column header.

Access in Runtime: Read

## Syntax

Object.**ColumnTitle**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

### BOOLEAN

### BOOLEAN

TRUE: The column header is displayed.

FALSE The column header is not displayed.

## See also

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## ColumnUpdateEnabled(i)

### Description

Specifies whether the selected column pair will be shown statically or dynamically.

Access in Runtime: Read and write

### Syntax

Object.**ColumnUpdateEnabled(i)**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

### BOOLEAN

Optional TRUE if the column pair is to be shown statically.

### Comments

The "CurrentColumnIndex" property references the column pair that is currently active.

## See also

OnlineTableControl (Page 4367)

**Command****Description**

Specifies whether there is a forced update of the values displayed in the control.

Access in Runtime: Read and write

**Syntax**

Object.**Command**[=String]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "OnlineTableControl".

**String**

Optional A value or a constant which specifies whether there is a forced update of the values displayed in the control.

**See also**

[OnlineTrendControl \(Page 4375\)](#)

[OnlineTableControl \(Page 4367\)](#)

**Comment****Description**

Reads or sets the Alarm object comment.

**CommonTimeAxisColor****Description**

Specifies the color of the mutual X axis.

Access in Runtime: Read and write

**Syntax**

Object.**CommonTimeAxisColor**[=Color]

**Object**

Required A "ScreenItem" object with the format "OnlineTrendControl".

**Color**

Optional A value or a constant that specifies the color of the common x axis.

**See also**

OnlineTrendControl (Page 4375)

**ComputerName**

**Description**

Returns the name of the computer on which the alarm object was triggered.

ComputerName (readonly)

**ConfigureTimeAxis(i)**

**Description**

Specifies whether a common time axis is used for all the trends in the trend view.

Access in Runtime: Read and write

**Syntax**

Object.**ConfigureTimeAxis(i)**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "OnlineTrendControl".

**BOOLEAN**

Optional TRUE, if a common axis is used for all the trends in the trend view.

**See also**

OnlineTrendControl (Page 4375)

**ConnectionType**

**Description**

Specifies the type of connector. It is possible to select between two connection types.

Access in Runtime: Read and write

## Syntax

Object.**ConnectionType**[=ConnectorConnectionType]

### Object

Required An object of the "ScreenItem" type with the format "Connector".

### ConnectorConnectionType

( 0): Automatic: Both objects are connected by a polyline made up of horizontal and vertical parts.

( 1): Single: Both objects are connected by a straight line between the connecting points. The fields are arranged right-justified.

## See also

SmartClientView (Page 4415)

Connector (Page 4312)

## ConnectTrendWindows

### Description

Specifies whether the configured trend views are connected. The requirement is that you have configured several trend views.

The connected trend views have the following properties:

- A common X axis
- A scrollbar
- A ruler

Access in Runtime: Read

### Syntax

Object.**ConnectTrendWindows**[=Boolean]

### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

### Boolean

TRUE = All configured trend views are connected.

FALSE = The trend views are displayed separately.

### See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

### Context

### Description

Reads or sets the alarm object server prefix.

### ContinuousChange

### Description

Specifies whether the value of the "ProcessValue" property will be transferred when the mouse button is released or as soon as the slider position changes in Runtime.

Access in Runtime: Read and write

### Syntax

Object.**ContinuousChange**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Slider".

#### BOOLEAN

Optional TRUE, if the value of the property "ProcessValue" will be transferred when the mouse button is released or as soon as the slider position changes in Runtime.

### See also

Slider (Page 4412)

### CornerStyle

### Description

Specifies the type of border lines for the specified object.

Access in Runtime: Read-only

### Syntax

Object.**ConerStyle**[=Int]

**Object**

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "TubePolyLone", "GraphicIOField", "Bar", "Checkbox", "OptionGroup", "WindowSlider", "Connector", "MultiLineEdit" or "ComboBox".

**Int**

Optional A value or a constant that specifies the type of border lines for the specified object.

0 = filled line

1 = broken line

2 = dotted line

3 = dashed and dotted line

4 = dash - dot - dot line

**See also**

## Count

### Description

Returns the number of elements in the specified list.

Access in Runtime: Read

### Syntax

Object.Count

#### Object

Required A "Collection" object.

## CountDivisions

### Description

Specifies the number of segments in which the bar will be divided by the large marking lengths of the scale.

Access in Runtime: Read and write

### Syntax

Object.CountDivisions[=Int]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### Int

Optional A value or a constant that specifies the number of segments in which the bar will be divided by the large marking lengths of the scale.

0-100: An object can be divided into a maximum of 100 segments

= 0: The optimum number of segments will be established automatically.

### See also

Bar (Page 4287)

## CountSubDivisions

### Description

Specifies the number of scale marking lengths between two main marking lengths of the "Bar" object.

Access in Runtime: Read and write

### Syntax

Object.**CountSubDivisions**[= LONG]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### LONG

Optional A value or a constant that specifies the number of scale segments.

### See also

Bar (Page 4287)

## CountValueColumns

### Description

Returns the number of configured trends or column pairs (visible and invisible) of the window.

Access in Runtime: Read and write

### Syntax

Object.**CountValueColumns**[=Int]

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

#### Int

Optional A value or a constant that returns the number of configured trends or column pairs (visible and invisible) of the window.

### See also

OnlineTableControl (Page 4367)

## CountVisibleItems

### Description

Specifies how many lines the selection list will contain. If the number of configured texts is greater than this value, then the selection list will have a vertical scroll bar.

Access in Runtime: Read and write

### Syntax

Object.**CountVisibleItems**[=Int]

#### Object

Required An object of the "ScreenItem" type with the format "SymbolicIOField", "StatusForce", "OnlineTrendControl" or "UserArchivControl".

#### Int

Optional A value or a constant that specifies how many lines the selection list will contain.

### See also

SymbolicIOField (Page 4422)

UserView (Page 4466)

StatusForce (Page 4417)

Listbox (Page 4357)

TrendView (Page 4447)

## CurrentColumnIndex

### Description

Specifies which settings can be assigned to a selected column pair. The property is evaluated by other properties. Valid values for the index have values from 0 to -1. The "CountValueColumns" property contains the number of column pairs that are to be shown.

Access in Runtime: Read and write

### Syntax

Object.**CurrentColumnIndex**[=Int]

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

**Int**

Optional A value or a constant that specifies which settings can be assigned to a particular column pair.

**Comments**

The "NumlItems" property contains the number of trends / column pairs to be shown.

**See also**

OnlineTableControl (Page 4367)

**CurrentContext****Description**

Returns a character string depending on the use of the function.

If the function is contained in a screen in the screen window, CurrentContext returns the symbolic server name which supplies the screen. Example: "WinCCProject\_MyComputer::"

If the function is contained in the main screen, an empty character string is returned.

Access in Runtime: Read

**Syntax**

Object.**CurrentContext**

**Object**

Required A "HMIRuntime" object.

**See also**

HMIRuntime (Page 4248)

**CurrentCurveIndex****Description**

Specifies the index for the active trends.

Access in Runtime: Read and write

**Syntax**

Object.**CurrentCurveIndex**[=Int]

**Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl" or "OnlineTrendControl".

**Int**

Optional A value or a constant that specifies the index of the trends that are currently active.

**Comments**

The "CurrentCurveIndex" property is evaluated by other properties so that their settings can be assigned to a specific trend. Valid values range from 0 to -1. The "CurvesCount" property contains the number of trends to be shown.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**CursorControl**

**Description**

Specifies whether the mouse cursor jumps to the next field of the TAB order after leaving the field.

Access in Runtime: Read and write

**Syntax**

Object.**CursorControl**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the formats "IOField" or "SymbolicIOField".

**BOOLEAN**

Optional. TRUE, if the mouse cursor jumps to the next field of the TAB-order after leaving the field.

**Comments**

For this purpose, the "CursorMode" property must be set to TRUE.

**See also**

IOField (Page 4351)

SymbolicIOField (Page 4422)

## CurveColor(i)

### Description

Specifies the color of the selected trend.

Access in Runtime: Read and write

### Syntax

Object.**CurveColor(i)**[=Color]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

#### Color

Optional A value or a constant that specifies the color of the selected trend.

### Comments

The parameter i indicates the number of the trend.

### See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

## CurveLineWidth(i)

### Description

Specifies the line weight of the selected trend.

Access in Runtime: Read and write

### Syntax

Object.**CurveLineWidth(i)**[=Int]

#### Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

#### Int

Optional A value or a constant that specifies the line weight of the selected trend. Value range from 0 to 10.

## Comments

The parameter *i* indicates the number of the trend.

## See also

OnlineTrendControl (Page 4375)

## CurvesCount

### Description

Returns the number of configured trends or column pairs (visible and invisible) of the window.

Access in Runtime: Read and write

### Syntax

Object.**CurvesCount**[=Int]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

#### Int

Optional A value or a constant that returns the number of configured trends or column pairs (visible and invisible) of the window.

## See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

## CurveUpdateEnabled(i)

### Description

Specifies whether the selected trend will be shown statically or dynamically.

Access in Runtime: Read and write

### Syntax

Object.**CurveUpdateEnabled(i)**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

**BOOLEAN**

Optional TRUE if the trend is to be shown statically.

**Comments**

The parameter i indicates the number of the trend.

**See also**

OnlineTrendControl (Page 4375)

**Properties D****DangerRangeColor****Description**

Specifies the color of the danger range of the scale of the "Gauge" object.

The "DangerRangeVisible" property must have the value TRUE so that the danger range is displayed.

Access during runtime: Read and write

**Syntax**

Object.**DangerRangeColor**[= Color]

**Object**

Required An object of the "ScreenItem" type with the characteristic "Gauge".

**Color**

Optional A value or a constant that specifies the color of the danger range.

**Comments**

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

**See also**

Gauge (Page 4338)

DangerRangeVisible (Page 4588)

## DangerRangeStart

### Description

Specifies at which scale value the danger range of the "Gauge" object will start.

The "DangerRangeColor" property must have the value TRUE so that the danger range is displayed.

Access in Runtime: Read and write

### Syntax

Object.**DangerRangeStart**[= DOUBLE]

#### Object

Required A "ScreenItem" object with the format "Gauge".

#### DOUBLE

Optional A value or a constant that specifies the scale value for the start of the danger range.

### Comments

The range extends from the value "Gefahr" through to the end of the scale.

### See also

Gauge (Page 4338)

DangerRangeVisible (Page 4588)

## DangerRangeVisible

### Description

Specifies whether the danger range in the scale of the "Gauge" object will be displayed.

Access in Runtime: Read and write

### Syntax

Object.**DangerRangeVisible**[= BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Gauge".

#### BOOLEAN

Optional TRUE, if the danger range will be displayed in the scale.

**Comments**

Specifies the color of the danger range with the "DangerRangeColor" property.  
Specifies the start of the danger range with the "DangerRangeStart" property.

**See also**

Gauge (Page 4338)

**DataFormat****Description**

Returns the data type of the I/O field object. Read only access.

Value range from 0 to 3.

0: Binary

1: Decimal

2: String

3: Hexadecimal

**See also**

IOField (Page 4351)

**DataIndex(i)****Description**

Returns the current index for the data of the current trend.

Access in Runtime: Read and write

**Syntax**

Object.**DataIndex(i)**[=Int]

**Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

**Int**

Optional A value or a constant that specifies the current index of the data for the current trend.

**See also**

FunctionTrendControl (Page 4330)

## DataLogs

### Description

Returns an object of type "DataLogs".

Access in Runtime: Read

### Syntax

Object.**DataLogs**

#### Object

Required A "Logging" object.

### See also

Logging (Page 4253)

## DataLogTag

### Description

Specifies which tag is linked with the selected trend.

Access in Runtime: Read and write

### Syntax

Object.**DataLogTag**[=HmiLoggingTag]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "OnlineTableControl".

#### HmiLoggingTag

Optional A value or a constant that specifies which tags are linked to the selected trend.

### Comments

The parameter i indicates the number of the trend.

### See also

OnlineTrendControl (Page 4375)

OnlineTableControl (Page 4367)

## DataSet

### Description

Returns an object of type "DataSet".

Access in Runtime: Read

### Syntax

Object.**DataSet**

#### Object

Required A "Screen" object.

### See also

HMIRuntime (Page 4248)

Screen (Page 4256)

## DataX(i)

### Description

Inserts one single data record and must be set prior to the call of "InsertData(i)".

Access in Runtime: Read and write

### Syntax

Object.**DataX(i)**[=object]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

#### object

Optional A value or a constant that inserts one single data record.

### See also

FunctionTrendControl (Page 4330)

## DataXY(i)

### Description

Inserts several data records as Array with value pairs and must be set before calling "InsertData(i)".

The data in the Array are applied if "DataX(i)" is a VT\_EMPTY type. Otherwise, the single value pair resulting from "DataX(i)" and "DataY(i)" will be used in the attribute "InsertData(i)".

Access in Runtime: Read and write

### Syntax

Object.**DataXY**(i)[=object]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendView".

#### object

Optional A value or a constant which inserts several data records as Array with value pairs.

### See also

FunctionTrendControl (Page 4330)

## DataY(i)

### Description

Inserts one single data record and must be set prior to the call of "InsertData(i)".

Access in Runtime: Read and write

### Syntax

Object.**DataY**(i)[=Double]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

#### Double

Optional A value or a constant that inserts one single data record.

### See also

FunctionTrendControl (Page 4330)

## DeleteData(i)

### Description

Specifies which data from the data buffer of the active trend will be deleted.

TRUE:

Access in Runtime: Read and write

### Syntax

Object.**DeleteData**(i)[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

#### BOOLEAN

Optional TRUE, if all the data of the trend is to be deleted.

FALSE, if the value pair at position "DataIndex(i)" is to be deleted.

### See also

FunctionTrendControl (Page 4330)

## DeleteEnable

### Description

Specifies whether the recipe view can be cleared in Runtime.

Access in Runtime: Read and write

### Syntax

Object.**DeleteEnable**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl".

#### BOOLEAN

Optional TRUE, if the recipe view can be cleared in Runtime.

## DialColor

### Description

Specifies the color of the dial for the selected object.

Access during runtime: Read and Write

### Syntax

Object.**DialColor**[= Color]

#### Object

Required An object of the "ScreenItem" type with the characteristics "Clock," or "Gauge".

#### Color

Optional A value or a constant that specifies the color of the dial.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

### See also

Gauge (Page 4338)

## DialFillStyle

### Description

Specifies the type of background of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**DialFillStyle**[=GaugeBackStyle]

#### Object

Required A "ScreenItem" object with the format "Gauge".

#### GaugeBackStyle

hmiGaugeBackStyleSolid ( 0): The rectangular background of the display is filled with the specified border color. The scale is filled with the specified background color.

solid backstyle.

`hmiGaugeBackStyleFrameTransparent ( 1)`: The rectangular background of the Gauge is transparent. The scale is filled with the specified background color. As a result, a circular display can be shown.

Identifies only frame is transparent.

`hmiGaugeBackStyleTransparent ( 2)`: The rectangular background and the scale are transparent.

Identifies a transparent backstyle.

### See also

Gauge (Page 4338)

### DialSize

### Description

Specifies the diameter of the scale in relation to the smaller value of the geometry attributes "Width" and "Height".

Access in Runtime: Read and write

### Syntax

Object.**DialSize**[=Single]

#### Object

Required A "ScreenItem" object with the format "Gauge".

#### Single

Optional A value or a constant that establishes the diameter of the scale in relation to the smaller value of the geometry attributes "Width" and "Height".

### See also

Gauge (Page 4338)

### Direction

### Description

Defines or returns the bar direction or the position of the slider object.

Access in Runtime: Read and write

## Syntax

Object.**Direction** [=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "Bar" or "Slider".

### BOOLEAN

0 = top

1 = bottom

2 = left

3 = right

## DisplayName(i)

### Description

Specifies the name for the selected trend.

Access in Runtime: Read and write

### Syntax

Object.**DisplayName**(i)[=String]

### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

### String

Optional A value or a constant that specifies the name for the selected trend.

### Comments

The parameter i indicates the number of the trend.

### See also

FunctionTrendControl (Page 4330)

## DisplayOptions

### Description

Specifies which messages are displayed.

Access in Runtime: Read

**Syntax**

Object.**DisplayOptions** [=DisplayOption]

**Object**

Required A "ScreenItem" object with the format "AlarmControl".

**DisplayOption**

0: All messages

1: Only displayed messages

2: Only hidden messages

**See also**

AlarmControl (Page 4273)

**DoubleClickAction****Description**

Specifies the action to be executed in Runtime by double-clicking on a message line.

Access in Runtime: Read

**Syntax**

Object.**DoubleClickAction**[=ClickAction]

**Object**

Required A "ScreenItem" object with the format "AlarmControl".

**ClickAction**

Value	Description	Description
0	none	No action.
1	Loop-in-alarm	Calls the "Loop-in-alarm" function.
2	Open comments dialog	Calls the "Comments dialog" button function.
3	Open Infotext dialog	Calls the "Infotext dialog" button function.
4	Column-dependent	The action is determined by the column in which you double-clicked.

**See also**

AlarmControl (Page 4273)

## DrawAlwaysInsideFrame

### Description

Specifies whether the border line of the selected object should be illustrated with a line weight greater than 1 within the border or symmetrically to the border.

Access in Runtime: Read and write

### Syntax

Object.**DrawAlwaysInsideFrame**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Rectangle".

#### BOOLEAN

Option TRUE, if the border line of the specified object will be illustrated with a line weight greater than 1 within the border.

### See also

Rectangle (Page 4402)

## DrawEnhancedHTMLBrowser

### Description

Specifies the style of the HTML-Browsers.

Access in Runtime: Read and write

### Syntax

Object.**DrawEnhancedHTMLBrowser**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "HTMLBrowser".

#### BOOLEAN

Optional TRUE, if an extended HTML-Browser will be displayed.

### See also

HTMLBrowser (Page 4349)

## DrawInsideFrame

### Description

Specifies whether the border line of the selected object should be illustrated with a line weight greater than 1 within the border or symmetrically to the border.

Access in Runtime: Read and write

### Syntax

Object.**DrawInsideFrame**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "GraphicView", "GraphicIOField", "Bar", "CheckBox", "OptionGroup", "WindowSlider" or "Connector".

#### BOOLEAN

Optional TRUE, if the border line of the specified object will be illustrated with a line weight greater than 1 within the border.

### See also

- WindowSlider (Page 4468)
- Connector (Page 4312)
- RoundButton (Page 4404)

## DrawStylishButton

### Description

Specifies whether the button will be displayed in the general Windows style.

Access in Runtime: Read and write

### Syntax

Object.**DrawStylishButton**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Button".

#### BOOLEAN

Optional TRUE, if the button will be displayed in the general Windows style.

### See also

Button (Page 4294)

## Drive

### Description

Specifies the characters of the drive that is to be monitored.

Access in Runtime: Read and write

### Syntax

Object.**Drive**[=String]

#### Object

Required A "ScreenItem" object with the format "DiskSpaceView".

#### String

Optional A value or a constant that specifies the characters of the drive that is to be monitored.

**See also**

DiskSpaceView (Page 4317)

**Properties E-F****EdgeStyle****Description**

Determines the line style of the given object.

Access during runtime: Read and Write

**Syntax**

Object.EdgeStyle [= THmiLineStyle]

**Object**

Required. An object of the type "ScreenItem" with the characteristic "Ellipse", "Circle", "Rectangle", "Polygon", "TextField" or "IOField".

**THmiLineStyle**

Optional. A value or constant that defines the line style. Value range from -1 to 4.

The objects "Ellipse", "Circle", "Rectangle" and "Polygon" support the line style:

- hmiLineStyleSolid (0): solid line
- hmiLineStyleDash (1): dashed line
- hmiLineStyleDot (2): dotted line
- hmiLineStyleDashDot (3): dash dot line
- hmiLineStyleDashDotDot (4): dash dot dot line

The objects "TextField" and "IOField" support only the line style:

- hmiLineStyleNone (-1): no line
- hmiLineStyleSolid (0): solid line

Default setting: hmiLineStyleSolid

**See also**

GraphicIOField (Page 4341)

Switch (Page 4419)

CircleSegment (Page 4305)

DateTimeField (Page 4315)

Ellipse (Page 4319)

## EdgeStyle

### Description

Specifies the line style of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**EdgeStyle**[= THmiLineStyle]

#### Object

Required An object of the "ScreenItem" type with the format "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

#### THmiLineStyle

Optional A value or a constant that specifies the line style. Value range from -1 to 4.

The objects "Ellipse", "Circle", "Rectangle" and "Polygon" support the line styles:

- hmiLineStyleSolid (0): solid line
- hmiLineStyleDash (1): broken line
- hmiLineStyleDot (2): dotted line
- hmiLineStyleDashDot (3): dash - dot line
- hmiLineStyleDashDotDot (4): dash - dot - dot line

The objects "TextField" and "IOField" support only the line styles:

- hmiLineStyleNone (-1): no line
- hmiLineStyleSolid (0): solid line

Default setting: hmiLineStyleSolid

## Editable(i)

### Description

Specifies whether a column pair can be edited. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

### Syntax

Object.**Editable**(i)[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

#### BOOLEAN

Optional TRUE, if the column pair can be edited. The column pair is referenced by the parameter i.

### See also

OnlineTableControl (Page 4367)

## EditAtOnce

### Description

TRUE, if accessing the field with the <TAB> key permits input immediately and without further action. BOOLEAN write-read access.

## EditEnabled

### Description

Specifies whether edit mode is enabled for a cell, if the property "Editable(i)" has the value TRUE.

Access in Runtime: Read and write

### Syntax

Object.**EditEnabled**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

#### BOOLEAN

Optional TRUE, if the edit mode is enabled for a cell if the property "Editable(i)" has the value TRUE.

### See also

OnlineTableControl (Page 4367)

## EditOnFocus

### Description

Specifies whether the data input is immediately possible if the input field is selected using the <Tab> key.

Access in Runtime: Read and write

### Syntax

Object.**EditOnFocus**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the formats "IOField" or "SymbolicIOField".

#### BOOLEAN

Optional TRUE, if the data input is immediately possible and the input field has been selected using the <Tab> key.

**See also**

IOField (Page 4351)  
SymbolicIOField (Page 4422)

**Enabled****Description**

Specifies whether the selected object can be operated in Runtime.  
Access in Runtime: Read and write

**Syntax**

Object.**Enabled**[= BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "StatusForce", "Clock", "Gauge", "Slider", "SymbolLibrary", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "UserView", "HTMLBrowser", "Checkbox", "OptionGroup", "WindowSlider", "OleView", "Connector", "DiskSpaceView", "ChannelDiagnose" or "UserArchiveControl".

**BOOLEAN**

Optional TRUE, if the specified object can be operated in Runtime.

- Listbox (Page 4357)
- UserArchiveControl (Page 4459)

**Enabled**

**Description**

Determines whether the given object can be operated in runtime.

Access during runtime: Read and Write

## Syntax

Object.Enabled [= BOOLEAN]

### Object

Required. An object of the type "ScreenItem" with the characteristic "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField", "Bar", "RecipeView", "StatusForce", "Slider", "SymbolLibrary", "TrendView", "MessageView", "UserView" or "BrowserView".

### BOOLEAN

Optional. TRUE, if the given object can be operated.

## EnableEdit

## Description

Enables editing of the data displayed during runtime.

Access in Runtime: Read and write

## Syntax

Object.**EnableEdit**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "OnlineTableControl", "UserArchiveControl".

### BOOLEAN

TRUE: The data can be changed in Runtime.

FALSE: The data cannot be changed.

## See also

UserArchiveControl (Page 4459)

OnlineTableControl (Page 4367)

## EndAngle

## Description

Specifies the angle at which the end point of the selected object deviates from the zero position (0°).

Access in Runtime: Read and write

## Syntax

Object.**EndAngle**[=Int]

### Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

### Int

Optional A value or a constant that specifies the angle at which the end point of the selected object deviates from the zero position (0°).

## See also

EllipseSegment (Page 4321)

CircleSegment (Page 4305)

EllipticalArc (Page 4324)

CircularArc (Page 4308)

TubeArcObject (Page 4450)

## EndPoint

### Description

Specifies the position of the end point.

Access in Runtime:

### Syntax

Object.**EndPoint**[=Point]

#### Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

#### Point

Optional A value that specifies the position of the end point.

### See also

EllipseSegment (Page 4321)

CircleSegment (Page 4305)

EllipticalArc (Page 4324)

CircularArc (Page 4308)

## EndPointLeft

### Description

Specifies the horizontal distance in pixels of the end point from the left edge of the screen.

Access in Runtime: Read and write

### Syntax

Object.**EndPointLeft**[=Int]

#### Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

#### Int

Optional A value that specifies the horizontal distance in pixels of the end point from the left edge of the screen.

### See also

EllipseSegment (Page 4321)

CircleSegment (Page 4305)

EllipticalArc (Page 4324)

CircularArc (Page 4308)

### EndPointTop

#### Description

Specifies the vertical distance in pixels of the end point from the upper edge of the screen.

Access in Runtime: Read and write

#### Syntax

Object.**EndPointTop**[=Int]

#### Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

#### Int

Optional A value that specifies the vertical distance in pixels of the end point from the upper edge of the screen.

### See also

EllipseSegment (Page 4321)

CircleSegment (Page 4305)

EllipticalArc (Page 4324)

CircularArc (Page 4308)

### EndStyle

#### Description

Specifies how the line-end shapes of the selected object will be displayed.

Access in Runtime: Read and write

#### Syntax

Object.**EndStyle**[= THmiLineEndStyle]

**Object**

Required A "ScreenItem" object with the formats "Line", "Polyline" or "Connector".

**THmiLineEndStyle**

Optional A value or a constant that specifies the line-end shapes.

hmiLineEndStyleNone (0): The line has no end symbol.

hmiLineEndStyleFilledArrow (2): The line ends with a filled arrowhead.

**See also**

Line (Page 4355)

Polyline (Page 4390)

Connector (Page 4312)

**EndStyle****Description**

Determines how the line end of the given object is displayed.

Access during runtime: Read and Write

**Syntax**

Object.EndStyle [= THmiLineEndStyle]

**Object**

Required. An object of the "ScreenItem" type with the characteristic "Line," or "Polyline".

**THmiLineEndStyle**

Optional. A value or constant which determines the line end.

hmiLineEndStyleNone (0): The line has no end symbol.

hmiLineEndStyleFilledArrow (2): The line ends with a filled arrow.

**EndTime(i)****Description**

Specifies the end time of the time range to be shown in the trend view. The property "TagProviderType(i)" must have the value -1.

Access in Runtime: Read and write

## Syntax

Object.**EndTime**(i)[=Time]

### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl" or "OnlineTabelControl".

### Time

Optional A value or a constant that specifies the end time of the time range that is to be shown in the trend window.

## Comments

The parameter i indicates the number of the trend.

If "EndTime(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent an immediate acceptance of the change with "FreezeProviderConnections" before changing "EndTime(i)".

## See also

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

## ErrorDescription

### Description

Returns one of the following error descriptions in English:

Output	Description
" "	OK
"Operation Failed"	Execution error
"Variable not found"	Tag error
"Server down"	Server not available.
"An error occured for one or several tags"	Multi Tag Error (Error in one or several tags)

To obtain an error description, first of all carry out the Read method.

### Note

If the error occurs when accessing via the TagSet object, evaluate the ErrorDescription property for each tag of the TagSet object.

Access in Runtime: Read

## Syntax

Object.**ErrorDescription**

### Object

Required A "Tag" object.

## Example

The following example shows the error description for the "Tag1" tag:

```
'VBS72
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objtag.Read
MsgBox objTag.ErrorDescription
```

The following example adds two tags to the TagSet list and outputs the ErrorDescription property as Trace:

```
'VBS179
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
HMIRuntime.Trace "ErrorDescription: " & group.ErrorDescription & vbNewLine
```

The ErrorDescription property of a tag contained in the list may be accessed as follows:

```
HMIRuntime.Trace "ErrorDescription: " & group("Motor1").ErrorDescription & vbNewLine
```

## See also

Tag (Page 4267)

TagSet (list) (Page 4271)

## Exponent

## Description

TRUE, when the display of numbers should be with exponents (e.g."1.00e+000"). BOOLEAN write-read access.

## ExportDirectoryChangeable

### Description

Enables changing of the directory for data export in Runtime.

### Syntax

Object.**ExportDirectoryChangeable**=[Boolean]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl", "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### Boolean

TRUE, the directory for the data export can be changed in Runtime.

FALSE, the directory for the data export cannot be changed in Runtime.

### See also

[OnlineTrendControl](#) (Page 4375)

## ExportDirectoryname

### Description

Defines the directory to which the exported Runtime data is written.

Access in Runtime: Read and write

### Syntax

Object.**ExportDirectoryname**[=String]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl", "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**String**

Optional A value or a constant which specifies the directory.

OnlineTrendControl (Page 4375)

**ExportFileExtension****Description**

Specifies the file extension of the export file. Only the file extension "csv" is supported.

**Syntax**

Object.**ExportFileExtension**

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl", "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

## ExportFilenameChangeable

### Description

Enables renaming of the export file in Runtime.

### Syntax

Object.**ExportFilenameChangeable**=[Boolean]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl", "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### Boolean

TRUE, , the file name of the export file can be changed in Runtime.

FALSE, , the file name of the export file cannot be changed in Runtime.

## ExportSelection

### Description

Specifies which runtime data of the control is exported.

### Syntax

Object.**ExportSelection**=[Boolean]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl", "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**Boolean**

Value	Description	Explanation
0	all	All Runtime data of the control is exported.
1	Selection	Selected Runtime data of the control is exported.

**See also**

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

OnlineTrendControl (Page 4375)

## ExportXML

## ExportXML

Only used internally.

The attribute can be assigned dynamic properties by means of the name **ExportXML**.

## ExtendedOperation

### Description

TRUE, when the slider regulator is set at the respective end value (minimum/maximum value). This is done by clicking the mouse in an area outside the current regulator setting. BOOLEAN write-read access.

## ExtendedZoomingEnable

### Description

Specifies whether the operator can zoom the screen in or out in runtime by turning the mouse wheel.

Access during runtime: Read and write

### Syntax

Object.**ExtendedZoomingEnable**[=BOOLEAN]

#### Object

Necessary. A "Screen" object.

#### BOOLEAN

Optional TRUE, if the operator can zoom the screen in and out in runtime.

### Example

The following example shows how the extended zoom can be enabled for the NewPDL1 screen:

```
'VBS155  
Dim objScreen
```

```
Set objScreen = HMIRuntime.Screens("NewPDL1")
objScreen.ExtendedZoomingEnable = 1
```

## See also

Screen (Page 4256)

## ExtraSpaceForLabelDisplay

### Description

Specifies the extra space required for the label.

Access in Runtime: Read and write

### Syntax

Object.**ExtraSpaceForLabelDisplay**[=Int]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### Int

Optional A value that specifies the extra space required for the label.

## See also

Bar (Page 4287)

## FieldLengthReadOnlySpecial

### Description

Specifies that the "field length string" field is read-only.

Access during runtime: Read and write

### Syntax

Object.**FieldLengthReadOnlySpecial**[=BOOLEAN]

#### Object

Necessary. A "ScreenItem" object with the format "IOField".

#### BOOLEAN

Optional TRUE, if the "field length string" can only be read.

**Used for the following object types:**

IOField

**See also**

IOField (Page 4351)

**FillColor**

**Description**

Defines or returns the fill pattern color for the object.

Access during runtime: Read and write

**Syntax**

Object.**FillColor**[=LONG]

**Object**

Necessary. An object of the "ScreenItem" type with the format "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "Switch", "Bar", "StatusForce", "Clock", "Gauge", "Slider", "Checkbox".

**Determination of Color Value**

The color is displayed in RGB format (Red, Green, Blue). Enter the appropriate decimal value for each of the three RGB values.

Example:

RGB(200, 150, 100)

**Example**

The following example defines the fill color for "ScreenWindow1" to blue:

```
'VBS73
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
objScreen.FillStyle = 131075
objScreen.FillColor = RGB(0, 0, 255)
```

## FillColorMode

### Description

Specifies the type of foreground for the selected object.

Access in Runtime: Read and write

### Syntax

Object.**FillColorMode**[=SymbolLibAppearance]

#### Object

Required A "ScreenItem" object with the format "SymbolLibrary".

#### SymbolLibAppearance

hmiSymbolLibraryAppearanceOriginal ( 0): The surface is gray.

hmiSymbolLibraryAppearanceShaded ( 1): The display is shaded.

hmiSymbolLibraryAppearanceSolid ( 2): The display is solid.

hmiSymbolLibraryAppearanceTransparent ( 3): The display is gray.

### See also

SymbolLibrary (Page 4427)

## Filling

### Description

TRUE, when the object can be filled by closed border lines (e.g. representing the fill level of a tank). BOOLEAN write-read access.

The fill level of the object is set by means of the "FillingIndex" property.

## FillingIndex

### Description

Defines the %age value (related to the height of the object) to which the object with closed border line is to be filled.

The fill level is represented by the current background color. The unfilled background is transparent.

## FillPatternColor

### Description

Specifies the color of the fill pattern for the selected object.

Access in Runtime: Read and write

### Syntax

Object.**FillPatternColor**[=Color]

#### Object

Required An object of the "ScreenItem" type with the format "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "GraphicView", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

#### Color

Optional A value or a constant that establishes the color of the fill pattern for the specified object.

OptionGroup (Page 4384)  
WindowSlider (Page 4468)  
Listbox (Page 4357)  
ProjectName (Page 4392)

## FillStyle

### Description

Specifies the fill style of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**FillStyle**[= THmiLineFillStyle]

#### Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "EllipticalArc" or "CircularArc".

#### THmiLineFillStyle

Optional A value or a constant that specifies the fill style.

hmiLineFillStyleTransparent (0): transparent fill

hmiLineFillStyleSolid (1): object is filled with the specified color

Default setting: hmiLineFillStyleSolid

### See also

Line (Page 4355)

Polyline (Page 4390)

EllipticalArc (Page 4324)

CircularArc (Page 4308)

## FillStyle

### Description

Determines the fill style of the specified object.

Access during runtime: Read and Write

### Syntax

Object.FillStyle [= THmiLineFillStyle]

#### Object

Required. An object of the "ScreenItem" type with the characteristic "Line," or "Polyline".

### **THmiLineFillStyle**

Optional. A value or constant which determines the fill style.

hmiLineFillStyleTransparent (0): Transparent fill

hmiLineFillStyleSolid (1): Object is filled with the specified color

Default setting: hmiLineFillStyleSolid

### **FillStyle2**

#### **Description**

Defines or returns the fill style of the bar.

### **FillstyleAlignment**

#### **Description**

Specifies the alignment within the specified object.

### **Filter**

#### **Description**

Specifies criteria in SQL syntax for the database.

Access in Runtime: Read and write

#### **Syntax**

Object.**Filter**[=String]

#### **Object**

Required A "ScreenItem" object with the format "PrintMessage".

#### **String**

Optional A value or a constant which specifies the criteria in SQL syntax for the database.

### **FirstConnectedObjectIndex**

#### **Description**

Specifies the index number of the upper connector point.

Access in Runtime: Read and write

**Syntax**

Object.**FirstConnectedObjectIndex**[=Int]

Object

Required A "ScreenItem" object with the format "Connector".

**Int**

Int

**See also**

Connector (Page 4312)

**FirstConnectedObjectName****Description**

Specifies the object name of the object that is docked at the upper connector point.

Access in Runtime: Read and write

**Syntax**

Object.**FirstConnectedObjectName**[=String]

Object

Required A "ScreenItem" object with the format "Connector".

**String**

String

**See also**

Connector (Page 4312)

**FixedAspectRatio****Description**

Specifies whether the aspect ratio should be maintained or changed when the symbol size is altered.

Access in Runtime: Read and write

**Syntax**

Object.**FixedAspectRatio**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "SymbolLibrary".

**BOOLEAN**

Optional TRUE, if the aspect ratio should be maintained when the symbol size is altered.

**See also**

SymbolLibrary (Page 4427)

**FlashBackColor**

**Description**

TRUE, when flashing of the background is activated. BOOLEAN write-read access

**FlashBorderColor**

**Description**

TRUE, when flashing of the object lines is activated. BOOLEAN write-read access.

**FlashFlashPicture**

**Description**

TRUE, when flashing of the flash picture is activated. BOOLEAN write-read access.

**FlashForeColor**

**Description**

TRUE, when flashing of the text is activated. BOOLEAN write-read access.

**FlashingColorOff**

**Description**

Specifies the color of the border line for the selected object for the flashing status "off".

Access in Runtime: Read and write

## Syntax

Object.**FlashingColorOff**[=Color]

### Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "Connector".

### Color

Optional A value or a constant that specifies the color of the border line of the selected object for the flashing status "off".

## FlashingColorOn

### Description

Specifies the color of the border line for the selected object for the flashing status "on".

Access in Runtime: Read and write

### Syntax

Object.**FlashingColorOn**[=Color]

#### Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "Connector".

#### Color

Optional A value or a constant that specifies the color of the border line of the selected object for the flashing status "on".

OptionGroup (Page 4384)

Connector (Page 4312)

RoundButton (Page 4404)

## FlashingEnable

### Description

Specifies whether the border line of the selected object will flash in runtime.

Access in Runtime: Read and write

### Syntax

Object.**FlashingEnable**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "Connector".

#### BOOLEAN

Optional TRUE, if the border line of the object is flashing.

## FlashingRate

### Description

Specifies the flash rate of the border line for the selected object.

Access in Runtime: Read and write

### Syntax

Object.**FlashingRate**[=FlashingRate]

#### Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "Connector".

#### FlashingRate

hmiFlashingRateSlow ( 0): The length of the flashing rate is 1000 ms.

hmiFlashingRateMedium ( 1): The length of the flashing rate is 500 ms.

hmiFlashingRateFast ( 2): The length of the flashing rate is 250 ms.

Connector (Page 4312)  
RoundButton (Page 4404)

## FlashPicReferenced

### Description

TRUE, when the assigned flash picture is to be saved. Otherwise, only the associated object reference is saved. Read only access.

## FlashPicture

### Description

Returns the flash picture. Read-only access.  
The graphic (\*.BMP or \*.DIB) must be located in the "GraCS" folder of the current project so that it can be integrated.  
In this context, the "FlashPicReferenced" property defines whether the flash picture should be saved or referenced together with the object.

## FlashRate

### Description

Defines or returns the flash frequency. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

## FlashRateBackColor

### Description

Defines or returns the flash frequency for the object background. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

## FlashRateBorderColor

### Description

Defines or returns the flash frequency for the lines of the object. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

## FlashRateFlashPic

### Description

Defines or returns the flash frequency for the flash picture. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

## FlashRateForeColor

### Description

Defines or returns the flash frequency for the object label. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

## FlashTransparentColor

### Description

Specifies the color of the bitmap object of a flashing graphic that is set to "transparent".

Access in Runtime: Read and write

### Syntax

Object.**FlashTransparentColor**[=Color]

#### Object

Required A "ScreenItem" object with the format "GraphicIOField".

#### Color

Optional A value or a constant that specifies the color of the bitmap object of a flashing graphic that is set to "transparent".

### See also

GraphicIOField (Page 4341)

## Flip

### Description

Flips the symbol on the vertical and / or horizontal center axis of the symbol.

Access in Runtime: Read and write

### Syntax

Object.**Flip**[=SymbolLibFlip]

#### Object

Required A "ScreenItem" object with the format "SymbolLibrary".

#### SymbolLibFlip

hmiSymbolLibraryFlipNone ( 0): The symbol is not flipped.

hmiSymbolLibraryFlipHorizontal ( 1): The symbol is flipped horizontally.

hmiSymbolLibraryFlipVertical ( 2): The symbol is flipped vertically.

hmiSymbolLibraryFlipBoth ( 3): The symbol is flipped horizontally and vertically.

## See also

SymbolLibrary (Page 4427)

## FocusColor

### Description

Specifies that the color for the focus border of the selected object is currently active.

Access in Runtime: Read and write

### Syntax

Object.**FocusColor**[= Color]

#### Object

Required A "ScreenItem" object with the formats "SymbolicIOField", "Button", "Switch", "GraphicIOField", "RecipeView", "StatusForce", "Slider", "TrendView", "MessageView" or "AlarmView".

#### Color

Optional A value or a constant that specifies the frame color.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

## See also

SymbolicIOField (Page 4422)

Button (Page 4294)

Switch (Page 4419)

GraphicIOField (Page 4341)

Slider (Page 4412)

AlarmControl (Page 4273)

## FocusColor

### Description

Determines the color for the focus frame of the given object that has the focus.

Access during runtime: Read and Write

## Syntax

Object.FocusColor [= Color]

### Object

Required An object of the "ScreenItem" type with the characteristics "Button", "Switch", "GraphicIOField", "RecipeView", "StatusForce", "Slider", "TrendView" or "MessageView".

### Color

Optional A value or constant which determines the frame color.

## Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

## See also

AlarmView (Page 4284)

RecipeView (Page 4398)

TrendView (Page 4447)

StatusForce (Page 4417)

## FocusWidth

## Description

Specifies the border width of the specified object if the object is currently active.

Access in Runtime: Read and write

## Syntax

Object.FocusWidth[= LONG]

### Object

Required A "ScreenItem" object with the formats "SymbolicIOField", "Button", "Switch", "GraphicIOField", "RecipeView", "StatusForce", "Slider", "TrendView", "MessageView" or "AlarmView".

### **LONG**

Optional A value or a constant that specifies the border width in pixels. Value range from 1 to 10.

### **See also**

SymbolicIOField (Page 4422)

Button (Page 4294)

Switch (Page 4419)

GraphicIOField (Page 4341)

AlarmControl (Page 4273)

### **FocusWidth**

### **Description**

Determines the border width of the given object if the object has a focus.

Access during runtime: Read and Write

### **Syntax**

Object.FocusWidth [= LONG]

### **Object**

Required. An object of type "ScreenItem" with the characteristic "SymbolicIOField", "Button", "Switch", "GraphicIOField", "RecipeView", "StatusForce", "Slider", "TrendView" or "MessageView".

### **LONG**

Optional. A value or constant which determines the border width in pixels. Value range from 1 to 10.

### **See also**

AlarmView (Page 4284)

RecipeView (Page 4398)

TrendView (Page 4447)

StatusForce (Page 4417)

BatteryView (Page 4293)

## Font

### Description

Specifies or returns the font.

The font object has the following sub-properties

- Size (Font Size)
- Bold (yes/no)
- Name (font name)
- Italic (yes/no)
- Underline (underline yes/no)
- StrikeThrough (yes/no)

If two font properties are directly assigned, only the default property "Name" is assumed.

Access during runtime: Read and write

### Syntax

Object.**Font** [=Font]

#### Object

Necessary. An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchiveControl", "MediaPlayer", "FunctionTrendControl" or "Slider".

#### Font

Font

### Example

```
'VBS74
Dim objControl1
Dim objControl2
Set objControl1 = ScreenItems("Control1")
Set objControl2 = ScreenItems("Control2")
objControl2.Font = objControl1.Font ' take over only the type of font
```

## FontBold

### Description

Specifies whether the text of the selected object should be shown in bold.  
Access in Runtime: Read and write

### Syntax

Object.**FontBold**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Bar", "Checkbox" or "OptionGroup".

**BOOLEAN**

Optional TRUE, if the text of the selected object should be shown in bold.

**See also**

**FontItalic****Description**

Specifies whether the text of the selected object should be shown in italic.

Access in Runtime: Read and write

**Syntax**

Object.**FontItalic**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Bar", "Checkbox" or "OptionGroup".

**BOOLEAN**

Optional TRUE, if the text of the selected object should be shown in italic.

**See also**

## FontName

### Description

Specifies the font of the selected object.  
Access in Runtime: Read and write

### Syntax

Object.**FontName**[=String]

#### Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Bar", "Checkbox" or "OptionGroup".

#### String

Optional A value or a constant that specifies the font of the selected object.

### See also

ProjectName (Page 4392)

## FontSize

### Description

Specifies the font size of the text for the selected object.

Access in Runtime: Read and write

### Syntax

Object.**FontSize**[=Int]

#### Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Bar", "Checkbox" oder "OptionGroup".

#### Int

Optional A value or a constant that specifies the font size of the text for the selected object.

## FontUnderline

### Description

Specifies whether the text of the selected object should be underlined.

Access in Runtime: Read and write

### Syntax

Object.**FontUnderline**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Bar", "Checkbox" oder "OptionGroup".

### BOOLEAN

Optional TRUE, if the text of the selected object should be shown underlined.

### See also

### ForeColor

### Description

Specifies the font color of the text for the selected object.

Access in Runtime: Read and write

### Syntax

Object.**ForeColor**[=Color]

### Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch", "Bar", "RecipeView", "Slider", "SymbolLibrary", "MessageView", "Checkbox" or "OptionGroup".

### Color

Optional A value or a constant that specifies the font color of the text for the selected object.

**See also**

**ForeColor****Description**

Determines the text color of the given object.  
Access during runtime: Read and Write

**Syntax**

Object.ForeColor [= Color]

**Object**

Required An object of the "ScreenItem" type with the characteristics "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "Bar", "RecipeView", "Slider" or "SymbolLibrary".

**Color**

Optional A value or constant which determines the text color.

**Comments**

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

AlarmView (Page 4284)  
DateTimeField (Page 4315)  
ProjectName (Page 4392)

## ForeFlashColorOff

### Description

Defines or returns the color of the text for flash status "Off". LONG write-read access.

## ForeFlashColorOn

### Description

Defines or returns the color of the text for flash status "On". LONG write-read access.

## FormatPattern

### Description

Specifies the format of the output value.  
Access in Runtime: Read and write

### Syntax

Object.**FormatPattern**[=String]

#### Object

Required A "ScreenItem" object with the format "IOField".

#### String

Optional A value or a constant that specifies the format of the output value.

## See also

IOField (Page 4351)

## FormatPatternReadOnlySpecial

### Description

Specifies that the "format pattern" field can only be read.

Access in Runtime: Read and write

### Syntax

Object.**FormatPatternReadOnlySpecial**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "IOField".

#### BOOLEAN

Optional TRUE, if the "format pattern" field can only be read.

### See also

IOField (Page 4351)

## FormatType

### Description

Specifies the data type of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**FormatType**[=IOFieldDataFormat]

#### Object

Required A "ScreenItem" object with the format "IOField".

#### IOFieldDataFormat

hmiOutputFormatString ( 2): String

hmiOutputFormatDecimal ( 1): Decimal

hmiOutputFormatHexadecimal ( 3): Hexadecimal

hmiOutputFormatBinary ( 0): Binary

hmiOutputFormatDate ( 4): Date

hmiOutputFormatTime ( 5): Time

hmiOutputFormatDateTime ( 6): Date and time

## See also

IOField (Page 4351)

## Free

### Description

Returns the size of the free disk space.

Access in Runtime: Read and write

### Syntax

Object.**Free**[=Double]

#### Object

Required A "ScreenItem" object with the format "DiskSpaceView".

#### Double

Optional A value or a constant that returns the size of the free disk space.

## See also

DiskSpaceView (Page 4317)

## FreePercent

### Description

Returns the measured values for the free disk space as a percentage. The values can be queried in Runtime. The values cannot be predefined.

Access in Runtime: Read and write

### Syntax

Object.**FreePercent**[=Int]

#### Object

Required A "ScreenItem" object with the format "DiskSpaceView".

#### Int

Optional A value or a constant that returns the measured values for the free disk space as a percentage.

**See also**

DiskSpaceView (Page 4317)

**FreezeProviderConnections****Description**

Specifies whether the properties for the data connection ("TagProviderType(i)", "Source.."...) can be changed without the change becoming effective immediately. If you change from, for example, "XDataLogTag(i)" illegal combinations with "YDataLogTag(i)" could arise.

This means attributes must have the value TRUE before changing the data connection "FreezeProviderConnections". After changing all the properties for the data connection, "FreezeProviderConnection" will be set to FALSE and the changes will become effective.

Access in Runtime: Read and write

**Syntax**

Object.**FreezeProviderConnections**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

**BOOLEAN**

Optional TRUE, if the properties for the data connection ("TagProviderType(i)", "Source.."...) can be changed without the change becoming effective immediately.

**See also**

FunctionTrendControl (Page 4330)

**Properties G-H****GetSelectionText****Description**

Returns the selected text of the "MultiLineEdit" object.

**Gradation****Description**

Specifies the value difference between two main marking lengths of the "Gauge" object.

Access in Runtime: Read and write

## Syntax

Object.**Gradation**[= LONG]

### Object

Required A "ScreenItem" object with the format "Gauge".

### LONG

Optional A value or a constant that specifies the value difference.

## See also

Gauge (Page 4338)

## GraphDirection

## Description

Specifies at which border of the trend view the current values are displayed.

Access in Runtime: Read and write

## Syntax

Object.**GraphDirection**[=Direction]

### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

### Direction

0: Positive values run to the right and upwards.

-1: Positive values run to the left and upwards.

-2: Positive values run to the right and upwards.

-3: Positive values run to the right and downwards.

## See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## GridBackColor

### Description

Specifies the background color for the recipe view in Runtime.

Access in Runtime: Read and write

### Syntax

Object.**GridBackColor**[=Color]

#### Object

Required A "ScreenItem" object with the format "UserArchiveControl".

#### Color

Optional A value or a constant that specifies the background color in the recipe view in Runtime.

## GridForeColor

### Description

Defines the font color for the recipe view.

Access in Runtime: Read and write

### Syntax

Object.**GridForeColor**[=Color]

#### Object

Required A "ScreenItem" object with the format "UserArchiveControl".

#### Color

Optional A value or a constant that specifies the font color for the recipe view.

## GridLineColor

### Description

Specifies the color for the grid lines.

Access in Runtime: Read and write

### Syntax

Object.**GridlineColor**[=Color]

**Object**

Required A "ScreenItem" object with the format "AlarmControl".

**Color**

Optional A value or a constant that specifies the color of the grid lines.

**See also**

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

**GridLineColor**

**Color of the row divider / content - GridLineColor**

Defines the color of row/column dividers in table contents. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **GridLineColor**.

**See also**

AlarmView (Page 4284)

**GridLineWidth**

**Description**

Defines the line weight of the row/column dividers in pixels.

Access in Runtime: Read and write

**Syntax**

Object.**GridLineWidth**[=Width]

**Object**

Required A "ScreenItem" object with the format "AlarmControl".

**Width**

Optional A value or a constant which specifies the width of the grid line.

## See also

AlarmControl (Page 4273)  
UserArchiveControl (Page 4459)  
TrendRulerControl (Page 4439)  
OnlineTableControl (Page 4367)

## Height

### Description

Specifies the height of the selected objects "Ellipse", "Circle" and "Rectangle".

Access during runtime: Read and write

The other objects only have read access to the property.

### Syntax

Object.**Height**[= LONG]

#### Object

Necessary. A "Screen" object or an object of type "ScreenItem". This property is a standard property of the ScreenItem-Objekts and is therefore available for all formats.

#### LONG

Optional A value or a constant that specifies the height in pixels. This parameter can be set only for the objects "Ellipse", "Circle" and "Rectangle".

### Example

The following example halves the height of all objects of the image "NewPDL1", whose name starts with "Circle":

```
'VBS75
Dim objScreen
Dim objCircle
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
'
'Searching all circles
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
If "Circle" = Left(strName, 6) Then
'
'to halve the height of the circles
Set objCircle = objScreen.ScreenItems(strName)
```

```
objCircle.Height = objCircle.Height / 2  
End If  
Next
```

## HelpText

### Description

Returns the tooltip that is shown in Runtime as an operating aid for the specified object.

Access in Runtime: Read

### Syntax

Object.HelpText

#### Object

Required An object of the "ScreenItem" type with the format "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch", "GraphicIOField" or "OnlineTrendControl".

### See also

IOField (Page 4351)

SymbolicIOField (Page 4422)

Button (Page 4294)

Switch (Page 4419)

GraphicIOField (Page 4341)

## HelpText

### Description

Returns the tooltip that is shown in Runtime as an operating aid for the specified object.

Access in Runtime: Read

### Syntax

Object.HelpText

#### Object

Required An object of the type "ScreenItem" with the characteristic "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField" or "TrendView".

### See also

TrendView (Page 4447)

DateTimeField (Page 4315)

## HiddenInput

### Description

Specifies whether the input value or a \* for each character will be shown during the input.

Access in Runtime: Read and write

### Syntax

Object.**HiddenInput**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "IOField".

#### BOOLEAN

Optional TRUE, if the input value is not shown during the input. An \* is shown for each character.

### See also

IOField (Page 4351)

## HideTagNames

### Description

Specifies whether the tag name is shown in the f/t() trend view.

Access in Runtime: Read and write

### Syntax

Object.**HideTagNames**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

#### BOOLEAN

Optional TRUE, if the tag names are displayed.

### See also

OnlineTrendControl (Page 4375)

## HighLimitColor

### Description

Specifies the color of the top or right scroll button in a scroll bar.

Access in Runtime: Read and write

### Syntax

Object.HighLimitColor[=Color]

#### Object

Required A "ScreenItem" object with the format "WindowSlider".

#### Color

Optional A value or a constant that specifies the color of the top or right scroll button in a scroll bar.

### See also

WindowSlider (Page 4468)

## HitlistColumnAdd

### Description

Transfers the selected message block from the list of available message blocks to the list of selected message blocks.

Access in Runtime: Read and write

### Syntax

Object.HitlistColumnAdd

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## HitlistColumnCount

### Description

Specifies the number of message blocks displayed in the hitlist in Runtime.

Access in Runtime: Read and write

### Syntax

Object.**HitlistColumnCount**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## HitlistColumnIndex

### Description

References a message block selected for the hitlist. Using this attribute you can assign the values of other attributes to a specific message block of the hitlist.

Values between 0 and "HitlistColumnCount" minus 1 are valid for "HitlistColumnIndex". Attribute "HitlistColumnCount" defines the number of message blocks selected for the hitlist. The "HitlistColumnIndex" attribute can be assigned dynamic properties by means of attribute **HitlistColumnRepos**.

Access in Runtime: Read and write

### Syntax

Object.**HitlistColumnIndex**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## HitlistColumnName

### Description

Displays the name of the message block of the hitlist which is referenced with attribute "HitlistColumnIndex". You cannot edit this name.

Access in Runtime: Read and write

### Syntax

Object.**HitlistColumnName**

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## HitlistColumnRemove

### Description

Removes the marked message block from the list of selected message blocks and inserts it in the list of existing message blocks.

Access in Runtime: Read and write

### Syntax

Object.**HitlistColumnRemove** [=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## HitlistColumnRepos

### Description

Resorts the message blocks. The "Up" and "Down" commands move the selected message block accordingly in the list. This moves the message block in Runtime Control towards the front or towards the back.

Access in Runtime: Read and write

## Syntax

For hitlist: Object.**HitlistColumnRepos** For message list: Object.**MessageColumnRepos**

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

## See also

AlarmControl (Page 4273)

## HitlistColumnSort

### Description

Defines the sorting order of the message block referenced in "HitlistColumnIndex" in the hitlist.

Access in Runtime: Read and write

## Syntax

Object.**HitlistColumnSort** [=Sort]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

### Sort

0: No sorting.

1: Ascending sorting from the lowest to highest value

2 Descending sorting from the highest to lowest value

## See also

AlarmControl (Page 4273)

## HitlistColumnSortIndex

### Description

Defines the sorting order of the message block referenced in "HitlistColumnIndex" in the hitlist. The sorting criterion is removed from "HitlistColumnSort" if you set a "0" value..

Access in Runtime: Read and write

## Syntax

Object.**HitlistColumnSortIndex**

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

## See also

AlarmControl (Page 4273)

## HitlistColumnVisible

### Description

The selected message blocks of the message list or hitlist which are used in Runtime in the control are displayed in the list.

Access in Runtime: Read and write

### Syntax

For hitlist: Object.**HitlistColumnVisible** For message list: Object.**MessageColumnVisible**

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

## See also

AlarmControl (Page 4273)

## HitlistDefaultSort

### Description

Defines the default sorting order in the table columns of the hitlist.

Access in Runtime: Read and write

### Syntax

Object.**HitlistDefaultSort**[=Sort]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

**Sort**

0: The list is sorted in ascending order of frequency.

1:: The list is sorted in descending order of frequency.

**See also**

AlarmControl (Page 4273)

**HitlistMaxSourceItems****Description**

Specifies the maximum number of data records that can be used from the alarm log to create the hit list. The value can be anything between "0 - 10000".

Access in Runtime: Read and write

**Syntax**

Object.**HitlistMaxSourceItems**[=Long]

**Object**

Required A "ScreenItem" object with the format "AlarmControl".

**Long**

Optional A value or a constant that specifies the maximum number of data records that can be used from the alarm log to create the hit list.

**See also**

AlarmControl (Page 4273)

**HitlistMaxSourceItemsWarning****Description**

Specifies whether a warning should be given if the maximum number of data records that is defined in "HitlistMaxSourceItems" is reached.

Access in Runtime: Read and write

**Syntax**

Object.**HitlistMaxSourceItemsWarning**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "AlarmControl".

**BOOLEAN**

Optional TRUE, if a warning is given as soon as the maximum number of data records that is defined in "HitlistMaxSourceItems" is reached.

**See also**

AlarmControl (Page 4273)

**HitlistRelativeTimeFactor**

**Description**

Specifies the time factor which, alongside the time type "HitlistRelativeTimeFactorType", determines the time period in which the statistics of the hit list will be created.

If you do not wish to specify a period of time, set the time factor to "0".

Access in Runtime: Read and write

**Syntax**

Object.HitlistRelativeTimeFactor[=Long]

**Object**

Required A "ScreenItem" object with the format "AlarmControl".

**Long**

Optional A value or a constant that specifies the time factor.

**See also**

AlarmControl (Page 4273)

**HitlistRelativeTimeFactorType**

**Description**

Specifies the time type which, alongside the time factor "HitlistRelativeTimeFactor", determines the time period in which the statistics of the hit list will be created.

Access in Runtime: Read and write

## Syntax

Object.**HitlistRelativeTimeFactorType**[=AlarmViewAdvancedTimeFactorUnit]

### Object

Required A "ScreenItem" object with the format "AlarmControl".

### AlarmViewAdvancedTimeFactorUnit

hmiAlarmViewAdvancedTimeFactorUnitMinute ( 0): The time range for the statistics will be measured in minutes.

hmiAlarmViewAdvancedTimeFactorUnitHour ( 1): The time range for the statistics will be measured in hours.

hmiAlarmViewAdvancedFactorUnitDay ( 2): The time range for the statistics will be measured in days.

hmiAlarmViewAdvancedTimeFactorUnitWeek ( 3): The time range for the statistics will be measured in weeks.

hmiAlarmViewAdvancedTimeFactorUnitMonth ( 4): The time range for the statistics will be measured in months.

## See also

AlarmControl (Page 4273)

## HitListRelTime

### Description

Sets a time range for the statistics.

If you do not wish to specify a period of time, set the time factor to "0".

Access in Runtime: Read and write

## Syntax

Object.**HitListRelTime**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "AlarmControl".

### BOOLEAN

TRUE: If no time range is specified in the selection, the specified time range is used for the statistics.

FALSE: The specified time range is not used.

## See also

AlarmControl (Page 4273)

## HorizontalAlignment

### Description

Specifies the horizontal alignment of the text within the specified object.

Access in Runtime: Read and write

### Syntax

Object.**HorizontalAlignment**[= THmiHorizontalAlignment]

#### Object

Required A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch", "CheckBox", "OptionGroup", "PageNumber", "ProjectName", "ReportName", "OdbcDatabaseField".

#### THmiHorizontalAlignment

Optional A value or a constant that specifies the horizontal alignment of the text.

hmiAlignmentLeft (0): The text is arranged flush left in the object.

hmiAlignmentCentered (1): The text is arranged horizontally centered in the object.

hmiAlignmentRight (2): The text is arranged flush right in the object.

## See also

TextField (Page 4436)

IOField (Page 4351)

SymbolicIOField (Page 4422)

Button (Page 4294)

Switch (Page 4419)

CheckBox (Page 4300)

OptionGroup (Page 4384)

AlarmControl (Page 4273)

MultiLineEdit (Page 4362)

Listbox (Page 4357)

RoundButton (Page 4404)

## HorizontalAlignment

### Description

Determines the horizontal alignment of the text within the given object.

Access during runtime: Read and Write

### Syntax

Object.HorizontalAlignment [= THmiHorizontalAlignment]

#### Object

Required An object of the "ScreenItem" type with the characteristics "TextField", "IOField", "SymbolicIOField", "Button" or "Switch".

#### THmiHorizontalAlignment

Optional A value or constant which determines the horizontal alignment of the text.

hmiAlignmentLeft (0): The text is aligned left justified in the object.

hmiAlignmentCentered (1): The text is centered horizontally in the object.

hmiAlignmentRight (2): The text is aligned right justified in the object.

### See also

DateTimeField (Page 4315)

ProjectName (Page 4392)

## HorizontalGridLines

### Description

Defines whether horizontal separating lines will be displayed.

Access in Runtime: Read and write

### Syntax

Object.HorizontalGridLines[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

TRUE: Horizontal grid lines are displayed.

FALSE: Horizontal grid lines are not displayed.

## See also

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## HorizontalScrollbarPosition

### Description

Specifies the horizontal positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

## See also

ScreenWindow (Page 4408)

## Hotkey property

### Description

Returns the function key related to the mouse operation in respect of a button object.

