

The tabular network overview supplements the graphical network view with the following additional functions:

- You obtain detailed information on the structure and parameter settings of the devices.
- Using the "Subnet" column, you can connect communication-capable components to subnets that have been created.

## Connecting devices

After you network the devices together, you configure the connection. You configure the "HMI connection" connection type for communication with the HMI device.

### 10.11.1.3 Data exchange using tags

#### Communication using tags

Process values are forwarded in runtime using tags. Process values are data which is stored in the memory of one of the connected automation systems. They represent the status of a plant in the form of temperatures, fill levels or switching states, for example. Define external tags for processing the process values in WinCC.

WinCC works with two types of tag:

- External tags
- Internal tags

#### Working with tags

See the chapter "Working with tags" for further information about configuring tags.

#### 10.11.1.4 Data exchange using area pointers

##### Communication using area pointers

Area pointers are parameter fields. WinCC receives information from these parameter fields in Runtime during the course of the project. This information contains data on the location and size of data areas in the PLC.

During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

The area pointers are managed centrally in the "Connections" editor. Area pointers are used to exchange data from specific user data areas.

You use the following area pointers in WinCC:

- Data record
- Date/time
- Coordination
- Job mailbox
- Date/time PLC
- Project ID
- Screen number

The availability of the various area pointers is determined by the HMI device used.

#### 10.11.1.5 Communication drivers

##### Communication drivers

A communication driver is a software component that establishes a connection between a PLC and an HMI device. The communication driver thus enables the assignment of process values to HMI tags.

The interface as well as the profile and transmission speed can be chosen, depending on the HMI device used and the connected communication partner.

## 10.11.2 Editors for communication

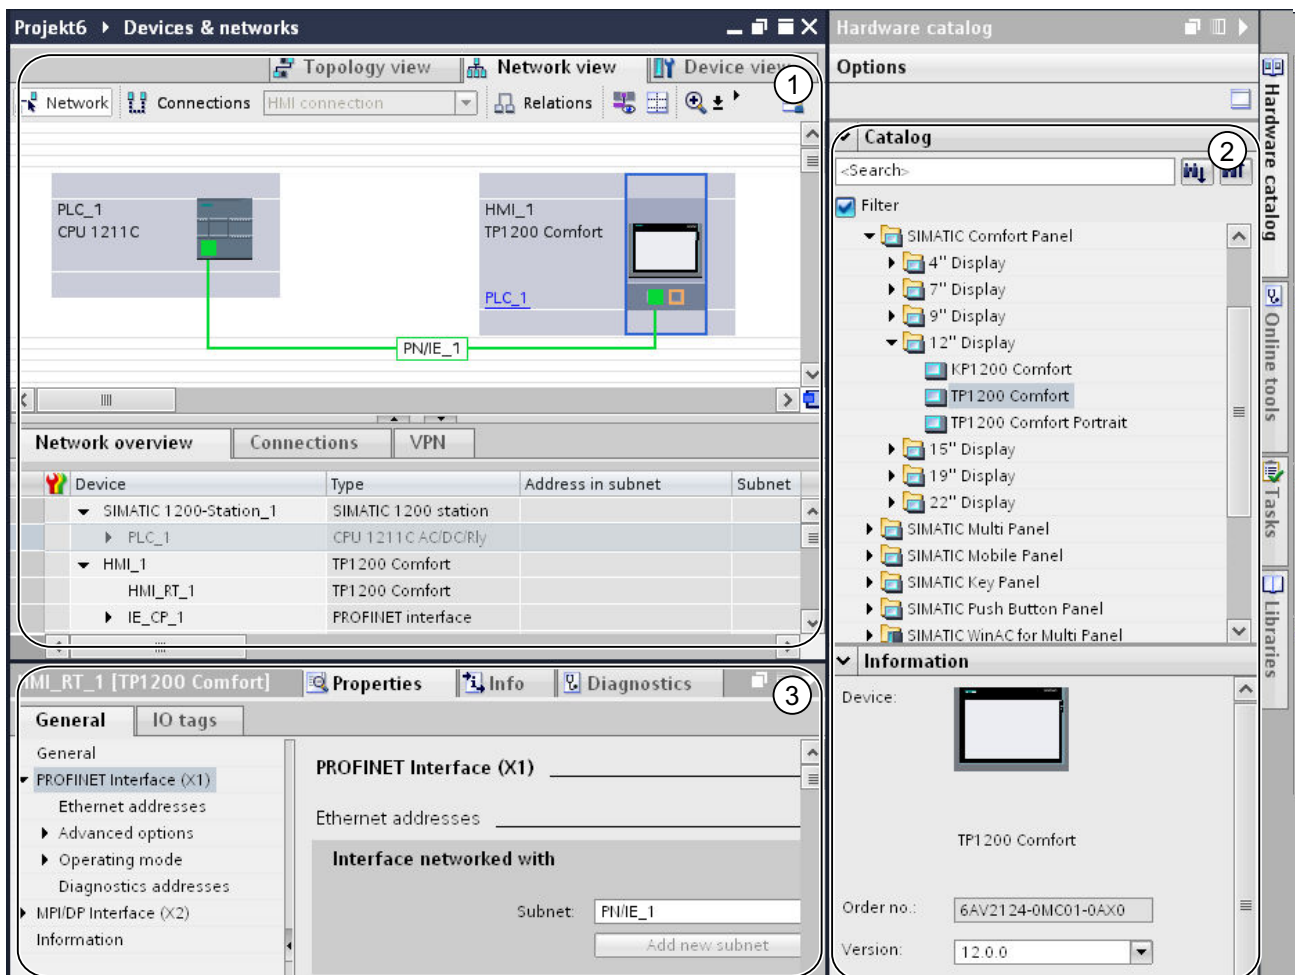

### 10.11.2.1 "Devices & networks" editor

#### Function of the hardware and network editor

The "Devices & networks" editor is the development environment for networking, configuring and assigning parameters to devices and modules.

#### Configuration

The "Devices & networks" editor consists of the following components:

- 1 Device view, network view, topology view
- 2 Hardware catalog
- 3 Inspector window

The "Devices & networks" editor provides you with three different views of your project. You can switch between these three views at any time depending on whether you want to produce and edit individual devices and modules, entire networks and device configurations or the topological structure of your project.

The inspector window contains information on the object currently marked. Here you can change the settings for the object marked.

Drag the devices and modules you need for your automation system from the hardware catalog to the network, device or topology view.

### **10.11.2.2 Network view**

#### **Introduction**

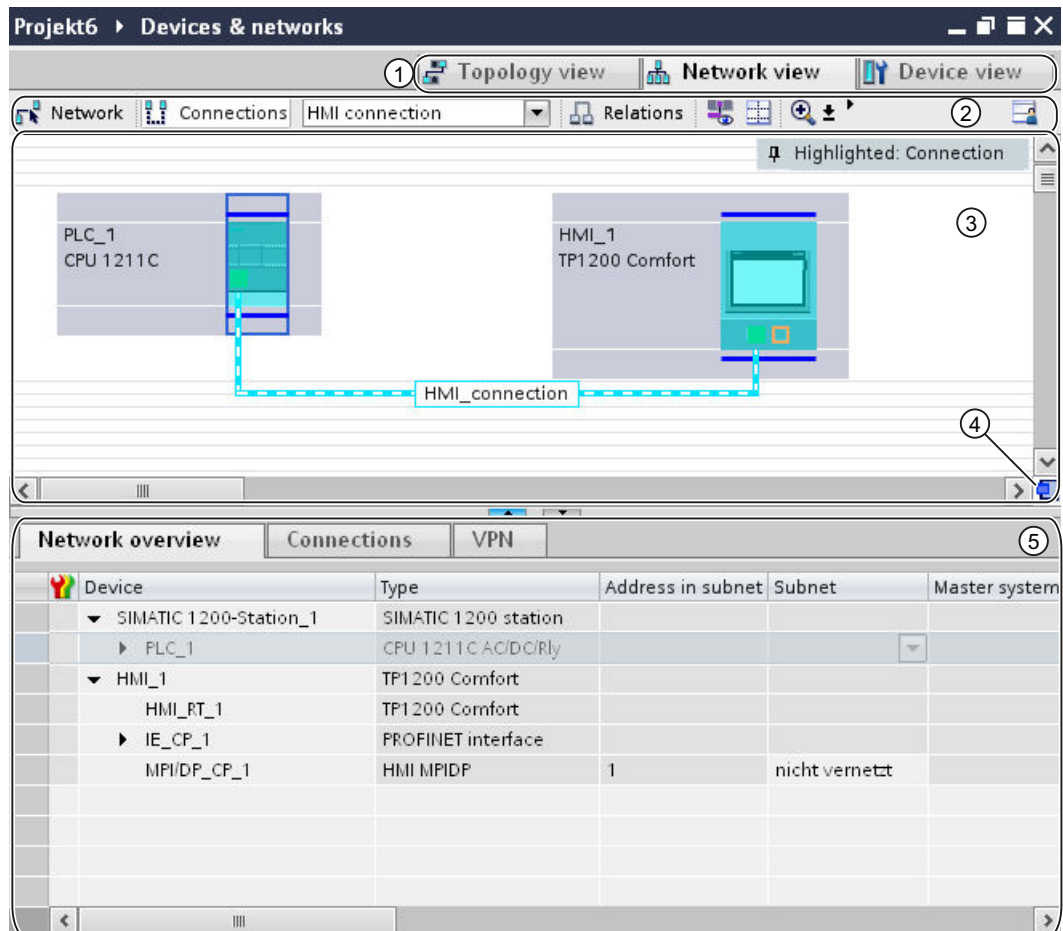

The network view is a working area of the hardware and network editor.

You undertake the following tasks in network view:

- Configuring and assign device parameters
- Networking devices with one another

## Structure

The following diagram shows the components of the network view:

- 1 Changeover switch: network view/device view/topology view
- 2 Toolbar of network view
- 3 Graphic area of network view
- 4 Overview navigation
- 5 Table area of network view

You can use your mouse to change the spacing between the graphic and table areas of the network view.

To do this, click on the upper edge of the table view and expand or contract this by moving the mouse with the mouse button held down.

You can use the two small arrow keys to minimize, maximize or select the latest table structure of the table view with just one click.

## Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Mode to network devices.
	Mode to create connections. You can select the connection type using the adjacent drop-down list.
	Mode to create relations.
	Show interface addresses.
	Adjust the zoom setting. You can select the zoom setting or enter it directly in the adjacent drop-down list. You can also zoom in or zoom out the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
	Show page breaks Enables the page break preview. Dashed lines will be displayed at the positions where the pages will break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

## Graphic area

The graphic area of the network view displays any network-related devices, networks, connections and relations. In this area, you add devices from the hardware catalog, connect them with each other via their interfaces and configure the communication settings.

## Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

## Table area

The table area of the network view includes various tables for the devices, connections and communication settings present:

- Network overview
- Connections
- I/O communication

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

### 10.11.2.3 Network data

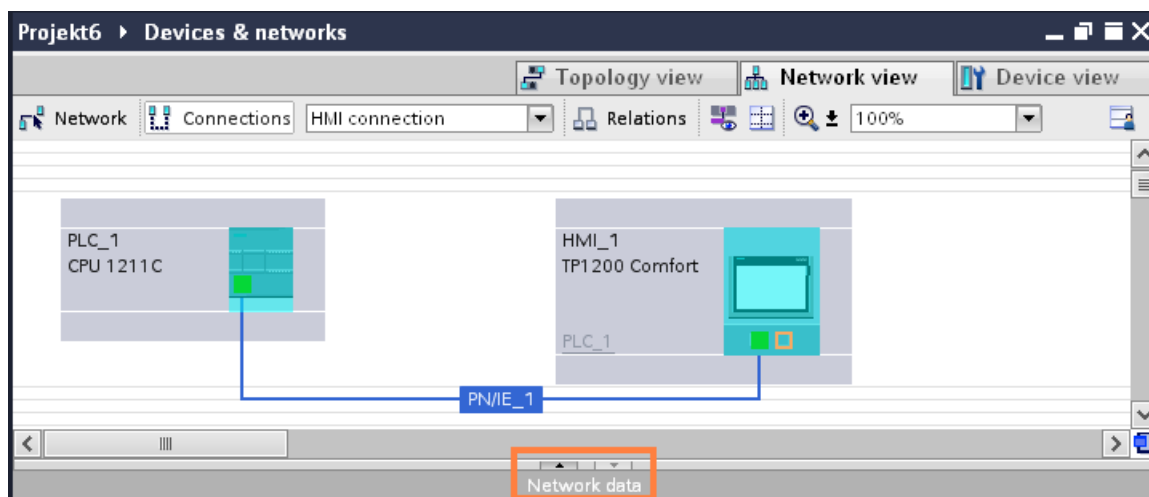

#### Introduction

The "Network view" editor also gives you a tabular view of the "Network data" in addition to the graphic network view.

You have the following selections in the "Network data" editor:

- Network overview
- Connections
- VPN
- I/O communication

You open the "Network data" below the graphic network overview.

#### Basic functions

The network data are displayed in tabular form and support the following basic functions for editing a table:

- Displaying and hiding table columns  
Note: The columns of relevance to configuration cannot be hidden.
- Optimizing column width
- Sorting table
- Displaying the meaning of a column, a row or cell using tooltips.

## Network overview

The tabular network overview adds the following functions to the graphic network view:

- You obtain detailed information on the structure and parameter settings of the devices.
- Using the "Subnet" column, you can connect components capable of communication with created subnets.

The

Network overview						Connections	VPN
Device	Type	Address in subnet	Subnet	Master system			
▼ SIMATIC 1200-Station_1	SIMATIC 1200 station						
▶ PLC_1	CPU 1211 C AC/DC/Rly						
▼ HMI_1	TP1200 Comfort						
HMI_RT_1	TP1200 Comfort						
▶ IE_CP_1	PROFINET interface						
MPIDP_CP_1	HMI MPIDP	1	nicht vernetzt				

## Connections

You will find additional network data under "Connections".

Network overview							Connections	VPN				
Local connection name	Local end point	Local ID (hex)	Partner ID (hex)	Partner	Connection type							
<div style="border: 1px solid gray; padding: 5px;"> <p>Show/hide columns</p> <p>Optimize column width</p> <p>Optimize width of all columns</p> </div>							<input checked="" type="checkbox"/> Local connection name <input checked="" type="checkbox"/> Local end point <input checked="" type="checkbox"/> Local ID (hex) <input checked="" type="checkbox"/> Partner ID (hex) <input checked="" type="checkbox"/> Partner <input checked="" type="checkbox"/> Connection type <input type="checkbox"/> One-way <input type="checkbox"/> Connection establishment <input type="checkbox"/> Local subnet <input type="checkbox"/> Partner subnet <input type="checkbox"/> Local interface <input type="checkbox"/> Partner interface <input type="checkbox"/> Local address <input type="checkbox"/> Partner address <input type="checkbox"/> Local TSAP <input type="checkbox"/> Partner TSAP <input type="checkbox"/> Local port <input type="checkbox"/> Partner port <input type="checkbox"/> Local LSAP <input type="checkbox"/> Partner LSAP <input type="checkbox"/> Protocol					

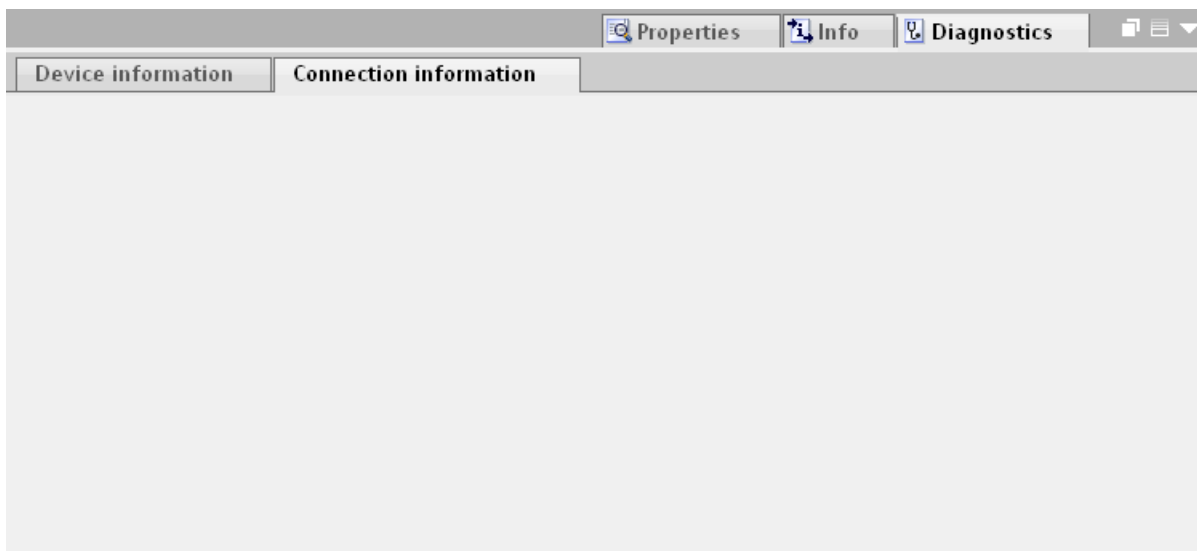

## Connection information

Use the "Connection information" function to display the diagnostics data of the connection selected in the "Devices&Networks" editor.

A graphic displays the communication partners of the connection and by which communication driver they are connected with each other.

The following data is displayed:

- End point
- Interface
- Subnet
- Address
- TSAP
- Number of HMI resources

### 10.11.2.5 Device view

#### Introduction

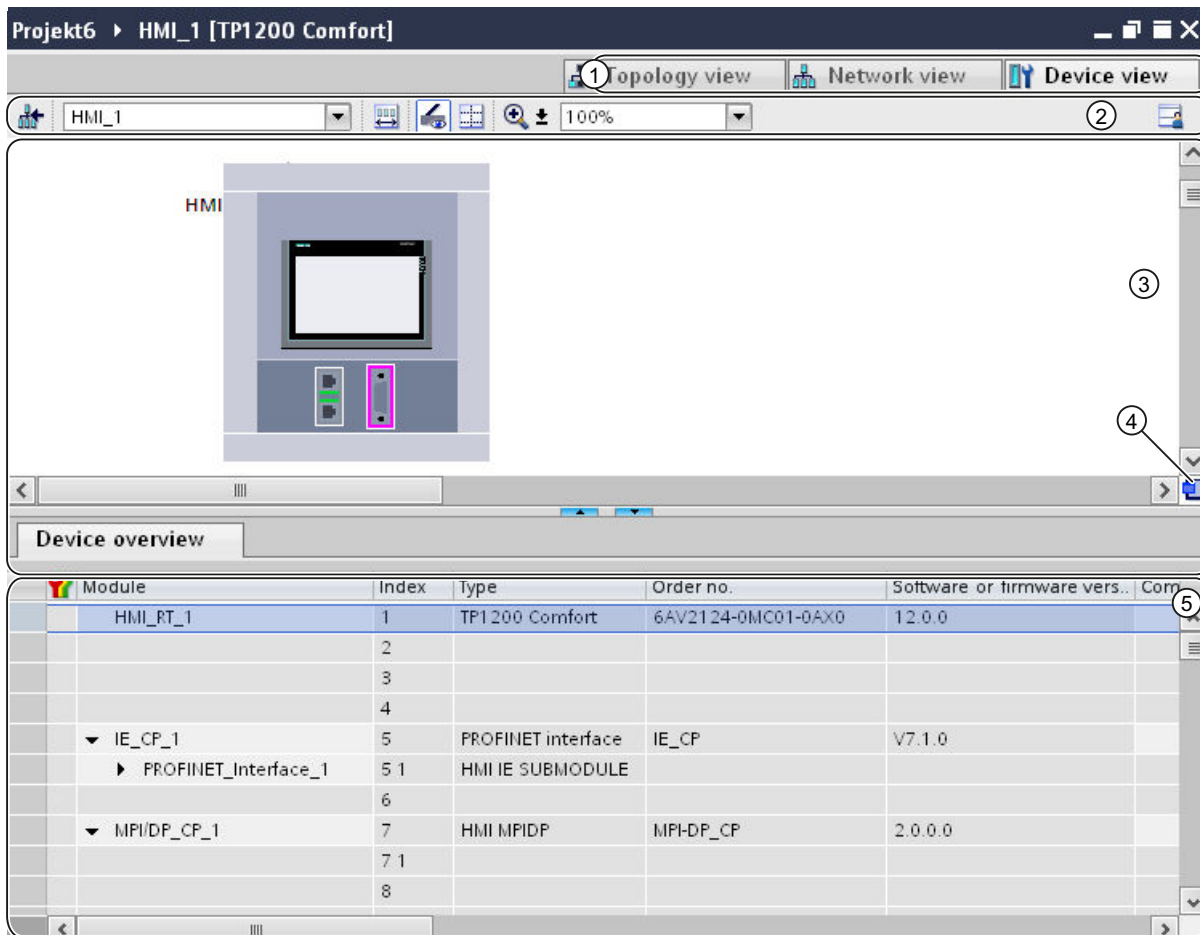

The device view is a working area of the hardware and network editor.

You undertake the following tasks in the device view:

- Configuring and assign device parameters
- Configuring and assign module parameters

## Structure

The following diagram shows the components of the device view:

- 1 Changeover switch: network view/device view/topology view
- 2 Toolbar of device view
- 3 Graphic area of the device view
- 4 Overview navigation
- 5 Table area of device view

You can use your mouse to change the spacing between the graphic and table areas of the device view.

To do this, click on the upper edge of the table view and expand or contract this by moving the mouse with the mouse button held down. You can use the two small arrow keys to minimize, maximize or select the latest table structure of the table view with just one click.

## Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Switches to the network view. Note: The device view can switch between the existing devices using the drop-down list.
	Show the area of unplugged modules.
	Show module labels.
	Adjust the zoom setting. Select the zoom setting or enter it directly in the adjacent drop-down list. You can use the Zoom button to zoom in or out incrementally or to drag a frame around an area to be enlarged. You can read the address descriptions of the I/O channels of signal modules at a zoom level setting of 200% or higher.
	Show page breaks Enables the page break preview. Dashed lines will be displayed at the positions where the pages will break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

## Graphic area

The graphic area of the device view displays hardware components and if necessary the associated modules that are assigned to each other via one or more racks. In the case of devices with racks, you have the option of installing additional hardware objects from the hardware catalog into the slots on the racks.

## Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

## Table area

The table area of the device view gives you an overview of the modules used and the most important technical and organizational data.

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

### 10.11.2.6 Topology view

## Introduction

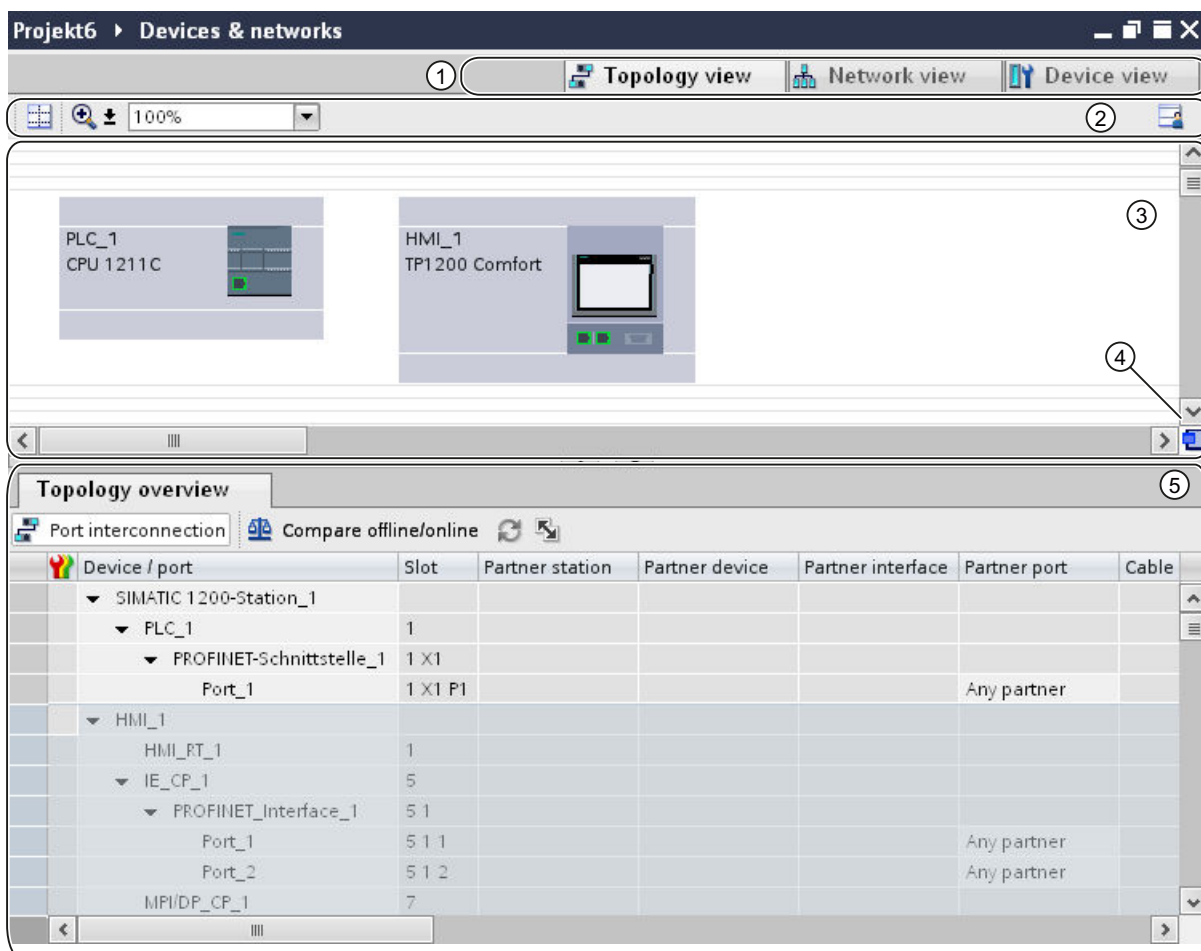

The topology view is a working area of the hardware and network editor.

You undertake the following tasks in topology view:

- Displaying the Ethernet topology
- Configuring the Ethernet topology
- Identify and minimize differences between the desired and actual topology

## Structure

The following figure provides an overview of the topology view.

- 1 Changeover switch: device view / network view / topology view
- 2 Topology view toolbar
- 3 Graphic area of the topology view
- 4 Overview navigation
- 5 Table area of the topology view

You can use your mouse to change the spacing between the graphic and table areas of the topology view.

To do this, click on the upper edge of the table view and expand or contract this by moving the mouse with the mouse button held down. You can use the two small arrow keys to minimize, maximize or select the latest table structure of the table view with just one click.

## Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Adjust the zoom setting. You can select the zoom setting via the adjacent drop-down list or enter it directly. You can also zoom in or zoom out the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
	Show page breaks Enables the page break preview. Dashed lines will be displayed at the positions where the pages will break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

## Graphic area

The graphic area of the topology view displays Ethernet modules with their appropriate ports and port connections. Here you can add additional hardware objects with Ethernet interfaces.

## Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

## Table area

This displays the Ethernet or PROFINET modules with their appropriate ports and port connections in a table. This table corresponds to the network overview table in the network view.

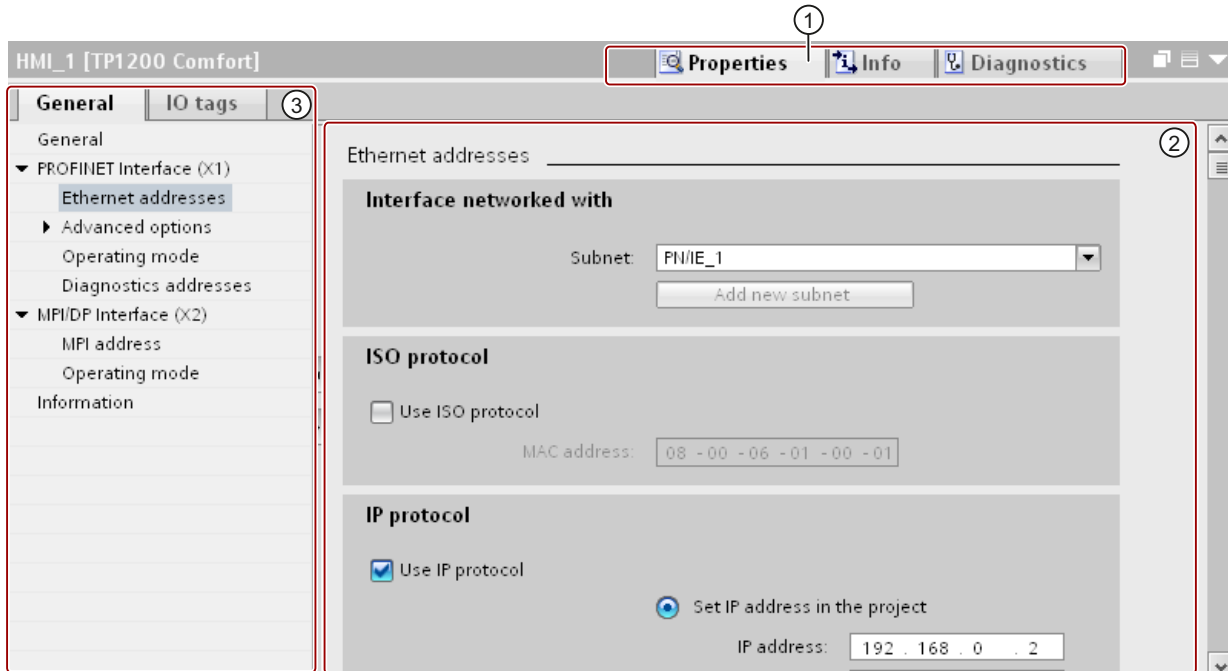

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

### 10.11.2.7 Inspector window

The properties and parameters shown for the object selected can be edited in the inspector window.

## Structure

The inspector window consists of the following components:

- 1 Switch between various information and work areas
- 2 Navigation between various pieces of information and parameters
- 3 Display showing the selected information and parameters

## Function

The information and parameters in the inspector window are split into different types of information:

- Properties
- Info
- Diagnostics

To display the corresponding information and parameters, click in the area you want. The "Properties" area is the most important one for configuring an automation system. This area is displayed by default.

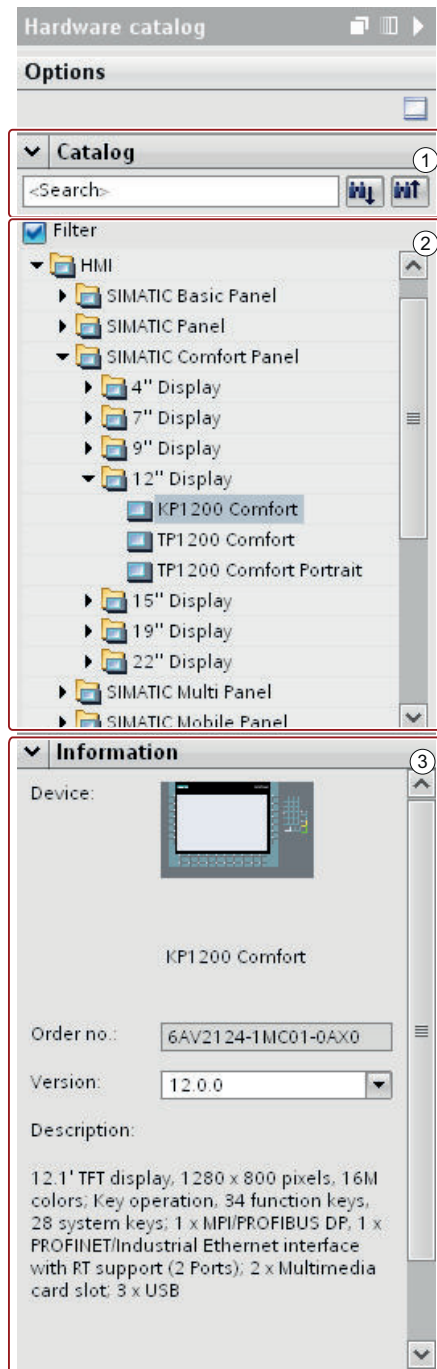

The left pane of the inspector window is used for area navigation. Information and parameters are arranged there in groups. If you click on the arrow symbol to the left of the group name, you can expand the group if sub-groups are available. If you select a group or sub-group, the corresponding information and parameters are displayed in the right pane of the inspector window and can be edited there too.

### **10.11.2.8 Hardware catalog**

The "Hardware catalog" task card gives you easy access to a wide range of hardware components.

## Structure

The "Hardware catalog" task card consists of the following panes:

- 1 "Catalog" pane, search and filter function
- 2 "Catalog" pane, component selection
- 3 "Information" pane

## Search and filter function

The search and filter functions of the "Catalog" pane make it easy to search for particular hardware components. You can limit the display of the hardware components to certain criteria using the filter function. For example, you can limit the display to objects that you can also place within the current context or which contain certain functions.

Objects that can be used in the current context include, for example, interconnectable objects in the network view or only modules compatible with the device in the device view.

## Component selection

The component selection in the "Catalog" pane contains the installed hardware components in a tree structure. You can move the devices or modules you want from the catalog to the graphic work area of the device or network view.

Installed hardware components without a license are grayed out. You cannot use non-licensed hardware components.

Hardware components belonging to various components groups thematically are partially implemented as linked objects. When you click on such linked hardware components, a catalog tree opens in which you can find the appropriate hardware components.

## Information

The "Information" pane contains detailed information on the object selected from the catalog:

- Schematic representation
- Name
- Order number
- Version number
- Description

### 10.11.2.9 Information on hardware components

In the hardware catalog, you can display information on selected hardware components in the "Information" pane. You can also display further information on the selected hardware components using the shortcut menu.

## Access to further information

If you select a hardware object in the hardware catalog and open the shortcut menu, you not only have the "Copy" function available but also three options for accessing information on Service & Support:

- Information regarding product support
- FAQs
- Manuals

The required information is displayed in the work area of the hardware and network editor.

---

**Note**

You can only access Service & Support when you are connected to the Internet and the function is enabled. By default, the function is disabled.

To enable the function, refer to the instructions in the section "Enabling product support".

---

### Information regarding product support

Here, you have access to general information on hardware and software components. The order number of the selected hardware object is entered automatically in the search mask. You can, however, also search for other hardware and software components.

### FAQs

Here, you have access to "Frequently Asked Questions" (FAQs). You can view various entries on hardware and software questions. Using a detailed search mask, you can filter the required topics.

### Manuals

Here, you have access to the manuals of the various hardware components. This is particularly useful if the configuration, addressing or parameter assignment you are planning requires more detailed knowledge of the hardware you are using.

## 10.11.3 Networks and connections

### 10.11.3.1 SIMATIC communication networks

#### Communication networks

##### Overview

Communication networks are a central component of modern automation solutions. Industrial networks have to fulfill special requirements, for example:

- Coupling of automation systems as well as simple sensors, actuators, and computers.
- The information has to be correct and has to be transferred at the right moment.
- Robust against electromagnetic disturbances, mechanical stresses and soiling
- Flexible adaptation to the production requirements

Industrial networks belong to the LANs (Local Area Networks) and allow communication within a limited area.

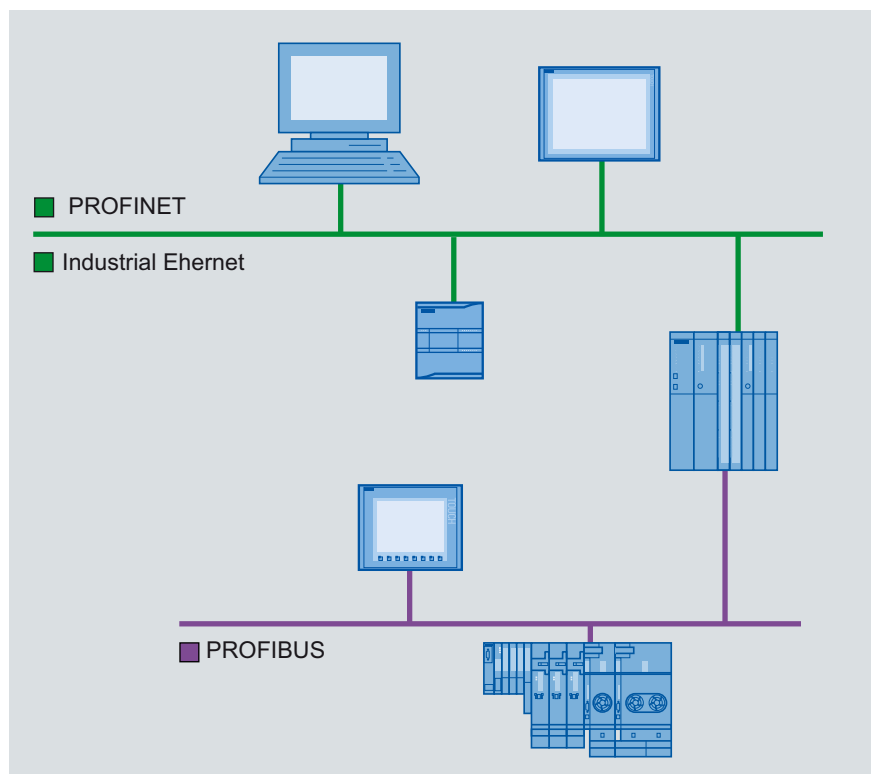

Industrial networks fulfill the following communication functions:

- Process and field communication of the automation systems including sensors and actuators
- Data communication between automation systems
- IT communication for integrating the modern information technology

## Overview of the networks

This section examines the following networks:

- **Industrial Ethernet**  
The industrial network standard for all levels
- **PROFINET**  
The open Industrial Ethernet standard for automation
- **PROFIBUS**  
The international standard for the field area and market leader at the field busses
- **MPI**  
The integrated interface of the SIMATIC products
- **PPI**  
The integrated interface specially for the S7-200

## PROFINET and Ethernet

### Industrial Ethernet

Industrial Ethernet, which is based on IEEE 802.3, enables you to connect your automation system to your office networks. Industrial Ethernet provides IT services that you can use to access production data from the office environment.

### Ethernet network

An Ethernet network allows you to interconnect all devices that are connected to the network via an integrated Ethernet interface or a communication module. This enables connection of multiple HMI devices to one SIMATIC S7 PLC and multiple SIMATIC S7 PLCs to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used. Additional information is available in the documentation for the respective HMI device.

### PROFINET

PROFINET is an open standard for industrial automation defined by IEEE 61158 and based on Industrial Ethernet. PROFINET makes use of IT standards all the way to the field level and enables plant-wide engineering.

With PROFINET, you can realize high-performance automation solutions for applications with stringent real-time requirements.

### PROFIBUS

#### PROFIBUS DP

PROFIBUS DP (distributed I/O) is used to connect the following devices:

- PLCs, PCs, HMI devices
- Distributed I/O devices, e.g., SIMATIC ET 200
- Valves
- Drives

PROFIBUS DP's fast response times make it ideally suited for the manufacturing industry.

Its basic functionality includes cyclic exchange of process data between the master and PROFIBUS DP slaves, as well as diagnostics.

#### PROFIBUS network

You can connect an HMI device within the PROFIBUS network to any SIMATIC S7 module that has an integrated PROFIBUS or PROFIBUS DP interface. You can thereby connect multiple HMI devices to one SIMATIC S7 PLC and multiple SIMATIC S7 PLCs to one HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used. Additional information is available in the documentation for the respective HMI device.

You configure the SIMATIC S7-200 PLC as a passive device in the network. You connect the SIMATIC S7-200 using the DP connector or a PROFIBUS communication module.

## MPI

## MPI

MPI (Multi-Point Interface) is the integrated interface for SIMATIC products:

- PLCs
- HMI devices
- Programming device/PC

Small subnets with the following characteristics are set up with MPI:

- Short distances
- Few devices
- Small data quantities

## MPI network

You connect the HMI device to the MPI interface of the SIMATIC S7 PLC. This enables connection of multiple HMI devices to one SIMATIC S7 PLC and multiple SIMATIC S7 PLCs to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used. Additional information is available in the documentation for the respective HMI device.

## Network architectures

MPI is based on the PROFIBUS standard (IEC 61158 and EN 50170) and supports the following bus topologies:

- Line
- Star
- Tree

An MPI subnet contains a maximum of 127 devices and consists of multiple segments. Each segment contains a maximum of 32 devices and is limited by terminating resistors. Repeaters are used to connect segments. The maximum cable length without a repeater is 50 m.

## PPI

### Introduction

PPI (point-to-point interface) is an integrated interface that was developed specially for the SIMATIC S7-200. A PPI network typically connects S7-200 PLCs. However, other SIMATIC PLCs (e.g., S7-300 and S7-400) or HMI devices can communicate with a SIMATIC S7-200 in the PPI network.

### PPI network

A PPI connection is a point-to-point connection. The HMI device is the master. The SIMATIC S7-200 is the slave.

You can connect a maximum of one SIMATIC S7-200 to an HMI device. You use the serial connector of the CPU to connect the HMI device. You can connect multiple HMI devices to one SIMATIC S7-200. From the perspective of the SIMATIC S7-200, only one connection at a time is possible.

---

#### Note

The PPI network can contain a maximum of four masters in addition to the HMI device. For performance reasons, do not configure more than four devices at a time as a master in the PPI network.

---

### Network architectures

PPI is based on the PROFIBUS standard (IEC 61158 and EN 50170) and supports the following bus topologies:

- Line
- Star

Multi-master networks with a maximum of 32 masters are set up with PPI:

- An unlimited number of masters can communicate with each slave.
- A slave can be assigned to multiple masters.

The RS 485 repeater can be used to extend the PPI network. Modems can also be connected to the PPI network.

### 10.11.3.2 Configuring networks and connections

#### Networking devices

##### Introduction

The "Devices & Networks" editor is provided for configuring connections. You can network devices in the editor. You can also configure and assign parameters to devices and interfaces. You then configure the required connections between the networked devices.

In the "Devices & Networks" editor you configure HMI connections with the PLCs:

- SIMATIC S7 1500
- SIMATIC S7 1200
- SIMATIC S7 300
- SIMATIC S7 400

You configure the HMI connections to other PLCs in the "Connections" editor of the respective HMI device.

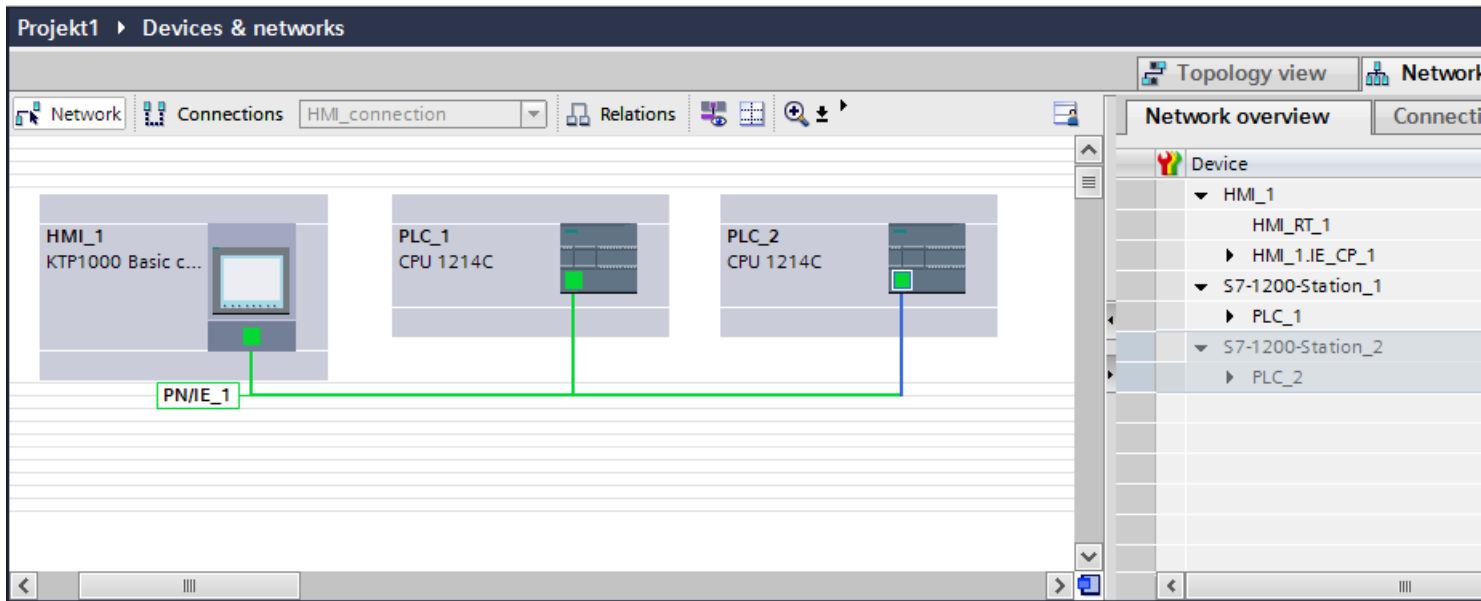

#### Networking devices

The network view of the "Devices & Networks" editor includes a graphical area and a tabular area. You can use the graphical area to network the devices in the project with drag-and-drop. The tabular area provides an overview of the devices and their components.

You can network the following PLCs together with HMI devices in the "Devices & Networks" area.

- SIMATIC S7 1500
- SIMATIC S7 1200
- SIMATIC S7 300
- SIMATIC S7 400

All other PLCs are available in the TIA-Portal and are configured "not integrated". You configure "not integrated" connections in the "Connections" editor of the HMI device.

With the networking step, you configure the physical connection of the communication partners. The networking of devices is depicted by lines that are colored according to the interface.

## Configuring an integrated connection in the "Devices & Networks" editor

### Introduction

You configure an HMI connection between the HMI device and a SIMATIC S7 PLC in the "Devices & Networks" editor. This HMI connection is the direct connection between the communication partners that you have created in a project.

### Integrated connections

Connections of devices within a project are referred to as integrated connections. In the case of integrated connections, you can directly configure addresses of PLC tags.

---

#### Note

An HMI connection can be configured in the "Devices & Networks" editor for the following PLCs only:

- SIMATIC S7 1500
- SIMATIC S7 1200
- SIMATIC S7 300
- SIMATIC S7 400

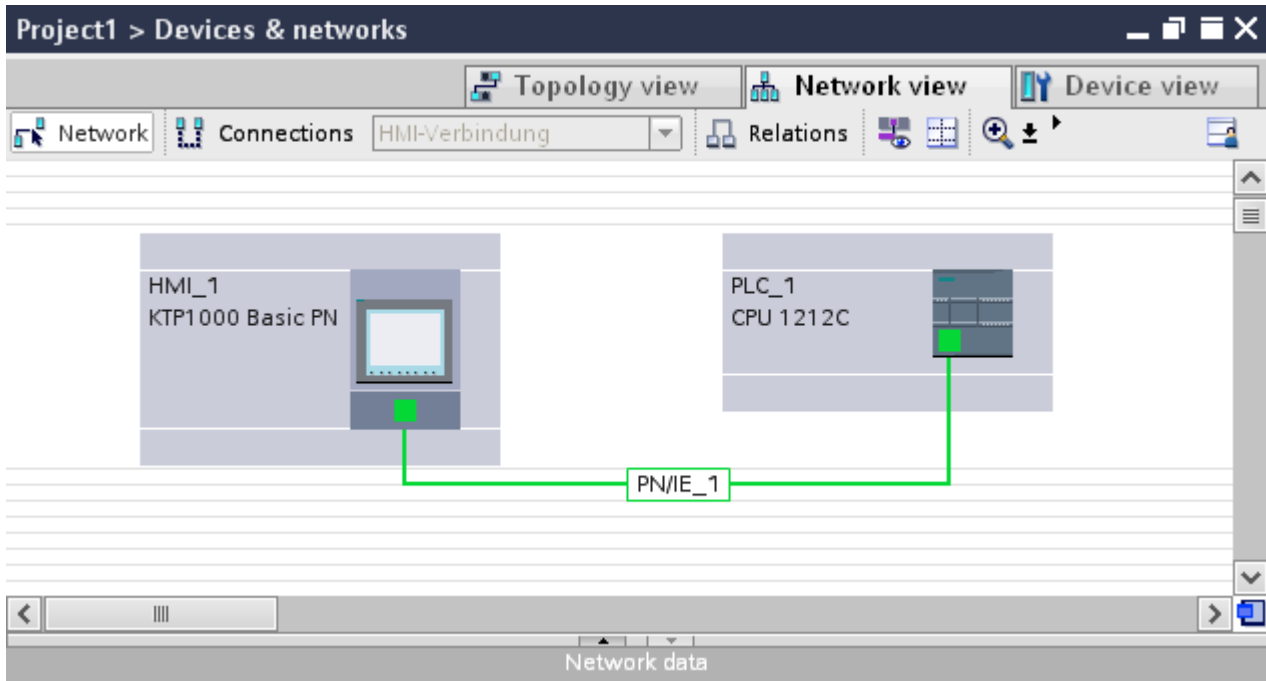

You configure the HMI connections to all other PLCs in the "Connections" editor of the HMI device.

---

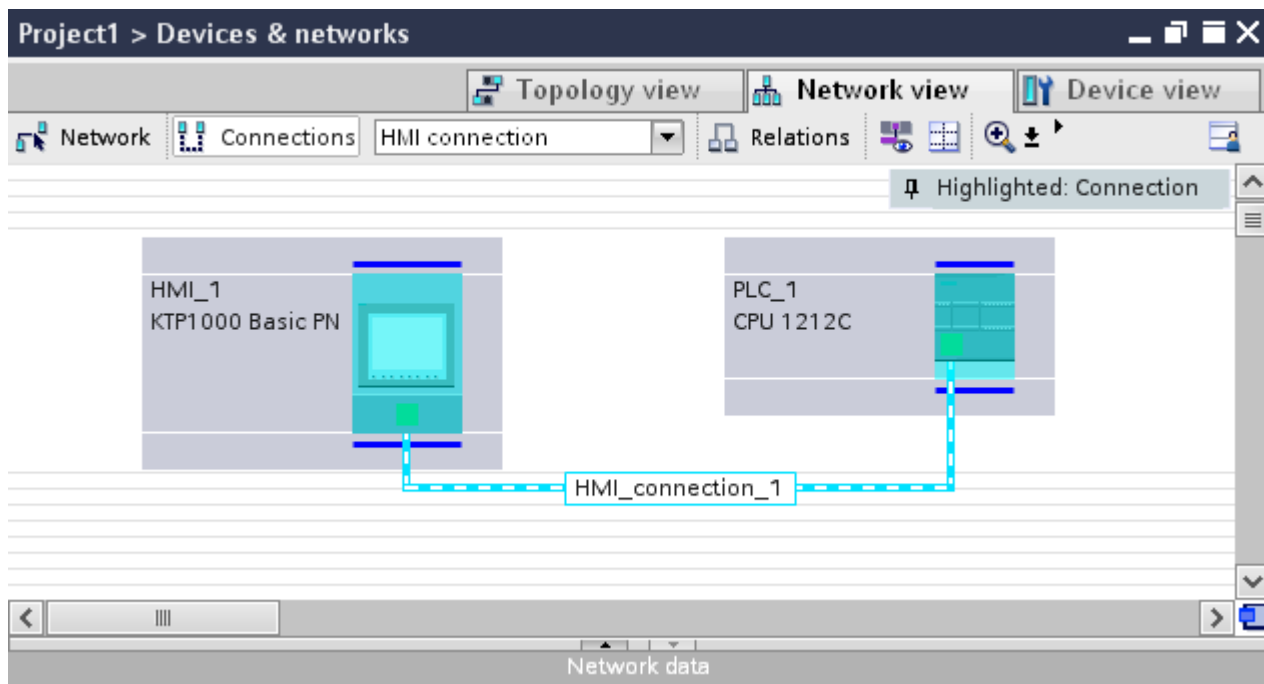

## Configuring an HMI connection in the "Devices & Networks" editor

1. Insert an HMI device and a SIMATIC S7 PLC in your project.

2. Switch to "Connections" mode.
3. Select the "HMI connection" connection type.

4. Use a drag-and-drop operation to interconnect the two PROFINET interfaces.

5. Change the IP address and subnet mask address parameters according to the requirements of your project.

## Special considerations of the "Devices & Networks" editor

### Introduction

If you are configuring or have already configured networks or HMI connections, the "Devices & Networks" editor supports you with the following functions:

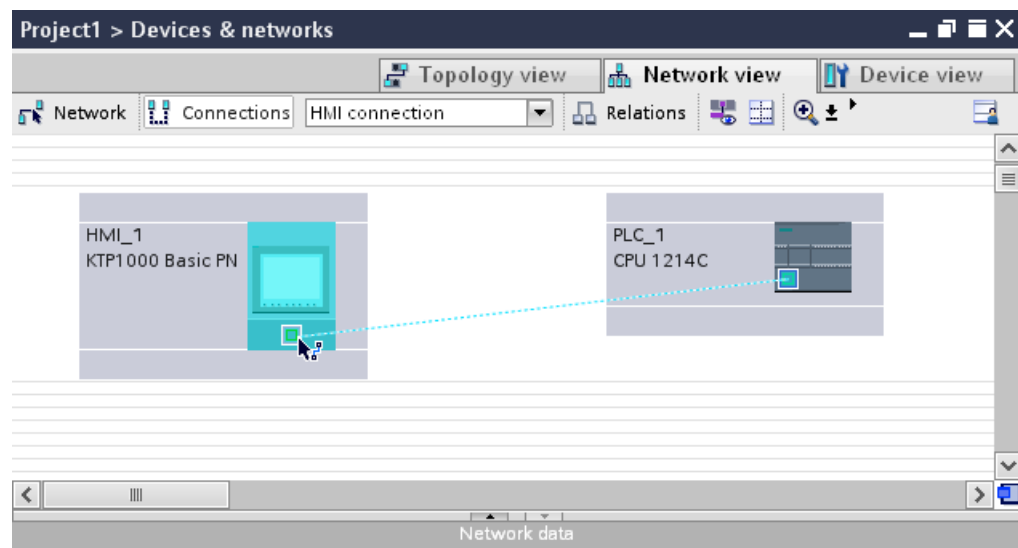

- Highlighting of communication partners
- Highlighting of HMI connections
- Automatic creation of subnets

### Highlighting of communication partners

All communication partners for which an HMI connection is possible are highlighted in turquoise if you have selected the "HMI connection" type.

Starting from the interface of a device create an HMI connection to the device of another device using a drag-and-drop operation. During the drag-and-drop operation all potential communication partners are highlighted in turquoise.

Use the ESC key to stop connecting interfaces using a drag-and-drop operation.

When the mouse pointer is moved over the interface of a device, the following icons indicate whether a connection is possible:

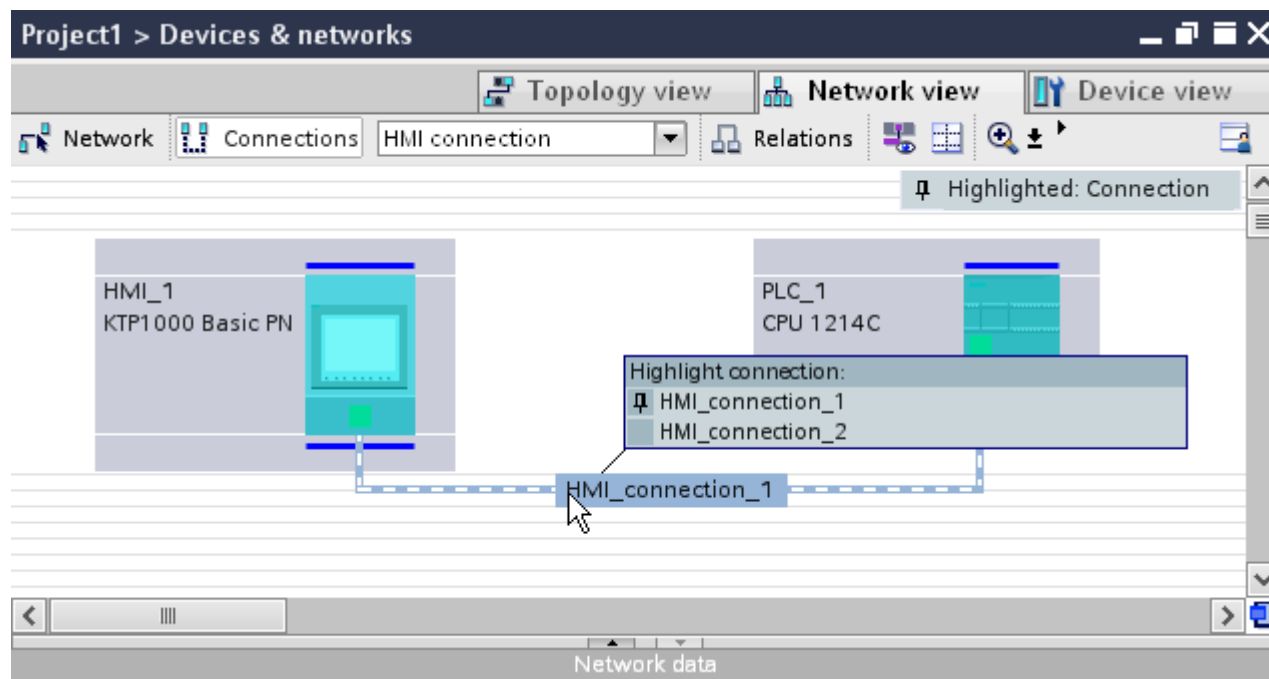

A connection is possible.

A connection is not possible.

### Highlighting of HMI connections

A turquoise highlighting of the connection indicates that a HMI connection was created. If several HMI connections are created, you can select one of the already created HMI connections in a dialog.

Then you can configure the parameters of the selected HMI connection and the communication partners in the inspector window.

### Subnets

Subnetworks are automatically created and used under the following conditions:

- If both communication partners are not already interconnected in different networks
- If a free interface is available to both communication partners.
- If a subnetwork already exists then that subnetwork is automatically used for the HMI connection.

### Configuring a non-integrated connection in the "Connections" editor

#### Introduction

You use the "Connections" editor of the HMI device to configure a connection between an HMI device and a PLC that cannot be configured in the "Devices & Networks" editor.

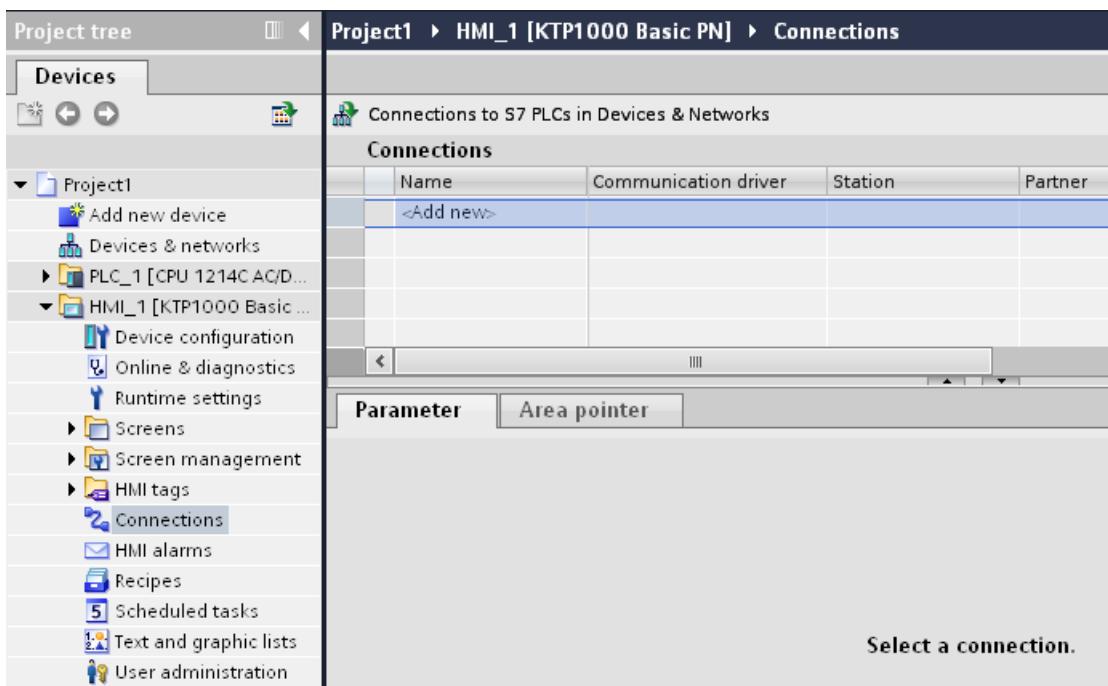

These connections are referred to as non-integrated connections.

## Requirements

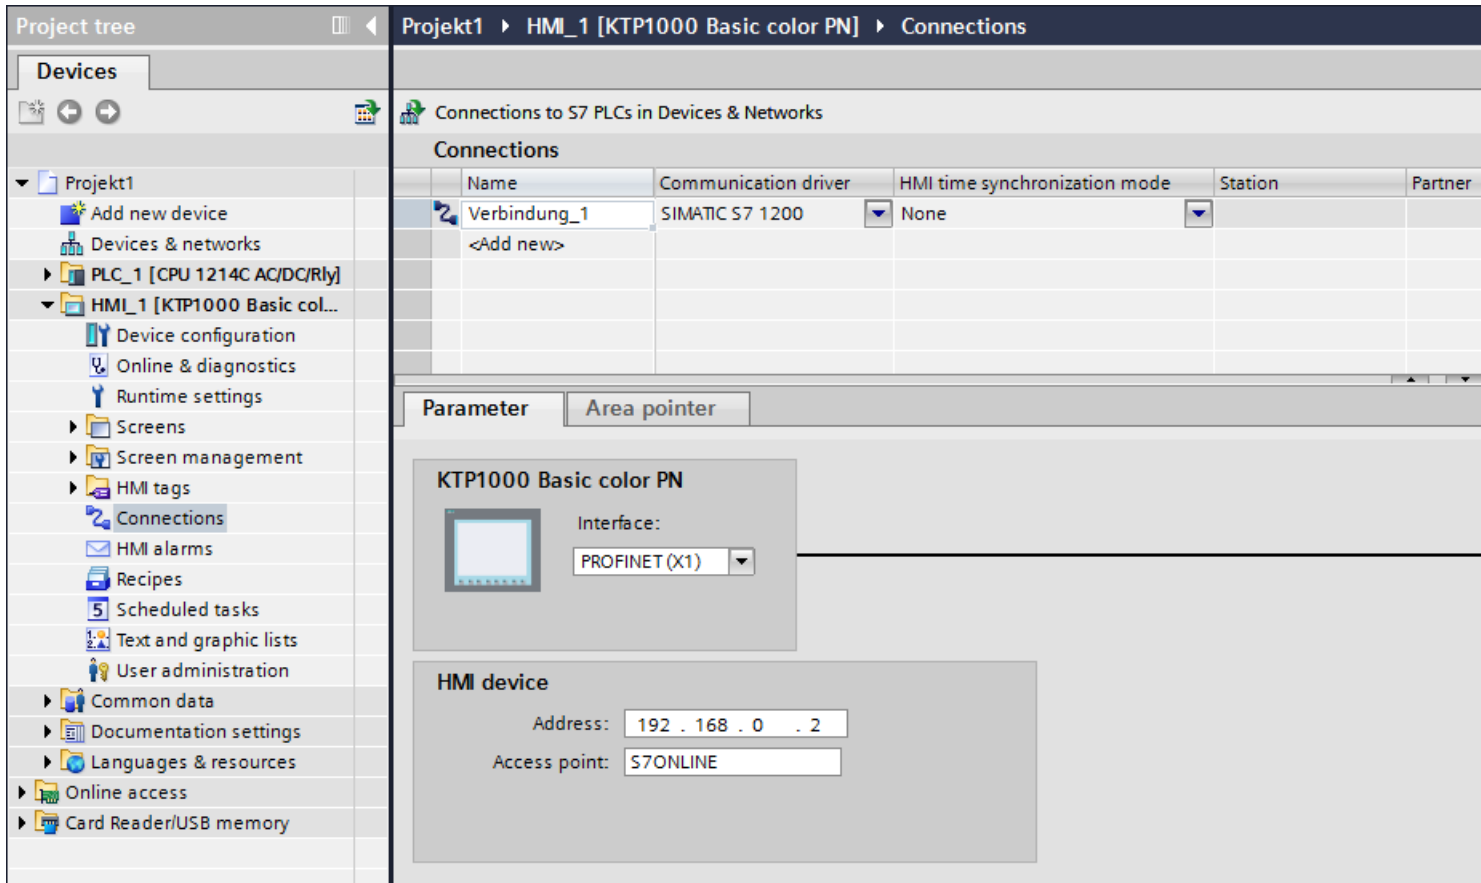

- A project is open.
- An HMI device has been created.

## Configuring a connection in the "Connections" editor

1. Open the "Connections" editor of the HMI device.
2. Create a new connection.

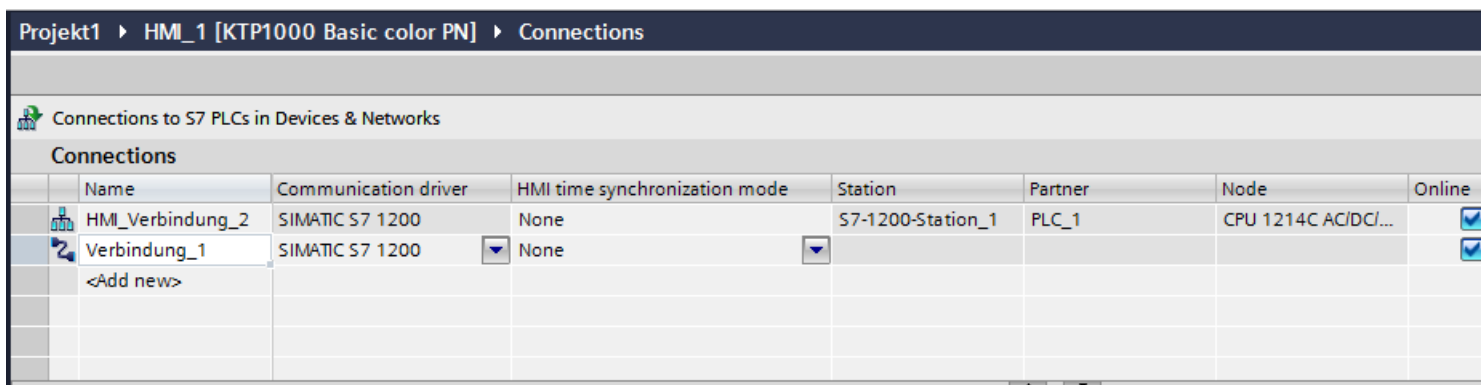

3. Select the communication driver.
4. Set the connection parameters.

### Integrated connections in the "Connections" editor

If you have already configured the integrated connections of the HMI device in the "Devices & Networks" editor, they are also displayed in the "Connections" editor.

Meaning of the icons used:

-  Integrated connection
-  Non-integrated connection

## 10.11.4 Data exchange

### 10.11.4.1 Data exchange using tags

#### Basics of tags

##### Introduction

Process values are forwarded in runtime using tags. Process values are data which is stored in the memory of one of the connected automation systems. They represent the status of a plant in the form of temperatures, fill levels or switching states, for example. Define external tags for processing the process values in WinCC.

WinCC works with two types of tag:

- External tags
- Internal tags

The external tags form the link between WinCC and the automation systems. The values of external tags correspond to the process values from the memory of an automation system. The value of an external tag is determined by reading the process value from the memory of the automation system. It is also possible to rewrite a process value in the memory of the automation system.

Internal tags do not have a process link and only convey values within the WinCC. The tag values are only available as long as runtime is running.

#### Tags in WinCC

For external tags, the properties of the tag are used to define the connection that the WinCC uses to communicate with the automation system and form of data exchange.

Tags that are not supplied with values by the process - the internal tags - are not connected to the automation system. In the tag's "Connection" property, this is identified by the "Internal tag" entry.

You can create tags in different tag tables for greater clarity. You then directly access the individual tag tables in the "HMI tags" node in the project tree. The tags from all tag tables can be displayed with the help of the table "Show all tags".

With structures you bundle a number of different tags that form one logical unit. Structures are project-associated data and are available for all HMI devices of the project. You use the "Types" editor in the project library to create and edit a structure.

## Overview of HMI tag tables

### Introduction

HMI tag tables contain the definitions of the HMI tags that apply across all devices. A tag table is created automatically for each HMI device created in the project.

In the project tree there is an "HMI tags" folder for each HMI device. The following tables can be contained in this folder:

- Default tag table
- User-defined tag tables
- Table of all tags

In the project tree you can create additional tag tables in the HMI tags folder and use these to sort and group tags and constants. You can move tags to a different tag table using a drag-and-drop operation or with the help of the "Tag table" field. Activate the "Tags table" field using the shortcut menu of the column headings.

### Default tag table

There is one default tag table for each HMI device of the project. It cannot be deleted or moved. The default tag table contains HMI tags and, depending on the HMI device, also system tags. You can declare all HMI tags in the standard tags table or, as necessary, additional user-defined tables of tags.

### User-defined tag tables

You can create multiple user-defined tag tables for each HMI device in order to group tags according to your requirements. You can rename, gather into groups, or delete user-defined tag tables. To group tag tables, create additional subfolders in the HMI tags folder.

### All tags

The "All tags" table shows an overview of all HMI tags and system tags of the HMI device in question. This table cannot be deleted, renamed or moved. This table also contains the "Tags table" column, which indicates the tag table of where a tag is included. Using the "Tags table" field, the assignment of a tag to a tags table can be changed.

With devices for Runtime Professional, the table "All tags" contain an additional tab "System tags". The system tags are created by the system and used for internal management of the project. The names of the system tags begin with the "@" character. System tags cannot be deleted or renamed. You can evaluate the value of a system tag, but cannot modify it.

## Additional tables

The following tables are also available in an HMI tag table:

- Discrete alarms
- Analog alarms
- Logging tags

With the help of these tables you configure alarms and logging tags for the currently selected HMI tag.

## Discrete alarms table

In the "Discrete alarms" table, you configure discrete alarms to the HMI tag selected in the HMI tag table. When you configure a discrete alarm, multiple selection in the HMI tag table is not possible. You configure the discrete alarms for each HMI tag separately.

## Analog alarms table

In the "Analog alarms" table, you configure analog alarms to the HMI tag selected in the HMI tag table. When you configure an analog alarm, multiple selection in the HMI tag table is not possible. You configure the analog alarms for each HMI tag separately.

## Logging tags table

In the "Logging tags" table, you configure logging tags to the HMI tag selected in the HMI tag table. When you configure a logging tag, multiple selection in the HMI tag table is not possible. You configure the logging tags for each HMI tag separately. The "Logging tags" table is only available if the HMI device used supports logging.

If WinCC Runtime Professional is used, you can also assign several log tags to a tag. With the other HMI devices, you can only assign one log tag to a tag.

## External tags

### Introduction

External tags allow communication (data exchange) between the components of an automation system, for example, between an HMI device and a PLC.

### Principle

An external tag is the image of a defined memory location in the PLC. You have read and write access to this storage location from both the HMI device and from the PLC.

Since external tags are the image of a storage location in the PLC, the applicable data types depend on the PLC which is connected to the HMI device.

If you write a PLC control program in STEP 7, the PLC tags created in the control program will be added to the PLC tag table. If you want to connect an external tag to a PLC tag, access the PLC tags directly via the PLC tag table and connect them to the external tag.

## Data types

All the data types which are available at the connected PLC are available at an external tag in WinCC. Information about data types which are available for connection to other PLCs can be found in the documentation about the respective communication drivers.

See "Communication between devices (Page 5234)" for additional information.

---

### Note

As well as external tags, area pointers are also available for communication between the HMI device and PLC. You can set up and enable the area indicators in the "Connections" editor.

---

## Synchronization with PLC tags

A variety of options for synchronizing external tags with the PLC tags are available in the Runtime settings under "Settings for tags".

When you perform synchronization, you have the option of automatically applying the tag names of the PLC to external tags and reconnecting the existing tags.

The generated tag name is derived from the position of the data value in the hierarchical structure of the data block.

## Update of tag values

For external tags, the current tag values are transmitted in runtime via the communication connection between WinCC and the connected automation systems and then saved in the runtime memory. Next, the tag value will be updated to the set cycle time. For use in the runtime project, WinCC accesses tag values in the runtime memory that were read from the PLC at the previous cycle time. As a result, the value in the PLC can already change whilst the value from the runtime memory is being processed.

---

### Note

#### PLC array elements in conjunction with S7-1200 or S7-1500

The index of the PLC array elements can begin with any number. In WinCC, indexing always starts with 0.

A PLC tag "Array [1..3] of Int", for example, is mapped to "Array [0..2] of Int" in WinCC.

When you access an array in a script, pay attention to the correct indexing.

---

## Addressing external tags

### Introduction

The options for addressing external tags depend on the type of connection between WinCC and the PLC in question. A distinction must be made between the following connection types:

- **Integrated connection**  
Connections of devices which are within a project and were created with the "Devices & Networks" editor are referred to as integrated connections.
- **Non-integrated connection**  
Connections of devices which were created with the "Connections" editor are referred to as non-integrated connections. It is not necessary that all of the devices be within a single project.

The connection type can also be recognized by its icon.

	Integrated connection
	Non-integrated connection

You can find additional information in the section "Basics of communication (Page 5234)".

### Addressing with integrated connections

An integrated connection offers the advantage that you can address a tag both symbolically and absolutely.

For symbolic addressing, you select the PLC tag via its name and connect it to the HMI tag. The valid data type for the HMI tag is automatically selected by the system. You have to distinguish between the following cases when you address elements in data blocks:

#### **Symbolic addressing of data blocks with optimized access and standard access:**

During the symbolic addressing of a data block with optimized access and standard access, the address of an element in the data block is dynamically assigned and is automatically adopted in the HMI tag in the event of a change. You do not need to compile the connected data block or the WinCC project for this step.

For data blocks with optimized access, only symbolic addressing is available.

For symbolic addressing of elements in a data block, you only need to recompile and reload the WinCC project in case of the following changes:

- If the name or the data type of the linked data block element or global PLC tag has changed.
- If the name or the data type of the higher level structure node of a linked element in the data block element or global PLC tag has changed.
- If the name of the connected data block has changed.

Symbolic addressing is currently available with the following PLCs:

- SIMATIC S7 1200
- SIMATIC S7 1500

Symbolic addressing is also available if you have an integrated link.

**Note**

Symbolic addressing is not possible if you are using the "Date/Time" area pointer.

You can also use absolute addressing with an integrated connection. You have to use absolute addressing for PLC tags from a SIMATIC S7 300/400 PLC. If you have connected an HMI tag with a PLC tag and the address of the PLC tag changes, you only have to recompile the control program to update the new address in WinCC. Then you recompile the WinCC project and load it onto the HMI device.

In WinCC, symbolic addressing is the default method. To change the default setting, select the menu command "Options > Settings". Select "Visualization > Tags" in the "Settings" dialog. If required, disable the "Symbolic access" option.

The availability of an integrated connection depends on the PLC used. The following table shows the availability:

PLC	Integrated connection	Comments
S7 300/400	Yes	The linking of tags is not checked in Runtime. If the tag address changes in the PLC and the HMI device is not compiled again and loaded, the change is not registered in runtime.
S7 1200	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the following behavior applies to the S7 300/400.
S7 1500	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the following behavior applies to the S7 300/400.

Create an integrated connection in the "Devices & Networks" editor. If the PLC is contained in the project and integrated connections are supported, you can then also have the connection created automatically. To do this, when configuring the HMI tag, simply select an existing PLC tag to which you want to connect the HMI tag. The integrated connection is then automatically created by the system.

### Addressing with non-integrated connections

In the case of a project with a non-integrated connection, you always configure a tag connection with absolute addressing. Select the valid data type yourself. If the address of a PLC tag changes in a project with a non-integrated connection during the course of the project, you also have to make the change in WinCC. The tag connection cannot be checked for validity in Runtime, an error message is not issued.

A non-integrated connection is available for all supported PLCs.

Symbolic addressing is not available in a non-integrated connection.

With a non-integrated connection, the control program does not need to be part of the WinCC project. You can perform the configuration of the PLC and the WinCC project independently of each other. For configuration in WinCC, only the addresses used in the PLC and their function have to be known.

Basics of communication (Page 5234)

## Internal Tags

### Introduction

Internal tags do not have any connection to the PLC. Internal tags transport values within the HMI device. The tag values are only available as long as runtime is running.

### Principle

Internal tags are stored in the memory of the HMI device. Therefore, only this HMI device has read and write access to the internal tags. You can create internal tags to perform local calculations, for example.

You can use the HMI data types for internal tags. Availability depends on the HMI device being used.

The following HMI data types are available:

HMI data type	Data format
Array	One-dimensional array
Bool	Binary tag
DateTime	Date/time format
DInt	Signed 32-bit value
Int	Signed 16-bit value
LReal	Floating-point number 64-bit IEEE 754
Real	Floating-point number 32-bit IEEE 754
SInt	Signed 8-bit value
UDnt	Unsigned 32-bit value
UInt	Unsigned 16-bit value
USInt	Unsigned 8-bit value
WString	Text tag, 16-bit character set

### 10.11.4.2 Data exchange using area pointers

#### Basic information on area pointers

##### Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

For example, area pointers are required for the following data:

- Recipes
- Job mailboxes
- Sign-of-life monitoring

##### Area pointer

The following area pointers are supported:

##### Area pointer

Area pointers can be configured for connections.

- Data record
- Date/time
- Coordination
- Job mailbox

##### Global area pointers of the HMI device

Global area pointers can be configured to only one connection for each project.

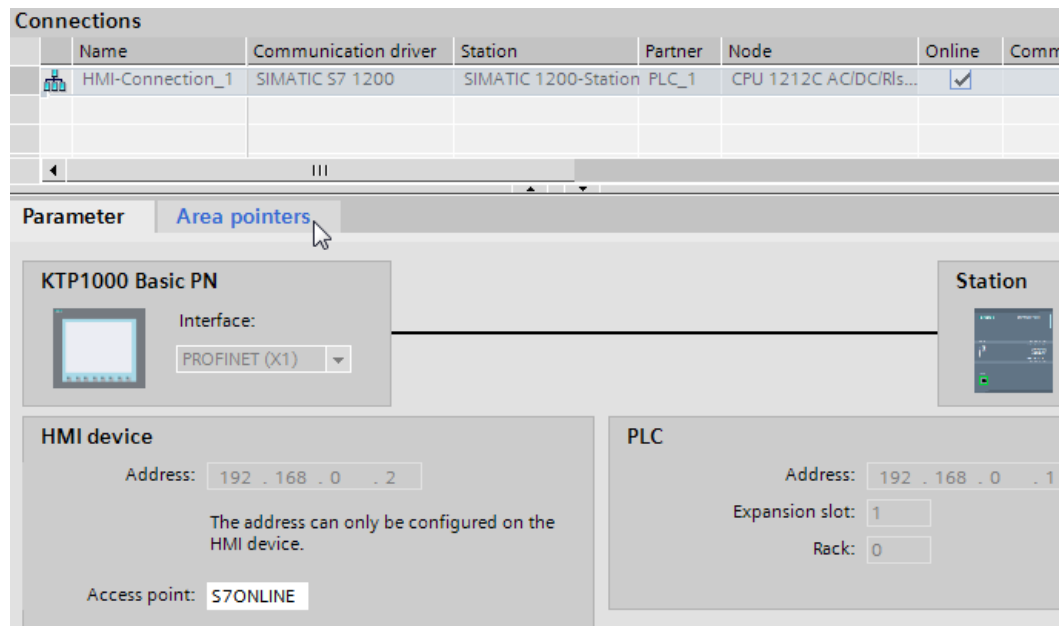

- Screen number
- Date/time PLC
- Project ID

##### Area pointers for connections

##### Introduction

Using the "Area pointer" tab of the "Connections" editor, you can configure the usage of the available area pointers.

To configure the area pointers, open the "Connections" editor and open the "Area pointer" tab.

### Structure

The "Area pointer" tab contains two tables of area pointers. The top part of the table contains the area pointers you can create and enable separately for each available connection.

The "Global area pointers of HMI device" table contains the area pointers which are created only once in the project and can be used for only one connection.

Parameter		Area pointer						
Active	Display name	PLC tag	Access mode	Address	Length	Acquisition mode	Acquisition cycle	Comment
<input type="checkbox"/>	Coordination	<Undefined>	<symbolic access>		1	Cyclic continuous	<Undefined>	
<input type="checkbox"/>	Date/time	<Undefined>	<symbolic access>		6	Cyclic continuous	<Undefined>	
<input type="checkbox"/>	Job mailbox	<Undefined>	<symbolic access>		4	Cyclic continuous	<Undefined>	
<input type="checkbox"/>	Data record	<Undefined>	<symbolic access>		5	Cyclic continuous	<Undefined>	

Global area pointer of HMI device								
Connection	Display name	PLC tag	Access mode	Address	Length	Acquisition mode	Acquisition cycle	Comment
<Undefined>	Project ID	<Undefined>	<symbolic access>		1	Cyclic continuous	<Undefined>	
<Undefined>	Screen number	<Undefined>	<symbolic access>		5	Cyclic continuous	<Undefined>	
<Undefined>	Date/time PLC	<Undefined>	<symbolic access>		6	Cyclic continuous	<Undefined>	

## Use of area pointers

### "Area pointer" tab

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You assign the following parameters in the "Area pointer" tab:

Parameter		Area pointer							
Active	Display name	PLC tag	Access mode	Address	Length	Acquisition mode	Acquisition cycle	Comment	
<input type="checkbox"/>	Coordination	<Undefined>	<symbolic access>		1	Cyclic continuous	<Undefined>		
<input type="checkbox"/>	Date/time	<Undefined>	<symbolic access>		6	Cyclic continuous	<Undefined>		
<input type="checkbox"/>	Job mailbox	<Undefined>	<symbolic access>		4	Cyclic continuous	<Undefined>		
<input type="checkbox"/>	Data record	<Undefined>	<symbolic access>		5	Cyclic continuous	<Undefined>		

Global area pointer of HMI device								
Connection	Display name	PLC tag	Access mode	Address	Length	Acquisition mode	Acquisition cycle	Comment
<Undefined>	Project ID	<Undefined>	<symbolic access>		1	Cyclic continuous	<Undefined>	
<Undefined>	Screen number	<Undefined>	<symbolic access>		5	Cyclic continuous	<Undefined>	
<Undefined>	Date/time PLC	<Undefined>	<symbolic access>		6	Cyclic continuous	<Undefined>	

- **Active**  
Enables the area pointer.
- **Pointer name**  
Name of the area pointer specified by WinCC.
- **PLC tag**  
Here you select the PLC tag or the tag array that you have configured as the data area for the area pointer.
- **Access mode**  
Here you can select from the following access modes:
  - Symbolic access
  - Absolute access
- **Address**  
If you selected "Symbolic access", no address is entered in this field.  
If you selected "Absolute access", enter the address of a tag in the "Address" field.
- **Length**  
WinCC specifies the length of the area pointer.
- **Acquisition cycle**  
You specify the acquisition cycle in this field for area pointers that are read by the HMI device. Note that a very short acquisition time may have a negative impact on HMI device performance.
- **Comment**  
Enter a comment, for example, to describe the purpose of the area pointer.

## Accessing data areas

### Accessing data areas

The following table shows how HMI devices and PLCs access individual data areas for read (R) or write (W) operations.

Data area	Required for	HMI device	PLC
Screen number	Evaluation by the PLC in order to determine the active screen.	W	R
Data record	Transfer of data records with synchronization	R/W	R/W
Date/time	Transfer of the date and time from the HMI device to the PLC	W	R
Date/time PLC	Transfer of the date and time from the PLC to the HMI device	R	W
Coordination	Requesting the HMI device status in the PLC program	W	R
Project ID	Runtime checks for consistency between the WinCC project ID and the project in the PLC	R	W
Job mailbox	Triggering of HMI device functions by the PLC program	R/W	R/W

## Configuring area pointers

### Configuration of area pointers

#### Introduction

You use an area pointer to access a data area in the PLC. The data area is stored in the PLC.

#### Prior to configuring area pointers

Before you use the area pointer, you must enable and parameterize it under "Connections > Area Pointer".

#### Global data block

To access the data area in the PLC, you have to create a global data block in the PLC program. The following example shows the use of a data block.

#### Length of area pointers

For area pointers with a length  $\geq 1$ , you set up the data area as a tag array in a global data block or instance data block.

You also have the option to use a PLC tag for area pointers with a length = 1.

The configuration of the tags in a data block is dependent on the length of the area pointer you want to use. The unit for the length of an area pointer is a 16-bit word.

If, for example, you want to use an area pointer with a length of "5", you must create an array with 5 array elements of the data type UINT in the data block.

### Alternative procedure

Alternatively, you can also use the absolute access mode to access area pointers. Absolute access mode only works on standard PLC data blocks.

## Parameterizing a global data block

### Introduction

To access the data area in the PLC, a global data block for the area pointer must be parameterized in the PLC program.

### Requirements

- A PLC is created in the project.
- A connection is configured between the PLC and the HMI device.
- The PLC program contains a global data block.

### Procedure

1. Open "PLC > Program blocks" in the project tree.
2. Double-click the global data block you created previously.  
The data block opens.

3. Enter a tag name in the "Name" column.
4. Select "Array[lo .. hi] of type" as the data type in the "Data type" column.
5. Replace the "lo" entry by the low value for the dimension of the array.
6. Replace the "hi" entry by the high value for the dimension of the array.  
Example: If you configure an area pointer with the length "4", enter the value "0" for "lo" and the value "3" for "hi" inside the brackets.

7. Replace the "type" designation with the "word" data type.  
The full data type for an array of 4 tags appears as follows: "Array[0 .. 3] of word".  
The tag array is created after the entry is confirmed.
8. Click "Compile".  
The project is compiled.

Data_block_1						
	Name	Data type	Default value	Initial value	Retain	Comment
1	Static				<input type="checkbox"/>	
2	Job_mailbox	Array [0 .. 3] of word			<input type="checkbox"/>	
3	Job_mailbox[0]	Word	W#16#0000	W#16#0000	<input type="checkbox"/>	
4	Job_mailbox[1]	Word	W#16#0000	W#16#0000	<input type="checkbox"/>	
5	Job_mailbox[2]	Word	W#16#0000	W#16#0000	<input type="checkbox"/>	
6	Job_mailbox[3]	Word	W#16#0000	W#16#0000	<input type="checkbox"/>	

## Configuring an area pointer for a connection

### Introduction

After you have parameterized the global data block, you now create the area pointer for the connection.

### Requirements

- The global data block has been parameterized in the PLC program.

### Procedure

1. Open "HMI >Connections" in the project tree.
2. Click the "Area pointer" tab.
3. Enable the required area pointer.  
You enable a global area pointer by selecting the connection in the "Connection" field.
4. Click the navigation button in the "PLC tag" field.  
The object list opens.

- Navigate to the data block in the object list, and select the tag in the right window. You do not need an array tag to configure an area pointer with the length of "1".

Parameter		Area pointers				
Active	Display name	PLC tag	Address	Length	Acquisition mode	
<input type="checkbox"/>	Data record			5	Cyclic continuous	
<input type="checkbox"/>	Datetime			6	Cyclic continuous	
<input type="checkbox"/>	Coordination			1	Cyclic continuous	
<input checked="" type="checkbox"/>	Job mailbox	Data_block_1_Job_mailbox ...	<symbolic access>	4	Cyclic continuous	

Global area pointer of HMI device						
Connection	Display name	PLC tag	Address	Length	Acquisition mode	Acquisition cycle
<Undefined> ...	Screen number			5	Cyclic continuous	<Undefined>
<Undefined>	Datetime PLC			6	Cyclic continuous	<Undefined>
<Undefined>	Project ID			1	Cyclic continuous	<Undefined>

- Select the "Word" data type when creating the tag in the data block. If required, set additional parameters, such as the acquisition cycle, during configuration.

## Result

The area pointer is enabled and connected to the PLC tag in the global data block.

## 10.11.5 Device dependency

### 10.11.5.1 Basic Panel

#### Communication drivers

#### SIMATIC communication drivers

#### Device dependency of the Basic Panels

Various communication drivers are configured for Basic Panels depending on the communication.

The following tables show the communication drivers released for integrated and non-integrated communication.

There are different versions of the HMI devices within the integrated communication.

**Communication drivers for integrated communication (V11.0)**

HMI devices	SIMATIC S7-1200 (V1)	SIMATIC S7-1200 (V2)	SIMATIC S7-1200 (V2.2)	SIMATIC S7-1200 (V3)	SIMATIC S7-1200 (V4)	SIMATIC S7-1500	SIMATIC S7-300/400
KP300 Basic	Yes	Yes	Yes	Yes	Yes	No	Yes
KP400 Basic	Yes	Yes	Yes	Yes	Yes	No	Yes
KTP400 Basic PN	Yes	Yes	Yes	Yes	Yes	No	Yes

<sup>3)</sup> only approved with RS 422-RS232 converter

Order number: 6AV6 671-8XE00-0AX0

## Area pointers for Basic Panels

### Introduction

Area pointers are parameter fields from which the HMI device obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time
- Date/time PLC
- Coordination

### Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

### Area pointer

- 1) For SIMATIC S7-200 only
- 2) Not approved for TP 177B DP, OP 177B DP.
- 3) For serial communication, deselect "Remote Control" of "Channel 1" in the "File > Transfer >Options" menu.
- 4) Only with PLC5 or KF2 module.

- 5) Direct communication with PLC5 or KF2 module, otherwise only approved with RS422-RS232 converter 6AV6 671-8XE00-0AX0 (option)
- 6) Can be selected and used, but not approved.
- 7) Only with RS 422-RS 232 converter 6AV6 671-8XE00-0AX0 (option)
- 8) "PROFINET IO Enabled" must be disabled.

## Area pointers for Panels

### Introduction

Area pointers are parameter fields from which the HMI device obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time
- Date/time PLC
- Coordination

### Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

### Area pointers

	OP 73	OP 77A	OP 77B	TP 177A	TP 177B OP 177B	TP 277 OP 277

- 1) For SIMATIC S7-200 only
- 2) only with RS 422-RS232 converter (option)  
Order number: 6AV6 671-8XE00-0AX0
- 3) For serial communication, deselect "Remote Control" of "Channel 1" in the "File > Transfer >Options" menu.
- 4) Direct communication with PLC5 or KF2 module, otherwise only approved with RS422-RS232 converter (option).  
Order number: 6AV6 671-8XE00-0AX0
- 5) "PROFINET IO Enabled" must be disabled.

## Area pointers for Multi Panel

### Introduction

Area pointers are parameter fields from which the HMI device obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time
- Date/time PLC
- Coordination

### Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

### Area pointers

	MP 177	MP 277	MP 377
Screen number	Yes	Yes	Yes
Data record	Yes	Yes	Yes

	MP 177	MP 277	MP 377
Date/time	Yes	Yes	Yes
Date/time PLC	Yes	Yes	Yes
Coordination	Yes	Yes	Yes
Project ID	Yes	Yes	Yes
Job mailbox	Yes	Yes	Yes

### 10.11.5.5 Mobile Panel

#### Communication drivers

#### SIMATIC communication drivers

#### Device dependency of the Mobile Panels

Various communication drivers are configured for Comfort Panels depending on the communication.

The following tables show the communication drivers released for integrated and non-integrated communication.

There are different versions of the HMI devices within the integrated communication.

#### Communication drivers for integrated communication (V11.0)

HMI devices	SIMATIC S7-1200 (V1)	SIMATIC S7-1200 (V2)	SIMATIC S7-1200 (V2.2)	SIMATIC S7-1200 (V3)	SIMATIC S7-1200 (V4)	SIMATIC S7-1500	SIMATIC S7-300/400
Mobile Panel 177 6" DP	No	Yes	Yes	Yes	Yes	No	Yes

Allen-Bradley DF1	IF1A <sup>3)</sup> , IF1B <sup>3)</sup> <sup>4) 6)</sup> (terminal box)	—	IF1A <sup>3)</sup> , IF1B <sup>3)</sup> <sup>4) 6)</sup> (terminal box)	—	—	—
Allen-Bradley EtherNet/IP	---	ETHERNET	ETHERNET	ETHERNET	ETHERNET	ETHERNET
Mitsubishi MC TCP/ IP	--	ETHERNET	ETHERNET	ETHERNET	—	—
Mitsubishi FX	IF1A <sup>3)</sup> , IF1B <sup>3)</sup> <sup>6)</sup> (terminal box)	—	IF1A <sup>3)</sup> , IF1B <sup>3)</sup> <sup>6)</sup> (terminal box)	—	—	—
Modicon Modbus RTU	IF1A <sup>3)</sup> , IF1B <sup>3)</sup> <sup>5) 6)</sup> (terminal box)	—	IF1A <sup>3)</sup> , IF1B <sup>3)</sup> <sup>5) 6)</sup> (terminal box)	—	—	—
Modicon Modbus TCP/IP	—	ETHERNET	ETHERNET	ETHERNET	—	—
Omron Host Link	IF1A <sup>3)</sup> , IF1B <sup>3)</sup> <sup>6)</sup> (terminal box)	—	IF1A <sup>3)</sup> , IF1B <sup>3)6)</sup> (terminal box)	—	—	—

- 1) For SIMATIC S7-200 only
- 2) Depending on the terminal box used
- 3) For serial communication, deselect "Remote Control" of "Channel 1" in the "File > Transfer > Options" menu.
- 4) With PLC5 and KF2 module only
- 5) Can be selected and used, but not approved.
- 6) "PROFINET IO Enabled" must be disabled.

## Area pointers for Mobile Panel

### Introduction

Area pointers are parameter fields from which the HMI device obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time
- Date/time PLC
- Coordination

### Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

#### Area pointer

	Mobile Panel 177	Mobile Panel 277	Mobile Panel 277 IWLAN V2	Mobile Panel 277F IWLAN V2	Mobile Panel 277F IWLAN V2 (RFID tag)	Mobile Panel 277

OPC	ETHERNET	ETHERNET
OPC UA	ETHERNET	--
Allen-Bradley EtherNet/IP	ETHERNET	ETHERNET
Allen-Bradley DF1	COM1 to COM4 <sup>1)</sup>	--
Mitsubishi MC TCP/IP	ETHERNET	ETHERNET
Mitsubishi FX	COM1 to COM4 <sup>1)</sup>	--
Modicon Modbus TCP/IP	ETHERNET	ETHERNET

	WinCC RT Advanced	WinCC RT Professional
Modicon Modbus RTU	COM1 to COM4 <sup>1)</sup>	--
Omron Host Link	COM1 to COM4 <sup>1)</sup>	--

<sup>1)</sup> COM2 is blocked for Panel PC 477

<sup>2)</sup> for SIMATIC PC, via integrated interface; for standard PC, e.g., via SIMATIC NET CP 5611 A2

## Area pointers for PC systems

### Introduction

Area pointers are parameter fields from which WinCC RT Advanced obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time
- Date/time PLC
- Coordination

### Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

Table 10-154 WinCC RT Advanced

	WinCC RT Advanced
Screen number	Yes
Data record	Yes
Date/time	Yes
Date/time PLC	Yes
Coordination	Yes
Project ID	Yes
Job mailbox	Yes

### 10.11.5.7 Parallel communication

#### Parallel communication of communication drivers

The following table shows an overview of which communication drivers you can use simultaneously on one HMI device.

**Note**

Parallel communication is not approved for Basic Panels.

#### Parallel communication over Ethernet interfaces

The approved combinations can be operated via the same Ethernet interface. Several Ethernet interfaces are not required.

Parallel communication only concerns the Ethernet-based communication drivers.

	Allen-Bradley Ethernet/IP	Mitsubishi MC TCP/IP	Modicon Modbus TCP/IP	OPC (DA/XML DA)	OPC UA (DA)	SIMATIC LOGO!	SIMATIC S7 200	SIMATIC S7 300/400	SIMATIC S7 1200	SIMATIC S7 1500	SIMATIC C HTTP protocol	Sinumerik NC
Allen-Bradley Ethernet/IP	--	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Mitsubishi MC TCP/IP	No	--	No	Yes	Yes	No	No	No	No	No	Yes	No
Modicon Modbus TCP/IP	No	No	--	Yes	Yes	No	No	No	No	No	Yes	No

SIMATIC C LOGO!	Yes	No	No	Yes	Yes	--	Yes	Yes	Yes	Yes	Yes	Yes
SIMATIC S7 200	Yes	No	No	Yes	Yes	Yes	--	Yes	Yes	Yes	Yes	Yes

	Allen-Bradley Ethernet/IP	Mitsubishi MC TCP/IP	Modicon Modbus TCP/IP	OPC (DA/XML DA)	OPC UA (DA)	SIMATIC LOGO!	SIMATIC S7 200	SIMATIC S7 300/400	SIMATIC S7 1200	SIMATIC S7 1500	SIMATIC C HTTP protocol	Sinumerik NC
SIMATIC S7 300/400	Yes	No	No	Yes	Yes	Yes	Yes	--	Yes	Yes	Yes	Yes
SIMATIC S7 1200	Yes	No	No	Yes	Yes	Yes	Yes	Yes	--	Yes	Yes	Yes
SIMATIC S7 1500	Yes	No	No	Yes	Yes	Yes	Yes	Yes	Yes	--	Yes	Yes
SIMATIC C HTTP protocol	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	--	Yes
Sinumerik NC	Yes	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	--

### Parallel communication over serial interfaces

The following applies for parallel communication over serial interfaces:

- One communication driver per interface.
- One interface per communication driver.

## 10.11.6 Communicating with SIMATIC S7 1500

### 10.11.6.1 Communication with SIMATIC S7 1500

#### Introduction

This section describes the communication between an HMI device and the SIMATIC S7 1500 PLC.

You can configure the following communication channels for the SIMATIC S7 1500 PLC:

- PROFINET
- PROFIBUS

#### HMI connection for communication

Configure connections between the HMI device and a SIMATIC S7 1500 in the "Devices & Networks" Editor.

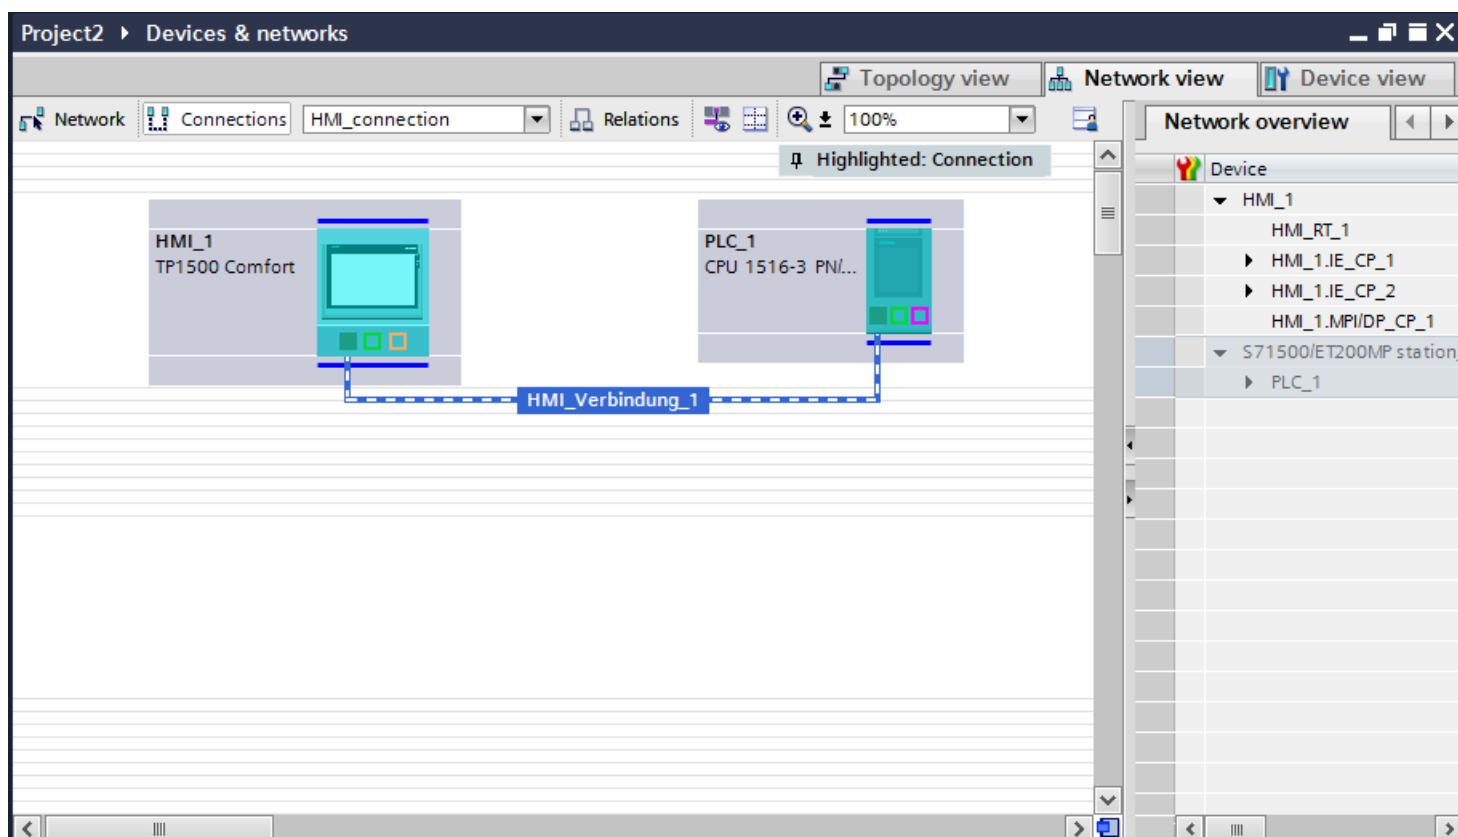

### 10.11.6.2 Communication via PROFINET

#### Configuring an HMI connection

#### Communication via PROFINET

#### HMI connections via PROFINET

If you have inserted an HMI device and a SIMATIC S7 1500 into the project, interconnect the two PROFINET interfaces in the "Devices & Networks" editor.

You can also connect multiple HMI devices to a single SIMATIC S7 1500 and multiple SIMATIC S7 1500 to a single HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

#### HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

## Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

## Configuring an HMI connection via PROFINET

### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1500 via PROFINET or Ethernet in the "Devices & Networks" editor.

#### CAUTION

##### Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

### Requirements

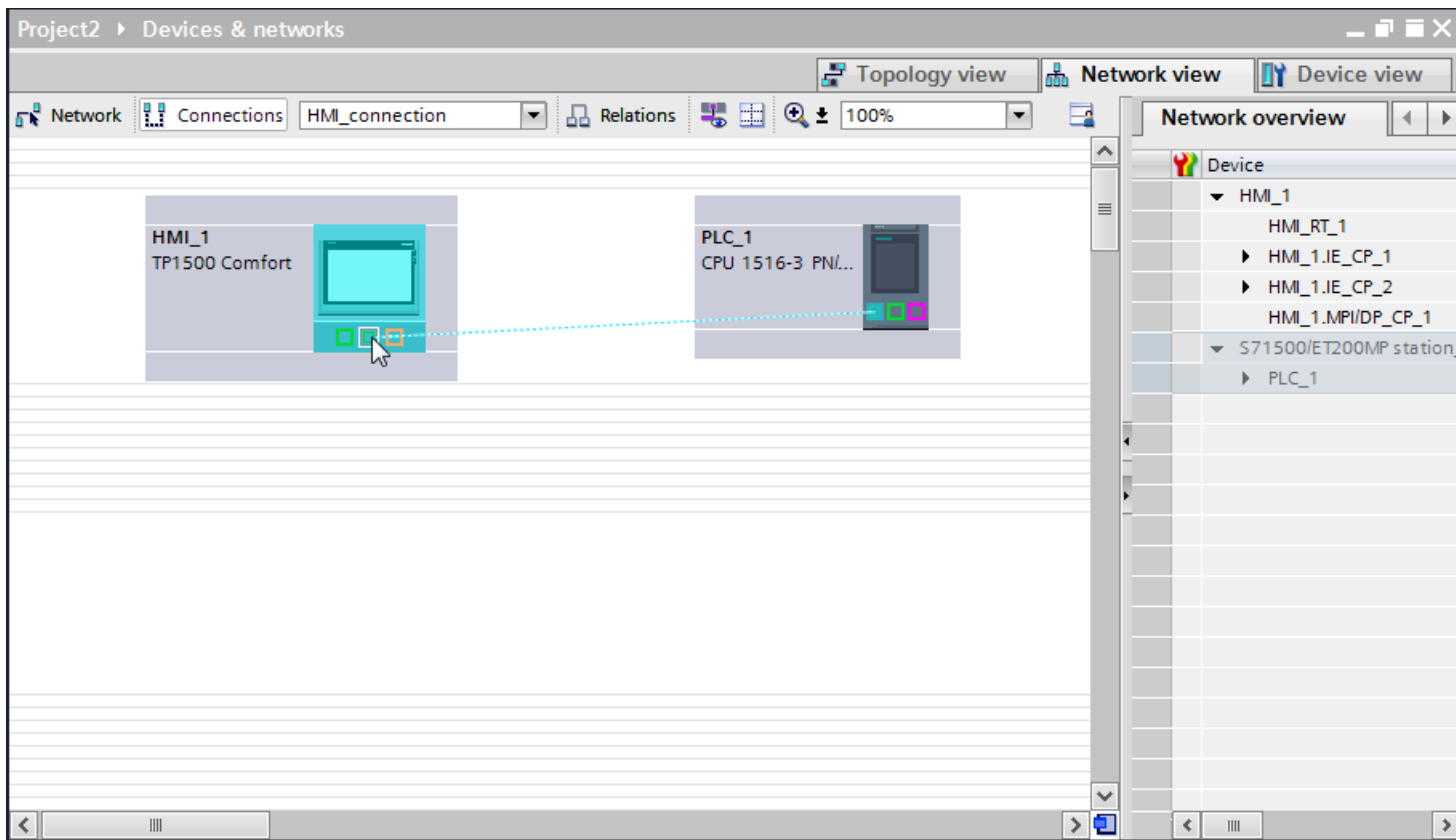

The following communication partners are created in the "Devices & Networks" editor:

- HMI device with PROFINET or Ethernet interface
- SIMATIC S7 1500 with PROFINET interface

### Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.

3. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the HMI device.

4. Click the connecting line.
5. Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
6. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project. See the chapter "PROFINET parameters (Page 5327)" for additional details.

---

**Note**

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

---

**Result**

You have created a connection between an HMI device and a SIMATIC S7 1500. The IP address and subnet mask connection parameters are configured.

## **Configuring an HMI connection**

### **Communication via PROFINET**

#### **Communication via PROFINET**

This chapter describes communication over PROFINET between a WinCC Runtime and the SIMATIC S7 1500 PLC.

You can use the following WinCC Runtimes as an HMI device:

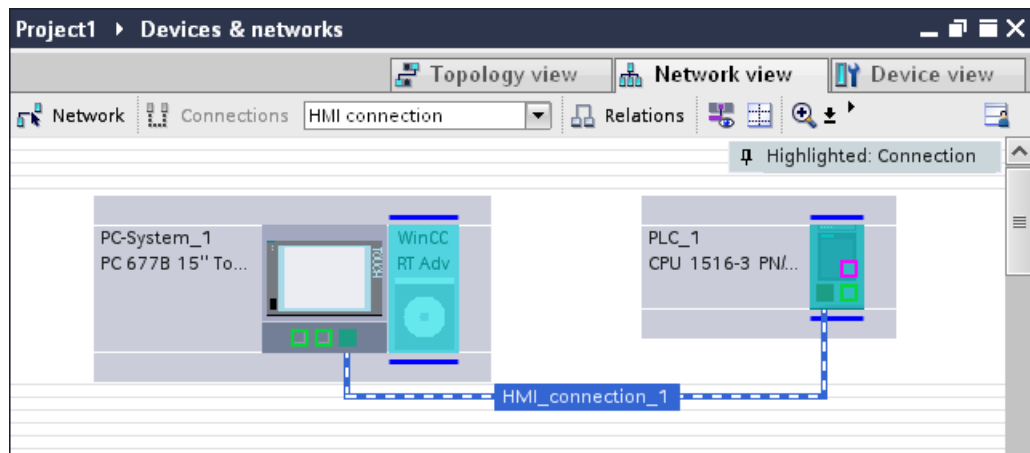

- WinCC RT Advanced

#### **WinCC Runtime as HMI device**

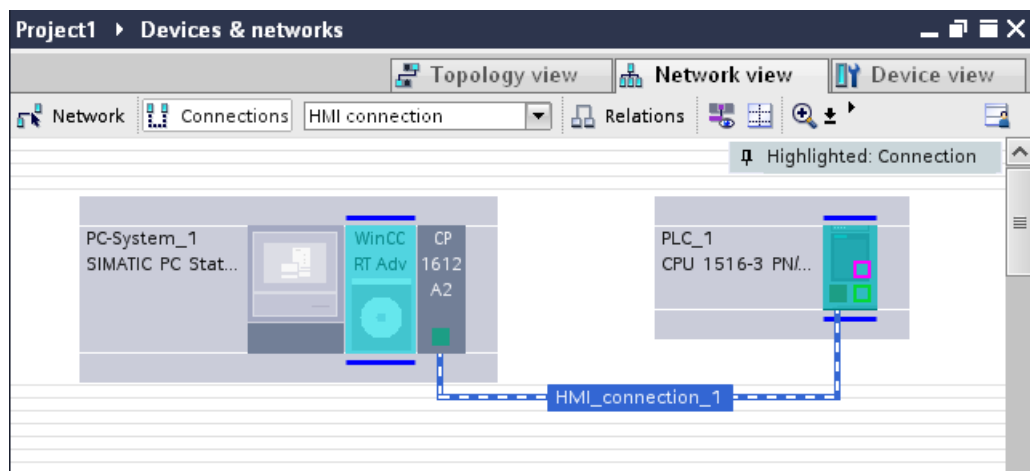

Configure the HMI connections between a WinCC Runtime and SIMATIC S7 1500 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC. In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.

2. You create a WinCC Runtime and configure a communication processor to the Runtime. In this way you use your configuration PC with a WinCC Runtime as an HMI device.

You can also connect multiple HMI devices to a single SIMATIC S7 1500 and multiple SIMATIC S7 1500 to a single HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

### HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

### Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

## Configuring an HMI connection via PROFINET with a PC

### Introduction

You configure an HMI connection over PROFINET or Ethernet between HMI devices and a SIMATIC S7 1500 in the "Devices & Networks" editor.

 <b>CAUTION</b>
<b>Communication via Ethernet</b>
In Ethernet-based communication, the end user is responsible for the security of his data network.
Targeted attacks can overload the device and interfere with proper functioning.

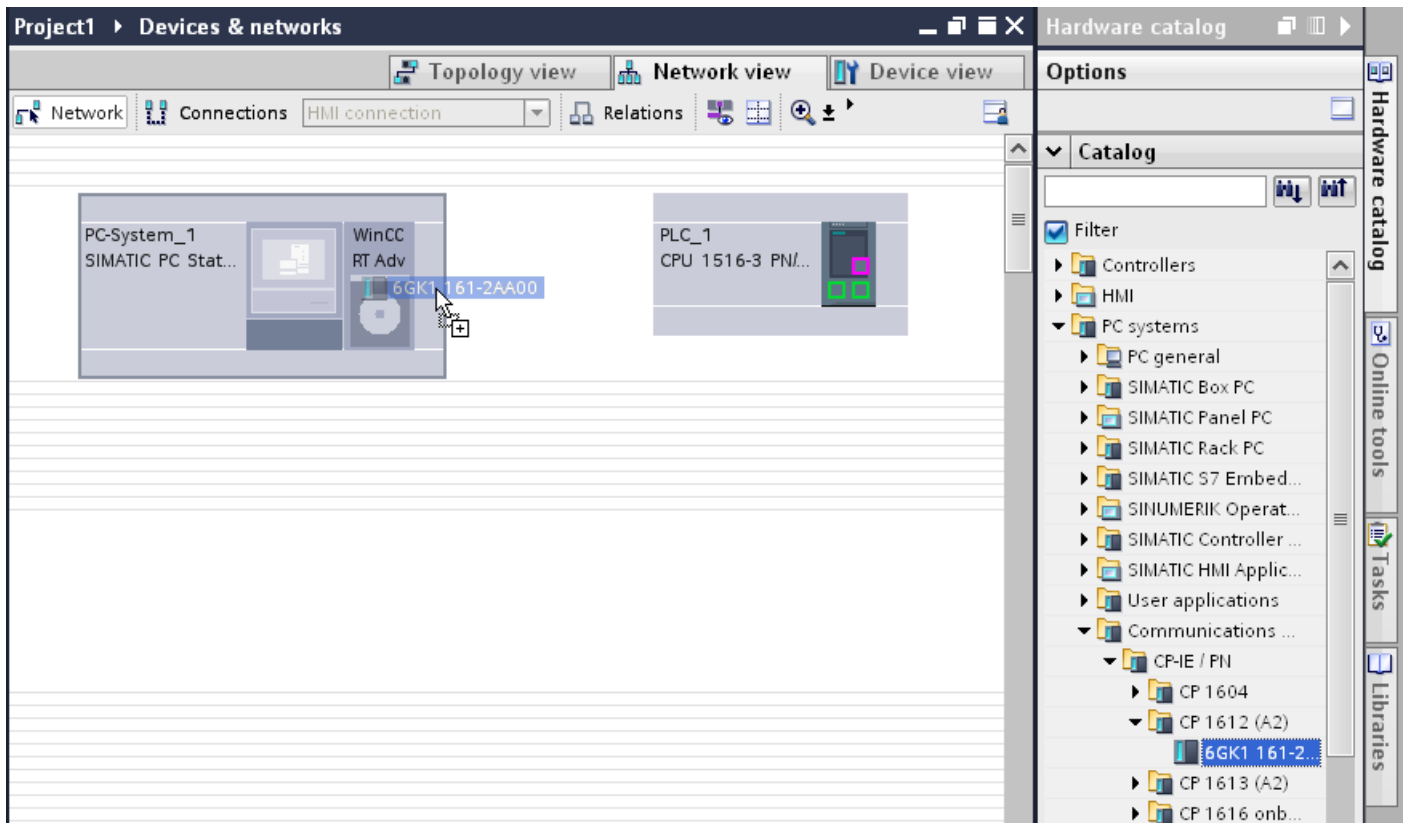

### Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1500 with PROFINET interface
- PC station with WinCC RT Advanced

### Procedure

1. Double-click the "Devices & Networks" item in the project navigation.  
The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFINET-capable communication processor from the hardware catalog to the WinCC Runtime.

3. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.

- Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET interface of the communication processor.

- Click the connecting line.  
The connection is displayed graphically in the Inspector window.
- Click "Highlight HMI connection" and select the HMI connection.  
The connection is displayed graphically in the Inspector window.
- Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project. See the chapter "PROFINET parameters (Page 5327)" for additional details.

---

**Note**

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

---

**Result**

You have created a connection between an HMI device and a SIMATIC S7 1500. The IP address and subnet mask connection parameters are configured.

## Configuring an HMI connection via PROFINET with a SIMATIC PC

### Introduction

You configure an HMI connection over PROFINET or Ethernet between HMI devices and SIMATIC S7 1500 in the "Devices & Networks" editor.

#### CAUTION

##### Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

### Requirements

The following communication partners are created in the "Devices & Networks" editor:

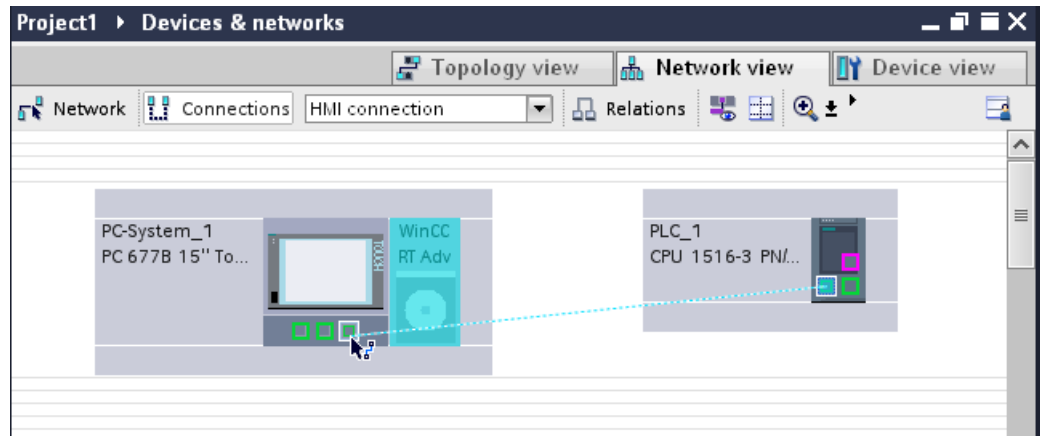

- SIMATIC S7 1500 with PROFINET interface
- SIMATIC PC with PROFINET interface

### Procedure

1. Double-click the "Devices & Networks" item in the project navigation.  
The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.

3. Click the "Connections" button and select "HMI connection" for the connection type. The devices available for connection are highlighted in color.
4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the PC.

5. Click the connecting line.
6. Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project. See the chapter "PROFINET parameters (Page 5327)" for additional details.

---

#### Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

---

## Result

You have created a connection between an HMI device and a SIMATIC S7 1500. The IP address and subnet mask connection parameters are configured.

## PROFINET parameters

### PROFINET parameters for the HMI connection

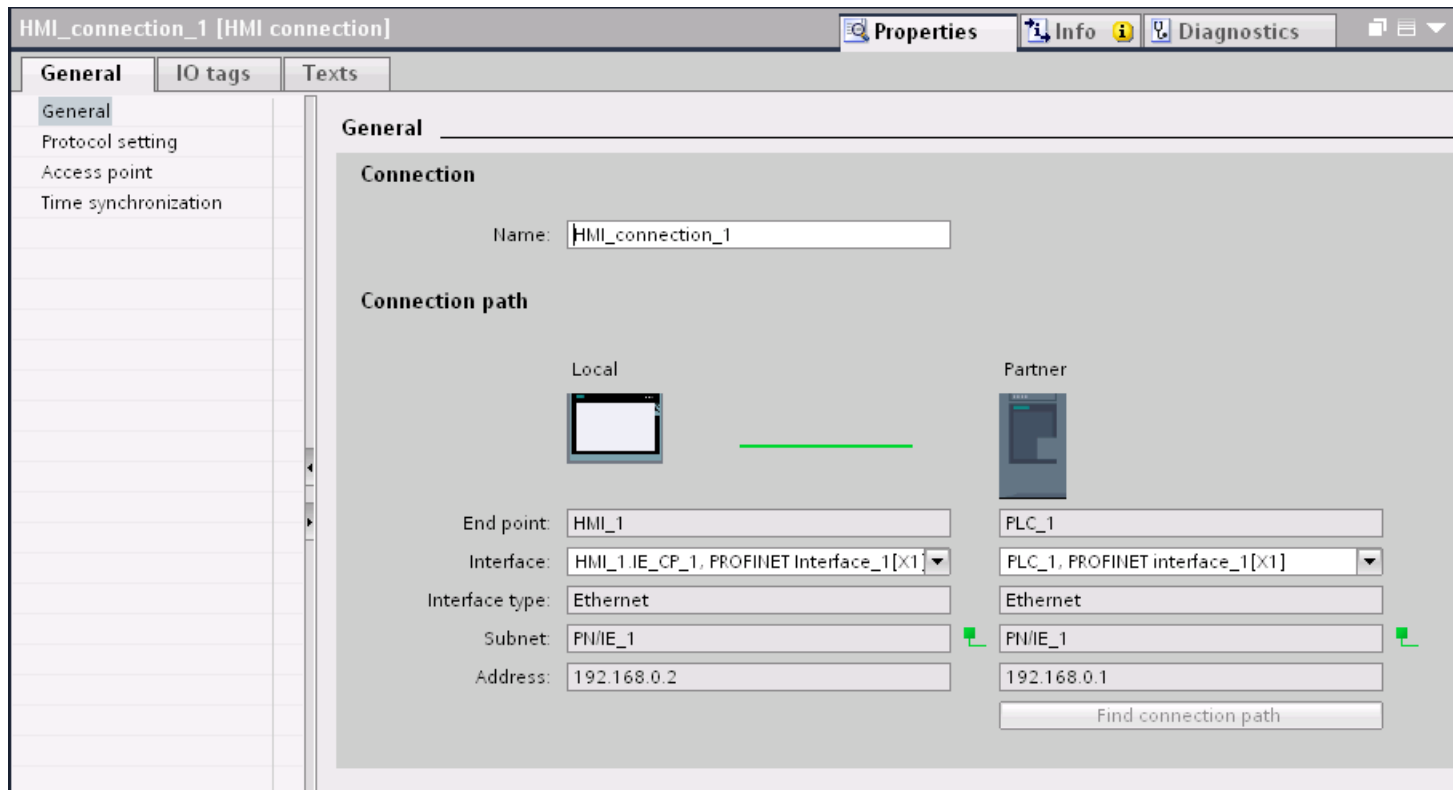

### PROFINET parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

## Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".

### "Connection"

Shows the name of the HMI connection.

### "Connection path"

The communication partners of the selected HMI connection and the associated PROFINET parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"  
Displays the device name. This area cannot be edited.
- "Interface"  
Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"  
Displays the selected interface type. This area cannot be edited.
- "Subnet"  
Displays the selected subnet. This area cannot be edited.

- "Address"  
Displays the selected IP address of the device. This area cannot be edited.
- "Find connection path" button  
Enables the subsequent specification of connections.

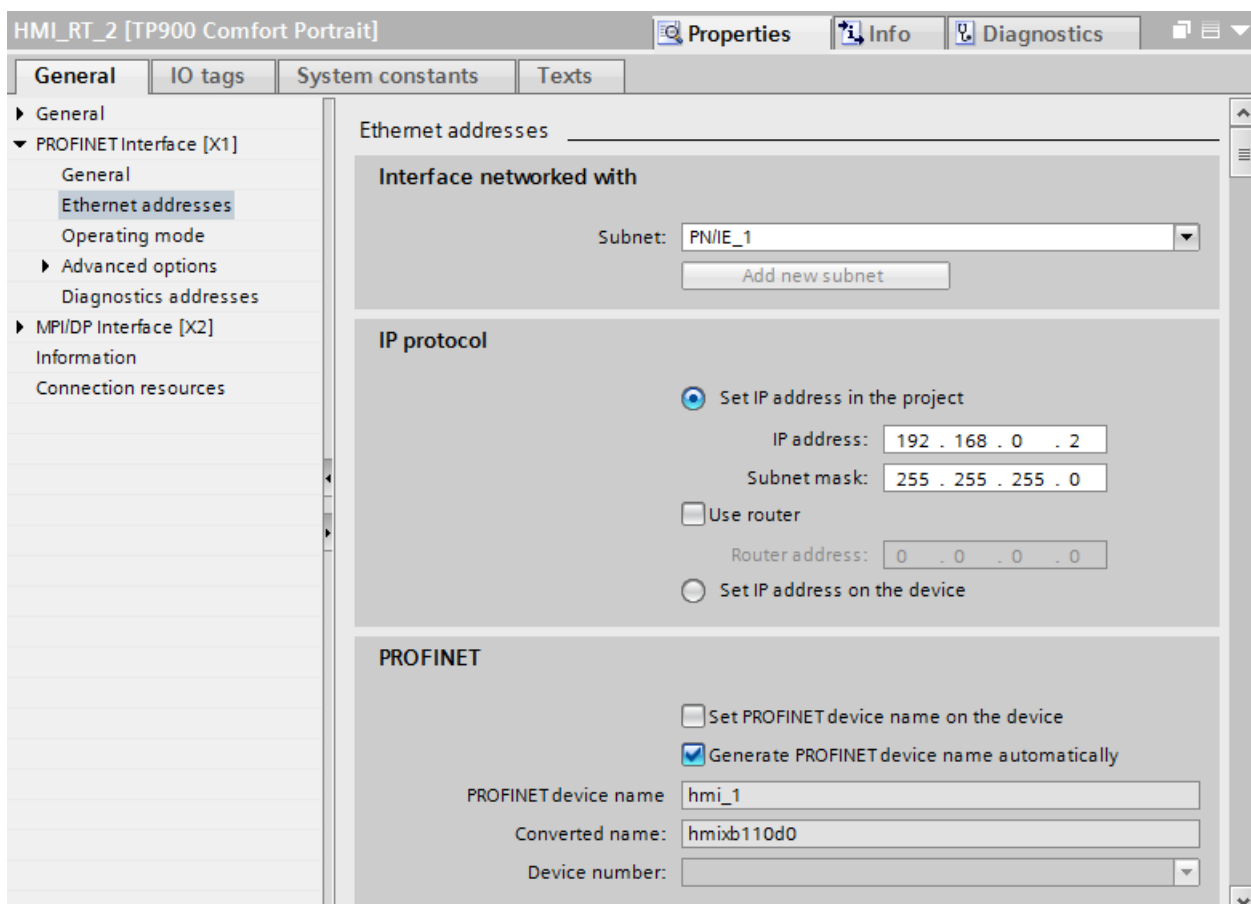

## PROFINET parameters for the HMI device

## PROFINET parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

## Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General".

### "Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

### "IP protocol"

- "Set IP address in the project"  
When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

---

#### Note

The device is automatically restarted in the case of HMI devices with the Windows CE 3.0 operating system.

HMI devices with Windows CE 3.0:

- Mobile Panel 177 PN
  - Mobile Panel 177 DP
- 
- "Subnet mask"  
You assign data of the subnet mask in the "Subnet mask" area.
  - "Use IP router"  
If you are using an IP router, select "Use IP router" and enter the router address in the "Router address" field.
  - "Set IP address on the device"  
If the "Set IP address on the device" function is enabled, the IP address is not taken from the project. You have to enter the IP address directly in the Control Panel of the HMI device.

### PROFINET parameters for the PLC

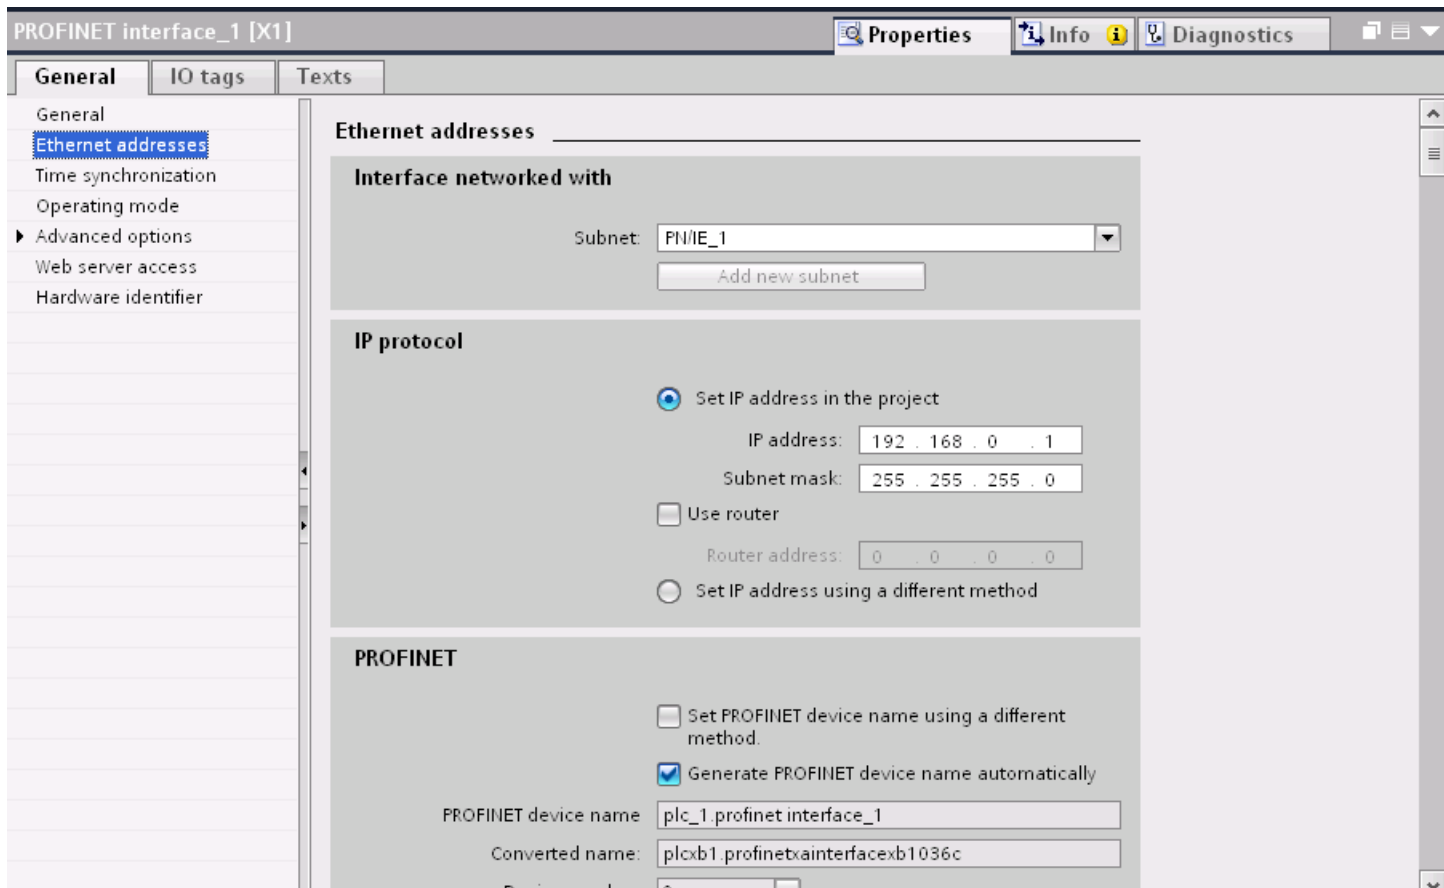

### PROFINET parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

## Displaying and changing PROFINET parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".

### "Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

### "IP protocol"

- "Interface type"  
Depending on the HMI device type, you have various interfaces to choose from.
- "IP address"  
You assign the IP address of the HMI device in the "IP address" area.
- "Subnet mask"  
You assign data of the subnet mask in the "Subnet mask" area.  
If you are using an IP router, select "Use IP router" and enter the router address in the field.

## Protection of communication

### Security levels

If you want to protect the PLC and HMI device communication, you can assign protection levels for the communication.

For a SIMATIC S7-1500 CPU, you can enter multiple passwords and thereby set up different access rights for various user groups.

The passwords are entered in a table, so that exactly one protection level is assigned to each password.

The effect of the password is given in the "Protection" column.

For the SIMATIC S7-1200 controller, several aspects need to be considered when setting protection levels. For additional information on this, see: S7-1200 protection levels

### Example

You select the "Complete protection" protection level for a standard CPU (i.e., not an F-CPU) when configuring it.

Afterwards, you enter a separate password for every protection level above it in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the assigned passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (no protection) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (write protection) allows access as if the CPU were write-protected. Despite knowing the password, users who know this password only have read access to the CPU.
- The password in row 3 (read and write protection) allows access as if the CPU were read-protected and write-protected, so that only HMI access is possible for users who know this password.

## Access password for the HMI connection

### Introduction

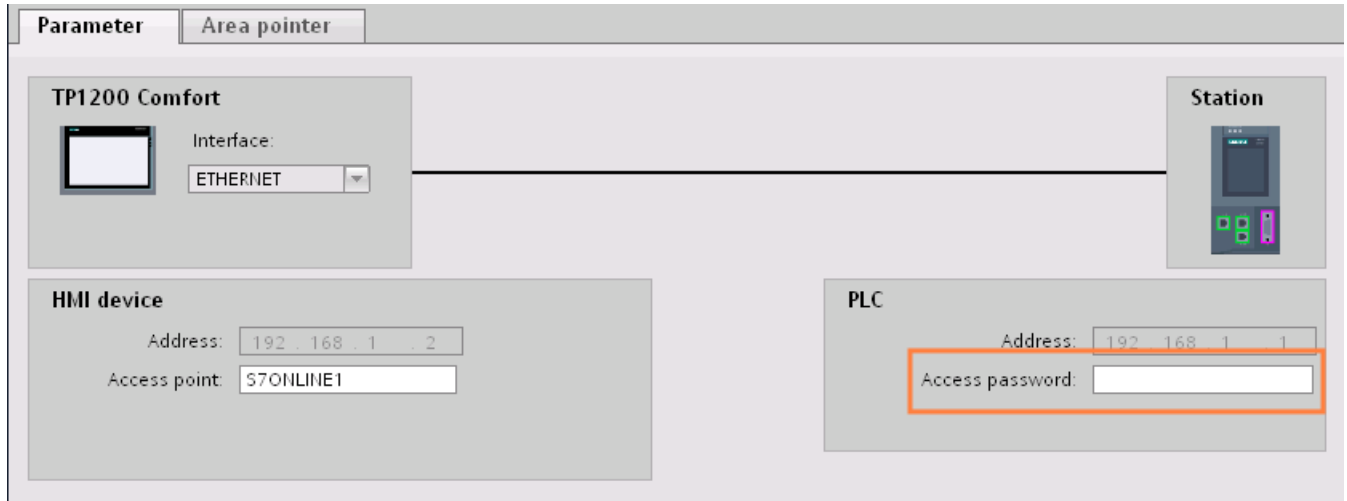

Communication with a PLC with the "Complete protection" protection level is protected by a password. The password is stored in the properties of the PLC.

Enter the password from the PLC in the "Access password" area.

Communication to the PLC is denied if an incorrect password or no password is entered.

## Entering the access password

Enter the access password for the HMI connection in the "Connections" editor.

## Setting port options

## Setting the port options

## Changing connection settings for the PROFINET IO port

You can change the network settings for the PROFINET IO port as required. By default, the settings are made automatically. In normal situations, this guarantees problem-free communication.

### Possible settings for transmission rate / duplex

Depending on the selected device, you can make the following settings for "Transmission rate / duplex":

- Automatic setting  
Recommended default setting of the port. The transmission settings are automatically "negotiated" with the peer port. The "Enable autonegotiation" option is also enabled as a default, in other words, you can use cross cables or patch cables for the connection.
- TP/ITP at x Mbps full duplex (half duplex)  
Setting of the transmission rate and the full duplex/half duplex mode. The effectiveness depends on the "Enable autonegotiation" setting:
  - Autonegotiation enabled  
You can use both cross cable and patch cable.
  - Autonegotiation disabled  
Make sure that you use the correct cable (patch cable or cross cable)! The port is also monitored with this setting.
- Deactivated  
Depending on the module type, the drop down list box can contain the "- Disabled -" option. This option, for example, allows you to prevent access to an unused port for security reasons. With this setting, diagnostic events are not generated.

### "Monitor" option

This option enables or disables port diagnostics. Examples of port diagnostics: The link status is monitored, in other words, the diagnostics are generated during link-down and the system reserve is monitored in the case of fiber optic ports.

### Option "Enable autonegotiation "

The autonegotiation setting can only be changed if a concrete medium (for example, TP 100 Mbps full duplex) is selected. Whether or not a concrete medium can be set depends on the properties of the module.

If autonegotiation is disabled, this causes the port to be permanently specified, as for example, is necessary for a prioritized startup of the IO device.

You must make sure the partner port has the same settings because with this option the operating parameters of the connected network are not detected and the data transmission rate and transmission mode can accordingly not be optimally set.

---

#### Note

When a local port is connected, STEP 7 makes the setting for the partner port if the partner port supports the setting. If the partner port does not accept the setting, an error message is generated.

---

## Wiring rules for disabled autonegotiation

### Requirements

You have made the following settings for the port in question, for example, to accelerate the startup time of the IO device:

- Fixed transmission rate
- Autonegotiation incl. autocrossing disabled

The time for negotiating the transmission rate during startup has been saved.

If you have disabled autonegotiation, you must observe the wiring rules.

### Wiring rules for disabled autonegotiation

PROFINET devices have the following two types of ports:

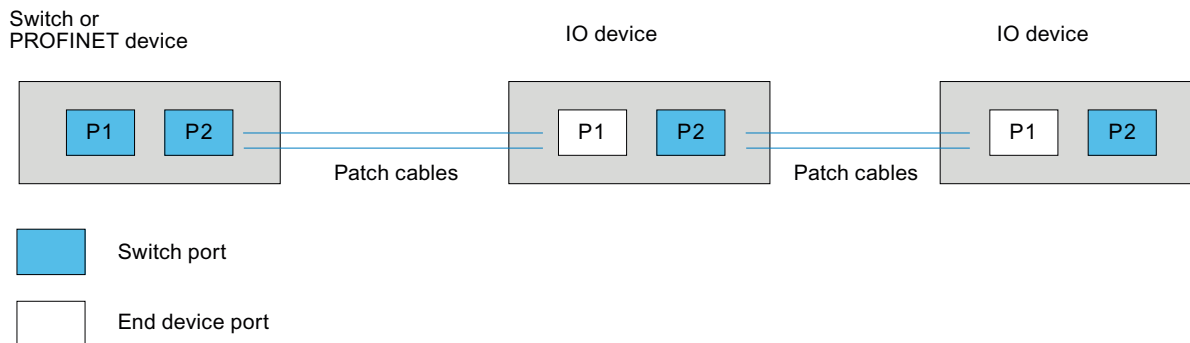

Type of port	PROFINET devices	Note
Switch port with crossed pin assignment	For IO devices: Port 2 For S7 CPUs with 2 ports: Ports 1 and 2	Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is exchanged internally.
End device port with uncrossed pin assignment	For IO devices: Port 1 For S7 CPUs with one port: Port 1	-

### Validity of the wiring rules

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting.

## Rules for cabling

You can connect several IO devices in line using a single cable type (patch cable). To do this, you connect port 2 of the IO device (distributed I/O) with port 1 of the next IO device. The following graphic gives an example with two IO devices.

## Boundaries at the port

### Requirements

To use boundaries, the respective device must have more than one port. If the PROFINET does not support boundary settings, they are not shown.

### Enable boundaries

"Boundaries" are limits for transmission of certain Ethernet frames. The following boundaries can be set at a port:

- "End of discovery of accessible devices"  
No forwarding of DCP frames to identify accessible devices. Devices downstream from this port cannot be reached by the project tree under "Accessible devices". Devices downstream from this port cannot be reached by the CPU.
- "End of topology discovery"  
LLDP frames (Link Layer Discovery Protocol) are not forwarded for topology detection.
- "End of sync domain"  
No forwarding of sync frames transmitted to synchronize nodes within a sync domain. If you operate, for example, a PROFINET device with more than two ports in a ring, you should prevent the sync frame from being fed into the ring by setting a sync boundary (at the ports not inside the ring).  
Additional example: If you want to use several sync domains, configure a sync domain boundary for the port connected to a PROFINET device from the other sync domain.

## Restrictions

The following restrictions must be observed:

- The individual check boxes can only be used if the port supports the function in question.
- If a partner port has been determined for the port, the following check boxes cannot be used:
  - "End of discovery of accessible devices"
  - "End of topology discovery"
- If autonegotiation is disabled, none of the check boxes can be used.