Read only access.

## See also

Button (Page 4294)

## HourNeedleHeight

### Description

Specifies the length of the hour hand in the "Clock" object.

Access in Runtime: Read and write

## Syntax

Object.HourNeedleHeight[= LONG]

**Object**

Required A "ScreenItem" object with the format "Clock".

**LONG**

Optional A value or a constant that specifies the length of the hour hand.

Specify the length of the hour hand as a percentage relating to the radius of the clock face.

**See also**

Clock (Page 4310)

**HourNeedleWidth****Description**

Specifies the width of the hour hand in the "Clock" object.

Access in Runtime: Read and write

**Syntax**

Object.HourNeedleWidth[= LONG]

**Object**

Required A "ScreenItem" object with the format "Clock".

**LONG**

Optional A value or a constant that specifies the width of the hour hand.

Specify the width of the hour hand as a percentage relating to double the length of the clock face.

**See also**

Clock (Page 4310)

**Hysteresis property****Description**

TRUE, when the display should appear with hysteresis. BOOLEAN write-read access.

## HysteresisRange

### Description

Defines the hysteresis in % of the displayed value or returns it.  
The Hysteresis property must be set to TRUE for the hysteresis to be calculated.

### Properties I-J

## IconSpace

### Description

Defines the spacing between the icons and text in the table cells. The value is active if and icon and text are displayed.

Access in Runtime: Read and write

### Syntax

Object.**IconSpace**[=Space]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchiveControl".

#### Space

Optional Value which specifies the spacing.

### See also

[AlarmControl \(Page 4273\)](#)

[UserArchiveControl \(Page 4459\)](#)

[TrendRulerControl \(Page 4439\)](#)

[OnlineTableControl \(Page 4367\)](#)

## Index

### Description

Specifies the index for the selected text field.

Access in Runtime: Read and write

## Syntax

Object.**Index**[=Int]

### Object

Required A "ScreenItem" object with the formats "Checkbox" or "OptionGroup".

### Int

Optional A value or a constant that specifies the index of the selected text field.

## See also

OptionGroup (Page 4384)

Listbox (Page 4357)

## InnerBackColorOff

### Description

Specifies the color under the slider of the "Switch" object if the object is in OFF status.

Access during runtime: Read and Write

### Syntax

Object.**InnerBackColorOff**[= Color]

### Object

Required An object of the "ScreenItem" type with the characteristic "Switch".

### Color

Optional A value or a constant that specifies the color for the OFF status.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

## See also

Switch (Page 4419)

## InnerBackColorOn

### Description

Specifies the color under the slider of the "Switch" object if the object is in ON status.

Access during runtime: Read and Write

### Syntax

Object.InnerBackColorOn[= Color]

#### Object

Required An object of the "ScreenItem" type with the characteristic "Switch".

#### Color

Optional A value or a constant that specifies the color for the ON status.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

### See also

Switch (Page 4419)

## InputValue

### Description

Defines the value to be entered by the user in the I/O field. The value is not displayed in the I/O field when the property is set.

If you want the value to be displayed in the I/O field after confirmation with the <Return> key, configure a direct connection between the properties "input value" and "output value". The direct connection is only practical when no tag is connected to the output value, but the user can nevertheless query the specified value, for example, through a script.

LONG write-read access.

### See also

SymbolicIOField (Page 4422)

IOField (Page 4351)

## InsertData(i)

### Description

Specifies which data will be inserted for the active trend.

Access in Runtime: Read and write

### Syntax

Object.**InsertData**(i)[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendControi".

#### BOOLEAN

Optional TRUE, if "DataIndex(i)" is ignored and the data added to the rear of the data buffer.

FALSE, if the data is inserted at the position "DataIndex(i)" of the data buffer.

### Comments

The trend view is redrawn in every operation with "InsertData(i)".

### See also

FunctionTrendControl (Page 4330)

## InsertEnable

### Description

Specifies whether an entry can be made in the recipe view in Runtime.

Access in Runtime: Read and write

### Syntax

Object.**InsertEnable**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "UserArchiveControl".

#### BOOLEAN

Optional TRUE, if an entry can be made in the recipe view in Runtime.

## Instance

### Description

Returns an instance of the alarm object.

## IntegerDigits

### Description

Establishes the number of integer digits (0 to 20).

Access in Runtime: Read and write

### Syntax

Object.**IntegerDigits**[=Int]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### Int

Optional A value or a constant that specifies the number of integer digits (0 to 20).

### See also

Bar (Page 4287)

## Interval

### Description

Specifies the time interval for updating the displayed measured value. You enter the value in minutes.

Access in Runtime: Read and write

### Syntax

Object.**Interval**[=Int]

#### Object

Required A "ScreenItem" object with the format "DiskSpaceView".

#### Int

Optional A value or a constant that specifies the time interval for updating the measured values.

**See also**

DiskSpaceView (Page 4317)

**ItemBorderBackColor****Description**

Defines or returns the background color for dividing lines in the selection list of the text list object. LONG write-read access. The background color is only visible with the property setting ItemBorderStyle > 0.

**ItemBorderColor****Description**

Defines or returns the color for dividing lines in the selection list of the text list object. LONG write-read access.

**ItemBorderStyle****Description**

Specifies the line style of the separation lines in the selection list of the selected object.  
Access in Runtime: Read and write

**Syntax**

Object.**ItemBorderStyle**[=LineStyle]

**Object**

Required A "ScreenItem" object with the format "SymbolicIOField".

**LineStyle**

hmiLineStyleNone (-1): The selection list has no separation lines.

hmiLineStyleSolid ( 0): The selection list has solid separation lines.

hmiLineStyleDash ( 1): The selection list has broken separation lines.

hmiLineStyleDot ( 2): The selection list has dotted separation lines.

hmiLineStyleDashDot ( 3): The selection list has dash - dot lines as separation lines.

hmiLineStyleDashDotDot ( 4): The selection list has dash - dot - dot lines as separation lines.

## See also

SymbolicIOField (Page 4422)

## ItemBorderWidth

### Description

Defines or returns the dividing line weight in pixels in the selection list of the text list object.

## JumpToLimitsAfterMouseClicked

### Description

Specifies whether the slider will be set to the associated end value. The end value is the minimum or maximum value. To set the slider to the end value, users click on the area outside of the current slider setting.

Access in Runtime: Read and write

### Syntax

Object.**JumpToLimitsAfterMouseClicked**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "WindowSlider".

#### BOOLEAN

Optional TRUE, if the slider will be set to the associated end value.

## See also

WindowSlider (Page 4468)

## Properties K-L

### LabelColor

### Description

Specifies the color of the scale label in the "Slider" object.

Access in Runtime: Read and write

## Syntax

Object.**LabelColor**[= Color]

### Object

Required A "ScreenItem" object with the format "Slider".

### Color

Optional A value or a constant that specifies the color of the scale label.

## Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

## See also

Slider (Page 4412)

## Language

## Description

Determines the current Runtime language.

Access in Runtime: Read and write

## Syntax

Object.**Language**[= LONG]

### Object

Required A "HMIRuntime" object.

### LONG

Optional A value or a constant that specifies the national code.

## Comments

Specify the Runtime language in VBS with a national code, e.g. 1031 for German, 2057 for English etc.. Refer to the VBScript basics under the topic "Current local ID (LCID) diagram" for an overview of all the national codes.

## See also

HMIRuntime (Page 4248)

## LanguageSwitch

### Description

Returns the value which defines where the language dependent assigned texts are stored.  
Read only access.

TRUE, if the texts are managed in the project texts editor. Translations into other languages are made in the project texts editor.

FALSE, when the texts are managed directly in the object. Translations into other languages can be made by means of the export/import function.

## LargeTicksBold

### Description

Specifies whether the long marking lengths of a scale are shown in bold.

Access in Runtime: Read and write

### Syntax

Object.**LargeTicksBold**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format ""Bar".

#### BOOLEAN

Optional. TRUE, if the long marking lengths of a scale are shown in bold.

### See also

Bar (Page 4287)

## LargeTicksSize

### Description

Specifies the length of the long marking lengths of a scale.

Access in Runtime: Read and write

### Syntax

Object.**LargeTicksSize**[=Int]

**Object**

Required A "ScreenItem" object with the format "Bar".

**Int**

Optional A value or a constant that specifies the length of the long marking lengths of a scale.

**See also**

Bar (Page 4287)

**LastConnectedObjectIndex****Description**

Specifies the index number of the connection point for the last, connected object.

Access in Runtime: Read and write

**Syntax**

Object.**LastConnectedObjectIndex**[=Int]

**Object**

Required A "ScreenItem" object with the format "Connector".

**Int**

Int

**See also**

Connector (Page 4312)

**LastConnectedObjectName****Description**

Specifies the object name of the object that is docked at the lower connector point.

Access in Runtime: Read and write

**Syntax**

Object.**LastConnectedObjectName**[=String]

**Object**

Required A "ScreenItem" object with the format "Connector".

**String**

String

**See also**

Connector (Page 4312)

**LastError**

**Description**

Returns an error code regarding the success of the last operation, e.g. information on a tag write or read process:

Code in hexadecimal notation	Description
0x00000000	OK
0x80040001	Execution error
0x80040002	Tag error
0x80040003	Server not available.
0x80040004	Multi Tag Error; error in one or several tags

To obtain an error description, first of all carry out the Read method.

---

**Note**

If the error occurs when accessing via the TagSet object, evaluate the LastError property for each tag of the TagSet object.

---

To obtain a statement about the quality of the supplied value, use the "QualityCode" property. To obtain a description of the error, use the "ErrorDescription" property.

Access during runtime: Read

**Syntax**

Object.**LastError**

**Object**

Necessary. A "Tag" object.

**Example**

The following example shows the error code for the "Tag1" tag:

```
'\VBS77  
Dim objTag
```

```
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
MsgBox objTag.LastError
```

The following example adds two tags to the TagSet list and outputs the LastError property as Trace:

```
'VBS178
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
HMIRuntime.Trace "LastError: " & group.LastError & vbNewLine
```

The LastError property of a tag contained in the list may be accessed as follows:

```
HMIRuntime.Trace "LastError: " & group("Motor1").LastError & vbNewLine
```

## See also

[Tag \(Page 4267\)](#)

[TagSet \(list\) \(Page 4271\)](#)

## Layer

### Description

Returns the layer that contains an object as LONG in the screen. There is a total of 32 layers available, whereby Layer "0" is the bottom layer and Layer "31" the top layer.

The configured objects are initially in the background of a layer.

Access during runtime: Read

### Syntax

Object.**Layer**

### Object

Necessary. A "ScreenItem" object.

---

### Note

The Layer property specifies the layer in which the object is located. The layer "0" is output as layer "0".

When accessed, the layers are counted up from 1 in VBS. Therefore, address the level "1" with layers(2).

---

### Example

The following example displays the name and layer of all objects in the screen "NewPDL1":

```
'VBS78
Dim objScreen
Dim objScrItem
Dim lngAnswer
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
lngAnswer = MsgBox(strName & " is in layer " & objScrItem.Layer, vbOKCancel)
If vbCancel = lngAnswer Then Exit For
Next
```

## Layer00Checked

### Description

TRUE, when limit 0 should be monitored. BOOLEAN write/read access.  
Limit value and representation are defined with the Layer00Value and Layer00Color properties.

## Layer00Color

### Description

Defines or returns the color for limit 0. LONG write/read access.  
When monitoring of the limit value is activated (Layer00Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

## Layer00Value

### Description

Determines the value for "Limit 0" or returns it.  
Monitoring only takes effect when the Layer00Checked property value is set to TRUE.

## Layer01Checked

### Description

TRUE, when limit 1 should be monitored. BOOLEAN write/read access.  
Limit value and representation are defined with the Layer01Value and Layer01Color properties.

## Layer01Color

### Description

Defines or returns the color for limit 1. LONG write/read access.  
When monitoring of the limit value is activated (Layer01Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

## Layer01Value

### Description

Determines the value for "Limit 1" or returns it.  
Monitoring only takes effect when the Layer01Checked property value is set to TRUE.

## Layer02Checked

### Description

TRUE, when limit 2 should be monitored. BOOLEAN write/read access.  
Limit value and representation are defined with the Layer02Value and Layer02Color properties.

## Layer02Color

### Description

Defines or returns the color for limit 2. LONG write/read access.  
When monitoring of the limit value is activated (Layer02Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

## Layer02Value

### Description

Determines the value for "Limit 2" or returns it.  
Monitoring only takes effect when the Layer02Checked property value is set to TRUE.

## Layer03Checked

### Description

TRUE, when limit 3 should be monitored. BOOLEAN write/read access.  
Limit value and representation are defined with the Layer03Value and Layer03Color properties.

## Layer03Color

### Description

Defines or returns the color for limit 3. LONG write/read access.  
When monitoring of the limit value is activated (Layer03Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

## Layer03Value

### Description

Determines the value for "Limit 3" or returns it.  
Monitoring only takes effect when the Layer03Checked property value is set to TRUE.

## Layer04Checked

### Description

TRUE, when limit 4 should be monitored. BOOLEAN write/read access.  
Limit value and representation are defined with the Layer04Value and Layer04Color properties.

## Layer04Color

### Description

Defines or returns the color for limit 4. LONG write/read access.  
When monitoring of the limit value is activated (Layer04Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

## Layer04Value

### Description

Determines the value for "Limit 4" or returns it.  
Monitoring only takes effect when the Layer04Checked property value is set to TRUE.

## Layer05Checked

### Description

TRUE, when limit 5 should be monitored. BOOLEAN write/read access.  
Limit value and representation are defined with the Layer05Value and Layer05Color properties.

## Layer05Color

### Description

Defines or returns the color for limit 5. LONG write/read access.  
When monitoring of the limit value is activated (Layer05Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

## Layer05Value

### Description

Determines the value for "Limit 5" or returns it.  
Monitoring only takes effect when the Layer05Checked property value is set to TRUE.

## Layer06Checked

### Description

TRUE, when limit 6 should be monitored. BOOLEAN write/read access.  
Limit value and representation are defined with the Layer06Value and Layer06Color properties.

## Layer06Color

### Description

Defines or returns the color for limit 6. LONG write/read access.  
When monitoring of the limit value is activated (Layer06Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

## Layer06Value

### Description

Determines the value for "Limit 6" or returns it.  
Monitoring only takes effect when the Layer06Checked property value is set to TRUE.

## Layer07Checked

### Description

TRUE, when limit 7 should be monitored. BOOLEAN write/read access.  
Limit value and representation are defined with the Layer07Value and Layer07Color properties.

## Layer07Color

### Description

Defines or returns the color for limit 7. LONG write/read access.  
When monitoring of the limit value is activated (Layer07Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

## Layer07Value

### Description

Determines the value for "Limit 7" or returns it.  
Monitoring only takes effect when the Layer07Checked property value is set to TRUE.

## Layer08Checked

### Description

TRUE, when limit 8 should be monitored. BOOLEAN write/read access.  
Limit value and representation are defined with the Layer08Value and Layer08Color properties.

## Layer08Color

### Description

Defines or returns the color for limit 8. LONG write/read access.  
When monitoring of the limit value is activated (Layer08Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

## Layer08Value

### Description

Determines the value for "Limit 8" or returns it.  
Monitoring only takes effect when the Layer08Checked property value is set to TRUE.

## Layer09Checked property

### Description

TRUE, when limit 9 should be monitored. BOOLEAN write/read access.  
Limit value and representation are defined with the Layer09Value and Layer09Color properties.

## Layer09Color

### Description

Defines or returns the color for limit 9. LONG write/read access.  
When monitoring of the limit value is activated (Layer09Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

## Layer09Value

### Description

Determines the value for "Limit 9" or returns it.  
Monitoring only takes effect when the Layer09Checked property value is set to TRUE.

## Layer10Checked

### Description

TRUE, when limit 10 should be monitored. BOOLEAN write/read access.  
Limit value and representation are defined with the Layer10Value and Layer10Color properties.

## Layer10Color

### Description

Defines or returns the color for limit 10. LONG write/read access.  
When monitoring of the limit value is activated (Layer10Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

## Layer10Value

### Description

Determines the value for "Limit 10" or returns it.  
Monitoring only takes effect when the Layer10Checked property value is set to TRUE.

## LayerDeclutteringEnable

### Description

Indicates whether the layers of a screen can be shown or hidden dependent on the set minimum and maximum zoom.

Access during runtime: Read

### Syntax

Object.**LayerDeclutteringEnable**

#### Object

Necessary. A "Screen" object.

### Example:

The example outputs the LayerDecluttering property of the "NewPDL1" screen as Trace.

```
'VBS156
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

### See also

Screen (Page 4256)

## Layers

### Description

Returns an object of type "Layers".

Access in Runtime: Read

## Syntax

Object.**Layers**

### Object

Required A "Screen" object.

## See also

Screen (Page 4256)

## LeaveMarginForBorder

### Description

Specifies whether an additional margin will be left for borders.

Access in Runtime: Read and write

### Syntax

Object.**LeaveMarginForBorder**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Bar".

### BOOLEAN

Optional TRUE, if an additional margin is enabled for borders.

## See also

Bar (Page 4287)

## LeaveMarginForMarkers

### Description

Specifies whether an additional margin will be left for markers.

Access in Runtime: Read and write

### Syntax

Object.**LeaveMarginForMarkers**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Bar".

**BOOLEAN**

Optional TRUE, if an additional margin is enabled for markers.

**See also**

Bar (Page 4287)

**Left****Description**

Specifies the value of the X coordinate of the selected object.

Access during runtime: Read and write

**Syntax**

Object.**Left**[= DOUBLE]

**Object**

Necessary. A "ScreenItem" object. This property is a standard property of the ScreenItem-Objekts and is therefore available for all formats.

**DOUBLE**

Optional A value or a constant that contains the value of the X coordinate in pixels (measured from the top left edge of the screen).

**Comments**

The X coordinate refers to the top left corner of the rectangle that surrounds the object. The screen limits are also monitored in runtime. If the assigned coordinate value exceeds the display size, the user-defined function is interrupted with an error message.

**Used for the following object types:**

IOField

Rectangle

Slider

## LeftComma property

### Description

Defines or returns the number of digits to the left of the decimal point (0 to 20).

## LeftOffset

### Description

Defines or returns the distance of the picture from the left edge of the picture window.

The picture is displayed as a cutout of the picture window. The picture scroll bars are located at the left and upper edge of the picture. If you wish to display the picture in the picture window

by using the horizontal and vertical positioning of the picture scroll bars, use the properties "HorizontalScrollBarPosition" and "VerticalScrollBarPosition" for such positioning.

### See also

ScreenWindow (Page 4408)

### LightEffect property

#### Description

TRUE, when the light effect should be activated. BOOLEAN write-read access.

### Limit4LowerLimit

#### Description

Specifies the lower limit for ""Reserve4".

The "Limit4LowerLimitEnable" property must be set to TRUE so that the limit "Reserve4"" can be monitored.

Access in Runtime: Read and write

#### Syntax

Object.Limit4LowerLimit[=Double]

##### Object

Required A "ScreenItem" object with the format "Bar".

##### Double

Optional A value or a constant that specifies the lower limit for "Reserve4".

#### Comments

The "Limit4LowerLimitRelative" property specifies whether the object is evaluated as a percentage or absolutely.

### See also

Bar (Page 4287)

## Limit4LowerLimitColor

### Description

Specifies the color for the lower limit "Reserve4".

The "Limit4LowerLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

### Syntax

Object.Limit4LowerLimitColor[=Color]

#### Object

Required A ""ScreenItem" object with the format "Bar".

#### Color

Optional A value or a constant that specifies the color for the lower limit ""Reserve4".

### See also

Bar (Page 4287)

## Limit4LowerLimitEnabled

### Description

Specifies whether the lower limit ""Reserve4"" is to be monitored.

Access in Runtime: Read and write

### Syntax

Object.Limit4LowerLimitEnabled[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### BOOLEAN

Optional TRUE, if the lower limit ""Reserve4" is to be monitored.

### Comments

The following values will be specified with the properties ""Limit4LowerLimit", "Limit4LowerLimitColor" and "Limit4LowerLimitRelative"":

Limit

Representation upon reaching the limit

Type of evaluation

### See also

Bar (Page 4287)

## Limit4LowerLimitRelative

### Description

Specifies whether the lower limit "Reserve4" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

### Syntax

Object.Limit4LowerLimitRelative[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### BOOLEAN

Optional. TRUE,, if the lower limit "Reserve4" is to be evaluated as a percentage.

### See also

Bar (Page 4287)

## Limit4UpperLimit

### Description

Specifies the lower limit for "Reserve4".

The "Limit4UpperLimitEnable"" property must be set to TRUE so that the limit ""Reserve4" can be monitored.

Access in Runtime: Read and write

### Syntax

Object.Limit4UpperLimit[=Double]

#### Object

Required A "ScreenItem" object with the format "Bar".

**Double**

Optional A value or a constant that specifies the upper limit for "Reserve4".

**Comments**

The "Limit4UpperLimitRelative" property specifies whether the object is evaluated as a percentage or absolutely.

**See also**

Bar (Page 4287)

**Limit4UpperLimitColor****Description**

Specifies the color for the upper limit ""Reserve4".

The "Limit4UpperLimitEnable"" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

**Syntax**

Object.Limit4UpperLimitColor[=Color]

**Object**

Required A "ScreenItem" object with the format "Bar".

**Color**

Optional A value or a constant that specifies the color for the upper limit "Reserve4".

**See also**

Bar (Page 4287)

**Limit4UpperLimitEnabled****Description**

Specifies whether the upper limit "Reserve4" is to be monitored.

Access in Runtime: Read and write

## Syntax

Object.Limit4UpperLimitEnabled[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Bar".

### BOOLEAN

Optional TRUE, if the upper limit "Reserve4" is to be monitored.

## Comments

The following values will be specified with the properties "Limit4UpperLimit", "Limit4UpperLimitColor" and "Limit4UpperLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

## See also

Bar (Page 4287)

## Limit4UpperLimitRelative

### Description

Specifies whether the upper limit "Reserve4" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

### Syntax

Object.Limit4UpperLimitRelative[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Bar".

### BOOLEAN

Optional TRUE, if the upper limit "Reserve4" is to be evaluated as a percentage.

## See also

Bar (Page 4287)

## Limit5LowerLimit

### Description

Specifies the lower limit for "Reserve5".

The "Limit5LowerLimitEnable" property must be set to TRUE so that the limit ""Reserve5" can be monitored.

Access in Runtime: Read and write

### Syntax

Object.Limit5LowerLimit[=Double]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### Double

Optional A value or a constant that specifies the lower limit for "Reserve5".

### Comments

The "Limit5LowerLimitRelative" property specifies whether the object is evaluated as a percentage or absolutely.

### See also

Bar (Page 4287)

## Limit5LowerLimitColor

### Description

Specifies the color for the lower limit ""Reserve5".

The "Limit5LowerLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

### Syntax

Object.Limit5LowerLimitColor[=Color]

#### Object

Required A "ScreenItem" object with the format "Bar".

### Color

Optional A value or a constant that specifies the color for the lower limit ""Reserve5".

### See also

Bar (Page 4287)

## Limit5LowerLimitEnabled

### Description

Specifies whether the lower limit "Reserve5" is to be monitored.

Access in Runtime: Read and write

### Syntax

Object.Limit5LowerLimitEnabled[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### BOOLEAN

Optional TRUE, if the lower limit ""Reserve5" is to be monitored.

### Comments

The following values will be defined using the properties "Limit5LowerLimit", "Limit5LowerLimitColor" and "Limit5LowerLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

### See also

Bar (Page 4287)

## Limit5LowerLimitRelative

### Description

Specifies whether the lower limit ""Reserve5" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

## Syntax

Object.Limit5LowerLimitRelative[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Bar".

### BOOLEAN

Optional TRUE, if the lower limit "Reserve5" is to be evaluated as a percentage.

## See also

Bar (Page 4287)

## Limit5UpperLimit

### Description

Specifies the lower limit for "Reserve5".

The "Limit5UpperLimitEnable" property must be set to TRUE so that the limit "Reserve5" can be monitored.

Access in Runtime: Read and write

## Syntax

Object.Limit5UpperLimit[=Double]

### Object

Required A "ScreenItem" object with the format "Bar".

### Double

Optional A value or a constant that specifies the upper limit for "Reserve5".

## Comments

The "TypeLimitHigh5" property specifies whether the object is evaluated as a percentage or absolutely.

## See also

Bar (Page 4287)

## Limit5UpperLimitColor

### Description

Specifies the color for the upper limit "Reserve5".

The "Limit5UpperLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

### Syntax

Object.Limit5UpperLimitColor[=Color]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### Color

Optional A value or a constant that specifies the color for the upper limit ""Reserve5".

### See also

Bar (Page 4287)

## Limit5UpperLimitEnabled

### Description

Specifies whether the upper limit "Reserve5" is to be monitored.

Access in Runtime: Read and write

### Syntax

Object.Limit5UpperLimitEnabled[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### BOOLEAN

Optional TRUE, if the upper limit ""Reserve5"" is to be monitored.

### See also

Bar (Page 4287)

## Limit5UpperLimitRelative

### Description

Specifies whether the upper limit "Reserve5" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

### Syntax

Object.Limit5UpperLimitRelative[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### BOOLEAN

Optional TRUE, if the upper limit "Reserve5" is to be evaluated as a percentage.

### See also

Bar (Page 4287)

## LimitHigh4

### Description

Determines the upper limit value for "Reserve 4" or returns it.

The CheckLimitHigh4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.

The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh4 property.

## LimitHigh5

### Description

Determines the upper limit value for "Reserve 5" or returns it.

The CheckLimitHigh5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.

The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh5 property.

## LimitLow4

### Description

Determines the lower limit value for "Reserve 4" or returns it.  
The CheckLimitLow4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.  
The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow4 property.

## LimitLow5

### Description

Determines the lower limit value for "Reserve 5" or returns it.  
The CheckLimitLow5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.  
The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow5 property.

## LimitMax

### Description

Determines the upper limit value as an absolute value depending on the data format or returns it.  
If the displayed value exceeds the upper limit value, it is displayed by a sequence of \*\*\* (not displayable).

## LimitMin

### Description

Determines the lower limit value as an absolute value depending on the data format or returns it.  
If the displayed value exceeds the upper limit value, it is displayed by a sequence of \*\*\* (not displayable).

## LineColor

### Description

Specifies the color of the window dividers. The button opens the "Color selection" dialog.

OptionGroup (Page 4384)

## LineWidth

### Description

Specifies the line weight of the selected object.

Access in Runtime: Read and write

### Syntax

Object.LineWidth [= LONG]

#### Object

Required A "ScreenItem" object with the formats "Line" "Polyline", "EllipticalArc", "CircularArc" or "Connector".

#### LONG

Optional A value or a constant that specifies the line weight in pixels.

### See also

Line (Page 4355)

OnlineTableControl (Page 4367)

## LineWidth

### Description

Determines the LineWidth of the given object.

Access during runtime: Read and Write

### Syntax

Object.LineWidth [= LONG]

#### Object

Required. An object of the "ScreenItem" type with the characteristic "Line," or "Polyline".

#### LONG

Optional. A value or constant which determines the line width in pixels.

### See also

OnlineTrendControl (Page 4375)

## ListType property

### Description

Returns the data type displayed in the case of a text list object. Read only access.

Value range from 0 to 2.

0 = decimal

1 = binary

2 = bit

## LoadDataImmediately

### Description

Specifies whether in the event of a screen impact the tag values should be downloaded from the archives for the time range that is to be shown.

Access in Runtime: Read and write

### Syntax

Object.LoadDataImmediately[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

### BOOLEAN

Optional TRUE, if in the event of a screen impact the tag values should be downloaded from the archives for the time range that is to be shown.

### See also

[OnlineTrendControl \(Page 4375\)](#)

[FunctionTrendControl \(Page 4330\)](#)

[OnlineTableControl \(Page 4367\)](#)

### Localizable

### Description

Specifies whether a font should be assigned and can be formatted for each Runtime language.

Access in Runtime: Read and write

### Syntax

Object.**Localizable**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl", "OnlineTableControl", "AlarmControl" or "UserArchiveControl".

### BOOLEAN

Optional TRUE, if a font should be assigned and can be formatted for each Runtime language.

### See also

[OnlineTrendControl \(Page 4375\)](#)

## LocalCursor

### Description

Establishes whether the cursor data is transferred separately in order to increase the performance.

### Syntax

Object.**LocalCursor**

#### Object

Required A "ScreenItem" object with the format "SmartClientView".

### See also

SmartClientView (Page 4415)

## LockSquaredExtent

### Description

Specifies whether the size of the clock can be adjusted with the mouse.

Access in Runtime: Read and write

### Syntax

Object.**LockSquaredExtent**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the formats "Clock" or "Gauge".

#### BOOLEAN

Optional TRUE, if the size of the clock can be adjusted by dragging the mouse on the selection points to the desired aspect ratio.

### See also

Clock (Page 4310)

Gauge (Page 4338)

## LockStatus

### Description

TRUE, when a locked measuring point should be displayed. BOOLEAN write-read access.

## LockText

### Description

Defines the label of a button for a locked measuring point.  
The LockStatus property must be set to TRUE for the label to be displayed.

## LockTextColor

### Description

Defines or returns the color of the button label for a locked measuring point. LONG write/read access.  
The LockStatus property must be set to TRUE for the background color to be displayed.

## Logging

### Description

Returns an object of type "Logging".  
Access in Runtime: Read

### Syntax

Object.**Logging**

#### Object

Required A "HMIRuntime" object.

### See also

HMIRuntime (Page 4248)

## LogOperation

### Description

Specifies whether, after operating this object, an alarm is output on the alarm system.

Access in Runtime: Read and write

## Syntax

Object.**LogOperation**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the formats "IOField", "SymbolicIOField", "CheckBox", "OptionGroup" or "WindowSlider".

### BOOLEAN

Optional. TRUE, if, after operating this object, an alarm is output on the alarm system.

## See also

IOField (Page 4351)

SymbolicIOField (Page 4422)

CheckBox (Page 4300)

OptionGroup (Page 4384)

WindowSlider (Page 4468)

Listbox (Page 4357)

## LongStrokesBold

### Description

TRUE, when the long sections of a scale should be displayed in bold face. BOOLEAN write-read access.

## LongStrokesOnly

### Description

TRUE, when only the long sections of a scale should be displayed . BOOLEAN write-read access.

## LongStrokesSize

### Description

Defines or returns the length of the axis section in pixels.

## LongStrokesTextEach

### Description

Returns the value which defines which sections of the scale displayed should be labeled (1 = every section, 2 = every second section, etc.). Read only access

## LongTermArchiveConsistency

### LongTermArchiveConsistency

If "LongTimeArchiveConsistency" is set to "No", 1000 messages are displayed in the long-term archive list on the single-user system, server or client for each server, or for each redundant server pair.

If the "LongTimeArchiveConsistency" is set to "yes", the most recent 1000 messages are displayed on the client of all servers or redundant server pair in the long-term archive list.

The attribute can be assigned dynamic properties by means of the name **LongTimeArchiveConsistency** .

### See also

AlarmControl (Page 4273)

## LowerLimit

### Description

Specifies the lower limit for input values.

Access in Runtime: Read and write

### Syntax

Object.**LowerLimit**[=Double]

#### Object

Required A "ScreenItem" object with the format "IOField".

#### Double

Optional A value or a constant that specifies the lower limit for input values.

### See also

IOField (Page 4351)

## LowerLimitColor(i)

### Description

Specifies the color that identifies the tag values for the selected trend and which lie below the value of "LowerLimitValue(i)". Whether the information is evaluated depends on the property "LowerLimitEnabled(i)".

Access in Runtime: Read and write

### Syntax

Object.**LowerLimitColor(i)**[=Color]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

#### Color

Optional A value or a constant which specifies the color which identifies tag values of the specified trend which are below the value of "LowerLimitValue(i)".

### Comments

The parameter i indicates the number of the trend.

### See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

## LowerLimitEnabled(i)

### Description

Specifies whether the information from "LowerLimitColor(i)" is used to identify the tag values that lie beneath the value of "LowerLimitValue(i)".

Access in Runtime: Read and write

### Syntax

Object.**LowerLimitEnabled(i)**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

**BOOLEAN**

Optional TRUE, if the information from "LowerLimitColor(i)" is used to identify the tag values that lie beneath the value of "LowerLimitValue(i)".

**Comments**

The parameter i indicates the number of the trend.

**See also**

- OnlineTrendControl (Page 4375)
- FunctionTrendControl (Page 4330)
- OnlineTableControl (Page 4367)

**LowerLimitValue(i)**

**Description**

Specifies whether the tag values which drop below the value of "LowerLimitValue(i)" are marked by the color specified in "LowerLimitColor(i)". Whether the specification is evaluated depends on the attribute "LowerLimitEnabled(i)".

Access in Runtime: Read and write

**Syntax**

Object.LowerLimitValue(i)[=Double]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

**Double**

Optional A value or a constant that determines if the tag values that fall short of the "LowerLimitValue(i)" are to be identified with the color specified in "LowerLimitColor(i)".

**Comments**

The parameter i indicates the number of the trend.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**LowLimitColor****Description**

Specifies the color of the bottom or left scroll button in a scroll bar.

Access in Runtime: Read and write

**Syntax**

Object.**LowLimitColor**[=Color]

**Object**

Required A "ScreenItem" object with the format "WindowSlider".

**Color**

Optional A value or a constant that specifies the color of the bottom or left scroll button in a scroll bar.

**See also**

WindowSlider (Page 4468)

**Properties M-N****MachineName****Description**

Specifies the network code of the device that is to be monitored.

Enter the name or the port of the device as the network code.

Access in Runtime: Read and write

**Syntax**

Object.**MachineName**= [STRING]

**Object**

Required A "ScreenItem" object with the format "SmartClientView".

### **STRING**

Optional A value or a constant that contains the network code.

### **See also**

SmartClientView (Page 4415)

## **MarginToBorder**

### **Description**

Specifies the width of the 3D border in pixels. The value of the width is dependent on the size of the object.

Access in Runtime: Read and write

### **Syntax**

Object.**MarginToBorder**[=Int]

#### **Object**

Required A ""ScreenItem" object with the format "WindowSlider".

#### **Int**

Optional A value or a constant that specifies the width of the 3D border in pixels.

### **See also**

WindowSlider (Page 4468)

## **Marker property**

### **Description**

TRUE, when the limit values should be displayed as scale values. BOOLEAN write-read access.

## **Max property**

### **Description**

Defines or returns the absolute value in the case of a full value display. This value is displayed if the scale display is active.

## MaximizeButton property

### Description

TRUE, when the object can be maximized in Runtime. Read only access.

## MaximumValue

### Description

Specifies the maximum value of the scale in the selected object.

Access in Runtime: Read and write

### Syntax

Object.MaximumValue [= DOUBLE]

#### Object

Required A "ScreenItem" object with the formats "Bar", "Gauge", "Slider" or "WindowSlider".

#### DOUBLE

Optional A value or a constant that specifies the maximum value.

### See also

Bar (Page 4287)

Gauge (Page 4338)

Slider (Page 4412)

WindowSlider (Page 4468)

## MaximumValue

### Description

Determines the maximum value of the scale in the given object.

Access during runtime: Read and Write

### Syntax

Object.MaximumValue [= DOUBLE]

#### Object

Required. An object of the type "ScreenItem" with the characteristic "Bar", "Gauge" or "Slider".

**DOUBLE**

Optional. A value or constant which determines the maximum value.

**MCGUBackColorOff**

**Description**

Defines or returns the background color for flash status "Off" in the case of the "Departed Unacknowledged" status. LONG write-read access.

**MCGUBackColorOn**

**Description**

Defines or returns the background color for flash status "On" in the case of the "Departed Unacknowledged" status. LONG write-read access.

**MCGUBackFlash**

**Description**

TRUE, when the background should flash when a message departs unacknowledged. BOOLEAN write-read access.

**MCGUTextColorOff**

**Description**

Defines or returns the color of the text for flash status "Off" for the "Outgoing unacknowledged" status. LONG write-read access.

**MCGUTextColorOn**

**Description**

Defines or returns the background color of the text for flash status "On" for the "Outgoing unacknowledged" status. LONG write-read access.

## MCGUTextFlash

### Description

TRUE, when the font should flash when a message departs unacknowledged. BOOLEAN write-read access.

## MCKOBackColorOff

### Description

Defines or returns the background color for flash status "Off" in the case of the "Arrived" status. LONG write-read access.

## MCKOBackColorOn

### Description

Defines or returns the background color for flash status "On" in the case of the "Arrived" status. LONG write-read access.

## MCKOBackFlash

### Description

TRUE, when the background should flash when a message arrives. BOOLEAN write-read access.

## MCKOTextColorOff

### Description

Defines or returns the color of the text for flash status "Off" for the "Incoming" status. LONG write-read access.

## MCKOTextColorOn

### Description

Defines or returns the background color of the text for flash status "On" for the "Incoming" status. LONG write-read access.

## **MCKOTextFlash**

### **Description**

TRUE, when the font should flash when a message arrives. BOOLEAN write-read access.

## **MCKQBackColorOff**

### **Description**

Defines or returns the background color for flash status "Off" in the case of the "Departed Acknowledged" status. LONG write-read access.

## **MCKQBackColorOn**

### **Description**

Defines or returns the background color for flash status "On" in the case of the "Departed Acknowledged" status. LONG write-read access.

## **MCKQBackFlash**

### **Description**

TRUE, when the background should flash when a message departs acknowledged. BOOLEAN write-read access.

## **MCKQTextColorOff**

### **Description**

Defines or returns the color of the text for flash status "Off" for the "Outgoing acknowledged" status. LONG write-read access.

## **MCKQTextColorOn**

### **Description**

Defines or returns the background color of the text for flash status "On" for the "Outgoing acknowledged" status. LONG write-read access.

## MCKQTextFlash

### Description

TRUE, when the font should flash when a message departs acknowledged. BOOLEAN write-read access.

## MCText

### Description

Defines or returns the label for the respective message class.

## MenuToolBarConfig

### Description

Loads the given configuration file with configured menu and toolbars or returns the name of the configuration file.

Access in Runtime: Read and write

### Syntax

Object.**MenuToolBarConfig**[=STRING]

#### Object

Required A "HMIRuntime" object.

#### STRING

Optional The configuration file with user-defined menu and toolbars.

### See also

HMIRuntime (Page 4248)

ScreenWindow (Page 4408)

## MessageBlockAlign

### Description

Aligns the contents of a selected message block in the table.

Access in Runtime: Read and write

## Syntax

Object.**MessageBlockAlign** [=Align]

### Object

Required An object of the "ScreenItem" type with the format "AlarmContro", "TrendRulerControl", "OnlineTableControl", "UserArchiveControl".

### Align

Value	Description	Explanation
0	Left	Aligns the contents of a selected message block to the left.
1	Centered	Aligns the contents of a selected message block to the center.
2	Right	Aligns the contents of a selected message block to the right.

## See also

AlarmControl (Page 4273)

## MessageBlockAutoPrecisions

### Description

Enables automatic setting of the number of decimal places.

Access in Runtime: Read and write

### Syntax

Object.**MessageBlockAutoPrecisions**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "AlarmControl".

### BOOLEAN

TRUE: The number of decimal places is specified automatically.

FALSE: The value in the "Decimal places" field is effective.

## See also

AlarmControl (Page 4273)

## MessageBlockCaption

### Description

Specifies the caption of the column header in the message view for the selected message block. You can only edit the labels after having disabled the "Apply project settings" option. The entered caption is effective in all Runtime languages.

Access in Runtime: Read and write

### Syntax

Object.**MessageBlockCaption**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## MessageBlockCount

### Description

Specifies the number of available message blocks which are available for the message list and hit list.

Access in Runtime: Read

### Syntax

Object.**MessageBlockCount**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## MessageBlockDateFormat

### Description

Defines the date format for displaying messages.

Access in Runtime: Read and write

## Syntax

Object.**MessageBlockDateFormat**[=DateFormat]

### Object

Required A "ScreenItem" object with the format "AlarmControl".

### DateFormat

Value	Description
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.10.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2010.
dd/MM/yy	Day/Month/Year, e.g. 24/12/10.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2010.

## See also

AlarmControl (Page 4273)

## MessageBlockExponentialFormat

### Description

Specifies the exponential notation for visualization of the values of a selected message block.

Access in Runtime: Read and write

### Syntax

Object.**MessageBlockExponentialFormat**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "AlarmControl".

### BOOLEAN

TRUE: The values are displayed in exponential format.

FALSE: The values are displayed in decimal format.

## See also

AlarmControl (Page 4273)

## MessageBlockFlashOn

### Description

Enables flashing of the selected message block in Runtime after a message was activated.

Access in Runtime: Read and write

### Syntax

Object.**MessageBlockFlashOn**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

TRUE: The content of the message block flashes.

FALSE: The content of the message block does not flash.

### See also

AlarmControl (Page 4273)

## MessageBlockHideText

### Description

Enables the textual display of the content of a selected message block.

Access in Runtime: Read and write

### Syntax

Object.**MessageBlockHideText**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

TRUE: The content is not shown as a text. The option is not activated.

FALSE: The content is shown as a text. The option is activated.

### See also

AlarmControl (Page 4273)

## MessageBlockHideTitleText

### Description

Enables the display of the header of a selected message block in text format.

### Syntax

Object.**MessageBlockHideTitleText**=[BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

TRUE : The header is not shown as a text. The option is not activated.

FALSE : The header is shown as a text. The option is activated.

### See also

AlarmControl (Page 4273)

## MessageBlockId

### Description

Specified assignment of ID number and message block in the message view.

Access in Runtime: Read

### Syntax

Object.**MessageBlockID**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## MessageBlockIndex

### Description

References an existing message block. You can assign the values of other attributes to a certain message block by using the attribute. Valid values for "MessageBlockIndex" are between 0 and "MessageBlockCount" minus 1.

The "MessageBlockIndex" attribute can be dynamized by the **MessageBlockRepos** attribute.

Access in Runtime: Read

### Syntax

Object.**MessageBlockIndex**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## MessageBlockLeadingZeros

### Description

Enables the display of selected message blocks with leading zero format.

Access in Runtime: Read and write

### Syntax

Object.**MessageBlockLeadingZeros**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

TRUE: Leading zeros are displayed. The number of leading zeros is specified in the properties.

FALSE: Leading zeros are not displayed.

### See also

AlarmControl (Page 4273)

## MessageBlockLength

### Description

Defines the length of the message block selected based on the number of characters. You can only enter a value if the "Apply project settings" field is disabled.

Access in Runtime: Read and write

### Syntax

Object.**MessageBlockLength**[=Int]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Int

Value which specifies the length of the message block.

### See also

AlarmControl (Page 4273)

## MessageBlockName

### Description

Displays the object name of the message block selected. You cannot edit this name.

Access in Runtime: Read

### Syntax

Object.**MessageBlockName**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## MessageBlockPrecisions

### Description

Specifies the decimal precision of the values of a selected message block. You can only enter the value if the "Automatic" option is deactivated.

Access in Runtime: Read and write

### Syntax

Object.**MessageBlockPrecisions**[=Precision]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Precision

Number of decimal places

### See also

AlarmControl (Page 4273)

## MessageBlockSelected

### Description

The available message block can be used in Runtime control for the message list or hitlist.

Select the "Message blocks" tab to activate existing message blocks as required in the Control. Select the "Hitlist" and "Message list" tabs to configure the hitlist and message list based on the available blocks.

### Syntax

Object.**MessageBlockSelected**]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## MessageBlockShowDate

### Description

Enables the display of a date in the "Time" message block in addition to the time.

Access in Runtime: Read and write

### Syntax

Object.**MessageBlockFlashOn**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

TRUE: The date and the time are displayed.

FALSE: The time is displayed.

### See also

AlarmControl (Page 4273)

## MessageBlockShowIcon

### Description

Enables the display of the content of a selected message block as icon.

Access in Runtime: Read and write

### Syntax

Object.**MessageBlockShowIcon**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

TRUE: The content is shown as an icon.

FALSE: The content is not shown as an icon.

### See also

AlarmControl (Page 4273)

## MessageBlockShowTitleIcon

### Description

Specifies whether the header of the selected message block is displayed as a text.

### Syntax

Object.**MessageBlockShowTitleIcon**=[BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

TRUE : The header is shown as an icon.

FALSE : The header is not shown as an icon.

### See also

AlarmControl (Page 4273)

## MessageBlockTextId

### Description

Specifies the caption of the selected message block using a Text ID which was derived from the text library. The caption is adapted automatically if a user changes the Runtime language.

You can only enter a text ID after having disabled the "Apply project settings" option.

Access in Runtime: Read and write

### Syntax

Object.**MessageBlockTextId**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## MessageBlockTimeFormat

### Description

Defines which time format or duration format is used for displaying the messages.

Access in Runtime: Read and write

### Syntax

Object.**MessageBlockTimeFormat**[=TimeFormat]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### TimeFormat

The following time formats are available:

Value	Explanation
Automatic	The time format is set automatically.
HH:mm:ss	Hours:Minutes:Seconds, e.g. 15:35:44
HH:mm:ss.ms	Hours:Minutes:Seconds.Milliseconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

The following duration formats are available:

Value	Explanation
Automatic	The duration format is determined automatically.
d H:mm:ss	Day Hours:Minutes:Seconds, e.g. 1 2:03:55.
H:mm:ss.	Hours:Minutes:Seconds, e.g. 26:03:55.
m:ss	Minutes:Seconds, Example: 1563:55.
s	Seconds, e.g. 93835.

### See also

AlarmControl (Page 4273)

## MessageBlockType

### Description

Specifies the number of available message blocks which are available for the message list and hit list.

Access in Runtime: Read and write

**Syntax**

Object.**MessageBlockType**[=BlockType]

**Object**

Required A "ScreenItem" object with the format "AlarmControl".

**BlockType**

Value	Description	Description
0	System block	The message block belongs to the system block category
1	Text block	The message block belongs to the user text block category
2	Process value block	The message block belongs to the process value block category
3	Hitlist block	The message block belongs to the message blocks of the hitlist.

**See also**

AlarmControl (Page 4273)

**MessageClass****Description**

Defines the respective limit violation (Alarm High, Alarm Low, Warning High, Warning Low, etc.) for which the "Display Text", "Incoming -", "Incoming acknowledged -", and "Outgoing unacknowledged -" settings have been configured.

**MessageColumnAdd****Description**

Adds the selected message block from the list of existing message blocks to the list of selected message blocks.

Access in Runtime: Read

**Syntax**

Object.**MessageColumnAdd**

**Object**

Required A "ScreenItem" object with the format "AlarmControl".

## See also

AlarmControl (Page 4273)

## MessageColumnCount

### Description

Specifies the number of message blocks to be displayed in the message list in Runtime.

Access in Runtime: Read

### Syntax

Object.**MessageColumnCount**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

## See also

AlarmControl (Page 4273)

## MessageColumnIndex

### Description

References a message block selected for the message list. Using this attribute you can assign the values of other attributes to a specific message block of the message list.

Valid values for "MessageColumnIndex" are between 0 and "MessageColumnCount" minus 1. The "MessageColumnIndex" attribute can be dynamized by the attribute

**MessageColumnRepos.**

Access in Runtime: Read and write

### Syntax

Object.**MessageColumnIndex**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

## See also

AlarmControl (Page 4273)

## MessageColumnName

### Description

Shows the name of the message block in the message list which is referenced with the "MessageColumnIndex" property. You cannot edit this name.

Access in Runtime: Read

### Syntax

Object.**MessageColumnName**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## MessageColumnRemove

### Description

Removes the marked message block from the list of selected message blocks and inserts it in the list of existing message blocks.

Access in Runtime: Read and write

### Syntax

Object.**MessageColumnRemove**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## MessageColumnRepos

### Description

Resorts the message blocks. The "Up" and "Down" commands move the selected message block accordingly in the list. This places the message block further forward or back in the message view in Runtime.

### Syntax

Object.**MessageColumnRepos**

Object.**HitlistColumnRepos**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## MessageColumnSort

### Description

Defines the sorting order of the message block referenced in "MessageColumnIndex" .

Access in Runtime: Read and write

### Syntax

Object.MessageColumnSort [=Sort]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Sort

0: No sorting.

1: Ascending sorting from the lowest to highest value

2 Descending sorting from the highest to lowest value

### See also

AlarmControl (Page 4273)

## MessageColumnSortIndex

### Description

Defines the sorting order of the message block referenced in "MessageColumnIndex". The sorting criterion is removed from "MessageColumnSort" if you set a "0" value.

Access in Runtime: Read and write

### Syntax

Object.**MessageColumnSortIndex**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## MessageColumnVisible

### Description

The selected message blocks of the message list or hit list which are used in Runtime in the message view are displayed in the list.

### Syntax

Object.**HitlistColumnVisible**

Object.**MessageColumnVisible**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## MessageListType

### Description

Selection field for defining the active list for picture calls.

### Syntax

Object.**MessageListType**=[ListType]

### Object

Required A "ScreenItem" object with the format "AlarmControl".

### ListType

Value	Description	Description
0	Message list	The currently active messages are displayed after a picture was called.
1	Short-term archive list	A short-term archive list displays the logged messages after the picture was called. The display is updated immediately on activation of new messages.
2	Long-term archive list	A long-term archive list displays the logged messages after a picture was called.
3	Lock list	Only the currently locked messages are displayed after a picture was called.
4	Hitlist	The configured statistics data is displayed after a picture was called.
5	List of messages to be hidden	The messages to be hidden are displayed at the call of a picture.

### See also

AlarmControl (Page 4273)

### Min

### Description

Defines or returns the absolute value in the case of the smallest value display. This value is displayed if the scale display is active.

### MinimumValue

### Description

Specifies the minimum value of the scale in the selected object.

Access in Runtime: Read and write

### Syntax

Object.MinimumValue [= DOUBLE]

**Object**

Required A "ScreenItem" object with the formats "Bar", "Gauge", "Slider" or "WindowSlider".

**DOUBLE**

Optional A value or a constant that specifies the minimum value.

**See also**

Bar (Page 4287)

Gauge (Page 4338)

Slider (Page 4412)

WindowSlider (Page 4468)

**MinimumValue****Description**

Determines the minimum value of the scale in the given object.

Access during runtime: Read and Write

**Syntax**

Object.MinimumValue [= DOUBLE]

**Object**

Required. An object of the type "ScreenItem" with the characteristic "Bar", "Gauge" or "Slider".

**DOUBLE**

Optional. A value or constant which determines the minimum value.

**MinuteNeedleHeight****Description**

Specifies the length of the minute hand in the ""Clock" object.

Access in Runtime: Read and write

**Syntax**

Object.MinuteNeedleHeight[= LONG]

**Object**

Required A "ScreenItem" object with the format "Clock".

**LONG**

Optional A value or a constant that specifies the length of the minute hand.

Specify the length of the minute hand as a percentage relating to the radius of the clock face.

**See also**

Clock (Page 4310)

**MinuteNeedleWidth**

**Description**

Specifies the width of the minute hand in the "Clock" object.

Access in Runtime: Read and write

**Syntax**

Object.**MinuteNeedleWidth**[= LONG]

**Object**

Required A "ScreenItem" object with the format "Clock".

**LONG**

Optional A value or a constant that specifies the width of the minute hand.

Specify the width as a percentage relating to double the length of the minute hand.

**See also**

Clock (Page 4310)

**Mode**

**Description**

Specifies the field type of the selected object.

Access during runtime: Read and write

**Syntax**

Object.**Mode**[=IOFieldType]

**Object**

Necessary. A "ScreenItem" object with the formats "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch" or "GraphicIOField".

**IOFieldType**

hmilOFieldInput ( 1): input field

hmilOFieldOutput ( 0): output field

hmilOFieldInOut ( 2): input and output field

**Used for the following object types:**

IOField

**See also**

IOField (Page 4351)

SymbolicIOField (Page 4422)

Button (Page 4294)

Switch (Page 4419)

GraphicIOField (Page 4341)

DateTimeField (Page 4315)

RoundButton (Page 4404)

**Movable****Description**

Specifies whether the window can be moved in Runtime.

Access in Runtime: Read and write

**Syntax**

Object.**Movable**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "UserArchiveControl".

**BOOLEAN**

Optional. TRUE, if the window can be moved in Runtime.

**See also**

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

OnlineTrendControl (Page 4375)

## MsgFilterSQL

### Description

Specifies one or more SQL statements for the customized selection of the messages. Several customized selections are connected with "OR". If you have configured a fixed selection "DefaultMsgFilterSQL", the SQL statements of "DefaultMsgFilterSQL" and "MsgFilterSQL" are connected with "AND".

### Syntax

Object.**MsgFilterSQL**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

### Name

### Description

Returns the object name as STRING. The returned value is dependent upon the used object.

Access during runtime: Read

### Syntax

Object.**Name**

#### Object

Necessary. An object of the "Tag", "Project", "DataItem", "Layer" and "ScreenItem" type with the format "FunctionTrendControl"

### Comments

Dependent on the specified object, the following object names will be returned:

- Tag: Name of the tag without server and tag prefix.
- Project: Name of the current Runtime project.

- Dataltem: Name of the Dataltem object.
- Layer: Name of the layer.
- FunctionTrendControl : Name of the trend referenced by the "Index" property.

---

**Note**

Use the "Name" property to address a tag in the Tags" list. Tag names are structured in WinCC according to the following scheme:

<Tag prefix><Name of tag>

If you only specify the tag name, the tag prefix is applied from the screen window shortcut.

---

## Example

The following example returns the name of the current Runtime project as Trace:

```
'VBS160  
HMIRuntime.Trace "Name: " & HMIRuntime.ActiveProject.Name & vbNewLine
```

## NeedleBorderColor

### Description

Specifies the line color of the pointer in the ""Clock"" object.

Access in Runtime: Read and write

### Syntax

Object.**NeedleBorderColor**[= Color]

#### Object

Required A "ScreenItem" object with the format "Clock".

#### Color

Optional A value or a constant that specifies the line color of the pointer.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen .

## See also

Clock (Page 4310)

## NeedleColor

### Description

Specifies the hand color of the "Clock" object.

You must have configured the "NeedleFillStyle" property as "Transparent" for the pointer color to be shown.

Access in Runtime: Read and write

### Syntax

Object.**NeedleColor**[= Color]

#### Object

Required A "ScreenItem" object with the format "Clock".

#### Color

Optional A value or a constant that specifies the pointer color.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

## See also

Clock (Page 4310)

## NeedleFillStyle

### Description

Specifies whether the pointers are filled or transparent:

0: The pointers are filled in the pointer fill color and shown with a margin in the foreground color.

1: The pointers appear to be transparent and will be indicated by a margin in the foreground color.

Access in Runtime: Read and write

## Syntax

Object.**NeedleFillStyle**[=NeedleFillStyle]

### Object

Required A "ScreenItem" object with the format ""Clock".

### NeedleFillStyle

hmiNeedleFillStyleTransparent ( 1): The pointers are filled in the pointer fill color and shown with a margin in the foreground color.

Identifies a transparent clock hand.

hmiNeedleFillStyleSolid ( 0): The pointers appear to be transparent and will be indicated by a margin in the foreground color.

Identifies a opaque clock hand.

## See also

Clock (Page 4310)

## NormalRangeColor

### Description

Specifies the color of the normal range on the scale of the "Gauge" object.

The "NormalRangeVisible" property must have the value TRUE so that the normal range is displayed.

Access during runtime: Read and write

### Syntax

Object.**NormalRangeColor**[= Color]

### Object

Required An object of the "ScreenItem" type with the characteristic "Gauge".

### Color

Optional A value or a constant that specifies the color of the normal range.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

## See also

Gauge (Page 4338)

## NormalRangeVisible

### Description

Specifies whether the normal range in the scale of the ""Gauge" object will be displayed.

Access in Runtime: Read and write

### Syntax

Object.**NormalRangeVisible**[= BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Gauge".

#### BOOLEAN

Optional TRUE, if the normal range will be displayed in the scale.

### Comments

Specify the color of the normal range with the ""NormalRangeColor" property.

## See also

Gauge (Page 4338)

## NumberLines

### Description

Defines or return the number of lines the text list object should contain. If the amount of configured text is larger than this value, the selection list receives a vertical scroll bar.

## NumberOfValues(i)

### Description

Specifies the number of values that are shown in the trend window. The property "TagProviderType(i)"" must have the value -1. Whether the information is evaluated depends on the property "UseMeasurePoints(i)".

Access in Runtime: Read and write

## Syntax

Object.NumberOfValues(i)[=Int]

### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

### Int

Optional A value or a constant that specifies the number of values that are shown in the trend window.

## Comments

Number of value pairs for trend i (from tag provider)

## See also

FunctionTrendControl (Page 4330)

## Properties O-P

## Object

## Description

If you use a Control that is not a standard WinCC control, it could be that the properties provided by the Control have the same names as the general ScreenItem properties. In this case, the ScreenItem properties take priority. You can access the "hidden" properties of an outside provider Controls via the additional ""object" property.

## Syntax

Object.Object

### Object

Required A "ScreenItem" object with the format ""ForeignControl".

## Application example

To do this, address the properties of an outside provider control in the following way:

Control.object.type

If you are using only the form Control.type, the properties of the ScreenItem object will be used in case of identical names.

## ObjectName

### Description

Returns the name of the specified object.

Access in Runtime: Read

### Syntax

Object.ObjectName

#### Object

Required A "ScreenItem" object. This property is a standard property of the ScreenItem object and is therefore available for all formats.

## ObjectSizeDeclutteringEnable

### Description

Specifies whether only the objects within a set size range are displayed.  
Access during runtime: Read

### Syntax

**Object.ObjectSizeDeclutteringEnable**

#### Object

Necessary. A "Screen" object.

### Example

The example outputs the Decluttering properties of the screen "NewPDL1" as Trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

## See also

Screen (Page 4256)

## ObjectSizeDeclutteringMax

### Description

Returns the upper size range for the display suppression of objects of the specified screen as LONG.

Access during runtime: Read

### Syntax

Object.**ObjectSizeDeclutteringMax**

#### Object

Necessary. A "Screen" object.

### Example

The example outputs the Decluttering properties of the screen "NewPDL1" as Trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

## See also

Screen (Page 4256)

## ObjectSizeDeclutteringMin

### Description

Returns the lower size range for the display suppression of objects of the specified screen as LONG.

Access during runtime: Read

### Syntax

Object.**ObjectSizeDeclutteringMin**

**Object**

Necessary. A "Screen" object.

**Example**

The example outputs the Decluttering properties of the screen "NewPDL1" as Trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

**See also**

Screen (Page 4256)

**OCXState****Description**

Specifies the status of the OCX.

Access in Runtime: Read and write

**Syntax**

Object.**OCXState**[=Stream]

**Object**

Required A "ScreenItem" object with the format "ForeignControl".

**Stream**

Optional A value or a constant that specifies the status of the OCX.

**See also**

ForeignControl (Page 4326)

**Online****Description**

Specifies start and stop of the updating.

Access in Runtime: Read and write

## Syntax

Object.**Online**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

### BOOLEAN

Optional TRUE, if the updated display should be stopped. The values are stored in the cache and when the button is reactivated they are added . FALSE, if the updated display is to be continued.

## See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

## OnTop

## Description

TRUE, when the object should remain in the foreground in Runtime. Read only access.

## OperationMessage property

## Description

TRUE, if an alarm should be output when an operation is performed. BOOLEAN write-read access.

The operation is sent to the alarm system and is logged. The alarm system can be used to output an alarm in an alarm line, for example.

### Particularities for I/O field, text list, and slider

The reason for the operation can only be entered if the "OperationReport" property has been set to TRUE.

## OperationReport property

### Description

TRUE, if the reason for an operation should be recorded. BOOLEAN write/read access. When the object is used or operated in Runtime, a dialog opens in which the operator can input the reason for the operation in the form of text. The operation is sent to the message system, and is archived.

## OperationSteps

### Description

Specifies by how many steps the slider of the scrollbar is moved with one mouseclick.

Access in Runtime: Read and write

### Syntax

Object.**OperationSteps**[=Int]

#### Object

Required A ""ScreenItem" object with the format "WindowSlider".

#### Int

Optional A value or a constant which specifies by how many steps the slider of the scrollbar is moved with one mouseclick.

### See also

WindowSlider (Page 4468)

## OperatorMessageID

### Description

Specified assignment of ID number and trigger event in the message view.

### Syntax

Object.**OperatorMessageID**[=MessageID]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

**MessageID**

Value	Description	Description
0	Lock	Trigger event "Lock"
1	Unlock	"Unlock" Trigger Event
2	Hide	Trigger event "Hide"
3	Unhide	Trigger event "Unhide"
4	Ackn	Trigger event "Acknowledge"

**See also**

AlarmControl (Page 4273)

**OperatorMessageIndex**

**Description**

References an operator message event. You can assign the values of other properties to a specific operator message by using the property.

**Syntax**

Object.**OperatorMessageIndex** [=MessageIndex]

**Object**

Required A "ScreenItem" object with the format "AlarmControl".

**MessageIndex**

Value	Description
0	Message event "Lock"
1	"Unlock" Message Event
2	Message event "Hide"
3	Message event "Unhide"
4	Message event "Acknowledge"

**See also**

AlarmControl (Page 4273)

## OperatorMessageName

### Description

Indicates the name which is referenced with the "OperatorMessageIndex" in message events for operator messages. You cannot edit this name.

### Syntax

Object.**OperatorMessageName**[=Name]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Name

Value	Description
Lock	Message event "Lock"
Unlock	Message event "Enable"
Hide	Message event "Hide"
Unhide	Message event "Unhide"
Quit	Message event "Ackn."

### See also

AlarmControl (Page 4273)

## OperatorMessageNumber

### Description

Specify a message number for the operator message of the selected message event if you do not use the operator message of WinCC.

### Syntax

Object.**OperatorMessageNumber**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## OperatorMessageSelected

### Description

Activate the message events which trigger operator messages in the list.

### Syntax

Object.**OperatorMessageSelected**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## OperatorMessageSource1

### Description

Define the message block of an operated message to be added to "Process value block 1" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty" should be displayed in "Process value block 1" of the operator message. Select "1" at process value as the message lock of the operated message "User text block 1".

### Syntax

Object.**OperatorMessageSource1**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## OperatorMessageSource2

### Description

Define the message block of an operated message to be added to "Process value block 2" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty" should be displayed in "Process value block 2" of the operator message. Select "2" at process value as the message lock of the operated message "User text block 1".

### Syntax

Object.**OperatorMessageSource2**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## OperatorMessageSource3

### Description

Define the message block of an operated message to be added to "Process value block 3" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty" should be displayed in "Process value block 3" of the operator message. Select "3" at process value as the message lock of the operated message "User text block 1".

### Syntax

Object.**OperatorMessageSource3**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## OperatorMessageSource4

### Description

Define the message block of an operated message to be added to "Process value block 4" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 4" of the locked message, e.g. "Motor faulty" should be displayed in "Process value block 4" of the operator message. Select "4" at process value as the message lock of the operated message "User text block 1".

### Syntax

Object.**OperatorMessageSource4**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## OperatorMessageSource5

### Description

Define the message block of an operated message to be added to "Process value block 5" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 5" of the operator message. Select "User text block 1" under process value "5" as the message block of the operated message.

### Syntax

Object.**OperatorMessageSource5**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## OperatorMessageSource6

### Description

Define the message block of an operated message to be added to "Process value block 6" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 6" of the operator message. Select "6" at process value as the message lock of the operated message "User text block 1".

### Syntax

Object.**OperatorMessageSource6**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## OperatorMessageSource7

### Description

Define the message block of an operated message to be added to "Process value block 7" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 7" of the operator message. Select "7" at process value as the message lock of the operated message "User text block 1".

### Syntax

Object.**OperatorMessageSource7**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## OperatorMessageSource8

### Description

Define the message block of an operated message to be added to "Process value block 8" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 8" of the operator message. Select "8" at process value as the message lock of the operated message "User text block 1".

### Syntax

Object.**OperatorMessageSource8**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## OperatorMessageSource9

### Description

Define the message block of an operated message to be added to "Process value block 9" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 9" of the operator message. Select "9" at process value as the message lock of the operated message "User text block 1".

### Syntax

Object.**OperatorMessageSource9**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## OperatorMessageSource10

### Description

Define the message block of an operated message to be added to "Process value block 10" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 10" of the operator message. Select "10" at process value as the message lock of the operated message "User text block 1".

### Syntax

Object.**OperatorMessageSource10**

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

### See also

AlarmControl (Page 4273)

## OperatorMessageSourceType1

### Description

Specifies the format of the source content for the transfer.

### Syntax

Object.**OperatorMessageType1**[=Type]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Type

Value	Description	Description
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

### See also

AlarmControl (Page 4273)

## OperatorMessageSourceType2

### Description

Specifies in what format the content of the source is transferred.

### Syntax

Object.OperatorMessageType2[=Type]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

### See also

AlarmControl (Page 4273)

## OperatorMessageSourceType3

### Description

Specifies in what format the content of the source is transferred.

### Syntax

Object.OperatorMessageType1[=Type]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

### See also

AlarmControl (Page 4273)

## OperatorMessageSourceType4

### Description

Specifies in what format the content of the source is transferred.

### Syntax

Object.OperatorMessageType4[=Type]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

### See also

AlarmControl (Page 4273)

## OperatorMessageSourceType5

### Description

Specifies in what format the content of the source is transferred.

### Syntax

Object.OperatorMessageType5[=Type]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

### See also

AlarmControl (Page 4273)

## OperatorMessageSourceType6

### Description

Specifies in what format the content of the source is transferred.

### Syntax

Object.**OperatorMessageType6**[=Type]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

### See also

AlarmControl (Page 4273)

## OperatorMessageSourceType7

### Description

Specifies in what format the content of the source is transferred.

### Syntax

Object.**OperatorMessageType7**[=Type]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

### See also

AlarmControl (Page 4273)

## OperatorMessageSourceType8

### Description

Specifies in what format the content of the source is transferred.

### Syntax

Object.OperatorMessageType8[=Type]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

### See also

AlarmControl (Page 4273)

## OperatorMessageSourceType9

### Description

Specifies in what format the content of the source is transferred.

### Syntax

Object.OperatorMessageType9[=Type]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

### See also

AlarmControl (Page 4273)

## OperatorMessageSourceType10

### Description

Specifies in what format the content of the source is transferred.

### Syntax

Object.**OperatorMessageType10**[=Type]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

### See also

AlarmControl (Page 4273)

### Orientation

### Description

Specifies the text direction (orientation) of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**Orientation**[=TextOrientation]

#### Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "Bar", "OnlineTrendControl", "FunctionTrendControl", "Checkbox", "OptionGroup" or "WindowSlider".

#### TextOrientation

hmiTextHorizontal ( 0): The text is shown horizontally.

hmiTextRotated90Degree (-1): The text is shown vertically and left justified.

hmiTextRotated270Degree ( 1): The text is shown vertically and right justified.

**See also**

TextField (Page 4436)

IOField (Page 4351)

SymbolicIOField (Page 4422)

Button (Page 4294)

Switch (Page 4419)

Bar (Page 4287)

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

CheckBox (Page 4300)

OptionGroup (Page 4384)

WindowSlider (Page 4468)

**OutputFormat****Description**

Returns the value for the representation of the output value. The representation is dependent on the data format. Read only access.

**OutputValue****Description**

Determines the default setting for the value to be displayed or returns it. This value is used in Runtime when the associated tag cannot be connected or updated when a picture is started.

**PageMode****Description**

Enables paging in the long-term archive list. Allows you to display all messages of the short-term archive in the long-term archive list. Use the "Messages per page" property to determine the number of messages output per page.

The page up/down buttons of the toolbar can be used if paging is enabled.

**Syntax**

Object.**PageMode**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "AlarmControl".

**BOOLEAN**

TRUE: Scrolling in the long-term log list is possible.

FALSE: Scrolling in the long-term log list is not possible.

**See also**

AlarmControl (Page 4273)

**PageModeMessageNumber**

**Description**

Defines the number of messages shown per page when paging the long-term archive list.

**Syntax**

Object.**PageModeMessageNumber**

**Object**

Required A "ScreenItem" object with the format "AlarmControl".

**BOOLEAN**

Optional TRUE, if the dialog box is shown in Runtime.

**See also**

AlarmControl (Page 4273)

**Parent**

**Description**

Returns the screen in which the specified object is embedded.

Access in Runtime: Read

**Syntax**

Object.Parent

**Object**

Required A "ScreenItem" object. This property is a standard property of the ScreenItem object and is therefore available for all formats.

## Application example

The following example writes the name of the root screen in "BaseScreenName" tag:

```
'VBS_Example_Parent
Dim objScrItem, BaseScreenName
Set objScrItem = HMIRuntime.Screens(1).ScreenItems(1)
BaseScreenName = "Name of BaseScreen: " & objScrItem.Parent.ObjectName
```

## Path

### Description

Returns the path of the current project without the file names as STRING. For a WinCC client without its own path, the path is returned in UNC format, otherwise the local path is returned.

Access during runtime: Read

### Syntax

Object.**Path**

#### Object

Necessary. A "Project" object.

### Example

The following example returns the project path as Trace:

```
'VBS161
HMIRuntime.Trace "Path: " & HMIRuntime.ActiveProject.Path & vbNewLine
```

### See also

Project (Page 4255)

### Password

### Description

Determines the password for the loading of the remote monitor.

Access during runtime: Read and Write

## Syntax

Object.Password = [STRING]

### Object

Required. An object of the "ScreenItem" type with the characteristic "SmartClientView."

### STRING

Optional. A value or constant which contains the password.

## See also

SmartClientView (Page 4415)

## PersistentRTAuthorization

### Description

Specifies the authorization for operators which is necessary to change the persistence setting in Runtime. The value to be entered corresponds to the number which has the desired authorization in the user administration. Whether the information is evaluated depends on the value of the property "AllowPersistence". This does not apply for the message view.

Access in Runtime: Read and write

## Syntax

Object.**PersistentRTAuthorization**[=RtAuthorization]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

### RtAuthorization

Optional A value or a constant that specifies the authorization for operators to change the persistence setting.

## See also

AlarmControl (Page 4273)

## PersistentRTCSAuthorization

### Description

Specifies the operator authorization to be able to change the persistence setting in Runtime. The value to be entered corresponds to the number which has the desired authorization in the user administration. Whether the information is evaluated depends on the value of the property "AllowPersistence". This does not apply for the message view.

Access in Runtime: Read and write

### Syntax

Object.**PersistentRTCSAuthorization**[=RtAuthorization]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

#### RtAuthorization

Optional A value or a constant that specifies the operator authorization to change the persistence setting.

### See also

AlarmControl (Page 4273)

## PersistentRuntime

### Description

Specifies whether changed settings in the window will also be maintained after a screen change.

Access in Runtime: Read and write

### Syntax

Object.**PersistentRuntime**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" oder "OnlineTableControl".

#### BOOLEAN

Optional. TRUE, if changed settings in the window will also be maintained after a screen change.

## Comments

The "AllowPersistence" property specifies whether the information will be evaluated.

## See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

## PersistentRuntimeAuthorization

### Description

Specifies the access authorization to change the persistence setting in Runtime. The value to be entered corresponds to the number which has the desired authorization in the user administration.

Access in Runtime: Read and write

### Syntax

Object.**PersistentRuntimeAuthorization**[=HmiRTAuthorization]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

#### HmiRTAuthorization

Optional A value or a constant that specifies the access authorization required to change the persistence setting in Runtime.

## Comments

The "AllowPersistence" property specifies whether the information will be evaluated. This does not apply for the message view.

## See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

## PersistentToDownload

### Description

Specifies whether the settings will be maintained until the next ES download.

Access in Runtime: Read and write

### Syntax

Object.**PersistentToDownload**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

#### BOOLEAN

Optional TRUE, if the settings will be maintained until the next ES download.

### See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

## PersistentToDownloadAuthorization

### Description

Specifies the access authorization required to change the settings until the next ES download.

Access in Runtime: Read and write

### Syntax

Object.**PersistentToDownloadAuthorization**[=HmiRTAuthorization]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

#### HmiRTAuthorization

Optional A value or a constant that specifies the access authorization required to change the settings until the next ES download.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

**PicAlignment****Description**

Specifies the alignment within the specified object.

**PicDeactReferenced****Description**

TRUE, when the picture assigned for the "Disable" status should be saved in the RoundButton object. Otherwise, only the associated object reference is saved. Read only access.

**PicDeactTransparent****Description**

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "Disabled" status should be set to "transparent". LONG Write/Read Access.  
The color is only set to "Transparent" if the value of the "PicDeactUseTransColor" property is "True".

**PicDeactUseTransColor****Description**

TRUE, when the transparent color defined by the "PicDeactTransparent" property for the "Disable" status should be used. BOOLEAN write-read access.

**PicDownReferenced****Description**

TRUE, when the picture assigned for the "On" status is to be saved. Otherwise, only the associated object reference is saved. Read only access.

## PicDownTransparent

### Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "On" status should be set to "transparent". LONG Write/Read Access.  
The color is only set to "Transparent" if the value of the "PicDownUseTransColor" property is "True".

## PicDownUseTransColor

### Description

TRUE, when the transparent color defined by the "PicDownTransparent" property for the "On" status should be used. BOOLEAN write-read access.

## PicReferenced

### Description

TRUE, when the assigned picture is references the object and is not saved in it. Read only access.

## PicTransparentColor

### Description

Defines or returns which color of the assigned bitmap object (.bmp, .dib) should be set to "transparent". LONG Write/Read Access.  
The color is only set to "Transparent" if the value of the "PicUseTransparentColor" property is "True".

## Picture

### Description

Specifies the screen that will be displayed in the graphics object in Runtime.  
Access in Runtime: Read and write

### Syntax

Object.**Picture**[=Image]

**Object**

Required A ""ScreenItem" object with the formats "GraphicView", "Clock"" or ""SymbolLibrary".

**Image**

Optional A value or a constant that specifies the screen that will be displayed in the graphics object in Runtime.

**Comments**

The picture (\*.BMP or \*.DIB) must be located in the "GraCS" folder of the current project so that it can be integrated.

**See also**

GraphicView (Page 4344)

Clock (Page 4310)

SymbolLibrary (Page 4427)

**PictureAlignment****Description**

Defines or returns the mode of representation of the background image in the process picture.  
LONG write-read access.

**See also**

Button (Page 4294)

RoundButton (Page 4404)

**PictureDeactivated****Description**

Specifies the picture that is displayed in the "Deactivated" state.  
Access during runtime: Read and write

**Syntax**

Object.**PictureDeactivated**[=Image]

**Object**

Required A ""ScreenItem" object with the format ""Roundbutton".

**Image**

Optional A value or a constant that specifies the picture that will be displayed in the "Deactivated" status.

**Comments**

The picture must be located in the "GraCS" folder of the current project in order to integrate it.

**PictureName**

**Description**

Defines the path and file name of the background image in the process picture or returns it. LONG write-read access.

**PictureOff**

**Description**

Specifies the picture that is displayed in the "Off" status.

Access during runtime: Read and write

**Syntax**

Object.**PictureOff**[=Image]

**Object**

Required A "ScreenItem"" object with the formats ""Button", ""Roundbutton", "Switch"" or "GraphicIOField".

**Image**

Optional A value or a constant that specifies the picture that will be displayed in the "Off" status.

**Comments**

The picture (\*.BMP or \*.DIB) must be in the "GraCS" folder of the current project so that you can integrate it.

**See also**

Button (Page 4294)  
Switch (Page 4419)  
GraphicIOField (Page 4341)

**PictureOn****Description**

Specifies the screen that will be displayed in the "on" state.  
Access in Runtime: Read and write

**Syntax**

Object.**PictureOn**[=Image]

**Object**

Required A "ScreenItem" object with the formats "Button", "Roundbutton", "Switch" or "GraphicIOField".

**Image**

Optional A value or a constant that specifies the screen that will be displayed in the "on" state.

**Comments**

The screen (\*.BMP or \*.DIB) must be in the "GraCS" folder of the current project in order to be able to integrate it.

**See also**

Button (Page 4294)  
Switch (Page 4419)  
GraphicIOField (Page 4341)

**PictureUp****Description**

Defines the picture to be displayed in the "Off" status or returns the picture name.  
The picture (\*.BMP or \*.DIB) must be located in the "GraCS" folder of the current project so that it can be integrated.

## PicUpReferenced

### Description

TRUE, when the picture assigned for the "Off" status should be saved in the object. Otherwise, only the associated object reference is saved. Read only access.

## PicUpTransparent

### Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "Off" status should be set to "transparent". LONG Write/Read Access.  
The color is only set to "Transparent" if the value of the "PicUpUseTransColor" property is "True".

## PicUpUseTransColor

### Description

TRUE, when the transparent color defined by the "PicUpTransparent" property for "Off" status should be used. BOOLEAN write-read access.

## PicUseTransColor

### Description

TRUE, when the transparent color defined by the "PicDeactTransparent" property for the "Disable" status should be used. BOOLEAN write-read access.

## Pinned

### Description

Defines whether the display of the picture window in Runtime depends on the process picture in which the picture window was configured.

## PointCount

### Description

Defines or returns the number of corner points. Each corner point has position coordinates and is identified via an index.

## PointerColor

### Description

Specifies the pointer color of the "Gauge" object.

Access during runtime: Read and Write

### Syntax

Object.**PointerColor**[= Color]

#### Object

Required An object of the ""ScreenItem" type with the characteristic "Gauge".

#### Color

Optional A value or a constant that specifies the pointer color.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

### See also

Gauge (Page 4338)

## PointsCount

### Description

Specifies the number of corner points of the polyline or of the polygon.

Access in Runtime: Read and write

### Syntax

Object.**PointsCount**[=Int]

#### Object

Required A "ScreenItem" object with the formats "Polyline" or "Polygon".

#### Int

Optional A value or a constant that specifies the number of corner points of the polyline.

## See also

Polyline (Page 4390)

Polygon (Page 4387)

TubePolyline (Page 4454)

## Position

### Description

Defines the presetting for the position of the slider.

This value is used as the start value in Runtime.

To operate the process value linked to this attribute, it is necessary that the process value is also linked to the "Position" event. You will find the event "Position" in the "Event" tab, in the topic tree under SliderCtrl\Property Topics\Control Properties\Value.

## Precision

### Description

Specifies the number of decimal places (0 to 20).

Access in Runtime: Read and write

## Syntax

Object.**Precision**[=Int]

### Object

Required A "ScreenItem" object with the format "Bar".

### Int

Optional A value or a constant that specifies the number of decimal places (0 to 20).

## See also

Bar (Page 4287)

## PredefinedAngles

### Description

Defines or returns the depth of the display of the 3DBarGraph object. Value range from 0 to 3.

0 = cavalier

- 1 = isometric
- 2 = axionometric
- 3 = freely defined

## Pressed

### Description

Specifies whether the selected object is displayed in a pressed state.

Access in Runtime: Read and write

### Syntax

Object.**Pressed**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Roundbutton".

#### BOOLEAN

Optional TRUE, if the selected object is displayed in a pressed state.

### See also

Button (Page 4294)

## PrintConfiguration

### Description

Specifies the log for the printout.

Access in Runtime: Read and write

### Syntax

Object.**PrintConfiguration**[=HMIPrintConfiguration]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl", "OnlineTableControl", "AlarmControl" or "UserArchiveControl".

#### HMIPrintConfiguration

Optional A value or a constant which specifies the log for the printout.

## See also

OnlineTrendControl (Page 4375)  
FunctionTrendControl (Page 4330)  
OnlineTableControl (Page 4367)  
AlarmControl (Page 4273)

## PrintJobName

### Description

Defines the print job triggered by the print function of the "Print" toolbar button. The recommended print job is set for the control by default.

Open the "Select Print Job" dialog using the selection button.

### Syntax

Object.**PrintJobName**]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "FunctionTrendControl", "OnlineTableControl", "OnlineTrendControl", "TrendRulerControl", "UserArchiveControl".

## See also

AlarmControl (Page 4273)

## PrintVisibleColumnsOnly

### Description

Specifies whether only the current visible columns should be output in quick print.

Access in Runtime: Read and write

### Syntax

Object.**PrintVisibleColumnsOnly**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "UserArchiveControl".

#### BOOLEAN

Optional TRUE, if only the current visible columns should be output in quick print.

## Process

### Description

Defines or returns presetting for the value to be displayed.  
This value is used in Runtime when the associated tag cannot be connected or updated when a picture is started.

## Processvalue

### Description

Specifies the default for the value to be displayed.  
This value will be used in runtime if the associated tag is not connected or has not been updated when the screen starts.  
Access during runtime: Read and write

## Syntax

Object.**Processvalue**[=DOUBLE]

### Object

Necessary. A "ScreenItem" object with the formats "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch", "GraphicIOField", "Bar", "Gauge", "Slider", "SymbolLibrary", "CheckBox", "OptionGroup" or "WindowSlider".

### DOUBLE

Optional A value or a constant that includes the default value.

## Comments

If you want to assign the "ProcessValue" SmartTags property, then you must formulate the assignment as follows:

'Examples for the assignment of SmartTags

'Example 1

```
IOField.ProcessValue = SmartTags("TagName").Value
```

'Example 2

```
HmiRuntime.Screens("Screen_1").ScreenItems("IOField_1").ProcessValue =  
SmartTags("Tag_1").Value
```

## See also

IOField (Page 4351)  
SymbolicIOField (Page 4422)  
Button (Page 4294)  
Switch (Page 4419)  
GraphicIOField (Page 4341)  
Bar (Page 4287)  
Gauge (Page 4338)  
Slider (Page 4412)  
SymbolLibrary (Page 4427)  
CheckBox (Page 4300)  
OptionGroup (Page 4384)  
WindowSlider (Page 4468)  
DateTimeField (Page 4315)

## Processvalue

### Description

Defines the presetting for the value to be displayed.

This value is used in runtime when a screen is started and the associated tag has not been connected nor updated.

Access during runtime: Read and Write

### Syntax

Object.Processvalue [=DOUBLE]

#### Object

Required. An object of the "ScreenItem" type with the characteristic "Bar," "Gauge", "IOField" or "Slider".

#### DOUBLE

Optional. A value or constant which contains preset the Web address.

### Remarks

To assign SmartTags to the "ProcessValue" property, you must formulate the assignment as follows:

Examples of the assignment of SmartTags

'Example 1

```
IOField.ProcessValue = SmartTags("TagName").Value  
'Example 2  
HmiRuntime.Screens("Screen_1").ScreenItems("IOField_1").ProcessValue  
= SmartTags("Tag_1").Value
```

### See also

SymbolLibrary (Page 4427)

Button (Page 4294)

Switch (Page 4419)

### ProgID

#### Description

In the case of non-WinCC controls, the version-independent ProgID is returned as the type.

### See also

ForeignControl (Page 4326)

### ProjectPath

#### Description

Contains the path and name of the associated project.

Access in Runtime: Read-only

### Syntax

Object.**ProjectPath**[=String]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### String

Optional A value or a constant that specifies which path and name the associated project will contain.

### See also

AlarmControl (Page 4273)

## Properties Q-R

### QualityCode

#### Description

Returns the quality of a tag value after reading the tag as SHORT. After a tag has been written, the value is invalid.

Access during runtime: Read

#### Syntax

Object.**QualityCode**

#### Object

Necessary. An object of the "HMIRuntime" type.

#### Example

The following example indicates the quality of the read value when no errors have occurred during the reading process:

```
'VBS83
Dim objTag
Dim lngLastErr
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
lngLastErr = objTag.LastError
If 0 = lngLastErr Then
MsgBox objTag.QualityCode
End If
```

#### See also

Tag (Page 4267)

### Radius

#### Description

Determines the radius of the given object "Circle."

Access during runtime: Read and Write

**Syntax**

Object.Radius [= LONG]

**Object**

Required. An object of the "ScreenItem" type with the characteristic "Circle".

**LONG**

Optional. A value or constant which determines the radius in pixels.

**Radius****Description**

Specifies the radius of the selected object "Circle".

Access in Runtime: Read and write

**Syntax**

Object.**Radius**[= LONG]

**Object**

Required An object of the "ScreenItem" type with the format "Circle", "CircleSegment", "CircularArc" or "Roundbutton".

**LONG**

Optional A value or a constant that specifies the radius in pixels.

**See also**

Circle (Page 4303)

CircleSegment (Page 4305)

CircularArc (Page 4308)

**RadiusHeight****Description**

Determines the secondary axis of the object "Ellipse".

Access during runtime: Read and Write

**Syntax**

Object.RadiusHeight

**Object**

Required. An object of the "ScreenItem" type with the characteristic "Ellipse."

**LONG**

Optional. A value or constant which determines the secondary axis in pixels.

**RadiusHeight**

**Description**

Specifies the minor axis of the ""Ellipse" object.

Access in Runtime: Read and write

**Syntax**

Object.RadiusHeight

**Object**

Required A "ScreenItem" object with the formats "Ellipse", "EllipseSegment" or "EllipticalArc".

**LONG**

Optional A value or a constant that specifies the minor axis in pixels.

**See also**

Ellipse (Page 4319)

EllipseSegment (Page 4321)

EllipticalArc (Page 4324)

TubeArcObject (Page 4450)

**RadiusWidth**

**Description**

Determines the main axis of the object "Ellipse".

Access during runtime: Read and Write

**Syntax**

Object.RadiusWidth

**Object**

Required. An object of the "ScreenItem" type with the characteristic "Ellipse."

**LONG**

Optional. A value or constant which determines the main axis in pixels.

**RadiusWidth****Description**

Specifies the major axis of the "Ellipse" object.

Access in Runtime: Read and write

**Syntax**

Object.RadiusWidth

**Object**

Required A "ScreenItem" object with the formats "Ellipse", "EllipseSegment" or "EllipticalArc".

**LONG**

Optional A value or a constant that specifies the major axis in pixels.

**See also**

Ellipse (Page 4319)

EllipseSegment (Page 4321)

EllipticalArc (Page 4324)

TubeArcObject (Page 4450)

**ReadOnly****Description**

Specifies whether the Control has read and write access in Runtime.

Access in Runtime: Read and write

**Syntax**

Object.**ReadOnly**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "UserArchiveControl".

**BOOLEAN**

Optional TRUE, if the Control has read and write access in Runtime.

**RecipeName**

**Description**

Returns the name of the recipe that is currently being displayed in the "RecipeView".

Access in Runtime: Read

**Syntax**

Object.RecipeName

**Object**

Required A "ScreenItem" object with the format "RecipeView".

**RecipeNumber**

**Description**

Returns the number of the recipe that is currently being displayed in the "RecipeView".

Access in Runtime: Read

**Syntax**

Object.RecipeNumber

**Object**

Required A "ScreenItem" object with the format "RecipeView".

**RecordName**

**Description**

Returns the name of the recipe data record that is currently being displayed in the "RecipeView".

Access in Runtime: Read

**Syntax**

Object.RecordName

**Object**

Required A "ScreenItem" object with the formats "RecipeView" or "PrintRecipe".

**RecordNumber****Description**

Returns the number of the recipe data record that is currently being displayed in the "RecipeView".

Access in Runtime: Read

**Syntax**

Object.RecordNumber

**Object**

Required A "ScreenItem" object with the format "RecipeView".

**ReferenceRotationLeft****Description**

Defines or returns the X-coordinate of the reference point about which the object should be rotated in Runtime.

The value of the x coordinate is relative to the object width. Enter the value in percent starting from the left edge of the rectangle enclosing the object.

**ReferenceRotationTop****Description**

Defines or returns the Y-coordinate of the reference point about which the object should be rotated in Runtime.

The value of the Y-coordinate is relative to the object height. Enter the value in percent starting from the top edge of the rectangle enclosing the object.

**RelativeFillLevel****Description**

Specifies the fill percentage for the object.

Access in Runtime: Read and write

## Syntax

Object.**RelativeFillLevel**[=Int]

### Object

Required A "ScreenItem" object with the formats "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "Button", "Roundbutton", "GraphicView", "Checkbox", "OptionGroup" or "WindowSlider".

### Int

Optional A value or a constant that specifies the fill percentage of the object.

## Relevant property

### Description

TRUE, when the object will be taken into account when forming the group display. BOOLEAN write-read access.

## RemoveAssignment

### Description

Removes an entry.

## RemoveAllAssignment

### Description

Deletes all entries.

## RightComma property

### Description

Defines or returns the number of decimal places (0 to 20).

## Rotation

### Description

Specifies the angle of rotation in degrees of the selected object. The angle of rotation is measured counterclockwise.

Access in Runtime: Read and write

### Syntax

Object.**Rotation**[=SymbolLibRotation]

#### Object

Required A "ScreenItem" object with the format "SymbolLibrary".

#### SymbolLibRotation

hmiSymbolLibraryRotationNone ( 0): The object rotates by 0 degrees.

hmiSymbolLibraryRotation90Degree ( 90): The object rotates by 90 degrees.

hmiSymbolLibraryRotation180Degree ( 180): The object rotates by 180 degrees.

hmiSymbolLibraryRotation270Degree ( 270): The object rotates by 270 degrees.

### See also

SymbolLibrary (Page 4427)

## RotationAngle

### Description

Specifies the angle of rotation in degrees.

Access in Runtime: Read and write

## Syntax

Object.**RotationAngle**[=Int]

### Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Polygon" or "TextField".

### Int

Optional A value or a constant that specifies the angle of rotation in degrees.

## Comments

In Runtime the object rotates clockwise on the reference point.

## See also

Line (Page 4355)

Polyline (Page 4390)

Polygon (Page 4387)

TextField (Page 4436)

TubeTeeObject (Page 4457)

## RotationCenterLeft

### Description

Establishes the X coordinates of the pivot point to rotate the object in Runtime.

Access in Runtime: Read and write

### Syntax

Object.**RotationCenterLeft**[=Int]

### Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Polygon" or "TextField".

### Int

Optional A value or a constant that specifies the X coordinates of the pivot point to rotate the object in runtime.

## Comments

The value of the X coordinate is relative to the object width. Specify the value as a percentage from the left edge of the rectangle that surrounds the object.

**See also**

Line (Page 4355)  
Polyline (Page 4390)  
Polygon (Page 4387)  
TextField (Page 4436)

**RotationCenterTop****Description**

Specifies the Y coordinates of the pivot point to rotate the object in Runtime.

Access in Runtime: Read and write

**Syntax**

Object.**RotationCenterTop**[=Int]

**Object**

Required A "ScreenItem" object with the formats "Line", "Polyline", "Polygon" or "TextField".

**Int**

Optional A value or a constant that specifies the Y coordinates of the pivot point to rotate the object in Runtime.

**Comments**

The value of the Y coordinate is relative to the object width. Specify the value as a percentage from the upper edge of the rectangle that surrounds the object.

**See also**

Line (Page 4355)  
Polyline (Page 4390)  
Polygon (Page 4387)  
TextField (Page 4436)

**RoundCornerHeight****Description**

Defines or returns the corner radius.

Enter the value as a percentage of half the height of the object.

**See also**

Rectangle (Page 4402)

**RoundCornerWidth**

**Description**

Defines or returns the corner radius.  
Enter the value as a percentage of half the width of the object.

**See also**

Rectangle (Page 4402)

**RowNumber**

**Description**

Specifies the row number of the Row object of a Table Control.

**See also**

AlarmControl (Page 4273)

**RowScrollbar**

**Description**

Enables the display of row scroll bars.

**Syntax**

Object.**RowScrollbar**[=ScrollbarVisibility]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "TrendRulerControl" or "OnlineTableControl".

**ScrollbarVisibility**

Value	Description	Description
0	no	No row scroll bars.
1	as required	Row scroll bars are displayed if horizontal space requirements of the control are greater than the actually available display area.
2	always	Row scroll bars are always displayed.

**See also**

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

**RowSizingEnable****Description**

Specifies whether the row height can be changed.

The "RowSizingEnable" property is then only disabled if both properties "RowSizingEnable" and "AdaptFontSizeToLineHeight" have the value FALSE.

Access in Runtime: Read and write

**Syntax**

Object.**RowSizingEnable**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "AlarmControl".

**BOOLEAN**

Optional TRUE, if the row height can be changed.

**See also**

AlarmControl (Page 4273)

**RowTitleAlign****Row label alignment - RowTitleAlign**

Specifies the type of row label alignment.

The following settings are available:

Value	Description	Description
0	left	The row headers are aligned left.
1	centered	The row headers are aligned to center.
2	right	The row headers are aligned right.

The attribute can be assigned dynamic properties by means of the name **RowTitleAlign**.

**See also**

AlarmControl (Page 4273)

**RTPersistence**

**Description**

Specifies how online configurations of WinCC are retained.

**Syntax**

Object.**RTPersistence**[=RTPersistence]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "TrendRulerControl" or "OnlineTableControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**RTPersistence**

Value	Description	Explanation
0	Discard	The current online configurations are discarded at the next picture change.
1	Retain	The current online configurations are retained at the next picture change.
2	Reset	All online configurations made are lost. The picture is set to the contents found in the configuration system.

**See also**

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

OnlineTrendControl (Page 4375)

## RTPersistencePasswordLevel

### Description

Displays the authorization for online configuration. You can edit the authorization using the selection button. Authorizations are configured in the user administration.

### Syntax

Object.**RTPersistencePasswordLevel**

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "TrendRulerControl" or "OnlineTableControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

### See also

AlarmControl (Page 4273)

## RTPersistenceType

### Description

Specifies how online configurations of WinCC are retained.

### Syntax

Object.**RTPersistenceType**[=RTPersistenceType]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "TrendRulerControl" or "OnlineTableControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### RTPersistenceType

Value	Description	Explanation
0	Do not retain	Online configurations are not retained. These are lost at the next picture change.
1	Retain during runtime	Online configurations are retained during runtime. These are lost on exiting.
2	Retain permanently	Online configurations are retained permanently. These are also available after restart.

## See also

AlarmControl (Page 4273)  
UserArchiveControl (Page 4459)  
TrendRulerControl (Page 4439)  
FunctionTrendControl (Page 4330)  
OnlineTableControl (Page 4367)  
OnlineTrendControl (Page 4375)

## RulerColor

### Description

Specifies the color of the scale gradation (help line) of the axis label in the "OnlineTrendControl" object.

Access in Runtime: Read and Write

### Syntax

Object.**RulerColor**[= Color]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### Color

Optional A value or a constant that specifies the color of the scale gradation.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

## See also

TrendView (Page 4447)

## RulerPrecision(i)

### Description

Specifies the number of decimal places with which a measurement value of the specified trend will be displayed if it is measured via the function "Display value here".

Access in Runtime: Read and write

## Syntax

Object.**RulerPrecision**(i)[=Int]

### Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

### Int

Optional A value or a constant that specifies the number of decimal places with which a measurement value of the specified trend will be displayed if it is measured via the function "Display value here".

## See also

OnlineTrendControl (Page 4375)

## RulerXPrecision(i)

### Description

Specifies the number of decimal places with which a measurement value of the X coordinate will be displayed. Whether the information is evaluated depends on the value of the property "XAxisMode(i)".

Access in Runtime: Read and write

## Syntax

Object.**RulerXPrecision**(i)[=Int]

### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

### Int

Optional A value or a constant that specifies the number of decimal places with which a measurement value of the X coordinate will be displayed.

## Comments

The parameter i indicates the number of the trend.

You use the function "Display value here" to view the X coordinate of the measurement value.

## See also

FunctionTrendControl (Page 4330)

## RulerYPrecision(i)

### Description

Specifies the number of decimal places with which a measurement value of the Y coordinate will be displayed. Whether the information is evaluated depends on the value of the property "XAxisMode(i)".

Access in Runtime: Read and write

### Syntax

Object.**RulerYPrecision**(i)[=Int]

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

#### Int

Optional A value or a constant that specifies the number of decimal places with which a measurement value of the Y coordinate will be displayed.

### Comments

The parameter i indicates the number of the trend.

You use the function "Display value here" to view the Y coordinate of the measurement value.

### See also

FunctionTrendControl (Page 4330)

## Properties S

### SameSize

#### Description

TRUE, when all four buttons of a Group Display object have the same size. BOOLEAN write-read access.

### ScaleColor

#### Description

Specifies the color of the scale of the selected object.

Access in Runtime: Read and write

## Syntax

Object.**ScaleColor**[= Color]

### Object

Required An object of the "ScreenItem" type with the format "Bar" or "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

### Color

Optional A value or a constant that specifies the color of the scale.

## Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

ScreenItem object with the format "Bar": For the color to be displayed, the property ""ShowScale" must have the value TRUE.

## See also

Bar (Page 4287)

TrendView (Page 4447)

## ScaleGradation

### Description

Specifies the distance between two large marking lengths of the scale.

Access in Runtime: Read and write

### Syntax

Object.**ScaleGradation**[=Double]

### Object

Required A "ScreenItem" object with the format "Bar".

### Double

Optional A value or a constant that specifies the distance between two large marking lengths of the scale.

## See also

Bar (Page 4287)

## ScaleLabelColor

### Description

Specifies the color of the label for the scale gradation of the "Gauge" object.

Access during runtime: Read and Write

### Syntax

Object.**ScaleLabelColor**[= Color]

#### Object

Required An object of the "ScreenItem" type with the characteristic "Gauge".

#### Color

Optional A value or a constant that specifies the label color of the scale gradation.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

### See also

Gauge (Page 4338)

## ScaleNumerator

### Description

Defines the counter for scaling on the client.

### Syntax

Object.**ScaleNumerator** =[Int]

#### Object

Required A "ScreenItem" object with the format "SmartClientView".

#### Int

Optional A value or a constant that specifies the value.

**See also**

SmartClientView (Page 4415)

**ScalePosition****Description**

Specifies the position of the scale of the selected object. The "ShowScale" property must be set to TRUE so that the scale can be displayed.

Access in Runtime: Read and write

**Syntax**

Object.**ScalePosition**[=ScalePosition]

**Object**

Required A "ScreenItem" object with the format "Bar".

**ScalePosition**

hmiScalePositionLeftUp ( 0): For a vertical bar the scale will be displayed at the top. For a horizontal bar the scale will be shown at the left.

hmiScalePositionRightDown ( 1): For a vertical bar the scale will be displayed at the bottom. For a horizontal bar the scale will be shown at the right.

**See also**

Bar (Page 4287)

**ScaleTickColor****Description**

Specifies the color of the scale gradation of the "Gauge" object.

Access in Runtime: Read and write

**Syntax**

Object.**ScaleTickColor**[= Color]

**Object**

Required A "ScreenItem" object with the format "Gauge".

**Color**

Optional A value or a constant that specifies the color of the scale gradation.

## Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

## See also

Gauge (Page 4338)

## ScaleTickLabelPosition

### Description

Specifies the diameter of the assumed circle on which the label of the scale divisions is located.

Access in Runtime: Read and write

### Syntax

Object.**ScaleTickLabelPosition**[=Double]

#### Object

Required A "ScreenItem" object with the format "Gauge".

#### Double

Optional A value or a constant that specifies the diameter of the assumed circle on which the label of the scale division is located.

Value range from 0 to 1

0: The label is located in the center of the scale.

1: The diameter of the assumed circle for the label is the smaller value of the geometry properties "Width" and "Height". A part of the label can lie outside the object limits and is therefore invisible.

## See also

Gauge (Page 4338)

## ScaleTickLength

### Description

Specifies the length of the main markings for the scale division. The value refers to half the smaller value of the geometry properties "Width" and "Height".

The length of the marking lengths for the fine divisions is 0.5\* scale width.

Access in Runtime: Read and write

## Syntax

Object.**ScaleTickLength**[=Double]

### Object

Required A "ScreenItem" object with the format "Gauge".

### Double

Optional A value or a constant that specifies the length of the main markings of the scale.

Value range 0 to scale end value

0: There are no scale divisions. The divisions of the scale in the areas are not visible.

Scale end value: The scale division ranges from the mid point of the scale disc to the value specified by the scale end value.

## See also

Gauge (Page 4338)

## ScaleTickPosition

### Description

Specifies the diameter of the assumed circle on which the scale divisions are located.

The main markings of the scale divisions lie with their outward-facing ends on this circle.

Access in Runtime: Read and write

### Syntax

Object.**ScaleTickPosition**[=Double]

### Object

Required A "ScreenItem" object with the format "Gauge".

### Double

Optional A value or a constant that specifies the diameter of the assumed circle on which the scale divisions are located.

Value range from 0 to 1

0: The scale divisions are located in the center of the scale.

1: The diameter of the assumed circle for the label is the scale divisions is the smaller value of the geometry properties ""Width" and "Height".

## See also

Gauge (Page 4338)

## ScaleTicks

### Description

Defines the number of segments into which the bar will be subdivided by large tick marks of the scale:

0-100: Object can be divided into a maximum of 100 segments

= 0: The optimum number of segments is set automatically.

## ScaleDenominator

### Description

Defines the counter for scaling on the client.

### Syntax

Object.**ScaleDenominator**=[Int]

#### Object

Required A "ScreenItem" object with the format "SmartClientView".

#### Int

Optional A value or a constant that specifies the value.

## See also

SmartClientView (Page 4415)

## Scaling

### Description

TRUE, when a scale should also be used to represent a value. BOOLEAN write-read access.

## See also

SmartClientView (Page 4415)

## ScalingType

### Description

Specifies the type of bar scaling.

Access in Runtime: Read and write

### Syntax

Object.**ScalingType**[=BarScalingType]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### BarScalingType

Optional A value or a constant that specifies the type of bar scaling.

- hmiBarScalingLinear ( 0): Linear  
The large marks are distributed evenly over the scale. The distance between the large marks corresponds to the value of the "axis section" attribute.
- hmiBarScalingLogarithmic ( 1): Logarithmic  
The distribution of the large marks on the scale follows a logarithmic function. The representation of low values is very strongly highlighted.
- hmiBarScalingNegativeLogarithmic ( 2): Negative logarithmic  
The distribution of the large marks on the scale follows a negative logarithmic function. The representation of high values is very strongly highlighted.
- hmiBarScalingAutomatic ( 3): Automatic  
The large marks are distributed evenly over the scale. The distance between the large marks is specified automatically.
- hmiBarScalingTangent ( 4): Tangents  
The distribution of the large marks on the scale highlights the representation of the low and high values.
- hmiBarScalingQuadratic( 5): Square  
The distribution of the large marks follows a square function. The representation of high values is highlighted.
- hmiBarScalingCubic ( 6): Cubic  
The distribution of the large marks on the scale follows a cubic function. This highlights the representation of large values.

### Comments

For the color to be displayed, the property "ShowScale" must have the value TRUE.

### See also

Bar (Page 4287)

## ScreenItems

### Description

Returns the ScreenItems list.

Access in Runtime: Read

### Syntax

Object.ScreenItems

#### Object

Required A "ScreenItems"." object.

## ScreenName

### Description

Defines the picture to be displayed in the picture window in Runtime or returns the picture name.

---

#### Note

Always enter picture names without the extension "PDL" for reasons of compatibility with future versions.

---

### See also

ScreenWindow (Page 4408)

## Screens

### Description

Returns the Screens list. The Screens list contains two elements: The first element with the index 0 represents the permanent window. The second element with the index 1 represents the root screen. Alternatively, the two elements can be addressed by means of their names. Use "Overview" for the permanent window and "Base" for the root screen.

#### Note

The alarm window and the alarm indicator are not contained in the Screens list, even if they have the focus in Runtime.

Access in Runtime: Read

**Syntax**

Object.Screens

**Object**

Required A "Screens" object.

**Scrollable****Description**

Specifies whether the DXF screen display supports the Scroll functions in Runtime mode.

Access in Runtime: Read and write

**Syntax**

Object.**Scrollable**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "DXFView".

**BOOLEAN**

Optional TRUE, if the DXF screen display supports the Scroll functions in Runtime mode.

**ScrollBars****Description**

TRUE, when the object is equipped with a scroll bar in Runtime. Read only access.

**ScrollPositionX****Description**

Specifies the horizontal positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

## ScrollPositionY

### Description

Specifies the vertical positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

## SecondNeedleHeight

### Description

Specifies the length of the second hand in the "Clock" object.

Access in Runtime: Read and write

### Syntax

Object.**SecondNeedleHeight**[= LONG]

#### Object

Required A ""ScreenItem" object with the format "Clock".

#### LONG

Optional A value or a constant that specifies the length of the second hand.

Specify the length of the second hand as a percentage relating to the radius of the clock face.

### See also

Clock (Page 4310)

## SecondNeedleWidth

### Description

Specifies the width of the second hand in the "Clock" object.

Access in Runtime: Read and write

### Syntax

Object.**SecondNeedleWidth**[= LONG]

**Object**

Required An object of the type "ScreenItem" with the definition "Clock".

**LONG**

Optional A value or a constant that specifies the width of the second hand. Specify the width as a percentage relating to double the length of the second hand.

**See also**

Clock (Page 4310)

**SegmentColoring****Description**

Specifies the type of color change that should be displayed in the "Bar" if the limits are exceeded.

Access in Runtime: Read and write

**Syntax**

Object.**SegmentColoring**[= THmiBarColorType]

**Object**

Required A "ScreenItem" object with the format "Bar".

**THmiBarColorType**

Optional A value or a constant that specifies the type of color change. Value range from 0 to 1.

hmiBarColorEntire (0): Color change applied to the entire bar.

hmiBarColorSegmented (1): Color change applied to segments.

**See also**

Bar (Page 4287)

**SelBGColor****Description**

Defines or returns the background color of the selected entry in a text list object. LONG write-read access.

## SelectedText

### Description

Shows the text defined with the "Selected field" (SelIndex) attribute which is highlighted in the combobox or list box.

### See also

Listbox (Page 4357)

## SelectBackColor

### Description

Specifies the background color of the selected text entry for the selected object.

Access in Runtime: Read and write

### Syntax

Object.**SelectBackColor**[=Color]

#### Object

Required A "ScreenItem" object with the format "SymbolicIOField".

#### Color

Optional A value or a constant that specifies the background color of the selected text entry of the selected object.

### See also

SymbolicIOField (Page 4422)

## SelectedCellColor

### Description

Specifies the background color of a selected cell. You open a color selection dialog box with the button.

Access in Runtime: Read and write

### Syntax

Object.**SelectedCellColor**=[Color]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

**Color**

Optional A value or a constant which specifies the background color.

**See also**

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

**SelectedCellForeColor****Description**

Specifies the font color of the selected cell. You open a color selection dialog box with the button.

Access in Runtime: Read and write

**Syntax**

Object.**SelectedCellForeColor**=[Color]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

**Color**

Optional A value or a constant which specifies the font color.

**See also**

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

## SelectedIndex

### Description

Defines and returns the index of which the associated text is highlighted in the combobox or list box.

The maximum value is the number of lines (NumberLines) of the object.

### See also

Listbox (Page 4357)

## SelectedRowColor

### Description

Specifies the background color of the selected line. You open a color selection dialog box with the button.

Access in Runtime: Read and write

### Syntax

Object.**SelectedRowColor**[=Color]

#### Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "RecipeView", "RulerControl".

#### Color

Optional A value or a constant which specifies the background color.

### See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

## SelectedRowForeColor

### Description

Specifies the font color of the selected row. You open a color selection dialog box with the button.

Access in Runtime: Read and write

## Syntax

Object.**SelectedRowForeColor**[=Color]

### Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "RecipeView", "RulerControl".

### Color

Optional A value or a constant which specifies the font color.

## See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

## SelectedTitleColor

### Description

Specifies the background color of a selected table header. You open a color selection dialog box with the button.

The settings are only active in Runtime if the "Marking color" option is enabled.

Access in Runtime: Read and write

### Syntax

Object.**SelectedTitleColor**[=Color]

### Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "RecipeView", "RulerControl".

### Color

Optional A value or a constant which specifies the background color.

## See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

## SelectedTitleForeColor

### Description

Specifies the font color of the marked table header. You open the color selection dialog box with the button.

The setting is only effective in Runtime when the "Marking color" option is activated.

Access in Runtime: Read and write

### Syntax

Object.**SelectedTitleForeColor**[=Color]

#### Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "RecipeView", "RulerControl".

#### Color

Optional A value or a constant which specifies the font color.

## See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

## SelectForeColor

### Description

Specifies the color of the selected text entry for the selected object.

Access in Runtime: Read and write

## Syntax

Object.**SelectForeColor**[=Color]

### Object

Required A "ScreenItem" object with the format "SymbolicIOField".

### Color

Optional A value or a constant that specifies the color of the selected text entry of the selected object.

## See also

SymbolicIOField (Page 4422)

## SelectionBackColor

### Description

Specifies the background color of the selected cells.

Access in Runtime: Read and write

## Syntax

Object.**SelectionBackColor**[= Color]

### Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl", "StatusForce", "OnlineTrendControl", "AlarmControl", "UserView".

### Color

Optional A value or a constant that specifies the background color of the selected row.

## Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

## See also

TrendView (Page 4447)

## SelectionBackColor

### Description

Determines the background color of the selected cells.

Access during runtime: Read and Write

### Syntax

Object.SelectionBackColor [= Color]

#### Object

Required An object of the "ScreenItem" type with the characteristics "RecipeView," "StatusForce", "MessageView" or "UserView".

#### Color

Optional A value or constant which determines the background color of the selected row.

### Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

### See also

AlarmView (Page 4284)

RecipeView (Page 4398)

StatusForce (Page 4417)

UserView (Page 4466)

## SelectionColoring

### Description

Enables the use of selection colors for cells or rows.

Access in Runtime: Read and write

### Syntax

Object.**SelectionColoring**[=GridSelectionColoring]

**Object**

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "RecipeView", "RulerControl".

GridSelectionColoring:

Value	Description	Description
0	None	No selection colors for cells and rows.
1	Cell	Selection color for cell.
2	Row	Selection color for row.
3	Cell and row	Selection colors for cell and row.

**See also**

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

**SelectionForeColor****Description**

Specifies the foreground color of the selected cells.

Access in Runtime: Read and write

**Syntax**

Object.**SelectionForeColor**

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

**Comments**

You can use the "RGB" function to specify the color in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

**See also**

TrendView (Page 4447)

## SelectionForeColor

### Description

Determines the foreground color of the selected cells.

Access during runtime: Read and Write

### Syntax

Object.SelectionForeColor

#### Object

Required An object of the "ScreenItem" type with the characteristics "RecipeView," "StatusForce", "MessageView" or "UserView".

### Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

### See also

## SelectionMode

### Description

Defines whether and how a message line can be selected.

.

Access in Runtime: Read and write

### Syntax

Object.**SelectionMode**[=Mode]

#### Object

Required A "ScreenItem" object with the format "MessageView".

**Mode**

0 - NoSelection: Prevents the selection of a message. Acknowledgement affects the oldest pending message.

1 - Cell: Enables the selection of fields in the message line. Acknowledgement affects the selected message.

2 - Line: Enables the selection of a message line. Acknowledgement affects the selected message.

**SelectionMode****Description**

Specifies whether and how the alarm line can be selected.

Access in Runtime: Read and write

**Syntax**

Object.**SelectionMode**[=AlarmViewAdvancedSelectionMode]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl".

**AlarmViewAdvancedSelectionMode**

hmiAlarmViewAdvancedSelectionModeNone ( 0): Prevents the selection of an alarm. An acknowledgement always affects the oldest pending alarm.

hmiAlarmViewAdvancedSelectionModeCell ( 1): Enables the selection of fields in the alarm line. An acknowledgement always effects the selected alarm.

hmiAlarmViewAdvancedSelectionModeLine ( 2): Enables the selection of an alarm line. An acknowledgement always effects the selected alarm.

**See also**

AlarmControl (Page 4273)

**SelectionRect****Description**

Enables the use of a selection border for selected cells or rows.

Access in Runtime: Read and write

**Syntax**

Object.**SelectionRect**[=GridSelectionBorder]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

**GridSelectionBorder.**

Value	Description	Description
0	None	No selection border is drawn for selected cells or rows.
1	Cell	A selection border is drawn for the selected cell.
2	Row	A selection border is drawn for the selected row.

**See also**

- UserArchiveControl (Page 4459)
- TrendRulerControl (Page 4439)
- OnlineTableControl (Page 4367)
- AlarmControl (Page 4273)

**SelectionRectColor**

**Description**

Specifies the color of the rectangle in the message window if SelectionType equals "1".  
Access in Runtime: Read and write

**Syntax**

Object.**SelectionRectColor**[=Color]

**Object**

Required A "ScreenItem" object with the format "MessageView".

**Color**

Optional A value or a constant which specifies the color.

**See also**

- UserArchiveControl (Page 4459)
- TrendRulerControl (Page 4439)
- OnlineTableControl (Page 4367)
- AlarmControl (Page 4273)

## SelectionRectWidth

### Description

Specifies the line width of the selection rectangle in the message window when the the SelectionType is "1".

Access in Runtime: Read and write

### Syntax

Object.**SelectionRectWidth**[=Int]

#### Object

Required A "ScreenItem" object with the format "MessageView".

#### Int

Optional A value or a constant which specifies the line width.

### See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

## SelectionType

### Description

Specifies the number of lines you can mark.

The following settings are available:

Value	Description	Explanation
0	None	No line is marked.
1	Single selection	One line can be marked.
2	Multiple selection	Several lines can be marked.

The attribute can be made dynamic with the name SelectionType. The data type is LONG.

## SelTextColor

### Description

Defines or returns the color of the text of the selected entry in the text list object. LONG write-read access.

## SeparatorBackColor

### Description

Specifies the background color of the broken separation lines in the selection list of the specified object.

Access in Runtime: Read and write

### Syntax

Object.**SeparatorBackColor**[=Color]

#### Object

Required A "ScreenItem" object with the format "SymbolicIOField".

#### Color

Optional A value or a constant that specifies the background color of the broken separation lines in the selection list of the specified object.

### See also

SymbolicIOField (Page 4422)

## SeparatorColor

### Description

Specifies the color of the separation lines in the selection list of the specified object.

Access in Runtime: Read and write

### Syntax

Object.**SeparatorColor**[=Color]

#### Object

Required A "ScreenItem" object with the format "SymbolicIOField".

**Color**

Optional A value or a constant that specifies the color of the separation lines in the selection list of the specified object.

**See also**

SymbolicIOField (Page 4422)

**SeparatorCornerStyle****Description**

Specifies the shape of the corners for the object of the type "ScreenItem" with the format "SymbolicIOField".

**See also**

SymbolicIOField (Page 4422)

**SeparatorStyle****Description**

Specifies the line style of the separation lines in the selection list of the selected object.

Access in Runtime: Read and write

**Syntax**

Object.**SeperatorStyle**[=LineStyle]

**Object**

Required A "ScreenItem" object with the format "SymbolicIOField".

**LineStyle**

hmiLineStyleNone (-1): The selection list has no separation lines.

hmiLineStyleSolid ( 0): The selection list has solid separation lines.

hmiLineStyleDash ( 1): The selection list has broken separation lines.

hmiLineStyleDot ( 2): The selection list has dotted separation lines.

hmiLineStyleDashDot ( 3): The selection list has dash - dot lines as separation lines.

hmiLineStyleDashDotDot ( 4): The selection list has dash - dot - dot lines as separation lines.

### See also

SymbolicIOField (Page 4422)

## SeparatorWidth

### Description

Specifies the width of the separation lines in the selection list of the specified object.

Access in Runtime: Read and write

### Syntax

Object.**SeparatorWidth**[=Int]

#### Object

Required A "ScreenItem" object with the format "SymbolicIOField".

#### Int

Optional A value or a constant that specifies the width of the separation lines in the selection list of the specified object.

### See also

SymbolicIOField (Page 4422)

## SeperatorLineEndShapeStyle

### Description

Specifies the shape of the line ends for the object of the type "ScreenItem" with the format "SymbolicIOField".

### See also

SymbolicIOField (Page 4422)

## ServerScale

### Description

Establishes whether the Sm@rtClient view should be zoomed in or out.

## Syntax

Object.**ServerScale** =[Int]

### Object

Required A "ScreenItem" object with the format "SmartClientView".

### Int

Optional A value or a constant that specifies the value.

## See also

SmartClientView (Page 4415)

## ServerNames

### Description

Specifies the servers of a distributed system from which the message view draws data. The information is given in form of: NameServer1;NameServer2;NameServer3.

Access in Runtime: Read-only

## Syntax

Object.**ServerNames**[=String]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl" or "UserName".

### String

Optional A value or a constant that specifies the server of a distributed system from which the alarm window receives information.

## See also

AlarmControl (Page 4273)

## ServerPrefix

### Description

Defines the server containing the picture to be displayed in the picture window in Runtime or returns the server name.

Enter the server name followed by two colons: "<Servername>:". No check is made as to whether the server actually exists.

## SetAllAssignment

### Description

Sets all entries.

## SetSelection

### Description

Sets a list of the lines which are selected.

## SetpointTrendArchiveStartId(i)

### Description

Specifies the starting position from which the values of the setpoint trend will be read from the recipe. Whether the information is evaluated depends on the value of the property "ShowSetpointTrend(i)".

Access in Runtime: Read and write

### Syntax

Object.**SetpointTrendArchiveStartId**(i)[=Int]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

#### Int

Optional A value or a constant that specifies the starting position from which the values of the setpoint trend will be read from the recipe.

### Comments

The parameter i indicates the number of the trend.

### See also

FunctionTrendControl (Page 4330)

## SetpointTrendColor(i)

### Description

Specifies the color of a setpoint trend. Whether the information is evaluated depends on the value of the property "ShowSetpointTrend(i)".

Access in Runtime: Read and write

### Syntax

Object.**SetpointTrendColor(i)**[=Color]

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

#### Color

Optional A value or a constant that specifies the color of a setpoint trend.

### Comments

The parameter i indicates the number of the trend.

### See also

FunctionTrendControl (Page 4330)

## SetpointTrendNumberOfValues(i)

### Description

Specifies the number of value pairs of a setpoint trend. Whether the information is evaluated depends on the value of the property "ShowSetpointTrend(i)".

Access in Runtime: Read and write

### Syntax

Object.**SetpointTrendNumberOfValues(i)**[=Int]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

#### Int

Optional A value or a constant that specifies the number of value pairs of a setpoint trend.

## Comments

The parameter *i* indicates the number of the trend.

## See also

FunctionTrendControl (Page 4330)

## SetProps

## Description

Sets the value of the property.

## ShareTimeAxis

## Description

Specifies whether the trends of a trend window are displayed with a shared X axis.

Access in Runtime: Read and write

## Syntax

Object.**ShareTimeAxis**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

### BOOLEAN

Optional. TRUE, if the trends of the trend window are displayed with a shared X axis.

## See also

OnlineTrendControl (Page 4375)

## ShareTimeColumn

## Description

Specifies whether a shared time column will be used in the table window.

Access in Runtime: Read and write

## Syntax

Object.**ShareTimeColumn**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "OnlineTableControl".

**BOOLEAN**

Optional TRUE, if a shared time column will be used in the table window.

**See also**

OnlineTableControl (Page 4367)

**ShareValueAxis****Description**

Specifies whether the trends of a trend window are displayed with a shared Y axis.

Access in Runtime: Read and write

**Syntax**

Object.**ShareValueAxis**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "OnlineTrendControl".

**BOOLEAN**

Optional TRUE, if the trends of the trend window are displayed with a shared Y axis.

**See also**

OnlineTrendControl (Page 4375)

**ShareXAxis****Description**

Specifies whether the trends of a trend window are displayed with a shared X axis.

Access in Runtime: Read and write

**Syntax**

Object.**ShareXAxis**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

**BOOLEAN**

Optional TRUE, if the trends of the trend window are displayed with a shared X axis.

**See also**

FunctionTrendControl (Page 4330)

**ShareYAxis**

**Description**

Specifies whether the trends of a trend window are displayed with a shared Y axis.

Access in Runtime: Read and write

**Syntax**

Object.**ShareYAxis**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

**BOOLEAN**

Optional TRUE, if the trends of the trend window are displayed with a shared Y axis.

**See also**

FunctionTrendControl (Page 4330)

**Shared**

**Description**

Specifies that an HMI device is shared by several Sm@rtClient Views.

**Syntax**

Object.**Shared**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "SmartClientView".

**See also**

SmartClientView (Page 4415)

## ShiftDecimalPointReadOnlySpecial

### Description

Specifies that the "Shift decimal point" field can only be read.

Access in Runtime: Read and write

### Syntax

Object.**ShiftDecimalPointReadOnlySpecial**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "IOField".

#### BOOLEAN

Optional TRUE, if the "Shift decimal point" field can only be read.

### See also

IOField (Page 4351)

## ShortenCellText

### Description

Specifies whether the content of the fields of an alarm line should be shortened if the column width is too small.

Access in Runtime: Read and write

### Syntax

Object.**ShortenCellText**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

Optional TRUE, if the content of the fields of an alarm line should be shortened if the column width is too small.

### See also

AlarmControl (Page 4273)

## ShortenColumnHeaderText

### Description

Specifies whether the content of the fields of a title line should be shortened if the column width is too small.

Access in Runtime: Read and write

### Syntax

Object.**ShortenColumnHeaderText**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

Optional TRUE, if the content of the fields of a title line should be shortened if the column width is too small.

### See also

AlarmControl (Page 4273)

## ShowAlarmsFromDate

### Description

Specifies that only those message events are displayed that are saved in this tag.

Access in Runtime: Read and write

### Syntax

Object.**ShowAlarmsFromDate**[=Tag]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

#### Tag

Optional A value or a constant which specifies that only those message events are displayed that are saved in this tag.

### See also

AlarmView (Page 4284)

## ShowBadTagState

Defines whether the object is grayed out when a bad QualityCode or tag status is detected.

- |     |   |
|-----|---|
| Yes | If the quality code or the the tag status are poor, the object is grayed out or the settings for the grid color are used.         |
| No  | If the quality code or the the tag status are poor, the object is not grayed out or the settings for the grid color are not used. |

IOField (Page 4351)

OptionGroup (Page 4384)

## ShowBar

### Description

Specifies whether the displayed process value in the "Slider" object is also shown by a filled bar.

Access in Runtime: Read and write

### Syntax

Object.ShowBar

#### Object

Required A "ScreenItem" object with the format "Slider".

Optional TRUE, if the process value is also shown by a filled bar.

## See also

Slider (Page 4412)

## ShowBorder

### Description

Specifies whether the window will be shown with a border.

Access in Runtime: Read and write

## Syntax

Object.**ShowBorder**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "UserArchiveControl".

### BOOLEAN

Optional TRUE if the window is to be shown with a border.

## ShowCaption

### Description

Specifies whether the title line is hidden or shown.

+C1763

Access in Runtime: Read and write

### Syntax

Object.**ShowCaption**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl", "OnlineTableControl", "AlarmControl", "ScreenWindow", "ApplicationWindow" or "UserArchiveControl".

### BOOLEAN

Optional TRUE, if the title line is shown.

## ShowColumn(i)

### Description

Specifies whether a column pair that is referenced via the "CurrentColumnIndex" property is shown.

Access in Runtime: Read and write

### Syntax

Object.**ShowColumn(i)**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

#### BOOLEAN

Optional TRUE, if a column pair that is referenced via the "CurrentColumnIndex" property is shown.

### See also

OnlineTableControl (Page 4367)

## ShowCurve(i)

### Description

Specifies whether a trend that is referenced via the "CurrentCurveIndex" property is shown.

Access in Runtime: Read and write

### Syntax

Object.**ShowCurve(i)**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

#### BOOLEAN

Optional TRUE, if a trend that is referenced via the "CurrentCurveIndex" property is shown.

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

## ShowDecimalPoint

### Description

Specifies whether the scale is identified with decimal figures (decimal point and one decimal place) or with whole integers.

Access in Runtime: Read and write

### Syntax

Object.**ShowDecimalPoint**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Gauge".

#### BOOLEAN

Optional TRUE, if the scale is identified with decimal figures (decimal point and one decimal place).

### See also

Gauge (Page 4338)

## ShowFillLevel

### Description

Specifies whether the selected object is filled.

Access in Runtime: Read and write

### Syntax

Object.**ShowFillLevel**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the formats "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "Button", "Roundbutton", "GraphicView", "Checkbox", "OptionGroup" or "WindowSlider".

#### BOOLEAN

Optional TRUE, if the selected object is filled.

**See also**

Ellipse (Page 4319)  
Circle (Page 4303)  
EllipseSegment (Page 4321)  
CircleSegment (Page 4305)  
Rectangle (Page 4402)  
Polygon (Page 4387)  
TextField (Page 4436)  
Button (Page 4294)  
GraphicView (Page 4344)  
OptionGroup (Page 4384)  
WindowSlider (Page 4468)

**ShowFocusRectangle****Description**

Specifies whether the button is given a selection border when it is activated in Runtime.

Access in Runtime: Read and write

**Syntax**

Object.**ShowFocusRectangle**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "Clock".

**BOOLEAN**

Optional TRUE, if the button is given a selection border when it is activated in Runtime.

**See also**

Clock (Page 4310)

**ShowInputControls****Description**

Establishes whether additional fields exist for entering the address and password.

## Syntax

Object.**ShowInputControls**

### Object

Required A "ScreenItem" object with the format "SmartClientView".

## ShowLargeTicksOnly

### Description

Defines or returns the length of the axis section in pixels.

### See also

Bar (Page 4287)

## ShowLimitMarkers

### Description

Specifies whether the limit value is shown as a scale value.

Access in Runtime: Read and write

### Syntax

Object.**ShowLimitMarkers**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Bar".

### BOOLEAN

Optional TRUE, if the limit value is shown as a scale value.

### See also

Bar (Page 4287)

## ShowMainFrame

### Description

Specifies whether the entire bar object is provided with a border.

Access in Runtime: Read and write

## Syntax

Object.**ShowMainFrame**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Bar".

### BOOLEAN

Option TRUE, if the entire bar object is shown with a border.

## See also

Bar (Page 4287)

## ShowMessagesAtDate

### Description

Determines at which time the alarms will be displayed.

---

#### Note

This function does not filter out alarms, it positions the display range of the alarm list as of the specified date.

---

Access during runtime: Read and Write

## Syntax

Object.**ShowMessagesAtDate** [= DATE]

### Object

Required. An object of the "MessageView" type.

### Remarks

To assign SmartTags to the "ShowMessagesAtDate" property, you must formulate the assignment as follows:

'Example 1