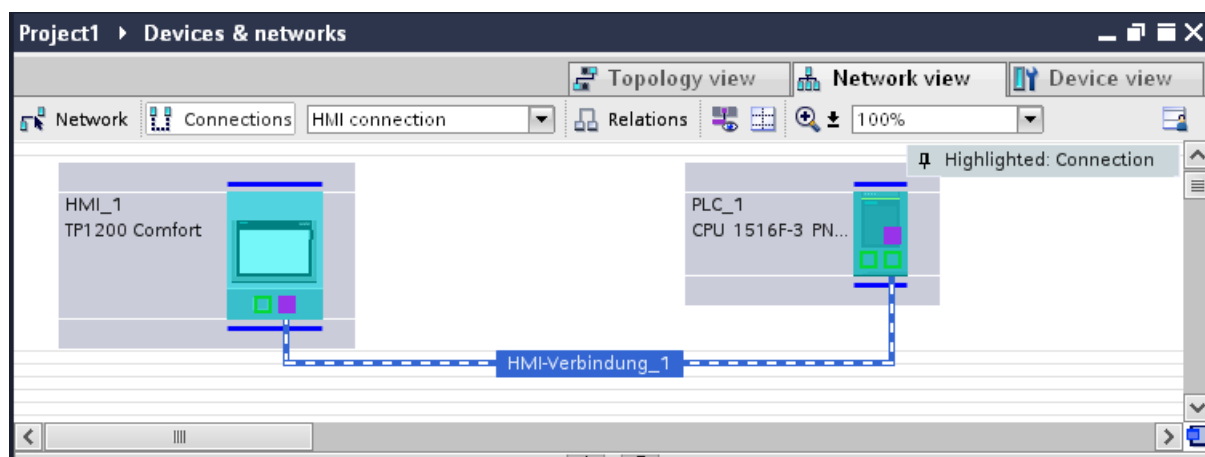

### 10.11.6.3 Communication via PROFIBUS

#### Configuring an HMI connection

#### Communication via PROFIBUS

#### HMI connections via PROFIBUS

If you have inserted an HMI device and a SIMATIC S7 1500 into the project, interconnect the two PROFIBUS interfaces in the "Devices & Networks" editor.

#### HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

#### Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device in the "Connections" editor of the HMI device.

## Configuring an HMI connection via PROFIBUS

### Introduction

You configure an HMI connection over PROFIBUS between HMI devices and a SIMATIC S7 1500 in the "Devices & Networks" editor.

### Requirements

The following communication partners are created in the "Devices & Networks" editor:

- HMI device with MPI/DP interface
- SIMATIC S7 1500 with PROFIBUS interface

### Procedure

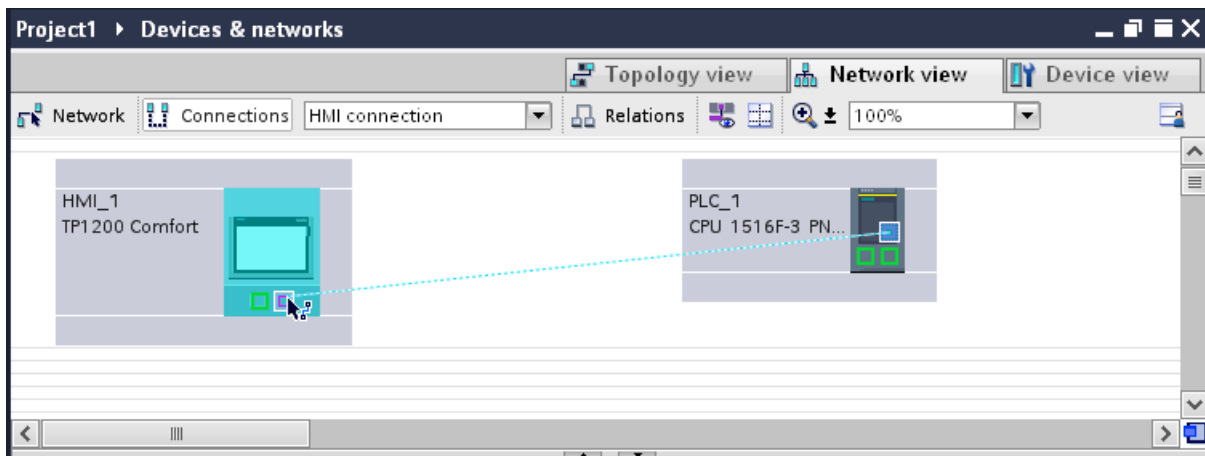

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed graphically in the network view.

2. Click the "Connections" button.  
The devices available for connection are highlighted in color.
3. Click the HMI device interface.
4. Select the "PROFIBUS" interface type in the Inspector window under "Properties > General > HMI MPIDP > Parameters".

- Click the interface of the PLC and use a drag-and-drop operation to draw a connection to the HMI device.

- Click the connecting line.
- Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
- Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project. See the chapter "PROFIBUS parameters (Page 5344)" for additional details.

---

#### Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

---

## Result

You have created an HMI connection over PROFIBUS between an HMI device and a SIMATIC S7 1500.

## Configuring an HMI connection

## Communication via PROFIBUS

## Communication via PROFIBUS

This chapter describes communication over PROFIBUS between a WinCC Runtime and the SIMATIC S7 1500 PLC.

You can use the following WinCC Runtimes as an HMI device:

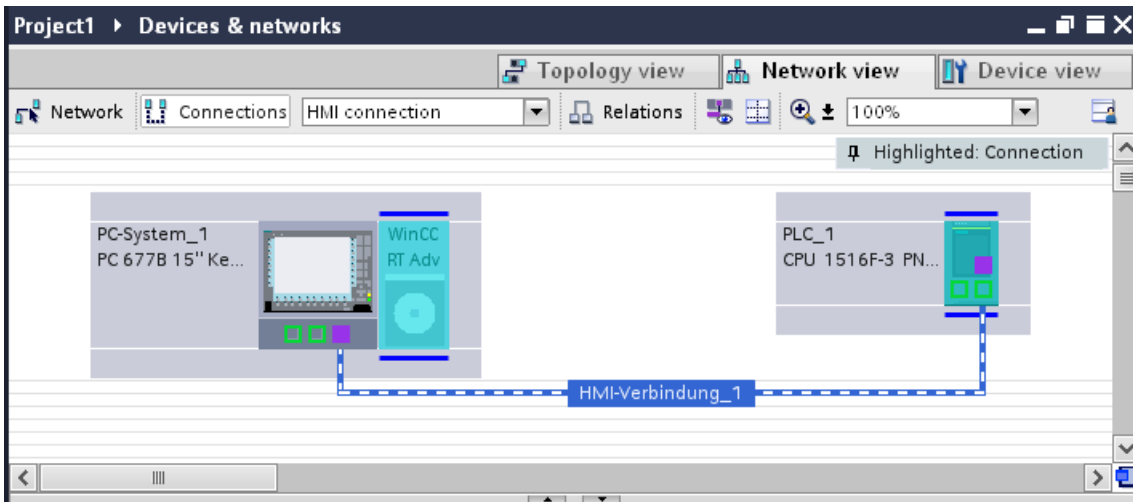

- WinCC RT Advanced
- WinCC RT Professional

### WinCC Runtime as HMI device

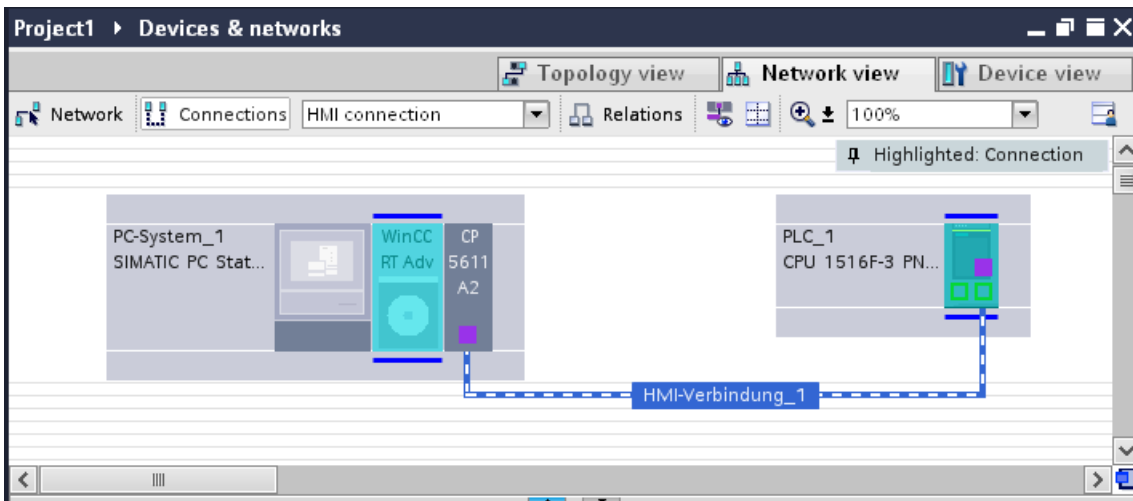

Configure the HMI connections between WinCC Runtime and SIMATIC S7 1500 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC. In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.

2. You create a WinCC Runtime and configure a communication processor to the Runtime. In this way you use your configuration PC with a WinCC Runtime as an HMI device.

You can also connect multiple HMI devices to a single SIMATIC S7 1500 and multiple SIMATIC S7 1500 to a single HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

## HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

## Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFIBUS in the "Connections" editor of the HMI device.

## Configuring an HMI connection via PROFIBUS with a PC

### Introduction

You configure an HMI connection over PROFIBUS between the HMI device and SIMATIC S7 1500 in the "Devices & Networks" editor.

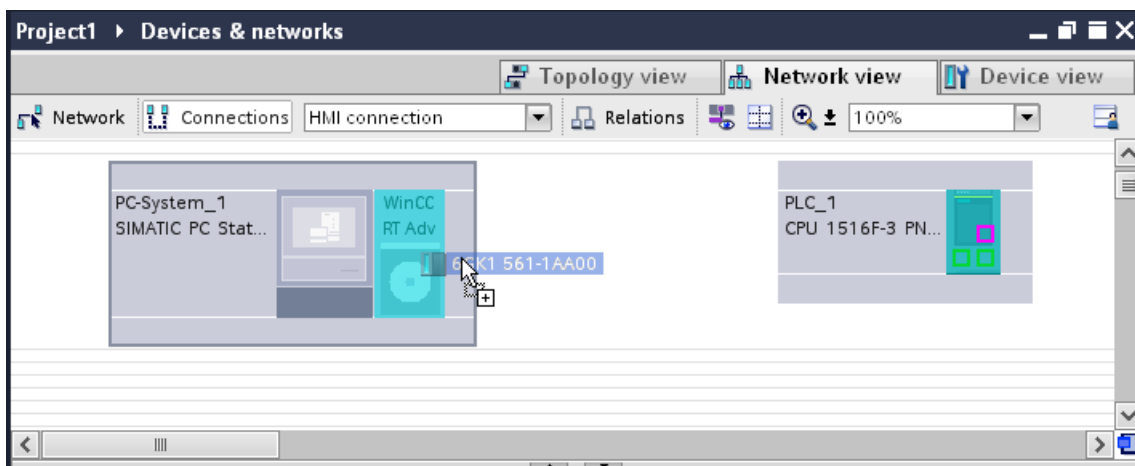

### Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1500 with PROFIBUS interface
- PC station with WinCC RT Advanced or WinCC RT Professional

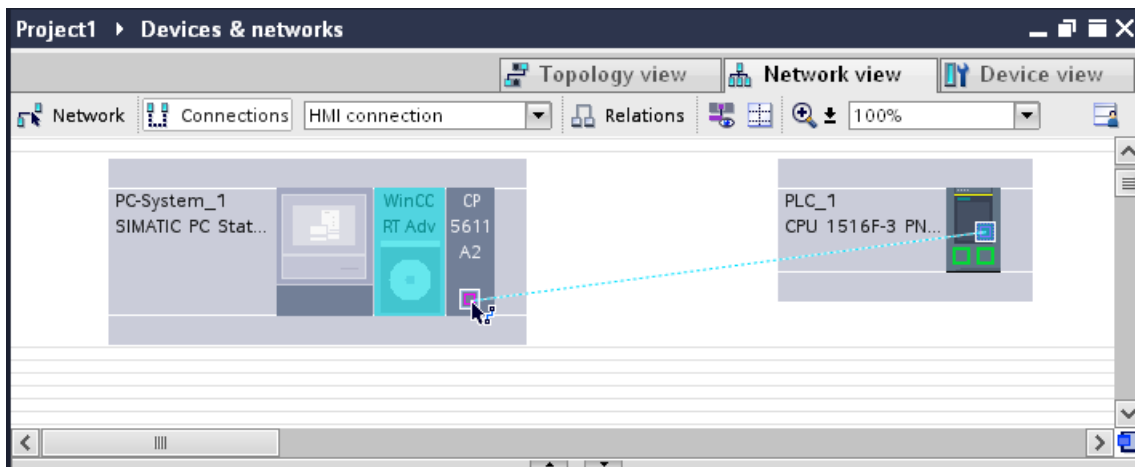

### Procedure

1. Double-click the "Devices & Networks" item in the project navigation.  
The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFIBUS-capable communication processor from the hardware catalog to the WinCC Runtime.

3. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.

- Click the PROFIBUS interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the communication processor.

- Click the connecting line.
- Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
- Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project. See the chapter "PROFIBUS parameters (Page 5344)" for additional details.

---

**Note**

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

---

**Result**

You have created an HMI connection over PROFIBUS between an HMI device and a SIMATIC S7 1500.

**Configuring an HMI connection via PROFIBUS with a SIMATIC PC**

**Introduction**

You configure an HMI connection over PROFIBUS between HMI devices and a SIMATIC S7 1500 in the "Devices & Networks" editor.

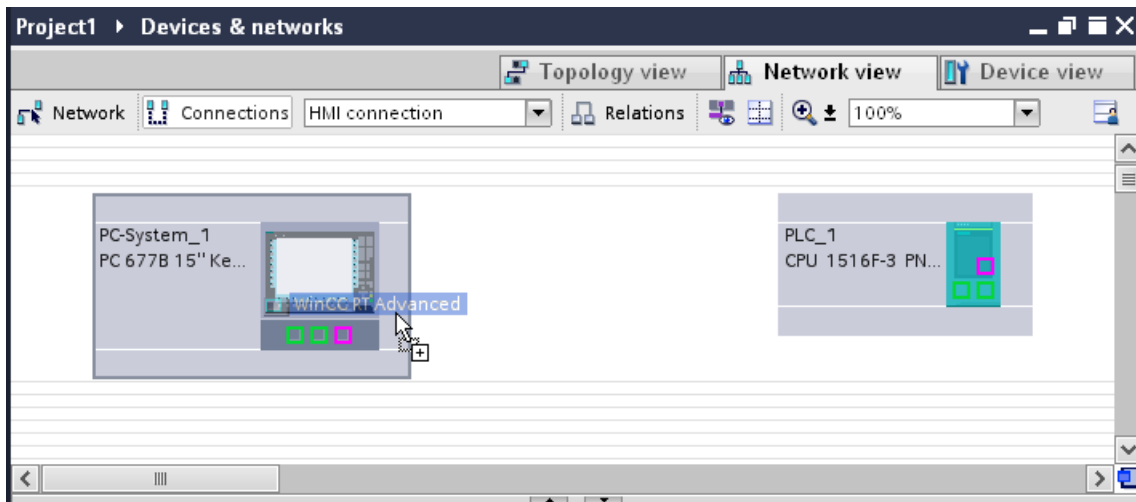

**Requirements**

The following communication partners are created in the "Devices & Networks" editor:

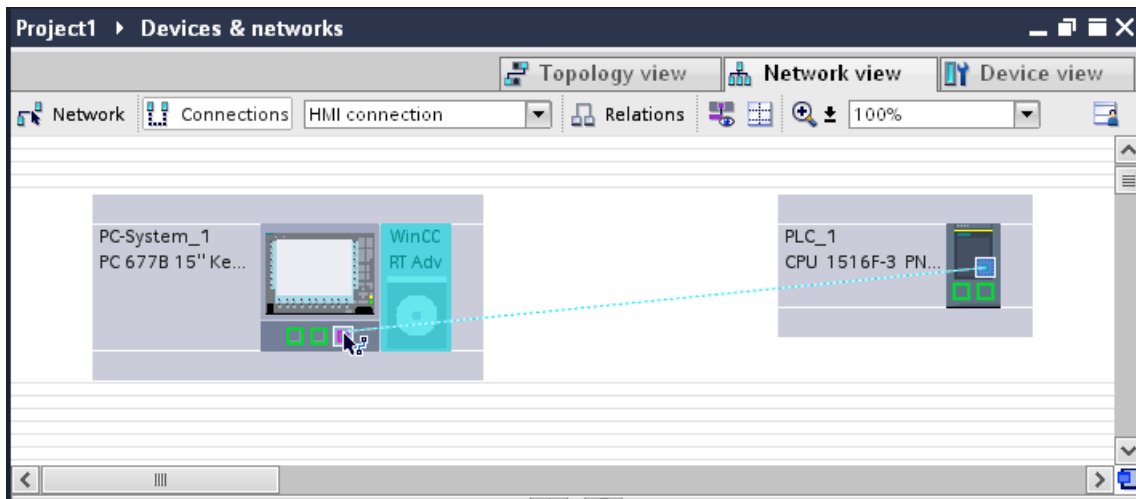

- SIMATIC S7 1500 with PROFIBUS interface
- SIMATIC PC with PROFIBUS interface

## Procedure

1. Double-click the "Devices & Networks" item in the project navigation.  
The available communication partners in the project are displayed in the network view.
2. Click the MPI interface of the PC and select "PROFIBUS" for the interface type in the Inspector window.
3. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.

4. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.
5. Click the PROFIBUS interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the PC.

6. Click the connecting line.

7. Click "Highlight HMI connection" and select the HMI connection.  
The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.  
See the chapter "PROFIBUS parameters (Page 5344)" for additional details.

---

**Note**

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

---

**Result**

You have created an HMI connection over PROFIBUS between an HMI device and a SIMATIC S7 1500.

**PROFIBUS parameters**

**PROFIBUS parameters for the HMI connection**

**PROFIBUS parameters for the HMI connection**

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

## Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".

### "Connection"

Displays whether the devices are networked together.

- displayed if the devices are networked together.
- displayed if the devices are not networked together.

### "Connection path"

The communication partners of the selected HMI connection and the associated PROFIBUS parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"  
Displays the device name. This area cannot be edited.
- "Interface"  
Displays the selected interface of the device. You can choose between several interfaces, depending on the device.

- "Interface type"  
Displays the selected interface type. This area cannot be edited.
- "Subnet"  
Displays the selected subnet. This area cannot be edited.
- "Address"  
Displays the PROFIBUS address of the device. This area cannot be edited.
- "Find connection path" button  
Enables the subsequent specification of connections.

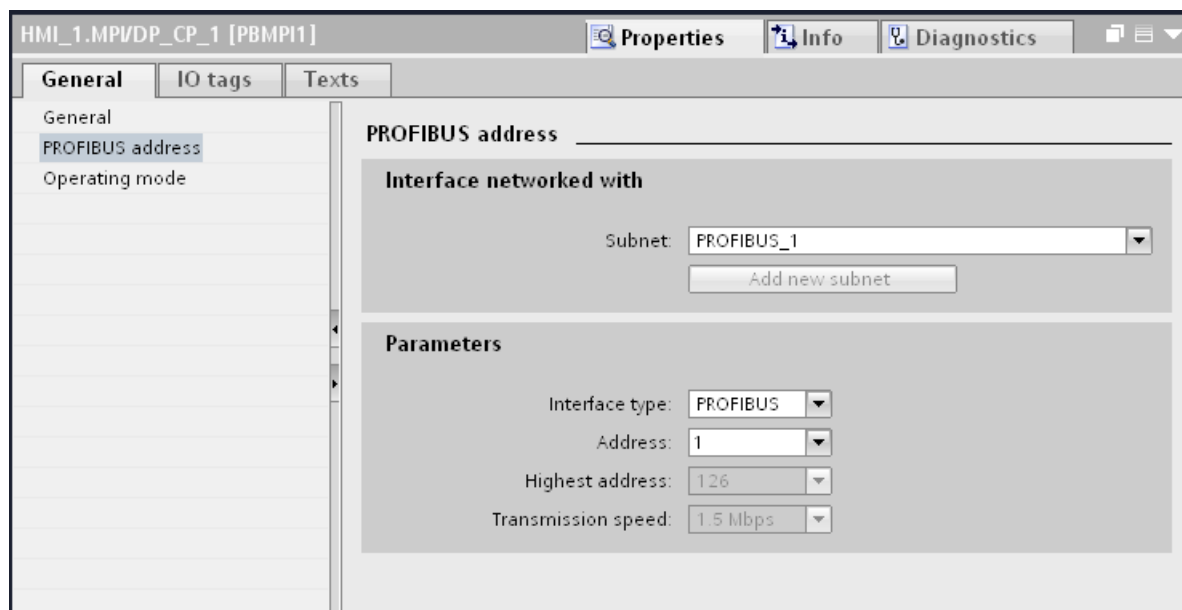

## PROFIBUS parameters for the HMI device

### PROFIBUS parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

### Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".

### "Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

## "Parameters"

- "Interface type"  
You assign the interface type in the "Interface type" area. Depending on the HMI device type, you have various interfaces to choose from.
- "Address"  
You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"  
The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"  
The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

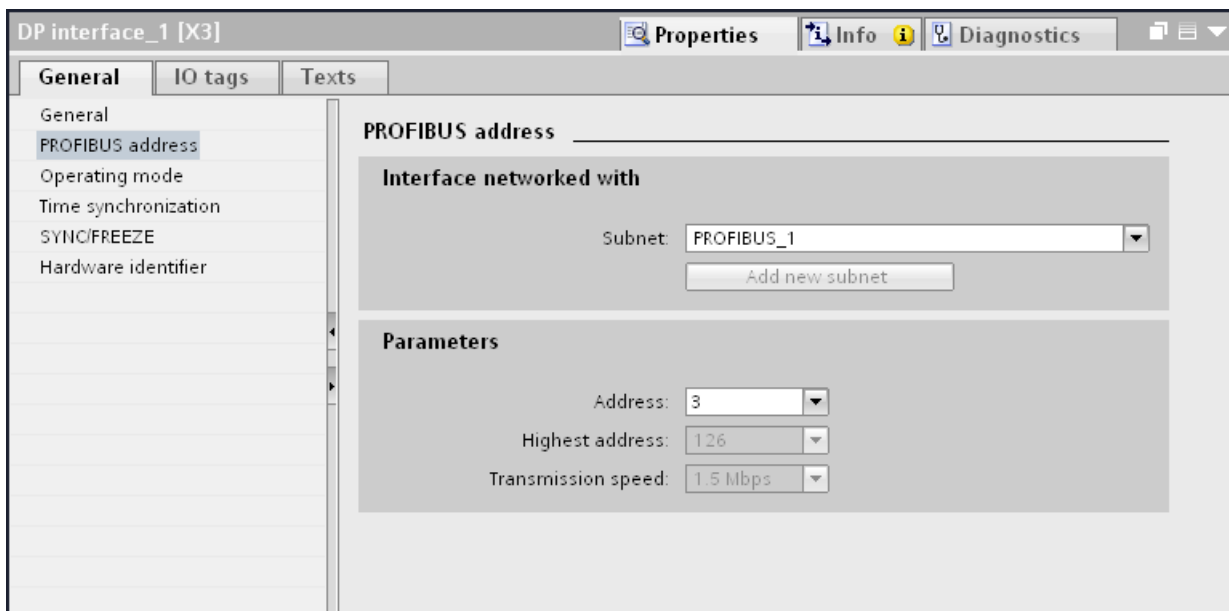

## PROFIBUS parameters for the PLC

## PROFIBUS parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

## Displaying and changing PROFIBUS parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".

### "Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

### "Parameters"

- "Interface type"  
Depending on the HMI device type, you have various interfaces to choose from.
- "Address"  
You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"  
The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"  
The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

### Protection of communication

#### Security levels

If you want to protect the PLC and HMI device communication, you can assign protection levels for the communication.

For a SIMATIC S7-1500 CPU, you can enter multiple passwords and thereby set up different access rights for various user groups.

The passwords are entered in a table, so that exactly one protection level is assigned to each password.

The effect of the password is given in the "Protection" column.

For the SIMATIC S7-1200 controller, several aspects need to be considered when setting protection levels. For additional information on this, see: Auto-Hotspot

#### Example

You select the "Complete protection" protection level for a standard CPU (i.e., not an F-CPU) when configuring it.

Afterwards, you enter a separate password for every protection level above it in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the assigned passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (no protection) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (write protection) allows access as if the CPU were write-protected. Despite knowing the password, users who know this password only have read access to the CPU.
- The password in row 3 (read and write protection) allows access as if the CPU were read-protected and write-protected, so that only HMI access is possible for users who know this password.

## Access password for the HMI connection

### Introduction

Secure access to a PLC by assigning a password.

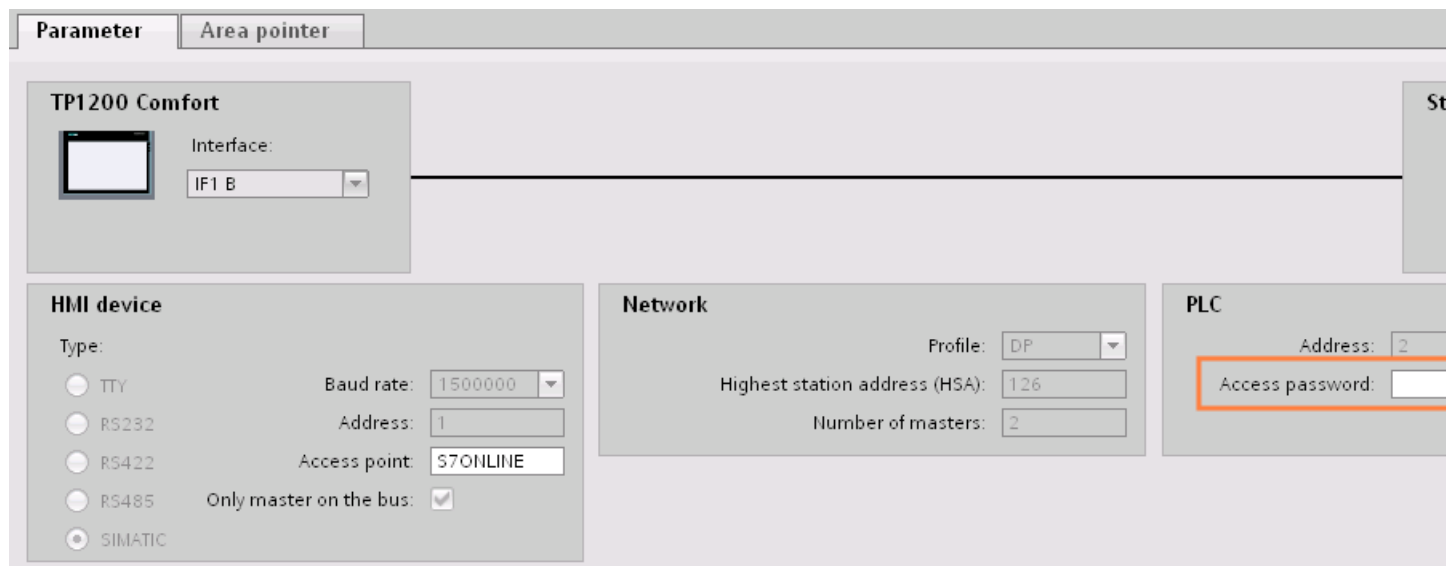

Assign the password when configuring the connection.

Input of the password of the PLC is mandatory as of "Complete protection" security level.

Communication to the PLC is denied if an incorrect password or no password is entered.

### Assigning password

Enter the "Access password" for the PLC in the "Connections" editor.

#### 10.11.6.4 Data exchange

##### Data exchange using area pointers

##### General information on area pointers

##### Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

##### Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Data exchange using area pointers (Page 5241)

##### Restrictions

You can only configure the following data types for communication with SIMATIC S7 1500 for data exchange using area pointers:

- UInt and array of UInt
- Word and array of Word
- Int and array of Int
- "Array[0..15] of Bool" for area pointer "Coordination"
- Date\_And\_Time
- DTL and LDT

##### "Screen number" area pointer

##### Function

The HMI device saves information about the screen called on the HMI device to the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. The PLC can trigger specific reactions such as the call of a different screen.

## Use

Configure and enable the area pointer in "Communication > Connections" before you put it into use. You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

## Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1st word	Current screen type															
2nd word	Current screen number															
3rd word	Reserved															
4th word	Current field number															
5th word	Reserved															

- Current screen type  
"1" for root screen or  
"4" for permanent window
- Current screen number  
1 to 32767
- Current field number  
1 to 32767

## "Date/time" area pointer

### Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" or "40" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer. All definitions are coded in BCD format.

---

#### Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

---

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte					Least significant byte					
	7				0	7				0	
n+0	Reserved					Hour (0 to 23)					Time
n+1	Minute (0 to 59)					Second (0 to 59)					
n+2	Reserved					Reserved					
n+3	Reserved					Weekday (1 to 7, 1=Sunday)					Date
n+4	Day (1 to 31)					Month (1 to 12)					
n+5	Year (80 to 99/0 to 29)					Reserved					

**Note**

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

**Using data types**

The data types "Date\_And\_Time, DTL" and "LDT" can only be used with the "Date/time" and "Date/time PLC" area pointers.

The data format of the "Date/time" area pointer depends on job mailbox 40/41.

If there are no control tags linked to the area pointer, or a control tag is linked with the data type "Array[0..5] of UInt/Word/Int", the following applies:

The configuration of the "Date/time" area pointer is only used for job mailbox 41.

If job mailbox 40 is used, the data format "DATE\_AND\_TIME (BCD-encoded)" is used (shown in the next section).

If the "Date/time" and "Date/time PLC" area pointers are linked to a control tag with the data type "DATE\_AND\_TIME", "DTL" or "LDT", the associated data format is used in the corresponding area pointer.

**"Date/time PLC" area pointer**

**Function**

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer. All definitions are coded in BCD format.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

---

**Note**

Set an acquisition cycle of sufficient length for the Date/time area pointer in order to avoid any negative impact on HMI device performance.

Recommended: Acquisition cycle of 1 minute, if the process allows this.

---

"Date/Time PLC" is a global area pointer and may be configured only once per project.

---

**Note**

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

---

The date/time data area has the following structure:

**DATE\_AND\_TIME format (in BCD code)**

Data word	Most significant byte			Least significant byte		
	7	.....	0	7	.....	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved	Weekday (1 to 7, 1=Sunday)	
n+4 <sup>1)</sup>	Reserved			Reserved		
n+5 <sup>1)</sup>	Reserved			Reserved		

- 1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

---

**Note**

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

---

**Using data types**

The data types "Date\_And\_Time, DTL" and "LDT" can only be used with the "Date/time" and "Date/time PLC" area pointers.

The data format of the "Date/time" area pointer depends on job mailbox 40/41.

If there are no control tags linked to the area pointer, or a control tag is linked with the data type "Array[0..5] of UInt/Word/Int", the following applies:

The configuration of the "Date/time" area pointer is only used for job mailbox 41.

If job mailbox 40 is used, the data format "DATE\_AND\_TIME (BCD-encoded)" is used (shown in the next section).

If the "Date/time" and "Date/time PLC" area pointers are linked to a control tag with the data type "DATE\_AND\_TIME", "DTL" or "LDT", the associated data format is used in the corresponding area pointer.

## "Coordination" area pointer

### Function

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

By default, the "Coordination" area pointer has the length of one word and cannot be changed.

### Usage

#### Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

### Assignment of the bits in the "Coordination" area pointer

### Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

## Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The status of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit in the control program.

## Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not there is still a connection to the HMI device by querying this bit in the control program.

## "Project ID" area pointer

### Function

When Runtime starts, a check can be carried out as to whether the HMI device is connected to the correct PLC. This check is important when operating with several HMI devices.

For this, the HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of the configuration data with the PLC program. If there is no concordance, a system event is given on the HMI device and Runtime is stopped.

### Use

---

#### Note

**HMI connections cannot be switched "online".**

The HMI connection in which the "Project ID" area pointer is used must be switched "online".

---

To use this area pointer, set up the following during the configuration:

- Define the version of the configuration. Values between 1 and 255 are possible.  
You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- Data address of the value for the version that is stored in the PLC:  
You enter the data address in the editor "Communication > Connections" under "Address".

## Connection failure

A connection failure to a device on which the "project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the engineering system.

## "Job mailbox" area pointer

### Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

### Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

## Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

No.	Function	
14	<b>Set time (BCD-coded)</b>	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-

No	Function	
<b>14</b>	<b>Set time (BCD-coded)</b>	
<b>15</b>	<b>Setting the date (BCD coded)</b> <sup>3) 4)</sup>	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
<b>23</b>	<b>User logon</b>	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
<b>24</b>	<b>User logoff</b>	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
<b>40</b>	<b>Transfer date/time to PLC</b>	
	(in the S7 format DATE_AND_TIME) An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
<b>41</b>	<b>Transfer date/time to PLC</b>	
	(In OP/MP format) An interval of at least 5 seconds must be maintained between successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
<b>46</b>	<b>Update tag</b>	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
<b>49</b>	<b>Delete alarm buffer</b>	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
<b>50</b>	<b>Delete alarm buffer</b>	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
<b>51</b>	<b>Screen selection</b> <sup>2)</sup>	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
<b>69</b>	<b>Reading data record from PLC</b> <sup>1)</sup>	
	Parameter 1	Recipe number (1-999)

No	Function	
<b>14</b>	<b>Set time (BCD-coded)</b>	
	Parameter 2	Data record number (1-65535)
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
<b>70</b>	<b>Writing data record to PLC <sup>1)</sup></b>	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

<sup>1)</sup>	Only for devices supporting recipes.
<sup>2)</sup>	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
<sup>3)</sup>	The weekday is ignored on HMI device KTP 600 BASIC PN.
<sup>4)</sup>	The weekday is ignored when you configure the "Date/Time PLC" area pointer.

## "Data record" area pointer

## "Data record" area pointer

### Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

### Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization via the data mailbox

Data records are always transferred directly, which means that the tag values are read straight from an address or written straight to an address configured for this tag without being redirected via an interim memory.

### Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes  
The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a configured function or by a job mailbox, the recipe view on the HMI device remains operable. The data records are transferred in the background.

Simultaneous processing of several transfer requests is, however, not possible. In this case, the HMI device rejects the other transfer requests with a system alarm.

### Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

### Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:  
The values are downloaded to the HMI device. You can then, for example, process, edit, or save these values in the HMI device.
- Triggering by a function or job mailbox:  
The values are saved immediately to the data volume.

### Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:  
The current values are written to the PLC.
- Triggering by a function or job mailbox:  
The current values are written to the PLC from the data medium.

### Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. You can use this mechanism to prevent uncontrolled overwriting of data in either direction in your control program.

### Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

### Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Communication > Connections" editor in "Area pointer".
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:  
"Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

### Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	<b>15</b>		<b>0</b>
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status  
The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data mailbox free
2	0000 0010	Transferring
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

### Sequence of a transfer triggered by a job mailbox

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxes No. 69 and No. 70 are available for this type of transfer.

**No. 69: Read data record from PLC ("PLC → DAT")**

Job mailbox no. 69 transfers data records from the PLC to the HMI device. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1 to 65535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

**No. 70: Write data record to PLC ("DAT → PLC")**

Job mailbox No. 70 transfers data records from the HMI device to the PLC. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	—	

**Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)**

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data record.	Abort without return message.
3	The HMI device reads the values from the PLC and saves these to the data record defined in the job mailbox.	
4	<ul style="list-style-type: none"> <li>If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed."</li> <li>If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.</li> </ul>	
5	The control program must reset the status word to zero in order to enable further transfers.	

**Sequence of writing to the PLC with job mailbox "DAT → PLC" (no. 70)**

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the function from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

**Sequence of the transfer when triggered by a configured function**

**Reading from the PLC using a configured function**

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	
4	<ul style="list-style-type: none"> <li>If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed."</li> <li>If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.</li> </ul>	
5	The control program must reset the status word to zero in order to enable further transfers.	

**Writing to the PLC by means of configured function**

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.

Step	Action
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.
4	The HMI device sets the status "Transfer completed."
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.

### Possible causes of error when transferring data records

#### Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible
- Recipe number does not exist
- Data record number does not exist

---

#### Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

---

#### Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
  - The data mailbox status is set to "Transfer completed with error".
- 

### Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view  
Information in the status bar of the recipe view and output of system alarms
- Triggered by function  
Output of system alarms
- Triggering by job mailbox  
No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data record.

## Trends

### General information on trends

#### Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3569)

---

#### Note

The value is read out time-triggered for Basic Panels.

---

#### Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

#### Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

#### Trend request and trend transfer

##### Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

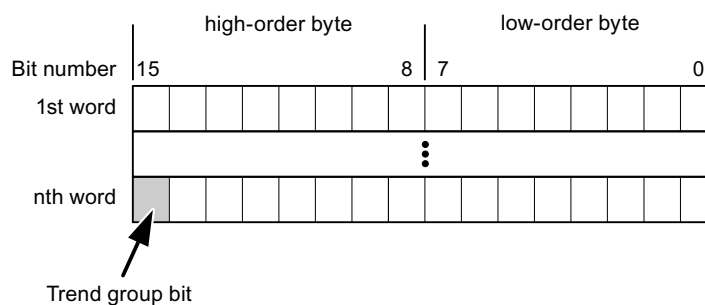

The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

### Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.

The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

### Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

### Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

### Permitted data types for trends

#### For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

## Alarms

### Configuring alarms

#### Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Configuring Alarms (Page 3593)

#### Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

#### Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

#### How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0							Byte 1							
	Most significant byte							Least significant byte							
In SIMATIC S7 PLCs	7						0	7							0
In WinCC you configure:	15						8	7							0

## Acknowledgment of alarms

### Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

### Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.

### Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment

tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

**Note**

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.

**LED mapping**

**Function**

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

**Note**

The LED function cannot be configured for Basic Panels.

**Requirements**

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

**LED assignment**

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

### 10.11.6.5 Performance features of communication

#### S7-1500 device dependency

##### Device dependency

If you use devices from an earlier version of the TIA Portal with TIA Portal V13, it may not be possible to configure connections to certain HMI devices.

### Valid data types for SIMATIC S7 1500

#### Valid data types for connections with SIMATIC S7 1500

The table lists the data types that can be used when configuring tags and area pointers.

<b>Data type</b>	<b>Length</b>
BOOL	1 bit
BYTE	1 byte
WORD	2 bytes
DWORD	4 bytes
CHAR	1 byte
INT	2 bytes
DINT	4 bytes
REAL	4 bytes
TIME	4 bytes
DATE	2 bytes
TIME_OF_DAY	4 bytes
S5TIME	2 bytes
COUNTER	2 bytes
TIMER	2 bytes
DATE_AND_TIME	8 bytes
STRING	(2+n) bytes, n = 0 to 254
DTL	12 bytes
LDT	8 bytes

Data type	Length
LINT	8 bytes
LREAL	8 bytes
LTIME	8 bytes
LTIME_OF_DAY	8 bytes
SINT	1 byte
UDINT	4 bytes
UINT	2 bytes
ULINT	8 bytes
USINT	1 byte

### 10.11.6.6 Configuring connections in the "Connections" editor

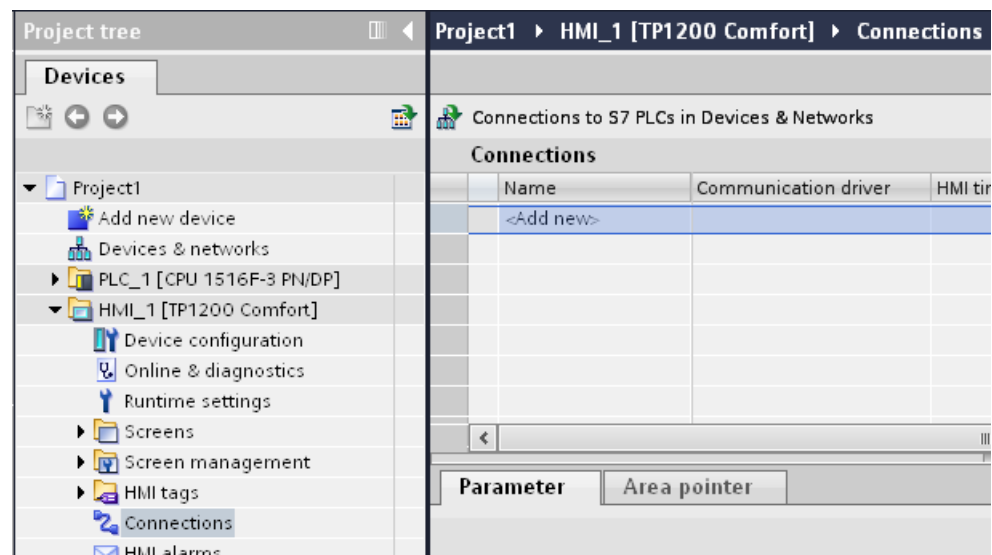

#### Creating a PROFINET connection

#### Requirements

- A project is open.
- An HMI device with a PROFINET interface has been created.

#### Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".

3. Select the driver in the "Communication driver" column.

The screenshot shows the 'Connections' table in the WinCC software. The table has the following data:

Name	Communication driver	HMI time synchronization mode	Station	Partner
Connection_2	SIMATIC S7 1500	None		
<Add new>				

Below the table, the 'Inspector' window is open, showing the configuration for the 'TP1200 Comfort' HMI device. The 'Interface' is set to 'ETHERNET'. The 'HMI device' section shows an 'Address' of '192 . 168 . 0 . 2' and an 'Access point' of 'S7ONLINE'. The 'PLC' section shows an 'Address' of '192 . 168 . 0 . 2' and an empty 'Access password' field.

4. Click the name of the connection.
5. Select a PROFINET interface of the HMI device in the Inspector window under "Parameters > Interface".
6. Set the IP addresses of the communication partners in the Inspector window:
  - HMI device: "Parameters > HMI device > Address"
  - PLC: "Parameters > PLC > Address"

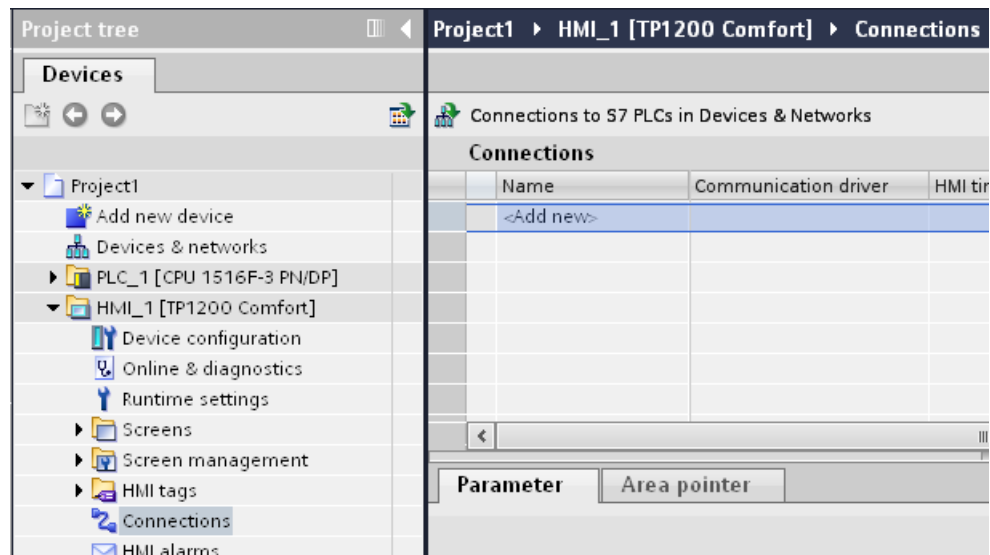

## Creating a PROFIBUS connection

### Requirements

- A project is open.
- An HMI device with a PROFIBUS interface has been created.

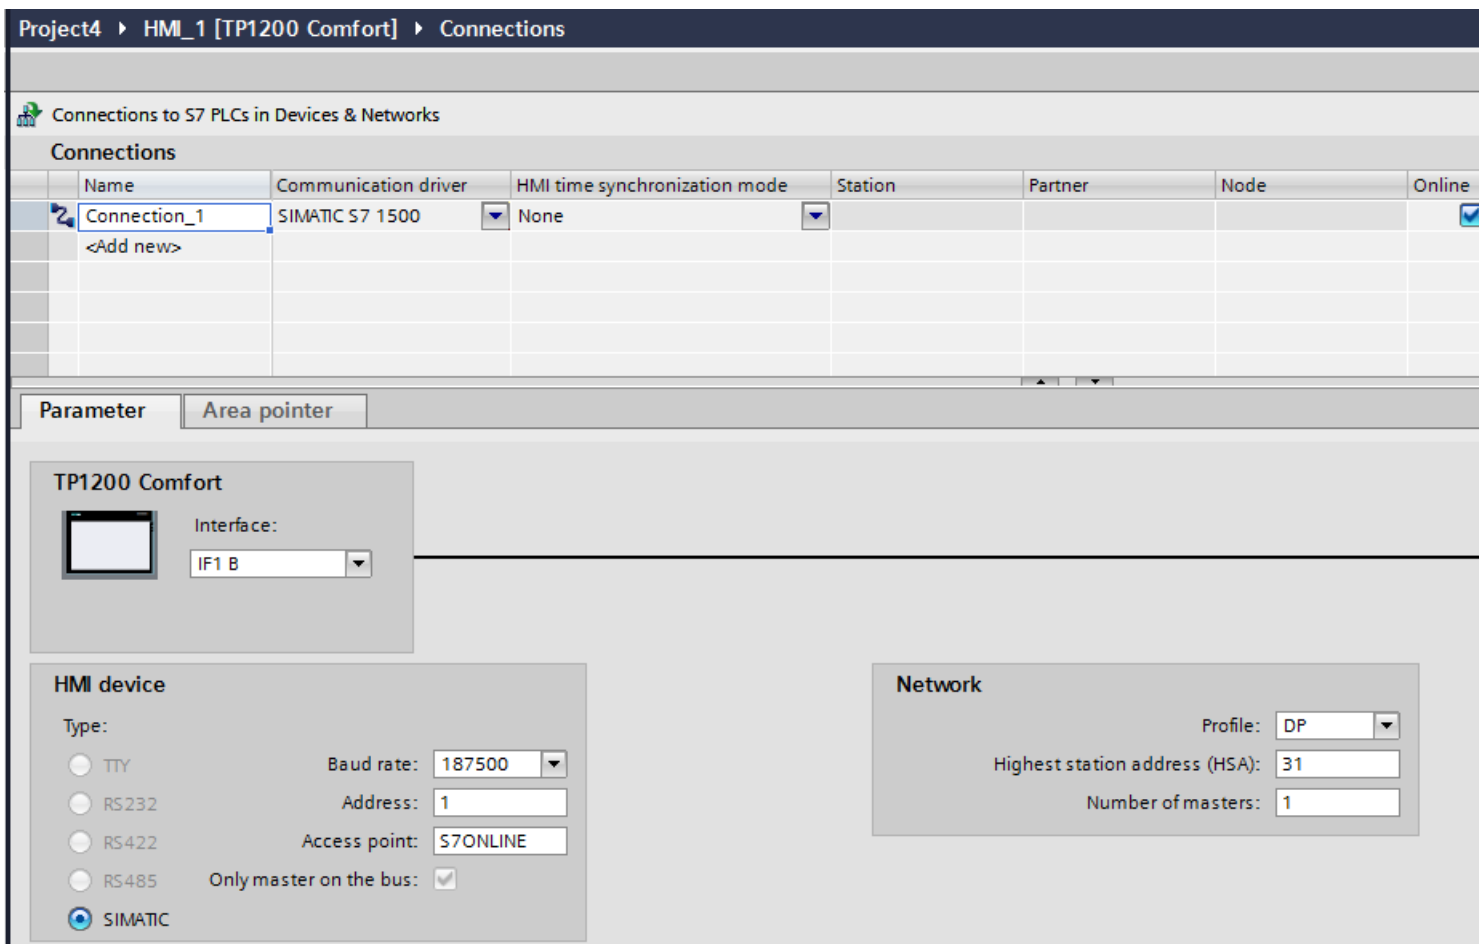

## Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".

3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select the "IF 1 B" interface from "Parameters > interface" in the Inspector window.

6. Select the "DP" profile in the Inspector window under "Parameters > Network".

7. Set the addresses of the communication partners in the inspector window:

- HMI device: "Parameters > HMI device > Address"
- PLC: "Parameters > PLC > Address"

## Connection parameters

## Connection parameters

### Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.

Projekt1 ▶ HMI\_4 [TP1200 Comfort] ▶ Connections

Address:

Access point:

**PLC**

Address:

Access password:

## PROFIBUS parameters

### Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"  
Specifies the physical connection used.
- "Interface"  
For "Interface", you select the HMI device interface via which the HMI device is connected to the PROFIBUS network.

- "Baud rate"  
For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

---

**Note**

If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

---

- "Address"  
You set the PROFIBUS address of the HMI device under "Address". The PROFIBUS address must be unique in the PROFIBUS network.
- "Only master on bus"  
Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master).  
In S7-200, you must set an HMI device as the master.
- "Access point"  
The access point defines a logical device name through which the communication partner can be reached.

## Parameters for the network

Under "Network", you set the parameters for the PROFIBUS network to which the HMI device is linked.

- "Profile"  
For "Profile", you select the network profile that is used in the network. In "Profile", set "DP", "Universal", or "Standard". The setting must be identical throughout the network.
- "Highest address"  
For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual PROFIBUS address. The setting must be identical throughout the network.

---

**Note**

If you set a baud rate of 1.5 Mbaud in the OP 73 or the OP 77A, the highest station address must be less than or equal 63.

---

- "Number of masters"  
For "Number of masters", set the number of masters in the PROFIBUS network. This information is necessary to correctly calculate the bus parameters.

## Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"  
For "Address", set the PROFIBUS address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Access password"  
Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

---

### Note

You only need a password if you have set "Complete protection" at the PLC.

No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

---

## Ethernet parameters

### Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"  
If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

---

### Note

The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

---

The IP address is transferred to the HMI device during project transfer.

To set up the IP address of the HMI device:

- Click the HMI device.
- Open the "Device configuration" editor.
- Click the Ethernet interface.
- Assign the IP address in the inspector window under:

"General > PROFINET interface > Ethernet addresses"

- "Address"  
You assign the IP address of the HMI device in the "Address" area.  
When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.
- "Access point"  
Specifies the access point for the PG/PC interface that can be used to reach the communication partner.

### Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"  
Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Access password"  
Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

---

#### Note

You only need a password if you have set "Complete protection" at the PLC.

No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

---

### 10.11.6.7 Configuring connections in the "Connections" editor

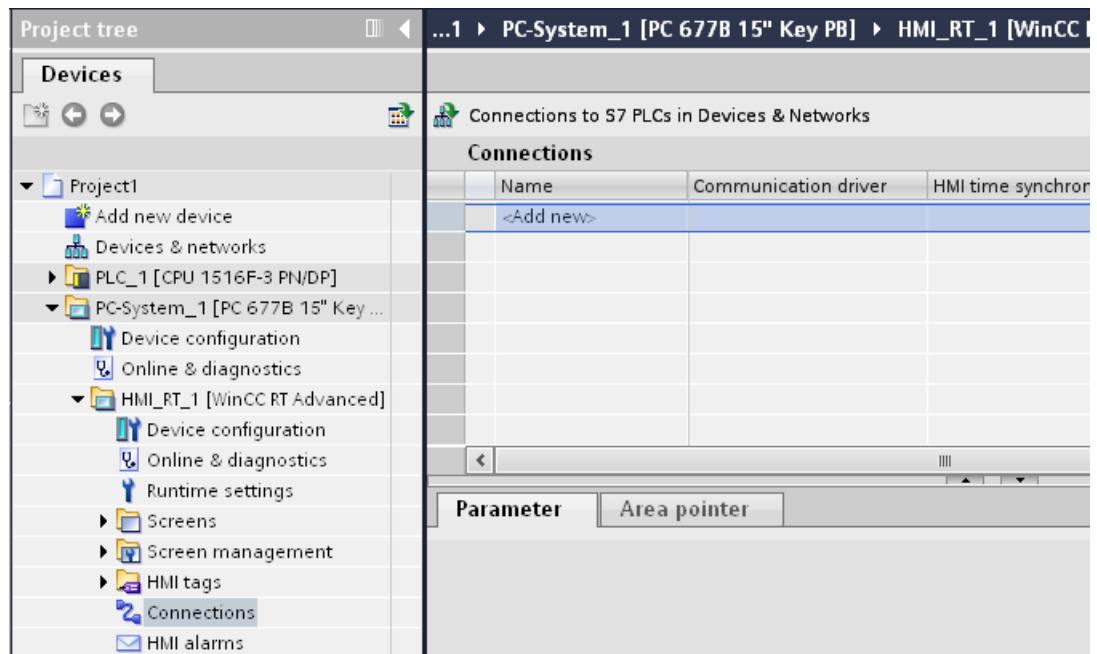

#### Creating a connection

#### Requirements

- A project is open.
- WinCC RT Advanced is created.

## Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".

3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select an interface of the HMI device in the Inspector window under "Parameters > Interface".
6. Set the parameters for the connection in the Inspector window.

## Interfaces

Select one of the following interfaces in the Inspector window under "Parameters > WinCC RT Advanced > Interfaces".:

- Industrial Ethernet
- MPI
- PROFIBUS

For additional information on the parameters of the interfaces see:

Connection parameters (Page 5384)

## Connection parameters

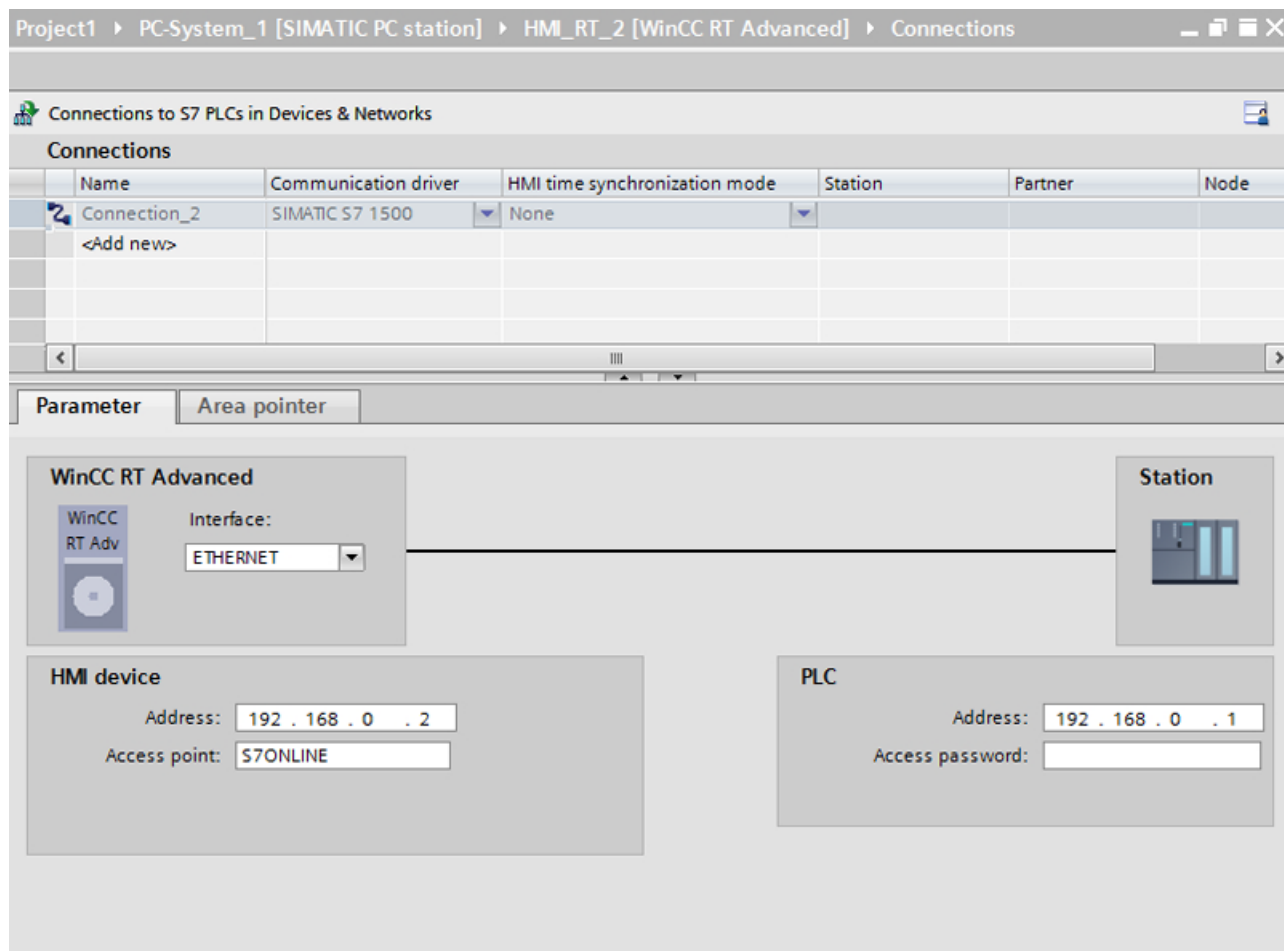

### ETHERNET

#### Introduction

You assign the parameters for the HMI device and the controller in the network under "Parameters".

The parameters described in the following apply to the following interfaces:

- TCP/IP

#### HMI device

- "Address"  
Enter the IP address of the HMI device under "Address".
- "Access point"  
Specifies the access point for the PG/PC interface that can be used to reach the communication partner.

## Controller

- "Address"  
Enter the IP address of the controller under "Address".
- "Access password"  
Enter a password in the "Access password" field. This password must match the one you saved to the controller.

---

### Note

You only need a password if you have set the "Complete protection" protection level at the controller.

No connection to the controller is established if the "Complete protection" protection level is stored on the controller and you do not enter a password.

---

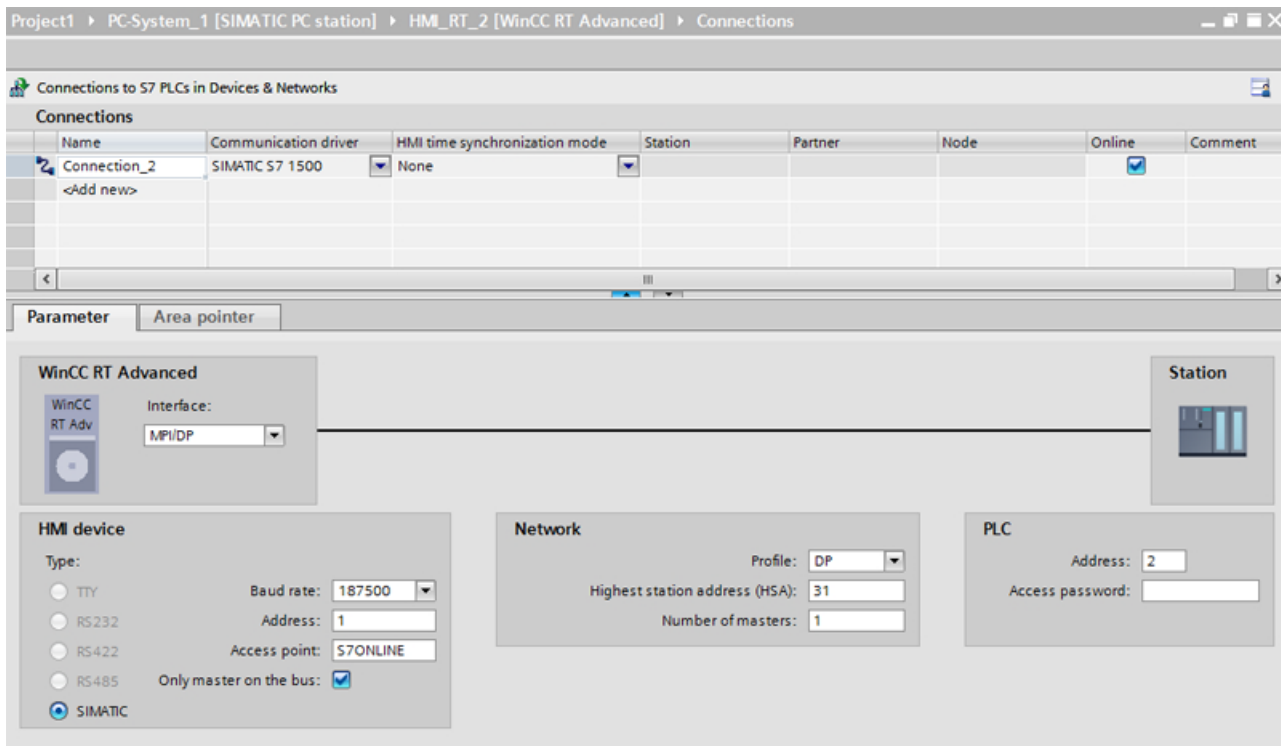

## MPI/DP

### Introduction

You assign the parameters for the HMI device and the controller in the network under "Parameters".

The parameters described in the following apply to the following interfaces:

- PROFIBUS

### HMI device

- "Baud rate"  
Select the baud rate of the HMI device under "Baud rate".
- "Address"  
Enter the address of the HMI device under "Address".
- "Access point"  
Enter the logical device name under "Access point".

### Controller

- "Address"  
Enter the address of the controller under "Address".
- "Access password"  
If you have configured the degree of protection "Complete protection" for the controller, enter the password for the controller under "Access password".

### 10.11.6.8 Configuring time synchronization

#### Time synchronization

##### Introduction

To have the same time of day throughout the plant, you can synchronize the time on various plant components using time synchronization. WinCC time synchronization is operated as a master-slave system.

One system component must be a clock for all components of a plant to work with identical time. The component functioning as the clock is referred to as the time master. The components that receive the time are time slaves.

##### Properties of time synchronization

- The HMI device can define the time as master or can accept the time of the PLC as slave.
- In "master mode", the time is synchronized at each connection setup.
- In "slave mode", the time is synchronized at each connection setup and then at cyclic intervals of 10 minutes.
- The first time synchronization is performed on the HMI device immediately after the start of runtime.
- Time synchronization is only performed on the HMI device during operation of runtime.

#### Time synchronization restrictions

##### Approved HMI devices

You can configure the time synchronization between a SIMATIC S7-1200 or SIMATIC S7-1500 and an HMI device with the following HMI devices:

Device	Operating system
Basic Panels	-
TP177 4"	Windows CE 5.0
Multi Panel 177	Windows CE 5.0
Multi Panel 277	Windows CE 5.0
Multi Panel 377	Windows CE 5.0
Mobile Panel 277	Windows CE 5.0
Mobile 277 IWLAN V2	Windows CE 5.0
Comfort Panels	Windows CE 6.0
PC systems with WinCC RT Advanced	Microsoft Windows XP Microsoft Windows 7

### Configuration restrictions

- If an HMI device has several connections to SIMATIC S7-1200 or SIMATIC S7-1500, you can only configure one connection as "slave".
- If you have enabled time synchronization for the HMI device as "slave", you can no longer use the global area pointer "Date/time PLC".
- An HMI device can only request the time from a PLC with "Complete protection" security type configuration if the correct "Access password" is configured. Configure the "Access password" for communication with a PLC with "Complete protection" security type in the "Connections" editor of the HMI device. This "Access password" must match the password configured on the PLC. The PLC password is assigned in the PLC properties at: "General > Security"
- Basic Panels can only be configured as "Slave".
- If you use Basic Panels for the configuration, it is not possible to use time synchronization via NTP and the "Date/time PLC" area pointer simultaneously.
- Time synchronization with SIMATIC S7-1200 (V1.0) controllers is not possible.
- Time synchronization between the HMI device TP177 4" and SIMATIC S7-1200 (V4.0) controllers is not possible.
- Time synchronization between the HMI device TP177 4" and SIMATIC S7-1500 is not possible.

### Configuring time synchronization for integrated connections

#### Introduction

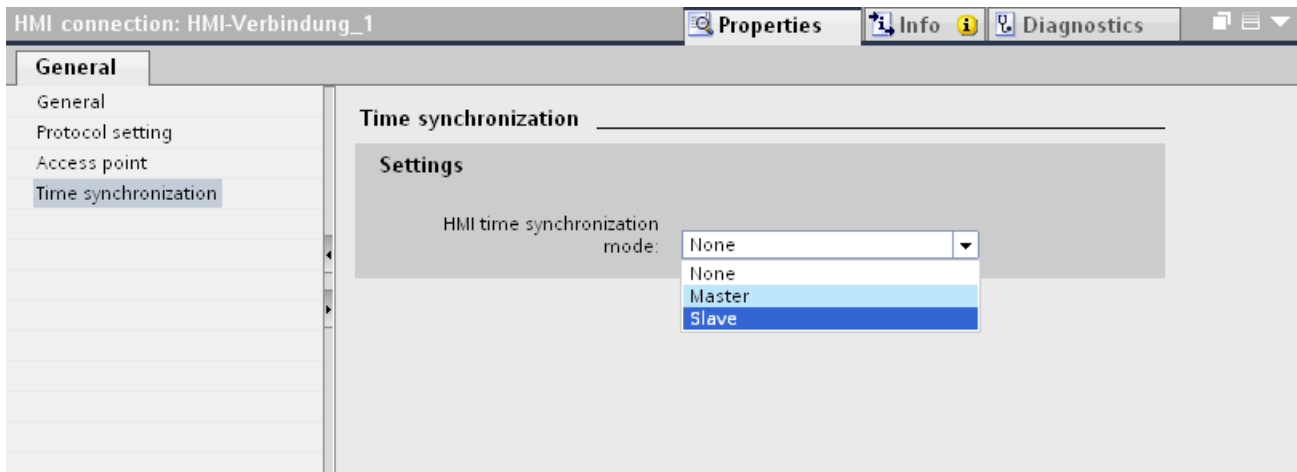

You configure time synchronization for an integrated connection in the "Devices & Networks" editor.

#### Requirements

- An HMI connection between an HMI device and a SIMATIC S7 1200 or SIMATIC S7 1500 has been configured.
- The HMI device must support the "time synchronization" function.
- The "Devices & Networks" editor is open.

## Procedure

1. Click the line of the HMI connection in the "Devices & networks" editor.
2. Select the following in the inspector window under "General > Time synchronization > Settings":
  - None: No time synchronization is used.
  - Master: The HMI device sets the time.
  - Slave: The PLC sets the time.

## Configuring time synchronization for non-integrated connections

### Introduction

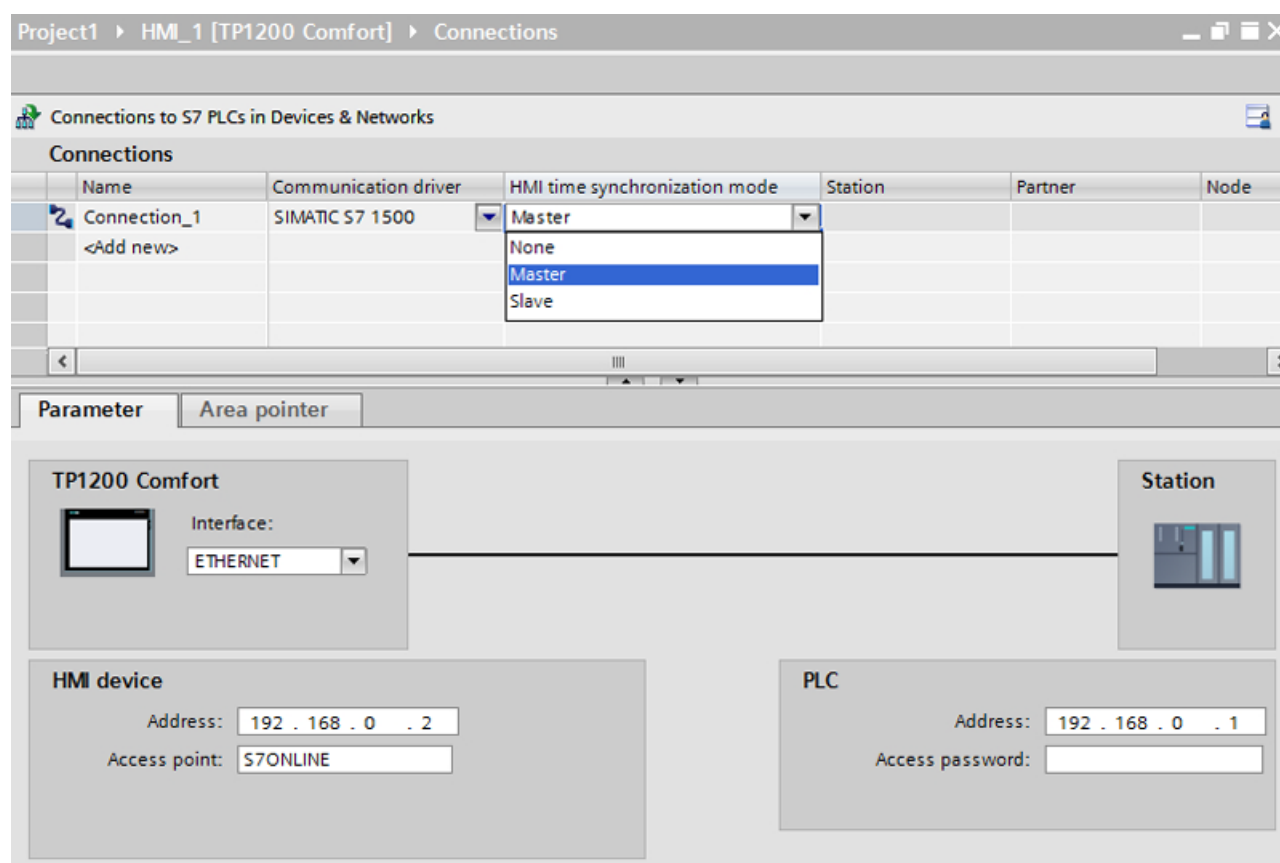

You configure time synchronization for a non-integrated connection in the "Connections" editor.

### Requirements

- An HMI device which supports the "time synchronization" function has been created.
- "Connections" editor is open.

## Procedure

1. Double-click "<Add>".
2. In the "Communication drivers" column, select the "SIMATIC S7 1200" PLC.
3. Select the following in the "HMI time synchronization mode" column:
  - None: No time synchronization is used.
  - Master: The HMI device sets the time.
  - Slave: The PLC sets the time.

## 10.11.7 Communicating with SIMATIC S7 1200

### 10.11.7.1 Communication with SIMATIC S7 1200

#### Introduction

This section describes the communication between an HMI device and the SIMATIC S7 1200 PLC.

You can configure the following communication channels for the SIMATIC S7 1200 PLC:

- PROFINET
- PROFIBUS

### HMI connection for communication

You configure connections between the HMI device and a SIMATIC S7 1200 in the "Devices & Networks" editor. If you have configured a HMI device with a serial port, you must configure a PROFIBUS-capable communication module to the SIMATIC S7 1200.

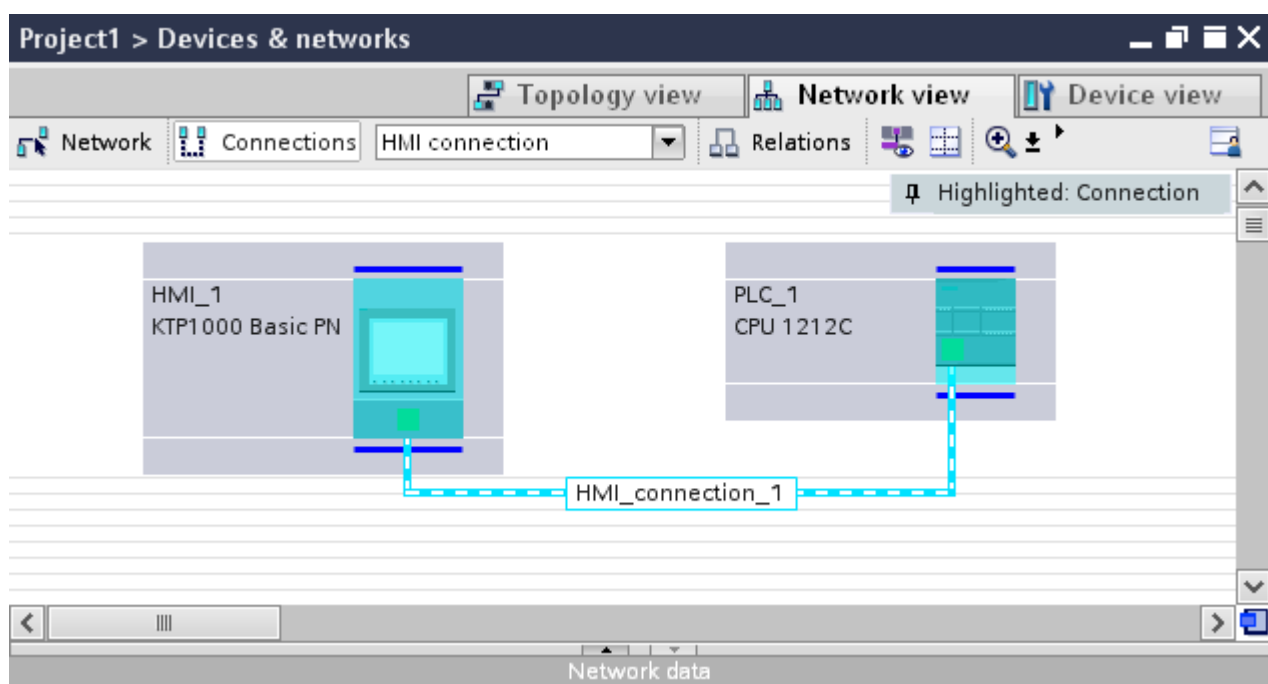

#### 10.11.7.2 Communication via PROFINET

##### Configuring an HMI connection

##### Communication via PROFINET

##### HMI connections via PROFINET

If you have inserted an HMI device and a SIMATIC S7 1200 into the project, you interconnect the two PROFINET interfaces in the "Devices & Networks" editor.

You can also connect multiple HMI devices to one SIMATIC S7 1200 and multiple SIMATIC S7 1200s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

## HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

## Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

## Configuring an HMI connection via PROFINET

### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFINET or Ethernet in the "Devices & Networks" editor.

#### CAUTION

#### Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

### Requirements

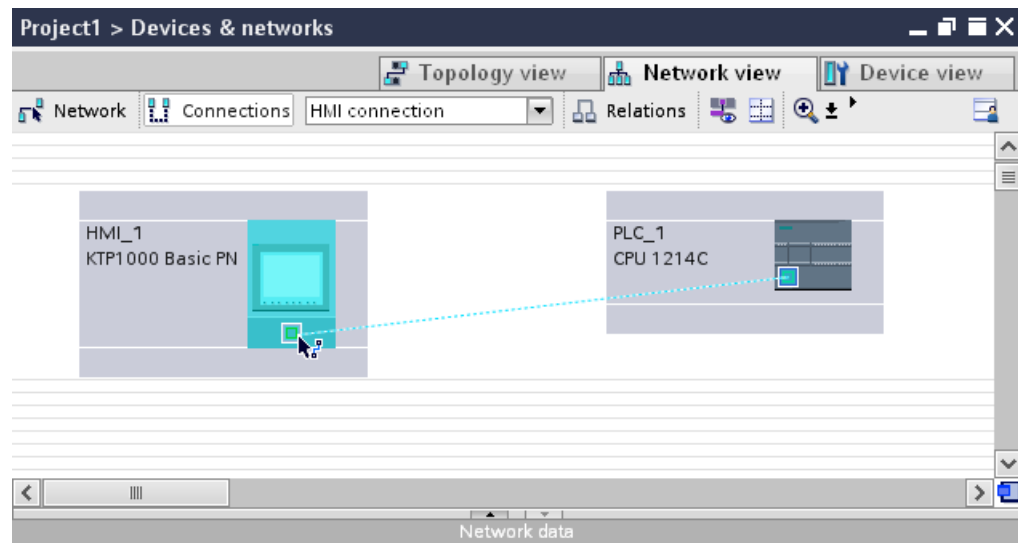

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1200
- HMI device with PROFINET or Ethernet interface

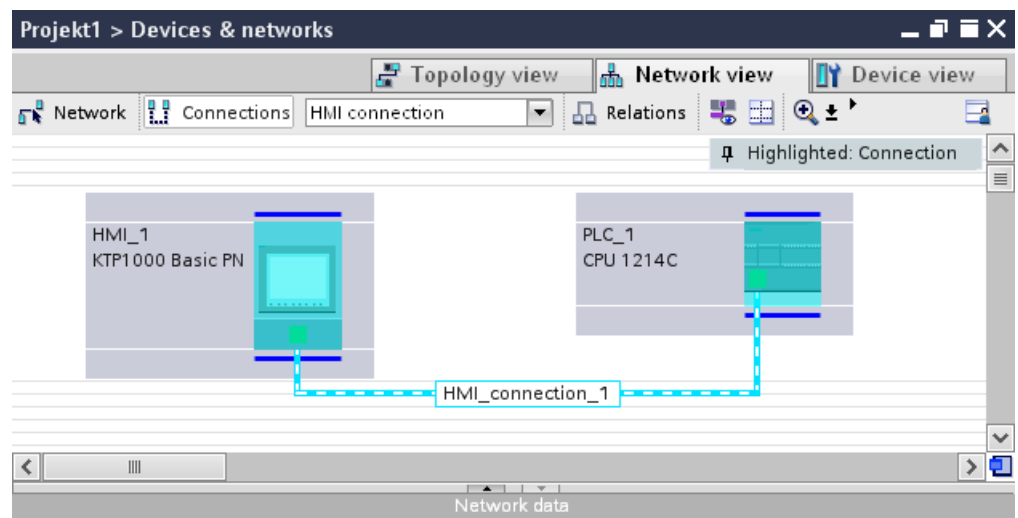

### Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.

- Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the HMI device.

- Click the connecting line.
- Click "Highlight HMI connection" and select the HMI connection.

The connection is displayed graphically in the Inspector window.

- Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project. See the chapter "PROFINET parameters (Page 5400)" for additional details.

#### Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

## Result

You have created a connection between an HMI device and a SIMATIC S7 1200. The IP address and subnet mask connection parameters are configured.

## Configuring an HMI connection

### Communication via PROFINET

### Communication via PROFINET

This section describes the communication between a WinCC Runtime and the SIMATIC S7 1200 PLC via PROFINET.

You can use the following WinCC Runtimes as an HMI device:

- WinCC RT Advanced

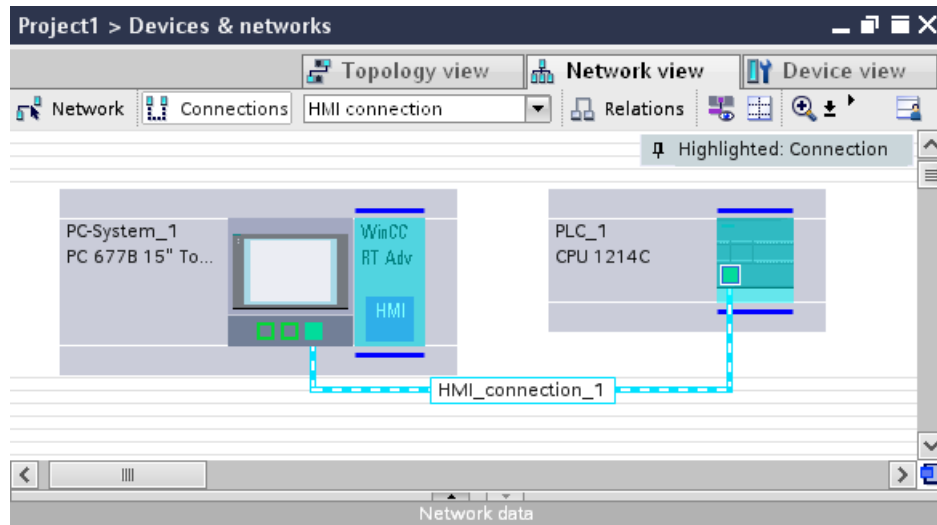

### WinCC Runtime as HMI device

You configure the HMI connections between WinCC Runtime and SIMATIC S7 1200 in the "Devices & Networks" editor.

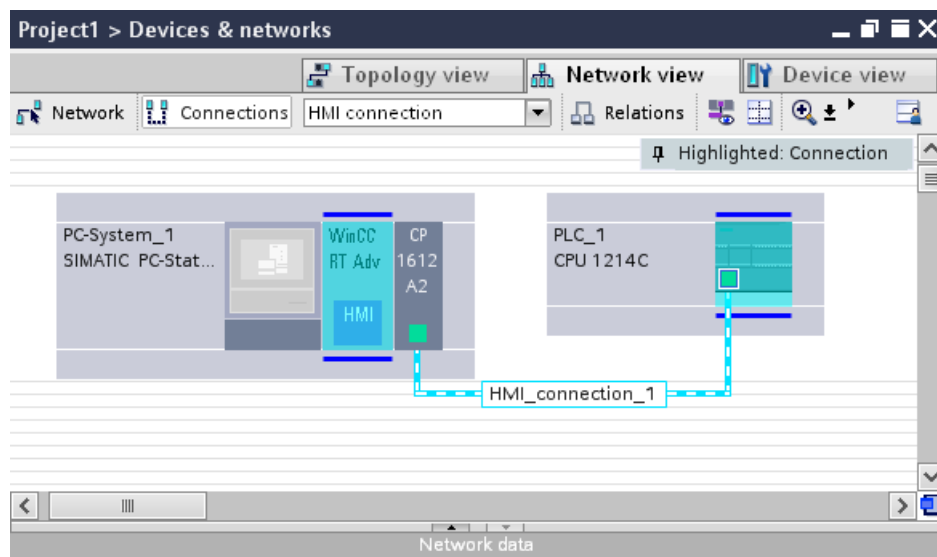

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC. In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.

2. You create a Runtime and configure a communication processor to the Runtime. In this way you use your configuration PC as an HMI device.

You can also connect multiple HMI devices to one SIMATIC S7 1200 and multiple SIMATIC S7 1200s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

## HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

### Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

## Configuring an HMI connection via PROFINET with a SIMATIC PC

### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFINET or Ethernet in the "Devices & Networks" editor.

#### CAUTION

##### Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

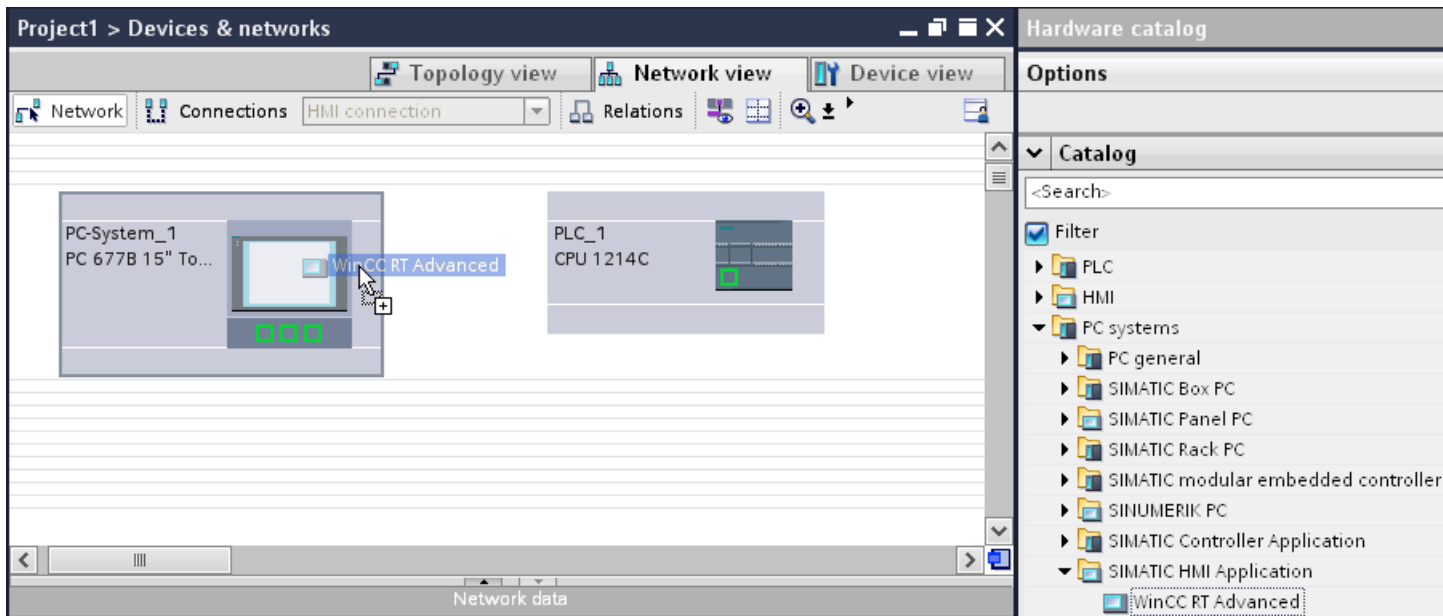

### Requirements

The following communication partners are created in the "Devices & Networks" editor:

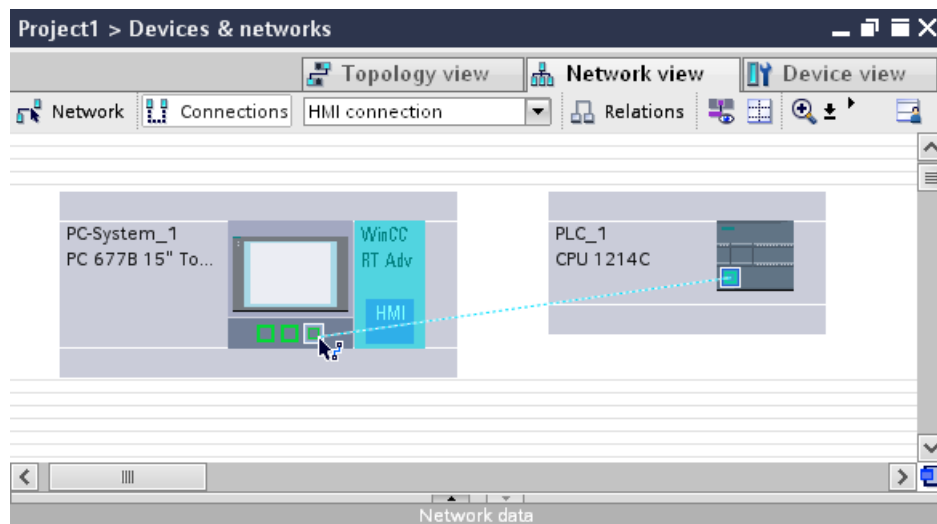

- SIMATIC S7 1200
- SIMATIC PC with PROFINET interface

## Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.

3. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.
4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET interface of the PC.

5. Click the connecting line.

6. Click "Highlight HMI connection" and select the HMI connection.  
The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.  
See the chapter "PROFINET parameters (Page 5400)" for additional details.

---

**Note**

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

---

## Result

You have created a connection between an HMI device and a SIMATIC S7 1200. The IP address and subnet mask connection parameters are configured.

## Configuring an HMI connection via PROFINET with a PC

### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFINET or Ethernet in the "Devices & Networks" editor.

**CAUTION**

**Communication via Ethernet**

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

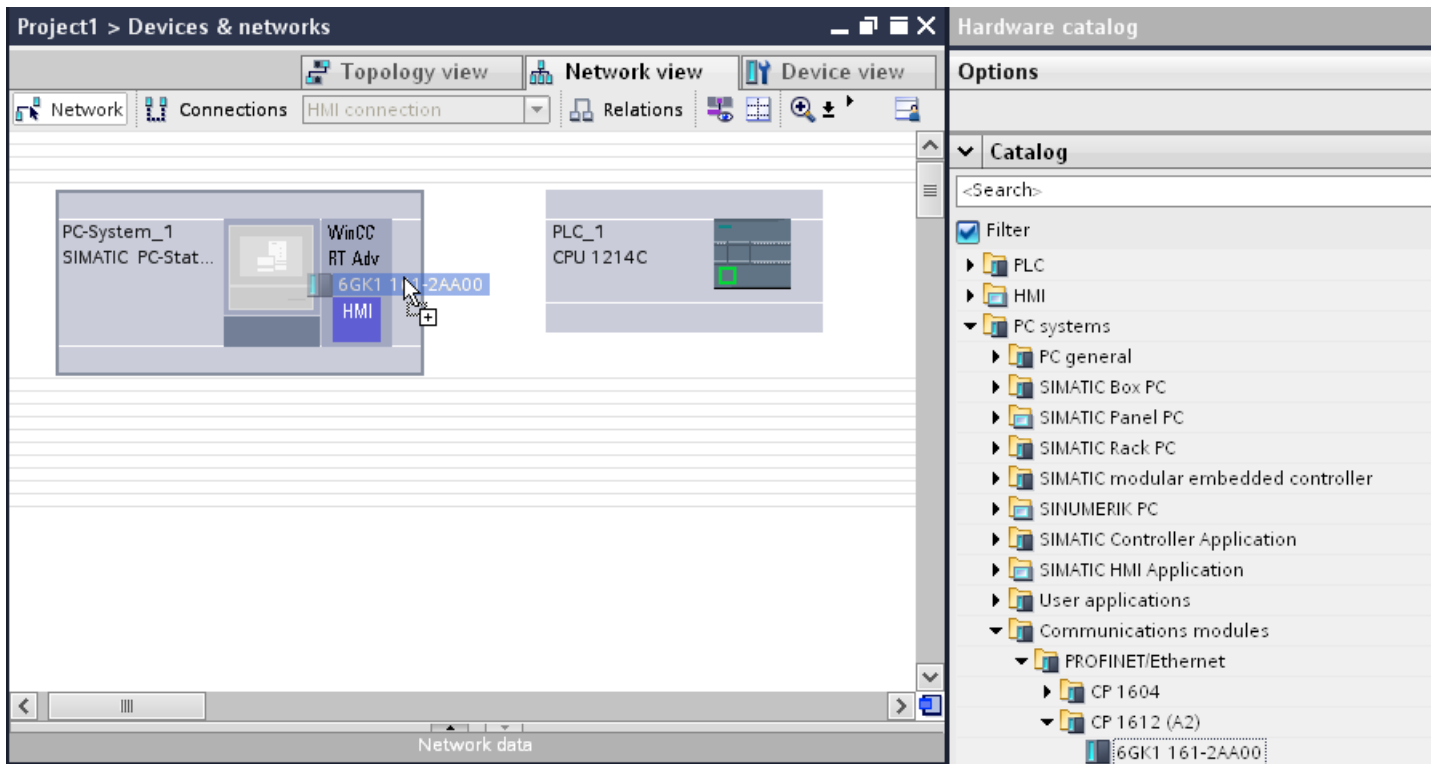

### Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1200
- PC station with WinCC RT Advanced

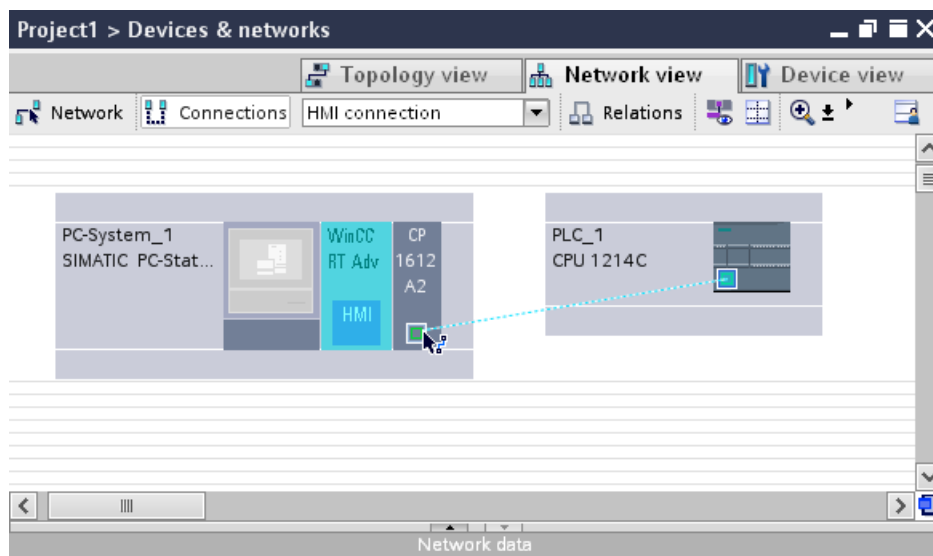

## Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a communication processor from the hardware catalog to the WinCC Runtime.

3. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.

- Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET interface of the communication processor.

- Click the connecting line.
- Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
- Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project. See the chapter "PROFINET parameters (Page 5400)" for additional details.

**Note**

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

**Result**

You have created a connection between an HMI device and a SIMATIC S7 1200. The IP address and subnet mask connection parameters are configured.

**PROFINET parameters**

**PROFINET parameters for the HMI connection**

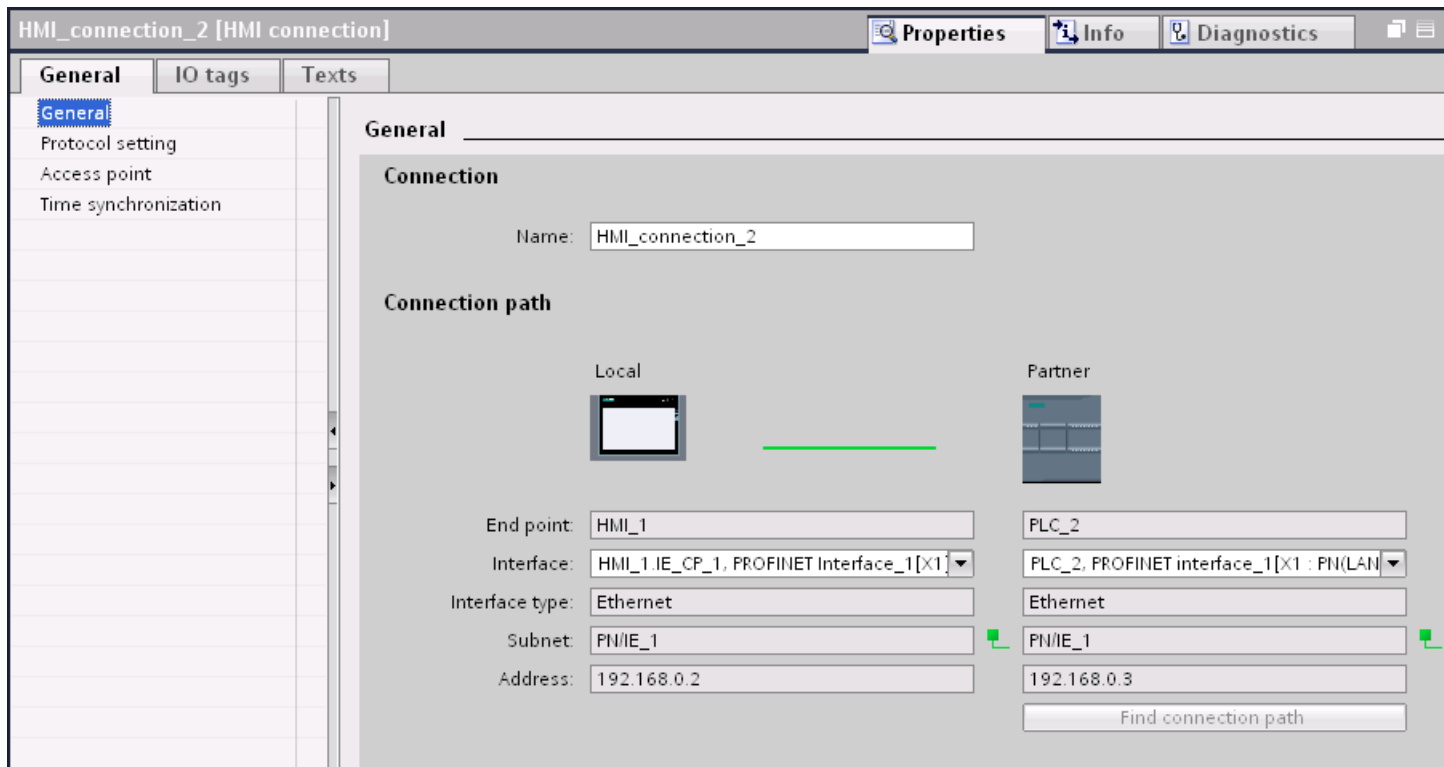

**PROFINET parameters for the HMI connection**

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

## Displaying and editing HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".

## Connection

The "Connection" area displays the HMI connection created for communication between the devices.

You can edit the name of the HMI connection in this area.

## "Connection path"

The communication partners of the selected HMI connection and the associated PROFINET parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"  
Displays the device name. This area cannot be edited.
- "Interface"  
Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"  
Displays the selected interface type. This area cannot be edited.

- "Subnet"  
Displays the selected subnet. This area cannot be edited.
- "Address"  
Displays the selected IP address of the device. This area cannot be edited.
- "Find connection path" button  
Enables the subsequent specification of connections.

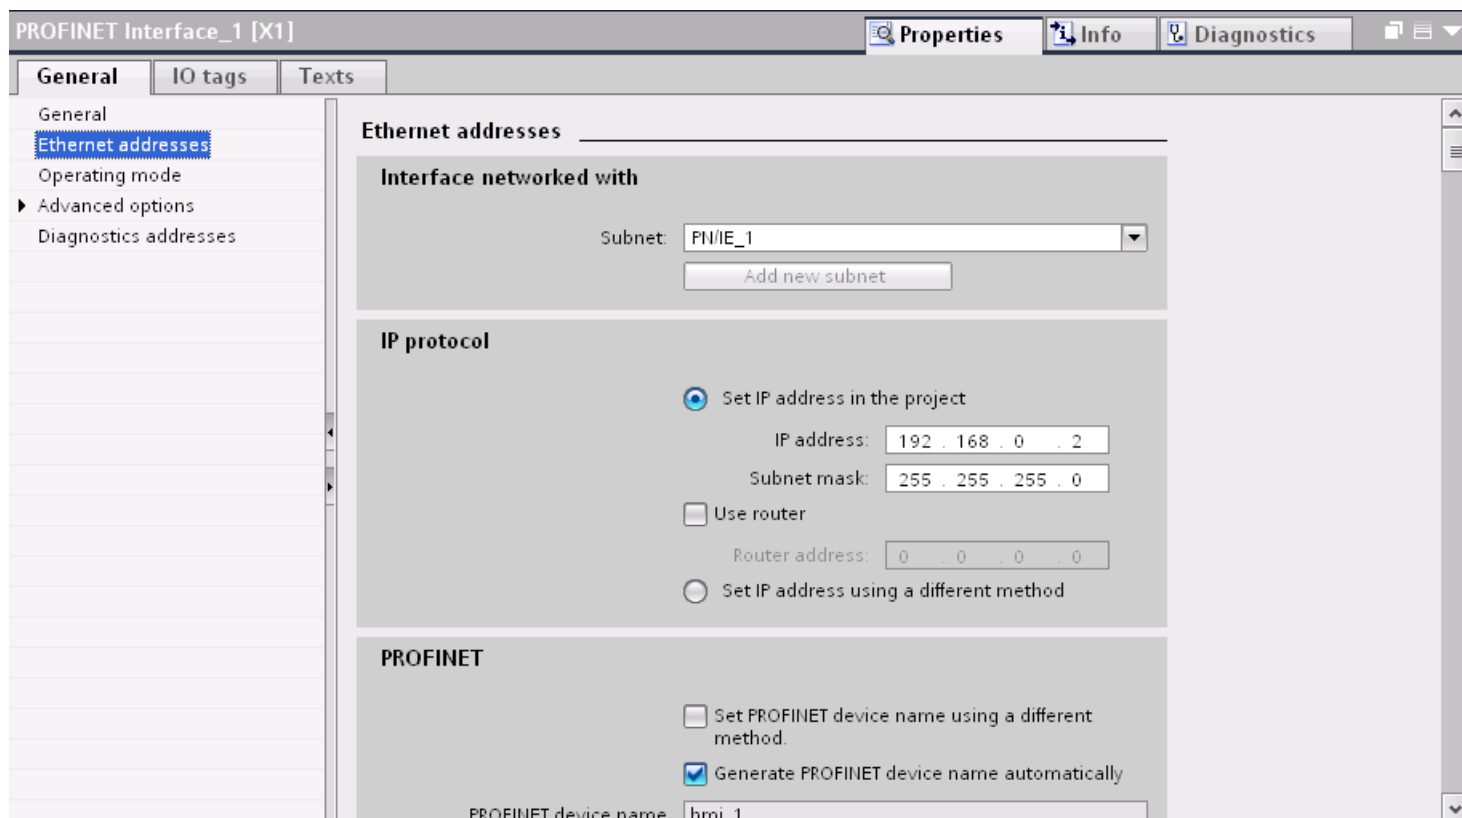

## PROFINET parameters for the HMI device

## PROFINET parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

## Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".

**"Interface networked with"**

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

**"IP protocol"**

- "Set IP address in the project"  
When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

---

**Note**

The device is automatically restarted in the case of HMI devices with the Windows CE 3.0 operating system.

HMI devices with Windows CE 3.0:

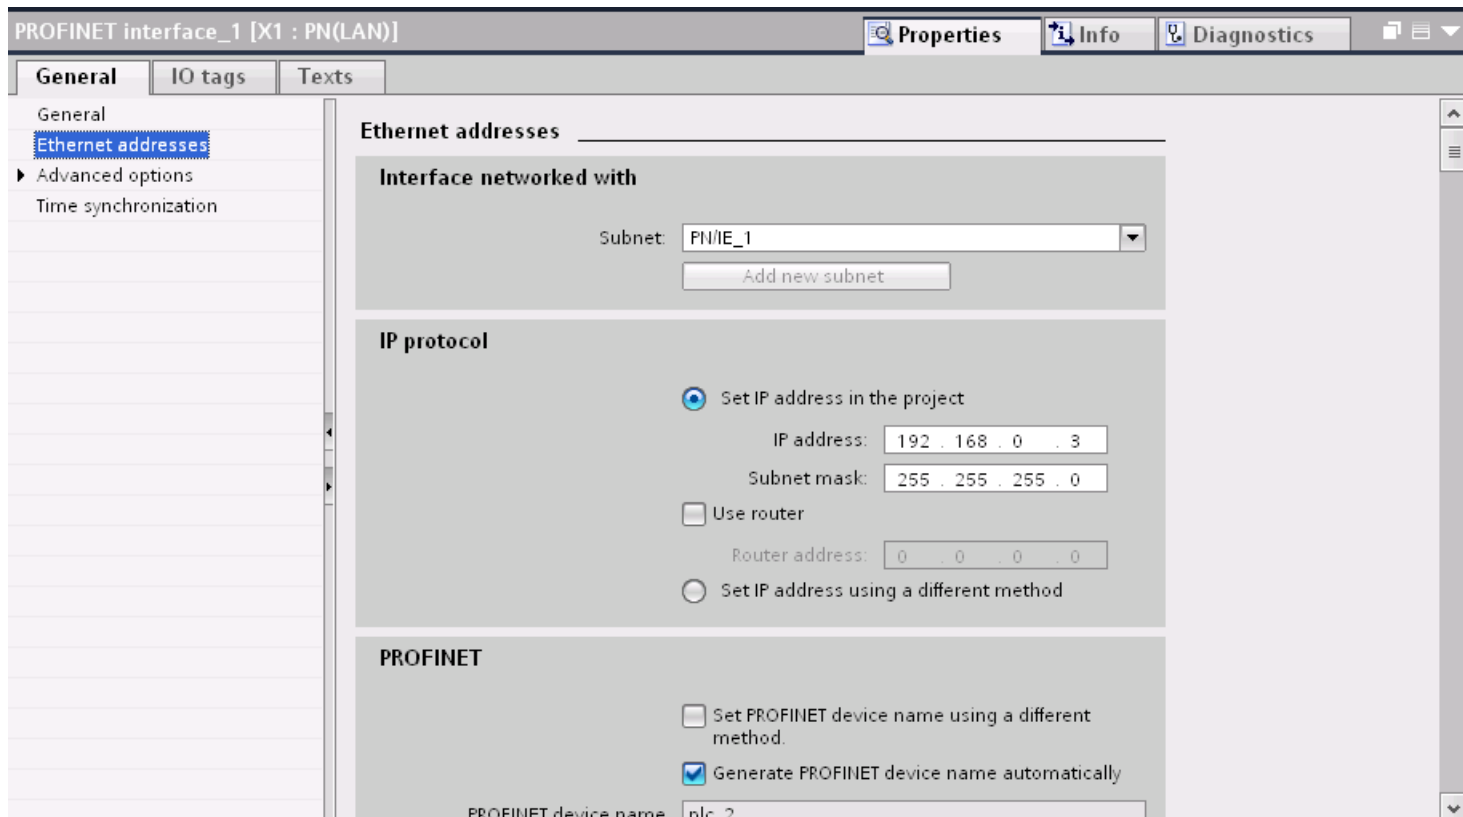

- OP 77B
  - TP 177B color PN/DP
  - TP 177B mono DP
  - OP 177B color PN/DP
  - OP 177B mono DP
  - Mobile Panel 177 PN
  - Mobile Panel 177 DP
  - TP 277 6"
  - OP 277 6"
- 
- "Subnet mask"  
You assign data of the subnet mask in the "Subnet mask" area.
  - "Use IP router"  
If you are using an IP router, select "Use IP router" and enter the router address in the "Router address" field.
  - "Set IP address using a different method"  
If the function "Set IP address using a different method" is activated, the IP address is not taken from the project. You have to enter the IP address directly in the Control Panel of the HMI device.

**PROFINET parameters for the PLC****PROFINET parameters for the PLC**

An overview of the configured parameters can be found in the properties for the PLC.

## Displaying and changing PROFINET parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".

### "Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

### "IP protocol"

- "Interface type"  
Depending on the HMI device type, you have various interfaces to choose from.
- "IP address"  
You assign the IP address of the HMI device in the "IP address" area.
- "Subnet mask"  
You assign data of the subnet mask in the "Subnet mask" area.  
If you are using an IP router, select "Use IP router" and enter the router address in the field.

## Configuring Industrial Ethernet

### Rules for the network configuration

The Ethernet interfaces of the devices have a default IP address that you can change.

### IP address

The IP parameters are visible if the communication-capable devices support the TCP/IP protocol.

The IP address consists of 4 decimal figures in the range of 0 to 255. The decimal figures are separated from one another by a dot.

Example: 140.80.0.2

The IP address consists of the following:

- The address of the (sub) net
- The address of the node (generally also called host or network node)

### Subnet mask

The subnet mask splits these two addresses. It determines which part of the IP address addresses the network and which part of the IP address addresses the node.

The set bits of the subnet mask determine the network part of the IP address.

Example:

Subnet mask: 255.255.0.0 = 11111111.11111111.00000000.00000000

In the example given for the above IP address, the subnet mask shown here has the following meaning:

The first 2 bytes of the IP address identify the subnet - i.e. 140.80. The last two bytes address the node, thus 0.2.

It is generally true that:

- The network address results from AND linking the IP address and subnet mask.
- The node address results from AND NOT linking the IP address and subnet mask.

### Relation between IP address and default subnet mask

An agreement exists relating to the assignment of IP address ranges and so-called "Default subnet masks". The first decimal number (from the left) in the IP address determines the structure of the default subnet mask. It determines the number of "1" values (binary) as follows:

IP address (decimal)	IP address (binary)	Address class	Default subnet mask
0 to 126	0xxxxxxx.xxxxxxxx...	A	255.0.0.0
128 to 191	10xxxxxx.xxxxxxxx...	B	255.255.0.0
192 to 223	110xxxxx.xxxxxxxx...	C	255.255.255.0

**Note**

**Range of values for the first decimal point**

A value of between 224 and 255 is also possible for the first decimal number of the IP address (address class D etc). This is, however, not recommended because there is no address check for these values.

**Masking other subnets**

You can use the subnet mask to add further structures and form "private" subnets for a subnet that is assigned one of the address classes A, B or C. This is done by setting other lower points of the subnet mask to "1". For each bit set to "1", the number of "private" networks doubles and the number of nodes they contain is halved. Externally, the network functions like an individual network as it did previously.

Example:

You have a subnet of address class B (e.g. IP address 129.80.xxx.xxx) and change the default subnet mask as follows:

Masks	Decimal	Binary
Default subnet mask	255.255.0.0	11111111.11111111.00000000.00000000
Subnet mask	255.255.128.0	11111111.11111111.10000000.00000000

Result:

All nodes with addresses between 129.80.001.xxx and 129.80.127.xxx are on one subnet, all nodes with addresses between 129.80.128.xxx and 129.80.255.xxx are on another subnet.

**Router**

The job of the routers is to connect the subnets. If an IP datagram is to be sent to another network, it first has to be conveyed to a router. To make this possible, in this case you have to enter the address of the router for each node in the subnet.

The IP address of a node in the subnet and the address of the router may only differ at the points at which there is a "0" in the subnet mask.

**Configuring time synchronization for integrated connections**

**Introduction**

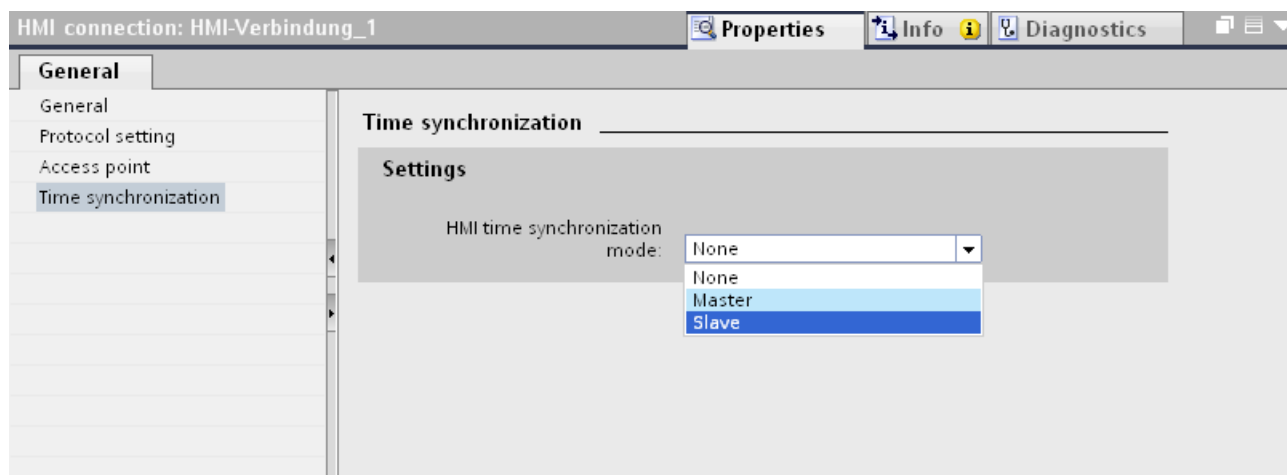

You configure time synchronization for an integrated connection in the "Devices & Networks" editor.

## Requirements

- An HMI connection between an HMI device and a SIMATIC S7 1200 has been configured.
- The HMI device must support the "time synchronization" function.
- The "Devices & Networks" editor is open.

## Procedure

1. Click the line of the HMI connection in the "Devices & networks" editor.
2. Select the following in the inspector window under "General > Time synchronization > Settings":
  - None: No time synchronization is used.
  - Master: The HMI device sets the time.
  - Slave: The PLC sets the time.

## Protection of communication

### Security levels

If you want to protect the PLC and HMI device communication, you can assign protection levels for the communication.

For a SIMATIC S7-1500 CPU, you can enter multiple passwords and thereby set up different access rights for various user groups.

The passwords are entered in a table, so that exactly one protection level is assigned to each password.

The effect of the password is given in the "Protection" column.

For the SIMATIC S7-1200 controller, several aspects need to be considered when setting protection levels. For additional information on this, see: S7-1200 protection levels

## Example

You select the "Complete protection" protection level for a standard CPU (i.e., not an F-CPU) when configuring it.

Afterwards, you enter a separate password for every protection level above it in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the assigned passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (no protection) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (write protection) allows access as if the CPU were write-protected. Despite knowing the password, users who know this password only have read access to the CPU.
- The password in row 3 (read and write protection) allows access as if the CPU were read-protected and write-protected, so that only HMI access is possible for users who know this password.

## Access password for the HMI connection

### Introduction

Secure access to a PLC by assigning a password.

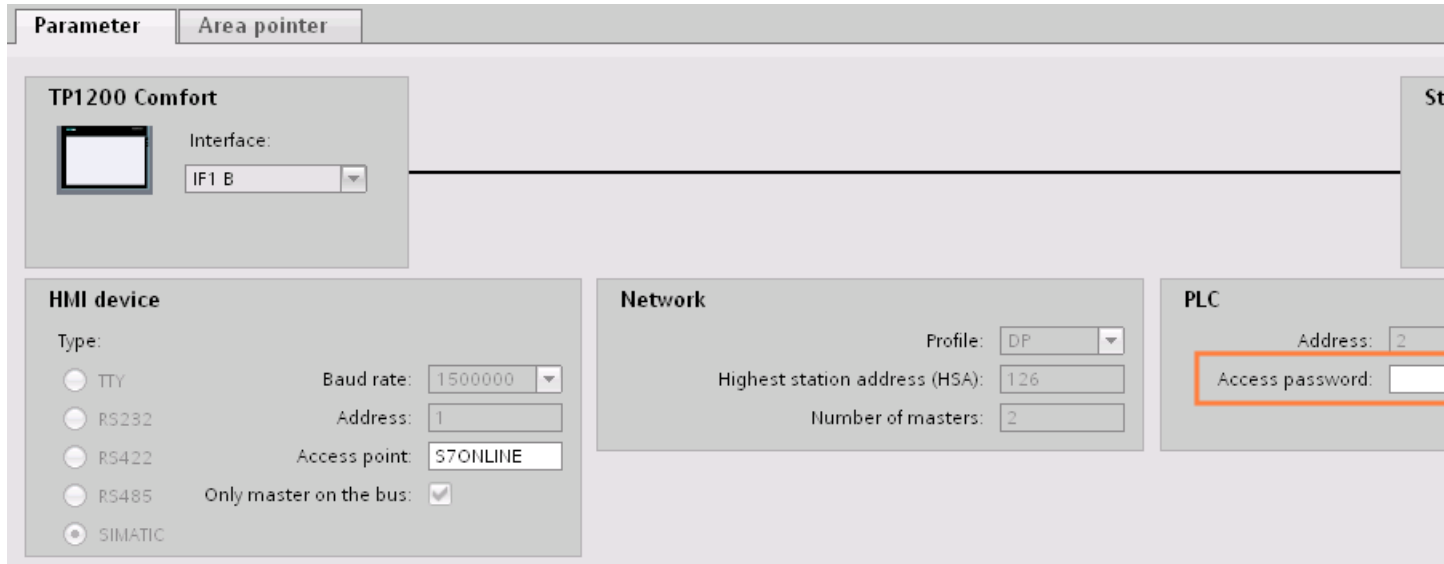

Assign the password when configuring the connection.

Input of the password of the PLC is mandatory as of "Complete protection" security level.

Communication to the PLC is denied if an incorrect password or no password is entered.

## Assigning password

Enter the "Access password" for the PLC in the "Connections" editor.

## Setting port options

### Setting the port options

### Changing connection settings for the PROFINET IO port

You can change the network settings for the PROFINET IO port as required. By default, the settings are made automatically. In normal situations, this guarantees problem-free communication.

### Possible settings for transmission rate / duplex

Depending on the selected device, you can make the following settings for "Transmission rate / duplex":

- **Automatic setting**  
Recommended default setting of the port. The transmission settings are automatically "negotiated" with the peer port. The "Enable autonegotiation" option is also enabled as a default, in other words, you can use cross cables or patch cables for the connection.
- **TP/ITP at x Mbps full duplex (half duplex)**  
Setting of the transmission rate and the full duplex/half duplex mode. The effectiveness depends on the "Enable autonegotiation" setting:
  - Autonegotiation enabled  
You can use both cross cable and patch cable.
  - Autonegotiation disabled  
Make sure that you use the correct cable (patch cable or cross cable)! The port is also monitored with this setting.
- **Deactivated**  
Depending on the module type, the drop down list box can contain the "- Disabled -" option. This option, for example, allows you to prevent access to an unused port for security reasons. With this setting, diagnostic events are not generated.

### "Monitor" option

This option enables or disables port diagnostics. Examples of port diagnostics: The link status is monitored, in other words, the diagnostics are generated during link-down and the system reserve is monitored in the case of fiber optic ports.

### Option "Enable autonegotiation "

The autonegotiation setting can only be changed if a concrete medium (for example, TP 100 Mbps full duplex) is selected. Whether or not a concrete medium can be set depends on the properties of the module.

If autonegotiation is disabled, this causes the port to be permanently specified, as for example, is necessary for a prioritized startup of the IO device.

You must make sure the partner port has the same settings because with this option the operating parameters of the connected network are not detected and the data transmission rate and transmission mode can accordingly not be optimally set.

---

#### Note

When a local port is connected, STEP 7 makes the setting for the partner port if the partner port supports the setting. If the partner port does not accept the setting, an error message is generated.

---

## Wiring rules for disabled autonegotiation

### Requirements

You have made the following settings for the port in question, for example, to accelerate the startup time of the IO device:

- Fixed transmission rate
- Autonegotiation incl. autocrossing disabled

The time for negotiating the transmission rate during startup has been saved.

If you have disabled autonegotiation, you must observe the wiring rules.

### Wiring rules for disabled autonegotiation

PROFINET devices have the following two types of ports:

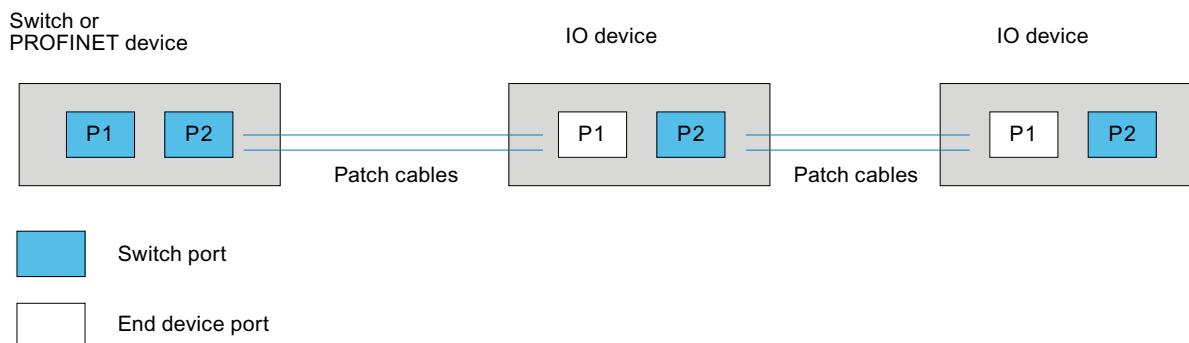

Type of port	PROFINET devices	Note
Switch port with crossed pin assignment	For IO devices: Port 2 For S7 CPUs with 2 ports: Ports 1 and 2	Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is exchanged internally.
End device port with uncrossed pin assignment	For IO devices: Port 1 For S7 CPUs with one port: Port 1	-

### Validity of the wiring rules

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting.

## Rules for cabling

You can connect several IO devices in line using a single cable type (patch cable). To do this, you connect port 2 of the IO device (distributed I/O) with port 1 of the next IO device. The following graphic gives an example with two IO devices.

## Boundaries at the port

### Requirements

To use boundaries, the respective device must have more than one port. If the PROFINET does not support boundary settings, they are not shown.

### Enable boundaries

"Boundaries" are limits for transmission of certain Ethernet frames. The following boundaries can be set at a port:

- "End of discovery of accessible devices"  
No forwarding of DCP frames to identify accessible devices. Devices downstream from this port cannot be reached by the project tree under "Accessible devices". Devices downstream from this port cannot be reached by the CPU.
- "End of topology discovery"  
LLDP frames (Link Layer Discovery Protocol) are not forwarded for topology detection.
- "End of sync domain"  
No forwarding of sync frames transmitted to synchronize nodes within a sync domain. If you operate, for example, a PROFINET device with more than two ports in a ring, you should prevent the sync frame from being fed into the ring by setting a sync boundary (at the ports not inside the ring).  
Additional example: If you want to use several sync domains, configure a sync domain boundary for the port connected to a PROFINET device from the other sync domain.

## Restrictions

The following restrictions must be observed:

- The individual check boxes can only be used if the port supports the function in question.
- If a partner port has been determined for the port, the following check boxes cannot be used:
  - "End of discovery of accessible devices"
  - "End of topology discovery"
- If autonegotiation is disabled, none of the check boxes can be used.

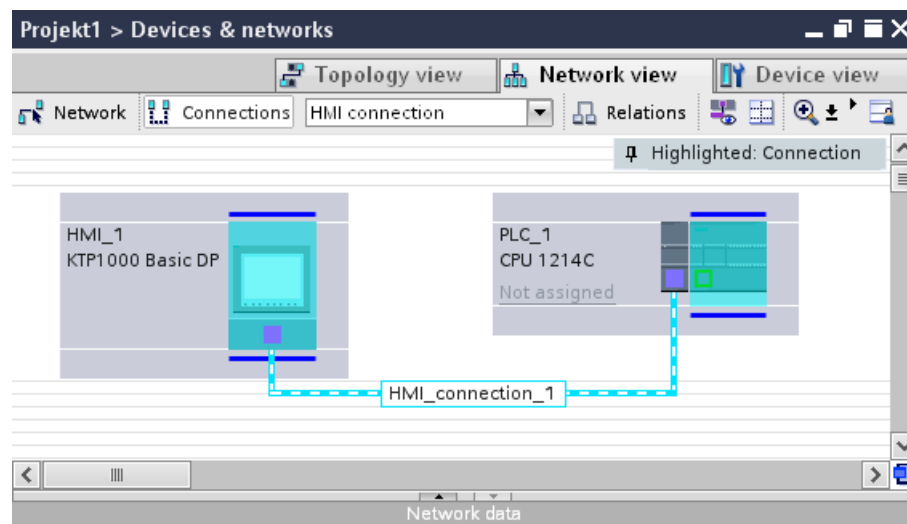

### 10.11.7.3 Communication via PROFIBUS

#### Configuring an HMI connection

#### Communication via PROFIBUS

#### HMI connections via PROFIBUS

If you want to connect a SIMATIC S7 1200 to a HMI device via PROFIBUS, you must configure a PROFIBUS-capable communication module to a slot of the controller first.

#### HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

## Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device in the "Connections" editor of the HMI device.

## Configuring an HMI connection via PROFIBUS

### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7-1200 via PROFIBUS in the "Devices & Networks" editor.

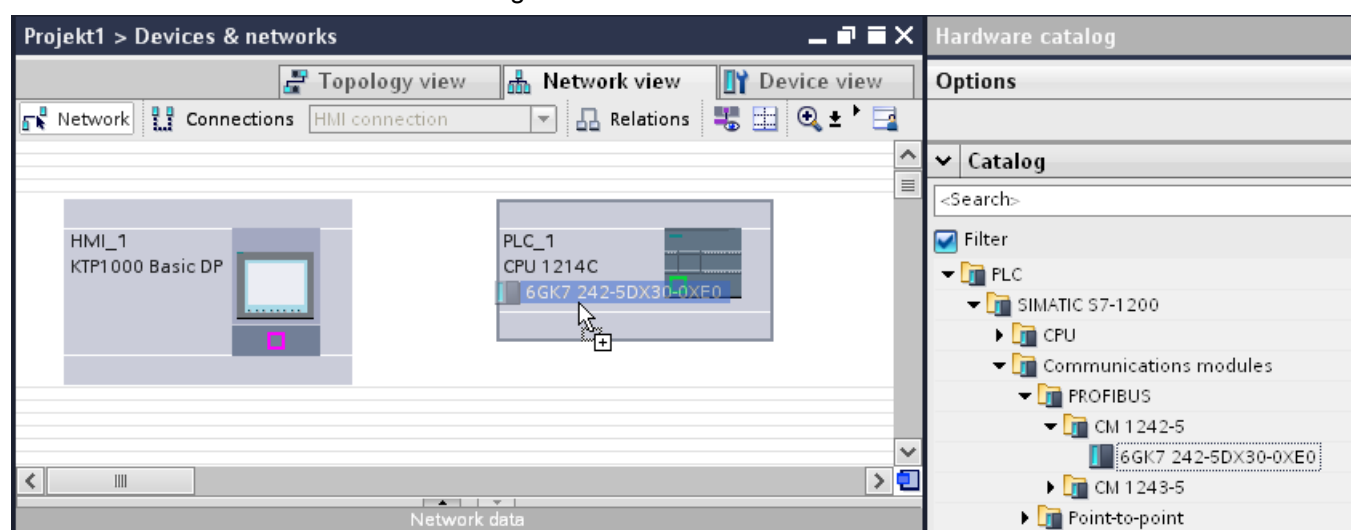

### Requirements

The following communication partners are created in the "Devices & Networks" editor:

- HMI device with MPI/DP interface
- SIMATIC S7-1200

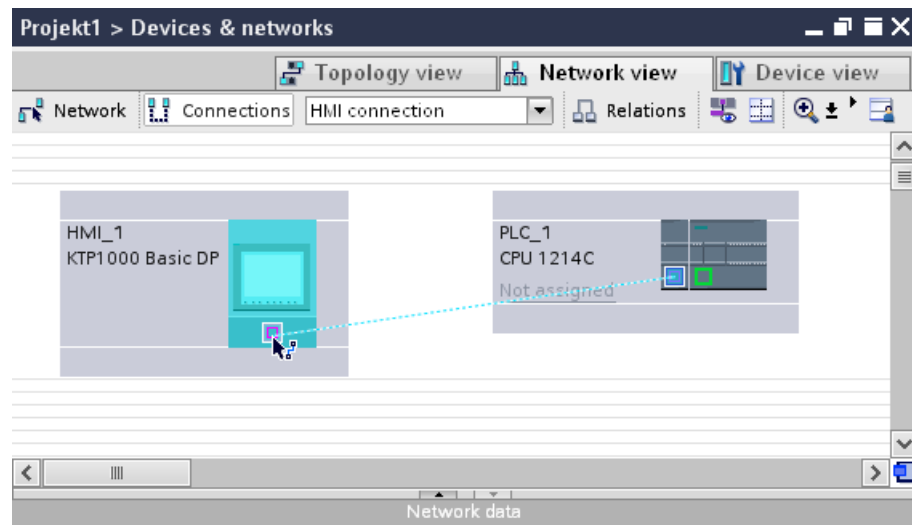

### Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button.  
The devices available for connection are highlighted in color.
3. Use a drag-and-drop operation to move a PROFIBUS-capable communication module from the hardware catalog to the PLC.

4. Click the HMI device interface.
5. Select the "PROFIBUS" interface type in the Inspector window under "Properties > General > PROFIBUS address/ MPI address > Parameters".

- Click the interface of the communication module and use a drag-and-drop operation to draw a connection to the HMI device.

- Click the name of the connection.  
The connection is displayed graphically in the Inspector window.
- Click "Highlight HMI connection" and select the HMI connection.
- Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project. See the section "PROFIBUS parameters (Page 5421)" for additional details.

#### Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

## Result

You have created an HMI connection between an HMI device and a SIMATIC S7-1200 via PROFIBUS.

## Configuring an HMI connection

## Communication via PROFIBUS

## Communication via PROFIBUS

This section describes the communication between a WinCC Runtime and the SIMATIC S7 1200 PLC via PROFIBUS.

You can use the following WinCC Runtimes as an HMI device:

- WinCC RT Advanced

If you want to connect a SIMATIC S7 1200 to an HMI device via PROFIBUS, you must configure a PROFIBUS-capable communication module in a slot of the PLC.

### WinCC Runtime as HMI device

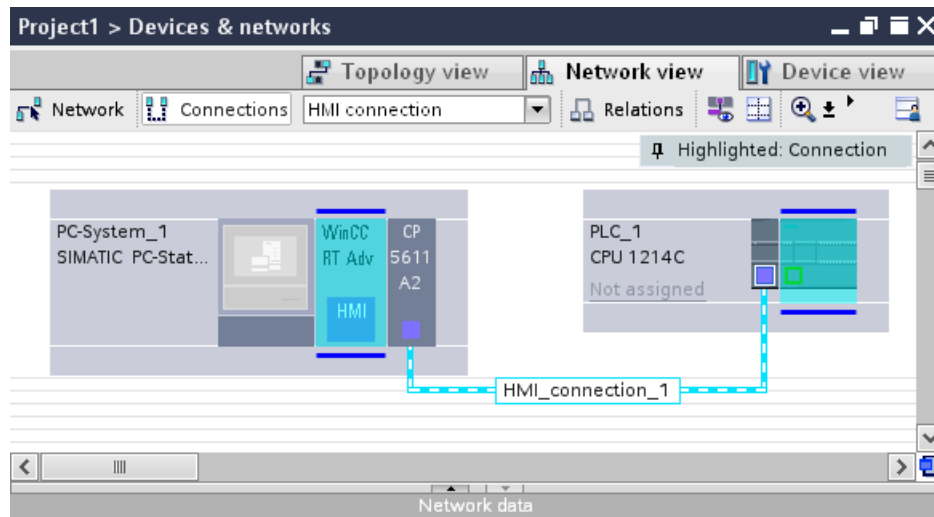

You configure the HMI connections between WinCC Runtime and SIMATIC S7 1200 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC. In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.

2. You create a WinCC Runtime and configure a communication processor to the Runtime. In this way you use your configuration PC with a WinCC Runtime as an HMI device.

You can also connect multiple HMI devices to one SIMATIC S7 1200 and multiple SIMATIC S7 1200s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

### **HMI connection in the "Devices & Networks" editor**

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

### **Connection in the "Connections" editor**

Alternatively, you configure the connection between the PLC and HMI device via PROFIBUS in the "Connections" editor of the HMI device.

## **Configuring an HMI connection via PROFIBUS with a SIMATIC PC**

### **Introduction**

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFIBUS in the "Devices & Networks" editor.

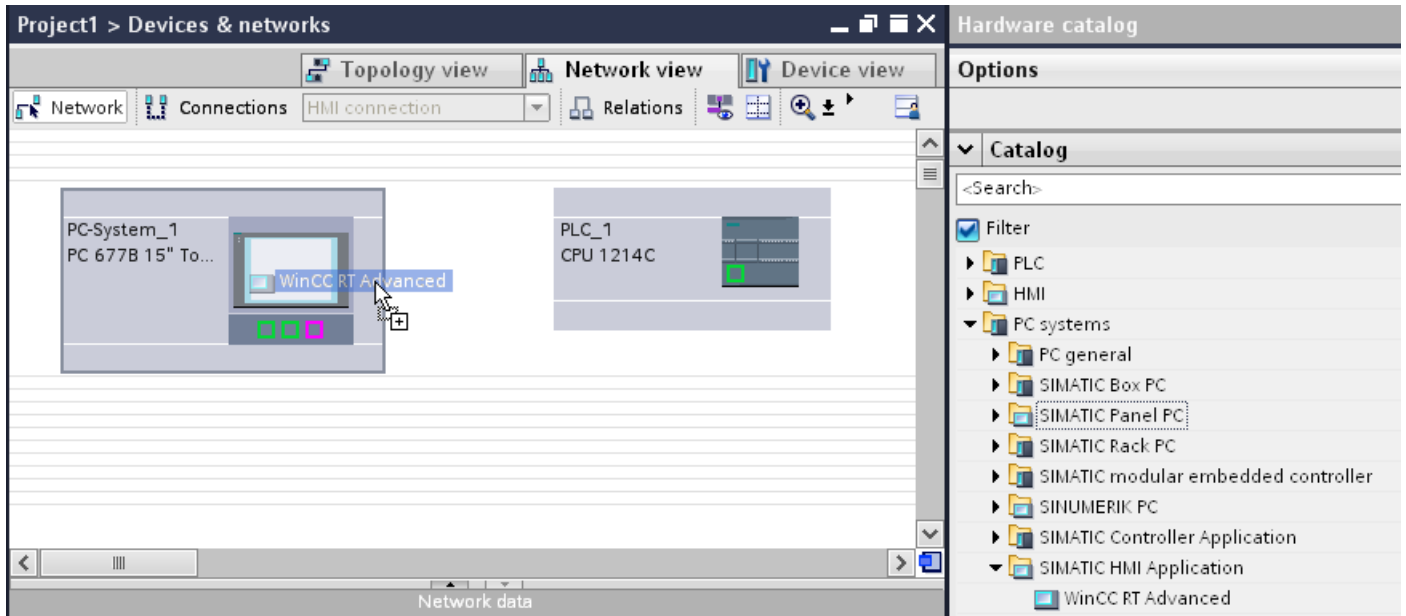

### **Requirements**

The following communication partners are created in the "Devices & Networks" editor:

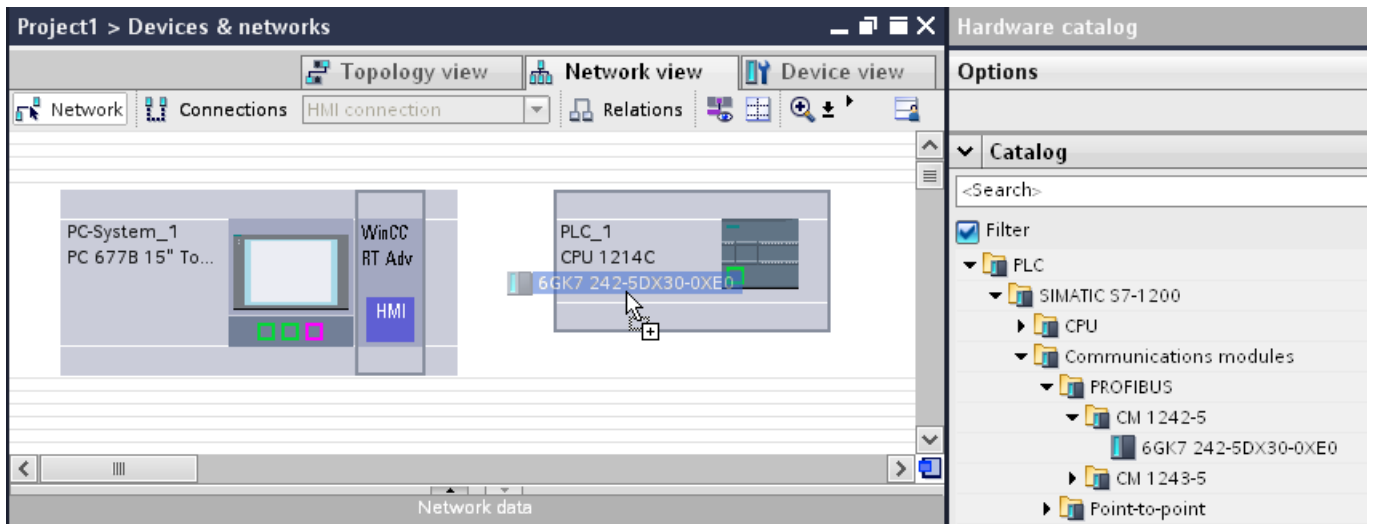

- SIMATIC S7 1200
- SIMATIC PC with PROFIBUS interface

**Procedure**

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.

3. Use a drag-and-drop operation to move a PROFIBUS-capable communication module from the hardware catalog to the PLC.

4. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.

- Click the PROFIBUS interface of the communication module and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the PC.

- Click the connecting line.
- Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
- Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project. See the chapter "PROFIBUS parameters (Page 5421)" for additional details.

#### Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

## Result

You have created an HMI connection between an HMI device and a SIMATIC S7 1200 via PROFIBUS.

## Configuring an HMI connection via PROFIBUS with a PC

### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFIBUS in the "Devices & Networks" editor.

## Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1200
- PC station with WinCC RT Advanced

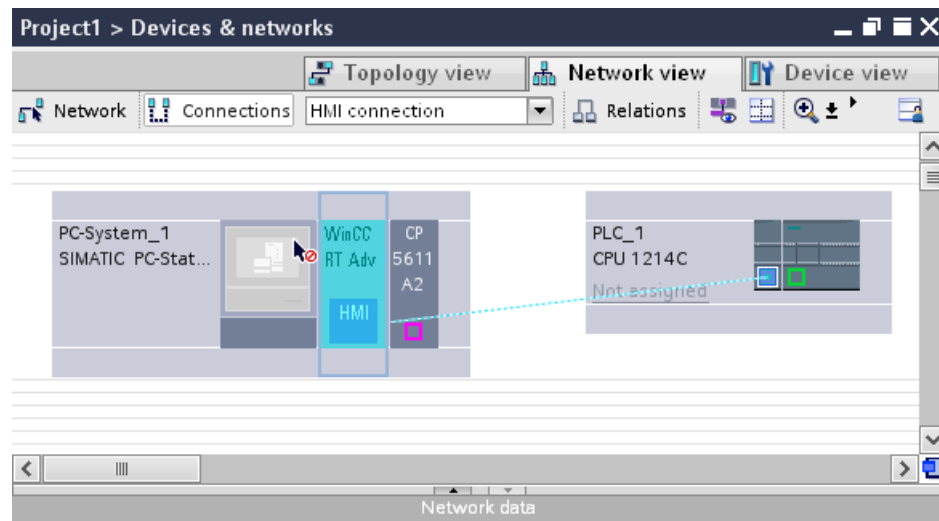

## Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFIBUS-capable communication processor from the hardware catalog to the WinCC Runtime.
3. Use a drag-and-drop operation to move a PROFIBUS-capable communication module from the hardware catalog to the PLC.

4. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.

- Click the PROFIBUS interface of the communication module and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the communication processor.

- Click the connecting line.
- Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
- Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project. See the chapter "PROFIBUS parameters (Page 5421)" for additional details.

---

#### Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

---

## Result

You have created an HMI connection between an HMI device and a SIMATIC S7 1200 via PROFIBUS.

## PROFIBUS parameters

### PROFIBUS parameters for the HMI connection

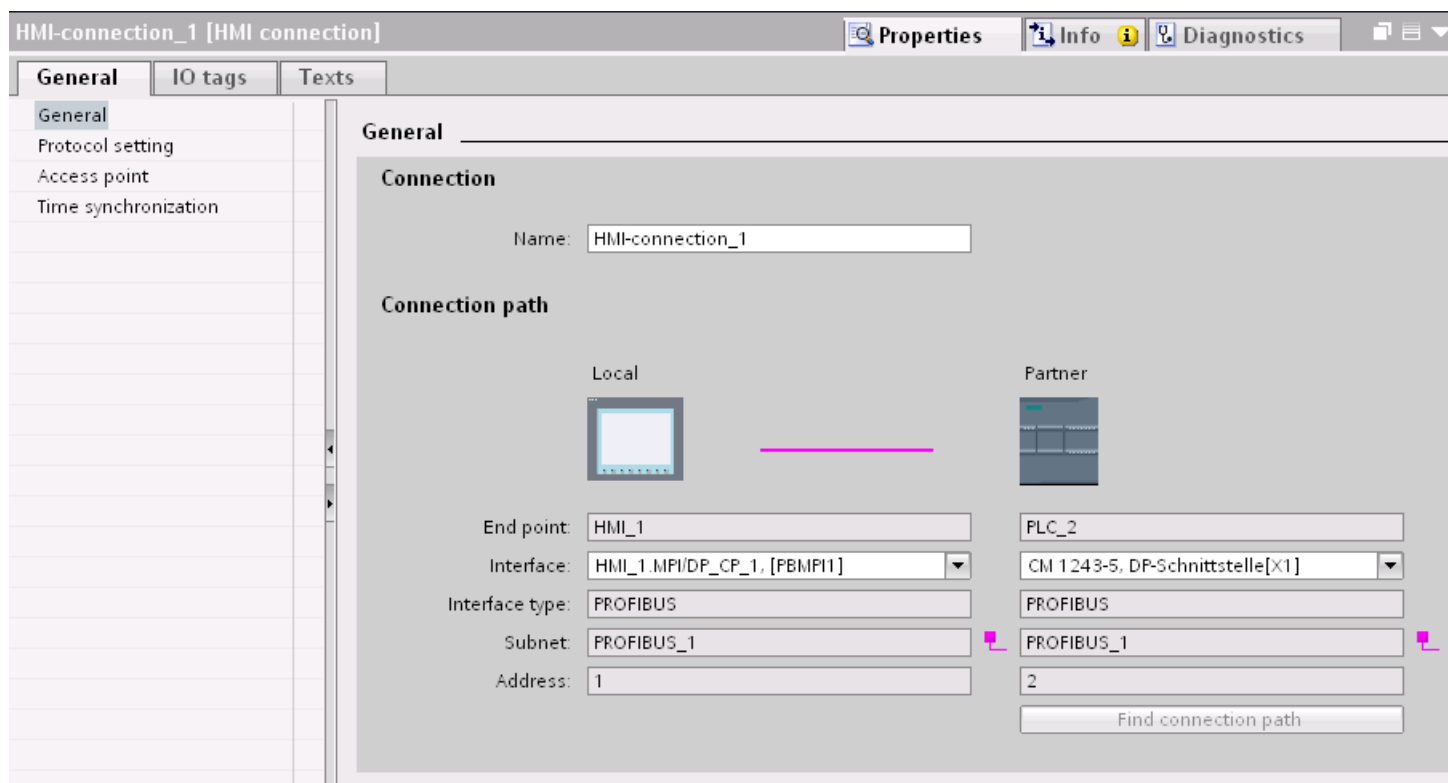

### PROFIBUS parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

## Displaying and editing HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".

### "Connection"

The "Connection" area displays the HMI connection created for communication between the devices.

You can edit the name of the HMI connection in this area.

### "Connection path"

The communication partners of the selected HMI connection and the associated PROFIBUS parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"  
Displays the device name. This area cannot be edited.
- "Interface"  
Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"  
Displays the selected interface type. This area cannot be edited.

Displays the selected interface type. This area cannot be edited.

- "Subnet"  
Displays the selected subnet. This area cannot be edited.
- "Address"  
Displays the PROFIBUS address of the device. This area cannot be edited.
- "Find connection path" button  
Enables the subsequent specification of connections.

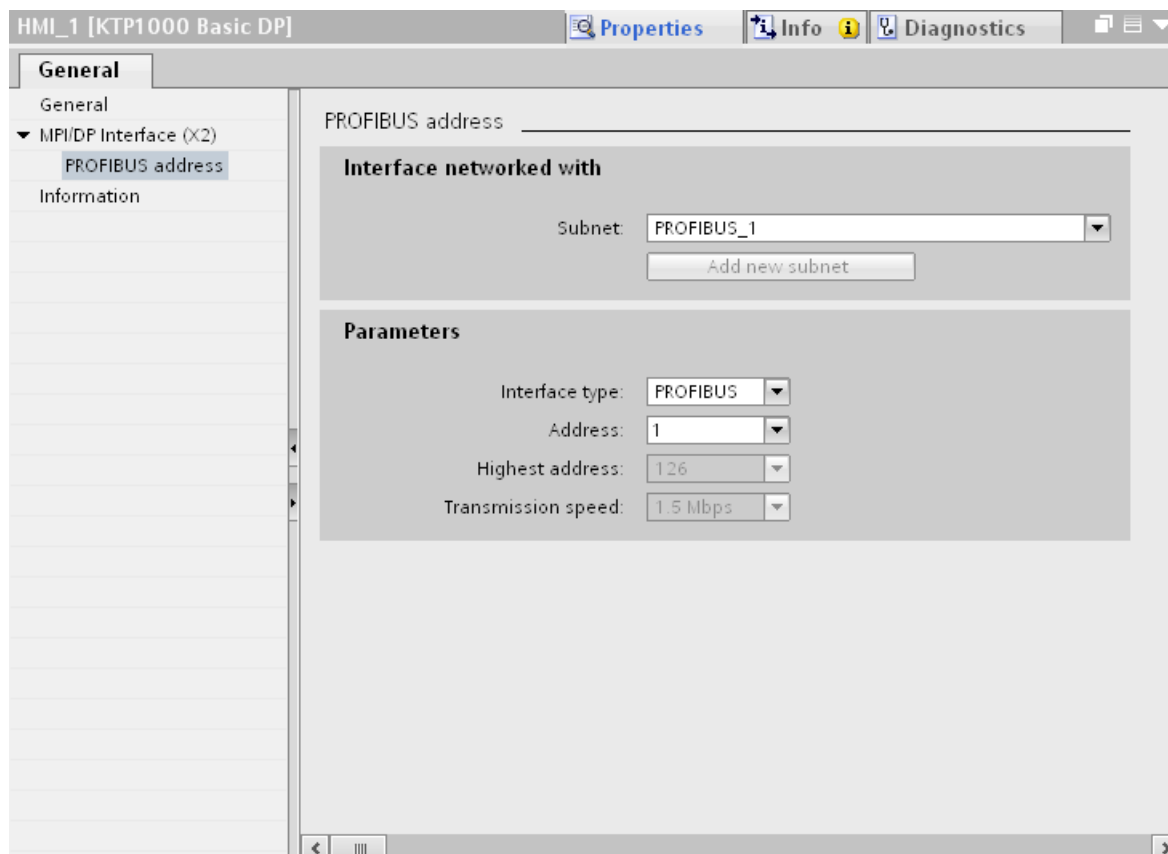

## PROFIBUS parameters for the HMI device

## PROFIBUS parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

## Displaying and changing PROFIBUS parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".

### "Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

### "Parameters"

- "Interface type"  
Depending on the HMI device type, you have various interfaces to choose from.
- "Address"  
You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"  
The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"  
The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

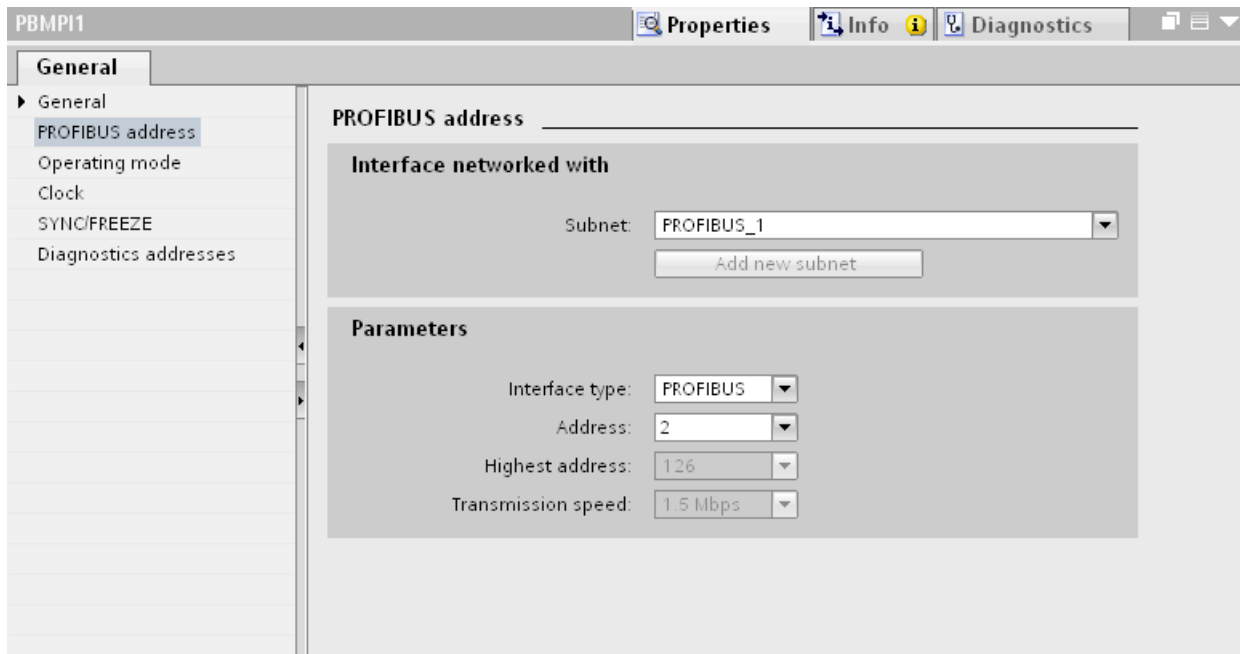

### PROFIBUS parameters for the PLC

### PROFIBUS parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

## Displaying and changing PROFIBUS parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".

### "Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

### "Parameters"

- "Interface type"  
Depending on the HMI device type, you have various interfaces to choose from.
- "Address"  
You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"  
The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"  
The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

## Bus profiles with PROFIBUS

### Introduction

Depending on the device types connected and protocols used on the PROFIBUS, different profiles are available. The profiles differ in terms of the setting options and calculation of bus parameters. The profiles are explained below.

### Devices with different profiles on the same PROFIBUS subnet

The PROFIBUS subnet only functions without problem if the bus parameters of all devices have the same values.

### Profiles and transmission rates

Profiles	Supported transmission speeds in Kbits/s
DP	9,6 19,2 45,45 93,75 187,5 500 1500 3000 6000 12000
Standard	9,6 19,2 45,45 93,75 187,5 500 1500 3000 6000 12000
Universal	9,6 19,2 93,75 187,5 500 1500

### Meaning of profiles

Profile	Meaning
DP	<p>Select the "DP" bus profile when the only devices connected to the PROFIBUS subnet are those which satisfy the requirements of standard EN 50170 Volume 2/3, Part 8-2 PROFIBUS. The bus parameter setting is optimized on these devices.</p> <p>This includes devices with DP master and DP slave interfaces of the SIMATIC S7 and distributed I/Os of other manufacturers.</p>
Standard	<p>Compared to the "DP" profile, the "Standard" profile also offers scope for devices of another project or devices which have not been configured here to be taken into account when calculating the bus parameters. The bus parameters are then calculated following a simple, non-optimized algorithm.</p>
Universal	<p>Select the "Universal" bus profile when individual devices on the PROFIBUS subnet use the PROFIBUS-FMS service.</p> <p>This includes the following devices for example:</p> <ul style="list-style-type: none"> <li>• CP 343-5</li> <li>• PROFIBUS-FMS devices of other manufacturers</li> </ul> <p>As with the "Standard" profile, this profile allows you to take other devices into account when calculating the bus parameters.</p>

## Protection of communication

### Security levels

If you want to protect the PLC and HMI device communication, you can assign protection levels for the communication.

For a SIMATIC S7-1500 CPU, you can enter multiple passwords and thereby set up different access rights for various user groups.

The passwords are entered in a table, so that exactly one protection level is assigned to each password.

The effect of the password is given in the "Protection" column.

For the SIMATIC S7-1200 controller, several aspects need to be considered when setting protection levels. For additional information on this, see: Auto-Hotspot

### Example

You select the "Complete protection" protection level for a standard CPU (i.e., not an F-CPU) when configuring it.

Afterwards, you enter a separate password for every protection level above it in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the assigned passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (no protection) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (write protection) allows access as if the CPU were write-protected. Despite knowing the password, users who know this password only have read access to the CPU.
- The password in row 3 (read and write protection) allows access as if the CPU were read-protected and write-protected, so that only HMI access is possible for users who know this password.

## Access password for the HMI connection

### Introduction

Secure access to a PLC by assigning a password.

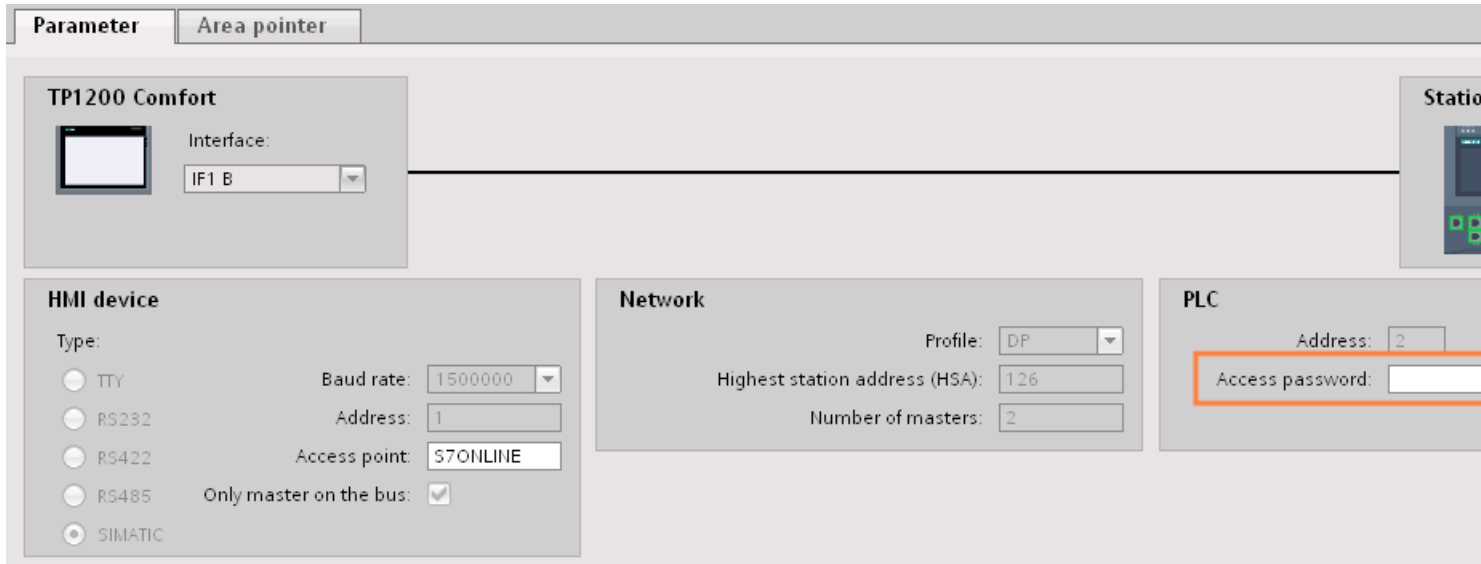

Assign the password when configuring the connection.

Input of the password of the PLC is mandatory as of "Complete protection" security level.

Communication to the PLC is denied if an incorrect password or no password is entered.

## Assigning password

Enter the "Access password" for the PLC in the "Connections" editor.

### 10.11.7.4 Data exchange

#### Data exchange using area pointers

#### General information on area pointers

#### Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

#### Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Configuring area pointers (Page 5281)

## Area pointer "Date/time"

### Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer.

---

#### Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

---

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte						Least significant byte						
	7					0	7					0	
n+0	Reserved						Hour (0 to 23)						Time
n+1	Minute (0 to 59)						Second (0 to 59)						
n+2	Reserved						Reserved						
n+3	Reserved						Weekday (1 to 7, 1=Sunday)						Date
n+4	Day (1 to 31)						Month (1 to 12)						
n+5	Year (80 to 99/0 to 29)						Reserved						

---

#### Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

---

### Permitted data types

You can use the following data types when you configure the "Date/Time" area pointer.

- Word
- UInt
- DTL

### Use of the "DTL" data type

Use of data type "DTL" with communication driver S7-1200. A tag of the "DTL" data type has a length of 12 bytes and saves information on date and time in a predefined structure.

The "DTL" data type has the following structure:

Byte	Component	Data type	Value range
0	Year	UINT	1970 to 2554
1			
2	Month	USINT	0 to 12
3	Day	USINT	1 to 31
4	Day of week	USINT	1(Sunday) to 7(Saturday) The weekday is not considered in the value entry.
5	Hour	USINT	0 to 23
6	Minute	USINT	0 to 59
7	Second	USINT	0 to 59
8	Nanoseconds	UDINT	0 to 999 999 999
9			
10			
11			

The "DTL" data type supports time information down to the nanosecond range. Because panels only support time information down to the millisecond, you may encounter the following restriction when using the area pointers:

For the transmission of time information from a panel to the controller, the smallest unit of time is 1 millisecond. The value range from microseconds to nanoseconds of the "DTL" data type is filled with zeros.

## "Date/time PLC" area pointer

### Function

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

---

#### Note

Set an acquisition cycle of sufficient length for the date/time area pointer PLC to avoid any negative impact on HMI device performance.

Recommended: Acquisition cycle of 1 minute, if the process allows this.

---

"Date/Time PLC" is a global area pointer and may be configured only once per project.

---

#### Note

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

---

The date/time data area has the following structure:

#### DATE\_AND\_TIME format (in BCD code)

Data word	Most significant byte			Least significant byte		
	7	.....	0	7	.....	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved	Weekday (1 to 7, 1=Sunday)	
n+4 <sup>1)</sup>	Reserved			Reserved		
n+5 <sup>1)</sup>	Reserved			Reserved		

- 1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

---

#### Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

---

#### Permitted data types

You can use the following data types when you configure the "Date/Time PLC" area pointer:

- DTL

#### Use of the "DTL" data type

Use of data type "DTL" with communication driver S7-1200. A tag of the "DTL" data type has a length of 12 bytes and saves information on date and time in a predefined structure.

The "DTL" data type has the following structure:

Byte	Component	Data type	Value range
0	Year	UINT	1970 to 2554
1			
2	Month	USINT	0 to 12
3	Day	USINT	1 to 31
4	Day of week	USINT	1(Sunday) to 7(Saturday) The weekday is not considered in the value entry.
5	Hour	USINT	0 to 23
6	Minute	USINT	0 to 59
7	Second	USINT	0 to 59
8	Nanoseconds	UDINT	0 to 999 999 999
9			
10			
11			

The HMI devices do not support the use of nanoseconds. Values in the nanosecond range will be ignored during processing in Runtime.

The "DTL" data type supports time information down to the nanosecond range. Because panels only support time information down to the millisecond, you may encounter the following restriction when using the area pointers:

For the transmission of time information from a controller to a panel, the range from microseconds to nanoseconds is ignored. The time information is processed on the panel down to milliseconds.

## Area pointer "Coordination"

### Function

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

By default, the "Coordination" area pointer has the length of one word and cannot be changed.

### Usage

---

#### Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

---

## Assignment of the bits in the "Coordination" area pointer

### Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

### Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The status of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit in the control program.

### Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not there is still a connection to the HMI device by querying this bit in the control program.

### Processing in the PLC

For a simpler evaluation in the PLC program, use a Bool array for this area pointer when using the SIMATIC S7 1200 communication driver. You will have to map the complete 16-bit word of the area pointer. Configure a tag of the data type "Array [0 .. 15] of bool" for this purpose.

### Permitted data types

You can use the following data types when you configure the "Coordination" area pointer.

- Word
- UInt
- Bool

## Area pointer "Screen number"

### Function

The HMI devices store information about the screen called up on the HMI device in the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. Certain reactions can be triggered in the PLC, such as the call of a different screen.

### Use

Before the "Screen number" area pointer can be used, it must be set up and activated by selecting "Communication ► Area pointer". You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

### Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1. Word	Current screen type															
2. Word	Current screen number															
3. Word	Reserved															
4th word	Current field number															
5. Word	Reserved															

- Current screen type  
"1" for root screen or  
"4" for permanent window
- Current screen number  
1 to 32767
- Current field number  
1 to 32767

---

#### Note

##### Device dependency

Permanent windows are not available on Basic Panels.

---

## Permitted data types

You can use the following data types when you configure the "Screen number" area pointer.

- Word
- UInt

## Area pointer "Project ID"

### Function

When Runtime starts, a check can be carried out as to whether the HMI device is connected to the correct PLC. This check is important when operating with several HMI devices.

For this, the HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of the configuration data with the PLC program.

A missing compatibility results in a corresponding alarm and Runtime will not be started.

### Use

---

#### Note

**HMI connections cannot be switched "online".**

The HMI connection in which the "Project ID" area pointer is used must be switched "online".

---

To use this area pointer, set up the following during the configuration:

- Define the version of the configuration. Values between 1 and 255 are possible.  
You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- This is where you select the PLC tag or the tag array that you have configured as the data area for the area pointer.

## Connection failure

A connection failure to a device on which the "project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the engineering system.

### Permitted data types

You can use the following data types when you configure the "Project ID" area pointer.

- Word
- UInt

### Area pointer "Job mailbox"

#### Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

#### Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

### Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

No.	Function	
14	<b>Set time (BCD-coded)</b>	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-

No	Function	
<b>14</b>	<b>Set time (BCD-coded)</b>	
<b>15</b>	<b>Set date (BCD-coded)</b>	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
<b>23</b>	<b>User logon</b>	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
<b>24</b>	<b>User logoff</b>	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
<b>40</b>	<b>Transfer date/time to PLC</b>	
	An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
<b>41</b>	<b>Transfer date/time to PLC</b>	
	An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
<b>46</b>	<b>Update tag</b>	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
<b>49</b>	<b>Clear event buffer</b>	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
<b>50</b>	<b>Clear error alarm buffer</b>	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
<b>51</b>	<b>Display selection</b>	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
<b>69</b>	<b>Reading data record from PLC</b> <sup>1)</sup>	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)

No	Function	
14	<b>Set time (BCD-coded)</b>	
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
70	<b>Writing data record to PLC <sup>1)</sup></b>	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

<sup>1)</sup>	Only devices supporting recipes
<sup>2)</sup>	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
<sup>3)</sup>	The weekday is ignored on HMI device KTP 600 BASIC PN.

### Permitted data types

You can use the following data types when you configure the "Screen number" area pointer:

- Word
- UInt

### "Data record" area pointer

### "Data mailbox" area pointer

### Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

### Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization over the data mailbox

Data records are always transferred directly. That is, the tag values are read from an address or written to an address configured for this tag directly, without redirecting the values by means of interim memory.

### Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes  
The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a job mailbox, the data in the recipe view will be updated as well. Avoid operating the recipe view while job mailboxes for transfer of data records are being triggered. If you have already started editing a data record and a job mailbox is triggered for transfer of data records, then this job mailbox will be rejected.

### Permitted data types

You can use the following data types when you configure the "Data record" area pointer.

- Word
- UInt

### Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example, when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

### Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:  
The values are downloaded to the HMI device. You can then process, edit, or save these values, for example.
- Triggering by a function or job mailbox:  
The values are saved immediately to the data volume.

## Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:  
The current values are written to the PLC.
- Triggering by a function or job mailbox:  
The current values are written to the PLC from the data medium.

## Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. Use this mechanism to prevent uncontrolled overwriting of data in either direction of your control program.

## Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

## Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Connections ▶ Area pointer" editor.
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:  
"Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

## Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15	0
1. Word	Current recipe number (1 - 999)	
2. Word	Current data record number (0 - 65535)	
3. Word	Reserved	
4. Word	Status (0, 2, 4, 12)	
5. Word	Reserved	

- Status

The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data record free
2	0000 0010	Transfer is busy
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

### Sequence of a transfer started by the operator in the recipe display

#### Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data mailbox and sets the data record number to 0.	Abort with system alarm.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

#### Writing to the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data mailbox.	Abort with system alarm.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized between the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	
4	If required, the control program can now evaluate the transferred data.	
5	The control program must reset the status word to zero in order to enable further transfers.	

**Note**

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

**Note**

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

**Sequence of the transfer triggered by a job mailbox**

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxes No. 69 and No. 70 are available for this type of transfer.

**No. 69: Read data record from PLC ("PLC → DAT")**

Job mailbox no. 69 transfers data mailboxes from the PLC to the HMI device. The job mailbox is structured as follows:

	Most significant byte	Least significant byte
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

**No. 70: Write data record to PLC ("DAT → PLC")**

Job mailbox no. 70 transfers data mailboxes from the HMI device to the PLC. The job mailbox is structured as follows:

	Most significant byte	Least significant byte
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	—	

**Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)**

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device reads the values and stores the values in the data record specified in the job mailbox.	
4	<ul style="list-style-type: none"> <li>If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed".</li> <li>If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.</li> </ul>	
5	The control program must reset the status word to zero in order to enable further transfers.	

**Sequence writing to the PLC with job mailbox "DAT → PLC" (no. 70)**

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the job from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The PLC program can now evaluate the transferred data. To allow further transfers, the PLC program must set the status word to 0 again.	

**Sequence of the transfer when triggered by a configured function****Reading from the PLC using a configured function**

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system alarm.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	

Step	Action
4	<ul style="list-style-type: none"> <li>• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed."</li> <li>• If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.</li> </ul>
5	The control program must reset the status word to zero in order to enable further transfers.

### Writing to the PLC by means of configured function

Step	Action									
1	Check: Status word = 0?									
	<table border="1"> <thead> <tr> <th>Yes</th> <th>No</th> </tr> </thead> <tbody> <tr> <td>The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.</td> <td>Abort with system alarm.</td> </tr> <tr> <td>The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.</td> <td></td> </tr> <tr> <td>The HMI device sets the status "Transfer completed."</td> <td></td> </tr> <tr> <td>The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.</td> <td></td> </tr> </tbody> </table>	Yes	No	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system alarm.	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.		The HMI device sets the status "Transfer completed."		The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.
Yes	No									
The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system alarm.									
The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.										
The HMI device sets the status "Transfer completed."										
The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.										

### Possible causes of error when transferring data records

#### Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible

- Recipe number does not exist
- Data record number does not exist

---

**Note**

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

---

**Note**

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
  - The data mailbox status is set to "Transfer completed with error".
- 

### Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view  
Information in the status bar of the recipe view and output of system alarms
- Triggered by function  
Output of system alarms
- Triggering by job mailbox  
No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data mailbox.

---

**Note****Availability for specific devices**

Notes in the status bar of the recipe view are not available in Basic Panels.

---

## Trends

### General information on trends

#### Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3569)

---

**Note**

The value is read out time-triggered for Basic Panels.

---

**Time-triggered trends**

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

**Bit-triggered trends**

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

**See also**

Trends (Page 3569)

**Trend request and trend transfer**

**Trend request area**

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

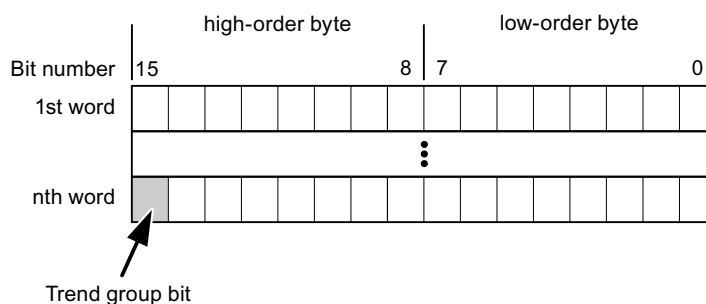

The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

## Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.

The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

## Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

## Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

## Permitted data types for trends

### For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

## Alarms

### Configuring alarms

#### Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3592)

#### Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

#### Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

#### How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0							Byte 1							
	Most significant byte							Least significant byte							
In SIMATIC S7 PLCs	7						0	7							0
In WinCC you configure:	15						8	7							0

## Acknowledgment of alarms

### Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

### Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.

### Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment

tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

---

**Note**

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

---

The figure below shows the pulse diagram.

## LED mapping

### Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

---

**Note**

The LED function cannot be configured for Basic Panels.

---

### Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

### LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

### 10.11.7.5 Performance features of communication

#### S7-1200 device dependency

#### Communication with the SIMATIC S7-1200 controller

If you use devices from an earlier version of the TIA Portal with TIA Portal V13, it may not be possible to configure integrated connections to certain HMI devices.

#### Basic Panels V11.0

### Valid data types for SIMATIC S7-1200

#### Valid data types for connections with SIMATIC S7-1200

The table lists the user data types that can be used when configuring tags and area pointers.

Data type	Length
BOOL	1-bit
SINT	1 byte
INT	2 bytes
DINT	4 bytes
USINT	1 byte
UINT	2 bytes
UDINT	4 bytes
REAL	4 bytes
LREAL	8 bytes

---

Data type	Length
TIME	4 bytes
DATE	2 bytes
DTL	12 bytes
TIME_OF_DAY, TOD	4 bytes
STRING	(2+n) bytes, n = 0 to 254
CHAR	1 byte
BYTE	1 byte
WORD	2 bytes
DWORD	4 bytes

### 10.11.7.6 Creating connections in the "Connections" editor

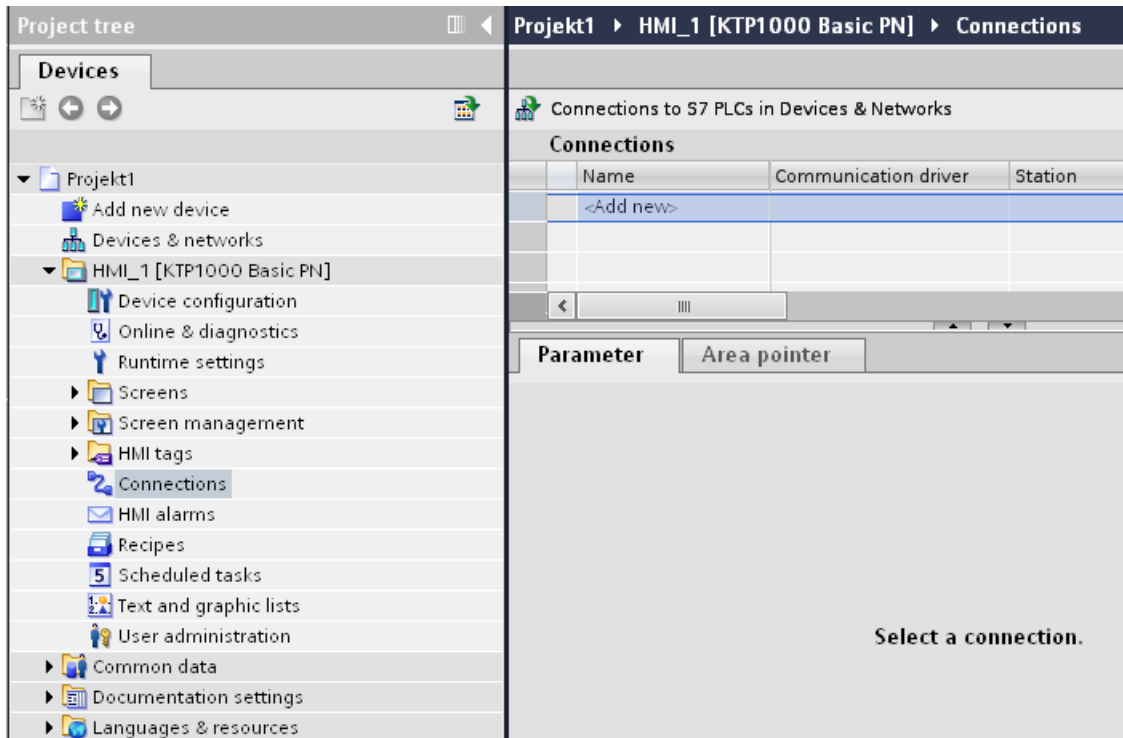

#### Creating a PROFINET connection

#### Requirements

- A project is open.
- An HMI device with a PROFINET interface has been created.

### Procedure

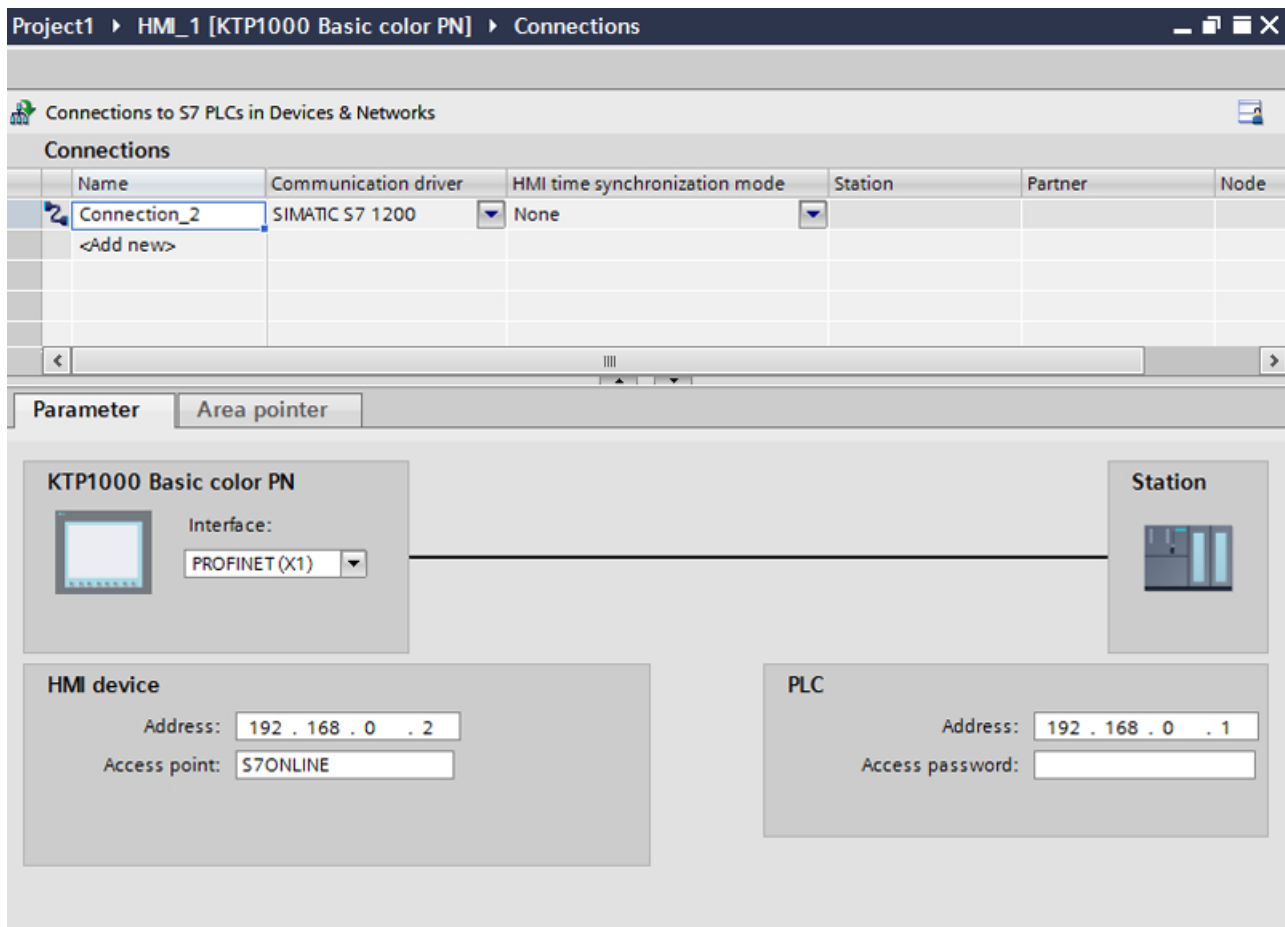

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".

3. In the "Communication drivers" column, select the "SIMATIC S7 1200" driver.
4. Click the name of the connection.

5. Select a PROFINET interface of the HMI device in the Inspector window under "Parameters > Interface".

6. Set the IP addresses of the communication partners in the Inspector window:
  - HMI device: "Parameters > HMI device > Address"
  - PLC: "Parameters > PLC > Address"

## Creating a PROFIBUS DP connection

### Requirements

- A project is open.
- An HMI device with a PROFIBUS interface has been created.

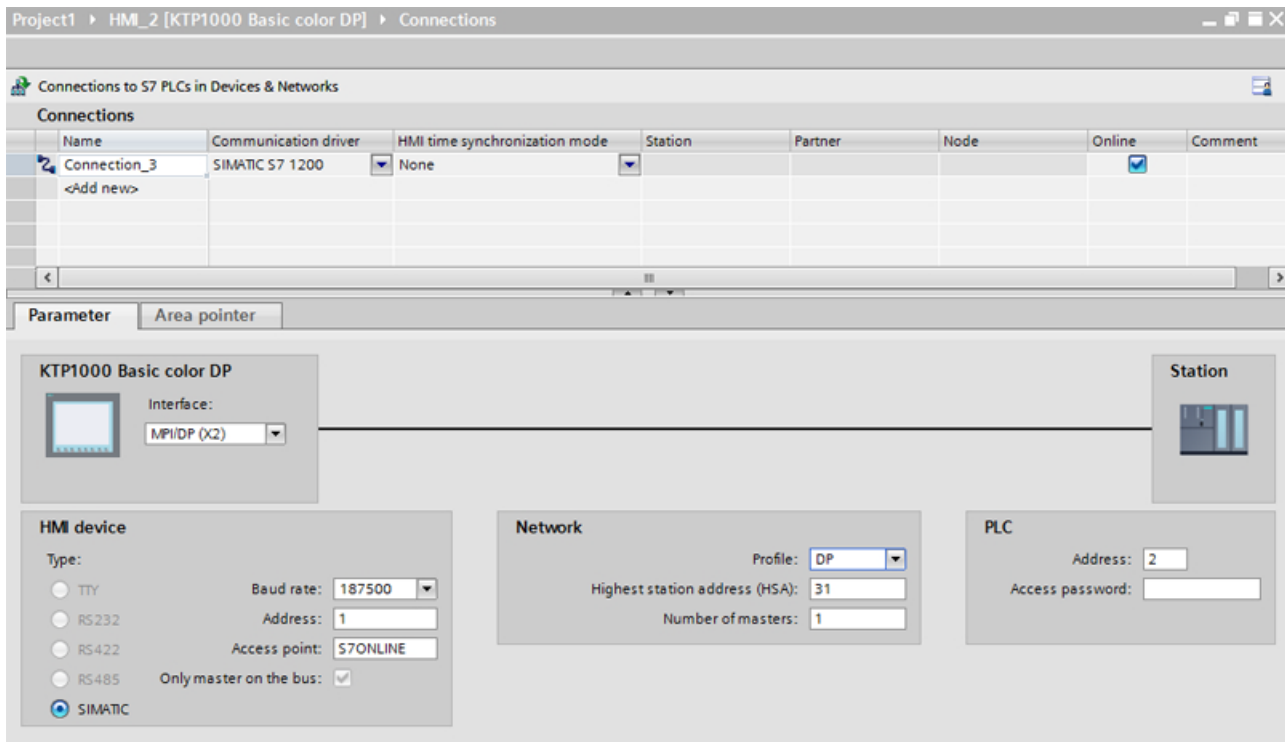

### Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".

3. In the "Communication drivers" column, select the "SIMATIC S7 1200" driver.
4. Click the name of the connection.
5. Select the "MPI/DP" interface in the Inspector window under "Parameters".

6. Select the "DP" profile in the Inspector window under "Parameters > Network".

7. Set the addresses of the communication partners in the Inspector window:

- HMI device: "Parameters > HMI device > Address"
- PLC: "Parameters > PLC > Address"

## Parameters for the connection

### Parameters for the connection (SIMATIC S7 1200)

#### Parameters to be set

To assign the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.

The screenshot shows the 'Connections' configuration window in WinCC. At the top, the breadcrumb path is 'Project1 > HMI\_1 [KTP1000 Basic color PN] > Connections'. Below this is a table titled 'Connections to S7 PLCs in Devices & Networks'. The table has columns for Name, Communication driver, HMI time synchronization mode, Station, Partner, and Node. One connection is listed: 'Connection\_2' with 'SIMATIC S7 1200' as the communication driver and 'None' as the HMI time synchronization mode. Below the table are tabs for 'Parameter' and 'Area pointer'. The 'Parameter' tab is active, showing a diagram of the connection. On the left is the 'KTP1000 Basic color PN' HMI device with an 'Interface' dropdown set to 'PROFINET (X1)'. On the right is the 'Station' representing the PLC. A line connects the HMI device to the PLC. Below the diagram are two configuration boxes: 'HMI device' with 'Address: 192 . 168 . 0 . 2' and 'Access point: S7ONLINE', and 'PLC' with 'Address: 192 . 168 . 0 . 1' and an empty 'Access password' field.

Name	Communication driver	HMI time synchronization mode	Station	Partner	Node
Connection_2	SIMATIC S7 1200	None			
<Add new>					

**Parameter** | Area pointer

**KTP1000 Basic color PN**  
Interface: PROFINET (X1)

**Station**

**HMI device**  
Address: 192 . 168 . 0 . 2  
Access point: S7ONLINE

**PLC**  
Address: 192 . 168 . 0 . 1  
Access password:

## Ethernet parameters

### Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"  
If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

---

**Note**

The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

---

The IP address is transferred to the HMI device during project transfer.  
To set up the IP address of the HMI device:

- Click the HMI device.
  - Open the "Device configuration" editor.
  - Click the Ethernet interface.
  - Assign the IP address in the inspector window under:  
"General > PROFINET interface > Ethernet addresses"
- "Address"  
You assign the IP address of the HMI device in the "Address" area.  
When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.
  - "Access point"  
Specifies the access point for the PG/PC interface that can be used to reach the communication partner.

## Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"  
Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Access password"  
Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

---

### Note

You only need a password if you have set "Complete protection" at the PLC.

No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

---

## PROFIBUS parameters

### Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"  
Specifies the physical connection used.
- "Interface"  
For "Interface", you select the HMI device interface via which the HMI device is connected to the PROFIBUS network.
- "Baud rate"  
For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

---

### Note

If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

---

- "Address"  
You set the PROFIBUS address of the HMI device under "Address". The PROFIBUS address must be unique in the PROFIBUS network.

- "Only master on bus"  
Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master).  
In S7-200, you must set an HMI device as the master.
- "Access point"  
The access point defines a logical device name through which the communication partner can be reached.

### Parameters for the network

Under "Network", you set the parameters for the PROFIBUS network to which the HMI device is linked.

- "Profile"  
For "Profile", you select the network profile that is used in the network. In "Profile", set "DP", "Universal", or "Standard". The setting must be identical throughout the network.
- "Highest address"  
For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual PROFIBUS address. The setting must be identical throughout the network.

---

#### Note

If you set a baud rate of 1.5 Mbaud in the OP 73 or the OP 77A, the highest station address must be less than or equal 63.

---

- "Number of masters"  
For "Number of masters", set the number of masters in the PROFIBUS network. This information is necessary to correctly calculate the bus parameters.

## Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"  
For "Address", set the PROFIBUS address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Access password"  
Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

---

### Note

You only need a password if you have set "Complete protection" at the PLC.

No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

---

## 10.11.7.7 Time synchronization

### Time synchronization

#### Introduction

To have the same time of day throughout the plant, you can synchronize the time on various plant components using time synchronization. WinCC time synchronization is operated as a master-slave system.

One system component must be a clock for all components of a plant to work with identical time. The component functioning as the clock is referred to as the time master. The components that receive the time are time slaves.

#### Properties of time synchronization

- The HMI device can define the time as master or can accept the time of the PLC as slave.
- In "master mode", the time is synchronized at each connection setup.
- In "slave mode", the time is synchronized at each connection setup and then at cyclic intervals of 10 minutes.
- The first time synchronization is performed on the HMI device immediately after the start of runtime.
- Time synchronization is only performed on the HMI device during operation of runtime.

## Time synchronization restrictions

### Approved HMI devices

You can configure the time synchronization between a SIMATIC S7-1200 or SIMATIC S7-1500 and an HMI device with the following HMI devices:

Device	Operating system
Basic Panels	-
TP177 4"	Windows CE 5.0
Multi Panel 177	Windows CE 5.0
Multi Panel 277	Windows CE 5.0
Multi Panel 377	Windows CE 5.0
Mobile Panel 277	Windows CE 5.0
Mobile 277 IWLAN V2	Windows CE 5.0
Comfort Panels	Windows CE 6.0
PC systems with WinCC RT Advanced	Microsoft Windows XP Microsoft Windows 7

### Configuration restrictions

- If an HMI device has several connections to SIMATIC S7-1200 or SIMATIC S7-1500, you can only configure one connection as "slave".
- If you have enabled time synchronization for the HMI device as "slave", you can no longer use the global area pointer "Date/time PLC".
- An HMI device can only request the time from a PLC with "Complete protection" security type configuration if the correct "Access password" is configured. Configure the "Access password" for communication with a PLC with "Complete protection" security type in the "Connections" editor of the HMI device. This "Access password" must match the password configured on the PLC. The PLC password is assigned in the PLC properties at: "General > Security"
- Basic Panels can only be configured as "Slave".
- If you use Basic Panels for the configuration, it is not possible to use time synchronization via NTP and the "Date/time PLC" area pointer simultaneously.
- Time synchronization with SIMATIC S7-1200 (V1.0) controllers is not possible.
- Time synchronization between the HMI device TP177 4" and SIMATIC S7-1200 (V4.0) controllers is not possible.
- Time synchronization between the HMI device TP177 4" and SIMATIC S7-1500 is not possible.

## Configuring time synchronization for integrated connections

### Introduction

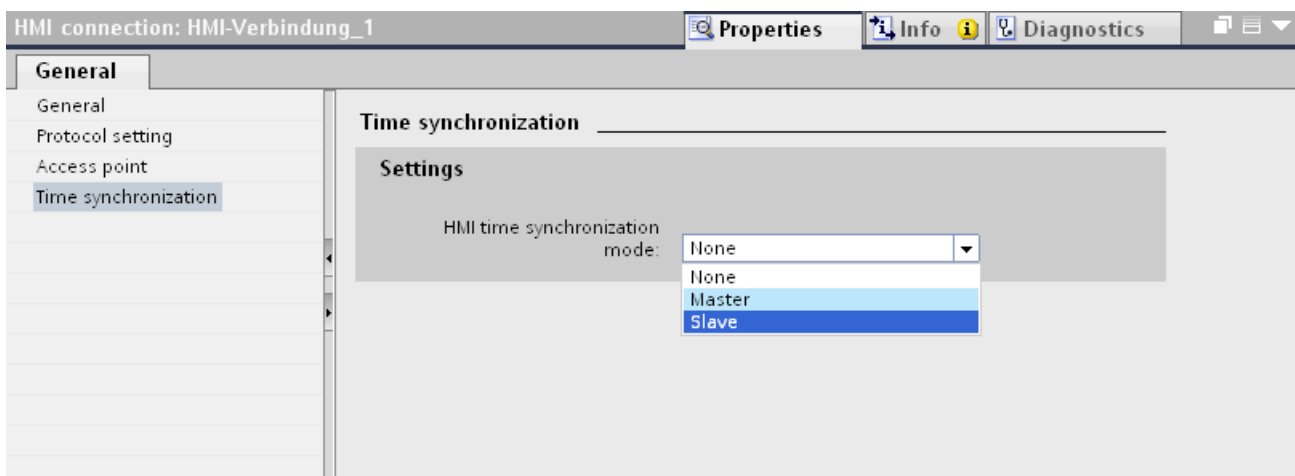

You configure time synchronization for an integrated connection in the "Devices & Networks" editor.

### Requirements

- An HMI connection between an HMI device and a SIMATIC S7 1200 has been configured.
- The HMI device must support the "time synchronization" function.
- The "Devices & Networks" editor is open.

### Procedure

1. Click the line of the HMI connection in the "Devices & networks" editor.
2. Select the following in the inspector window under "General > Time synchronization > Settings":
  - None: No time synchronization is used.
  - Master: The HMI device sets the time.
  - Slave: The PLC sets the time.

## Configuring time synchronization for non-integrated connections

### Introduction

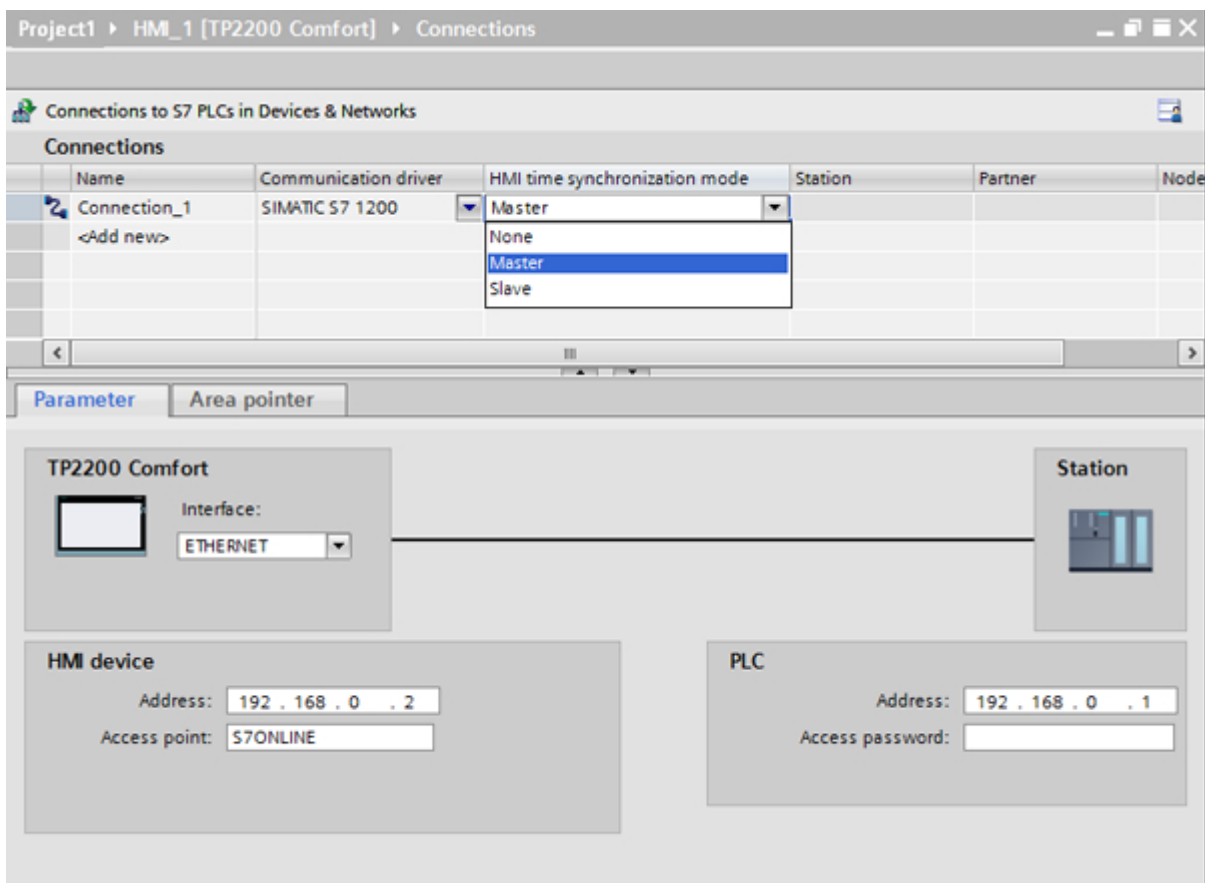

You configure time synchronization for a non-integrated connection in the "Connections" editor.

## Requirements

- An HMI device which supports the "time synchronization" function has been created.
- "Connections" editor is open.

## Procedure

1. Double-click "<Add>".
2. In the "Communication drivers" column, select the "SIMATIC S7 1200" PLC.
3. Select the following in the "HMI time synchronization mode" column:
  - None: No time synchronization is used.
  - Master: The HMI device sets the time.
  - Slave: The PLC sets the time.

## **10.11.8 Communicating with SIMATIC S7 300/400**

### **10.11.8.1 Communication with SIMATIC S7 300/400**

#### **Introduction**

This section describes the communication between an HMI device and the SIMATIC S7 300 and S7 400 PLCs. These two PLCs will be referred to jointly as SIMATIC S7 300/400.

You can configure the following communication channels for the SIMATIC S7 300/400 PLC:

- PROFINET
- PROFIBUS
- MPI

#### **HMI connection for communication**

You configure connections between the HMI device and a SIMATIC S7 300/400 in the "Devices & Networks" editor.

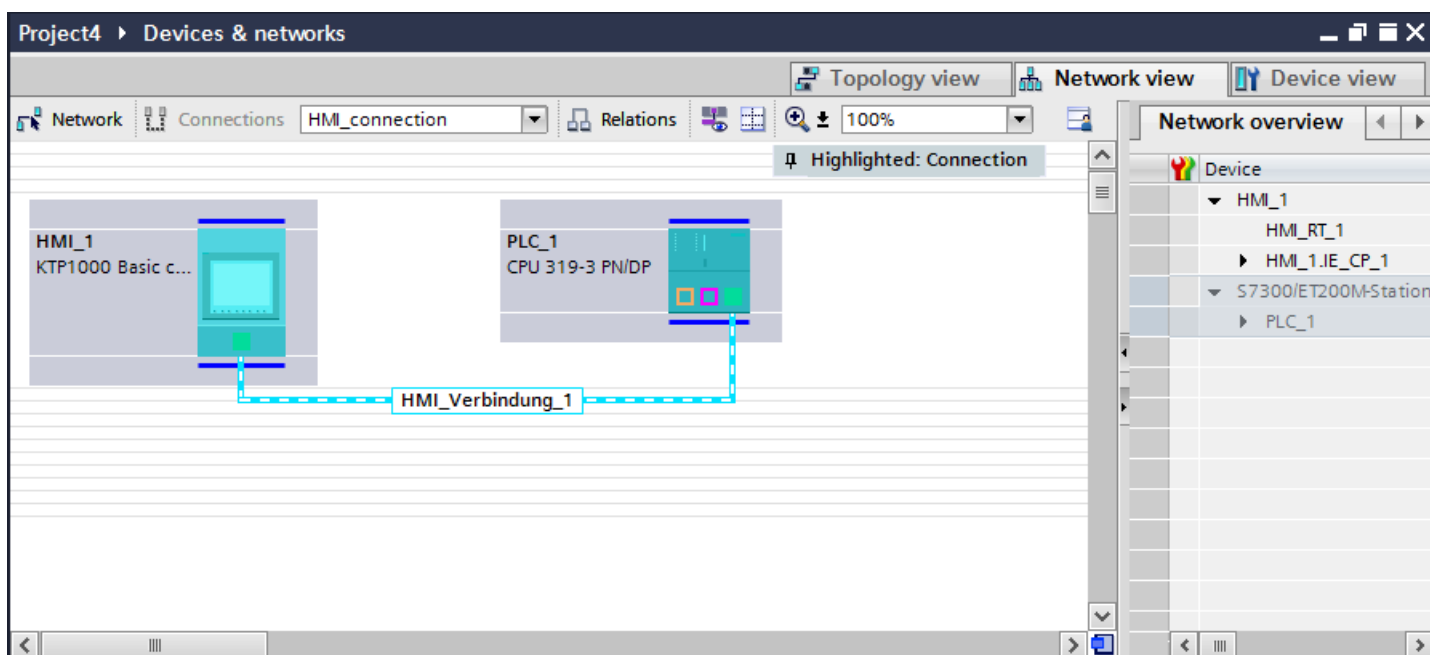

### 10.11.8.2 Communication via PROFINET

#### Configuring an HMI connection

#### Communication via PROFINET

#### HMI connections via PROFINET

If you have inserted an HMI device and a SIMATIC S7 300/400 into the project, you interconnect the two PROFINET interfaces in the "Devices & Networks" editor.

You can also connect multiple HMI devices to one SIMATIC S7 300/400 and multiple SIMATIC S7 300/400s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

#### HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

#### Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

## Configuring an HMI connection via PROFINET

### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFINET or Ethernet in the "Devices & Networks" editor.

#### CAUTION

##### Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

### Requirements

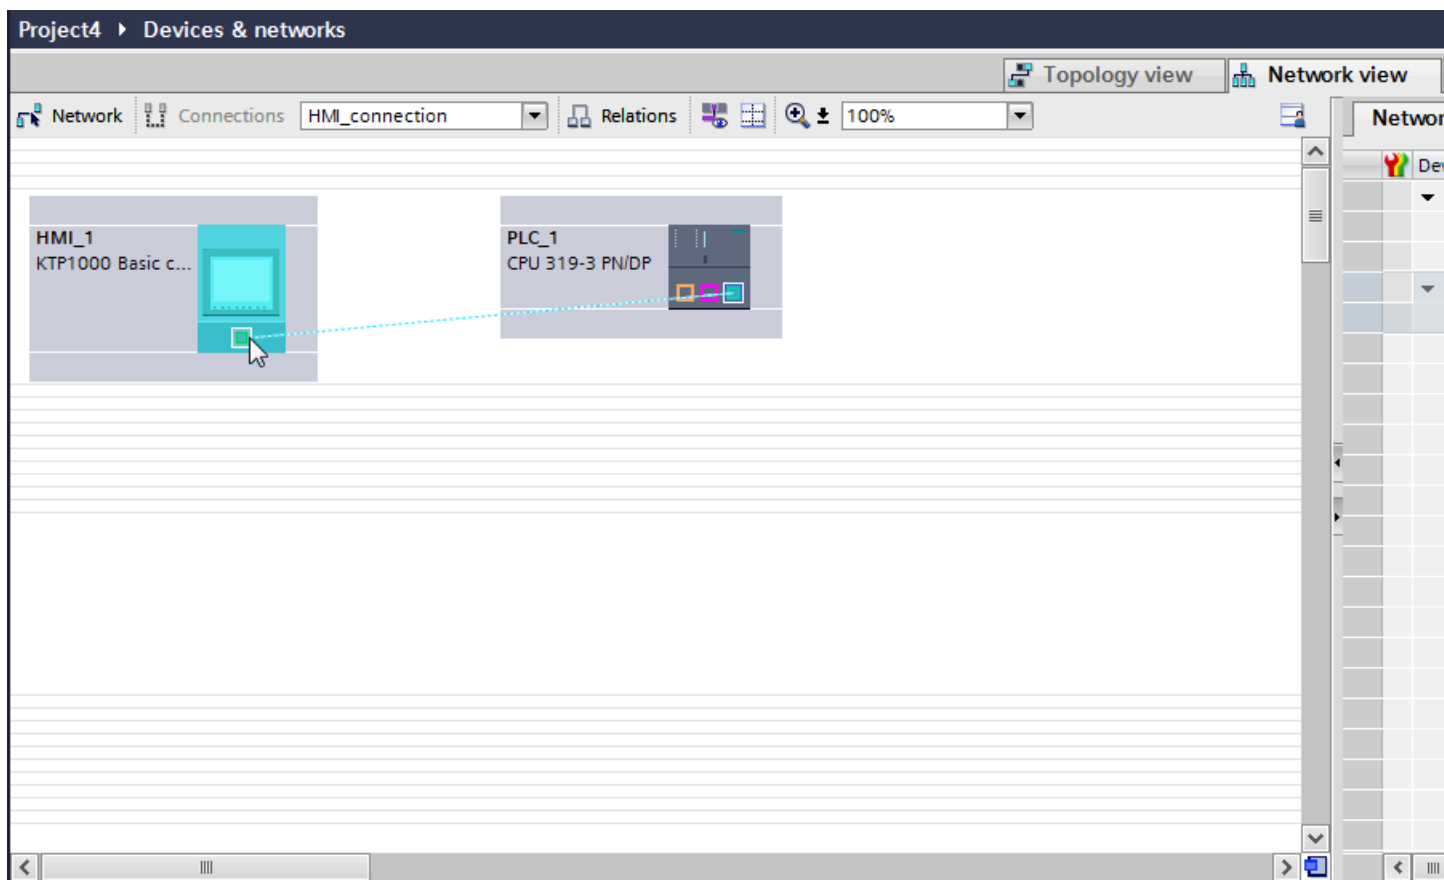

The following communication partners are created in the "Devices & Networks" editor:

- HMI device with PROFINET or Ethernet interface
- SIMATIC S7 300/400 with PROFINET interface.

### Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.

- Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the HMI device.

- Click the connecting line.
- Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
- Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project. See the chapter "PROFINET parameters (Page 5479)" for additional details.

---

**Note**

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

---

**Result**

You have created a connection between an HMI device and a SIMATIC S7 300/400. The IP address and subnet mask connection parameters are configured.

## **Configuring an HMI connection**

### **Communication via PROFINET**

#### **Communication via PROFINET**

This section describes the communication between a WinCC Runtime and the SIMATIC S7 300/400 PLC via PROFINET.

You can use the following WinCC Runtimes as an HMI device:

- WinCC RT Advanced

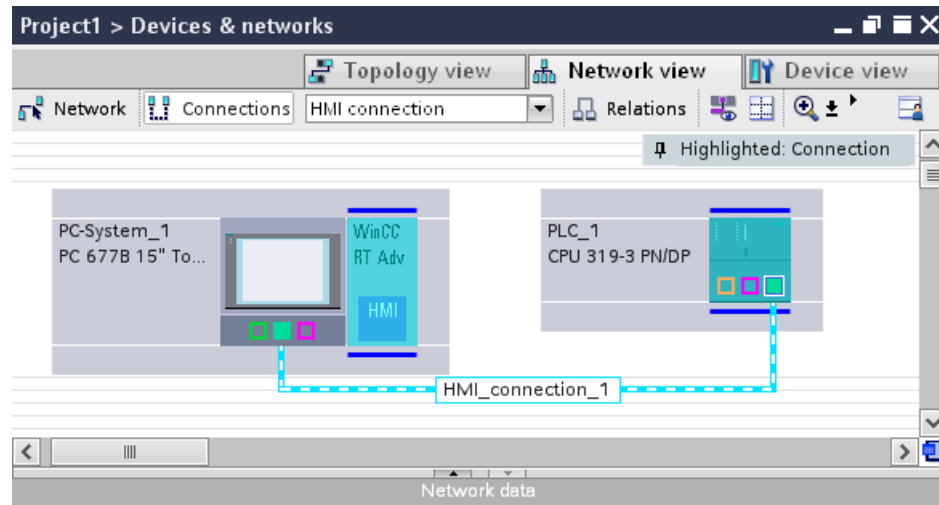

#### **WinCC Runtime as HMI device**

You configure the HMI connections between WinCC Runtime and SIMATIC S7 300/400 in the "Devices & Networks" editor.

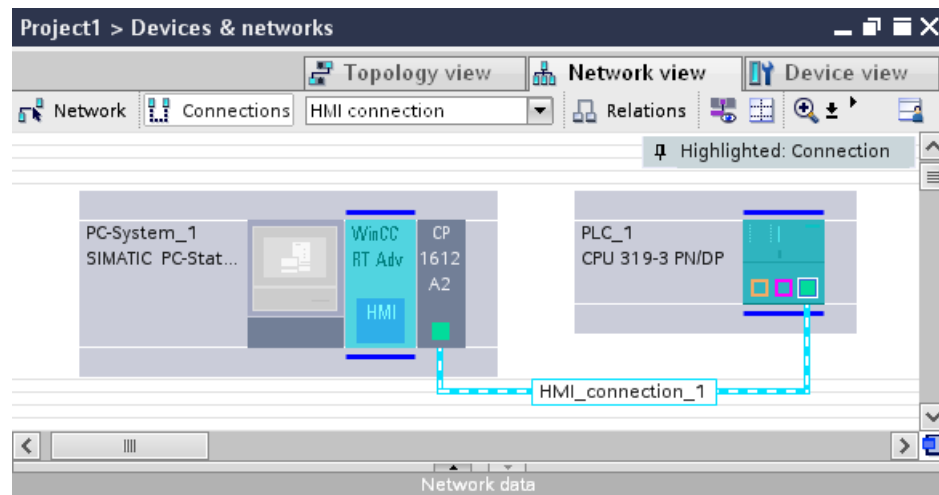

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC. In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.

2. You create a WinCC Runtime and configure a communication processor to the Runtime. In this way you use your configuration PC with a WinCC Runtime as an HMI device.

You can also connect multiple HMI devices to one SIMATIC S7 300/400 and multiple SIMATIC S7 300/400s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

### HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

### Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

## Configuring an HMI connection via PROFINET with a SIMATIC PC

### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFINET or Ethernet in the "Devices & Networks" editor.

#### CAUTION

##### Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

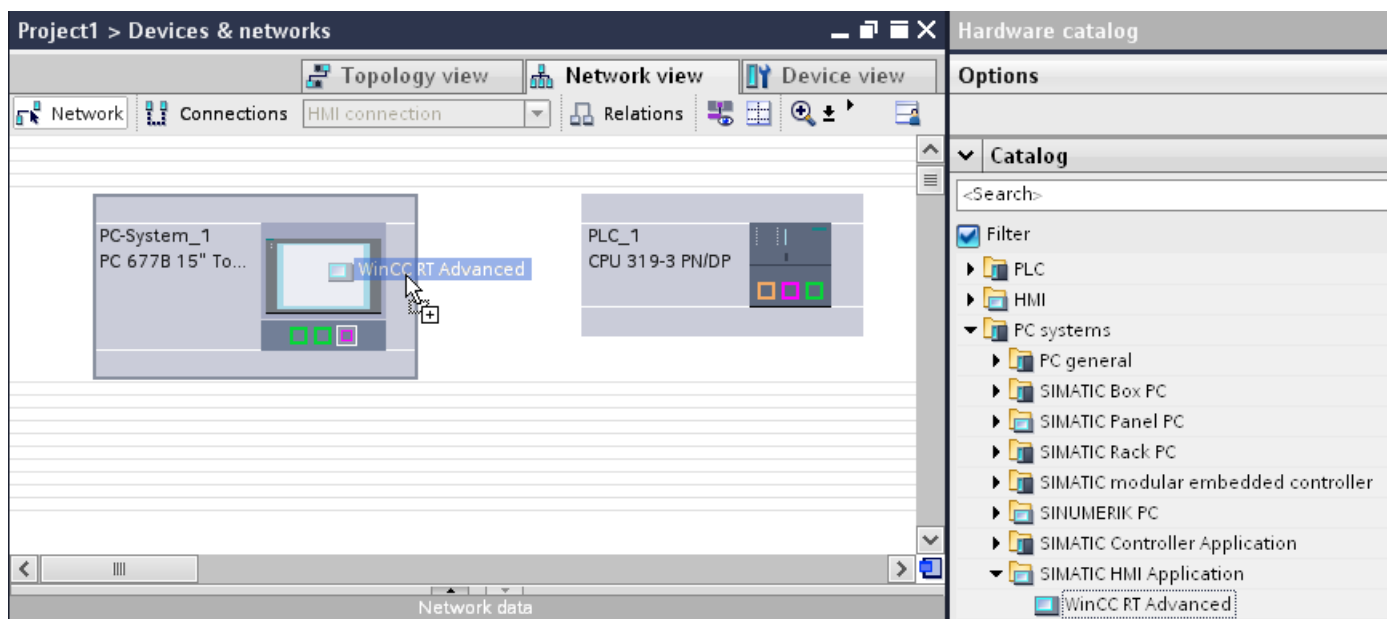

### Requirements

The following communication partners are created in the "Devices & Networks" editor:

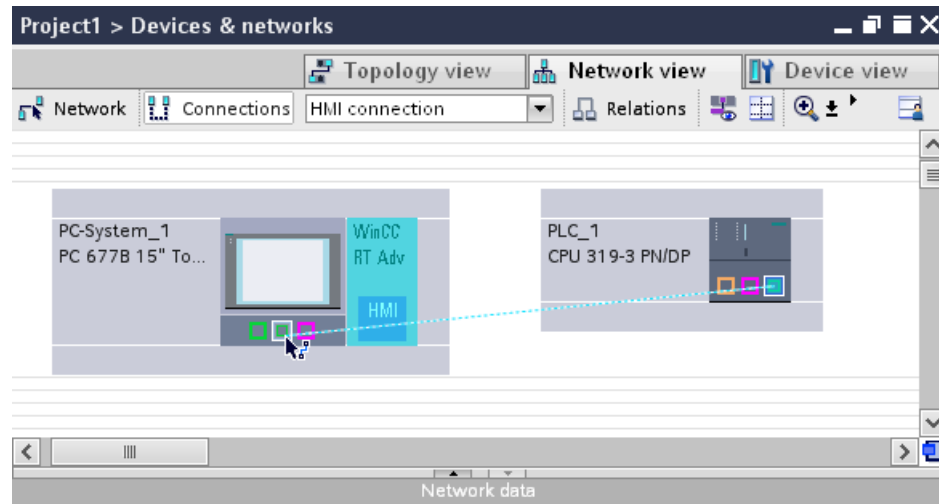

- SIMATIC S7 300/400 with PROFINET interface
- SIMATIC PC with PROFINET interface

### Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.

3. Click the "Connections" button and select "HMI connection" for the connection type. The devices available for connection are highlighted in color.
4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the PC.

5. Click the connecting line.
6. Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project. See the chapter "PROFINET parameters (Page 5479)" for additional details.

---

#### Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

---

## Result

You have created a connection between an HMI device and a SIMATIC S7 300/400. The IP address and subnet mask connection parameters are configured.

## Configuring an HMI connection via PROFINET with a PC

### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFINET or Ethernet in the "Devices & Networks" editor.

#### CAUTION

##### Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

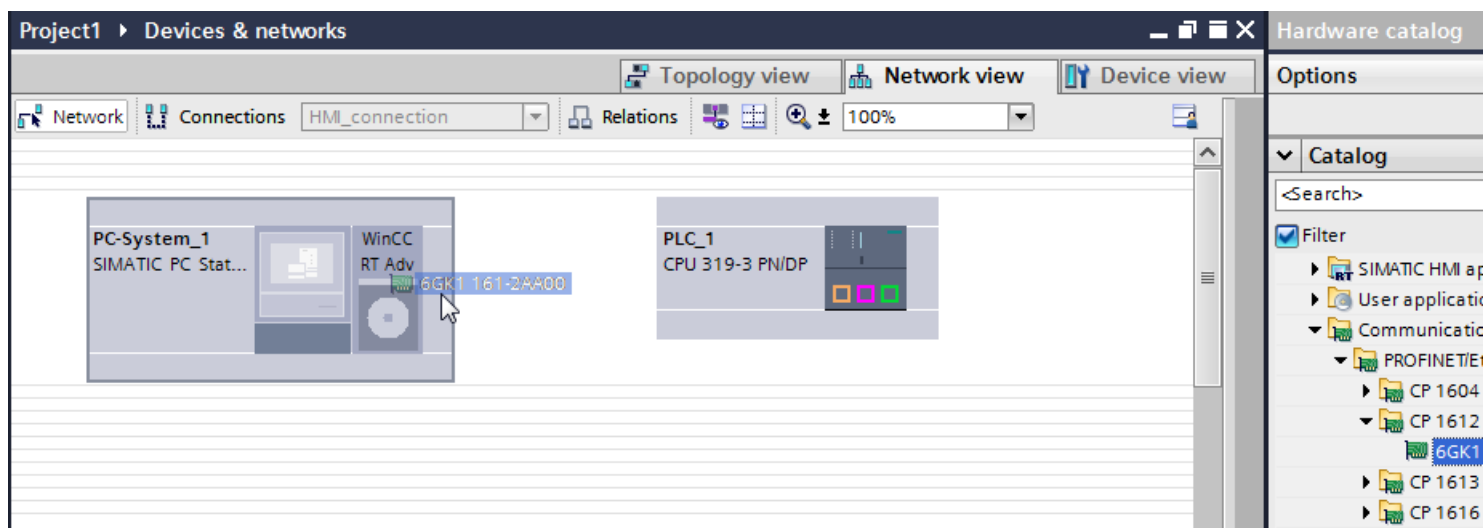

### Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 300/400 with PROFINET interface
- PC station with WinCC RT Advanced

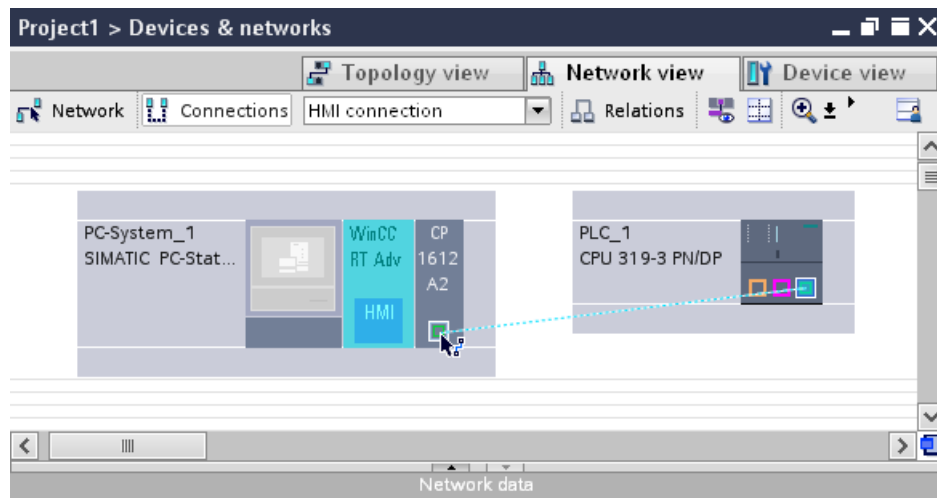

### Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed graphically in the network view.
2. Use a drag-and-drop operation to move a PROFINET-capable communication processor from the hardware catalog to the WinCC Runtime.

3. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.

- Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET interface of the communication processor.

- Click the connecting line.  
The connection is displayed graphically in the Inspector window.
- Click "Highlight HMI connection" and select the HMI connection.  
The connection is displayed graphically in the Inspector window.
- Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.  
See the chapter "PROFINET parameters (Page 5479)" for additional details.

#### Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

## Result

You have created a connection between an HMI device and a SIMATIC S7 300/400. The IP address and subnet mask connection parameters are configured.

## PROFINET parameters

### PROFINET parameters for the HMI connection

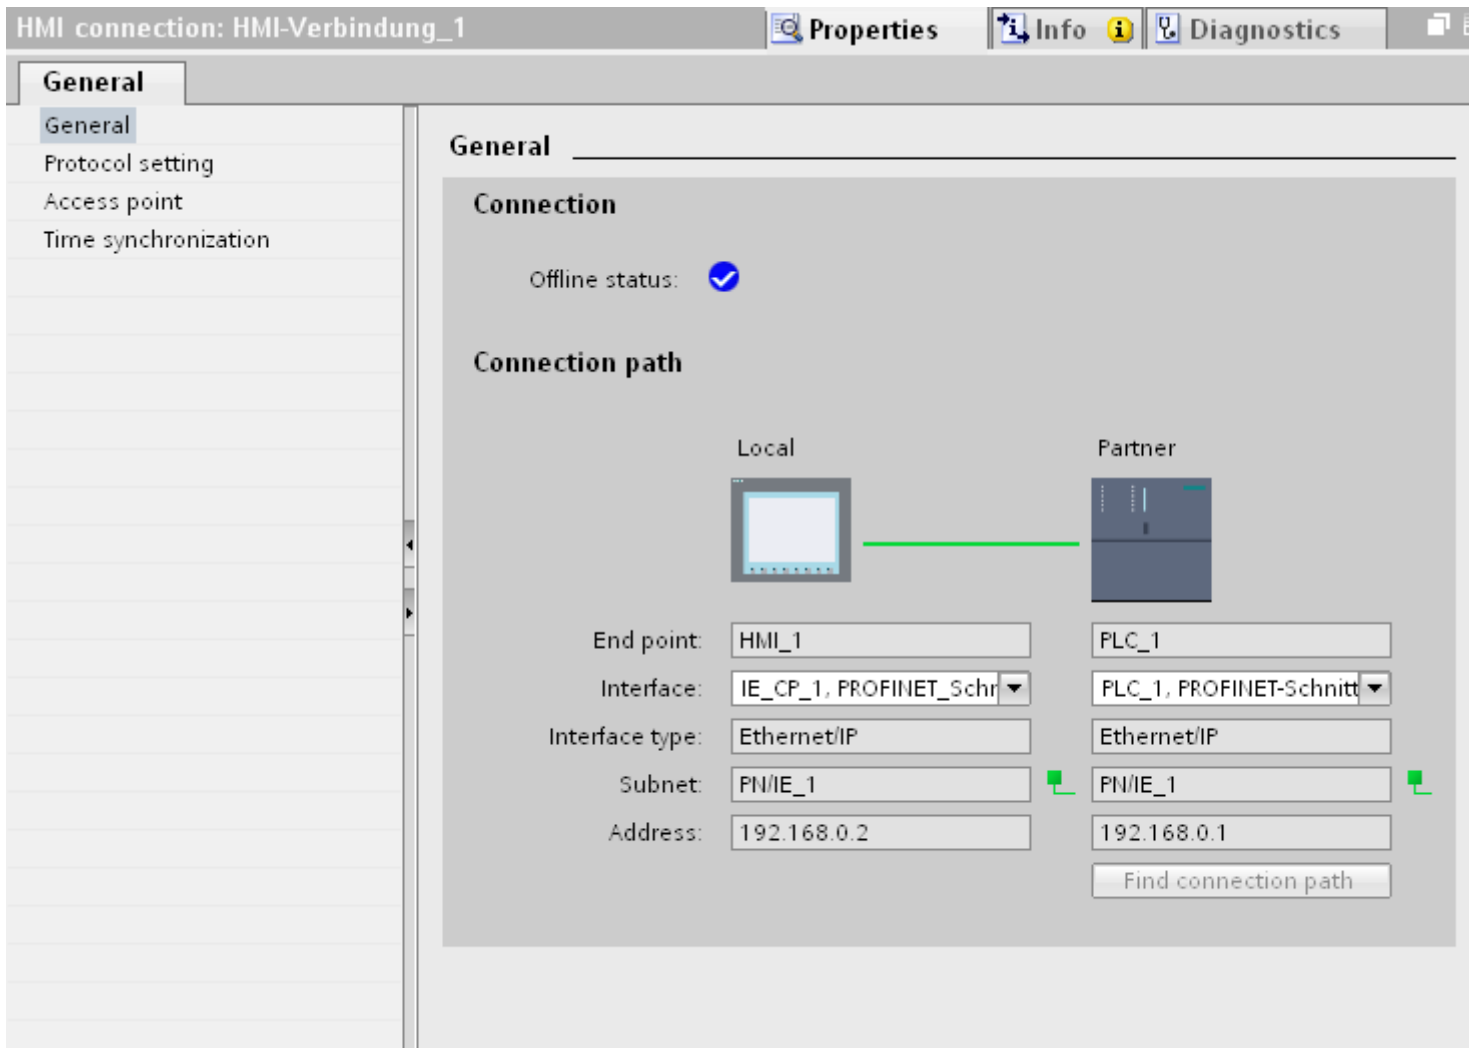

### PROFINET parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

### Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".

### "Connection"

Displays whether the devices are networked together.

- displayed if the devices are networked together.

- displayed if the devices are not networked together.

### "Connection path"

The communication partners of the selected HMI connection and the associated PROFINET parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"  
Displays the device name. This area cannot be edited.
- "Interface"  
Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"  
Displays the selected interface type. This area cannot be edited.
- "Subnet"  
Displays the selected subnet. This area cannot be edited.
- "Address"  
Displays the selected IP address of the device. This area cannot be edited.
- "Find connection path" button  
Enables the subsequent specification of connections.

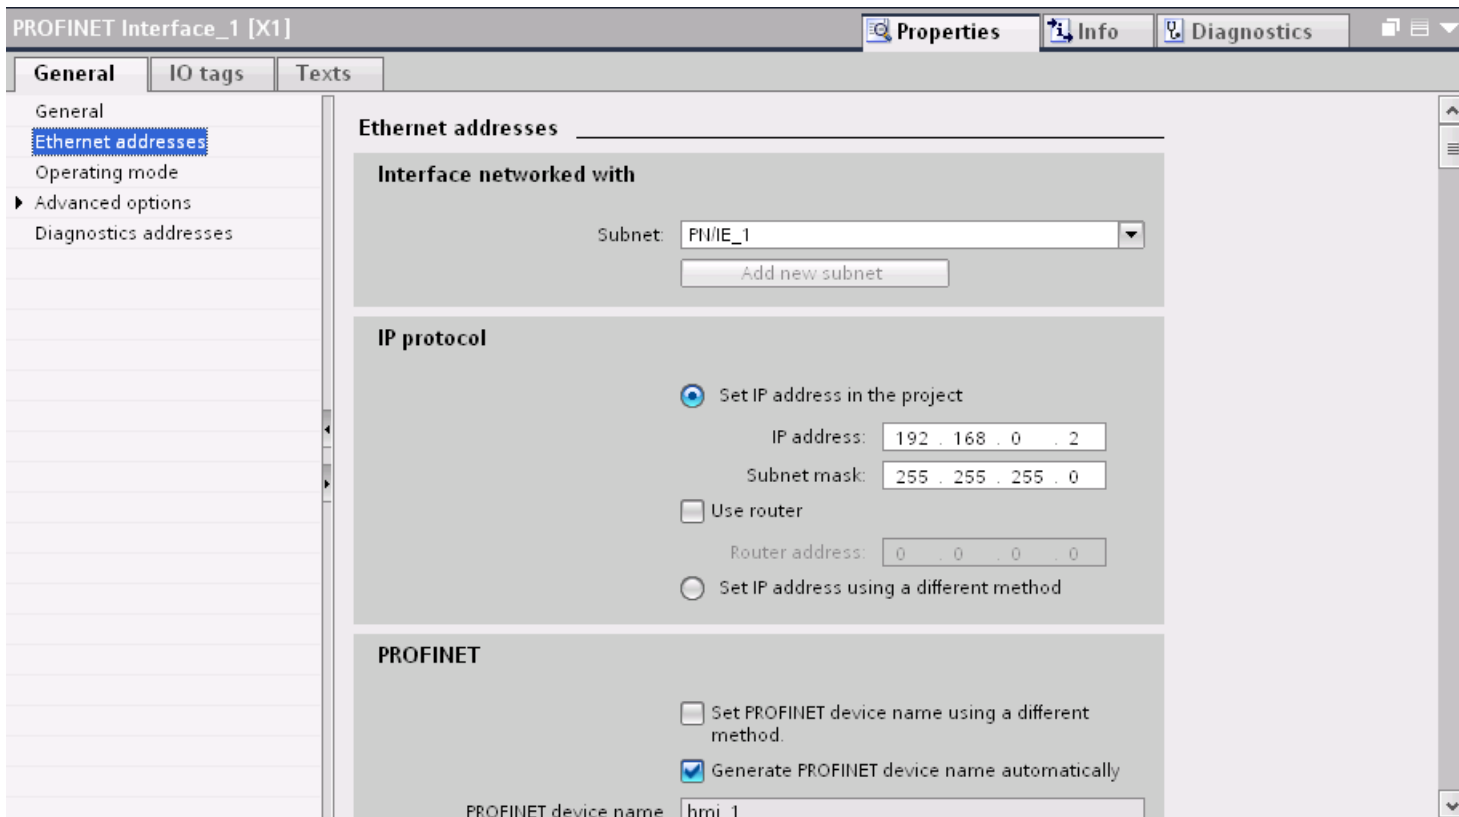

### PROFINET parameters for the HMI device

### PROFINET parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

### Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General".

#### "Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

**"IP protocol"**

- "Set IP address in the project"  
When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

---

**Note**

The device is automatically restarted in the case of HMI devices with the Windows CE 3.0 operating system.

HMI devices with Windows CE 3.0:

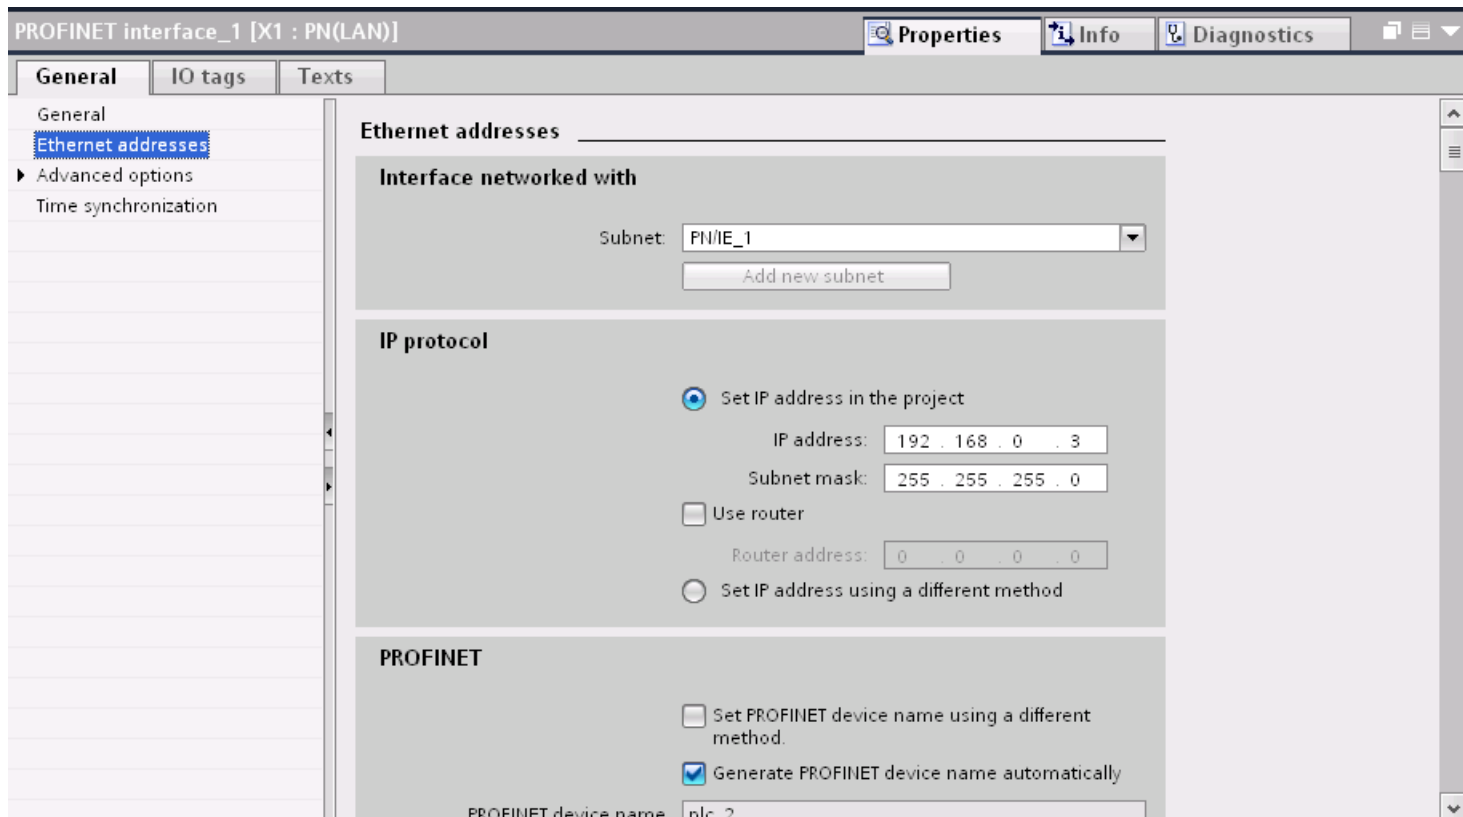

- OP 77B
  - TP 177B color PN/DP
  - TP 177B mono DP
  - OP 177B color PN/DP
  - OP 177B mono DP
  - Mobile Panel 177 PN
  - Mobile Panel 177 DP
  - TP 277 6"
  - OP 277 6"
- 
- "Subnet mask"  
You assign data of the subnet mask in the "Subnet mask" area.
  - "Use IP router"  
If you are using an IP router, select "Use IP router" and enter the router address in the "Router address" field.
  - "Set IP address using a different method"  
If the function "Set IP address using a different method" is activated, the IP address is not taken from the project. You have to enter the IP address directly in the Control Panel of the HMI device.

**PROFINET parameters for the PLC****PROFINET parameters for the PLC**

An overview of the configured parameters can be found in the properties for the PLC.

## Displaying and changing PROFINET parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".

### "Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

### "IP protocol"

- "Interface type"  
Depending on the HMI device type, you have various interfaces to choose from.
- "IP address"  
You assign the IP address of the HMI device in the "IP address" area.
- "Subnet mask"  
You assign data of the subnet mask in the "Subnet mask" area.  
If you are using an IP router, select "Use IP router" and enter the router address in the field.

## Configuring Industrial Ethernet

### Rules for the network configuration

The Ethernet interfaces of the devices have a default IP address that you can change.

### IP address

The IP parameters are visible if the communication-capable devices support the TCP/IP protocol.

The IP address consists of 4 decimal figures in the range of 0 to 255. The decimal figures are separated from one another by a dot.

Example: 140.80.0.2

The IP address consists of the following:

- The address of the (sub) net
- The address of the node (generally also called host or network node)

### Subnet mask

The subnet mask splits these two addresses. It determines which part of the IP address addresses the network and which part of the IP address addresses the node.

The set bits of the subnet mask determine the network part of the IP address.

Example:

Subnet mask: 255.255.0.0 = 11111111.11111111.00000000.00000000

In the example given for the above IP address, the subnet mask shown here has the following meaning:

The first 2 bytes of the IP address identify the subnet - i.e. 140.80. The last two bytes address the node, thus 0.2.

It is generally true that:

- The network address results from AND linking the IP address and subnet mask.
- The node address results from AND NOT linking the IP address and subnet mask.

### Relation between IP address and default subnet mask

An agreement exists relating to the assignment of IP address ranges and so-called "Default subnet masks". The first decimal number (from the left) in the IP address determines the structure of the default subnet mask. It determines the number of "1" values (binary) as follows:

IP address (decimal)	IP address (binary)	Address class	Default subnet mask
0 to 126	0xxxxxxx.xxxxxxxx...	A	255.0.0.0
128 to 191	10xxxxxx.xxxxxxxx...	B	255.255.0.0
192 to 223	110xxxxx.xxxxxxxx...	C	255.255.255.0

**Note****Range of values for the first decimal point**

A value of between 224 and 255 is also possible for the first decimal number of the IP address (address class D etc). This is, however, not recommended because there is no address check for these values.

**Masking other subnets**

You can use the subnet mask to add further structures and form "private" subnets for a subnet that is assigned one of the address classes A, B or C. This is done by setting other lower points of the subnet mask to "1". For each bit set to "1", the number of "private" networks doubles and the number of nodes they contain is halved. Externally, the network functions like an individual network as it did previously.

Example:

You have a subnet of address class B (e.g. IP address 129.80.xxx.xxx) and change the default subnet mask as follows:

Masks	Decimal	Binary
Default subnet mask	255.255.0.0	11111111.11111111.00000000.00000000
Subnet mask	255.255.128.0	11111111.11111111.10000000.00000000

Result:

All nodes with addresses between 129.80.001.xxx and 129.80.127.xxx are on one subnet, all nodes with addresses between 129.80.128.xxx and 129.80.255.xxx are on another subnet.

**Router**

The job of the routers is to connect the subnets. If an IP datagram is to be sent to another network, it first has to be conveyed to a router. To make this possible, in this case you have to enter the address of the router for each node in the subnet.

The IP address of a node in the subnet and the address of the router may only differ at the points at which there is a "0" in the subnet mask.

## Setting port options

### Setting the port options

#### Changing connection settings for the PROFINET IO port

You can change the network settings for the PROFINET IO port as required. By default, the settings are made automatically. In normal situations, this guarantees problem-free communication.

#### Possible settings for transmission rate / duplex

Depending on the selected device, you can make the following settings for "Transmission rate / duplex":

- **Automatic setting**  
Recommended default setting of the port. The transmission settings are automatically "negotiated" with the peer port. The "Enable autonegotiation" option is also enabled as a default, in other words, you can use cross cables or patch cables for the connection.
- **TP/ITP at x Mbps full duplex (half duplex)**  
Setting of the transmission rate and the full duplex/half duplex mode. The effectiveness depends on the "Enable autonegotiation" setting:
  - Autonegotiation enabled  
You can use both cross cable and patch cable.
  - Autonegotiation disabled  
Make sure that you use the correct cable (patch cable or cross cable)! The port is also monitored with this setting.
- **Deactivated**  
Depending on the module type, the drop down list box can contain the "- Disabled -" option. This option, for example, allows you to prevent access to an unused port for security reasons. With this setting, diagnostic events are not generated.

#### "Monitor" option

This option enables or disables port diagnostics. Examples of port diagnostics: The link status is monitored, in other words, the diagnostics are generated during link-down and the system reserve is monitored in the case of fiber optic ports.

#### Option "Enable autonegotiation "

The autonegotiation setting can only be changed if a concrete medium (for example, TP 100 Mbps full duplex) is selected. Whether or not a concrete medium can be set depends on the properties of the module.

If autonegotiation is disabled, this causes the port to be permanently specified, as for example, is necessary for a prioritized startup of the IO device.

You must make sure the partner port has the same settings because with this option the operating parameters of the connected network are not detected and the data transmission rate and transmission mode can accordingly not be optimally set.

---

**Note**

When a local port is connected, STEP 7 makes the setting for the partner port if the partner port supports the setting. If the partner port does not accept the setting, an error message is generated.

---

**Wiring rules for disabled autonegotiation**

**Requirements**

You have made the following settings for the port in question, for example, to accelerate the startup time of the IO device:

- Fixed transmission rate
- Autonegotiation incl. autocrossing disabled

The time for negotiating the transmission rate during startup has been saved.

If you have disabled autonegotiation, you must observe the wiring rules.

**Wiring rules for disabled autonegotiation**

PROFINET devices have the following two types of ports:

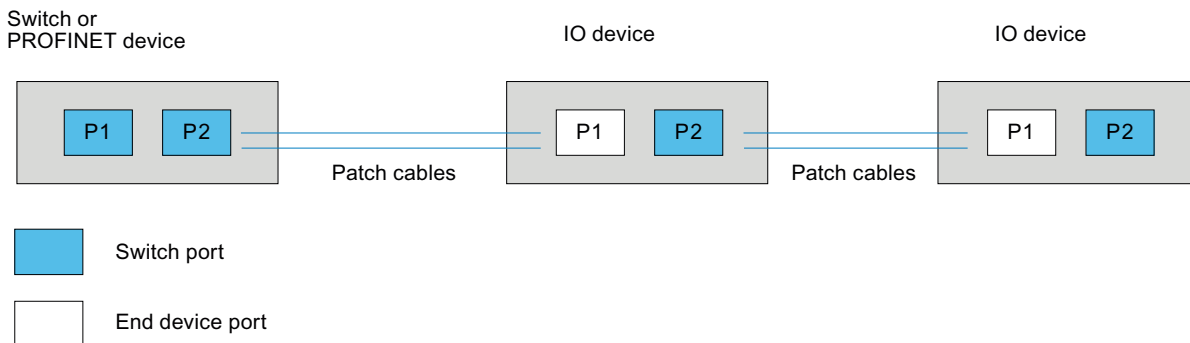

Type of port	PROFINET devices	Note
Switch port with crossed pin assignment	For IO devices: Port 2 For S7 CPUs with 2 ports: Ports 1 and 2	Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is exchanged internally.
End device port with uncrossed pin assignment	For IO devices: Port 1 For S7 CPUs with one port: Port 1	-

**Validity of the wiring rules**

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting.

## Rules for cabling

You can connect several IO devices in line using a single cable type (patch cable). To do this, you connect port 2 of the IO device (distributed I/O) with port 1 of the next IO device. The following graphic gives an example with two IO devices.

## Boundaries at the port

### Requirements

To use boundaries, the respective device must have more than one port. If the PROFINET does not support boundary settings, they are not shown.

### Enable boundaries

"Boundaries" are limits for transmission of certain Ethernet frames. The following boundaries can be set at a port:

- "End of discovery of accessible devices"  
No forwarding of DCP frames to identify accessible devices. Devices downstream from this port cannot be reached by the project tree under "Accessible devices". Devices downstream from this port cannot be reached by the CPU.
- "End of topology discovery"  
LLDP frames (Link Layer Discovery Protocol) are not forwarded for topology detection.
- "End of sync domain"  
No forwarding of sync frames transmitted to synchronize nodes within a sync domain. If you operate, for example, a PROFINET device with more than two ports in a ring, you should prevent the sync frame from being fed into the ring by setting a sync boundary (at the ports not inside the ring).  
Additional example: If you want to use several sync domains, configure a sync domain boundary for the port connected to a PROFINET device from the other sync domain.

## Restrictions

The following restrictions must be observed:

- The individual check boxes can only be used if the port supports the function in question.
- If a partner port has been determined for the port, the following check boxes cannot be used:
  - "End of discovery of accessible devices"
  - "End of topology discovery"
- If autonegotiation is disabled, none of the check boxes can be used.

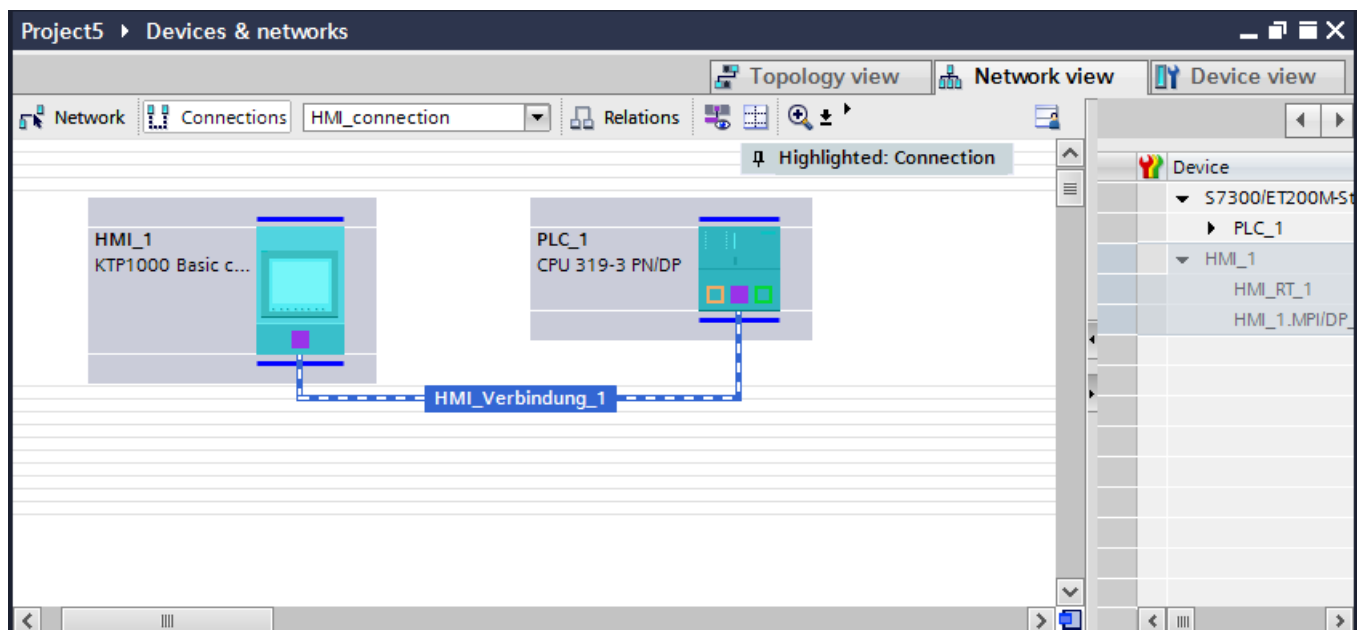

### 10.11.8.3 Communication via PROFIBUS

#### Configuring an HMI connection

#### Communication via PROFIBUS

#### HMI connections via PROFIBUS

If you have inserted an HMI device and a SIMATIC S7 300/400 into the project, you interconnect the two PROFIBUS interfaces in the "Devices & Networks" editor.

#### HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

## Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device in the "Connections" editor of the HMI device.

## Configuring an HMI connection via PROFIBUS

### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFIBUS in the "Devices & Networks" editor.

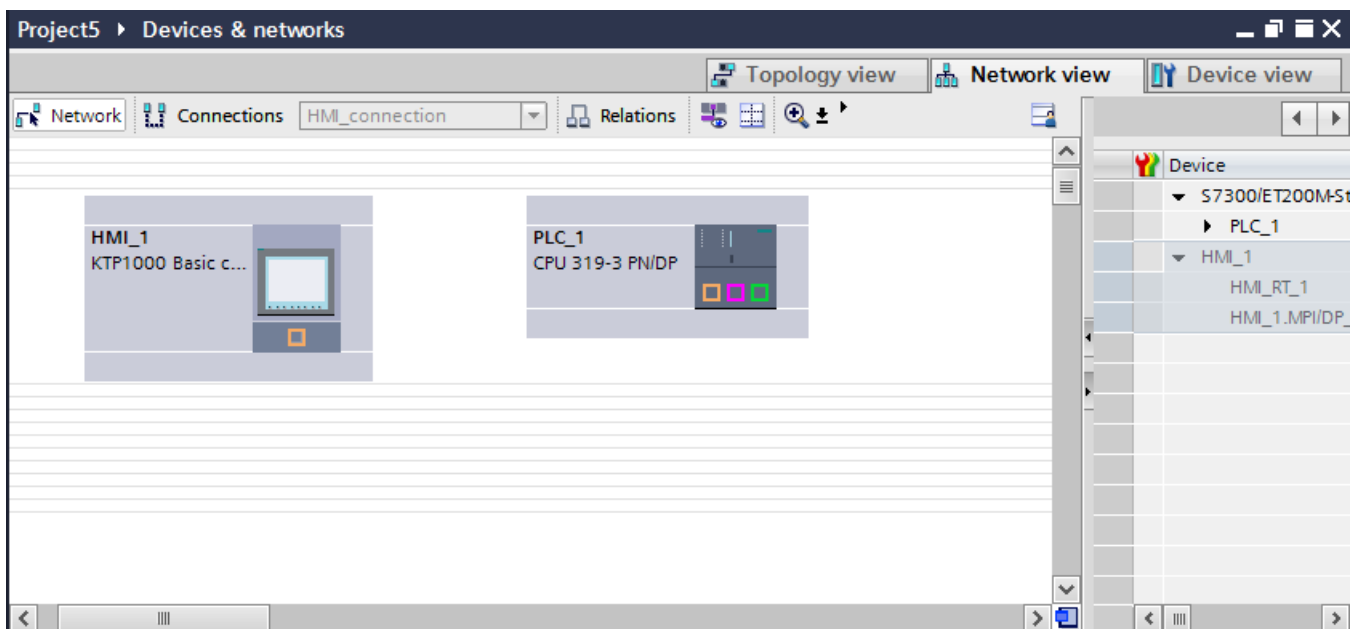

### Requirements

The following communication partners are created in the "Devices & Networks" editor:

- HMI device with MPI/DP interface
- SIMATIC S7 300/400 with PROFIBUS interface

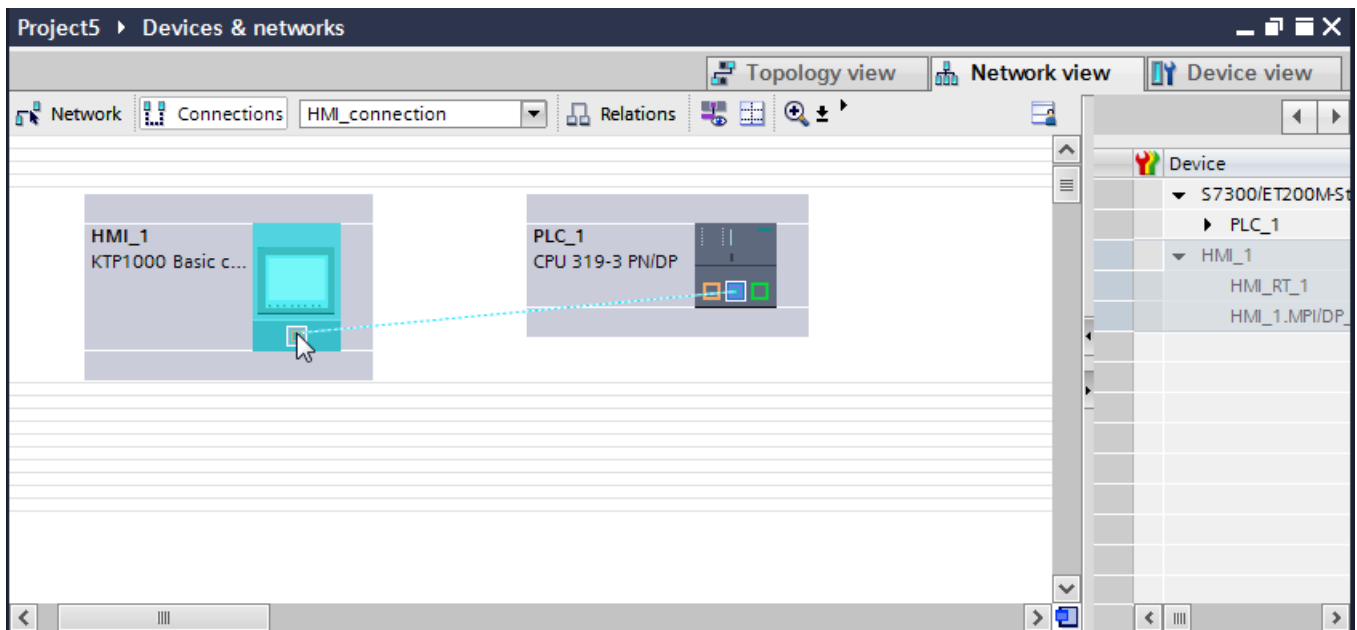

### Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed graphically in the network view.

2. Click the "Connections" button.  
The devices available for connection are highlighted in color.
3. Click the HMI device interface.
4. Select the "PROFIBUS" interface type in the Inspector window under "Properties > General > HMI MPIDP > Parameters".

5. Click the interface of the PLC and use a drag-and-drop operation to draw a connection to the HMI device.

6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project. See the chapter "PROFIBUS parameters (Page 5498)" for additional details.

---

**Note**

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

---

**Result**

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via PROFIBUS.

## **Configuring an HMI connection**

### **Communication via PROFIBUS**

#### **Communication via PROFIBUS**

This section describes the communication between a WinCC Runtime and the SIMATIC S7 300/400 PLC via PROFIBUS.

You can use the following WinCC Runtimes as an HMI device:

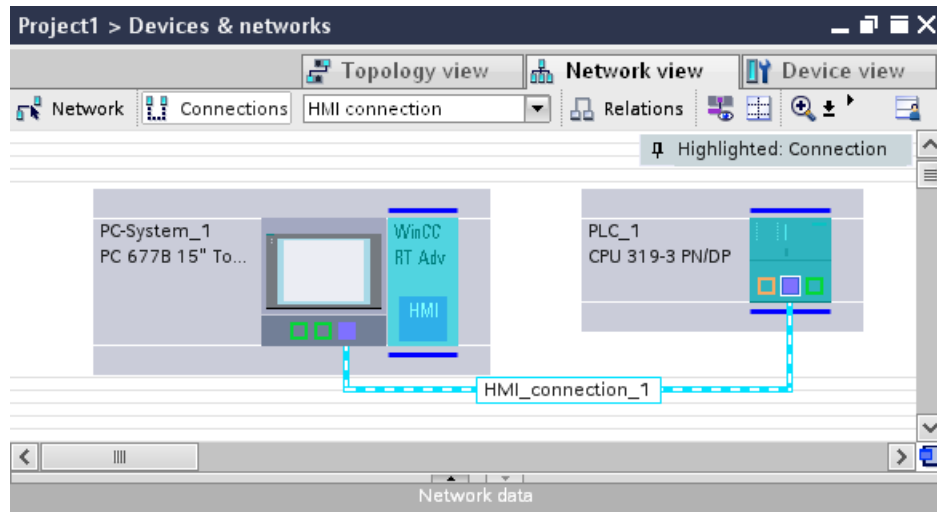

- WinCC RT Advanced
- WinCC RT Professional

#### **WinCC Runtime as HMI device**

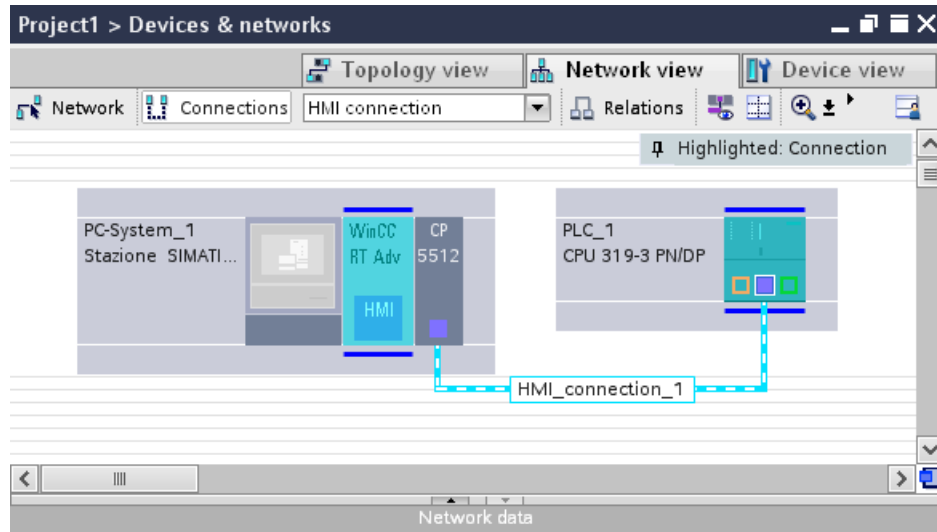

You configure the HMI connections between WinCC Runtime and SIMATIC S7 300/400 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC. In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.

2. You create a WinCC Runtime and configure a communication processor to the Runtime. In this way you use your configuration PC with a WinCC Runtime as an HMI device.

You can also connect multiple HMI devices to one SIMATIC S7 300/400 and multiple SIMATIC S7 300/400s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

### HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

## Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFIBUS in the "Connections" editor of the HMI device.

## Configuring an HMI connection via PROFIBUS with a SIMATIC PC

### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFIBUS in the "Devices & Networks" editor.

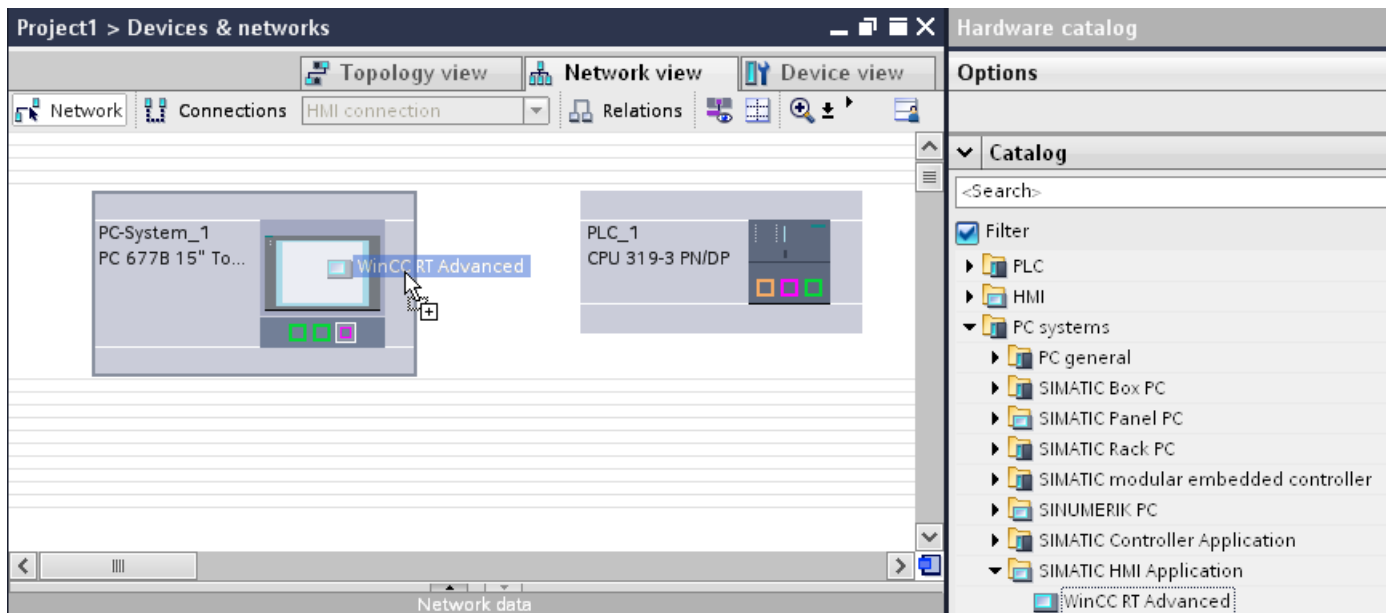

### Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 300/400 with PROFIBUS interface
- SIMATIC PC with PROFIBUS interface

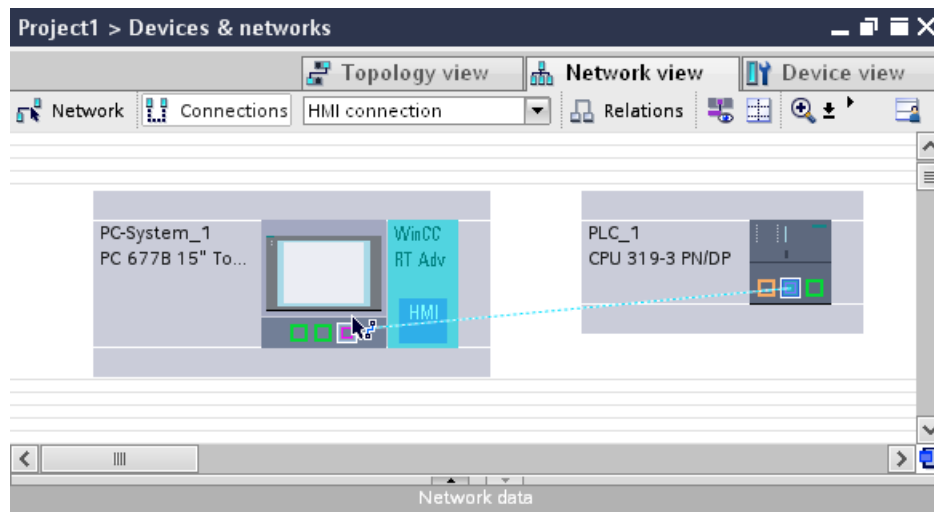

### Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed in the network view.
2. Click the MPI interface of the PC and select "PROFIBUS" for the interface type in the Inspector window.
3. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.

4. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.

5. Click the PROFIBUS interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the PC.

6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project. See the chapter "PROFIBUS parameters (Page 5498)" for additional details.

---

**Note**

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

---

**Result**

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via PROFIBUS.

**Configuring an HMI connection via PROFIBUS with a PC**

**Introduction**

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFIBUS in the "Devices & Networks" editor.

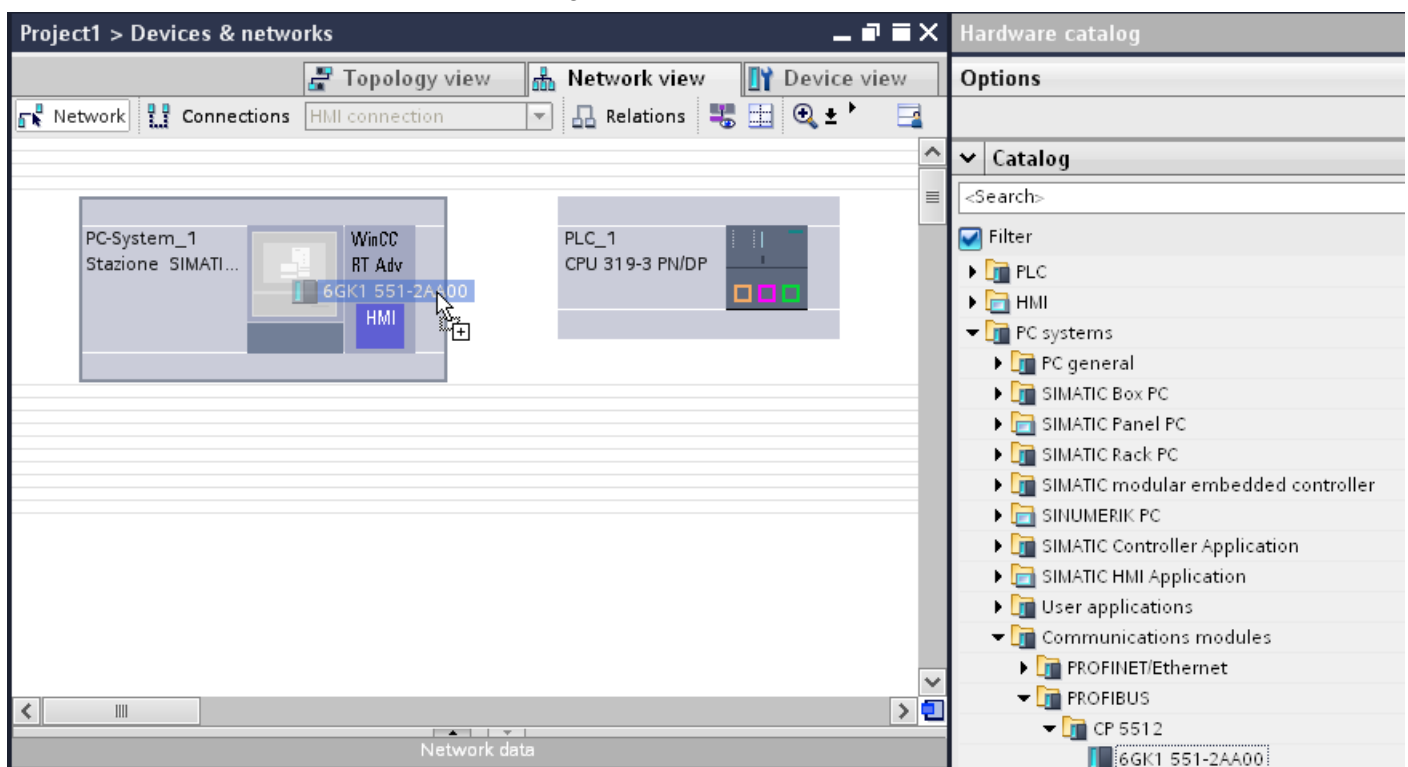

## Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 300/400
- PC station with WinCC RT Advanced

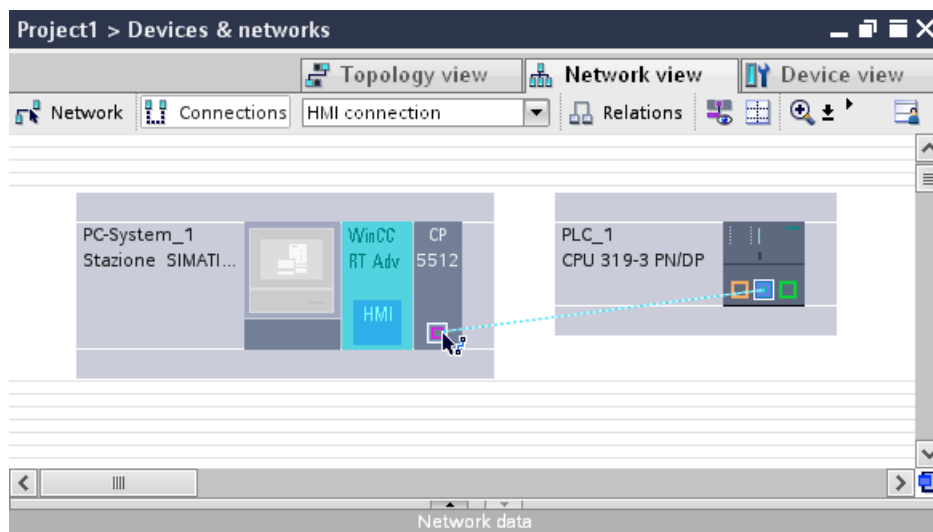

## Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFIBUS-capable communication processor from the hardware catalog to the WinCC Runtime.

3. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.

- Click the PROFIBUS interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the communication processor.

- Click the connecting line.
- Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
- Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project. See the chapter "PROFIBUS parameters (Page 5498)" for additional details.

**Note**

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

**Result**

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via PROFIBUS.

**PROFIBUS parameters**

**PROFIBUS parameters for the HMI connection**

**PROFIBUS parameters for the HMI connection**

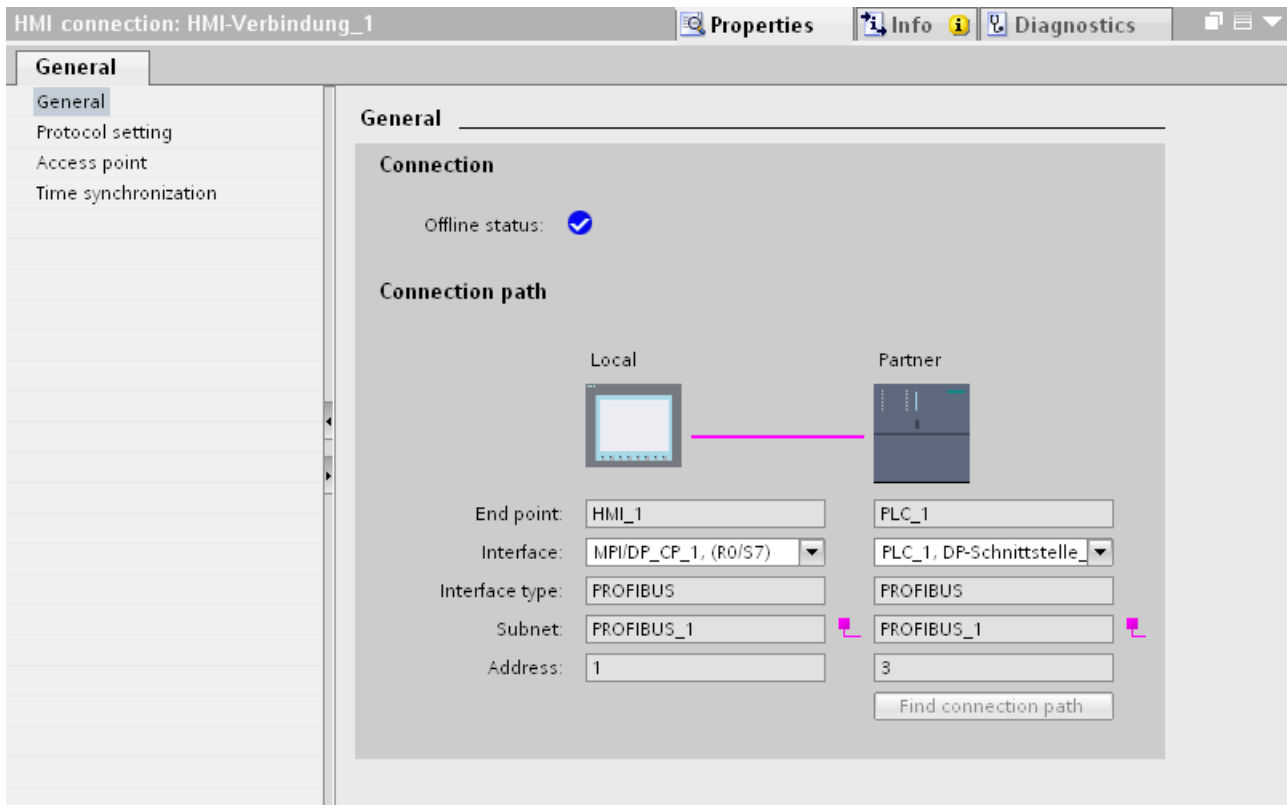

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

## Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".

### "Connection"

Displays whether the devices are networked together.

- displayed if the devices are networked together.
- displayed if the devices are not networked together.

### "Connection path"

The communication partners of the selected HMI connection and the associated PROFIBUS parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"  
Displays the device name. This area is not editable.
- "Interface"  
Displays the selected interface of the device. You can choose between several interfaces, depending on the device.

- "Interface type"  
Displays the selected interface type. This area is not editable.
- "Subnet"  
Displays the selected subnet. This area is not editable.
- "Address"  
Displays the PROFIBUS address of the device. This area is not editable.
- "Find connection path" button  
Enables the subsequent specification of connections.

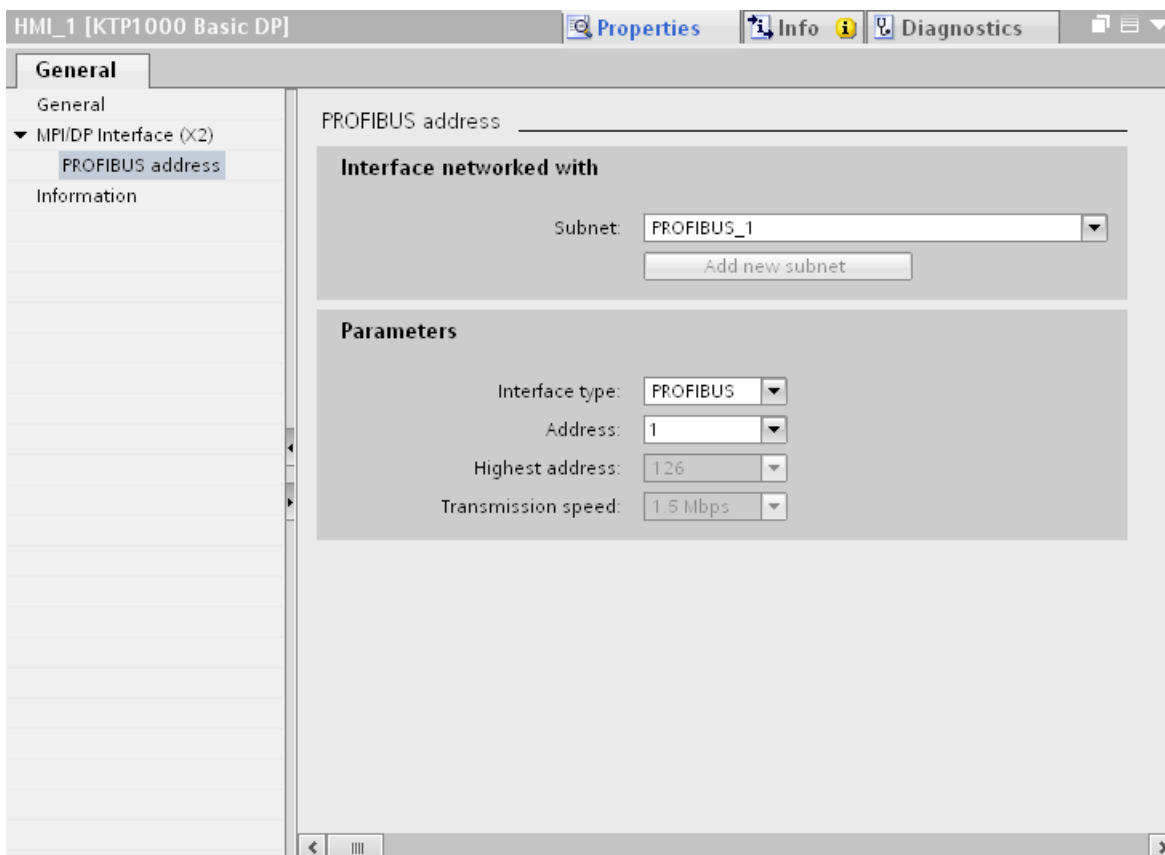

## PROFIBUS parameters for the HMI device

## PROFIBUS parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

## Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".

**"Interface networked with"**

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

**"Parameters"**

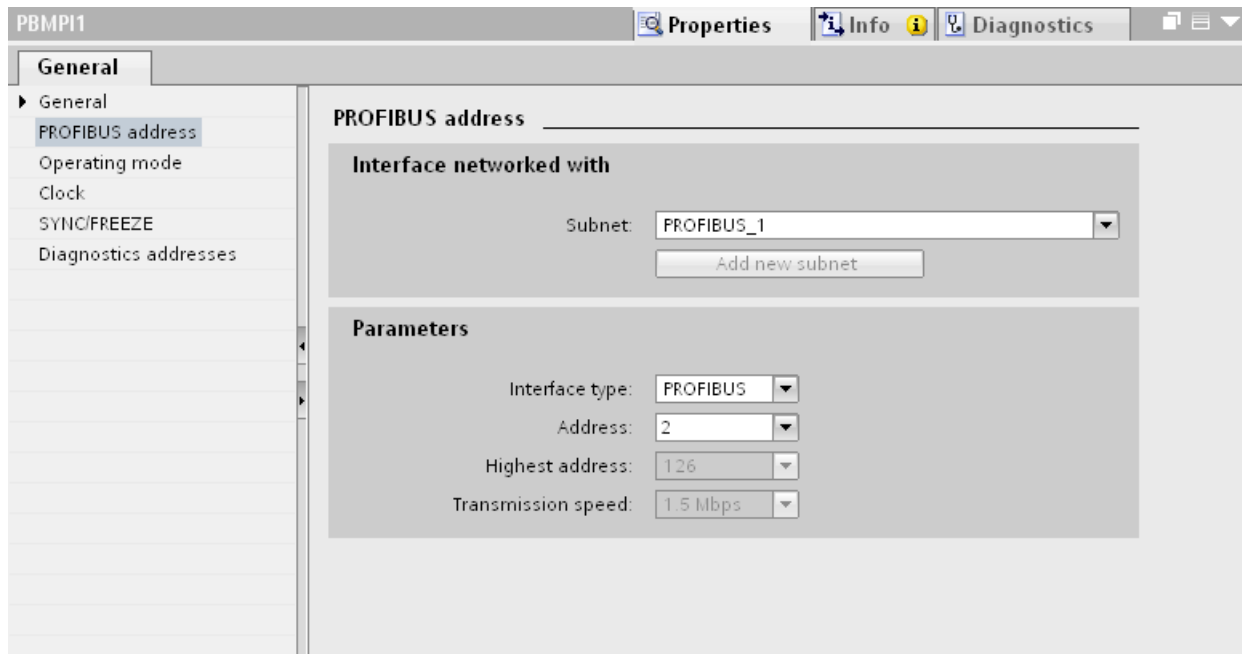

- "Interface type"  
You assign the interface type in the "Interface type" area. Depending on the HMI device type, you have various interfaces to choose from.
- "Address"  
You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"  
The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"  
The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

**PROFIBUS parameters for the PLC****PROFIBUS parameters for the PLC**

An overview of the configured parameters can be found in the properties for the PLC.

## Displaying and changing PROFIBUS parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".

### "Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

### "Parameters"

- "Interface type"  
Depending on the HMI device type, you have various interfaces to choose from.
- "Address"  
You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"  
The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"  
The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

## Bus profiles with PROFIBUS

### Introduction

Depending on the device types connected and protocols used on the PROFIBUS, different profiles are available. The profiles differ in terms of the setting options and calculation of bus parameters. The profiles are explained below.

### Devices with different profiles on the same PROFIBUS subnet

The PROFIBUS subnet only functions without problem if the bus parameters of all devices have the same values.

### Profiles and transmission rates

Profiles	Supported transmission speeds in Kbits/s
DP	9,6 19,2 45,45 93,75 187,5 500 1500 3000 6000 12000
Standard	9,6 19,2 45,45 93,75 187,5 500 1500 3000 6000 12000
Universal	9,6 19,2 93,75 187,5 500 1500

### Meaning of profiles

Profile	Meaning
DP	<p>Select the "DP" bus profile when the only devices connected to the PROFIBUS subnet are those which satisfy the requirements of standard EN 50170 Volume 2/3, Part 8-2 PROFIBUS. The bus parameter setting is optimized on these devices.</p> <p>This includes devices with DP master and DP slave interfaces of the SIMATIC S7 and distributed I/Os of other manufacturers.</p>
Standard	<p>Compared to the "DP" profile, the "Standard" profile also offers scope for devices of another project or devices which have not been configured here to be taken into account when calculating the bus parameters. The bus parameters are then calculated following a simple, non-optimized algorithm.</p>
Universal	<p>Select the "Universal" bus profile when individual devices on the PROFIBUS subnet use the PROFIBUS-FMS service.</p> <p>This includes the following devices for example:</p> <ul style="list-style-type: none"> <li>• CP 343-5</li> <li>• PROFIBUS-FMS devices of other manufacturers</li> </ul> <p>As with the "Standard" profile, this profile allows you to take other devices into account when calculating the bus parameters.</p>

### 10.11.8.4 Communication via MPI

#### Configuring an HMI connection

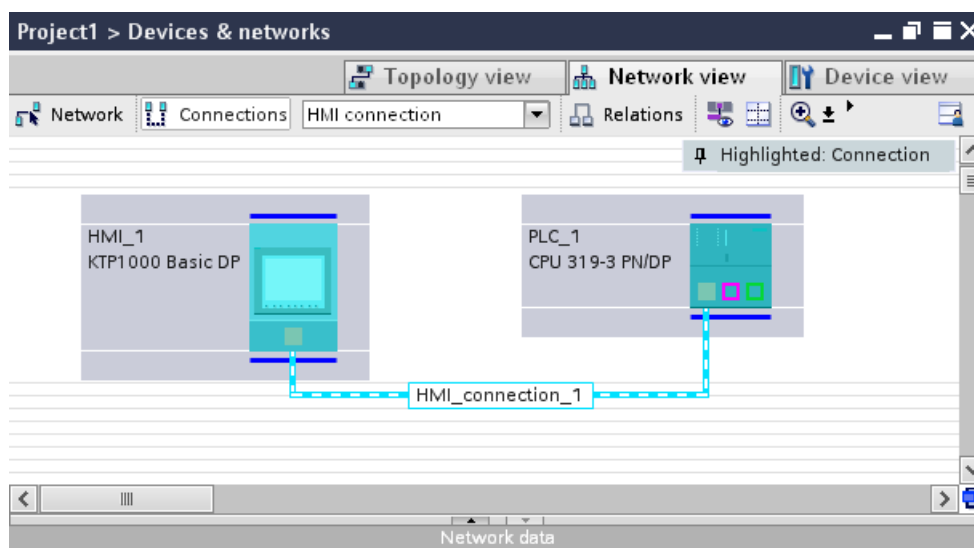

#### Communication via MPI

#### HMI connections via MPI

If you have inserted an HMI device and a SIMATIC S7 300/400 into the project, you interconnect the two MPI interfaces in the "Devices & Networks" editor.

#### HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

#### Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device in the "Connections" editor of the HMI device.

#### Configuring an HMI connection via MPI

#### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via MPI in the "Devices & Networks" editor.

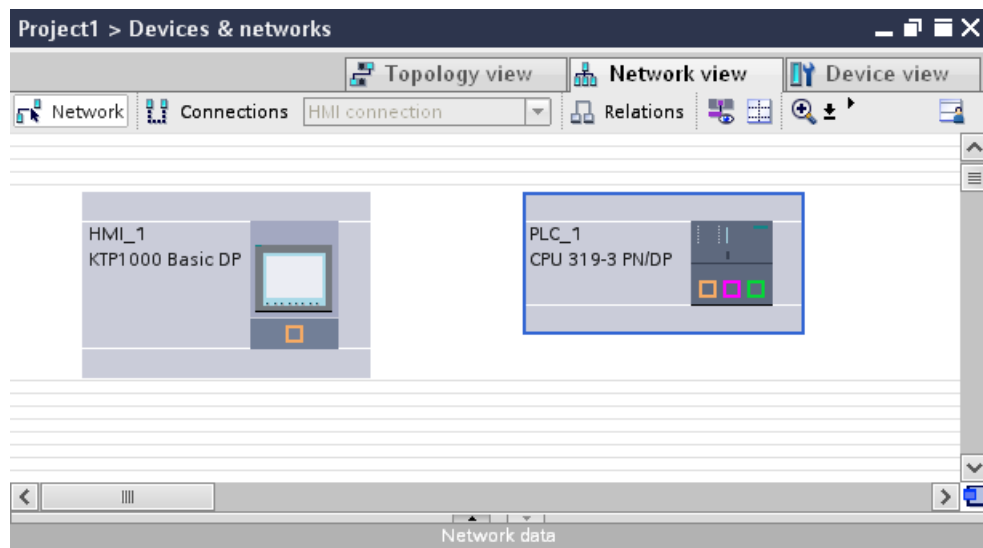

## Requirements

The following communication partners are created in the "Devices & Networks" editor:

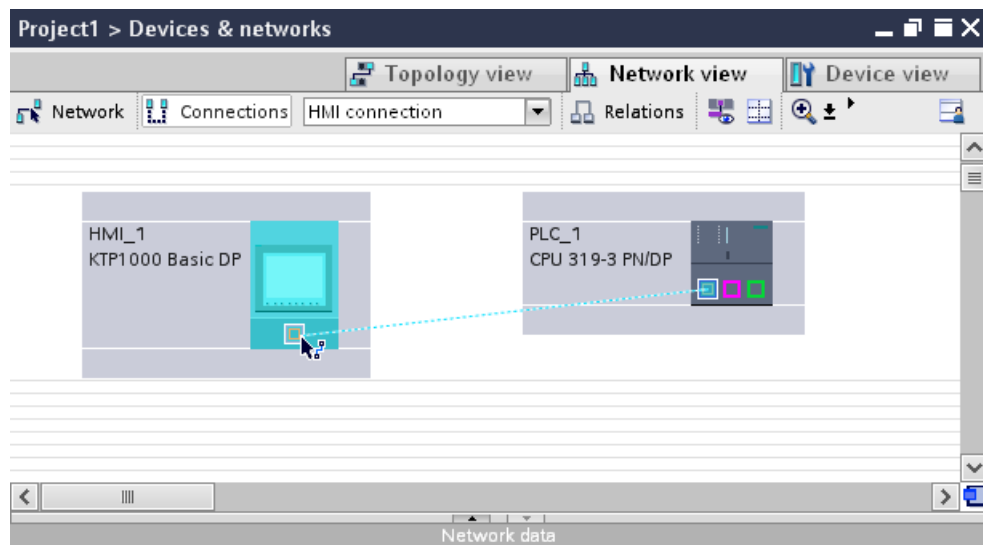

- HMI device with MPI/DP interface
- SIMATIC S7 300/400 with MPI/DP interface

## Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed graphically in the network view.

2. Click the "Connections" button.  
The devices available for connection are highlighted in color.
3. Click the interface of the PLC and use a drag-and-drop operation to draw a connection to the HMI device.

4. Click the connecting line.  
The connection is displayed graphically in the Inspector window.
5. Click "Highlight HMI connection" and select the HMI connection.
6. Click the communication partners in the "Network view" and change the MPI parameters in the Inspector window according to the requirements of your project.  
See the chapter "MPI parameters (Page 5511)" for additional details.

---

**Note**

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. Use the table to monitor the connection parameters and change the connection partner. You can change the local name for the connection only in the table.

---

## Result

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via MPI.

## Configuring an HMI connection

### Communication via MPI

### Communication via MPI

This section describes the communication between a WinCC Runtime and the SIMATIC S7 300/400 PLC via MPI.