```
HmiRuntime.Screens("Screen_1").ScreenItems("Alarm  
view_1").ShowMessagesAtDate = SmartTags("intern_1").Value
```

'Example 2

```
HmiRuntime.Screens("Screen_1").ScreenItems("Alarm  
view_1").ShowMessagesAtDate = CDate(SmartTags("intern_1"))
```

SmartTag "intern\_1" must be of the "DateTime" type.

## See also

AlarmView (Page 4284)

## ShowOverflowIndicator

### Description

Specifies whether an overflow indicator is shown when the process value exceeds or falls short of the limit value.

Access in Runtime: Read and write

### Syntax

Object.**ShowOverflowIndicator**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format ""Bar".

#### BOOLEAN

TRUE, if an overflow indicator is shown when the process value exceeds or falls short of the limit value.

## See also

Bar (Page 4287)

## ShowPeakValuePointer

### Description

Specifies whether a slave pointer will be used for the selected object.

The slave pointer shows the maximum pointer deflection provided in Runtime while the process screen is loaded. If you reload the process screen, the slave pointer will be reset.

Access in Runtime: Read and write

### Syntax

Object.**ShowPeakValuePointer**[= BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Gauge".

#### BOOLEAN

Optional TRUE, if the slave pointer is used.

**See also**

Gauge (Page 4338)

**ShowPeakValuePointer****Description**

Determines whether a pointer for the given object is to be used.

The pointer shows the maximum hand deflection in runtime as long as the process screen is loaded. When you reload the process screen, the pointer is reset.

Access during runtime: Read and Write

**Syntax**

Object.ShowPeakValuePointer [= BOOLEAN]

**Object**

Required. An object of the "ScreenItem" type with the characteristic "Gauge".

**BOOLEAN**

Optional. TRUE, if the pointer is used.

**ShowPosition****Description**

Specifies whether the value of the current slider position should also be displayed numerically. The value is then displayed beneath the slider.

Access in Runtime: Read and write

**Syntax**

Object.ShowPosition[= BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "Slider".

**BOOLEAN**

Optional TRUE, if the value is also shown.

**See also**

Slider (Page 4412)

## ShowRowHeaders

### Description

Specifies whether the message view contains a column with consecutive numbering of the existing messages.

Access in Runtime: Read and write

### Syntax

Object.**ShowRowHeaders**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

Optional TRUE, if the message view contains a column with consecutive numbering of the existing messages.

### See also

AlarmControl (Page 4273)

## ShowRuler

### Description

Specifies whether a scale division (help line) is displayed for an axis label of the object "OnlineTrendControl".

Access in Runtime: Read and write

### Syntax

Object.**ShowRuler**[= BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "OnlineTrendControl" or "FunctionTrendControl".

#### BOOLEAN

Optional TRUE, if the scale gradation is shown.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**ShowRuler****Description**

Determines whether a scale gradation (help lines) is expanded for the axis label of the object "TrendView".

Access during runtime: Read and Write

**Syntax**

Object.ShowRuler [= BOOLEAN]

**Object**

Required. An object of the "ScreenItem" type with the characteristic "TrendView".

**BOOLEAN**

Optional. TRUE, if the scale gradation is shown.

**See also**

TrendView (Page 4447)

**ShowRulerInAxis****Description**

Enables the display of rulers in the time axis.

Access in Runtime: Read and write

**Syntax**

Object.**ShowRulerInAxis**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**BOOLEAN**

TRUE: The rulers are also displayed in the time axes.

FALSE: The rulers are not displayed in the time axes.

### See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

### ShowScale

#### Description

Specifies whether the values will also be shown in a scale.

Access in Runtime: Read and write

#### Syntax

Object.**ShowScale**[=BOOLEAN]

##### Object

Required A "ScreenItem" object with the format "Bar".

##### BOOLEAN

Optional TRUE, if the values will also be shown in a scale.

### See also

Bar (Page 4287)

### ShowScrollbars

#### Description

Scroll bars - ShowScrollbars

Enables the display of scroll bars.

Access in Runtime: Read and write

#### Syntax

Object.**ShowScrollbars**[=ShowScrollbars]

##### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**ShowScrollbars**

Value	Description	Explanation
0	no	The display of scroll bars is disabled.
1	as required	Scroll bars are displayed if space requirements of the control are greater than the actual display area.
2	always	The scroll bars are always displayed.

**See also**

ScreenWindow (Page 4408)

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

**ShowSetpointTrend(i)****Description**

Specifies whether a setpoint trend that belongs to a trend that is referenced via "CurrentCurveIndex" should be shown.

Access in Runtime: Read and write

**Syntax**

Object.**ShowSetpointTrend(i)**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

**BOOLEAN**

Optional TRUE, if a setpoint trend that belongs to a trend that is referenced via "CurrentCurveIndex" should be shown.

**See also**

FunctionTrendControl (Page 4330)

**ShowSortButton****Description**

Enables the display of a sorting button above the vertical scroll bar. Click this sorting button to sort the selected column based on the configured sorting criteria. The sorting button is not displayed if the table does not contain a vertical scroll bar.

Access in Runtime: Read and write

## Syntax

Object.**ShowSortButton**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

### BOOLEAN

TRUE: The sorting key is displayed. You can sort the selected column.

FALSE: The sorting key is not displayed.

## See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

## ShowSortIcon

### Description

Enables the display of the sorting icon.

Access in Runtime: Read and write

### Syntax

Object.**ShowSortIcon**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

### BOOLEAN

TRUE: The sorting icon is displayed.

FALSE: The sorting icon is not displayed.

## See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

## ShowSortIndex

### Description

Specifies whether a sort index is displayed.

Access in Runtime: Read and write

### Syntax

Object.**ShowSortIcon**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

#### BOOLEAN

TRUE: A sort index is displayed.

FALSE: A sort index is not displayed.

### See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

## ShowStatusBar

### Description

Specifies whether the status bar is shown.

Access in Runtime: Read and write

### Syntax

Object.**ShowStatusBar**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl" or "HTMLBrowser".

### **BOOLEAN**

Optional TRUE, if the status bar is shown.

#### **See also**

OnlineTrendControl (Page 4375)  
FunctionTrendControl (Page 4330)  
OnlineTableControl (Page 4367)  
AlarmControl (Page 4273)  
HTMLBrowser (Page 4349)  
MediaPlayer (Page 4360)

### **ShowTableGridlines**

#### **Description**

Specifies whether the gridlines are shown in the table of the selected object.

Access in Runtime: Read and write

#### **Syntax**

Object.**ShowTableGridlines**[= BOOLEAN]

#### **Object**

Required An object of the "ScreenItem" type with the format "StatusForce", "OnlineTrendControl" or "UserView".

#### **BOOLEAN**

Optional TRUE, if gridlines are shown.

#### **See also**

TrendView (Page 4447)

### **ShowTableGridlines**

#### **Description**

Determines whether gridlines are shown in the table of the given object.

Access during runtime: Read and Write

## Syntax

Object.ShowTableGridlines [= BOOLEAN]

### Object

Required. An object of the "ScreenItem" type with the characteristic "StatusForce".

### BOOLEAN

Optional. TRUE, if gridlines are displayed.

## See also

StatusForce (Page 4417)

UserView (Page 4466)

## ShowThumb

### Description

Specifies whether the slider of the "Slider" object will be displayed.

Access in Runtime: Read and write

## Syntax

Object.ShowThumb[= BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Slider".

### BOOLEAN

Optional TRUE, if the slider is shown.

## See also

Slider (Page 4412)

## ShowTickLabels

### Description

Specifies whether the label is shown in the scale.

Access during runtime: Read and write

## Syntax

Object.**ShowTickLabels**[= BOOLEAN]

### Object

Necessary. A "ScreenItem" object with the formats "Bar" or "Slider".

### BOOLEAN

Optional TRUE, if the label is shown.

## Comments

The increments for the measured value are automatically established dependent upon the specified measurement range and the size of the object.

### Used for the following object types:

Slider

## See also

Bar (Page 4287)

Slider (Page 4412)

## ShowTicks

## Description

Specifies whether the marking lengths are shown in the scale of the selected object.

Access during runtime: Read and write

## Syntax

Object.**ShowTicks**[= BOOLEAN]

### Object

Necessary. A "ScreenItem" object with the formats "Clock" or "Slider".

### BOOLEAN

Optional TRUE, if the marking lengths are shown.

### Used for the following object types:

Slider

**See also**

Clock (Page 4310)

Slider (Page 4412)

**ShowTitle****Description**

Defines representation the Control window header.

Access in Runtime: Read and write

**Syntax**

Object.**ShowTitle**[=WindowHeaderStyle]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "FunctionTrendControl", "UserArchiveControl", "TrendRulerControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**WindowHeaderStyle**

Value	Designation	Description
0	No	No window title.
1	Normal	The window title consists of a WinCC icon and text. The text is entered in the "Text" field.
2	Narrow	The window title consists only of text. The text is entered in the "Text" field.

**See also**

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

OnlineTrendControl (Page 4375)

AlarmControl (Page 4273)

**ShowToolBar****Description**

Specifies whether the toolbar is shown.

Access in Runtime: Read and write

## Syntax

Object.**ShowToolBar**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl" or "HTMLBrowser".

### BOOLEAN

Optional TRUE, if a toolbar will be displayed.

## See also

AlarmControl (Page 4273)

HTMLBrowser (Page 4349)

## ShowTrendIcon

### Description

Enables the display of an icon below the value axes. The icon indicates the trend currently displayed in the foreground.

Access in Runtime: Read and write

### Syntax

Object.**ShowTrendIcon**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

### BOOLEAN

TRUE: The icon is displayed.

FALSE: The icon is not displayed.

## See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## ShowTrendIndicator

### Description

Specifies whether the tendency (increasing or falling) of the measurement value that is to be monitored is shown with a small arrow.

Access in Runtime: Read and write

### Syntax

Object.**ShowTrendIndicator**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### BOOLEAN

Optional TRUE, if the tendency (increasing or falling) of the measurement value that is to be monitored is shown with a small arrow.

### See also

Bar (Page 4287)

## ShowVerticalGridlines

### Description

Specifies whether the columns of the message view are separated by vertical lines.

Access in Runtime: Read and write

### Syntax

Object.**ShowVerticalGridlines**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "AlarmControl".

#### BOOLEAN

Optional TRUE, if the columns of the alarm window will be separated by vertical separation lines.

### See also

AlarmControl (Page 4273)

## ShowXValuesExponential(i)

### Description

Specifies whether a value of the X coordinate is shown in exponential format. Whether the information is evaluated depends on the property "XAxisMode(i)".

Access in Runtime: Read and write

### Syntax

Object.**ShowXValuesExponential**(i)[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

#### BOOLEAN

Optional TRUE, if a value of the X coordinate is shown in exponential format.

### Comments

The parameter i indicates the number of the trend.

You use the function "Display value here" to view the X coordinate of the measurement value.

### See also

FunctionTrendControl (Page 4330)

## ShowYValuesExponential(i)

### Description

Specifies whether a value of the Y coordinate is shown in exponential format. Whether the information is evaluated depends on the property "XAxisMode(i)".

Access in Runtime: Read and write

### Syntax

Object.**ShowYValuesExponential**(i)[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

#### BOOLEAN

Optional TRUE, if a value of the Y coordinate is shown in exponential format.

## Comments

The parameter *i* indicates the number of the trend.  
You use the function "Display value here" to view the Y coordinate of the measurement value.

## See also

FunctionTrendControl (Page 4330)

## SignificantMask property

### Description

Is required in Runtime to display the active message class with the highest priority.  
The value of the SignificantMask property represents an internal system output value does not require any specific configuration by the user. Updating is initiated in Runtime by clicking on the object.

## Sizeable property

### Description

TRUE, when it should be possible to change the size of the object in Runtime. BOOLEAN write-read access.

In the case of application window and picture window: Read only access

## See also

TrendRulerControl (Page 4439)  
OnlineTableControl (Page 4367)  
OnlineTrendControl (Page 4375)  
AlarmControl (Page 4273)

## SkinName

### Description

The control style can be defined in this selection field.

Access in Runtime: Writing

### Syntax

Object.**SkinName**[=SkinName]

**Object**

Required. An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "RecipeView", "RulerControl".

**SkinName**

The following settings are available:

Value	Designation	Description
	Project setting	The style corresponds to the project settings in WinCC Explorer.
0	Classic	"Classic" WinCC style
1	Standard	New WinCC V7 style

**SmallChange**

**Description**

Defines how many steps the controller can be moved with one mouse click or returns the value.

**SmartTags**

**Description**

Returns the SmartTags list.

Access in Runtime: Read

**Syntax**

Object.SmartTags

**Object**

Required A ""HMIRuntime" object.

**Sort**

**Description**

Specifies the sorting criteria in SQL syntax for the database.

Access in Runtime: Read and write

## Syntax

Object.**Sort**[=String]

### Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl".

### String

Optional A value or a constant that specifies the sort criteria in SQL syntax for the database.

## SortByTimeDirection

### Description

Specifies whether the last incoming message is shown at the top of the "AlarmControl" object (ascending sorting order).

Access in Runtime: Read and write

### Syntax

Object.**SortByTimeDirection**[= BOOLEAN]

### Object

Required A "ScreenItems" object with the format "AlarmControl".

### BOOLEAN

Optional TRUE, if the last incoming alarm is shown at the top.

### See also

AlarmControl (Page 4273)

AlarmView (Page 4284)

## SortByTimeEnable

### Description

Specifies whether the sorting direction can be altered in Runtime.

Access in Runtime: Read and write

### Syntax

Object.**SortByTimeEnable**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl".

**BOOLEAN**

Optional TRUE, if the sorting direction can be altered in Runtime.

**See also**

AlarmView (Page 4284)

**SortByTimeEnabled**

**Description**

Specifies whether the sorting of the messages can be altered according to the time in the "AlarmControl" object.

Access in Runtime: Read and write

**Syntax**

Object.**SortByTimeEnabled**[= BOOLEAN]

**Object**

Required A "ScreenItems" object with the format "AlarmControl".

**BOOLEAN**

Optional TRUE, if the sorting can be altered by the device operator.

**SortOnColumnHeaderClick**

**Description**

Specifies whether the alarm text blocks can be sorted via the column header of the alarm text block.

Access in Runtime: Read and write

**Syntax**

Object.**SortOnColumnHeaderClick**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl".

**BOOLEAN**

Optional TRUE, if the message blocks can be sorted by the column header of the message blocks.

**See also**

AlarmControl (Page 4273)

**SortSequence****Description**

Specifies how to change the sorting order by mouse click.

Access in Runtime: Read and write

**Syntax**

Object.**SortSequence**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "RecipeView", "RulerControl".

BOOLEAN.

Value	Description	Description
0	Up/down/none	You can toggle between ascending, descending and no sorting by means of mouse click.
1	Up/down	You can toggle between ascending and descending sorting order by means of mouse click.

**See also**

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

**SortTimeAscending****Description**

Determines whether the last message received is displayed on top (ascending sorting order) in the "MessageView" object.

Access during runtime: Read and Write

## Syntax

Object.SortTimeAscending [= BOOLEAN]

### Object

Required. An object of the "MessageView" type.

### BOOLEAN

Optional. TRUE, if the last message received is displayed on top.

## SortTimeEnable

### Description

Determines whether the sorting of messages can be changed according to time in the "MessageView" object.

Access during runtime: Read and Write

### Syntax

Object.SortTimeEnable [= BOOLEAN]

### Object

Required. An object of the "MessageView" type.

### BOOLEAN

Optional. TRUE, if the sorting can be changed by the operator on the device.

## StartAngle

### Description

Specifies the angle at which the start point of the selected object deviates from the zero position (0°).

Access in Runtime: Read and write

### Syntax

Object.**StartAngle**[=Int]

### Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

**Int**

Optional A value or a constant that specifies the angle at which the start point of the specified object deviates from the zero position (0°).

**See also**

EllipseSegment (Page 4321)

CircleSegment (Page 4305)

EllipticalArc (Page 4324)

CircularArc (Page 4308)

TubeArcObject (Page 4450)

**StartPoint****Description**

Specifies the beginning of the object or returns it.

**StartPointLeft****Description**

Specifies the horizontal distance in pixels from the left edge of the screen.

Access in Runtime: Read and write

**Syntax**

Object.**StartPointLeft**[=Int]

**Object**

Required An object of the "ScreenItem type with the format "Line"".

**Int**

Optional A value that specifies the horizontal distance in pixels of the start point from the left edge of the screen.

**See also**

EllipseSegment (Page 4321)

CircleSegment (Page 4305)

EllipticalArc (Page 4324)

CircularArc (Page 4308)

## StartStyle

### Description

Specifies how the line-start style of the specified object will be displayed.

Access in Runtime: Read and write

### Syntax

Object.**StartStyle**[= THmiLineEndStyle]

#### Object

Required A ""ScreenItem" object with the formats ""Line", "Polyline" or ""Connector".

#### THmiLineEndStyle

Optional A value or a constant that specifies the line-start style. Value range from 0 to 1.

hmiLineEndStyleNone (0): The line has no start symbol.

hmiLineEndStyleFilledArrow (2): The line starts with a filled arrowhead.

### See also

Line (Page 4355)

Polyline (Page 4390)

Connector (Page 4312)

## StartStyle

### Description

Determines how the line start of the given object is displayed.

Access in Runtime: Read and write

### Syntax

Object.StartStyle [= THmiLineEndStyle]

#### Object

Required An object of the "ScreenItem" type with the characteristic "Line," or "Polyline".

#### THmiLineEndStyle

Optional A value or constant which determines the line start. Value range from 0 to 2.

hmiLineEndStyleNone (0): The line has no start symbol.

hmiLineEndStyleFilledArrow (2): The line starts with a filled arrow.

## StartTop

### Description

Specifies the vertical distance in pixels of the start point from the upper edge of the screen.

Access in Runtime: Read and write

### Syntax

Object.**StartTop**[=Int]

#### Object

Required An object of the "ScreenItem" type with the format "Line".

#### Int

Optional A value that specifies the vertical distance in pixels of the start point from the upper edge of the screen.

### See also

[EllipticalArc \(Page 4324\)](#)

[CircularArc \(Page 4308\)](#)

[Line \(Page 4355\)](#)

## StartValue

### Description

Defines the value of the zero point of the scale indicator.

Defines or returns the absolute value for the zero point.

### See also

[Bar \(Page 4287\)](#)

## State

### Description

Returns the status of a message.

The following table shows the possible states of a message:

State	Alarm Log Status
1	Came In
2	Went Out
5	Came in and comment
6	Gone and comment

## StatusbarBackColor

### Description

Defines the background color of the status bar. You open a color selection dialog box with the button. Enable the "Display" option to active the setting.

### See also

AlarmControl (Page 4273)

## StatusbarElementAutoSize

### Description

Enables autosizing of the width of a status bar element selected.

Access in Runtime: Read and write

### Syntax

Object.**StatusbarElementAutoSize**

#### Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "FunctionTrendControl", "RecipeView", "RulerControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### BOOLEAN

TRUE: The width of the selected element is set automatically.

FALSE: The width of the selected element is not set automatically.

OnlineTableControl (Page 4367)

OnlineTrendControl (Page 4375)

AlarmControl (Page 4273)

## StatusbarElementID

### Description

Returns the ID number of the selected status bar element.

WinCC sets this read only ID.

### See also

TrendRulerControl (Page 4439)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

OnlineTrendControl (Page 4375)

AlarmControl (Page 4273)

## StatusbarElementIndex

### Description

References a status bar element. You can assign the values of other properties to a specific element of the status bar by using this property.

Values between 0 and "StatusbarElementCount" minus 1 are valid for "StatusbarElementIndex". Attribute "StatusbarElementCount" defines the number of configurable status bar elements.

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

OnlineTrendControl (Page 4375)

AlarmControl (Page 4273)

## StatusbarElementName

### Description

Displays the object name of the status bar element selected. You can rename the objects of custom status bar elements. The "StatusbarElementName" property for customized elements can be dynamized by the " StatusbarElementRename" property.

### See also

UserArchiveControl (Page 4459)

AlarmControl (Page 4273)

## StatusbarElementRename

### Description

Change the name of the customized element of the status bar that is referenced by the "StatusbarElementIndex" property.

The property with the name StatusbarElementRename can be dynamized for customized elements. With "StatusbarElementRename" you also dynamize the "StatusbarElementName" property.

AlarmControl (Page 4273)

## StatusbarElements

### Description

Specifies the elements that are to be shown in the status bar.

Access in Runtime: Read and write

### Syntax

Object.**StatusbarElements**[=Long]

#### Object

Required A "ScreenItem" object with the format "AlarmView".

**Long**

Optional A value or a constant that specifies the elements that are shown in the status bar.

**See also**

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

OnlineTrendControl (Page 4375)

**StatusbarElementTooltipText****Description**

Defines the tooltip text for the custom status bar element.

**See also**

UserArchiveControl (Page 4459)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

OnlineTrendControl (Page 4375)

AlarmControl (Page 4273)

**StatusbarElementUserDefined****Description**

Indicates whether the project engineer has added the status bar element as a new user-defined element.

Access in Runtime: Read

**Syntax**

Object.**StatusbarElementUserDefined**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTrendControl", "OnlineTableControl", "FunctionTrendControl", "RecipeView", "RulerControl".

### BOOLEAN

TRUE: The element of the status bar is customized.

FALSE: The element of the status bar is specified by the system.

### See also

**StatusbarShowArchiveName****Description**

Specifies whether the archive name will be displayed in the status bar.  
Access in Runtime: Read and write

**Syntax**

Object.**StatusbarShowArchiveName**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "UserArchiveControl".

**BOOLEAN**

Optional TRUE, if the archive name will be displayed in the status bar.

## StatusbarShowColumn

### Description

Specifies whether the current number of selected data record columns will be displayed.

Access in Runtime: Read and write

### Syntax

Object.**StatusbarShowColumn**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "UserArchiveControl".

#### BOOLEAN

Optional TRUE, specifies whether the current number of selected data record columns will be displayed.

## StatusbarShowRecord

### Description

Specifies whether the field coordinates of the selected data record will be displayed in the status bar.

Access in Runtime: Read and write

### Syntax

Object.**StatusbarShowRecord**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "UserArchiveControl".

#### BOOLEAN

Optional TRUE, if the field coordinates of the selected data record will be displayed in the status bar.

## StatusbarShowRow

### Description

Specifies whether the current number of selected data record rows will be displayed.

Access in Runtime: Read and write

## Syntax

Object.**StatusbarShowRow**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl".

### BOOLEAN

Optional TRUE, if the current number of selected data record rows will be displayed.

## StatusbarShowText

### Description

Specifies whether the current status of the database will be displayed in the status bar.

Access in Runtime: Read and write

## Syntax

Object.**StatusbarShowText**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "UserArchiveControl".

### BOOLEAN

Optional TRUE, specifies whether the current status of the database will be displayed in the status bar.

## StatusbarShowTooltips

### Description

Enables the display of tooltips for the status bar elements in Runtime.

Access in Runtime: Read and write

## Syntax

Object.**StatusbarShowTooltips**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "UserArchiveControl", "TrendRulerControl".

### BOOLEAN

TRUE: The tooltips are displayed.

FALSE: The tooltips are not displayed.

### StatusbarUseBackColor

#### Description

Sets a background color for the status bar.  
Access in Runtime: Read and write

#### Syntax

Object.**StatusbarUseBackColor**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "UserArchiveControl", "TrendRulerControl".

**BOOLEAN**

TRUE: The background color of the status bar is displayed.

FALSE: The background color of the status bar is not displayed.

AlarmControl (Page 4273)

**StatusbarVisible****Description**

Enables the display of the status bar of a control.

Access in Runtime: Read and write

**Syntax**

Object.**StatusbarVisible**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "RecipeView", "RulerControl".

**BOOLEAN**

TRUE: The status bar is displayed.

FALSE: The status bar is not displayed.

AlarmControl (Page 4273)

## Style

### Description

Specifies the line style of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**Style**[= THmiLineStyle]

#### Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "EllipticalArc", "CircularArc" or "Connector".

#### THmiLineStyle

Optional A value or a constant that specifies the line style. Value range from 0 to 4.

hmiLineStyleSolid (0): solid line

hmiLineStyleDash (1): broken line

hmiLineStyleDot (2): dotted line

hmiLineStyleDashDot (3): dash - dot line

hmiLineStyleDashDotDot (4): dash - dot - dot line

Default setting: hmiLineStyleSolid

### See also

Line (Page 4355)

Polyline (Page 4390)

EllipticalArc (Page 4324)

CircularArc (Page 4308)

Connector (Page 4312)

## Style

### Description

Determines the line style of the given object.

Access during runtime: Read and Write

## Syntax

Object.Style [= THmiLineStyle]

### Object

Required. An object of the "screen item" type with the characteristic "Line," or "Polyline".

### THmiLineStyle

Optional. A value or constant that defines the line style. Value range from 0 to 4.

hmiLineStyleSolid (0): solid line

hmiLineStyleDash (1): dashed line

hmiLineStyleDot (2): dotted line

hmiLineStyleDashDot (3): dash dot line

hmiLineStyleDashDotDot (4): dash dot dot line

Default setting: hmiLineStyleSolid

## StyleSettings

### Description

Defines the style in which the object is displayed.

User Defined	Shows the object according to the respective settings.
Global	Shows the object in a globally defined design.
Windows Style	Shows the object in Windows style.

### See also

Button (Page 4294)

WindowSlider (Page 4468)

RoundButton (Page 4404)

## SwapDimensionsWithOrientation

### Description

Specifies whether the values for the height and width of the bar should be automatically replaced if the bar alignment is changed.

Access in Runtime: Read and write

## Syntax

Object.**SwapDimensionsWithOrientation**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Bar".

### BOOLEAN

Optional TRUE, if the values for the height and width of the bar should be automatically replaced if the bar alignment is changed.

## See also

Bar (Page 4287)

## SwapFirstWithLastConnection

### Description

Specifies whether the text in the object is shown horizontally.

Access in Runtime: Read and write

### Syntax

Object.**SwapFirstWithLastConnection**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Connector".

### BOOLEAN

Optional TRUE, if the text in the object is shown horizontally.

## See also

Connector (Page 4312)

## Properties T

### TableBackColor

### Description

Specifies the background color of the table cells for the selected object.

Access in Runtime: Read and write

## Syntax

Object.**TableBackColor**[= Color]

### Object

Required An object of the "ScreenItem" type with the format "UserArchivControl", "StatusForce", "OnlineTrendControl", "AlarmControl" or "UserView".

### Color

Optional A value or a constant that specifies the background color of the table cells.

## Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

## TableBackColor

### Description

Determines the background color of the table cells of the given object.

Access during runtime: Read and Write

### Syntax

Object.TableBackColor [= Color]

### Object

Required An object of the "ScreenItem" type with the characteristics "RecipeView", "StatusForce", "TrendView", "MessageView" or "UserView".

### Color

Optional A value or constant which determines the background color of the table cells.

## Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

## TableFocusOnButtonCommand

### Description

Specifies whether by clicking on a Button in a script in Runtime the table of the Controls will be activated.

Access in Runtime: Read and write

### Syntax

Object.**TableFocusOnButtonCommand**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "AlarmView".

**BOOLEAN**

Optional TRUE, if by clicking on a Button in a script in Runtime the table of the Controls will be activated.

**See also**

AlarmControl (Page 4273)

**TableForeColor****Description**

Specifies the font color of the rows. You open a color selection dialog box with the button.

**TableForeColor****Description**

Specifies the text color used in the table cells of the selected object.

Access in Runtime: Read and write

**Syntax**

Object.**TableForeColor**[= Color]

**Object**

Required A "ScreenItem" object with the formats "RecipeView", ""StatusForce", "MessageView" or ""UserView".

**Color**

Optional A value or a constant that specifies the text color used in the table cells.

**Comments**

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

## TableForeColor

### Description

Determines the text color in the table cells of the given object.

Access during runtime: Read and Write

### Syntax

Object.TableForeColor [= Color]

#### Object

Required An object of the "ScreenItem" type with the characteristics "RecipeView," "StatusForce", "MessageView" or "UserView".

#### Color

Optional A value or constant which determines the text color of the table cells.

### Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

## TableGridLineColor

### Description

Specifies the color of the gridlines in the table of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**TableGridLineColor**[= Color]

#### Object

Required A "ScreenItem" object with the formats "RecipeView", "TrendView" or "UserView".

#### Color

Optional A value or a constant that specifies the color of the gridlines in a table.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

## TableGridLineColor

### Description

Determines the color of the gridlines in the table of the given object.

Access during runtime: Read and Write

### Syntax

Object.**TableGridLineColor** [= Color]

**Object**

Required An object of the "ScreenItem" type with the characteristics "RecipeView," "MessageView", "TrendView" or "UserView".

**Color**

Optional A value or constant which determines the color of the gridlines of the table.

**Comments**

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

**TableHeaderBackColor**

**Description**

Specifies the background color in the header of the table of the selected object.

Access during runtime: Read and Write

**Syntax**

Object.**TableHeaderBackColor**[= Color]

**Object**

Required An object of the "ScreenItem" type with the characteristics "RecipeView", "StatusForce", "TrendView", "MessageView," or "UserView".

**Color**

Optional A value or a constant that specifies the background color in the header.

**Comments**

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

**TableHeaderForeColor****Description**

Specifies the text color in the header of the table of the selected object.

Access during runtime: Read and Write

**Syntax**

Object.**TableHeaderForeColor**[= Color]

**Object**

Required An object of the "ScreenItem" type with the characteristics "RecipeView", "StatusForce", "TrendView", "MessageView" or "UserView".

**Color**

Optional A value or a constant that specifies the text color in the header.

**Comments**

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

StatusForce (Page 4417)  
TrendView (Page 4447)

## TagName

### Description

The "Index" property references a trend. "TagName" defines the tag linked to this trend. It is specified in the form "Archivname\Variablenname" to display tags in a process value archive or "TasgName" to display an internal or external tag which is not stored in an archive.

## TagPrefix

### Description

A tag prefix can be assigned for a screen window that is prefixed to all tags which are used in the screen. In this way, a picture that is embedded in a picture window retains access to its own tags while another accesses other tags.

The "TagPrefix" property specifies the prefix that is prefixed to all tags which are available in the screen.

The change to the tag prefix does not become effective until the screen is reloaded. This happens automatically when changing screens, otherwise the screen name must be reassigned.

The prefix is freely definable but must match the name of the structure tag.

## Example

The "InOutput" screen should be displayed in the screen window. The "InOutput" screen contains 3 I/O fields which are bound to a structure tag. The structure tag consists of the elements EA1, EA2, EA3; one element each for every I/O field.

Three such structure tags with the structure names Struct1, Struct2 and Struct3 are defined in the project for example.

The tag prefix is the structure name with a following period in this case. If you specify Struct2., for example, as a tag prefix (the period is necessary to address the elements of the structure tags syntactically correctly as structure elements), the I/O fields in the "InOutput" screen are bound with the elements of structure tag Struct2:

Tag prefix: "Struct2."

- Output value (first I/O field): EA1
- Output value (second I/O field): EA2
- Output value (third I/O field): EA3

The current tag binding in the screen window is therefore

- Output value (first I/O field): Struct2.EA1
- Output value (second I/O field): Struct2.EA2
- Output value (third I/O field): Struct2.EA3

**See also**

ScreenWindow (Page 4408)

**Tags****Description**

Returns an object of type "Tags".

Access during runtime: Read

**Syntax**

Object.**Tags**

**Object**

Necessary. An object of the "HMIRuntime" type.

**Example**

The following example accesses the tag "Tag1":

```
'VBS86
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
```

**See also**

HMIRuntime (Page 4248)

**Template****Description**

Returns the template for displaying the window content of the "Application Window" object.  
Read only access.

The following templates are possible depending on the property value:

**Window Contents = Global Script**

"GSC diagnostics"

The application window is supplied by applications of the Global Script. The results of the diagnosis system are displayed.

**"GSC Runtime"**

The application window is supplied by applications of the Global Script. The analysis results regarding characteristics in Runtime are displayed.

**Window Contents = Print Jobs**

**"All Jobs":**

The application window is supplied by the logging system. The available reports are displayed as a list.

**"All Jobs - Context Menu":**

The application window is supplied by the logging system. The available reports are displayed as a list. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the log.

**"Job Detail View":**

The application window is supplied by the logging system. The available reports are displayed in a selection menu. Detailed information is displayed for the selected report.

**"Selected Jobs - Context Menu":**

The application window is supplied by the logging system. The available reports are displayed as a list. This list only contains reports which you have activated the option "Mark for print job list" in the "Print Job Properties" dialog. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the log.

**See also**

ScriptDiagnostics (Page 4410)

**Text**

**Description**

Specifies the labeling for the text field.

Access in Runtime: Read and write

**Syntax**

Object.**Text**[= STRING]

**Object**

Required A "ScreenItem" " object with the formats "TextField", "CheckBox" or "OptionGroup".

**STRING**

Optional A value or a constant that specifies the labeling.

**See also**

TextField (Page 4436)

CheckBox (Page 4300)

OptionGroup (Page 4384)

MultiLineEdit (Page 4362)

Listbox (Page 4357)

RoundButton (Page 4404)

## Text

### Description

Determines the labeling of the text field.

Access during runtime: Read and Write

### Syntax

Object.Text [= STRING]

#### Object

Required. An object of the "ScreenItem" type with the characteristic "TextField".

#### STRING

Optional. A value or constant which determines the label text color.

## TextList

### Description

A list which contains the assignments between the output value and the output text actually to be output. The assignments are dependent on the set list type. You determine the list type with the ListType property.

Access in Runtime: Read

### Syntax

Object.TextList

#### Object

Required A "ScreenItem" object with the format "SymbolicIOField".

### See also

Button (Page 4294)

SymbolicIOField (Page 4422)

## TextOff

### Description

Specifies the text that will be displayed in the status "off" of the selected object.

Access in Runtime: Read and write

### Syntax

Object.**TextOff**[= STRING]

#### Object

Required A "ScreenItem" object with the formats "SymbolicIOField", "Button" or "Switch".

#### STRING

Optional A value or a constant that specifies the labeling for the status "off".

### Comments

The property is only available if the referenced object "SymbolicIOField", "Button" or "Switch" is type "Text".

### See also

SymbolicIOField (Page 4422)

Button (Page 4294)

Switch (Page 4419)

## TextOff

### Description

Determines the text which is displayed in the "Off" status of the given object.

Access during runtime: Read and Write

### Syntax

Object.**TextOff**[= STRING]

#### Object

Required. An object of the "ScreenItem" type with the characteristic "Button," and "Switch".

#### STRING

Optional. A value or constant which determines the label for the "Off" status.

**Remarks**

The property is only available if the referenced "Button" or "Switch" object is of the "Text" type.

**TextOn****Description**

Specifies the text that will be displayed in the status "on" of the selected object.

Access in Runtime: Read and write

**Syntax**

Object.**TextOn**[= STRING]

**Object**

Required A "ScreenItem" object with the formats "SymbolicOField", "Button" or ""Switch".

**STRING**

Optional A value or a constant that specifies the labeling for the status "on".

**Comments**

The property is only available if the referenced object "Button" or Switch" is type ""Text".

**See also**

SymbolicOField (Page 4422)

Button (Page 4294)

Switch (Page 4419)

**TextOn****Description**

Determines the text which is displayed in the "On" status of the given object.

Access during runtime: Read and Write

**Syntax**

Object.**TextOn**[= STRING]

**Object**

Required. An object of the "ScreenItem" type with the characteristic "Button," and "Switch".

### **STRING**

Optional. A value or constant which determines the label for the "On" status.

### **Remarks**

The property is only available if the referenced "Button" or "Switch" object is of the "Text" type.

### **TextOrientation**

### **Description**

Specifies the text direction (orientation) of the selected object.

Access in Runtime: Read and write

### **Syntax**

Object.**TextOrientation**[=TextOrientation]

#### **Object**

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "Bar", "OnlineTrendControl", "FunctionTrendControl", "Checkbox", "OptionGroup" or "WindowSlider".

#### **TextOrientation**

hmiTextHorizontal ( 0): The text is shown horizontally.

hmiTextRotated90Degree (-1): The text is shown vertically and left justified.

hmiTextRotated270Degree ( 1): The text is shown vertically and right justified.

### **See also**

CheckBox (Page 4300)

Button (Page 4294)

WindowSlider (Page 4468)

RoundButton (Page 4404)

Switch (Page 4419)

IOField (Page 4351)

TextField (Page 4436)

OptionGroup (Page 4384)

## ThumbBackColor

### Description

Specifies the background color of the slider in the ""Slider" object.

Access in Runtime: Read and write

### Syntax

Object.**ThumbBackColor**[= Color]

#### Object

Required A "ScreenItem" object with the formats ""Slider" or "WindowSlider".

#### Color

Optional A value or a constant that specifies the background color of the slider.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

### See also

Slider (Page 4412)

WindowSlider (Page 4468)

## ThumbBackColor

### Description

Determines the background color of the slider in the "Slider" object.

Access during runtime: Read and Write

### Syntax

Object.**ThumbBackColor**[= Color]

#### Object

Required An object of the "ScreenItem" type with the characteristic "Slider".

#### Color

Optional A value or constant which determines the background color of the slider.

## Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

## TicksColor

## Description

Specifies the color of the hour markers on the face of the "Clock" object.

Access during runtime: Read and Write

## Syntax

Object.**TicksColor**[= Color]

### Object

Required An object of the "ScreenItem" type with the characteristic "Clock".

### Color

Optional A value or a constant that specifies the color of the hour markers.

## Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

## See also

Clock (Page 4310)

## TickStyle

## Description

Specifies the scale display.

Access during runtime: Read and write

## Syntax

Object.**TickStyle**[=SliderTickStyle]

**Object**

Necessary. A "ScreenItem" object with the format "Slider".

**SliderTickStyle**

hmiSliderTickStyleNone ( 0): The object has no scale.

Identifies no strokes.

hmiSliderTickStyleEffect1 ( 1): The scale consists of main gradations only. The scale is black on a white background.

Identifies main strokes (black-white).

hmiSliderTickStyleEffect2 ( 2): The scale consists of main gradations only. The scale is white on a black background.

Identifies main strokes (white-black).

hmiSliderTickStyleNormal ( 3): The scale consists of simple gradations.

Identifies normal strokes.

**Comments**

Because of the automatic scaling it is possible that in some parts two marking lengths of the scale can be positioned directly adjacent to one another (looks like a wider marking length). You can correct this effect by slightly lengthening or shortening the slider object.

You you can also completely suppress the display of the scale ("WithAxes").

**Used for the following object types:**

Slider

**See also**

Slider (Page 4412)

**TimeAxisBeginTime(i)****Description**

Specifies the start time of the display for the selected trend. Whether the information that is evaluated should be dependent on the properties ""UseTimeRange(i)" and "ShareTimeAxis".

Access in Runtime: Read and write

**Syntax**

Object.**TimeAxisBeginTime(i)[=Time]**

**Object**

Required A "ScreenItem" object with the format "OnlineTrend".

**Time**

Optional A value or a constant that specifies the start time of the display for the selected trend.

**See also**

OnlineTrendControl (Page 4375)

**TimeAxisEndTime**

**Description**

Specifies the end time of the display for the selected trend. Whether the information is evaluated depends on the properties "Autorange", "UseTimeRange(i)" and "ShareTimeAxis".

Access in Runtime: Read and write

**Syntax**

Object.**TimeAxisEndTime**[=Time]

**Object**

Required A "ScreenItem" object with the format "OnlineTrend".

**Time**

Optional A value or a constant that specifies the end time of the display for the selected trend.

**See also**

OnlineTrendControl (Page 4375)

**TimeAxisLabel(i)**

**Description**

Specifies the labeling of the time axis. Whether the information is evaluated depends on the property "ConfigureTimeAxis(i)".

Access in Runtime: Read and write

**Syntax**

Object.**TimeAxisLabel**(i)[=String]

**Object**

Required A "ScreenItem" object with the format "OnlineTrend".

**String**

Optional A value or a constant that specifies the labeling of the time axis.

**Comments**

The parameter i indicates the number of the trend.

**See also**

OnlineTrendControl (Page 4375)

**TimeAxisRange****Description**

Time span that will be displayed by the time axis.

Access in Runtime: Read and write

**Syntax**

Object.**TimeAxisRange**[=Decimal]

**Object**

Required A "ScreenItem" object with the format "TrendView".

**Decimal**

Optional Time span that will be displayed by the time axis.

**See also**

TrendView (Page 4447)

**TimeAxisShowGridLines(i)****Description**

Specifies whether the trend window is shown with grid lines that run parallel to the x axis.

Access in Runtime: Read and write

## Syntax

Object.**TimeAxisShowGridLines**(i)[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "OnlineTrend".

### BOOLEAN

Optional TRUE, if the trend window is shown with grid lines that run parallel to the x axis.

## Comments

The distance between two grid lines can be altered with the "TimeAxisGridLineInterval(i)" property.

## See also

OnlineTrendControl (Page 4375)

## TimeAxisShowLargeIncrements(i)

## Description

Specifies whether the time axis is scaled with long marking lengths.

Access in Runtime: Read and write

## Syntax

Object.**TimeAxisShowLargeIncrements**(i)[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "OnlineTrend".

### BOOLEAN

Optional TRUE, if the time axis is scaled with long marking lengths.

## Comments

The distance of two long marking lines can be altered with the ""TimeAxisLargeIncrementSize(i) property.

## See also

OnlineTrendControl (Page 4375)

## TimeAxisShowSmallIncrements(i)

### Description

Specifies whether the time axis is scaled with short marking lengths.

Access in Runtime: Read and write

### Syntax

Object.**TimeAxisShowSmallIncrements(i)**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "OnlineTrend".

#### BOOLEAN

Optional TRUE, if the time axis is scaled with short marking lengths.

### Comments

The distance of two short marking lines can be altered with the "TimeAxisSmallIncrementSize(i)" property.

### See also

OnlineTrendControl (Page 4375)

## TimeAxisTimeFormat(i)

### Description

Specifies the format of the information along the time axis for the selected trend.

Access in Runtime: Read and write

### Syntax

Object.**TimeAxisTimeFormat(i)**[=TimeFormat]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

#### TimeFormat

( 0): The information is carried out in the form hh:mm.

( 1): The information is carried out in the form hh:mm:ss.

( 2): The information is carried out in the form hh:mm:ss.ms.

- ( 3): The information is carried out in the form hh:mm (full hours).
- ( 4): The information is carried out in the form hh:mm:ss (full minutes).
- ( 5): The information is carried out in the form hh:mm:ss:ms (full seconds).
- ( 6): The information is carried out in the form dd\_mm\_yy\_hh\_mm.
- ( 7): The information is carried out in the form dd\_mm\_yy\_hh\_mm (full hours).
- ( 8): The information is carried out in the form dd\_mm\_yy.
- ( 9): The information is carried out in the form dd\_mm\_yy\_ (full days).

## Comments

The parameter i indicates the number of the trend.

## See also

OnlineTrendControl (Page 4375)  
FunctionTrendControl (Page 4330)  
OnlineTableControl (Page 4367)

## TimeBase

### Description

Specifies the time zone in which the time values will be displayed.  
Access in Runtime: Read and write

### Syntax

Object.**TimeBase**[=TimeBase]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl", "OnlineTableControl", "AlarmControl" or "UserArchiveControl".

#### TimeBase

hmiTimeBaseLocalTimezone ( 0): Local time  
hmiTimeBaseServerTimezone ( 1): Time zone of the server  
hmiTimeBaseUTC ( 2): UTC (Universal Time Coordinated)  
hmiTimeBaseProjectSetting ( 3): Project settings

## Comments

Set the time mode in accordance with the computer settings on the properties page of the computer in WinCC Explorer. The following selection is offered:

## See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

## TimeColumnActualize

### Description

Enables the update of values in the selected column.

Access in Runtime: Read and write

### Syntax

Object.**TimeColumnActualize**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

#### **BOOLEAN**

TRUE: The time column is actualized.

FALSE: The time column is not actualized. This setting can be useful when comparing tables.

## See also

OnlineTableControl (Page 4367)

## TimeColumnAdd

### Description

Creates a new time column.

### Syntax

Object.**TimeColumnAdd**

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

### See also

OnlineTableControl (Page 4367)

### TimeColumnAlign

#### Description

Defines the mode of alignment of the time column selected.

Access in Runtime: Read and write

#### Syntax

Object.**TimeColumnAlign**[=HorizontalAlignment]

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

#### HorizontalAlignment

Value	Description	Description
0	left	The time column selected is displayed on the left.
1	Centered	The time column selected is aligned to center.
2	right	The time column selected is displayed on the right.

### See also

OnlineTableControl (Page 4367)

### TimeColumnAlignment(i)

#### Description

Specifies the alignment of the time column of a column pair i. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

## Syntax

Object.**TimeColumnAlignment**(i)[=AlignmentHorizontal]

### Object

Required A "ScreenItem" object with the format "TableView".

### AlignmentHorizontal

hmiAlignmentLeft ( 0): The text is shown left justified.

hmiAlignmentCentered ( 1): The text is shown centered.

hmiAlignmentRight ( 2): The text is shown right justified.

## See also

OnlineTableControl (Page 4367)

## TimeColumnBackColor

### Description

Specifies the background color of the time column selected. You open a color selection dialog box with the button.

The setting is useful if:

- The "Use value column colors" option is disabled
- The "Font color" option is set in the "Use column color" field of the "General" tab.

Access in Runtime: Read and write

## Syntax

Object.**TimeColumnBackColor**

### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

## See also

OnlineTableControl (Page 4367)

## TimeColumnBeginTime

### Description

Defines the start of the time range for a selected time column. .

### Syntax

Object.**TimeColumnBeginTime**

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

### See also

OnlineTableControl (Page 4367)

## TimeColumnCaption

### Description

Defines the caption of the time column.

### Syntax

Object.**TimeColumnCaption**

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

### See also

OnlineTableControl (Page 4367)

## TimeColumnCount

### Description

Defines the number of time columns configured.

### Syntax

Object.**TimeColumnCount**

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

### See also

OnlineTableControl (Page 4367)

## TimeColumnDateFormat

### Description

Defines the date format for visualizing a selected time column.

Access in Runtime: Read and write

### Syntax

Object.**TimeColumnDateFormat**[=DateFormat]

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

#### DateFormat

Value	Description
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.10.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2010.
dd/MM/yy	Day/Month/Year, e.g. 24/12/10.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2010.

### See also

OnlineTableControl (Page 4367)

## TimeColumnEndTime

### Description

Defines the end of the time range of a selected time column.

### Syntax

Object.**TimeColumnBeginTime**

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

### See also

OnlineTableControl (Page 4367)

## TimeColumnForeColor

### Description

Specifies the font color of the time column selected. You open a color selection dialog box with the button.

The setting is effective:

- When the option "in the colors of the value column" is not activated.
- When the "Font color" option is activated in the "Use column color" area of the "General" tab.

Access in Runtime: Read and write

### Syntax

Object.**TimeColumnForeColor**

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

### See also

OnlineTableControl (Page 4367)

## TimeColumnFormat(i)

### Description

Specifies the format of the time columns for the selected column pair. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

### Syntax

Object.**TimeColumnFormat**(i)[=TimeFormat]

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

#### TimeFormat

( 0): The information is carried out in the form hh:mm.

( 1): The information is carried out in the form hh:mm:ss.

( 2): The information is carried out in the form hh:mm:ss.ms.

( 3): The information is carried out in the form hh:mm (full hours).

- ( 4): The information is carried out in the form hh:mm:ss (full minutes).
- ( 5): The information is carried out in the form hh:mm:ss:ms (full seconds).
- ( 6): The information is carried out in the form dd\_mm\_yy\_hh\_mm.
- ( 7): The information is carried out in the form dd\_mm\_yy\_hh\_mm (full hours).
- ( 8): The information is carried out in the form dd\_mm\_yy.
- ( 9): The information is carried out in the form dd\_mm\_yy\_ (full days).

## See also

OnlineTableControl (Page 4367)

## TimeColumnHideText

### Description

Sets text format for displaying the content of a time column.

Access in Runtime: Read and write

### Syntax

Object.**TimeColumnActualize**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

#### BOOLEAN

TRUE: The content is not shown as a text.

FALSE: The content is shown as a text.

## See also

OnlineTableControl (Page 4367)

## TimeColumnHideTitleText

### Description

Sets text format for displaying the time column header.

Access in Runtime: Read and write

### Syntax

Object.**TimeColumnActualize**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "OnlineTableControl".

**BOOLEAN**

TRUE: The header is not shown as a text.

FALSE: The header is shown as a text.

**See also**

OnlineTableControl (Page 4367)

**TimeColumnIndex**

**Description**

References a configured time column. You can assign the values of other properties to a specific time column by using the property.

Valid values for "TimeColumnIndex" are between 0 and "TimeColumnCount" minus 1. The "TimeColumnCount" property indicates the number of configured time columns.

**Syntax**

Object.**TimeColumnIndex**

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTableControl"

**See also**

OnlineTableControl (Page 4367)

**TimeColumnLength**

**Description**

Specifies the width of a selected time column.

**Syntax**

Object.**TimeColumnLength**

**Object**

Required A "ScreenItem" object with the format "OnlineTableControl".

**See also**

OnlineTableControl (Page 4367)

**TimeColumnMeasurePoints**

**Description**

Defines the number of measurement points to be displayed in the time column selected.

**Syntax**

Object.**TimeColumnMeasurePoints**

**Object**

Required A "ScreenItem" object with the format "OnlineTableControl".

**See also**

OnlineTableControl (Page 4367)

**TimeColumnName**

**Description**

Specifies the name of a selected time column.

**Syntax**

Object.**TimeColumnName**

**Object**

Required A "ScreenItem" object with the format "OnlineTableControl".

**See also**

OnlineTableControl (Page 4367)

**TimeColumnRangeType**

**Description**

Defines the time range setting for the time column selected.

Access in Runtime: Read and write

### Syntax

Object.**TimeColumnRangeType**[=TimeRangeType]

### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

### TimeRangeType

Value	Description	Description
0	Time range	Defines the start time and time range of the time column.
1	Start to end time	Defines the start and end time for the time column.
2	Number of measurement points	Defines the start time and the number of measurement points for the time column.

### See also

OnlineTableControl (Page 4367)

## TimeColumnRemove

### Description

Removes the selected time column from the list.

### Syntax

Object.**TimeColumnRemove**

### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

### See also

OnlineTableControl (Page 4367)

## TimeColumnRename

### Description

Changes the name of the time column which is referenced by the "TimeColumnIndex" property. With "TimeColumnRename" you also dynamize the "TimeColumnName" property.

**Syntax**

Object.**TimeColumnRename**

**Object**

Required A "ScreenItem" object with the format "OnlineTableControl".

**See also**

OnlineTableControl (Page 4367)

**TimeColumnRepos****Description**

Repositions the order of time columns and of corresponding value columns. "Up" and "Down" move the time column selected up or down in the list. This moves the time column and corresponding value columns in the table towards the front or towards the back.

**Syntax**

Object.**TimeColumnRepos**

**Object**

Required A "ScreenItem" object with the format "OnlineTableControl".

**See also**

OnlineTableControl (Page 4367)

**TimeColumnShowDate****Description**

Enables the display of the date and time in the time column selected.

Access in Runtime: Read and write

**Syntax**

Object.**TimeColumnShowDate**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "OnlineTableControl".

### **BOOLEAN**

TRUE: The date and the time are displayed. The date format is defined in the "Date format" field.

FALSE: The date is not displayed. Only the time is displayed.

### **See also**

OnlineTableControl (Page 4367)

## **TimeColumnShowIcon**

### **Description**

Enables the display of time column contents as icon.

Access in Runtime: Read and write

### **Syntax**

Object.**TimeColumnActualize**[=BOOLEAN]

#### **Object**

Required A "ScreenItem" object with the format "OnlineTableControl".

### **BOOLEAN**

TRUE: The content is shown as an icon.

FALSE: The content is not shown as an icon.

### **See also**

OnlineTableControl (Page 4367)

## **TimeColumnShowTitleIcon**

### **Description**

Specifies whether the values of the selected column are updated.

Access in Runtime: Read and write

### **Syntax**

Object.**TimeColumnShowTitleIcon** [=BOOLEAN]

#### **Object**

Required A "ScreenItem" object with the format "OnlineTableControl".

**BOOLEAN**

TRUE: The header is shown as an icon.

FALSE: The header is not shown as an icon.

**See also**

OnlineTableControl (Page 4367)

**TimeColumnSort****Description**

Specifies how the time column referenced in "TimeColumnIndex" is sorted.

Access in Runtime: Read and write

**Syntax**

Object.**TimeColumnSort** [=TimeColumnSort]

**Object**

Required A "ScreenItem" object with the format "OnlineTableControl".

**TimeColumnSort**

Value	Description	Description
0	no	No sorting
1	Ascending	Ascending order, starting at the lowest value.
2	Descending	Descending order, starting at the highest value.

**See also**

OnlineTableControl (Page 4367)

**TimeColumnSortIndex****Description**

Specifies the sorting order of the time column referenced in "TimeColumnIndex". If you set the value to "0", the sorting criterion is removed in "TimeColumnSort".

### Syntax

Object.**TimeColumnSortIndex**

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTableControl"

### See also

OnlineTableControl (Page 4367)

## TimeColumnTimeFormat

### Description

Defines the time format for visualizing a selected time column.

Access in Runtime: Read and write

### Syntax

Object.**TimeColumnTimeFormat**[=TimeFormat]

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

#### TimeFormat

Value	Description
Automatic	The time format is set automatically.
HH:mm:ss.ms	Hours:Minutes:Seconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44.240 PM.

### See also

OnlineTableControl (Page 4367)

## TimeColumnTimeRangeBase

### Description

Defines the time unit for calculating the time range.

Access in Runtime: Read and write

**Syntax**

Object.**TimeColumnTimeRangeBase**[=TimeRangeBase]

**Object**

Required A "ScreenItem" object with the format "OnlineTableControl".

**TimeRangeBase**

Value	Description
500	500 ms
1000	1 second
60000	1 minute
3600000	1 hour
86400000	1 day

**See also**

OnlineTableControl (Page 4367)

**TimeColumnTimeRangeFactor****Description**

Defines the factor for calculating the time range. Only integer factors are valid.

**Syntax**

Object.**TimeColumnTimeRangeFactor**

**Object**

Required A "ScreenItem" object with the format "OnlineTableControl".

**See also**

OnlineTableControl (Page 4367)

**TimeColumnUseValueColumnColors****Description**

Defines whether the selected time column will be displayed in the value column colors.

Access in Runtime: Read and write

## Syntax

Object.**TimeColumnUseValueColumnColors**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

### BOOLEAN

TRUE: The selected time column is displayed in the colors of the value column. The settings in the "Font color" and "Background color" fields are disabled.

FALSE: The selected time column is displayed in the colors which are specified in the "Font color" and "Background color" fields.

## See also

OnlineTableControl (Page 4367)

## TimeColumnVisible

### Description

The list shows the time columns you created. Select the time columns to be displayed in the table from the list.

Click a time column entry in the list to adapt the properties and to define the time range of the time column.

## Syntax

Object.**TimeColumnVisible**

### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

## See also

OnlineTableControl (Page 4367)

## TimeJumpColor(i)

### Description

Specifies the color that is identified in the time jump available in the log. Whether the information is evaluated depends on the property "TimeJumpEnabled(i)".

Access in Runtime: Read and write

## Syntax

Object.**TimeJumpColor**(i)[=Color]

### Object

Required A "ScreenItem" object with the formats "OnlineTrend" or "TableView".

### Color

Optional A value or a constant that specifies the color that identifies the time jump available in the log.

## See also

OnlineTrendControl (Page 4375)

OnlineTableControl (Page 4367)

## TimeJumpEnabled(i)

### Description

Specifies if the time jumps available in the log are identified in the color set up in "TimeJumpColor(i)".

Access in Runtime: Read and write

## Syntax

Object.**TimeJumpEnabled**(i)[=BOOLEAN]

### Object

Required A "ScreenItem" object with the formats "OnlineTrend" or "TableView".

### BOOLEAN

Optional TRUE, if the time jumps available in the log are identified in the color specified in "TimeJumpColor(i)".

## See also

OnlineTrendControl (Page 4375)

OnlineTableControl (Page 4367)

## TimeOverlapColor(i)

### Description

Specifies the color that is identified in the time overlap available in the log. Whether the information is evaluated depends on the attribute "TimeOverlapEnabled(i)".

Access in Runtime: Read and write

### Syntax

Object.**TimeOverlapColor(i)**[=Color]

#### Object

Required A "ScreenItem" object with the formats "OnlineTrend" or "TableView".

#### Color

Optional A value or a constant that specifies the color that identifies the time overlap available in the log.

### See also

OnlineTrendControl (Page 4375)

OnlineTableControl (Page 4367)

## TimeOverlapEnabled(i)

### Description

Specifies if the time overlaps available in the log are identified in the color set up in "TimeOverlapColor(i)".

Access in Runtime: Read and write

### Syntax

Object.**TimeOverlapEnabled(i)**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the formats "OnlineTrend" or "TableView".

#### BOOLEAN

Optional TRUE, if the time jumps overlaps available in the log are identified in the color specified in "TimeOverlapColor(i)".

**See also**

OnlineTrendControl (Page 4375)

OnlineTableControl (Page 4367)

**TimeRangeBase(i)****Description**

Specifies the unit for determining the time interval of the selected trend.

Access in Runtime: Read and write

**Syntax**

Object.**TimeRangeBase(i)**[=TagLoggingTimeUnit]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

**TagLoggingTimeUnit**

( 1): The time intervals are set up in milliseconds.

hmiCurveTimeRangeBase500ms (500): The time intervals are set up in 500 ms.

hmiCurveTimeRangeBaseSecond ( 1000): The time intervals are set up in seconds.

hmiCurveTimeRangeBaseMinute ( 60000): The time intervals are set up in minutes.

hmiCurveTimeRangeBaseHour ( 3600000): The time intervals are set up in hours.

hmiCurveTimeRangeBaseDay ( 86400000): The time intervals are set up in days.

**Comments**

The time range to be displayed for the trend *i* is achieved by multiplying the values "TimeRangeBase(i)" and "TimeRangeFactor(i)", whereby the value of "TimeRangeBase(i)" is interpreted in milliseconds. The "TimeRangeBase(i)" and "TimeRangeFactor(i)" properties are only evaluated if the "TimeRange" property has the value "-1".

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

## TimeRangeFactor(i)

### Description

Specifies the factor for determining the time interval of the selected trend.

Access in Runtime: Read and write

### Syntax

Object.**TimeRangeFactor(i)**[=Int]

#### Object

Required A "ScreenItem" object with the formats "OnlineTrend", "FunctionTrendView" or "TableView".

#### Int

Optional A value or a constant that specifies the factor for determining the time interval of the selected trend.

### Comments

The time range to be displayed for the trend i is achieved by multiplying the values ""TimeRangeBase(i and "TimeRangeFactor(i)", whereby the value of "TimeRangeBase(i)" is interpreted in milliseconds. The "TimeRangeBase(i)" and "TimeRangeFactor(i)" " properties are only evaluated if the property "TimeRange" has the value "-1".

## Timestamp

### Description

Returns the time stamp of the last read access of a tag in local time as DATE.

Access in Runtime: Read

### Syntax

Object.**TimeStamp**

#### Object

Required A "Tag" object.

## Comments

To show the TimeStamp property in plain text, use the VBS function "FormatDateTime(Date[, NamedFormat])". The output is dependent on the language setting. To adjust the language, use the VBS function "SetLocale'()".

If you want to return the time stamp sorted by date, day and time, use the NamedFormat parameter or the VBS functions like Year, WeekDay, Day, Hour, Minute, Second. The name of a week day can be obtained using the VBS function WeekdayName.

## Examples

The following example issues the time stamp of the tag "Tag11" with the aid of the function "FormatDateTime":