You can use the following WinCC Runtimes as an HMI device:

- WinCC RT Advanced

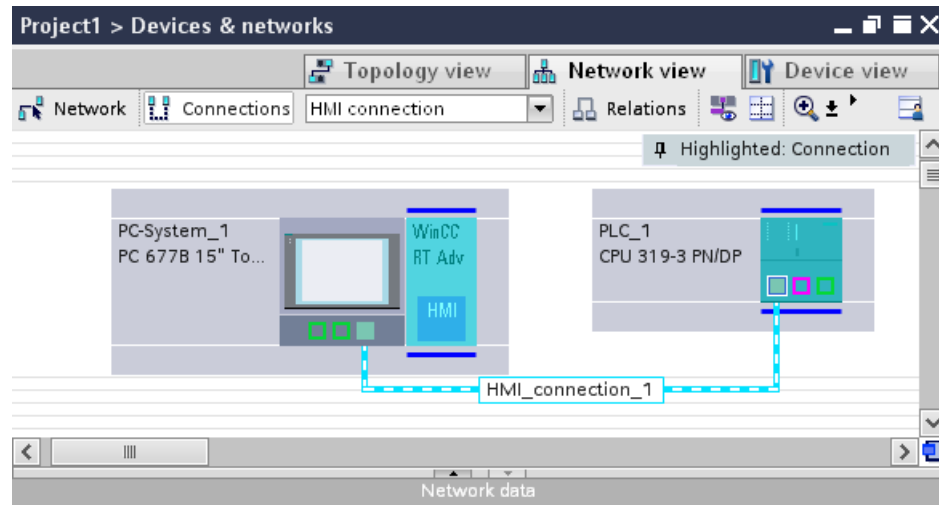

### WinCC Runtime as HMI device

You configure the HMI connections between WinCC Runtime and SIMATIC S7 300/400 in the "Devices & Networks" editor.

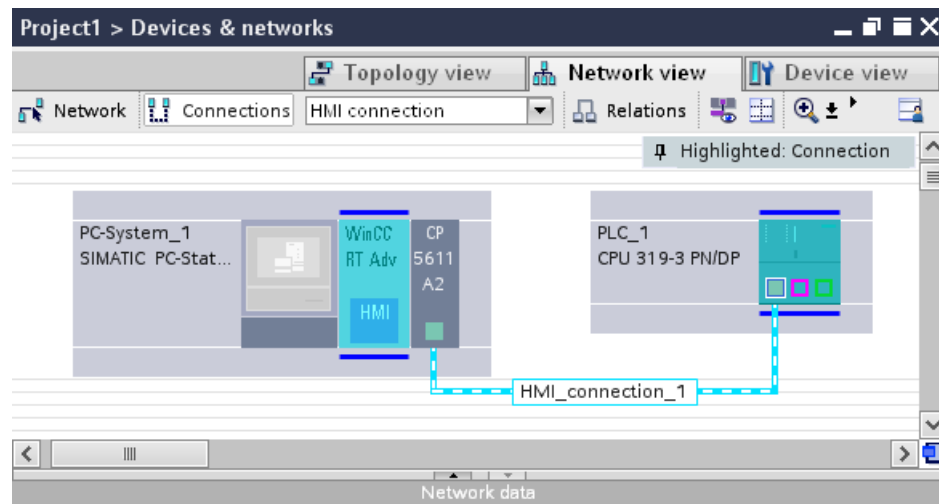

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC. In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.

2. You create a WinCC Runtime and configure a communication processor to the Runtime. In this way you use your configuration PC with a WinCC Runtime as an HMI device.

You can also connect multiple HMI devices to one SIMATIC S7 300/400 and multiple SIMATIC S7 300/400s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

### HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via MPI in the "Devices & Networks" editor.

### Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via MPI in the "Connections" editor of the HMI device.

### Configuring an HMI connection via MPI with a SIMATIC PC

#### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFIBUS in the "Devices & Networks" editor.

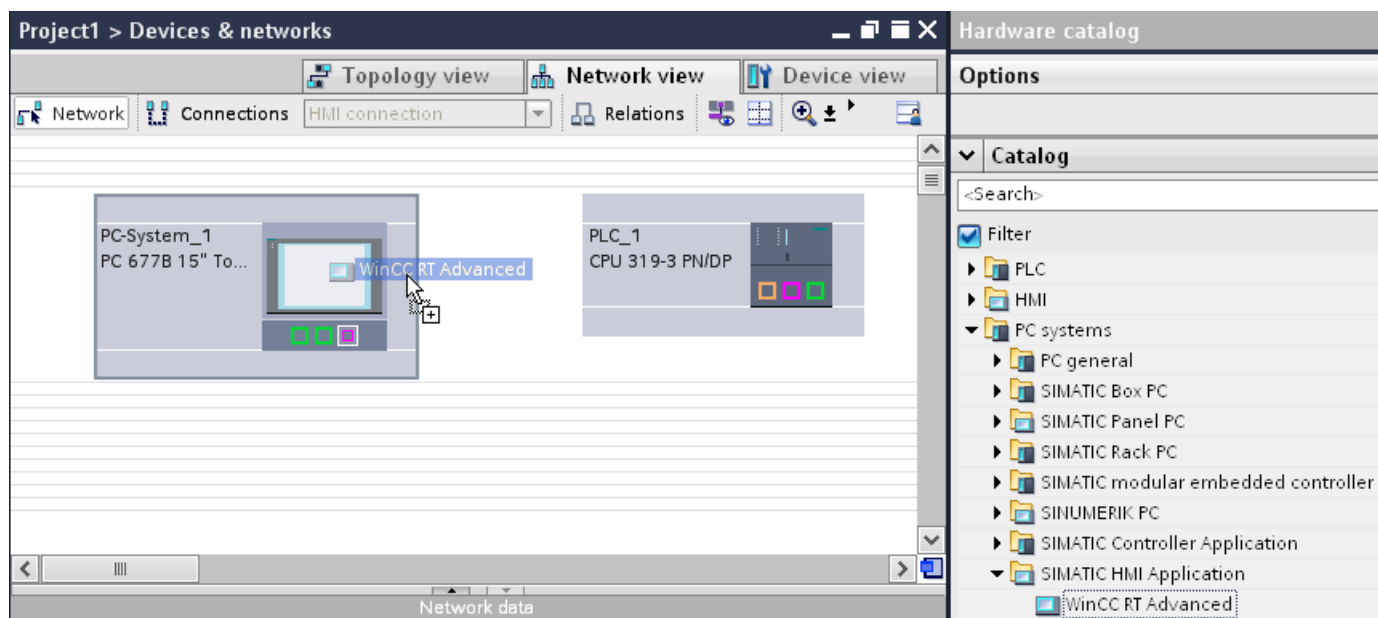

#### Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 300/400 with MPI interface
- SIMATIC PC with MPI interface

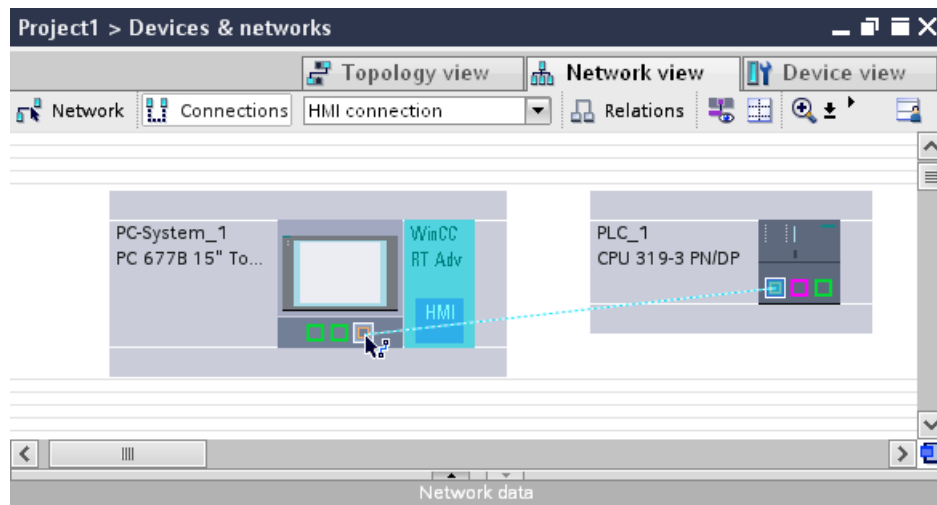

#### Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.

3. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.

- Click the MPI interface of the PLC and use a drag-and-drop operation to draw a connection to the MPI interface of the PC.

- Click the connecting line.
- Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
- Click the communication partners in the "Network view" and change the MPI parameters in the Inspector window according to the requirements of your project. See the chapter "MPI parameters (Page 5511)" for additional details.

---

#### Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

---

## Result

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via MPI.

## Configuring an HMI connection via MPI with a PC

### Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via MPI in the "Devices & Networks" editor.

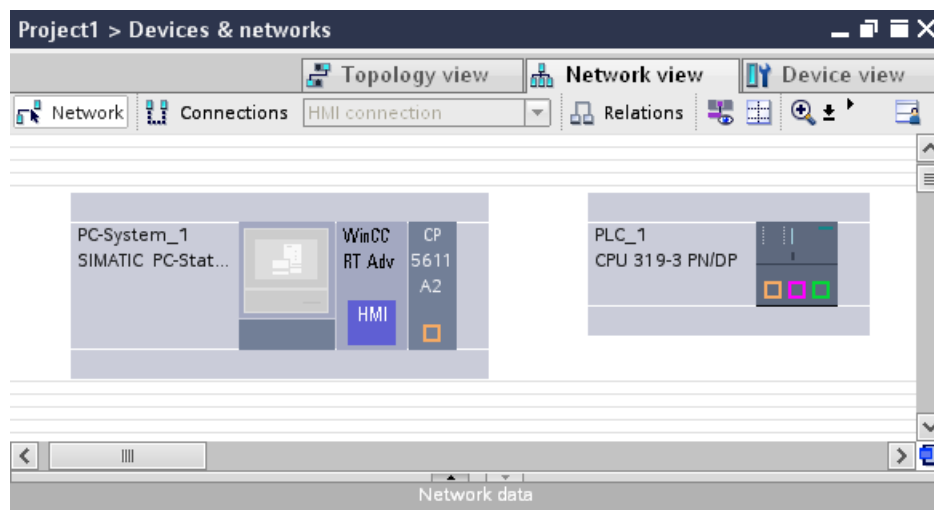

## Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 300/400 with MPI interface
- PC station with WinCC RT Advanced

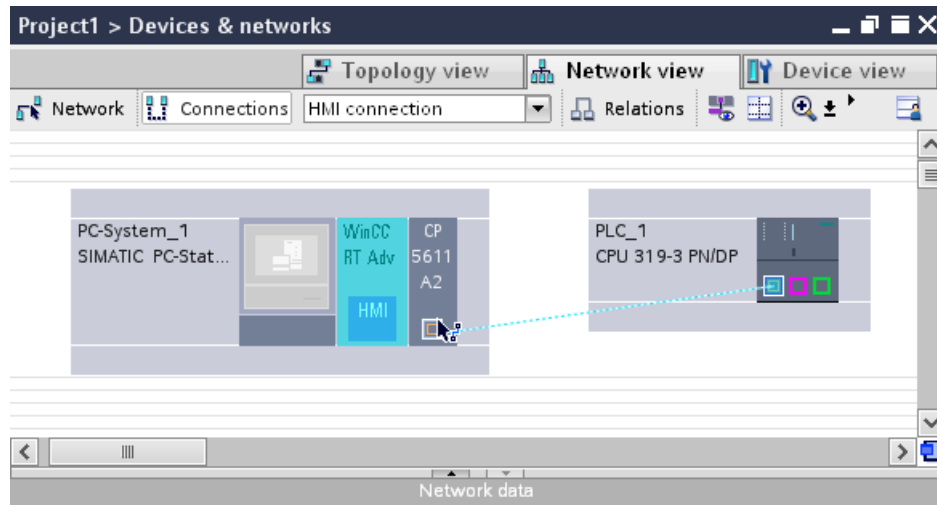

## Procedure

1. Double-click the "Devices & Networks" item in the project tree.  
The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFIBUS-capable communication processor from the hardware catalog to the WinCC Runtime.

3. Click the PROFIBUS interface of the communication processor and change the interface to "MPI".
4. Click the "Connections" button and select "HMI connection" for the connection type.  
The devices available for connection are highlighted in color.

- Click the MPI interface of the PLC and use a drag-and-drop operation to draw a connection to the MPI interface of the communication processor.

- Click the connecting line.
- Click "Highlight HMI connection" and select the HMI connection. The connection is displayed graphically in the Inspector window.
- Click the communication partners in the "Network view" and change the MPI parameters in the Inspector window according to the requirements of your project. See the chapter "MPI parameters (Page 5511)" for additional details.

#### Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

## Result

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via MPI.

## MPI parameters

### MPI parameters for the HMI connection

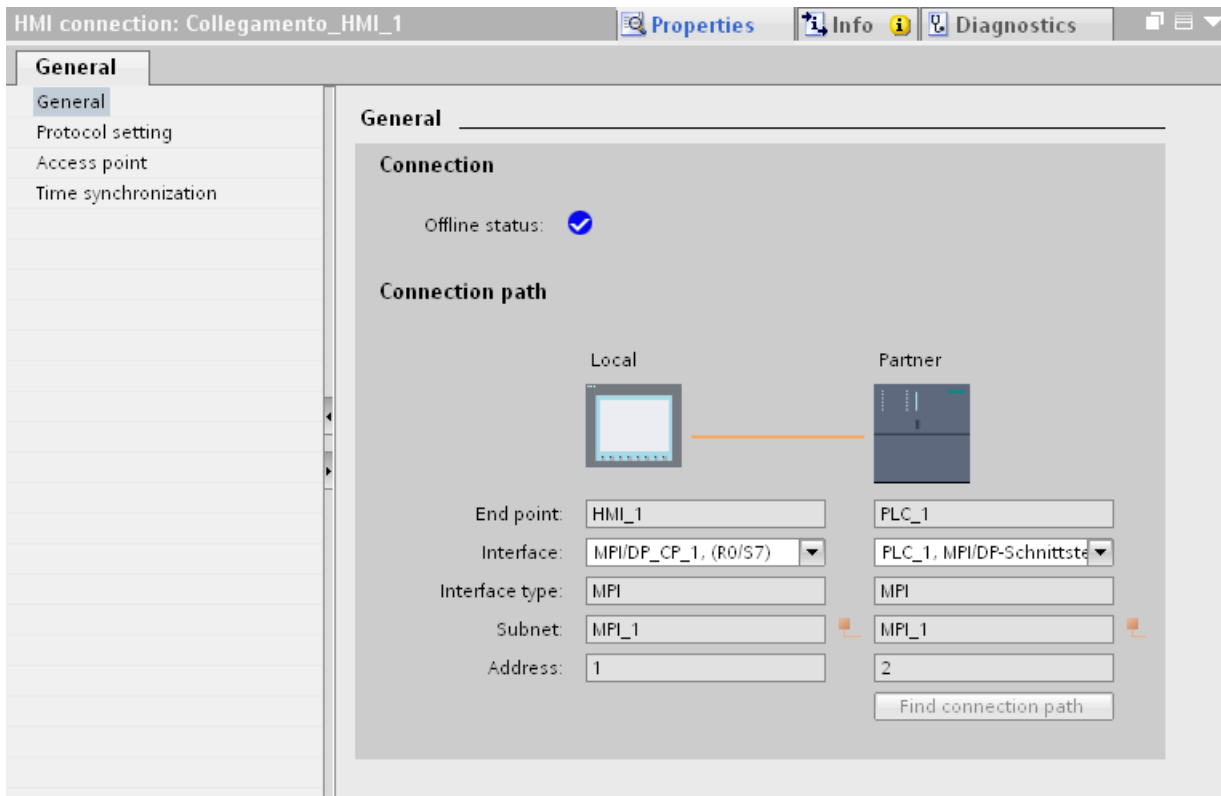

### MPI parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

### Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".

#### "Connection"

Displays whether the devices are networked together.

- displayed if the devices are networked together.
- displayed if the devices are not networked together.

#### "Connection path"

The communication partners of the selected HMI connection and the associated MPI parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"  
Displays the name of the device. This area is not editable.
- "Interface"  
Displays the selected interface of the device. You can choose between several interfaces, depending on the device.

- "Interface type"  
Displays the selected interface type. This area is not editable.
- "Subnet"  
Displays the selected subnet. This area is not editable.
- "Address"  
Displays the MPI address of the device. This area is not editable.
- "Find connection path" button  
Enables the subsequent specification of connections.

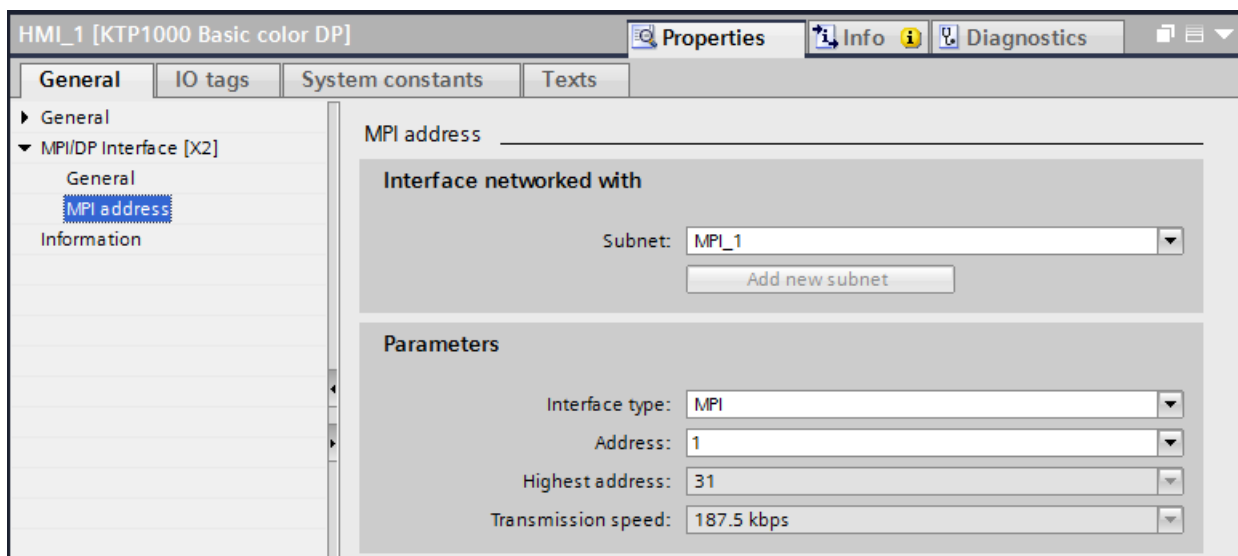

## MPI parameters for the HMI device

## MPI parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

## Displaying and changing MPI parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".

## "Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

## "Parameters"

- "Interface type"  
You assign the interface type in the "Interface type" area. Depending on the HMI device type, you have various interfaces to choose from.
- "Address"  
You assign the MPI address of the HMI device in the "Address" area. The MPI address must be unique throughout the MPI network.
- "Highest address"  
The "Highest address" area displays the highest address of the MPI network.
- "Transmission speed"  
The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

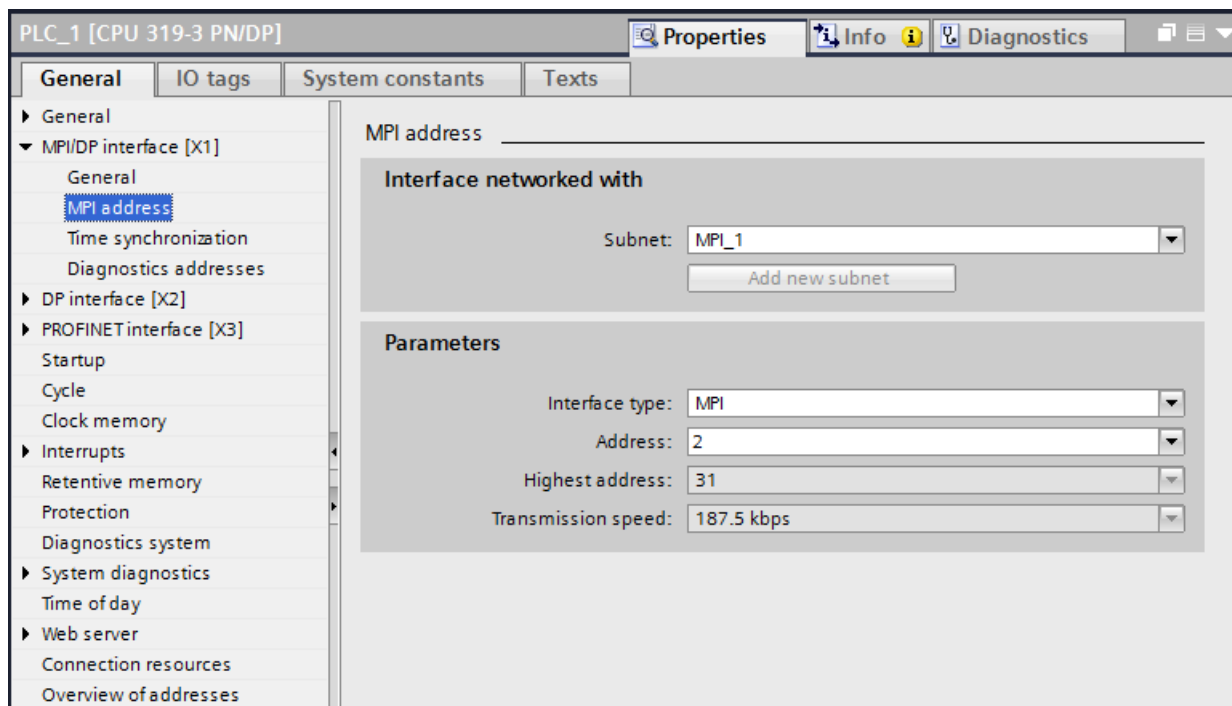

## MPI parameters for the PLC

## MPI parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

## Displaying and changing PROFIBUS parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".

### "Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

### "Parameters"

- "Interface type"  
Depending on the HMI device type, you have various interfaces to choose from.
- "Address"  
You assign the MPI address of the HMI device in the "Address" area. The MPI address must be unique throughout the MPI network.
- "Highest address"  
The "Highest address" area displays the highest address of the MPI network.
- "Transmission speed"  
The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

## Addressing of the PLC via MPI

### Introduction

Each communication partner must be assigned an MPI network address.

Each S7 module which supports communication functions and is operated the SIMATIC S7-300/400 PLC is assigned a unique MPI address. Only one CPU may be used per rack.

---

#### Note

#### **HMI devices cannot be operated with incorrect addressing**

Always avoid redundant addressing on the MPI bus.

---

### MPI address of the communication partner of a SIMATIC S7-300

When assigning addresses, you have to distinguish between communication partners with and without separate MPI address.

- If the communications partner has its own MPI address, you only need to define the MPI address.
- If the communication partners do not have a separate MPI address, specify the MPI address of the communications partner used for the connection. In addition, define the slot and rack of a communication partner without its own MPI address.

## MPI address of the communication partner of a SIMATIC S7-400

Only S7 modules with an MPI connector are assigned an MPI address. Modules without an MPI connector are addressed indirectly:

- MPI address of the module to which the HMI is connected.
- The slot and the rack of the module with which the HMI device communicates.

### 10.11.8.5 Data exchange

#### Data exchange using area pointers

#### General information on area pointers

##### Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

##### Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Configuring area pointers (Page 5281)

##### "Screen number" area pointer

##### Function

The HMI device saves information about the screen called on the HMI device to the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. The PLC can trigger specific reactions such as the call of a different screen.

##### Use

Configure and enable the area pointer in "Communication > Connections" before you put it into use. You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

## Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1st word	Current screen type															
2nd word	Current screen number															
3rd word	Reserved															
4th word	Current field number															
5th word	Reserved															

- Current screen type  
"1" for root screen or  
"4" for permanent window
- Current screen number  
1 to 32767
- Current field number  
1 to 32767

## "Date/time" area pointer

### Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" or "40" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer. All definitions are coded in BCD format.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

---

#### Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

---

#### Note

Symbolic addressing is not possible if you are using the "Date/Time" area pointer.

---

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte					Least significant byte					
	7				0	7				0	
n+0	Reserved					Hour (0 to 23)					Time
n+1	Minute (0 to 59)					Second (0 to 59)					
n+2	Reserved					Reserved					
n+3	Reserved					Weekday (1 to 7, 1=Sunday)					Date
n+4	Day (1 to 31)					Month (1 to 12)					
n+5	Year (80 to 99/0 to 29)					Reserved					

**Note**

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

**"Date/time PLC" area pointer**

**Function**

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer. All definitions are coded in BCD format.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

**Note**

Set an acquisition cycle of sufficient length for the Date/time area pointer in order to avoid any negative impact on HMI device performance.  
 Recommended: Acquisition cycle of 1 minute, if the process allows this.

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

**Note**

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The date/time data area has the following structure:

**DATE\_AND\_TIME format (in BCD code)**

Data word	Most significant byte			Least significant byte		
	7	.....	0	7	.....	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved	Weekday (1 to 7, 1=Sunday)	
n+4 <sup>1)</sup>	Reserved			Reserved		
n+5 <sup>1)</sup>	Reserved			Reserved		

- 1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

**Note**

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

**"Coordination" area pointer****Function**

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

By default, the "Coordination" area pointer has the length of one word and cannot be changed.

**Application****Note**

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

### Assignment of bits in the "Coordination" area pointer

### Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

### Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The status of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit in the control program.

### Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not there is still a connection to the HMI device by querying this bit in the control program.

### "Project ID" area pointer

#### Function

When Runtime starts, a check can be carried out as to whether the HMI device is connected to the correct PLC. This check is important when operating with several HMI devices.

For this, the HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of the configuration data with the PLC program. If there is no concordance, a system event is given on the HMI device and Runtime is stopped.

#### Use

---

#### Note

**HMI connections cannot be switched "online".**

The HMI connection in which the "Project ID" area pointer is used must be switched "online".

---

To use this area pointer, set up the following during the configuration:

- Define the version of the configuration. Values between 1 and 255 are possible.  
You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- Data address of the value for the version that is stored in the PLC:  
You enter the data address in the editor "Communication > Connections" under "Address".

### Connection failure

A connection failure to a device on which the "Project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "Project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the Engineering System.

### "Job mailbox" area pointer

#### Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

#### Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

### Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

No	Function	
<b>14</b>	<b>Set time (BCD-coded)</b>	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
<b>15</b>	<b>Setting the date (BCD coded)</b> <sup>3) 4)</sup>	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
<b>23</b>	<b>User logon</b>	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
<b>24</b>	<b>User logoff</b>	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
<b>40</b>	<b>Transfer date/time to PLC</b>	
	(in the S7 format DATE_AND_TIME) An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
<b>41</b>	<b>Transfer date/time to PLC</b>	
	(In OP/MP format) An interval of at least 5 seconds must be maintained between successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
<b>46</b>	<b>Update tag</b>	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
<b>49</b>	<b>Delete alarm buffer</b>	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	

No	Function	
<b>14</b>	<b>Set time (BCD-coded)</b>	
	Parameter 1, 2, 3	-
<b>50</b>	<b>Delete alarm buffer</b>	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
<b>51</b>	<b>Screen selection <sup>2)</sup></b>	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
<b>69</b>	<b>Reading data record from PLC <sup>1)</sup></b>	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
<b>70</b>	<b>Writing data record to PLC <sup>1)</sup></b>	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

<sup>1)</sup>	Only for devices supporting recipes.
<sup>2)</sup>	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
<sup>3)</sup>	The weekday is ignored on HMI device KTP 600 BASIC PN.
<sup>4)</sup>	The weekday is ignored when you configure the "Date/Time PLC" area pointer.

## "Data record" area pointer

## "Data record" area pointer

### Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

### Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization via the data mailbox

Data records are always transferred directly, which means that the tag values are read straight from an address or written straight to an address configured for this tag without being redirected via an interim memory.

### Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes  
The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a configured function or by a job mailbox, the recipe view on the HMI device remains operable. The data records are transferred in the background.

Simultaneous processing of several transfer requests is, however, not possible. In this case, the HMI device rejects the other transfer requests with a system alarm.

### Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

### Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:  
The values are downloaded to the HMI device. You can then, for example, process, edit, or save these values in the HMI device.
- Triggering by a function or job mailbox:  
The values are saved immediately to the data volume.

## Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:  
The current values are written to the PLC.
- Triggering by a function or job mailbox:  
The current values are written to the PLC from the data medium.

## Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. You can use this mechanism to prevent uncontrolled overwriting of data in either direction in your control program.

## Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

## Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Communication > Connections" editor in "Area pointer".
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:  
"Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

## Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15	0
1. Word	Current recipe number (1 - 999)	
2. Word	Current data record number (0 - 65535)	
3. Word	Reserved	
4. Word	Status (0, 2, 4, 12)	
5. Word	Reserved	

- Status  
The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data mailbox free
2	0000 0010	Transferring
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

### Sequence of a transfer started by the operator in the recipe view

#### Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data record and sets the data record number to 0.	Abort with system event.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

#### Writing to the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data record.	Abort with system event.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized between the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	
4	If required, the control program can now evaluate the transferred data.	
5	The control program must reset the status word to zero in order to enable further transfers.	

**Note**

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

**Note**

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

**Sequence of the transfer triggered by a job mailbox**

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxes No. 69 and No. 70 are available for this type of transfer.

**No. 69: Read data record from PLC ("PLC → DAT")**

Job mailbox no. 69 transfers data records from the PLC to the HMI device. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1 to 65535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

**No. 70: Write data record to PLC ("DAT → PLC")**

Job mailbox No. 70 transfers data records from the HMI device to the PLC. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	—	

**Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)**

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data record.	Abort without return message.
3	The HMI device reads the values from the PLC and saves these to the data record defined in the job mailbox.	
4	<ul style="list-style-type: none"> <li>If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed."</li> <li>If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.</li> </ul>	
5	The control program must reset the status word to zero in order to enable further transfers.	

**Sequence of writing to the PLC with job mailbox "DAT → PLC" (no. 70)**

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the function from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

**Sequence of the transfer when triggered by a configured function**

**Reading from the PLC using a configured function**

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	

Step	Action
4	<ul style="list-style-type: none"> <li>• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed."</li> <li>• If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.</li> </ul>
5	The control program must reset the status word to zero in order to enable further transfers.

### Writing to the PLC by means of configured function

Step	Action									
1	Check: Status word = 0?									
	<table border="1"> <thead> <tr> <th>Yes</th> <th>No</th> </tr> </thead> <tbody> <tr> <td>The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.</td> <td>Abort with system event.</td> </tr> <tr> <td>The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.</td> <td></td> </tr> <tr> <td>The HMI device sets the status "Transfer completed."</td> <td></td> </tr> <tr> <td>The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.</td> <td></td> </tr> </tbody> </table>	Yes	No	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.		The HMI device sets the status "Transfer completed."		The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.
Yes	No									
The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.									
The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.										
The HMI device sets the status "Transfer completed."										
The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.										

### Possible causes of error when transferring data records

#### Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible

- Recipe number does not exist
- Data record number does not exist

---

**Note**

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

---

**Note**

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
  - The data mailbox status is set to "Transfer completed with error".
- 

### Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view  
Information in the status bar of the recipe view and output of system alarms
- Triggered by function  
Output of system alarms
- Triggering by job mailbox  
No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data record.

### Trends

#### General information on trends

### Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3569)

---

**Note**

The value is read out time-triggered for Basic Panels.

---

## Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

## Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

## Trend request and trend transfer

### Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

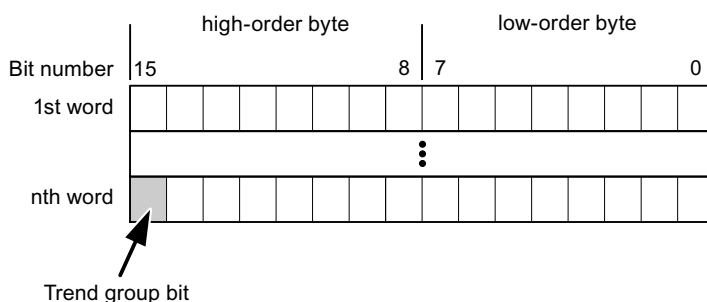

The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

### Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.

The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

## Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

## Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

## Permitted data types for trends

### For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

## Alarms

### Configuring alarms

### Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3592)

### Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

### Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 300/400	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, COUNTER, TIME

### How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0							Byte 1							
	Most significant byte							Least significant byte							
In SIMATIC S7 PLCs	7						0	7							0
In WinCC you configure:	15						8	7							0

### Acknowledgment of alarms

#### Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

### Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.

### Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

---

#### Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

---

The figure below shows the pulse diagram.

## LED mapping

### Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

#### Note

The LED function cannot be configured for Basic Panels.

### Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

### LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

### 10.11.8.6 Performance features of communication

#### Permitted data types for SIMATIC S7 300/400

#### Permitted data types for connections with SIMATIC S7 300/400

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Length
BOOL	1-bit
BYTE	1 byte
WORD	2 bytes
DWORD	4 bytes
CHAR	1 byte
INT	2 byte
DINT	4 bytes
REAL	4 bytes
TIME	4 bytes
DATE	2 bytes
TIME_OF_DAY, TOD	4 bytes
S5TIME	2 bytes
COUNTER	2 bytes
TIMER	2 bytes
DATE_AND_TIME	8 bytes
STRING	(2+n) bytes, n = 0 to 254

### 10.11.8.7 Creating connections in the "Connections" editor

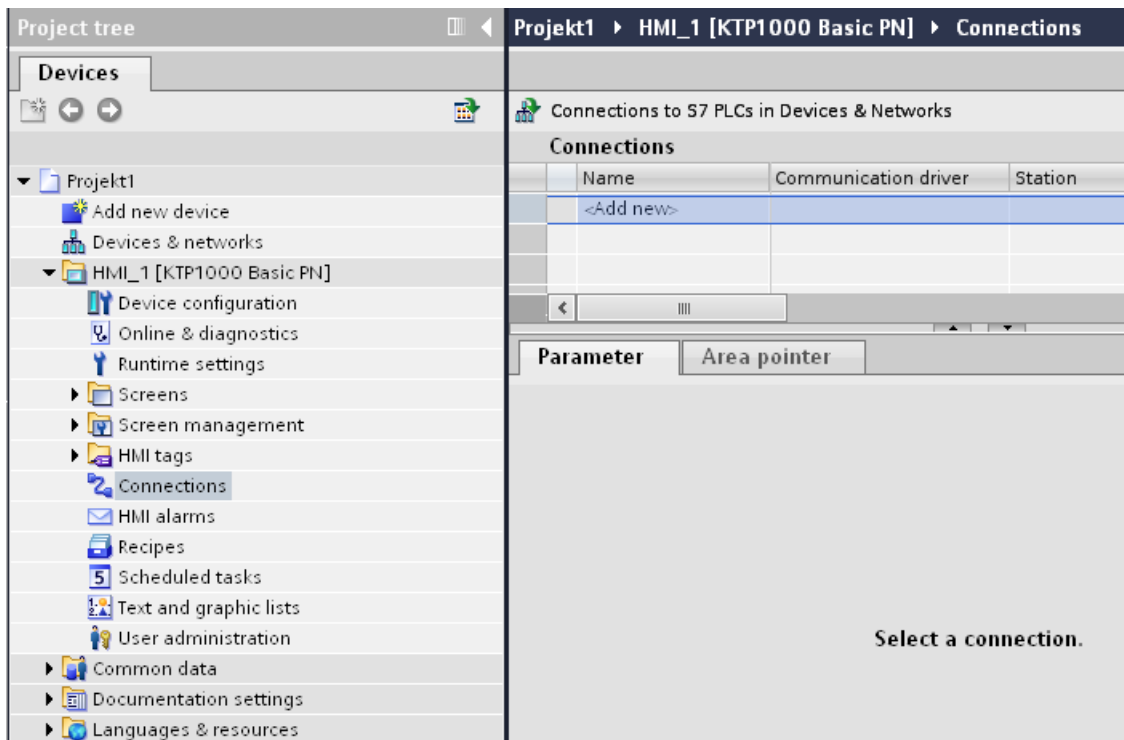

#### Creating a PROFINET connection

#### Requirements

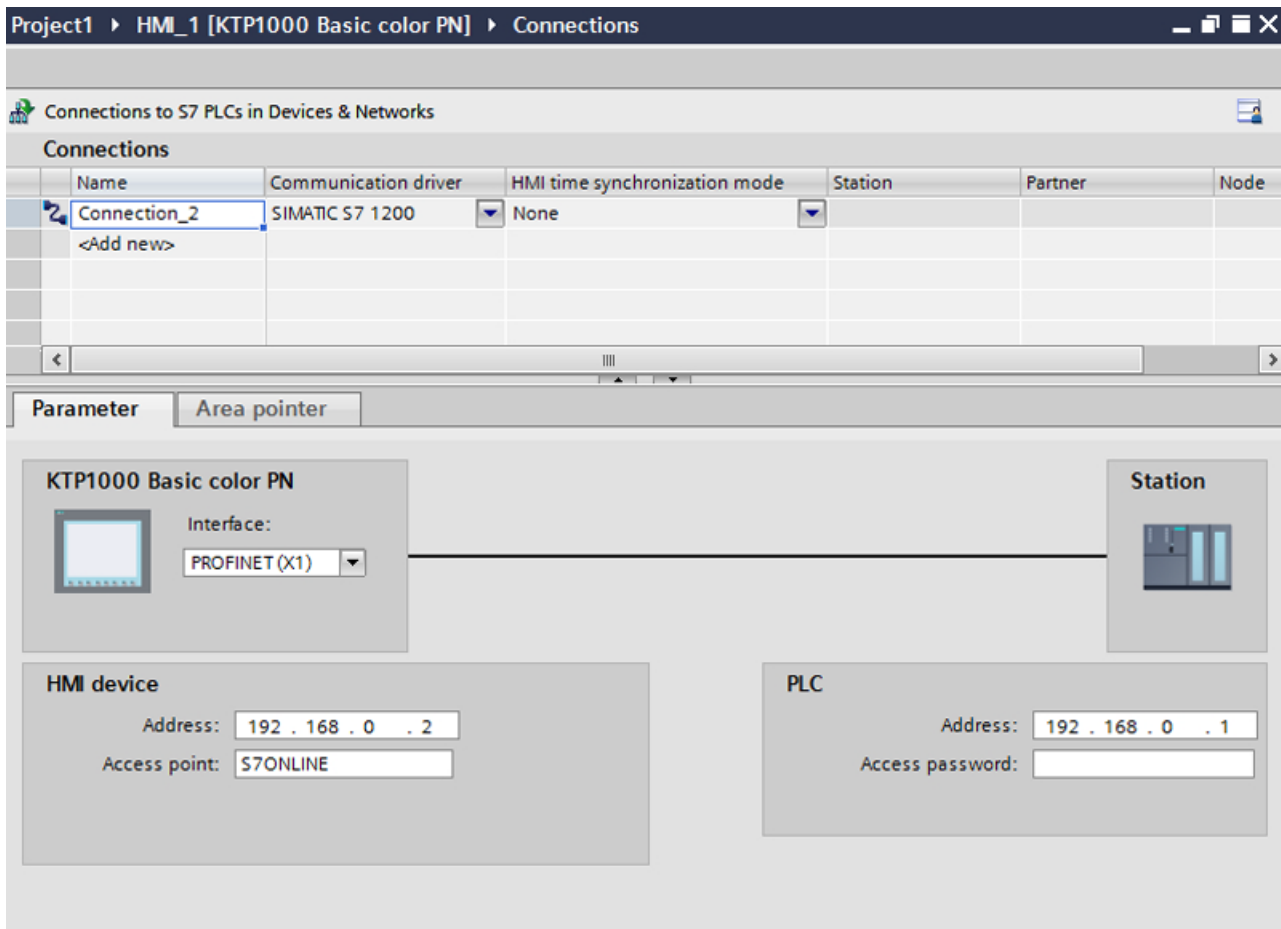

- A project is open.
- An HMI device with a PROFINET interface has been created.

## Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".

3. Select the driver in the "Communication driver" column.

4. Click the name of the connection.

5. Select a PROFINET interface of the HMI device in the Inspector window under "Parameters > Interface".

6. Set the IP addresses of the communication partners in the Inspector window:

- HMI device: "Parameters > HMI device > Address"
- PLC: "Parameters > PLC > Address"

## Creating a PROFIBUS connection

### Requirements

- A project is open.
- An HMI device with a PROFIBUS interface has been created.

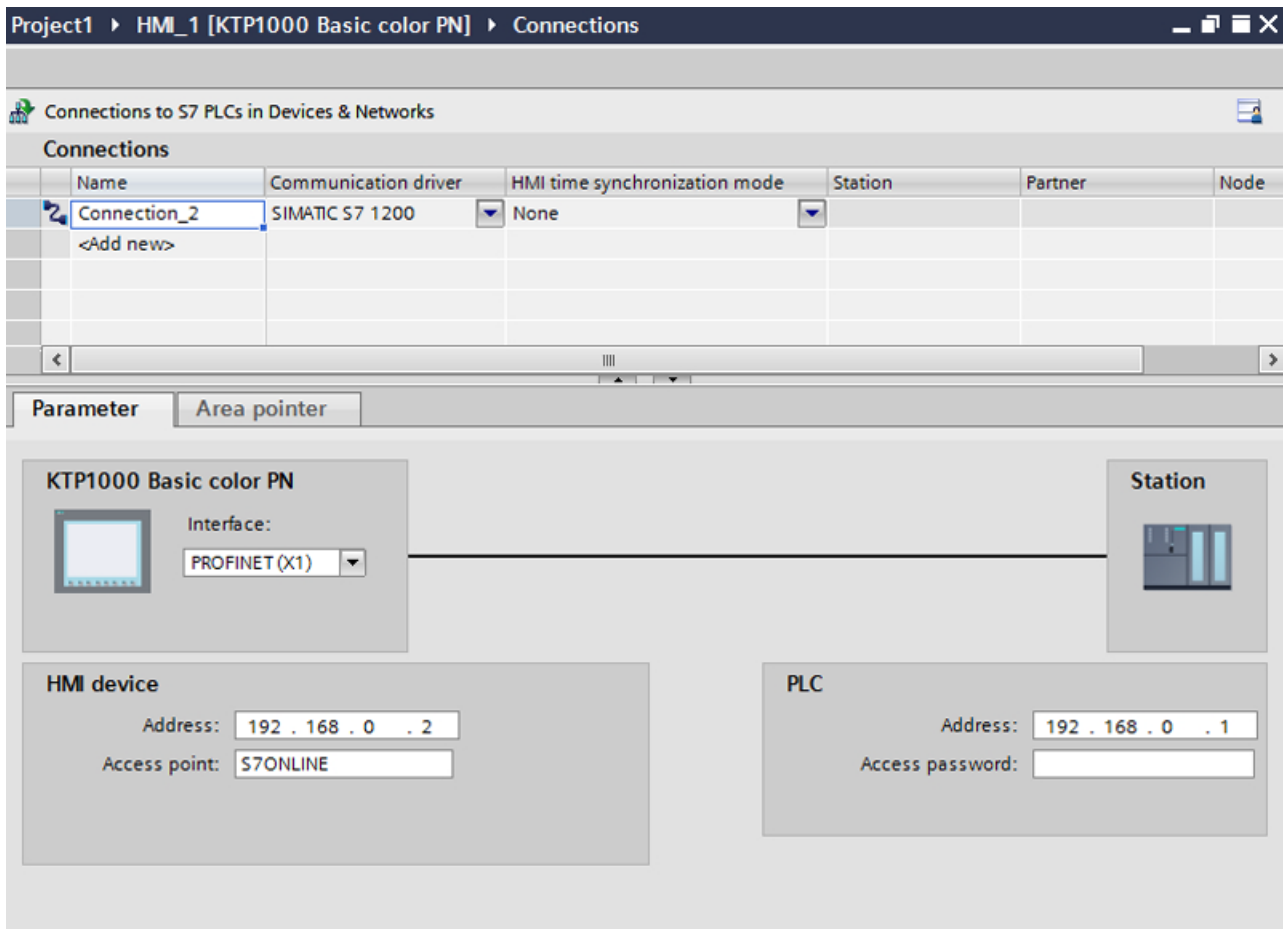

## Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".

3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select the "MPI/DP" interface in the Inspector window under "Parameters > Interface".

6. Select the "DP" profile in the Inspector window under "Parameters > Network".

7. Set the addresses of the communication partners in the inspector window:

- HMI device: "Parameters > HMI device > Address"
- PLC: "Parameters > PLC > Address"

## Creating an MPI connection

### Requirements

- A project is open.
- An HMI device with an MPI interface has been created.

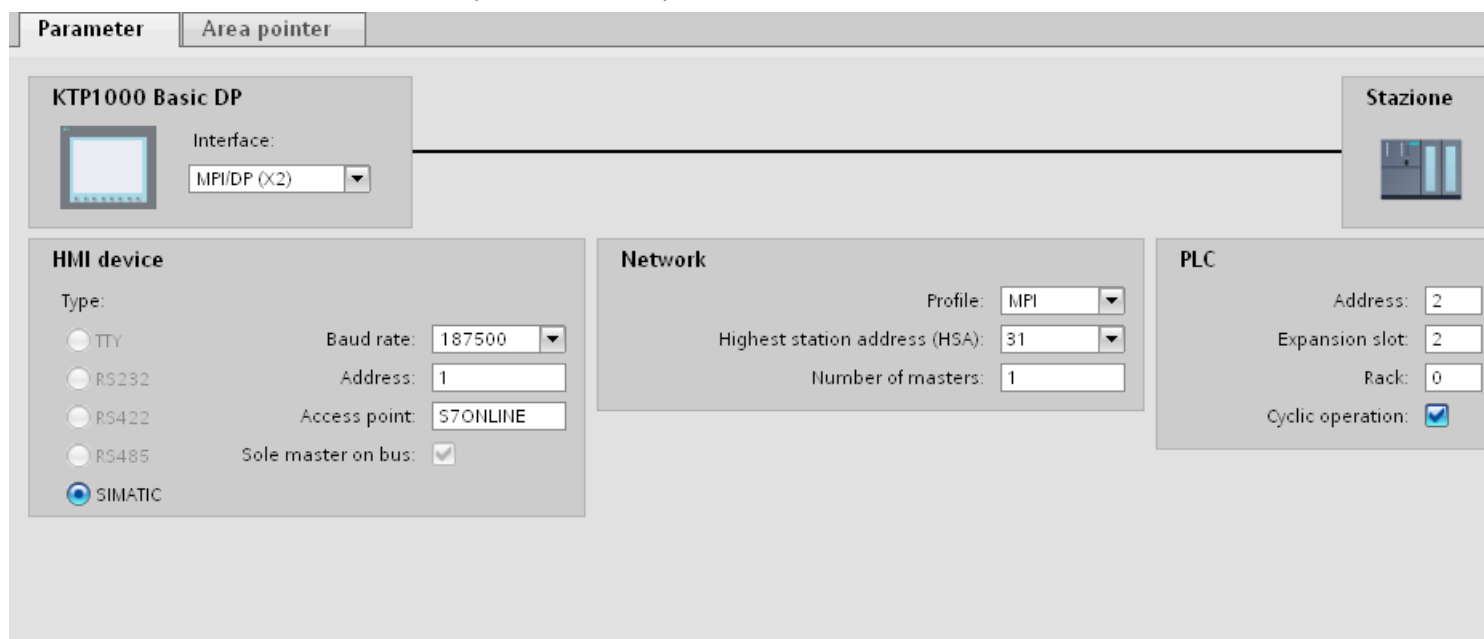

## Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".

3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select the "MPI/DP" interface in the Inspector window under "Parameters > Interface".

6. Select the "MPI" profile in the Inspector window under "Parameters > Network".

7. Set the addresses of the communication partners in the inspector window:

- HMI device: "Parameters > HMI device > Address"
- PLC: "Parameters > PLC > Address"

## Parameters for the connection

### Parameters for the connection (SIMATIC S7 300/400)

#### Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.

Project1 > HMI\_1 [KTP1000 Basic color PN] > Connections

Connections to S7 PLCs in Devices & Networks

**Connections**

Name	Communication driver	HMI time synchronization mode	Station	Partner	Node
Connection_2	SIMATIC S7 1200	None			
<Add new>					

Parameter | Area pointer

**KTP1000 Basic color PN**

Interface: PROFINET (X1)

**Station**

---

**HMI device**

Address: 192 . 168 . 0 . 2

Access point: S7ONLINE

**PLC**

Address: 192 . 168 . 0 . 1

Access password:

## Ethernet parameters

### Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"  
If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

---

#### Note

The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

---

The IP address is transferred to the HMI device during project transfer.  
To set up the IP address of the HMI device:

- Click the HMI device.
- Open the "Device configuration" editor.
- Click the Ethernet interface.
- Assign the IP address in the inspector window under:  
"General > PROFINET interface > Ethernet addresses"
- "Address"  
You assign the IP address of the HMI device in the "Address" area.  
When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.
- "Access point"  
The access point defines a logical device name through which the communication partner can be reached.

### Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"  
Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Expansion slot"  
Defines the number of the expansion slot of the CPU to be addressed.

- "Rack"  
Defines the rack number of the CPU to be addressed.
- "Cyclic operation"

---

**Note**

The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

---

When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance.

Disable cyclic mode if you are operating several HMI devices in parallel.

## PROFIBUS parameters

### Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"  
Specifies the physical connection used.
- "Interface"  
For "Interface", you select the HMI device interface via which the HMI device is connected to the PROFIBUS network.
- "Baud rate"  
For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

---

**Note**

If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

---

- "Address"  
You set the PROFIBUS address of the HMI device under "Address". The PROFIBUS address must be unique in the PROFIBUS network.
- "Sole master on bus"  
Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master).  
In S7 200, you must set an HMI device as the master.
- "Access point"  
The access point defines a logical device name through which the communication partner can be reached.

### Parameters for the network

Under "Network", you set the parameters for the PROFIBUS network to which the HMI device is linked.

- "Profile"  
For "Profile", you select the network profile that is used in the network. In "Profile", set "DP", "Universal", or "Standard". The setting must be identical throughout the network.
- "Highest address"  
For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual PROFIBUS address. The setting must be identical throughout the network.

---

#### Note

If you set a baud rate of 1.5 Mbaud in the OP 73 or the OP 77A, the highest station address must be less than or equal 63.

---

- "Number of masters"  
For "Number of masters", set the number of masters in the PROFIBUS network. This information is necessary to correctly calculate the bus parameters.

### Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"  
For "Address", set the PROFIBUS address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Cyclic operation"

---

#### Note

The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

---

When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance. Disable cyclic mode if you are operating several HMI devices in parallel. This setting is not required for SIMATIC S7-200 PLCs.

## MPI parameters

### Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"  
Specifies the physical connection used.
- "Interface"  
For "Interface", you select the HMI device interface via which the HMI device is connected to the MPI network.
- "Baud rate"  
For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

---

**Note**

If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

---

- "Address"  
For "Address", you set the MPI address of the HMI device. The MPI address must be unique throughout the MPI network.
- "Sole master on bus"  
Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master). If you have connected only slaves to the HMI device, you must therefore disable the "Sole master on bus" safety feature.  
In S7 200, you must set an HMI device as the master.

### Parameters for the network

Under "Network", you set the parameters for the MPI network to which the HMI device is linked.

- "Profile"  
For "Profile", you select the network profile that is used in the network. In "Profile", set "MPI". The setting must be identical throughout the network.
- "Highest address"  
For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual MPI address. The setting must be identical throughout the network.
- "Number of masters"  
This setting is not required for MPI.

## Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"  
For "Address", set the MPI address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Cyclic mode"  
When cyclic mode is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This improves system performance. Disable cyclic mode if you are operating several HMI devices in parallel. This setting is not required for SIMATIC S7-200.

## Cyclic operation

### Handling the "Cyclic operation" selection

If "Cyclic operation" is enabled, the HMI device sends a message frame to the CPU at the beginning of communication indicating that certain tags are required on a recurring basis.

The CPU then always transmits the data at the same cyclic interval. This saves the HMI device from having to output new requests for the data.

If cyclic operation is disabled, the HMI device sends a request whenever information is required.

Additional properties:

- Cyclic operation reduces data transmission load at the HMI device. The PLC resources are used to relieve load on the HMI device.
- The PLC only supports a certain number of cyclic services. The HMI device handles the operation if the PLC cannot provide any further resources for cyclic services.
- The HMI device generates the cycle if the PLC does not support the cyclic mode.
- Screen tags are not integrated in cyclic operation.
- Cyclic mode is only set up at the restart of Runtime.
- The HMI device transfers several jobs to the PLC if cyclic mode is enabled, depending on the PLC.
- The HMI device only transfers one job to the PLC if cyclic mode is disabled.

## 10.11.9 Communicating with SIMATIC S7 200

### 10.11.9.1 Communication with SIMATIC S7 200

#### Introduction

This section describes the communication between an HMI device and the SIMATIC S7 200 PLC.

You can configure the following communication channels for the SIMATIC S7 200 PLC:

- PROFINET and Ethernet
- PROFIBUS
- MPI
- PPI

#### HMI connection for communication

You configure connections between the HMI device and a SIMATIC S7 200 in the "Connections" editor of the HMI device.

### 10.11.9.2 Creating a connection to SIMATIC S7 200

#### Introduction

You configure a connection to the SIMATIC S7 200 PLC in the "Connections" editor of the HMI device. The interfaces are named differently depending on the HMI device.

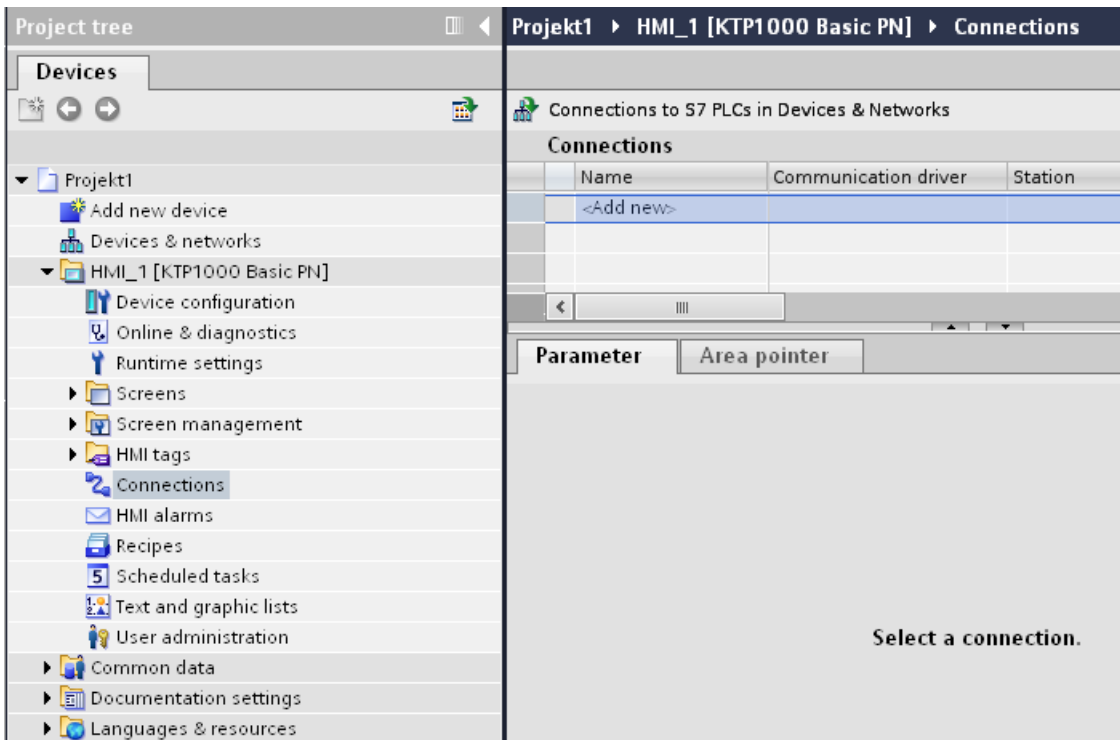

#### Requirements

- A project is open.
- An HMI device has been created.

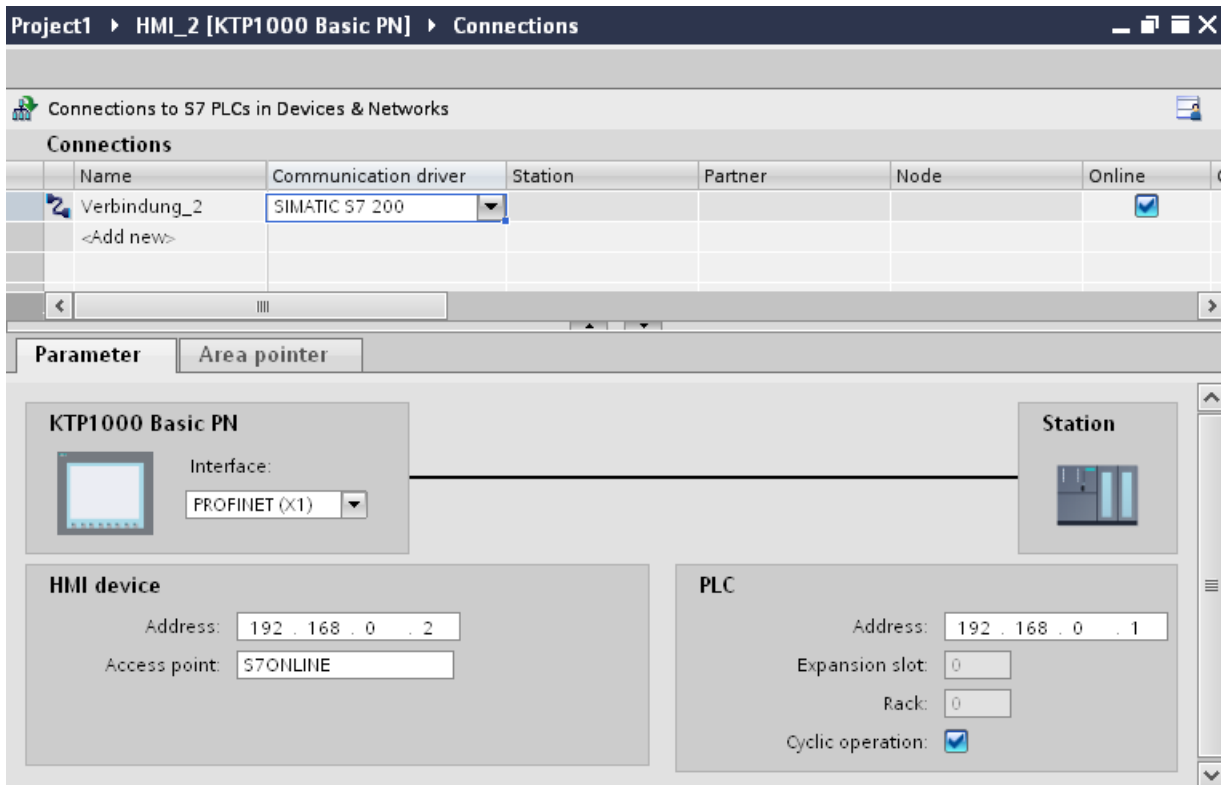

#### Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.

4. In the "Communication drivers" column, select the "SIMATIC S7 200" driver.
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

See the chapter "Parameters for the connection (Page 5551)" for additional details.

### 10.11.9.3 Parameters for the connection

#### Parameters for the connection (SIMATIC S7 200)

##### Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.

The screenshot shows the 'Connections' window in WinCC. The title bar reads 'Project1 > HMI\_2 [KTP1000 Basic PN] > Connections'. Below the title bar, there is a section for 'Connections to S7 PLCs in Devices & Networks'. A table lists the connections:

Name	Communication driver	Station	Partner	Node	Online
Verbindung_2	SIMATIC S7 200				<input checked="" type="checkbox"/>
<Add new>					

Below the table, there are two tabs: 'Parameter' and 'Area pointer'. The 'Parameter' tab is active, showing a graphical configuration for the 'KTP1000 Basic PN' HMI device and its connection to a 'Station' (PLC). The HMI device is connected to the PLC via 'PROFINET (X1)'. The HMI device parameters are:

- Address: 192 . 168 . 0 . 2
- Access point: S7ONLINE

The PLC parameters are:

- Address: 192 . 168 . 0 . 1
- Expansion slot: 0
- Rack: 0
- Cyclic operation:

## Ethernet parameters

### Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"  
If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

---

#### Note

The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

---

The IP address is transferred to the HMI device during project transfer.  
To set up the IP address of the HMI device:

- Click the HMI device.
- Open the "Device configuration" editor.
- Click the Ethernet interface.
- Assign the IP address in the inspector window under:  
"General > PROFINET interface > Ethernet addresses"
- "Address"  
You assign the IP address of the HMI device in the "Address" area.  
When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.
- "Access point"  
The access point defines a logical device name through which the communication partner can be reached.

### Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"  
Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Expansion slot"  
Defines the number of the expansion slot of the CPU to be addressed.

- "Rack"  
Defines the rack number of the CPU to be addressed.
- "Cyclic operation"

---

**Note**

The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

---

When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance.  
Disable cyclic mode if you are operating several HMI devices in parallel.

## PROFIBUS parameters

### Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"  
Specifies the physical connection used.
- "Interface"  
For "Interface", you select the HMI device interface via which the HMI device is connected to the PROFIBUS network.
- "Baud rate"  
For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

---

**Note**

If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

---

- "Address"  
You set the PROFIBUS address of the HMI device under "Address". The PROFIBUS address must be unique in the PROFIBUS network.
- "Sole master on bus"  
Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master).  
In S7 200, you must set an HMI device as the master.
- "Access point"  
The access point defines a logical device name through which the communication partner can be reached.

## Parameters for the network

Under "Network", you set the parameters for the PROFIBUS network to which the HMI device is linked.

- "Profile"  
For "Profile", you select the network profile that is used in the network. In "Profile", set "DP", "Universal", or "Standard". The setting must be identical throughout the network.
- "Highest address"  
For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual PROFIBUS address. The setting must be identical throughout the network.

---

### Note

If you set a baud rate of 1.5 Mbaud in the OP 73 or the OP 77A, the highest station address must be less than or equal 63.

---

- "Number of masters"  
For "Number of masters", set the number of masters in the PROFIBUS network. This information is necessary to correctly calculate the bus parameters.

## Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"  
For "Address", set the PROFIBUS address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Cyclic operation"

---

### Note

The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

---

When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance. Disable cyclic mode if you are operating several HMI devices in parallel. This setting is not required for SIMATIC S7-200 PLCs.

## MPI parameters

### Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"  
Specifies the physical connection used.
- "Interface"  
For "Interface", you select the HMI device interface via which the HMI device is connected to the MPI network.
- "Baud rate"  
For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

---

#### Note

If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

---

- "Address"  
For "Address", you set the MPI address of the HMI device. The MPI address must be unique throughout the MPI network.
- "Sole master on bus"  
Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master). If you have connected only slaves to the HMI device, you must therefore disable the "Sole master on bus" safety feature.  
In S7 200, you must set an HMI device as the master.

### Parameters for the network

Under "Network", you set the parameters for the MPI network to which the HMI device is linked.

- "Profile"  
For "Profile", you select the network profile that is used in the network. In "Profile", set "MPI". The setting must be identical throughout the network.
- "Highest address"  
For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual MPI address. The setting must be identical throughout the network.
- "Number of masters"  
This setting is not required for MPI.

## Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"  
For "Address", set the MPI address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Cyclic mode"  
When cyclic mode is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This improves system performance. Disable cyclic mode if you are operating several HMI devices in parallel. This setting is not required for SIMATIC S7-200.

## PPI parameters

### Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"  
Specifies the physical connection used.
- "Interface"  
For "Interface", you select the HMI device interface via which the HMI device is connected to the PP network.
- "Baud rate"  
For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

---

#### Note

If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

---

- "Address"  
For "Address", you set the PPI address of the HMI device. The PPI address must be unique throughout the PPI network.
- "Access point"  
For "Access point", you set the access point via which the communication partner is reached.
- "Sole master on bus"  
Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master). If you have connected only slaves to the HMI device, you must therefore disable the "Sole master on bus" safety feature.  
In S7 200, you must set an HMI device as the master.

### Parameters for the network

Under "Network", you set the parameters for the network to which the HMI device is linked.

- "Profile"  
For "Profile", you select the network profile that is used in the network. In "Profile", set "PPI". The setting must be identical throughout the network.
- "Highest address"  
For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual MPI address. The setting must be identical throughout the network.
- "Number of masters"  
Set the number of the master on the network to "1".

### Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"  
For "Address", set the PPI address of the S7 module to which the HMI device is connected.
- "Cyclic operation"  
This parameter is not required for communication via PPI.

### Cyclic operation

#### Handling the "Cyclic operation" selection

If "Cyclic operation" is enabled, the HMI device sends a message frame to the CPU at the beginning of communication indicating that certain tags are required on a recurring basis.

The CPU then always transmits the data at the same cyclic interval. This saves the HMI device from having to output new requests for the data.

If cyclic operation is disabled, the HMI device sends a request whenever information is required.

Additional properties:

- Cyclic operation reduces data transmission load at the HMI device. The PLC resources are used to relieve load on the HMI device.
- The PLC only supports a certain number of cyclic services. The HMI device handles the operation if the PLC cannot provide any further resources for cyclic services.
- The HMI device generates the cycle if the PLC does not support the cyclic mode.
- Screen tags are not integrated in cyclic operation.
- Cyclic mode is only set up at the restart of Runtime.
- The HMI device transfers several jobs to the PLC if cyclic mode is enabled, depending on the PLC.
- The HMI device only transfers one job to the PLC if cyclic mode is disabled.

## 10.11.9.4 Data exchange

### Data exchange using area pointers

#### General information on area pointers

##### Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

##### Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Configuring area pointers (Page 5281)

##### See also

Data exchange using area pointers (Page 5278)

### "Screen number" area pointer

##### Function

The HMI device saves information about the screen called on the HMI device to the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. The PLC can trigger specific reactions such as the call of a different screen.

##### Application

Configure and enable the area pointer in "Communication > Connections" before you put it into use. You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

## Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1st word	Current screen type															
2nd word	Current screen number															
3rd word	Reserved															
4th word	Current field number															
5th word	Reserved															

- Current screen type  
"1" for root screen or  
"4" for permanent window
- Current screen number  
1 to 32767
- Current field number  
1 to 32767

## "Date/time" area pointer

### Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer. All definitions are coded in BCD format.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

---

#### Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

---

#### Note

Symbolic addressing is not possible if you are using the "Date/Time" area pointer.

---

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte					Least significant byte					
	7				0	7				0	
n+0	Reserved					Hour (0 to 23)					Time
n+1	Minute (0 to 59)					Second (0 to 59)					
n+2	Reserved					Reserved					
n+3	Reserved					Weekday (1 to 7, 1=Sunday)					Date
n+4	Day (1 to 31)					Month (1 to 12)					
n+5	Year (80 to 99/0 to 29)					Reserved					

**Note**

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

**"Date/time PLC" area pointer****Function**

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer. All definitions are coded in BCD format.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

**Note**

Set an acquisition cycle of sufficient length for the Date/time area pointer in order to avoid any negative impact on HMI device performance.  
Recommended: Acquisition cycle of 1 minute, if the process allows this.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

**Note**

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The date/time data area has the following structure:

**DATE\_AND\_TIME format (in BCD code)**

Data word	Most significant byte			Least significant byte		
	7	.....	0	7	.....	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved	Weekday (1 to 7, 1=Sunday)	
n+4 <sup>1)</sup>	Reserved			Reserved		
n+5 <sup>1)</sup>	Reserved			Reserved		

- 1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

**Note**

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

**"Coordination" area pointer**

**Function**

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

By default, the "Coordination" area pointer has the length of one word and cannot be changed.

**Usage**

**Note**

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

- Define the version of the configuration. Values between 1 and 255 are possible.  
You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- Data address of the value for the version that is stored in the PLC:  
You enter the data address in the editor "Communication > Connections" under "Address".

### Connection failure

A connection failure to a device on which the "Project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "Project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the Engineering System.

### "Job mailbox" area pointer

#### Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

#### Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

## Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

No	Function	
<b>14</b>	<b>Set time (BCD-coded)</b>	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
<b>15</b>	<b>Setting the date (BCD coded)</b> <sup>3)</sup>	
	Parameter 1	Left byte: - Right byte: Weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
<b>23</b>	<b>User logon</b>	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
<b>24</b>	<b>User logoff</b>	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
<b>40</b>	<b>Transfer date/time to PLC</b>	
	(In the S7 format DATE_AND_TIME) An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
<b>41</b>	<b>Transfer date/time to PLC</b>	
	(In OP/MP format) An interval of at least 5 seconds must be maintained between successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
<b>46</b>	<b>Update tag</b>	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
<b>49</b>	<b>Delete alarm buffer</b>	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	

No	Function	
<b>14</b>	<b>Set time (BCD-coded)</b>	
	Parameter 1, 2, 3	-
<b>50</b>	<b>Delete alarm buffer</b>	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
<b>51</b>	<b>Screen selection <sup>2)</sup></b>	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
<b>69</b>	<b>Reading data record from PLC <sup>1)</sup></b>	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
<b>70</b>	<b>Writing data record to PLC <sup>1)</sup></b>	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

<sup>1)</sup>	Only devices supporting recipes
<sup>2)</sup>	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
<sup>3)</sup>	The weekday is ignored on HMI device KTP 600 BASIC PN.

## "Data record" area pointer

## "Data record" area pointer

### Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

### Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization over the data record

Data records are always transferred directly. That is, the tag values are read from an address or written to an address configured for this tag directly, without redirecting the values by means of interim memory.

### Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes  
The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a configured function or by a job mailbox, the recipe view on the HMI device remains operable. The data records are transferred in the background.

Simultaneous processing of several transfer requests is, however, not possible. In this case, the HMI device rejects the other transfer requests with a system event.

### Sequence of a transfer started by the operator in the recipe view

#### Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data record and sets the data record number to 0.	Abort with system event.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

#### Writing to the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data mailbox.	Abort with system event.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized in the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	

Step	Action
4	If required, the control program can now evaluate the transferred data.
5	The control program must reset the status word to zero in order to enable further transfers.

**Note**

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

**Note**

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

**Sequence of the transfer triggered by a job mailbox**

The transfer of data records between the HMI device and the PLC can be initiated by the HMI device or by the PLC.

The two job mailboxes No. 69 and No. 70 are available for this type of transfer.

**No. 69: Read data record from PLC ("PLC → DAT")**

Job mailbox no. 69 transfers data records from the PLC to the HMI device. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

**No. 70: Write data record to PLC ("DAT → PLC")**

Job mailbox No. 70 transfers data records from the HMI device to the PLC. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	70
Word 2	Recipe number (1-999)	

	Left byte (LB)	Right byte (RB)
Word 3	Data record number (1-65,535)	
Word 4	—	

### Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device reads the values from the PLC and saves these to the data record defined in the job mailbox.	
4	<ul style="list-style-type: none"> <li>If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed."</li> <li>If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.</li> </ul>	
5	The control program must reset the status word to zero in order to enable further transfers.	

### Sequence of writing to the PLC using job mailbox "DAT → PLC" (no. 70)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the job from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

### Sequence of the transfer when triggered by a configured function

#### Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No

Step	Action	
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	
4	<ul style="list-style-type: none"> <li>If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed."</li> <li>If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.</li> </ul>	
5	The control program must reset the status word to zero in order to enable further transfers.	

### Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

### Possible causes of error when transferring data records

#### Possible causes of faults

The section below shows possible causes of errors which lead to a data record transfer being terminated with errors:

- Tag address not set up on the PLC
- Overwriting data records not possible

- Recipe number does not exist
- Data record number does not exist

---

**Note**

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

---

**Note**

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
  - The data mailbox status is set to "Transfer completed with error".
- 

### Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view  
Information in the status bar of the recipe view and output of system events
- Triggered by function  
Output of system events
- Triggering by job mailbox  
No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data mailbox.

### Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example, when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

## Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:  
The values are downloaded to the HMI device. You can then process, edit, or save these values, for example.
- Triggering by a function or job mailbox:  
The values are saved immediately to the data volume.

## Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:  
The current values are written to the PLC.
- Triggering by a function or job mailbox:  
The current values are written to the PLC from the data medium.

## Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. You can use this mechanism to prevent uncontrolled overwriting of data in either direction in your control program.

## Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

## Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Communication > Connections" editor in "Area pointer".
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:  
"Recipes" editor in the Inspector window the "Coordinated transfer of data records" option under "General > Synchronization > Settings".

## Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	<b>15</b>		<b>0</b>
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status

The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data record free
2	0000 0010	Transferring
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

## Trends

### General information on trends

### Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3569)

---

#### Note

The value is read out time-triggered for Basic Panels.

---

### Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

### Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

### Trend request and trend transfer

#### Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

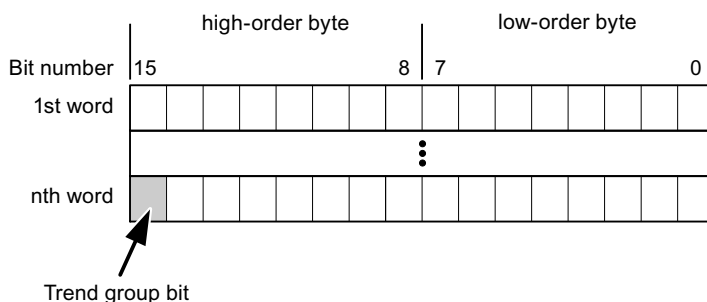

The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

#### Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.

The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

## Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

## Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

## Permitted data types for trends

### For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

## Alarms

### Configuring alarms

#### Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3592)

#### Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

## Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

## How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1								
	Most significant byte								Least significant byte								
In SIMATIC S7 PLCs	7							0	7								0
In WinCC you configure:	15							8	7								0

## Acknowledgment of alarms

### Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

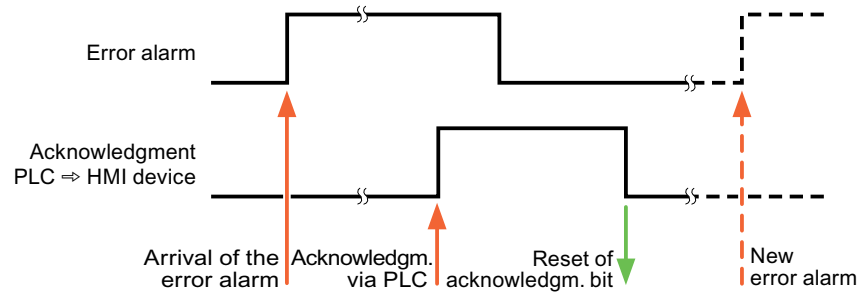

### Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.

### Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

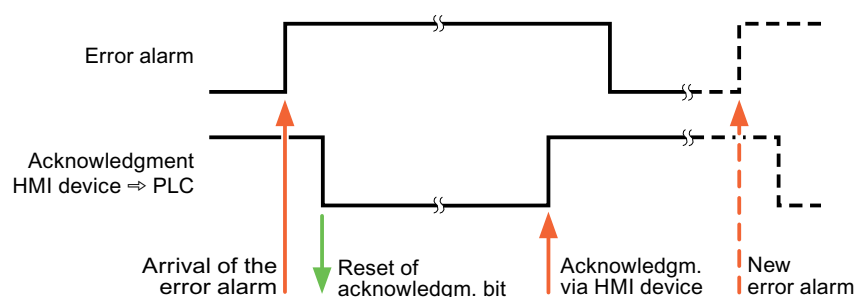

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

#### Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.

## LED mapping

### Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

---

#### Note

The LED function cannot be configured for Basic Panels.

---

### Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

### LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

#### 10.11.9.5 Performance features of communication

### Permitted data types for SIMATIC S7 200

#### Permitted data types for connections with SIMATIC S7 200

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Length
Bool	1 bit
Byte	1 byte

---

Data type	Length
Char	1 byte
Word	2 bytes
Int	2 bytes
DWord	4 bytes
DInt	4 bytes
Real	4 bytes
StringChar	--
Timer	2 bytes
Array	--

---

**Note****Disconnection with a PPI network**

If you are using arrays in the configuration, an array size of approximately 1000 bytes may cause an interruption of the connection.

Use smaller arrays in your configuration.

---

## 10.11.10 Communicating with SIMATIC LOGO!

### 10.11.10. Communication with SIMATIC LOGO!

1

#### Introduction

This section describes the communication between an HMI device and the SIMATIC SIMATIC LOGO! controller.

You can configure the following communication channels for the SIMATIC LOGO! controller:

- PROFINET
- Ethernet

#### HMI connection for communication

You configure connections between the HMI device and SIMATIC LOGO! in the "Connections" editor of the HMI device.

#### Data exchange

Data exchange with the SIMATIC LOGO! control system is possible by means of tags.

Data cannot be exchanged using area pointers.

### 10.11.10. Creating a connection to SIMATIC LOGO!

2

#### Introduction

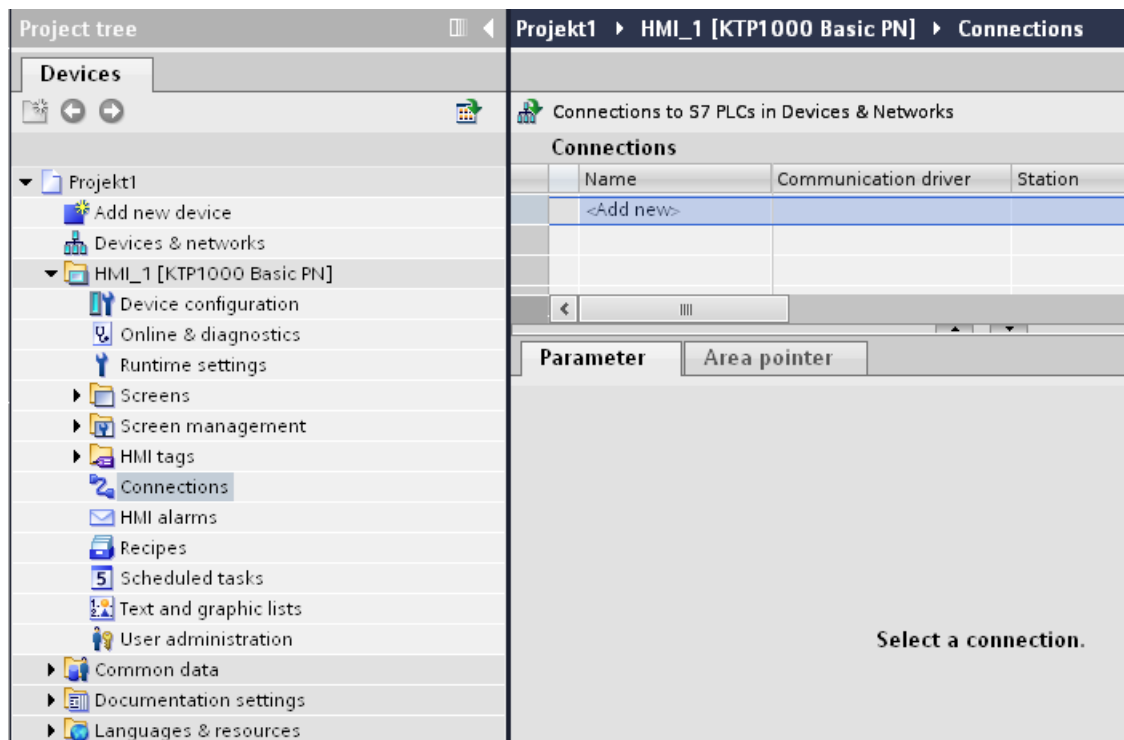

You configure a connection to the SIMATIC LOGO! controller in the "Connections" editor of the HMI device. The interfaces are named differently depending on the HMI device.

#### Requirements

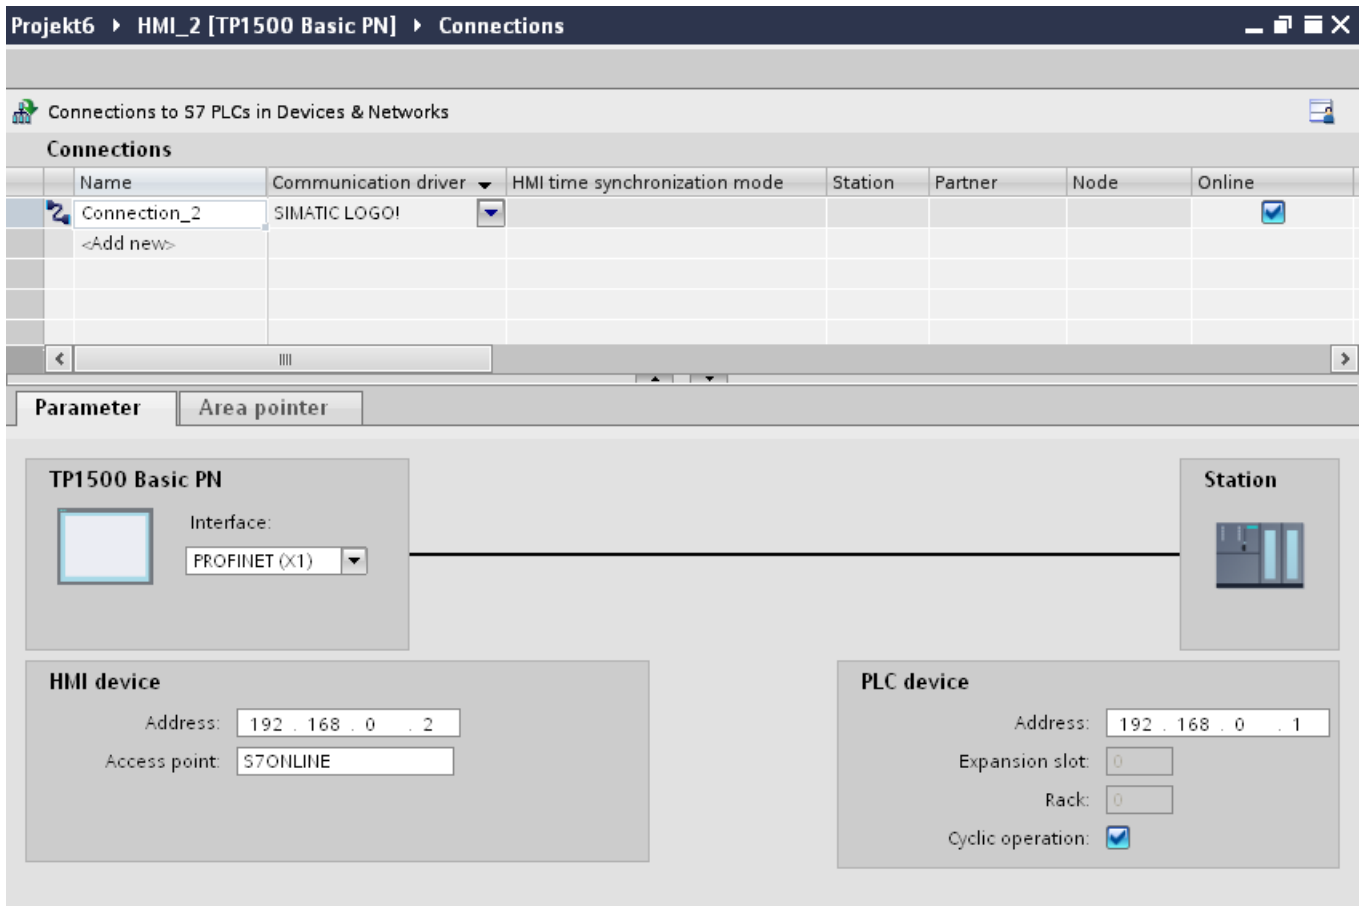

- A project is open.
- An HMI device has been created.

#### Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.

4. In the "Communication drivers" column, select the "SIMATIC LOGO!" driver.
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

See the chapter "Connection parameters (Page 5581)" for additional details.

### 10.11.10. Connection parameters

3

#### Connection parameters

##### Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.

The screenshot shows the 'Connections' configuration window in WinCC. At the top, the breadcrumb path is 'Projekt6 > HMI\_2 [TP1500 Basic PN] > Connections'. Below this, there is a table titled 'Connections to S7 PLCs in Devices & Networks' with the following data:

Name	Communication driver	HMI time synchronization mode	Station	Partner	Node	Online
Connection_2	SIMATIC LOGO!					<input checked="" type="checkbox"/>
<Add new>						

Below the table, there are two tabs: 'Parameter' and 'Area pointer'. The 'Parameter' tab is active, showing a network diagram. On the left is a 'TP1500 Basic PN' device with an 'Interface' dropdown set to 'PROFINET (X1)'. On the right is a 'Station' device. A horizontal line connects the two devices. Below the diagram are two configuration panels:

- HMI device:** Address: 192 . 168 . 0 . 2, Access point: S7ONLINE
- PLC device:** Address: 192 . 168 . 0 . 1, Expansion slot: 0, Rack: 0, Cyclic operation:

## Ethernet parameters

### Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"  
If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

---

#### Note

The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

---

The IP address is transferred to the HMI device during project transfer.  
To set up the IP address of the HMI device:

- Click the HMI device.
- Open the "Device configuration" editor.
- Click the Ethernet interface.
- Assign the IP address in the inspector window under:  
"General > PROFINET interface > Ethernet addresses"
- "Address"  
You assign the IP address of the HMI device in the "Address" area.  
When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.
- "Access point"  
The access point defines a logical device name through which the communication partner can be reached.

### Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"  
Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Expansion slot"  
Defines the number of the expansion slot of the CPU to be addressed.

- "Rack"  
Defines the rack number of the CPU to be addressed.
- "Cyclic operation"

---

**Note**

The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

---

When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance.  
Disable cyclic mode if you are operating several HMI devices in parallel.

## Cyclic operation

### Handling the "Cyclic operation" selection

If "Cyclic operation" is enabled, the HMI device sends a message frame to the CPU at the beginning of communication indicating that certain tags are required on a recurring basis.

The CPU then always transmits the data at the same cyclic interval. This saves the HMI device from having to output new requests for the data.

If cyclic operation is disabled, the HMI device sends a request whenever information is required.

Additional properties:

- Cyclic operation reduces data transmission load at the HMI device. The PLC resources are used to relieve load on the HMI device.
- The PLC only supports a certain number of cyclic services. The HMI device handles the operation if the PLC cannot provide any further resources for cyclic services.
- The HMI device generates the cycle if the PLC does not support the cyclic mode.
- Screen tags are not integrated in cyclic operation.
- Cyclic mode is only set up at the restart of Runtime.
- The HMI device transfers several jobs to the PLC if cyclic mode is enabled, depending on the PLC.
- The HMI device only transfers one job to the PLC if cyclic mode is disabled.

### 10.11.10. Data exchange

4

## Trends

### General information on trends

## Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Auto-Hotspot

---

**Note**

The value is read out time-triggered for Basic Panels.

---

## Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

## Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

## Trend request and trend transfer

### Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

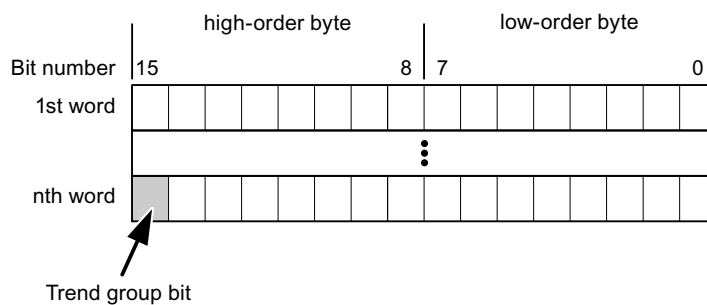

The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

### Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.

The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

### Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

### Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

## Permitted data types for trends

### For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

## Alarms

### Configuring alarms

#### Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Auto-Hotspot

#### Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

## Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

### How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1								
	Most significant byte								Least significant byte								
In SIMATIC S7 PLCs	7							0	7								0
In WinCC you configure:	15							8	7								0

### Acknowledgment of alarms

#### Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

#### Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.

## Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

---

### Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

---

The figure below shows the pulse diagram.

### 10.11.10. Performance features of communication

### 10.11.11 Configuring direct keys

#### 10.11.11. Direct keys

1

##### Introduction

In addition to their standard use, the F, K and S keys of an HMI device with key operation can be used as direct keys.

With HMI devices with touch operation, you configure the system function "Direct key" to a button

You can configure the following direct keys:

- PROFINET connection: PROFINET IO direct keys
- PROFIBUS connection: PROFIBUS DP direct keys

##### Operating mode of HMI devices with direct keys

Before accessing the PLC from the HMI device using the direct keys you have to change the operating mode of the HMI device.

### 10.11.11. Changing the operating mode of the HMI device

2

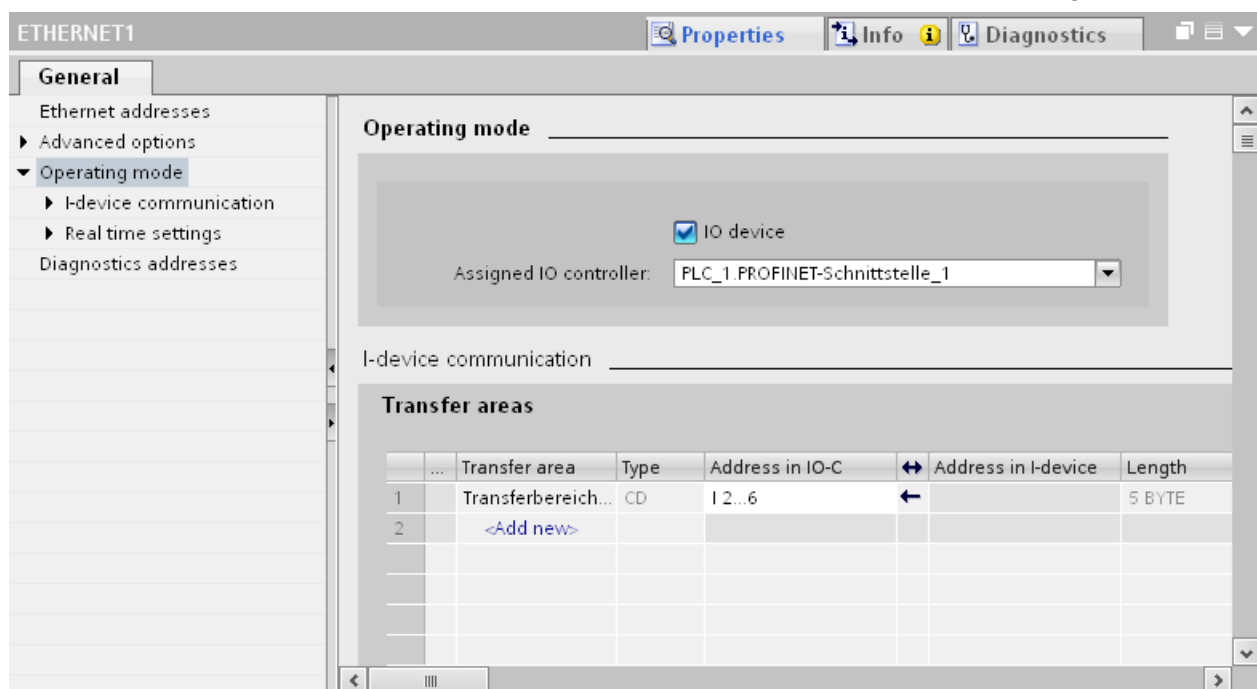

#### Changing the operating mode for a PROFINET connection

##### Requirements

The HMI device is networked with a PLC via PROFINET.

##### Procedure

1. Click the PROFINET interface of the HMI device in the "Devices & Networks" editor.
2. Click "Operating mode" under "Properties > General" in the Inspector window.
3. Select the function "IO device" in the "Operating mode" area.
4. Select the PLC which is networked with the HMI device under "Assigned IO controller".

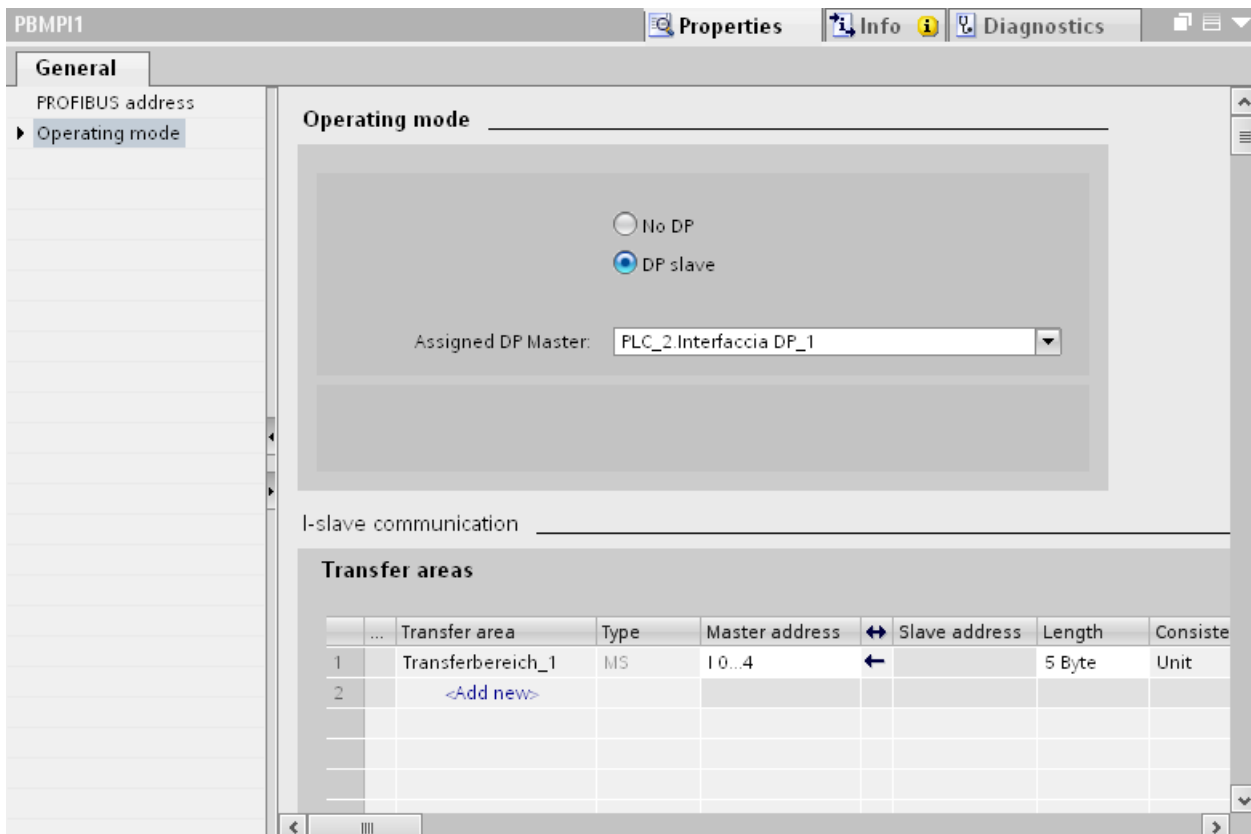

#### Changing the operating mode for a PROFIBUS connection

##### Requirements

The HMI device is networked with a PLC via PROFIBUS.

## Procedure

1. Click the PROFIBUS interface of the HMI device in the "Devices & Networks" editor.
2. Click "Operating mode" under "Properties > General" in the Inspector window.
3. Select the function "DP slave" in the "Operating mode" area.
4. Select the PLC which is networked with the HMI device under "Assigned DP master".

### 10.11.11. Configuring direct keys

3

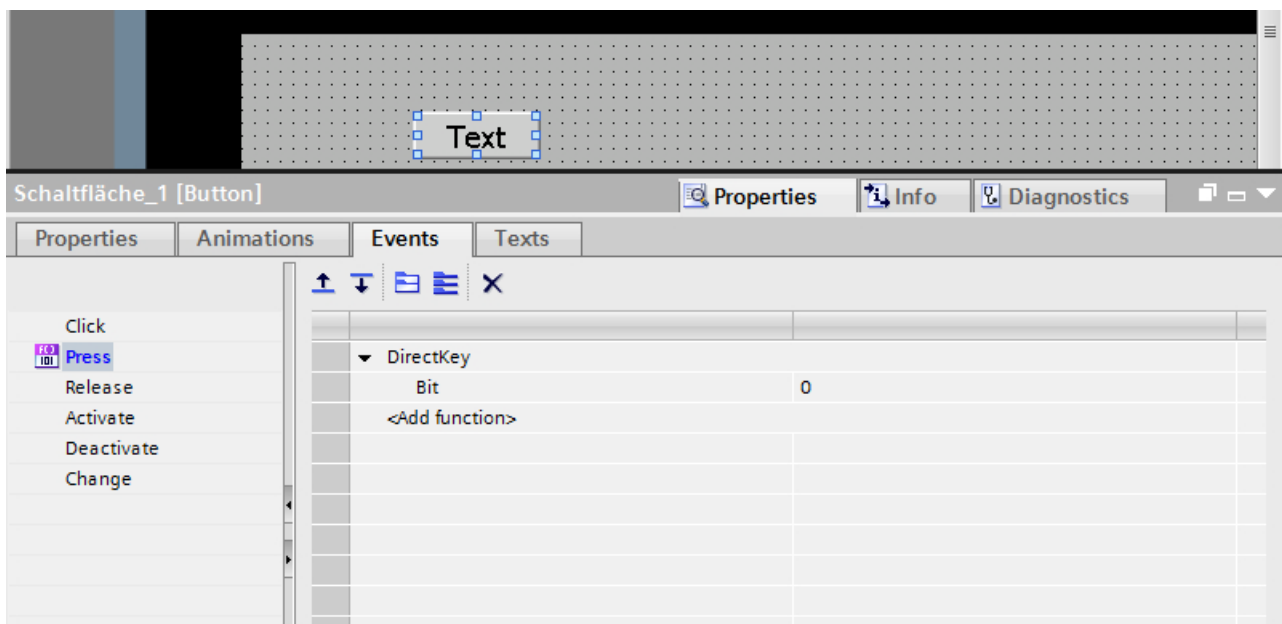

#### Configuring direct keys for an HMI device with touch operation

#### Requirements

- An HMI device with key operation has been created.
- You have created an LED tag.

## Procedure

1. Create a new screen.
2. Drag-and-drop a button from the "Tools" task card into the screen.
3. Click the button.
4. In the Inspector window, click "Properties > Events > Press".
5. Click "<Add function>".
6. Select the "Direct key" system function.

7. Under "Bit" enter the correct bit number.  
The correct bit number depends on the HMI device and the input and output assignments on the HMI device.

## Assignment of inputs and outputs

The exact assignment of inputs and outputs can be found under:

- PROFINET IO direct keys: Assignment of inputs and outputs (Page 5597)
- PROFIBUS DP direct keys: Assignment of inputs and outputs (Page 5614)

### 10.11.11. PROFINET IO direct keys

4

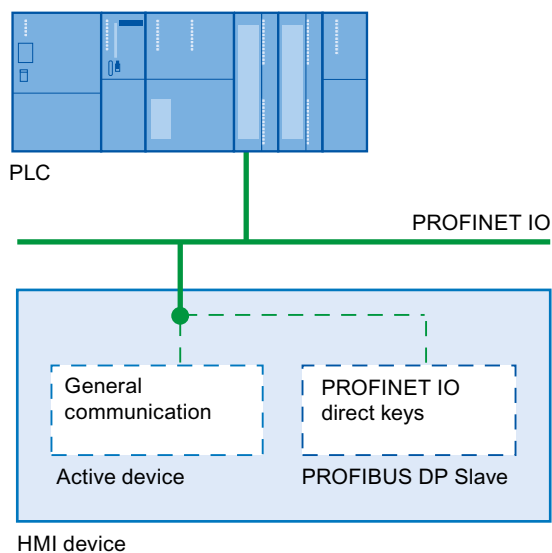

#### PROFINET IO direct keys

#### PROFINET IO direct keys

You configure the HMI device created in WinCC as an active communication partner in the automation network.

For the PROFINET IO direct keys, the HMI device can also be configured as a slave in the PROFINET IO network.

The following figure shows the basic configuration based on an automation network with an HMI device and a PLC.

#### Mode of operation of the PROFINET IO direct keys

The cycle time of the Ethernet bus can be set between 8 ms and 512 ms.

Thus, the reaction time of the PROFINET IO direct keys can also be determined. For a typical configuration with a cycle time of 64 ms, the response time of the PROFINET IO direct keys is < 100 ms.

A response time of < 100 ms to the CPU is usually ensured when using the PROFINET IO direct keys. This time can be exceeded significantly in the following cases:

- Complex functions run in the background, e.g. transmitting recipes, printing reports.
- At the same time, multiple connections can be maintained to the CPU.

## HMI devices for the configuration of PROFINET IO direct keys

### HMI devices

You can configure PROFINET IO direct keys with the following HMI devices:

HMI device class	HMI device
Panel	OP 177B PN/DP OP 277 6" TP 177B 4" PN/DP TP 177B 6" PN/DP TP 277 6"
Mobile Panel	Mobile Panel 177 PN Mobile Panel 277 8" Mobile Panel 277 10" Mobile Panel 277 IWLAN V2 Mobile Panel 277(F) IWLAN V2 Mobile Panel 277(F) IWLAN V2 (RFID tags)
Multi Panel	Multi Panel 177 6" Touch Multi Panel 277 Key Multi Panel 277 Touch Multi Panel 377 Key Multi Panel 377 Touch
Comfort Panel	KTP400 Comfort KP400 Comfort KP700 Comfort TP700 Comfort KP900 Comfort TP900 Comfort KP1200 Comfort TP1200 Comfort KP1500 Comfort TP1500 Comfort TP1900 Comfort TP2200 Comfort

### Restrictions for PROFINET IO direct keys

#### Note

Direct keys are still active when the HMI device is in "offline" mode.

---

**Note**

If an external application such as Pocket Internet Explorer or Control Panel is started, it will run in the foreground and Runtime is placed in the background. The bit for the function "DirectKeyScreenNumber" is no longer set and the keys or buttons with the configured function "DirectKey" no longer trigger the associated bit in the PLC.

---

**Restrictions**

- It is not permitted to operate PROFIBUS IO direct keys and PROFINET DP direct keys simultaneously.
- Establish the following via the "PROFINET IO enabled" option in the control panel of the HMI device:
  - Option disabled = PROFIBUS DP direct keys enabled
  - Option enabled = PROFINET IO direct keys enabled
- If communication is enabled with PROFINET IO, you are not permitted to use the serial interface.
- You can operate direct keys only on local HMI devices. On the Sm@rtClient it is possible to operate the key / button for the direct key. However, No bit is set in the I/O area of the CPU.
- Direct keys which are assigned to a button are only triggered through touch operation. Triggering with a mouse click, for example with a connected USB mouse, is not possible.
- With touch operation, direct keys are triggered independent of any configured password protection.
- The buttons used as direct keys on HMI devices with touch screen functionality may not be modified as follows by means of scripting:
  - Moving
  - Resizing
  - Hiding
  - Disabling for operation
- The LEDs are addressed either via the PROFINET IO direct keys or the HMI Runtime application. Avoid concurrent addressing via the PROFINET IO direct keys and the HMI Runtime application. The LEDs "ACK", "A-Z l", "A-Z r" and "HELP" are reserved for system functions and cannot be configured. It is not advisable to control the "ACK", "A-Z l", "A-Z r" and "HELP" LEDs by means of PROFINET IO direct key functionality.

## Inputs and outputs of HMI devices

### Assignment of inputs and outputs

#### Assigning the inputs/outputs

The keys or buttons of the device are assigning bytes in the input area. The LEDs are assigning bytes in the output area. The number of bytes used depends on the HMI device.

The touch panels do not have any permanently assigned keys. They only have user-configurable buttons. Via the "DirectKey system function you can assign a bit to a button in the input area. The counting direction of the bit in the input direction is from right to left. In contrast to the operator panels which have permanently assigned keys, the touch panel buttons can be assigned freely.

#### Assigning direct keys to screen numbers (only for touch devices)

If a PROFINET IO direct key is using the same bit for different functions in different screens, the SIMATIC PLC must differentiate between the respective functionality by means of the screen number. You can use the "DirectKeyScreenNumber" system function to avoid the delayed updating of the screen number following a screen change.

Using the "DirectKeyScreenNumber" system function you can set within the input area any number of bits in order to identify the screen and simultaneously transfer the direct key bits to the PLC. This ensures unambiguous allocation of a control bit to screen number at all times.

### 10.11.11. PROFIBUS DP direct keys 5

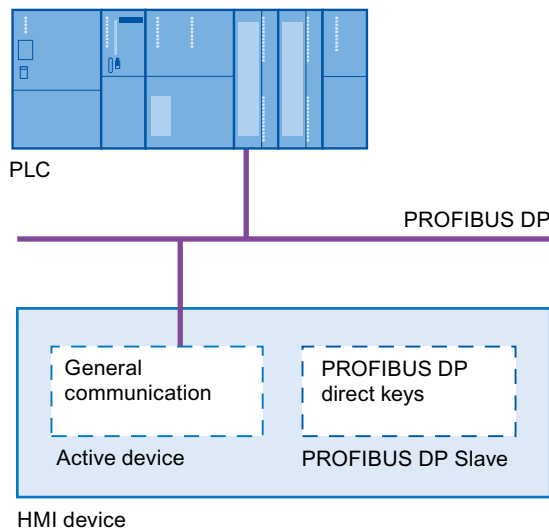

#### PROFIBUS DP direct keys

#### PROFIBUS DP direct keys

You configure the HMI device created in WinCC as an active communication partner in the automation network.

For the PROFIBUS DP direct keys, also configure the HMI device as a slave in the PROFIBUS DP network.

The following figure shows the basic configuration based on an automation network with an HMI device and a PLC.

### Mode of operation of the PROFIBUS DP direct keys

With PROFIBUS DP direct keys, when the key or button is pressed, a bit is set in the I/O area of the CPU.

The cycle time of the PROFIBUS DP bus is calculated from the total of all configured inputs and outputs.

The number of configured inputs and outputs can influence the reaction time of the PROFIBUS DP direct key. For a typical configuration the response time of the PROFIBUS DP direct key is < 100 ms.

### HMI devices for the configuration of PROFIBUS DP direct keys

#### HMI devices

You can configure PROFIBUS DP direct keys with the following HMI devices:

HMI device class	HMI device
Panel	OP 77B
	OP 177B
	OP 277 6"
	TP 177B 4"
	TP 177B 6"
	TP 277 6"
Mobile Panel	Mobile Panel 177 DP
	Mobile Panel 277 8"
	Mobile Panel 277 10"

HMI device class	HMI device
Multi Panel	Multi Panel 177 6" Touch
	Multi Panel 277 Key
	Multi Panel 277 Touch
	Multi Panel 377 Key
	Multi Panel 377 Touch
Comfort Panel	KTP400 Comfort
	KP400 Comfort
	KP700 Comfort
	TP700 Comfort
	KP900 Comfort
	TP900 Comfort
	KP1200 Comfort
	TP1200 Comfort
	KP1500 Comfort
	TP1500 Comfort
	TP1900 Comfort
	TP2200 Comfort

## Restrictions for PROFIBUS DP direct keys

### Note

If an external application such as Pocket Internet Explorer or Control Panel is started, it will run in the foreground and Runtime is placed in the background. The bit for the function "DirectKeyScreenNumber" is no longer set and the keys or buttons with the configured function "DirectKey" no longer trigger the associated bit in the PLC.

## Restrictions

- It is not possible to operate PROFIBUS DP direct keys and PROFINET IO direct keys simultaneously.  
Establish the following via the "PROFINET IO enabled" option in the control panel of the HMI device:
  - Option disabled = PROFIBUS DP direct keys enabled
  - Option enabled = PROFINET IO direct keys enabled
- You can operate direct keys only on local HMI devices. On the Sm@rtClient it is possible to operate the key / button for the direct key. However, No bit is set in the I/O area of the CPU.

- The buttons used as direct keys on HMI devices with touch screen functionality may not be modified as follows by means of scripting:
  - Moving
  - Resizing
  - Hiding
  - Disabling for operation
- The LEDs are addressed either via the PROFIBUS DP direct keys or the HMI Runtime application. Avoid concurrent addressing via the PROFIBUS DP direct keys and the HMI Runtime application. The LEDs "ACK", "A-Z l", "A-Z r" and "HELP" are reserved for system functions and cannot be configured. We do not recommend addressing the LEDs "ACK", "A-Z l", "A-Z r" and "HELP" with the PROFIBUS DP direct keys.
- The PROFIBUS direct keys on an HMI device are triggered independent of any configured password protection.

## Inputs and outputs of HMI devices

### Assignment of inputs and outputs

#### Assigning the inputs/outputs

The keys or buttons of the device are assigning bytes in the input area. The LEDs occupy bytes in the DP output area. The following table shows the number of bytes used in the various HMI devices. The precise assignment is shown in the following screens.

The touch panels do not have any permanently assigned keys. They only have user-configurable buttons. Via the direct keys function you can assign to a button a bit in the input area. The counting direction of the bit in the input direction is from right to left. In contrast to the operator panels which have permanently assigned keys, the touch panel buttons can be assigned freely. For more detailed information, refer to the "WinCC flexible - Configuring WinCC Windows-based Systems" user manual.

#### Assigning direct keys to screen numbers (only for touch devices)

If a PROFIBUS DP direct key is using the same bit for different functions in different screens, the S7 must differentiate between the respective functionality by means of the screen number. To combat the delayed updating of the screen number in the PLC after a change of screen you use the "DirectKeyScreenNumber" screen function.

Using the "DirectKeyScreenNumber" you can set within the input area any number of bits in order to identify the screen and simultaneously transfer the direct key bits to the PLC. This ensures unambiguous allocation of a control bit to screen number at all times.

### HTTP components

The components of the SIMATIC HMI HTTP Protocol are transferred to the HMI device in "Load to device".

HTTP components are:

- HTTP server
- HTTP client

If you use a Standard-PC or SIMATIC IPC, you must install WinCC RT Advanced or WinCC RT Professional first.

### SMTP protocol

The SMTP protocol is not a requirement for communication via SIMATIC HMI HTTP Protocol .

## HTTP / HTTPS

The SIMATIC HMI HTTP Protocol offers two standards:

- HTTP  
Is implemented in local networks for a fast, uncoded transfer of uncritical data.
- HTTPS  
Enables a reliable HTTP connection between devices. Initially there is an exchange of secret keys. Then, in a further step, the respective public keys can be securely exchanged in the form of digital certificates. The public keys are used to encode the utility data in order to guarantee a bug-proof communication.

---

### Note

Due to the encryption, the HTTPS protocol has a lower transmission performance than the HTTP protocol.

---

### CAUTION

End users are responsible for the security of their own networks.

### 10.11.12. Configuring a connection via SIMATIC HMI HTTP

2

#### Configuring a connection via SIMATIC HMI HTTP

#### Communication between HMI devices via SIMATIC HMI HTTP protocol

Several steps are needed to configure communication between HMI devices via the SIMATIC HMI HTTP protocol:

1. Configure HMI device as a server.
2. Configure HMI device as a client.
3. Assign tag parameters in the client.
4. Commission connection.

#### Access to tags via SIMATIC HMI HTTP protocol

If access to tags via the SIMATIC HMI HTTP protocol is to be enabled, these tags must be defined for the relevant HMI devices and interconnected.

## Configuring an HMI device as a server

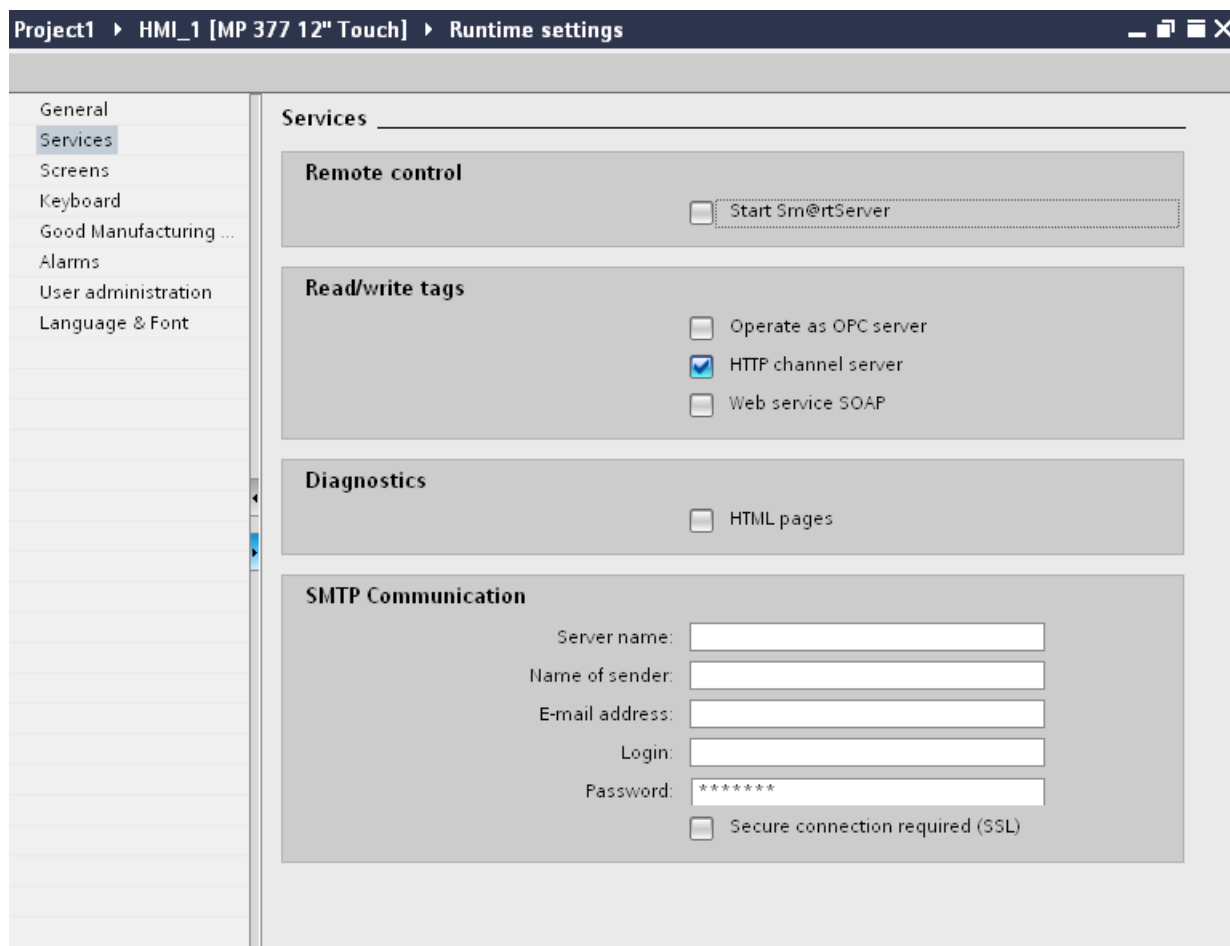

### Configuring a server

#### Requirements

- The HTTP communication channel must be set in the Control Panel of the HMI device.

#### Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click "Runtime settings".  
The "Runtime settings" editor opens.
3. Click "Services".
4. Select the "HTTP channel server" option.

If you use the SMTP protocol, you assign the following values under "SMTP settings" according to your project specifications:

- Server name
- Login
- Password

## Result

The HMI device has been configured as a server.

## Tags in the server

### Tags used

The client can use the HTTP protocol for read and write access to tags configured on the server in runtime. This means that it is not necessary to configure additional tags for an HTTP communication.

However, the following aspects must be taken into account to ensure correct data exchange:

- The data type of the server tags must match the data type in the client.
- The tag name configured in the HTTP server must be identical to the name of the address tag of the HTTP client.

## Configuring an HMI device as a client

### Configuring a client

### Requirements

- The HTTP communication channel must be set in the Control Panel of the HMI device.
- An HMI device has been configured as a server.

### Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.
4. In the "Communication drivers" column, select the "SIMATIC HMI HTTP Protocol" driver.

Connections						
	Name	Communication driver	HMI time synchronization mode	Station	Partner	Node
	Connection_2	SIMATIC HMI HTTP				
	<Add new>					

5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".
6. Set the parameters in the Property window.  
See "Setting parameters for the client" for more information about the parameters.

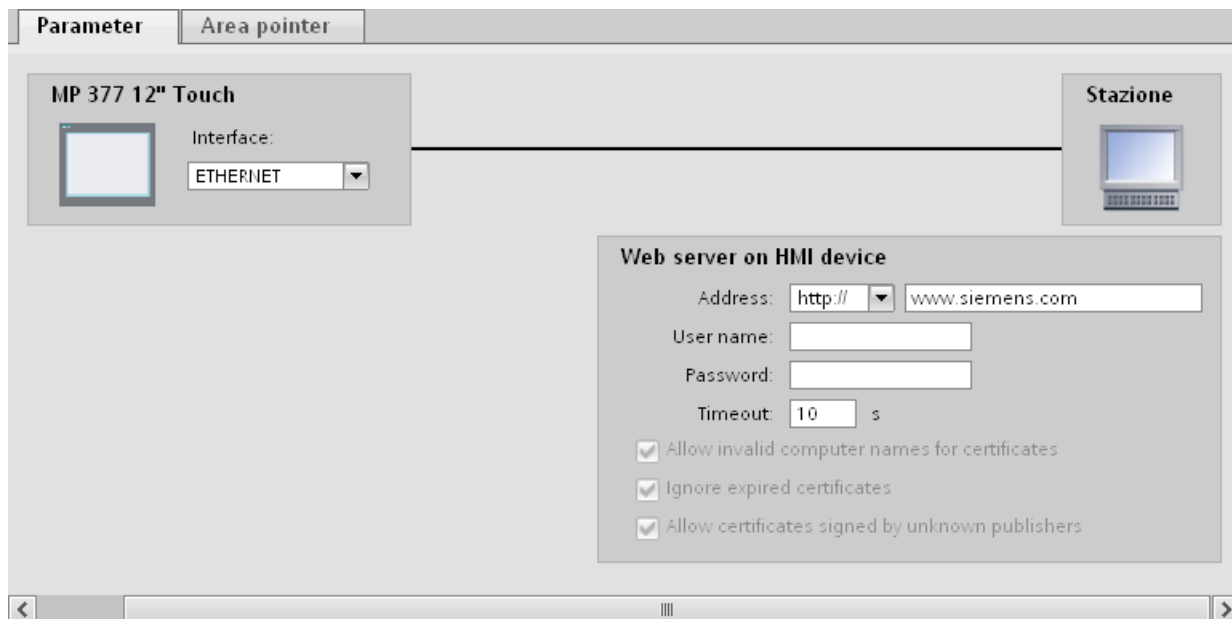

## Setting parameters for the client

### Requirements

- Connection has been created via SIMATIC HMI HTTP protocol.
- "Connections" editor is open.

### Procedure

1. Select "Ethernet" in the Inspector window under "Parameters > Interface".
2. Select protocol http:// or https://.
3. Enter the name of the server or its IP address.

### User name and password

If the "Authentication required" check box was selected in the server in the "Control Panel > WinCC Internet Settings > Web Server" dialog, a user name and password must be entered here in the client.

### Timeout

Assign a time after which a connection break is recognized.

## HTTPS protocol

If the HTTPS protocol is selected, with the following settings you can establish how the HTTPS client should check the properties of the server certificate and how it should react in the event of error:

- "Allow invalid computer names for certificates"
- "Allow expired certificates"
- "Allow certificates signed by unknown publishers"

## Reading out an IP address

If the server has already been commissioned, you can read out the IP address on the server as well:

- For Panel  
Click "Start > Programs > Command Prompt" on the server and enter the "ipconfig" command using the screen keyboard. The IP address is displayed after pressing <Ret>.
- For PC / Panel PC  
Click "Start > Run" on the server, enter "Cmd", and press <Ret>: The command interpreter is displayed. Enter the "ipconfig" command. The IP address is displayed after pressing <Ret>.

## Assigning tag parameters in the client

## Assigning tag parameters in the client

### Introduction

In order to be able to access tags on the server, they must be configured in the client as tag addresses.

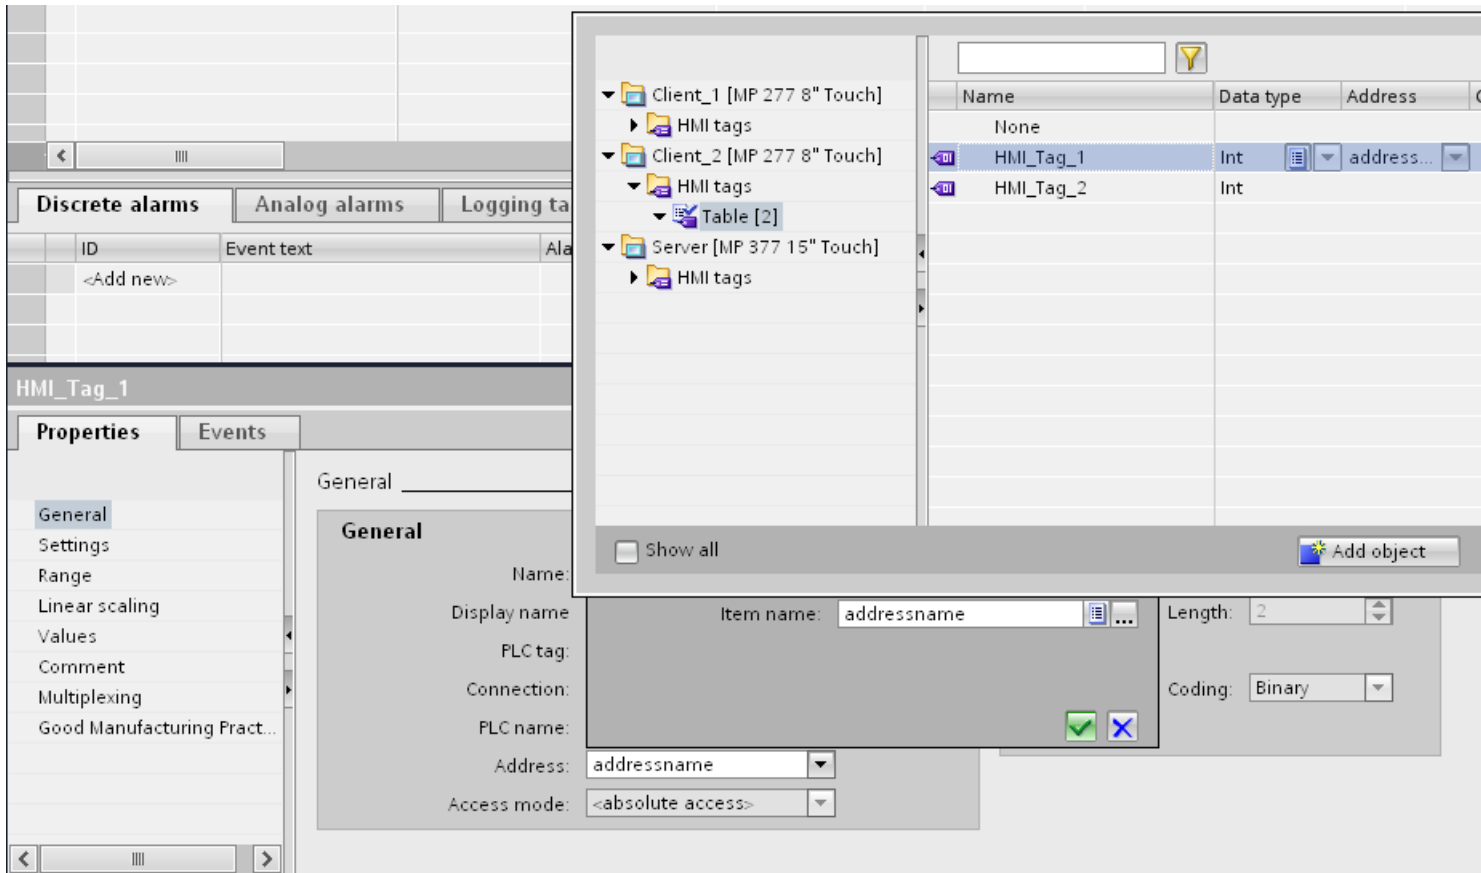

### Requirements

- Tags have been created in the "HMI tags" editor of the server.

### Procedure

1. Double-click the client under "Devices" in the project tree.
2. Double-click "HMI tags".
3. Create a new tag.
4. Select a data type.

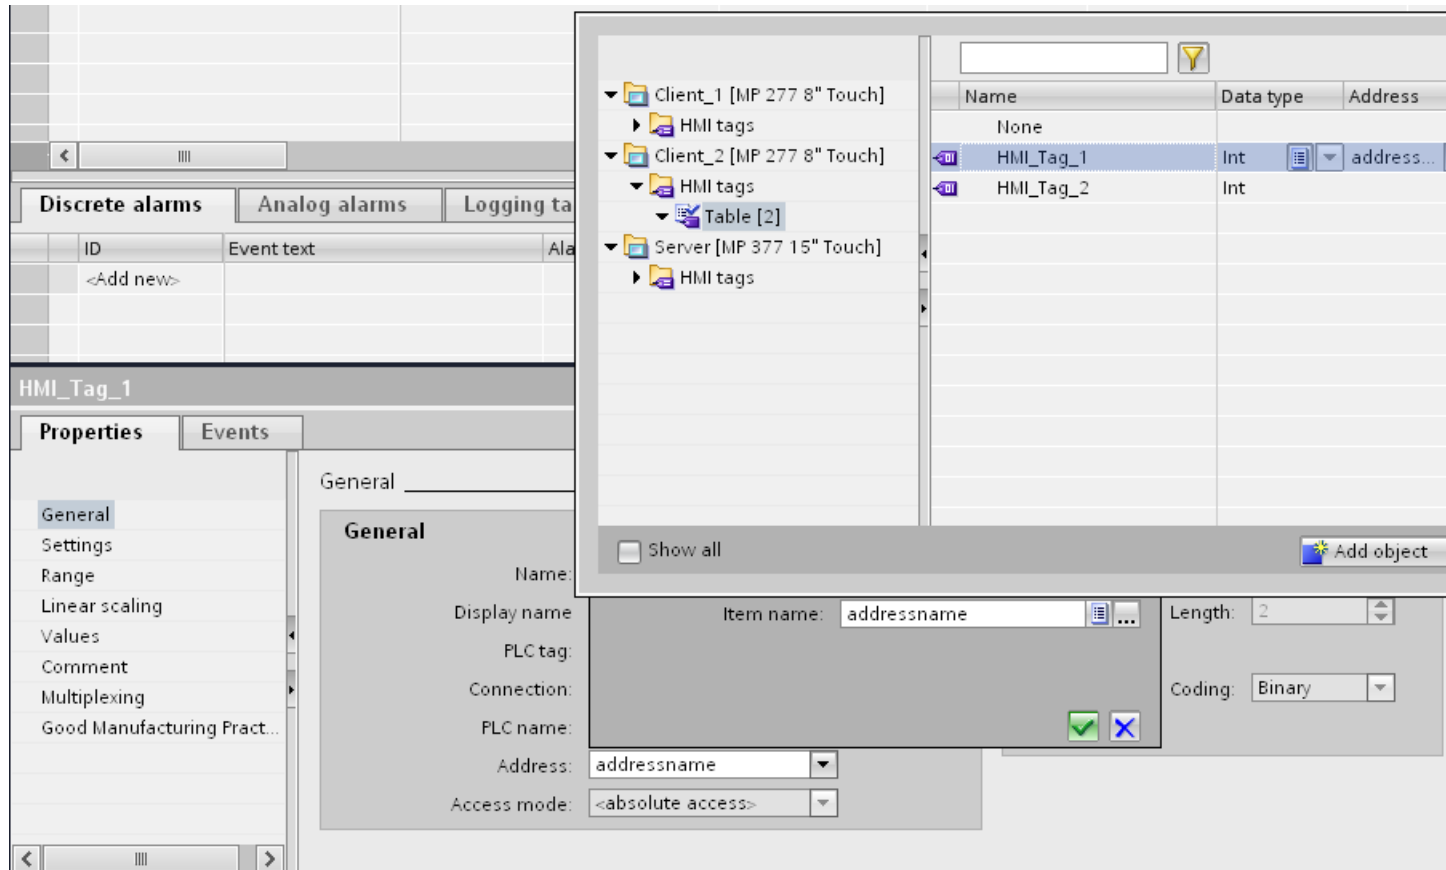

- Open the selection dialog in the "Addresses" column.

- Define the parameters in the working area:  
See "Parameters for the client tags" for more information about the parameters.

## Parameters for the tags of the client

### Parameters for the tags

### Data type

- The client does not check the data type. Therefore, pay attention that the data type selected here matches the data type of the tags on the server.
- Array tags are not permitted.

### Addressing

If the server and client are not within the same project, note the following:

- Enter the exact name of the tag that is to be communicated with on the server.

## Commissioning a connection

### Setting the server's Internet Settings

#### Introduction

To commission an HTTP/HTTPS connection, the WinCC Internet Settings must be set up in the Control Panel of both the server and client, in addition to the configuration in WinCC.

The name and number of tabs contained in the "WinCC Internet Settings" dialog depend on the software installed.

Only the required tabs with the MP 277 HMI device as an example are shown below.

#### WinCC Internet Settings, Proxy tab

The valid network settings are specified by the network administrator.

Make the following settings:

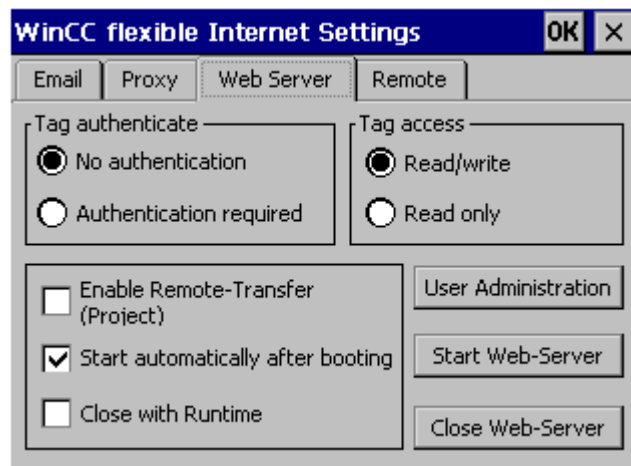

- Internet settings for HMI devices with Windows CE  
In this case, there are several options for calling the Control Panel:
  - In the startup phase, click on the "Control Panel" button in the Windows CE Loader menu.
  - Select "Start > Settings > Control Panel" in the toolbar.
  - During normal operation, pressing the key combination <CTRL + ESC> opens the toolbar. Start the Control Panel by selecting "Start > Settings > Control Panel".
  - Using the RT function "OpenControlPanel"

The language in the Windows CE based devices is always English.

#### WinCC Internet Settings, Web Server tab

Settings for using the integrated Web Server are made in this tab.

The "Web Server" tab is only available in the WinCC Internet Settings if the Web Server is installed on the HMI device.

- Tag authenticate  
Controls authentication for tag access:
  - "No authentication": Authentication (user name password) is not required for access.
  - "Authentication required": Authentication (user name password) is required for access. The user name and password for the client are specified during configuration.
- Tag access  
Controls access to tags:
  - "Read/write": Tags can be read and rewritten.
  - "Read only": Tags can only be read.
- Group for defining operational performance  
The following check boxes are not selected in conjunction with tag exchange via the HTTP/HTTPS protocol:
  - Enable remote transfer (project)  
Select this check box to enable an HTTP transfer from the configuration computer to the HMI device.
  - Start automatically after booting  
Specifies when the HTTP server should be started:  
Enabled: The HTTP server starts immediately after the HMI device is booted, irrespective of the runtime software  
Disabled: The HTTP server starts at the same time as the runtime software.
  - Close with Runtime  
Enabling this check box causes the HTTP server to be closed at the same time as the runtime software.

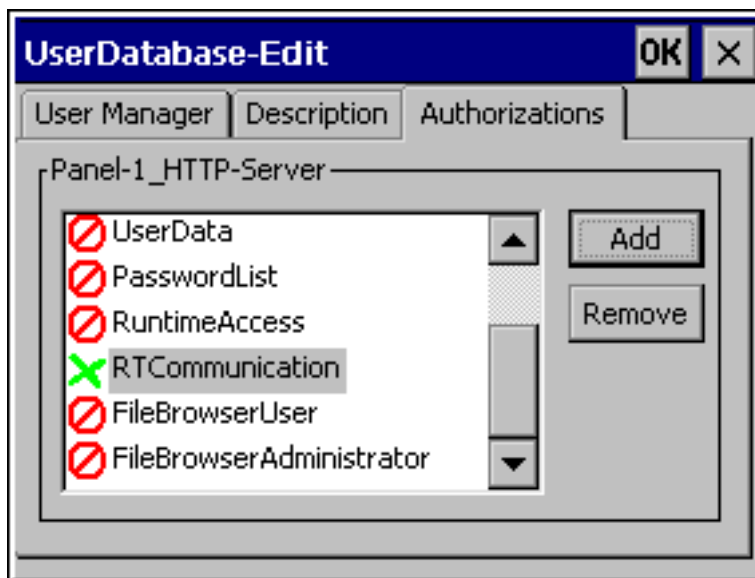

- User Administration  
This button opens the "UserDatabase-Edit" dialog box.

In the "User Manager" tab of this dialog box, you can select, delete, or create a new user. The "Description" and "Authorizations" tabs always apply to the user currently selected. (This example dialog box shows a user with the name 'Panel-1\_HTTP-Server'.)

- User Manager  
"Administrator" is the default user name, and "100" is the default password setting. If a user name and password have been entered for the HTTP server under "Connections" in your WinCC project, the same user name and password must be specified on the server.

- Description  
Enables input of a user description.
- Authorizations  
The newly set up user must be assigned the authorizations for "RT Communication on the "Authorizations" tab control.

## Establishing an HTTP connection

### Introduction

To establish an HTTP connection, you must perform the following actions:

- In the "Connections" editor of WinCC, configure the connection as an "https://" protocol type and define how the HTTPS client should verify the properties of the server certificate and respond to errors.
- Install a valid certificate on the HTTPS client.  
Certificates are necessary for server authentication. Using certificates you can ensure that the server with which the connection is to be developed is actually the server for which it is outputting.

### Principle of an HTTPS connection

After runtime start, the HTTPS client establishes a connection to the HTTPS server. The HTTPS server presents its certificate, which the client verifies for authenticity. The session

code that can only be read by the HTTPS server is then transmitted. The session code is now available on both sides and enables a symmetrical data encryption.

**Note**

The certificate contains the current time. The current time can lead to problems if the time zones of the server and client are different. For example, a certificate generated on a server with an Asian time zone only becomes valid on a client with European time zone in the future (8 hours).

**Preparation for installing a certificate on the client**

With the first HTTPS client access, the HTTPS server generates the certificate itself and then saves it in the "Cert.cer" memory. The file is stored in the following directory:

- On a PC/panel PC (with Windows XP) in the directory "..\\Siemens\\Automation\\WinCC Runtime Advanced\\SystemRoot\\SSL"
- On Windows CE-based devices in the directory "Flash\\Simatic\\SystemRoot\\SSL"  
The certificate must be stored on the HTTPS client on a storage medium from which it can be launched with a double click.

Server	Client	Possible file transfer
with Windows XP (PC, Panel PC)	with Windows XP (PC, Panel PC)	<ul style="list-style-type: none"> <li>• Disk</li> <li>• USB stick</li> <li>• LAN (Ethernet)</li> <li>• Internet Explorer (via TCP/IP, if Service is already running)</li> </ul>
With Windows CE (xP 270, xP 277, MP 370, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	with Windows XP (PC, Panel PC)	<ul style="list-style-type: none"> <li>• Memory card</li> <li>• ActiveSync (serial)</li> </ul>
with Windows XP (PC, Panel PC)	With Windows CE (xP 270, xP 277, MP 370, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	
With Windows CE (xP 270, xP 277, MP 370, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	With Windows CE (xP 270, xP 277, MP 370, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	<ul style="list-style-type: none"> <li>• Memory card</li> </ul>

### Installing a certificate on a client with Windows XP

Insert the storage medium on which you have saved the "Cert.cer" file into the HTTPS client or open the directory in which the file is located. Double click on the file and follow the instructions in the Windows dialog.

Tip: The Internet Explorer provides an easy way to install a certificate. Connect to this device via HTTPS (e.g.: `https://<my device>`). The browser establishes if a certificate has not yet been imported. In this case, the browser asks if you want to install the certificate. Any errors in the certificate will be displayed.

### Installing a certificate on a client with Windows CE

Insert the memory card on which you have saved the converted "Cert.cer" file into the HTTPS client. WinCC provides the "InstallCert.exe" tool for importing certificates with Windows CE.

You can implement the installation as follows:

- In Explorer:  
Double click the "Cert.cer" file to install the certificate.
- At the command prompt:  
Enter "InstallCert /[command parameter] [filename]".
  - command parameters:  
/r parameter must be specified because the certificate used in WinCC Runtime is a root certificate.  
A root certificate is the main certificate and is used to verify the authenticity of all other certificates transferred.
  - filename  
You must specify the certificate file with its complete path (e.g. "\\Storage Card\Cert.cer")

A status alarm is output when you completed the installation. Runtime has to be restarted after the installation of a certificate on Windows CE- HMI devices with HTTPS clients. It is necessary to restart Runtime so that an HTTPS connection can be established.

### The file "Cert.cer" cannot be opened.

The "Cert.cer" file generated at the HTTPS server cannot be opened on HMI devices based on Windows CE 5.0 by double-clicking the client.

1. Open the Control Panel.
2. Select "Certificates > My Certificates."
3. Click the "Import" button.  
A dialog box opens.
4. Select the "From a File" menu in the file browser and select the "Cert.cer" file.

## 10.11.12. Performance features of communication

## 3

## Permitted data types

## Permitted data types

When configuring tags, the data types listed below can be used.

Data type in the SIMATIC HMI HTTP protocol	Length	Sign	Range of values
Bool	0	No	true (-1) or false (0)
SInt	1 Byte	Yes	-128 to 127
USInt	1 Byte	No	0 to 255
Int	2 Byte	Yes	-32768 to 32767
UInt	2 Byte	No	0 to 65535
DInt	4 Byte	Yes	-2,147,483,648 to 2,147,483,647
UDInt	4 Byte	No	0 to 4,294,967,295
Real	4 Byte	Yes	-3.402823E38 to -1.401298E-45 for negative values and 1.401298E-45 to 3.402823E38 for positive values
LReal	8 Byte	Yes	-1.79769313486231E308 to -4.94065645841247E-324 for negative values and 4.94065645841247E-324 to 1.79769313486232E308 for positive values
String	1 to 255 byte	—	
DateTime	8 Byte	—	1.1.1970 00:00:00 up to 31.12.2037 23:59:59

**Note****Data types for third-party PLCs**

Data types in third-party PLCs may differ from those in WinCC.

Note the the tag definition of the third-party PLC for the correct assignment.

**Note**

It is not possible to access array tags from an HTTP client.

Multiplex tags are not supported by the HTTP protocol. If you need a multiplex tag, you must configure it on the HTTP client. You will have to create the tags for the multiplex list on the server and the client and then connect them. You will then add these tags to the multiplex list on the client.

Address multiplex tags are not supported by the HTTP protocol.

## 10.11.13 Communication via OPC

### 10.11.13. Communication via OPC

1

#### Introduction

This section describes the communication between an HMI device and a device via OPC.

In this case, the HMI device is the OPC client and the device is the OPC server.

For more detailed information on OPC and on configuring OPC servers, refer to Section "OPC (Page 6254)".

### 10.11.13. Configuring a connection via OPC

2

#### Introduction

You configure a connection to a device via OPC in the "Connections" editor of the HMI device.

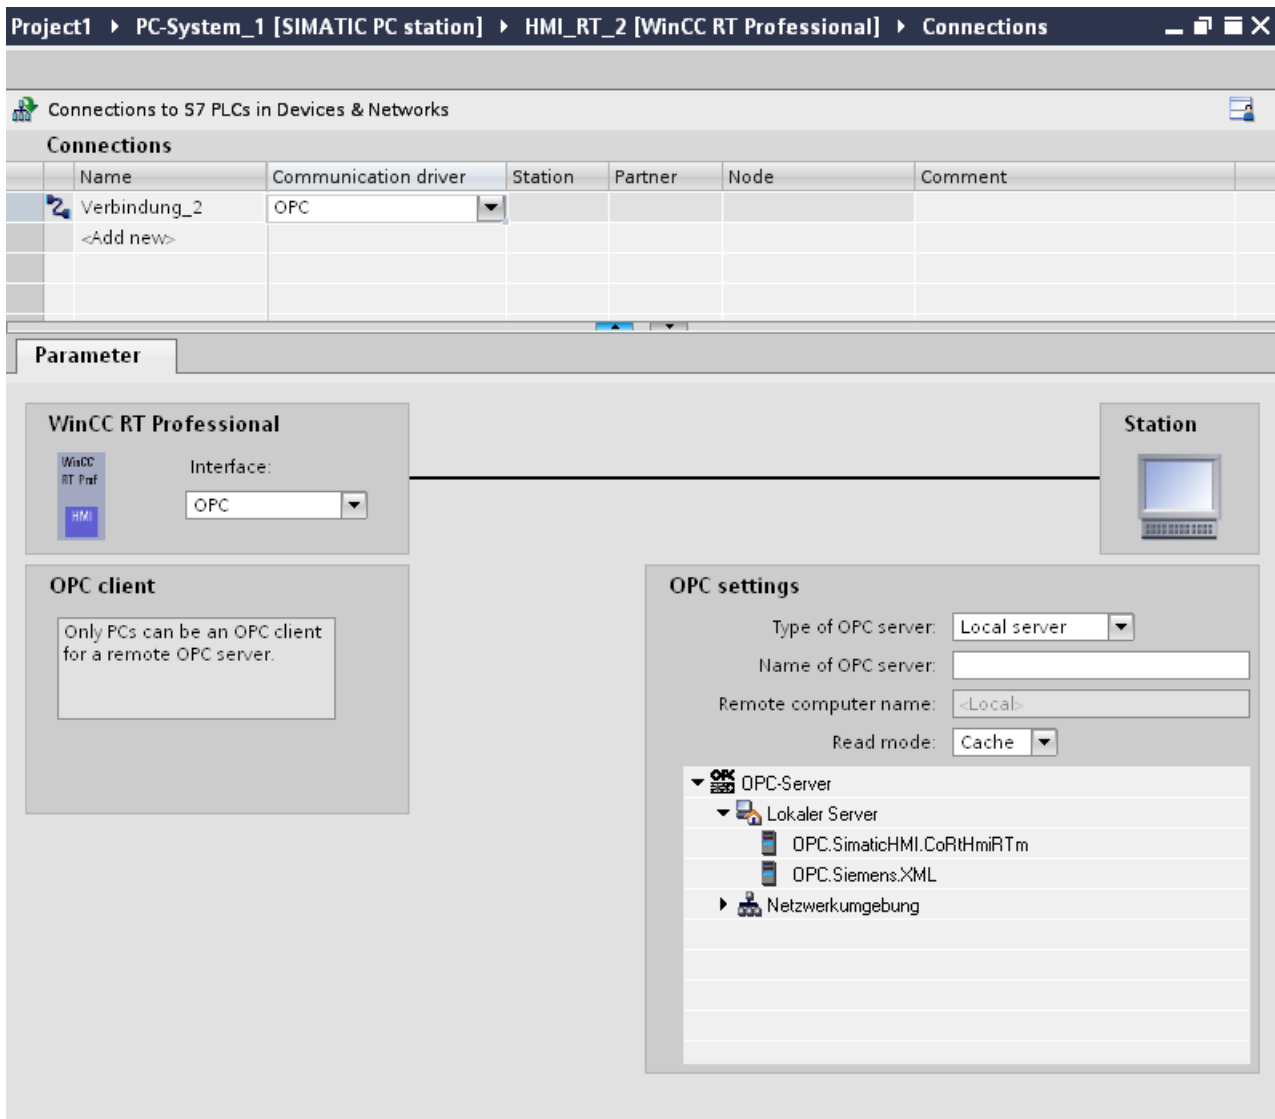

#### Requirements

- A project is open.
- An HMI device has been created.

#### Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.
4. In the "Communication drivers" column, select the "OPC" driver.

5. Select the "OPC" interface for the HMI device under "Parameters > Interface".

6. Select an OPC server from the tree view under "Parameters > OPC servers".  
The OPC server is entered in the "Name of OPC server" field.

### 10.11.13. Performance features of communication

3

#### Permitted data types for OPC DA

#### Permitted data types for connections with OPC DA

The table lists the user data types that can be used when configuring tags.

Data type	Length
VT_BOOL	1-bit
VT_I1	1 byte
VT_UI1	1 bytes
VT_I2	2 bytes
VT_UI2	2 bytes
VT_I4	4 bytes
VT_UI4	4 bytes
VT_R4	4 bytes
VT_R8	8 bytes
VT_BSTR	--
VT_DATE	8 bytes
VT_DATE VT_ARRAY	--
VT_I1 VT_ARRAY	--
VT_UI1 VT_ARRAY	--
VT_I2 VT_ARRAY	--
VT_UI2 VT_ARRAY	--
VT_I4 VT_ARRAY	--
VT_UI4 VT_ARRAY	--
VT_R4 VT_ARRAY	--
VT_R8 VT_ARRAY	--

## Permitted data types for OPC XML DA

### Permitted data types for connections with OPC DA XML

The table lists the user data types that can be used when configuring tags.

Data type	Length
boolean	1-bit
byte	1 byte
unsignedByte	1 byte
short	2 bytes
unsignedShort	2 bytes
int	4 bytes
unsignedInt	4 bytes
float	4 bytes
double	8 bytes
string	--
dateTime	--
time	--
date	--

## Permitted data types for OPC UA

### Permitted data types for connections with OPC UA

The table lists the user data types that can be used when configuring tags.

Data type	Length
Boolean	1-bit
SByte	1 byte
Byte	1 byte
Int16	2 bytes
UInt16	2 bytes
Int32	4 bytes
UInt32	4 bytes
Float	4 bytes
Double	8 bytes
String	--
DateTime	--

## 10.11.14 Communication via routing

### 10.11.14. Communication via routing

1

#### Introduction

If all stations in an automation system are not connected to the same subnet, these stations cannot be accessed directly online.

A connection between partners in different subnets is only possible via routing.

You configure the routing settings with the properties of the interfaces.

Communication from connection partners in various different subnets can be routed via the following links:

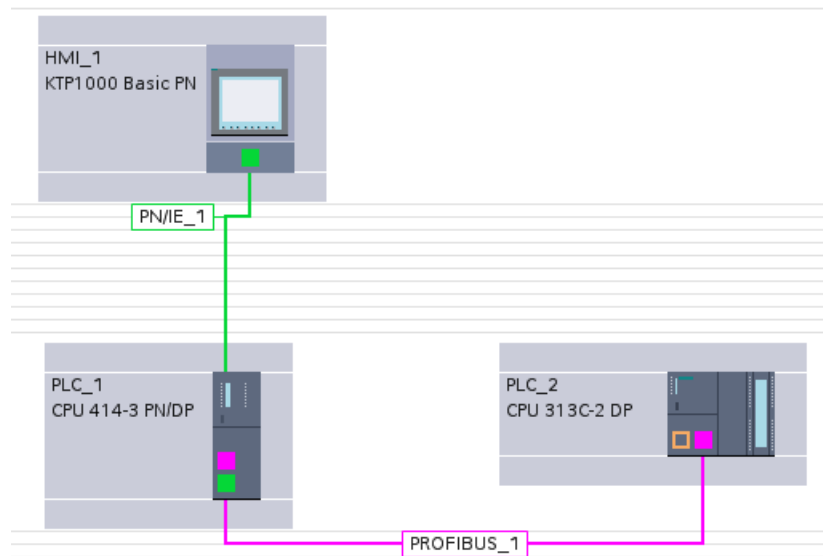

- PROFINET
- PROFIBUS
- MPI

#### Requirements for routing

To establish a connection to these devices, a router must be interposed. In this case, a SIMATIC station can also act as a router if it has appropriate interfaces with the different subnets.

Modules with communication capability (CPUs or CPs) used to establish gateways between the subnetworks must have routing capability.

A connection between partners in different subnets is only possible with IP routing. The routing settings can be edited in the corresponding interface properties.

### Routing path

The routing path is determined in Runtime by the system and cannot be influenced by the user. During configuration, it is not possible to generate information about a faulty connection.

### HMI devices as routers

Only SIMATIC PCs or PC stations can be used as a router.

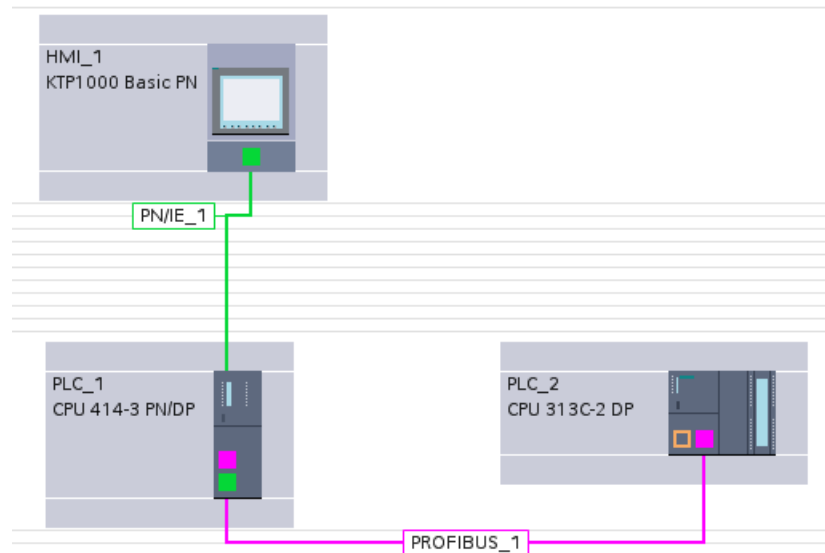

All other HMI devices from the "HMI" area cannot be used as a router.

#### 10.11.14. Example for communication via routing 2

### Communication via routing

Illustration of a hardware configuration with a routing connection

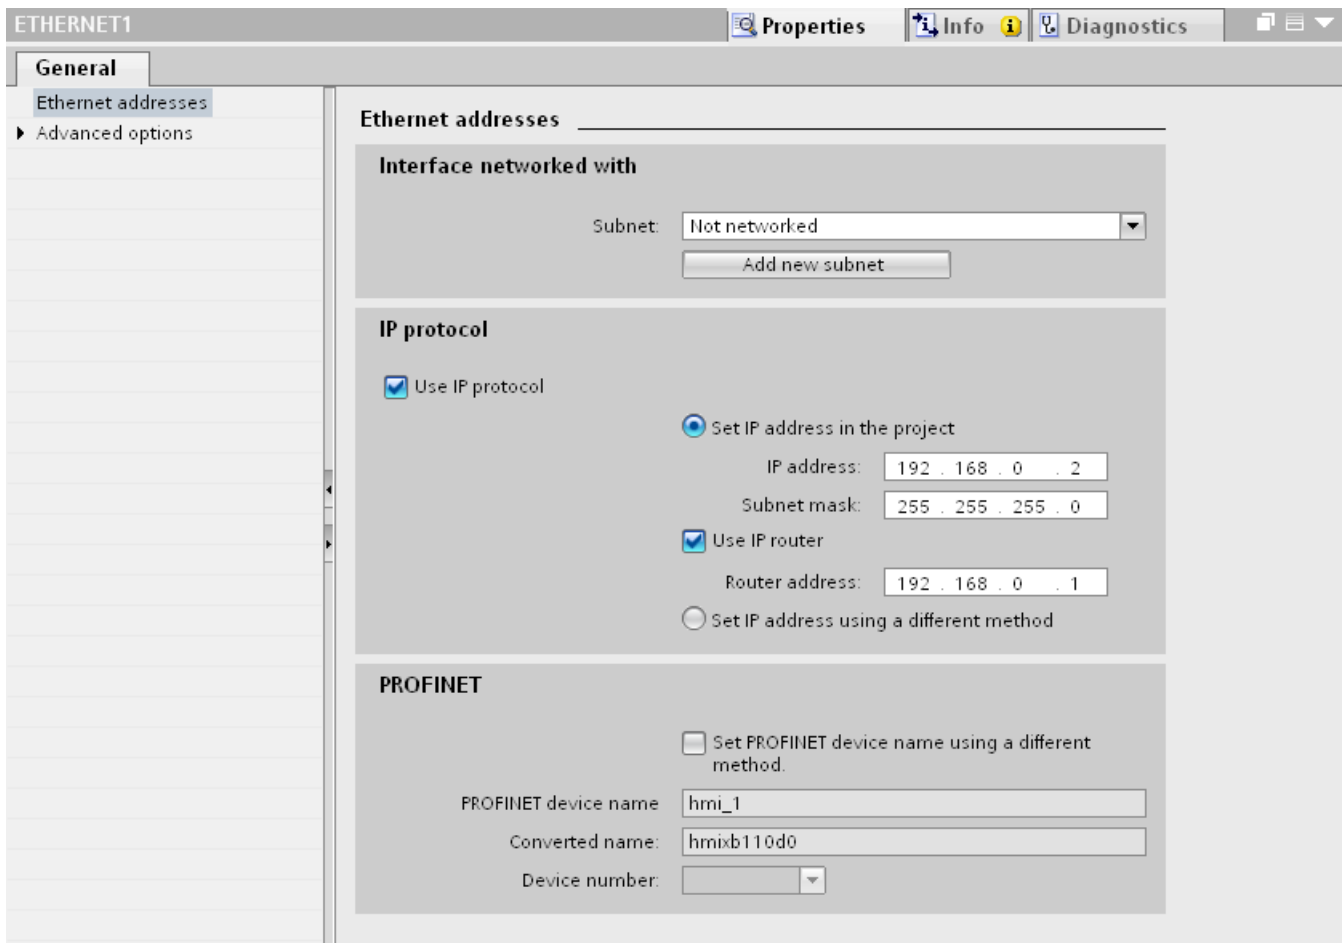

In the figure above, a routing connection has been established between an HMI device and the SIMATIC S7-300 controller.

The SIMATIC S7-400 automation device serves as a router.

A routing connection can be made directly in integrated projects. The communication partners are connected in the "Devices and Networks" editor.

You configure the parameters of the connection and interface in the Inspector window.

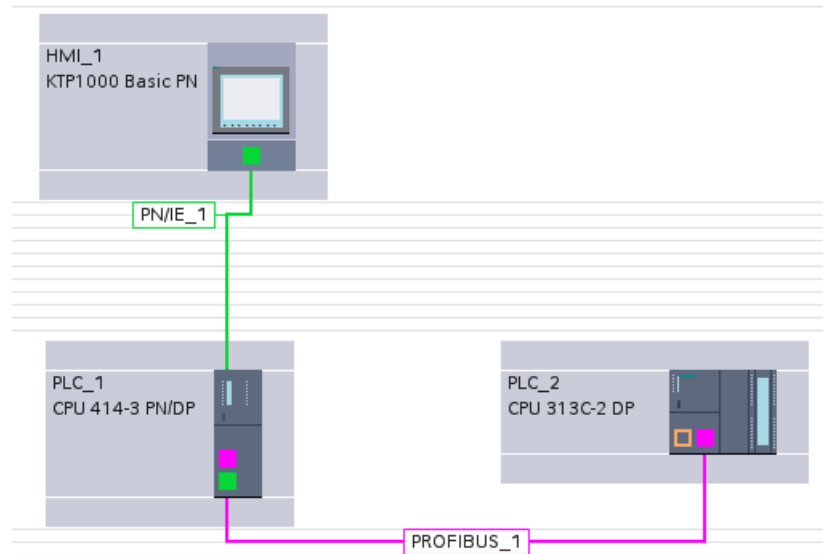

### 10.11.14. Configuring communication via routing 3

#### Introduction

The following configuration describes a network for the following communication partners:

- KTP1000 Basic PN
- SIMATIC S7-400 with PROFINET and PROFIBUS interface
- SIMATIC S7-300 with PROFIBUS interface

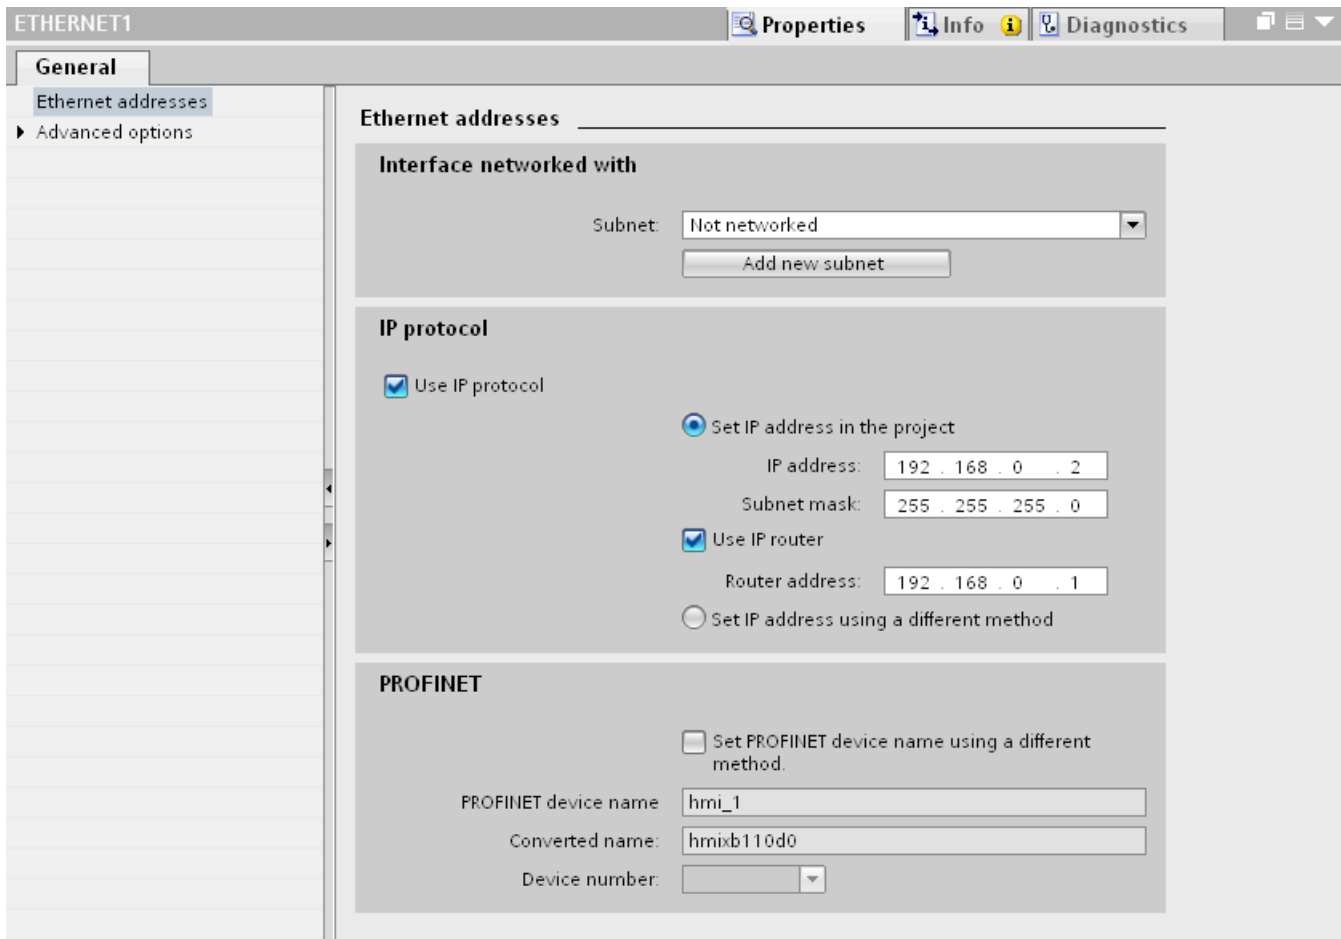

#### Requirements

- KTP1000 Basic PN is connected via PROFINET to the SIMATIC S7-400.
- SIMATIC S7-400 is connected via PROFIBUS to the SIMATIC S7-300.

#### Procedure

1. Click on the PROFINET interface of the HMI device.
2. In the Inspector window, click "Properties > General > Ethernet addresses".

3. Click "Use router" in the "IP protocol" area.
4. Enter the IP address of the router in the "Router address" field.

### 10.11.15 PROFINET IO and IRT

#### 10.11.15. PROFINET IO

1

#### What is PROFINET IO?

#### PROFINET IO

PROFINET is an Ethernet-based automation standard of PROFIBUS Nutzerorganisation e.V. (PNO) which defines a manufacturer-neutral communication, automation and engineering model.

## Objective

The objective of PROFINET is:

- Integrated communication via field bus and Ethernet
- Open, distributed automation
- Use of open standards

## Architecture

The PROFIBUS User Organisation e.V. (PNO) has designated the following aspects for PROFINET architecture:

- Communication between controllers as components within distributed systems.
- Communication between field devices, such as I/O devices and drives.

## Implementation by Siemens

The demand for "Communication between controllers as components within distributed systems" is implemented by "Component Based Automation" (CBA). Component Based Automation is used to create a distributed automation solution based on prefabricated components and partial solutions.

The demand for "Communication between field devices" is implemented by Siemens with "PROFINET IO". Just as with PROFIBUS DP, the complete configuration and programming of the components involved is possible using the Totally Integrated Automation Portal.

The following sections deal with the configuration of communication between field devices using PROFINET IO.

## PROFINET IO systems

### PROFINET IO system

A PROFINET IO system is comprised of a PROFINET IO controller and its assigned PROFINET IO devices.

- A PROFINET IO controller is a PLC that controls the automation task.  
Example: SIMATIC S7 1500 PLC
- A PROFINET IO device is a device that is controlled by an IO controller.  
Examples: HMI device TP 1200 Comfort, a head module of the distributed IO family ET 200S

As soon as you connect an IO controller to an IO device, a controller-device link is established.

### 10.11.15. IRT communication

2

#### Overview of RT classes

##### RT classes in PROFINET IO

PROFINET IO is a scalable, real-time communication system based on Ethernet technology. The scalable approach is reflected in several real-time classes:

- **RT:** Transmission of data in prioritized, non-isochronous Ethernet frames. The required bandwidth is within the free bandwidth area for TCP/IP communication.
- **IRT:** Isochronous transmission of data with high stability for time-critical applications (for example, motion control). The required bandwidth is from the area of bandwidth reserved for cyclic data.

##### Device dependency

Depending on the device, not all real-time classes are supported.

You can find further information on device dependency here: Performance characteristics of PROFINET IO and IRT (Page 5662)

##### Introduction: Isochronous Realtime Ethernet

##### Introduction: Isochronous Realtime Ethernet

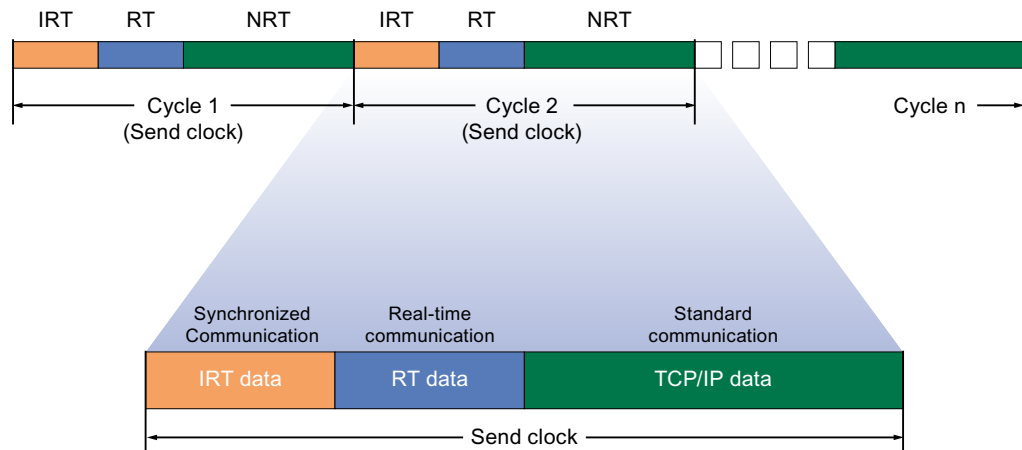

IRT is a transmission method by which PROFINET devices are synchronized with very high accuracy.

A sync master specifies the clock to which sync slaves are synchronized. An IO controller or an IO device can have the role of sync master.

Sync master and sync slaves are always devices in a sync domain. Bandwidth is reserved within the sync domain for IRT communication. Real-time and non-real-time communication (TCP/IP communication) is possible outside of the reserved bandwidth.

## Time ranges of communication cycles

The communication cycle is divided into three time ranges, which are represented in the following chart:

- **IRT data (synchronized communication)**  
This area can be reserved in specific steps, depending on the send clock. Within this time range the IRT data is transmitted.
- **RT data (real-time communication)**  
In this time range the cyclic RT data is transmitted. RT data has a higher priority than "normal" TCP/IP data. TCP/IP data or Ethernet frames can have a priority between 1 and 7. RT data has a priority of 6.
- **TCP/IP data (standard communication)**  
Standard communication (TCP/IP, etc.) is transmitted in the remaining interval of the communication cycle.

## Applications of IRT

PROFINET with IRT is especially suited for:

- High performance and deterministics for large quantity structures with regard to user data communications (productive data)
- High performance even with many devices in the line topology with regard to user data communications (productive data).
- Parallel transmission of production and TCP/IP data over wire, and securing the forwarding of production data when data volume is high by reserving transmission bandwidth.

## Basic procedures for configuring IRT

### Basic procedures for configuring IRT

If you want to upgrade equipment with PROFINET IO to IRT, follow these three steps:

1. Configure the PROFINET IO device. The PROFINET device must support IRT.
2. Set which device acts as the sync master and synchronizes the other devices. For this you must configure a sync domain with a sync master and at least one sync slave.
3. Download the configuration to all involved devices.

You can find further information on IRT configuration here: [Auto-Hotspot](#)

### Creating PROFINET IO configuration for IRT

As a prerequisite for IRT configuration, there must be an existing PROFINET IO configuration, i.e., one or more stations must be configured with an IO controller and IO devices.

You can read which components are suitable for IRT communication in the task card "Information", once you have selected the corresponding components in the hardware catalog.

The requirements for functioning IRT communication are met simply by configuring a PROFINET IO system with components that support IRT.

### Sync domain

### Sync domain

A sync domain is required for synchronization of PROFINET IO devices. The sync domain assures that all devices belonging to it communicate synchronously.

Prerequisite for IRT communication is a synchronization cycle to distribute a common time base for all PROFINET devices in a sync domain. With this base synchronization, a synchronous transmission cycle of PROFINET devices within a sync domain is achieved. The sync master (usually an IO controller) generates the common synchronization clock and specifies the time basis on which all other sync slaves (usually IO devices) are synchronized.

If the sync master fails, the communication between the IRT devices reverts to RT communication.

### Background processes during configuration of an IO system

If you configure an IO controller and network it with an Ethernet subnet, it will automatically be added to the default sync domain of the Ethernet subnet. The default sync domain is always available. The IO controller operates unsynchronized.

If you assign an additional IO device to the IO system of the IO controller, the IO device automatically assigns the IO controller's sync domain.

### 10.11.15. Configuring the HMI device as IO device

3

#### Introduction

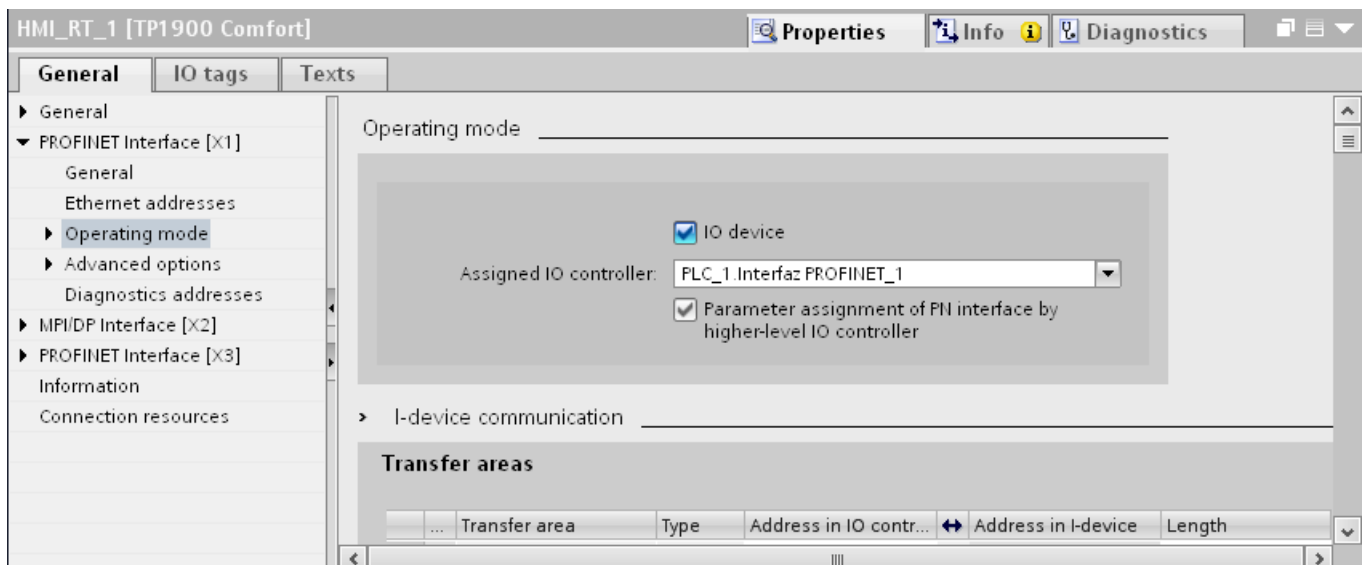

An IO controller and at least one PROFINET IO device are necessary for a PROFINET IO system.

#### Requirements

- A SIMATIC S7 1200 or SIMATIC S7 1500 PLC has been created.
- An HMI device from the Comfort Panels device family has been created.
- The "Devices & Networks" editor is open.

#### Procedure

1. You network the PLC with the HMI device:
2. Click the HMI device in the "Devices & Networks" editor.
3. In the inspector window, you select the following:  
"General > PROFINET Interface (X1) > Operating mode"
4. Select the "IO device".

5. You assign the parameters required for your PROFINET IO system  
You can find further information on the parameters for PROFINET IO systems here:  
[Parameters for PROFINET IO and IRT \(Page 5660\)](#)

### 10.11.15. Parameters for PROFINET IO and IRT

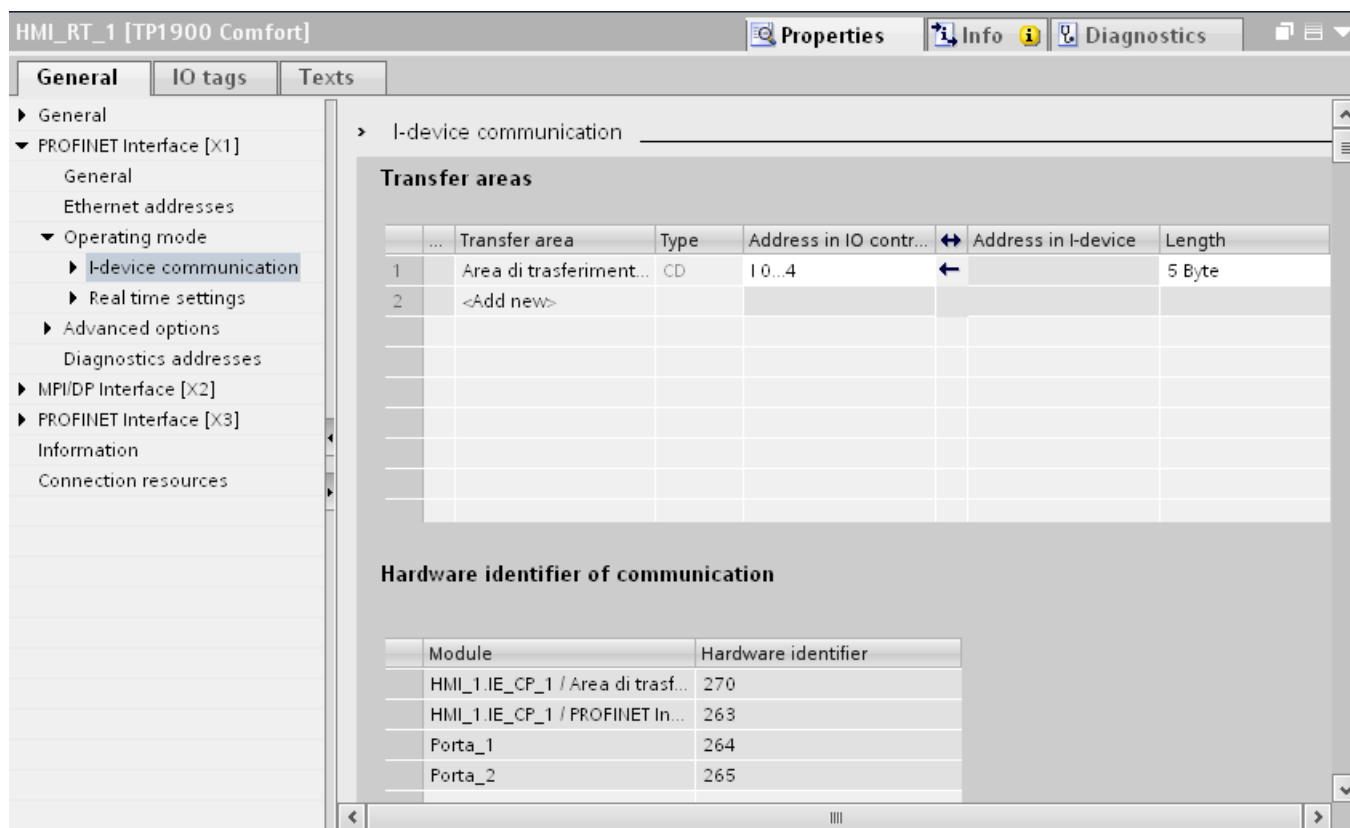

4

#### I-device communication

#### I-device

The "I-device" functionality (intelligent IO device) of a CPU allows data to be exchanged with an IO controller and therefore to use the CPU, for example, as an intelligent preprocessing unit of subprocesses. The I-device is linked as an IO device to a "higher-level" IO controller.

#### Parameters for I-device communication

- Transfer areas  
Display transfer areas of the I-device communication
- Diagnostics address of communication  
Display of diagnostic data of the IO device

#### Configuring an I-device with a GSD file

If you use an I-device in another project, or if the I-device is used in another engineering system, then configure the higher-level IO controller and the I-device as described above.

However, click on the "Export" button after configuring the transfer areas in order to create a GSD file from the I-device. This GSD file represents the configured I-device in other projects.

The "Export" button is found in the "I-device communication" section of the inspector window.

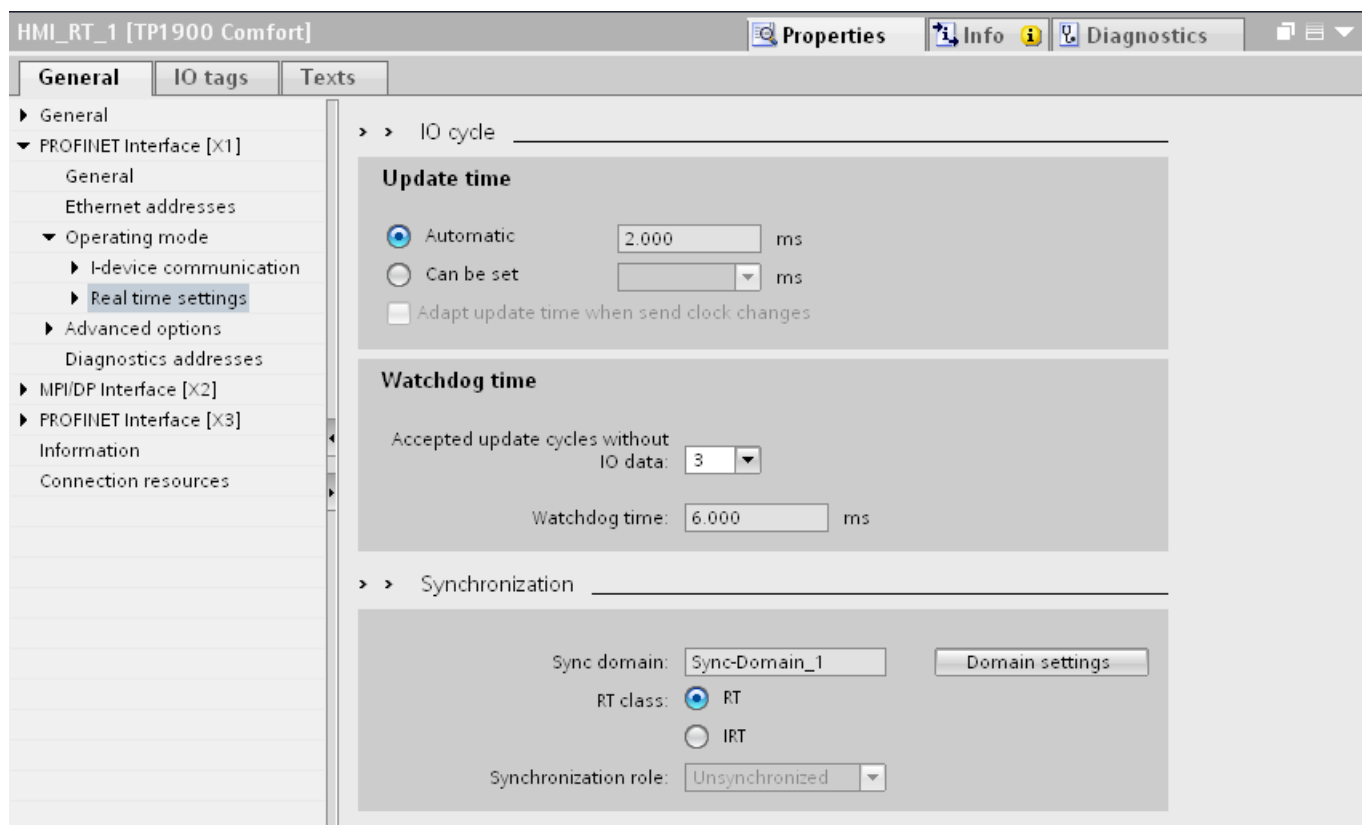

The hardware configuration is compiled and the export dialog opened.

Assign a name for the I-device proxy as well as a description in the fields provided. Click the "Export" button to complete your process.

Finally, import the GSD file, for example, into another project.

## Real-time settings

### Parameters for real-time settings

- Update time
  - Display of update time used in network.
  - Selection of update times available in network.
- Watchdog time
  - Selection of available update cycles.
  - Display of watchdog time used in network.
- Synchronization
  - Display of sync domain used
  - Selection of RT class.
  - Selection of role in the sync domain.

#### 10.11.15. Performance characteristics of PROFINET IO and IRT

5

### Configuration of PROFINET and IRT

#### Setting up PROFINET with IRT

Keep in mind the following rules for the set up and operation of a PROFINET IO system in IRT operation. They serve to insure an optimal operation of your PROFINET IO system.

- When using IRT, you must configure the topology. This will enable exact calculation of the update time, bandwidth, and additional parameters.
- If you would like to use multiple sync domains, configure a sync domain boundary for the port which is currently connected to the PROFINET device of another sync domain.
- In a sync domain you can only configure one sync master at a time.
- A PROFINET IO system may only be part of a single sync domain.
- If you configure a PROFINET device in a sync domain and want to synchronize with IRT, the PROFINET devices concerned must support IRT communication.
- Wherever possible, use the same PROFINET device as the PROFINET IO controller and sync master.
- If only some of the PROFINET devices in a PROFINET IO system are synchronized, please keep in mind the following: PROFINET devices which are not part of IRT communication are placed outside of the sync domain.

## Device dependency

### IRT communication

The following HMI devices support IRT communication:

- TP700 Comfort and KP700 Comfort
- TP900 Comfort and KP900 Comfort
- TP1200 Comfort and KP1200 Comfort
- TP1500 Comfort and KP1500 Comfort
- TP1900 Comfort
- TP2200 Comfort

### Communication options

The following configuration options are available for Comfort Panels:

- Comfort Panel with PROFINET Basis functionality without PROFINET IO
- Comfort Panel with PROFINET RT in an RT network networked with an RT controller
- Comfort Panel with PROFINET RT as end point in an IRT network networked with an RT controller
- Comfort Panel with PROFINET IRT in an IRT network networked with an IRT controller

## 10.11.16 Media redundancy

### 10.11.16. Restrictions with media redundancy

1

#### Diagnostic interrupts

If you have activated "Diagnostic interrupts", diagnostic interrupts pertaining to "Media redundancy" are only processed by PROFINET-compatible devices and displayed on the "IO Controller".

If you do not use a PROFINET-compatible device, the "Diagnostic interrupts" selection does not have any function.

Diagnostic interrupts are only detected by the IO controller. There is no separate diagnostic interrupts for HMI devices that are detected and displayed by HMI devices.

### 10.11.16. Media redundancy

2

#### Media redundancy options

To increase the network availability of an industrial Ethernet network with optical or electrical line topology, the following options are available:

- Meshing networks
- Parallel switching of transmission modes
- Consolidation of a line topology to a ring topology

#### Media redundancy in ring topologies

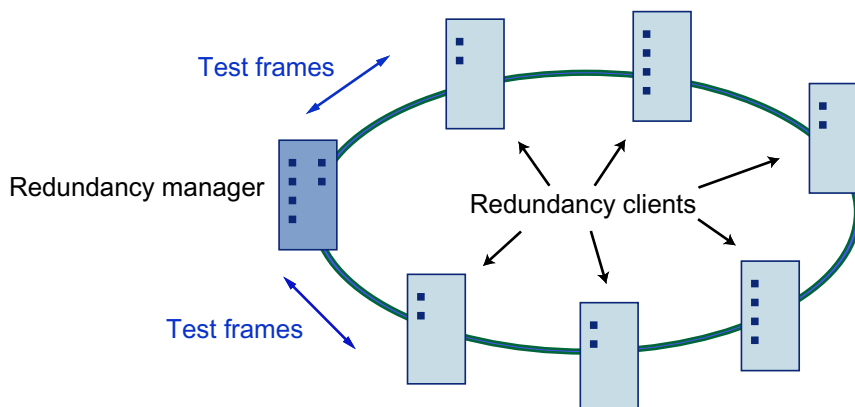

Devices in ring topologies can be the external switches and/or integrated switches of communication modules.

To set up a ring topology with media redundancy you must join both free ends of a line-shaped network topology to one device.

Consolidation of a line topology to a ring takes place over 2 ports (ring ports) in a device in the ring.

This device is the redundancy manager. All other devices in the ring are the redundancy clients.

The following figure shows the ring type interconnection:

The two ring ports in a device are the ports which create the connection to both of its neighboring devices in a ring topology.

The selection and set up of the ring ports takes place during configuration of the respective device.

Download the configuration in the individual devices before physically connecting the ring.

#### Functions of media redundancy in a ring topology

If a part of the ring is disconnected, then the data paths between the individual devices is automatically reconfigured. After the reconfiguration the devices are once again accessible in the newly created topology.

In the redundancy manager, 2 ring ports will be separated from each other during interruption-free network operation, so that no data frames circulate.

The ring topology is a line when viewed from the standpoint of data transfer. The redundancy manager monitors the ring topology. To do so it sends a test frame not only from ring port 1 but also from ring port 2. The test frame passes through the ring in both directions until it arrives at the other ring port on the redundancy manager.

An interruption in the ring can occur from connection failure between two devices or device failure in the ring.

If the redundancy manager's test telegram does not reach the other ring port because of interruption in the ring, the redundancy manager connects via both ports.

With this alternate route a functioning connection is again created among all remaining devices in a line-shaped topology.

The time between ring interruption and re-establishment of a functional line topology is called the reconfiguration time.

As soon as the interruption is eliminated, the original transmission route is again created, both ring ports in the redundancy manager are separated from each other, and the redundancy clients are notified of the change.

The redundancy clients then use the new route to the other devices.

If the redundancy manager fails, then the ring is changed to a functional line.

### 10.11.16. Media Redundancy Protocol (MRP)

3

#### Media Redundancy Protocol (MRP)

The MRP process works in conformity with Media Redundancy Protocol (MRP), which is specified in IEC 61158 Type 10 "PROFINET".

The reconfiguration time following an interruption of the ring amounts to a maximum of 0.2 seconds.

#### Requirements for trouble-free operation

Requirements for trouble-free operation with media redundancy process MRP are:

- MRP is supported in ring topologies of up to 50 devices. Exceeding the device limit can lead to data traffic failure.
- All devices must be connected to each other via their ring ports.
- "MRP" must be activated on all devices in the ring.
- The connection settings (transfer medium / duplex) must be set to full duplex and for at least 100 Mbit/s for all ring ports. Otherwise data traffic failure can occur.
- In STEP 7 configuration in the properties dialog for all ports in the ring, set the connection in the register "Options" to "Automatic settings".

### HMI devices for media redundancy

The following HMI devices support "Media Redundancy":

- KP700 Comfort
- TP700 Comfort
- KP900 Comfort
- TP900 Comfort
- KP1200 Comfort
- TP1200 Comfort
- KP1500 Comfort
- TP1500 Comfort
- TP1900 Comfort
- TP2200 Comfort

#### 10.11.16. Configuring media redundancy for HMI devices

4

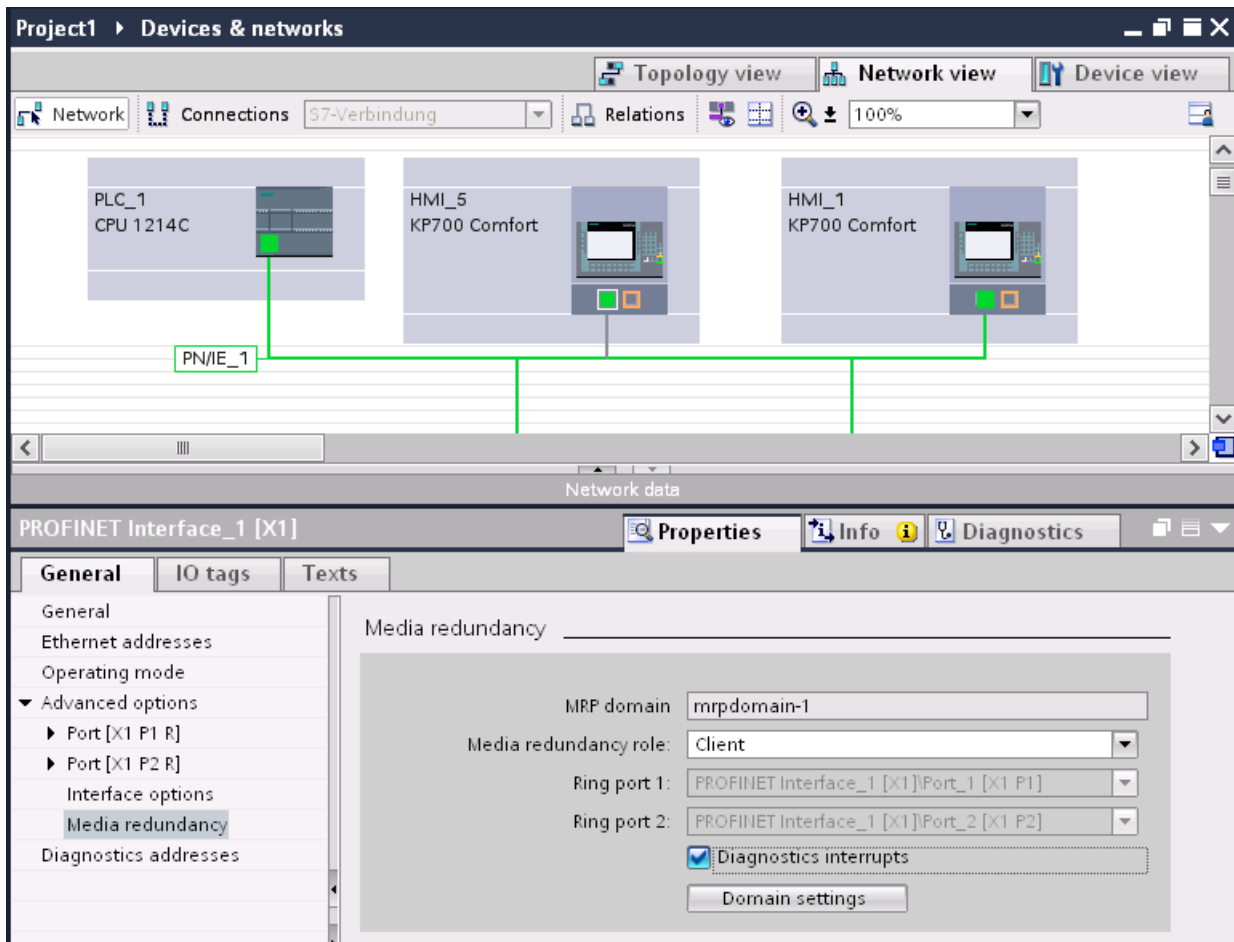

##### Requirements

- The participating components must support "media redundancy".
- IRT communication is not configured
- One device on the network must be configured as "Redundancy manager".
- A ring topology is set up by means of port interconnections.

## Procedure

1. Click on the PROFINET interface of an HMI device.
2. Select "General > Advanced settings > Media redundancy" in the properties.
3. Select "Client" in the "Media redundancy role" area.

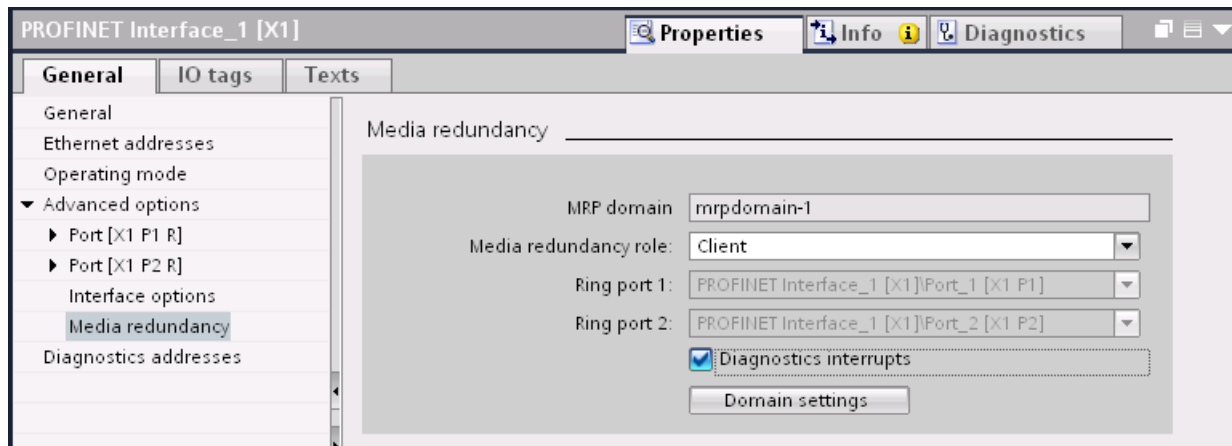

## Result

The HMI device is now operating as client on the MRP network.

The default ring ports will automatically be displayed in the subjacent fields.

### 10.11.16. Parameters for media redundancy

5

#### MRP domain

This area displays the MRP domain.

You can rename the MRP domain in the "Domain settings" dialog.

#### Domain settings

Click "Domain settings" to open the "Domain settings" editor.

You also manage the MRP domains in the MRP domain area of the "Domain settings" editor.

#### Media redundancy role

Assign the role of the HMI device in the "Media redundancy role" area.

You have the following options:

- Client  
The HIM device is operated as "Client" in an MRP domain.
- Not a node of the ring  
The HIM device is not operated within an MRP domain.

#### Ring port 1 and Ring port 2

Display of available ring ports

## Diagnostic interrupts

The following diagnostic interrupts can be generated if "Diagnostic interrupts" is activated:

- Wiring or port error  
Diagnostics interrupts will be generated for the following errors in the ring ports:
  - A neighbor of the ring port does not support MRP
  - A ring port is connected to a non-ring port

### 10.11.16. Managing MRP domains

#### 6

You can monitor and adjust the media redundancy settings centrally.

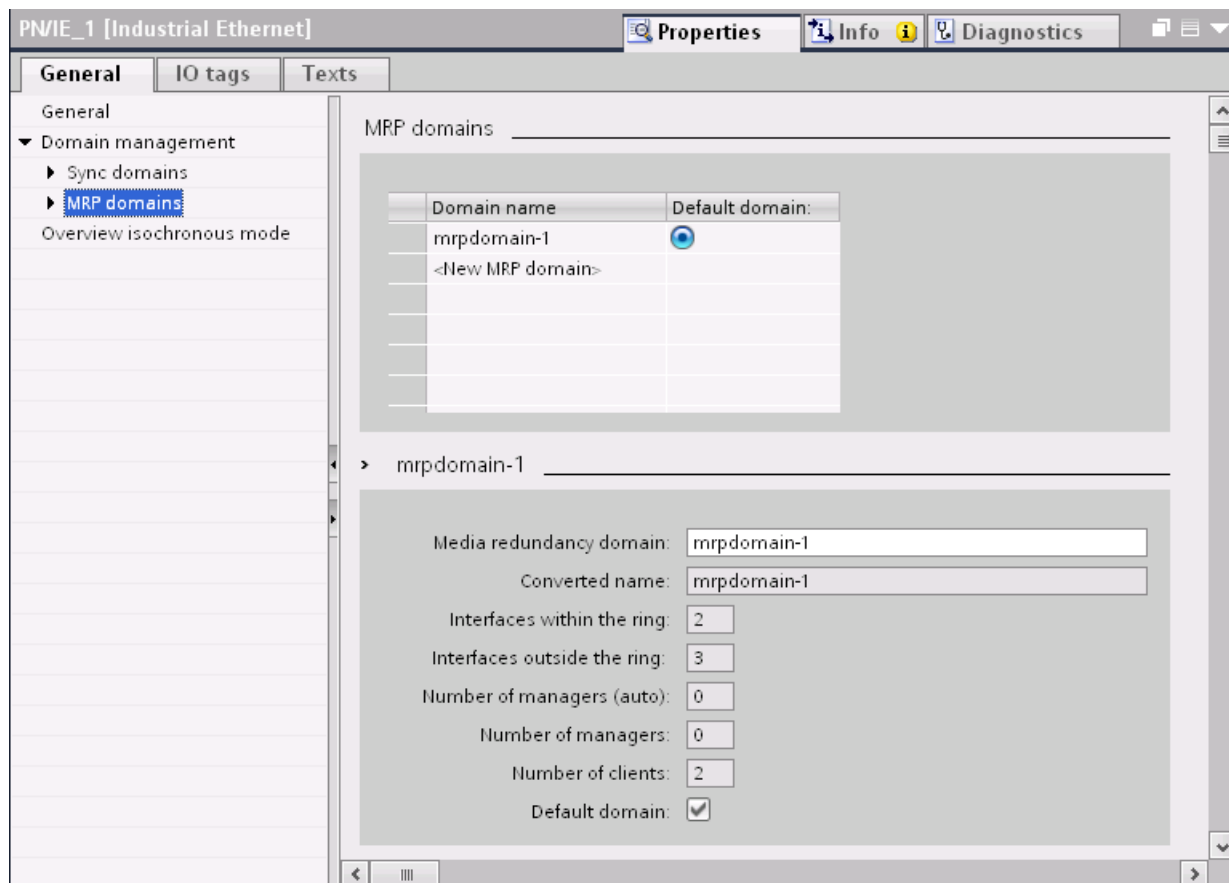

## Requirements

The devices are configured and networked.

## Procedure

1. Select the PROFINET interface of the HMI device.
2. Select the "Advanced options > Media redundancy" area in the Inspector window.

3. Click the "Domain settings" button.
4. Navigate to the "Domain management > MRP domains" area in the Inspector window.

## MRP domains

You can specify the default MRP domain in the "MRP domains" area.

You can rename all domains and check the redundancy roles and ring ports.

For each MRP domain, you receive an overview of how many PROFINET interfaces are interconnected in the ring, how many PROFINET interfaces are located outside the ring, and the number of redundancy managers and redundancy clients.

You can have the devices in the ring, including device name, associated MRP domain, media redundancy role, and utilized ring ports, displayed in groups:

- IO systems  
The list shows you all configured devices of the selected IO system.
- Rings  
The list shows you all ring interconnections of the selected IO system. The identified rings are numbered consecutively. If all devices of this ring belong to one MRP domain, this is also displayed.
- MRP domain  
The list shows you the existing MRP domains of the selected IO system.

## 10.11.17 Communication with other PLCs

### 10.11.17. Communication with other PLCs

1

#### Introduction

Communication with other PLCs is communication with PLCs that are not in the SIMATIC family.

These PLCs have proprietary protocols for data exchange. The protocols are configured as communication drivers in WinCC.

#### Communication drivers

The following communication drivers are supported in WinCC and are already installed:

- Allen-Bradley
  - Allen-Bradley EtherNet/IP
  - Allen-Bradley DF1
- Mitsubishi
  - Mitsubishi MC TCP/IP
  - Mitsubishi FX
- Modicon Modbus
  - Modicon Modbus TCP/IP
  - Modicon Modbus RTU
- Omron
  - Omron Host Link

#### Communication drivers in WinCC RT Professional

The following communication drivers are supported for RT Professional:

- Allen-Bradley
  - Allen-Bradley EtherNet/IP
- Mitsubishi
  - Mitsubishi MC TCP/IP
- Modicon Modbus
  - Modicon Modbus TCP

## Connections between HMI devices and other PLCs

You configure the connections between HMI devices and other PLCs in the "Connections" editor of the HMI device. These connections are non-integrated connections.

### 10.11.17. Distinctive features when configuring

2

#### Distinctive features for data exchange

Distinctive features apply when configuring connections to other PLCs, compared to configuring integrated connections.

Note the following distinctive features when configuring:

- Addressing of tags
- Permitted data types
- Distinctive features when configuring area pointers
- Distinctive features when configuring alarms
- Distinctive features when configuring trends

For more detailed information on distinctive features when configuring, refer to Section "Data exchange" of the respective communication driver.

### 10.11.17. Parallel communication

3

#### Parallel communication of communication drivers

The following table shows an overview of which communication drivers you can use simultaneously on one HMI device.

---

**Note**

Parallel communication is not approved for Basic Panels.

---

#### Parallel communication over Ethernet interfaces

The approved combinations can be operated via the same Ethernet interface. Several Ethernet interfaces are not required.

Parallel communication only concerns the Ethernet-based communication drivers.

	Allen-Bradley EtherNet/IP	Mitsubishi MC TCP/IP	Modicon Modbus TCP/IP	OPC (DA/ XML DA)	OPC UA (DA)	SIMATIC LOGO!	SIMATIC S7 200	SIMATIC S7 300/400	SIMATIC S7 1200	SIMATIC S7 1500	SIMATIC C HTTP protocol	Sinumerik NC
Allen-Bradley	--	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
EtherNet/IP												
Mitsubishi MC TCP/IP	No	--	No	Yes	Yes	No	No	No	No	No	Yes	No
Modicon Modbus TCP/IP	No	No	--	Yes	Yes	No	No	No	No	No	Yes	No
OPC (DA/ XML DA)	Yes	Yes	Yes	--	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
OPC UA (DA)	Yes	Yes	Yes	Yes	--	Yes	Yes	Yes	Yes	Yes	Yes	Yes
SIMATIC LOGO!	Yes	No	No	Yes	Yes	--	Yes	Yes	Yes	Yes	Yes	Yes
SIMATIC S7 200	Yes	No	No	Yes	Yes	Yes	--	Yes	Yes	Yes	Yes	Yes
SIMATIC S7 300/400	Yes	No	No	Yes	Yes	Yes	Yes	--	Yes	Yes	Yes	Yes
SIMATIC S7 1200	Yes	No	No	Yes	Yes	Yes	Yes	Yes	--	Yes	Yes	Yes
SIMATIC S7 1500	Yes	No	No	Yes	Yes	Yes	Yes	Yes	Yes	--	Yes	Yes
SIMATIC C HTTP protocol	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	--	Yes
Sinumerik NC	Yes	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	--

## Parallel communication over serial interfaces

The following applies for parallel communication over serial interfaces:

- One communication driver per interface.
- One interface per communication driver.

### 10.11.17. Communication drivers

4

## Allen-Bradley

### Allen-Bradley communication drivers

#### Introduction

This section describes the communication between an HMI device and PLCs that use Allen-Bradley communication drivers.

The following communication drivers are supported:

- Allen-Bradley EtherNet/IP
- Allen-Bradley DF1

#### Data exchange

Data is exchanged by means of tags or area pointers.

- Tags  
The PLC and the HMI device use process values for data exchange. You create tags in the configuration that point to addresses in the PLC. The HMI device reads the value from the defined address, and then displays it. The operator may also enter values on the HMI device, which are then written to the address in the PLC.
- Area pointers  
Area pointers are used to exchange specific data and are only set up when these data are used.

## Allen-Bradley EtherNet/IP

### Configuring a connection via Allen-Bradley EtherNet/IP

#### Introduction

You configure a connection to a PLC with an Allen-Bradley EtherNet/IP communication driver in the "Connections" editor of the HMI device.

The Ethernet interfaces are named differently depending on the HMI device.

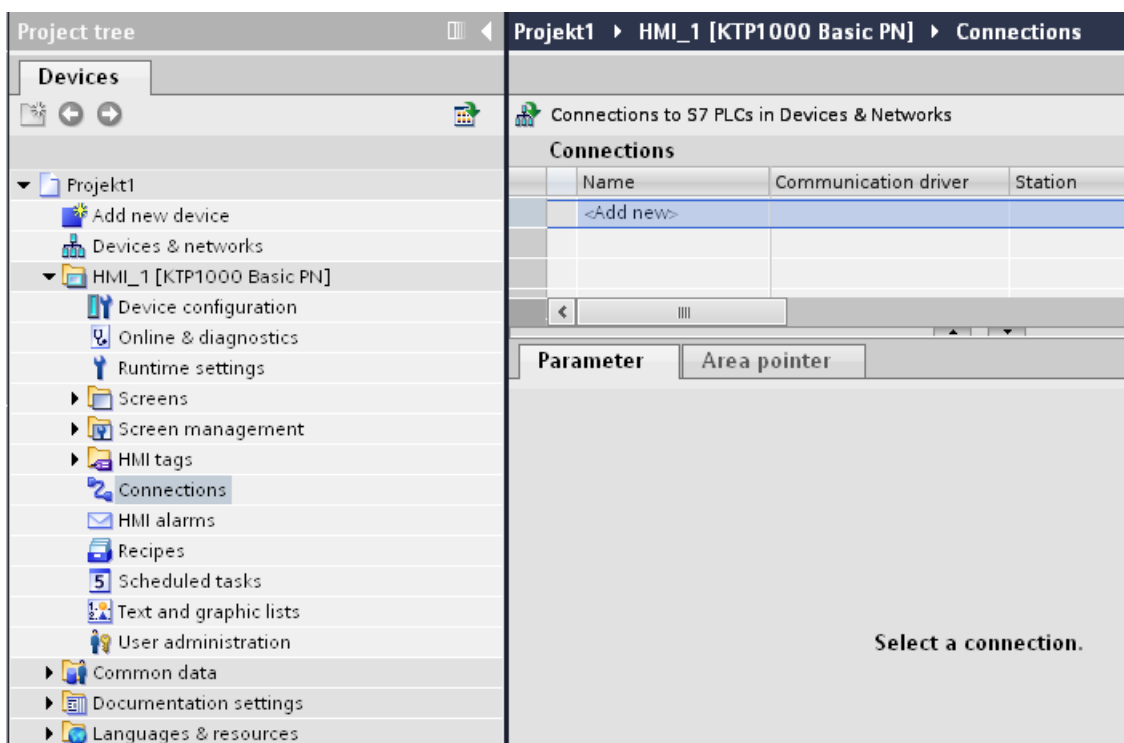

Example: PROFINET interface corresponds to the Ethernet interface

## Requirements

- A project is open.
- An HMI device has been created.

## Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.

- In the "Communication drivers" column, select the "Allen-Bradley EtherNet/IP" driver.

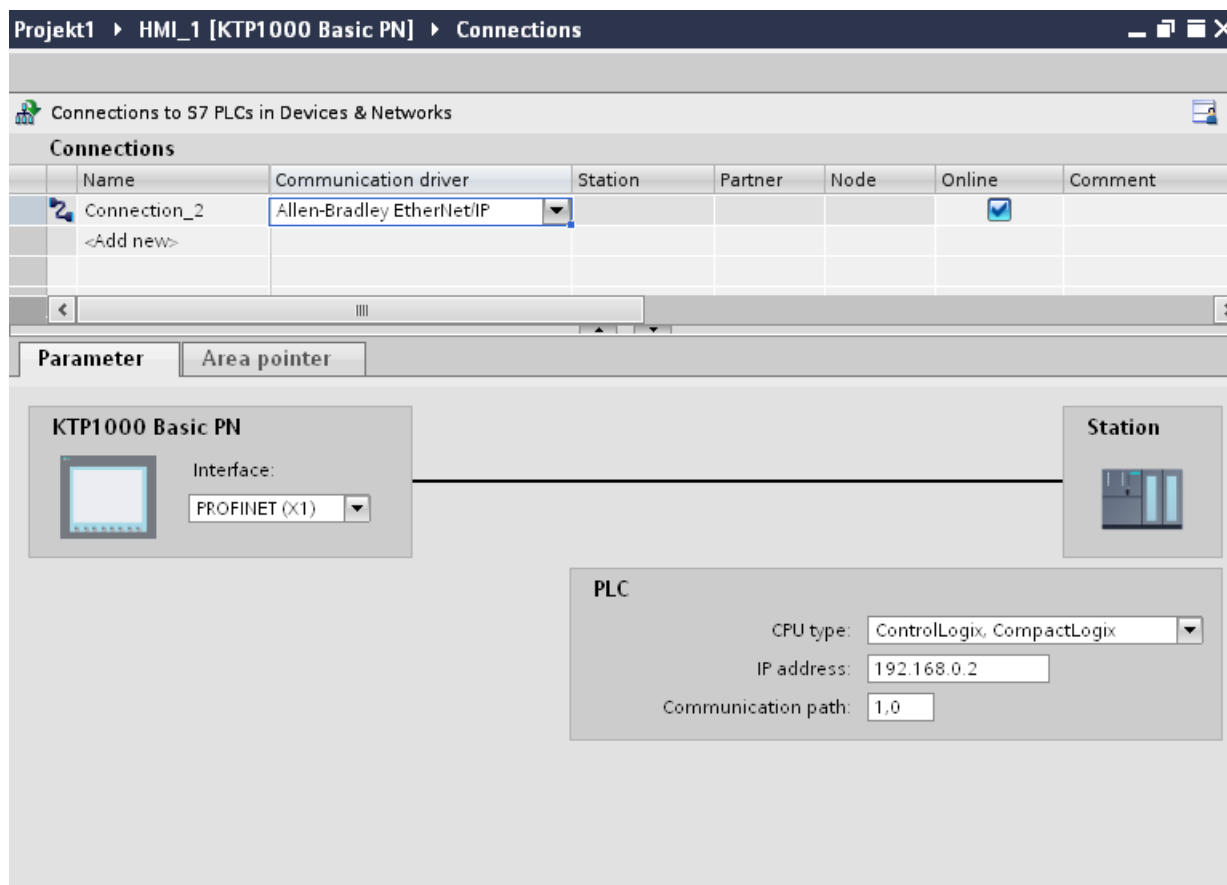

- Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

### Parameters for the connection (Allen-Bradley EtherNet/IP)

#### Parameters to be set

To assign the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "PLC" area is available for assigning parameters according to the interface used.

## Parameters for the HMI device

You can select only one interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC. The IP address is transferred to the HMI device upon subsequent loading.

---

### Note

The IP address in the control panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the control panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

---

To set up the IP address of the HMI device:

1. Click on the HMI device.
2. Open the "Device configuration" editor.

3. Click the Ethernet interface.
4. Assign the IP address in the inspector window under:  
"General > PROFINET interface > Ethernet addresses"

### Parameters for the PLC

- CPU type  
For "CPU type", set the CPU type of the PLC used.
- IP address  
Set the IP address or host name of the Ethernet/IP module of the PLC. Only the IP address can be used on a Basic Panel.
- Communication path  
Set the CIP path from the Ethernet module to the PLC. This establishes a logical connection between the Ethernet module and PLC, even if both devices are located in different CIP networks.  
For additional information see: Examples: Communication path

### Connecting HMI device to PLC

#### Connections via Allen-Bradley EtherNet/IP

##### Connection

The HMI device can be connected to the Allen-Bradley PLC using the following components:

- Existing Ethernet network that also contains the PLCs
- Cross-over Ethernet cable connected directly to the Ethernet interface of the CPU or the communication module

The connection of the HMI device to an Allen-Bradley PLC is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

##### Communication types

#### Approved communication types with Allen-Bradley EtherNet/IP

The following communication types are system-tested and approved:

- Point-to-point connection to the approved PLCs
- Multipoint connection from a HMI device (Allen-Bradley Ethernet/IP-Client) with up to 4 PLCs with the respectively approved PLCs. CPU types can be mixed.

## Connection

Connection with the following PLCs is approved with Allen-Bradley EtherNet/IP:

- CPU type: "ControlLogix, Compact Logix"
  - ControlLogix 556x(1756-L6x) with Ethernet module 1756-ENBT
  - Guard Logix-System ControlLogix 556xS(1756-L6xS) with Ethernet module 1756-ENBT
  - CompactLogix 533xE(1769-L3xE) with Ethernet interface onboard
  - 532xE(1769-L2xE) with Ethernet interface onboard
  - 534x (1768-L4x) with Ethernet module 1768-ENBT
- CPU type: "SLC, MicroLogix"
  - MicroLogix 1100 (with Ethernet interface onboard)
  - MicroLogix 1400 (with Ethernet interface onboard)
  - SLC 5/05 (with Ethernet interface onboard)

## Performance features of communication

### Permitted data types for Allen-Bradley EtherNet/IP

#### Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

#### CPU type: ControlLogix, CompactLogix

Data type	Length
Bool	1 bit
DInt	4 bytes
Int	2 bytes
Real	4 bytes
SInt	1 byte
String	1 to 80 characters
UDInt	4 bytes
UInt	2 bytes
USInt	1 byte

Permitted data types arrays

Address	Permitted data types
Array	SInt, USInt, Int, UInt, DInt, UDInt, Real
Individual bits from the basic data types of the PLC SInt, USInt, Int, UInt, DInt, UDInt	Bool*

\* Any changed value of certain defined bits is written back to the PLC. There is no check to determine whether any other bits have changed. The PLC (or other PLCs) may only read access the value.

### CPU type: SLC, MicroLogix

Data type	Operand type	Length
ASCII	A	0 to 80 characters
Bool	N, R, C, T, B, S, I, O	1 bit
DInt	N	4 bytes
Int	N, R, C, T, S	2 bytes
Real	N, F	4 bytes
String	ST	1 to 82 characters
UDInt	N	4 bytes
UInt	N, R, C, T, B, I, O	2 bytes

Permitted data types arrays

Address	Permitted data types
Array	Int, UInt, DInt, UDInt, Real

### Distinctive features for connections with Allen-Bradley Ethernet/IP

With the communication driver Allen Bradley Ethernet/IP and the CPU type SLC, MicroLogix, you can only use array tags for discrete alarms and trends.

#### Note

I/O modules with 8 or 16 ports occupy one data word on the PLC.

I/O modules with 24 or 32 ports occupy two data words.

The HMI device does not output an error message if using non-existent bits.

You should always make sure that I/O modules with 8 or 24 ports only occupy the bits that are actually assigned to a port.

## Supported CPU types for Allen-Bradley EtherNet/IP

### CPU types

The following CPU types are supported for configuring the Allen-Bradley EtherNet/IP communication driver.

- CompactLogix
  - 1769-L2xE with Ethernet interface onboard
  - 1769-L3xE with Ethernet interface onboard
  - 1768-L4x with Ethernet module 1768-ENBT
- ControlLogix
  - 1756-L6x with Ethernet module 1756-ENBT
- GuardLogix
  - 1756-L61S with Ethernet module 1756-ENBT
  - 1756-L62S with Ethernet module 1756-ENBT
  - 1756-L63S with Ethernet module 1756-ENBT
- MicroLogix
  - MicroLogix 1100 / 1400
- SLC50x
  - SLC5/05

### Addressing in the C.Logix CPU type

#### Addressing

#### Addressing

A tag is uniquely referenced in WinCC by means of an address in the PLC. The address must correspond with the tag name in the PLC. The tag address is defined by a string with a length of up to 128 characters.

#### Using characters for addressing

Valid characters for tag addressing:

- Letters (a to z, A to Z)
- Numbers (0 to 9)
- Underscore ( \_ )

The tag address consists of tag name and other character strings used to specify the tag in the PLC.

Tag name properties:

- The tag name may begin but not end with an underscore character.
- Strings with successive underscore and space characters are invalid.
- The address may not exceed a length of 128 characters.

---

**Note**

The characters reserved for tag addressing may not be used in program/tag names or at any other address instance.

---

The reserved characters are listed below:

Reserved character	Function
.	Element delimiter
:	Definition of a program tag
,	Delimiter for addressing multi-dimensional arrays
/	Reserved for bit addressing.
[ ]	Addressing of array elements or arrays

## PLC and program tags

The Allen-Bradley EtherNet/IP communication driver supports addressing of PLC tags (global project tags) and/or program tags (global program tags).

A program tag is declared based on the program name in the PLC and actual tag name which are delimited by colon. PLC tags are simply addressed by their name.

---

**Note**

**Addressing errors**

Addressing errors occur when the tag name and data type are inconsistent.

Note that the tag name defined in the address field in WinCC must match the tag name in the PLC. Make sure that the data types of tags in WinCC match the data types in the PLC.

---

**Note**

Module-specific tags, e.g. for data on input and output modules, cannot be addressed directly. Instead, use an alias tag in the PLC.

Example: Local:3:O. Data cannot be addressed in WinCC.

If the alias "MyOut" is defined for Local:3:O in the PLC, you can address with WinCC via MyOut.Data.

---

## Addressing syntax

### Notation of addresses

The tables below define the notation for the individual addressing options for Allen-Bradley EtherNet/IP.

Table 10-155 Access to arrays, basic data types and structure elements

Data types	Type	Address
Basic data types	PLC tag	Tag name
	Program tag	Programname:tagname
Arrays	PLC tag	Array tag
	Program tag	Program name: array tag
Bits	PLC tag	Tagname/bitnumber
	Program tag	Programname:tagname/bitnumber
Structure elements	PLC tag	Structure tag. Structure element
	Program tag	Program name: structure tag. structure element

#### Note

Bit addressing with the data types Bool, Real and String is not permitted and will cause an addressing fault.

### Description of the syntax

Syntax description:

```
(Programname:)tagname([x(,y)(,z)]){.tagname([x(,y)(,z)])}(/bitnumber)
```

- The "(" defines an optional, single instance of an expression.
- The "{" defines an optional expression with multiple single instances.

The address string length may not exceed 128 characters.

### Addressing types

#### Arrays

An array is a data structure that includes a number of data of the same type. WinCC only supports one-dimensional arrays.

In the address column of the tag editor, enter the array name possibly by specifying a start element. The length is defined in the Array Elements input box of the tag editor. If array limits in the PLC are exceeded (due to faulty indexing), addressing errors result.

These arrays must be declared in the PLC as controller or program tags.

Two- or three-dimensional arrays in the PLC can only be addressed in WinCC if these can be mapped area-wise onto one-dimensional arrays .

---

**Note**

During all read accesses and all write accesses, all array elements of a tag are always read or written, respectively. The contents of an array tag which is interconnected with a PLC are always transferred whenever there is a change. The HMI device and the PLC cannot concurrently write data to the same array tag for this reason. Instead of writing data only to a single element, the program writes the entire array to the PLC.

---

### Array elements

Elements of one-dimensional, two-dimensional and three-dimensional arrays in the PLC are indexed by setting an index and the corresponding notation in the tag editor. Array addressing starts at element "0", with arrays of all basic types being valid for element addressing. Read/write operations are only carried out at the addressed element, and not for the entire array.

### Bits and bit tags

Bit access is allowed to all basic data types with the exception of Bool, Real and String. Bit addressing is also allowed at array/structure elements. The Bool data type is set in WinCC when bits and bit tags in the basic data types are addressed.

Single-digit bit numbers are addressed with "/x" or "/0x" (x = bit number). Bit numbers are defined by up to two digits.

---

**Note**

With the "Bool" data type in the data types SInt, Int and DInt, after changing the specified bit the complete tag is then written in the PLC again. In the meantime, no check is made as to whether other bits in the tag have since changed. Therefore, the PLC may have only read access to the specified tag.

---

### Structures

User-defined data types are created by means of structures. These structures group tags of different data types. Structures may consist of basic types, arrays and of other structures. In WinCC, only structure elements are addressed and not entire structures.

### Structure elements

Structure elements are addressed by means of the name of the structure and of the required structure element. This addressing is separated by point. In addition to basic data types, the

structure elements may represent arrays or other structures. Only one-dimensional arrays may be used as a structure element.

---

**Note**

The nesting depth of structures is only limited by the maximum length of 128 characters for the address.

---

## Address multiplexing

### Address multiplexing

Address multiplexing is possible with the CompactLogix, ControlLogix CPU type.

Address multiplexing requires two tags:

- "Tag\_1" of data type "String"; contains a logical address such as "HMI:Robot5.Block5" as value.  
The value may change to a second valid address, for example, "HMI:Robot4.Block3".
- "Tag\_2" is a tag in which the "Allen-Bradley EtherNet/IP" communication driver is set up as a connection.  
Enter a valid name of an HMI\_tag in square brackets as the address.
  - e.g.: "[Tag\_1]"
  - The tag must be of the String data type.
  - The square brackets indicate address multiplexing.
  - The address is derived from the actual value in "Tag\_1".

---

**Note**

You can only multiplex entire Allen-Bradley EtherNet/IP addresses. Multiplexing of address elements is not possible. "HMI:Robot[Tag\_1].Block5" is an invalid address.

You can optionally click the arrow right icon in the "Address" column. Replace the "Constant" with the "Multiplex" entry by clicking the arrow on the left edge of the next address dialog box. Now the tag selection list only returns tags of data type "String".

You can also configure a function triggered by a "change of value" event for multiplexed tags.

---

## Examples for addressing

### Example of a table for addressing

The table below defines the basic variants for addressing PLC tags. Other addressing variants are possible by means of combination.

Type	Type	Address
General	PLC tag	Tag name
	Program tag	Program:tagname
Array	Access to an element of a 2-dimensional array	Arraytag[Dim1,Dim2]
	Element of structure array (1-dimensional)	Arraytag[Dim1].structureelement
	Bit in element basic type array (2-dimensional)	Arraytag[Dim1,Dim2]/Bit
Structure	Array in structure	Structuretag.arraytag
	Bit in the element of an array in the substructure	Structuretag.structure2.arraytag [element]/bit

**Note**

Program tags are addressed by leading the address with the program name derived from the PLC with colon delimiter.

Example: Programname:arraytag[Dim1,Dim2]

**Access to array elements**

Type	Address
PLC tag	Arraytag[Dim1]
	Arraytag[Dim1,Dim2]
	Arraytag[Dim1,Dim2,Dim3]
Program tag	Programname:arraytag[Dim1]
	Programname:arraytag[Dim1,Dim2]
	Programname:arraytag[Dim1,Dim2,Dim3]

**Examples: Communication path**

**Example 1:**

Connection with a PLC in the same Allen-Bradley rack.

1,0

Number	Meaning
1	Stands for a backplane connection.
0	Stands for a CPU slot number.

**Example 2:**

Connection with a PLC in remote Allen-Bradley racks. Two Allen-Bradley racks are networked on Ethernet.

1,2,2,190.130.3.101,1,5

Number	Meaning
1	Backplane connection
2	Stands for the CPU slot number of the second Ethernet module.
2	Stands for an Ethernet connection.
190.130.3.101	IP address of a remote AB rack on the network – in particular the third Ethernet module
1	Backplane connection
5	Slot number of the CPU

**Commissioning components****Transferring a project to the HMI device**

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
  - Interface
  - Transfer parameters
  - Target storage location
3. Start the project transfer.  
The project is compiled automatically.  
All compilation and transfer steps are logged to a message window.

**Note**

If running the CompactLogix PLC with firmware earlier than version 18, you will possibly have to restart the HMI device following the transfer of the PLC program.

You could also terminate the connection before transferring the PLC program and set up the connection again after having completed the transfer of the PLC program.

**Interconnecting the PLC with the HMI device**

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

## Optimizing the configuration

### Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

### Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

### Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

### Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

## Allen-Bradley DF1

### Configuring a connection via Allen-Bradley DF1

#### Introduction

You configure a connection to a PLC with an Allen-Bradley DF1 communication driver in the "Connections" editor of the HMI device.

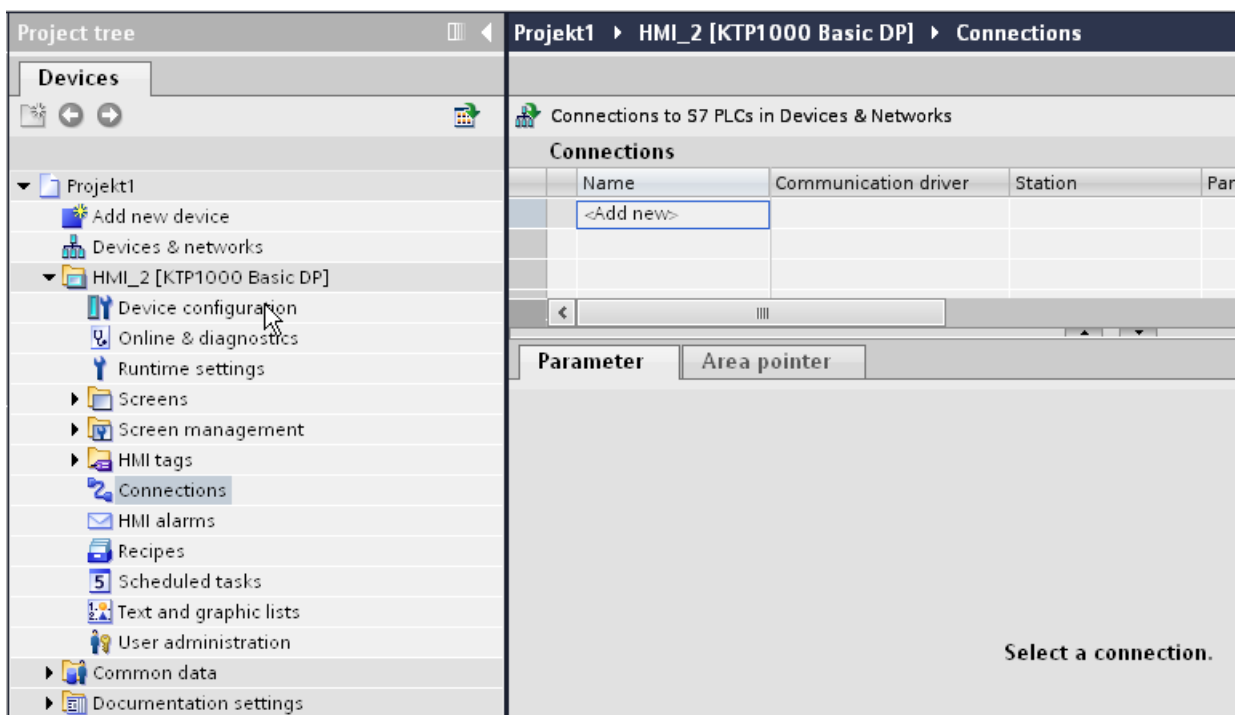

The interfaces are named differently depending on the HMI device.

#### Requirements

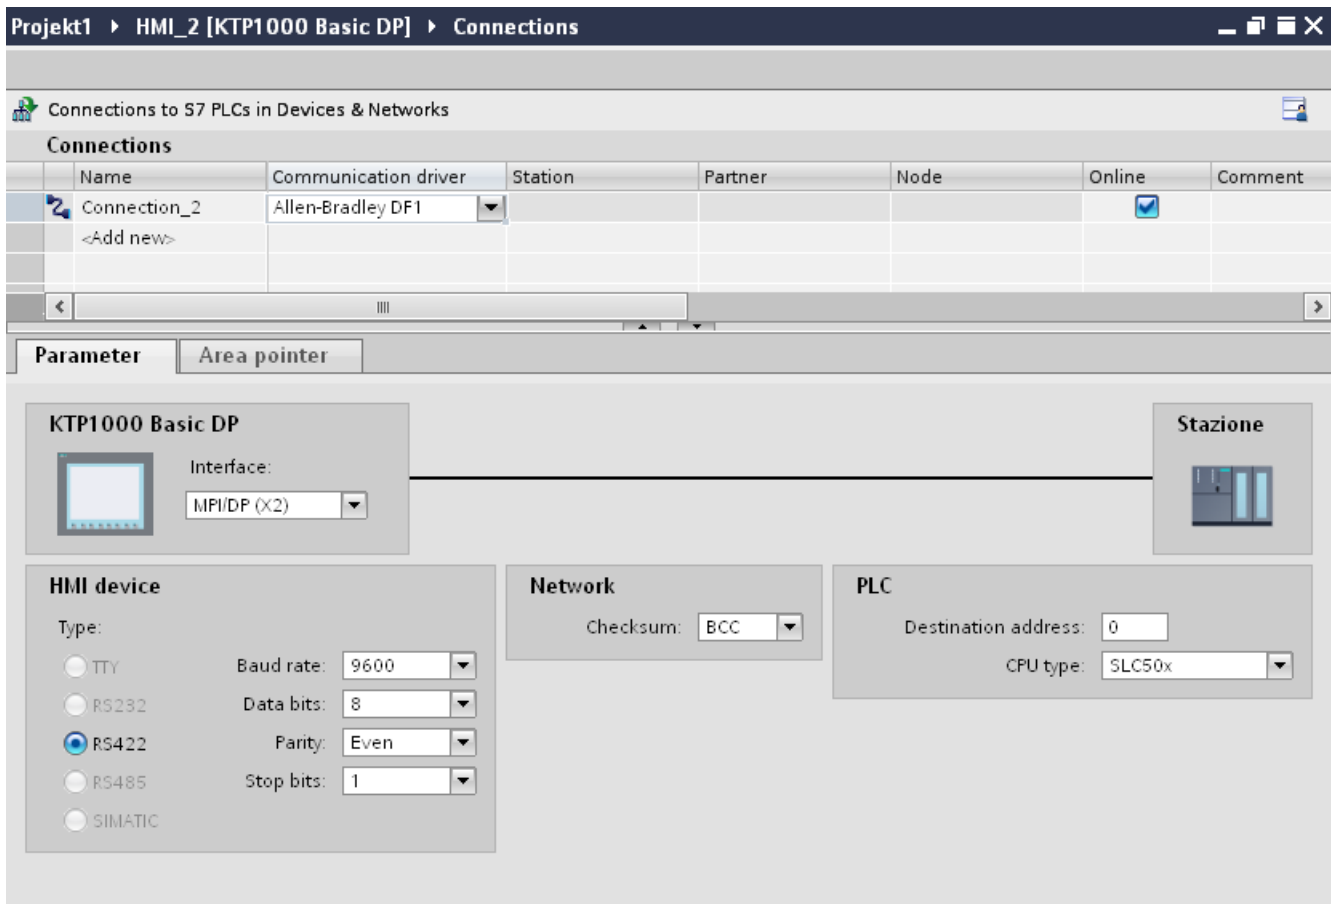

- A project is open.
- An HMI device has been created.

#### Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.

4. In the "Communication drivers" column, select the "Allen-Bradley DF1" driver.

5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

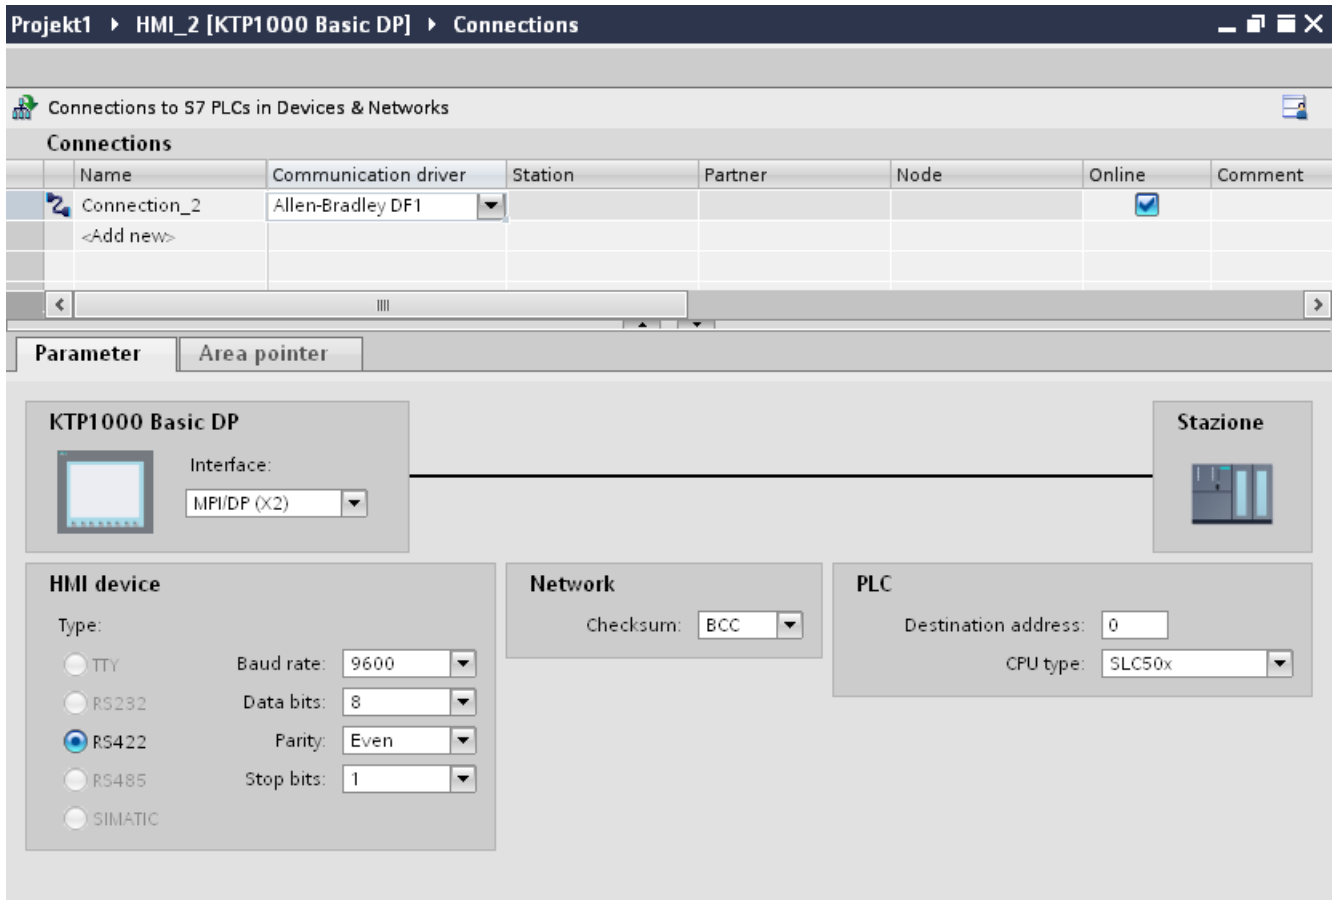

## Parameters for the connection (Allen-Bradley DF1)

### Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.

### Parameters for the HMI device

- **Interface**  
Under "Interface", you select the interface of the HMI device to which the PLC is connected. For additional information, refer to the device manual for the HMI device.
- **Type**  
Specifies the physical connection used.

---

#### Note

If you are using the IF1B interface, you must also reconnect the RS-485 receive data and the RTS signal to the rear of the HMI devices via 4 DIP switches.

---

- **Baud rate**  
For "Baud rate", select the transmission speed between the HMI device and PLC.
- **Data bits**  
For "Data bits", you can choose between "7 bits" and "8 bits".
- **Parity**  
For "Parity", you can choose from "None", "Even", and "Odd".
- **Stop bits**  
For "Stop bits", you can choose between 1 and 2 bits.

### Parameters for the network

- Checksum  
For "Checksum", choose the method for determining the error code: "BCC" or "CRC".

### Parameters for the PLC

- Destination address  
For "Destination address", choose the PLC address. If there is a point-to-point DF1 connection, you set the address "0".
- CPU type  
For "CPU type", set the CPU type of the PLC used.

---

**Note**

Assign the DF1 FULL-DUPLEX driver in the CPU as follows: "NO HANDSHAKING" for "Control Line" and "AUTO-DETECT" for "Embedded Responses".

---

### Connecting HMI device to PLC

#### Connections via Allen-Bradley DF1

#### Connection

The connection is established when you have matched the parameters of the PLC and the HMI device. Special blocks for the connection are not required in the PLC.

---

**Note**

Rockwell offers a variety of communication adapters for integrating "DF1 devices" for the DH485, DH, and DH+ networks. Of these connections, the direct connection and the connection via KF2 and KF3 module are approved. None of the other connections have been system-tested by SIEMENS AG and are therefore not approved.

---

## Communication partners for Allen-Bradley DF1

### Connectable PLCs

The communication drivers listed below support Allen-Bradley PLCs :

PLC	DF1 (point-to-point)	DF1 (point-to-point)	DF1 (multipoint) over KF2 module to DH+ LAN RS-232/RS-422	DF1 (multipoint) over KF3 module to DH485 LAN RS-232
	RS-232	RS-422		
SLC500	–	–	–	X
SLC501	–	–	–	X
SLC502	–	–	–	X
SLC503	X	–	–	X
SLC504	X	–	X	X
SLC505	X	–	–	X
MicroLogix	X	–	–	X
PLC-5 <sup>1)</sup>	X	X	X	–

<sup>1)</sup> Processors released for PLC-5: PLC-5/11, PLC-5/20, PLC-5/30, PLC-5/40, PLC-5/60, and PLC-5/80.

## Communication types

### PLCs with Allen-Bradley DF1 communication driver

The communication between the HMI device and the following Allen Bradley PLCs is described in this section:

- SLC500
- SLC501
- SLC502
- SLC503
- SLC504
- SLC505
- PLC5
- MicroLogix

In these PLCs the connection is made by the PLC-internal protocols Allen Bradley DF1, Allen Bradley DH485 and Allen Bradley DH+.

The Allen-Bradley DF1 communication driver is used here, the protocol of which is converted into one of the other two PLC-internal protocols in multipoint communication with the communication modules KF2 (Allen Bradley DH+) and KF3(Allen Bradley DH485).

### Enabled types of communication with Allen-Bradley DF1

The following communication types are system-tested and enabled:

- HMI (Allen Bradley DF1)  
Point-to-point connection
- HMI (Allen Bradley DF1)  
Via KF2 module to Allen Bradley DH+ (communication with up to 4 PLCs)
- HMI (Allen Bradley DF1)  
Via KF3 module to Allen Bradley DH485 (communication with up to 4 PLCs)

### Connectable PLCs

The Allen Bradley DF1 communication driver is available for the following Allen-Bradley PLCs:

PLC	DF1 (point-to-point)	DF1 (point-to-point)	DF1 (multipoint) via KF2 module to DH+ LAN RS 232/RS 422	DF1 (multipoint) via KF3 module to DH485 LAN RS 232 <sup>2)</sup>
	RS 232	RS 422		
SLC500	–	–	–	X
SLC501	–	–	–	X
SLC502	–	–	–	X
SLC503	X <sup>2)</sup>	–	–	X
SLC504	X <sup>2)</sup>	–	X	X
SLC505	X <sup>2)</sup>	–	–	X
MicroLogix	X <sup>2)</sup>	–	–	X
PLC-5 <sup>1)</sup>	X	X	X	–

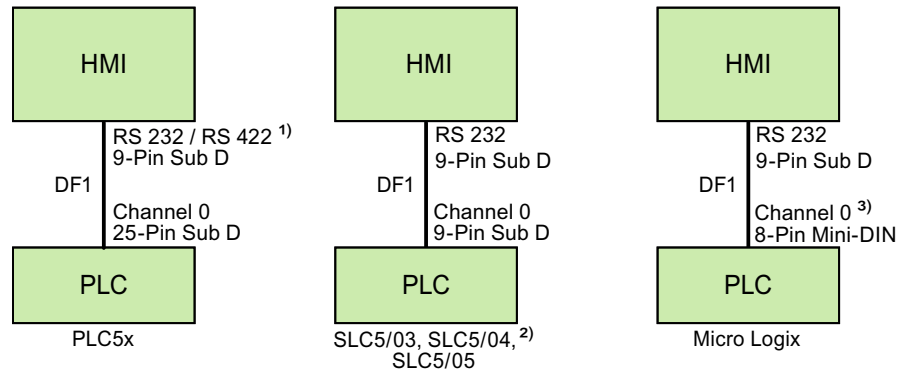

1) Only the following processors are approved for PLC-5: PLC-5/11, PLC-5/20, PLC-5/30, PLC-5/40, PLC-5/60 und PLC-5/80.

2) For HMI devices which only have an RS 422/485 interface and the communication partner is an RS 232 interface, the RS 422/232 converter is tested and approved.  
Order number: 6AV6 671-8XE00-0AX0

## DF1 protocol with multi-point connection

### Point-to-point connection with DF1 protocol

Only point-to-point connections can be established with the DF1 protocol.

- 1) Only RS 232 is possible for Panel PC and PC.
- 2) A point-to-point connection to the SLC500, SLC501, and SLC502 PLCs via DF1 is not possible.
- 3) For MicroLogix ML1500 LRP, Channel 1 (9-pin Sub D) is also possible.

### Connecting cable

HMI panel interface used	For connection to PLC5x	For connection to SLC5/03, SLC5/04, SLC5/05	For connection to MicroLogix
RS 232 9-pin	Allen-Bradley cable 1784-CP10	Allen-Bradley cable 1747-CP3	Allen-Bradley cable 1761-CBL-PM02
RS 422 9-pin	Connecting cable 9-pin Sub D RS 422	—	—

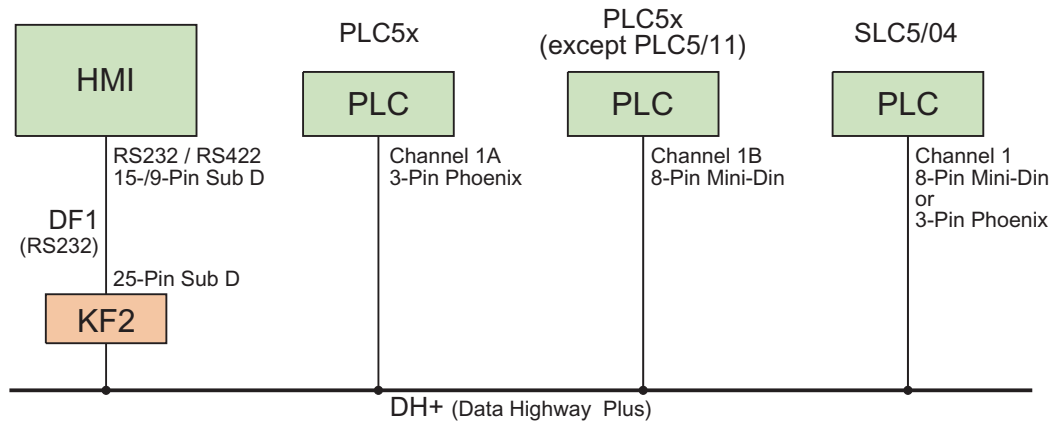

Refer to the relevant device manual to determine which HMI device interface is to be used.

The cable pin assignments can be found in Section "Connecting cables for Allen-Bradley".

**DF1 protocol with multi-point connection via KF2 module**

**DF1 protocol with multi-point connection via KF2 module to DH+ LAN**

The use of a KF2 protocol interface module enables a connection to be made to PLCs in the DH+ LAN (Data Highway Plus Local Area Network).

**Connecting cable**

HMI panel interface used	For connection to KF2 interface module
RS 232 9-pin	Allen-Bradley cable 1784-CP10 and 25-pin socket/socket adapter
RS 422 9-pin	9-pin Sub D RS 422 connecting cable and 25-pin female/female adapter

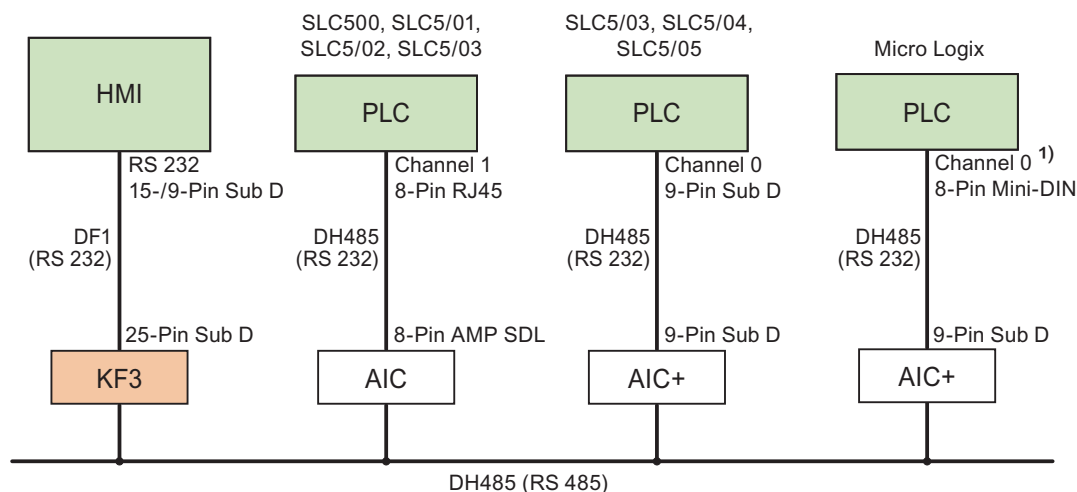

Refer to the Allen-Bradley documentation for the cable connection from the PLCs to the DH+ data bus.

Refer to the relevant device manual to determine which HMI device interface is to be used.

The cable pin assignments can be found in Section "Connecting cables for Allen-Bradley".

**DF1 protocol with multi-point connection via KF3 module**

**DF1 protocol with multi-point connection via KF3 module to DH485 LAN**

1) For MicroLogix ML1500 LRP, Channel 1 (9-pin Sub D) is also possible.

**Connecting cable**

HMI panel interface used	For connection to KF3 interface module
RS 232 9-pin	Allen-Bradley cable 1784-CP10 and 25-pin socket/socket adapter

Refer to the relevant device manual to determine which HMI device interface is to be used.

The cable pin assignments can be found in Section "Connecting cables for Allen-Bradley".

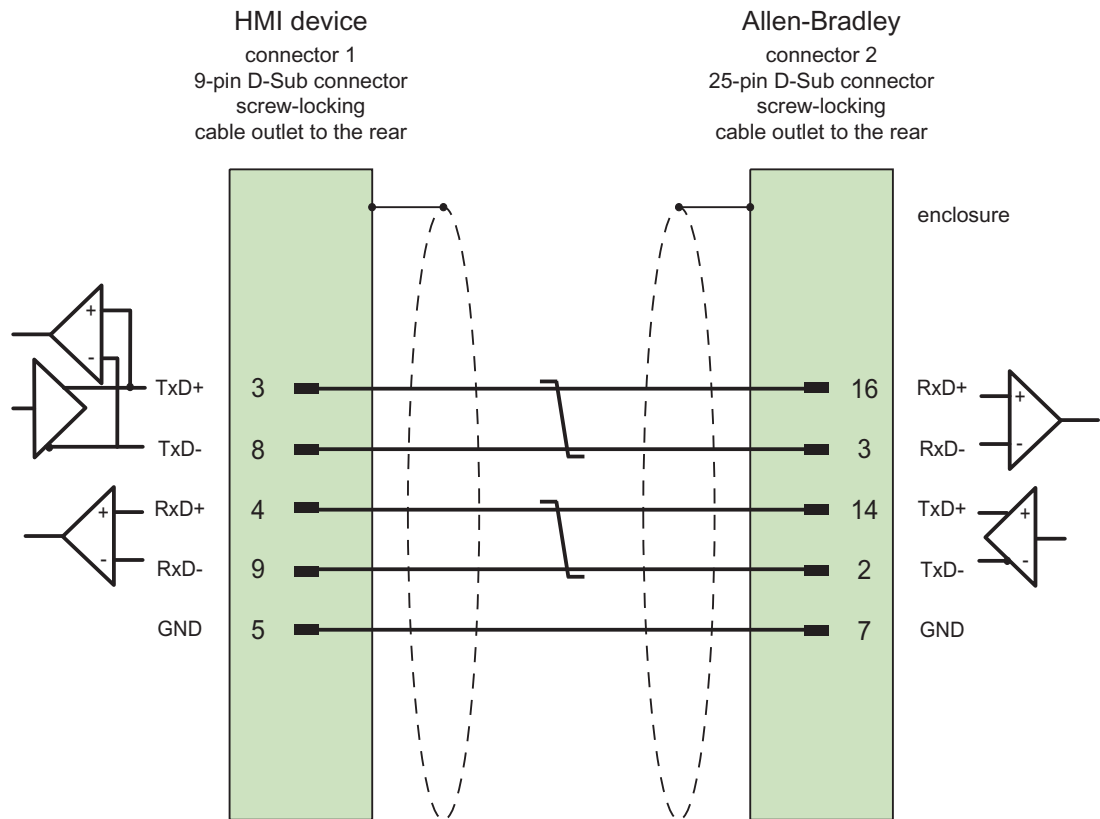

**Connecting cables for Allen-Bradley DF1**

**Connecting cable 9-pin Sub D RS 422 for Allen-Bradley**

**Connecting cable 9-pin Sub D RS 422**

For interconnecting the HMI device (RS 422, 9-pin sub D) - PLC5x, KF2, KF3

You require an additional 25-pin, female / female adapter (gender changer) for interconnections with KF2 and KF3.

Shield with large-area contact to housing at both ends, interconnected shield contacts  
 Cable: 3 x 2 x 0.14 mm<sup>2</sup>, shielded,  
 max. length 60 m

### Connecting cable 1784-CP10, RS 232, for Allen-Bradley

#### Allen-Bradley cable 1784-CP10

For interconnecting the HMI device (RS 232, 9-pin sub D) - PLC5x, KF2, KF3

You require an additional 25-pin, female / female adapter (gender changer) for interconnections with KF2 and KF3.

Screen connected with housing over large area on both sides  
max. length 15 m

### Connecting cable 1747-CP3, RS-232, for Allen-Bradley

#### Allen-Bradley cable 1747-CP3

For interconnecting the HMI device (RS 232, 9-pin sub D) - SLC503, SLC504, SLC505 (Channel 0), AIC+

Screen connected with housing over large area on both sides  
max. length 3 m

### Connecting cable 1761-CBL-PM02, RS-232, for Allen-Bradley

#### Allen-Bradley cable 1761-CBL-PM02

For interconnecting the HMI device (RS 232, 9-pin sub D) - Micro Logix, AIC+

Screen connected with housing over large area on both sides  
max. length 15 m

### Performance features of communication

### Permitted data types for Allen-Bradley DF1

### Permitted data types for Allen-Bradley DF1

The table lists the user data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
ASCII	A <sup>1)</sup>	1 to 80 characters
Bool	N, R, C, T, B, S, I, O	1 bit
Int	N, R, C, T, S	2 bytes
DInt	N, D <sup>2)</sup>	4 bytes
UInt	N, R, C, T, B, I, O, D <sup>2)</sup>	2 bytes
UDInt	N, D <sup>2)</sup>	4 bytes
Real	N, F <sup>1)</sup>	4 bytes

- 1) Selectable depending on the selected CPU type.
- 2) Only for PLC5 CPU type

## Abbreviations

In WinCC, formats of the data types are abbreviated as follows:

- UNSIGNED INT = UInt
- UNSIGNED LONG = ULong
- SIGNED INT = Int
- SIGNED LONG = DInt

## Distinctive features for connections with Allen-Bradley DF1

With Allen Bradley DF1, array tags may only be used for discrete alarms and trends.

---

### Note

I/O modules with 8 or 16 ports occupy one data word on the PLC.

I/O modules with 24 or 32 ports occupy two data words.

The HMI device does not output an error message if using non-existent bits.

You should always make sure that I/O modules with 8 or 24 ports only occupy the bits that are actually assigned to a port.

---

## Supported CPU types for Allen-Bradley DF1

### CPU types

The following CPU types are supported for configuring the Allen-Bradley DF1 communication driver.

- SLC
  - SLC500
  - SLC501
  - SLC502
  - SLC503
  - SLC504
  - SLC505
- MicroLogix
  - MicroLogix 1x00
  - MicroLogix 1100 / 1400
- PLC 5
  - PLC-5/11
  - PLC-5/20
  - PLC-5/40
  - PLC-5/60
  - PLC-5/80

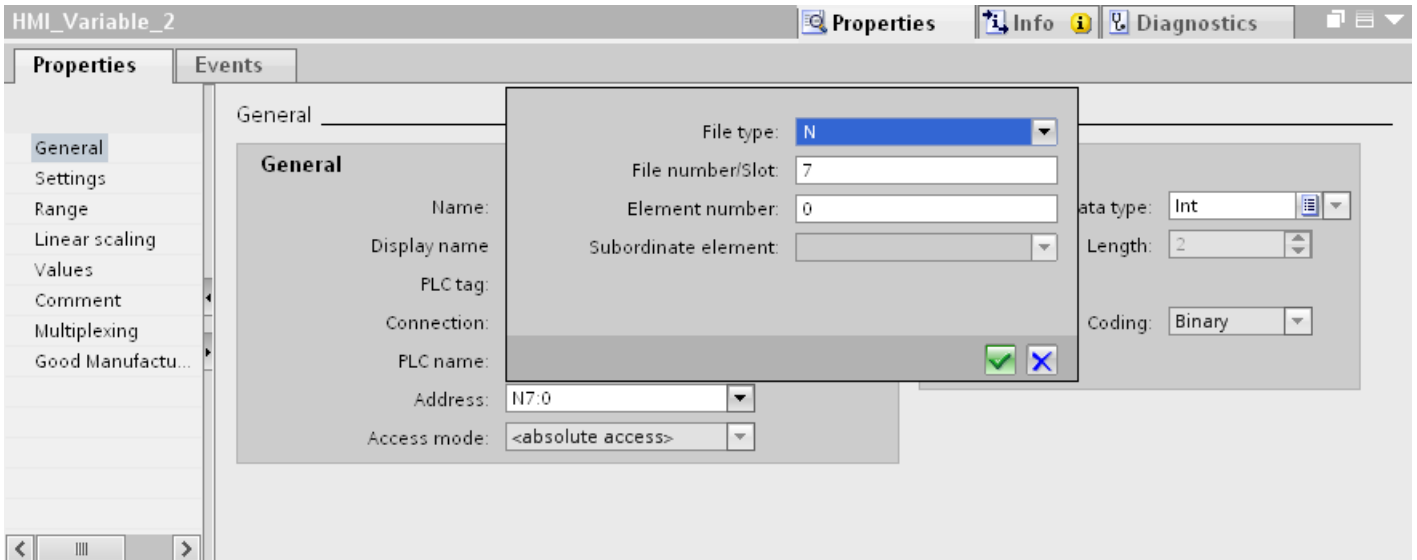

### Addressing

#### Addressing

The addressing is entered in the following order in the Allen-Bradley DF1 communication driver:

- Operand type
- File number
- Element number

- Child element
- Bit number

The address then appears in the following format without spaces:

- File type file number : Element number . Child element
- e.g. T8:2.ACC

## Operand type

You have the following options under operand type:

- I
- O
- S
- B
- T
- C
- R
- N
- A
- D only for PLC5 CPU type

## File number

Select the number between two limits under file number:

- Low limit
- High limit

The limit values depend on the selected file type.

### Child element

You can select a child element when you have selected one of the following data types:

- R
- C
- T

### Commissioning components

#### Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
  - Interface
  - Transfer parameters
  - Target storage location
3. Start the project transfer.

The project is compiled automatically.  
All compilation and transfer steps are logged to a message window.

#### Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

### Optimizing the configuration

#### Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.

- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

## Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

## Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

## Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

## Data exchange

### Area pointers for Allen-Bradley

### Area pointers for connections using an Allen-Bradley communication driver

You use an area pointer to access a data area in the PLC.

For more detailed information on area pointers and their configuration, refer to Section "Data exchange using area pointers".

### Distinctive features for connections via Allen-Bradley EtherNet/IP

You can configure the following area pointers

Area pointer	Allen-Bradley EtherNet/IP	Allen-Bradley DF1
Screen number	Yes	Yes
Date/time	Yes	Yes
Date/time PLC	Yes	Yes

Area pointer	Allen-Bradley EtherNet/IP	Allen-Bradley DF1
Coordination	Yes	Yes
Project ID	Yes	Yes
Job mailbox	Yes	Yes
Data record	Yes	Yes

### Restrictions Allen-Bradley Ethernet/IP

The following restrictions apply for configuring area pointers.

CPU type	Data types	File types
ControlLogix, CompactLogix	Int, UInt	--
SLC, MicroLogix	Int, UInt	N, B

### Restrictions Allen-Bradley DF1

The following restrictions apply for configuring area pointers.

CPU type	Data types	File types
MicroLogix	--	N, O, I, B
SLC50x	--	N, O, I, B
PLC5	--	N, O, I, B

### See also

Data exchange using area pointers (Page 5795)

### Trends

#### General information on trends

### Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3569)

#### Note

The value is read out time-triggered for Basic Panels.

### Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

### Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

### Trend request and trend transfer

#### Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

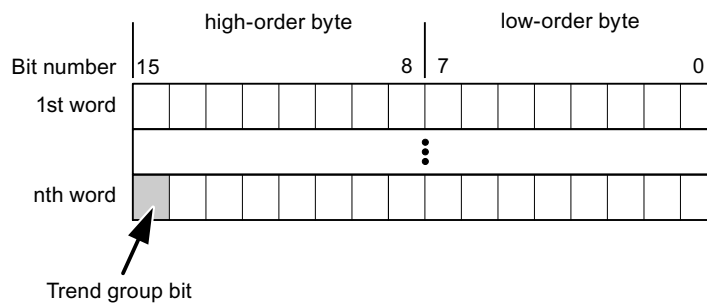

The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

#### Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.

The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

## Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

## Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

## Restrictions to the trend control

### For Allen-Bradley DF1 communication drivers

Tags of the following operand types are permitted:

- "N"
- "O"
- "I"
- "S"
- "B"

Permitted data types:

- "UInt"
- "Int"
- Array tag of "UInt"
- Array tag of "Int"

You assign a bit to a trend during configuration. This sets a defined bit assignment for all trend areas.

### For Allen-Bradley EtherNet/IP communication drivers

Tags of data type "Int" or an array tag of data type "Int" are permitted. You assign a bit to a trend during configuration. This sets a defined bit assignment for all trend areas.

### ControlLogix and CompactLogix

The following data types are possible for tags for the ControlLogix and CompactLogix CPU types:

- "UInt"
- "Int"
- Array tag of "UInt"
- Array tag of "Int"

### SLC and MicroLogix

The following operand types are permitted for tags of the SLC and MicroLogix CPU types:

- "N"
- "O"
- "I"
- "S"
- "B"

Permitted data types:

- "UInt"
- "Int"
- Array tag of "UInt"
- Array tag of "Int"

## Alarms

### Configuring alarms

#### Configuring alarms for non-integrated connections

Several steps are necessary to configure alarms such as warnings, error messages and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3592)

### Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

### Restrictions

Only tags whose "File type" is "N", "O", "I", "S" and "B" are allowed for use as a "trigger tag" for discrete alarms. These tags are only valid for the data types "Int" and "UInt".

### Data types

For connections with an Allen-Bradley communication driver, the following data types are supported:

Communication drivers	PLC	Permitted data types	
		Discrete alarms	Analog alarms
Allen-Bradley DF1	SLC500, SLC501, SLC502, SLC503, SLC504, SLC505, PLC5, MicroLogix	Int, UInt	Int, UInt, Long, ULong, Real
Allen-Bradley EtherNet/IP	ControlLogix, CompactLogix, SLC, Micrologix	Int, UInt	SInt, USInt, Int, UInt, DInt, UDIInt, Real

### How the bit positions are counted

For connections with an Allen-Bradley communication driver, the following counting method applies:

How the bit positions are counted	Left byte								Right byte									
In Allen-Bradley PLCs	15								8	7								0
In WinCC you configure:	15								8	7								0

## Acknowledgment of alarms

### Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

### Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.

### Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment

tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

---

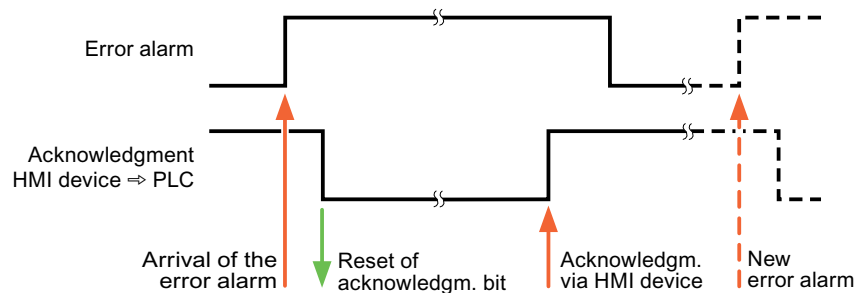

### Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

---

The figure below shows the pulse diagram.

## LED mapping

### Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

---

### Note

The LED function cannot be configured for Basic Panels.

---

## Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

## LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

## Mitsubishi

### Mitsubishi communication drivers

#### Introduction

This section describes the communication between an HMI device and PLCs that use Mitsubishi communication drivers.

The following communication drivers are supported:

- Mitsubishi MC TCP/IP
- Mitsubishi FX

#### Data exchange

Data is exchanged by means of tags or area pointers.

- Tags  
The PLC and the HMI device use process values for data exchange. You create tags in the configuration that point to addresses in the PLC. The HMI device reads the value from the defined address, and then displays it. The operator may also enter values on the HMI device, which are then written to the address in the PLC.
- Area pointers  
Area pointers are used to exchange specific data and are only set up when these data are used.

## Mitsubishi MC TCP/IP

### Configuring a connection via Mitsubishi MC TCP/IP

#### Introduction

You configure a connection to a PLC with a Mitsubishi MC TCPI/IP communication driver in the "Connections" editor of the HMI device.

The Ethernet interfaces are named differently depending on the HMI device.

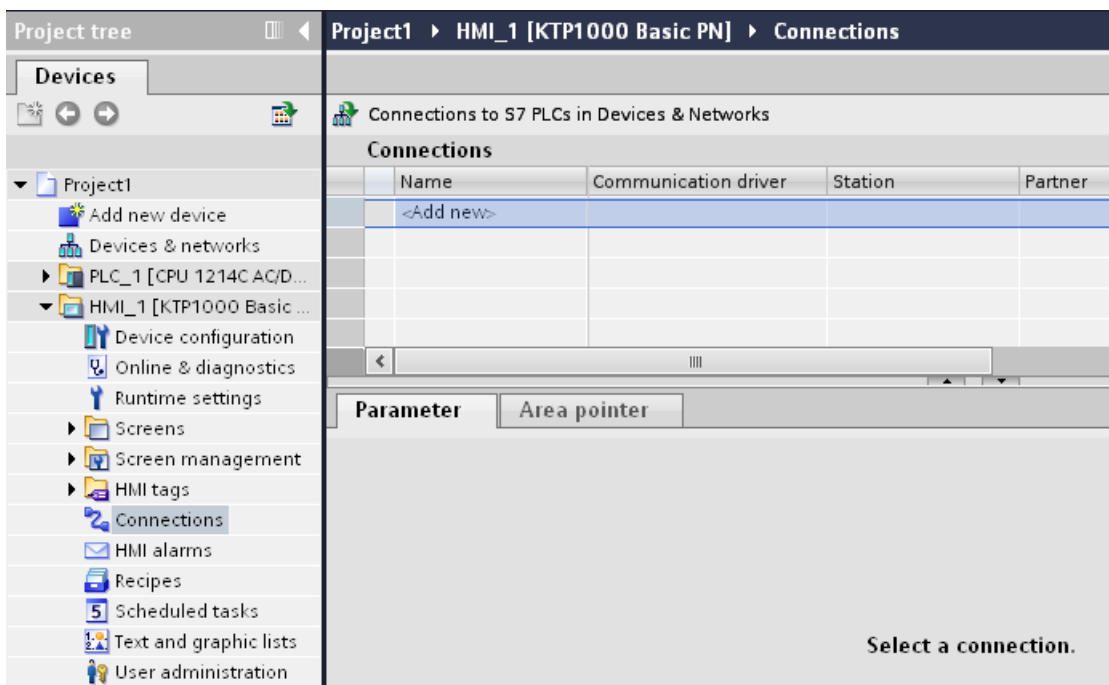

Example: PROFINET interface corresponds to the Ethernet interface

## Requirements

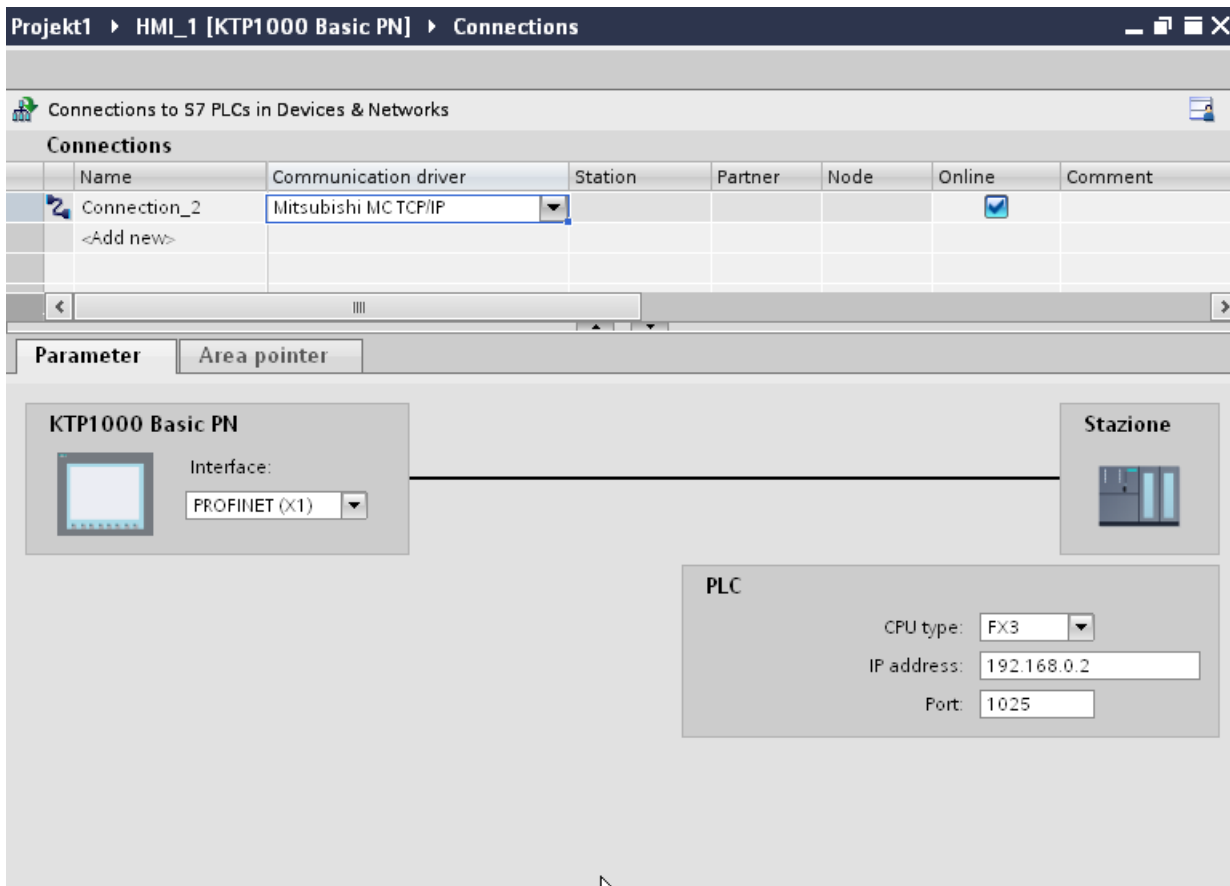

- A project is open.
- An HMI device has been created.

## Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.

- In the "Communication drivers" column, select the "Mitsubishi MC TCP/IP" driver.

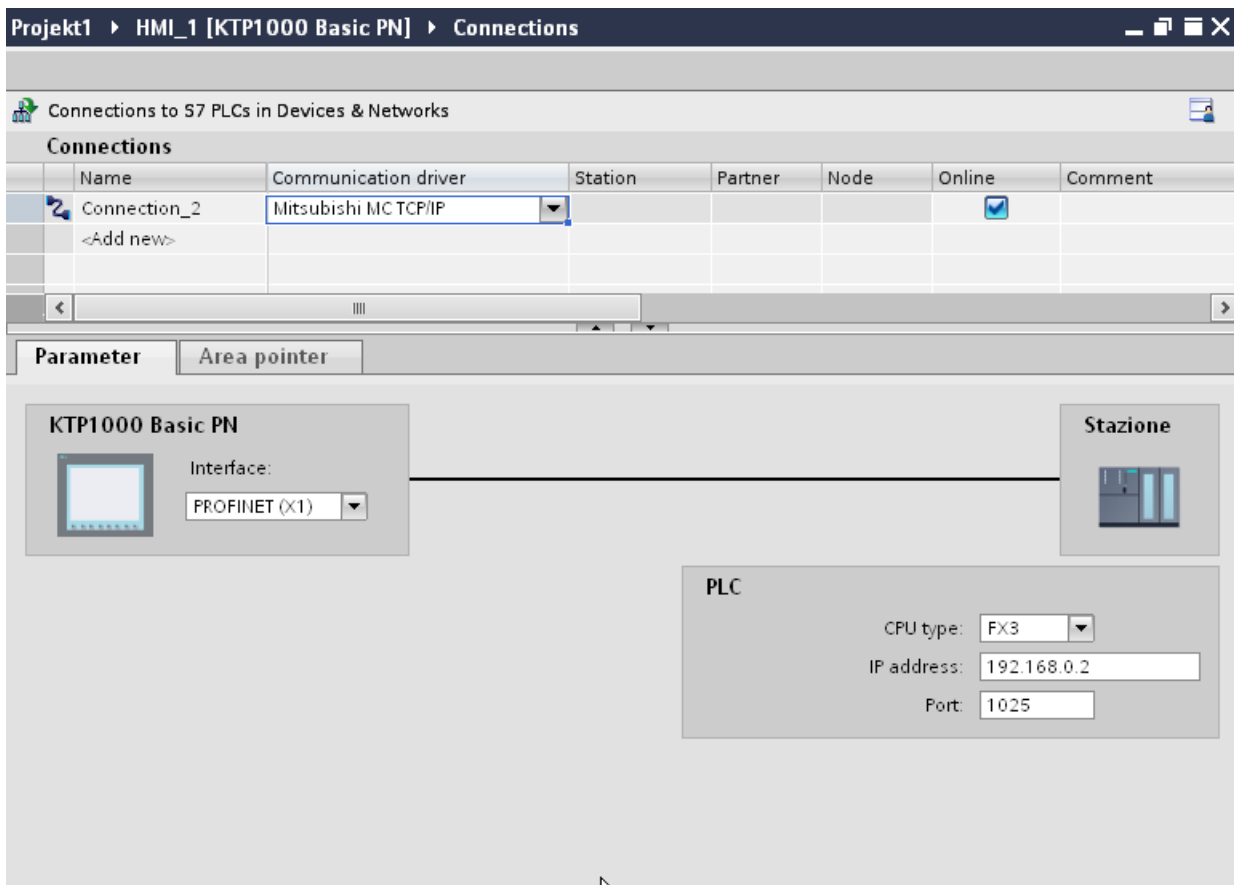

- Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

### Parameters for the connection (Mitsubishi MC TCP/IP)

#### Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.

## Parameters for the HMI device

You can select only one interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC. The IP address is transferred to the HMI device during project transfer.

---

### Note

The IP address in the control panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the control panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

---

To set up the IP address of the HMI device:

1. Click on the HMI device.
2. Open the "Device configuration" editor.

3. Click the Ethernet interface.
4. Assign the IP address in the inspector window under:  
"General > PROFINET interface > Ethernet addresses"

### Parameters for the PLC

- CPU type  
For "CPU type", you set the type of PLC to which the HMI device is connected.  
The following settings are possible:  
–FX3  
–Q  
If you select the FX3 CPU type, the Mitsubishi MC protocol "1E" is used and "3E" for the "Q" CPU type.  
The "Binary code" protocol variant is always used.

---

#### Note

If the CPU type is changed for a configured connection, tags with the following properties must be revised:

- Operands that do not exist for the new CPU type, such as "W", "B", "F".
  - Inputs and outputs with different addressing (hexadecimal/octal)
  - Addresses greater than the valid address area of the new CPU type
- 
- IP address  
Set the IP address or host name of the Ethernet/IP module of the PLC. Only the IP address can be used on a Basic Panel.
  - Port  
Set the port number of the module of the PLC.

### Connecting HMI device to PLC

#### Connections via Mitsubishi MC TCP/IP

##### Connection

The HMI device can be connected to the Mitsubishi PLC using the following components:

- Existing Ethernet network that also contains the PLCs
- Cross-over Ethernet cable connected directly to the Ethernet interface of the CPU or the communication module

The connection of the HMI device to a Mitsubishi PLC is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

Connect the HMI device to one or several Q-series and/or FX3 PLCs. Connect the HMI device via the following interfaces:

- Communication interface OnBoard
- Approved communication module suitable for the PLC

---

**Note****Timeout response with TCP/IP (Ethernet)**

Due to the use of the TCP/IP protocol, the breakdown of a connection is detected at the earliest after approximately one minute. Communication failure cannot be reliably detected if no tags are requested, for example, no output tags in the current screen.

Configure area pointer coordination for each PLC. This setting ensures that a communication failure is recognized after approximately two minutes, even in the aforementioned scenario.

---

## Communication types

### Approved communication types

- Only applies for Mitsubishi FX(PG protocol):  
The point-to-point connection from a HMI device to an approved Mitsubishi FX-CPU via Mitsubishi FX is system-tested and approved by Siemens AG.
- Only applies for Mitsubishi MC TCP/IP:  
The following communication types are system-tested and approved:
  - Point-to-point connection to the approved PLCs
  - Multipoint connection from a HMI device with up to 4 PLCs with the respectively approved PLCs. CPU types (FX3 and Q) can be mixed.

---

**Note**

The HMI device is a client and the PLC must operate as a server.

---

## Connectable PLCs

Connections can be implemented for the following Mitsubishi PLCs:

PLC	Mitsubishi FX (PG protocol)	Mitsubishi MC TCP/IP
MELSEC FX1n, FX2n	Yes	No
MELSEC FX3U, FX3UC, FX3G with communication module FX3U-ENET	No	Yes
MELSEC System Q <ul style="list-style-type: none"><li>• Q-series with the communication module QJ71E71-100</li><li>• QnUDEH CPU with Ethernet interface onboard</li></ul>	No	Yes

## Parameterization of the communications modules

### FX3 PLCs

#### Procedure

1. Start the FX-Configurator.
2. Select the module.
3. Assign the following settings in the "Operational settings" dialog:
  - Communication data code:  
Binary code
  - Initial timing:  
Always wait for OPEN
  - IP address:  
IP address
  - Send frame setting:  
Ethernet(V2.0)
  - TCP Existence confirmation setting:  
Use the Ping

## 4. Assign the following settings in the "Open Settings" dialog:

- Protocol:  
TCP
- Open system:  
Unpassive
- Fixed buffer:  
Receive
- Fixed buffer communication procedure:  
Procedure exist(MC)
- Pairing open  
Disable
- Existence confirmation  
No confirm
- Host station Port No. (DEC)  
Port number

---

**Note**

The port number chosen in the communication module must match the port number in WinCC. A connection with a port number must be assigned for each connected HMI device.

You must specify port numbers in decimal values.

---

## 5. Confirm the default settings of the other dialog boxes.

The network no. and station no. parameters are not relevant for the connection and can be chosen as required.

## Q PLCs

### Procedure

1. Click "Edit network parameters".
2. Select the network type:
  - Ethernet  
The network number and the group / station number are not evaluated and can be freely assigned

3. Assign the following settings in the "Operational settings" dialog:
  - Communication data code:  
Binary code
  - Initial timing:  
Always wait for OPEN
  - IP address:  
IP address
  - Send frame setting:  
Ethernet(V2.0)
  - Enable write operations during RUN
4. Assign the following settings in the "Open settings" dialog:
  - Protocol:  
TCP
  - Open system:  
Unpassive
  - Pairing open  
Disable
  - Existence confirmation  
No confirm
  - Host station Port No. (HEX)  
Port-Nummer

---

**Note**

The port number chosen in the communication module must match the port number in WinCC. A connection with a port number must be assigned for each connected HMI device.

You must specify port numbers in hexadecimal values.

---

## Internal Ethernet port of the Q0xUDEH CPU

### Procedure

1. Assign the following settings in the "Internal Ethernet Port" dialog:
  - IP address:  
IP address
  - Communication data code:  
Binary code
  - Enable online changes
2. Assign the following settings in the "Open settings" dialog:
  - Protocol:  
TCP
  - Open system:  
MC-Protocol
  - Host station Port No. (HEX)  
Port number

---

#### Note

The port number chosen in the communication module must match the port number in WinCC. A connection with a port number must be assigned for each connected HMI device.

---

## Performance features of communication

### Permitted data types for Mitsubishi MC TCPI/IP

#### Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
4-bit block	M, X, Y, B, F	1 byte
8-bit block	M, X, Y B, F	1 byte
12-bit block	M, X, Y B, F	2 bytes
16-bit block	M, X, Y B, F	2 bytes
20-bit block	M, X, Y B, F	4 bytes
24-bit block	M, X, Y B, F	4 bytes
28-bit block	M, X, Y B, F	4 bytes
32-bit block	M, X, Y B, F	4 bytes
Bool	M, D, X, Y B, F	1-bit

Data type	Operand type	Length
DInt	D, W	4 bytes
DWord	D, C, W	4 bytes
Int	D, W	2 bytes
Real 1)	D, W	4 bytes
String 1)	D	1 to 80 characters
Word	D, T, C, W	2 bytes

- 1) The "String" and "Real" data types are not available for all CPUs.
- 2) Operand types B, F and W are only available for CPU type "Q".

---

**Note**

Note the following for write accesses:

Tags can only be written if "Enable online changes" or "Enable write operations during RUN" was selected when parameterizing the Mitsubishi communication modules.

For data type "Bool" in operand type "D", the entire word is written back to the PLC following a change to the specified bit. There is no check to determine whether any other bits in the word have changed. As a result, the PLC only has read access to the specified word.

---

**Note**

Array elements in I/O fields cannot be used in communication with a Mitsubishi PLC.

---

## Supported CPU types for Mitsubishi MC TCP/IP

### CPU types

The following CPU types are supported for configuring the Mitsubishi MC TCP/IP communication driver.

- FX3 series
  - FX 3G / FX 3G with communication modul FX3U-ENET
  - FX 3U / FX 3U with communication modul FX3U-ENET
  - FX 3UC / FX 3UC with communication modul FX3U-ENET
- Q series
  - Q-Series with QJ71E71-100 communication module
- iQ series / QnUD
  - QnUDEHCPU with built in ethernet module

## Addresses for Mitsubishi MC TCP/IP

### Address areas for connections via Mitsubishi MC TCP/IP

The address area boundaries differ for the different series; refer to the Mitsubishi Computerlink manuals for this information.

Examples of address area boundaries dependent on the CPU and communication format:

Name	Operand type	Max. address FX3	Max. address Q-Series
Output/Input	Y/X	Octal X/Y 0 - 777	HEX X/Y 0 - 7FF
Bit memory	M	M0 - M3071 and M8000 - M8255	M/L/S 0 - 8191
Data register	D	D0 - 7999 D8000 - D8255	D0 - 8191 D9000 - D9255 becomes SD1000 - SD1255
Counter	C	C0 - 255	C0 - 1023
Timer	T	T0 - 255	T0 - 2047
Link register	W	--	Hex: W0 - FFF
Link flag	B	--	Hex: B0 - FFF
Error flag	F	--	F0 - 2047

### Address areas for Mitsubishi MC TCP/IP

#### FX0

Address areas	Data types												
	Bool	Word	DWord	Real	String	4-bit block	8-bit block	12-bit block	16-bit block	20-bit block	24-bit block	28-bit block	32-bit block
M	M0 - M9999	--	--	--	--	M0 - M999 6	M0 - M999 2	M0 - M998 8	M0 - M998 4	M0 - M9980	M0 - M9976	M0 - M9972	M0 - M9968
D	D0.0 - D999.15	D0 - D999	D0 - D998	D0 - D998	D0 - D998	--	--	--	--	--	--	--	--
T		T0 - T255	--	--	--	--	--	--	--	--	--	--	--
C-16-Bit	--	C-16-Bit 0 - C-16-Bit 199	--	--	--	--	--	--	--	--	--	--	--

Address areas	Data types												
	Bool	Word	DWord	Real	String	4-bit block	8-bit block	12-bit block	16-bit block	20-bit block	24-bit block	28-bit block	32-bit block
C-32-Bit	--	--	C-32-Bit 200 - C-32-Bit 255	--	--	--	--	--	--	--	--	--	--
X	X0 - X255	--	--	--	--	X0 - X252	X0 - X248	X0 - X244	X0 - X240	X0 - X236	X0 - X232	X0 - X228	X0 - X224
Y	Y0 - X255	--	--	--	--	Y0 - Y252	Y0 - Y248	Y0 - Y244	Y0 - Y240	Y0 - Y236	Y0 - Y232	Y0 - Y228	Y0 - Y224

## Commissioning components

### Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
  - Interface
  - Transfer parameters
  - Target storage location
3. Start the project transfer.  
 The project is compiled automatically.  
 All compilation and transfer steps are logged to a message window.

### Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

### Optimizing the configuration

#### Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

## Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

## Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

## Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

## Mitsubishi FX

### Configuring a connection via Mitsubishi FX

#### Introduction

You configure a connection to a PLC with a Mitsubishi FX communication driver in the "Connections" editor of the HMI device.

The Mitsubishi FX protocol is also referred to as the Mitsubishi PG protocol.