```
'VBS87
Dim objTag
Dim lngCount
lngCount = 0
Set objTag = HMIRuntime.Tags("Tag11")
objTag.Read
SetLocale("en-gb")
MsgBox FormatDateTime(objTag.TimeStamp)      'Output: e.g. 06/08/2002 9:07:50
MsgBox Year(objTag.TimeStamp)              'Output: e.g. 2002
MsgBox Month(objTag.TimeStamp)             'Output: e.g. 8
MsgBox Weekday(objTag.TimeStamp)           'Output: e.g. 3
MsgBox WeekdayName(Weekday(objTag.TimeStamp)) 'Output: e.g. Tuesday
MsgBox Day(objTag.TimeStamp)               'Output: e.g. 6
MsgBox Hour(objTag.TimeStamp)              'Output: e.g. 9
MsgBox Minute(objTag.TimeStamp)            'Output: e.g. 7
MsgBox Second(objTag.TimeStamp)            'Output: e.g. 50
For lngCount = 0 To 4
MsgBox FormatDateTime(objTag.TimeStamp, lngCount)
Next
'lngCount = 0: Output: e.g. 06/08/2002 9:07:50
'lngCount = 1: Output: e.g. 06 August 2002
'lngCount = 2: Output: e.g. 06/08/2002
'lngCount = 3: Output: e.g. 9:07:50
'lngCount = 4: Output: e.g. 9:07
```

The following example issues the time stamp of the tag "Tag1":

```
'VBS88
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
MsgBox objTag.TimeStamp
```

## TitleBackColor

### Description

Specifies the background color of the table headers for the selected status. You open a color selection dialog box with the button.

## TitleCut

### Description

Defines whether the content of the fields of a title bar should be shortened if the column width is too small. Write/Read access.

### See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## TitleDarkShadowColor

### Description

Specifies the color of the dark side of shading. You open a color selection with the button. The settings are only active if the "Shading Color" option is enabled.

### See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## TitleForeColor

### Description

Specifies the font color of the table headers for the selected status. You open a color selection dialog box with the button.

### See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

### TitleGridLineColor

#### Description

Defines the color of row/column dividers in the table header. You open a color selection dialog box with the button.

### See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

### TitleLightShadowColor

#### Description

Specifies the color of the bright side of shading. You open a color selection dialog box with the button. The setting is only effective when the "Shading color" option is activated.

### See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

### Titleline

#### Description

TRUE, when the control has a title bar and it can be moved in Runtime. BOOLEAN write-read access.

## TitleSort

### Description

Defines how to trigger sorting by column title. You can only sort by column title if the "Auto-scrolling" option is disabled.

Access in Runtime: Read and write

### Syntax

Object.**TitleSort**[=GridSortTrigger]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTableControl", "OnlineTrendControl", "MessageView", "RecipeView".

#### GridSortTrigger

Value	Description	Explanation
0	No	Sorting by column header is disabled.
1	With click	Sorting is triggered by clicking in the column header.
2	With double-click	Sorting is triggered by double-clicking in the column title.

### See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

## TitleStyle

### Description

Specifies whether to set a shading color for the table header.

Access in Runtime: Read and write

### Syntax

Object.**TitleStyle**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTableControl", "OnlineTrendControl", "MessageView", "RecipeView".

**BOOLEAN**

Value	Description	Description
0	Flat	Disables the use of shading colors. Flat header style.
1	Button	Enables the use of shading colors. 3D representation of the header.

**See also**

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

**Toggle****Description**

Specifies whether the selected object engages after it has been operated in Runtime.

Access in Runtime: Read and write

**Syntax**

Object.**Toggle**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format ""Roundbutton".

**BOOLEAN**

Optional TRUE, if the selected object engages after it has been operated in Runtime.

**See also**

Button (Page 4294)

**Tolerance****Description**

Specifies the limit for the storage space display as of which a deviation will be reported.

Access in Runtime: Read and write

**Syntax**

Object.**Tolerance**[=Int]

**Object**

Required A "ScreenItem" object with the format "DiskSpaceView".

**Int**

Optional A value or a constant that specifies the limit for the storage space display as of which a deviation will be reported.

**See also**

DiskSpaceView (Page 4317)

**ToleranceColor**

**Description**

Specifies the colors in which the bars of the storage space display will be shown as soon as the tolerance range is exceeded.

Access in Runtime: Read and write

**Syntax**

Object.**ToleranceColor**[=Color]

**Object**

Required A "ScreenItem" object with the format "DiskSpaceView".

**Color**

Optional A value or a constant that specifies the colors in which the bars of the storage space display will be shown as soon as the tolerance range is exceeded.

**See also**

DiskSpaceView (Page 4317)

**ToleranceHigh property**

**Description**

Defines or returns the limit value for "Tolerance high".

The type of the evaluation (in percent or absolute) is defined in the "TypeToleranceHigh" property.

The monitoring of the limit value is only valid if the "CheckToleranceHigh" property is set to "TRUE".

## ToleranceLow property

### Description

Defines or returns the limit value for "Tolerance low".  
The type of the evaluation (in percent or absolute) is defined in the "TypeToleranceLow" property.  
The monitoring of the limit value is only valid if the "CheckToleranceLow" property is set to "TRUE".

## ToleranceLowerLimit

### Description

Specifies whether the "ToleranceLowerLimit" limit is to be monitored.  
Access in Runtime: Read and write

### Syntax

Object.**ToleranceLowerLimit**[=Double]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### Double

Optional A value or a constant that specifies whether the limit "ToleranceLowerLimit" is monitored.

### See also

Bar (Page 4287)

## ToleranceLowerLimitColor

### Description

Specifies the color for the lower limit "ToleranceLowerLimit".  
Access in Runtime: Read and write

### Syntax

Object.**ToleranceLowerLimitColor**[=Color]

#### Object

Required A "ScreenItem" object with the format "Bar".

### Color

Optional A value or a constant that specifies the color for the lower limit "ToleranceLowerLimit".

### Comments

The "ToleranceLowerLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

### See also

Bar (Page 4287)

## ToleranceLowerLimitEnabled

### Description

Specifies whether the "ToleranceLowerLimit" limit is to be monitored. The limit, the display when the limit has been reached, and the type of evaluation are set with the properties "ToleranceLowerLimit", "ToleranceLowerLimitColor" and "ToleranceLowerLimitRelative".

Access in Runtime: Read and write

### Syntax

Object.**ToleranceLowerLimitEnabled**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### BOOLEAN

Optional TRUE, if the "ToleranceLowerLimit" limit is to be monitored.

### See also

Bar (Page 4287)

## ToleranceLowerLimitRelative

### Description

Specifies whether the lower limit "ToleranceLowerLimit" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

## Syntax

Object.**ToleranceLowerLimitRelative**[=BOOLEAN]

### Object

Required A ""ScreenItem" object with the format "Bar".

### BOOLEAN

Optional TRUE, if the lower limit "ToleranceLowerLimit" is to be evaluated as a percentage or an absolute value.

## See also

Bar (Page 4287)

## ToleranceUpperLimit

### Description

Specifies whether the "ToleranceUpperLimit" limit is to be monitored.

Access in Runtime: Read and write

### Syntax

Object.**ToleranceUpperLimit**[=Double]

### Object

Required A "ScreenItem" object with the format ""Bar".

### Double

Optional A value or a constant that specifies whether the limit "ToleranceUpperLimit" is monitored.

## Comments

The following values will be specified with the properties "ToleranceUpperLimit", "ToleranceUpperLimitColor" and "ToleranceUpperLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

## See also

Bar (Page 4287)

## ToleranceUpperLimitColor

### Description

Specifies the color for the upper limit "ToleranceUpperLimit".

Access in Runtime: Read and write

### Syntax

Object.ToleranceUpperLimitColor[=Color]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### Color

Optional A value or a constant that specifies the color of the upper limit "ToleranceUpperLimit".

### See also

Bar (Page 4287)

## ToleranceUpperLimitEnabled

### Description

Specifies whether the "ToleranceUpperLimit" limit is to be monitored.

Access in Runtime: Read and write

### Syntax

Object.ToleranceUpperLimitEnabled[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### BOOLEAN

Optional TRUE, if the "ToleranceUpperLimit" limit is to be monitored.

### Comments

The following values will be specified with the properties "ToleranceUpperLimit", "ToleranceUpperLimitColor" and "ToleranceUpperLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

### See also

Bar (Page 4287)

## ToleranceUpperLimitRelative

### Description

Specifies whether the lower limit "ToleranzHigh" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

### Syntax

Object.**ToleranceUpperLimitRelative**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format ""Bar".

#### BOOLEAN

Optional TRUE, if the lower limit "ToleranzHigh" is to be evaluated as a percentage or an absolute value.

### See also

Bar (Page 4287)

## ToolbarAlignment

### Description

Defines or returns the position of the toolbar. Write/Read access.

### See also

## ToolbarBackColor

### Description

Background color - ToolbarBackColor

Specifies the background color of the toolbar. Open the "Color selection" dialog by clicking the button.

The background color you configured is only displayed if the "Display" option is enabled.

Access in Runtime: Read and write

### Syntax

Object.**ToolbarBackColor**[=Color]

#### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "RecipeView".

#### Color

Optional A value or a constant which specifies the background color.

## ToolbarButtonActive

### Description

Activates a button function in Runtime. Clicking the button in Runtime triggers the corresponding function.

Access in Runtime: Read and write

### Syntax

Object.**ToolbarButtonActive**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "RecipeView".

**BOOLEAN**

TRUE: The function connected to the key is active.

FALSE: The function connected to the key is not active. You can connect your own functions to the key by local scripts.

**ToolBarButtonBeginGroup****Description**

Inserts a leading separator (vertical line) for the selected button function on the toolbar. These separators can be used to group the icons of the button functions.

Access in Runtime: Read and write

## Syntax

Object.**ToolBarButtonBeginGroup**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "RecipeView".

### BOOLEAN

TRUE: The separator is inserted in front of the selected key function.

FALSE: The separator is not inserted in front of the selected key function.

**ToolBarButtonUserDefined****Description**

Indicates whether the project engineer has added the toolbar button as new user-defined button.

Access in Runtime: Read

**Syntax**

Object.**ToolBarButtonUserDefined**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl", "FunctionTrendControl", "TrendRulerControl", "UserArchiveControl".

**Boolean**

TRUE: The key of the toolbar is customized.

FALSE: The key of the toolbar is specified by the system.

**ToolBarShowTooltips****Description**

Enables the display of tooltips for the button functions in Runtime. The property can be dynamized with the ToolBarShowTooltips name. The property for specifying the tooltip text is "ToolBarButtonTooltipText".

Access in Runtime: Read and write

## Syntax

Object.**ToolbarShowTooltips**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "FunctionTrendControl", "RecipeView", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

### BOOLEAN

TRUE: The tooltips are displayed.

FALSE: The tooltips are not displayed.

## ToolbarVisible

### Description

Enables the display of the Control toolbar.

Access in Runtime: Read and write

### Syntax

Object.**ToolbarVisible**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "MessageView", "RulerControl", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "RecipeView".

### BOOLEAN

TRUE: The toolbar is displayed.

FALSE: The toolbar is not displayed.

## ToolTipText

### Description

Specifies the tooltip text.

Access in Runtime: Read and write

### Syntax

Object.ToolTipText[=String]

#### Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "StatusForce", "Checkbox", "OptionGroup", "WindowSlider", "OleView" or "Connector".

#### String

Optional A value or a constant that specifies the tooltip text.

Listbox (Page 4357)

## Top

## Description

Specifies the value of the Y coordinate of the selected object.

Access during runtime: Read and write

## Syntax

Object.**Top**[= DOUBLE]

### Object

Necessary. A "ScreenItem" object. This property is a standard property of the ScreenItem object and is therefore available for all formats.

### DOUBLE

Optional A value or a constant that contains the value of the Y coordinate in pixels (measured from the top left edge of the screen).

## Comments

The Y coordinate refers to the top left corner of the rectangle that surrounds the object. The screen limits are also monitored in runtime. If the assigned coordinate value exceeds the display size, the user-defined function is interrupted with an error message.

### Used for the following object types:

IOField  
Rectangle  
Slider

## **TopConnectedConnectionPointIndex**

### **Description**

Specifies or sets the index number of the top connecting point.  
LONG write-read access.

## TopConnectedObjectName

### Description

Specifies or sets the object name of the object which is docked on at the bottom connecting point.

LONG write-read access.

## TopOffset

### Description

Defines or returns the distance of the picture from the top edge of the picture window.

The picture is displayed as a cutout of the picture window. The picture scroll bars are located at the left and upper edge of the picture. If you wish to display the picture in the picture window by using the horizontal and vertical positioning of the picture scroll bars, use the properties "HorizontalScrollBarPosition" and "VerticalScrollBarPosition" for such positioning.

### See also

ScreenWindow (Page 4408)

## Total

### Description

Returns the storage capacity.

Access in Runtime: Read and write

### Syntax

Object.**Total**[=Double]

#### Object

Required A "ScreenItem" object with the format "DiskSpaceView".

#### Double

Optional A value or a constant that returns the storage capacity.

### See also

DiskSpaceView (Page 4317)

## Transparency

### Description

Defines and returns the percentage transparency of the object.

0 = no transparency; 100 = complete transparency (invisible)

The text and fields of the graphic objects are only transparent at "100."

In runtime, a completely transparent object (invisible) is also functional.

## TransparentColor

### Description

Specifies which color of the allocated graphic (\*.bmp, \*dib) of the specified object will be set to "transparent".

The "UseTransparentColor" property must have the value TRUE so that the color will be shown as transparent.

Access in Runtime: Read and write

### Syntax

Object.**TransparentColor**[= Color]

#### Object

Required An object of type "ScreenItem" with the formats "GraphicView" or "GraphicIOField".

#### Color

Optional A value or a constant that specifies the color that will be shown transparent.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

GraphicIOField (Page 4341)

UseTransparentColor (Page 5008)

## TransparentColorDeactivatedPicture

### Description

Specifies which color of the allocated bitmap object will be set to "transparent" for the status "disabled".

Access in Runtime: Read and write

### Syntax

Object.TransparentColorDeactivatedPicture[=Color]

#### Object

Required A ""ScreenItem" object with the format ""Roundbutton".

#### Color

Optional A value or a constant that specifies which color of the allocated bitmap object will be set to transparent" for the status "disabled".

### Comments

The "PicDeactUseTransColor" property must have the value TRUE so that the color can be set to ""transparent".

## TransparentColorPictureOff

### Description

Specifies which color of the allocated bitmap object will be set to transparent" for the status "off".

Access in Runtime: Read and write

### Syntax

Object.TransparentColorPictureOff[=Color]

#### Object

Required A "ScreenItem" object with the format "Roundbutton".

#### Color

Optional A value or a constant that specifies which color of the allocated bitmap object will be set to transparent" for the status "off".

### See also

Button (Page 4294)

## TransparentColorPictureOn

### Description

Specifies which color of the allocated bitmap object will be set to transparent" for the status "on".

Access in Runtime: Read and write

### Syntax

Object.TransparentColorPictureOn[=Color]

#### Object

Required A "ScreenItem" object with the format "Roundbutton".

#### Color

Optional A value or a constant that specifies which color of the allocated bitmap object will be set to "transparent" for the status "on".

### Comments

The "PicDownUseTransColor"" property must have the value TRUE so that the color can be set to "transparent".

### See also

Button (Page 4294)

### Trend

#### Description

TRUE, when the tendency (rising or falling) of the measuring value being monitored should be displayed by a small arrow. BOOLEAN write-read access.

## TrendActualize

### Description

Enables the update of a selected trend.

Access in Runtime: Read and write

### Syntax

Object.TrendActualize[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**BOOLEAN**

TRUE: The selected trend is always actualized.

FALSE: The selected trend is not actualized. This setting is useful when a logged trend is compared with a current trend.

**See also**

FunctionTrendControl (Page 4330)

**See also**

FunctionTrendControl (Page 4330)

**TrendExtendedColorSet**

**Description**

Enables configuration of the point and fill colors and the display of colors in Runtime.

Access in Runtime: Read and write

## Syntax

Object.**TrendExtendedColorSet**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

### BOOLEAN

TRUE: The settings in the "Point color" and "Fill color" fields are configurable and effective in Runtime.

FALSE: The settings in the "Point color" and "Fill color" fields are not configurable and effective in Runtime.

## See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendFill

## Description

Specifies if the area beneath the trend is to be filled.

Access in Runtime: Read and write

## Syntax

Object.**TrendFill**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

### BOOLEAN

TRUE: The area beneath the trend is shown filled. You can define the trend color as fill color if the "Advanced" option is deactivated.

FALSE: The trend is not shown filled.

## See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendFillColor

### Description

Specifies the fill color of the trend. The settings are only active if the "Filled" option is enabled. Open the "Color selection" dialog by clicking the button.

The settings are only active if the "Advanced" option is enabled.

### See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendIndex

### Description

References a configured trend. You can assign the values of other properties to a specific trend by using the property. The index must always be set before you change the properties of a trend in runtime.

Valid values for "TrendIndex" are between 0 and "TrendCount" minus 1. The "TrendCount" property indicates the number of configured trends.

### See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendIndicatorColor

### Description

Specifies the color for the trend indicator. The trend indicator represents the tendency (increasing or falling) of the measurement value that is to be monitored with a small arrow. To activate the trend indicator, the property "ShowTrendIndicator" must have the value TRUE.

Access in Runtime: Read and write

### Syntax

Object.**TrendIndicatorColor**[=Color]

#### Object

Required A "ScreenItem" object with the format "Bar".

**Color**

Optional A value or a constant that specifies the color of the trend indicator.

**See also**

Bar (Page 4287)

**TrendLabel**

**Description**

Defines the label of the trend selected. The label is displayed in Runtime if the value at attribute "UseTrendNameAsLabel" is "FALSE".

**See also**

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

**TrendLineStyle**

**Example**

Defines the line style for trend visualization.

Access in Runtime: Read and write

**Syntax**

Object.**TrendLineStyle**[=LineStyle]

**Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**LineStyle**

Value	Description	Explanation
0	Solid	The trend is visualized as solid line.
1	Dashed	The trend is visualized as dashed line.
2	Dotted	The trend is visualized as dotted line.
3	Dash dot	The trend is visualized as dot-dash line.
4	Dash Dot Dot	The trend is visualized as dash-dot-dot line.

**See also**

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

**TrendLineType****Description**

Defines how to visualize a trend.

Access in Runtime: Read and write

**Syntax**

Object.**TrendLineType**[=LineType]

**Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**LineType**

Value	Description	Explanation
0	None	Only the dots are displayed.
1	Line	Visualizes a trend with linear interconnection of points.
2	Stepped	Visualizes a stepped trend and its interconnected points.

**See also**

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

**TrendLineWidth****Description**

Defines the line weight of the line displayed.

**See also**

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendLowerLimit

### Description

Specifies the low limit of a tag. If the tag drops below the value of "TrendLowerLimit", the values are marked with the color set in "TrendLowerLimitColor". The specification is effective if the "TrendLowerLimitColoring" property has the value "TRUE".

### See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendLowerLimitColor

### Description

Specifies the color which marks tag values which are below the value of "TrendLowerLimit". The setting is effective if the "TrendLowerLimitColoring" attribute has the value "TRUE".

### See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendLowerLimitColoring

### Description

Enables the "TrendLowerLimitColor" attribute for identifying tag values which are less than the value at "TrendLowerLimitValue".

### Syntax

Object.**TrendLowerLimitColoring** [=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### Boolean

TRUE: The "TrendLowerLimitColor" property is effective.

FALSE: The "TrendLowerLimitColor" property is not effective.

**See also**

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

**TrendMeasurePoints****Number of measurement points - TrendMeasurePoints**

Defines the number of measurement points for visualization of selected trends.

Defines the number of value pairs provided to the trend from a user archive.

The attribute can be assigned dynamic properties by means of the name **TrendMeasurePoints**.

**See also**

FunctionTrendControl (Page 4330)

**TrendName****Description**

Displays the name of the selected trend. The name is defined on the "Trends" tab. The "TrendName" property can be dynamized by the TrendRename property.

Access in Runtime: Read and write

**Syntax**

Object.**TrendName**

**Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**See also**

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

**TrendPointColor****Description**

Defines the color of trend points. Open the "Color selection" dialog by clicking the button.

The settings are only active if the "Advanced" option is enabled.

### See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendPointStyle

### Description

Defines the dot style for trend visualization.

Access in Runtime: Read and write

### Syntax

Object.**TrendPointStyle**[=PointStyle]

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### PointStyle

Value	Description	Explanation
0	None	The points are not displayed.
1	Dots	The trend points are visualized with a size of one pixel. The setting in the "Dot width" field is deactivated.
2	Squares	The dots are displayed as square. The setting in the "Dot width" field is active.
3	Circles	The dots are displayed as circles. The setting in the "Dot width" field is active.

### See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendPointWidth

### Description

Sets the dot width in pixels. You can only define the dot width for the "square" and "circular" type.

**See also**

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

**TrendProvider****Description**

Specifies the data source for a selected trend.

Access in Runtime: Read and write

**Syntax**

Object.**TrendProvider**[=Provider]

**Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**Provider**

Value	Description	Explanation
0	None	No data source configured for implementation in Runtime by means of a user-defined function.
1	Archive tags	Data source with archive tags of a process value archive.
2	HMI tags	Data supply with tag values of HMI tags
3	Recipe data	Data supply with columns of a recipe

**See also**

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

**TrendRangeType****Description**

Defines the time range for providing data to the selected trend.

You can only define the number of measuring points if you select user archives as the data source.

Access in Runtime: Read and write

## Syntax

Object.**TrendRangeType**[=RangeType]

### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

### RangeType

Value	Description	Explanation
0	Time range	Defines the start time and the time range for the data connection.
1	Start to end time	Defines the start and end time for the data connection.
2	Number of measurement points	Defines the start time and the number of measurement points for the data connection.

## TrendSelectTagNameX

### Description

Opens the dialog box for selecting the tag name for the data supply of the X axis in the f(x) trend view. Programmers can use the property to let the user select a tag name with a button for example.

### See also

FunctionTrendControl (Page 4330)

## TrendSelectTagNameY

### Description

Opens the dialog box for selecting the tag name for the data supply of the Y axis in the f(x) trend view. Programmers can use the property to let the user select a tag name with a button for example.

### See also

FunctionTrendControl (Page 4330)

## TrendTag

### Description

Specifies which tag is linked with the selected trend.

You enter the value either in the form "archive name/tag name", to show tags of a process value archive, or in the form "tag name" to show an internal or an external tag that will now be saved in an archive.

Access in Runtime: Read and write

### Syntax

Object.**TrendTag**[=HmiTag]

#### Object

Required A ""ScreenItem" object with the format "OnlineTrend".

#### HmiTag

Optional A value or a constant that specifies which tags are linked with the selected trend.

### Comments

The parameter i indicates the number of the trend.

### See also

OnlineTrendControl (Page 4375)

### TrendTagNameX

#### Description

Shows the name of the bound HMI tag or column for the X axis. You select an HMI tag or a column with the selection button.

Access in Runtime: Read and write

#### Syntax

Object.**TrendTagNameX**

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

### See also

FunctionTrendControl (Page 4330)

## TrendTagNameY

### Description

Shows the name of the bound HMI tag or column for the Y axis. You select an HMI tag or a column with the selection button.

Access in Runtime: Read and write

### Syntax

Object.TrendTagNameX

#### Object

Required. An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

### See also

FunctionTrendControl (Page 4330)

## TrendTimeRangeBase

### Description

Defines the time unit for calculating the time range.

Access in Runtime: Read and write

### Syntax

Object.TrendTimeRangeBase[=TimeRangeBase]

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### TimeRangeBase

Value	Description
500	500 ms
1000	1 second
60000	1 minute
3600000	1 hour
86400000	1 day

**See also**

**Description**

Defines the factor for calculating the time range. Only integer factors are valid. .

**See also**

FunctionTrendControl (Page 4330)

**TrendTrendWindow**

**Description**

Defines the trend window for visualizing the trend selected. Define the available trend windows in the "Trend window" tab.

**See also**

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

**TrendUncertainColor**

**Description**

Value are in uncertain state if the initial value is unknown after runtime has been activated, or if a substitute value is used. With the "TrendUncertainColor" property you specify the color which is used for marking these values. Whether the information is evaluated depends on the "TrendUncertainColoring" property.

**See also**

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendUncertainColoring

### Description

Value are in uncertain state if the initial value is unknown after runtime has been activated, or if a substitute value is used. The "TrendUncertainColoring" attribute is used to enable identification of such values based on the color set in "TrendUncertainColor".

Access in Runtime: Read and write

### Syntax

Object.**TrendUncertainColoring**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### **BOOLEAN**

TRUE: The setting of the "TrendUncertainColor" property is effective.

FALSE: The setting of the "TrendUncertainColor" property is not effective.

### See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendUpperLimit

### Description

Specifies the high limit of a tag. If the tag drops below the value of "TrendUpperLimit", the values are marked by the color set in "TrendUpperLimitColor". The specification is effective if the "TrendUpperLimitColoring" attribute has the value "TRUE".

### See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendUpperLimitColor

### TrendUpperLimitColor

Specifies the color of tag values which are less than the value at "TrendLowerLimit". This setting is only active if the value at attribute "TrendUpperLimitColoring" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendUpperLimitColor**.

### See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendUpperLimitColoring

### Description

Specifies whether the selection frame is shown with the specified color.

Access in Runtime: Read and write

### Syntax

Object.**TrendUpperLimitColoring**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### BOOLEAN

TRUE: The setting of the "TrendUpperLimitColor" attribute is effective.

FALSE: The setting of the "TrendUpperLimitColor" attribute is not effective.

## TrendWindowCoarseGrid

### Description

Enables the display of grid lines for the main scale.

Access in Runtime: Read and write

### Syntax

Object.**TrendWindowCoarseGrid**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### BOOLEAN

TRUE: The grid lines for the main scaling are displayed.

FALSE: The grid lines for the main scaling are not displayed.

### See also

FunctionTrendControl (Page 4330)

## TrendWindowRepos

### Description

Changes the order of the trend view. "Up" and "Down" move the selected trend up or down in the list.

The sorting order in the list defines the position in the Control. The first trend view is shown in the lowest position, the last trend view in the highest position.

### See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendWindowRulerColor

### Description

Specifies the ruler color. Open the "Color selection" dialog by clicking the button.

The color can be configured and displayed if "1 - graphic" is set for visualization.

### See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendWindowRulerLayer

### Description

Specifies the display layer of the ruler in the trend view.

Access in Runtime: Read and write

### Syntax

Object.**TrendWindowRulerLayer**[=RulerLayer]

**Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**RulerLayer**

Value	Description	Explanation
0	Under grid	The ruler is visualized on a layer under the grid.
1	Between grid and trend	The ruler is positioned on top of the trend and under the grid.
2	On top of trend	The ruler is positioned on top of the trend.

**See also**

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

**TrendWindowRulerStyle****Description**

Defines the appearance of the ruler.

Access in Runtime: Read and write

**Syntax**

Object.**TrendWindowRulerStyle** [=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**BOOLEAN**

TRUE: The ruler is displayed as a single black line.

FALSE: The ruler is is displayed in the configured "Color" and "Width".

**See also**

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## TrendWindowRulerWidth

### Description

Defines the width of the ruler in pixels.  
The width can be configured and displayed if "1 - graphic" is set for visualization.

### See also

FunctionTrendControl (Page 4330)  
OnlineTrendControl (Page 4375)

## TrendWindowSpacePortion

### Description

Specifies the proportion of the trend widow to be used for the selected curve.

### See also

FunctionTrendControl (Page 4330)  
OnlineTrendControl (Page 4375)

## TrendWindowVerticalGrid

### Description

Enables the display of vertical grid lines.  
Access in Runtime: Read and write

### Syntax

Object.**TrendWindowVerticalGrid**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### BOOLEAN

TRUE: The vertical grid lines are displayed.  
FALSE: The vertical grid lines are not displayed.

**See also**

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

**TrendWindowVisible****Description**

The trend lines which you have created are listed in the list.

Activate the trend views in the list which you want to display in the control.

Click a list entry to adapt the ruler and grid line properties.

**See also**

**TrendXAxis****Description**

Defines the X axis to be used for the trend selected. Define the available X axes inn the "X Axes" tab.

**See also**

FunctionTrendControl (Page 4330)

**TrendYAxis****Description**

Defines the Y axis to be used for the trend selected. Define the available Y axes inn the "Y Axes" tab.

**See also**

FunctionTrendControl (Page 4330)

## Type

### Description

Returns the type of the specified object as STRING. Name diagram: Hmi<ObjectName>, e.g. HmiCircle for the "circle" screen object.

Access in Runtime: Read

### Syntax

Object.Type

#### Object

Required A "ScreenItem" object.

## TypeAlarmHigh

### Description

TRUE, when the upper limit value, at which an alarm is triggered, should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

## TypeAlarmLow

### Description

TRUE, when the lower limit value, at which an alarm is triggered, should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

## TypeLimitHigh4

### Description

TRUE, when the "Reserve 4" upper limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

## TypeLimitHigh5

### Description

TRUE, when the "Reserve 5" upper limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

### TypeLimitLow4

#### Description

TRUE, when the "Reserve 4" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

### TypeLimitLow5

#### Description

TRUE, when the "Reserve 5" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

### TypeToleranceHigh

#### Description

TRUE, when the "Tolerance high" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

### TypeToleranceLow

#### Description

TRUE, when the "Tolerance low" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

### TypeWarningHigh

#### Description

TRUE, when the "Warning high" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

### TypeWarningLow

#### Description

TRUE, when the "Warning low" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

## Properties U-W

### UncertainStateColor(i)

#### Description

Specifies the color for the identification of values with an uncertain status.

Access in Runtime: Read and write

#### Syntax

Object.**UncertainStateColor**(i)[=Color]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

#### Color

Optional A value or a constant that specifies the color for the identification of values with an uncertain status.

#### Comments

The parameter i indicates the number of the trend.

If the start value of a value is not known after Runtime has been activated or a substitute value is used, then this value has an uncertain status.

#### See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

### UncertainStateEnabled(i)

#### Description

Specifies if values with an uncertain status are identified with the color set up in "ReplacementColor(i)".

If the start value of a value is not known after Runtime has been activated or a substitute value is being used, then this value is considered to have an uncertain status.

Access in Runtime: Read and write

**Syntax**

Object.**UncertainStateEnabled**(i)[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

**BOOLEAN**

Optional TRUE, if values with an uncertain status are identified with the color specified in ""ReplacementColor(i)".

**Comments**

The parameter i indicates the number of the trend.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**Unit****Description**

Specifies the unit of measurement in the "IOField" object.

**See also**

Bar (Page 4287)

IOField (Page 4351)

**UnitColor****Description**

Specifies the text color for the label of the measurement unit in the "Gauge" object

Access in Runtime: Read and write

**Syntax**

Object.**UnitColor**[= Color]

**Object**

Required A "ScreenItem" object with the format "Gauge".

**Color**

Optional A value or a constant that specifies the text color for the measurement unit.

**Comments**

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

**See also**

Gauge (Page 4338)

**UnitText**

**Description**

Specifies the text for the measurement unit of the selected object.

Access in Runtime: Read and write

**Syntax**

Object.**UnitText**[= STRING]

**Object**

Required A "ScreenItem" object with the format ""Gauge".

**STRING**

Optional A value or a constant that specifies the text for the measurement unit.

**Comments**

Enter a text to show, for example, the physical unit of the displayed value. It is standard for no text to be set as a default.

**See also**

Gauge (Page 4338)

## UnitTop

### Description

Specifies the distance of the measurement unit to the upper edge of the selected object. The lettering can be positioned only in line with the vertical diameter of the scale. The value of the property refers to the height of the selected object and is measured from the upper edge of the selected object to the lower edge of the lettering.

Access in Runtime: Read and write

### Syntax

Object.UnitTop[=Double]

#### Object

Required A ""ScreenItem" object with the format "Gauge".

#### Double

Optional A value or a constant that specifies the distance of the measurement unit to the upper edge of the selected object.

Value range from 0 to 1

0: The lower edge of the lettering is positioned on the upper limit of the selected object. The text is no longer visible as it is positioned outside of the selected object.

1: The lower edge of the lettering is positioned on the lower limit of the selected object.

### See also

Gauge (Page 4338)

## UnselBGColor property

### Description

Defines or returns the background color of entries in the text list object which are not selected. LONG write-read access.

## UnselTextColor property

### Description

Defines or returns the color of the text for entries in the text list object which are not selected. LONG write-read access.

## UpdateCycle property

### Description

Returns the type and frequency of updating the picture window in Runtime. Read only access.

## UpdateEnable

### Description

Specifies whether the recipe view can be altered in Runtime.

Access in Runtime: Read and write

### Syntax

Object.**UpdateEnable**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl".

#### BOOLEAN

Optional TRUE, if the recipe view can be altered in Runtime.

## UpperLimit

### Description

Specifies the upper limit for input values.

Access in Runtime: Read and write

### Syntax

Object.**UpperLimit**[=Double]

#### Object

Required A "ScreenItem" object with the format "IOField".

#### Double

Optional A value or a constant that specifies the upper limit for input values.

### See also

IOField (Page 4351)

## UpperLimitColor(i)

### Description

Specifies the color that identifies the tag values that lie above the value of ""UpperLimitValue(i)". Whether the information is evaluated depends on the value of the property ""UpperLimitEnabled(i)".

Access in Runtime: Read and write

### Syntax

Object.**UpperLimitColor(i)**[=Color]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

#### Color

Optional A value or a constant that identifies the tag values that lie above the value of ""UpperLimitValue(i)".

### Comments

The parameter i indicates the number of the trend.

### See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

## UpperLimitEnabled(i)

### Description

Specifies whether the information from "UpperLimitColor(i)" is used to identify the tag values that lie above the value of "UpperLimitValue(i)".

Access in Runtime: Read and write

### Syntax

Object.**UpperLimitEnabled(i)**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

**BOOLEAN**

Optional TRUE, if the information from "UpperLimitColor(i)"" is used to identify the tag values that lie above the value of "UpperLimitValue(i)".

**Comments**

The parameter i indicates the number of the trend.

**See also**

- OnlineTrendControl (Page 4375)
- FunctionTrendControl (Page 4330)
- OnlineTableControl (Page 4367)

**UpperLimitValue(i)**

**Description**

Specifies whether the tag values that exceed the "UpperLimitValue(i)" are to be identified with the color specified in "UpperLimitColor(i)"". Whether the information is evaluated depends on the value of the property "UpperLimit(i)".

Access in Runtime: Read and write

**Syntax**

Object.UpperLimitValue(i)[=Double]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

**Double**

Optional A value or a constant that specifies whether the tag values that exceed the ""UpperLimitValue(i)" value are to be identified with the color specified in UpperLimitColor(i)"".

**Comments**

The parameter i indicates the number of the trend.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**UseAllServers****Description**

Specifies whether the data to be shown in the alarm window can be requested from all servers in a distributed system. Alarm Logging must be activated on the respective servers.

Access in Runtime: Read-only

**Syntax**

Object.**UseAllServers**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "AlarmView".

**BOOLEAN**

Optional. TRUE, if the data to be shown in the alarm window can be requested from all servers in a distributed system.

**See also**

AlarmControl (Page 4273)

**UseBarBorderConstraints****Description**

Specifies whether the bar border is restricted to specific values.

Access in Runtime: Read and write

**Syntax**

Object.**UseBarBorderConstraints**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "Bar".

**BOOLEAN**

Optional. TRUE, if the bar border is restricted to specific values.

## See also

Bar (Page 4287)

## UseTagLimitColors

### Description

Specifies that colors are used.

## UseDesignColorShema

### Description

Defines whether the colors defined for the current design in the global color scheme will be used for this object.

TRUE if the object is displayed with the colors from the global color scheme defined for this object type.

FALSE if the object is displayed with the colors as per the settings in the object.

BOOLEAN write-read access.

## UseDesignShadowSettings

### Description

Defines whether the object will be displayed with the shadowing defined in the active design.  
TRUE if the object is displayed with the global shadow defined for this object type.  
FALSE if no shadow is displayed.  
BOOLEAN write-read access.

## UseEffectiveProcessValue

### Description

Specifies whether an actual percentage made up of maximum value, minimum value, average of the last 15 values and hysteresis will be used.

Access in Runtime: Read and write

### Syntax

Object.**UseEffectiveProcessValue**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### BOOLEAN

Optional TRUE, if an actual percentage made up of maximum value, minimum value, average of the last 15 values and hysteresis will be used.

**See also**

Bar (Page 4287)

**UseExponentialFormat****Description**

Specifies whether the figures are shown exponentially (e.g. "1,00e+000").

Access in Runtime: Read and write

**Syntax**

Object.**UseExponentialFormat**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "Bar".

**BOOLEAN**

Optional TRUE, if the figures are shown exponentially (e.g. "1,00e+000").

**See also**

Bar (Page 4287)

**UseFlashTransparentColor****Description**

Specifies whether the color of the bitmap object of a flashing graphic will be set to "transparent".

Access in Runtime: Read and write

**Syntax**

Object.**UseFlashTransparentColor**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "GraphicIOField".

**BOOLEAN**

Optional TRUE, if the color of the bitmap object of a flashing graphic will be set to "transparent".

## See also

GraphicIOField (Page 4341)

## UseGDI

### Description

Specifies whether the ellipse is shown via GDI or GDI+.

Access in Runtime: Read and write

### Syntax

Object.**UseGDI**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "Ellipse".

#### BOOLEAN

Optional TRUE, if the ellipse is shown via GDI.

## See also

Ellipse (Page 4319)

## UseMeasurePoints(i)

### Description

Specifies whether the time range for the selected trend will be determined by measuring points or the end time. Whether the information is evaluated depends on the properties "TimeAxisEndTime", "TimeAxisBeginTime(i)".

Define time range for curve i through measure points (TRUE) or end time (FALSE) (for time based tag providers)

Access in Runtime: Read and write

#### Syntax

Object.**UseMeasurePoints**(i)[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

#### BOOLEAN

Optional TRUE, if the time range for the selected trend will be determined by measuring points.

**Comments**

The parameter *i* indicates the number of the trend.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**UseMessageColor****Description**

Specifies whether the agreed colors of the message classes are displayed.

Access in Runtime: Read and write

**Syntax**

Object.**UseMessageColor**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "AlarmControl".

**BOOLEAN**

TRUE: The colors are displayed.

FALSE: The color settings specified for the table content on the "Layout" tab are effective.

**See also**

AlarmControl (Page 4273)

**UseMultipleLimits****Description**

Specifies whether one or more pairs of limits are shown as a selection or a line.

Access in Runtime: Read and write

**Syntax**

Object.**UseMultipleLimits**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format ""Bar".

**BOOLEAN**

Optional TRUE, if one or more pairs of limits are displayed as a selection or a line.

**See also**

Bar (Page 4287)

**UseScaleConstraints**

**Description**

Specifies whether the distance between two large marking lengths of the scale are calculated from the minimum and maximum values.

Access in Runtime: Read and write

**Syntax**

Object.**UseScaleConstraints**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "Bar".

**BOOLEAN**

Optional TRUE, if the distance between two large marking lengths of the scale are calculated from the minimum and maximum values.

**See also**

Bar (Page 4287)

**UseScaledBarBorder**

**Description**

Specifies whether the rectangle that surrounds the object is shown dependent of the scale or as a default.

Access in Runtime: Read and write

**Syntax**

Object.**UseScaledBarBorder**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "Bar".

**BOOLEAN**

Optional TRUE, if the rectangle that surrounds the object is shown dependent on the scale.

**See also**

Bar (Page 4287)

**UseSelectedTitleColor****Description**

Specifies whether to use a selection color for the headers of selected table cells.

Access in Runtime: Read and write

**Syntax**

Object.**UseSelectedTitleColor**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl", "AlarmControl", "TrendRulerControl".

**BOOLEAN**

TRUE: A marking color is used. The "Background" and "Font" settings are active in Runtime.

FALSE: A marking color is not used. The "Background" and "Font" settings are disabled in Runtime.

**See also**

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

**UseSeparateDiagrams****Description**

Specifies whether the trends are shown staggered.

Access in Runtime: Read and write

## Syntax

Object.**UseSeparateDiagrams**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the formats "OnlineTrend" or "FunctionTrendView".

### BOOLEAN

Optional TRUE, if the trends are shown staggered.

## See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

## UseSimplePresicionOffset

### Description

Specifies how the field length will be calculated for the labeling of the scale.

Access in Runtime: Read and write

### Syntax

Object.**UseSimplePresicionOffset**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Bar".

### BOOLEAN

Optional TRUE, if the field length will be calculated for the labeling of the scale.

## See also

Bar (Page 4287)

## UseTableColor2

### Description

Specifies whether to use a second row color for the representation of the table.

Access in Runtime: Read and write

## Syntax

Object.**UseTableColor2**[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl", "AlarmControl", "TrendRulerControl".

### BOOLEAN

TRUE: The settings of "RowColor 2" are used in alternation with "RowColor1".

FALSE: The settings of "RowColor 1" are used for all rows.

## See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

## UseTimeRange(i)

### Description

Specifies how the time range that is to be shown for the selected trend will be defined.

Access in Runtime: Read and write

### Syntax

Object.**UseTimeRange**(i)[=BOOLEAN]

### Object

Required A "ScreenItem" object with the formats "OnlineTrend", "FunctionTrendView" or "TableView".

### BOOLEAN

Optional TRUE, if the time range that is to be shown is defined by means of a start time ("TimeAxisBeginTime(i)") and an end time ("TimeAxisEndTime").

FALSE,, if the time range that is to be shown is defined by means of a start time ("TimeAxisBeginTime(i)") and an end time "TimeRangeBase(i)" and "TimeRangeFactor(i)".

### Comments

The parameter i indicates the number of the trend.

## See also

OnlineTrendControl (Page 4375)  
FunctionTrendControl (Page 4330)  
OnlineTableControl (Page 4367)

## UseTransparentColor

### Description

Specifies whether the color described with the property "TransparentColor" will be shown as transparent for the selected object.

Access in Runtime: Read and write

### Syntax

Object.**UseTransparentColor**[= BOOLEAN]

#### Object

Required A "ScreenItem" object with the formats "GraphicView" or "GraphicIOField".

#### BOOLEAN

Optional TRUE, if the specified color is to be shown as transparent.

## See also

GraphicView (Page 4344)  
GraphicIOField (Page 4341)

## UseTransparentColorDeactivatedPicture

### Description

Specifies if the transparent color defined with the property "TransparentColorDeactivatedPicture" for the status "disabled" will be used.

Access in Runtime: Read and write

### Syntax

Object.**UseTransparentColorDeactivatedPicture**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format ""Roundbutton".

**BOOLEAN**

Optional TRUE, if the transparent color defined with the property "TransparentColorDeactivatedPicture" for the status "disabled" will be used.

**UseTransparentColorPictureOff****Description**

Specifies if the transparent color defined with the property "TransparentColorPictureOff" for the status "off" will be used.

Access in Runtime: Read and write

**Syntax**

Object.**UseTransparentColorPictureOff**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "Roundbutton".

**BOOLEAN**

Optional TRUE, if the transparent color defined with the property "TransparentColorPictureOff" for the status "off" will be used.

**See also**

Button (Page 4294)

**UseTransparentColorPictureOn****Description**

Specifies if the transparent color defined with the property "TransparentColorPictureOn" for the status "on" will be used.

Access in Runtime: Read and write

**Syntax**

Object.**UseTransparentColorPictureOn**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "Roundbutton".

**BOOLEAN**

Optional TRUE, if the transparent color defined with the property "TransparentColorPictureOn" for the status "on" will be used.

## See also

Button (Page 4294)

## UseTrendNameAsLabel

### Description

Specifies whether the "Name" or "Label" property is used as a designation for the trend in Runtime.

Access in Runtime: Read and write

### Syntax

Object.**UseTrendNameAsLabel**[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### BOOLEAN

TRUE: The name configured under "Properties > Properties > Trends > Name" is used.

FALSE: The name configured under "Properties > Properties > Trends > Label" is used.

## See also

FunctionTrendControl (Page 4330)

OnlineTrendControl (Page 4375)

## Used

### Description

Returns the size of the used disk space.

Access in Runtime: Read and write

### Syntax

Object.**Used**[=Double]

#### Object

Required A "ScreenItem" object with the format ""DiskSpaceView".

**Double**

Optional A value or a constant that returns the size of the used disk space.

**See also**

DiskSpaceView (Page 4317)

**UsedPercent****Description**

Returns the measured value for the used disk space as a percentage. The values can be queried in Runtime. The values cannot be predefined.

Access in Runtime: Read and write

**Syntax**

Object.**UsedPercent**[=Int]

**Object**

Required A "ScreenItem" object with the format "DiskSpaceView".

**Int**

Optional A value or a constant that returns the measured value for the used disk space as a percentage.

**See also**

DiskSpaceView (Page 4317)

**UserArchiveNumberOfValues(i)****Description**

Specifies the number of values that are loaded from the recipe. The "TagProviderType(i)" property must have the value -2.

Access in Runtime: Read and write

**Syntax**

Object.**UserArchiveNumberOfValues(i)**[=Int]

**Object**

Required A "ScreenItem" object with the format "FunctionTrendView".

**Int**

Optional A value or a constant that specifies the number of values that are loaded from the recipe.

**Comments**

The parameter i indicates the number of the trend.

If "UserArchiveNumberOfValues(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent immediate acceptance of the change with "FreezeProviderConnections" before changing "UserArchiveNumberOfValues(i)".

**See also**

FunctionTrendControl (Page 4330)

**UserArchiveStartId(i)**

**Description**

Specifies the data record starting from which the values for the selected trend are loaded from the recipe. The "TagProviderType(i)" property must have the value -2.

Access in Runtime: Read and write

**Syntax**

Object.**UserArchiveStartId(i)**[=Int]

**Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

**Int**

Optional A value or a constant that specifies the data record starting from which the values for the selected trend are loaded from the recipe.

**Comments**

The parameter i indicates the number of the trend.

If "UserArchiveStartId(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent immediate acceptance of the change with "FreezeProviderConnections" before changing "UserArchiveStartId(i)".

**See also**

FunctionTrendControl (Page 4330)

## UserData

### Description

Specifies the value that is passed to the VB script when a user-defined menu entry or toolbar button is executed.

Use the "Data" field in the "Menus and toolbars" editor to pass a parameter to the procedure.

Access in Runtime: Read and write

### Syntax

Object.**UserData**[=String]

#### Object

Required A "Item"-type object.

#### String

Optional. A value or constant that is passed to the VB script when a user-defined menu entry or toolbar button is executed.

## UserName

### Description

Returns the name of the user who triggered the alarm object.

## UserValue1 property

### Description

Defines or returns a value.

The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

## UserValue2 property

### Description

Defines or returns a value.

The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

## UserValue3 property

### Description

Defines or returns a value.  
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

## UserValue4 property

### Description

Defines or returns a value.  
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

## ValidateFormatPattern

### Description

Specifies that the "format pattern" field can be checked for specific characters.  
Access in Runtime: Read and write

### Syntax

Object.**ValidateFormatPattern**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "IOField".

#### BOOLEAN

Optional TRUE, if the "format pattern" field can be checked for specific characters.

### See also

IOField (Page 4351)

### Value

### Description

Specifies a value for the object being used or returns it.  
Access during runtime: Read and write

## Syntax

Object.Value[=VARIANT]

### Object

Necessary. An object of type "Tag", "DataItem" or "ScreenItem" with the format "Gauge".

### VARIANT

Optional The value that is specified dependent on the object being used:

- Tag.Value: returns the tag value for the last read access or specifies the future tag value. Use the "Read" method to read the tag value from the "Value" property. You assign a new tag value to the "Value" property with the "Write" method.
- Dataset.Value: Specifies a value or returns a copy of the value or the object reference. When returning object references, ensure that the object reference is multithread-capable.
- ScreenItem("Gauge\_1").Value: Specifies the value to which the pointer points. The value range within the values set via the properties "ValueMin", and "ValueMax".

## Examples

The following example writes a new value in the "Tag1" tag:

```
'VBS94
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Value = 50
objTag.Write
```

The example shows how to add a value to a list of tags and output it as a trace. After that, the value is changed, output again and then removed. It make sense to perform this in several different actions:

```
'VBS198
HMIRuntime.DataSet.Add "motor1", 23
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
HMIRuntime.DataSet("motor1").Value = 55
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
HMIRuntime.DataSet.Remove("motor1")
```

## ValueAxisAutorange(i)

### Description

Specifies whether the value range of the Y axis is determined automatically or via the values "ValueAxisBegin(i)" and "ValueAxisEnd(i)".

Access in Runtime: Read and write

### Syntax

Object.**ValueAxisAutorange**(i)[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

#### BOOLEAN

Optional TRUE, if the value range of the Y axis is established automatically or via the values "ValueAxisBegin(i)" and "ValueAxisEnd(i)".

### See also

FunctionTrendControl (Page 4330)

## ValueAxisBegin(i)

### Description

Specifies the lower limit of the value range for the selected trend that is to be displayed. Whether the information is evaluated depends on the properties "Autorange" and "ShareValueAxis".

Access in Runtime: Read and write

### Syntax

Object.**ValueAxisBegin**(i)[=Double]

#### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

#### Double

Optional A value or a constant that specifies the lower limit of the value range of the selected trend that is to be shown.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**ValueAxisDecimalPrecision(i)****Description**

Specifies the number of decimal places for the value range of the selected trend.

Access in Runtime: Read and write

**Syntax**

Object.**ValueAxisDecimalPrecision**(i)[=Int]

**Object**

Required A "ScreenItem" object with the formats "OnlineTrend" or "FunctionTrendView".

**Int**

Optional A value or a constant that specifies the number of decimal places for the value range of the selected trend.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**ValueAxisEnd(i)****Description**

Specifies the upper limit of the value range of the selected trend that is to be displayed. Whether the information is evaluated depends on the properties "Autorange" and "ShareValueAxis".

Access in Runtime: Read and write

**Syntax**

Object.**ValueAxisEnd**(i)[=Double]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

**Double**

Optional A value or a constant that specifies the upper limit of the value range of the selected trend that is to be shown.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**ValueAxisGridLineInterval(i)**

**Description**

Specifies the distance between two grid lines. Whether the information is evaluated depends on the properties "ValueAxisShowGridLines(i)" and "TimeAxisShowGridLines(i)".

Access in Runtime: Read and write

**Syntax**

Object.**ValueAxisGridLineInterval**(i)[=Double]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

**Double**

Optional A value or a constant that specifies the distance between two grid lines.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**ValueAxisLabel(i)**

**Description**

Specifies the labeling of the value axis. Whether the information is evaluated depends on the property "ConfigureTimeAxis(i)".

Access in Runtime: Read and write

**Syntax**

Object.**ValueAxisLabel**(i)[=String]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

**String**

Optional A value or a constant that specifies the labeling of the value axis.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**ValueAxisLargeIncrementSize(i)****Description**

Specifies the distance between two long marking lengths of the scale. Whether the information is evaluated depends on the properties "ValueAxisShowLargeIncrements(i)" and ""TimeAxisShowLargeIncrements(i)".

Access in Runtime: Read and write

**Syntax**

Object.**ValueAxisLargeIncrementSize(i)**[=Double]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

**Double**

Optional A value or a constant that specifies the distance between two marking lengths of the scale.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**ValueAxisScalingType(i)****Description**

Specifies the type of axis scaling.

Access in Runtime: Read and write

## Syntax

Object.**ValueAxisScalingType**(i)[=AxisScalingType]

### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

### AxisScalingType

hmiBarScalingLinear ( 0): Linear axis scaling.

hmiBarScalingLogarithmic ( 1): Logarithmic axis scaling

hmiBarScalingNegativeLogarithmic ( 2): Negative logarithmic axis scaling

## Comments

The parameter i indicates the number of the trend. The parameter i indicates the number of the trend.

## See also

[OnlineTrendControl \(Page 4375\)](#)

[FunctionTrendControl \(Page 4330\)](#)

## ValueAxisShowGridLines(i)

### Description

Specifies whether the trend window is shown with grid lines that run parallel to the y axis.

Access in Runtime: Read and write

### Syntax

Object.**ValueAxisShowGridLines**(i)[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

### BOOLEAN

Optional TRUE, if the trend window is shown with grid lines that run parallel to the y axis.

## Comments

The distance between two grid lines can be altered with the "ValueAxisGridLineInterval(i)" property.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**ValueAxisShowLargeIncrements(i)****Description**

Specifies whether the value axis is scaled with long marking lengths.

Access in Runtime: Read and write

**Syntax**

Object.**ValueAxisShowLargeIncrements(i)**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" with the format "OnlineTrendControl" or "FunctionTrendControl".

**BOOLEAN**

Optional TRUE, if the value axis is scaled with long marking lengths.

**Comments**

The distance of two long marking lines can be altered with the "ValueAxisLargeIncrementSize(i)" property.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**ValueAxisShowSmallIncrements(i)****Description**

Specifies whether the value axis is scaled with short marking lengths.

Access in Runtime: Read and write

**Syntax**

Object.**ValueAxisShowSmallIncrements(i)**[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

**BOOLEAN**

Optional TRUE, if the value axis is scaled with short marking lengths.

**Comments**

The distance between two short marking lines can be altered with the "ValueAxisSmallIncrementSize(i)" property.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**ValueAxisSmallIncrementSize(i)**

**Description**

Specifies the distance between two short marking lengths of the scale. Whether the information is evaluated depends on the properties ""ValueAxisShowSmallIncrements(i)"" and ""TimeAxisShowSmallIncrements(i)"".

Access in Runtime: Read and write

**Syntax**

Object.ValueAxisSmallIncrementSize(i)[=Double]

**Object**

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

**Double**

Optional A value or a constant that specifies the distance between two short marking lengths of the scale.

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

## ValueColumnAlignment(i)

### Description

Specifies the alignment of the tag values of this column pair. The parameter *i* indicates the number of the column pair.

Access in Runtime: Read and write

### Syntax

Object.**ValueColumnAlignment**(i)[=AlignmentHorizontal]

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

#### AlignmentHorizontal

hmiAlignmentLeft ( 0): The text is shown left justified.

hmiAlignmentCentered ( 1): The text is shown centered.

hmiAlignmentRight ( 2): The text is shown right justified.

### See also

OnlineTableControl (Page 4367)

## ValueColumnPrecision(i)

### Description

Specifies the number of decimal places that are shown in this value column. The parameter *i* indicates the number of the column pair. A maximum of 16 decimal places can be shown.

Access in Runtime: Read and write

### Syntax

Object.**ValueColumnPrecision**(i)[=Int]

#### Object

Required A "ScreenItem" object with the format "OnlineTableControl".

#### Int

Optional A value or a constant that specifies the number of decimal places that are shown in this value column.

## See also

OnlineTableControl (Page 4367)

## VerticalAlignment

### Description

Specifies the vertical alignment of the text within the selected object.

Access in Runtime: Read and write

### Syntax

Object.**VerticalAlignment**[=AlignmentVertical]

#### Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch", "Checkbox" or "OptionGroup".

#### AlignmentVertical

A value that specifies the vertical alignment.

hmiAlignmentTop ( 0): The text will be shown in the upper margin.

hmiAlignmentMiddle ( 1): The text will be shown in the middle.

hmiAlignmentBottom ( 2): The Text will be shown in the lower margin.

## See also

TextField (Page 4436)

IOField (Page 4351)

SymbolicIOField (Page 4422)

Button (Page 4294)

Switch (Page 4419)

OptionGroup (Page 4384)

DateTimeField (Page 4315)

RoundButton (Page 4404)

## VerticalAlignment

### Description

Determines the vertical alignment of the text within the given object.

Access during runtime: Read and Write

## Syntax

Object.VerticalAlignment [= THmiVerticalAlignment]

### Object

Required An object of the "ScreenItem" type with the characteristics "TextField", "IOField", "SymbolicIOField", "Button" or "Switch".

### THmiVerticalAlignment

Optional A value or constant which determines the vertical alignment of the text.

hmiAlignmentTop (0): The text is aligned at the top of the object.

hmiAlignmentMiddle (1): The text is centered vertically in the object.

hmiAlignmentBottom (2): The text is aligned at the bottom in the object.

## See also

ProjectName (Page 4392)

## VerticalGridLines

### Description

Enables the display of vertical dividers.

Access in Runtime: Read and write

## Syntax

Object.VerticalGridLines[=BOOLEAN]

### Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

### BOOLEAN

TRUE: Vertical grid lines are displayed.

FALSE: Vertical grid lines are not displayed.

## See also

UserArchiveControl (Page 4459)

TrendRulerControl (Page 4439)

OnlineTableControl (Page 4367)

AlarmControl (Page 4273)

## VerticalScrollbarPosition

### Description

Specifies the vertical positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

### See also

ScreenWindow (Page 4408)

## ViewOnly

### Description

Specifies whether the Sm@rtClient display will be used for remote monitoring or remote maintenance.

Remote maintenance means that settings can be changed on the monitored device.

Remote monitoring means that settings of the monitored device cannot be changed.

Access in Runtime: Read and write

### Syntax

Object.**ViewOnly**[=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "SmartClientView".

#### BOOLEAN

Optional TRUE, if the Sm@rtClient display is to be used only for remote monitoring.

### See also

SmartClientView (Page 4415)

## Visible

### Description

Specifies whether the selected object is visible.

Access during runtime: Read and write

## Syntax

Object.**Visible**[=BOOLEAN]

### Object

Necessary. An object of the type "ScreenItem".

### BOOLEAN

Optional TRUE, if the object is visible.

### Used for the following object types:

Rectangle

## Warning

### Description

Specifies the limit for the storage space display as of which a warning will be reported.

Access in Runtime: Read and write

### Syntax

Object.**Warning**[=Int]

#### Object

Required A "ScreenItem" object with the format "DiskSpaceView".

#### Int

Optional A value or a constant that specifies the limit for the storage space display as of which a warning will be reported.

### See also

DiskSpaceView (Page 4317)

## WarningColor

### Description

Specifies the color in which the bar of the storage space display will be shown as soon as the warning area is reached.

Access in Runtime: Read and write

### Syntax

Object.**WarningColor**[=Color]

#### Object

Required A "ScreenItem" object with the format "DiskSpaceView".

#### Color

Optional A value or a constant that specifies the color in which the bar of the storage space display will be shown as soon as the warning area is exceeded.

### See also

DiskSpaceView (Page 4317)

## WarningHigh

### Description

Defines or returns the upper limit value for "Warning High".

In order that the limit value is monitored, the "CheckWarningHigh" property must be set to TRUE.

The display on reaching the limit value and the type of evaluation are defined by means of the "ColorWarningHigh" and "TypeWarningHigh" properties.

## WarningLow

### Description

Defines or returns the lower limit value for "Warning Low".

In order that the limit value is monitored, the "CheckWarningLow" property must be set to TRUE.

The display on reaching the limit value and the type of evaluation are defined by means of the "ColorWarningLow" and "TypeWarningLow" properties.

## WarningLowerLimit

### Description

Specifies the lower limit for "WarningLowerLimit".

The ""WarningLowerLimitEnable" property must have the value TRUE so that the limit is monitored.

Access in Runtime: Read and write

### Syntax

Object.**WarningLowerLimit**[=Double]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### Double

Optional A value or a constant that specifies the lower limit for "WarningLowerLimit".

### Comments

The following values will be specified with the properties "WarningLowerLimitColor" and "WarningLowerLimitRelative":

Representation upon reaching the limit

Type of evaluation

**See also**

Bar (Page 4287)

**WarningLowerLimitColor****Description**

Specifies the color for the lower limit ""WarningLowerLimit".

The ""WarningLowerLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

**Syntax**

Object.**WarningLowerLimitColor**[=Color]

**Object**

Required A "ScreenItem" object with the format "Bar".

**Color**

Optional A value or a constant that specifies the color for the lower limit "WarningLowerLimit".

**Comments**

The following values are specified by the "WarningUpperLimit", "WarningUpperLimitColor" and "WarningUpperLimitRelative" properties:

- Limit
- Representation upon reaching the limit
- Type of evaluation

**See also**

Bar (Page 4287)

**WarningLowerLimitEnabled****Description**

Specifies whether the limit ""WarningLowerLimit" is to be monitored.

Access in Runtime: Read and write

## Syntax

Object.**WarningLowerLimitEnabled**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "Bar".

### BOOLEAN

Optional TRUE, if the "WarningLowerLimit" limit is to be monitored.

## Comments

The following values will be specified with the properties "WarningLowerLimit", "WarningLowerLimitColor" and "WarningLowerLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

## See also

Bar (Page 4287)

## WarningLowerLimitRelative

### Description

Determines whether the lower limit "WarningLowerLimit" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

### Syntax

Object.**WarningLowerLimitRelative**[=BOOLEAN]

### Object

Required A ""ScreenItem" object with the format "Bar".

### BOOLEAN

Optional TRUE, if the lower limit ""WarningLowerLimit" is to be evaluated as a percentage.

## See also

Bar (Page 4287)

## WarningRangeColor

### Description

Specifies the color of the warning range on the scale of the "Gauge" object.

The "WarningRangeVisible" property must have the value TRUE so that the warning range is displayed.

Access in Runtime: Read and write

### Syntax

Object.**WarningRangeColor**[= Color]

#### Object

Required A "ScreenItem" object with the format "Gauge".

#### Color

Optional A value or a constant that specifies the color of the warning range.

### Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

### See also

Gauge (Page 4338)

## WarningRangeStart

### Description

Specifies at which scale value the warning range of the "Gauge" object will start.

The "WarningRangeVisible" property must have the value TRUE so that the warning range is displayed.

Access in Runtime: Read and write

### Syntax

Object.**WarningRangeStart**[= DOUBLE]

#### Object

Required A "ScreenItem" object with the format "Gauge".

### **DOUBLE**

Optional A value or a constant that contains the scale value for the start of the warning range.

### **Comments**

The range extends from the value "Warning" through to the value "Danger". If no range is activated for "Danger", then the range for "Warning" extends to the end of the scale.

### **See also**

Gauge (Page 4338)

## **WarningRangeVisible**

### **Description**

Specifies whether the warning range in the scale of the "Gauge" object will be displayed.

Access in Runtime: Read and write

### **Syntax**

Object.**WarningRangeVisible**[= BOOLEAN]

#### **Object**

Required A "ScreenItem" object with the format "Gauge".

#### **BOOLEAN**

Optional TRUE, if the warning range will be displayed in the scale.

### **Comments**

Specifies the color of the warning range with the ""WarningRangeColor" property.

Specifies the start of the warning range with the "WarningRangeStart"" property.

### **See also**

Gauge (Page 4338)

WarningRangeColor (Page 5031)

WarningRangeStart (Page 5031)

## WarningUpperLimit

### Description

Specifies the upper limit for "WarningUpperLimit".

The "WarningUpperLimitEnable" property must have the value TRUE so that the limit is monitored.

Access in Runtime: Read and write

### Syntax

Object.**WarningUpperLimit**[=Double]

#### Object

Required A "ScreenItem" object with the format "Bar".

#### Double

Optional A value or a constant that specifies the upper limit for "WarningUpperLimit".

### Comments

The following values will be specified with the properties "WarningUpperLimitColor" and "WarningUpperLimitRelative":

- Representation upon reaching the limit
- Type of evaluation

### See also

Bar (Page 4287)

## WarningUpperLimitColor

### Description

Specifies the color for the upper limit "WarningUpperLimit".

The "WarningUpperLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

### Syntax

Object.**WarningUpperLimitColor**[=Color]

**Object**

Required A "ScreenItem" object with the format "Bar".

**Color**

Optional A value or a constant that specifies the color for the upper limit "WarningUpperLimit".

**See also**

Bar (Page 4287)

**WarningUpperLimitEnabled**

**Description**

Specifies whether the limit ""WarningUpperLimit" is to be monitored.

Access in Runtime: Read and write

**Syntax**

Object.**WarningUpperLimitEnabled**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "Bar".

**BOOLEAN**

Optional TRUE, if the "WarningUpperLimit" limit is to be monitored.

**See also**

Bar (Page 4287)

**WarningUpperLimitRelative**

**Description**

Determines whether the lower limit "WarningUpperLimit" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

**Syntax**

Object.**WarningUpperLimitRelative**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "Bar".

**BOOLEAN**

Optional TRUE, if the lower limit "WarningUpperLimit" is to be evaluated as a percentage.

**See also**

Bar (Page 4287)

**Width****Description**

Specifies the width of the selected objects "Ellipse", "Circle" and "Rectangle".

Access in Runtime: Read and write.

The other objects only have read access to the property.

**Syntax**

Object.**Width**[=LONG]

**Object**

Required A "Screen" object or an object of type "ScreenItem". This property is a standard property of the ScreenItem-object and is therefore available for all formats.

**LONG**

Optional A value or a constant that specifies the width in pixels. This parameter can only be set for the objects "Ellipse", "Circle" and "Rectangle".

## WinCCStyle

### Description

Defines the style in which the object is displayed.

User Defined	Shows the object according to the respective settings.
Global	Shows the object in a globally defined design.
Windows Style	Shows the object in Windows style.

## WindowBorder

### Description

TRUE, when the window is displayed with borders in Runtime. Read only access.

## WindowCloseEnabled

### Description

Specifies whether the window can be closed in Runtime.

Access in Runtime: Read and write

## Syntax

Object.**WindowCloseEnabled**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the formats "OnlineTrend", "FunctionTrendView" or "TableView".

### BOOLEAN

Optional TRUE, if the window can be closed in Runtime.

## See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

OnlineTableControl (Page 4367)

## WindowMaximizeenabled

### Description

TRUE, when the object can be maximized in Runtime. Read only access.

## See also

ScreenWindow (Page 4408)

ScriptDiagnostics (Page 4410)

## WindowMovingEnabled

### Description

TRUE, when the object can be moved in Runtime. Read only access.

## See also

ScreenWindow (Page 4408)

ScriptDiagnostics (Page 4410)

## WindowOnTop

### Description

TRUE, when the object should remain in the foreground in Runtime. Read only access.

**See also**

ScreenWindow (Page 4408)  
ScriptDiagnostics (Page 4410)

**WindowsContents****Description**

Supplies the content of the application window Read only access.

**See also**

ScriptDiagnostics (Page 4410)

**WindowSizingEnabled****Description**

Specifies whether the size of the specified object can be changed in Runtime.  
Access in Runtime: Read and write

**Syntax**

Object.**WindowSizingEnabled**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the formats "OnlineTrend", "FunctionTrendView" or "TableView".

**BOOLEAN**

Optional. TRUE, if the size of the selected object can be changed in Runtime.

**See also**

OnlineTrendControl (Page 4375)  
FunctionTrendControl (Page 4330)  
OnlineTableControl (Page 4367)

**WindowsStyle****Description**

Specifies whether the object will be displayed in the general Windows style.

Access in Runtime: Read and write

## Syntax

Object.**WindowsStyle**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the formats "Button" or "WindowSlider".

### BOOLEAN

Optional TRUE, if the object will be displayed in the general Windows style.

## See also

Button (Page 4294)

WindowSlider (Page 4468)

## Properties X-Z

### XAxisAdd

#### Description

Creates a new X axis.

#### Syntax

Object.**XAxisAdd**

#### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

## See also

FunctionTrendControl (Page 4330)

### XAxisAlign

#### Description

Defines the alignment mode for a selected axis.

**Syntax**

Object.**XAxisAlign**[=Alignment]

**Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

**Alignment**

Value	Description	Description
0	Bottom	The X axis selected is displayed below the trend.
1	Top	The X axis selected is displayed above the trend.

**XAxisAutoPrecisions****Description**

Enables automatic setting of the decimal precision.

Access in Runtime: Read and write

**Syntax**

Object.**XAxisAutoPrecisions**[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

**BOOLEAN**

TRUE: The number of decimal places is specified automatically.

FALSE: The value configured under "Properties > X axis > Format > Decimal places" is effective.

**See also**

FunctionTrendControl (Page 4330)

**XAxisAutorange(i)****Description**

Specifies whether the value range of the X axis is determined automatically or via the attributes "XAxisBegin(i)" and "XAxisEnd(i)".

Access in Runtime: Read and write

## Syntax

Object.**XAxisAutorange**(i)[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "FunctionTrendView".

### BOOLEAN

Optional TRUE, if the value range of the X axis is determined automatically or via the values "XAxisBegin(i)" and "XAxisEnd(i)".

## See also

FunctionTrendControl (Page 4330)

## XAxisBegin(i)

### Description

Specifies the lower limit of the X axis of a trend that has been referenced with the property "CurrentCurveIndex". Whether the information is evaluated depends on the properties "XAxisAutorange(i)" and "ShareXAxis".

Access in Runtime: Read and write

## Syntax

Object.**XAxisBegin**(i)[=String]

### Object

Required A ""ScreenItem" object with the format ""FunctionTrendView".

### String

Optional A value or a constant that specifies the lower limit of the X axis of a trend that has been referenced with the property "CurrentCurveIndex".

## See also

FunctionTrendControl (Page 4330)

## XAxisBeginValue

### Description

Specifies the lower range of values of the axis selected. To configure the value, deactivate the "Automatic" option in "Value range".

**See also**

FunctionTrendControl (Page 4330)

**XAxisColor****Description**

Use this attribute to define the color for the common X-axis.

Access in Runtime: Read and write

**Syntax**

Object.**XAxisColor**[=COLOR]

**Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl" or "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

**Color**

The color is defined as an RGB value.

**See also**

FunctionTrendControl (Page 4330)

**XAxisCount****Description**

Defines the number of X axes configured.

**Syntax**

Object.**XAxisCount**

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl"..

**See also**

FunctionTrendControl (Page 4330)

## XAxisDecimalPrecision(i)

### Description

Specifies the number of decimal places with which the scaling value of the X axis will be displayed.

Access in Runtime: Read and write

### Syntax

Object.XAxisDecimalPrecision(i)[=Int]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendView".

#### Int

Optional A value or a constant that specifies the number of decimal places with which the scaling value for the X axis will be displayed.

### See also

FunctionTrendControl (Page 4330)

## XAxisEnd(i)

### Description

Specifies the lower limit of the X axis of a trend that has been referenced with the property "CurrentCurveIndex". Whether the information is evaluated depends on the properties "XAxisAutorange(i)" and "ShareXAxis".

Access in Runtime: Read and write

### Syntax

Object.XAxisEnd(i)[=String]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendView".

#### String

Optional A value or a constant that specifies the upper limit of the X axis of a trend that has been referenced with the property "CurrentCurveIndex".

### See also

FunctionTrendControl (Page 4330)

## XAxisEndValue

### Description

Specifies the upper range of values of the axis selected. To configure the value, deactivate the "Automatic" option in "Value range".

### See also

FunctionTrendControl (Page 4330)

## XAxisExponentialFormat

### Description

Enables the exponential notation for visualization of a selected axis.

Access in Runtime: Read and write

### Syntax

Object.**XAxisExponentialFormat** [=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

#### BOOLEAN

TRUE: The values are displayed in exponential format.

FALSE: The values are displayed in exponential format.

### See also

FunctionTrendControl (Page 4330)

## XAxisGridLineInterval(i)

### Description

Specifies the distance between two grid lines of the X axis. Whether the information is evaluated depends on the value of the property ""XAxisShowGridLines(i)".

Access in Runtime: Read and write

### Syntax

Object.**XAxisGridLineInterval(i)**[=Double]

**Object**

Required A "ScreenItem" object with the format "FunctionTrendView".

**Double**

Optional A value or a constant that specifies the distance between two grid lines of the X axis.

**See also**

FunctionTrendControl (Page 4330)

**XAxisIndex**

**Description**

References a configured X axis. You can assign the values of other properties to a specific X axis by using the property.

Valid values for "Index" are between 0 and "XAxisCount" minus 1. The "ToolbarButtonCount" property specifies the number of configured X axes.

**See also**

FunctionTrendControl (Page 4330)

**XAxisInTrendColor**

**Description**

Enables the display of an axis selected in the trend color. The color of the first trend is activated if several trends are displayed in the trend window. The order of the trends is determined in the "Trends" properties.

Access in Runtime: Read and write

**Syntax**

Object.XAxisInTrendColor[=BOOLEAN]

**Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

**BOOLEAN**

TRUE: The selected axis is displayed in the trend color. The setting in the "Color" field is disabled.

FALSE: The selected axis is displayed in the color which is set in the "Color" field.

**See also**

FunctionTrendControl (Page 4330)

**XAxisLabel(i)****Description**

Specifies the labeling of the X axis of a trend that has been referenced with the property "CurrentCurveIndex", dependent upon the value of "XAxisMode(i)".

Access in Runtime: Read and write

**Syntax**

Object.XAxisLabel(i)[=String]

**Object**

Required A "ScreenItem" object with the format "FunctionTrendView".

**String**

Optional A value or a constant that specifies the labeling of the X axis of a trend that has been referenced with the property "CurrentCurveIndex".

**See also**

FunctionTrendControl (Page 4330)

**XAxisLargeIncrementSize(i)****Description**

Specifies the distance of two long marking lengths of the X axis. Whether the information is evaluated depends on the property "XAxisShowLargeIncrements(i)".

Access in Runtime: Read and write

**Syntax**

Object.XAxisLargeIncrementSize(i)[=Double]

**Object**

Required A "ScreenItem" object with the format "FunctionTrendView".

**Double**

Optional A value or a constant that specifies the distance of two long marking lengths of the scaling of the X axis.

## See also

FunctionTrendControl (Page 4330)

## XAxisMode(i)

### Description

Specifies whether a mutual time axis will be used in the trend window for all trends.

Specifies time units used by tag logging controls.

Access in Runtime: Read and write

### Syntax

Object.XAxisMode(i)[=TrendViewTimeAxisMode]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

#### TrendViewTimeAxisMode

( 1): The time axis will be scaled.

( 2): No time range has been specified. Only a random sample will be displayed.

( 3): The time range will be established via tags.

( 4): The time range will be defined by constant values.

### Comments

Specifies whether a mutual X axis will be used in the trend window for all trends.

## See also

FunctionTrendControl (Page 4330)

## XAxisName

### Description

Specifies the name of a selected axis.

### Syntax

Object.XAxisName

**Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

**See also**

FunctionTrendControl (Page 4330)

**XAxisPrecisions****Description**

Specifies the decimal precision for displaying the axis selected. To configure the value, deactivate the "Automatic" option in "Format".

**See also**

FunctionTrendControl (Page 4330)

**XAxisRemove****Description**

Removes the selected axis from the list.

**Syntax**

Object.**XAxisRemove**

**Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

**See also**

FunctionTrendControl (Page 4330)

**XAxisRepos****Description**

Changes the sorting order of the axes. "Up" and "Down" move the axis selected up or down in the list. The order in the list determines the position of the axis in the trend view in Runtime. If the alignment is identical and the axis is further up in the list, it is shown at a position further away from the trend.

## Syntax

Object.**XAxisRepos**

### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

## See also

FunctionTrendControl (Page 4330)

## XAxisScalingType(i)

### Description

Specifies the type of scaling for the X axis. Whether the information is evaluated depends on the value of the property "XAxisMode(i)".

Access in Runtime: Read and write

### Syntax

Object.**XAxisScalingType**(i)[=AxisScalingType]

### Object

Required A "ScreenItem" object with the format "FunctionTrendView".

### AxisScalingType

hmiBarScalingLinear ( 0): Linear axis scaling.

hmiBarScalingLogarithmic ( 1): Logarithmic axis scaling

hmiBarScalingNegativeLogarithmic ( 2): Negative logarithmic axis scaling

### Comments

The parameter i indicates the number of the trend.

## See also

FunctionTrendControl (Page 4330)

## XAxisShowGridLines(i)

### Description

Specifies whether the trend window is shown with grid lines that run parallel to the X axis. The distance between two grid lines can be altered with the ""XAxisGridLineInterval(i)" property.

Access in Runtime: Read and write

## Syntax

Object.**XAxisShowGridLines**(i)[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "FunctionTrendView".

### BOOLEAN

Optional TRUE, if the trend window is shown with grid lines that run parallel to the X axis.

## See also

FunctionTrendControl (Page 4330)

## XAxisShowLargeIncrements(i)

### Description

Specifies whether the X axis is scaled with long marking lengths. The distance of two long marking lines can be altered with the "XAxisLargeIncrementSize(i)" property.

Access in Runtime: Read and write

## Syntax

Object.**XAxisShowLargeIncrements**(i)[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format ""FunctionTrendView".

### BOOLEAN

Optional TRUE, if the X axis is scaled with long marking lengths.

## See also

FunctionTrendControl (Page 4330)

## XAxisShowSmallIncrements(i)

### Description

Specifies whether the X axis is scaled with short marking lengths. The distance of two short marking lines can be altered with the "XAxisSmallIncrementSize(i)" property.

Access in Runtime: Read and write

## Syntax

Object.XAxisShowSmallIncrements(i)[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "FunctionTrendView".

### BOOLEAN

Optional TRUE, if the X axis is scaled with short marking lengths.

## See also

FunctionTrendControl (Page 4330)

## XAxisSmallIncrementSize(i)

### Description

Specifies the distance of two short marking lengths of the X axis. Whether the information is evaluated depends on the property "XAxisShowSmallIncrements(i)".

Access in Runtime: Read and write

## Syntax

Object.XAxisSmallIncrementSize(i)[=Double]

### Object

Required A "ScreenItem" object with the format "FunctionTrendView".

### Double

Optional A value or a constant that specifies the distance of two short marking lengths of the X axis scaling.

## See also

FunctionTrendControl (Page 4330)

## XAxisTrendWindow

### Description

Specifies in which trend view the selected axis is used. The available trend views are specified in the properties in "Trends".

Access in Runtime: Read and write

**Syntax**

Object.XAxisTrendWindow

**Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

**See also**

FunctionTrendControl (Page 4330)

**XAxisVisible****Description**

The list shows all axes you created.

Activate the axes which are to be displayed in the trend views in the list.

Click an axis in the list to adapt the properties and to assign the axis to a trend view.

**See also**

FunctionTrendControl (Page 4330)

**XDataLogTag(i)****Description**

Specifies the tag that will be shown along the X axis. The property "TagProviderType(i)" must have the value -1.

Access in Runtime: Read and write

**Syntax**

Object.XDataLogTag(i)[=HmiLoggingTag]

**Object**

Required A ""ScreenItem" object with the format "FunctionTrendView".

**HmiLoggingTag**

Optional A value or a constant that specifies which tag will be shown along the X axis.

## Comments

If "XOnlineTag(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent immediate acceptance of the change with "FreezeProviderConnections" before changing "XOnlineTag(i)".

## See also

FunctionTrendControl (Page 4330)

## XOnlineTag(i)

### Description

Specifies the tag that will be shown along the X axis. The property "TagProviderType(i)" must have the value -1.

Access in Runtime: Read and write

### Syntax

Object.XOnlineTag(i)[=HmiTag]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendView".

#### HmiTag

Optional A value or a constant that specifies which tag will be shown along the X axis.

## Comments

The parameter i indicates the number of the trend.

If "XOnlineTag(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent an immediate acceptance of the change with "FreezeProviderConnections" before changing "XOnlineTag(i)".

## See also

FunctionTrendControl (Page 4330)

## YAxisAdd

### Description

Creates a new X axis.

**Syntax**

Object.YAxisAdd

**Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

**See also**

FunctionTrendControl (Page 4330)

**YAxisAlign****Description**

Specifies how the selected axis is aligned.

**Syntax**

Object.YAxisAlign[=Alignement]

**Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

**Alignment**

Value	Description	Explanation
0	Left	The X axis selected is displayed on left side of the trend.
1	Right	The selected Y axis is displayed to the right of the trend.

**YAxisAutoPrecisions****Description**

Enables automatic setting of the decimal precision.

Access in Runtime: Read and write

**Syntax**

Object.YAxisAutoPrecisions[=BOOLEAN]

**Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

### BOOLEAN

TRUE: The number of decimal places is specified automatically.

FALSE: The value configured under "Properties > Y axis > Format > Decimal places" is effective.

### See also

FunctionTrendControl (Page 4330)

### YAxisAutoRange

#### Value range automatic - X/YAxisAutoRange

Enables automatic calculation of the value range of the axis selected.

Value	Description
TRUE	The range of values is calculated automatically.
FALSE	The range of values is calculated based in the values configured in the "from" and "to" fields.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisAutoRange**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisAutoRange**.

### See also

FunctionTrendControl (Page 4330)

### YAxisBeginValue

#### Description

Specifies the lower value range of the selected axis. To configure the value, deactivate the "Automatic" option in "Value range".

### See also

FunctionTrendControl (Page 4330)

## YAxisColor

### Description

Specifies the color of the axis selected. Open the "Color selection" dialog by clicking the button. . The setting is only active if the "Use trend color" field is disabled.

### Syntax

Object.**YAxisColor**[=COLOR]

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl" or "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

#### Color

The color is defined as an RGB value.

### See also

FunctionTrendControl (Page 4330)

## YAxisCount

### Description

Defines the number of Y axes configured.

### Syntax

Object.**YAxisCount**

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

### See also

FunctionTrendControl (Page 4330)

## YAxisEndValue

### Description

Specifies the upper value range of the selected axis. To configure the value, deactivate the "Automatic" option in "Value range".

### See also

FunctionTrendControl (Page 4330)

## YAxisExponentialFormat

### Description

Enables the exponential notation for visualization of a selected axis.

Access in Runtime: Read and write

### Syntax

Object.YAxisExponentialFormat [=BOOLEAN]

#### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

#### BOOLEAN

TRUE: The values are displayed in exponential format.

FALSE: The values are displayed in exponential format.

### See also

FunctionTrendControl (Page 4330)

## YAxisIndex

### Description

References a configured Y axis. You can assign the values of other properties to a specific Y axis by using the property.

Valid values for "Index" are between 0 and "YAxisCount" minus 1. The "ToolbarButtonCount" property specifies the number of configured Y axes.

### See also

FunctionTrendControl (Page 4330)

## YAxisInTrendColor

### Description

Enables the display of an axis selected in the trend color. The color of the first trend is activated if several trends are displayed in the trend window. The order of the trends is determined in the "Trends" properties.

Access in Runtime: Read and write

### Syntax

Object.YAxisInTrendColor[=BOOLEAN]

#### Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

#### BOOLEAN

TRUE: The selected axis is displayed in the trend color. The setting in the "Color" field is disabled.

FALSE: The selected axis is displayed in the color which is set in the "Color" field.

### See also

FunctionTrendControl (Page 4330)

## YAxisLabel

### Description

Defines the label text for a selected axis.

### See also

FunctionTrendControl (Page 4330)

## YAxisName

### Description

Specifies the name of the selected axis.

### Syntax

Object.XAxisName

### **Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

### **See also**

FunctionTrendControl (Page 4330)

## **YAxisPrecisions**

### **Description**

Specifies the decimal precision for displaying the axis selected. To configure the value, deactivate the "Automatic" option in "Format".

### **See also**

FunctionTrendControl (Page 4330)

## **YAxisRename**

### **Description**

Changes the name of the Y axis which is referenced by the "YAxisIndex" property.

### **Syntax**

Object.**YAxisRename**

### **Object**

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

## **YAxisRemove**

### **Description**

Removes the selected axis from the list.

### **Syntax**

Object.**YAxisRemove**

### **Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

**See also**

FunctionTrendControl (Page 4330)

**YAxisRepos****Description**

Changes the order of the axes. "Up" and "Down" move the selected axis up or down in the list.

The order in the list determines the position of the axis in the trend view in Runtime. The axis output position is moved away from the trend if the axis is moved further up in the list and the orientation is the same.

**Syntax**

Object.**YAxisRepos**

**Object**

Required A "ScreenItem" object with the format "FunctionTrendControl".

**See also**

FunctionTrendControl (Page 4330)

**YAxisScalingType****Scaling - X/YAxisScalingType**

Defines the scaling mode for a selected axis.

The following settings are available:

Value	Description
0	Linear
1	Logarithmic
2	Logarithmically negated

The X axis attribute can be assigned dynamic properties by means of the name **XAxisScalingType**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisScalingType**.

## See also

FunctionTrendControl (Page 4330)

## YAxisTrendWindow

### Description

Specifies in which trend view the selected axis is used. The available trend views are specified in the properties in "Trends".

Access in Runtime: Read and write

### Syntax

Object.YAxisTrendWindow

#### Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

## See also

FunctionTrendControl (Page 4330)

## YAxisVisible

### Description

The list shows all axes you created.

Activate the axes which are to be displayed in the trend views in the list.

Click an axis in the list to adapt the properties and to assign the axis to a trend view.

## See also

FunctionTrendControl (Page 4330)

## YDataLogTag(i)

### Description

Specifies the tag that will be shown along the Y axis. The property "TagProviderType(i)"" must have the value -1.

Access in Runtime: Read and write

## Syntax

Object.YDataLogTag(i)[=HmiLoggingTag]

### Object

Required A "ScreenItem" object with the format "FunctionTrendView".

### HmiLoggingTag

Optional A value or a constant that specifies which tag will be shown along the Y axis.

## Comments

If "YOnlineTag(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent immediate acceptance of the change with "FreezeProviderConnections" before changing "YOnlineTag(i)".

## See also

FunctionTrendControl (Page 4330)

## YOnlineTag(i)

## Description

Specifies the tag that will be shown along the Y axis. The property "TagProviderType(i)" must have the value -1.

Access in Runtime: Read and write

## Syntax

Object.YOnlineTag(i)[=HmiTag]

### Object

Required A "ScreenItem" object with the format "FunctionTrendView".

### HmiTag

Optional A value or a constant that specifies which tag will be shown along the Y axis.

## Comments

The parameter i indicates the number of the trend.

If "YOnlineTag(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent immediate acceptance of the change with "FreezeProviderConnections" before changing "YOnlineTag(i)".

## See also

FunctionTrendControl (Page 4330)

## ZeroPoint

### Description

Specifies the position of the zero point as a percentage of the bar height. The zero point can also be located outside of the displayed area.

The "ScalingType" property must be set to "Auto".

The "ShowScale" property must be set to "TRUE".

Access in Runtime: Read and write

### Syntax

Object.**ZeroPoint**[=Int]

#### Object

Required A ""ScreenItem" object with the format ""Bar".

#### Int

Optional A value or a constant that specifies the position of the zero point as a percentage of the bar height.

## See also

Bar (Page 4287)

## ZeroPointValue

### Description

Defines the value of the zero point of the scale indicator.

Defines or returns the absolute value for the zero point.

## Zoom/Zoomfactor

### Description

Sets or reads the zoom factor of a screen or screen window.

If the indicated zoom factor is smaller than the minimum value, the zoom factor is automatically set to the minimum value. If the indicated zoom factor is larger than the minimum value, the zoom factor is automatically set to the maximum value.

The minimum value of the zoom factor is at 2%, the maximum value at 800%.

With the Screen Object the zoom factor is indicated as a numeric value and with a picture window object, it is indicated in percent.

Zoom: Zoom factor of picture

Zoomfactor: Zoom factor of picture window

## Example

The following example doubles the zoom factor of the current picture:

```
'VBS97
HMIRuntime.ActiveScreen.Zoom = HMIRuntime.ActiveScreen.Zoom * 2
```

## See also

ScreenWindow (Page 4408)

## Zoomable

## Description

Specifies whether the DXF screen display supports the zoom functions in Runtime mode.

Access in Runtime: Read and write

## Syntax

Object.**Zoomable**[=BOOLEAN]

### Object

Required A "ScreenItem" object with the format "DXFView".

### BOOLEAN

Optional TRUE, if the DXF screen display supports the zoom functions in Runtime mode.

## Methods

### Methods A-G

#### Activate

#### Description

Activates the permanent window or the root screen.

To activate a not selected screen, use the "BaseScreenName" property.

It only makes sense to use the activate method with the following operable screen objects. An error message is output at screen objects which cannot be operated, for example rectangles.

- I/O field
- Switch
- Symbol library
- Trend view
- f(x) trend view
- HTML browser
- Slider
- Graphic I/O field
- Symbolic I/O field
- Button
- Alarm view
- User view
- Recipe view
- Sm@rtClient View
- Status/Force

#### Syntax

Expression.Activate

#### Expression

Necessary. An output which returns an object of the "Screen" or "ScreenItem" type.

#### Parameters

--

## ActivateDynamic

### Description

Dynamically activates a trigger and the specified cycle for a property at runtime. This requires a VB script at the property as well as a trigger set to "On demand". Every time the trigger is activated a different activation cycle can be used.

### Syntax

```
Expression.ActivateDynamic (ByVal bstrPropertyName As String, ByVal  
bstrCycleName As String)
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

## Parameters

Parameter	Description
bstrPropertyName	Name of property to which trigger relates.
bstrCycleName	Name of activation cycle, e.g. "CycleTime1s".

## Add

### Description of TagSet Object

Adds a tag to the list. A tag may be added to the tag object by using name or reference.

### syntax

```
Expression.Add [Tag]
```

#### Expression

Necessary. An expression which returns an object of type "TagSet".

### Parameters

VARIANT

Parameters	Description
Tag	Name of a WinCC tag or reference to a tag object to be added to the list.

**Example:**

In the following example, a TagSet object is generated and a tag is added.

```
'VBS170
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
```

Tag objects may also be added as follows.

```
'VBS171
Dim Tag
Set Tag = HMIRuntime.Tags("Motor2")
Dim group2
Set group2 = HMIRuntime.Tags.CreateTagSet
group2.Add Tag
```

**Description of DataSet Object**

Adds a value or object reference to the list.

**Note**

The Data Set Object does not support classes.

Objects of type Screen, Screens, ScreenItem, ScreenItems, Tag and TagSet cannot be included in the DataSet list.

For object references it must be ascertained that objects are multiread-enabled.

**syntax**

```
Expression.Add [vtName], [vtUserData]
```

**Expression**

Necessary. An expression which returns an object of type "DataSet".

**Parameters**

VARIANT

Parameters	Description
vtName	Name by which value or tag are to be added to list.
vtUserData	Value to be added to list.

### Example:

In this example, a value is included in the DataSet list.

```
'VBS172  
HMIRuntime.DataSet.Add "Motor1",23
```

### See also

[DataSet \(list\) \(Page 4246\)](#)

### AttachDB method

#### Description

Executes the "Connect backup" key function of the control.

#### Syntax

```
Ausdruck.AttachDB()
```

#### Expression

Required An expression that returns an object of the "ScreenItem" type.

#### Parameters

--

### See also

[OnlineTrendControl \(Page 4375\)](#)

[OnlineTableControl \(Page 4367\)](#)

[FunctionTrendControl \(Page 4330\)](#)

[AlarmControl \(Page 4273\)](#)

### CalculateStatistic

#### Description

Executes the "calculate statistics" key function of the f(t) trend view.

**Syntax**

```
Ausdruck.CalculateStatistic()
```

**Expression**

Required An expression that returns an object of the "ScreenItem" type.

**Parameters**

--

**See also**

[OnlineTrendControl \(Page 4375\)](#)

[OnlineTableControl \(Page 4367\)](#)

**CopyRows****Description**

Executes the "Copy lines" key function of the control.

**Syntax**

```
Ausdruck.CopyRows()
```

**Expression**

Required An expression that returns an object of the "ScreenItem" type.

**Parameters**

--

**See also**

[OnlineTrendControl \(Page 4375\)](#)

[OnlineTableControl \(Page 4367\)](#)

[UserArchiveControl \(Page 4459\)](#)

[AlarmControl \(Page 4273\)](#)

**Create****Description**

Creates a new Alarm object.

## Syntax

```
Expression.Create (VARIANT vtApplication)
```

### Expression

Required An expression which returns an object of type "Alarm".

## Parameters

VARIANT

Parameters	Description
vtApplication	Name of alarm object (optional)

## See also

OnlineTrendControl (Page 4375)

## CreateTagSet

### Description

Creates a new TagSet object. This object may be used for optimized multi-tag access.

### syntax

```
Expression.CreateTagSet ()
```

### Expression

Necessary. An expression which returns an object of type "TagSet".

## Parameters

VARIANT

## Example:

The following example shows how to create a TagSet object.

```
'VBS168  
'Build a Reference to the TagSet Object  
Dim group  
Set group = HMIRuntime.Tags.CreateTagSet
```

**See also**

OnlineTrendControl (Page 4375)

**CutRows****Description**

Executes the "Cut rows" key function of the recipe view.

**Syntax**

```
Ausdruck.CutRows()
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

--

**See also**

OnlineTrendControl (Page 4375)

UserArchiveControl (Page 4459)

**DeactivateDynamic****Description**

Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/ during runtime.

**Syntax**

```
Ausdruck.DeactivateDynamic(ByVal bstrPropertyName As String)
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

## Parameters

String

Parameters	Description
bstrPropertyName	Name of property to which trigger relates.

**GetColumn****Description**

Returns the column object of the recipe view designated by name or index as "ICCAxUAColumn" type.

**Syntax**

```
Ausdruck.GetColumn(ByVal vIndex As Variant)
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the column of the recipe view

### Example

```
'VBS312
Dim ctrl
Dim objColumn
Set ctrl = ScreenItems("RecipeControl")
Set objColumn = ctrl.GetColumn("Field1")
objColumn.Length = 30
Set objColumn = ctrl.GetColumn(3)
objColumn.Align = 2
```

---

### Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "Column" listing, for example, you write "objColumn.Align" instead of "objColumn.ColumnAlign".

---

### GetColumnCollection

### Description

Returns the list of all column objects of the recipe view as "ICCAxCollection" type.

## Syntax

```
Ausdruck.GetColumnCollection()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

## Parameters

--

## Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

## Example

```
'VBS313
Dim ctrl
Dim coll
Dim field
Set ctrl = ScreenItems("RecipeControl")
Set coll = ctrl.GetColumnCollection
HMIRuntime.Trace "Number of fields:" & coll.Count & vbCrLf
For Each field In coll
  HMIRuntime.Trace field.Name & vbCrLf
  HMIRuntime.Trace field.Type & vbCrLf
  HMIRuntime.Trace field.Length & vbCrLf
  HMIRuntime.Trace field.Caption & vbCrLf
Next
```

## GetHitlistColumnCollection

### Description

Returns the list of all column objects of the message view hit list as "ICCAxCollection" type.

### Syntax

```
Expression.GetHitlistColumnCollection()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

### Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

### Example

```
'VBS315
Dim ctrl
Dim coll
Dim hitlistcol
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetHitlistColumnCollection
HMIRuntime.Trace "Number of hitlist columns:" & coll.Count & vbCrLf
For Each hitlistcol In coll
  HMIRuntime.Trace hitlistcol.Index & vbCrLf
  HMIRuntime.Trace hitlistcol.Name & vbCrLf
  HMIRuntime.Trace hitlistcol.Sort & vbCrLf
  HMIRuntime.Trace hitlistcol.SortIndex & vbCrLf
Next
```

AlarmControl (Page 4273)

**GetHitlistColumn****Description**

Returns the column object of the message view hit list designated by name or index as "ICCAxMessageColumn" type.

**Syntax**

```
Expression.GetHitlistColumn(ByVal vIndex As Variant)
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

VARIANT

Parameters	Description
vIndex	Index or name of hitlist column

**Example**

```
'VBS314
Dim ctrl
Dim objHitlistColumn
Set ctrl = ScreenItems("AlarmControl")
Set objHitlistColumn = ctrl.GetHitlistColumn("Date")
objHitlistColumn.Sort = 2
Set objHitlistColumn = ctrl.GetHitlistColumn("AverageComeGo")
objHitlistColumn.Visible = FALSE
```

**Note**

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "HitlistColumn" listing, for example, you write "objHitlistColumn.Visible" instead of "objHitlistColumn.HitlistColumnVisible".

## GetMessageBlock

### Description

Returns the message block of the message view designated by name or index as "ICCAxMessageBlock" type.

### Syntax

```
Expression.GetMessageBlock(ByVal vIndex As Variant)
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

VARIANT

Parameters	Description
vIndex	Index or name of message block.

### Example

```
'VBS316  
Dim ctrl  
Dim objMsgBlock  
Set ctrl = ScreenItems("AlarmControl")  
Set objMsgBlock = ctrl.GetMessageBlock("Date")  
objMsgBlock.Align = 2  
Set objMsgBlock = ctrl.GetMessageBlock("Number")  
objMsgBlock.LeadingZeros = 4
```

**Note**

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "MessageBlock" listing, for example, you write "objMsgBlock.Align" instead of "objMsgBlock.MessageBlockAlign".

---

**See also**

OnlineTrendControl (Page 4375)

**GetMessageBlockCollection****Description**

Returns the list of all message block objects of the message view as "ICCAxCollection" type.

**Syntax**

```
Expression.GetMessageBlockCollection()
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

--

**Features and functions of the ICCAxCollection**

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

## Example

```
'VBS317
Dim ctrl
Dim coll
Dim msgblock
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetMessageBlockCollection
For Each msgblock In coll
  msgblock.Align = 1
  msgblock.Length = 12
  msgblock.Selected = TRUE
Next
```

---

### Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "MessageBlock" listing, for example, you write "msgblock.Align" instead of "msgblock.MessageBlockAlign".

## GetMessageColumn

### Description

Returns the column object of the message view designated by name or index as "ICCAxMessageColumn" type.

### Syntax

```
Expression.GetMessageColumn(ByVal vIndex As Variant)
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

## Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column in message list.

## Example

```
'VBS318
Dim ctrl
Dim objMessColumn
Set ctrl = ScreenItems("AlarmControl")
Set objMessColumn = ctrl.GetMessageColumn("Date")
objMessColumn.Visible = FALSE
Set objMessColumn = ctrl.GetMessageColumn("Number")
objMessColumn.Sort = 1
```

### Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "MessageColumn" listing, for example, you write "objMessColumn.Visible" instead of "objMessColumn.MessageColumnVisible".

## GetOperatorMessage

### Description

Returns the operator message object of the message view designated by name or index as "ICCAxOperatorMessage" type.

### Syntax

```
Expression.GetOperatorMessage(ByVal vIndex As Variant)
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

VARIANT

Parameters	Description
vIndex	Index or name of operator message

**Example**

```
'VBS320
Dim ctrl
Dim objOpMess
Set ctrl = ScreenItems("AlarmControl")
Set objOpMess = ctrl.GetOperatorMessage(0)
objOpMess.Source1 = "Number"
objOpMess.SourceType1 = 1
```

---

**Note**

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "OperatorMessage" listing, for example, you write "objOpMess.Source1" instead of "objOpMess.OperatorMessageSource1".

**GetMessageColumnCollection**

**Description**

Returns the list of all column objects of the message view as "ICCAxCollection" type.

**Syntax**

```
Expression.GetMessageColumnCollection()
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

--

**Features and functions of the ICCAxCollection**

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

**Example**

```
'VBS319
Dim ctrl
Dim coll
Dim msgcol
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetMessageColumnCollection
HMIRuntime.Trace "Number of message columns:" & coll.Count & vbCrLf
For Each msgcol In coll
  HMIRuntime.Trace msgcol.Index & vbCrLf
  HMIRuntime.Trace msgcol.Name & vbCrLf
  HMIRuntime.Trace msgcol.Sort & vbCrLf
  HMIRuntime.Trace msgcol.SortIndex & vbCrLf
Next
```

**GetOperatorMessageCollection****Description**

Returns the list of all operator message objects of the message view as "ICCAxCollection" type.

## Syntax

```
Expression.GetOperatorMessageCollection()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

## Parameters

--

## Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

## Example

```
'VBS321
Dim ctrl
Dim coll
Dim opmsg
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetOperatorMessageCollection
For Each opmsg In coll
  HMIRuntime.Trace opmsg.Index & vbCrLf
  HMIRuntime.Trace opmsg.Name & vbCrLf
  HMIRuntime.Trace opmsg.Number & vbCrLf
  HMIRuntime.Trace opmsg.Selected & vbCrLf
Next
```

## GetRow

### Description

Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.

### Syntax

```
Expression.GetRow(ByVal IRow As Long)
```

#### Expression

Required An expression that returns an object of the "ScreenItem" type.

### Parameters

Long

Parameters	Description
IRow	Number of the desired line of the control.

### Example

```
'VBS356
Dim coll
Dim ctrl
Dim lIndex
Dim lCellIndex
Set ctrl = ScreenItems("UAControl")
Set coll = ctrl.GetRowCollection
'enumerate and trace out row numbers
For lIndex = 1 To coll.Count
  HMIRuntime.trace "Row: " & (ctrl.GetRow(lIndex).RowNumber) & " "
  'enumerate and trace out column titles and cell texts
  For lCellIndex = 1 To ctrl.GetRow(lIndex).CellCount
    HMIRuntime.trace ctrl.GetRow(0).CellText(lCellIndex) & " "
    HMIRuntime.trace ctrl.GetRow(lIndex).CellText(lCellIndex) & " "
  Next
  HMIRuntime.trace vbNewLine
Next
```

---

**Note**

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

**GetRowCollection**

**Description**

Returns the list of all row objects of the table-based controls type "ICCAxDataRowCollection".

**Syntax**

```
Expression.GetRowCollection()
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

--

**Properties of the ICCAxDataRowCollection**

The ICCAxDataRowCollection refers to runtime data. The data is read-only. It is not possible to add and edit the data.

The following properties are available for the ICCAxDataRowCollection:

- Count - Determines the number of rows in the collection.
- Item - Access to an individual row within the collection via the row number. Numbering runs from 1 to Count. A Row object is returned.

## Example

```
'VBS357
Dim ctrl
Dim coll
Dim lIndex
Dim lCellIndex
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetRowCollection
HMIRuntime.Trace "Number of message rows:" & coll.Count & vbCrLf
'enumerate and trace out row numbers
For lIndex = 1 To coll.Count
  HMIRuntime.Trace "Row: " & (ctrl.GetRow(lIndex).RowNumber) & " "
  'enumerate and trace out column titles and cell texts
  For lCellIndex = 1 To ctrl.GetRow(lIndex).CellCount
    HMIRuntime.Trace ctrl.GetMessageColumn(lCellIndex -1).Name & " "
    HMIRuntime.Trace ctrl.GetRow(lIndex).CellText(lCellIndex) & " "
  Next
  HMIRuntime.Trace vbCrLf
Next
```

## GetRulerBlock

### Description

Returns the block object of the evaluation table designated by name or index as "ICCAxRulerBlock" type.

### Syntax

```
Expression.GetRulerBlock(ByVal vIndex As Variant)
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

## Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the block in the evaluation table

## Example

```
'VBS322
Dim ctrl
Dim objRulerBlock
Set ctrl = ScreenItems("RulerControl")
Set objRulerBlock = ctrl.GetRulerBlock(0)
objRulerBlock.Caption = "RulerBlock1"
Set objRulerBlock = ctrl.GetRulerBlock("Name")
objRulerBlock.Length = 10
```

---

### Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "RulerBlock" listing, for example, you write "objRulerBlock.Caption" instead of "objRulerBlock.BlockCaption".

## GetRulerBlockCollection

### Description

Returns the list of all block objects of the evaluation table as "ICCAxCollection" type.

### Syntax

```
Expression.GetRulerBlockCollection()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

## Parameters

--

## Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

## Example

```
'VBS323
Dim ctrl
Dim coll
Dim rulerblock
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetRulerBlockCollection
For Each rulerblock In coll
    rulerblock.Align = 1
    rulerblock.Length = 12
Next
```

---

### Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "RulerBlock" listing, for example, you write "rulerblock.Align" instead of "rulerblock.RulerBlockAlign".

## GetRulerColumn

### Description

Returns the column object of the evaluation table designated by name or index as "ICCAxRulerColumn" type.

### Syntax

```
Expression.GetRulerColumn(ByVal vIndex As Variant)
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the column of the evaluation

### Example

```
'VBS324  
Dim ctrl  
Dim objRulercol  
Set ctrl = ScreenItems("RulerControl")  
Set objRulercol = ctrl.GetRulerColumn("Name")  
objRulercol.Sort = 0  
Set objRulercol = ctrl.GetRulerColumn("ValueY")  
objRulercol.Visible = FALSE
```

---

### Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "RulerColumn" listing, for example, you write "objRulercol.Visible" instead of "objRulercol.ColumnVisible".

**GetRulerColumnCollection****Description**

Returns the list of all column objects of the evaluation table as "ICCAxCollection" type.

**Syntax**

```
Expression.GetRulerColumnCollection()
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

--

**Features and functions of the ICCAxCollection**

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

**Example**

```
'VBS325
Dim ctrl
Dim coll
Dim rulercol
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetRulerColumnCollection
HMIRuntime.Trace "Number of ruler columns:" & coll.Count & vbCrLf
For Each rulercol In coll
  HMIRuntime.Trace rulercol.Index & vbCrLf
  HMIRuntime.Trace rulercol.Name & vbCrLf
  HMIRuntime.Trace rulercol.Sort & vbCrLf
  HMIRuntime.Trace rulercol.SortIndex & vbCrLf
```

Next

### GetRulerData

#### Description

Returns the value of the called trend at the ruler position.

#### Syntax

```
Expression.GetRulerData( ByVal RulerIndex As Long, pvValue As Variant, Optional pvTimeStamp As Variant, Optional pvFlags As Variant) Long
```

#### Expression

Necessary. An expression which returns an object of the "Trend" type.

#### Parameters

Parameters	Description
RulerIndex	0 =Ruler
pvValue	Value of X axis
pvTimeStamp	Time or value of the Y axis
pvFlags	Qualitycode

#### Example

```
'VBS326  
Dim ctrl  
Dim objTrend  
Dim objIOField1  
Dim objIOField2  
Dim rulvalue  
Dim rultime  
Set ctrl = ScreenItems( "Controll1" )  
Set objTrend = ctrl.GetTrend( "Trend 1" )  
Set objIOField1 = ScreenItems( "I/O Field1" )  
Set objIOField2 = ScreenItems( "I/O Field2" )
```

```
objTrend.GetRulerData 0, rulvalue, runtime  
objIOField1.OutputValue = rulvalue  
objIOField2.OutputValue = runtime
```

## GetSelectedRow

### Description

Returns the selected row object of a table-based control as "ICCAxDataRow" type.

### Syntax

```
Expression.GetSelectedRow()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

### Example

```
'VBS358  
Dim ctrl  
Dim lCellIndex  
Dim lCellCount  
Dim headingRow  
Dim selectedRow  
Set ctrl = ScreenItems("TableControl")  
Set headingRow = ctrl.GetRow(0)  
Set selectedRow = ctrl.GetSelectedRow  
lCellCount = headingRow.CellCount  
'enumerate and trace out column titles and cell texts  
For lCellIndex = 1 To lCellCount  
  HMIRuntime.trace headingRow.CellText(lCellIndex) & ": "  
  HMIRuntime.trace selectedRow.CellText(lCellIndex)  
  HMIRuntime.trace vbNewLine  
Next
```

---

**Note**

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

**GetSelectedRows**

**Description**

Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.

**Syntax**

Expression.GetSelectedRows()

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

--

**Example**

```
'VBS359
Dim ctrl
  Dim lCellIndex
  Dim lCellCount
  Dim lRowIndex
```

```
Dim lRowCount
Dim headingRow
Dim selectedRow
Dim selectedRows
Set ctrl = ScreenItems("TableControl")
Set headingRow = ctrl.GetRow(0)
Set selectedRows = ctrl.GetSelectedRows
lCellCount = headingRow.CellCount
lRowCount = selectedRows.Count
'enumerate selected rows
For lRowIndex = 1 To lRowCount
  Set selectedRow = selectedRows(lRowIndex)
  HMIRuntime.Trace "Row number: " & CStr(lRowIndex) & vbNewLine
  'enumerate and trace out column titles and cell texts
  For lCellIndex = 1 To lCellCount
    HMIRuntime.trace headingRow.CellText(lCellIndex) & ": "
    HMIRuntime.trace selectedRow.CellText(lCellIndex)
    HMIRuntime.trace vbNewLine
  Next
Next
Next
```

---

**Note**

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

**GetStatisticAreaColumn****Description**

Returns the column object of the statistic area window of the evaluation window designated by name or index as "ICCAxRulerColumn" type.

## Syntax

```
Ausdruck.GetStatisticAreaColumn(ByVal vIndex As Variant)
```

## Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

## Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column of statistics area window.

## Example

```
'VBS327  
Dim ctrl  
Dim objStatAreaCol  
Set ctrl = ScreenItems("RulerControl")  
Set objStatAreaCol = ctrl.GetStatisticAreaColumn("DatasourceY")  
objStatAreaCol.Visible = FALSE  
Set objStatAreaCol = ctrl.GetStatisticAreaColumn("ValueY(LL)")  
objStatAreaCol.Sort = 1
```

---

### Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

**Description**

Returns the column object of the statistic window of the evaluation window designated by name or index as "ICCAxRulerColumn" type.

**Syntax**

Ausdruck.GetStatisticResultColumn(ByVal vIndex As Variant)

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

VARIANT

Parameters	Description
vIndex	Index or name of column of statistics window.

**Example**

```
'VBS329
Dim ctrl
Dim objStatResCol
Set ctrl = ScreenItems("RulerControl")
Set objStatResCol = ctrl.GetStatisticResultColumn("MaxValue")
objStatResCol.Visible = FALSE
Set objStatResCol = ctrl.GetStatisticResultColumn("Average")
objStatResCol.Sort = 2
```

## GetStatusbarElement

### Description

Returns the element of the control status bar designated as name or index as type "ICCAxStatusbarElement".

### Syntax

```
Ausdruck.GetStatusbarElement(ByVal vIndex As Variant)
```

### Expression

Required An expression that returns an object of the "ScreenItem" type.

### Parameters

VARIANT

Parameters	Description
vIndex	Index or name of status bar element.

### Example

```
'VBS331  
Dim ctrl  
Dim objStatusbar  
Set ctrl = ScreenItems( "Control1" )  
Set objStatusbar = ctrl.GetStatusbarElement(1)  
objStatusbar.Visible = FALSE  
Set objStatusbar = ctrl.GetStatusbarElement(3)  
objStatusbar.Width = 10
```

**Note**

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "StatusBarElement" listing, for example, you write "objStatusBar.Visible" instead of "objStatusBar.StatusbarElementVisible".

## GetTimeAxis

### Description

Returns the time object that is specified by name or index for the f(t) trend view as "ICCAxTimeAxis" type.

## Syntax

```
Expression.GetTimeAxis(ByVal vIndex As Variant)
```

### Expression

Necessary. Expression that returns an object of the "ScreenItem" type.

## Parameters

VARIANT

Parameters	Description
vIndex	Index or name of time axis.

## Example

```
'VBS333
Dim ctrl
Dim objTimeAxis
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTimeAxis = ctrl.GetTimeAxis(1)
objTimeAxis.Visible = FALSE
Set objTimeAxis = ctrl.GetTimeAxis("axis 2")
objTimeAxis.Label = "Time axis 2"
objTimeAxis.DateFormat = "dd.MM.yy"
objTimeAxis.TimeFormat = "HH:mm:ss.ms"
objTimeAxis.RangeType = 2
'The format to be used for date and time entries depends on the
'regional settings and language options in the operating system.
objTimeAxis.BeginTime = "06.04.2010 9:33:18"
'objTimeAxis.BeginTime = "04/06/2010 9:33:18"
objTimeAxis.MeasurePoints = 100
```

### Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "TimeAxis" listing, for example, you write "objTimeAx.Visible" instead of "objTimeAx.TimeAxisVisible".

Returns the list of all time column objects of the table view as "ICCAxCollection" type.

### Syntax

```
Expression.GetTimeColumnCollection()
```

### Expression

Necessary. Expression that returns an object of the "ScreenItem" type.

## Parameters

--

## Features and functions of the ICCAxCollection

The following properties are available for ICCAxCollection:

- Count
- Item

The following functions are available for ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

## Example

```
'VBS336
Dim ctrl
Dim objTimeCol1
Dim objTimeCol2
Dim coll
Dim timecol
Set ctrl = ScreenItems("TableControl")
Set objTimeCol1 = ctrl.GetTimeColumnCollection.AddItem("TimeColumn2010")
Set objTimeCol2 = ctrl.GetTimeColumnCollection.AddItem("TimeColumn2011")
objTimeCol1.Caption = "2010"
objTimeCol1.RangeType = 1
'The format to be used for date and time entries depends on the
'regional settings and language options in the operating system.
objTimeCol1.BeginTime = "01.01.2010 0:00:00"
'objTimeCol1.BeginTime = "01/01/2010 0:00:00"
objTimeCol1.EndTime = "31.12.2010 11:59:59"
'objTimeCol1.EndTime = "12/31/2010 11:59:59"
objTimeCol2.Caption = "2011"
objTimeCol2.RangeType = 0
objTimeCol2.BeginTime = "01.01.2011 0:00:00"
'objTimeCol2.BeginTime = "01/01/2011 0:00:00"
objTimeCol2.TimeRangeFactor = 1
objTimeCol2.TimeRangeBase = 3600000
Set coll = ctrl.GetTimeColumnCollection
For Each timecol In coll
    timecol.Align = 1
    timecol.Length = 12
    timecol.BackColor = RGB(240,240,0)
    timecol.ForeColor = RGB(130,160,255)
Next
```

**GetToolBarButton**

**Description**

Returns the button function designated by name or index on the control toolbar as "ICCAxToolBarButton" type.

**Syntax**

```
Ausdruck.GetToolBarButton(ByVal vIndex As Variant)
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

VARIANT

Parameters	Description
vIndex	Index or name of toolbar button function.

**Example**

```
'VBS337  
Dim ctrl  
Set ctrl = ScreenItems( "Controll" )  
Dim toolbu  
Set toolbu = ctrl.GetToolBarButton ("ShowHelp")  
HMIRuntime.Trace "Name: " & toolbu.Name & vbCrLf  
HMIRuntime.Trace "Index: " & toolbu.Index & vbCrLf  
HMIRuntime.Trace "Hotkey: " & toolbu.HotKey & vbCrLf
```

---

**Note**

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "ToolBarButton" listing, for example, you write "toolbu.Index" instead of "toolbu.ToolBarButtonIndex".

## GetToolBarButtonCollection

### Description

Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.

### Syntax

```
Ausdruck.GetToolBarButtonCollection()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

## Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following methods are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

## Example

```
'VBS338  
Dim ctrl

**GetTrend**

**Description**

Returns the f(t) or f(x) trend view designated by name or index as "ICCAxTrend" or "ICCAxFunctionTrend" type.

**Syntax**

```
Ausdruck.GetTrend(ByVal vIndex As Variant)
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

VARIANT

Parameters	Description
vIndex	Index or name of curve.

**Example for Runtime Professional**

```
'VBS339
Dim ctrl
```

```
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrend = ctrl.GetTrend( "Trend 1" )
objTrend.PointStyle = 1
objTrend.LineWidth = 4
Set objTrend = ctrl.GetTrend(2)
objTrend.Provider = 1
objTrend.TagName = "Archive\ArchiveTag2"
```

---

**Note**

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Trend" listing, for example, you write "objTrend.PointStyle" instead of "objTrend.TrendPointStyle".

**GetTrendCollection****Description**

Returns the list of all trends of the f(t) or f(x) trend view as "ICCAxCollection" type.

**Syntax**

```
Ausdruck.GetTrendCollection()
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

--

## Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

## Example for Runtime Professional

```
'VBS340
Dim ctrl
Dim objTrendWnd
Dim objTimeAxis
Dim objValAxis
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis = ctrl.GetTimeAxisCollection.AddItem("myTimeAxis")
Set objValAxis = ctrl.GetValueAxisCollection.AddItem("myValueAxis")
objTimeAxis.TrendWindow = objTrendWnd.Name
objValAxis.TrendWindow = objTrendWnd.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.Provider = 1
objTrend.TagName = "Archive\ArchiveTag1"
objTrend.TrendWindow = objTrendWnd.Name
objTrend.TimeAxis = objTimeAxis.Name
objTrend.ValueAxis = objValAxis.Name
```

---

### Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Trend" listing, for example, you write "objTrend.TagName" instead of "objTrend.TrendTagName".

---

## GetTrendWindow

### Description

Returns the trend view object of the f(t) trend view or the f(x) trend view designated by name or index as "ICCAxTrendWindow" type.

### Syntax

```
Ausdruck.GetTrendWindow(ByVal vIndex As Variant)
```

### Expression

Required An expression that returns an object of the "ScreenItem" type.

### Parameters

VARIANT

Parameters	Description
vIndex	Index or name of curve window.

### Example for Runtime Professional

```
'VBS341
Dim ctrl
Dim objTrendWnd
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindow(1)
objTrendWnd.Visible = FALSE
Set objTrendWnd = ctrl.GetTrendWindow("trend window 2")
objTrendWnd.VerticalGrid = TRUE
objTrendWnd.FineGrid = TRUE
```

#### Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "TrendWindow" listing, for example, you write "objTrendWnd.Visible" instead of "objTrendWnd.TrendWindowVisible".

## GetTrendWindowCollection

### Description

Returns the list of all trend window objects of the f(t) trend display or the f(x) trend display as "ICCAxCollection" type.

### Syntax

```
Ausdruck.GetTrendWindowCollection()
```

#### Expression

Required. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

## Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

## Example for Runtime Professional

```
'VBS342
Dim ctrl
Dim objTrendWnd
Dim objTimeAxis
Dim objValAxis
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis = ctrl.GetTimeAxisCollection.AddItem("myTimeAxis")
Set objValAxis = ctrl.GetValueAxisCollection.AddItem("myValueAxis")
objTimeAxis.TrendWindow = objTrendWnd.Name
```

```
objValAxis.TrendWindow = objTrendWnd.Name
```

## GetValueAxis

### Description

Returns the value axis object of the f(t) trend view designated by name or index as "ICCAxValueAxis" type.

### Syntax

```
Ausdruck.GetValueAxis(ByVal vIndex As Variant)
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the value axis

### Example

```
'VBS343
Dim ctrl
Dim objValAxis
Set ctrl = ScreenItems("OnlineTrendControl")
Set objValAxis = ctrl.GetValueAxis(1)
objValAxis.Visible = FALSE
Set objValAxis = ctrl.GetValueAxis("axis 2")
objValAxis.Label = "Value axis 2"
objValAxis.ScalingType = 0
objValAxis.Precisions = 2
objValAxis.AutoRange = TRUE
```

---

**Note**

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "ValueAxis" listing, for example, you write "objValueAx.Visible" instead of "objValueAx.ValueAxisVisible".

---

**GetValueAxisCollection**

**Description**

Returns the list of all value axis objects of the f(t) trend view as "ICCAxCollection" type.

**Syntax**

```
Ausdruck.GetValueAxisCollection()
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

--

**Features and functions of the ICCAxCollection**

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

## Example

```
'VBS344
Dim ctrl
Dim objTrendWnd
Dim objValAxis1
Dim objValAxis2
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objValAxis1 = ctrl.GetValueAxisCollection.AddItem("myValueAxis1")
Set objValAxis2 = ctrl.GetValueAxisCollection.AddItem("myValueAxis2")
objValAxis1.TrendWindow = objTrendWnd.Name
objValAxis1.Label = "Value1"
objValAxis2.TrendWindow = objTrendWnd.Name
objValAxis2.inTrendColor = TRUE
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.ValueAxis = objValAxis1.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend2")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.ValueAxis = objValAxis2.Name
```

---

### Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "ValueAxis" listing, for example, you write "objValueAxis1.Label" instead of "objValueAxis1.ValueAxisLabel".

---

## GetValueColumn

### Description

Returns the value column object defined by name or index for the tabular view as "ICCAxValueColumn" type.

### Syntax

```
Expression.GetValueColumn(ByVal vIndex As Variant)
```

**Expression**

Necessary. Expression that returns an object of the "ScreenItem" type.

**Parameters**

VARIANT

Parameters	Description
vIndex	Index or name of the value column of the f(t) trend view.

**Example**

```
'VBS345
Dim ctrl
Dim objValueColumn
Set ctrl = ScreenItems("TableControl")
Set objValueColumn = ctrl.GetValueColumn("Valuecolumn1")
objValueColumn.Precisions = 4
Set objValueColumn = ctrl.GetValueColumn(2)
objValueColumn.ExponentialFormat = TRUE
```

---

**Note**

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "ValueColumn" listing, for example, you write "objValueColumn.Precisions" instead of "objValueColumn.ValueColumnPrecisions".

**GetValueColumnCollection**

**Description**

Returns the list of all value column objects of the f(t) trend view as "ICCAxCollection" type.

## Syntax

```
Ausdruck.GetValueColulmnCollection()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

## Parameters

--

## Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

## Example

```
'VBS346
Dim ctrl
Dim objValCol1
Dim objValCol2
Dim coll
Dim valcol
Set ctrl = ScreenItems("TableControl")
Set objValCol1 = ctrl.GetValueColumnCollection.AddItem("ValueColumn1")
Set objValCol2 = ctrl.GetValueColumnCollection.AddItem("ValueColumn2")
objValCol1.Caption = "Value Archive"
objValCol1.Provider = 1
objValCol1.TagName = "ProcessValueArchive\arch1"
objValCol1.TimeColumn = "TimeColumn1"
objValCol2.Caption = "Value Tag"
objValCol2.Provider = 2
objValCol2.TagName = "tagxx"
objValCol2.TimeColumn = "TimeColumn2"
Set coll = ctrl.GetValueColumnCollection
For Each valcol In coll
    valcol.Align = 2
    valcol.Length = 10
    valcol.AutoPrecisions = TRUE
Next
```

## GetXAxis

### Description

Returns the X axis object of the f(x) trend view designated by name or index as "ICCAxValueAxis" type.