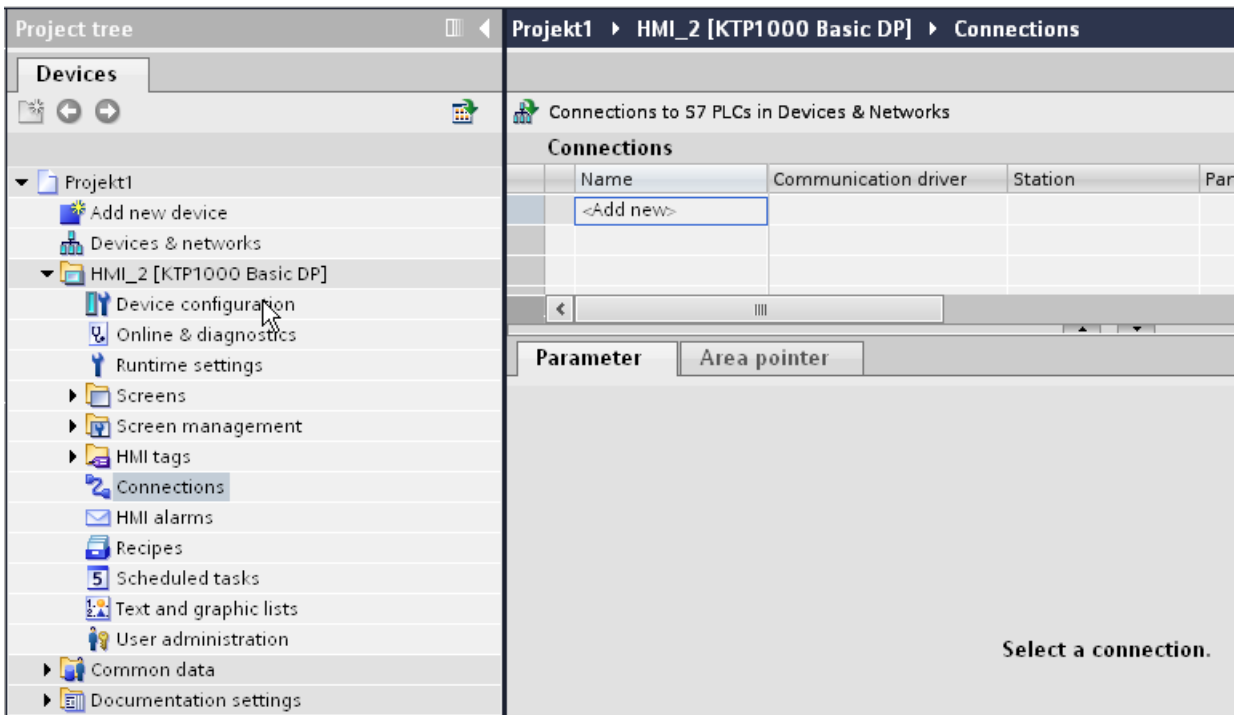

The interfaces are named differently depending on the HMI device.

### Requirements

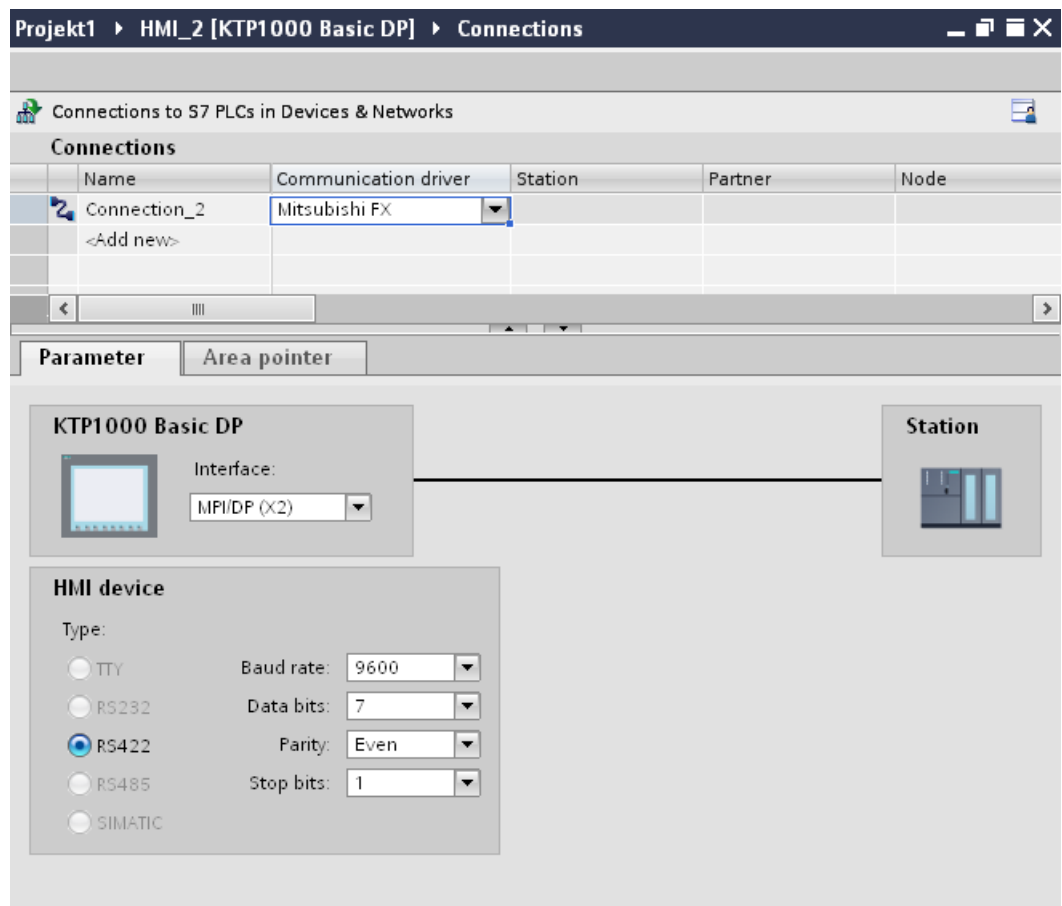

- A project is open.
- An HMI device has been created.

### Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.

4. In the "Communication drivers" column, select the "Mitsubishi FX" driver.

5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

## Parameters for the connection (Mitsubishi FX)

### Parameters to be set

To assign the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.

### Parameters for the HMI device

You can select an interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

- "Type"  
Specifies the physical connection used.

---

#### Note

If you use the IF1B interface, you must switch over the RS422 receive data and the RTS signal additionally by 4 DIL-switches on the back of the HMI device.

---

### Parameters for the PLC

- Baud rate: For "Baud rate", select the transmission speed between the HMI device and PLC. Select the baud rate "9600".
- Data bits: Under "Data bits", select "7 bits".
- Parity: Under "Parity", select "Even".
- Stop bits: Under "Stop bits", select "1 bit".

## Connecting HMI device to PLC

### Connections via Mitsubishi FX

#### Connection

Connect the HMI device to the programming interface of the CPU (RS 422) (see documentation of the PLC).

The connection between the HMI device and the Mitsubishi PLC is basically restricted to setting the interface parameters. Special blocks for the connection are not required in the PLC.

#### Connecting cable

The following connecting cables are available to connect the HMI device to the PLC.

Interface to HMI device or adapter	Mitsubishi Electric PLC via FX protocol
	FX1n, Fx2n, Mini DIN, 8-pin
RS 232, 9-pin	Mitsubishi SC-09 <sup>1)</sup>
RS 422, 9-pin	Connecting cable RS422-2P
<sup>1)</sup> Since the Mitsubishi PLCs communicate via RS 422 as a standard, the Mitsubishi programming cable SC-09 with integrated RS 422/RS 232 adaptor is necessary for connecting a HMI device via RS 232.	

#### Note

##### Applies only to RS 232:

Cable length is restricted to 0.32 m.

Refer to the relevant device manual to determine which HMI device interface is to be used.

The cable pin assignments can be found in Section "Connecting cables for Mitsubishi FX".

## Communication types

### Approved communication types

- Only applies for Mitsubishi FX(PG protocol):  
The point-to-point connection from a HMI device to an approved Mitsubishi FX-CPU via Mitsubishi FX (PG protocol := protocol for access to the program and memory elements of the FX series PC CPU version V1.21 and after) is system-tested and approved by Siemens AG.
- Only applies for Mitsubishi MC TCP/IP:  
The following communication types are system-tested and approved:
  - Point-to-point connection to the approved PLCs
  - Multipoint connection from a HMI device with up to 4 PLCs with the respectively approved PLCs. CPU types (FX3 and Q) can be mixed.

**Note**

The HMI device is a client and the PLC must operate as a server.

### Connectable PLCs

Connections can be implemented for the following Mitsubishi PLCs:

Shield with large-area contact to housing at both ends  
 Cable: 3 x 2 x 0.14 mm<sup>2</sup>, shielded,  
 max. length 500 m

## Performance features of communication

## Permitted data types for Mitsubishi FX

### Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
4-bit block	M, X, Y	1 byte
8-bit block	M, X, Y	1 byte
12-bit block	M, X, Y	2 bytes
16-bit block	M, X, Y	2 bytes
20-bit block	M, X, Y	4 bytes
24-bit block	M, X, Y	4 bytes
28-bit block	M, X, Y	4 bytes
32-bit block	M, X, Y	4 bytes
Bool	D, M, X, Y	1-bit
DWord	D, C-32 bit	4 bytes
Real	D	4 bytes
String	D	1 to 50 characters
Word	D, T, C-16 bit	2 bytes

#### Note

Note the following for write accesses:

For data type "Bool" in operand type "D", the entire word is written back to the PLC following a change to the specified bit. There is no check to determine whether any other bits in the word have changed. As a result, the PLC only has read access to the specified word.

#### Note

Array elements in I/O fields cannot be used in communication with a Mitsubishi PLC.

## Supported CPU types for Mitsubishi FX

### CPU types

The following CPU types are supported for configuring the Mitsubishi FX communication driver.

- FX1 series
  - FX1n
- FX2 series
  - FX2n

### Configurable address areas for Mitsubishi FX

#### Permitted address areas

The following address areas can be configured for the "Mitsubishi FX" communication driver

X	Input	Octal 0- 377
Y	Output	Octal 0- 377
M	Bit memory	0...9999
D	Data register	0...999
C	Counter	0...199
T	Timer	0...25

### Address areas for Mitsubishi FX

#### FX3

Address areas	Data types															
	Bool	Int	Word	DInt	DWord	Real	String	4-bit block	8-bit block	12-bit block	16-bit block	20-bit block	24-bit block	28-bit block	32-bit block	
M	M0 - M999	--	--	--	--	--	--	M0 - M99	M0 - M99	M0 - M99	M0 - M99	M0 - M998	M0 - M997	M0 - M997	M0 - M996

C-32- Bit			C-32- Bit 200 - C-32- Bit 255										
X	X0 - X255					X0 - X252	X0 - X248	X0 - X244	X0 - X240	X0 - X236	X0 - X232	X0 - X228	X0 - X224
Y	Y0 - X255					Y0 - Y252	Y0 - Y248	Y0 - Y244	Y0 - Y240	Y0 - Y236	Y0 - Y232	Y0 - Y228	Y0 - Y224

**Commissioning components**

**Transferring a project to the HMI device**

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
  - Interface
  - Transfer parameters
  - Target storage location
3. Start the project transfer.  
 The project is compiled automatically.  
 All compilation and transfer steps are logged to a message window.

**Interconnecting the PLC with the HMI device**

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

## Optimizing the configuration

### Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

### Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

### Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

### Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

## Data exchange

### Area pointers for Mitsubishi

#### Area pointers for connections via Mitsubishi communication drivers

You use an area pointer to access a data area in the PLC.

For more detailed information on area pointers and their configuration, refer to Section "Data exchange using area pointers".

#### Special considerations for connections via Mitsubishi communication drivers

You can configure the following area pointers

Area pointers	Mitsubishi MC TCP/IP	Mitsubishi FX
Screen number	Yes	Yes
Date/time	Yes	Yes
Date/time PLC	Yes	Yes
Coordination	Yes	Yes
Project ID	Yes	Yes
Job mailbox	Yes	Yes
Data record	Yes	Yes

#### Restrictions Mitsubishi MC TCP/IP

The following restrictions apply for configuring area pointers.

CPU type	Data types	Operand type
FX3	Int, Word	D
Q	Int, Word	D

#### Mitsubishi FX restrictions

You cannot use the D operand type for configuring area pointers.

## Trends

### General information on trends

#### Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Auto-Hotspot

---

**Note**

The value is read out time-triggered for Basic Panels.

---

### Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

### Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

### See also

Displaying tags with Runtime Advanced and Panels (Page 3569)

### Trend request and trend transfer

#### Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

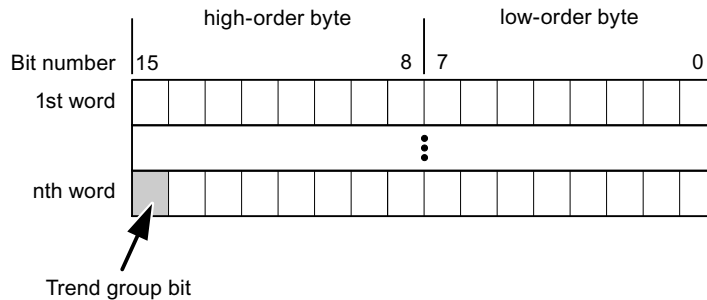

The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

### Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.

The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

### Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

### Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

### Restrictions to the trend control

#### Data types for Mitsubishi MC TCPI/IP

For trend control you can create tags and array tags of the operand type "D" with the data type "Word" or "Int".

#### Data types for Mitsubishi FX

For trend control you can create tags and array tags of the operand type "D" with the data type "Word".

## Alarms

### Configuring alarms

#### Configuring alarms for non-integrated connections

Several steps are necessary to configure alarms such as warnings, error messages and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3592)

#### Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

### Data types

For connections with a Mitsubishi communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
FX1n, FX2n, FX3 series, Q-Series, iQ-Series	Word, Int <sup>1)</sup>	4-bit block, 8-bit block, 12-bit block, 16-bit block, 20-bit block, 24-bit block, 28-bit block, 32-bit block, Word, DWord, Int <sup>1)</sup> , DInt <sup>1)</sup> , Real,
<sup>1)</sup> Not for Mitsubishi FX communication driver		

### How the bit positions are counted

For connections with a Mitsubishi communication driver, the following counting method applies:

How the bit positions are counted	Left byte								Right byte								
In Mitsubishi PLCs	15							8	7								0
In WinCC you configure:	15							8	7								0

### Restrictions on alarms

- Mitsubishi MC TCP/IP  
Only tags of operand type "D" and data types "Word" and "Int" are permitted as trigger tags for discrete alarms. You can use array tags (operand type: "D"; data types: "ARRAY [x..y] of Word" or "ARRAY [x..y] of Int") for discrete alarms.
- Mitsubishi FX  
Only tags of operand type "D" and data type "Word" are permitted as trigger tags for discrete alarms. You can use array tags (operand type "D"; data type "ARRAY [x..y] of Word") for discrete alarms."

### Acknowledgment of alarms

#### Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

#### Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.

### Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

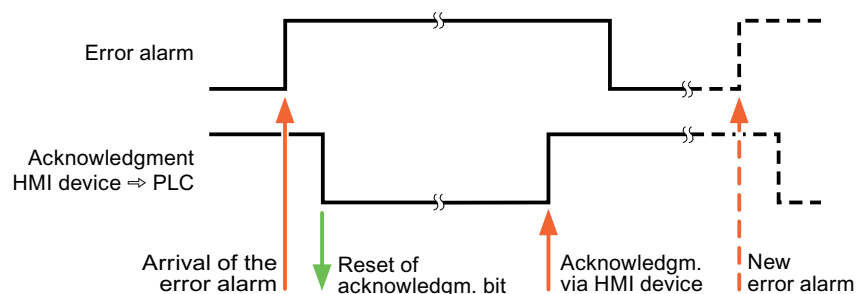

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

#### Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.

## LED mapping

### Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

---

#### Note

The LED function cannot be configured for Basic Panels.

---

### Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

### LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

## Modicon Modbus

### Modicon Modbus communication drivers

#### Introduction

This section describes the communication between an HMI device and PLCs that use Modicon Modbus communication drivers.

The following communication drivers are supported:

- Modicon Modbus TCP/IP
- Modicon Modbus RTU

## Data exchange

Data is exchanged by means of tags or area pointers.

- **Tags**  
The PLC and the HMI device use process values for data exchange. You create tags in the configuration that point to addresses in the PLC. The HMI device reads the value from the defined address, and then displays it. The operator may also enter values on the HMI device, which are then written to the address in the PLC.
- **Area pointers**  
Area pointers are used to exchange specific data and are only set up when these data are used.

## Modicon Modbus TCP/IP

### Configuring a connection via Modicon Modbus TCP/IP

#### Introduction

You configure a connection to one of the PLCs with Modicon Modbus TCP/IP communication driver in the "Connections" editor of the HMI device.

The Ethernet interfaces are named differently depending on the HMI device.

Example: PROFINET interface corresponds to the Ethernet interface

#### Requirements

- A project is open.
- An HMI device has been created.

#### Procedure

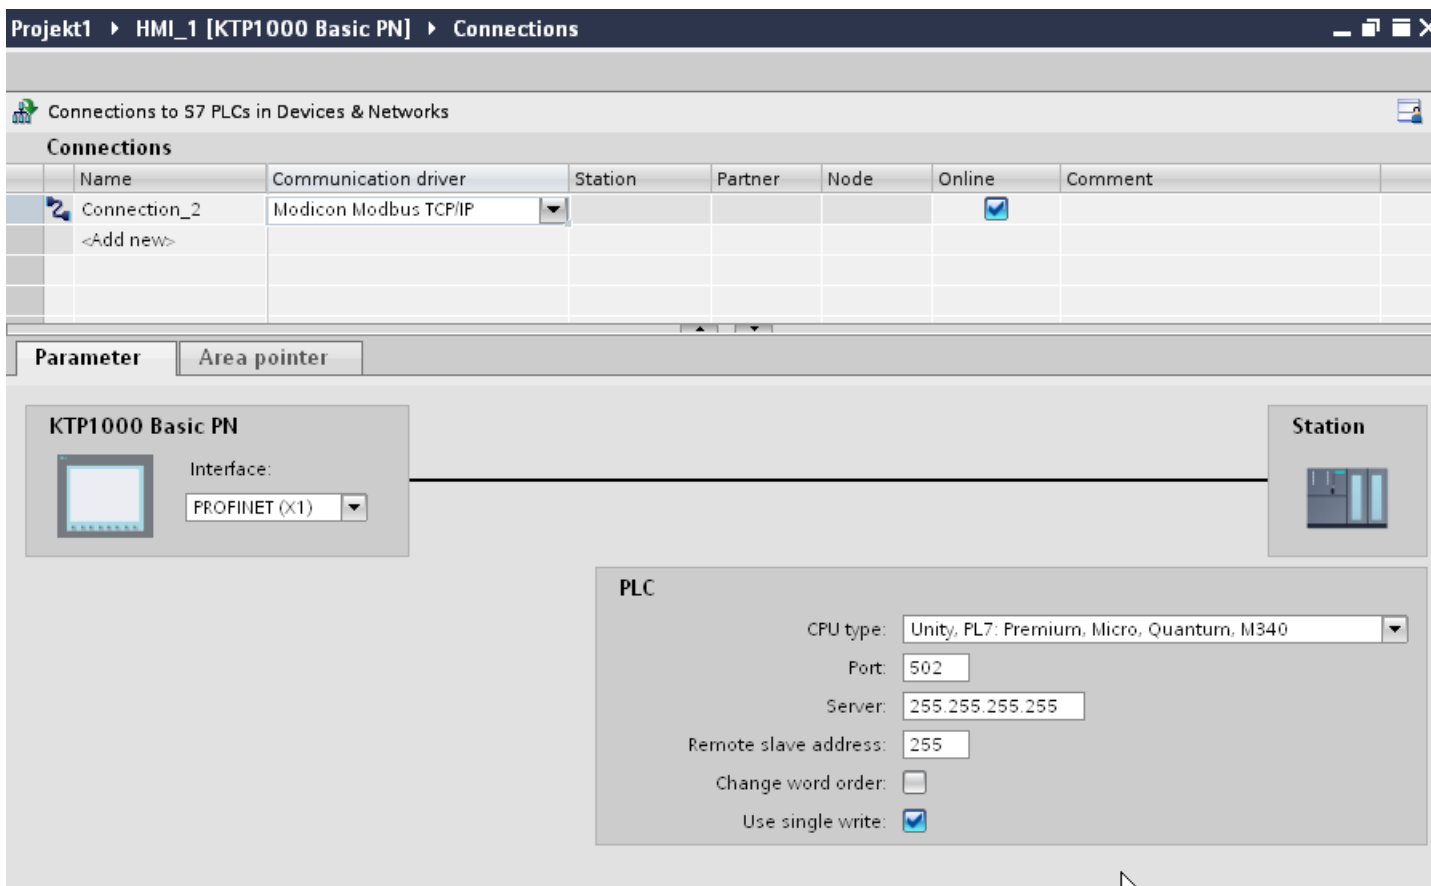

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.

4. Select the "Modicon Modbus TCP" driver in the "Communication driver" column.

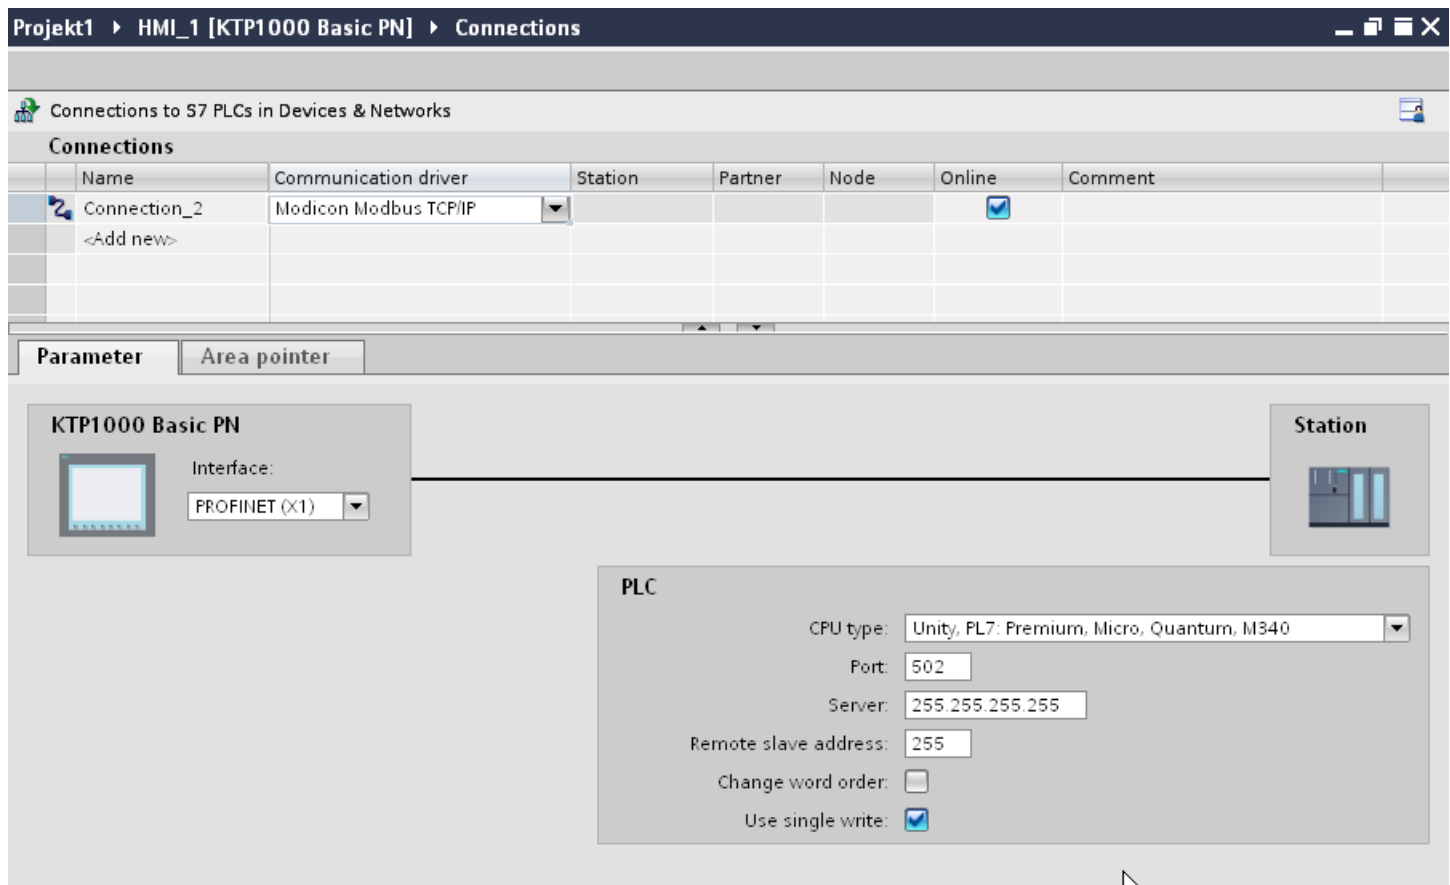

5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

## Parameters for the connection (Modicon Modbus TCP/IP)

### Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.

### Parameters for the HMI device

You can select only one interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC. The IP address is transferred to the HMI device during project transfer.

---

#### Note

The IP address in the control panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the control panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

---

To set up the IP address of the HMI device:

1. Click the HMI device.
2. Open the "Device configuration" editor.

3. Click the Ethernet interface.
4. Assign the IP address in the inspector window under:  
"General > PROFINET interface > Ethernet addresses"

### Parameters for the PLC

- "CPU type"  
For "CPU type", you set the Modicon PLC to which the HMI device is connected.
- "Port"  
For "Port", you set the port that is used for the TCP/IP connection. The port used by the Modicon PLCs is 502.
- "Server"  
You set the IP address or host name of the PLC under "Server". Only the IP address can be used on a Basic Panel.
- "Distributed slave address"  
For "Distributed slave address", set the slave address of the remote PLC, but only if a bridge is used.  
If a bridge is not used, the default value "255" (or "0") must be retained.
- "Change word order"  
The "Change word order" parameter only affects the word order of the 32-bit values display. The setting pertains to the data types Double, Double+/-, and Float. The byte order cannot be changed.
  - "Change word order" not activated  
The most significant byte is sent first.  
For double words, the least significant word is sent before the most significant word.  
This setting has been system-tested for all approved PLCs.
  - "Change word order" activated  
The most significant byte is sent first.  
For double words, the most significant word is sent before the least significant word.

---

#### Note

This setting must be used for the SIEMENS SENTRON PAC3200 and PAC4200 multi-function meters and can be used for PLCs of other manufacturers.

---

- "Use single write"  
If you deselect this function, only function codes 15H and 16H are used for writing into the PLC.  
If this function remains selected, the function codes 05H, 06H, 15H, and 16H are used.

## Connecting HMI device to PLC

### Connections via Modicon Modbus TCP/IP

#### Connection

The HMI device can be connected to the Modicon Modbus PLC using the following components:

- Existing Ethernet network that also contains the PLCs
- Cross-over Ethernet cable connected directly to the Ethernet interface of the CPU or the communication module

The connection of the HMI device to a Modicon Modbus PLC is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

---

#### Note

Timeout response with TCP/IP (Ethernet)

Due to the use of the TCP/IP protocol, the breakdown of a connection is detected at the earliest after approximately one minute. Communication failure cannot be reliably detected if no tags are requested, for example, no output tags in the current screen.

Configure area pointer coordination for each PLC. This setting ensures that a communication failure is recognized after approximately two minutes, even in the aforementioned scenario.

---

## Communication types

### Approved communication types

The following communication types are system-tested and approved:

- Point-to-point coupling:
- Multiple point coupling of a HMI device (Modbus TCP/IP Client) with up to 4 PLCs, each with different couplings. CPU types can be mixed.  
The following couplings are possible:
  - Coupling the Ethernet CPU interface of the TSX Unity Quantum.
  - Coupling via the communication modules for Ethernet 140 NOE 771 01 for the TSX Quantum and TSX Unity Quantum series
  - Coupling via the Ethernet interface of the 171 CCC 980 30 CPU adapter of the Momentum series
  - Coupling the Ethernet CPU interface of the TSX Unity Premium.
  - Coupling via the Ethernet TCP/IP connect module TSX ETY 110 for the TSX Premium and TSX Unity Premium series
  - Coupling via the Ethernet TCP/IP connect module TSX ETY 410 for the Micro series
  - Coupling via the Ethernet TCP/IP Modbus Plus Bridge 174 CEV 200 40 to the Modbus Plus interface of the Compact, the TSX Quantum and the TSX Unity Quantum series

Via the TCP/IP Modbus Plus Bridge, 174 CEV 200 40, the PLCs can be accessed at their Remote Slave Address via the Ethernet interface of this bridge.

---

#### Note

Integration of the HMI device in a Modbus network via a bridge is not possible. The HMI device is the Modbus master.

---

## Restrictions

The coupling of the HMI device to PLCs of other manufacturers who offer a Modbus TCP/IP interface is not system-tested and thus, not enabled.

However, if another PLC is to be used, observe the following instructions:

- Use the following CPU types, because these operate without address offset and in the usual bit count manner.
  - Unity, PL7: Premium, Micro, Quantum, M340
- The following function codes are used for the respective data areas:

Reading function codes		Address range	
01	ReadCoilStatus	0x / %M	DIGITAL_OUT
02	ReadInputStatus	1x / %I	DIGITAL_IN
03	ReadHoldingRegisters	4x / %MW	USERDATA

Reading function codes		Address range	
04	ReadInputRegisters	3x / %IW	ANALOG_IN
20 (14Hex)	ReadGeneralReference	6x / -	EXTENDEDMEMORY (not for all CPUs)

Writing function codes		Address range	
06 <sup>1)</sup>	PresetSingleRegister	4x / %MW	USERDATA Single
16 (10Hex)	PresetMultipleRegisters	4x / %MW	USERDATA Multiple
05 <sup>1)</sup>	ForceSingleCoil	0x / %M	DIGITAL_OUT with BIT
15 (0FHex)	ForceMultipleCoils	0x / %M	DIGITAL_OUT with 16 BIT GROUP
21 (15Hex)	WriteGeneralReference	6x / -	EXTENDEDMEMORY (not for all CPUs)

<sup>1)</sup> Select use with "Use single write".

### Connectable PLCs

Connections can be implemented for the following Modicon Modbus PLCs:

Modicon Modbus PLC	Supported protocol	
	Modicon Modbus RTU <sup>2)</sup>	Modicon Modbus TCP/IP
TSX Compact	x	x <sup>1)</sup>
TSX Quantum	x	x
Momentum	x	x
Premium	-	x
Micro	-	x
M340 20x0 (without 2010)	-	x

<sup>1)</sup> Only via Ethernet TCP/IP Modbus Plus Bridge

<sup>2)</sup> Communication via RS 232 is tested and enabled for the PLC. In the HMIs that only have a RS 422/485 interface, the RS 422/232 converter with the order number 6AV6 671-8XE00-0AX0 was tested and enabled.

## Performance features of communication

### Permissible data types for Modicon Modbus TCP/IP

#### Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

---

#### Note

If you change the Modicon Modbus RTU communication driver to Modicon Modbus TCP/IP, the string in the "String" data type may be different.

---

### Permitted data types for CPU type "Unity, PLC: Premium, Micro, Quantum M340"

Data type	Operand type	Length
+/- Double	%MW	4 bytes
+/- Int	%MW, %IW	2 bytes
16-bit group	%MW, %I	2 bytes
ASCII	%MW	0 to 80 characters
Bit	%MW, %IW, %M, %I	1-bit
Double	%MW	4 bytes
Float	%MW	4 bytes
Int	%MW, %IW	2 bytes

---

#### Note

The ranges "%I" and "%IW" are not supported for the following CPU types:

- Premium
  - Micro
  - M340
- 

### Permitted data types for CPU type "Concept, ProWORX: Compact, Quantum, Momentum"

Data type	Operand type	Length
+/- Double	4x, 6x	4 bytes
+/- Int	3x, 4x, 6x	2 bytes
16-bit group	0x, 1x	2 bytes
ASCII	4x, 6x	0 to 80 characters
Bit	0x, 1x, 3x, 4x, 6x	1-bit

Data type	Operand type	Length
Double	4x, 6x	4 bytes
Float	4x, 6x	4 bytes
Int	3x, 4x, 6x	2 bytes

### Bit counting method

The usual bit counting method "16 LSB - 1 MSB" in the following CPU types is only used in the "HMI tags" editor with the selected "Bit" data type:

- Concept, ProWORX: Compact, Quantum, Momentum

The following bit location assignment applies:

	Left byte								Right byte							
Counting with tags	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

### Format for "Signed"

The placeholder "+/-" stands for the data types "Signed Int" and "Signed Double".

### Supported CPU types for Modicon Modbus TCP/IP

#### CPU types

The following CPU types are supported for configuring the Modicon Modbus TCP/IP communication driver.

- Compact
- Momentum
- Quantum
  - Concept Quantum
  - Unity Quantum
- Micro
- Premium
- Modicon M340
  - 20x0 (except 2010)

## Address areas for Modicon Modbus TCP/IP

## Unity, PI7

Address areas	Data types							
	Bool	16 Bit Group	Int	+/- Int	Dint	+/- Dint	Float	ASCII
%I	%I0 - %I65535	%I65535 %I0 - %I65520	--	--	--	--	--	--
%M	%M0 - %M65535	%M65535 %M0 - %M65520	--	--	--	--	--	--
%IW	%IW0.0 - %IW65535. 15	--	%IW0 - %IW65535	%IW0 - %IW65535	--	--	--	--
%MW	%MW0.0 - %MW6553 5.15	--	%MW0 - %MW6553 5	%MW0 - %MW6553 5	%MW0 - %MW6553 4	%MW0 - %MW6553 4	%MW0 - %MW6553 4	%MW0 - %MW6553 5

## Concept, ProWORX

Address areas	Data types							
	Bool	16 Bit Group	Int	+/- Int	Dint	+/- Dint	Float	ASCII
0x	0x1 - 0x65535	0x1 - 0x65520	--	--	--	--	--	--
1x	1x100001 - 1x165535	1x100001 - 1x165520	--	--	--	--	--	--
3x	3x300001.1 - 3x365535.1 6	--	3x300001 - 3x365535	3x300001 - 3x365535	--	--	--	--
4x	4x400001.1 - 4x465535.1 6	--	4x400001 - 4x465535	4x400001 - 4x465535	4x400001 - 4x465534	4x400001 - 4x465534	4x400001 - 4x465534	4x400001 - 4x465535
6x	6x60000.1: 1 - 6x69999.16 :10	--	6x60000:1 - 6x69999:10	6x60000:1 - 6x69999:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69999:10

## Commissioning components

### Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
  - Interface
  - Transfer parameters
  - Target storage location
3. Start the project transfer.  
The project is compiled automatically.  
All compilation and transfer steps are logged to a message window.

### Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

## Optimizing the configuration

### Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

## Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

## Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

## Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

## Modicon Modbus RTU

### Configuring a connection via Modicon Modbus RTU

#### Introduction

You configure a connection to a PLC with a Modicon Modbus RTU communication driver in the "Connections" editor of the HMI device.

The interfaces are named differently depending on the HMI device.

#### Requirements

- A project is open.
- An HMI device has been created.

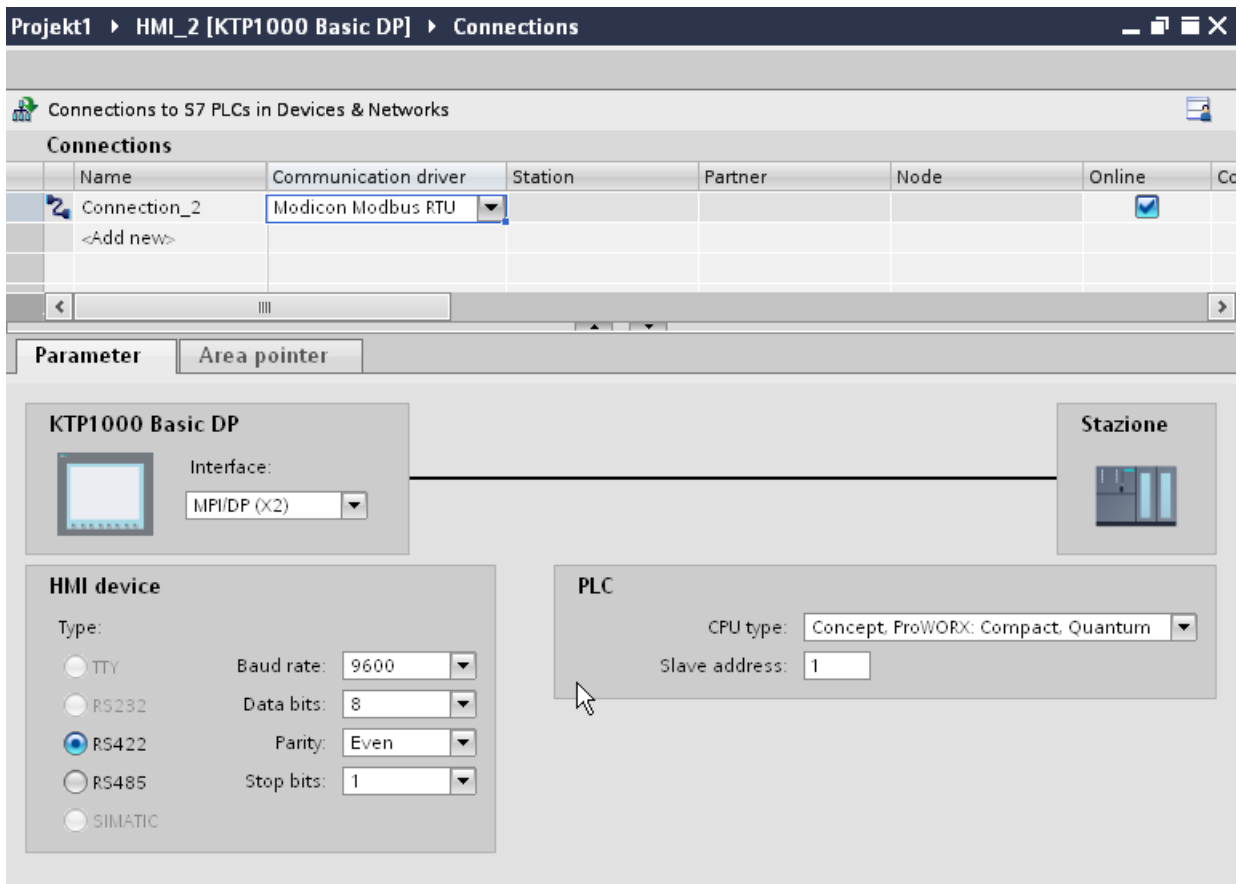

#### Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.

4. In the "Communication drivers" column, select the "Modicon Modbus RTU" driver.

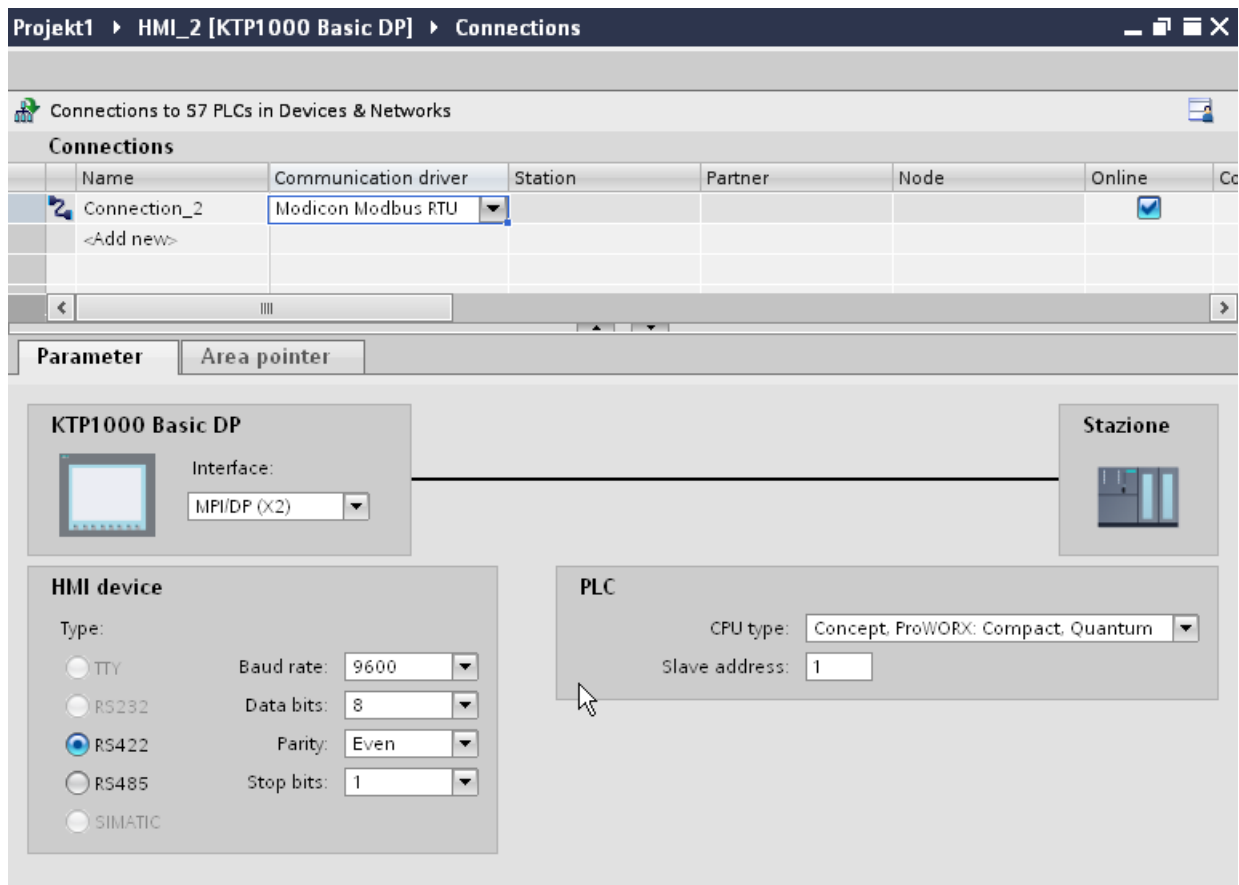

5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

## Parameters for the connection (Modicon Modbus RTU)

### Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.

### Parameters for the HMI device

You can select an interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

- Type  
Only RS 232 is system-tested.  
No warranty is given for RS 485.

---

#### Note

RS 422 is only approved in combination with the RS 422-RS 232 converter.

Order number: 6AV6 671-8XE00-0AX0

---

#### Note

If you use the IF1B interface, you must switch over the RS422 receive data additionally by 4 DIL-switches on the back of the HMI device.

---

- Baud rate  
For "Baud rate", select the transmission speed between the HMI device and Modicon PLC. A baud rate of 19200 or 9600 can be selected for the communication.  
A baud rate of 4800 can be selected for certain HMI devices.

- Data bits  
For "Data bits", only the value "8" can be selected.
- Parity  
For "Parity", you can choose from "None", "Even", and "Odd".
- Stop bits  
For "Stop bits", you can choose between 1 and 2 bits.

### Parameters for the PLC

- CPU type  
For "CPU type", you set the Modicon PLC to which the HMI device is connected.  
You can select the following CPUs:
  - Concept, ProWORX: Compact, Quantum
- Slave address  
Under "Slave address" you set which slave address the CPU has.

### Connecting HMI device to PLC

#### Connections via Modicon Modbus RTU

##### Connection

Connect the HMI device to the Modicon Modbus RTU interface of the Modicon Modbus RTU slave.

The connection of the HMI device to Modicon is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

##### Connection cable

The following connecting cables are available to connect the HMI device to Modicon Modbus.

Interface to the HMI device	Modicon PLC		
	directly via Modbus interface (RS232) 9-pin Sub D male connector	Via MB Bridge (RS 232)	directly via Modbus interface (RS232) 8-pin RJ45 connector
RS 232, 9-pin	PP1	PP1	PP2

The cable pin assignments can be found in Section "Connecting cables for Modicon Modbus RTU".

## Communication types

### Approved communication types

The following communication types are system-tested and approved:

- Ppoint-to-point connection only via the RS-232 interface.
- Multipoint connection from a HMI device (Modbus-Master) with up to 4 PLCs: The HMI device must be connected with a Modbus Plus Bridge or a Compact, Momentum CPU or TSX Quantum CPU which is configured as a Modbus Plus Bridge.
- You connect the other PLCs via the Modbus Plus connection on the first PLC. The PLCs can be reached under their address via the bridge functionality of the first PLC.

---

#### Note

It is not possible to integrate the HMI device into a Modbus network because the HMI device is Modbus-Master.

---

- Integration of the HMI device into a Modbus Plus network via the "bridge mode" of the Compact, Momentum or Quantum (logical point-to-point communication of the HMI device with a Compact, Momentum or Quantum).

### Restrictions

The connection of the HMI device to PLCs of other manufacturers which offer a Modicon Modbus interface is not system-tested and therefore not approved.

If you use another PLC nevertheless, observe the following information:

- These drivers only work for tags with the bit counting method typical for Modicon PLCs from left (bit1 = most significant bit) to right (bit16 = least significant bit in data type INT).
- The address offset displayed in the configuring is subtracted at protocol level in the message frame. E.g. in Holding Register 4x the offset "40001". The configured address "40006" therefore becomes address "5" in the message frame. The address (e.g. "5") transferred in the message frame is transformed to the PLC-specific address range in the different Non-Modicon PLCs.
- A reply message frame without "ExceptionCode" is expected within 500 ms.
- The following function codes are used for the respective data areas:

Reading function codes		Address range	
01	ReadCoilStatus	0x	DIGITAL_OUT
02	ReadInputStatus	1x	DIGITAL_IN
03	ReadHoldingRegisters	4x	USERDATA
04	ReadInputRegisters	3x	ANALOG_IN
20 (14Hex)	ReadGeneralReference	6x	EXTENDEDMEMORY (not for all CPUs)

Writing function codes		Address range	
06	PresetSingleRegister	4x	USERDATA Single
16 (10Hex)	PresetMultipleRegisters	4x	USERDATA Multiple
05	ForceSingleCoil	0x	DIGITAL_OUT with data type Bit
15 (0FHex)	ForceMultipleCoils	0x	DIGITAL_OUT with data type 16 bit group
21 (15Hex)	WriteGeneralReference	6x	EXTENDEDMEMORY (not for all CPUs)

## Connectable PLCs

Connections can be implemented for the following Modicon Modbus PLCs:

Modicon Modbus PLC	Supported protocol	
	Modicon Modbus RTU <sup>2)</sup>	Modicon Modbus TCP/IP
TSX Compact	x	x <sup>1)</sup>
TSX Quantum	x	x
Momentum	x	x
Premium	-	x
Micro	-	x
M340 20x0 (without 2010)	-	x

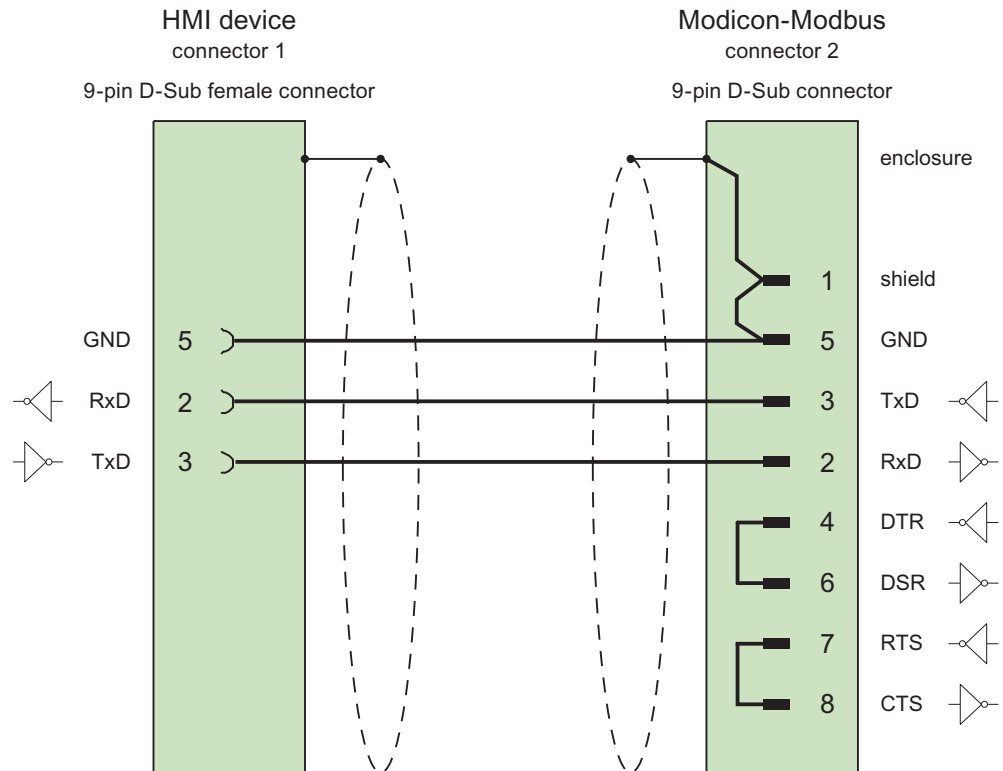

<sup>1)</sup> Only via Ethernet TCP/IP-Modbus Plus Bridge

<sup>2)</sup> Communication via RS 232 is tested and enabled for the PLC. In the HMI devices which only have an RS 422/485 interface, the RS 422/232 converter with the order number 6AV6 671-8XE00-0AX0 was tested and approved.

### Connecting cables for Modicon Modbus RTU

#### Connecting cable PP1, RS-232, for Modicon

#### Point-to-point cable 1: PLC > PC ...

Cables: 3 x 0.14 mm<sup>2</sup>, shielded,  
max. length 15 m

Connecting cable PP2, RS-232, for Modicon

Point-to-point cable 2: PLC (TSX Compact) > PC...

Cables: 3 x 0.14 mm<sup>2</sup>, shielded,  
max. length 15 m

## Performance features of communication

### Permitted data types for Modicon Modbus RTU

#### Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
+/- Double	4x, 6x	4 bytes
+/- Int	3x, 4x, 6x	2 bytes
16-bit group	0x, 1x	2 bytes
ASCII	4x, 6x	0 to 80 characters
Bit <sup>1)</sup>	0x, 1x, 3x, 4x, 6x	1-bit
Double	4x, 6x	4 bytes
Float	4x, 6x	4 bytes
Int	3x, 4x, 6x	2 bytes

<sup>1)</sup> Note the following for write accesses:

For data type "Bit" with the operand types "4x" and "6x", the entire word is written back to the PLC following a change to the specified bit. There is no check to determine whether any other bits in the word have changed. As a result, the PLC only has read access to the specified word.

The usual bit counting method (16 LSB - 1 MSB) in the following CPU types is only used in the "HMI tags" editor with the selected "Bit" data type:

- Concept ProWORX: Compact, Quantum

The following bit location assignment applies:

	Left byte								Right byte							
Counting with tags	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

#### Format for "Signed"

The placeholder "+/-" stands for the data types "Signed Int" and "Signed Double".

## Supported CPU types for Modicon Modbus RTU

### CPU types

The following CPU types are supported in the configuration of the Modicon Modbus RTU communication driver.

- Compact
- Momentum
- Quantum

### Address areas for Modicon Modbus RTU

#### Concept, ProWORX

Address areas	Data types							
	Bool	16 Bit Group	Int	+/- Int	Dint	+/- Dint	Float	ASCII
0x	0x1 - 0x65535	0x1 - 0x65520	--	--	--	--	--	--
1x	1x100001 - 1x165535	1x100001 - 1x165520	--	--	--	--	--	--
3x	3x300001.1 - 3x365535.1 6	--	3x300001 - 3x365535	3x300001 - 3x365535	--	--	--	--
4x	4x400001.1 - 4x465535.1 6	--	4x400001 - 4x465535	4x400001 - 4x465535	4x400001 - 4x465534	4x400001 - 4x465534	4x400001 - 4x465534	4x400001 - 4x465535
6x	6x60000.1: 1 - 6x69999.16 :10	--	6x60000:1 - 6x69999:10	6x60000:1 - 6x69999:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69999:10

## Commissioning components

### Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
  - Interface
  - Transfer parameters
  - Target storage location
3. Start the project transfer.  
The project is compiled automatically.  
All compilation and transfer steps are logged to a message window.

### Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

## Optimizing the configuration

### Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

## Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

## Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

## Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

## Data exchange

### Area pointers for Modicon Modbus

#### Area pointers for connections via Modicon Modbus communication drivers

You use an area pointer to access a data area in the PLC.

For more detailed information on area pointers and their configuration, refer to Section "Data exchange using area pointers".

#### Special considerations for connections via Modicon communication drivers

You can configure the following area pointers

Area pointers	Modicon Modbus TCP/IP	Modicon Modbus RTU
Screen number	Yes	Yes
Date/time	Yes	Yes
Date/time PLC	Yes	Yes
Coordination	Yes	Yes
Project ID	Yes	Yes
Job mailbox	Yes	Yes
Data record	Yes	Yes

### Restrictions Modicon Modbus TCP/IP

The following restrictions apply for configuring area pointers.

CPU type	Data types	File types
Concept, ProWORX: Compact, Quantum, Momentum	+/- Int, Int	4x, 6x
Unity, PL7: Premium, Micro, Quantum, M340	+/- Int, Int	%MW

### Modicon Modbus RTU restrictions

The following restrictions apply for configuring area pointers.

CPU type	Data types	File types
Concept, ProWORX: Compact, Quantum, Momentum	+/- Int, Int	4x, 6x

## Trends

### General information on trends

### Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3569)

---

#### Note

The value is read out time-triggered for Basic Panels.

---

### Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

### Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

## Trend request and trend transfer

### Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

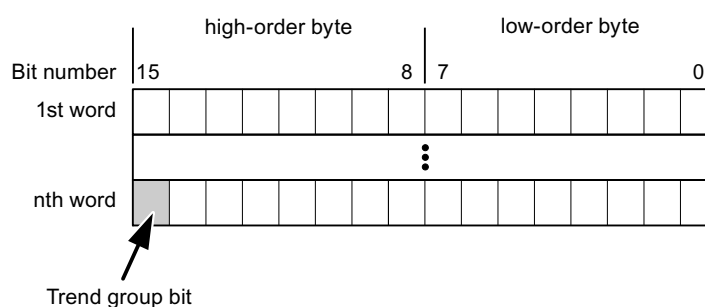

The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

### Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.

The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

### Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

### Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

### Permitted data types for trend control

#### Modicon Modbus TCP/IP

Tags of the following operand types are permitted for CPU type "Concept, ProWORX: Compact, Quantum, Momentum".

- "4x"
- "6x"

Tags of the following operand types are permitted for CPU type "Unity, PL7: Premium, Micro, Quantum, M340".

- "%MW"

The tags for trend control must have data type "Int" or "+/- Int" or be an array tag with data type "Int" or "+/-Int".

You assign a bit to a trend during configuration. This sets a defined bit assignment for all areas.

#### Modicon Modbus RTU

Tags of the following operand types are permitted for CPU type "Concept, ProWORX: Compact, Quantum".

- "4x"
- "6x"

The tags for trend control must have data type "Int" or "+/- Int" or be an array tag with data type "Int" or "+/-Int".

You assign a bit to a trend during configuration. This sets a defined bit assignment for all areas.

## Alarms

### Configuring alarms

#### Configuring alarms for non-integrated connections

Several steps are necessary to configure alarms such as warnings, error messages and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3592)

#### Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

### Data types

For connections with a Modicon Modbus communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
All Modicon series	Int, +/-Int	16 Bit Group, Int, +/-Int, Double, +/-Double, Float

Arrays and array tags cannot be used for discrete alarms.

#### How the bit positions are counted

For connections with a Modicon Modbus communication driver, the following counting method applies:

How the bit positions are counted	Left byte								Right byte							
In WinCC you configure:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## Acknowledgment of alarms

### Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

### Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.

### Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment

tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

---

### Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

---

The figure below shows the pulse diagram.

## LED mapping

### Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

---

### Note

The LED function cannot be configured for Basic Panels.

---

## Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

## LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

## Omron

### Omron communication drivers

#### Introduction

This section describes the communication between an HMI device and PLCs that use Omron communication drivers.

The following communication drivers are supported:

- Omron Host Link

#### Data exchange

Data is exchanged by means of tags or area pointers.

- Tags  
The PLC and the HMI device use process values for data exchange. You create tags in the configuration that point to addresses in the PLC. The HMI device reads the value from the defined address, and then displays it. The operator may also enter values on the HMI device, which are then written to the address in the PLC.
- Area pointers  
Area pointers are used to exchange specific data and are only set up when these data are used.

## Omron Host Link

### Configuring a connection via Omron Host Link

#### Introduction

You configure a connection to a PLC with an Omron Host Link communication driver in the "Connections" editor of the HMI device.

---

#### Note

##### Connection with Omron Host Link

A connection will not automatically be established when runtime is started if you have configured a connection via Omron.

A tag which is in the valid PLC memory area must be configured in the runtime start screen.

The connection will otherwise only be established once a corresponding screen has been selected.

This tag will be accessed when runtime is started and a connection will then be established.

---

The interfaces are named differently depending on the HMI device.

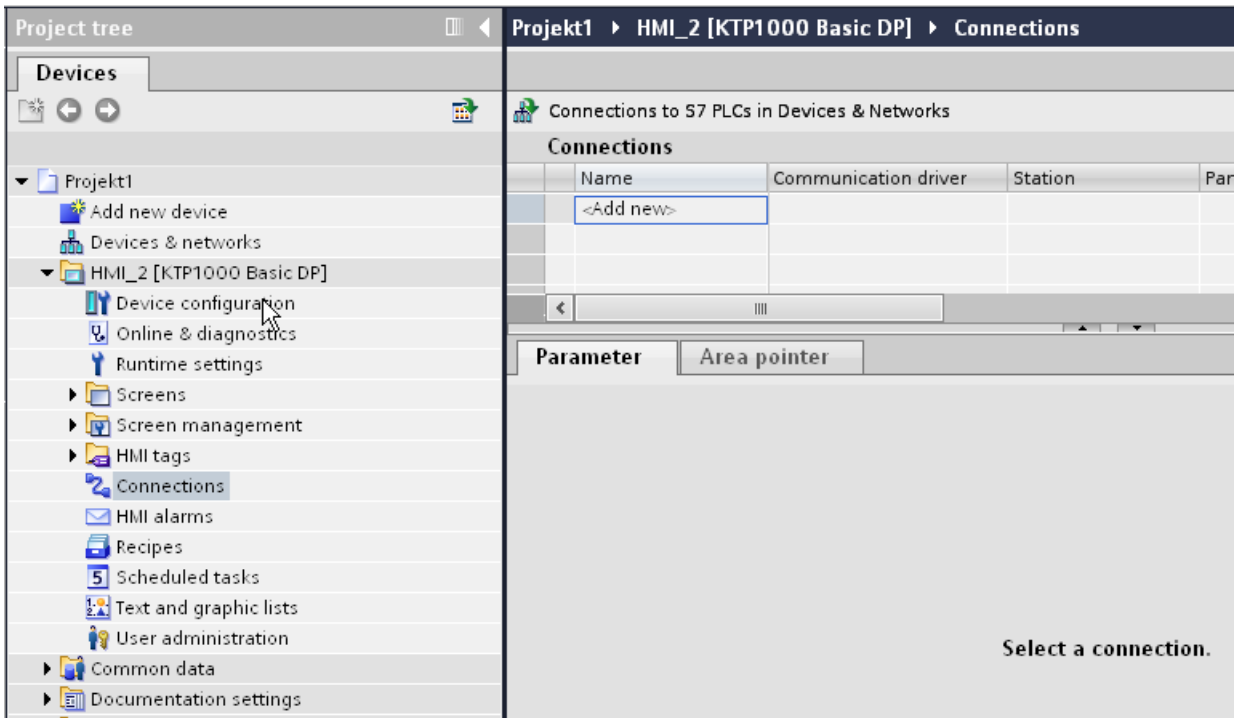

#### Requirements

- A project is open.
- An HMI device has been created.

#### Procedure

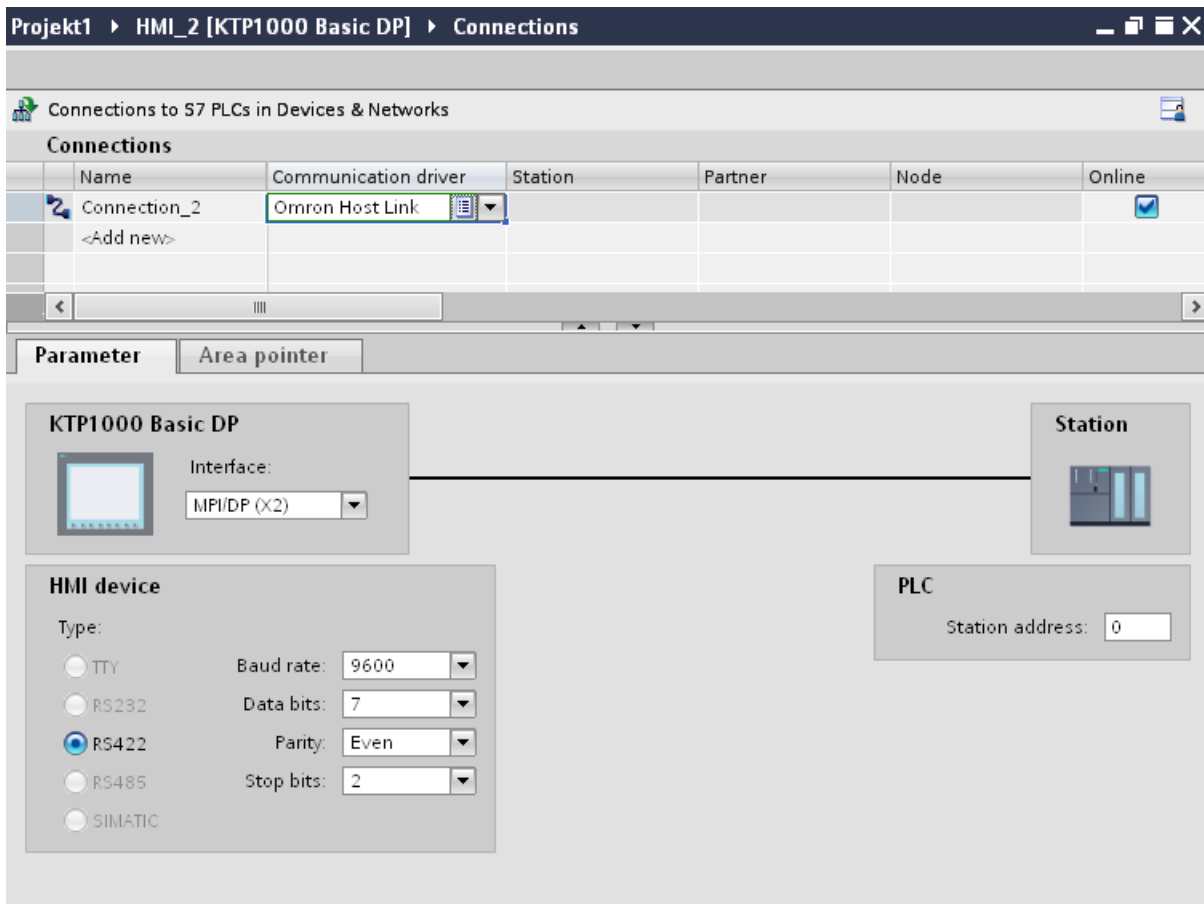

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.

4. Select the "Omron Host Link" driver in the "Communication driver" column.

5. Select all necessary connection parameters for the interface in the inspector window under "Parameters".

## Parameters for the connection (Omron Hostlink)

### Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.

### Parameters for the HMI device

You can select an interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

- **Type**  
Specifies the physical connection used.
- **Baud rate**  
For "Baud rate", you set the transmission speed of the HMI device to OMRON. A baud rate of 19200 or 9600 can be selected for the communication.
- **Data bits**  
For "Data bits", you can choose between "7 bits" and "8 bits".
- **Parity**  
For "Parity", you can choose from "None", "Even", and "Odd".
- **Stop bits**  
For "Stop bits", you can choose between 1 and 2 bits.

## Parameters for the PLC

- Station address  
For "Station address", set the station number of the connected PLC.

## Connecting HMI device to PLC

### Connections via Omron Host Link

#### Connection

The connection of the HMI device to an OMRON PLC is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

#### Connection cable

The following connecting cables are available to connect the HMI device to an Omron PLC.

Interface to the HMI device	Omron PLC			
	RS232, 9-pin	RS232 I/O port	RS422, 9-pin	RS422, terminals/pins
RS232, 9-pin	PP1	Programming cable (standard cable of Omron)	—	—
RS232 via converter	—	—	—	Multi-point cable 1
RS422, 9-pin	—	—	PP2	Multi-point cable 2

Refer to the relevant device manual to determine which HMI device interface is to be used.

## Communication types

### Approved communication types

The connection from a HMI device to an OMRON-CPU with the Omron Host Link protocol via RS232 and via RS 422 is system-tested and approved by Siemens AG.

This concerns the following CPU types:

- CP1x (CP1L, CP1H, CP1E)
- CJ1x (CJ1M, CJ1H, CJ1G)
- CJ2H

- CS1x (CS1G, CS1H, CS1D)
  - CPM2C
- 

**Note**

Only the following CPU types have been tested and released for Basic Panels, TP 177A and OP 77A:

- CP1x (CP1L, CP1H, CP1E)
  - CJ1x (CJ1M, CJ1H, CJ1G)
- 

### Multipoint connection

A multipoint connection to the up to 4 approved OMRON PLCs in a RS422-four-wire connection can be implemented with communication modules on the PLCs and is system-tested and approved by Siemens AG.

---

**Note**

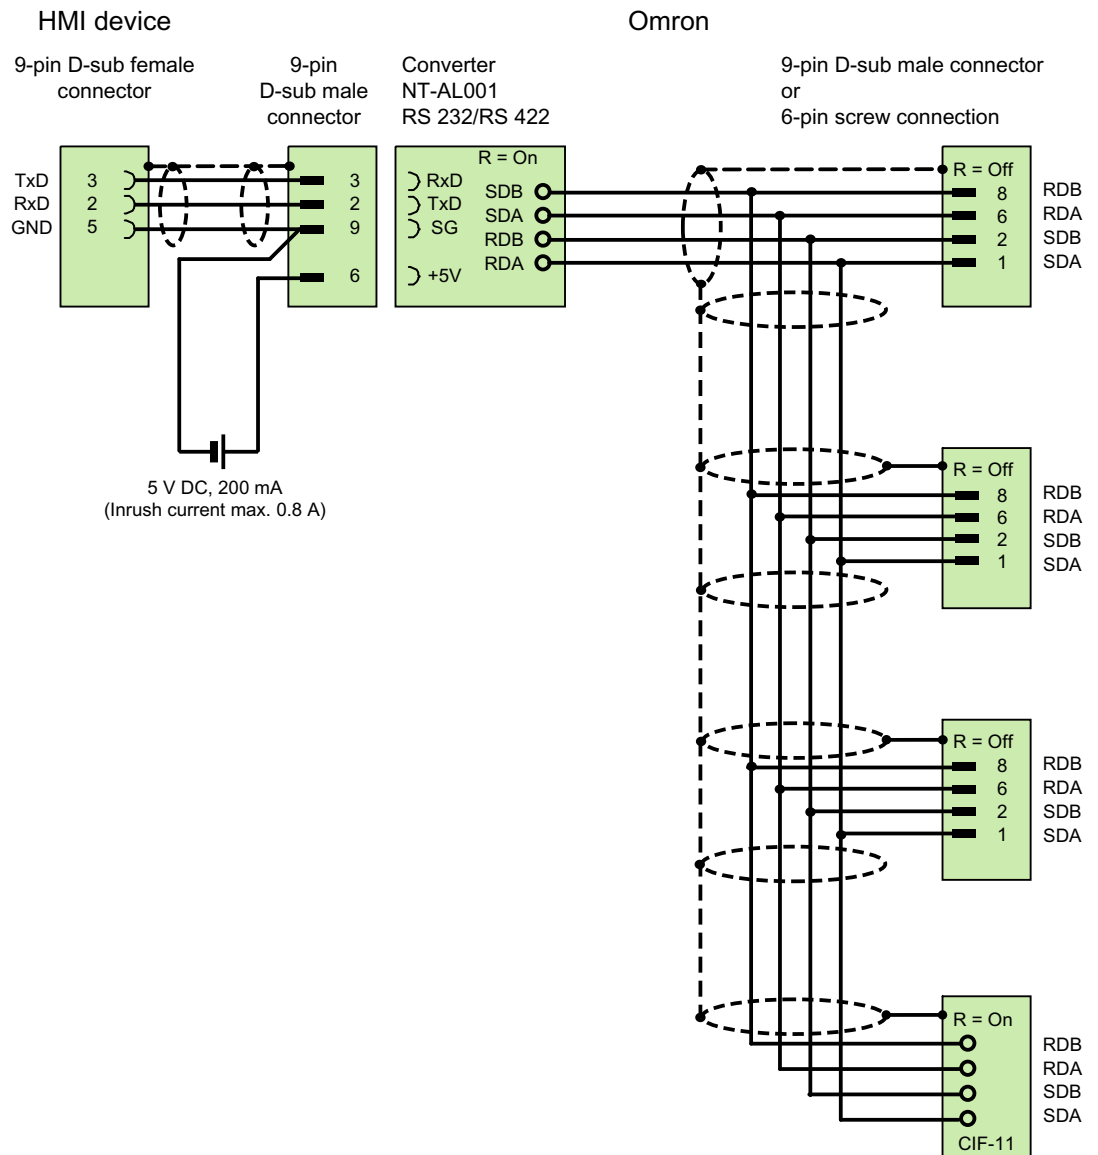

The HMI device can only be operated as a master. Exactly one master is possible in the RS422-four-wire-Multidrop connection.

---

### Connecting cables for Omron Host Link

### Connecting cable MP1, RS-232, over converter, for Omron

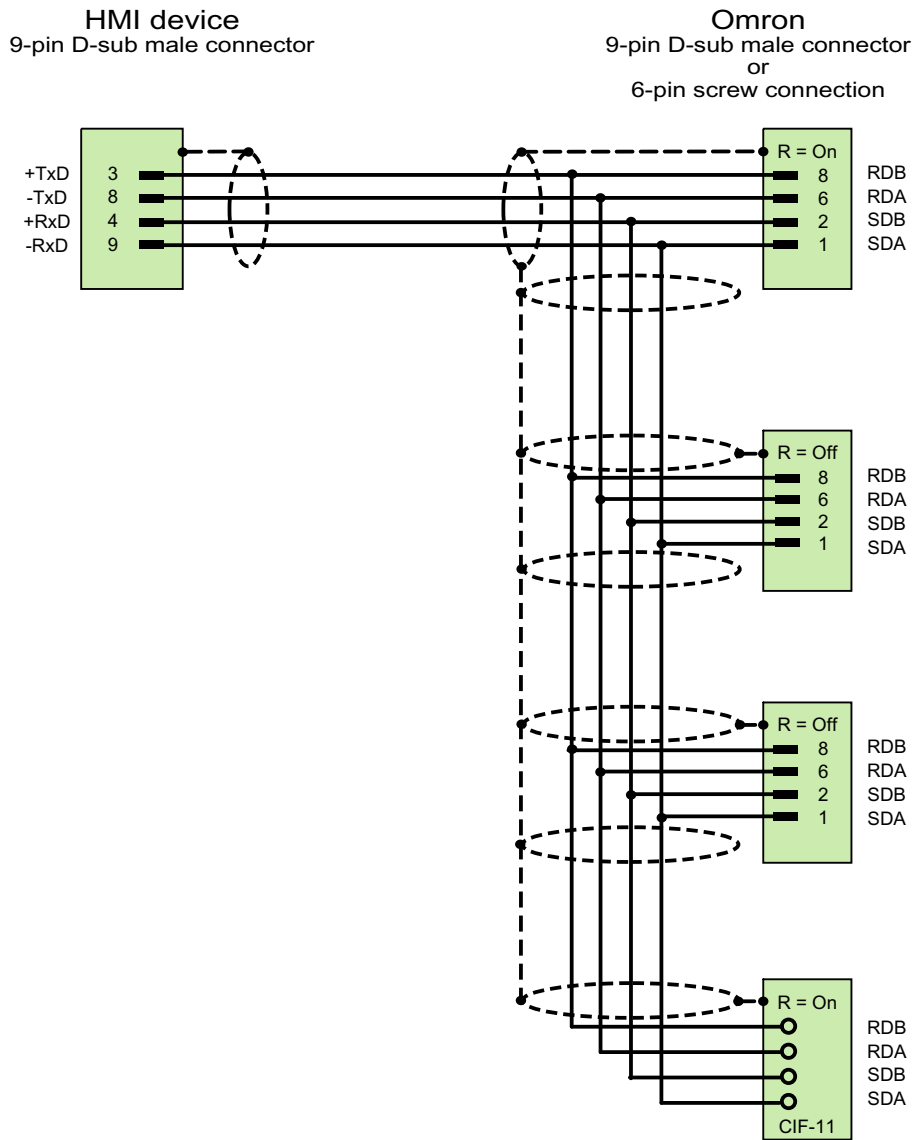

### Multipoint cable 1: MP/TP/PC > PLC

<sup>1)</sup> Inrush current max. 0.8 A  
shielded, max. length 500 m

Connecting cable MP2, RS-422, for Omron

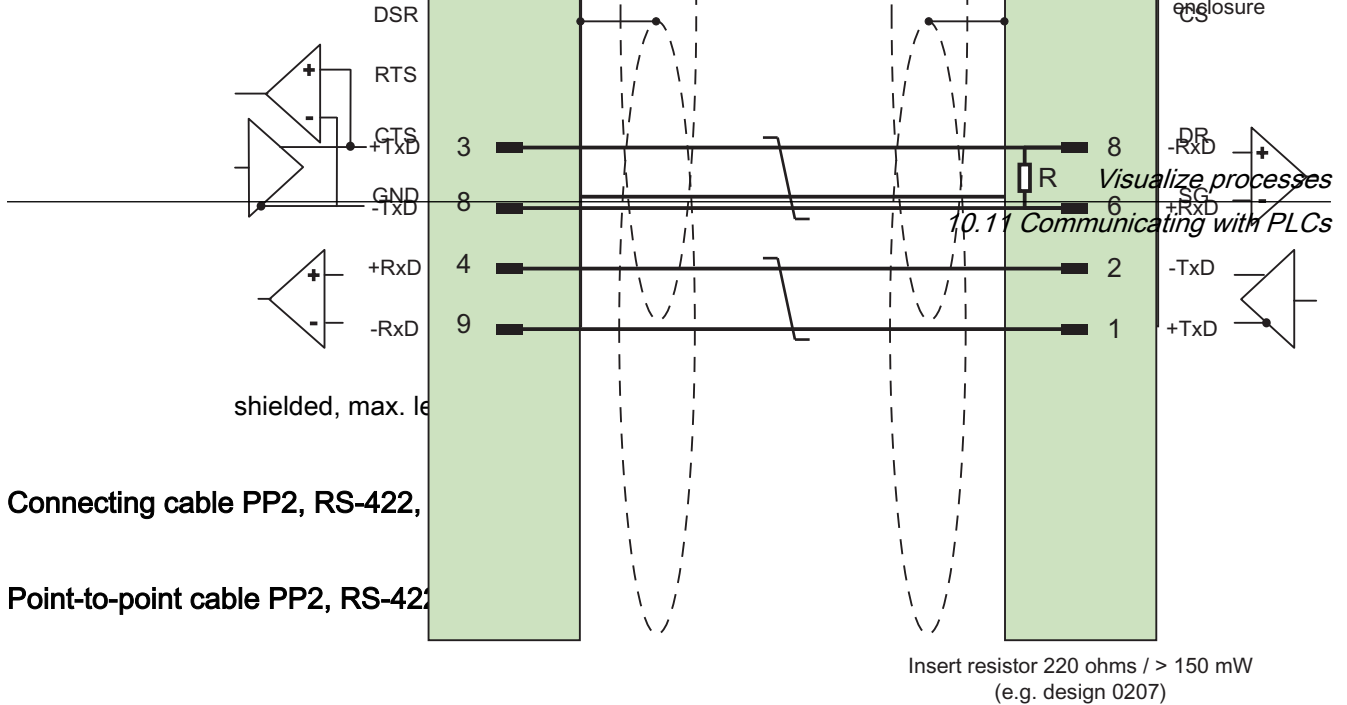

Multipoint cable 2: RS422, MP/TP/PC > SPS\_

shielded, max. length 500 m

Connecting cable PP1, RS-232, for Omron

Point-to-point cable PP1, PC/TP/OP - PLC

Connecting cable PP2, RS-422,

Point-to-point cable PP2, RS-422

shielded, max. length 500 m

### Performance features of communication

### Permissible data types for Omron Host Link

### Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
Bool	I/O, HR, AR, LR, DM, T/ C bit, CPU status	1-bit
Byte	CPU type	1 byte
DInt	HR, AR, LR, DM	4 bytes
Int	I/O, HR, AR, LR, DM, T/ C Val	2 bytes
Real	HR, DM	4 bytes
String	HR, AR, LR, DM	0 to 80 characters
UDInt	HR, AR, LR, DM	4 bytes
UInt	I/O, HR, AR, LR, DM, T/ C Val	2 bytes

### Note

Read and write operations of all data areas in the OMRON PLC can only be reliably carried out in "STOP" or "MONITOR" mode.

"I/O" refers either to the IR/SR area or the CIO area depending on the PLC series. The operand types "LR", "HR" and "AR" are not available in all PLC series.

**Note**

Note the following for write accesses:

For the "Bool" data type with the operand types "I/O", "HR", "AR", "LR" and "DM", the entire word is written back into the PLC when the specified bit is changed. There is no check to determine whether any other bits in the word have changed. As a result, the PLC only has read access to the specified word.

Operand type old PLC	Operand type CS and CJ PLC
CPU Status	CPU Status
I/O	CIO
HR	H Range 0-511
AR	A
LR	n/a 1)
DM	D
T/C	T/C
CPU type	CPU type

- 1) You do not get an error message when you read or write the LR area in the following PLCs
- CS
  - CJ
  - CP

**Supported CPU types for Omron Host Link**

**CPU types**

The following CPU types are supported in the configuration of the Omron Host Link communication driver.

- CP1
  - CP1L
  - CP1H
  - CP1E
- CJ1
  - CJ1M
  - CJ1H
  - CJ1G

- CJ2
  - CJ2H
- CS1
  - CS1G
  - CS1H
  - CS1D
- CPM
  - CPM2C

## Addressing in Omron Host Link

### Addressing of PLCs in Omron Host Link

In PLCs of the series CS, CP and CJ, the timers 0-4095 are addressed with T/C 0-2047.

The counters 0-4095 must be addressed with an offset of 2048 (T/C 2048-4095 correspond to the counters 0-2047). Counters and timers with addresses > 2047 cannot be addressed via Host Link.

Counters and timers with addresses > 2047 cannot be addressed via Host Link.

Example:

If you want to address counter C20, you must address T/C  $20+2048 = T/C 2068$ .

### Address areas for Omron Hostlink

#### Omron

Address areas	Data types							
	Bool	Byte	UInt	Int	UDInt	DInt	Real	String
I/O	I/O 0.0 - I/O 9999.15	--	I/O 0 - I/O 9999	I/O 0 - I/O 9999	--	--	--	--
HR	HR 0.0 - HR 9999.15		HR 0 - HR 9999	HR 0 - HR 9999	HR 0 - HR 9998	HR 0 - HR 9998	HR 0 - HR 9999	HR 0 - HR 9999
AR	AR 0.0 - AR 9999.15		AR 0 - AR 9999	AR 0 - AR 9999	AR 0 - AR 9998	AR 0 - AR 9998		AR 0 - AR 9999
LR	LR 0.0 - LR 9999.15		LR 0 - LR 9999	LR 0 - LR 9999	LR 0 - LR 9998	LR 0 - LR 9998		LR 0 - LR 9999
DM	DM 0.0 - DM 9999.15		DM 0 - DM 9999	DM 0 - DM 9999	DM 0 - DM 9998	DM 0 - DM 9998	DM 0 - DM 9999	DM 0 - DM 9999
T/C Bit	T/C Bit 0 - T/C Bit 4095							

Address areas	Data types							
	Bool	Byte	UInt	Int	UDInt	DInt	Real	String
T/C Val			T/C Val 0 - T/C Val 4095	T/C Val 0 - T/C Val 4095				
CPU Status	RUN, MONITOR							
CPU type	CPU type							

## Commissioning components

### Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
  - Interface
  - Transfer parameters
  - Target storage location
3. Start the project transfer.  
The project is compiled automatically.  
All compilation and transfer steps are logged to a message window.

### Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

## Optimizing the configuration

### Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.

- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

## Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

## Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

## Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

## Data exchange

### Area pointers for Omron

#### Area pointers in connections via Omron communication drivers

You use an area pointer to access a data area in the PLC.

For more detailed information on area pointers and their configuration, refer to Section:

"Data exchange using area pointers".

#### Special features of connections via Omron Host Link

Area pointers can only be created in the following "File types": "DM", "I/O", "HR", "AR", and "LR".

## Trends

### General information on trends

#### Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3569)

---

#### Note

The value is read out time-triggered for Basic Panels.

---

#### Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

#### Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

#### Trend request and trend transfer

##### Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

### Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.

The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

### Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

### Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

### Restrictions to the trend control

#### For Omron Host Link communication drivers

Tags of "Operand type" "DM", "I/O", "HR", "AR" or "LR" are permitted.

They must be data type "UInt", "Int" or an array tag of data type "UInt", "Int". You assign a bit to a trend during configuration. This sets a defined bit assignment for all areas.

## Alarms

### Configuring alarms

#### Configuring alarms for non-integrated connections

Several steps are necessary to configure alarms such as warnings, error messages and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3592)

#### Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

### Data types

For connections with an Omron communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
CP1, CJ1, CJ2, CS1, CPM	UInt, int	UInt, Int, UDInt, DInt

#### How the bit positions are counted

For connections with an Omron communication driver, the following counting method applies:

How the bit positions are counted	Left byte								Right byte								
In Omron PLCs	15							8	7								0
In WinCC you configure:	15							8	7								0

Only tags for the "DM", "I/O", "HR", "AR", and "LR" file types are allowed for use as a trigger tag for discrete alarms.

## Configuring discrete alarms

Use arrays for discrete alarms and append each individual alarm to one bit of the array tags themselves and not to the individual subelements.

Only tags for the "DM", "I/O", "HR", "AR", "LR" areas and the "Int" and "UInt" file types are permitted for discrete alarms and arrays.

## Acknowledgment of alarms

### Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

### Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.

### Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

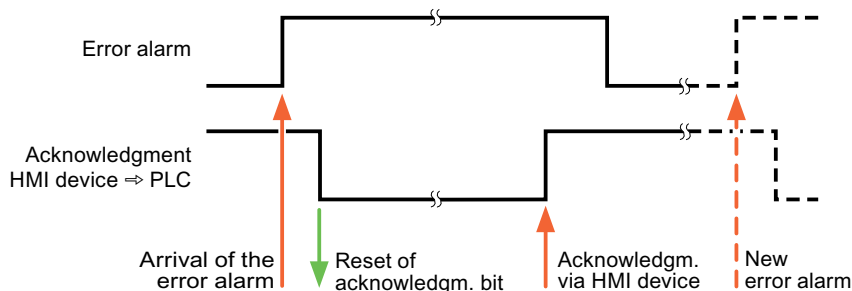

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

**Note**

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.

**LED mapping**

**Function**

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

**Note**

The LED function cannot be configured for Basic Panels.

**Requirements**

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

## LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels, all Comfort Panels	Panel PCs
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

## Communication Service Packages

### 10.11.17. Data exchange using area pointers

5

## General information on area pointers

### Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

### Configuration of area pointers

Before you use the area pointer, you enable it in "Connections ► Area pointers". You then assign the area pointer parameters.

Parameter		Area pointer						
Active	Display name	PLC tag	Access mode	Address	Length	Acquisition mode	Acquisition cycle	Comment
<input type="checkbox"/>	Coordination	<Undefined>	<symbolic access>		1	Cyclic continuous	<Undefined>	
<input type="checkbox"/>	Date/time	<Undefined>	<symbolic access>		6	Cyclic continuous	<Undefined>	
<input type="checkbox"/>	Job mailbox	<Undefined>	<symbolic access>		4	Cyclic continuous	<Undefined>	
<input type="checkbox"/>	Data record	<Undefined>	<symbolic access>		5	Cyclic continuous	<Undefined>	

Global area pointer of HMI device								
Connection	Display name	PLC tag	Access mode	Address	Length	Acquisition mode	Acquisition cycle	Comment
<Undefined>	Project ID	<Undefined>	<symbolic access>		1	Cyclic continuous	<Undefined>	
<Undefined>	Screen number	<Undefined>	<symbolic access>		5	Cyclic continuous	<Undefined>	
<Undefined>	Date/time PLC	<Undefined>	<symbolic access>		6	Cyclic continuous	<Undefined>	

- **Active**  
Enables the area pointer.
- **Pointer name**  
Name of the area pointer specified by WinCC.
- **PLC tag**  
Here you select the PLC tag or the tag array that you have configured as the data area for the area pointer.
- **Address**  
No address is entered into this field because of the symbolic access.
- **Length**  
WinCC specifies the length of the area pointer.
- **Acquisition cycle**  
You specify the acquisition cycle in this field for area pointers that are read by the HMI device. Note that a very short acquisition time may have a negative impact on HMI device performance.
- **Comment**  
Enter a comment, for example, to describe the purpose of the area pointer.

## Accessing data areas

### Accessing data areas

The following table shows how HMI devices and PLCs access individual data areas for read (R) or write (W) operations.

Data area	Required for	HMI device	PLC
Screen number	Evaluation by the PLC in order to determine the active screen.	W	R
Data record	Transfer of data records with synchronization	R/W	R/W
Date/time	Transfer of the date and time from the HMI device to the PLC	W	R
Date/time PLC	Transfer of the date and time from the PLC to the HMI device	R	W
Coordination	Requesting the HMI device status in the PLC program	W	R
Project ID	Runtime checks for consistency between the WinCC project ID and the project in the PLC	R	W
Job mailbox	Triggering of HMI device functions by the PLC program	R/W	R/W

### "Screen number" area pointer

#### Function

The HMI device saves information about the screen called on the HMI device to the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. The PLC can trigger specific reactions such as the call of a different screen.

#### Use

Configure and enable the area pointer in "Communication > Connections" before you put it into use. You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

#### Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1. word	Current screen type															
2. word	Current screen number															
3. word	Reserved															
4th word	Current field number															
5. word	Reserved															

- Current screen type  
"1" for root screen or  
"4" for permanent window
- Current screen number  
1 to 32767
- Current field number  
1 to 32767

### "Date/time" area pointer

#### Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer. All definitions are coded in BCD format.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

---

#### Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

---

The date/time data area has the following structure:

Data word	Left byte				Right byte				
	15				8	7			
n+0	Reserved				Hour (0 to 23)				Time
n+1	Minute (0 to 59)				Second (0 to 59)				
n+2	Reserved				Reserved				
n+3	Reserved				Weekday (1 to 7, 1=Sunday)				Date
n+4	Day (1 to 31)				Month (1 to 12)				
n+5	Year (80 to 99/0 to 29)				Reserved				

---

#### Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

---

**"Date/time PLC" area pointer****Function**

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer. All definitions are coded in BCD format.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

**Note**

Set an acquisition cycle of sufficient length for the Date/time area pointer in order to avoid any negative impact on HMI device performance.

Recommended: Acquisition cycle of 1 minute if your process can handle it.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

**Note**

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The "Date/time PLC" data area has the following structure:

Data word	Left byte			Right byte		
	15	.....	8	7	.....	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved	Weekday (1 to 7, 1=Sunday)	
n+4 <sup>1)</sup>	Reserved			Reserved		
n+5 <sup>1)</sup>	Reserved			Reserved		

- 1) The two data words must exist in the data area to ensure that the data format matches WinCC and to avoid reading false information.

**Note**

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

## "Coordination" area pointer

### Function

The "Coordination" area pointer is used to implement the following functionality:

- Detecting the startup of the HMI device in the control program
- detection in the control program of the current HMI device operating mode
- detection in the control program of the HMI devices ready to communicate state

The "Coordination" area pointer has a length of one word.

### Use

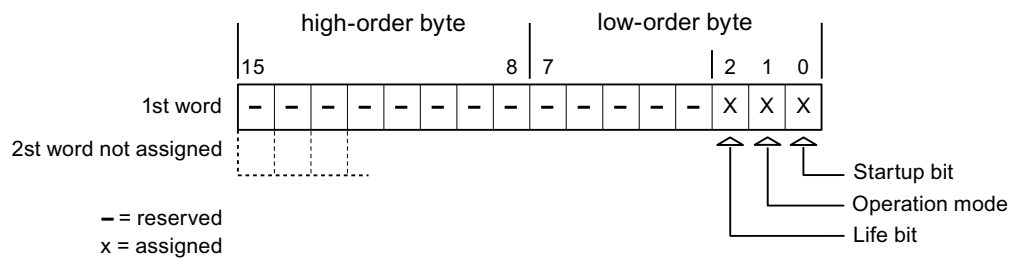

---

#### Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program may not make changes to the coordination area for this reason.

---

### Assignment of bits in the "Coordination" area pointer

### Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

### Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The state of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit.

### Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not the connection to the HMI device is still up by querying this bit in the control program.

## "Project ID" area pointer

### Function

You can check whether the HMI device is connected to the correct PLC at the start of runtime. This check is important when operating with several HMI devices.

The HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of configuration data with the control program. If discrepancy is detected, a system event is displayed on the HMI device and runtime is stopped.

### Use

To use this area pointer, set up the following during the configuration:

- Define the version of configuration. Possible values between 1 and 255.  
You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- Data address of the value for the version that is stored in the PLC:  
You enter the data address in the editor "Communication > Connections".

### Connection failure

A connection failure to a device on which the "project ID" area pointer is configured results in all the other connections in the project being switched to "offline".

This behavior has the following prerequisites:

- You have configured several connections in a project.
- You are using the "project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the engineering system.

## "PLC job" area pointer

### Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

## Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Left byte	Right byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

## Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

### Note

Please note that not all HMI devices support job mailboxes.

No.	Function	
<b>14</b>	<b>Setting the time (BCD coded)</b>	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
<b>15</b>	<b>Setting the date (BCD coded)</b>	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
<b>23</b>	<b>User logon</b>	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-

No	Function	
<b>14</b>	<b>Setting the time (BCD coded)</b>	
<b>24</b>	<b>User logoff</b>	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
<b>40</b>	<b>Transfer date/time to PLC</b>	
	(in the S7 format DATE_AND_TIME) An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
<b>41</b>	<b>Transfer date/time to PLC</b>	
	(In OP/MP format) An interval of at least 5 seconds must be maintained between successive jobs in order to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
<b>46</b>	<b>Update tags</b>	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
<b>49</b>	<b>Delete alarm buffer</b>	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
<b>50</b>	<b>Delete alarm buffer</b>	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
<b>51</b>	<b>Screen selection <sup>1)</sup></b>	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
<b>69</b>	<b>Read data record from PLC</b>	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
<b>70</b>	<b>Write data record to PLC</b>	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

<sup>1)</sup> OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.

## "Data record" area pointer

## "Data mailbox" area pointer

### Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

### Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization over the data record

Data records are always transferred directly. That is, the tag values are read from an address or written to an address configured for this tag directly, without redirecting the values by means of interim memory.

### Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes  
The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a configured function or by a job mailbox, the recipe view on the HMI device remains operable. The data records are transferred in the background.

Simultaneous processing of several transfer requests is, however, not possible. In this case, the HMI device rejects the other transfer requests with a system event.

### Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example, when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

## Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:  
The values are downloaded to the HMI device. You can then process, edit, or save these values, for example.
- Triggering by a function or job mailbox:  
The values are saved immediately to the data volume.

## Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:  
The current values are written to the PLC.
- Triggering by a function or job mailbox:  
The current values are written to the PLC from the data medium.

## Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. You can use this mechanism to prevent uncontrolled overwriting of data in either direction in your control program.

## Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

## Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Communication > Connections" editor in "Area pointer".
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:  
"Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

### Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	<b>15</b>		<b>0</b>
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status

The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data record free
2	0000 0010	Transferring.
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

### Sequence of a transfer started by the operator in the recipe display

#### Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data record and sets the data record number to 0.	Abort with system event.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

### Writing to the PLC started by the operator in the recipe view

Step	Action	
	Check: Status word = 0?	
1	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data record.	Abort with system event.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized between the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	
4	If required, the control program can now evaluate the transferred data.	
5	The control program must reset the status word to zero in order to enable further transfers.	

#### Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

#### Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

### Sequence of the transfer triggered by a PLC job

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxes No. 69 and No. 70 are available for this type of transfer.

#### No. 69: Read data record from PLC ("PLC → DAT")

Job mailbox no. 69 transfers data records from the PLC to the HMI device. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1 to 65535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

**No. 70: Write data record to PLC ("DAT → PLC")**

Job mailbox No. 70 transfers data records from the HMI device to the PLC. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1 to 65535)	
Word 4	—	

**Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)**

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data record.	Abort without return message.
3	The HMI device reads the values from the PLC and saves these to the data record defined in the job mailbox.	
4	<ul style="list-style-type: none"> <li>If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed."</li> <li>If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data record.</li> </ul>	
5	The control program must reset the status word to zero in order to enable further transfers.	

**Sequence of writing to the PLC with job mailbox "DAT → PLC" (no. 70)**

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data record.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the function from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

## Sequence of the transfer when triggered by a configured function

### Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data record.	Abort with system event.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	
4	<ul style="list-style-type: none"> <li>• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed."</li> <li>• If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data record.</li> </ul>	
5	The control program must reset the status word to zero in order to enable further transfers.	

### Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data record.	Abort with system event.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

## Possible causes of error when transferring data records

### Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible

- Recipe number does not exist
- Data record number does not exist

---

**Note**

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

---

**Note**

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
  - The data mailbox status is set to "Transfer completed with error".
- 

### Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view  
Information in the status bar of the recipe view and output of system alarms
- Triggered by function  
Output of system alarms
- Triggering by job mailbox  
No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data record.

## 10.11.18 Special features of WinAC MP

### 10.11.18. WinAC MP basics

1

#### WinAC MP basics

WinAC MP is a software package for HMI devices. WinAC MP integrates a software PLC compatible with SIMATIC S7 in WinCC Runtime.

Using WinAC MP you can execute STEP 7 programs on the HMI device.

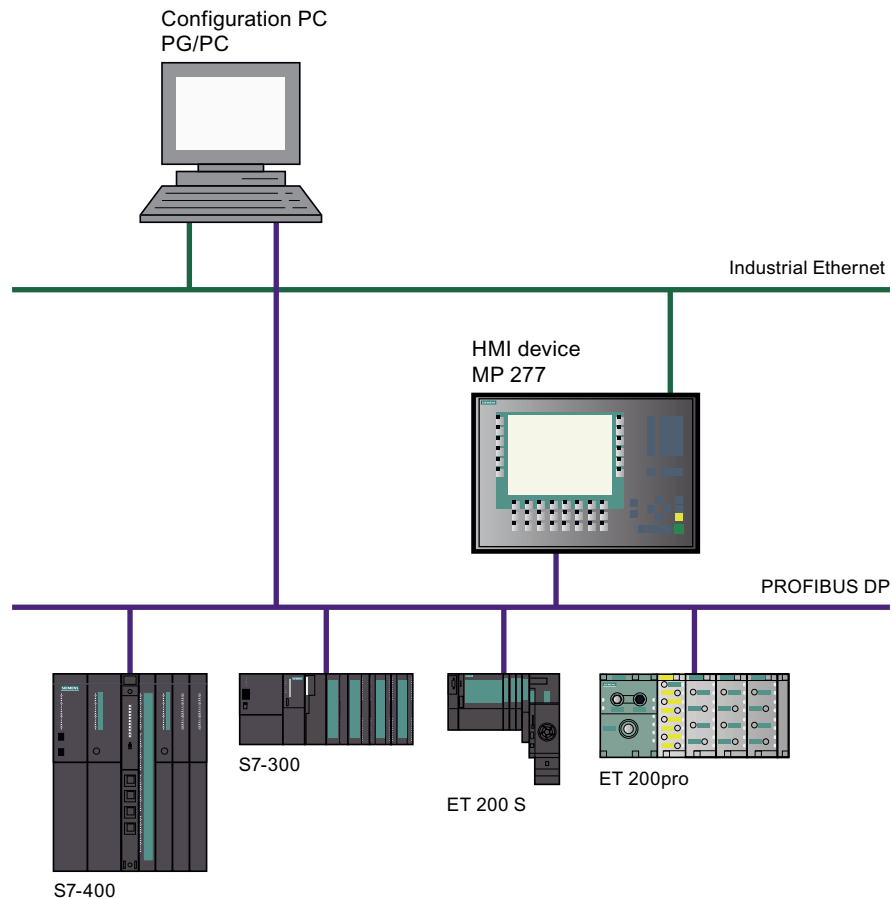

The common use of WinAC MP and WinCC provides process control and visualization on one HMI device.

The communications driver for WinAC MP supports the following protocols for controlling the process components:

- Industrial Ethernet
- PROFIBUS DP

The following screen shows the principal connection of the process components on the PROFIBUS DP example.

If you wish to control your process using an HMI device and WinAC MP, then you must install WinAC MP on your configuration PC. Then transfer WinAC MP and the project to your HMI device.

---

### Note

#### Notes about instructions

The following describes how to install WinAC MP and transfer WinAC MP to an HMI device.

To transfer a STEP 7 project with a WinAC MP controller to an HMI device, you require experience with STEP 7.

---

### 10.11.18. Communication options with WinAC MP

2

#### Definition of "routing"

If there are stations in an automation system that are not connected to the same bus, these stations cannot be accessed directly online. To establish a connection to these devices, a router must be included between them.

An MP x77 HMI device with WinAC MP can function as the router. As a router, it connects the Ethernet and PROFIBUS networks.

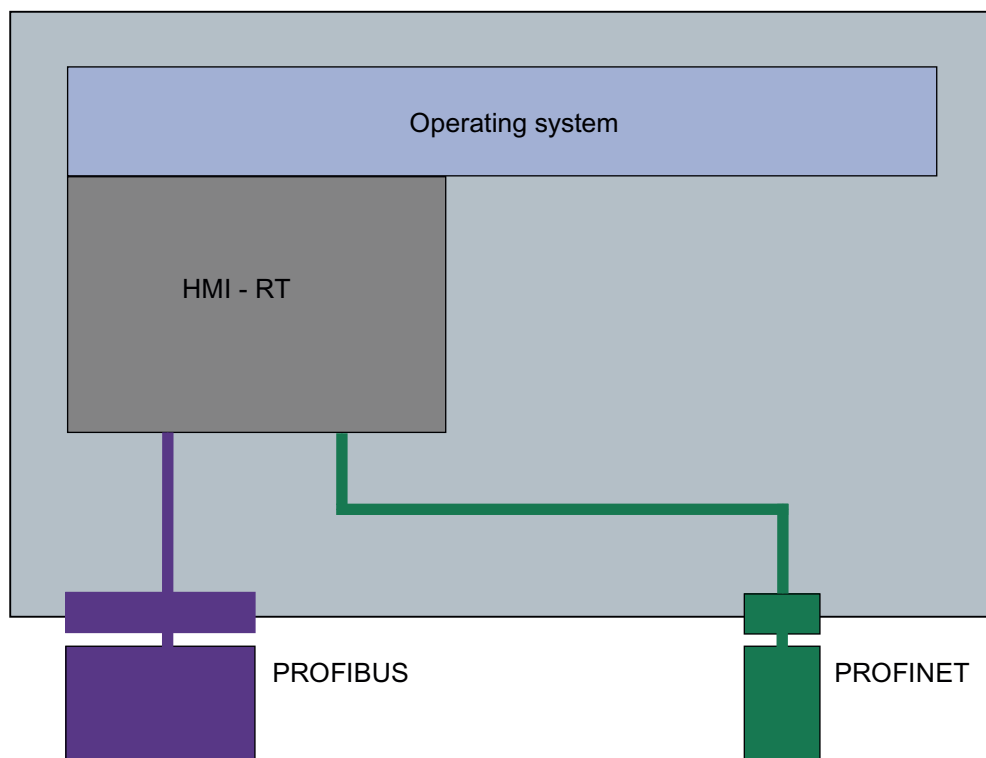

You can use routing, for example, to do the following:

- Download STEP 7 user programs
- Download a hardware configuration
- Execute testing and diagnostics functions

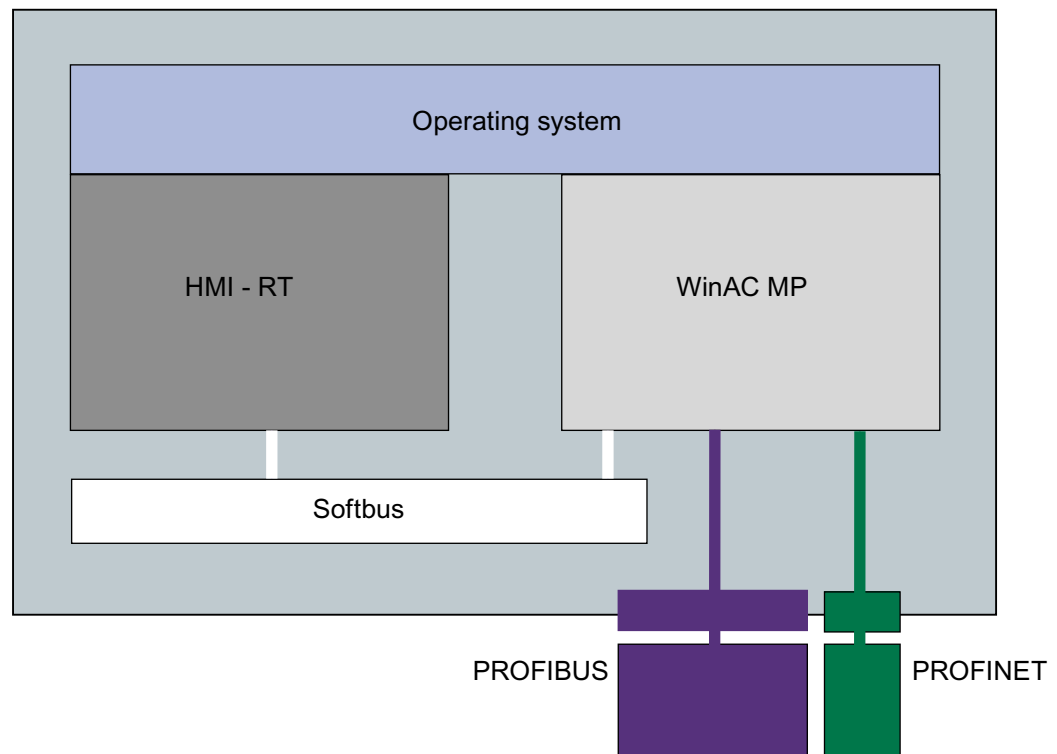

#### Definition of "Softbus"

Virtual bus that allows data exchange between WinCC Runtime and WinAC MP. This bus is also installed when you install WinCC . After installing WinAC MP, S7 connections from WinCC Runtime to external stations on PROFIBUS or Ethernet are routed over Softbus.

#### Prior to installation of WinAC MP (without Softbus)

#### After installation of WinAC MP (with Softbus)

### Routing from Ethernet to PROFIBUS DP with WinAC MP

With STEP 7 on Industrial Ethernet, you can access all nodes on PROFIBUS DP from the HMI device. With WinCC, you can access the HMI device but not the nodes connected over PROFIBUS DP.

If the configuration PC is not connected directly to PROFIBUS DP, the nodes on PROFIBUS can nevertheless be reached because the MP x77 HMI device serves as a router.

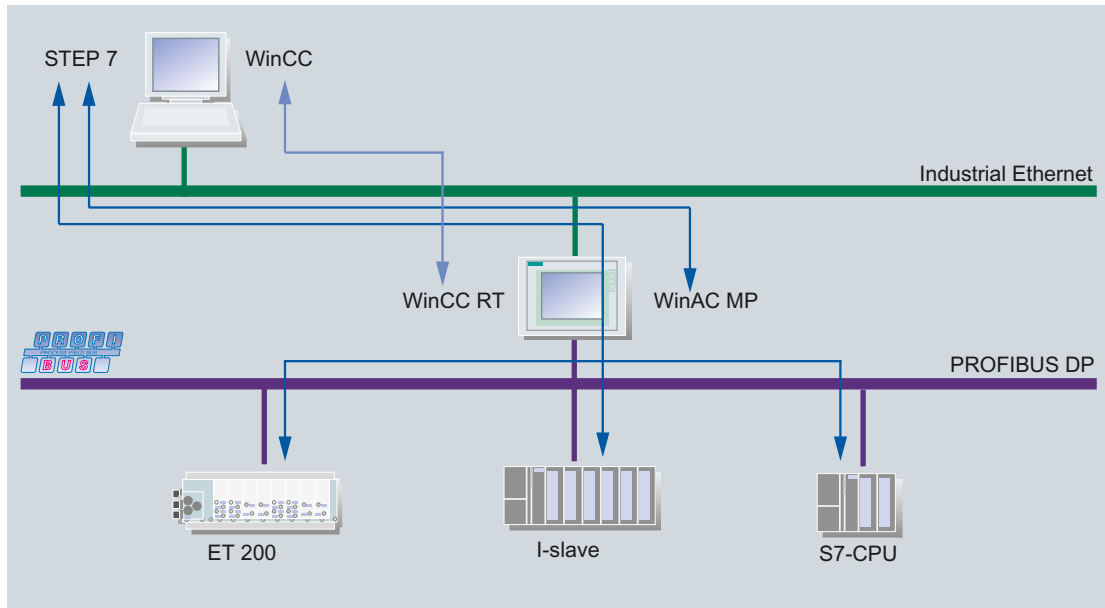

Figure 10-5 Routing from Ethernet to PROFIBUS DP with WinAC MP

### Routing from PROFIBUS DP to Ethernet with WinAC MP

With STEP 7 on PROFIBUS DP, you can access all nodes on Industrial Ethernet from the HMI device. With WinCC on PROFIBUS DP, you have access to the HMI device and to OPs connected over PROFIBUS DP.

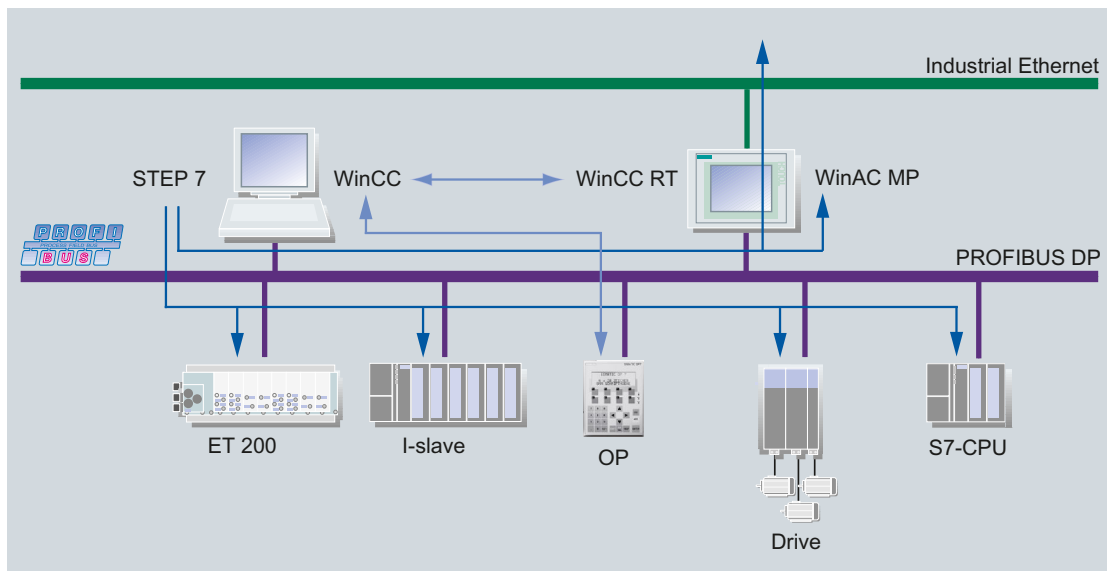

Figure 10-6 Routing with WinAC MP over PROFIBUS

### Visualization over WinAC MP

Visualization over the HMI device between Industrial Ethernet and PROFIBUS DP is possible with WinCC.

It is not necessary to program the communication links. A PC serves as the visualization platform.

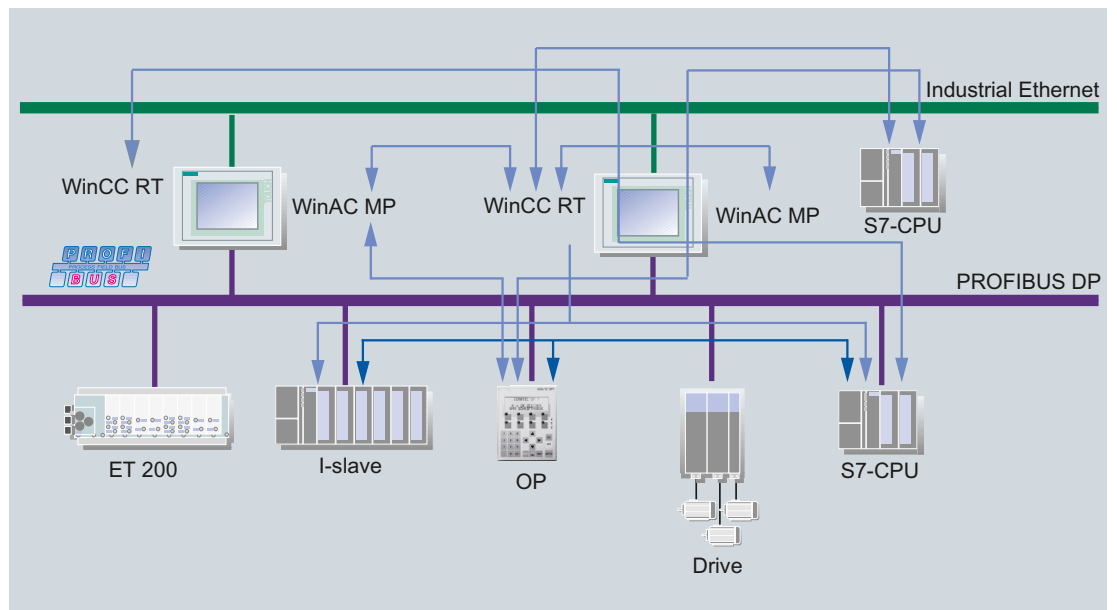

Figure 10-7 Visualization over WinAC MP

### CPU-CPU communication over WinAC MP

CPU-CPU communication is possible with the HMI device.

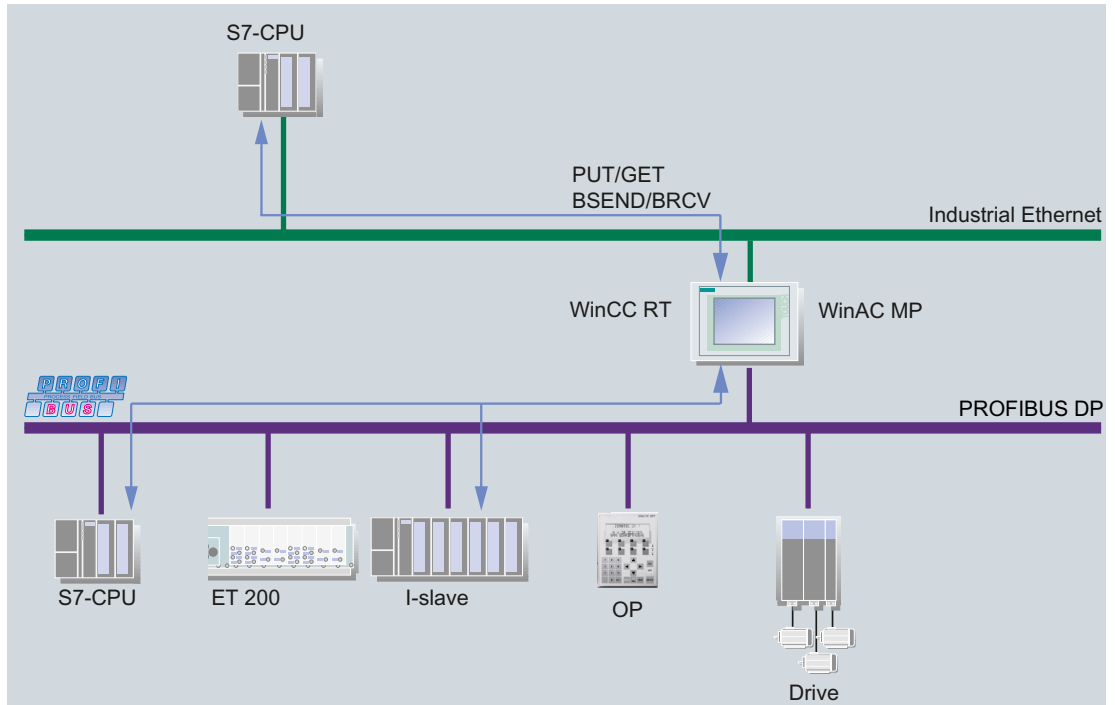

Figure 10-8 CPU-CPU communication over WinAC MP

#### 10.11.18. Standard procedure for communication with WinAC MP

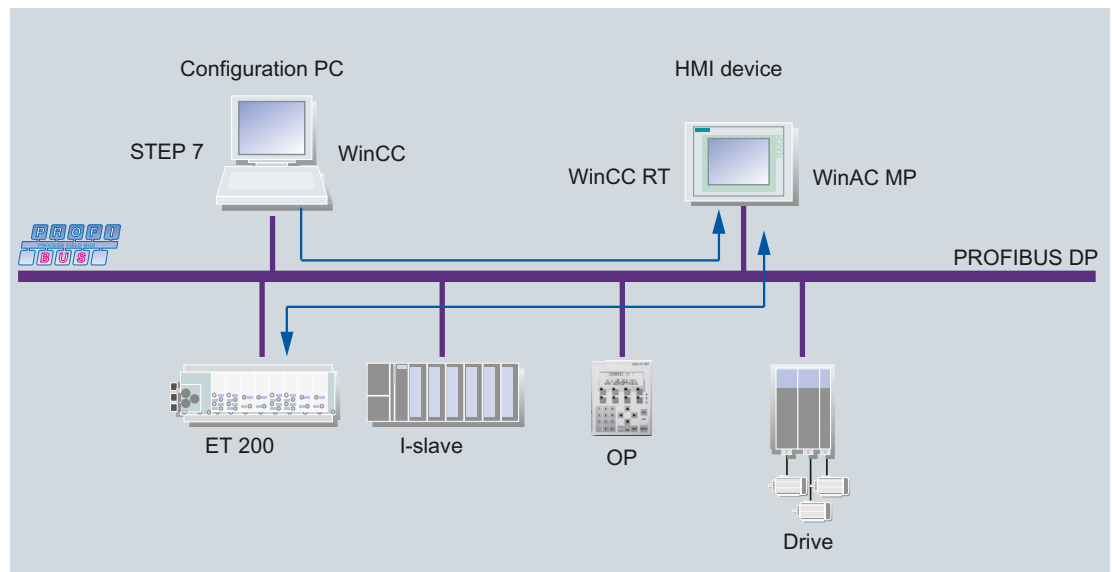

3

##### Overview

The section below shows how to configure WinAC MP in a SIMATIC HMI station using a configuration PC on which STEP 7 and WinCC are installed.

The configuration PC and WinAC MP in a SIMATIC HMI station are interconnected via PROFIBUS DP. Configuration via Ethernet is also possible. A description of the procedure can be found in the "WinAC MP" manual.

You can integrate DP slaves for WinAC MP in the STEP 7 project.

## Procedure

The basic steps are as follows:

1. Configure WinAC MP in STEP 7.
2. Create a connection between WinAC MP and WinCC Runtime.
3. In STEP 7, download the configuration to WinAC MP.
4. Configure (visualization) HMI objects with WinCC .
5. Download the (visualization) configuration (for example, visualization with histogram) from WinCC to the HMI device.

### 10.11.18. Configuring the WinAC MP communications driver

4

## Requirements for the use of WinAC MP

### Requirements

In order to use WinAC MP in the process control, you must perform the installation and development steps on your configuration PC. Transfer the necessary components to the HMI device.

## Basic procedure

The following steps are described in more detail in the following:

1. Check that your system meets the system requirements:
  - STEP 7 and the authorization are installed on the configuration PC.
  - WinCC and the authorization are installed on the configuration PC.  
WinCC Runtime and ProSave were installed along with WinCC.
2. When WinCC is installed, the WinAC MP option is also automatically installed. Authorization of the WinAC MP is carried out via separate licenses.  
The following components are installed alongside WinAC MP:
  - WinAC MP Runtime files
  - WinAC MP system library
3. Develop a STEP 7 project for controlling your process with WinAC MP on the HMI device.
4. Develop a WinCC project for operating and visualizing your controller.
5. Connect the process components via the PROFIBUS network and configure the hardware.
6. Transfer the WinAC MP Runtime files from the configuration PC to the HMI device.  
Use ProSave for this.
7. Transfer the WinAC MP authorization from its storage location to the HMI device.  
Use the Automation License Manager for this.
8. Transfer the STEP 7 project to the HMI device.
9. Transfer WinCC Runtime and the WinCC project to the HMI device.  
To do this, use the "Transfer" function.

## Changing the device type

### Introduction

There are different ways to create a SIMATIC HMI-station with an HMI device and a configured WinAC MP controller.

#### Procedure 1

Create an HMI device in a SIMATIC HMI-station in the device and network view. Then add the corresponding variant of WinAC MP.

The advantage of this procedure is that you can choose the device type (MP 177, MP 277 or MP 377) and the design of the device type (monitor size and touch or key) directly on selection in the hardware catalog.

#### Procedure 2

Insert the desired variant of WinAC MP directly in the device and network view.

This procedure creates, by default, the largest touch design of the selected HMI device in the device and network view.

## Changing the device type

Select a device. You can change the device type using the shortcut menu command "Change device". When the device type MP277 is changed to MP377 and MP 177 or vice versa with a configured WinAC MP controller in a SIMATIC HMI station, the WinAC MP controller is automatically moved to the storage location of the non slotted modules. It can therefore not be used in the new HMI device. If the the device type is changed, the WinAC MP-configuration must be created again.

## Connecting the configuration PC and HMI device

### Procedure for creating a connection via Ethernet or PROFIBUS DP

#### Basic procedure

WinAC MP supports the communication between the configuration PC and the HMI device via the following connections:

- Industrial Ethernet
- PROFIBUS DP
- USB

To achieve successful communication, follow these steps:

1. Connect the configuration PC to the HMI device.
2. Make the parameter settings for data transfer on the control panel.
3. Make the parameter settings for data transfer on the configuration PC.
4. Set the communications parameters in ProSave.  
With ProSave you can load the WinAC MP Runtime files in the HMI device. Therefore, you must set the communication parameters both in ProSave as well as on the HMI device.
5. Set the communications parameters in WinCC.  
Use WinCC to download your project to the HMI device using the "Download" function.

## Establishing a connection over Ethernet

### Connect the configuration PC to the HMI device (Ethernet)

In order to communicate via an Ethernet network you can either use a direct connection or a networked connection.

To connect a configuration PC to an HMI device via Ethernet, follow these steps:

1. Connect the interfaces of the configuration PC and the HMI device with an Ethernet cable.

---

**Note**

Use a crossover cable to create a direct connection between the configuration PC and the HMI device.

To connect the configuration PC and the HMI device to an Ethernet (LAN) use a 1 to 1 cable with RJ45 connector.

The interface to be used on the HMI device can be established from the operating instructions of your HMI device.

---

### Configuring the transmission settings in the Control Panel (Ethernet)

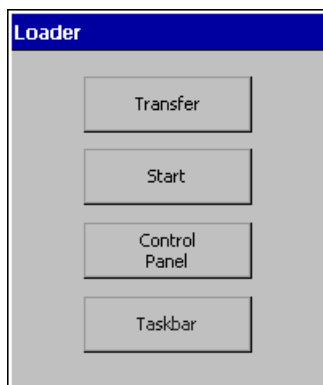

#### Requirements

The configuration PC and HMI device are connected to each other over an Ethernet cable.

#### Setting up an IP address on the control panel

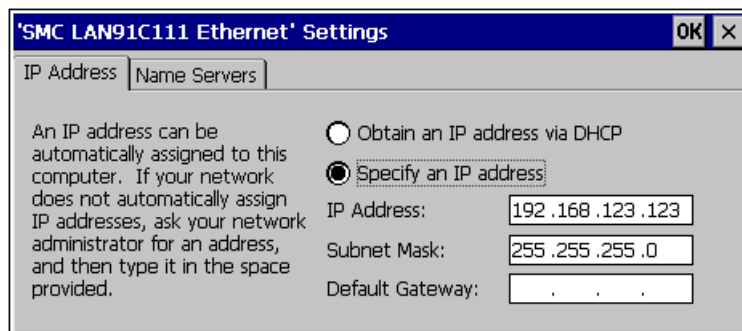

The set up the IP address on the control panel, follow these steps:

1. Switch on the HMI device.  
Before the HMI device opens an existing project, the "Loader" selection field appears.
2. Select "Control Panel".

3. Double click on the "Network and Dial-up Connection" symbol.
4. Double-click on the LAN connection.
5. Select the "IP Adress" tab.

6. Select "Specify an IP address".

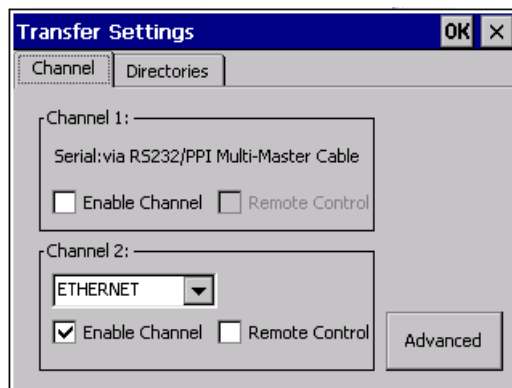

7. Enter the IP address and the subnet mask that you were given by your network administrator.
8. Confirm your entries with "OK".

### Entering transfer settings

To make the data transfer settings, follow these steps:

1. In the control panel, double click on the "Transfer" symbol.
2. Select the "Channel" tab.
3. Select the "Ethernet" option in the "Channel 2" area.
4. Enable "Enable Channel" and confirm your entries.

5. Click "OK" and end the dialog "Transfer Settings".

### The transmission settings are configured on the configuration PC

#### Requirement

- The configuration PC and HMI device are connected to each other over an Ethernet cable
- The data transfer settings have been made on the control panel

## Procedure

To make the data transfer settings on the configuration PC, follow these steps:

1. Open the network settings of your PC.
2. Select the "Internet Protocol (TCP/IP)".
3. Enable the "General" tab.
4. Select the "Use the following IP address" check box in the protocol properties.
5. Enter an "IP address".
6. Enter a "subnetwork mask".
7. Confirm your entries.

---

### Note

The IP addresses of the configuration PC and the HMI device must not be the same.  
The subnet mask must be the same for the configuration PC and the HMI device.

---

## Set the communication parameters (Ethernet)

### Requirement

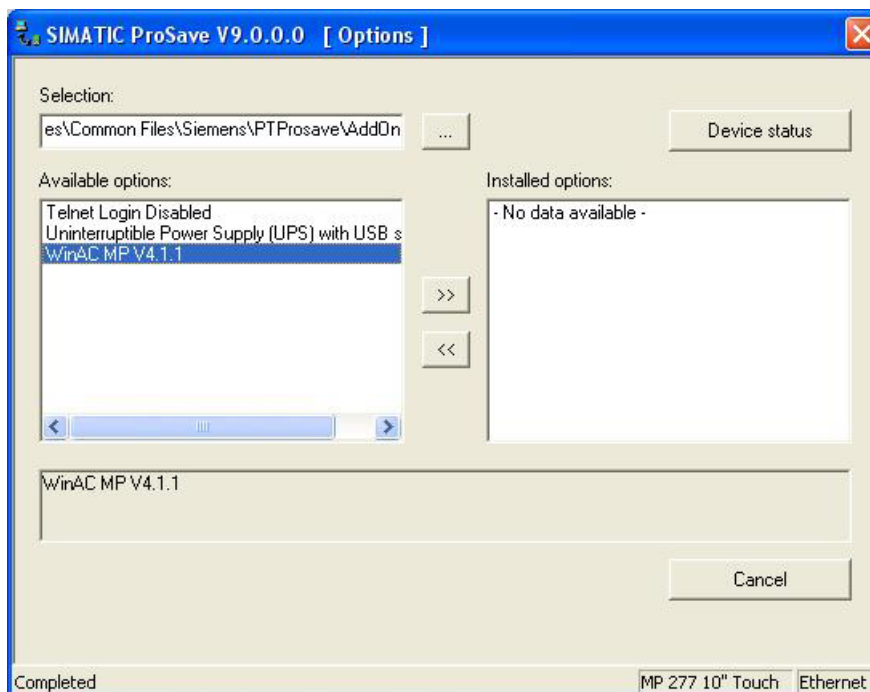

- The configuration PC and HMI device are connected to each other over an Ethernet cable
- The data transfer settings have been made on the control panel
- The data transfer settings have been made on the configuration PC

### Procedure

To make the communications parameter settings in ProSave, follow these steps:

1. Make the transfer settings first.
2. To do this, select the desired component in the project tree.
3. Select the "Download to device > Software" command in the shortcut menu.
  - If you have not already established an online connection, the "Extended download to device" dialog will automatically open. In this case, set all the necessary parameters for the connection and click "Load".
  - If you have already defined an online connection, the project data will be compiled immediately and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for uploading.
4. Select the "Options" command from the "Online > HMI device maintenance" menu to start ProSave .

5. Select an element under "Available options".
6. Click ">>".

## Setting the communication parameters in WinCC (Ethernet)

### Requirement

- The configuration PC and HMI device are connected to each other over an Ethernet cable.
- The data transfer settings have been made on the control panel.
- The data transfer settings have been made on the configuration PC.

### Procedure

To make the connection settings in WinCC, follow these steps:

1. Open the transfer settings.
2. Select the desired HMI device in the project tree.
3. Select the "Download to device > Software" command in the shortcut menu.
  - If you have not already established an online connection, the "Extended download to device" dialog will automatically open. In this case, set all the necessary parameters for the connection and click "Load".
  - If you have already defined an online connection, the project data will be compiled immediately and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for uploading.

4. Select the "Ethernet" mode.
5. Specify the IP address or the computer name of the HMI device.
6. Switch the HMI device to "transfer" mode.
7. Transfer the WinCC project to the HMI device.

**WARNING**

**Death, serious bodily harm and / or damage to property from unexpected process or machine behavior.**

If you use DHCP it is not guaranteed that every time the same IP address will be issued if a node is switched on.

Nodes could lose the connection in the Industrial Ethernet or be connected with incorrect nodes. Always enter a static IP address for the HMI device. Contact your network administrator for address allocations.

## Establishing a connection via PROFIBUS DP

### Connect the configuration PC to the HMI device (PROFIBUS DP)

1. Connect the interfaces from the configuration PC and the HMI device with an PROFIBUS DP cable.

---

#### Note

To communicate via an PROFIBUS DP network you must create a direct connection.

Check if your configuration PC has a suitable interface for connection to the PROFIBUS DP.

If this interface is missing, you must perform the following steps:

- Build a card into the configuration PC, e.g. CP 5611 for desktop PCs.
  - Install the respective drivers.
- 

### Configuring the transmission settings in the Control Panel (PROFIBUS DP)

#### Requirement

- The configuration PC and HMI device are linked with each other via a PROFIBUS DP cable.

#### Procedure

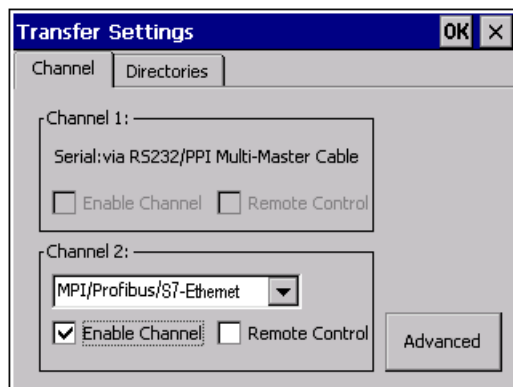

Perform the following steps on the HMI device:

1. Switch on the HMI device.  
Before the HMI device opens an existing project, the "Loader" selection field appears.
2. Select "Control Panel".

3. Double click on "Transfer".
4. Select the "MPI/PROFIBUS" option from the "Channel 2" selection list under the "Channel" tab.

5. Select "Enable Channel".

6. Confirm with "OK".
7. "Transfer Settings" End the dialog.

## Setting the communication parameters in ProSave (PROFIBUS DP)

### Requirement

The configuration PC and HMI device are linked with each other via a PROFIBUS DP cable.  
The data transfer settings have been made on the control panel.

### Procedure

To make the communications parameter settings in ProSave, follow these steps:

1. Make the transfer settings first.
2. To do this, select the desired component in the project tree.
3. Select the "Download to device > Software" command in the shortcut menu.
  - If you have not already established an online connection, the "Extended download to device" dialog will automatically open. In this case, set all the necessary parameters for the connection and click "Load".
  - If you have already defined an online connection, the project data will be compiled immediately and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for uploading.
4. Select the "Options" command from the "Online > HMI device maintenance" menu to start ProSave .

5. Select an element under "Available options".
6. Click ">>".

## Set the communication parameters in WinCC (PROFIBUS DP)

### Requirement

- The configuration PC and HMI device are linked with each other via a PROFIBUS DP cable.
- The data transfer settings have been made on the control panel.

### Procedure

To make the connection settings in WinCC, follow these steps:

1. Open the transfer settings.
2. Select the desired HMI device in the project tree.
3. Select the "Download to device > Software" command in the shortcut menu.
  - If you have not already established an online connection, the "Extended download to device" dialog will automatically open. In this case, set all the necessary parameters for the connection and click "Load".
  - If you have already defined an online connection, the project data will be compiled immediately and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for uploading.
4. Select the "MPI / PROFIBUS DP" mode.

5. Specify the PROFIBUS address that is assigned to the HMI device.  
The PROFIBUS address is the station address and corresponds to the address configured for the WinAC MP controller.
6. Switch the HMI device to "transfer" mode.
7. Transfer the WinCC project to the HMI device.

---

**Note**

For PROFIBUS DP transmission the WinAC MP control must be started on the HMI device.

---

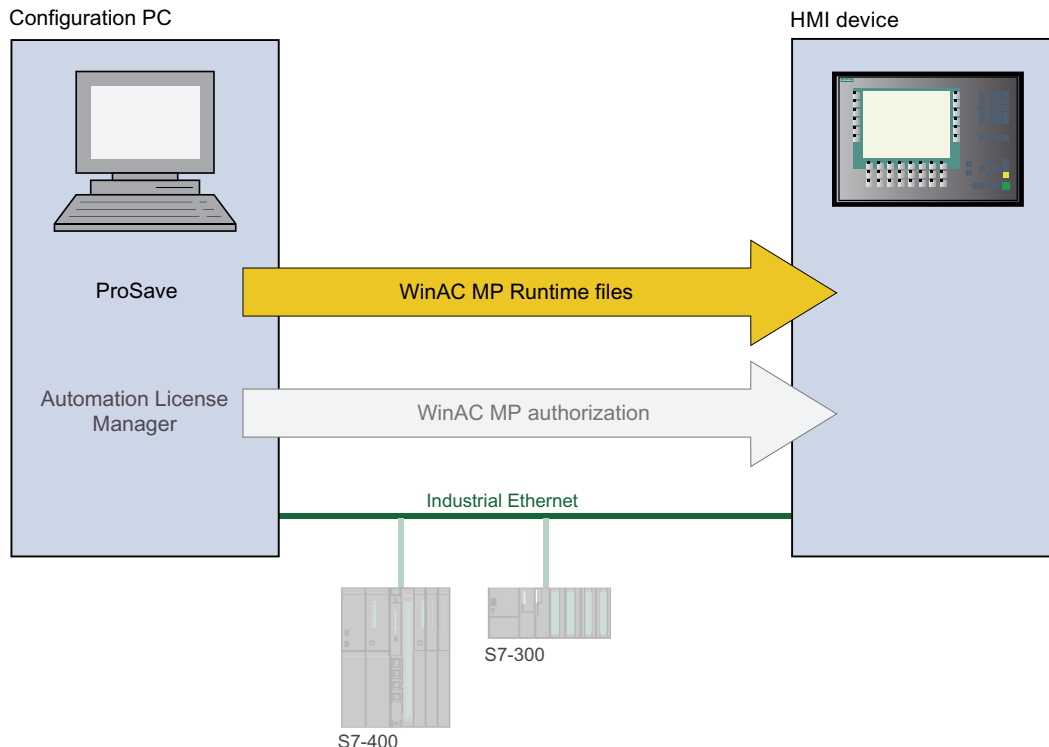

### 10.11.18. Transferring WinAC MP to the HMI device

5

#### Procedure for transferring WinAC MP

##### Introduction

If you want to execute WinAC MP on the HMI device you must transfer the WinAC MP Runtime files from the configuration PC to the HMI device. For the transfer there must be a data connection between the configuration PC and the HMI device. The following screen shows the arrangement using example Industrial Ethernet.

## Basic procedure

To transfer WinAC MP Runtime files to an HMI device, follow these steps:

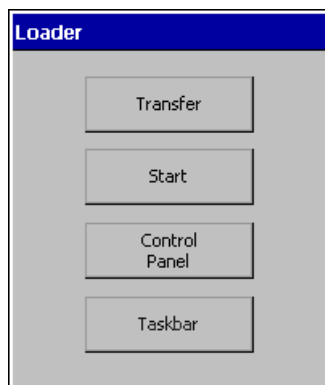

1. Setting up the HMI device.
2. Configure the ProSave on the configuration PC.
3. Start transfer.

## Switch the HMI device to transfer mode

### Procedure

For the transfer of data you must switch the HMI device to "Transfer":

1. Switch on the HMI device.  
Before the HMI device opens an existing project, the "Loader" selection field appears.
2. Click on the "Transfer" button.  
The dialog window displays the message "Connecting to host ...".

## Configuring ProSave on the configuration PC

### Requirement

The HMI device was switched to transfer mode.

### Procedure

To set up a configuration PC to transfer WinAC MP, proceed as follows:

1. Start ProSave.
2. Select the "General" tab.
3. Select the device type of your HMI device.

4. Select the "Ethernet" connection type.
5. Specify the IP address or the computer name of the HMI device.
6. Start the transfer of WinAC MP.

## Start transfer

## Requirement

- The HMI device was switched to transfer mode.
- ProSave is set up on the configuration PC.

## Procedure

To start the transfer of WinAC MP files, follow these steps:

1. Open the "Options" tab in transfer mode and click the "Device status" button. If no error message is shown then the communication connection is valid.

---

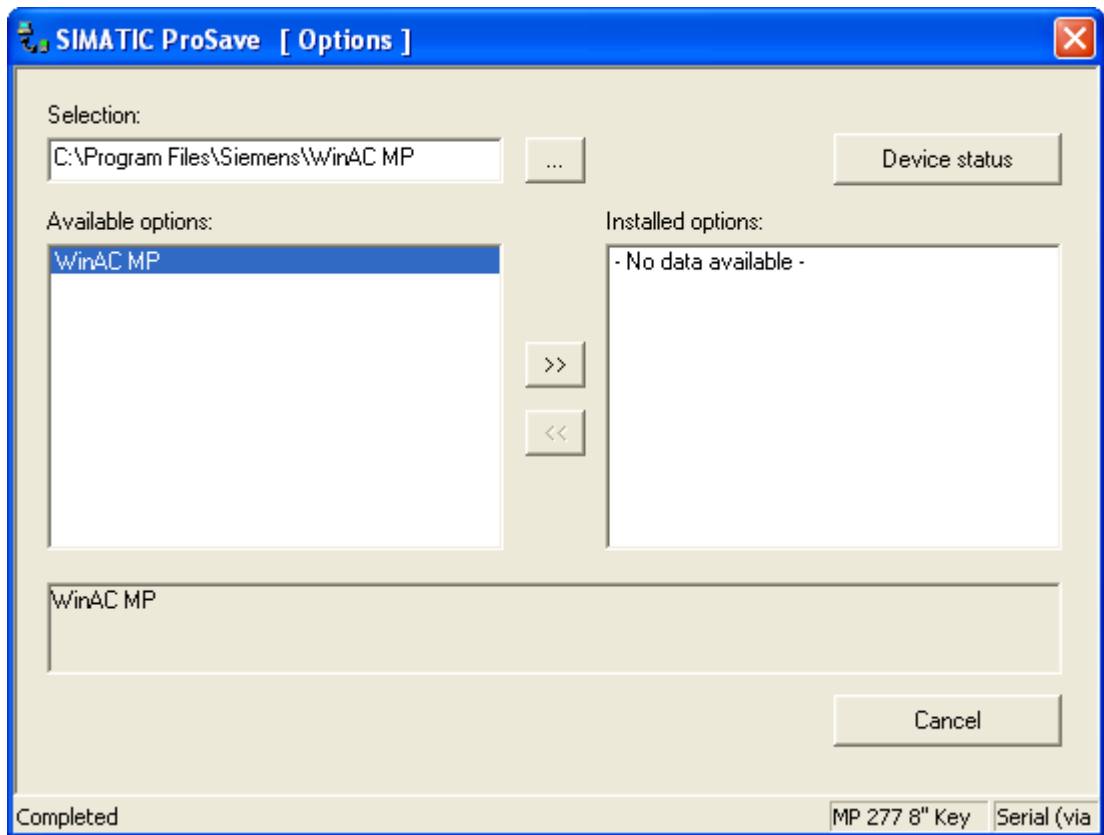

### Note

If there is a communication error, then you must check the following circumstances:

- The HMI device must be in Transfer mode.
  - Check the cable connections for a correct and firm connection.
  - The settings in ProSave and on the HMI device must be correctly defined for the connection.
- 

2. In the "Options" tab, select "WinAC MP" below "Available options".

3. To transfer WinAC MP to the HMI device, click the  button.

ProSave then starts to load the software of the WinAC MP control to the HMI device. While the files are being transferred the configuration PC shows the progress of the transfer. The following messages are displayed on the HMI device in the "Transfer" dialog box:

- Progress of the file receipt on the HMI device.
- Unzip data in the Flash file system.
- Save data in the Flash file system.

At the end of the transfer, a message confirms a successful transfer.

4. When transfer is complete, you will be asked to restart the device. Restart the device.

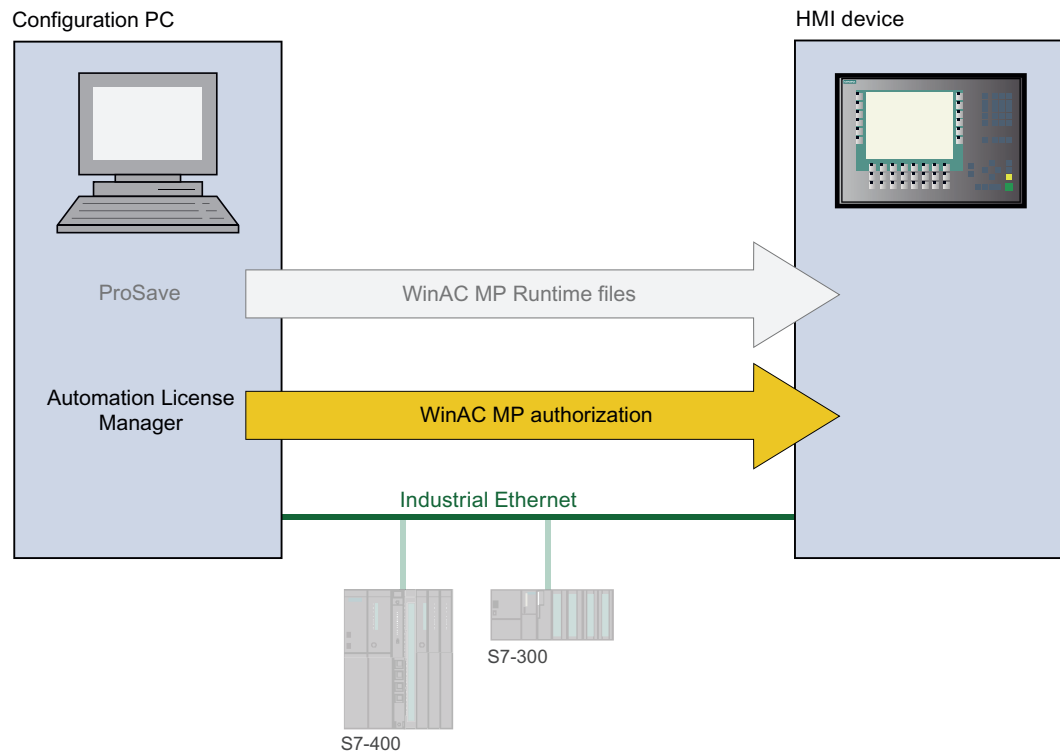

## Result

The WinAC MP control is now installed on the HMI device. Now, transfer the authorization for WinAC MP to the HMI device.

## 10.11.18. Transferring authorization to the HMI device 6

### Introduction

You need a license key to operate WinAC MP. The license key is transferred with the Automation License Manager to the HMI device.

### Requirements

The storage location of the license key can be called from the configuration PC.

### Procedure

To transfer the WinAC MP authorization to an HMI device, follow these steps:

1. Select the "Authorize/License" command from the "Online > Device maintenance" menu to start WinAC MP authorization.  
Automation License Manager is launched.
2. Select the "Connect HMI device" menu command.
3. Select the device type of the HMI device.
4. Select the type of connection and set the parameters for the connection.  
The connection to the HMI device is established. The connected HMI device is displayed.
5. Select the source drive.

6. Drag one or more license keys to the HMI device.  
The license keys are then transferred to the HMI device.
7. Close the Automation License Manager after a successful transfer.

### 10.11.18. WinAC MP system library

7

#### Screens from the system library

The screens from the system library are optimized for a 6' display with a resolution of 320 x 240. If you use a display of a different size, you can adapt the screens for your display in WinCC.

#### Standard screens and tags

The WinAC MP-system library offers you the standard screens "WinAC\_MP\_Home" and "WinAC\_MP\_Tuning" and the tags "WinAC\_MP\_Tags". To use the standard screens, move them to the "Screens" folder in the project tree.

In addition to the standard screens, the tags must be copied separately. To do this, drag "WinAC\_MP\_Tags" from the WinAC MP-system library to the "HMI\_Tags" folder in the project tree.

## 10.12 Using global functions

### 10.12.1 HMI device wizard basics

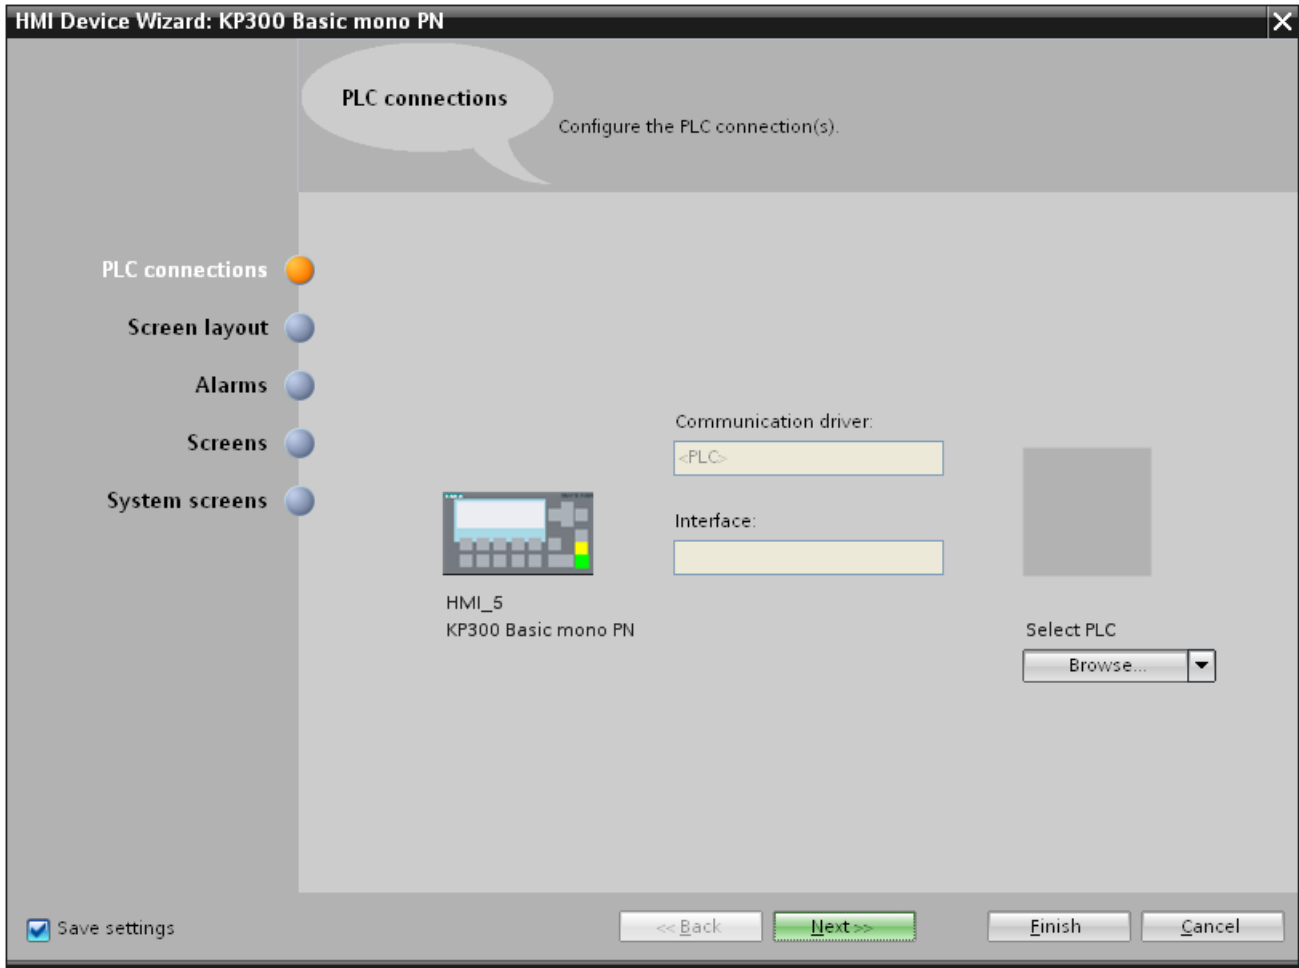

#### Introduction

The HMI device wizard will automatically start when you create a new HMI device in your project.

## HMI device wizard

The HMI device wizard will guide you through each dialog step by step and help you set up a device. You use the HMI device wizard to specify the basic settings for your HMI device, such as screen layout and the connection to your PLC.

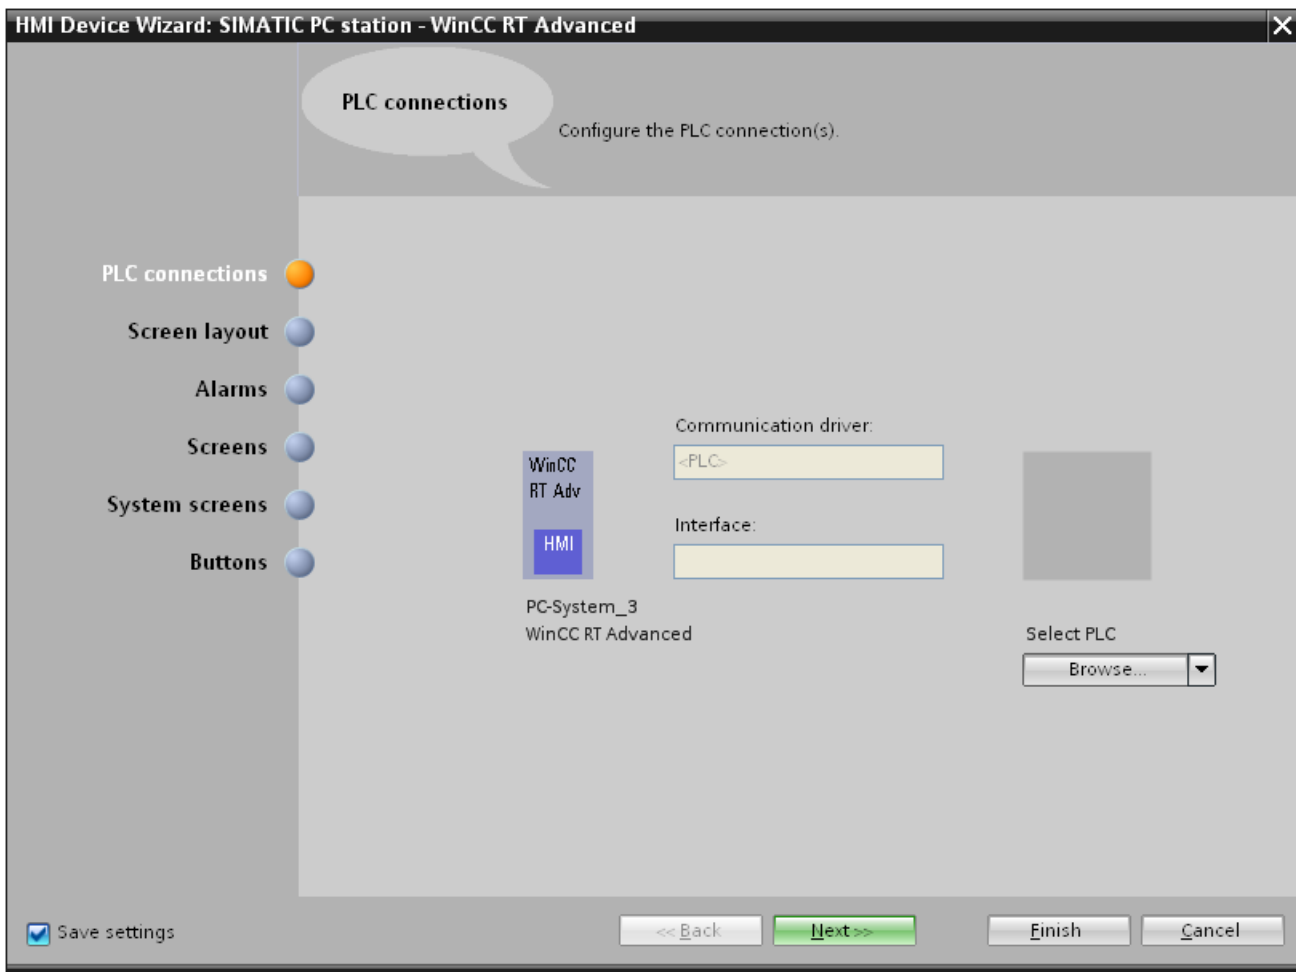

## See also

HMI device wizard basics (Page 5836)

## 10.12.2 HMI device wizard basics

### Introduction

The HMI device wizard will guide you through each dialog step by step and help you set up a device. You use the HMI device wizard to specify the basic settings for your HMI device, such as screen layout and the connection to your PLC.

### Opening the HMI device wizard

1. Add a new device to your project, for example, RT Advanced.
2. Click on the device in the project tree.
3. Select "Start the HMI device wizard" in the shortcut menu. The "HMI device wizard" opens.

---

#### Note

If you make changes after adding the device, such as adding a new screen, the HMI device wizard will not open again.

---

## See also

HMI device wizard basics (Page 5832)

## 10.12.3 Working with libraries

### 10.12.3.1 Basics on libraries

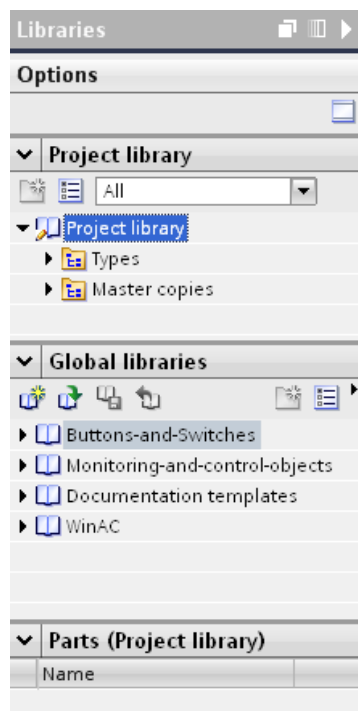

#### Introduction

Store all objects you need frequently in the libraries. An object that is stored in the library only has to be configured once. It can then be used repeatedly as often as required. Library objects extend the number of available screen objects and increase the effectiveness during configuration through the multiple usage of ready-to-use objects.

Your WinCC software package is supplied with comprehensive libraries that contain, for example, "Motor" or "Valve" objects. You may, however, define your own library objects.

You manage libraries in the "Libraries" task card or library view. The following libraries are available:

- Project library
- Global libraries

---

**Note**

There is a symbol library in the "Tools" task card in the "Graphics" palette.

---

### Project library

There is one library for each project. Objects of the project library are stored alongside with the project data and are available only for the project in which the library was created. If the project is moved to another PC, any project library created in it is also moved.

To use the library object of the project library in other objects, move or copy the object into a global library.

### Global libraries

A global library is saved independently of the project data in its own file with the extension \*.al12.

A project can access several global libraries. A global library may be used concurrently in several projects.

When a library object is changed by a project, this library will be changed in all projects in which these libraries are open.

### Library objects

A library can contain all WinCC objects. Examples:

- Complete HMI device
- Screens
- Display and control objects including tags and functions
- Graphics
- Tags
- Alarms
- Text and graphics lists
- Faceplates
- User data types

### See also

Copy templates and types (Page 5840)

Screen basics (Page 3241)

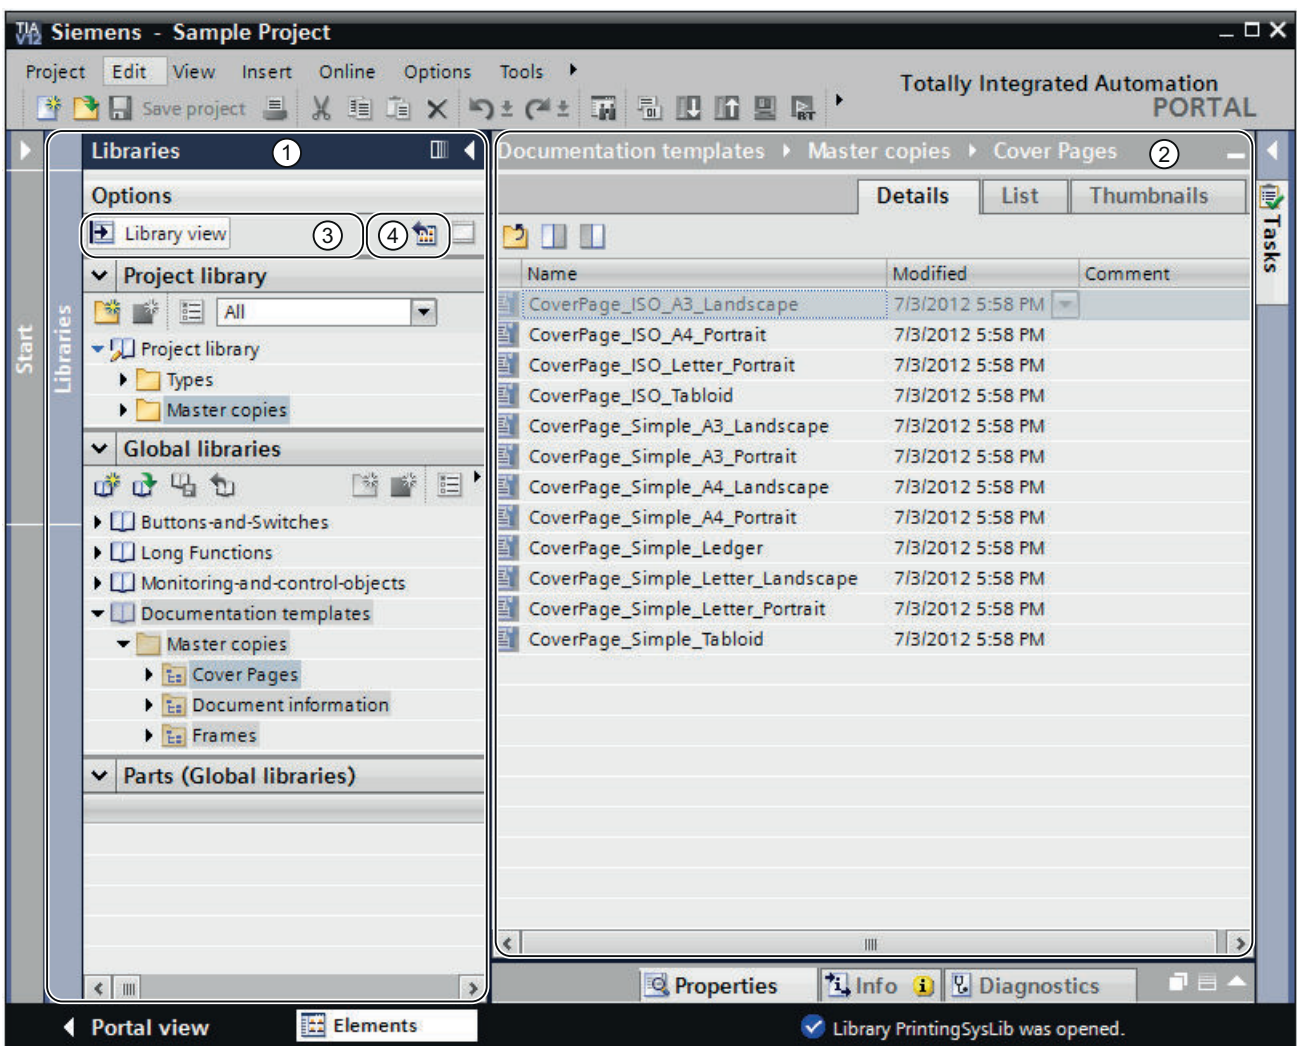

### 10.12.3.2 Overview of the library view

#### Function of the library view

The library view combines the functionality of the "Libraries" task card and the overview window. In the library view, the elements of a library are displayed in various views. In the details view, for example, you see additional properties of the individual elements. You can also edit and version the types in the library view.

#### Layout of the library view

The following figure shows the components of the library view:

- 1 Library tree
- 2 Library overview
- 3 "Library view" button
- 4 "Open or close library overview" button

## Library tree

The library tree is similar to the "Libraries" task card, apart from a few minor differences. In contrast to the task card, there is no "Elements" palette, because the elements are displayed in the library overview. In addition, you can close the library view in the library tree, or open and close the library overview.

## Library overview

The library overview corresponds to the overview window and displays the elements of the currently selected object in the library tree. You can display the elements in three different views. You can also perform the following actions in the library overview, for example:

- Copying elements
- Moving elements
- Versioning types
- Editing faceplates and HMI user data types
- Editing type instances

### 10.12.3.3 Copy templates and types

#### Introduction

Both the "Project library" and the "Global library" contain the two folders "Master copies" and "Types". You can create or use the library objects either as a master copy or a type.

#### Master copies

Use master copies to create independent copies of the library object.

#### Types

Create instances of objects of the "Types" folder and use these in your project. The instances are bound to their respective type.

#### Administration of the library objects

You can copy and move library objects to another library. You can only copy master copies to the "Master copies" folder or any sub-folder of "Master copies". You can also only insert types in the "Types" folder or any sub-folder of "Types".

#### See also

Basics on libraries (Page 5835)

State of type versions (Page 5854)

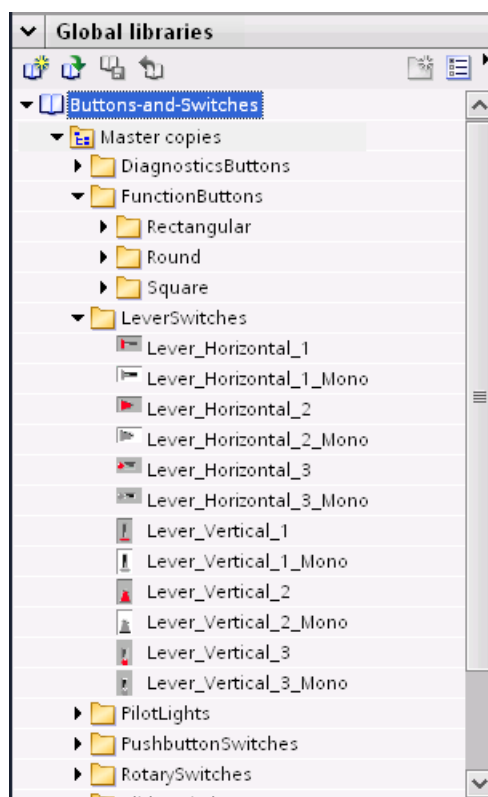

### 10.12.3.4 Libraries in WinCC

#### Introduction

The WinCC software package includes extensive libraries. Sorted by topic into folders, they contain preassembled graphic objects which you can use in screens for operation and monitoring of your plant.

#### Global library "Buttons and Switches"

The libraries "Buttons and Switches" offer a wide selection of buttons and switches.

The folders divide switches and buttons into categories. The "DiagnosticsButtons" folder contains the object "System diagnostics indicator", for example. You use the "System diagnostics indicator" object for system diagnostics in your plant.

---

#### Note

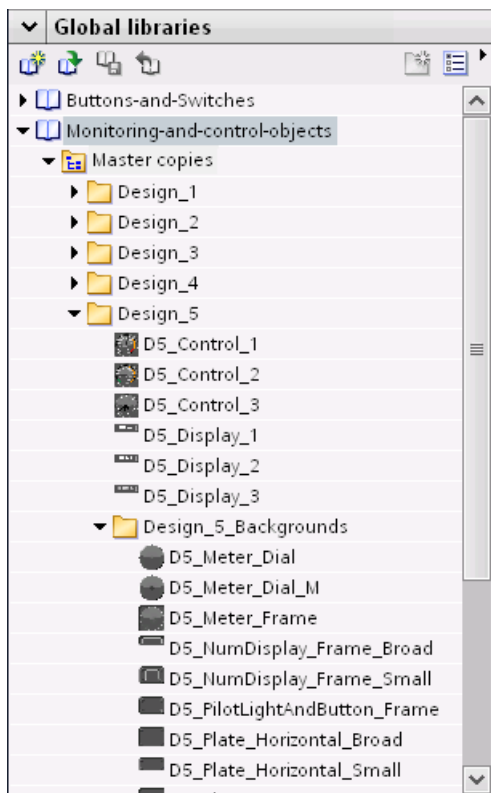

You can only use the objects in the "DiagnosticsButtons" folder on Comfort Panels.

You cannot use objects which have "Switch" in the object name or in the associated folder name in Runtime Professional.

---

### Global library "Monitoring and Control objects"

The "Monitoring and Control objects" library offers more complex display and operating objects in several designs and corresponding control lights, buttons and switches.

In addition, graphics views for the designs are stored in the "Design\_Backgrounds" folder; they can be used as object backgrounds for the custom extension of the scope of the library.

---

#### Note

You cannot use objects which have "Switch" in the object name in Runtime Professional. The same applies for the object "D5\_Display\_3" with the date/time field it contains.

---

### 10.12.3.5 Managing libraries

#### Overview of the library management

#### Function of the library management

Master copies and types with dependencies to other library elements are subject to some functional restrictions. They can, for example, not be deleted as long as dependencies still

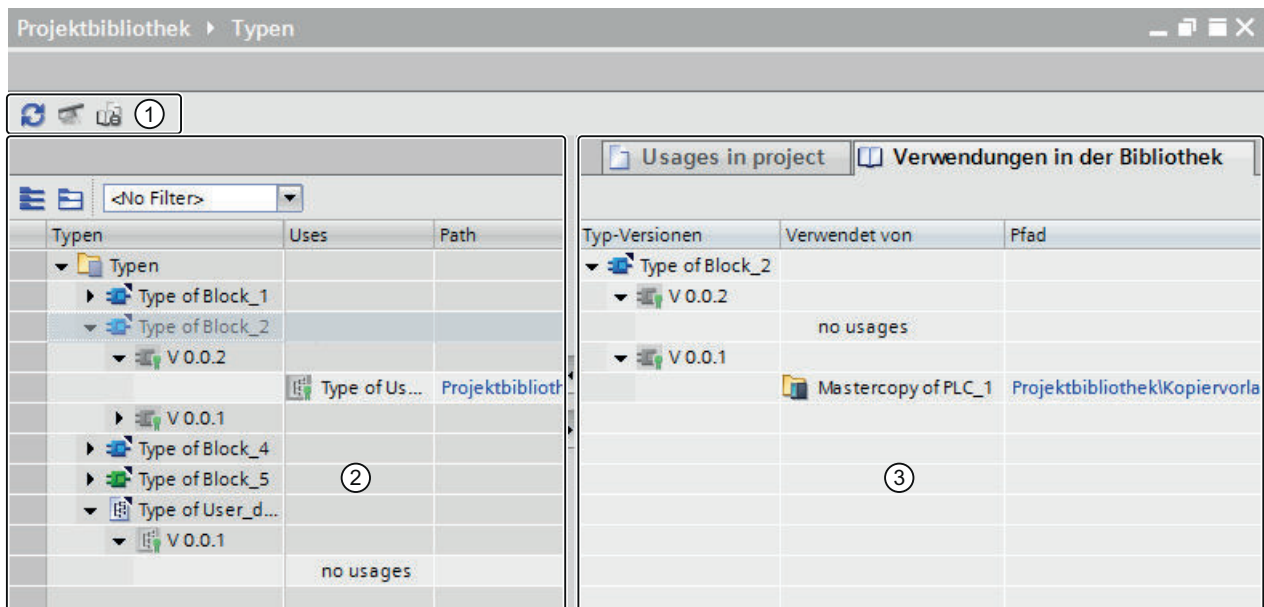

exist. This prevents other library elements from becoming useless. The library management is used to identify the dependencies and to create an overview of the work progress.

The library management offers the following functions:

- Display of the correlations of types and master copies  
If a type is referenced in other types or master copies, the correlations are displayed in the library management. You will also be able to see which library elements reference a type or a master copy.
- Display of points of use of types in the project
- Display all types that include a version with the "In testing" or "In progress" status

### Layout of the library management

The following figure shows the components of the library management:

- ① Toolbar of the library management
- ② "Types" area
- ③ "Uses" area

## Toolbar of the library management

You can perform the following tasks in the toolbar of the library management:

- **Update view**  
If the project was changed, you can update the view of the library management.
- **Clean up library**  
You can clean up the project library and global libraries. By cleaning up a library, you delete all types and type versions that are not linked to an instance in the project.
- **Harmonize project**  
By harmonizing a project, you adapt the names and the path structures of type uses in the project to the corresponding names and path structures of the types within a library.

## "Types" area

The "Types" area displays the contents of the folder that you have selected in the library view. You can open or close all types by using the buttons in the toolbar of the "Types" area. You can also use the "Filter" drop-down list to filter the view and display all types with the "In testing" or "In progress" status only. For each type, the types that it references are displayed.

## "Uses" area

The "Uses" area gives you an overview of the points of use of the selected types and master copies. The "Uses" area is divided into two tabs:

- **"Uses in the project" tab**  
The "Uses in the project" tab is used to show the instances of type versions and their respective point of use in the project. When you select an instance, you can show the cross references of the instance in the project in the Inspector window.
- **"Uses in the library" tab**  
The "Uses in the library" tab is used to show all points within the library at which a type or a master copy is used.

## Opening library management

### Procedure

To open the library management, follow these steps:

1. Open the library view.
2. Select a type or any folder that contains types.
3. Select the "Library management" command from the shortcut menu.

### Result

The library management opens and the types are displayed with their versions.

## Filtering types in the library management

### Introduction

A filter function in the library management enables you to limit the displayed types. The following filters are available:

- Display all types that include a version with "in progress" status
- Display all types that have no instances in the project
- Display all types that have more than one version
- Display all released types

### Requirement

At least one type has been created.

### Filtering for all types with "in progress" status

1. Select the "Types" folder in the project library.
2. Select the "Library Management" command in the shortcut menu of the "Types" folder. The library management opens.
3. Select "Pending changes" from the "Filter" drop-down list. The "Types" area only displays types that have the "in progress" status.

### Filtering for all types that have no instances in the project

1. Select the "Types" folder in the project library.
2. Select the "Library Management" command in the shortcut menu of the "Types" folder. The library management opens.
3. Select "No instances in project" from the "Filter" drop-down list. "Not used in project" or "No instances in the project"? The "Types" area only displays types that have the "in progress" status.

### Filtering for types with multiple versions

1. Select the "Types" folder in the project library.
2. Select the "Library Management" command in the shortcut menu of the "Types" folder. The library management opens.
3. Select "Multiple versions" from the "Filter" drop-down list.
4. The "Types" area only displays types that have more than one version.

## Filtering for all released types

1. Select the "Types" folder in the project library.
2. Select the "Library Management" command in the shortcut menu of the "Types" folder. The library management opens.
3. Select "Released types" from the "Filter" drop-down list. The "Types" area only displays types that have released versions.

## See also

Opening library management (Page 5842)

Creating a faceplate type (Page 3384)

## Creating a global library

### Introduction

In the libraries you store the configured objects that you want to use several times in your configuration. To use objects in several projects, create a global library.

### Requirement

- A project is open.
- The "Libraries" task card is displayed or the "Library view" is open.

### Procedure

1. Click the  icon under "Global library". The "Create new global library" dialog opens.

The screenshot shows a dialog box titled "Create new global library". It has a close button (X) in the top right corner. The dialog contains the following fields and values:

- Library name: my\_library
- Path: C:\Program Files\SIEMENS\Automation\Portal V11...
- Author: vmadmin
- Comment: (empty text area)

At the bottom right of the dialog, there are two buttons: "Create" (highlighted in green) and "Cancel".

2. Enter a name.
3. Select the path where the new library is to be stored.
4. Click "Create".

## Result

The new library is shown in the "Global libraries" palette. The global library contains the "Types", "Master copies" and "Common data" folders. Under the "Common data" you can find reports for the global library.

A folder with the name of the global library is created in the file system at the storage location of the global library. This actual library file is given the file name extension ".al12".

## Saving a global library

### Introduction

A global library is stored in a separate file on your hard disk drive. The file contains the objects of the global library including the referenced objects. E.g. the reference of a tag which was configured on an I/O field is also saved in the library.

WinCC prompts you to save the global libraries when you close WinCC or your project without saving. You also can store the global library during configuration, without storing the entire project.

### Requirement

- You have opened a project which contains at least one library.
- The "Global libraries" palette is displayed or the library view is open.

### Procedure

1. Click the  icon in the "Global library" palette to save the library you want to save.
2. Click the  icon in the "Global library" palette.

You can alternatively select the "Save Library" command in the shortcut menu.

If you want to store the global library in a different folder, select "Save as" in the shortcut menu. Select the path in which you want to store the new library and enter a file name.

## Result

The global libraries are saved under their current file name or a file name you have specified.

## Opening a global library

### Introduction

In WinCC, the global libraries are stored in separate files. You can use a global library in every project.

## Requirement

- You have saved a global library.
- A project is open.
- The "Libraries" task card is displayed or the library view is open.

## Procedure

1. Click the  icon in the "Global library" palette.  
The "Open global library" dialog box is displayed.
2. Select the path in which the library is stored.
3. Click "Open".

---

### Note

To have the access to a global library from multiple projects, open the global library read-only. As soon as a global library is not opened read-only, access from other projects is blocked.

---

## Result

WinCC displays the opened global library in the "Global library" palette.

## Displaying logs of global libraries

Logs listing all changes made to the global library are created when global libraries are updated. The logs are stored together with the global library and are always available once you have opened the global library.

## Procedure

To open the logs of a global library, follow these steps:

1. Open the global library in the "Libraries" task card or in the library view.
2. Open "Common data > Logs" in the lower-level folder.
3. Double-click the required log.  
The log opens in the work area.

## Updating a project with the contents of a library

### Introduction

After you have edited several types in the project library, update all instances in the project to the most recent version of the types from the project library.

## Requirement

The "Libraries" task card or the library view is open.

## Procedure

1. Select the project library.
2. Select "Update > Project" from the shortcut menu. A dialog opens.
3. Select either the entire project or individual devices for the update.
4. Select the "Delete all unused versions of affected types" check box to delete all older versions of the updated types from the project library.
5. Click "OK" to confirm.

## Result

All instances of the types are updated in the project to the most recent version of the selected types in the project library.

You can find a log of the update process in the project tree under "Common data".

## Updating a library with the contents of another library

The following options are available for updating libraries:

- Updating a global library with types from another global library
- Updating the project library with types from a global library

Each of the following elements can be selected as source for the update:

- An entire library
- Individual folders within a library
- Individual types

## Requirement

To update a global library, open the library with write rights.

## Requirement

The "Libraries" task card or the library view is open.

## Procedure

To update a library with the contents of a different library, follow these steps:

1. Select the entire library or a folder within the library or individual types.
2. Right-click the source and select the "Update > Library" command from the shortcut menu. The "Update library" dialog box opens.

3. Select the type of library you want to update:
  - Select "Update the project library" to update the project library with types from a global library.
  - Select "Update a global library" if you want to update a global library.
4. Optional: Select the global library you want to update from the drop-down list.
5. Select the "Delete all unused versions of affected types" check box to delete all older versions of the updated types from the project library.
6. Click "OK" to confirm.

## Result

- Types not yet available in the target library are supplemented there with all their versions. More recent versions are added to the types that already exist in the target library. If a more recent version of a type already exists in the target library, the latest version is nevertheless copied and automatically assigned a newer version number.
- A log listing all performed changes to the target library is created for the update process. If you have updated the project library, you can find the log in the project tree under "Common data > Logs". If you have updated a global library, you can find the log in the "Common data > Logs" folder in the level below the global library.

### 10.12.3.6 Managing objects in a library

#### Displaying library objects

##### Introduction

The libraries are displayed as file folders in the corresponding palette. The elements contained in the library are displayed in the file folder and in the "Elements" palette.

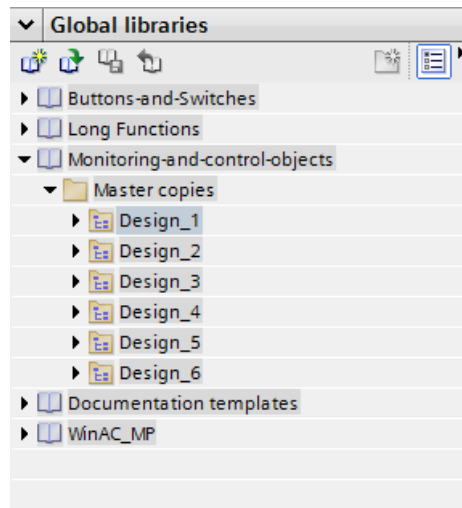

##### Requirement

- At least one library object has been created in a library.
- The "Libraries" task card is opened.

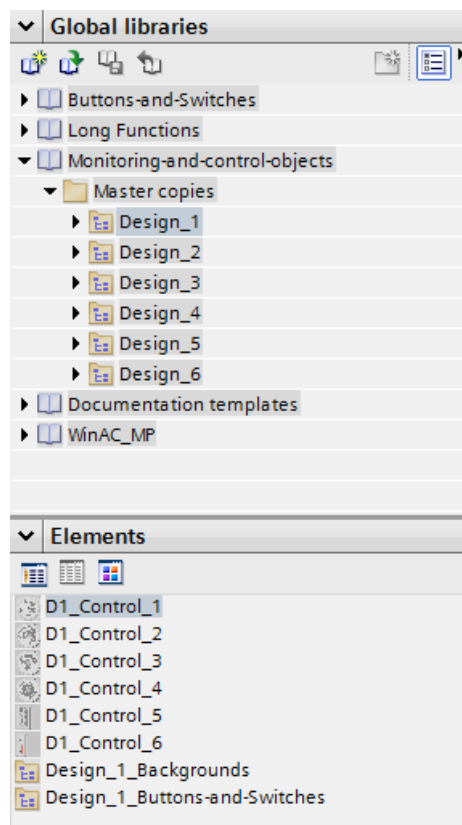

## Procedure

1. Select the library in the corresponding palette whose library objects you want to display.

2. Click .  
The contained library objects are displayed in the "Elements" palette.

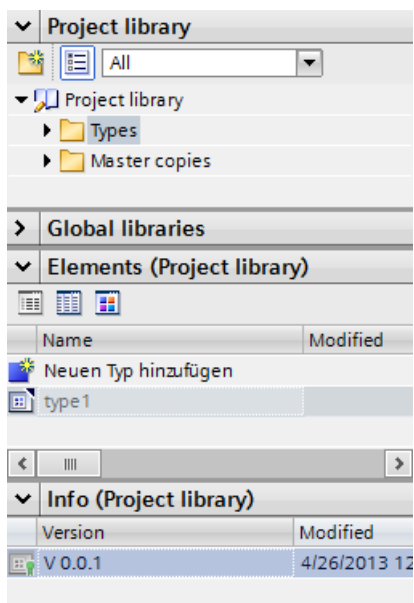

3. Click one of the following icons:

Icon	Description
	Element view in detailed mode
	Element view in list mode
	Element view in overview mode with icons

When several objects are assigned to the library with a multiple selection, only one of the objects is shown in the "Elements" palette. The individual components of this element are displayed in the "Parts" palette.

### Show parts of the library objects

1. Select the library in the corresponding palette from which you want to view the components of an element.
2. Click .
3. The contained library objects are displayed in the "Elements" palette.
4. Select the element.  
The "Parts" palette shows the objects of which the element consists.

### Result

The library objects are displayed in accordance with the configuration. The components of the faceplates are displayed.

## Storing an object in a library

### Introduction

You can store all of WinCC objects, such as screens, tags, graphic objects or alarms in your libraries. You can use drag-and-drop to move the corresponding object from the work area, project window or detail view to the library. In a library you have divided into categories, you can directly add objects to a specific category.

### Requirement

- The "Screens" editor is open.
- A screen object has been created in the work area of the screen.
- The created libraries are displayed.

### Procedure

1. Select the object in the work area of the "Screens" editor.
2. Drag-and-drop the object from the work area to the desired library.  
The mouse pointer is transformed into a crosshair with an appended object icon.

### Result

The object is saved to the library for further use in multiple instances of your configuration.

## Inserting a library object

### Introduction

The system always assigns the inserted library object a name which consists of the name of the object type and of a consecutive number.

If the inserted object already exists, you have the option of replacing the object or of saving it under a new name.

You cannot insert library objects that are not supported by the HMI device.

---

**Note**

If you insert a screen with interconnected template from the library, the template will also be inserted. Any existing matching template is not used.

---

## Requirement

- The "Libraries" task card is opened.
- The editor in which you want to insert the library object is open.

## Procedure

1. Select a library object from the library.
2. Drag-and-drop the library object to the position in the work area where you want to insert the object.  
The library object is inserted.

## Result

If the object was contained in the "Copy templates" folder, you have inserted an independent copy of the library object in the editor.

If the object was contained in the "Types" folder, you have inserted an instance of the library object in the editor.

### 10.12.3.7 Using types and their versions

#### State of type versions

#### Introduction

Depending on the point of use, the version of a type has different statuses.

#### Released version

The "released version" status is available for all types, regardless of the point of use.

If you want to edit a released version, you must first create a new test version or an "in progress" version.

Released type versions of scripts and screens can be opened and viewed at their instance.

### **"In progress" version**

The "in progress" status is possible for the following types:

- Faceplates
- User data
- Styles

When you create a new type or a new version of a released type, the type is assigned the status "in progress".

Types with the "in progress" status can be edited in the library view without the need for a reference to an instance in the project. Upon release, the compatibility of the type is tested by a consistency check.

### **"In testing" version**

Only versions of scripts and HMI screens have the "in testing" status.

When you create a new version of a type, the type is assigned the status "in testing".

A version with "in testing" status is linked to an instance in the project. You can set only one version to "in testing" for each type at a given time.

A version in testing may only be linked to a single instance in the project. Therefore, it is not possible to copy an instance to the clipboard, to duplicate it or to create an additional type from the instance as long as it has "in testing" status.

### **See also**

- Generating a script as a type (Page 5855)
- Generating a screen as a type (Page 5856)
- Creating a faceplate type (Page 3384)
- Create a new version of a type (Page 5857)
- Copy templates and types (Page 5838)

### **Generating a script as a type**

#### **Requirement**

- A project is open.
- An HMI device has been created and opened.
- The project tree is open.
- The "Libraries" task card is opened.

## Procedure

1. Open the "Scripts" editor in the project tree.
2. Create a new script.
3. Select the script in the project tree.
4. Drag-and-drop the script into a library in the "Libraries" task card. A dialog opens.
5. Enter a name.
6. Enter a comment.

## Result

You have created a type version of a script in the library. The created type is stored as a released version in the library. An instance of the type is used in the project.

To change the script create a new version of the script.

## See also

State of type versions (Page 5852)

## Generating a screen as a type

### Requirement

- A project is open.
- An HMI device has been created and opened.
- The project tree is open.
- The "Libraries" task card is opened.

## Procedure

1. Open the "Screens" editor in the project tree.
2. Create a new screen.
3. Select the screen in the project tree.
4. Drag-and-drop the screen into a library in the "Libraries" task card. A dialog opens.
5. Enter a name.
6. Enter a comment.

## Result

You have created a type of a screen in the library.

The created type is stored as a released version in the library. An instance of the type is used in the project.

To change the screen create a new version of the screen.

## See also

State of type versions (Page 5852)

## Generating a style as a type

### Introduction

To define a new style, add a new type in the project library.

### Adding a new style

1. Open the "Libraries" task card.
2. Select the "Add new type" command under "Types" in the shortcut menu of the project library. A dialog opens.
3. Select "HMI style".

### Result

The new style is created and displayed under its selected name in the project library. The HMI style type is assigned the status "in progress" and the version 0.0.1.

## Create a new version of a type

### Principle

If you create a new version of a type, the point of use of the type determines the status of the newly created version.

### Requirement

The "Libraries" task card is opened.

A type has been created and released.

### Procedure

1. Select the released type.
2. Select "Edit type" in the shortcut menu.

## Result for types of faceplates, user data, and styles

A new version of the type is created.

The version has the status "in progress". The library view opens.

### Result for types of scripts and screens

A dialog opens.

After you have selected the settings in the dialog, the version is set to the status "in testing". The instance used in the project is set to the status "in testing". The library view opens.

### See also

State of type versions (Page 5852)

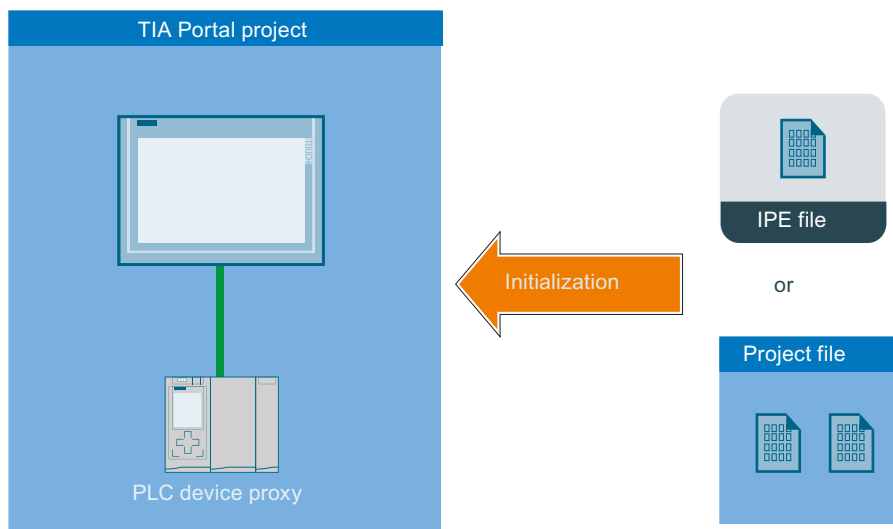

## 10.12.4 Using controller data from other projects

### 10.12.4.1 Basics of Inter Project Engineering (IPE)

#### What is IPE?

You can use the IPE (Inter Project Engineering) function to read in controller data from other TIA Portal projects and use it for configuring.

IPE enables you to transfer and merge the HMI configuration and PLC programming communication into various TIA Portal projects.

You can exchange controller data using IPE in two ways:

- Initializing device proxy via an IPE file (Page 5859)
- Initializing a device proxy via a project file (Page 5865)

## 10.12.4.2 Controller data

### Introduction

In the source project of the PLC, you can select which controller data is to be stored as device-proxy data.

To this end, you create a device proxy data from a configured PLC.

### Which device proxy data can be exchanged?

The following device proxy data can be exchanged via IPE:

- Program blocks
- Technology objects
- PLC tags
- PLC alarms

The following information is exchanged automatically:

- Interfaces of the PLC
- Configured communication processors and communication modules at the PLC

## 10.12.4.3 Initializing a device proxy via an IPE file

### Initializing device proxy via an IPE file

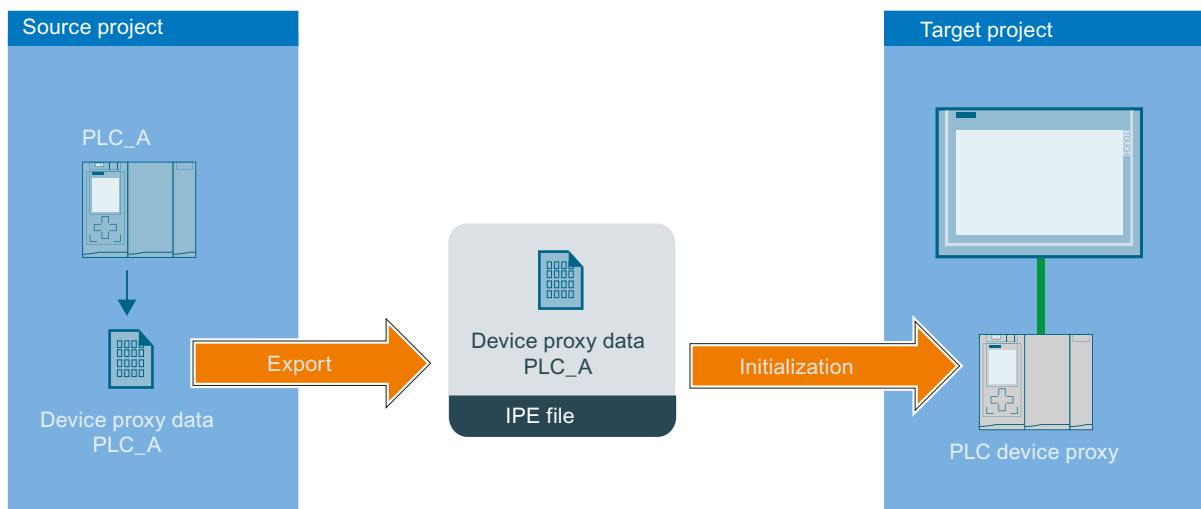

#### How does initialization of a device proxy via an IPE file work?

You can exchange controller data between two or more projects using IPE files.

Due to their small data volume, you can send IPE files by e-mail, for example.

You can create multiple IPE files with different device proxy data for each PLC.

A device proxy can only be filled with one device proxy data record in the target project.

- An IPE file is exported from the source project. The IPE file contains device proxy data of the PLC "PLC\_A".
- A device proxy is created in the target project.
- In the target project, the device proxy is then initialized with the device proxy data from the IPE file.
- Following initialization, all device proxy data from the IPE file is contained in the device proxy.
- If changes are made in the source project, the device proxy of PLC\_A in the target project can be updated via the new IPE file.

## Initializing a device proxy via an IPE file

### Introduction

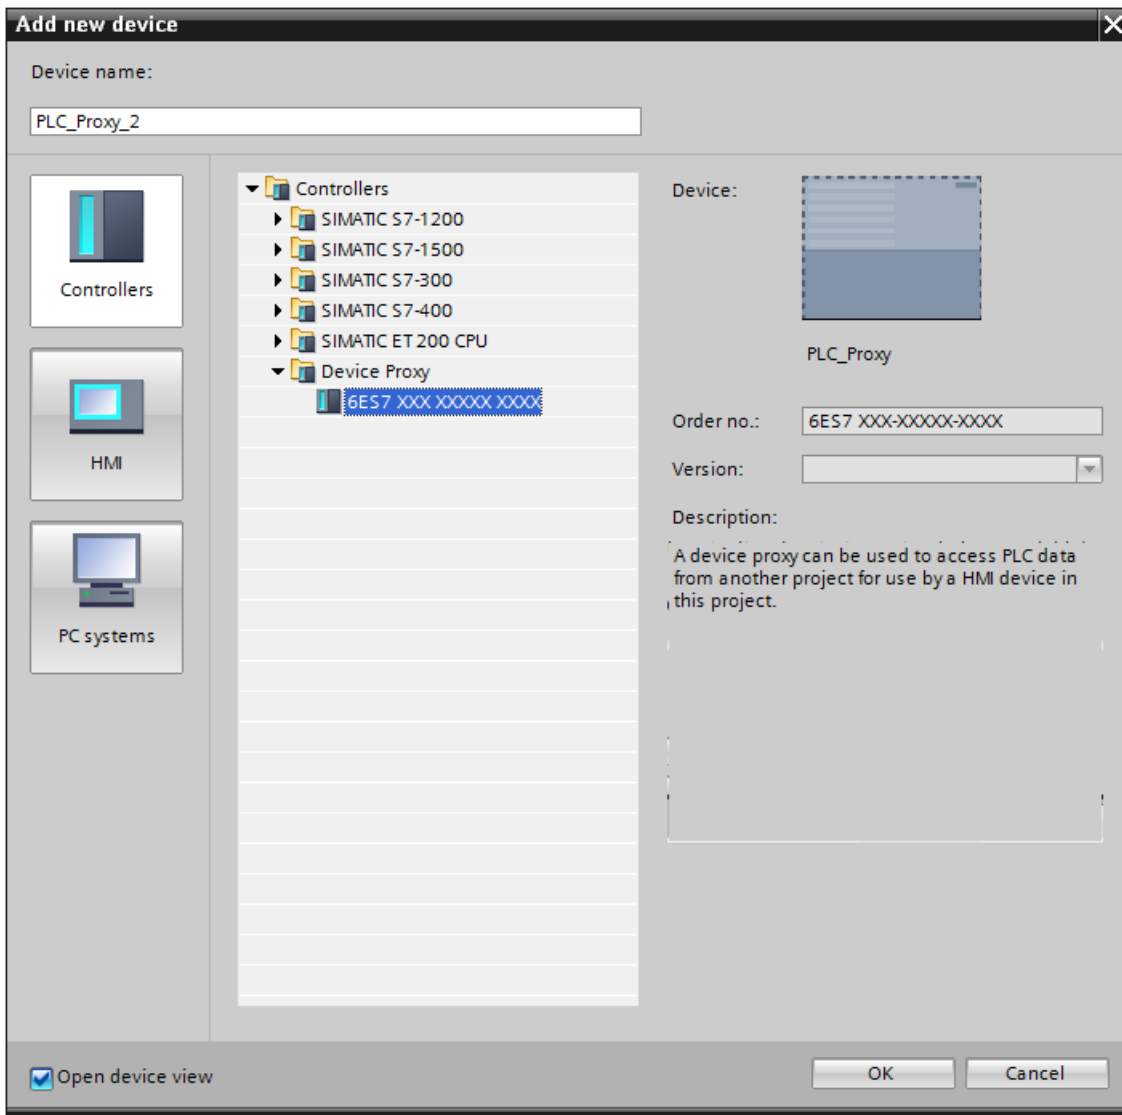

You initialize device proxy data using a dialog on the device proxy in the TIA Portal. The IPE file contains the device proxy data from the source project.

### Requirement

IPE file is available.

## Procedure

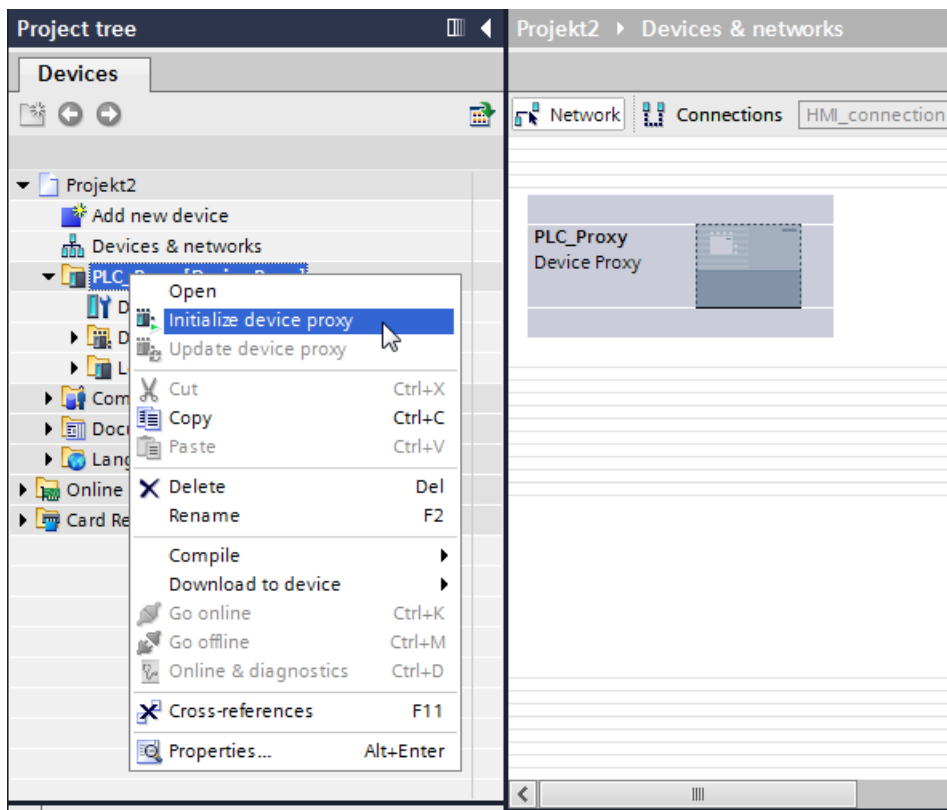

1. Double-click "Add new device" in the project tree.
2. Select the device proxy under "Controller".

A new device is created in the "Devices & Networks" editor.

3. Select the device proxy in the project tree.

- Click "Initialize device proxy" in the shortcut menu.

- Select the IPE file and click "Open".  
The "Initialize device proxy" dialog opens.

**Note**

You cannot select the device proxy data before initialization in the target project.

All device proxy data included in the IPE file is transferred.

Initialize a project file if you want to select specific device proxy data before initialization:  
[Initializing a device proxy via a project file \(Page 5865\)](#)

- Click "OK".  
Initialization of the device proxy is started.

**Result**

Following initialization, all device proxy data from the IPE file is contained in the device proxy.

You can now configure an HMI connection with the device proxy and connect PLC tags from the device proxy with HMI tags, for example.

## Updating a device proxy via an IPE file

### Introduction

If changes were made to the device proxy data in the device proxy source project, the device proxy data can be updated in the target project.

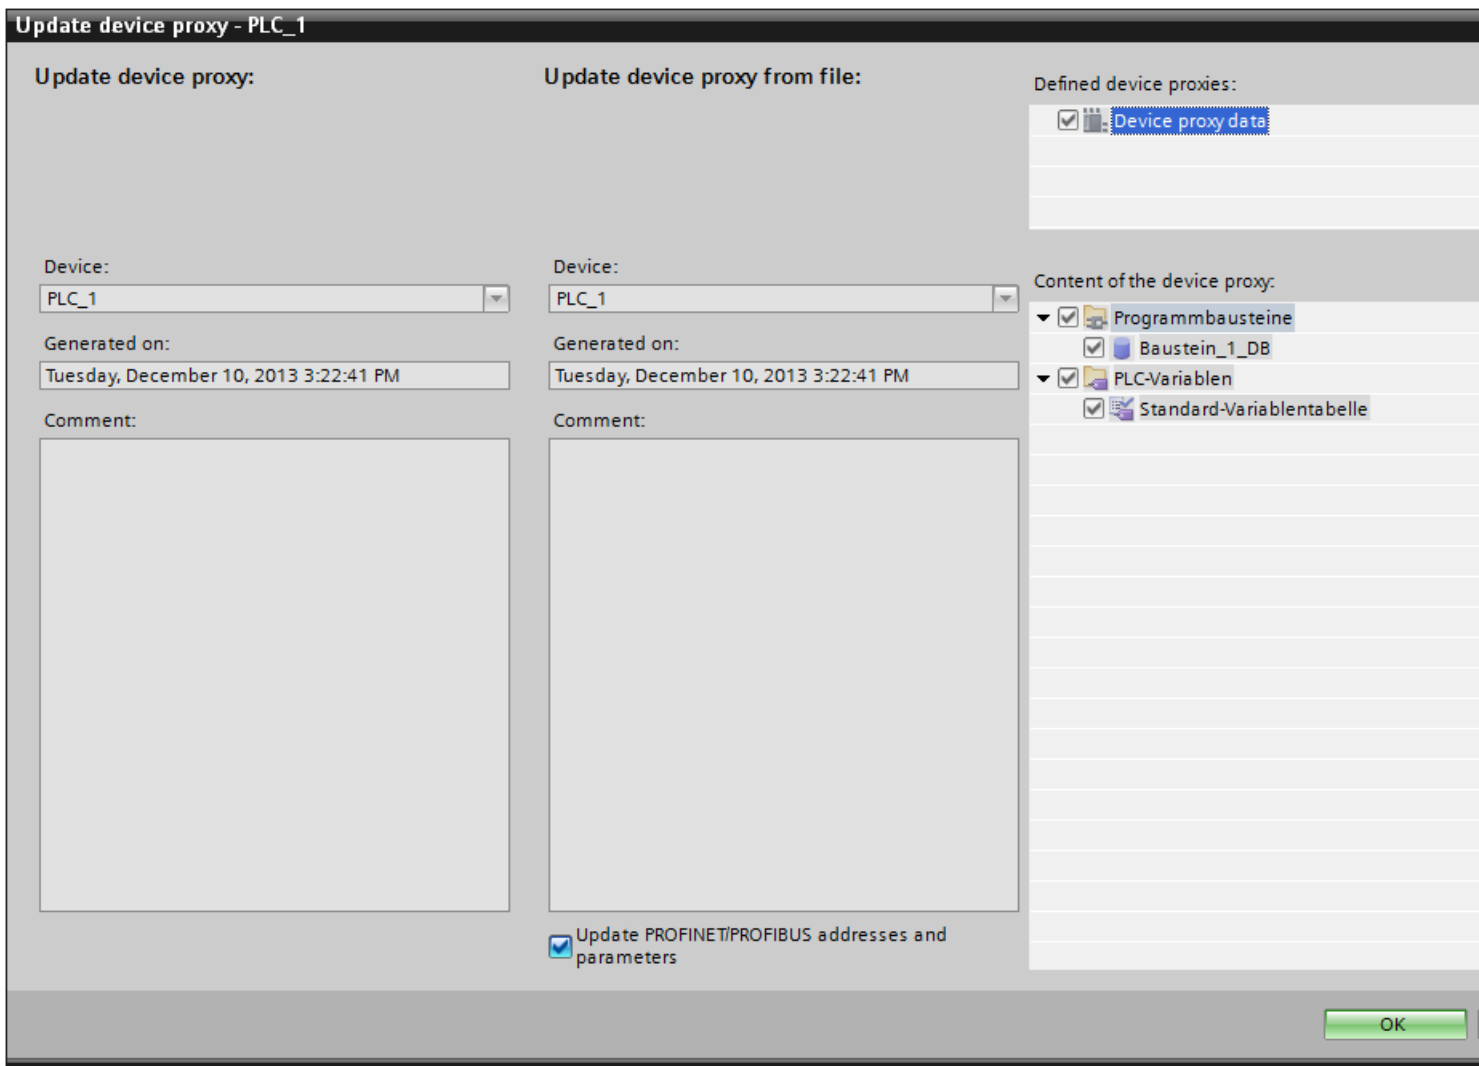

### Requirement

- New IPE file contains the device proxy data from the source project.
- A device proxy has already been initialized using an IPE file in the target project.

### Procedure

1. Select the device proxy in the project tree.
2. Click "Update device proxy" in the shortcut menu.

3. Select the IPE file.

4. Select whether you wish to update the PROFINET or PROFIBUS addresses.

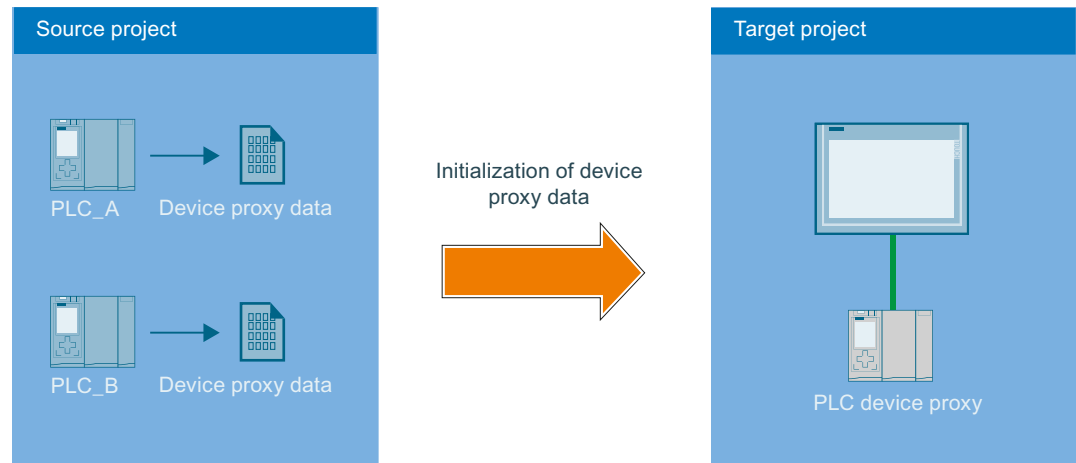

5. Click "OK".

#### 10.12.4.4 Initializing a device proxy via a project file

##### Initializing a device proxy via a project file

##### How does an initialization via project file work?

You can transfer controller data using a project file in your TIA Portal project:

- There are two PLCs in the source project.
- Device proxy data objects of the two PLCs are created in the source project.
- The source project is saved.
- A device proxy is created in the target project.
- The source project (\*.ap13) is first selected using the command for the initialization of device proxy in the device shortcut menu.
- The "PLC\_A" and "PLC\_B" controllers are available for selection and their device proxy data have already been created.
- After selection of device proxy data of "PLC\_A", the data is stored in the PLC\_Proxy of the target project.
- Changes from the source project can be transferred by an update via the project file.

##### Initializing a device proxy via a project file

##### Introduction

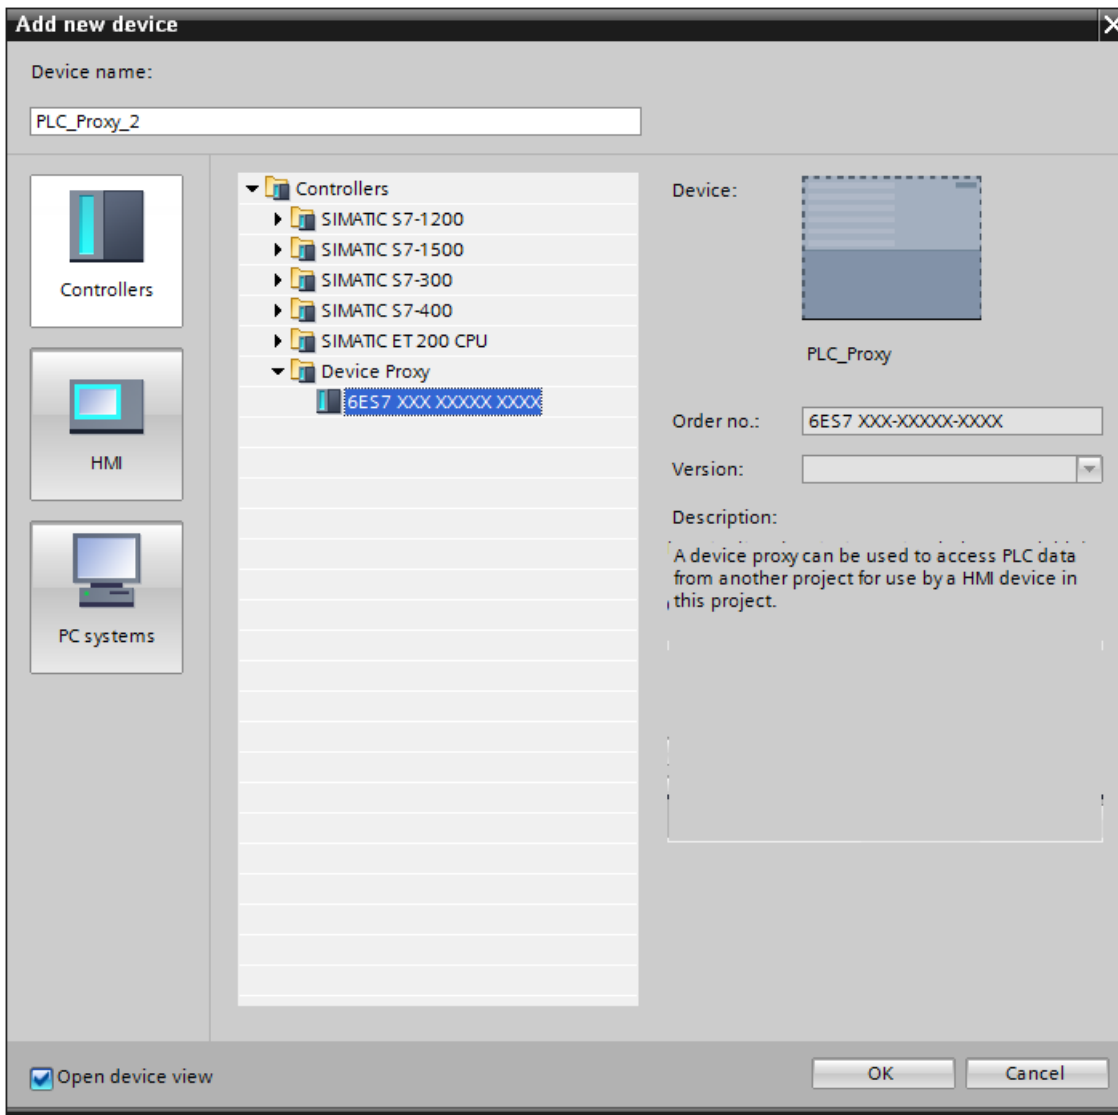

You initialize the device proxy using a project file.

##### Requirement

Project file (\*.ap13) exists.

### Procedure

1. Double-click "Add new device" in the project tree.
2. Select the device proxy under "Controller".

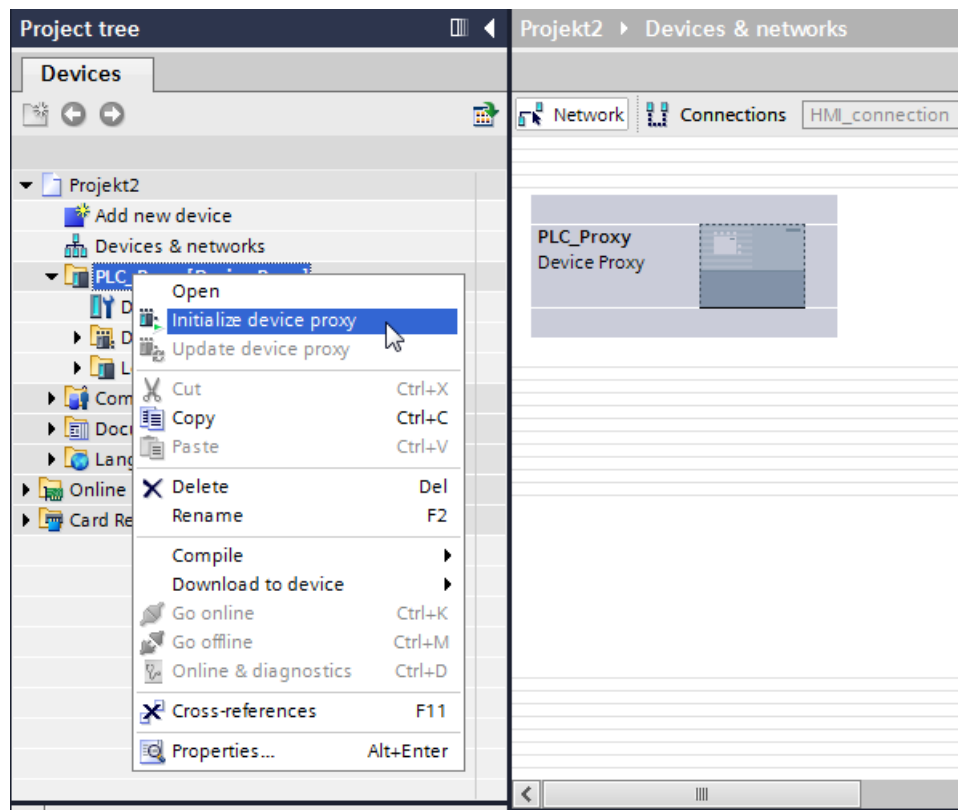

A new device is created in the "Devices & Networks" editor.

3. Select the device proxy in the project tree.

- Click "Initialize device proxy" in the shortcut menu.

- Select the following entry in the "Open device proxy data source" dialog:  
"TIA Portal projects (\*.ap13)"
- Select a project file and click "Open".  
The "Initialize device proxy" dialog opens.
- Select a device proxy data object already created from an available PLC to initialize the device proxy.
- Click "OK".

## Result

Following initialization, the controller data from the project file in the selected device proxy data object is stored in the device proxy.

You can now configure an HMI connection with the device proxy and connect PLC tags from the device proxy with HMI tags, for example.

## Initialization via Classic projects

You can find more information on importing controller data from projects prior to TIA Portal V11 in an FAQ.

Entry ID: 73502293 (<http://support.automation.siemens.com/WW/view/de/73502293>)

## **Updating a device proxy via a project file**

### **Introduction**

If changes have been made to the controller data in the source project of the device proxy, you can update the device proxy in your TIA Portal project.

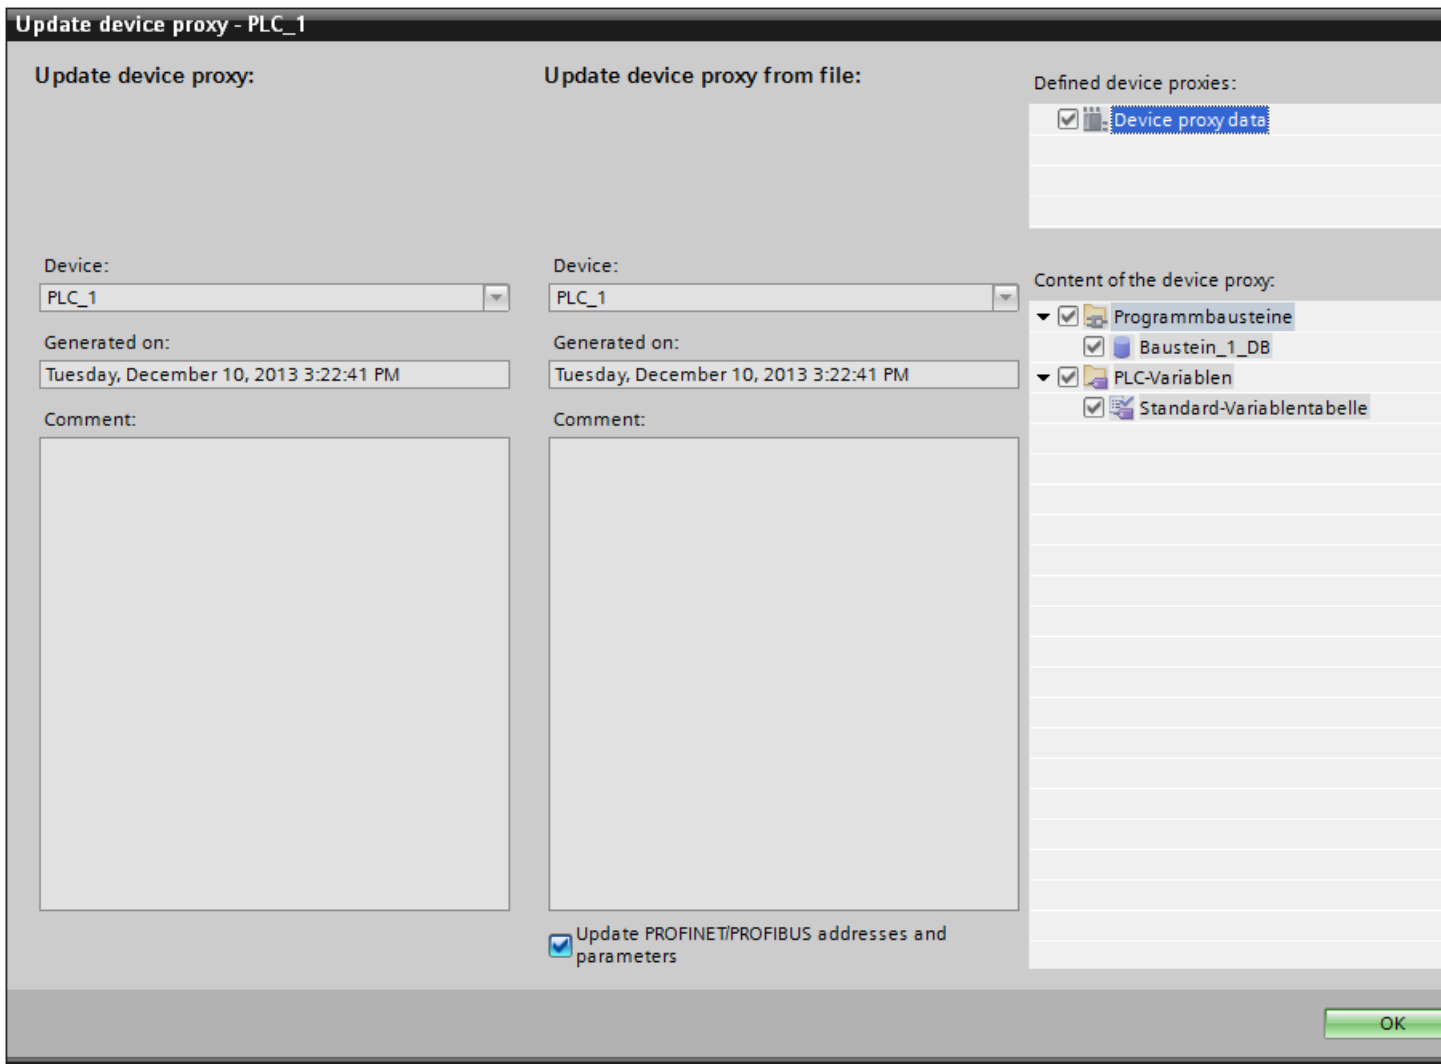

### **Requirement**

- Project file has been generated from the source project of the device proxy.
- A device proxy that has already been initialized is available in the target project.

### **Procedure**

1. Select the device proxy in the project tree.
2. Click "Update device proxy" in the shortcut menu.

3. Select the project file.  
The "Update device proxy" dialog opens.

4. Select a device.

---

**Note**

If you have created several device proxy data objects in the source project, you need to select one device proxy data object.

---

**Note**

Already initialized device proxies cannot be overwritten with controller data from a different PLC.

---

5. Select whether you wish to update the PROFINET or PROFIBUS addresses.
6. Click "OK".

## 10.12.5 Importing and exporting project data

### 10.12.5.1 Importing and exporting project data

#### Introduction

WinCC gives you the option of exchanging project data between the projects or copying them to external applications.

#### Exporting and importing between projects

You can export the following project data from a project and import them into another project.

- Recipe data records
- Alarms
- Tags
- Text lists
- Project texts

Exporting and importing reduces the workload. Instead of creating new data records, you use data already created in previous projects.

#### Editing the export file

The following file formats are available for export and import depending on the editor:

- \*.xlsx for alarms, tags, project texts and text lists
- \*.csv for recipe data records

You can edit the import file in Excel, for example.

#### XLSX file format

XLSX format is a file format for Excel tables based on the Open XML format. XLSX files are optimized for Microsoft Excel 2007.

You can sort the columns as required in the XLSX file.

#### CSV file format

CSV stands for Comma Separated Value. In this format, the columns of the table that contain the names and the value of the entry are separated by semicolons. Each table row terminates with a line break. You can also open the CSV file for editing in Excel.

#### Importing project data

When project data is imported, the objects in the project are created.

The syntax of the import file is checked during import. The accuracy of the values imported and dependencies between the imported values are not checked.

Any errors found in the imported data are reported when the project is compiled.

### **Copying in Excel format**

In all spreadsheet editors you can copy the content in Excel format into the buffer of your PC. Subsequently you insert the project data in Excel format directly into any application outside the TIA Portal. To this purpose you use the corresponding command in the shortcut menu of the work area:

- If you select the command in the shortcut menu of the line header, the complete line is copied into the buffer.
- If you select the command in the shortcut menu of a cell, only the cell content is copied into the buffer.
- If you select several lines and select the command, all marked data are always copied into the buffer.

This data exchange is only possible as an export.

## **10.12.5.2 Importing and exporting recipes**

### **Exporting recipes**

#### **Introduction**

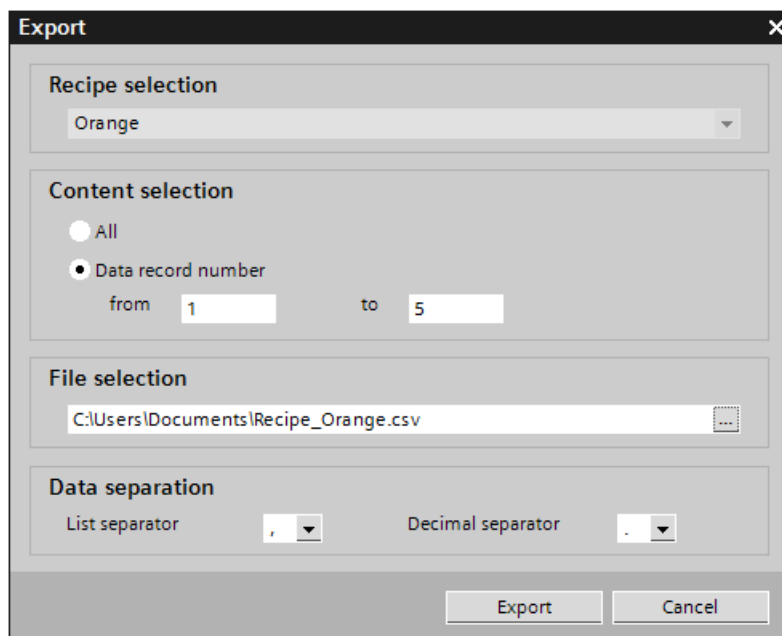

WinCC features an export function for exporting data records from recipes.

#### **Requirements**

- The WinCC project for the export is open.
- Recipes have been created in a project.
- The "Recipes" editor is open.

## Exporting recipes

1. In the "Recipes" editor, select the recipe with the data records you want to export.
2. Click .  
The "Export" dialog box opens.

The selected recipe is shown under "Recipe selection".

3. Under "Content selection", specify if all or only selected data records are to be exported.
4. Under "File selection", specify the file in which the recipe data is to be stored.
5. Specify the list separator and decimal separator under "Data separation".
6. Click "Export."  
The export will start.

## Result

The exported data has been written to a CSV file. The CSV file will be stored in the specified directory.

## See also

- Exporting alarms (Page 5875)
- Exporting text lists (Page 5888)

## Importing recipes

### Introduction

Recipes are identified by their name. The recipe name must therefore be unique. Open the import file in a simple text editor to check that it has the correct data structure.

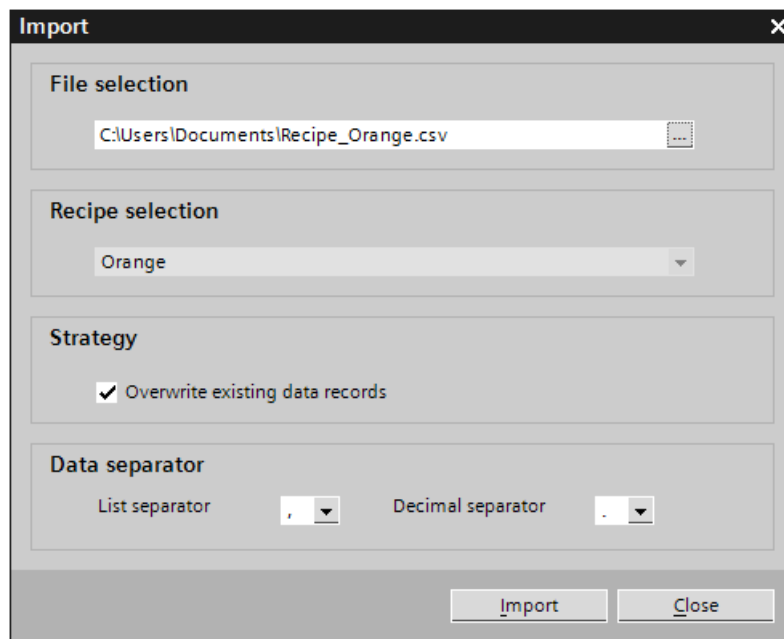

Specify whether or not existing data records should be overwritten by records with the same name during the import.

### Requirements

- A CSV file containing at least one recipe has been created.
- The WinCC project for the import is open.
- The "Recipes" editor is open with at least one recipe.

### Importing a recipe

1. In the "Recipes" editor, select the recipe with the data records you want to import.
2. Click  .  
The "Import" dialog box opens.

The selected recipe is shown under "Recipe selection".

3. Select the file you want to import under "File selection".
4. Under "Strategy", specify if existing data records should be overwritten by records of the same name.

5. Under "Data separation", select the list separator and the decimal separator to use in the CSV file.
6. Click "Import".  
The import will start.

## Result

The data records are created in the selected recipe. Depending on the setting for "Strategy", existing data records are overwritten by records with the same name from the CSV file.

Existing data records with the same name will also be imported from the CSV file if you deactivate the "Overwrite existing data records" option.

## Format of recipe data

### Introduction

This section describes the required format of the file for the import of recipes. The file containing the data of the recipes must be available in "\*.csv" format. :

### Structure of recipe data

The structure of the import file is fixed. The following example shows the structure of a recipe containing two recipe elements, each with two data records:

```
List separator=<List separator>Decimal symbol=<Decimal separator><List separator><Line break>
<Name of the recipe><List separator><List separator><Line break>
LANGID_<ID of the language><List separator>
<Display name, recipe element 1><List separator>
<Display name, recipe element 2><Line break>
<Number recipe><List separator>
<Recipe data record number 1><List separator>
<Recipe data record number 2><Line break>
<Tag recipe element 1><List separator>
<Recipe data record 1 value 1><List separator>
<Recipe data record 2 value 1><Line break>
<Tag recipe element 2><List separator>
<Recipe data record 1 value 2><List separator>
<Recipe data record 2 value 2><Line break>
```

### ID of the language

Use the "Windows language ID" in decimal notation, e.g. "1033" for English. Additional information is available in the documentation for the Windows operating system.

### 10.12.5.3 Importing and exporting alarms

#### Exporting alarms

##### Introduction

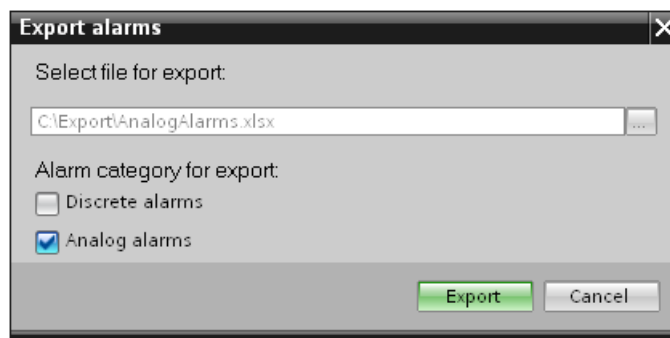

WinCC has an export function for alarms.

##### Requirements

- The WinCC project for the export is open.
- Alarms have been created in the project.
- The "HMI alarms" editor is open.

##### Exporting alarms

1. Click the  button in "Discrete alarms" or "Analog alarms". The "Export" dialog box opens.

2. Click the "..." button and specify in which file the data are saved.
3. Specify whether you want to export "Discrete alarms" or "Analog alarms".
4. Click "Export". The export will start.

##### Result

The exported data has been written to an xlsx file. The xlsx file will be stored in the specified folder.

##### See also

- Importing alarms (Page 5876)
- Format of the analog alarm data (Page 5877)
- Format of the discrete alarm data (Page 5880)
- Exporting recipes (Page 5869)

Exporting text lists (Page 5888)

Exporting tags (Page 5882)

## Importing alarms

### Introduction

Alarms are identified by their alarm number. The alarm numbers must be unique in the analog and discrete alarm types. Alarms with redundant alarm numbers will be overwritten. An alarm without an existing alarm number is created.

Any empty list entries for existing alarms contained in an xlsx file will be ignored for the purposes of the import. The entries of the existing alarms remain active and will not be replaced by empty ones.

### Requirements

- An xlsx file with alarms has been created.
- The structure of the xlsx file meets the requirements.
- The WinCC project for the import is open.
- The "HMI alarms" editor is open.

### Importing alarms

1. Click the  button in "Discrete alarms" or "Analog alarms". The "Import" dialog box opens.

2. Click the "..." button and select the file that you want to import.
3. Click on the "Import" button. The import will start. A progress bar indicates the progress of the import operation.

### Result

The corresponding alarms including alarm texts are created in WinCC on the basis of the import data. Alarms relating to the import operation are displayed in the output window. A log file is saved in the source directory of the import files. The log file has the same name as the respective import file but with the "\*.xml" extension.

Check when importing the data whether there are any links to objects, for example, dynamic parameters such as tags.

- If an object with the same name already exists, the existing object is used.
- If no object of the same name yet exists, create an object with the relevant name or create a new link.

---

**Note**

The syntax of the import file is checked during xlsx file import. The meaning of the properties or dependencies between the properties is not checked. It is possible to assign a trigger tag of an incorrect type, such as string, to an alarm. An error will be reported during compilation.

---

Exporting alarms (Page 5873)

Format of the discrete alarm data (Page 5880)

**Format of the analog alarm data****Introduction**

This chapter describes the required format of the file for the import of analog alarms. The file containing the analog alarm data must be in "\*.xlsx" format.

**Structure of the alarm data**

The import file in Microsoft Excel consists of a number of worksheets:

- Analog alarms(Analog alarms)
- Limits (Limits)

Each alarm is assigned a separate row in the import file. The import file with the analog alarms must be formatted as follows:

**Example of the worksheet "Analog alarms"**

	A	B	C	D	E
1	ID	Name	Event text [en-US], Alarm text	FieldInfo [Alarm text]	Class
2	1	Analog_alarm_1	AA1 Error-AC with maximum text length: abcdefghijklmnopqrstuvwxyz		Errors
3	2	Analog_alarm_2	AA2 Warning-AC <b>this text should be bold</b>		Warnings
4	3	Analog_alarm_3	AA3 SDm-AC <i>this text should be italic</i>		SDm
5	4	Analog_alarm_4	AA4 SDo-AC <u>this text should be underlined</u>		SDo
6	5	Analog_alarm_5	AA5 SystemAcknowledgement-AC <blink>this text should be flashing</blink>		System_Acknowledge
7	25	Analog_alarm_25	Internal AA23 switchDT: Deadband mode in case of violation - value HL		AADT-Internal
8	26	Analog_alarm_26	Internal AA23 switchDT: Deadband mode in case of violation - percent		AADT-Internal
9	31	Analog_alarm_31	Internal AA23 switchDT: Low limit violation static		AADT-Internal
10	32	Analog_alarm_32	Internal AA23 switchDT: High limit violation static		AADT-Internal
11	33	Analog_alarm_33	Internal AA23 switchDT: Low limit violation dynamic		AADT-Internal
12	34	Analog_alarm_34	Internal AA23 switchDT: High limit violation dynamic		AADT-Internal
13	35	Analog_alarm_35	Internal AA23 switchDT: delay 3 seconds High limit violation		AADT-Internal
14	42	Analog_alarm_40	Internal AA23 switchDT: delay 3 seconds Low limit violation LLV		AADT-Internal
15	23	Analog_alarm_41	AA23 DT in event text: <field ref="0" /> Bool, <field ref="1" /> Byte, <field ref="2" /> Count	<ref id = 0; type = AlarmTag; T	ACAT
16	24	Analog_alarm_42	AA24 DT in event text: <field ref="0" /> Timer, <field ref="1" /> Counter	<ref id = 0; type = AlarmTag; T	ACAT

Table 10-156 Meaning of the entries

List entry	Meaning
ID	The alarm number is used to reference an alarm. The alarm number is unique. Alarms with identical alarm numbers are overwritten during import. An alarm without an existing alarm number is created.
Name	Name of the analog alarm
Event text [de-DE], Alarm text	Displays the alarm text. The field designation contains a language ID. Alarm texts must be assigned a language ID for import. An expression with a reference ID will be added to the alarm text if the text has a dynamic parameter. Example: text <field ref="0" />. Use the ID to assign dynamic parameters to alarm texts.
FeldInfo	Specifies whether the alarm text contains dynamic parameters. The settings are separated by a semicolon ";". Example of dynamic parameters: Tag: <ref id = 0; type = AlarmTag; Tag = Tag1; DisplayType = Decimal; Length = 5;> Text list: <ref id = 1; type = CommonTextList; TextList = Textlist1; Tag = tag 2; Length = 5;>
Class	The class of an alarm determines whether or not the alarm must be acknowledged. It can also be used to determine how the alarm appears when it is displayed on the HMI device. The alarm class also determines whether and where the corresponding alarm will be logged.
Group	Indicates the allocation to an alarm group. If an alarm belongs to a group with other alarms, it can be acknowledged together with these alarms of the same group in a single operation.
Trigger tag	Specifies the tag monitored for limit value violation.
Delay time value	Specifies the delay time. The alarm is not triggered until the duration of the limit value violation equals the specified delay time.

List entry	Meaning
Delay time unit	Specifies the time unit for the delay.
Report	Enables reporting of the specific alarm on a printer. True or "1" = Reporting enabled. False or "0" = Reporting disabled. Reporting must also be globally enabled in the project.
Info text [de-DE], Info text	The tooltip is an optional property of an alarm. Tooltips can contain additional information about the alarm. A tooltip will be displayed in a separate window on the HMI device when the operator presses the <HELP> key. The field designation contains a language ID.

### Example of the worksheet "Limits"

	A	B	C	D	E	F	G
1	Alarm ID	Limit type	Limit value	Limit mode	Deadband mo	Deadband valu	Deadband in percent
2	1	Constant	0	Upper limit	Off	0	False
3	2	Constant	1	Upper limit	Off	0	False
4	3	Constant	2	Upper limit	Off	0	False
5	4	Constant	3	Upper limit	Off	0	False
6	5	Constant	4	Upper limit	Off	0	False
7	25	Constant	50	Upper limit	On both	5	False
8	26	Constant	50	Upper limit	On both	10	True
9	31	Constant	50	Lower limit	Off	0	False
10	32	Constant	50	Upper limit	Off	0	False
11	33	Tag	AASDTdyn	Lower limit	Off	0	False
12	34	Tag	AASDT1dyn	Upper limit	Off	0	False
13	35	Constant	50	Upper limit	Off	0	False
14	36	Constant	50	Lower limit	On both	5	False

Table 10-157 Meaning of the entries

List entry	Meaning
Alarm ID	Alarm number The alarm number is used to reference an alarm. The alarm number is unique. Alarms with identical alarm numbers are overwritten during import. An alarm without an existing alarm number is created.
Limit mode	Trigger mode Indicates the method used for monitoring the limit value.
Limit type	Specifies the limit that will be monitored. Both a tag and a constant can be used as limit value.
Limit value	Limit value Indicates the tag or constant monitored for limit violation.

List entry	Meaning
Deadband mode	Hysteresis mode Specifies whether and in which cases hysteresis will be used. For "Outgoing" For "Incoming" For "Incoming" and "Outgoing"
Deadband in percent	0 = The value specified for "Hysteresis" is considered to be absolute. 1 = The value specified for "Hysteresis" is referred to as a percentage of the limit value.
Deadband mode	Hysteresis Specifies a constant as a value of the hysteresis.

---

**Note**

**"No value" in the table**

Entries in the table which have the value "No value" delete the corresponding values in an existing alarm of the same name.

---

**See also**

Exporting alarms (Page 5873)

Format of the discrete alarm data (Page 5880)

**Format of the discrete alarm data**

**Introduction**

This chapter describes the required format of the file for the import of discrete alarms. The file containing the discrete alarm data must be in "\*.xlsx" format.

**Structure of the alarm data**

The import file in Microsoft Excel consists of the worksheets "Discrete alarms" (discrete alarms). Each alarm is assigned a separate row in the import file. Structure of the import file containing the discrete alarms:

### Example of the worksheet "Discrete alarms"

	A	B	C	D	E	
1	ID	Name	Event text [en-US], Alarm text	FieldInfo [Alarm text]	Class	Trigger
2	1	Discrete_alarm_1	DA1 Error-AC with maximum text length: abcdefghijklmnopqrstuvwxyz äöü\nä		Errors	HMI
3	2	Discrete_alarm_2	DA2 Warning-AC <b>this text should be bold</b>		Warnings	HMI
4	3	Discrete_alarm_3	DA3 SDm-AC <i>this text should be italic</i>		SDm	HMI
5	4	Discrete_alarm_4	DA4 SDo-AC <u>this text should be underlined</u>		SDo	HMI
6	5	Discrete_alarm_5	DA5 SystemAcknowledgement-AC <blink>this text should be flashing</blink>		System_Ackn	HMI
7	6	Discrete_alarm_6	DA6 SystemNoAcknowledgement-AC mixed test: <b>Bold,</b> <i>Italic,</i> <		System_No_A	HMI
8	7	Discrete_alarm_7	DA7 DT in event text: <field ref="0" /> Integer, <field ref="1" /> Real, <field re	<ref id = 0; type = AlarmTag; Tag = PL	ACAT	HMI
9	8	Discrete_alarm_8	DA8 DT in event text: <field ref="0" /> S5Time, <field ref="1" /> Timer, <field r	<ref id = 0; type = AlarmTag; Tag = PL	ACAT	HMI
10	11	Discrete_alarm_9	DA11 DT in event text: <field ref="0" /> Int, <field ref="1" /> Real, <field ref="	<ref id = 0; type = AlarmTag; Tag = In	ACAT	HMI
11	12	Discrete_alarm_10	DA12 DT in event text: <field ref="0" /> UDIInt, <field ref="1" /> UInt,	<ref id = 0; type = AlarmTag; Tag = U	ACAT	HMI
12	13	Discrete_alarm_11	DA13 Textformat: Integer: <field ref="0" /> decimal, <field ref="1" /> binary, <	<ref id = 0; type = AlarmTag; Tag = H	ACAT	HMI

Table 10-158 Meaning of the entries

List entry	Meaning
ID	The alarm number is used to reference an alarm. The alarm number is unique. Alarms with identical alarm numbers are overwritten during import. An alarm without an existing alarm number is created.
Name	Name of the analog alarm
Event text [de-DE], Alarm text	Displays the alarm text. The field designation contains a language ID. For import, a language ID must be assigned to alarm text.  An expression with a reference ID will be added to the alarm text if the text has a dynamic parameter. Example: text <field ref="0" />. Use the ID to assign dynamic parameters to alarm texts.
FieldInfo	Specifies whether the alarm text contains dynamic parameters. The settings are separated by a semicolon ";".  Example of dynamic parameters: Tag: <ref id = 0; type = AlarmTag; Tag = Tag1; DisplayType = Decimal; Length = 5;> Text list: <ref id = 1; type = CommonTextList; TextList = Textlist1; Tag = tag 2; Length = 5;>
Class	The class of an alarm determines whether or not the alarm must be acknowledged. It can also be used to determine how the alarm appears when it is displayed on the HMI device. The alarm class also determines whether and where the corresponding alarm will be logged.
Group	Indicates the allocation to an alarm group. If an alarm belongs to a group with other alarms, it can be acknowledged together with these alarms of the same group in a single operation.
Trigger tag	Specifies the tag containing the bit that triggers the alarm.
Trigger bit	Specifies the number of the bit that triggers the alarm.
Acknowledge tag	Specifies the tag containing the bit that is set by the operator upon acknowledgment. Only available if the selected alarm class requires alarm acknowledgment.
Acknowledgment bit	Specifies the number of the bit that is set when the operator acknowledges the alarm.

List entry	Meaning
PLC acknowledgement tag	Specifies the tag containing the bit that acknowledges the alarm of the control program. Only available if the selected alarm class requires alarm acknowledgment.
PLC acknowledgment bit	Specifies the number of the bit that acknowledges the alarm of the control program.
Delay time value	Specifies the delay time. The alarm is not triggered until the duration of the limit value violation equals the specified delay time.
Delay time unit	Specifies the time unit for the delay.
Report	Enables reporting of the specific alarm on a printer. True or "1" = Reporting enabled. False or "0" = Reporting disabled. Reporting must also be globally enabled in the project.
Info text [de-DE], Info text	The tooltip is an optional property of an alarm. Tooltips can contain additional information about the alarm. A tooltip will be displayed in a separate window on the HMI device when the operator presses the <HELP> key. The field designation contains a language ID.

---

**Note**

**"No value" in the table**

Entries in the table which have the value "No value" delete the corresponding values in an existing alarm of the same name.

Exporting alarms (Page 5873)

Format of the analog alarm data (Page 5875)

Importing alarms (Page 5874)

**10.12.5.4 Importing and exporting tags**

**Exporting tags**

**Introduction**

WinCC has an export function for tags.

## Requirements

- The WinCC project for the export is open.
- Tags have been created in the project.
- The "HMI tags" editor is open.

## Exporting tags

1. Click on the  button in the "HMI Tags" tab. The "Export" dialog box opens.

2. Click the "..." button and specify in which file the data are saved.
3. Click "Export". The export will start.

## Result

The exported data has been written to an xlsx file. The xlsx file will be stored in the specified folder.

## See also

- Importing tags (Page 5883)
- Format of the tag data (Page 5885)
- Exporting text lists (Page 5888)
- Exporting alarms (Page 5873)

## Importing tags

## Introduction

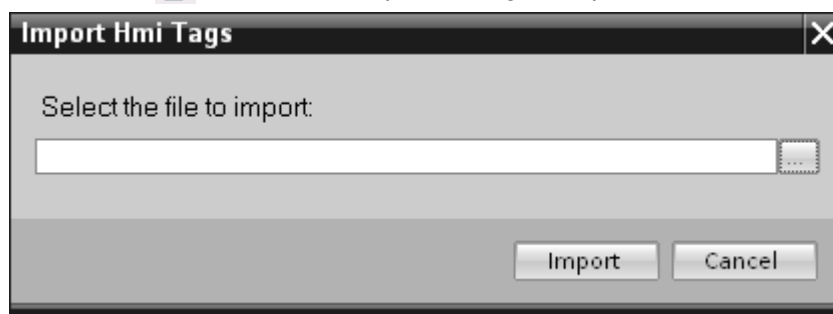

Tags are identified by the tag name. An existing tag will be overwritten with the data from the xlsx file if the tag name already exists in the project. A new tag is created if the tag does not yet exist.

## Requirements

- An xlsx file with tags has been created.
- The structure of the xlsx file meets the requirements.
- The WinCC project for the import is open.

## Importing tags

1. Click "HMI tags" in the project navigation.
2. Double-click "Show all tags". The "HMI tags" editor opens.
3. Click on the  button. The "Import" dialog box opens.

4. Click the "..." button and select the file that you want to import.
5. Click on the "Import" button. The import will start.

## Result

The relevant tags have been created in WinCC. Alarms relating to the import operation are displayed in the output window. A log file is saved in the source directory of the import files. The log file has the same name as the respective import file but with the ".xml" extension.

Check when importing the data whether there are any links to objects, for example, dynamic parameters such as tags.

- If an object with the same name already exists, the existing object is used.
- If no object of the same name yet exists, create an object with the relevant name or create a new link.

---

### Note

The syntax of the import file is checked during xlsx file import. The meaning of the properties or dependencies between the properties is not checked. It is possible to assign a tag a trigger tag of the wrong type, for example, string. An error will be reported during compilation.

---

## See also

- Exporting tags (Page 5880)
- Format of the tag data (Page 5885)

## Format of the tag data

### Introduction

This section describes the format required for the file with tag data used for imports. The tag data file must be in "\*.xlsx" format.

### Tag data structure

The import file in Microsoft Excel consists of a number of worksheets:

- HMI Tags (HMI tags)
- Multiplexing (multiplex tags)

Each tag is on a separate line in the import file. The import file with the tag data must have the following format:

### Example of the worksheet "HMI Tags"

	A	B	C	D	E	F	G	H
1	Name	Path	Connection	PLC tag	DataType	Length	Address	Access
2	HMI_Int	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Va
3	Mux_Tag_1	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Va
4	Mux_Tag_2	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Va
5	Mux_11	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Va
6	Mux_21	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Va
7	Mux_13	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Va
8	Mux_12	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Va
9	Mux_23	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Va
10	Mux_22	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Va
11	Mux_Tag_1_Index	Internal Tags	<No Value>	<No Value>	UInt	2	<No Value>	<No Va
12	Mux_Tag_12	Internal Tags	<No Value>	<No Value>	USInt	1	<No Value>	<No Va
13	Mux_Tag_11	Internal Tags	<No Value>	<No Value>	USInt	1	<No Value>	<No Va
14	Mux_Tag_13	Internal Tags	<No Value>	<No Value>	USInt	1	<No Value>	<No Va
15	HMI_UDInt	Internal Tags	<No Value>	<No Value>	UDInt	4	<No Value>	<No Va
16	Gauge_Process	Default tag table	<No Value>	<No Value>	Int	2	<No Value>	<No Va
17	Button_Tag_4	Default tag table	<No Value>	<No Value>	Int	2	<No Value>	<No Va
18	HMI_USInt	Internal Tags	<No Value>	<No Value>	USInt	1	<No Value>	<No Va
19	Data_block_2_PLC_DateTime_2	Default tag table	HMI_connection_1	Data_block_2.PLC	Date_And_Time	8	%DB28.DBX598.C	<absol

Table 10-159 Meaning of the entries

List entry	Meaning
Name	Indicates the configured name of an HMI tag.
Path	Specifies which folders in the project tree contain the tag. The folder structure is represented by "\" : "FolderName1\FolderName2\TagName".
PLC Tag	Indicates whether the tag is linked to a PLC tag.
Connection	Indicates the name of the connection to the PLC.
Data type	Specifies the data type of a tag. The data types allowed depend on the communication driver being used. See the "Communication" section of the documentation for additional information on the data types permitted for the various communication drivers.
Length	Specifies the length of the tag. This entry is only useful for data types with a dynamic length such as strings; it is left empty for all other data types.
Address	Specifies the tag address in the PLC. The tag address must exactly match the one used in WinCC, for example, "%DB1.DBW0". The tag address is empty for internal tags.
Multiplexing	Specifies whether multiplexing is used.
Index tag	Shows the name of the index tag for multiplexing. In Runtime, the system first reads the value of the index tag. It then accesses the tag in the corresponding place in the tag list.
StartValue	Specifies the start value of a tag.
ID tag	The update ID updates the value of a tag with the aid of a function or a PLC job. The update ID must be unique within an HMI device.
Coding	Shows the coding method.
Display Name [de_DE]	Shows the display name of an HMI tag. The field designation contains a language ID. The field designation contains a language ID. Display names must be assigned a language ID for import. Texts are imported to the corresponding project language.
Acquisition mode	Specifies the tag acquisition mode.
Acquisition cycle	Specifies the tag acquisition cycle. The acquisition cycle must correspond exactly to the one used in WinCC. The value is not language-dependent and should therefore be the same in every language. The default value is "1 s". The acquisition cycle is undefined if the tag acquisition mode is "on demand". User-defined acquisition cycles must be created beforehand as the file will otherwise not be imported.
High High Limit type	Indicates whether the limit value "High high" is monitored by a constant, a tag or not at all.
High High Limit	Displays the limit value "High High".
High Limit type	Indicates whether the limit value "High" is monitored by a constant, a tag or not at all.
High Limit	Displays the limit value "High".
Low Limit type	Indicates whether the limit value "Low" is monitored by a constant, a tag or not at all.
Low Limit	Displays the limit value "Low".
Low Low Limit type	Indicates whether the limit value "Low Low" is monitored by a constant, a tag or not at all.
Low Low Limit	Displays the limit value "Low Low".

List entry	Meaning
Linear scaling	Indicates whether linear scaling is enabled. This entry can only be used for external tags.
End value PLC	Specifies the end value of the PLC tag.
Start value PLC	Specifies the start value of the PLC tag.
End value HMI	Specifies the end value of the HMI tag.
Start value HMI	Specifies the start value of the HMI tag.

### Example of the worksheet "Multiplexing"

	A	B	C
1	HMI Tag name	Multiplex Tag	Index
2	Mux_Tag_1	Mux_11	0
3	Mux_Tag_1	Mux_12	1
4	Mux_Tag_1	Mux_13	2
5	Mux_Tag_2	Mux_21	0
6	Mux_Tag_2	Mux_22	1
7	Mux_Tag_2	Mux_23	2
8	Mux_Tag_12	HMI_Array_Mux2	-1
9	Mux_Tag_11	HMI_Array_Mux1	-1
10	Mux_Tag_13	HMI_Array_Mux3	-1

Table 10-160 Meaning of the entries

List entry	Meaning
Name	Indicates the configured name of an HMI tag which uses indirect addressing. The HMI tag must be available in the "HMI Tags" worksheet.
Index	Shows the value which governs which tag is selected.
Multiplex Tag	Displays the tag from the tag list corresponding to the index value.

#### Note

##### "No value" in the table

Entries in the table which have the value "No value" delete the corresponding values in an existing tag of the same name.

#### See also

Exporting tags (Page 5880)

Importing tags (Page 5881)

### 10.12.5.5 Importing and exporting text lists

#### Exporting text lists

##### Introduction

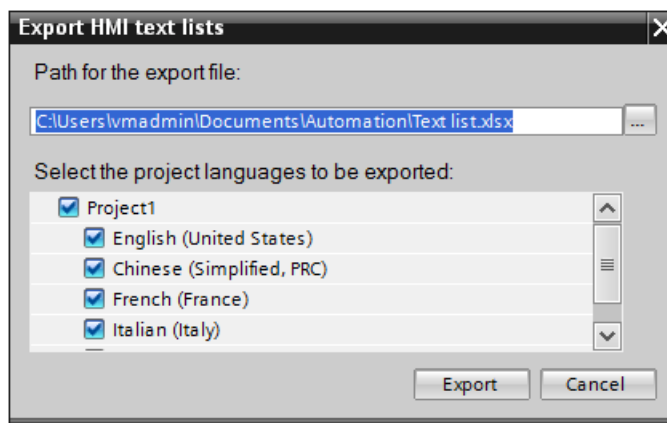

WinCC has an export function for text lists.

##### Requirements

- The WinCC project for the export is open.
- Text lists have been created in the project.
- The "Text & graphics lists" editor is open.

##### Exporting text lists

1. Click on the  button in the "TextLists" tab. The "Export" dialog box opens.

2. Click the "..." button and specify in which file the data are saved.
3. By default, texts are exported in all defined project languages. If you do not want to export specific languages, disable the unnecessary languages in the dialog.
4. Click "Export". The export will start.

##### Result

The exported data has been written to an xlsx file. The xlsx file will be stored in the specified folder.

## See also

- Exporting alarms (Page 5873)
- Exporting recipes (Page 5869)
- Exporting tags (Page 5880)

## Importing text lists

### Introduction

You then import text lists from an xlsx file to WinCC.

### Requirements

- An xlsx file with text lists has been created.
- The structure of the xlsx file meets the requirements.
- The WinCC project for the import is open.
- The "Text & graphics lists" editor is open.

### Importing text lists

1. Click on the  button in the "Text lists" tab. The "Import" dialog box opens.

2. Select the file you want to import under "File selection".
3. Click on the "Import" button. The import will start.

### Result

You have now imported the text lists. The relevant text lists have been created in WinCC. Alarms relating to the import operation are displayed in the output window. A log file is saved in the source directory of the import files. The log file has the same name as the respective import file but with the "\*.xml" extension.

Check when importing the data whether there are any links to objects, for example, dynamic parameters such as tags.

- If an object with the same name already exists, the existing object is used.
- If no object of the same name yet exists, create an object with the relevant name or create a new link.

## Format of text list data

### Introduction

This section describes the format required for the file with the text lists used for imports. The text list data file must be in ".xlsx" format.

### Tag data structure

The import file in Microsoft Excel consists of two worksheets:

- TextList (Text lists)
- TextListEntry (Text list entry)

Each text list is assigned a separate line in the import file. The import file containing the data must be structured as follows:

### Example of the worksheet "TextList"

	A	B	C
1	Name	ListRange	Comment
2	TLValue/Range	Decimal	
3	TLBit	Bit	
4	TLBitnumber	Binary	
5	TLall_1	Decimal	
6	TLall_2	Decimal	

Table 10-161 Meaning of the entries

List entry	Meaning
Name	Shows the name of the text list.
ListRange	Shows the text list range: Number = Bit number (0-31) Range = value/range (...-...) Bit = Bit (0;1)
Comment	Any comments on the text list. You can use up to 500 characters

### Example of the worksheet "TextListEntry"

	A	B	C	D	E	F
1	Name	Parent	DefaultEntry	Value	Text	FieldInfos
2	Text_list_entry_1	TLValue/Range	TRUE	0 - 1	Default entry TLValue/Range ->	
3	Text_list_entry_2	TLValue/Range		2 - 3	TLValue/Range = 2-3 ->	
4	Text_list_entry_3	TLValue/Range		1	TLValue Range - single value = 1 ->	
5	Text_list_entry_1	TLBit		0	TLBit = 0 ->	
6	Text_list_entry_2	TLBit		1	TLBit = 1 ->	
7	Text_list_entry_1	TLBitnumber	TRUE	0	Default entry TLBitnumber; ->	
8	Text_list_entry_2	TLBitnumber		0	TLBitnumber - Bitnumber 0 is set->	
9	Text_list_entry_3	TLBitnumber		1	TLBitnumber - Bitnumber 1 is set->	
10	Text_list_entry_4	TLBitnumber		2	TLBitnumber - Bitnumber 2 is set->	
11	Text_list_entry_5	TLBitnumber		3	TLBitnumber - Bitnumber 3 is set->	
12	Text_list_entry_1	TL1	TRUE	0 - 1	Default entry TL1	
13	Text_list_entry_2	TL1		1 - 3	TL1 Value between 1 - 3 ->	
14	Text_list_entry_3	TL1		4 - 6	TL1 Value between 4 - 6 ->	
15	Text_list_entry_4	TL1		7	TL1 Single value = 7 ->	
16	Text_list_entry_1	TL2	TRUE	0 - 1	<field ref="0" />->	<ref id = 0; type = CommonTextList; TextList = TLL1; Tag = HMI_TL1control; Leng
17	Text_list_entry_2	TL2		1	TL2 Single value = 1 ->	
18	Text_list_entry_3	TL2		2 - 3	TL2 Range between 2 - 3 ->	
19	Text_list_entry_1	TLMultilined	TRUE	0 - 1	Default entry TLMultilined; last row	
20	Text_list_entry_2	TLMultilined		0 - 3	TLMultilined Value between 0-3\nwith test of"\n"	
21	Text_list_entry_1	TLall_1	TRUE	0 - 1	Default entry TLall_1	
22	Text_list_entry_1	TLall_2	TRUE	0 - 1	Default entry TLall_2	

Table 10-162 Meaning of the entries

List entry	Meaning
Name	Shows the name of the text list entry.
Parent	Specifies the name of the corresponding text list.
DefaultEntry	Indicates whether the text list entry is a default entry. The default entry is always displayed when the tag has an undefined value.
Value	Specifies the tag integer values or value ranges which are assigned to the text entries in the text list.
Text	Shows the text list entry. The field designation contains a language ID. Text list entries must be assigned a language ID for import.  An expression with a reference ID will be added to the text if the text list entry has a dynamic parameter. Example: text <field ref="0" />. Use the ID to assign the dynamic parameter to a text list entry.
FeldInfo	Specifies whether the text list contains dynamic parameters. The settings are separated by a semicolon ";".  Example of dynamic parameters: Tag: <ref id = 0; type = CommonTagDisplayFormat; Tag = tag 1; DisplayType = Decimal; DisplayFormat = 9;> Text list: <ref id = 1; type = CommonTextList; TextList = Textliste_1; Tag = tag 2; Length = 5;> PLC tag: <ref id = 0; type = CommonControlTagDisplayFormat; DisplayType = Decimal; DisplayFormat = 9;>

## 10.12.6 Using cross-references

### 10.12.6.1 General information about cross references

#### Introduction

The cross-reference list provides an overview of the use of objects within the project.

#### Uses of cross-references

The cross-reference list offers you the following advantages:

- When creating and changing a program, you retain an overview of the objects, tags, and alarms etc. you have used.
- From the cross-references, you can jump directly to the object location of use.
- You can learn the following when debugging:
  - The objects used in a specific screen.
  - The alarms and recipes shown in a specific display.
  - The tags used in a specific alarm or object.
- As part of the project documentation, the cross-references provide a comprehensive overview of all object, alarms, recipes, tags and screens.

### 10.12.6.2 Displaying the cross-reference list

#### Introduction

Details on the use of objects can be found in the cross-reference list. You can show cross-references for HMI devices, folders and all editors in the project tree. The detail view also lets you select individual objects of the editors.

#### Requirement

You have created a project.

Several objects have been created.

#### Procedure

1. Select the required entry in the project tree or detail view.
2. Select "Cross-references" in the shortcut menu. The cross-reference list is opened in the work area.
3. Open the "Used by" tab to display where the objects shown in the cross-reference list are used.
4. Open the "Used" tab to view the users of the objects displayed in the cross-reference list.

5. You can sort the entries in the "Object" column in ascending or descending order by clicking on the corresponding column header.
6. To go to the location of use for a specific object, click on the displayed link.

## Result

The cross-reference list for the selected object is displayed in the work area.

### 10.12.6.3 Structure of the cross-reference list

#### Views of the cross-reference list

There are two views of the cross-reference list. The difference between the two views is in the objects displayed in the first column:

- Used by:  
Display of the referenced objects. Here, you can see where the object is used.
- Used:  
Display of the referencing objects. The users of the object are shown here.

The assigned tool tips provide additional information about each object.

#### Structure of the cross-reference list

Column	Content/meaning
Object	Name of the object that uses the lower-level objects or that is being used by the lower-level objects.
Numbers	Number of uses
Location of use	Each location of use, for example, an object or event
Property	Function of the referenced objects, for example, tag for data record or process value
Connected to	PLC tag with which the object is connected.
Type	Type of object
Path	Path of object

Depending on the installed products, additional columns or different columns are displayed for the cross-references.

### Settings in the cross-reference list

You can make the following settings using the icons in the toolbar for the cross-reference list:

- Update cross-reference list  
Updates the current cross-reference list.
- Making settings for the cross-reference list  
Here, you specify whether all used, all unused, all defined or all undefined objects will be displayed. If the "Undefined objects" option is enabled, references to previously deleted objects are also displayed.
- Collapse entries  
Reduces the entries in the current cross-reference list by closing the lower-level objects.
- Expand entries  
Expands the entries in the current cross-reference list by opening the low-level objects.

### Sorting in the cross-reference list

You can sort the entries in the "Object" column in ascending or descending order. Click on the column header to do this.

#### 10.12.6.4 Displaying cross-references in the Inspector window

##### Introduction

The Inspector window displays cross-reference information about a selected object in the "Info > Cross-references" tab. The Inspector window displays the cross-reference information in tabular format.

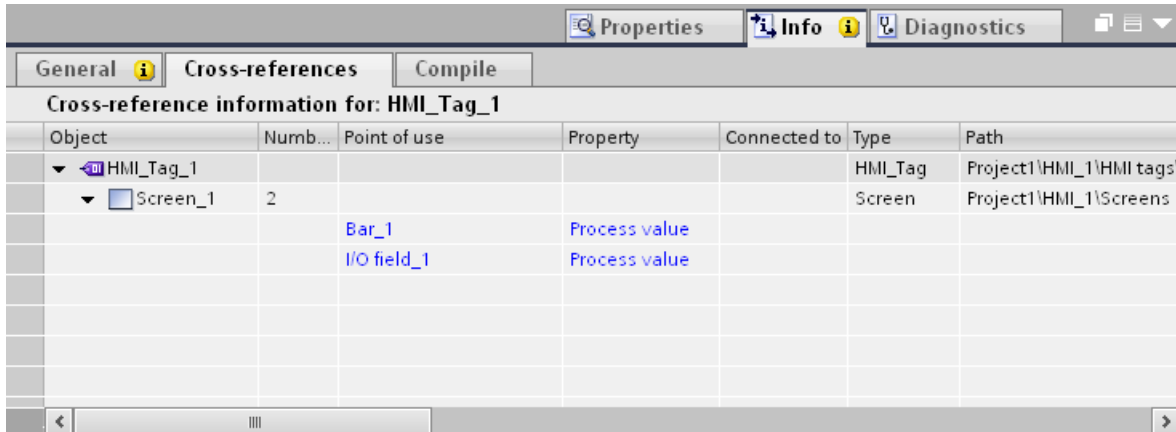

##### Requirement

You have created a project.

Several objects have been created.

## Procedure

1. Select an object in a screen or a tabular editor.
2. Select "Cross-reference information" in the shortcut menu. The cross-references are opened in the Inspector window.

## Result

The instances where and the other objects by which the selected object is being used are displayed.

The table below shows the additional information listed in the "About > Cross-reference" tab:

Column	Meaning
Object	Name of the object that uses the lower-level objects or that is being used by the lower-level objects.
Numbers	Number of uses
Location of use	Each location of use, for example an object or event
Property	Function of the referenced objects, for example tag for data record or process value
Connected to	PLC tag with which the object is connected.
Type	Type of object
Path	Path of object

Depending on the installed products, additional columns or different columns are displayed for the cross-references.

### 10.12.6.5 Rewiring tags in the screens

#### Introduction

You can change the references of tags in the properties of screen objects using the "Change object references" dialog.

This function lets you to replace a large number of tags in various screen objects.

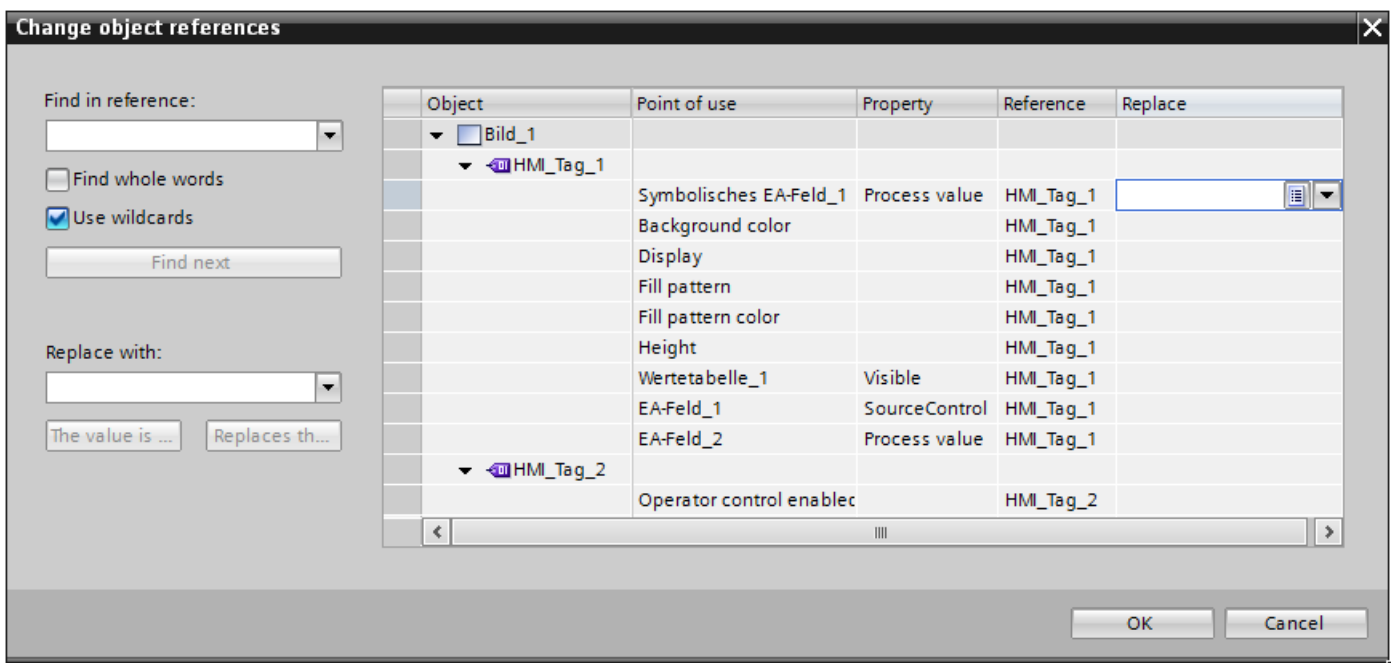

You search for and replace individual or multiple characters in the tag names.

You can open the "Change object references" dialog with the command in the shortcut menu.

You can open the dialog for one or more screen objects or a screen.

### How to replace a tag

1. Select the objects in the screen that contains a tag that you want to change.
2. Select the "Change object references" command in the shortcut menu or in the "Edit" menu. The "Change object references" dialog opens. You can see the selected screen objects and the tags used in the "Object" column.

3. Enter the name or part of the name you want to find in the "Find in reference" input box.
4. Start the search with the "Find next" button. If a reference is found, it is highlighted in the "Reference" column. Another click on the "Find next" button continues the search process until the list has been completely searched. After this, the search process starts again from the top of the list.
5. Enter the name or part of the name you want to replace for the found name in the "Replace with" input box.
6. Click the "Replace" button to replace the selected tag. All references found are replaced by clicking the "Replace all" button. In this way, you can replace a large number of references with another reference.
7. To select a tag from the list of all tags created in the project, click on the [Dropdown] button in the "Replace" column.

8. To select a tag from the object list or to create a new tag, click on the  button in the "Replace" column.
9. Confirm your entry with "OK".

The rewiring of the tags is applied in the project.

### **Additional options for searching**

You can narrow down your search by enabling the following options:

- Use wildcards  
Enter \* for any number of characters. Example: You want to search for all tags starting with "HMI". Enter "HMI\*" in the search key box.  
Enter ? for an individual character.
- Find whole words  
To search only for full names, enable the "Find whole words" option.

### **Replacing arrays and user-defined tags**

Variables whose names contain special characters . [ ] are shown in quotes.

Array type tags and tags of user-defined data types (UDT) contain special characters to separate tags from their elements. However, they are not shown in quotation marks. To replace an array or a UDT with an HMI tag with special characters, enter the name of the HMI tag in quotation marks in the "Replace" input box. If you type the name without quotation marks, a reference to a non-existent array or UDT is created instead of a reference to the desired HMI tag with special characters.

### **Correcting entries**

If an incorrect entry is made in the "Replace with" input box, the existing references can be replaced by references to non-existent tags.

If you detect an incorrect entry before confirming with "OK", you can correct the error. To do this, select the "Replace" column and press the "Remove" button. Any incorrect entries in the "Reference" column are deleted.

If you confirm the dialog with "OK", the affected properties of the screen objects are marked in red. Non-existent tags are highlighted in red in the "Change cross references" dialog.

If the new tag does not yet exist, you must subsequently create the tag.

## 10.12.7 Managing languages

### 10.12.7.1 Languages in WinCC

#### User interface language and project languages

A distinction is drawn between two different language levels in WinCC:

- **User interface language**  
During configuration, the text in the WinCC menus and dialogs is displayed in the user interface language. The user interface language also affects the labeling of operating elements, the parameters of the system functions, the online help, etc.
- **Project languages**  
Project languages are all languages in which a project will later be used. Project languages are used to create a project in multiple languages.

The two language levels are completely independent of one another. For example, you can create English projects at any time using a German user interface and vice versa.

#### Project languages

The following languages are differentiated within the project languages:

- **Reference language**  
The reference language is the language that you use to configure the project initially. During configuration, you select one of the project languages as the reference language. You use the reference language as a template for translations. All of the texts for the project are first created in the reference language and then translated. While you are translating the texts, you can have them displayed simultaneously in the reference language.
- **Editing language**  
You produce translations of the texts in the editing language. Once you have created your project in the reference language, you can translate the texts into the remaining project languages. Select a project language respectively as an edit language and edit the texts for the appropriate language variant. You can change the editing language at any time.

---

#### Note

When switching the project languages, the assignment to the keys on the keyboard also changes. For some languages (for example, Spanish), the operating system does not allow you to switch to the corresponding keyboard assignment. In this case, the keyboard assignment is switched to English.

---

- **Runtime languages**  
Runtime languages are those project languages that are transferred to the HMI device. You decide which project languages to transfer to the HMI device depending on your project requirements.  
You must provide appropriate controls so that the operator can switch between languages in runtime.

## See also

- Operating system settings for Asian languages (Page 5900)
- Selecting the user interface language (Page 5901)
- "Graphics" editor (Page 5912)
- Languages in Runtime (Page 5916)
- Example: Configuring a button for language switching (Page 5923)

### 10.12.7.2 Language settings in the operating system

#### Introduction

The configuration PC operating system settings influence WinCC language management in the following areas:

- Selection of project languages
- Regional format of dates, times, currency, and numbers
- Displaying ASCII characters

#### Project language selection

A language is not available as a project language unless it is installed in the operating system.

#### Regional format of dates, times, currency, and numbers

WinCC specifies a fixed date and time format in the Date - Time field for the selected project language and runtime language.

In order for dates, times, and numbers to be presented correctly in the selected editing language, this language must be set in the Regional Options in the Control Panel.

#### Displaying ASCII characters

With text output fields, the display of ASCII characters as of 128 depends on the set language and the operating system being used.

If the same special characters are to be displayed on different PCs, the PCs must use the same operating system and regional settings.

## See also

- Languages in WinCC (Page 5896)
- Operating system settings for Asian languages (Page 5900)

### 10.12.7.3 Operating system settings for Asian languages

#### Settings on Western operating systems

If you want to enter Asian characters, you must activate the support for this language in the operating system.

The Input Method Editor (IME) is available in Windows for configuring Asian texts. Without this editor, you can display Asian text but not edit it. For more information on the Input Method Editor, refer to the documentation for Windows. To enter Asian characters when configuring, switch to the Asian entry method in the "Input Method Editor".

Switch the operating system to the appropriate language to have language-specific project texts, such as alarm texts, displayed in the simulator in Asian characters.

#### Settings on Asian operating systems

If you are configuring on an Asian operating system, you must switch to the English default input language to enter ASCII characters, for example, for object names. As the English default input language is included in the basic installation of the operating system, you do not need to install an additional input locale.

#### Enable language support

1. Open the system controller.
2. Select "Regional and Language Options".
3. On the "Languages" tab, activate the check box "Install files for East Asian languages".
4. Then click on "Details" under "Text Services and Input Languages". The dialog "Text Services and Input Languages" is opened.
5. On the "Settings" tab add the required default input language under the "Installed Services".
6. Select the language of the operating system in the "Language for non-Unicode programs" area in the "Advanced" tab.

#### See also

Languages in WinCC (Page 5896)

Language settings in the operating system (Page 5897)

## 10.12.7.4 Setting project languages

### Selecting the user interface language

#### Introduction

The user interface language is used for displaying menu entries, title bars, infotexts, dialog texts and other designations in the WinCC user interface.

You can switch between the installed user interface languages during configuration. The labeling of the operating elements remains in the language you set when you added the object even if you change the user interface language.

#### Procedure

1. Select "Options > Settings" in the menu.  
The "Settings" dialog box is opened.
2. Select the desired user interface language under "General > General settings".

#### Result

WinCC will use the selected language as user interface language.

#### See also

Enable project languages (Page 5901)  
Selecting the reference language and editing language (Page 5902)  
Languages in WinCC (Page 5896)

### Enable project languages

#### Introduction

The project languages are set in the "Project languages" editor. You define which project language is to be the reference language and which the editing language.

## Enable project languages

1. Click on the arrow to the left of "Languages & resources" in the project tree.  
The lower-level elements will be displayed.
2. Double-click on "Project languages".  
The possible project languages will be displayed in the working area.
3. Enable the relevant project languages.

---

### Note

#### Copying multilingual objects

The copies of multilingual objects to a different project only include text objects in the project languages which are activated in the target project. Activate all project languages in the target project to include the corresponding text objects when transferring the copy.

---

## Disabling project languages

1. Disable the languages which are not relevant for the project.

<b>NOTICE</b>
---------------

If you disable a project language, all text and graphic objects you have already created in this language will be deleted from the current project.
---

## See also

Selecting the user interface language (Page 5899)

Selecting the reference language and editing language (Page 5902)

## Selecting the reference language and editing language

### Introduction

The project languages are set in the "Project languages" editor. You define which project language is to be the reference language and which the editing language. You can change the editing language at any time.

### Requirements

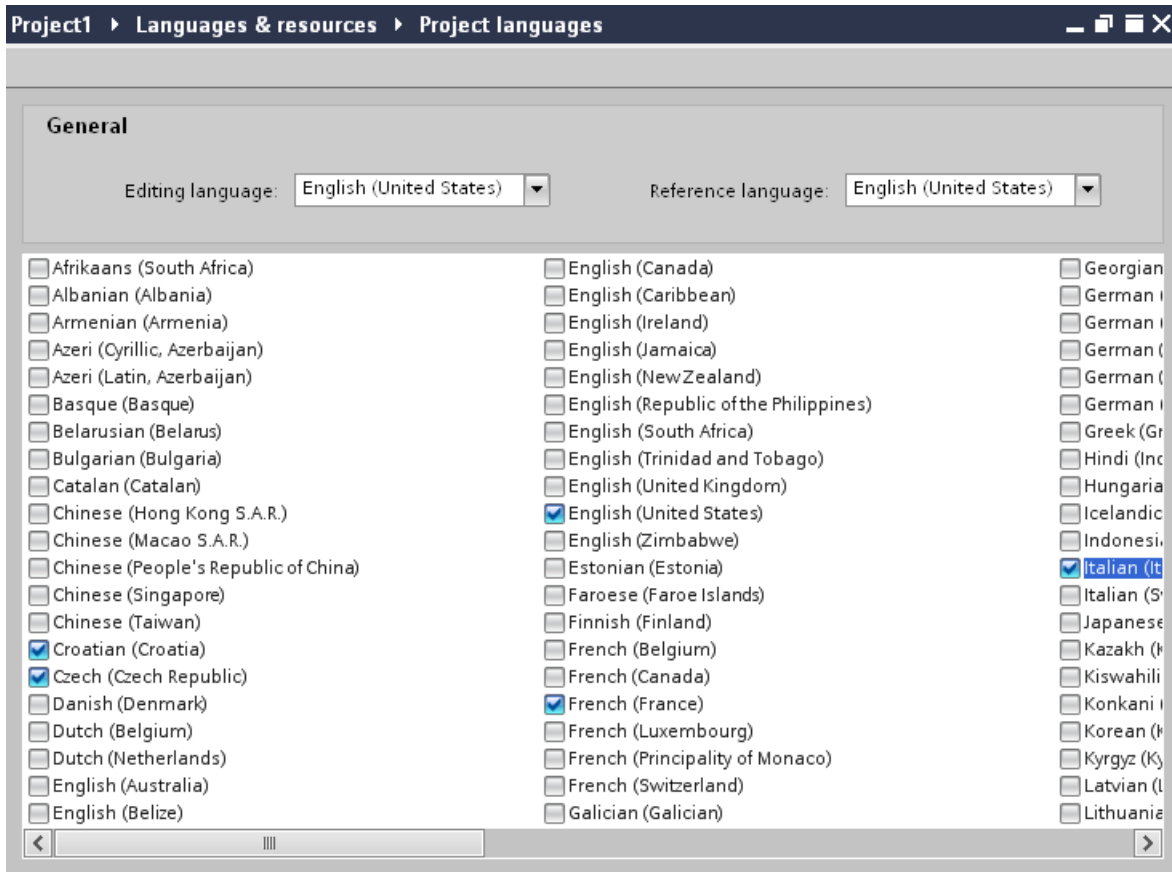

The "Project languages" editor is open.

Several project languages have been activated.

## Selecting the reference language and editing language

1. Click the arrow in the drop-down list in the "General > Editing language" section.
2. Click on the required language in the drop-down list, for example, German.

3. Click on the arrow in the drop-down list in the "General > Reference language" section.
  4. Click on the required language in the drop-down list, for example, English.
- The language selection is displayed in the list box.

## Result

You have now selected the editing and reference languages.

If you change the editing language, all future text input will be stored in the new editing language.

Enable project languages (Page 5899)

### 10.12.7.5 Creating one project in multiple languages

#### Working with multiple languages

##### Multilingual configuration in WinCC

You can configure your projects in multiple languages using WinCC. There are various grounds for creating a project in multiple languages:

- You would like to use a project in more than one country.  
You create the project in multiple languages but when the HMI device is commissioned, only the language spoken by the operators at the respective site will be transferred to the HMI device.
- The operators of a system speak a range of different languages.  
Example: An HMI device is used in China, but the service personnel understand only English.

##### Translating project texts

With WinCC, you can enter project texts directly in several languages in various different editors, for example, in the "Project texts" editor. WinCC also allows you to export and import your configuration for translation purposes. This is particularly advantageous if you configure projects containing a large amount of text and want to have it translated.

##### Language management and translation in WinCC

The following editors are used to manage languages and translate texts in WinCC:

Editor	Short description
Project languages	Selection of project languages, editing language and reference language.
Languages and fonts	Management of runtime languages and fonts used on the HMI device.
Project texts	Central management of configured texts in all project languages.
Graphics	Graphic library for managing graphics and their language-specific versions.

##### See also

Project text basics (Page 5905)

Translating texts directly (Page 5906)

Translating texts using reference texts (Page 5908)

Exporting project texts (Page 5909)

Importing project texts (Page 5911)

## Project text basics

### Texts in different languages in the project

Texts that are output on display devices during processing are typically entered in the language in which the automation solution is programmed. Comments and the names of objects are also entered in this language.

If operators do not understand this language, they require a translation of all operator-relevant texts into a language they understand. You can therefore translate all the texts into any language. In this way, you can ensure that anyone who is subsequently confronted with the texts in the project sees the texts in his/her language of choice.

### User texts and system texts

In the interests of clarity, a distinction is drawn between user texts and system texts:

- User texts are texts created by the user.
- System texts are texts created automatically and which are a product of configuration in the project.

The project texts are managed in the project text editor. This can be found in the project tree under "Languages & Resources > Project texts".

### Examples of multilingual project texts

You can, for example, manage the following types of text in more than one language:

- Display texts
- Alarm texts
- Comments in tables
- Labels of screen objects
- Text lists

### Translating texts

There are two ways of translating texts.

- Translating texts directly  
You can enter the translations for the individual project languages directly in the "Project texts" editor.
- Translating texts using reference texts  
You can change the editing language for shorter texts. You can enter the new texts in the editing language while the texts of the reference language are displayed.

### See also

Exporting project texts (Page 5909)

Importing project texts (Page 5911)

## **Translating texts directly**

### **Translating texts**

If you use several languages in your project, you can translate individual texts directly. As soon as you change the language of the software user interface, the translated texts are available in the selected language.

### **Requirements**

- You are in the project view.
- A project is open.
- You have selected at least two further project languages.

## Procedure

Proceed as follows to translate individual texts:

1. Click on the arrow to the left of "Languages & resources" in the project tree. The elements below this are displayed.
2. Double-click on "Project texts".  
A list with the texts in the project is displayed in the work area. There is a separate column for each project language.

	Engli...	Spanish...	Category	Croatian (Cr..	French (Fra...	Italian (Italy)	Czech (Czec..	Reference
			Alarm text					
			Alarm text					
			Comment...					Project1\PC-System_3
		Text	Hmi screen	Text	Text	Text	Text	Project1\HMI_1 [KTP40
		Text	Hmi screen	Text	Text	Text	Text	Project1\HMI_1 [KTP40
		Text	Hmi screen	Text	Text	Text	Text	Project1\HMI_1 [KTP40
		Text	Hmi screen	Text	Text	Text	Text	Project1\HMI_1 [KTP40
			Other text...					Project1\Comment
	!	!	Alarm text	!	!	!	!	
	!	!	Alarm text	!	!	!	!	
	\$	\$	Alarm text	\$	\$	\$	\$	
	\$	\$	Alarm text	\$	\$	\$	\$	
	0	0	Text List T...	0	0	0	0	Project1\SYSTEM_Alarn
	0	0	Text List T...	0	0	0	0	Project1\SYSTEM_Alarn
	0	0	Hmi screen	0	0	0	0	Project1\HMI_1 [KTP40
	0	0	Text List T...	0	0	0	0	Project1\SYSTEM_Alarn
	1	1	Hmi screen	1	1	1	1	Project1\HMI_1 [KTP40
	1	1	Text List T...	1	1	1	1	Project1\SYSTEM_Alarn
	1	1	Text List T...	1	1	1	1	Project1\SYSTEM_Alarn
	1	1	Text List T...	1	1	1	1	Project1\SYSTEM_Alarn
	10	10	Text List T...	10	10	10	10	Project1\SYSTEM_Alarn
	10	10	Text List T...	10	10	10	10	Project1\SYSTEM_Alarn
	10	10	Text List T...	10	10	10	10	Project1\SYSTEM_Alarn

3. To group identical texts and translate them simultaneously, click on the "E" button in the toolbar.
4. To hide texts that do not have a translation, click on the "Y" button in the toolbar.
5. Click on an empty column and enter the translation.