### Syntax

```
Ausdruck.GetXAxis (ByVal vIndex As Variant)
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

VARIANT

Parameters	Description
vIndex	Index or name of X axis.

### Example

```
'VBS347  
Dim ctrl  
Dim objXAx  
Set ctrl = ScreenItems("FunctionTrendControl")  
Set objXAx = ctrl.GetXAxis(1)  
objXAx.Visible = FALSE  
Set objXAx = ctrl.GetXAxis("axis 2")  
objXAx.Label = "X axis 2"  
objXAx.ScalingType = 0  
objXAx.Precisions = 2  
objXAx.Color = RGB(109,109,109)
```

**Note**

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "XAxis" listing, for example, you write "objXAx.Visible" instead of "objXAx.XAxisVisible".

**GetXAxisCollection****Description**

Returns the list of all X axis objects of the f(x) trend view as "ICCAxCollection" type.

**Syntax**

```
Ausdruck.GetXAxisCollection()
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

--

**Features and functions of the ICCAxCollection**

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

## Example

```
'VBS348
Dim ctrl
Dim objXAxis1
Dim objXAxis2
Dim coll
Dim axes
Set ctrl = ScreenItems("FunctionTrendControl")
Set objXAxis1 = ctrl.GetXAxisCollection.AddItem("myXAxis1")
objXAxis1.Label = "temperature"
Set objXAxis2 = ctrl.GetXAxisCollection.AddItem("myXAxis2")
objXAxis2.Label = "pressure"
Set coll = ctrl.GetXAxisCollection
HMIRuntime.Trace "Number of XAxis:" & coll.Count & vbCrLf
For Each axes In coll
    HMIRuntime.Trace axes.Name & vbCrLf
    HMIRuntime.Trace axes.Label & vbCrLf
Next
```

---

### Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "XAxis" listing, for example, you write "objXAxis1.Label" instead of "objXAxis1.XAxisLabel".

## GetYAxis

### Description

Returns the Y axis object of the f(x) trend view designated by name or index as "ICCAxValueAxis" type.

### Syntax

```
Ausdruck.GetYAxis (ByVal vIndex As Variant)
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameters**

VARIANT

Parameters	Description
vIndex	Index or name of Y axis.

**Example**

```
'VBS349
Dim ctrl
Dim objYAx
Set ctrl = ScreenItems("FunctionTrendControl")
Set objYAx = ctrl.GetYAxis(1)
objYAx.Visible = FALSE
Set objYAx = ctrl.GetYAxis("axis 2")
objYAx.Label = "Y axis 2"
objYAx.Align = 0
objYAx.Precisions = 3
objYAx.EndValue = 90.000
objYAx.BeginValue = 10.000
```

**Note**

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "YAxis" listing, for example, you write "objYAx.Visible" instead of "objYAx.YAxisVisible".

**See also**

OnlineTrendControl (Page 4375)

**GetYAxisCollection****Description**

Returns the list of all Y axis objects of the f(x) trend view as "ICCAxCollection" type.

## Syntax

```
Ausdruck.GetYAxisCollection()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

## Parameters

--

## Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

## Example

```
'VBS350
Dim ctrl
Dim objYAxis1
Dim objYAxis2
Dim coll
Dim axes
Set ctrl = ScreenItems("FunctionTrendControl")
Set objYAxis1 = ctrl.GetXAxisCollection.AddItem("myYAxis1")
objYAxis1.Label = "temperature"
Set objYAxis2 = ctrl.GetXAxisCollection.AddItem("myYAxis2")
objYAxis2.Label = "pressure"
Set coll = ctrl.GetYAxisCollection
HMIRuntime.Trace "Number of YAxis:" & coll.Count & vbCrLf
For Each axes In coll
  HMIRuntime.Trace axes.Name & vbCrLf
  HMIRuntime.Trace axes.Label & vbCrLf
Next
```

**Note**

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "YAxis" listing, for example, you write "objYAxis1.Label" instead of "objYAxis1.YAxisLabel".

---

**See also**

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

**Methods H-R****HideAlarm****Description**

Executes the "Hide alarm" button function of the alarm view.

**Syntax**

```
Expression.HideAlarm()
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameter**

--

**See also**

AlarmControl (Page 4273)

**InsertData****Description**

Adds data to the called trend.

## Syntax

Expression.InsertData(dblAxisX As Variant, dblAxisY As Variant)

### Expression

Necessary. An expression which returns an object of the "Trend" type.

## Parameters

Parameters	Description
dblAxisX	Value of X axis
dblAxisY	Value of Y axis

## Example

```
'VBS300
Dim lngFactor
Dim dblAxisX
Dim dblAxisY
Dim objTrendControl
Dim objTrend
Set objTrendControl = ScreenItems("Control1")
Set objTrend = objTrendControl.GetTrend("Trend 1")
For lngFactor = -100 To 100
dblAxisX = CDb1(lngFactor * 0.02)
dblAxisY = CDb1(dblAxisX * dblAxisX + 2 * dblAxisX + 1)
objTrend.InsertData dblAxisX, dblAxisY
Next
```

## Item

### Description

Returns an element from a list.

### Syntax

Expression.Item(Index)

### Expression

Necessary. An expression which returns a list.

## Parameters

### Index

The name or the index number of an element of the list:

- ScreenItems-Listing: Use an object name, e.g. "HmiRuntime.Screens(1).ScreenItems("Circle)", or the index number.
- Screens-Listing: Use either the name or the index number.
- SmartTags-Listing: You can only use the tag name as index in the SmartTags list. A counting of all tags is not possible.

If the transferred value does not correspond with an element in the list, an error occurs. The return value has the value "Nothing".

```
On Error Resume Next
Dim screen
Set screen = HmiRuntime.Screens("Screen_1")
If (screen is Nothing)
then...
Else...
End If
```

Best practice for optimizing auto-completion support is to use combined addressing by means of screen name and object name, e.g.

```
"HmiRuntime.Screens("Screen").ScreenItems("Circle)".
```

## Example

The item method is the default method for lists. Therefore, the results are the same for the following two examples:

```
'VBS_Example_Item
HMIRuntime.Screens.Item(1)
HMIRuntime.Screens(1)
```

Both instructions reference the respective base screen.

ScreenItems (list) (Page 4260)

ScreenItem (Page 4258)

## LockAlarm

### Description

Executes the "Disable alarm" button function of the alarm view.

### Syntax

```
Expression.LockAlarm()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## LoopInAlarm

### Description

Executes the "Loop in alarm" button function of the alarm view.

### Syntax

```
Expression.LoopInAlarm()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## MoveAxis

### Description

Executes the "Move axes area" button function of the f(t) and f(x) trend views.

### Syntax

```
Expression.MoveAxis()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

## MoveToFirst

### Description

Executes the "First line" button function of the control.

### Syntax

```
Expression.MoveToFirst()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

### See also

OnlineTrendControl (Page 4375)

OnlineTableControl (Page 4367)

UserArchiveControl (Page 4459)

## MoveToFirstLine

### Description

Executes the "First alarm" button function of the alarm view.

### Syntax

```
Ausdruck.MoveToFirstLine()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## MoveToFirstPage

### Description

Executes the "First page" button function of the alarm view.

### Syntax

```
Ausdruck.MoveToFirstPage()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## MoveToLast

### Description

Executes the "last data record" button function of the control.

### Syntax

```
Ausdruck.MoveToLast()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

## MoveToLastPage

### Description

Executes the "Last page" button function of the alarm view.

### Syntax

```
Ausdruck.MoveToLastPage()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## MoveToNext

### Description

Executes the "next data record" button function of the control.

### Syntax

```
Ausdruck.MoveToNext()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

### See also

OnlineTrendControl (Page 4375)

OnlineTableControl (Page 4367)

UserArchiveControl (Page 4459)

## MoveToNextLine

### Description

Executes the "Next alarm" button function of the alarm view.

### Syntax

```
Ausdruck.MoveToNextLine()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## MoveToNextPage

### Description

Executes the "Next page" button function of the alarm view.

### Syntax

```
Ausdruck.MoveToNextPage()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## MoveToPrevious

### Description

Executes the "previous data record" button function of the control.

### Syntax

```
Ausdruck.MoveToPrevious()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

Ausdruck.MoveToPreviousLine()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

[AlarmControl \(Page 4273\)](#)

## MoveToPreviousPage

### Description

Executes the "Previous page" button function of the alarm view.

### syntax

```
Ausdruck.MoveToPreviousPage()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## NextColumn

### Description

Executes the "Next column" button function of the table view.

### Syntax

```
Ausdruck.NextColumn()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

OnlineTableControl (Page 4367)

## NextTrend

### Description

Executes the "Next trend" button function of the f(t) and f(x) trend views.

### Syntax

```
Ausdruck.NextTrend()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

### See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

## OneToOneView

### Description

Executes the "Original view" button function of the f(t) and f(x) trend views.

### Syntax

```
Ausdruck.OneToOneView()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

VARIANT

### See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

## PasteRows

### Description

Executes the "Insert rows" button function of the recipe view.

### Syntax

```
Expression.PasteRows()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

UserArchiveControl (Page 4459)

## PreviousColumn

### Description

Executes the "Previous column" button function of the table view.

### Syntax

```
Ausdruck.PreviousColumn()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

OnlineTableControl (Page 4367)

## PreviousTrend

### Description

Executes the "Previous trend" button function of the f(t) and f(x) trend views.

### Syntax

```
Ausdruck.PreviousTrend()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

### See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

## Print

### Description

Executes the "Print" button function of the control.

### Syntax

```
Ausdruck.Print()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

### See also

OnlineTrendControl (Page 4375)

OnlineTableControl (Page 4367)

TrendRulerControl (Page 4439)

UserArchiveControl (Page 4459)

## QuitHorn

### Description

Executes the "Acknowledge central alarm generator" button function of the alarm view.

### Syntax

```
Ausdruck.QuitHorn()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## QuitSelected

### Description

Executes the "Single acknowledgment" button function of the alarm view.

### Syntax

```
Ausdruck.QuitSelected()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## QuitVisible

### Description

Executes the "Group acknowledgment" button function of the alarm view.

### Syntax

```
Ausdruck.QuitVisible()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## ReadTags

### Description

Executes the "Read tags" button function of the recipe view.

### Syntax

```
Ausdruck.ReadTags()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

UserArchiveControl (Page 4459)

## Read

### Description of Tag Object

Reads out the status of a tag (tag object) shortly after the moment it was called. At the same time, the tag object is provided with the values read. Upon reading a tag, its value, quality code and time stamp are determined. The "LastError" property can be used to determine whether the call was successful.

The "Name" and "Tagprefix" properties are not changed by this.

If the value of the tag is read successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	Tag values
Name	Tag name (unchanged)
QualityCode	Quality level
Timestamp	Current tag time stamp
LastError	0
ErrorDescription	" "

If the value of the tag is not read successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	VT_Empty
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	Read operation error codes
ErrorDescription	Error description on LastError

### syntax

```
Expression.Read([Readmode])
```

#### Expression

Necessary. An expression which returns a tag object. The return value of the Read method is the value of the tag read out.

## Parameters

The optional "Readmode" parameter enables the distinction between two types of reading:

Parameters	Description
0	The tag value is read from the process image (cache). 0 is the default value.
1	The value of a tag is read directly from AS or channel (direct).

If the "Readmode" parameter is omitted, the value is read from the process image by default. The return value of the Read method is the tag value read out as VARIANT.

## Reading From the Process Image

When reading from the process image, the tag is logged on and, from that moment, polled cyclically from the PLC. The login cycle is dependent on the configured trigger. The value is read from the tag image by WinCC. For Close Picture, the tag actions are ended again. The call is characterized by the following:

- The value is read by WinCC from the tag image.
- The call is faster in comparison to direct reading (except with the first call: The first call basically takes longer because the value from the PLC must be read out and logged on.)
- The duration of the call is not dependent on the bus load or AS.

### Behavior in actions with a tag trigger

All of the tags contained in the tag trigger are already known with Open Picture and are registered with the defined monitoring time. Since all tags are requested at once, the best possible optimization can be targeted from the channel. If a tag, contained in the trigger, is requested with Read during an action, the value already exists and is transferred directly to the call. If a tag is requested which is not contained in the trigger, the behavior is the same as with a standard trigger.

### Behavior in actions with a cyclic trigger

tags are registered with half of the cycle time with the first call. For every other call, the value is present.

### Behavior in event-driven actions

The tag is registered in the "upon change" mode with the first call. Process tags that are registered in the "upon change" mode correspond with a cyclic read job with a cycle time of 1s.

If an event (e.g. mouse click) requests a value asynchronously, the tag is transferred to the tag image. The tag is requested cyclically from the AS as of this point in time and therefore increases the basic load. To bypass this increase in the basic load, the value can also be read synchronously. The synchronous call causes a one-off increase in the communication load but the tag is not transferred to the tag image.

## Direct reading

In the case of direct reading, the current value is returned. The tag is not registered cyclically, the value is requested from the AS one time only. Direct reading has the following properties:

- The value is read explicitly from the AS.
- The call takes longer compared to reading from the process image.
- The duration of the call is dependent on the bus load and AS, amongst other things.

## Example

### Reading a tag directly from AS or channel

```
'VBS100
Dim objTag
Dim vntValue
Set objTag = HMIRuntime.Tags("Tagname")
vntValue = objTag.Read(1)      'Read direct
MsgBox vntValue
```

### Reading a tag from the process image

```
'VBS101
Dim objTag
Dim vntValue
Set objTag = HMIRuntime.Tags("Tagname")
vntValue = objTag.Read      'Read from cache
MsgBox vntValue
```

## Description of TagSet Object

The TagSet object offers the option of reading several tags in one call.

Functionality here is mostly identical with that of a tag object. In the following, only deviations thereof are described.

### Expression

Necessary. An expression which returns an object of type "TagSet".

## Reading From the Process Image

The TagSet object offers the advantage of requesting several tags in one read command. The tags are registered in the process image as a group, improving performance in the process.

## Direct reading

Since one call may process several read commands, performance is enhanced in comparison to single calls.

## Example

The following example shows how tags are included in the TagSet list, how tag values are imported and subsequently read.

```
'VBS174
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.Read
HMIRuntime.Trace "Motor1: " & group("Motor1").Value & vbNewLine
HMIRuntime.Trace "Motor2: " & group("Motor2").Value & vbNewLine
```

If the optional parameter "Readmode" is set to 1, the process tags are not registered but read directly from AS or channel.

```
group.Read 1
```

## Refresh

### Description

Drawing all visible pictures again.

### syntax

```
Expression.Refresh
```

#### Expression

Necessary. An expression which returns a "Screens" or "Screen" type object.

### Parameter

--

## Examples

The first example forces all visible pictures to be drawn again:

```
'VBS149
HMIRuntime.Screens.Refresh
```

The second example forces the basic picture to be immediately redrawn:

```
'VBS150
HMIRuntime.Screens(1).Refresh
```

## See also

Screen (Page 4256)

HMIRuntime (Page 4248)

## Remove

### Description of TagSet Object

Removes a tag from the TagSet list. The tag may be removed by name or reference to a tag object.

### Syntax

```
Expression.Remove [Tag]
```

#### Expression

Required An expression that returns an object of type "TagSet".

### Parameters

VARIANT

Parameters	Description
Tag	Name of a WinCC tag or reference to a tag object to be removed from the list.

### Example

The following example shows how several tags are included in the TagSet list, and how to remove a tag again.

```
'VBS175
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.Remove "Motor1"
```

### Description of DataSet Object

Deletes the element specified in parameter "Name" from a list.

### Syntax

Expression.Remove [Name]

#### Expression

Required An expression which returns an object of type "DataSet".

### Parameters

VARIANT

Parameters	Description
Name	Name of the object to be removed from the list.

### Example

The example shows how to remove the object "motor1" from the list.

```
'VBS166
HMIRuntime.DataSet.Remove("motor1")
```

### Description of objects Logging, AlarmLogs, DataLogs

The method deletes previously swapped-in log segments from the Runtime project.

Log segments that were deleted using the "Remove" method are removed from the "Common logging" folder of the project.

The call may require a somewhat longer time period, depending on the log data. This may block the processing of subsequent scripts. Blockage of actions within the picture may be

avoided if you start the call in a Global Scripting action, such as starting the action through a trigger tag.

The process of disconnecting and clearing logs creates a CPU load. This will affect performance.

---

**Note**

Calling up the "Remove" method is presently only possible at the server. There is an example, however, which shows how the method may be started by the client from a server.

---

## Syntax

### Objects Logging, AlarmLogs

```
Expression.Remove [TimeFrom] [TimeTo] [TimeOut] [ServerPrefix]
```

**Expression**

Required An expression that returns an object of type "Logging" or "AlarmLogs".

## Object DataLogs

```
Expression.Remove [TimeFrom] [TimeTo] [TimeOut] [Type] [ServerPrefix]
```

**Expression**

Required An expression that returns an object of type "DataLogs".

## Parameters

**TimeFrom**

Point in time, from which the logs are to be cleared.

When specifying the time information, a short form is also possible. This is described in the "Time format" section.

**TimeTo**

Time up to which log segments are to be cleared.

When specifying the time information, a short form is also possible. This is described in the "Time Format" section.

**Timeout**

Timeout in milliseconds.

If you enter "-1" as a value, the wait will be infinite. If you enter a value of "0", there will be no wait.

**Type**

Type of log.

The parameter can (optionally) be used only to delete log segments of the tag logging.

The following values can be entered:

Assigned value	Type	Description
1	hmiDataLogFast	Tag Logging Fast data
2	hmiDataLogSlow	Tag Logging Slow data
3	hmiDataLogAll	Tag Logging Fast and Slow data

**ServerPrefix**

Reserved for future versions.

**Return value**

If an error occurred during deletion of the log segments, the method will return an error alarm. Additional information may be found under the subject heading "Error alarms from database area".

**Time format**

The format for specifying time information is defined as follows: YYYY-MM-DD hh:mm:ss, where YYYY represents the year, MM the month, DD the day, hh the hour, mm the minute and ss the second. For example, the time of 2 minutes and one second past 11 o'clock on July 26, 2004 is displayed as follows: 2004-07-26 11:02:01.

For parameters "TimeFrom" and "TimeTo" the statement of data and time is also possible in short form. Not all format fields must be filled in this case. The short form means that the information on date and time may be lacking one or several parameters, beginning with the value for seconds. For example, the time may be specified in the "YYYY-MM" or "YYYY-MM-DD hh" format. Using the statement "TimeFrom" = "2004-09" and "TimeTo" = "2004-10-04" all log segments between September 2004 up to and including October 4.

**Example**

In the following example, log segments within a certain time period that were swapped in (again) after the fact are removed and the return value is output as a trace.

```
'VBS182
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Remove("2004-08-22","2004-09-22",-1) &
vbNewLine
```

In the following example, all log segments that were swapped-in (again) after the fact are removed and the return value is output as a trace.

```
'VBS183
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Remove("", "", -1) & vbNewLine
```

DataLogs (list) (Page 4244)  
AlarmLogs (list) (Page 4241)

**RemoveAll****Description of TagSet Object**

Deletes all tags from a TagSet list.

**syntax**

```
Expression.RemoveAll
```

**Expression**

Necessary. An expression which returns an object of type "TagSet".

**Parameters**

--

**Example:**

The following example shows how several tags are included in the TagSet list, and how to remove all tags again.

```
'VBS176  
Dim group  
Set group = HMIRuntime.Tags.CreateTagSet  
group.Add "Motor1"  
group.Add "Motor2"  
group.RemoveAll
```

**Description of DataSet Object**

Deletes all values or object references from a DataSet list.

**syntax**

```
Expression.RemoveAll
```

### Expression

Necessary. An expression which returns an object of type "DataSet".

### Parameters

--

### Example:

The example shows how all objects are removed from the list.

```
'\VBS167  
HMIRuntime.DataSet.RemoveAll
```

### See also

[DataSet \(list\) \(Page 4246\)](#)

### Restore

#### Description of objects Logging, AlarmLogs, DataLogs

The method adds swapped-out log segments to the Runtime project.

Upon swapping-in, the log segments are copied to the "Common logging" folder of the project. Therefore the appropriate storage capacity must be available.

The call may require a somewhat longer time period, depending on the log data. This may block the processing of subsequent scripts. Blockage of actions within the picture may be avoided if you start the call in a Global Scripting action, such as starting the action through a trigger tag.

The connecting/copying of the logs generates a CPU load because the SQL server experiences additional load, especially if signature checking is activated. Copying of log segments will slow down hard disk access.

If signature checking is activated, an error message is returned if an unsigned or modified log is to be swapped in. There is always only one error alarm returned, even if several errors occurred during a swap-in process. Additionally, a WinCC system alarm is generated for each log segment. An entry is added to the Windows event viewer in the "Application" section. This provides the opportunity to check which log segments are creating the error.

- With an unsigned log, the return value "0x8004720F" is returned. The event viewer contains the entry "Validation of database <db\_name> failed! No signature found!". The log is swapped in.
- With a changed log, the return value "0x80047207" is returned. The event viewer contains the entry "Validation of database <db\_name> failed!". The log is not swapped in.

---

**Note**

Calling up the "Restore" method is presently only possible at the server. There is an example, however, which shows how the method may be started by the client from a server.

---

## Syntax

### Objects Logging, AlarmLogs

```
Expression.Restore [SourcePath] [TimeFrom] [TimeTo] [TimeOut]  
[ServerPrefix]
```

**Expression**

Required An expression that returns an object of type "Logging" or "AlarmLogs".

## Object DataLogs

```
Expression.Restore [SourcePath] [TimeFrom] [TimeTo] [TimeOut] [Type]  
[ServerPrefix]
```

**Expression**

Required An expression that returns an object of type "DataLogs".

## Parameters

**SourcePath**

Path to log data.

**TimeFrom**

Point in time, from which the logs are to be swapped in.

When specifying the time information, a short form is also possible. This is described in the "Time format" section.

**TimeTo**

Time up to which log segments are to be swapped in.

When specifying the time information, a short form is also possible. This is described in the "Time Format" section.

**Timeout**

Timeout in milliseconds.

If you enter "-1" as a value, the wait will be infinite. If you enter a value of "0", there will be no wait.

**Type**

Type of log.

The parameter can (optionally) be used only to store log segments of the tag logging.

The following values can be entered:

Assigned value	Type	Description
1	hmiDataLogFast	Tag Logging Fast data
2	hmiDataLogSlow	Tag Logging Slow data
3	hmiDataLogAll	Tag Logging Fast and Slow data

**ServerPrefix**

Reserved for future versions.

**Return value**

If an error occurred while swapping in log segments, the method will return an error message. Additional information may be found under the subject heading "Error alarms from database area".

**Time format**

The format for specifying time information is defined as follows: YYYY-MM-DD hh:mm:ss, where YYYY represents the year, MM the month, DD the day, hh the hour, mm the minute and ss the second. For example, the time of 2 minutes and one second past 11 o'clock on July 26, 2004 is displayed as follows: 2004-07-26 11:02:01.

For parameters "TimeFrom" and "TimeTo" the statement of data and time is also possible in short form. Not all format fields must be filled in this case. The short form means that the information on date and time may be lacking one or several parameters, beginning with the value for seconds. For example, the statement may be in the form of "YYYY-MM" or "YYYY-MM-DD hh". Using the statement "TimeFrom" = "2004-09" and "TimeTo" = "2004-10-04" all log segments between September 2004 up to and including October 4.

**Example**

In the following example, all log segments since the start of the specified time period are swapped in again, and the return value is output as a trace.

```
'VBS184
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Restore("D:\Folder","2004-09-14","", -1) &
vbNewLine
```

In the following example, all Tag Logging Slow log segments in the specified time period are swapped in again, and the return value is output as a trace.

```
'VBS185
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.DataLogs.Restore("D:\Folder", "2004-09-14
12:30:05", "2004-09-20 18:30", -1, 2) & vbNewLine
```

In the following example, all Alarm Logging log segments up to the specified time period are swapped in again, and the return value is output as a trace.

```
'VBS186
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.AlarmLogs.Remove("", "2004-09-20", -1) &
vbNewLine
```

## Methods S-Z

### SelectAll

#### Description

Selects all rows in a table-based control.

#### Syntax

```
Expression.SelectAll()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

#### Parameters

--

## See also

OnlineTableControl (Page 4367)

TrendRulerControl (Page 4439)

UserArchiveControl (Page 4459)

AlarmControl (Page 4273)

## SelectedStatisticArea

### Description

Executes the "Set statistics range" button function of the table view.

### Syntax

```
Ausdruck.SelectedStatisticArea()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

## See also

OnlineTableControl (Page 4367)

## SelectRow

### Description

Selects a specific row in a table-based control.

### Syntax

```
Expression.SelectRow(ByVal IRow As Long, Optional bExtendSelection  
As Boolean)
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

## Parameters

Parameters	Description
IRow	Number of the row to be selected.
bExtendSelection	Indicates as an option whether the current selection will be extended. Is only relevant if multiple selections are possible.

## Example

- Row 1 is currently selected. If `SelectRow( 2, True )` is called, then row 1 and row 2 will be selected.
- Row 1 is currently selected. If `SelectRow( 2, False )` or `SelectRow( 2 )` is called without an optional parameter, then only row 2 will be selected.

## ServerExport

### Description

Executes the "Export log" button function of the recipe view.

### Syntax

```
Ausdruck.ServerExport()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

## See also

[UserArchiveControl \(Page 4459\)](#)

## ServerImport

### Description

Executes the "Import log" button function of the recipe view.

### Syntax

```
Ausdruck.ServerImport()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

UserArchiveControl (Page 4459)

## ShowColumnSelection

### Description

Executes the "Select columns" button function of the table view.

### Syntax

```
Ausdruck.ShowColumnSelection()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

OnlineTableControl (Page 4367)

## ShowComment

### Description

Executes the "Comment dialog" button function of the alarm view.

### Syntax

```
Ausdruck.ShowComment()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

### See also

AlarmControl (Page 4273)

## ShowDisplayOptionsDialog

### Description

Executes the "Display options dialog" button function of the alarm view.

### Syntax

```
Ausdruck.ShowDisplayOptionsDialog()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## ShowEmergencyQuitDialog

### Description

Executes the "Single acknowledgment" button function of the alarm view.

### Syntax

```
Ausdruck.ShowEmergencyQuitDialog()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## ShowHelp

### Description

Executes the "Help" button function of the control.

### Syntax

```
Ausdruck.ShowHelp()
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

## ShowHideList

### Description

Executes the "List of alarm to hide" button function of the alarm view.

### Syntax

```
Ausdruck.ShowHideList()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## ShowHitList

### Description

Executes the "Hitlist" button function of the alarm view.

### Syntax

```
Ausdruck.ShowHitList()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## ShowInfoText

### Description

Executes the "About dialog" button function of the alarm view.

### Syntax

```
Ausdruck.ShowInfoText ()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## ShowLockDialog

### Description

Executes the "Lock dialog" button function of the alarm view.

### Syntax

```
Ausdruck.ShowLockDialog ()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## ShowLockList

### Description

Executes the "Lock list" button function of the alarm view.

### Syntax

```
Ausdruck.ShowLockList()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## ShowLongTermArchiveList

### Description

Executes the "Historical alarm list (long-term)" button function of the alarm view.

### Syntax

```
Ausdruck.ShowLongTermArchiveList()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## ShowMessageList

### Description

Executes the "Alarm list" button function of the alarm view.

### Syntax

```
Ausdruck.ShowMessageList()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## ShowPercentageAxis

### Description

Executes the "Relative axis" button function of the f(t) trend view.

### Syntax

```
Ausdruck.ShowPercentageAxis()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

OnlineTrendControl (Page 4375)

## ShowPropertyDialog

### Description

Executes the "Configuration dialog" button function of the control.

### Syntax

```
Ausdruck.ShowPropertyDialog()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

## ShowSelectTimeBase

### Description

Executes the "Timebase dialog" button function of the recipe view.

### Syntax

```
Ausdruck.ShowSelectTimeBase()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

UserArchiveControl (Page 4459)

## ShowShortTermArchiveList

### Description

Executes the "Historical alarm list (short-term)" button function of the alarm view.

### Syntax

```
Ausdruck.ShowShortTermArchiveList()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## ShowSort

### Description

Executes the "Sorting dialog" button function of the recipe view.

### Syntax

```
Ausdruck.ShowSort ()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

UserArchiveControl (Page 4459)

## ShowSortDialog

### Description

Executes the "Sorting dialog" button function of the alarm view.

### Syntax

```
Ausdruck.ShowSortDialog ()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

AlarmControl (Page 4273)

## ShowTagSelection

### Description

Executes the "Select data connection" button function of the control.

### Syntax

```
Ausdruck.ShowTagSelection()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

## Stop

### Description

Closes WinCC Runtime.

### Syntax

```
Expression.Stop
```

#### Expression

Required An expression which returns an "HMIRuntime" type object.

### Parameters

--

### See also

[HMIRuntime \(Page 4248\)](#)

## Trace

### Description

Returns a user-defined text through the operating system channel for debug alarms.

The methods HMIRuntime.Trace works only in a PC-based environment. The text transferred as parameter can be displayed using the diagnostics tools "GSC Diagnostics" or "ApDiag". You can use the "ShowSystemAlarm" system function if you need to run a trace without using external tools.

### Syntax

Expression.Trace"STRING"

#### Expression

Required An expression which returns an "HMIRuntime" type object.

### Parameters

#### STRING

The text which is issued as a debug alarm. The transferred text can be displayed using the diagnostics tools "GSC Diagnostics" or "ApDiag". You can use the "ShowSystemAlarm" system function if you need to run a trace without using external tools.

### Example

In the following example a debug alarm is issued:

```
'VBS example trace  
HMIRuntime.Trace "Customized error message"
```

## UnhideAlarm

### Description

Executes the "Unhide alarm" button function of the alarm view.

### Syntax

Ausdruck.UnhideAlarm()

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameter**

--

**See also**

AlarmControl (Page 4273)

**UnlockAlarm****Description**

Executes the "Unlock alarm" button function of the alarm view.

**Syntax**

```
Ausdruck.UnlockAlarm()
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

**Parameter**

--

**See also**

AlarmControl (Page 4273)

**UnselectAll****Description**

Removes all selections from the cells of a table-based control.

**Syntax**

```
Expression.UnselectAll()
```

**Expression**

Necessary. An expression that returns an object of the "ScreenItem" type.

## Parameters

--

## See also

[OnlineTableControl \(Page 4367\)](#)

[TrendRulerControl \(Page 4439\)](#)

[UserArchiveControl \(Page 4459\)](#)

[AlarmControl \(Page 4273\)](#)

## UnselectRow

### Description

Removes the selections from a specific cell of a table-based control.

### Syntax

```
Expression.UnselectRow(ByVal IRow As Long)
```

### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

## Parameters

Long

Parameters	Description
IRow	Number of the row to be selected.

## See also

[OnlineTableControl \(Page 4367\)](#)

[TrendRulerControl \(Page 4439\)](#)

[UserArchiveControl \(Page 4459\)](#)

[AlarmControl \(Page 4273\)](#)

## Write

### Description of Tag Object

Writes a value to a tag. The "LastError" property can be used to determine whether the call was successful.

If the value of the tag is set successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	Tag values set by the user (unchanged)
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	0
ErrorDescription	" "

If the value of the tag is not set successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	Tag values set by the user (unchanged)
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	Write operation error codes
ErrorDescription	Error description on LastError

### syntax

```
Expression.Write [Value],[Writemode]
```

#### Expression

Necessary. An expression which returns a tag object.

### Parameters

The value to be written can be transferred directly to the method as a parameter. If the parameter is not specified, the value in the "Value" property is used. The "Writemode" option parameter can be used to select whether the tag value should be written synchronously or asynchronously. If the "Writemode" parameter is not used, writing is performed asynchronously as its default value.

During the writing process, no information is supplied on the status of the tags.

The "Value" property contains the value which was set before or during the writing operation, therefore it may not correspond to the real current value of the tag. If the data on the tag should be updated, use the Read method.

Parameters	Description
Value (optional)	The tag value is specified. The specified value overwrites the value in the "Value" property in the tag object. The tag value is not specified. The tag receives the current value from the "Value" property of the tag object.
Writemode (optional)	0 or empty: The tag value is written asynchronously. 0 is the default value. 1: The tag value is written synchronously.

On asynchronous writing, it is written immediately into the tag image. The user does not receive any feedback if the value has been written in the programmable controller, too.

In the case of synchronous writing (direct to the PLC), the writing operation actually occurs when the PLC is ready to operate. The user receives a check-back message if the writing operation was not successful.

## Example

### Asynchronous writing

```
'VBS104
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Value = 5
objTag.Write
MsgBox objTag.Value
```

or

```
'VBS105
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Write 5
MsgBox objTag.Value
```

### Synchronous writing

```
'VBS106
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Value = 5
objTag.Write ,1
MsgBox objTag.Value
```

or

```
'VBS107
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Write 5, 1
MsgBox objTag.Value
```

## Description of TagSet Object

The TagSet object offers the option of writing several tags in one call.

Functionality here is mostly identical with that of a tag object. In the following, only deviations thereof are described.

### Expression

Necessary. An expression which returns an object of type "TagSet".

## Parameters

In order to write different values, the "Value" property of individual tag objects must be set, and write must be called thereafter without the "Value" parameter. Since the write commands are grouped into one call, it results in improved performance compared to single calls.

In a TagSet object, it is not possible to pass on a value using the "Write" method. Individual values must be set using the "Value" property of the individual tag objects.

## Example

The following example shows how tags are included in the TagSet list, how tag values are set and subsequently written.

```
'VBS173
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Wert1"
group.Add "Wert2"
group("Wert1").Value = 3
group("Wert2").Value = 9
group.Write
```

If you set the optional parameter "Writemode" equal to 1, the process tags are written synchronously (directly to AS).

```
group.Write 1
```

## WriteTags

### Description

Executes the "Write tags" button function of the recipe view.

### Syntax

```
Expression.WriteTags ()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

UserArchiveControl (Page 4459)

## ZoomArea

### Description

Executes the "Zoom area" button function of the f(t) and f(x) trend views.

### Syntax

```
Ausdruck.ZoomArea ()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

### See also

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

## ZoomInOut

### Description

Executes the "Zoom +/-" button function of the f(t) and f(x) trend views.

### Syntax

```
Ausdruck.ZoomInOut()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

### See also

[OnlineTrendControl \(Page 4375\)](#)

[FunctionTrendControl \(Page 4330\)](#)

## ZoomInOutTime

### Description

Executes the "Zoom time axis +/-" button function of the f(t) trend view.

### Syntax

```
Ausdruck.ZoomInOutTime()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

[OnlineTrendControl \(Page 4375\)](#)

## ZoomInOutValues

### Description

Executes the "Zoom value axis +/-" button function of the f(t) trend view.

### Syntax

```
Ausdruck.ZoomInOutValues()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameter

--

### See also

OnlineTrendControl (Page 4375)

## ZoomInOutX

### Description

Executes the "Zoom X axis +/-" button function of the f(x) trend view.

### Syntax

```
Ausdruck.ZoomInOutX()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

### See also

FunctionTrendControl (Page 4330)

## ZoomInOutY

### Description

Executes the "Zoom Y axis +/-" button function of the f(x) trend view.

### Syntax

```
Ausdruck.ZoomInOutY()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

### See also

FunctionTrendControl (Page 4330)

## ZoomMove

### Description

Executes the "Move trend area" button function of the f(t) and f(x) trend views.

### Syntax

```
Ausdruck.ZoomMove()
```

#### Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

### Parameters

--

OnlineTrendControl (Page 4375)

FunctionTrendControl (Page 4330)

## 10.9 Mobile Wireless

### 10.9.1 Field of application of the Mobile Panel Wireless

#### Introduction

The Mobile Panel Wireless enables you to move through the plant without restrictions and with or without security technology. You can operate and monitor moving machine parts or the entire plant depending on the situation. You can plan, configure, simulate and extend wireless networks quickly and reliably.

The Mobile Panels Wireless are based on standardized WLAN technology and are specially tailored to the requirements of automation.

#### WLAN area

A WLAN area is the area of the plant in which the HMI device communicates with the PLC over a wireless local area network. The wireless coverage of the network has a sufficient signal strength in this area.

The WLAN of a plant is formed by the radio area of one or more Access Points.

#### Access Point

The Access Point serves as a gateway between the wireless and hard-wired network. The HMI device communicates with an Access Point via WLAN. You can operate the different machines or plants without annoying cables. The HMI device is connected to a network in which it communicates with a PLC via the access point.

#### Effective range

Safety-related operator input is only possible in a limited part of a WLAN area upstream of a machine or plant known as the effective range. One exception to this rule is the emergency stop, which works in the entire WLAN area.

The configured effective ranges are stored in the HMI device. The HMI device can only log on to a machine within the effective range. This also requires there no other HMI device is logged on in the same effective range.

To ensure clear logon and machine operator inputs, one effective range must not overlap another effective range.

#### Tags

Effective ranges are formed by the spatial assignment of tags to a machine or plant. Tags create a geometrical space which is relevant for logon to a machine. After logon you operate the machine using acknowledgement buttons.

A distinction is made between two types of tags:

- Transponder
- RFID tag

## Transponder

After successful logon to a machine, the spanned geometrical area will be monitored. The distance between the HMI device and the transponder can only be measured if the two devices are in the reception range of each other. When you leave the effective range, safety-related operator input of the machine with acknowledgment buttons is prevented.

## Zones in the transponder system

Zones are configurable objects within a transponder system. A zone is defined by the maximum distance from one or more transponders. In a hard-wired Mobile Panel, the length of the connection cable defines a zone around a connection box.

Zones are operating areas in which safety-related operator input is not possible. To enter a zone, you have to configure a screen change to the correct process picture.

## RFID tag

After successful logon to a machine, the spanned geometrical area is not monitored. Monitoring therefore calls for an additional organizational measure, for example: a light barrier or a protective fence. The protection area is separated from the plant by a security system. The protection area is the area in the plant in which you operate one or more machines in fail-safe operation. One or more RFID Tags are distributed within protection zones. The protection area is not a configurable object.

## 10.9.2 How does the transponder system work?

### Overview

To give a basic understanding of all this, the following section describes the interaction between:

- HMI device
- Zone
- Effective range
- Transponder

---

#### Note

You should always assign administrator rights or set up encryption to protect the project containing a Mobile Panel Wireless for fail-safe operation against unauthorized access.

---

Principle of operation in the transponder system

- 1 Access Point
- 2 WLAN of the Access Point
- 3 PLC
- 4 Plant
- 5 Effective range "Robot 1" with a transponder
- 6 Effective range "Robot 2" with two transponders
- 7 Zone "Zone 1" with a transponder
- 8 Radio area of the HMI device
- 9 HMI device

Example:

- A screen change is configured for "Zone 1".
- Transponder1 is assigned to the "Robot 2" effective range.
- The operator enters the radio cone of the transponder to receive the transponder ID.

- To log onto the machine "Robot 2", the operator presses the object "Effective range - Name".
- The "Effective range - Logon" dialog box opens. The operator enters the effective range ID and confirms with "OK". The dialog is closed.
- If the logon was successful, then the acknowledgement buttons will be active.
- The HMI device measures the distance from the transponder which is less than the configured distance of the effective range.

**Result:**

The operator is logged onto the machine "Robot 2". The operating element "Effective range - Name" is green and shows the name of the effective range "Robot 2".

If the HMI device is logged onto the effective range, then the following will apply:

- The operator may not leave the effective range without logging off. If the operator leaves the effective range without logging off for more than 30 seconds, a local rampdown will occur.
- No other HMI device can log onto the machine.

To log off from the machine, the operator presses the operating element "Effective range - Name". A logoff dialog is displayed. The operator confirms the dialog.

After successful logoff, another operator can log on to the machine "Robot2".

When the operator enters "Zone 1", a screen change will take place.

### 10.9.3 How does the RFID system work?

**Overview**

RFID stands for radio frequency identification. RFID allows wireless identification of objects without contact or visual sighting.

For a basic understanding, the following section describes the interaction between:

- HMI device
- Effective range (RFID)
- RFID tag

---

**Note****RFID Tags in the plant area**

You may only affix RFID Tags in restricted plant areas that are protected by additional protective measures, for example, protective railings.

---

Principle of operation in the RFID system

- ① Access Point
- ② WLAN of the Access Point
- ③ PLC
- ④ RFID tag with effective range (RFID) for logon to "Robot 1"
- ⑤ RFID tag with effective range (RFID) for logon to "Robot 2"
- ⑥ Plant
- ⑦ Protective area limit of the machine "Robot1"
- ⑧ Protective area limit of the machine "Robot2"
- ⑨ Radio area of the HMI device
- ⑩ HMI device

Example:

- "RFID Tag1" is assigned to the effective range (RFID) "Robot1".
- An operator enters the restricted plant area. The operator manually switches to the screen with the configured operating element "Effective range - Name (RFID)".

- At "RFID Tag1", he presses the "Scan" button.  
During the logon operation, the button is yellow and displays the text "Scanning...".
- The "Effective range - Logon" dialog box opens. The operator enters the effective range (RFID) ID and confirms it with "OK". The dialog is closed.
- The "Confirmation of logon" dialog box opens. The operator confirms logon with the acknowledgment button.
- If logon was successful, the acknowledgement buttons are active.

### Result:

The operator is logged on to the machine "Robot 1" and operates the machine within the protection area in fail-safe operation. The operating element "Effective range - Name (RFID)" is green and shows the name of the effective range (RFID) "Robot1".

If the HMI device is logged on to the machine, the following applies:

- The user may not leave the protection area without logging off from the machine. If the operator leaves the protection area without logging off, a local rampdown occurs.
- No other HMI device can log on to this machine.

To log off from the machine, the operator presses the operating element "Effective range - Name (RFID)". A logoff dialog is displayed. The operator confirms the dialog.

After successful logoff, another operator can log on to the machine "Robot 1".

## 10.9.4 Configuring the Mobile Panel V2 for fail-safe operation

### 10.9.4.1 Configuration overview

#### Introduction

Additional steps in the TIA Portal are necessary before the configuration of the Mobile Panels V2 for fail-safe operation. This affects the following HMI devices:

- Mobile Panel 277F IWLAN V2
- Mobile Panel 277F IWLAN (RFID Tag)

#### Procedures overview

1. Creating PLC for fail-safe operation
2. Installing a general station description (GSD)
3. Creating a module from the GSD file
4. Creating a connection between a module from the GSD file and the PLC
5. Creating Mobile Panel V2 for fail-safe operation

## See also

- Creating Mobile Panel (Page 5199)
- Creating a module from the GSD file (Page 5195)
- Installing a general station description (GSD) (Page 5195)
- Creating PLC for fail-safe operation (Page 5194)
- Creating a connection between a module and the PLC (Page 5198)

### 10.9.4.2 Creating PLC for fail-safe operation

#### Requirement

A project is open

#### Procedure

1. Click "Add new device" in the project navigation.
2. Click "PLC" in the "Add new device" dialog.
3. Select a PLC for fail-safe operation, for example, CPU-315F-2PN/DP. The "Devices & Networks" editor opens.
4. Open the device view.
5. Select the device and click on "Device overview".
6. Select the device.
7. Click "Properties > PROFINET interface [X2] > Ethernet addresses > Interface connected with > Add new subnet" in the inspector window.
8. Enter the IP address under "IP protocol > Set IP address in the project".
9. Enter a time for "Properties > PROFINET interface [X2] > F parameter > Set default F monitoring time for F I/O of this interface".
10. Specify the properties for fail-safe operation in "Properties > Fail-safe"
  - "F-capability activated"
  - "Basis for PROFI-safe addresses"
11. Specify further properties for fail-safe operation as usual, for example, protection level.

#### Result

You have created a PLC in the project and made the settings for fail-safe operation.

## See also

- Configuration overview (Page 5191)

### 10.9.4.3 Installing a general station description (GSD)

#### Introduction

A GSD file (device master data file) contains all the IO device properties. The language used to describe the GSD files is GSDML (Generic Station Description Markup Language). Install a GSD file to expand the hardware catalog.

#### Requirement

- The "Devices & Networks" editor is open.
- The "Network view" is open.
- The GSD file is available on your PC.

The GSD file can be found online:

GSD file of Mobile Panel V2 for fail-safe operation (<http://support.automation.siemens.com/WW/view/de/19241467>)

#### Procedure

1. Click "Options > Install general station description (GSD)".
2. In the "Install general station description" dialog, choose the directory in which the GSD files are located.
3. Select the GSD file from the list.
4. Click the "Install" button.
5. To create a log file for the installation, click on the "Save log file" button.

#### Result

You have installed the GSD file. You can find the new devices installed by means of the GSD files in the hardware catalog under "Additional field devices > PROFINET". Any problems that occur during the installation can be traced using the log file.

#### See also

Configuration overview (Page 5191)

### 10.9.4.4 Creating a module from the GSD file

#### Requirements

- A PLC for fail-safe operation is created in the project e.g. CPU-315F-2PN/DP.
- The GSD file is installed.
- The "Network view" is opened in the "Devices & Networks" editor.

## Procedure

1. Open the hardware catalog.
2. Open the directory "Additional field devices > PROFINET-IO > HMI > Siemens AG > SIMATIC HMI > 277".
3. Now open the folder of the Mobile Panel V2 for fail-safe operation whose device type you also have as hardware:
  - Mobile Panel 277F IWLAN V2 or
  - Mobile Panel 277F IWLAN V2 (RFID tag)
4. For Mobile Panel 277F IWLAN V2, select the module with the order number 6AV6645-0EC01-0AX1.

- For Mobile Panel 277F IWLAN V2 (RFID tag), select the module with the order number 6AV6645-0EF01-0AX1.

### Note

The order number of the module in the GSD file has to match the order number of the Mobile Panel V2 in the software.

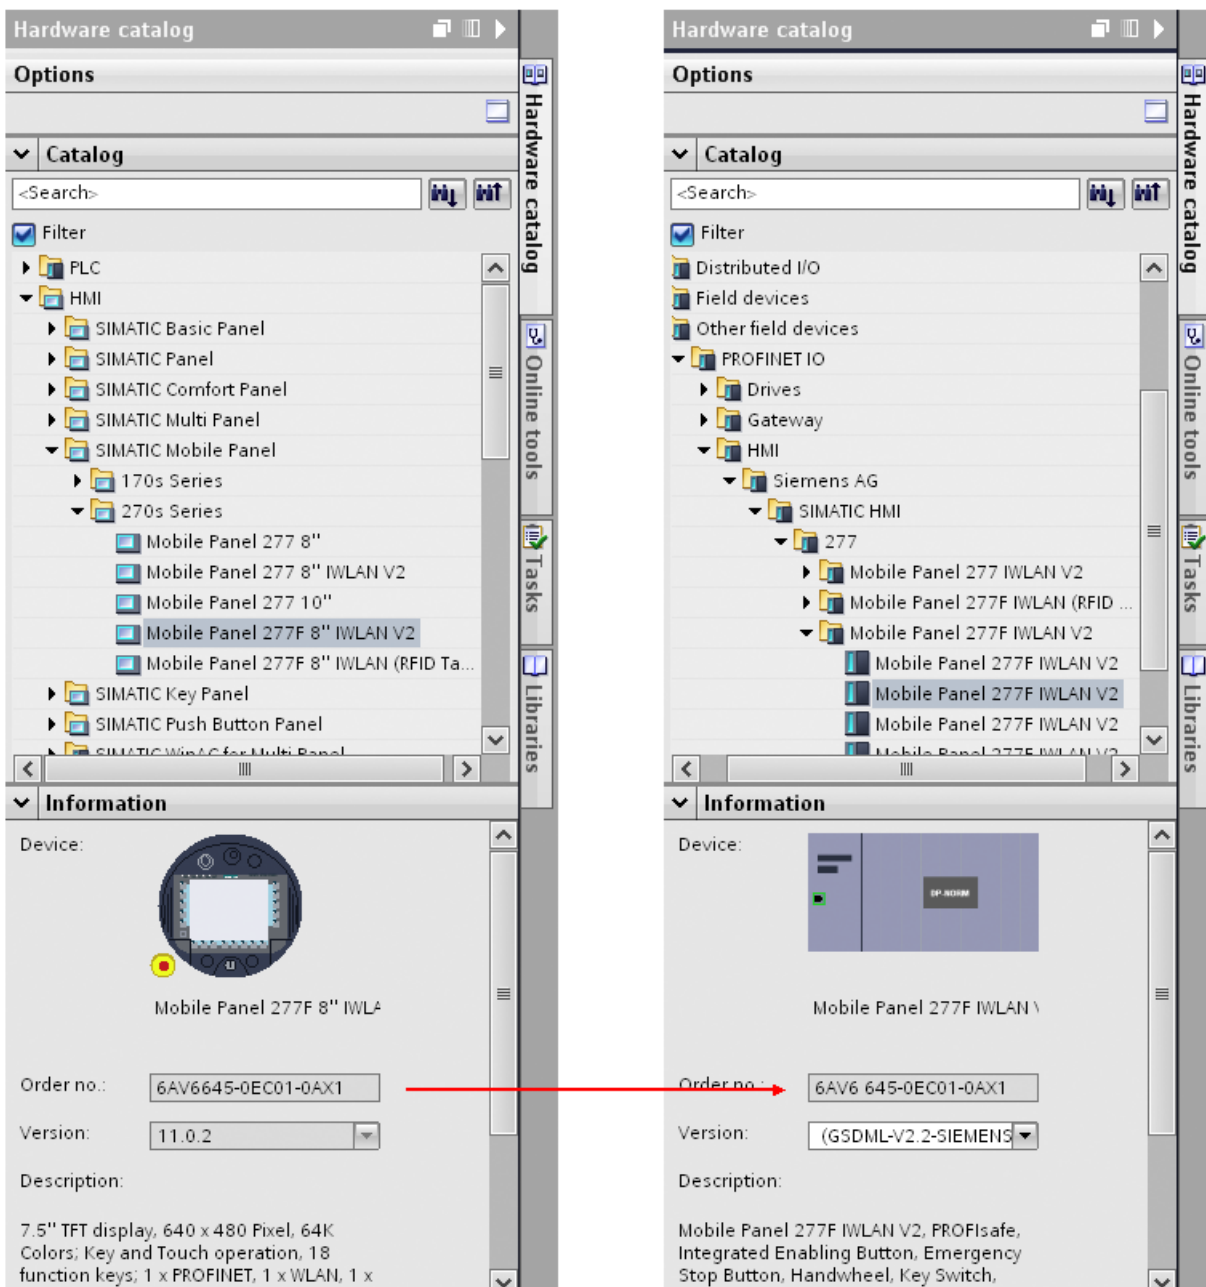

Figure 10-4 Left: Mobile Panel in the software. Right: Module in the GSD file

- Drag-and-drop the desired module into the network view.

## Result

You have created a module from the GSD file in your project.

## See also

PROFIsafe address (Page 5215)

Configuration overview (Page 5191)

### 10.9.4.5 Creating a connection between a module and the PLC

#### Requirements

- A PLC for fail-safe operation is created in the project e.g. CPU-315F-2PN/DP.
- The GSD file is installed.
- A module from the GSD file has been created.
- The "Devices & Networks" editor is open.

#### Procedure

1. Open the "Network view".
2. Select the module and right-click on "Not assigned". The shortcut menu is opened.
3. Select "Assign new IO controller". A dialog box opens.
4. Select the IO controller and confirm with OK. A connection is established.
5. Open the device view
6. Click on "Mobile277Failsafe\_IO\_1" in the device overview.
7. Specify the properties for fail-safe operation in the inspector window under "Properties > PROFIsafe":
  - "F-block ID"
  - "F-Source-Add"
  - "F-Dest-Add"
8. Click on the module in the device view.
9. Assign a name under "Properties > General > Name" in the inspector window.
10. Assign an IP address under "PROFINET interface [X1] > Ethernet addresses > IP protocol > Set IP address in the project".

## Result

The module from the GSD file is connected to the PLC. The module adopts the settings made in the PLC for PROFIsafe and PROFINET.

**See also**

Configuration overview (Page 5191)

**10.9.4.6 Creating Mobile Panel****Requirement**

- The inspector window is open.
- A PLC for fail-safe operation is created in the project, for example, CPU-315F-2PN/DP.
- The GSD device is created in the project.

**Inserting Mobile Panel into the project.**

1. Click "Add new device" in the project navigation.
2. Click on "HMI" in the "Add new device" dialog.
3. Select a Mobile Panel V2 for fail-safe operation, for example, Mobile Panel 277F IWLAN V2. The device is inserted into the project.

---

**Note**

Select the corresponding Mobile Panel for the module already installed from the GSD file.

---

**Defining properties**

1. Open the "Devices and Networks" editor.
2. Open the "Device view".
3. Select the Mobile Panel in the work area.
4. Open "Properties > General" in the inspector window.
5. To facilitate assignment in the project, enter the name of the associated module under "Name".
6. Enter the same IP address as in the module under "Set IP address in the project".
7. Activate "Set IP address using a different method".

**Result**

Entering the same IP address as in the device enables error-free communication. Alternatively, you can set the IP address on the Mobile Panel after loading the project.

**See also**

Configuration overview (Page 5191)

## 10.9.5 Basics

### 10.9.5.1 Zones

#### Introduction

The following section applies only to the Mobile Panels Wireless, e.g. Mobile Panel 277 IWLAN V2 and Mobile Panel 277F IWLAN V2. The "Zones" work area is only visible for these HMI devices.

---

#### Note

For more information refer to the operating instructions for the HMI device:

Complete documentation for Mobile Wireless (<http://support.automation.siemens.com/WW/view/en/26268960>)

---

#### Open

Depending on the HMI device selected, open the work area in the project window by double-clicking on "Zones" or "Zones and effective ranges".

#### Work area

The "Zones" work area displays the zones that have been set up and the transponders assigned to them.

#### Inspector window

When a zone is selected, you can edit the names, display names and the limits of the zone under the "General" category. The zone has the "On entry" and "On exit" zones. Assign the "ActivateScreen" system function to the events.

### 10.9.5.2 Zones working area

#### Introduction

The "Zones" work area displays the zones and the transponders assigned to them in table format. You create a list of transponders and assign certain transponders to a zone. The limit of the zone is defined by the maximum distance from the transponders.

## Principle

The work area consists of the "Zones" and "Transponders" tables.

Zones					
	Id	Name	Display name	Limit	Comment
	1	MixingPlant	MixingPlant	8	
<Add new>					

Transponder (MixingPlant)					
	<input type="checkbox"/> Enable all	Id	Name	Zone	Comment
	<input checked="" type="checkbox"/>	1	Transponder 1	MixingPlant	
	<input checked="" type="checkbox"/>	2	Transponder 2	MixingPlant	
<Add new>					

If you select a zone in the "Zones" table, the "Transponder" table displays the following:

- Transponder enabled: The transponder is assigned to the selected zone.
- Transponder deactivated: The transponder is not yet assigned to any zone.
- Transponder not available: The transponder has already been assigned to another zone. To undo the assignment, switch to the relevant zone and deactivate the transponder.

The zone and transponder IDs are initially assigned automatically. They can be changed, however.

Please note the following:

- A maximum of 254 zones may be configured.
- The zone ID must be unique and fall within the range from 1 - 254.
- You can initially configure transponders without assigning them to a zone.
- There may be no more than 255 transponders assigned to a zone.
- The transponder ID must be unique and fall within the range from 1 - 65534.

The transponder IDs are set on the transponder.

### 10.9.5.3 Effective ranges

#### Introduction

The following section applies only to the Mobile Panels Wireless that support fail-safe operation, e.g. Mobile Panel 277F IWLAN V2. The "Effective ranges" work area is only visible for these HMI devices.

You set up effective ranges in order to control safety related operations. An effective range is defined by the maximum distance from one or more transponders.

---

**Note**

For more information refer to the operating instructions for the HMI device:

Complete documentation for Mobile Wireless (<http://support.automation.siemens.com/WW/view/en/26268960>)

---

**Open**

Open the work area in the project window by double-clicking on "Zones & effective ranges". Click the "Effective ranges" tab.

**Work area**

The "Effective ranges" work area displays the effective ranges that have been set up and the transponders assigned to them.

**Inspector window**

When an effective range is selected, you can edit the names, display names and the limits of the effective range under the "General" category.

When you select a transponder, you can see both the effective range and the zone that are assigned to that transponder. You can only assign a transponder to one effective range so that the effective ranges do not overlap.

**10.9.5.4 Effective ranges working area**

**Introduction**

The "Effective ranges" work area displays the effective ranges and their transponders in table format. You create a list of transponders and assign certain transponders to an effective range. The limit of the effective range is defined by the maximum distance from the transponders.

## Principle

The work area consists of the "Effective ranges" and "Transponders" tables.

The screenshot displays two tables in a software interface. The top table, titled "Effective ranges", has a "Checksum" field set to 0. It contains one row with the following data:

Id	Name	Display name	Limit	Comment
1	MixingAxisControl	MixingAxisControl	5	

Below this table is a "Transponder (MixingAxisControl)" table. It includes an "Enable all" checkbox (checked) and an "RFID" icon. The table contains one row with the following data:

Id	Name	Effective range	Comment
1	Transponder 1	MixingAxisControl	

The HMI device calculates a checksum from the local data so that the configured effective ranges and transponders reliably match those locally on the machine. The project cannot be started on the HMI device unless the local checksum agrees with the checksum stored in the "Effective ranges" editor.

When you select an effective range from the "Effective ranges" table, the "Transponder" table displays the following:

- Transponder enabled: The transponder is assigned to the selected effective range.
- Transponder deactivated: The transponder is not yet assigned to any effective range.
- Transponder not available: The transponder has already been assigned to another effective range. To undo the assignment, switch to the relevant effective range and deactivate the transponder.
- The zone assigned to the transponder is displayed in addition to the effective range.

The effective range and transponder IDs are initially assigned automatically. They can be changed, however.

Please note the following:

- A maximum of 127 effective ranges may be configured.
- The effective range ID must be unique and fall within the range from 1 - 127.
- The display name of an effective range must not be the same as its ID.
- You can initially configure transponders without assigning them to an effective range.
- There may be no more than 127 transponders assigned to an effective range.
- The transponder ID must be unique and fall within the range from 1 - 65534.

The transponder IDs are set on the transponder.

## Effective range in Runtime

To log on to the effective range in Runtime, only the display name of the effective range appears to the operator in the Runtime language. The operator reads the effective range ID in the plant and enters it on the HMI device. This ensures that the right machine operated. The acknowledgment buttons are activated after successful logon.

### 10.9.5.5 Effective ranges (RFID)

#### Introduction

The following section only applies to the Mobile Panel 277F IWLAN (RFID tag) which supports fail-safe operation with RFID. The "Effective ranges (RFID)" work area is only visible with these HMI devices.

To monitor safety-related operator inputs, you set up effective ranges (RFID).

---

#### Note

For more information, refer to the operating instructions of the HMI device:

Complete documentation for Mobile Wireless (<http://support.automation.siemens.com/WW/view/en/26268960>)

---

#### Open

Open the work area in the project window by double-clicking on "Effective ranges (RFID)".

#### Work area

The "Effective ranges (RFID)" work area displays the effective ranges that have been set up and the RFID Tags assigned to them.

#### Inspector window

When an effective range (RFID) is selected, you can edit the name, display name and ID of the effective range under the "General" category.

### 10.9.5.6 Work area for effective ranges (RFID)

#### Introduction

The "Effective ranges (RFID)" work area displays the effective ranges (RFID) and their RFID Tags in table format. You create a list of RFID Tags and assign specific RFID Tags to an effective range.

## Principle

The work area consists of the "Effective ranges (RFID)" and "RFID Tags" tables.

Effective ranges (RFID)				
Checksum:		0		
Id	Name	Display name	Comment	
1	Effective range (RFID)_1	Effective range (RFID) (1)		
<Add n...>				
RFID tags (Effective range (RFID)_1)				
<input type="checkbox"/> Enable all				
Id	Name	Effective range (RFID)	Comment	
1	RFID tag_1	Effective range (RFID)_1		
<Add new>				

The HMI device calculates a checksum from the local data so that the configured effective ranges (RFID) and RFID Tags reliably match those locally on the machine. The project cannot be started on the HMI device unless the local checksum agrees with the checksum stored in the "Effective ranges (RFID)" editor.

When you select an effective range (RFID) in the "Effective ranges (RFID)" table, the "RFID Tags" table displays the following:

- RFID Tag enabled: The RFID Tag is assigned to the selected effective range (RFID).
- RFID Tag disabled: The RFID Tag is not yet assigned to any effective range (RFID).
- RFID Tag not available: The RFID Tag has already been assigned to another effective range (RFID). To undo the assignment, switch to the relevant effective range (RFID) and deactivate the RFID Tag.

The IDs of the effective ranges (RFID) and RFID Tags are initially assigned automatically. They can be changed, however.

Please note the following:

- A maximum of 127 effective ranges (RFID) may be configured.
- The effective range (RFID) ID must be unique and fall within the range from 1 - 127.
- The display name of an effective range (RFID) must not be the same as its ID.
- You can initially configure RFID Tags without assigning them to an effective range (RFID).
- A maximum of 127 RFID Tags is available to assign to an effective range (RFID).
- The RFID Tag ID must be unique and fall within the range 1-65534.

The RFID Tag ID is written to the RFID Tag by the HMI device.

## Effective range in Runtime

To log on to the effective range (RFID) in Runtime, only the display name of the effective range (RFID) is displayed to the operator in the Runtime language. The operator reads the effective

range (RFID) ID in the plant and enters it on the HMI device. This ensures that the right machine operated. The acknowledgment buttons are activated after successful logon.

## 10.9.6 Working with zones

### 10.9.6.1 Configuring a zone

#### Validity

The next section applies to all Mobile Panels Wireless, e.g. Mobile Panel 277 IWLAN.

#### Introduction

You will have to set up a zone in order to carry out plant-specific operator control and monitoring tasks.

#### Requirements

- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Zones" work area is open.

#### Procedure

1. Double-click "Add..." in the "Zones" table.
2. Enter the "MixingPlant" zone in the "Name" field.
3. Enter "MixingSystem" as the "Display name" for the zone at runtime. Enter zone "1" in the "ID" field.
4. Enter "8" meters as the zone "Limit".
5. Double-click "Add..." in the "Transponders" table.
6. Enter "Transponder 1" as the "Name" of the transponder.
7. Enter transponder "1" in the "ID" field.  
Then set transponder IDs on the transponder.
8. Enable the assignment of "Transponder 1".  
"Transponder 1" is assigned to the "MixingPlant" zone.
9. Repeat steps 6 to -9 accordingly for "Transponder 2".  
"Transponder 2" is assigned to the "MixingPlant" zone.

## Result

The "MixingPlant" zone is configured as two conical areas arranged at a distance of 8 meters, regardless of the effective ranges: one area around "Transponder 1" and one around "Transponder 2".

The screenshot shows two tables in a configuration window. The top table, titled 'Zones', has columns for Id, Name, Display name, Limit, and Comment. It contains one entry for 'MixingPlant' with Id 1 and a Limit of 8. The bottom table, titled 'Transponder (MixingPlant)', has columns for Enable all, Id, Name, Zone, and Comment. It contains two entries: 'Transponder 1' with Id 1 and 'Transponder 2' with Id 2, both associated with the 'MixingPlant' zone. Both transponders have their 'Enable all' checkboxes checked.

Zones					
	Id	Name	Display name	Limit	Comment
	1	MixingPlant	MixingPlant	8	
<Add new>					

Transponder (MixingPlant)					
	Enable all	Id	Name	Zone	Comment
	<input checked="" type="checkbox"/>	1	Transponder 1	MixingPlant	
	<input checked="" type="checkbox"/>	2	Transponder 2	MixingPlant	
<Add new>					

The display name designates the zone in the set editing language. An overview of the display names can be found in the "Project texts" editor.

### 10.9.6.2 Displaying the screen on entering a zone

#### Introduction

Configure a screen change when entering and leaving the zone.

#### Requirements

- A Mobile Panel which supports zones has been created, for example, Mobile Panel 277 IWLAN.
- The "MixingPlant" zone is configured.
- The "Plant\_1" screen has been created and opened.
- The "MixingPlant\_1" screen has been created and opened.
- The "Zones" work area is open.

#### Procedure

1. Select the "MixingPlant" zone from the "Zones" table.
2. Click "Properties> Events" in the Inspector window.
3. Click the event "On entry".

4. Select the "ActivateScreen" system function in the "function list".
5. Select "MixingPlant\_1" as the "Screen name".
6. Click the event "On exit".
7. Select the "ActivateScreen" system function in the function list.
8. Select "Plant\_1" as the "Screen name".

## Result

The "MixingPlant\_1" screen is displayed on the HMI device when you enter the "MixingPlant" zone. When you exit the zone, the "Plant\_1" screen appears once more.

### 10.9.6.3 Displaying an object in relation to the zone

## Validity

The following example is independent of the WLAN and applies to all Mobile Panels.

## Introduction

You configure an I/O field that is only visible within a specific zone.

## Requirements

- A Mobile Panel which supports zones has been created, for example, Mobile Panel 277 IWLAN.
- The "Zone\_id" variable of the "Int" data type has been created.
- A "Plant\_1\_Overview" screen has been created.

## Procedure

1. Open the "Runtime Settings > General" editor.
2. Select the "Zone\_id" tag as the "ID Zone/ Effective range".
3. Open the screen "Plant\_1\_Overview".
4. Drag and drop the "I/O box" object from the toolbox into the screen.
5. Click "Properties > Animations" in the Inspector window.
6. Click "Layout > Visibility."
7. Select "Zone\_id" as the "tag".
8. Select "from" 1 "to" 1 as the "Range".
9. Enable "Visible".

## Result

The IO field is only visible at runtime under the following conditions:

- The hard-wired Mobile Panel is connected to a connection box with ID = 1.
- The Mobile Panel Wireless is located in a zone with ID = 1, for example, the "MixingPlant" zone.

## 10.9.7 Working with effective ranges

### 10.9.7.1 Overview

#### Introduction

The following configuration guide describes the steps needed to set up an effective range for fail-safe operation on a Mobile Panel Wireless.

#### Procedures overview

1. Configuring the effective range:  
You configure the "MixingAxisControl" effective range as a conical area around "Transponder1 " at a distance of 5 meters.
2. Configuring the name of the effective range:  
To ensure logon to the effective range, configure the object "Effective range - Name".
3. Configuring additional effective range objects:  
Configure additional objects for displaying the position and signal strength within an effective range.
4. Set parameters for loading:
  - PROFIsafe communication
  - WLAN network
  - Power management
  - Interface
5. Configure the data channel
6. Configure network operation
7. Set the transponder
8. Commissioning effective ranges
9. Switching on and Testing the HMI device
10. Start loading manually
11. Acknowledging the effective range at the plant:  
You acknowledge the effective ranges and their transponders.

12. Determine the checksum
13. Load the project once again with checksum:  
Enter the checksum you have determined in the project and load the project once again.
14. Test effective range

---

**Note**

For detailed information on items 5 to 14, refer to the operating instructions of the HMI device.

Complete documentation for Mobile Wireless (<http://support.automation.siemens.com/WW/view/en/26268960>)

---

## 10.9.7.2 Configure effective range

### Introduction

You set up an effective range in order to control safety related operator input upstream of a machine or plant.

### Requirements

- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Effective ranges" work area is open.

### Procedure

1. Double-click "Add..." in the "Effective Ranges" table.
2. Enter "MixingAxisControl" as the "Name" of the effective range.
3. Enter "Mixing\_axis\_PLC" as the "Display name" for the effective range at runtime.
4. Enter effective range "1" in the "ID" field.  
Make sure that the effective range ID matches the ID on the machine.
5. Enter "5" meters as the "Limit" of the effective range.
6. Double-click "Add..." in the "Transponders" table.
7. Enter "Transponder 1" as the "Name" of the transponder.
8. Enter transponder "1" in the "ID" field.  
Then set transponder IDs on the transponder.
9. Enable the assignment of "Transponder 1".  
"Transponder 1" is assigned to the "MixingAxisControl" effective range.

## Result

You configure the "MixingAxisControl" effective range as a conical area around "Transponder 1" at a distance of 5 meters, regardless of the zones.

Effective ranges

Checksum: 0

Id	Name	Display name	Limit	Comment
1	MixingAxisControl	MixingAxisControl	5	
<Add new>				

Transponder (MixingAxisControl)

Enable all	Id	Name	Effective range	Comment
<input checked="" type="checkbox"/>	1	Transponder 1	MixingAxisControl	
<Add new>				

The display name designates the effective range in the set editing language. An overview of the display names can be found in the "Project texts" editor.

### 10.9.7.3 Configuring the effective range name

#### Introduction

Configure at least the "Effective range - Name" object so that an operator can log on and off a machine using an effective range. If you do not configure an effective range object for a Mobile Panel Wireless for fail-safe operation, a warning appears during generation.

#### Requirements

A screen has been created and opened.

#### Procedure

1. Select the "Effective range name" object from the "Elements" category in the toolbox.
2. Drag and drop the "Effective range - Name" object from the toolbox into the screen.

## Result

If the operator clicks an object during runtime, he initiates logon or logoff of the HMI device to a machine that is assigned to an effective range.

#### See also

Effective range name (Page 3483)

## 10.9.7.4 Configuring additional Mobile Wireless objects

### Introduction

You will need to configure other objects in order to display further information about the effective range during testing, for example.

### Requirements

A screen has been created and opened.

### Procedure

1. Select the "Effective range - Signal" object from the "Elements" category in the toolbox.
2. Drag and drop the "Effective range - Signal" object from the toolbox into the screen.
3. Repeat steps 1 and 2 with the "WLAN - Reception" object.

### Result

The "Effective range - Signal" object indicates how accurately the Mobile Panel Wireless is within an effective range. The "WLAN - Reception Quality" object displays the signal strength of the WLAN wireless connection.

### See also

Effective range signal (Page 3487)

WLAN reception (Page 3489)

## 10.9.8 Working with effective ranges (RFID)

### 10.9.8.1 Overview

#### Validity

The next section applies only to Mobile Panels Wireless with RFID, for example, Mobile Panel 277F IWLAN (RFID Tag).

#### Introduction

The following configuration guide describes the steps required to set up an effective range (RFID) for fail-safe operation on a Mobile Panel Wireless with RFID.

## Procedures overview

1. Configure effective range (RFID):  
You configure the effective range (RFID) "MixingAxisControl".
2. Configuring the name of the effective range (RFID):  
To ensure logon to the effective range, configure the object "Effective range - Name (RFID)".
3. Set parameters for loading
4. Configure the data channel
5. Configure network operation
6. Install RFID Tag in the plant
7. Turn on the HMI device and enable loading mode
8. Loading a project
9. Write the suitable IDs to the RFID Tags in the plant
10. Determine the checksum
11. Load the project once again with checksum:  
Enter the checksum you have determined in the project and load the project once again.
12. Test effective range (RFID)

---

### Note

For detailed information on items 4 to 12, refer to the operating instructions of the HMI device.

Complete documentation for Mobile Wireless (<http://support.automation.siemens.com/WW/view/en/26268960>)

---

## 10.9.8.2 Configuring effective range (RFID)

### Introduction

You set up an effective range (RFID) to control safety-related operator input upstream of a machine or plant.

### Requirements

- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Effective ranges (RFID)" work area is open.

### Procedure

1. Double-click "Add..." in the "Effective Ranges (RFID)" table.
2. Enter "MixingAxisControl" as the "Name" of the effective range (RFID).

3. Enter "MixingAxisControl" in the "Display name" field of the effective range (RFID).
4. Enter "1" in the "ID" field of the effective range (RFID).  
Make sure that the effective range (RFID)-ID matches the ID on the machine.
5. Double-click "Add..." in the "RFID Tag table.
6. Enter "RFID Tag 1" as the "Name" of the RFID Tag.
7. Enter "1" as the "ID" of the RFID Tag. Then set the RFID Tag-ID for the RFID Tag.
8. Enable the assignment of "RFID Tag 1".  
"RFID Tag 1" is assigned to the effective range (RFID) "MixingAxisControl".

## Result

The effective range (RFID) "MixingAxisControl" is configured.

Effective ranges (RFID)

Checksum: 0  

Id	Name	Display name	Comment
1	Effective range (RFID)_1	Effective range (RFID) (1)	
<Add n...>			

---

RFID tags (Effective range (RFID)\_1)

<input type="checkbox"/> Enable all	Id	Name	Effective range (RFID)	Comment
<input checked="" type="checkbox"/>	1	RFID tag_1	Effective range (RFID)_1	
<Add new>				

The display name describes the effective range (RFID) in the set editing language. An overview of the display names can be found in the "Project texts" editor.

### 10.9.8.3 Configuring the effective range name (RFID)

#### Introduction

Configure the "Effective range - Name" object so that an operator can log on and off a machine using an effective range (RFID). If you do not configure the "Effective range-Name" object for a Mobile Panel Wireless RFID with (RFID), a warning will appear during generation.

#### Requirements

A screen has been created and opened.

**Procedure**

1. Select the "Effective range - Name (RFID)" object from "<Elements" in the toolbox.
2. Drag and drop the "Effective range - Name (RFID)" object from the toolbox into the screen.

**Result**

If the operator clicks an object during runtime, he will initiate logon or logoff of the HMI device to a machine which has been assigned to an effective range (RFID).

**See also**

Effective range name (RFID) (Page 3486)

**10.9.9 Reference****10.9.9.1 PROFIsafe address****Validity**

The PROFIsafe address is only available for fail-safe operation for the Mobile Panel Wireless.

---

**Note**

Additional information on fail-safe operation can be found in the operating instructions for the HMI device:

Complete documentation for Mobile Wireless (<http://support.automation.siemens.com/WW/view/en/26268960>)

---

**PROFIsafe address**

The PROFIsafe address used for fail-safe I/Os in PROFIsafe communication is unique on the entire network and on all stations. On the Mobile Panel Wireless, you create a default value in the project and load it to the HMI device. You can also store a PROFIsafe address on the HMI device.

The PROFIsafe address fall within the range from 1 to 65534. The two PROFIsafe addresses (in the Engineering System and on the HMI device) are checked for formal validity.

The PROFIsafe address is loaded as follows at the start of Runtime:

- You programmed a valid PROFIsafe address in the Control Panel. The HMI loads the PROFIsafe address set in the Control Panel.
  - You did not program a valid PROFIsafe address in the Control Panel. The HMI loads the PROFIsafe address set in the project.
- 

**Note**

The invalid address 65.535 is programmed by default in the Control Panel of the HMI device. The HMI loads the address set in the project.

---

**See also**

Power Management (Page 5216)

Zone ID / connection point ID (Page 5217)

### 10.9.9.2 Power Management

**Validity**

In the "Runtime Settings > Power Management" editor, configure the energy-saving mode of a Mobile Panel.

**Power Management**

The Mobile Panel Wireless can save energy in the following ways:

- Reduce brightness - minimal saving
- Switch off display - significant saving

You can also indicate after how long without operator input the power management function is enabled. The communication link is maintained. The time for "Switch monitor off" is longer than the time for "Reduce brightness".

**See also**

PROFIsafe address (Page 5213)

### 10.9.9.3 Zone ID / connection point ID

#### Validity

In the "Runtime Settings > General" configure an internal tag which, depending on the value, shows specific information on the display of the HMI device.

---

**Note****Mobile Panels Wireless with RFID**

For Mobile Panels Wireless with RFID, the area "Zone ID / Connection point ID" is not available.

---

#### Zone ID / connection point ID

This field is used to configure an internal tag that contains the following value at runtime in relation to the type of HMI device:

- The ID of the connection box or effective range to which the hard-wired Mobile Panel is connected.
- The ID of the zone in which the Mobile Panel Wireless is located. If the value is set to 255, then the HMI device is not in any zone.

#### See also

PROFIsafe address (Page 5213)

## 10.10 Planning tasks

### 10.10.1 Field of application of the Scheduler

#### Definition

You can use the Scheduler to configure tasks to run independent of the screen in the background. You create tasks by linking system functions or scripts to a trigger. The linked functions will be called when the triggering event occurs.

#### Example of an application

The Scheduler is used to execute event-controlled tasks automatically. For example, you use a task to automate the following:

- Regular swap out of log data
- Printout of an alarm report when an alarm buffer overflow occurs

- Printout of a report at shift end
- Monitoring a tag
- Monitoring of a user change

---

**Note**

The availability of the listed examples is determined by the HMI device.

---

**See also**

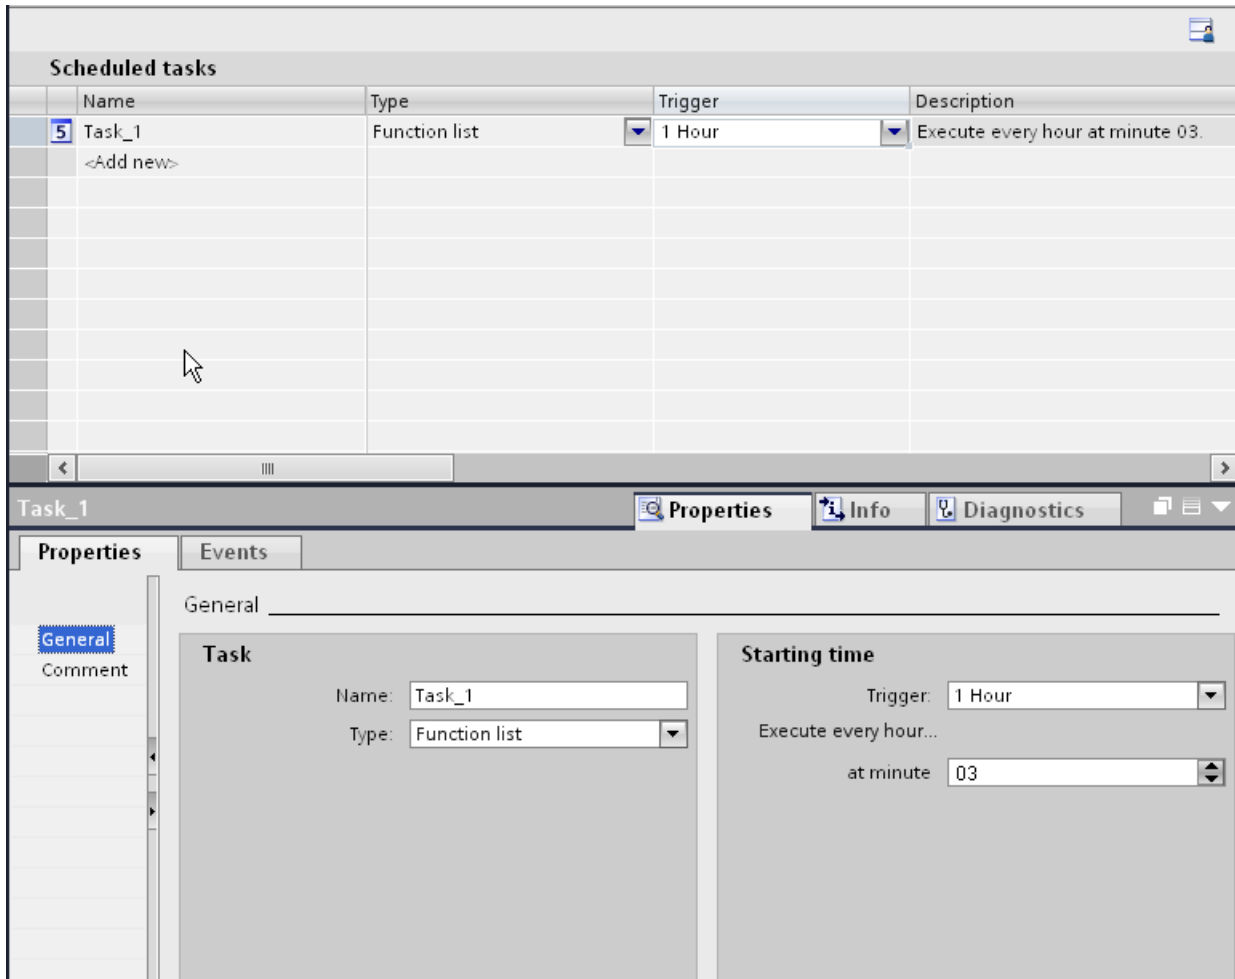

Work area of the "Scheduler" editor (Page 5220)

## 10.10.2 Working with tasks and triggers

### Introduction

A task consists of a trigger and a task type.

### Starting a task

Controlled by a trigger, the Scheduler starts the task linked to the trigger.

### 10.10.3 Basics

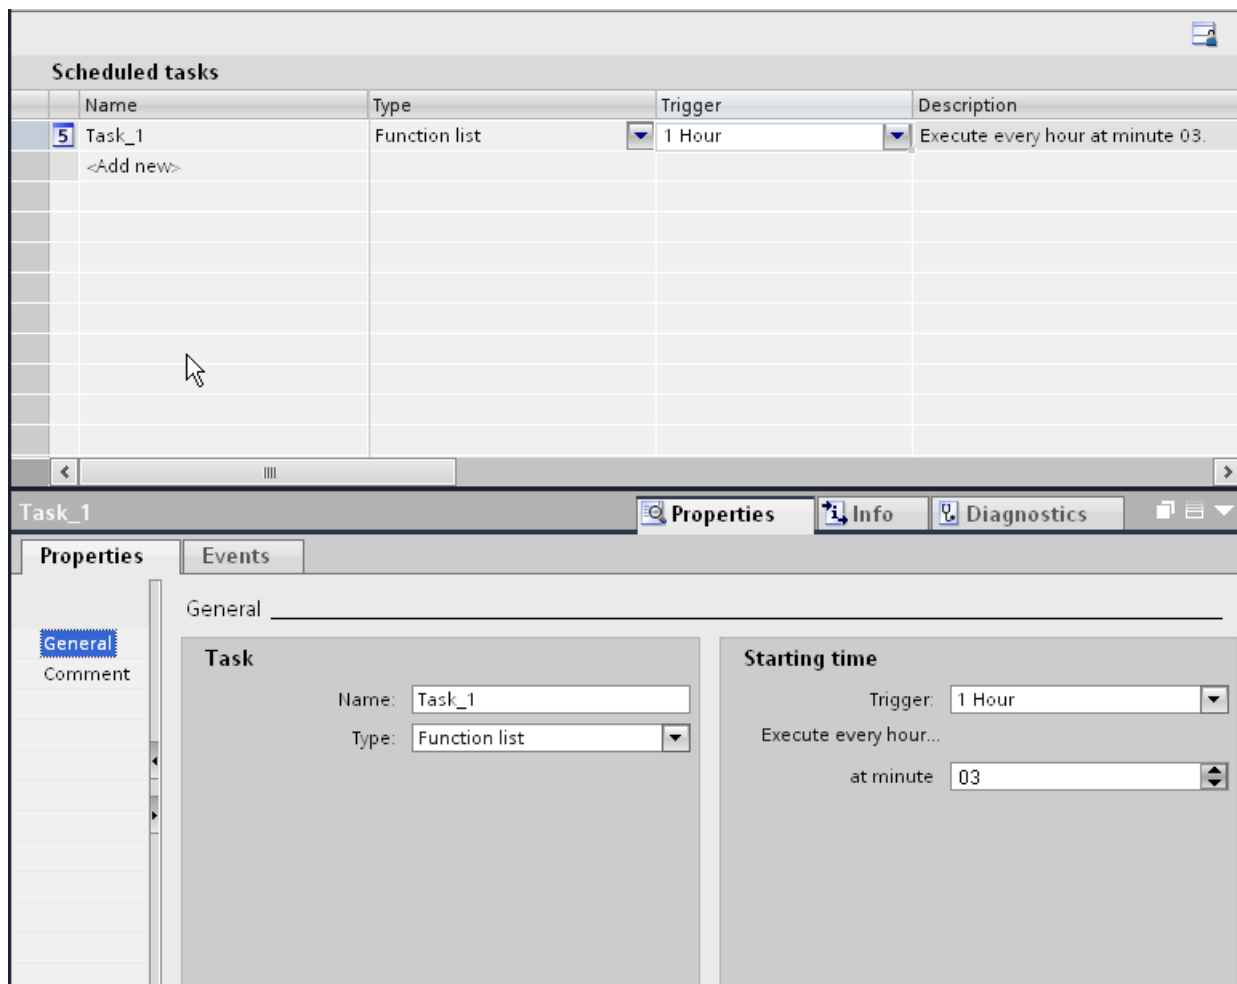

#### 10.10.3.1 Work area of the "Scheduler" editor

##### Introduction

Double-click on "Scheduler" to open it in the project view. The work area shows the scheduled tasks, which consist of the trigger and the task type, for example, the function list.

##### Structure

The work area consists of the table of jobs.

The table of tasks shows specified tasks with their properties, such as triggers. You select a task type and a trigger. You assign a name and a comment to the task. The description provides a written summary of the task including the timing for the task.

## Inspector window

The "Properties" tab of the Inspector window is split into two parts.

The "Job" area lists the name of the job and the job type. The "Starting time" area shows the trigger. The area is different depending on the trigger selected.

In the "Events" tab use the function list with system functions that will be executed in the task.

---

### Note

You can obtain more detailed information about the elements of the user interface using the tooltips. To do so, move the mouse pointer to the relevant object or press <F1> if the object has already been selected.

---

## See also

Field of application of the Scheduler (Page 5215)

Triggers (Page 5222)

### 10.10.3.2 Function list

#### Function list

A trigger starts the function list. The function list is executed line by line. Each line contains a system function. You can configure exactly one function list for each task.

---

### Note

The choice of configurable system functions in a function list depends on the selected trigger and the HMI device.

---

### 10.10.3.3 Function list

#### Function list

A trigger starts the function list. The function list is executed line by line. Each line contains a system function or a local script. You can configure exactly one function list for each task.

---

### Note

The choice of configurable system functions in a function list depends on the selected trigger and the HMI device.

---

### Processing of system functions and scripts

System functions and scripts in a function list are processed in Runtime sequentially from top to bottom.

Auto-Hotspot

Use a script with loops, conditional statements and abort conditions to program non-sequential and conditional procedures.

#### 10.10.3.4 Triggers

### Triggers

#### Introduction

A trigger is linked to a task and forms the triggering event which will call this task. The task is executed when the trigger occurs.

#### Event trigger

When a task is linked to a system event, the task will be triggered by the event. System events include, for example, Runtime stop, screen change, user change, etc.

Each system event can only be configured once for each HMI device.

#### Deactivating job

If you do not need a certain job temporarily, deactivate the job in the Engineering System. You also use the trigger "Deactivated" to make a previously configured system event available once again.

Example: Task "A" is planned with the system event "Shutdown". This system event is then no longer available for another task "B". Select "Disabled" as the trigger for task "A" to make the "Runtime stop" system event available again.

---

**Note**

The available triggers depend on the HMI device.

---

#### See also

Work area of the "Scheduler" editor (Page 5218)

## Triggers

### Introduction

A trigger is linked to a task and forms the triggering event which will call this task. The task is executed when the trigger occurs.

### Types of triggers

The Scheduler recognizes different types of triggers:

#### Acyclic triggers

They consist of a specification for the date and time of day. Tasks with an acyclic trigger are performed once by the Scheduler on the specified date and at the specified time.

#### Cyclic triggers

Tasks linked to a cyclic trigger occur regularly at a specific point in time.

- **Standard cycle:** With a standard cycle, the beginning of the first interval coincides with the start of Runtime. The length of the interval is determined by the cycle.
- **Trigger with defined starting time:** You specify a start time and a time interval. You can use cyclic triggers to perform tasks on a daily or weekly basis, for example. For example, you can select a "Weekly" trigger to specify a week as the interval. You specify the beginning of the interval with the day of the week and the time of day.

---

#### Note

##### User-defined cycles

You have defined your own cycles. You can only use cycles in the Scheduler whose maximum value amounts to one hour.

---

### Event trigger

When a task is linked to a system event, the task will be triggered by the event. In contrast to cyclic triggers, system events usually occur acyclically. A Runtime stop is a system event, for example.

Each system event can only be configured once for each HMI device.

### Deactivating job

If you do not need a certain job temporarily, deactivate the job in the Engineering System. You also use the trigger "Deactivated" to make a previously configured system event available once again.

Example: Task "A" is planned with the "User change" system event. This system event is then no longer available for another task "B". Select "Disabled" as the trigger for task "A" to make the "User change" system event available again.

---

**Note**

The available triggers depend on the HMI device.

---

## Timers for cyclic triggers

### Timers for cyclic and acyclic triggers

You have the option to change the start time of a task dynamically in Runtime. You can select an HMI variable as the timer. The value of the tag determines the start time for the task during Runtime.

---

**Note**

An HMI tag must be of the type "DateTime". A PLC tag must be of the type "Date and Time" or "DTL".

---

As long as the operator does not change the tag after Runtime starts, the start time configured in the task is valid. As soon as the operator enters a change to the tag, the current value of the tag is always the start time. To reset the configured time as the start time, the operator has to enter the configured time again.

## 10.10.4 Planning jobs

### 10.10.4.1 Planning tasks with acyclic triggers

#### Introduction

You are planning a one-time Runtime stop for maintenance work. The task starts a function which requires Runtime to stop.

#### Requirements

- The "Scheduler" editor is open.
- The Inspector window is open.

## Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Maintenance at end of year" as the "Name."
3. Select "Once" as the "Trigger."
4. Select "31.12.2008" in the "Properties > Properties > General > on" field of the Inspector window.
5. Enter the time "18:00" in the "at" field.
6. Click "Properties > Events" in the Inspector window.
7. Select the "StopRuntime" system function in the function list.
8. Select "Runtime" as the "Mode".

## Result

The task is executed once. Runtime will be stopped at 18:00 on December 31, 2008.

---

### Note

#### "StopRuntime" event on RT Professional

Please note that the "StopRuntime" event means runtime is in the process of ending and that some functionalities are therefore no longer available.

---

## 10.10.4.2 Planning tasks with cyclic triggers

### Introduction

You plan a job that provides a weekly printout of a report.

### Requirements

- A "Weekly report" report has been created.
- The "Scheduler" editor is open.
- The Inspector window is open.

### Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Weekly report printout for end of shift" as the "Name."
3. Select "Weekly" as the "Event".
4. Open the "Properties" tab in the Inspector window.
5. Select "Friday" in the "on day" field of the "Starting point" area.
6. Enter the time "18:00" in the "at" field in the "Starting point" area.
7. Click in the "Events" tab of the "Function list" on the entry "No function."
8. Select "Print/PrintReport" as the function.
9. Select "Weekly report" report.

## Result

The task is executed weekly. The report "Weekly report" will be printed every Friday at 18:00 hours.

### **10.10.4.3 Planning tasks with event triggers**

#### **Introduction**

You plan a task that generates a screen change when the user changes.

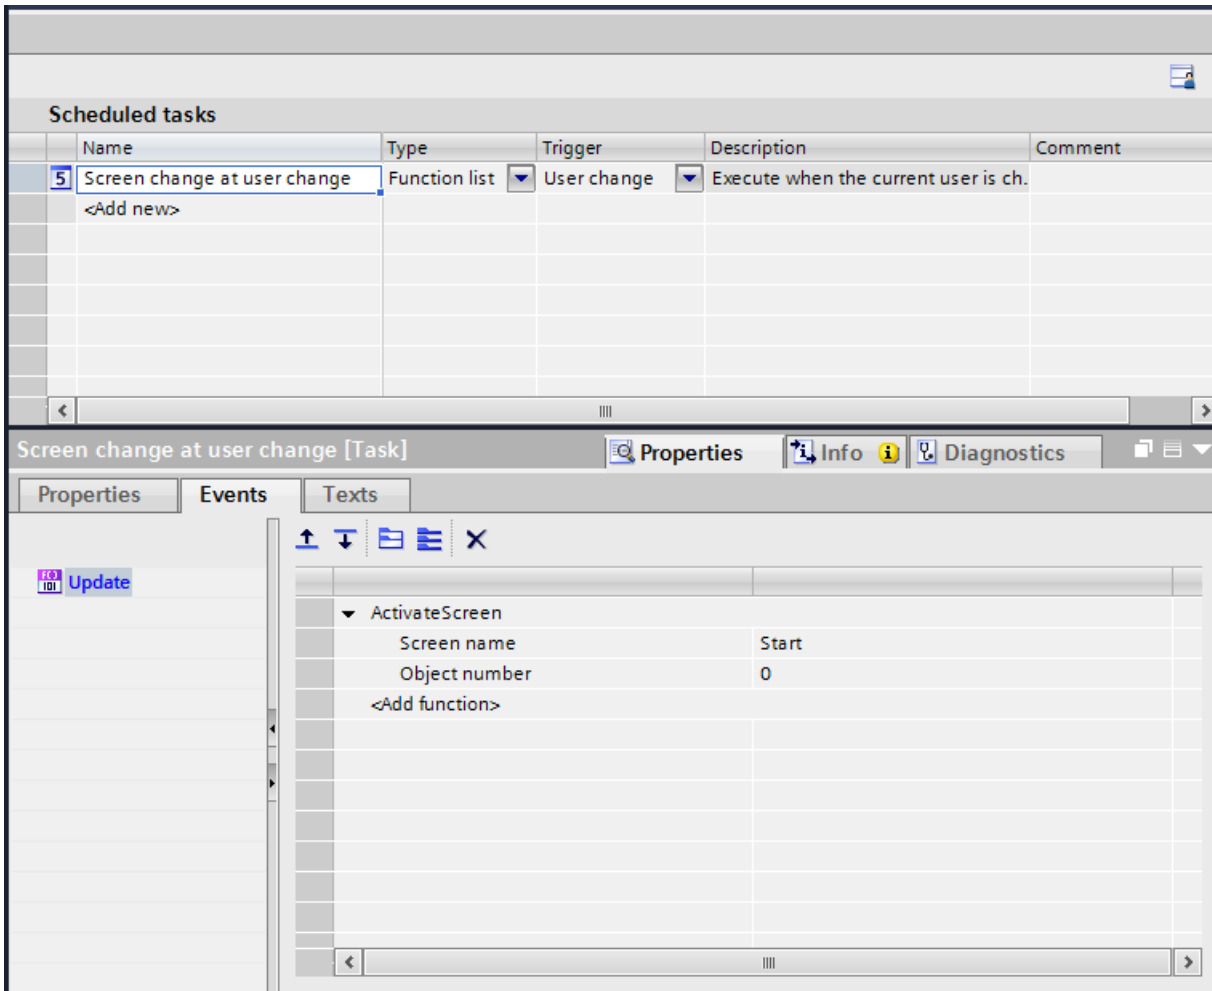

#### **Requirements**

- The "Scheduler" work area is open.
- You have created the "Start" screen.

#### **Procedure**

1. Click "Add..." in the table of the task area.
2. Enter "Screen change at user change" as the "Name."
3. Select "User change" as the "Trigger."
4. In the Inspector window, select "Properties > Events".

5. Select the "Screen/ActivateScreen" system function in the function list.
6. Select the "Start" screen in the screen name field.

## Result

The task is executed with the "User change" event. When a new user logs on successfully, the "Start" screen is called up.

### 10.10.4.4 Administer task

#### Changing the designation

1. In the work area, double-click the field in the "Name" column.
2. Change the name of the task.
3. Confirm your entry with <Return>.

As an alternative, you can change the designation in the "Job > Name" box of the Inspector window.

## Changing triggers

1. In the work area, mark the field in the "Trigger" column.
  2. Open the drop-down list using the  button and select the trigger you require.
- You can alternatively change the trigger in the "Starting time" area of the Inspector window.

## Deleting a task

1. Select one or more lines for the tasks to be deleted.
  2. Open the shortcut menu with the right button and select the menu command "Delete".
- As an alternative, delete one or more tasks by using the <Del> button.

## 10.10.5 Examples

### 10.10.5.1 Example: Terminating Runtime every day

#### Task

You plan a job that terminates Runtime every day at the end of work.

#### Requirements

- The "Scheduler" work area is open.

#### Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Runtime stop at end of work" as the "Name."
3. Select "Daily" as the "Event."
4. Open the "Properties" tab in the Inspector window.
5. Enter the time "21:00" in the "at" field in the "Starting point" area.
6. Open the "Events" tab in the Inspector window.
7. Click the "No function" entry in the "Function list".
8. Select "System functions/System/StopRuntime" as the function.

#### Result

Runtime is terminated every day at 21:00.

### 10.10.5.2 Example: Update user following change of user

#### Task

Configure an I/O field which displays the logged on user. Configure a task which updates the I/O field when the logged on user changes.

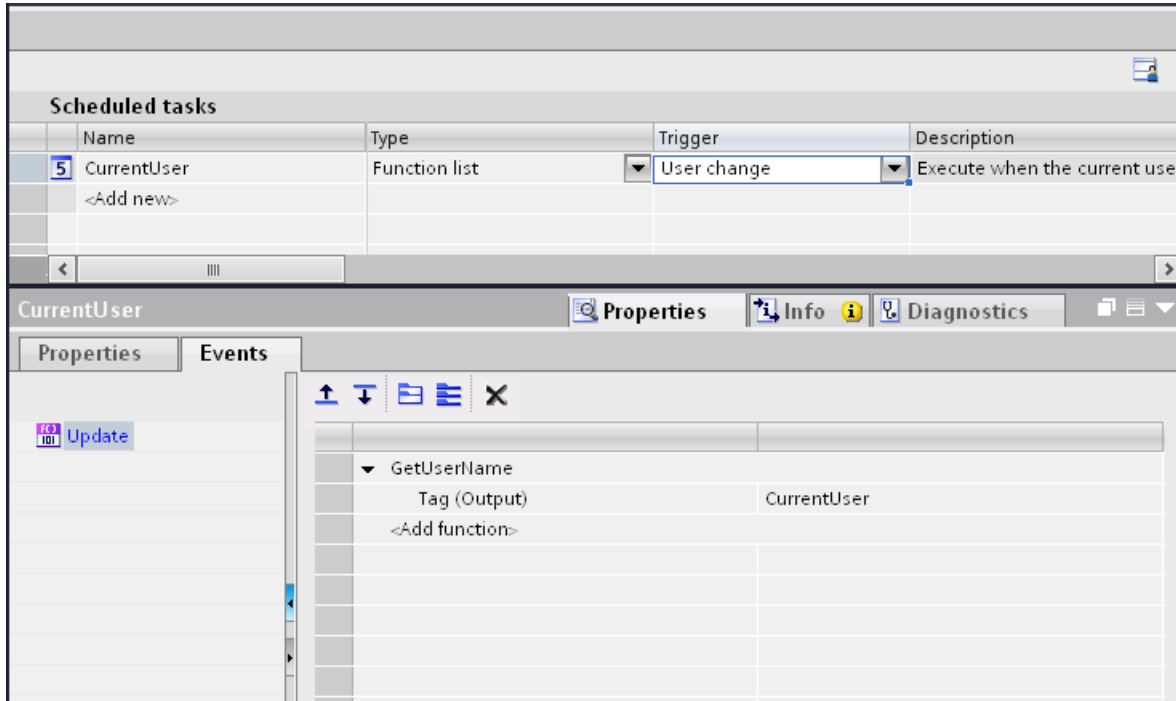

#### Requirements

- A "CurrentUser" tag of the "String" type is created.
- A screen has been created and opened.
- An I/O field is created in the screen.

#### Procedure

1. Click on the "I/O field" object.
2. In the Inspector window, select "Properties > Properties > General":
  - Select "String" as the "Display format."
  - Select "CurrentUser" as the "Variable."
  - Select "Output" as the mode.
3. Change to the work area of the Scheduler.
4. Click "Add..." in the table of the task area.
5. Enter "CurrentUser" as the "Name".
6. Select "User change" as the "Trigger."
7. In the Inspector window, select "Properties > Events".

8. Select the system function "ReadUserName" from the "User Management" group in the function list.
9. Select "CurrentUser" as the "Variable."

## Result

When a new user logs on successfully, the "ReadUserName" function is called up. The "CurrentUser" tag is updated and displayed in the I/O field of the newly logged on user.

If a user does not log on successfully, the logged on user is logged off. The I/O field continues to display the user previously logged on until a new user logs on successfully.

### 10.10.5.3 Example: Changing the starting point of a job in Runtime

#### Example: Changing the starting point of a task in Runtime

##### Introduction

A cyclic trigger, for example "Starting daily at 18:00," is configured in the Engineering System. The time "18:00" is fixed as a constant. To change the start time in Runtime, select a tag as the "Timer." The value of the tag determines the start time of the task during Runtime.

##### Task

You plan a task that swaps out log data daily and has the "LogTime" tag as the timer. You configure a "LogTime" tag in an input field.

## Requirements

- The "DataLogSource" source log has been created as a data log.
- The "DataLogDestination" destination log has been created as a data log.
- A "ChangeLogTime" screen has been created.

## Procedures overview

1. Creating a timer tag: You create a tag with which you change the starting point of the log data swap in Runtime.
2. Configuring a Date/time field: The operator changes the starting point of the task by using the Date/Time field in Runtime.
3. Configure the task with a timer tag: You create a task whose start time can be changed dynamically in Runtime.

## Result

If nothing is entered in the "LogDataTimeField" input field, then the task starts daily at 18:00 by default. The log data are swapped out. If an operator enters 19:00 in the "LogDataTimeField" input field, then the log data are swapped out at 19:00. Provided the value of the tag is not changed again before the task starts.

## See also

Example: 2. Configuring a Date/time field (Page 5233)

## Example: 1. Configuring a tag for Runtime

### Task

In the following example you configure the "LogTime" variable.

### Procedure

1. Open the "HMI tags" editor.
2. Click "Add..." in the table of the task area.
3. Enter "LogTime" as the "Name" of the variable.
4. Select "Internal variable" in the "Connection" column.
5. Select "DateTime" in the "Date type" column.

### Result

A variable of the "DateTime" type has been created.

## Example: 2. Configuring a Date/time field

### Task

In the following example you configure a Date/time field. To change the starting point of the task in Runtime, link the "LogTime" variable to the Date/time field.

### Requirements

- The "LogTime" variable of the "DateTime" type has been created.
- The "ChangeLogTime" screen is open.

### Procedure

1. In the toolbox view, drag-and-drop a "Date/time field" from the "Basic objects" category to the screen.
2. In the Inspector window, click "Properties > Properties > General".
3. Disable the "System time."
4. Click "Variable" and select "LogTime."
5. Disable "Display date" and enable "Display time."
6. Select "Input/output" as the "Mode."
7. Click "Properties > Miscellaneous."
8. Enter "LogDateTimeField" as the "Name".

### Result

The operator enters a time using the created date/time field.

### See also

Example: Changing the starting point of a task in Runtime (Page 5229)

## Example: 3. Configuring a swap to archive with a timer variable

### Task

In the following example you configure a task with a timer tag with which you change the starting point of the task in Runtime.

### Requirements

- The "LogTime" tag has been created.
- The "DataLogSource" source log has been created as a data log.

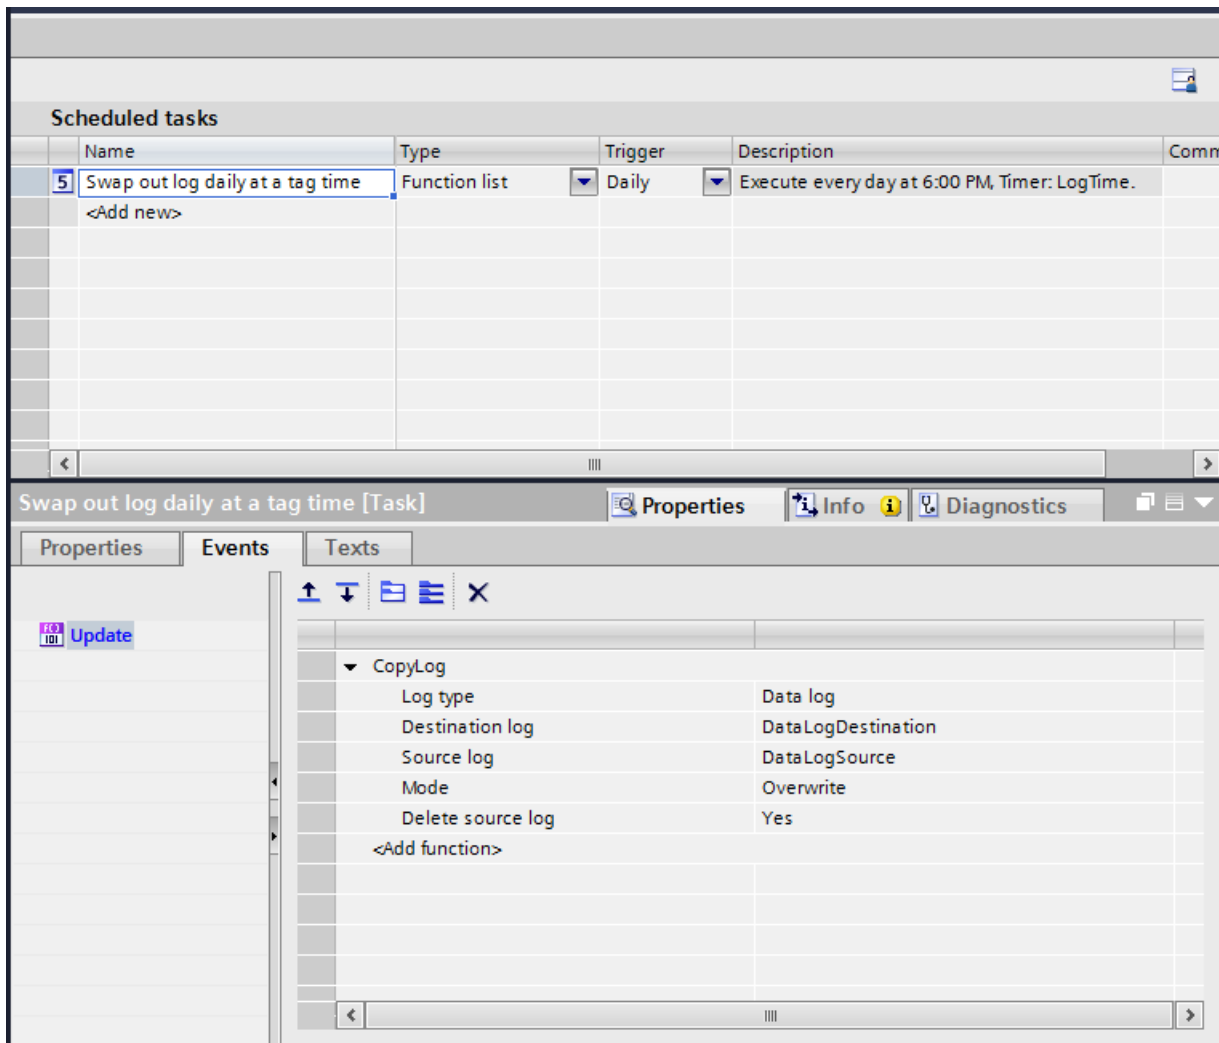

- The "DataLogDestination" destination log has been created as a data log.
- The Scheduler work area is open.

### Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Swap out log daily at a tag time" as the "Name".
3. Select "Daily" as the "Trigger".
4. In the Inspector window "Properties > Properties > General > at" enter the time "18:00".
5. Select the "LogTime" tag as the "Standard timer".
6. In the Inspector window, open "Properties > Events".

7. Select the "System functions/Logs/CopyLog" system function in the function list.
8. Select these settings:
  - Select "Data log" as the "Log type".
  - Select "DataLogDestination" as the "Destination log".
  - Select "DataLogSource" as the "Source log".
  - Select "Overwrite" as the "Mode".
  - Select "Yes" for "Delete source log".

## Result

If nothing is entered in the "LogDataTimeField" input field, then the task starts daily at 18:00 by default. The log data are swapped out. If an operator enters 19:00 in the "LogDataTimeField" input field, then the log data are swapped out at 19:00. Provided the value of the tag is not changed again before the task starts.

## 10.11 Communicating with PLCs

### 10.11.1 Basics of communication

#### 10.11.1.1 Communication between devices

##### Communication

The data exchange between two devices is known as communication. The devices can be interconnected directly or via a network. The interconnected devices in communication are referred to as communication partners.

Data transferred between the communication partners may serve different purposes:

- Display processes
- Operate processes
- Output alarms
- Archive process values and alarms
- Document process values and alarms
- Administer process parameters and machine parameters

##### Communication partners

Communication between the following devices is described in more detail in this section:

- PLC  
The PLC controls a process by means of a user program.
- HMI device  
You use the HMI device to operate and monitor the process.

### Basic information for all communication

The basis for all types of communication is a network configuration. In a network configuration, you specify the connection that exists between the configured devices.

With the network configuration, you also ensure the necessary prerequisites for communication, in other words:

- Every device in a network is assigned a unique address.
- The devices carry out communication with consistent transmission characteristics.

### Automation system

The following characteristics describe an automation system:

- The PLC and HMI device are interconnected
- The network between the PLC and HMI device is configured

### Communication between HMI devices

The HTTP protocol is available for communication between HMI devices.

For more detailed information, refer to the documentation on the SIMATIC HMI HTTP protocol.

### Communication via a uniform and vendor-neutral interface

With OPC (Openness Productivity Collaboration), WinCC has a uniform and manufacturer-neutral software interface. This interface enables standardized data exchange between industrial, office, and manufacturing applications.

For more detailed information, refer to the documentation for OPC.

## 10.11.1.2 Devices and networks in the automation system

### Introduction

To set up an automation system, you must configure, parameterize, and interconnect the individual devices.

You insert PLCs and HMI devices into the project in the same way. Likewise, you configure the two devices in the same way.

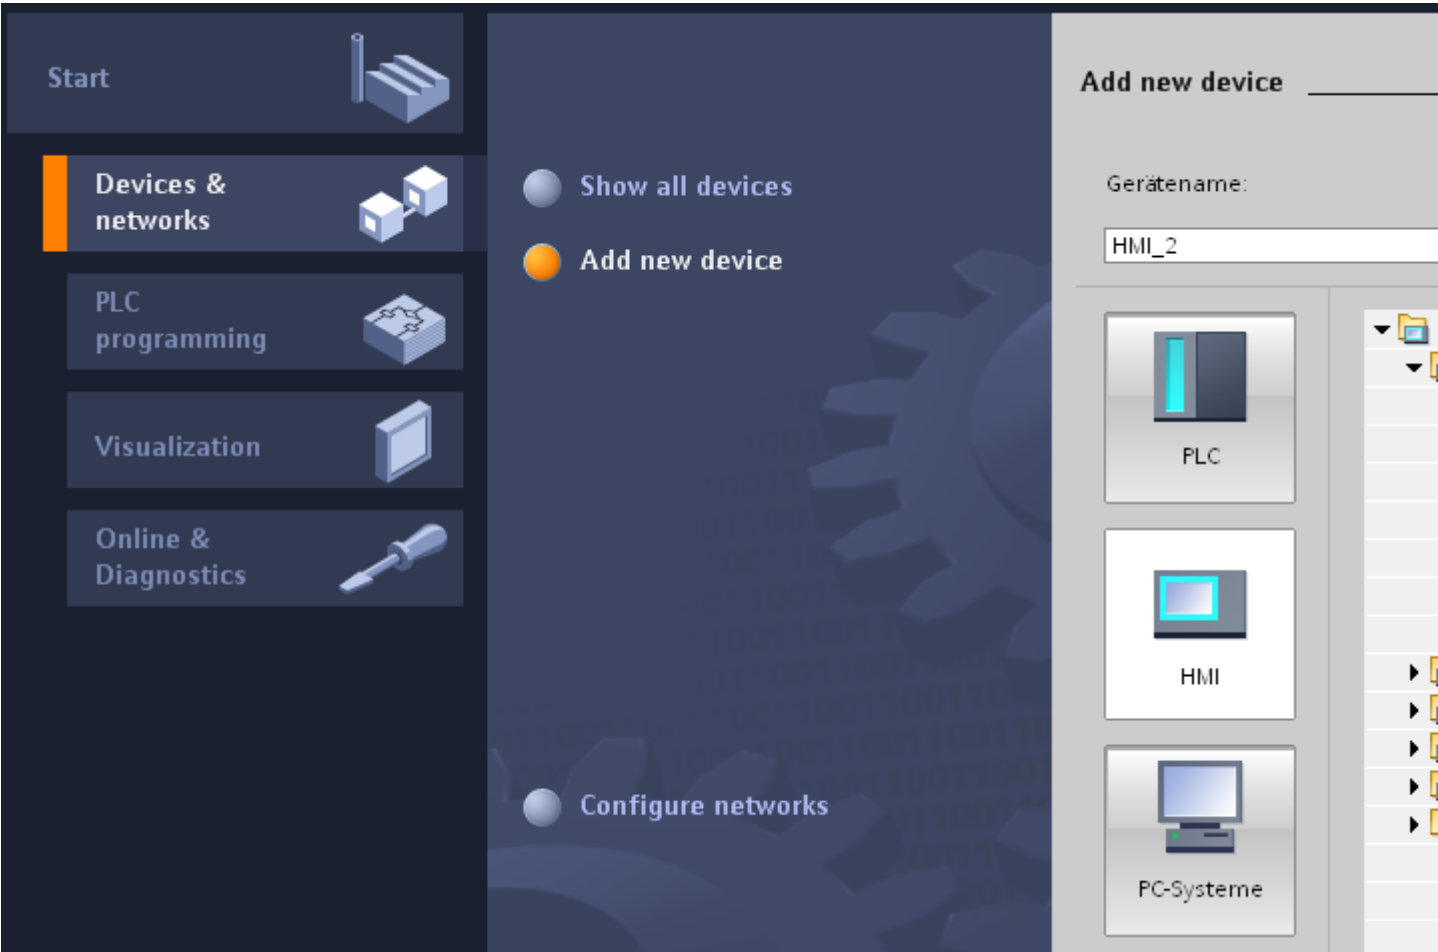

Automation system setup:

1. Insert PLC into the project.
2. Insert HMI device into the project.
3. Network the devices together.
4. Interconnect the devices.

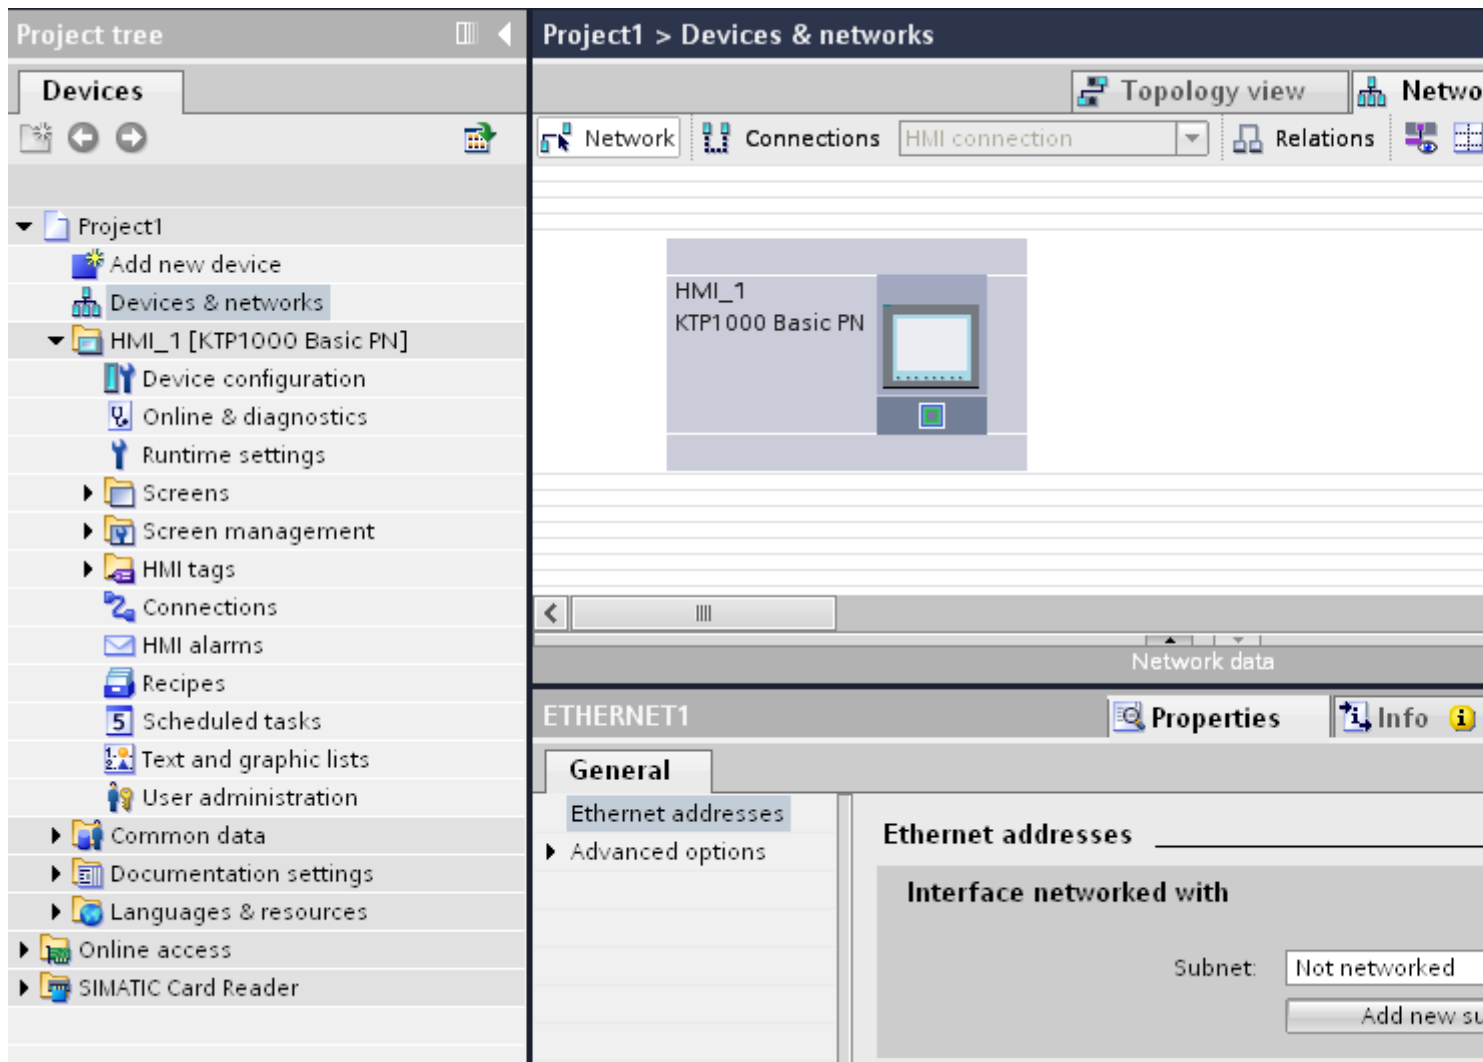

## **Inserting devices**

If you have created a project, you can add a device in the portal view or project view.

- Portal view

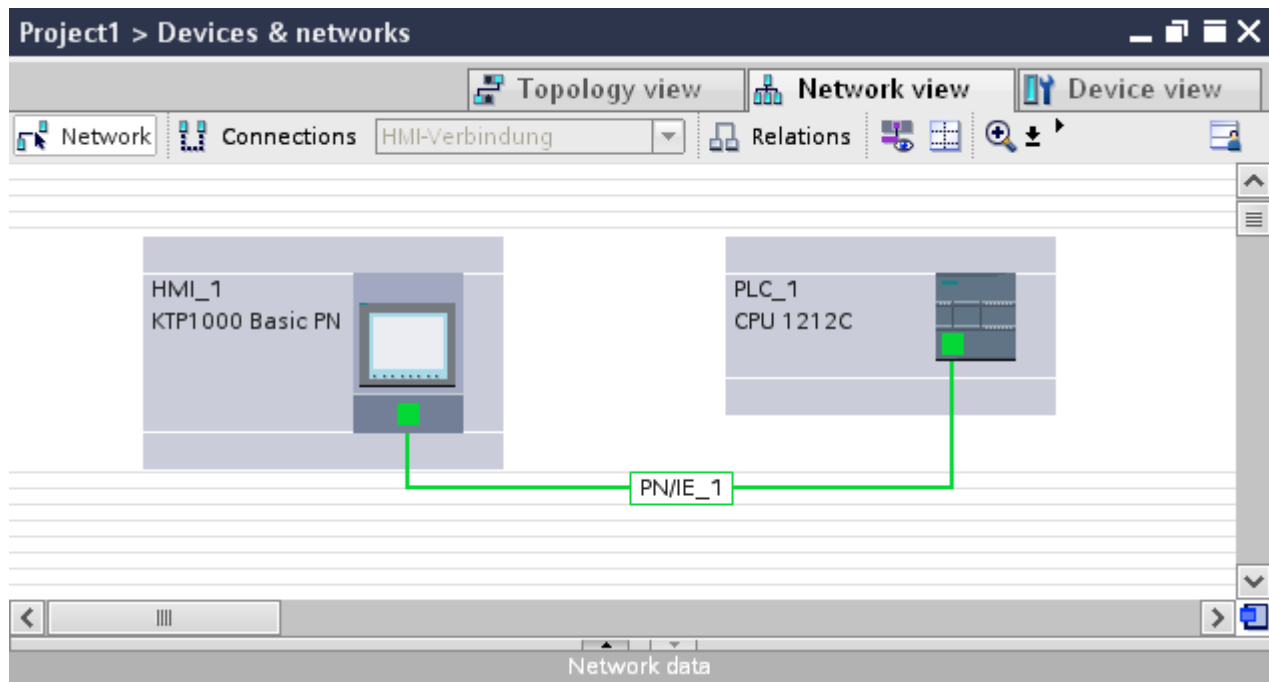

- Project view

## Networking devices

You can network the interfaces of the communication-capable devices conveniently in the "Devices & Networks" editor. In the networking step, you configure the physical device connections.