## Result

You have translated individual texts in the "Project texts" editor. The texts will then be displayed in the runtime language.

## See also

Working with multiple languages (Page 5902)

Exporting project texts (Page 5909)

Project text basics (Page 5903)

Importing project texts (Page 5911)

## Translating texts using reference texts

### Introduction

After changing the editing language, all texts are shown in input boxes in the new editing language. If there is not yet a translation available for this language, the input boxes are empty or filled with default values.

If you enter text again in an input field, this is saved in the current editing language. Following this, the texts exist in two project languages for this input field, in the previous editing language and in the current editing language. This makes it possible to create texts in several project languages.

You can display existing translations for an input box in other project languages. These serve as a comparison for text input in the current editing language and they are known as the reference language.

### Requirement

There is at least one translation into a different project language for an input field.

### Procedure

To display the translation of an input cell in a reference language, follow these steps:

1. Select "Tasks > Languages & resources" in the task card.
2. Select a reference language from the "Reference language" drop-down list.

### Result

The reference language is preset. If you click in a text block, translations that already exist in other project languages are shown in the "Tasks > Reference text" task card.

## See also

Working with multiple languages (Page 5902)

Exporting project texts (Page 5909)

Project text basics (Page 5903)

Importing project texts (Page 5911)

## Exporting project texts

Project texts are exported for translation. Texts are exported to Office Open XML files ending in ".xlsx". These files can be edited in Microsoft Excel, for example.

You can exchange the file with the translators and import it back to the project as soon as it has been translated.

## Requirements

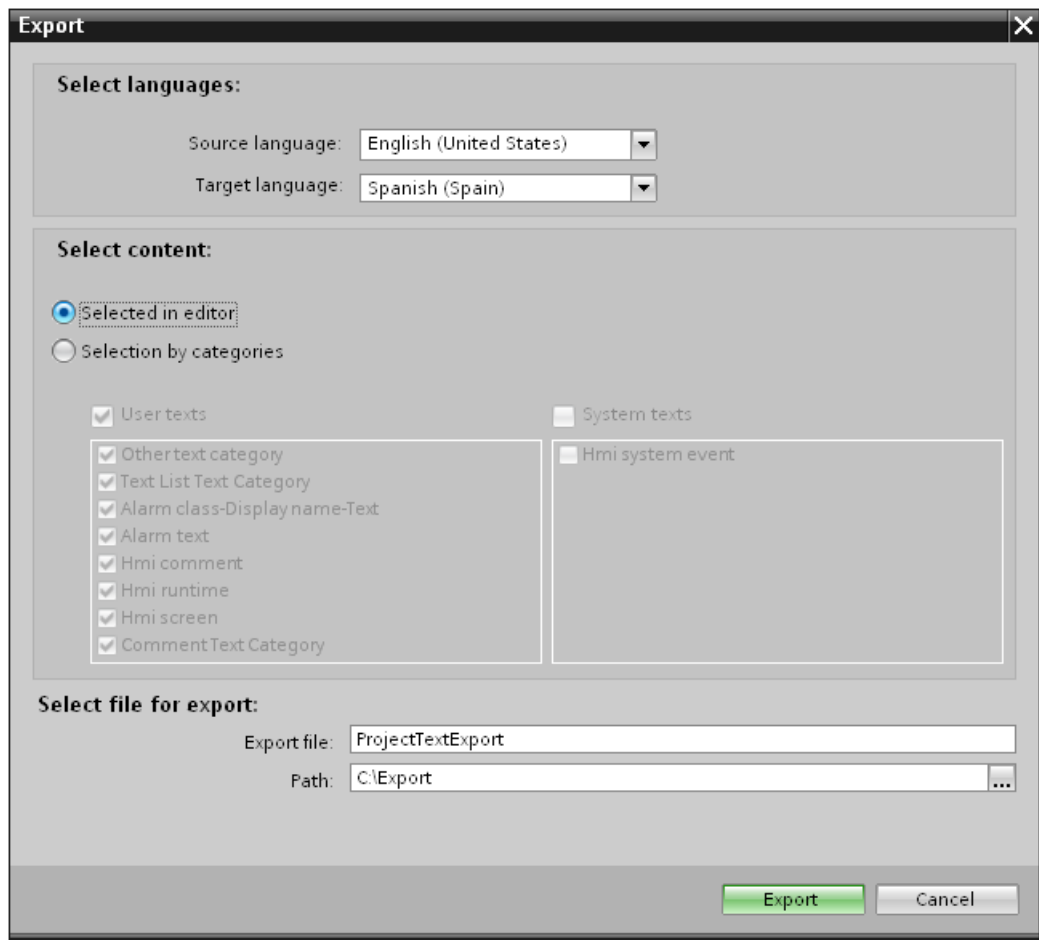

- At least two languages have been enabled in the "Project languages" editor, for example, Italian and French.

## Exporting project texts

To export individual project texts, proceed as follows:

1. Click on the arrow to the left of "Languages & resources" in the project tree. The child elements are displayed.
2. Double-click on "Project texts". The "Project texts" editor will open.
3. Select the texts you want to export.

- Click on the  button. The "Export" dialog opens.

- From the "Source language" drop-down list, select the language from which you wish to translate, for example Italian.
- From the "Target language" drop-down list, select the language into which the texts are to be translated, for example, French.
- Enter a file path and a file name for the export file in the "Export file" input field.
- Click "Export".

## Result

The texts selected in the "Project texts" editor are written to an xlsx file. The xlsx file will be stored in the specified folder.

You can alternatively select and export all project texts from categories. Select "User texts" or "System texts" in the "Export" dialog in line with the type of texts you wish to export. In this case, export can additionally be limited by categories.

---

**Note**

Project texts in library objects cannot be exported.

---

**See also**

Working with multiple languages (Page 5902)

Translating texts using reference texts (Page 5906)

Translating texts directly (Page 5904)

Project text basics (Page 5903)

Importing project texts (Page 5911)

**Importing project texts**

Edit the xlsx file or send it to a translator. Import the texts once they have been translated. The foreign languages will be imported to the relevant object in the project.

**Requirements**

- At least two languages have been enabled in the "Project languages" editor, for example, Italian and French.

**Importing project texts**

To import a project text file, proceed as follows:

1. Click on the arrow to the left of "Languages & resources" in the project tree. The lower-level elements will be displayed.
2. Double-click on "Project texts". The "Project texts" editor will open.
3. Click on the  button. The "Import" dialog opens.
4. Select the path and file name of the import file from the "Import file" field.
5. Activate the "Import source language" check box if you have made changes to the source language in the export file and would like to overwrite the entries in the project with the changes.
6. Click on "Import".

**Result**

You have imported the project texts.

### 10.12.7.6 Using language-specific graphics

## "Graphics" editor

### Introduction

You use the "Graphics" editor to manage the configured graphic objects in different language versions. Multilingual projects sometimes also require language-specific versions of the graphics, for example, if

- the graphics contain text;
- cultural aspects play a role in the graphics.

### Opening the "Graphics" editor

Double-click on "Languages and resources" in the project tree.

### Work area

The work area displays all configured graphic objects in a table. There is a separate column in the table for each project language. Each column in the table contains the versions of the graphics for one particular language.

In addition, you can specify a default graphic for each graphic to be displayed whenever a language-specific graphic for a project language does not exist.

### Preview

The preview shows you how the graphics will look on various devices.

## See also

- Storing an external image in the graphics library (Page 5914)
- Storing an image in the graphics library (Page 5913)
- Languages in WinCC (Page 5896)

## Storing an image in the graphics library

### Introduction

You use the "Graphics" editor to import graphics you want to use in screens in the "Screens" editor. It also allows you to manage language-specific versions of graphics. A preview shows the graphic displays on various HMI devices.

### Requirement

- The language-dependent versions of a graphic are available.
- Multiple languages have been enabled in the "Project languages" editor.
- The "Graphics" editor is open.

### Inserting graphics

1. Click "Add" in the "Graphics library" table. A dialog box opens.
2. Select the required graphic file.
3. Click "Open" in the dialog box.  
The graphic will be imported to the project and displayed in all cells in this row in the "Graphics" editor.
4. Click in the corresponding cell of a language for which a language-dependent version of this graphic exists.
5. Select "Add graphic" from the shortcut menu. A dialog box opens.
6. Select the desired graphic file and click "Open."  
The language-dependent version is inserted in the table in place of the reference language graphic.
7. Then, in the "Default graphic" column, import a graphic to be displayed in runtime for those languages for which there is no language-specific graphic.

You can also drag&drop a graphic from Windows Explorer to the relevant position in the "Graphics library" table.

### Displaying graphics in the HMI device preview

1. Click on a graphic in the table.
2. Select the required HMI device under "Properties > Graphics settings > Device preview" in the Inspector window.  
The graphic will then be displayed as it will appear in runtime on the selected HMI device.

### Result

The graphics added are available in the "Graphics" editor. The graphic assigned to the respective editing language will be displayed during editing. The default screen will be displayed in all editing languages for which no screen has been imported.

The screens assigned to the respective runtime language are displayed during runtime. The default screen is displayed in all runtime languages for which a screen has not been imported.

---

**Note**

If you disable a project language, all of the graphic objects you have already created in this language will be deleted from the current project.

---

**See also**

"Graphics" editor (Page 5910)

**Storing an external image in the graphics library**

**Introduction**

To display graphics that have been created in an external graphics program in your screens, you will first have to store these graphics in the graphics browser of the WinCC project.

**Requirement**

- Multiple languages have been enabled in the "Project languages" editor.
- The "Graphics" editor is open.
- There is a graphic in the "Graphics" editor.

**Creating and adding a new graphic as an OLE object**

1. Click "Add" in the "Graphics library" table. A dialog box opens.
2. Navigate to the folder in which the graphic is stored.
3. Click "Open" in the dialog box.  
The graphic will be imported to the project and displayed in all cells in this row in the "Graphics" editor.
4. Click in the corresponding cell of a language for which a language-dependent version of this graphic exists.
5. Select "Insert object" from the shortcut menu. The "Insert object" dialog box opens.

---

**Note**

In addition, the dialog "External application running..." will open. The dialog will not close until you exit the external application.

---

6. Select "Insert object > Create new" and an object type in the dialog.

7. Click "OK." The associated graphic program is opened.
8. Close the graphics program once you have created the graphic.  
The graphic will be stored in the graphic programming software standard format and added to the graphic browser.

### Inserting created graphics in WinCC

1. Click in the corresponding cell of a language for which a language-dependent version of this graphic exists.
2. Select "Insert object" from the shortcut menu. The "Insert object" dialog box opens.

---

#### **Note**

In addition, the dialog "External application running..." will open. The dialog will not close until you exit the external application.

---

3. From the "Insert object" dialog box, select "Create from file."
4. Click the "Browse" button.
5. Navigate to the created graphic and select it.

---

#### **Note**

To import graphics files, note the following size restrictions:

\*.bmp, \*.tif, \*.emf, \*.wmf ≤4 MB

\*.jpg, \*.jpeg, \*.ico, \*.gif ≤1 MB

---

### Result

The OLE objects added are available in the "Graphics" editor.

Versions of the graphics for the current editing language are displayed in the "Screens" editor. The default graphic is displayed in all editing languages for which no screen has been imported.

The graphic is displayed in runtime in the set runtime language. The default graphic is displayed in all runtime languages for which no graphic has been imported.

You can double-click OLE objects in your library to open them for editing in the corresponding graphic editor.

"Graphics" editor (Page 5910)

### 10.12.7.7 Languages in runtime

## Languages in Runtime

### Using multiple runtime languages

You can decide which project languages are to be used in runtime on a particular HMI device. The number of runtime languages that can be available at one time on the HMI device depends on the device. To enable the operator to switch between languages during runtime, you must configure a corresponding operator control.

When runtime starts, the project is displayed according to the most recent language setting. When runtime starts the first time, the language with the lowest number in the "Order for language setting" is displayed.

### Setting runtime languages during configuration

In the "Languages and Fonts" editor you can specify:

- The project languages to be available as runtime languages for the respective HMI device.
- The order in which the languages are to be switched.

### See also

Methods for language switching (Page 5916)

Enabling the runtime language (Page 5917)

Setting the runtime language order for language switching (Page 5919)

Setting the default font for a runtime language (Page 5921)

Selecting the log language (Page 5922)

Languages in WinCC (Page 5896)

## Methods for language switching

### Introduction

You need to configure language switching if you want to have multiple runtime languages available on the HMI device. This is necessary to enable the operator to switch between the various Runtime languages.

## Methods for language switching

You can configure the following methods for language switching:

- Direct language selection  
Each language is set by means of a separate button. In this case, you create a button for each Runtime language.
- Language switching  
The operator switches the languages using a button.

Regardless of the method used, the button names must be translated into each of the languages used. You can also configure an output field that displays the current language setting.

## See also

Languages in Runtime (Page 5914)

Selecting the log language (Page 5922)

Enabling the runtime language (Page 5917)

Setting the runtime language order for language switching (Page 5919)

Setting the default font for a runtime language (Page 5921)

## Enabling the runtime language

### Introduction

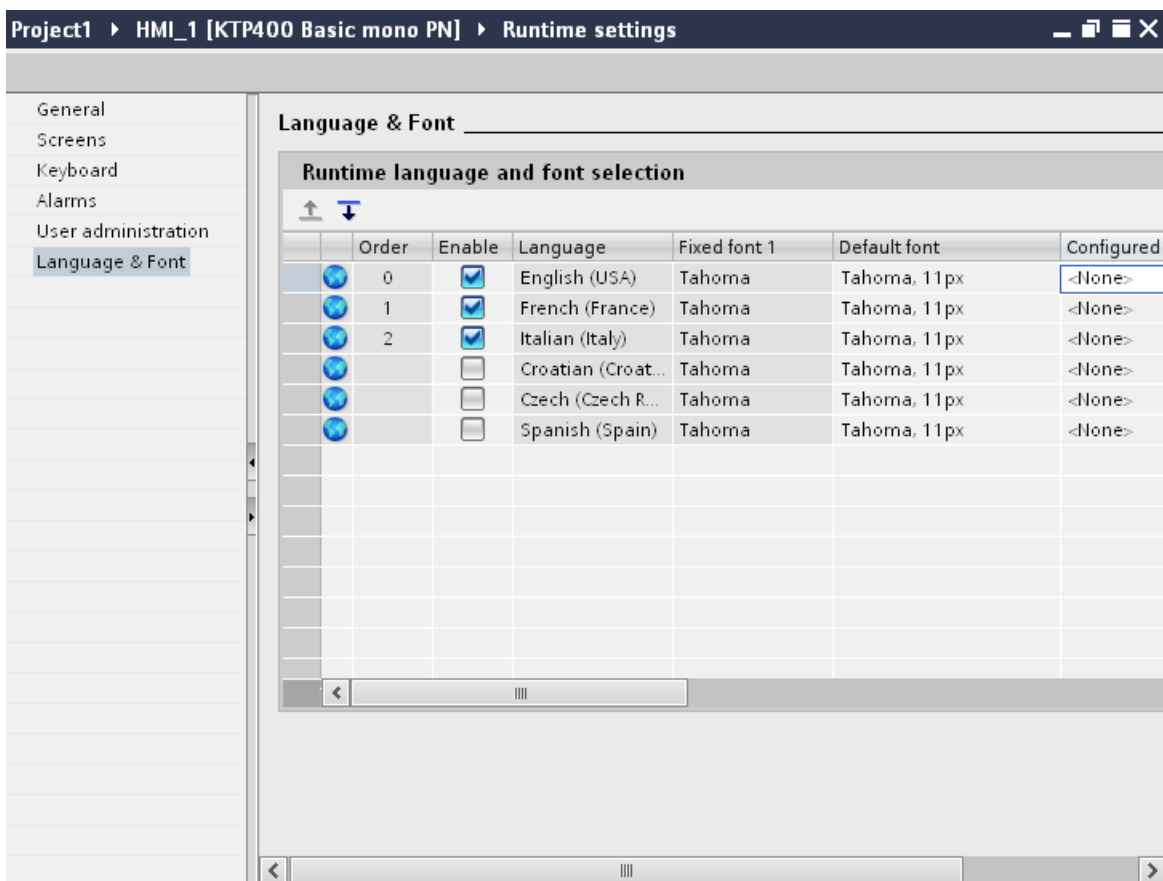

The "Language & Font" editor shows all project languages available in the project. Here you select which project languages are to be available as runtime languages on the HMI device.

### Requirements

Multiple languages have been enabled in the "Project languages" editor.

**Procedure**

1. Double-click on "Runtime settings" in the project tree.
2. Click on "Language & Font".
3. Select the following languages:
  - English
  - Italian
  - French

**Result**

You have now set three runtime languages. A number is automatically assigned to each language in the "Order" column. The enabled runtime languages are transferred with the compiled project to the HMI device.

If the number of languages selected exceeds the number that can be transferred to the HMI device, the table background changes color.

## See also

- Languages in Runtime (Page 5914)
- Selecting the log language (Page 5922)
- Setting the runtime language order for language switching (Page 5919)
- Methods for language switching (Page 5914)

## Setting the runtime language order for language switching

### Introduction

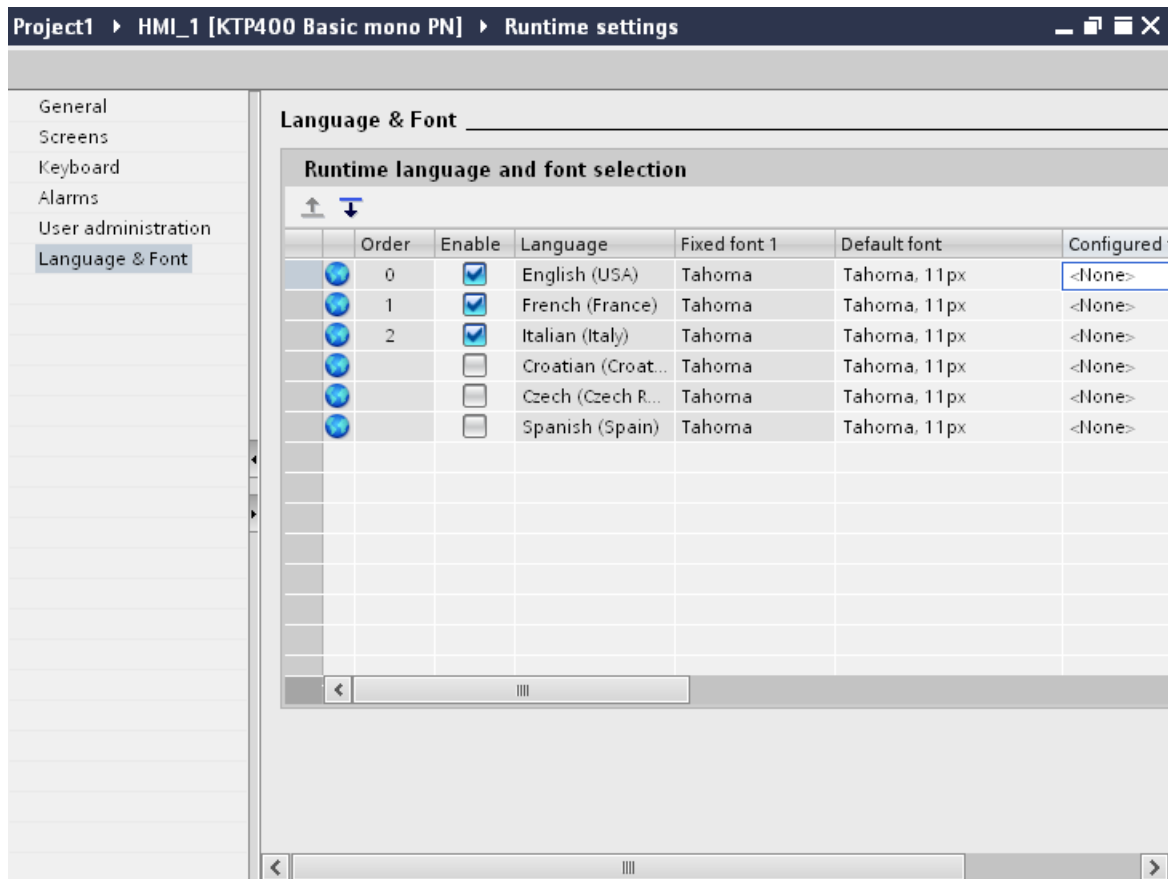

You specify the language order for runtime language switching. The first time runtime starts, the project is displayed in the language with the lowest number in the "Order" column.

### Requirements

- Multiple languages have been enabled in the "Project languages" editor.
- "Language & Font" is open in the editor and three runtime languages have been set in the following order:
  1. English
  2. Italian
  3. French

## Procedure

1. Select the runtime language "Italian".
2. Click the  button. The runtime language "Italian" is moved down a place. The number will automatically be changed to "2" in the "Order" column.

## Result

You have changed the order of runtime languages. The first time runtime starts, the project will be displayed in the language with the smallest number, in other words Chinese. If the language is switched, this will happen in numerical order.

## See also

- Languages in Runtime (Page 5914)
- Selecting the log language (Page 5922)
- Enabling the runtime language (Page 5915)
- Setting the default font for a runtime language (Page 5921)
- Methods for language switching (Page 5914)

## Setting the default font for a runtime language

### Introduction

You can specify the font used to display the texts for each runtime language on the HMI device in the "Language & Font" editor. The default font is used in all texts, such as dialog texts, for which you cannot define a specific font.

WinCC offers only fonts supported by the HMI device.

### Requirements

- Multiple languages have been enabled in the "Project languages" editor.
- Three runtime languages have been enabled in the "Language & Font" editor.
  1. Chinese
  2. German
  3. French

### Procedure

1. Double-click on "Runtime settings" in the project tree.
2. Click on "Language & Font". The table shows the runtime languages and fonts set.
3. Click in the "French" row in the "Default font" column.
4. Select the font to be used by default if a font cannot be selected for a given text.

### Result

The project texts for the runtime language "French" are displayed on the HMI device in the selected font.

These fonts are transferred to the HMI device during a transfer operation.

The default font is also used for the representation of dialogs in the operating system of the HMI device. Select a smaller font as default if the full length of the dialog texts or headers is not displayed.

### See also

Languages in Runtime (Page 5914)

Selecting the log language (Page 5922)

Setting the runtime language order for language switching (Page 5917)

Methods for language switching (Page 5914)

## Selecting the log language

### Introduction

In the "Runtime settings > General" editor, select the language to be used for writing to logs in runtime.

### Requirements

- The languages used in your project are activated in the "Project languages" editor, for example "German" and "English" .

### Procedure

1. Double-click on "Runtime settings" in the project tree.
2. Click on "Language & Font".
3. Activate the runtime languages, for example, "German" and "English".
4. Specify the "order":
  - 1 German
  - 2 English
5. Click on "Runtime settings > General".
6. Select "German" for "Logs > Log language".

### Result

After loading, the project will start in the runtime language "German". The logs are now written in German. During runtime, the operator switches the runtime language to English. The logs will still to be written in German.

### See also

Languages in Runtime (Page 5914)

Setting the default font for a runtime language (Page 5919)

Setting the runtime language order for language switching (Page 5917)

Methods for language switching (Page 5914)

Enabling the runtime language (Page 5915)

### 10.12.7.8 Example of multilingual configuration

#### Example: Configuring a button for language switching

##### Introduction

In this example, you configure a button that can be used to toggle between multiple runtime languages during runtime.

##### Requirements

- You have completed the "Configuring a button in multiple languages" example.
- The "Screen\_1" screen is open.
- The button on the screen has been selected.

##### Procedure

1. In the Inspector window, select "Properties > Events > Press".
2. Click on "Add function" in the table.
3. Select the "SetLanguage" system function and the "Switch" setting.

##### Result

You have assigned the button the function "SetLanguage". Pressing the button during runtime will switch the runtime language. The runtime languages are switched in the order specified by the number sequence in the "Languages and fonts" editor.

##### See also

Example: Configuring a button in multiple languages (Page 5923)

Example: Configuring a button for language switching for each runtime language (Page 5924)

Languages in WinCC (Page 5896)

#### Example: Configuring a button in multiple languages

##### Introduction

In this example, you configure a "Sprache umschalten" button in German and "Switch language" button in English.

## Requirements

- The languages "German" and "English" have been enabled in the "Project languages" editor.
- German has been set as editing and reference language.
- You have created and opened the "Screen\_1" screen.
- The Inspector window is open.

## Procedure

1. Drag-and-drop a button from the "Tools" task card into the screen. The button will be added to the screen.
2. In the Inspector window, open "Properties > Properties > General".
3. Enter the text ""Sprache umschalten" under "Text > off".
4. Press <Enter> to confirm. The button is named.
5. Open the "Tasks" task card.
6. Select "English" under "Languages & Resources > Editing language".
7. Enter the label "Switch Language" under "Properties > Properties > General > Text > Off" in the Inspector window.

## Result

The button name is configured in German and English language. The button name corresponding with the current Runtime language is shown in Runtime.

## See also

Example: Configuring a button for language switching (Page 5921)

Example: Configuring a button for language switching for each runtime language (Page 5924)

## Example: Configuring a button for language switching for each runtime language

### Introduction

In this example, you configure a "Sprache umschalten" button in German and "Switch language" button in English.

## Requirements

- The following languages have been enabled in the "Project languages" editor
  - German
  - English
  - Italian
- All languages have been set as runtime languages in the "Runtime settings > Language & Font" editor.
- You have created and opened the "Screen\_1" screen.
- Three buttons have been created on the screen:
  - Button\_1 labelled "Deutsch"
  - Button\_2 labelled "English"
  - Button\_3 labelled "Italiano"
- The Inspector window is open.

## Procedure

1. Select "Button\_1".
2. In the Inspector window, select "Properties > Events > Press".
3. Click on <Add function> in the table.
4. Select the "SetLanguage" system function.
5. Click on the "Switch" field.
6. Click on the  button.
7. Select "Runtime language". The field will be highlighted in red.
8. Select "German" from the drop-down list.
9. Repeat steps 1 - 8 for the other two buttons and select the corresponding runtime language.

## Result

You have configured three buttons for switching language in runtime. Each button will switch to a different runtime language. For example, clicking on the "English" button during runtime will switch the runtime language to English.

## See also

Example: Configuring a button for language switching (Page 5921)

Example: Configuring a button in multiple languages (Page 5921)

## 10.12.8 Replacing devices

### 10.12.8.1 Basics

#### Introduction

You can use existing configurations for new devices and optimize these configurations with little manual effort.

All data configured by you is retained in the configuration data. This means you do not need to copy individual objects of one device and paste them to another.

#### Principle

The following applies when you replace devices:

- Only functions supported by the new device are available. Only configuration data supported by the new device are displayed.  
This affects
  - recipes,
  - objects available on the screens,
  - available system functions,
  - available communication logs, etc.
- The number of supported objects, such as screens or tags, may be limited on the new device. If the existing objects exceed the limitations on the new device, the objects are displayed in full. The objects are, however, highlighted in color in the individual editors. An error is generated when the project data is compiled.  
Manual post processing is required when switching to a device with fewer features.  
Example: Limited number of connections  
All connections will be highlighted in color as invalid if fewer connections are supported on the new device than have been configured. Delete any excess connections.

---

#### Note

If you replace a Panel and select a PC Station as your new device, for example, WinCC Runtime Advanced will automatically be moved below the PC Station in the project tree.

---

Device-specific functions (Page 5927)

Engineering system (Page 6104)

Basic Panel (Page 6106)  
Panel (Page 6113)  
Mobile Panel (Page 6117)  
Multi Panel (Page 6122)  
Comfort Panel (Page 6125)  
WinCC Runtime Advanced (Page 6130)

## 10.12.8.2 Device-specific functions

### Device-specific functions

#### Functions dependent on the device

Functions dependent on the device are implemented as follows:

- Colors  
The color is changed automatically when you switch from a device with full color display to one with a smaller color range.  
If you change the color manually and then change back again to a device with a larger range of colors, the reduced range of colors will be retained.
- Fonts  
Any configured font not available on a device will be replaced by a similar one or by the configured default font. The default font depends on the device selected.
- Character sets with different font sizes  
Avoid using too many different font sizes when configuring the following devices:
  - OP 73
  - OP 77A
  - TP 177A

A character set is downloaded to the device for each font size. Check the Inspector window during compilation to see how much of the device memory is being used by the character sets.

- **Font size**  
Use small Windows fonts to display the text on devices. If you use large Windows fonts, then, depending on the size of the display, the text will not be displayed in full. Using font sizes of 28 pixels or more for the OP 77A and TP 177A devices will affect device performance.  
The character scope is much greater for Asian languages. The use of different font sizes therefore has serious implications on the memory requirements of all devices.  
Use the same font type for all large characters throughout the project to ensure effective and efficient configuration.
- **Screens and screen objects**  
If the new device supports a different resolution than the previous device when you replace a device, there are several ways to adjust the screens.  
Adjust the size of the screens to the new device in the menu under "Options > Settings > Visualization > Fit to size screen".

### See also

Example: Replacing devices (Page 5939)

Basics (Page 5924)

### Key assignment when replacing devices

#### Introduction

The devices available each have different function keys. The functions configured for these keys will be mapped to the available function keys of the new device if the device is replaced.

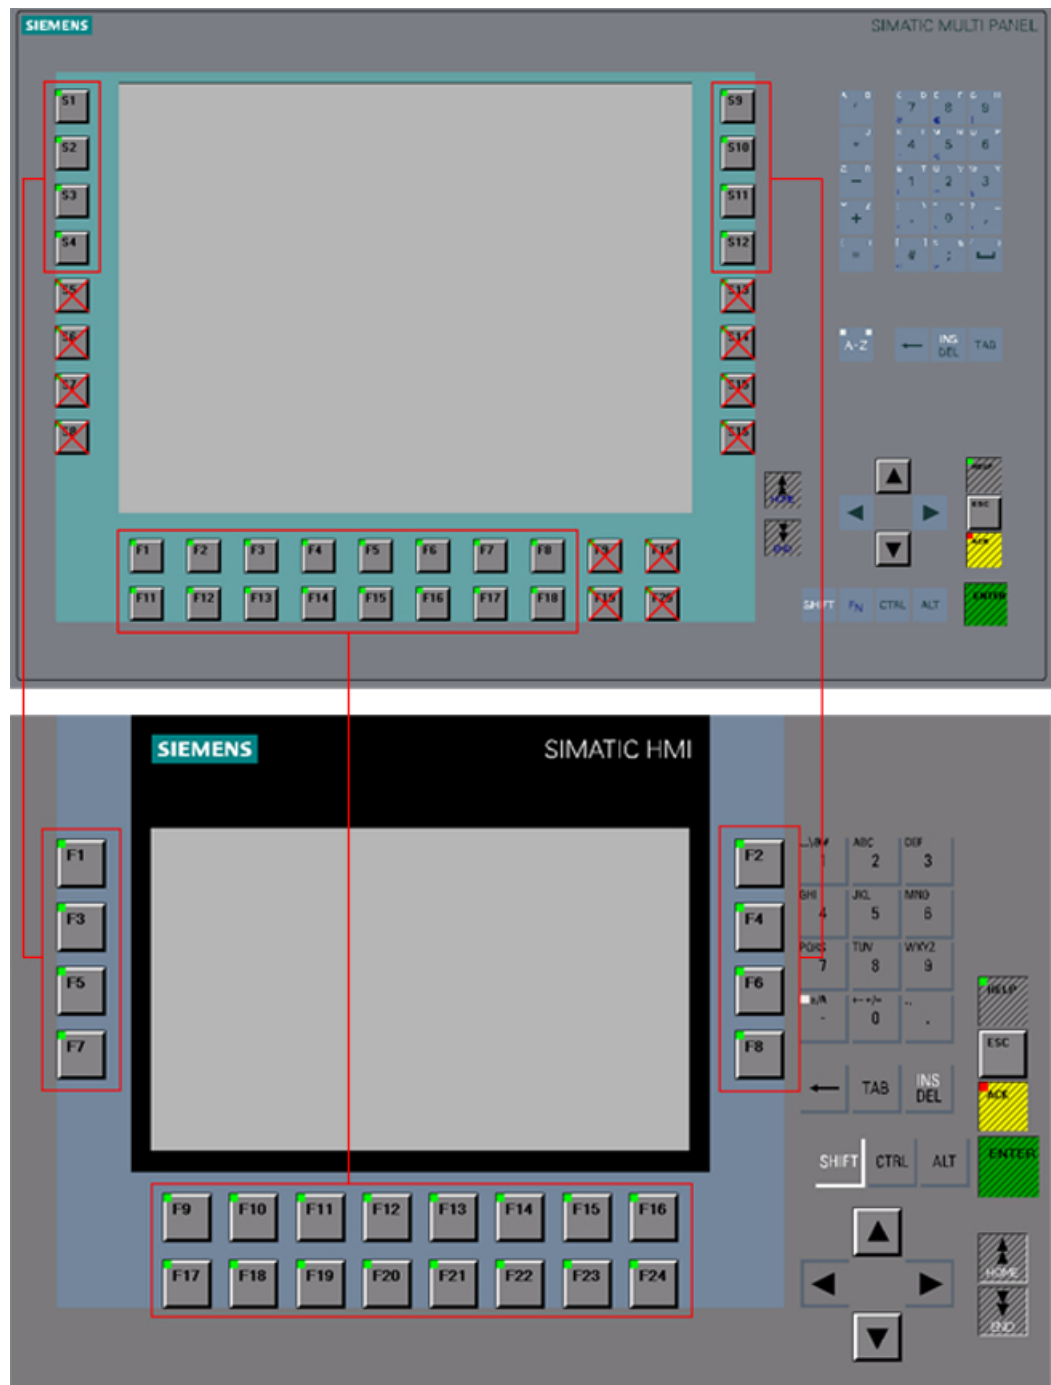

#### Function key mapping

The function keys to the left and right of the display are mapped from top to bottom to the new device. If the new device has fewer keys, the keys it does not have are not mapped. The function keys below the display are mapped from left to right to the new device. If the new device has fewer keys, the keys it does not have are not mapped.

#### Example: Exchange MP 377 with KP700 Comfort

You have configured a function on key S3 on the MP 377. This function is triggered by F5 if the panel is replaced with an KP700 Comfort.

If you use the S8 key on an MP 377, this function is no longer available when the panel is replaced with a KP700 Comfort.

## Mapping K-keys

K-keys are only mapped to the same K-keys in the new device, e.g. K5 to K5.

If the new device has no K keys, configurations for the K keys are lost.

## Mapping of control keys and cursor keys

The following keys are mapped only to the same keys of the new device:

- HELP
- ESC
- ACK
- ENTER
- PAGE UP
- PAGE DOWN
- CURSOR UP
- CURSOR DOWN

## Exception

"HELP" is triggered by "SHIFT+ ESC" on OP 73.

## See also

Key assignment when replacing devices (Page 5930)

Basics (Page 5924)

Screen adjustment options (Page 5932)

## Key assignment when replacing devices

### Introduction

The devices available each have different function keys. The functions configured for these keys will be mapped to the available function keys of the new device if the device is replaced.

### Function key mapping

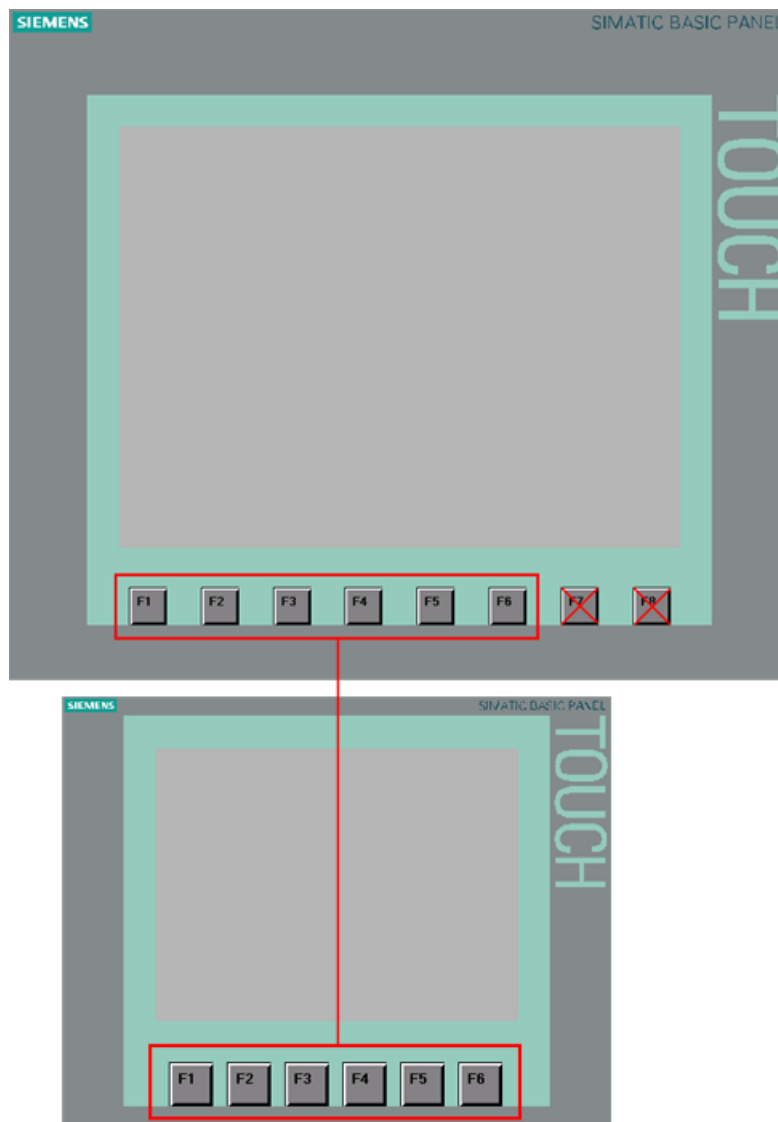

The function keys below the display are mapped from left to right to the new device. If the new device has fewer keys, the keys it does not have are not mapped.

### Example: Replacing a KTP1000 Basic with a KTP600 Basic

You have configured a function for F2 in KTP1000 Basic. This function is triggered by F2 following replacement with a KTP600 Basic.

If you have used F7 in a KTP1000 Basic, this function will no longer be available if the panel is replaced with a KTP600 Basic.

### Mapping of control keys and cursor keys

The following keys are mapped only to the same keys of the new device:

- HELP
- ESC
- ACK

- ENTER
- PAGE UP
- PAGE DOWN
- CURSOR UP
- CURSOR DOWN

### See also

Key assignment when replacing devices (Page 5926)

### 10.12.8.3 Adjust screens to the new device

#### Screen adjustment options

#### Introduction

Select fit to size for screens before you replace a device. Fit to size is particularly important when switching devices with different display resolutions.

Object adjustment to content can be prevented for objects such as graphic views or text fields.

---

#### Note

The objects are distorted if you replace a device with a landscape format display with a device with a portrait format display. The difference in display format can, for example, result in object labels being cut off and content not being fitted to the object. You must therefore adjust the screens to the new device once you have replaced devices.

---

## Screen adjustment when replacing devices

Adjust the size of the screens to the new device in the menu under "Tools > Settings > Visualization > Resize screen".

Select one of the following settings.

### None (default setting)

The screens are not scaled. The objects in the screen retain their position and size. Use this setting as first test for checking of a possible exchange result because there are no rounding losses during forth and back exchange.

This option may result in objects being outside the configurable area if the display of the new device is smaller than the old one.

### Fit to screen

The position and object size are adjusted to the new display size. Resizing takes place along the x-axis and the y-axis. Graphics and font size are adjusted accordingly.

### Fit to height

The aspect ratio is maintained and the screens are adjusted to the height of the new device.

Use this option when you are replacing a device with display format 4:3, for example, with a device with widescreen.

### Fit to width

The aspect ratio is maintained and the screens are adjusted to the width of the new device.

Use this option when you are replacing a device with widescreen, for example, with a device with display format 4:3.

### Free scale factor

You select a free scale factor for screen adjustment. You can specify a factor for the x-axis and the y-axis.

Using a free scale factor of  $< 1$  may distort the objects. Object labels may, for example, be cut off and the content may not be fitted to the object.

You must therefore adjust the screens to the new device once you have replaced devices.

---

#### Note

The aspect ratio is not adjusted for objects with a fixed aspect ratio, for example, gauge, circle. The objects are displayed on the new device with the same aspect ratio as prior to the replacement of the device.

---

#### See also

Example: Adjusting screens (Page 5938)

Specifying the position of screen objects (Page 5937)

Fit objects to contents (Page 5934)

Basics (Page 5924)

Key assignment when replacing devices (Page 5926)

#### Fit objects to contents

##### Introduction

For some objects, you can specify fit to respective content in the Inspector window, for example:

- Text field: fit to text content
- I/O field: fit to text content
- Symbolic I/O field: fit to text content or to text list
- Graphic view: fit to included graphic

##### Fit to size for text and graphic objects

Disable automatic fit to size of the individual objects in the menu under "Options > Settings > Visualization > Resize screen and screen objects > Fit to content". This results in scaling of the objects as specified under "Options > Settings > Visualization > Resize screen and screen objects".

Select the objects which are not automatically fitted to size.

- 
- Disable 'fit to size' for text objects
  - Disable 'fit to size' for graphical objects

- If "Disable 'fit to size' for text objects" is activated, automatic fit to size is ignored in the text object properties.  
If you have activated "Fit screen to window height", the text field along with the other objects is scaled in accordance with the height of the new device.
- If "Disable 'fit to size' for graphic objects" is activated, automatic fit to size is ignored in the graphic object properties.  
If you have activated "Fit screen to window width", the graphics view along with the other objects is scaled in accordance with the width of the new device.

---

**Note**

The settings have no effect on screen objects whose size cannot be changed, such as alarm indicators or screen objects with a fixed aspect ratio.

---

"Disable 'fit to size' for text objects" and "Disable 'fit to size' for graphic objects" have no effect if:

- You have activated "Resize screen and screen objects > None".
- You have activated "Fit screen to window width and height" and the new device has the same resolution as the current device.
- You have activated "Fit screen to window height" and the new device has the same resolution as the current device.
- You have activated "Fit screen to window width" and the new device has the same resolution as the current device.

**Example**

The figure below shows the effects of automatic sizing using a graphic object with two buttons aligned as an example:

① Initial situation:

- Two buttons are aligned on a graphic object.
- The option "Fit object size to graphic" or "Adjust object size to graphic" is activated in the object properties of the graphic object under "Display > Sizing".

② Option 1: The original properties of the graphic object are to be maintained after switching the HMI device.

- Deactivate the option "Disable 'fit to size' for graphical objects" in the settings under "Size adaptation of objects".

Effect: The graphic object retains its original size after switching the HMI device. The alignment to the buttons is lost.

③ Option 2: The graphic object is to be placed relative to the new screen resolution after switching the HMI device.

- Activate the option "Disable 'fit to size' for graphical objects" in the settings under "Size adaptation of objects".

The option "Fit graphic to object size" is activated automatically in the object properties of the graphic object. The two buttons are properly aligned on the graphic object even after switching the HMI device.

Specifying the position of screen objects (Page 5937)

Screen adjustment options (Page 5930)

Example: Adjusting screens (Page 5938)

## Specifying the position of screen objects

### Introduction

There are various ways to adjust the position of screen objects to the new device.

### Select position

Adjust the position of the screen objects to the new device in the menu under "Options > Settings > Visualization > Fit to size screen > Select position".

### Example

The following option aligns the objects with the top left edge.

The following object centers the objects in the middle of the screen.

Screen adjustment options (Page 5930)

Fit objects to contents (Page 5932)

Example: Adjusting screens (Page 5938)

## 10.12.8.4 Example: Replacing devices

### Example: Procedures overview

#### Introduction

In the following example you replace a TP177 B 6" PN/DP with a TP700 Comfort.

## Procedures overview

The procedure when replacing a device is as follows:

1. Adjust screens to the new device
2. Replacing devices

## See also

Example: Adjusting screens (Page 5938)

Example: Replacing devices (Page 5939)

## Example: Adjusting screens

### Introduction

Adapt the screen before you replace a device. Screen adaptation is required as the display formats are different.

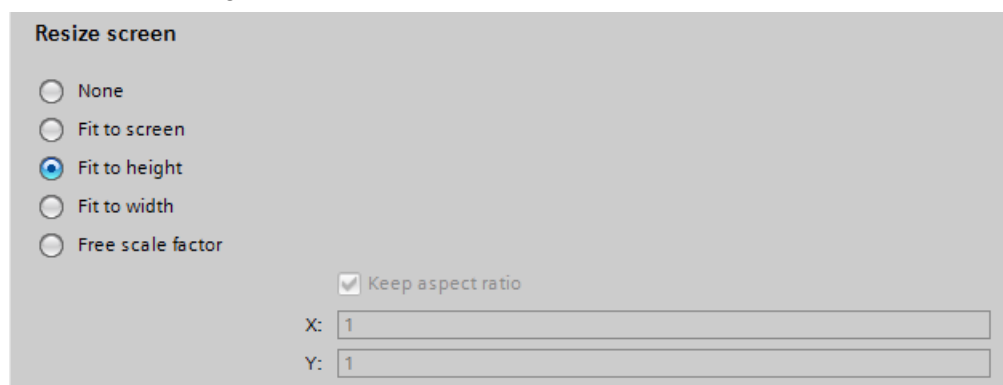

The TP 177B format is 320 x 240 pixels while the format of the TP700 Comfort is 800 x 480 pixels.

### Requirements

- A project is open.
- The TP 177B 6" PN/DP device is used in the project.

### Adjusting screens

1. Open the "Options > Settings" menu.
2. Click on "Visualization > Resize screen".
3. Activate "Fit to height".

4. Select "Disable fit to size for text objects".
5. Select "Disable fit to size for graphical objects".

## Result

You have carried out screen adjustment in preparation for replacing devices.

## See also

Example: Replacing devices (Page 5939)

Screen adjustment options (Page 5930)

Specifying the position of screen objects (Page 5935)

Fit objects to contents (Page 5932)

Example: Procedures overview (Page 5935)

## Example: Replacing devices

### Introduction

The following example shows you how to replace a device.

### Requirements

- A project has been created and opened.
- The TP 177B 6" PN/DP device is used in the project.

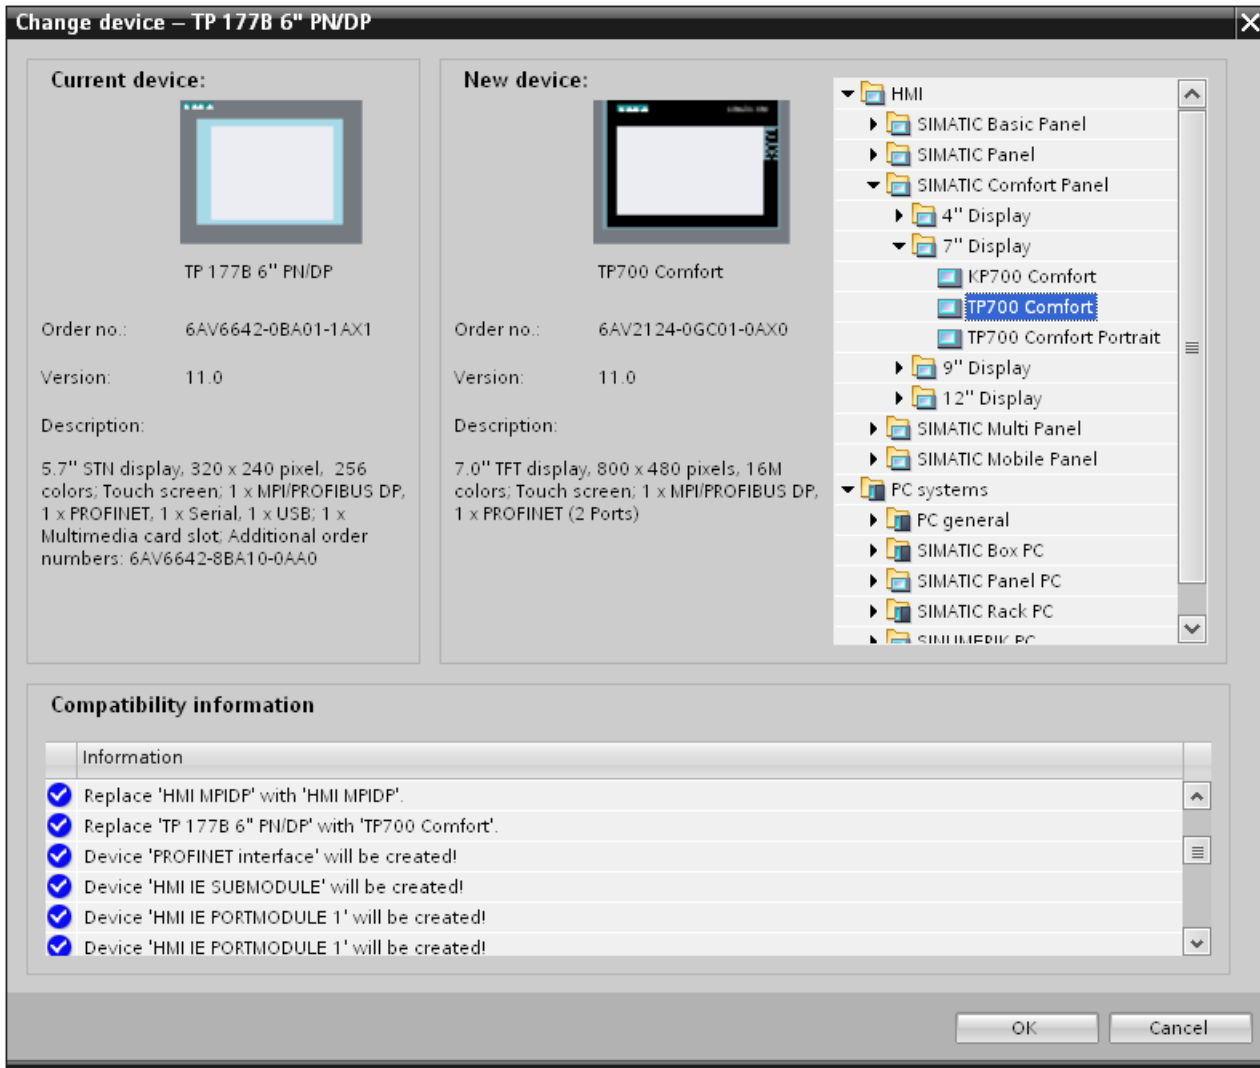

### Procedure

1. Double-click on "Devices & Networks" in the project navigation. The editor opens.
2. Click on the "TP 177B" device.
3. Select "Change Device/Version" in the device shortcut menu. A dialog opens.
4. Select the TP700 Comfort device.

5. Select the matching image for the HMI device version that suits your configuration under "Version".

When you change the image, the new image is automatically transferred to the target system with the next download. All runtime files are deleted during this step.

Details of hardware differences can be found in the "Compatibility information".

6. Click "OK". Device replacement is started.

## Result

You have replaced the TP 177B device used in the project. You now use the TP700 Comfort device.

## 10.12.9 Copying between devices and editors

### 10.12.9.1 Basics

#### Basics

#### Copying and pasting within an HMI device

You can copy and paste objects, such as display objects, within an HMI device. If the object is already created in the editor, when the object name is inserted a number is automatically attached, in accordance with the following principle:

- "<Object\_name>\_1" is renamed to "<Object\_name>\_2".
- "<Object\_name>\_2" is renamed to "<Object\_name>\_3".

#### Copying and pasting between HMI devices

You can also copy and paste between HMI devices. If an object with the same name already exists, you have the following options:

---

**Note**

**Exception to this basic rule**

Copying and pasting of an alarm class that has been generated from project-wide alarm class is handled differently than with this basic rule. When the copied alarm class already exists in the target HMI device within the same project, the "Paste" command is not performed.

---

### Copying user-defined folders

You can create user-defined folders for editors, for example, for HMI tags, screens, etc.

You can copy user-defined folders and paste them into another HMI device. The objects contained in a user-defined folder may exceed the limitations applying to the other HMI device, such as the number of supported screens. After they have been pasted, all the objects are displayed. An error is displayed when the project data is compiled.

System folders cannot be copied.

### See also

Unsupported objects and functionalities (Page 5943)

Copy and paste options (Page 5942)

### Copy and paste options

#### Copy and paste options

Copy and pasting individual objects simplifies configuration.

WinCC offers a number of options for copying and pasting objects.

### Shortcut menu

To copy and paste objects using the shortcut menu, proceed as follows:

1. Select an object, for example a button.
2. Select "Copy" in the shortcut menu.
3. Move the mouse cursor to the place on the screen where you want to paste the button.
4. Select "Paste" in the shortcut menu.  
The button will be pasted together with all properties already defined.

## Drag&drop

To drag-and-drop objects, proceed as follows:

1. Click on "Screens > Start" in the project tree of a device.
2. Drag-and-drop the "Start" screen into the "Screens" folder of another device.
3. A dialog will appear if the second device already contains a screen with the same name.
4. Choose whether to replace or rename the existing screen.

## See also

Basics (Page 5939)

## Unsupported objects and functionalities

### Introduction

When an object is copied, all its properties and settings are transferred to the target HMI device.

### Unsupported objects

Objects that are not supported in the target HMI device cannot be pasted.

---

#### Note

When you copy a screen containing objects which are not supported by the destination HMI device, the objects remain in the background. When you copy the screen again and the new device supports the objects, they are displayed again.

---

### Invalid objects

The following objects become invalid once they have been pasted into the target HMI device:

- Referenced objects that do not exist in the target HMI device.
- Objects with settings that are not supported in the target HMI device.
- System functions that were configured for objects and that are not supported in the target HMI device.

Invalid objects are highlighted by a color coding. Select a supported object or create a new one. If you retain an invalid object, an error will be displayed when the project data is compiled.

### Colors and fonts

Colors and fonts are supported to varying degrees by HMI devices. When unsupported colors and fonts are pasted, they are replaced by supported colors and fonts. When you paste the same object back into the source HMI device, the original settings become active again.

## See also

Basics (Page 5939)

### 10.12.9.2 Copy and paste

## Copying screens

### Introduction

You copy one or more screens from the "Screens" folder and paste them into the "Screens" folder of another device.

### Type and size of the displays

In the case of HMI devices with keys, the available keys are displayed automatically in the screen. When a screen is copied between HMI devices, the keys are either displayed or hidden; functions configured for function keys are not transferred.

If there is less space for the screen in the target HMI device than in the source HMI device, you can adjust the size of and the spacing between existing objects.

### Automatic fit to size for objects

1. Select "Options > Settings > Visualization > Resize screen and screen objects" in the menu.
2. Activate, for example, "Fit to height".

## See also

Screen adjustment options (Page 5930)

Fit objects to contents (Page 5932)

Specifying the position of screen objects (Page 5935)

Copying recipes within an HMI device (Page 5944)

Copying objects with linked objects (Page 5945)

Linked objects copied automatically (Page 5946)

Linked objects copied automatically (Page 5946)

Drag & drop from the details view (Page 5947)

## Copying recipes within an HMI device

### "Recipes" Editor

You can copy recipes, recipe elements and recipe data records within each table. You copy a recipe element to another recipe.

Only WinCC Runtime Professional: You can copy a recipe view element to another recipe view. If a recipe view element of the same name already exists, a conflict dialog is displayed. You can select whether to replace or rename the recipe element. You can copy recipe elements to the first empty row of the "Recipe views" editor, "Elements" tab.

You can copy a recipe data record to another recipe, if the other recipe contains the same number of recipe elements. If the data types differ, the value will be copied to the target data record but it is assigned an error flag.

### "Tags" editor

You can drag-and-drop a tag to a recipe element in the "Tag" column. The tag is linked to the recipe element. If a tag is already linked, an error message will be generated.

### "Screens" editor

If you drag-and-drop a recipe to a screen, a new recipe display will be created and linked to the recipe.

### See also

Copying screens (Page 5942)

## Copying objects with linked objects

### Introduction

An object is linked to another object in the following situations, for example:

- You specify a tag for an alarm as a trigger tag.  
The alarm is the object. The tag is the linked object.
- You specify a connection for an external tag.  
The tag is the object. The connection is the linked object.

The object is always fully inserted during copying and pasting. Whether or not the linked object is pasted depends on the command used to insert it.

### Simple pasting

The linked object is not copied. The linked object is transferred and handled as follows in the target HMI device:

- If an object with the same name exists, the existing object with its settings is used.
- If no object with the same name exists, the name of the object will be displayed. The object becomes invalid.

For some objects, linked objects are pasted automatically during simple pasting.

### Extended pasting

Select the "Extended paste" command in the shortcut menu to paste the linked objects as well. If objects of the same name exist in the target HMI device, you need to decide whether or not to overwrite each of these objects.

### See also

Copying screens (Page 5942)

### Linked objects copied automatically

#### Copying linked objects

The following table shows the objects for which linked objects are pasted automatically in simple pasting.

Object	Linked object
Screen	Template
Symbolic I/O field	Text list
Graphic I/O field	Graphics list
Graphic view	Graphic
Tag	Alarm
	Cycle
Recipe element	Text list
Scheduler	Triggers

### See also

Copying screens (Page 5942)

## Drag & drop from the details view

### Introduction

You can improve configuration efficiency with just a few simple measures. Below are a few examples of efficient configuration.

### Pasting objects to a screen from the details view

You can drag objects in the details view from various different editors to other editors.

### Pasting a symbolic I/O field

1. Open a screen.
2. Click on the "Text and graphics lists" editor in the project tree. All existing text and graphics lists will be shown in the details view.
3. Click on a text list, for example, "Textlist1" in the Details view.
4. Drag-and-drop a text list from the Details view to a screen. A symbolic I/O field has been created and connected to the text list "Textlist1".

### Pasting a graphic I/O field

1. Open a screen.
2. Click on the "Text and graphics lists" editor in the project tree. All existing text and graphics lists will be shown in the details view.
3. Click on a graphics list in the Details view, for example "Graficlist1".
4. Drag-and-drop a graphics list from the Details view to a screen. A graphic I/O field has been created and connected to the graphics list "Graficlist1".

### Pasting an I/O field

1. Open a screen.
2. Click on the "HMI tags" editor in the project tree. All existing HMI tags will be shown in the Details view.
3. Click on an HMI tag in the Details view, for example "Tag1".
4. Drag-and-drop the HMI tag from the Details view to a screen. An I/O field has been created and connected to the HMI tag "Tag1".

### See also

Copying screens (Page 5942)

### 10.12.9.3 Copying between different RT and ES versions

#### Introduction

You can copy and paste project data such as screens, objects or tags between projects with different WinCC versions.

All configurations that are supported in the target version are retained when you copy data between projects of different WinCC versions. Configurations that are not supported by the target version are marked as invalid with a color code.

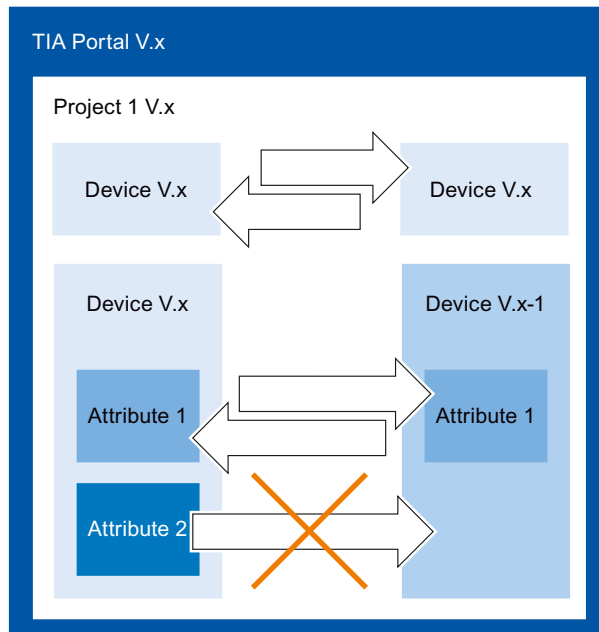

#### Copy of control between HMI devices from different device versions

WinCC supports all configurations of a previous WinCC version.

The following applies when copying within different ES versions:

- All the configurations that are also supported in the respective RT version are retained.
- Default settings are defined for configurations that are only supported in the WinCC version of the target project.

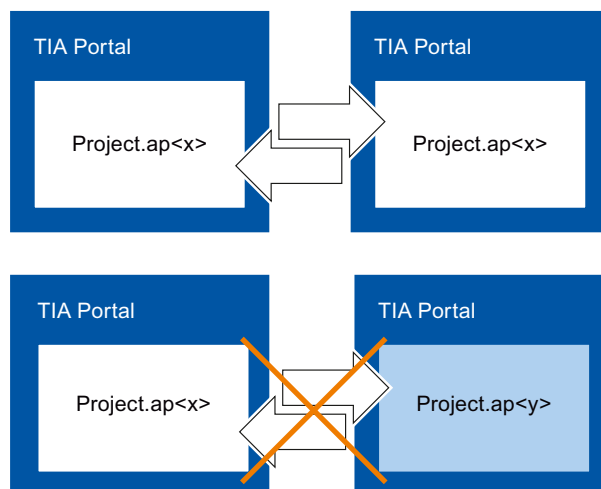

- Configurations that are not supported by the respective RT version are marked by color as invalid or are not displayed. All properties and settings originally defined in the source HMI device are reactivated when you copy an object back to the source HMI device unchanged.

- The HMI device must be valid for the current Runtime version.

### Copying between different ES versions

Open a second instance of the TIA Portal to copy between two TIA projects. You can only copy between projects that have the same ES version. The ES version of a project is indicated by the file extension \*.ap<version\_number>.

## 10.12.10 Using WinCC version compatibility

### 10.12.10. Basics on version compatibility

1

#### Introduction

Edit existing projects as follows with WinCC:

- You edit, compile and download existing projects with the range of functions of the previous version of WinCC. You can continue to edit these projects afterwards with the previous version of WinCC.
- You upgrade existing projects and use the functions of the current WinCC version.

---

#### Note

##### WinCC functions

While editing a project of a previous WinCC version, you can only access the functions and HMI devices of this previous WinCC version.

---

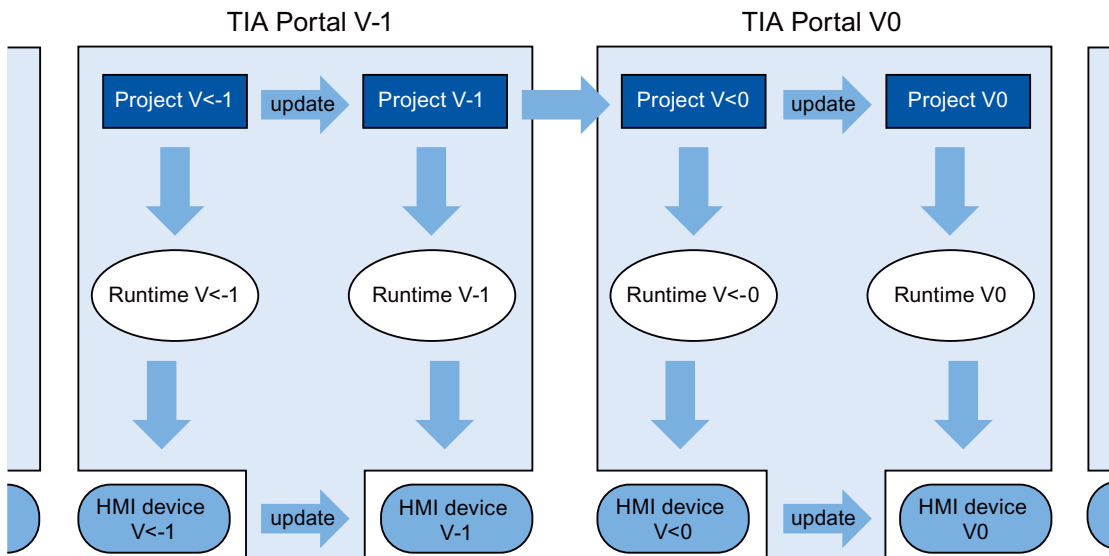

#### Versions in WinCC

In WinCC, you work with different version types:

- WinCC version  
The WinCC version installed on the configuration PC, for example, WinCC V12.
- Project version  
Projects are created using the WinCC version that is installed on the configuration PC. While you are editing a WinCC project from a previous version in the current WinCC version, the version ID is displayed behind the project name in the project tree.
- Runtime version  
You can configure HMI devices with different runtime versions in WinCC. You specify the runtime version once for an HMI device. The device version must match the Runtime version.
- Device versions  
Depending on the used HMI device, the image is a combination of the operating system and / or runtime software. For each HMI device, WinCC provides various images which can be loaded onto the HMI device, if necessary, according to the configuration. The device version corresponds to a specific image. The device version must match the configuration.

## Compatibility of WinCC versions, Runtime versions and device versions

The figure below shows the interaction of versions in the TIA Portal:

### Creating projects

After you create a new project in WinCC, open and edit it in the WinCC version in which you created it.

### Saving

To save a project of a predecessor WinCC version in this version again, save it in the usual way. If you manually upgrade the project to your WinCC version, please note that you will no longer be able to open the project in the previous WinCC version.

To save a project of the previous WinCC version in the current version, upgrade the project to your WinCC version. You can then no longer edit the project with a previous version of WinCC.

### Compiling, simulating and loading

If you are using a project of a previous WinCC version, you can use your current version to generate Runtime data for this previous version. This also allows you to load HMI devices that are no longer compatible with your WinCC version.

### Copying within projects with different WinCC versions

If objects and configurations are also available in the target version, copy these as required via the clipboard or using drag-and-drop.

### Opening, editing and saving projects of a previous WinCC version

You can open and edit projects of previous WinCC versions as required. In doing so, you only utilize the functions of the previous WinCC version. Once you have completed editing, you can once again save and edit the project in the previous WinCC version.

### Compiling, downloading and simulating projects of a previous WinCC version

You can compile, download and simulate projects of previous WinCC versions as required. Your current WinCC version will provide the Runtimes and device versions for the corresponding WinCC version.

#### 10.12.10. Editing projects of a previous WinCC version

2

##### Introduction

WinCC provides the option of editing projects of a previous WinCC version. While editing a project of a previous WinCC version, you can only access the functions of this version. In order to use the functions of your current WinCC version for this project, upgrade the project to your WinCC version.

---

##### Note

If you upgrade a project to your WinCC version, please note that you will no longer be able to open and edit the project in the previous WinCC version.

---

##### Requirement

- A project of a previous WinCC version has been created.
- The current WinCC version is installed on the configuration PC.

##### Procedure

Proceed as follows to edit a project of a previous WinCC version:

1. Open the project.
2. Edit the project using the functions of the previous WinCC version.
3. Save the project.
4. Compile the project.
5. Download and simulate the project.
6. You can open the project in the previous WinCC version for further editing, if required.

## Result

The modified project data can be edited further on a different configuration PC with the previous WinCC version for further processing. The Runtime project was generated and downloaded in the corresponding Runtime version.

### 10.12.10. Upgrading projects 3

## Introduction

If the project version is older than the WinCC version, the version ID is displayed in the project navigation. Your WinCC version also contains the previous version that you can use to edit projects as required. In order to use the functions and options of your WinCC version in a project, upgrade the project to your WinCC version. Then, change your device or runtime version(s) in accordance with the new project version.

---

### Note

#### WinCC version compatibility

If you upgrade a project to your WinCC version, please note that you will no longer be able to edit it with the previous WinCC version.

---

## Requirements

- The project version is a predecessor of your WinCC version.
- You have write access to your project drive.
- The project drive provides sufficient storage capacity for another project of this size.

## Procedure

Proceed as follows to upgrade a project to your WinCC version:

1. Select the project in the project navigation.
2. Select the "Upgrade project" command from the shortcut menu of the project.  
A dialog opens.
3. Click "Confirm".  
The project closes and the progress bar is displayed.

An alarm is output when the project has been upgraded.

## Result

- The project has been saved on the project drive in the previous WinCC version and with the corresponding file extension.
- The project is displayed on the project drive in the current WinCC version and with the corresponding file extension.
- The project is displayed without a WinCC version ID in the project navigation.

To make use of the functions of the new WinCC version, change your device or runtime version(s) in accordance with the new project version in the next step.

### 10.12.10. Upgrading a global library

4

#### Introduction

In order to process objects of a global library in a project, the global library must be available in the product version of the project. You can upgrade each global library from an older product version to the current product version. You are prompted accordingly when you open the global library.

#### Requirements

- The version of the global library is a predecessor of your WinCC version.
- You have write access to your project drive.
- All types in the library have been released.

---

#### Note

##### Upgrading a user library

If you want to use a user library from an earlier version of WinCC, you must upgrade it. Make sure that all types of the library have been released. The library being upgraded cannot contain a type with the "in progress" status.

---

#### Procedure

Proceed as follows to upgrade a global library from TIA Portal V12.x or lower:

1. Open the global library.  
The "Upgrade global library" dialog box opens.
2. Click "OK".

A copy of the global library is created and upgraded. The copy of the global library receives the name extension "\_V13". The global library opens.

**Result**

The global library is stored with the appropriate file extension.

**See also**

Basics on version compatibility (Page 5948)  
Managing libraries (Page 5840)

**10.12.10. Changing between device versions**  
**5**

**Selection of the device version**

When you configure a new HMI device, WinCC automatically selects the latest version of the device.

If you want to use a device version other than the one set in WinCC, transfer an image to the HMI device. WinCC provides the images required for the supported HMI devices.

Information on the device versions used in WinCC is available in the FAQs on the Internet, entry ID 21742389.

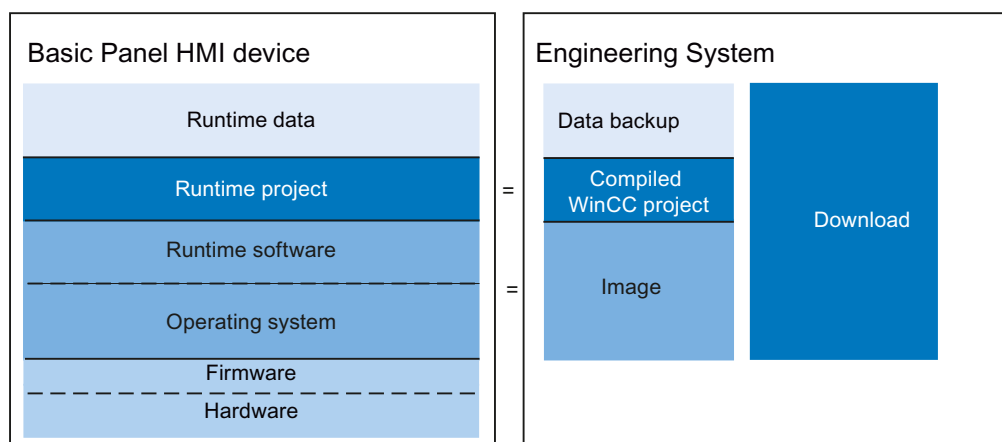

**NOTICE**

**Changing the device version deletes all data on the HMI device.**

Data is deleted on the target system if you change the device version. For this reason, you should save existing Runtime data before changing the device version.

**HMI device configuration**

The following figure shows the software components of an HMI device:

### 10.12.10. Changing the device version

6

#### Introduction

Depending on the required Runtime version, select the suitable device version for your configuration.

---

#### Note

##### Selection of device versions

The selection of available devices versions depends on the version of the project.

---

#### Requirements

- A project has been created and opened.
- The project contains an HMI device.

#### Procedure

To change the device version, follow these steps:

1. Double-click on "Devices & Networks" in the project tree.  
The editor opens.
2. Select the required HMI device from the device view.
3. Select "Change Device/Version" in the device shortcut menu of the HMI device.  
A dialog opens.
4. Select the required HMI device.
5. Select the required device version under "Version".
6. Confirm your selection with "OK".

#### Result

You have changed the device version in the WinCC project.

<b>NOTICE</b>
<b>Changing the device version deletes all data on the HMI device.</b>
All data is deleted from the HMI device when you change the device version and compile/download the project. You should therefore backup your Runtime data prior to the download.

## 10.12.11 Viewing memory card data

### 10.12.11. Basics

1

#### Introduction

WinCC provides you with the possibility of viewing data stored on your memory card. The function supports the use of memory cards of the HMI device and of the CPU.

You have the following options:

Viewing a backup (Page 5957)

Renaming and deleting backups (Page 5959)

Viewing HMI device images (Page 5960)

Deleting HMI device images (Page 5961)

Creating HMI device images on memory card (Page 5962)

#### See also

Viewing a backup (Page 5957)

Renaming and deleting backups (Page 5959)

Viewing HMI device images (Page 5960)

Deleting HMI device images (Page 5961)

Creating HMI device images on memory card (Page 5962)

### 10.12.11. Working with backups

2

#### Viewing a backup

#### Introduction

The backup of a Basic Panel that is stored on a memory card can also be viewed in the TIA Portal.

#### Requirements

- WinCC is installed.
- A memory card with a backup is available.
- The card reader is connected to the configuration PC.
- The project view is open.

### Backup on the memory card in the card reader

1. Insert the memory card into the card reader.
2. Open "SIMATIC Card Reader" in the project navigation.
3. Select the card reader drive.  
The "Online Card Data" folder is displayed.
4. Open the "Online Card Data" folder
5. Click the backup to open the shortcut menu.
6. Select "Properties".

### Backup on the memory card of the PLC

Proceed as follows if the backup is stored on the memory card of the PLC:

1. Connect the PLC with the configuration PC.
2. Click on the PLC in the project navigation.
3. Select "Connect online" from the shortcut menu.  
A connection to the PLC is established.  
Once the PLC is connected, the "Online Card Data" folder is displayed.
4. Open the "Online Card Data" folder.

---

#### Note

##### Accessing a password-protected PLC

When you attempt to access a PLC that is protected by a password, you will be prompted to enter the password.

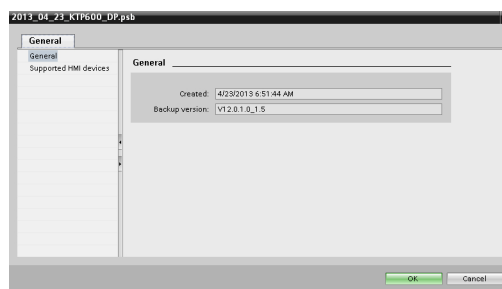

You need at least read access rights in order to view the data that is stored on the memory card.

---

5. Click the backup to open the shortcut menu.
6. Select "Properties".

### Result

The backup properties are displayed in a separate dialog.

## See also

- Renaming and deleting backups (Page 5959)
- Basics (Page 5955)

## Renaming and deleting backups

### Introduction

You may rename and delete backups from a memory card in the project navigation of the TIA Portal.

### Requirements

- WinCC is installed.
- The card reader is connected to the configuration PC.  
The PLC is connected online with the configuration PC.
- A memory card with a backup is available.
- The project view is open.
- The backup is displayed in the project navigation.

---

#### Note

##### Accessing a password-protected PLC

When you attempt to access a PLC that is protected by a password, you will be prompted to enter the password.

You need write access rights to rename or delete memory card data.

---

### Procedure

1. Click on the backup in the project navigation.
2. Open the shortcut menu.
3. Select "Rename" to rename the file.
4. Enter a new name.
5. Select "Delete" to delete the file.

### Result

The backup file is now renamed or deleted.

## See also

Viewing a backup (Page 5955)

Basics (Page 5955)

### 10.12.11. Working with HMI device images

3

## Viewing HMI device images

### Introduction

The HMI device image of a Comfort Panel that is stored on a memory card can be viewed in the TIA Portal.

### Requirements

- WinCC is installed.
- The card reader is connected to the configuration PC.
- A memory card with the HMI device image is available.
- The project view is open.

### Procedure

1. Insert the memory card into the card reader.
2. Open "SIMATIC Card Reader" in the project navigation.
3. Select the card reader drive.  
The "Online Card Data" dialog is displayed.
4. Open the "Online Card Data" folder.  
The available images of the HMI device are displayed in additional folders.
5. Click the required HMI device image.
6. Select "Properties" in the shortcut menu.

## Result

The properties of the HMI device image are displayed in a separate dialog.

## See also

- Deleting HMI device images (Page 5961)
- Creating HMI device images on memory card (Page 5962)
- Basics (Page 5955)

## Deleting HMI device images

### Introduction

You may delete the HMI device image of a Comfort Panel from a memory card in the project navigation of the TIA Portal.

## Requirements

- WinCC is installed.
- The card reader is connected to the configuration PC.
- A memory card with an HMI device image is available.
- The project view is open.
- The HMI device image is displayed in the project navigation.

## Procedure

1. Click the HMI device image in the project navigation.
2. Open the shortcut menu.
3. Select "Delete" to delete the file.

## Result

The HMI device image is deleted.

## See also

Viewing HMI device images (Page 5958)

Basics (Page 5955)

## Creating HMI device images on memory card

### Introduction

You may edit the HMI device image of a Comfort Panel without connecting the Comfort Panel to the configuration PC.

Simply create the HMI device image on an external memory card or USB stick and then transfer it from there to the Comfort Panel.

## Requirements

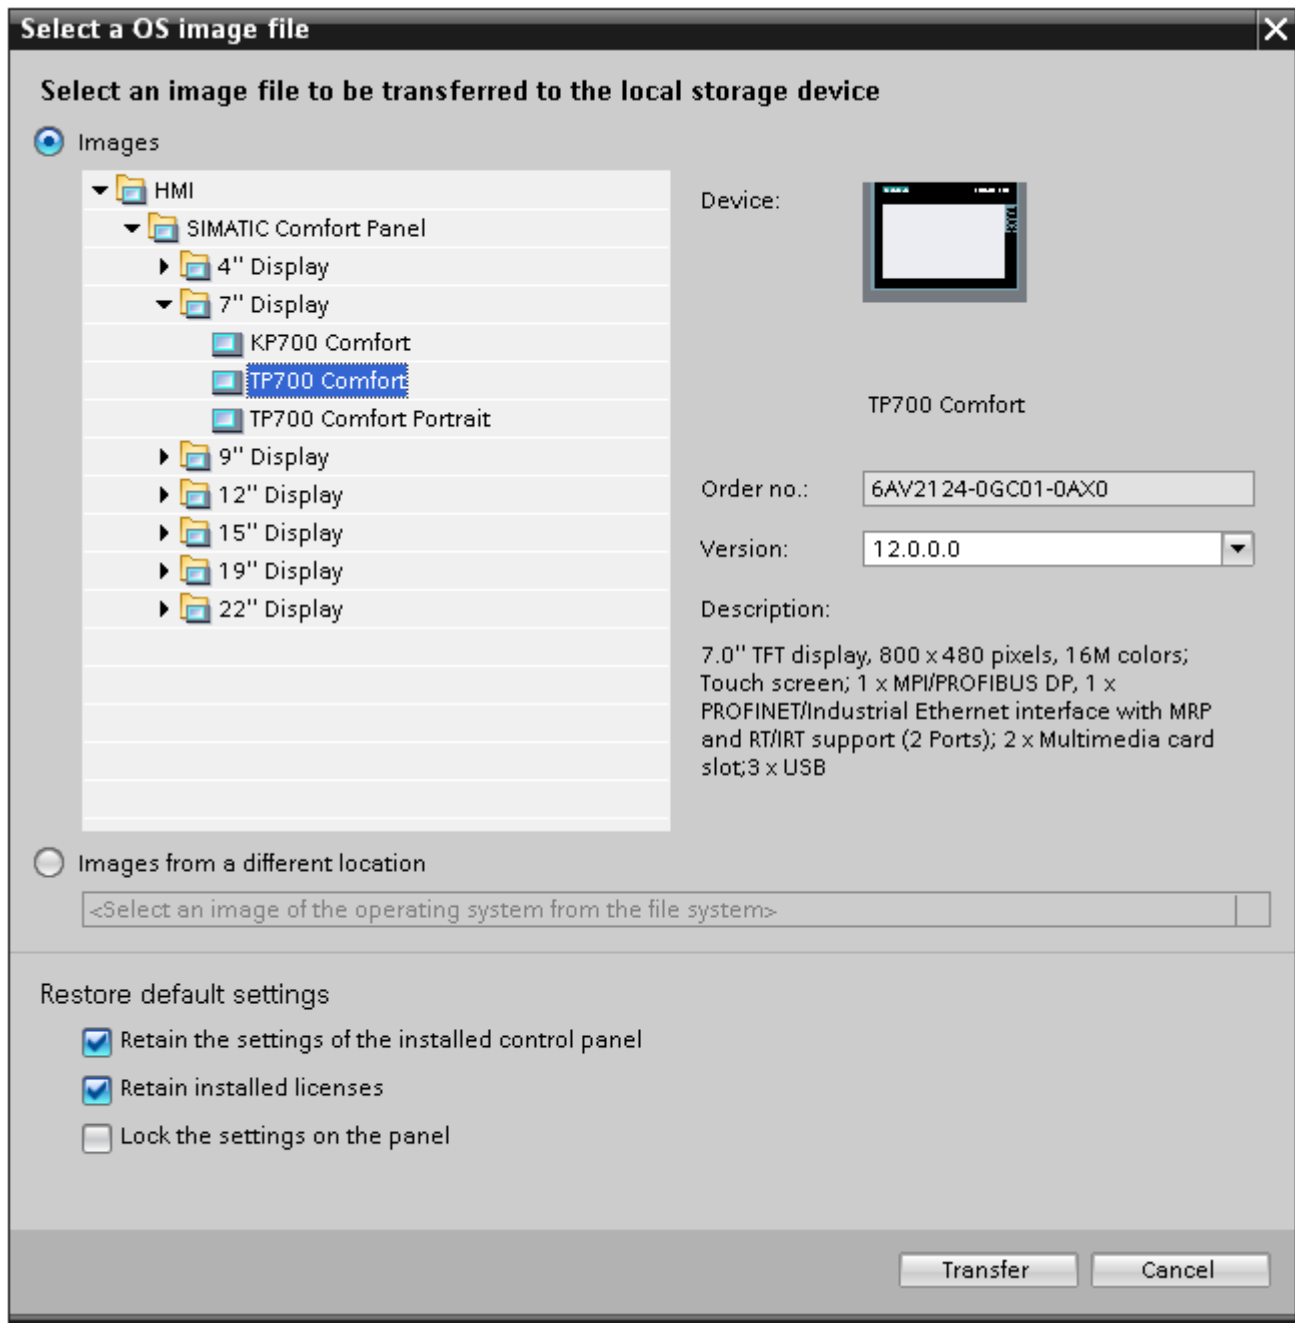

- WinCC is installed.
- The card reader is connected to the configuration PC.
- The project view is open.

## Procedure

1. Insert the memory card into the card reader.
2. Click on the memory card in the project navigation.
3. Open the shortcut menu.

4. Select "Create HMI OS image on memory card".  
A dialog opens.

5. Select an HMI device image.
6. Select the settings for the restoration.
  - Activate "Retain installed settings of the Control Panel"  
The settings you have made on the Comfort Panel are retained.
  - Activate "Retain installed licenses":  
The licenses on the Panel are retained.
  - Activate "Lock settings on the Panel"  
You can no longer change the selected settings for "Retain installed settings of the Control Panel" and "Retain installed licenses" on the Comfort Panel.

## Result

You have created an HMI device images on memory card. You may use a USB stick instead of a memory card.

## See also

Viewing HMI device images (Page 5958)  
Basics (Page 5955)

## 10.12.12 Using multi-touch functions

### 10.12.12. Multi-touch operation

1

#### Introduction

RT Advanced supports multi-touch operation under Windows 7 and Windows 8. You operate objects on the multi-touch screens by touching them with one or two fingers. Multi-touch operation is supported by TIA Portal V13. Versions V12 or older only support single-touch operation.

#### Requirement

The used monitor must support multi-touch functions.

#### Scrolling in lists and controls

You can scroll through lists and controls by dragging the screen margin.

You use horizontal dragging to move the content of the screen to the left or right. You use vertical dragging to scroll up or down in the view. An indicator appears during scrolling to indicate your position. When you drag a list diagonally on the screen, the content is moved horizontally and vertically at the same time.

Horizontal scrolling is not supported in the "Trend view" object.

You scroll five times faster up or down on a page when you use two fingers to drag up or down.

**Note**

**Current view is not persistent**

The position in the trend window changed by scrolling is not saved.  
In case of a screen change, the trend view is reset to the default setting.

**Zoom in and out**

You enlarge or reduce the view in "Trend view" and "f(x) trend view" objects by pinch-to-zoom with two fingers.

Double tap to switch from the magnified trend view back to the normal view.

The zooming function is limited to the time axis in the "Trend view" object.

If you have enabled the option "Range > Auto-size" during configuration of the value axes in f(x) trend view, the axes are constantly calculated during zooming.

**Note**

**Current view is not persistent**

The changes of the zoom factor are not saved.

In case of a screen change, the trend view is reset to the default setting.

**10.12.12. Supported gestures**

2

**Supported gestures**

The following gestures are supported.

Gesture		Function
	Tap	You can select a button, for example, by tapping.
	Drag	Use one finger to scroll horizontally and vertically, for example, in lists. You scroll horizontally and vertically at the same time with a vertical drag.

Gesture		Function
		Use two fingers to scroll up or down a page quickly.
	Scale	Pinch-to-zoom to enlarge or reduce the display of the control.
	Double tap	Double tap the display to reset the view to the default zoom factor 100%.

**Note**

**Operating with three or more fingers**

Do not use three or more fingers to operate the device. This can lead to incorrect operations.

**10.12.12. Two-hand operation of operator controls**

3

**Two-hand operation of operator controls**

**Introduction**

WinCC supports two-hand operation of operator controls with RT Advanced. It ensures safe operation of operator controls which are used to change critical system settings, for example, control tags with machine limits.

## Locked and unlocked operator controls

You define specific operator controls as "locked operator controls" for two-hand operation of operator controls. Locked operator controls usually cannot be operated in runtime. The operator can only operate the locked operator controls if he presses a release button at the same time.

In runtime, locked operator controls can only be accessed with the tab sequence if a release button is pressed at the same time.

## Locked operator controls and release buttons

You can configure the following operator controls as locked operator controls:

- I/O field as input field or input/output field
- Button (visible)
- Button (invisible)
- Status/Force
- Slider
- Date/time field

You must configure at least one button in the screen as release button. This can be any unlocked button.

---

### Note

You cannot configure operator controls or release buttons in the permanent window.

---

## Templates with locked operator controls

You can also use locked operator controls in screen templates. To lock or unlock operator controls in templates, proceed as you would with operator controls in screens.

You can also implement a release button in the template. Use the same approach as for release buttons in screens.

In a screen created from the template, the release buttons from the template and any release buttons of the screen are active.

## Display in runtime

The locked operator controls are displayed as dimmed in runtime. The release buttons are optically highlighted as soon as the operator presses a locked operator control. The locked operator controls are completely visible when they are unlocked by means of the release buttons.

This means you can configure the release buttons as invisible operator controls.

## Simulation of projects with multi-touch functions

WinCC supports the simulation of configured multi-touch functions. Requirement is that your monitor supports multi-touch operation.

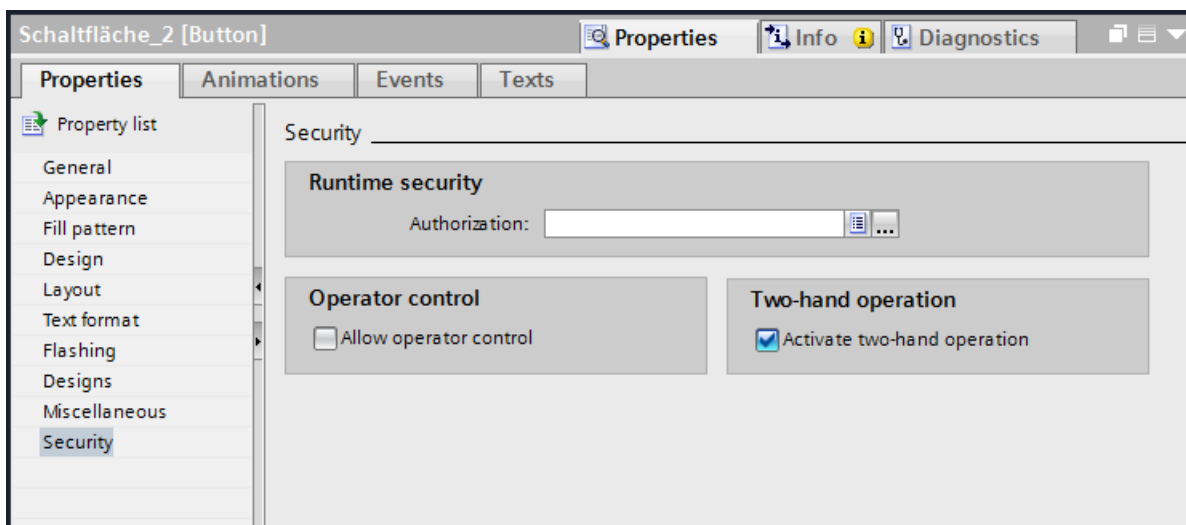

## Locking and unlocking operator controls

You can lock and unlock operator controls in projects for multi-touch devices. Locked operator controls can only be operated in runtime if the operator presses a release button at the same time.

You can lock and unlock individual operator controls or several operator controls simultaneously.

## Procedure

1. Configure operator controls of the type I/O field, button or slider.
2. Select the required operator control(s).
3. To lock the operator controls, enable the option "Activate two-hand operation" under "Properties > Properties > Security".

4. To unlock the operator controls, disable the option "Activate two-hand operation" under "Properties > Properties > Security".

In runtime, locked operator controls can only be operated if a release button is pressed at the same time.

## Defining release button

To use the locked operator controls, you must configure at least one release button (Page 5969) in the same screen.

If no release button is configured, WinCC makes you aware of this fact during compilation of the project.

## Configuring release button in screen or template

For the operator to operate locked operator controls on multi-touch devices (Page 5966), at least one release button must be configured in the same screen.

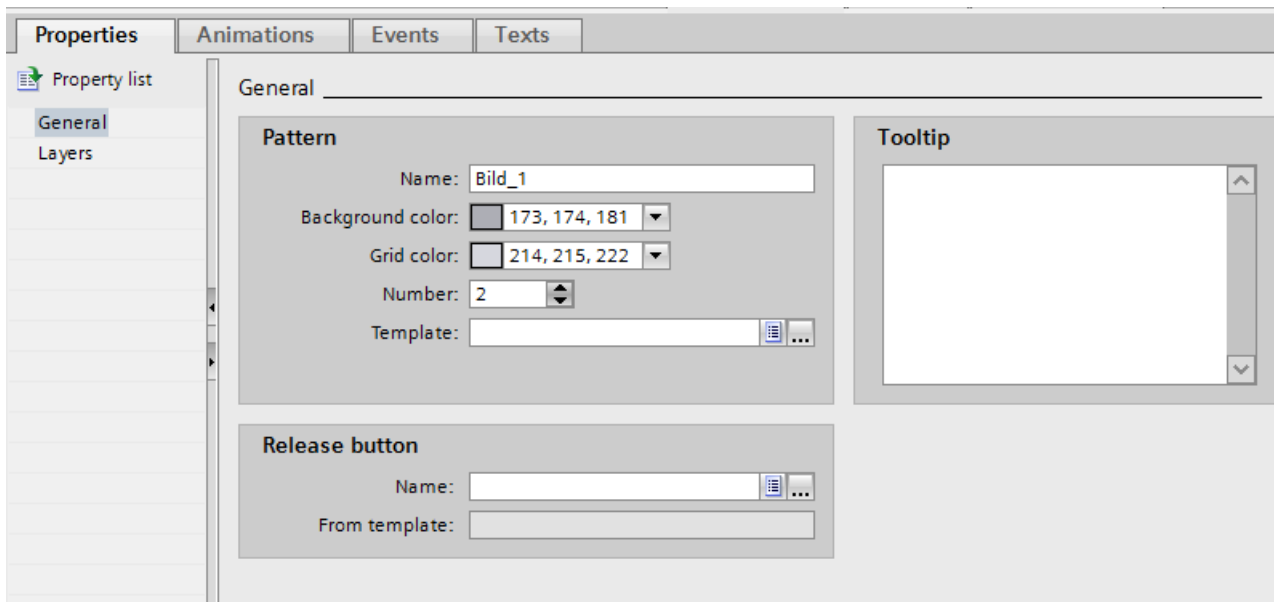

If the screen is based on a template and a release button is already defined in the template, the release button from the template is automatically in effect as release button of the screen. You can then configure an additional release button in the actual screen.

## Requirement

At least one unlocked button is configured in the screen or in the template.

## Procedure

1. Select the required button of the screen or template under "Release button" under "Properties > Properties > General".

---

### Note

You can also select a button from a group for this purpose. Buttons from faceplates, however, are not available.

The selected button can also be displayed as invisible. It is optically highlighted in runtime when you press a locked operator control.

---

If the screen is based on a template and a release button is already defined in this template, this button is automatically in effect as release button of the screen.

Locked operator controls can only be operated in runtime if the operator presses one of the configured release buttons at the same time.

### 10.12.12. Restrictions in Sm@rtServer/Client mode

4

#### Multi-touch server and single-touch client

The single-touch client device does not support operation by touch with two or more fingers as well as multi-touch functions. Single-touch client cannot be operated with gestures of the multi-touch Sm@rtServer.

Single-touch gestures work the same way as in WinCC V12.

#### Single-touch server and multi-touch client

The single-touch server device does not support operation by touch with two or more fingers as well as multi-touch functions. Multi-touch client cannot be operated with gestures of the single-touch Sm@rtServer.

Single-touch gestures work the same way as in WinCC V12.

## 10.13 Compiling and loading

### 10.13.1 Compiling and loading projects

#### 10.13.1.1 Overview of compiling and loading projects

##### Overview

The project is compiled in the background even as you are configuring it in WinCC. This reduces the time for final compilation. When you start compilation, you create a file that can be run on the corresponding HMI device.

If an error occurs during compilation, WinCC provides support in locating and correcting it.

Once you have corrected any problems, you download the compiled project to the HMI devices on which the project is to run. If the configuration PC is not connected to the HMI device, save the compiled project on a data medium of your choice. The compiled project is then transferred from a PC connected to the HMI device to the HMI device.

If you are using HMI tags in your project that are connected to PLC tags, you should also compile all modified S7 blocks with the command "Compile > Software" in the shortcut menu before you compile the HMI device.

##### Project

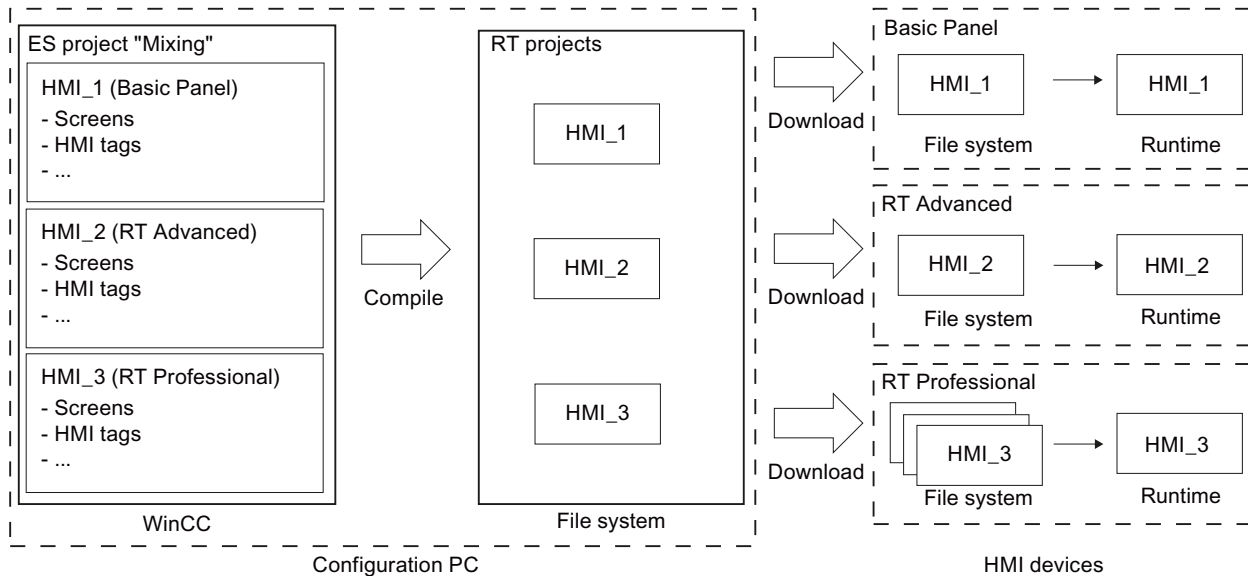

The term "project" has two different meanings in the contexts of compilation and loading. "Project" is the WinCC project on the configuration PC. "Project" is also the Runtime project

you create by compiling the configuration data of an HMI device and download to the HMI device.

- WinCC project: contains the configuration data of one or more HMI devices
- Runtime project: contains the compiled configuration data of an HMI device

The figure below illustrates the link between WinCC projects and Runtime projects using the example of the "Compile and load" process:

## Runtime

Runtime is the software for process visualization. In Runtime, you execute the project in process mode.

A distinction is made between two types of Runtime:

1. Runtime on a panel  
Before running a Runtime project on a panel, you have to transfer the Runtime project to the panel before startup.
2. Runtime on a PC  
You can execute the Runtime project directly on the configuration PC if Runtime has been installed on the configuration PC.  
If you want to execute the Runtime project on a different PC, you have to transfer the Runtime project to the PC before startup.

## Runtime version

The Runtime version depends on the image of the configured HMI device. The Runtime version of the compiled project is displayed under "Info" in the Inspector window.

## Simulation

You test your configuration with a simulation. You can start a simulation without a link to the active process.

In a simulation, you test configured tags or screen changes, for example. During the simulation, the configured tags can be manipulated, activated and deactivated with the help of the tag simulator.

There are two types of simulation:

1. Simulating a panel  
If you created a panel in your project, the panel is displayed in the simulation. With the help of this type of simulation, you can test your configuration on the HMI device without transferring the project to the panel.
2. Simulating Runtime  
Simulating Runtime allows you to test the project directly on the configuration PC.

Starting Runtime Advanced and Panels (Page 5988)

### 10.13.1.2 Compiling a project

#### Introduction

The changes made to the project are compiled in the background even as you are configuring a project in WinCC. Projects are compiled automatically when you load them. This ensures that the latest version of the project is loaded at all times.

WinCC checks consistency of the project during compilation. The error locations in the project are listed in the Inspector window. You can jump directly to the source of the error from the entry in the Inspector window. Check and correct errors found.

#### Scope of the compilation

Configuration data is compiled in the background as soon as you start configuring an HMI device. If you compile a project manually, only the changes in the configuration made since the last compilation process are compiled in the background.

You can start complete project compilation manually at any time; this may, for example, be done to test the consistency of the configured data.

## Requirement

- A project is open.

## Procedure

Proceed as follows to compile a project:

1. If you want to compile several HMI devices at the same time, select all the relevant HMI devices with multiple selection in the project tree.
2. Compile the project:
  - To only compile changes in the project, select the "Compile > Software (only changes)" command from the shortcut menu of the HMI device.
  - To compile all project data, select the "Compile > Software (compile all)" command from the shortcut menu.

## Result

The configuration data of all selected HMI devices is compiled. Any errors that occur during compilation are shown in the Inspector window.

### 10.13.1.3 Loading projects

#### Overview for loading of projects

#### Overview

Delta data of the project is automatically compiled before you download it to one or several HMI devices. This always ensures that the latest version of the project is transferred.

## Loading a project to an HMI device

The following steps are completed prior to downloading:

1. The download settings are verified. The "Extended download to device" dialog box opens automatically during the initial download of a project to an HMI device. You use this dialog to define the protocol and interface or destination path for the project in accordance with the HMI device Runtime used.

If the HMI device is part of a subnet, for example, you also select the subnet and the first gateway.

You can open the "Extended download to device" dialog at any time with the menu command "Online > Advanced download to device...".

The "Load preview" dialog opens.

2. The project is compiled. Warnings and errors during compilation are displayed in the Inspector window and in the "Load preview" dialog.

3. The "Load preview" dialog shows you the following information for each HMI device:

- The individual steps for loading
- If the device version of the target HMI device does not match the configured device version, you are queried if you want to change the device version at this time. As long as the project with the selected device version of the target HMI device is not executable, you cannot start the download.

### NOTICE

#### Changing the device version deletes all data on the HMI device.

Data is deleted on the target system if you change the device version. For this reason, you should first back up the following data:

- User administration
- Recipes
- Licenses

Resetting to factory settings also deletes the license keys. Back up the license keys before you reset the system to factory settings.

With Comfort devices, the licenses can only be deleted when resetting to factory settings. Back up the licenses and license keys before you reset the system to factory settings.

- Presettings that take effect at loading. You can change the default settings for this download process, if necessary.
- Warning events (optional). You can download a project while ignoring the "warnings". The functionality may be restricted in runtime.
- Error events (optional). You cannot load the project. Eliminate the errors and then reload the project.  
WinCC will open the invalid configuration in the corresponding editor if you double-click the error message in the Inspector window. Correct the errors and reload the project.

If you are using HMI tags in your project that are connected to PLC tags, you should also compile all modified S7 blocks with the command "Compile > Software" in the shortcut menu before you compile the HMI device.

---

**Note**

If the transfer is interrupted, WinCC V13 automatically ensures that no data is lost and that existing data is deleted on the HMI device only after complete transmission.

---

### Loading a project without a connected HMI device

If you cannot establish a direct connection from the configuration PC to the HMI device, save the compiled project on a data medium of your choice. Additional steps depend on the Runtime used:

- Panel Runtime: Copy the compiled project to a PC connected to the HMI device, for example, via a network. Download the project from this PC to the HMI device ("Pack&Go").
- Runtime Advanced: Move the compiled project to the HMI device.

### Loading with S7 routing

Configure the S7 routing settings in the "Devices & Networks" editor in the relevant PLC. The settings depend on the device configured.

S7 routing supports the following protocols:

- MPI/PROFIBUS
- PN/IE

### Transferring Runtime add-ons in WinCC V13

Projects can contain Runtime add-ons in the form of controls or CSP (Communication Support Packages). These Runtime add-ons are automatically transferred with the project.

### See also

Loading a project (Page 5975)

Generating a "Pack&Go" file (Page 5981)

### Loading a project

#### Introduction

Before a project can run on an HMI device, you must first load it to the HMI device. During loading, you must most importantly specify whether existing data on the HMI device such as "user administration" and "recipe data" is to be overwritten.

If the HMI device supports PROFINET, the name registered in the project tree is used for the PROFINET communication. The use of the name corresponds to the default settings of the PROFINET interface of the HMI device. For devices with more than one PROFINET interface, the name of the IE CP is automatically added to the device name with a separating period.

The name is written during download to the HMI device. If a device name for the PROFINET communication has already been entered in the HMI device, it will be overwritten.

You can find additional information about these settings in the information system in the "Assigning a device name and IP address" section.

As a general rule, only one project can be active in Runtime on an HMI device. An HMI device is generally configured to exit Runtime automatically when loading is started. If this is not the case, you will have to exit Runtime manually on the HMI device.

You can alternatively enable the "Remote" option in the transfer settings in the control panel of the HMI device. This will then allow you to load a project to the HMI device without first having to set the transfer mode manually on the HMI device. For Mobile Panels, the "Remote" option is disabled for security reasons.

If the device version of the target HMI device does not match the configured device version, you are asked whether you wish to change the device version at this time.

---

#### Note

If your HMI device is a PC, the device version of the target system is not automatically updated during the download.

Verify that the configured device version corresponds to the one of the target HMI device before you compile and download your project. If necessary, install the matching Runtime version on your HMI device or change the device version manually using the properties of the HMI device.

---

#### NOTICE

##### **Changing the device version deletes all data on the HMI device.**

Data is deleted on the target system if you change the device version. For this reason, you should first back up the following data:

- User administration
- Recipes
- Licenses

Resetting to factory settings also deletes the license keys. Back up the license keys before you reset the system to factory settings.

With Comfort devices, the licenses can only be deleted when resetting to factory settings. Back up the licenses and license keys before you reset the system to factory settings.

Please refer to the documentation for the HMI device used for more detailed information on transfer settings.

---

**Note**

**Closing Runtime automatically**

If automatic transfer is enabled on the HMI device and a transfer is started on the configuration PC, the running project is automatically stopped.

The HMI device then switches autonomously to "Transfer" mode.

After the commissioning phase, disable the automatic transfer function to prevent the HMI device from switching inadvertently to transfer mode.

Transfer mode can cause undesired reactions in the system.

To block access to the transfer settings and thus avoid unauthorized changes, assign a password in the Control Panel.

---

---

**Note**

**Transfer to an HMI device with WinAC MP**

The "PN/IE" channel is not approved for the project transfer on HMI devices with WinAC MP.

Use the "Ethernet" channel instead of "PN/IE" to transfer data to an HMI device that is running PLC WinAC MP.

---

## Requirement

- You have created an HMI device in the project.
- The HMI device is connected to the configuration PC.
- Transfer mode is set in the HMI device.

## Procedure

Proceed as follows to load a project:

1. To download a project simultaneously to several HMI devices, select the HMI devices by means of multiple selection in the project tree.
2. Select the "Download to device > Software" command from the shortcut menu of the HMI device.

### 10.13 Compiling and loading

3. If the "Extended loading" dialog is open, configure the "Settings for loading". Make sure that the "Settings for loading" correspond to the "Transfer settings in the HMI device".
  - Select the protocol used, for example, Ethernet or HTTP.
  - Configure the relevant interface parameters on the configuration PC.
  - Make any interface-specific or protocol-specific settings required in the HMI device.
  - Click "Download".

You can open the "Extended download to device" dialog at any time with the menu command "Online > Advanced download to device...".

The "Load preview" dialog opens. The project is compiled at the same time. The result is displayed in the "Load preview" dialog.

4. Check the displayed presettings and change them as necessary.
5. Click "Download".

## Result

The project is loaded to all selected HMI devices. In WinCC V13, the project with the Runtime add-ons is loaded to the selected HMI devices.

During the download, you can keep track of the files that are transferred.

If errors or warnings occur during the download, corresponding alarms are displayed under "Info > Load" in the Inspector window.

On completion of the successful download of the project, you can execute it on the HMI device.

---

### Note

If the transfer is interrupted, WinCC V13 automatically ensures that no data is lost and that existing data is deleted on the HMI device only after complete transmission.

---

## See also

Error messages during the download of projects (Page 6013)

Overview for loading of projects (Page 5971)

## Loading projects to a file

### Introduction

Load the Runtime project to the file system of your PC if that is your HMI device. Double-click the Runtime project to open it in runtime.

During loading, you must most importantly specify whether existing data on the HMI device such as "user administration" and "recipe data" is to be overwritten.

If the HMI device supports PROFINET, the name registered in the project tree is used for the PROFINET communication. The use of the name corresponds to the default settings of the

PROFINET interface of the HMI device. For devices with more than one PROFINET interface, the name of the IE CP is automatically added to the device name with a separating period. The name is written during download to the HMI device. If a device name for the PROFINET communication has already been entered in the HMI device, it will be overwritten.

You can find additional information about these settings in the information system in the "Assigning a device name and IP address" section.

As a general rule, only one project can be active in Runtime on an HMI device. An HMI device is generally configured to exit Runtime automatically when loading is started. If this is not the case, you will have to exit Runtime manually on the HMI device.

You can alternatively enable the "Remote" option in the transfer settings in the control panel of the HMI device. This will then allow you to load a project to the HMI device without first having to set the transfer mode manually on the HMI device.

---

**Note****Device version**

If the device version of the target HMI device does not correspond to that of the configured device version, Runtime cannot be started after loading.

Verify that the device version of the target HMI device conforms to your configuration before you compile and download your project.

If necessary, change the device version manually via the properties of the HMI device.

---

**NOTICE****Changing the device version deletes all data on the HMI device.**

Data is deleted on the target system if you change the device version. It is therefore advisable to generate a backup copy of the Runtime data prior to such actions.

Please refer to the documentation for the HMI device used for more detailed information on transfer settings.

---

**Note****Closing Runtime automatically**

If automatic transfer is enabled on the HMI device and a transfer is started on the configuration PC, the running project is automatically stopped.

The HMI device then switches autonomously to "Transfer" mode.

After the commissioning phase, disable the automatic transfer function to prevent the HMI device from switching inadvertently to transfer mode.

Transfer mode can cause undesired reactions in the system.

To block access to the transfer settings and thus avoid unauthorized changes, assign a password in the Control Panel.

---

## Requirement

- You have created an HMI device in the project.
- The HMI device is a PC.
- The HMI device is connected to the configuration PC.
- Transfer mode is set in the HMI device.

## Procedure

Proceed as follows to load a project to a file:

1. Select the project in the project tree.
2. Select the "Download to device > Software" command from the shortcut menu of an HMI device.
3. If the "Extended loading" dialog is open, configure the "Settings for loading". Make sure that the "Settings for loading" correspond to the "Transfer settings in the HMI device".
  - Select the "Type of the PG/PC interface > File" dialog,
  - Select "PG/PC interface > File system" in the dialog,
  - Select the file system path under "destination path".
  - Click "Download".You can open the "Extended download" dialog at any time with the menu command "Online > Advanced download to device...".  
The "Load preview" dialog opens. The project is compiled at the same time. The result is displayed in the "Load preview" dialog.
4. Check the displayed presettings and change them as necessary.
5. Decide whether to overwrite user administration data and/or recipe data on the HMI device.
6. Click "Download".

## Result

The Runtime is loaded to the file system. If errors or warnings occur during the download, corresponding alarms are displayed under "Info > Load" in the Inspector window.

On completion of the successful download of the project, you can execute it on the HMI device.

Double-click the Runtime project file on the target system to launch the Runtime project.

## Generating a "Pack&Go" file

### Introduction

Create a "Pack&Go" file if you cannot connect the HMI device to the configuration PC. The "Pack&Go" file is a ZIP file containing the following data:

- The compiled project
- A program for transferring the project to the HMI device
- Image for the configured HMI device

Typical example of an application: An engineering company creates a project variant for a new HMI device. The project engineer of the engineering company does not have direct access to the plant. The project engineer therefore e-mails the "Pack&Go" file to his local contact. The contact unpacks the "Pack&Go" file on a PC connected to the HMI device via a network. He then transfers the project from the PC to the HMI device.

### Requirement

- You have created an HMI device in the project.

### Procedure

To create a "Pack&Go" file, follow these steps:

1. Select the HMI device in the project tree.
2. Select the "Pack&Go" command from the menu under "Online > HMI Device maintenance".
3. The "Create Pack&Go file" opens.
4. Verify that the displayed device version corresponds with that of the target HMI device.
5. Select a protocol as transfer mode.
6. Select the storage location under "Pack&Go file" and enter the file name.
7. If necessary, specify if the "Pack&Go" file is split into several files.
8. Click "Create".

---

#### Note

To unzip a "Pack&Go" file which is distributed over several files, you need a compression program. The compression program integrated into the operating system is not adequate to unzip distributed files.

---

### Result

The "Pack&Go" file is created and saved to the specified folder in the file system. Now copy the "Pack&Go" file to the PC connected to the HMI device.

## See also

Downloading projects from a "Pack&Go" file to the HMI device (Page 5982)

## Downloading projects from a "Pack&Go" file to the HMI device

### Requirement

- .NET Framework with version 4.5
- ProSave is installed on the PC
- The "Pack&Go" file has been stored in the file system of a PC.
- The PC is connected to the HMI device.
- The device version of the HMI device is consistent with the device version in the project

---

### Note

To unzip a "Pack&Go" file which is distributed over several files, you need a compression program. The compression program integrated into the operating system is not adequate to unzip distributed files.

---

### Note

If the TIA Portal is not installed on your PC, install Microsoft Visual C++ 2010 Redistributable Package (x86) and .Net Framework 4.5 in order to run the Pack&Go application.

- You can find the Microsoft Visual C++ 2010 Redistributable Package (x86) in the Download Center of Microsoft at the following URL:  
<http://www.microsoft.com/en-us/download/details.aspx?id=5555>
  - You can find .Net Framework 4.5 at the following URL:  
<http://www.microsoft.com/en-us/download/details.aspx?id=30653>
- 

## Procedure

To download the project from a "Pack&Go" file to an HMI device, follow these steps:

1. Unpack the "Pack&Go" file to a folder of your choice in the file system of the PC.
2. From the "PackNGo" subfolder of this directory, run "Siemens.Simatic.Hmi.PackNgo.exe". The "Pack'n Go" dialog opens. The settings for loading are set by default. Exception: You must select the target device if you are using an S7 USB connection.
3. Adjust the settings for loading appropriately if they differ from the interfaces or protocols available on the PC.
4. Specify whether or not to overwrite the user management and recipe data already stored on the HMI device.
5. Click "Transfer".

## Result

The connection to the HMI device is set up via the selected path. An alarm is output if the device version used in the project differs from that of HMI device.

If this is the case, update the operating system on the HMI device. To update the operating system on the HMI device, you need ProSave. A prompt for operating system update will appear automatically if ProSave has been installed and the selected connection supports the update of the operating system.

Generating a "Pack&Go" file (Page 5979)

Updating the operating system (Page 6002)

Updating the operating system on the HMI device (Page 6003)

## Loading via USB interface

### Introduction

When you load a project via a USB port, connect the configuration PC and the HMI device with a USB cable.

### Requirements for transfer via USB

The following conditions must be met to ensure successful data transfer using a USB port:

- Use a USB host-to-host cable, USB 2.0 standard.
- You have installed the provided USB driver.  
You can find the driver on the WinCC Product DVD under "Support\DeviceDriver\USB".
- The HMI device being used is based on Windows CE and has a USB port.

You can find more information on the cables used and the manufacturers/suppliers in the Internet at:

- <http://support.automation.siemens.com> (<http://support.automation.siemens.com/WW/view/en/19142034>)
- 

**Note**

**Driver installation**

To avoid problems when transferring projects, only use the USB driver provided on the WinCC Product DVD.

---

**Note**

**Comfort HMI devices**

Use the mini USB port to load projects via USB with Comfort HMI devices. This driver is installed automatically.

---

## Restrictions

A project can always be transferred to an HMI device. Simultaneous transfer to several HMI devices is not possible.

## Installing a USB driver in Windows XP

### Introduction

To load a project via the USB port, install the USB drivers provided on the WinCC product DVD.

---

**Note**

**Driver installation**

To avoid problems when transferring projects, only use the USB driver provided on the WinCC product DVD.

---

**Note**

**Comfort HMI devices**

Use the mini USB port to load projects via USB with Comfort HMI devices. This driver is installed automatically.

---

## Requirement

- The WinCC product DVD is available.
- You are using a USB host-to-host cable, USB 2.0 standard.
- The HMI device has a USB port.

## Procedure

To install the USB driver under Windows XP, follow these steps:

1. Connect the USB host-to-host cable to the USB port of the configuration PC.  
The USB cable is automatically detected by the hardware detection under Windows XP.  
The driver installation wizard starts automatically.

---

### Note

Connect the HMI device only when the driver has been completely installed on the PC.

---

2. If you are prompted with "Can Windows connect to Windows Update to search for software", select "No, not this time" and click "Next".
3. Select "Install software from a list or specific source" and click "Next".
4. Select "Search removable media".
5. Insert the WinCC product DVD into the DVD drive and click "Next".  
The system will search the WinCC product DVD for the corresponding driver for the USB host-to-host cable.  
The drivers available on the WinCC product DVD are displayed. The wizard highlights the appropriate driver for Windows XP.
6. Check the selection and click "Next".

---

### Note

The "Hardware installation" dialog box indicates that the software found has not passed Windows Logo testing. The Logo test does not have any effects on the functioning of the USB driver. Continue with the installation.

---

7. Click "Hardware Installation > Continue installation".  
The driver is installed.
8. Click "Finish".  
The installation is complete.

## Result

The driver for the USB host-to-host cable has been installed. To load the project, connect the HMI device to the USB cable.

## Installing a USB driver in Windows 7

### Introduction

To load a project via the USB port, install the USB drivers provided on the WinCC product DVD.

---

#### **Note**

##### **Driver installation**

To avoid problems when transferring projects, only use the USB driver provided on the WinCC product DVD.

---

#### **Note**

##### **Comfort HMI devices**

Use the mini USB port to load projects via USB with Comfort HMI devices. This driver is installed automatically.

---

### Requirement

- The WinCC product DVD is available.
- You are using a USB host-to-host cable, USB 2.0 standard.
- The HMI device has a USB port.

### Procedure

To install the USB driver under Windows 7, follow these steps:

1. Connect the USB host-to-host cable to the PC's USB port.  
The USB cable is detected, but the wizard for the driver installation does not find the driver.

---

#### **Note**

Connect the HMI device only when the driver has been completely installed on the PC.

---

2. Open the Device Manager in the Control Panel.
3. Select "Other devices > USB host-to-host cable".
4. Select "USB host-to-host cable" and then select "Update driver software..." in the shortcut menu.
5. When the "How do you want to search for driver software?" prompt appears, select "Search for driver software on the computer".
6. Click "Update driver software > Browse...".
7. Insert the WinCC product DVD as the source for driver installation.

8. Select "Include subfolders" and then click "Next".  
The system will search the WinCC product DVD for the corresponding driver for the USB host-to-host cable.  
The drivers available on the WinCC product DVD are displayed. The wizard highlights the appropriate driver for Windows 7.
9. Check the selection and click "Next".
10. To continue with the installation, click "Hardware Installation > Continue installation".  
The driver is installed.
11. Click "Finish".  
The installation is complete.

## Result

The driver required for the USB host-to-host cable has been installed. To load the project, now connect the HMI device to the USB cable.

### 10.13.1.4 Runtime start

## Starting Runtime on the configuration PC

### Introduction

You can start a project in Runtime on the configuration PC if Runtime has been installed. The project settings defined in the "Runtime settings" of the HMI device are activated when the project is started in Runtime.

---

#### Note

You can only simulate HMI devices with Runtime Panels on the configuration PC. Select the "Online > Start simulation" menu command.

---

---

#### Note

##### Ending Runtime automatically

If automatic transfer is activated on the HMI device and if a transfer is started on the configuration PC, the running project is automatically ended.

The HMI device then switches autonomously to the "Transfer" operating mode.

Deactivate automatic transfer after the commissioning phase so that the HMI device does not inadvertently go into transfer mode.

Transfer mode can cause undesired reactions in the system.

In order to restrict access to the transfer settings and thus avoid unauthorized changes, enter a password in the control panel.

---

## Requirement

- A project is open on the configuration PC.
- Runtime is installed on the configuration PC.
- There is no project in Runtime on the configuration PC.

## Procedure

To start runtime on the configuration PC, follow these steps:

1. Select the desired HMI device in the project navigation.
2. Select the "Online > Start Runtime" menu command.

## Result

Runtime is started and the project is displayed on the configuration PC.

## See also

Simulating a project (Page 5992)

## Starting Runtime Advanced and Panels

### Introduction

You can start the project in Runtime as soon as you have downloaded the project to the HMI device. The project is generally started automatically on the HMI device.

There may be several projects in the file system of the HMI device for HMI devices with Runtime Advanced. You can start one of these projects in Runtime.

The project settings defined in the "Runtime settings" of the HMI device are activated when the project is started in Runtime. Make sure when defining the Runtime settings "Lock task

switching" and "Full screen" that you will be able to stop Runtime again. You can, for example, configure a button with the system function "StopRuntime".

---

**Note****Ending Runtime automatically**

If automatic transfer is activated on the HMI device and if a transfer is started on the configuration PC, the running project is automatically ended.

The HMI device then switches autonomously to the "Transfer" operating mode.

Deactivate automatic transfer after the commissioning phase so that the HMI device does not inadvertently go into transfer mode.

Transfer mode can cause undesired reactions in the system.

In order to restrict access to the transfer settings and thus avoid unauthorized changes, enter a password in the control panel.

---

**Requirement**

- WinCC Runtime Advanced or Panels is installed on the HMI device.
- The project was downloaded to the HMI device

**Starting Runtime on a PC**

The compiled project is saved in the PC file system with the extension "\*.fwc" and is freely accessible.

1. To start the project once the HMI device has booted up, enter the automatic start of a project file under "Settings" in the "RT Loader" ("HmiLoad.exe").  
You can also create a link to the project file in the Windows Autostart directory.

**Starting Runtime on a panel**

The project will be stored on a panel in a folder you specify in the HMI device transfer settings. The "RT Loader" application is started on a panel. The project loaded is started automatically after expiration of the configured delay.

If the project does not start automatically:

1. Click on "Start" to start the loaded project.

Refer to the documentation for the HMI device for additional information on startup of projects.

**Result**

Runtime is started on the HMI device.

## See also

Overview of compiling and loading projects (Page 5968)

Loading a project (Page 5973)

Downloading projects from a "Pack&Go" file to the HMI device (Page 5980)

## 10.13.2 Simulating projects

### 10.13.2.1 Simulation basics

#### Introduction

You can use the simulator to test the performance of your configuration on the configuration PC. This allows you to quickly locate any logical configuration errors before productive operation.

You can start the simulator as follows:

- In the shortcut menu of the HMI device or in a screen: "Start simulation"
- Menu command "Online > Simulation > [Start|With tag simulator|With script debugger]"
- Under "Visualization > Simulate device" in the portal view.

#### Requirement

The simulation/runtime component is installed on the configuration PC.

#### Field of application

You can use the simulator to test the following functions of the HMI system, for example:

- Checking limit levels and alarm outputs
- Consistency of interrupts
- Configured interrupt simulation
- Configured warnings
- Configured error messages
- Check of status displays

## See also

Simulating a screen (Page 5994)

WinCC Runtime Advanced simulation (Page 5991)

Working with the tag simulator (Page 5994)

## 10.13.2.2 WinCC Runtime Advanced simulation

### Introduction

There are two different simulation modes for Runtime Advanced simulation:

- Device simulation
- Tag simulation

Both types of simulation simulate the project without a direct process link to the configuration PC. Data such as logs or recipes generated during simulation are not deleted. This data is saved on the configuration PC in the paths configured in the project.

### Device simulation

Use device simulation to simulate operator control of the HMI device. Device simulation is, for example, used to test screen switching.

### Tag simulation

Use tag simulation to simulate the configured process tags. You can either have tag values generated automatically by a simulation table or define tag values yourself.

### See also

- Simulation basics (Page 5988)
- Simulating a project (Page 5992)
- Start debugger (Page 5996)

### 10.13.2.3 Simulating a project

#### Introduction

You simulate your project with one of the following two methods:

- Without a connected PLC  
You change the value of area pointers and tags in a tag simulator that is read for the simulation of WinCC Runtime.
- With a connected PLC without a running process  
You simulate your project by running it directly in Runtime. The tags and area pointers become active. This allows you to create an authentic simulation of your configured HMI device in Runtime.

---

#### Note

##### Simulation restrictions

You cannot simulate the following system functions:

- CalibrateTouchScreen

You cannot simulate the Media Player. A static screen appears in the simulation window instead of the Media Player.

File access via scripts is not possible for HMI devices with Windows CE.

---

#### Requirement

- Simulation without a connected PLC: Tags have been created
- Simulation with a connected PLC but no active process: A project with tags and area pointers has been created

#### Procedure

To simulate a project using the tag simulator, follow these steps:

1. Open the project on the configuration PC.
2. Select the "Online > Simulation > With tag simulator" menu command.  
For initial project simulation, the simulator is started with a new, empty table. The project is opened simultaneously in Runtime.  
Toggle between the tag simulator and Runtime using the <Alt +Tab> key combination.
3. To simulate a process value, select the corresponding "tag" from the tag simulator.  
The table lists all configured tags. You can simulate up to 300 tags simultaneously.
4. Select the simulation mode in the "Simulation" column.
5. Change the value of tags and area pointers in the respective columns.
6. Activate the "Start" check box to start the simulation for this tag.
7. To save the simulation, select the menu command "File > Save" and enter a descriptive name, for example, "Mixing".  
The file name is assigned the extension "\*.cors".

## Result

The process values are simulated in Runtime. The tag values are created at random, or incremented, depending on the simulation mode.

To specify tag values, change the simulation mode to "<Display>" and enter a value at "Set value".

The following figure shows a tag simulator with four tags whose values can be determined at random in a range of values from 10 to 1000:

The screenshot shows the 'Mixing.cors - WinCC Runtime Advanced Simulator' window. It features a menu bar (File, Edit, View, ?), a toolbar with icons for file operations, and a table for tag simulation. The table has columns for Tag, Data Type, Current val., Format, Write cycle (s), Simulation, Set value, MinValue, MaxValue, Cycle, and Start. The 'Start' column contains checkboxes. The status bar at the bottom indicates the connection path: 'Connected to C:\Documents and Settings\vmadmin\My Documents\Automation\Project1\IM\HMI\{11866113-3148}\Generates\pdata.fwc'.

Tag	Data Type	Current val.	Format	Write cycle (s)	Simulation	Set value	MinValue	MaxValue	Cycle	Start
FillLevel_Water	INT	374	Dec	1,0	Random		10	1000		<input checked="" type="checkbox"/>
FillLevel_Concentr...	INT	45	Dec	1,0	Random		10	1000		<input checked="" type="checkbox"/>
FillLevel_Sugar	INT	111	Dec	1,0	Random		10	1000		<input checked="" type="checkbox"/>
FillLevel_Aroma	INT	300	Dec	1,0	Random		10	1000		<input checked="" type="checkbox"/>
*---										<input type="checkbox"/>

## Managing simulation data

If you have saved data from a previous simulation, you can open the file at a later point in time and simulate your project again. The tags and area pointers listed in the tag simulator must still be available in the project.

Proceed as follows to open a simulation file:

1. Select the menu command "Online > Simulate Runtime > With tag simulator".
2. Select the menu command "File > Open" in the tag simulator.
3. Select the corresponding simulation file and click "Open".  
The simulator loads the stored data.

## Enabling and disabling tags

Start and stop the simulation for each tag separately in order to facilitate the transition from offline to online engineering. Activate "Start" in the corresponding row.

If a tag is activated, the simulation values are calculated and transferred to the WinCC simulator.

## Deleting a tag

To delete a tag from the tag simulator, follow these steps:

1. Select the cell that contains the tag name.
2. Select the "Edit > Cut" menu command.  
The tag is removed from the table.

### 10.13.2.4 Simulating a screen

#### Introduction

If you have only made changes to one screen, you can temporarily specify this screen as the start screen for simulation. In this way, you can debug changes without having to modify the start screen, or opening the screen on the HMI device.

#### Requirements

You created a project that contains at least one screen.

#### Procedure

To define a screen as temporary start screen for simulation, follow these steps:

1. In the project navigation, select the image to display as the start screen in the simulation.
2. Select the "Start simulation" command from the shortcut menu of the screen.

#### Result

Project simulation is started. Instead of the configured start screen, the simulation window the screen you selected in the project navigation.

#### See also

Simulation basics (Page 5988)

### 10.13.2.5 Working with the tag simulator

#### About the tag simulator

The tag simulator has the following columns:

Column	Description
Tag	Specifies the tags for the simulation.
Data type	Shows the data type of the selected tag.
Current value	Shows the simulated value of the defined tags.
Format	Specifies the selected format in which the tag values are simulated: <ul style="list-style-type: none"><li>• Decimal (1, 2, 3, 4, ...)</li><li>• Hexadecimal (03CE, 01F3, ...)</li><li>• Binary (0 and 1)</li></ul>
Write cycle	Specifies the selected time interval at which the current tag values are simulated. If you enter "2", for example, the current value of the tag will be shown every 2 seconds.
Simulation	Shows the method by which the tag values are processed during simulation.

Column	Description
Set value	Sets the selected value for the respective tag. The simulation start with the specified value.
minValue maxValue	Specifies the value range of the tag. You set a minimum and maximum value for this range. The default values are -32768 for the minimum and 32767 for the maximum.
Period	Contains the period during which the value of the tag is repeated for the "Increment" and "Decrement" simulation modes.
Start	Starts simulation of the tag based on the previously entered information.

## Simulation modes

The simulator has six different simulation modes. The configured tags are supplied with nearly realistic values during the simulation.

Simulation mode	Description
Sinusoidal	Changes the tag value to form a sinusoidal curve. The value is visualized as a periodic, non-linear function.
Random	Provides randomly generated values. The tag value is changed by means of a random function.
Increment	Increases the value of the tag continuously up to a specified maximum value. Begins again at the minimum after the maximum has been reached. The value trend corresponds to a positive saw-tooth curve.
Decrement	Reduces the value of the tag continuously down to a specified minimum value. Begins again at the maximum after the minimum has been reached. The value curve corresponds to a negative saw-tooth curve.
Shift bit	Shifts a set bit continuously by one position. The previous position is always reset. This lets you test the alarms of an HMI device, for example.
<Display>	The current tag value is displayed statically.

### Example: Simulate tags with the "Shift bit" simulation mode

Proceed as follows to simulate tags with the "Shift bit" simulation mode:

1. Open the project you want to simulate.
2. Select the menu command "Online > Simulate Runtime > With tag simulator".  
The tag simulator opens.
3. In the "Tag" column, select a tag from your project.
4. Select "Bin" in the "Format" column.
5. Enter the value "1" in the "Write cycle" column.
6. Select the "Shift bit" simulation mode in the "Simulation" column.
7. Enter the value "1" in the "Set value" column.
8. Enable the tag with the "Start" check box.

## Result

The simulator tests the selected tag bit-by-bit as follows:

Simulation values	Byte for alarms
Set start value	00000001
1. Simulation value	00000010
2. Simulation value	00000100
3. Simulation value	00001000
....	...

In Runtime you see if the desired alarm is output at a given value.

### 10.13.2.6 Simulation restrictions

#### Alarms with dynamic parameters

If you use tags or text lists as external tags for alarms, the dynamic parameters of the alarms are not displayed.

Only internal tags are enabled for the simulation of alarms in the tag simulator .

You can use PLCSim to simulate dynamic parameters.

### 10.13.2.7 Start debugger

#### Introduction

Select the "With script debugger" script mode to test scripts. The debugger allows you to set breakpoints in the code, for example, or implement a script step by step.

#### Requirements

- A debugger that supports VBS is installed on the Engineering Station, e.g. "MS Script Debugger".
- WinCC Runtime is installed on the Engineering Station.
- A project is open.

#### Procedure

1. Select the "Online > Simulation > With script debugger" menu command.  
The Runtime software searches for debuggers installed on the Engineering Station.
2. If several debuggers are found, click on a selected.

## Result

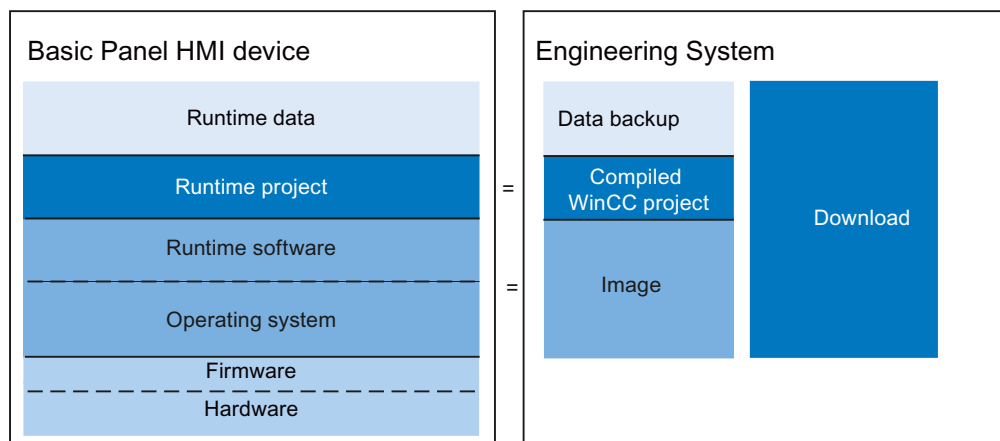

The debugger is connected automatically with the runtime software.

## 10.13.3 Servicing the HMI device

### 10.13.3.1 Overview of HMI device maintenance (Basic Panels)

## Structure

The following figure shows the software components of an HMI device and their relation to the engineering system.

## Runtime data

The Runtime data is generated during operation of the plant and stored on the HMI device. This data includes, for example, recipes and data for the user administration. This data is overwritten during loading. If required, save this data before loading a Runtime project.

## Runtime project

The Runtime project contains the compiled configuration data for an HMI device. You download the Runtime project from WinCC to the HMI device.

## Runtime software and operating system

Together, the Runtime software and operating system of an HMI device form the image. Various images are available for the HMI device. All images of an HMI device are available in WinCC. Depending on the configuration, download the appropriate image along with the Runtime project to the HMI device as required.

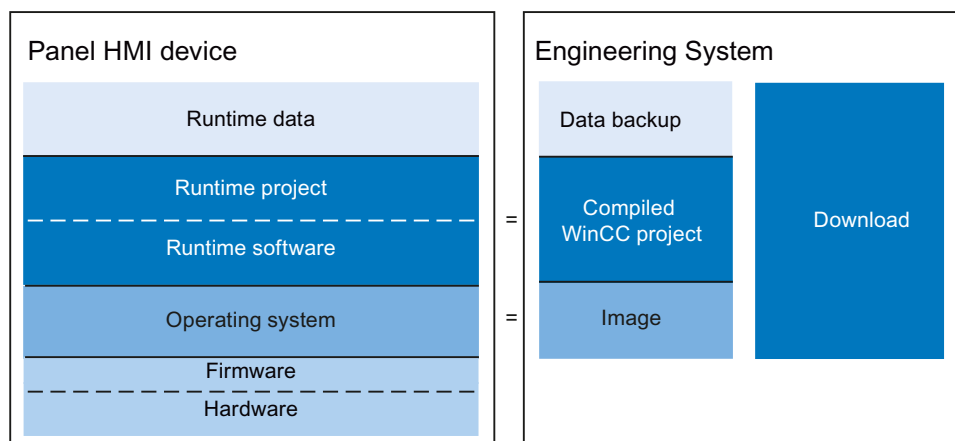

## Firmware and hardware

The HMI device is delivered with preconfigured firmware and hardware.

### 10.13.3.2 Overview of HMI device maintenance tasks (Basic Panels)

#### Structure

The following figure shows the software components of an HMI device and their relation to the engineering system.

#### Runtime data

The Runtime data is generated during operation of the plant and stored on the HMI device. This data includes, for example, recipes and data for the user administration. This data is overwritten during loading. If required, save this data before loading a Runtime project.

#### Runtime project and Runtime software

The Runtime project contains the compiled configuration data for an HMI device. Download the Runtime project along with the Runtime software from WinCC to the HMI device.

#### Operating system

The HMI operating system is referred to as image. Various images are available for the HMI device. All images of an HMI device are available in WinCC. Depending on the configuration, download the appropriate image along with the Runtime project to the HMI device as required.

#### Firmware and hardware

The HMI device is delivered with preconfigured firmware and hardware.

### 10.13.3.3 ProSave

#### Introduction

The "ProSave" service tool is installed by default when WinCC is installed. The ProSave functions are accessed in WinCC with the menu "Online > HMI Device maintenance".

#### Functional scope

ProSave provides all of the functions you need to manage data on the HMI device:

- Data backup and restoration of backed-up data
- Operating system update for HMI devices with Windows CE or below
- Transferring License Keys
- Installing and uninstalling drivers and options as well as information on installed options and options that can be installed on an HMI device
- Communication settings (transferred from WinCC)

#### See also

Backup of HMI data (Page 5999)

Updating the operating system (Page 6002)

Transferring license keys (Page 6005)

Installing and uninstalling an option (Page 6007)

Overview of HMI device maintenance (Basic Panels) (Page 5995)

### 10.13.3.4 Backup of HMI data

#### Introduction

Regular backups of HMI device data keep downtimes to a minimum, for example, when you replace a device. You simply transfer the backup data to the HMI device, restoring the original status.

#### Data backup with WinCC

If an HMI device is connected to the configuration PC, you can back up and restore HMI device data from the configuration PC using WinCC.

## Scope of data backup

Which data is backed up and restored depends on the type of HMI device:

- Complete backup  
Depending on the HMI device: Runtime, firmware, operating system, configuration, recipes, user administration, settings

---

### Note

License Keys can only be stored only in the following HMI devices:

- HMI devices of the 177 series (except TP 177A)
- HMI devices of the 277 series
- HMI devices of the 377 series
- Mobile Panel Wireless
- Comfort Panel

The License Keys are not saved for the following HMI devices:

- OP 77A°
  - all other Windows CE HMI devices
- 

- Firmware/configuration
- Recipes only
- Only recipes in CSV format
- User administration only

A backup file with the extension \*.psb is generated when you backup the data of an HMI device.

As a general rule, you can backup the data to any storage medium. If the HMI device is networked, you can also backup the data to a server.

---

### Note

#### Scope of data backup for Windows CE HMI devices

Data backup secures the contents of the flash memory. Alarm logs and process value logs are generally saved on the external storage medium. Alarm logs and process value logs are therefore not backed up. If necessary, back up the contents of the memory card separately.

Please note the following when performing a complete data file backup and restore operation for Windows CE devices:

- A full backup includes all options installed. As a rule, the backup includes all options data that is still available after "POWER OFF".
  - All data on the device, including License Keys and the operating system, are permanently deleted when you perform complete data restoration.
  - If the data restoration was interrupted, execute the command "Reset to factory settings". Restart data restoration.
- 

### Note

Use interfaces with high bandwidths, e.g. USB or Ethernet to backup and restore data.

---

---

**Note**

For Windows CE devices, you can also backup the data directly to a CF or PC card, independent of ProSave and WinCC. For additional information, refer to the relevant operating instructions.

---

**See also**

Backing up and restoring data of the HMI device (Page 6001)

Overview of HMI device maintenance (Basic Panels) (Page 5995)

### 10.13.3.5 Backing up and restoring data of the HMI device

---

**Note**

Use the restore function for project data only on operating devices which were configured using the same configuration software.

---

**Requirement**

- The HMI device is connected to the configuration PC
- The HMI device is selected in the project tree.
- If a server is used for data backup: The configuration PC has access to the server

**Backup of the data of the HMI device**

Proceed as follows to backup the data of the HMI device:

1. Select the "Backup" command from the "Online > HMI Device maintenance" menu. The "Create backup" dialog box opens.
2. Select the type of the PG/PC interface and the target device, and click "Create". The "SIMATIC ProSave" dialog box opens.
3. Select the data to backup for the HMI device under "Data type".
4. Enter the name of the backup file under "Save as".
5. Click "Start Backup".

This starts the data backup. The backup operation takes some time, depending on the connection selected.

### Restoring the data of the HMI device

Proceed as follows to restore the data of the HMI device:

1. Select the "Restore" command from the "Online > HMI Device maintenance" menu.  
The "Restore backup" dialog box opens.
2. Select the type of the PG/PC interface and the target device, and click "Load".  
The "SIMATIC ProSave" dialog box opens.
3. Enter the name of the backup file under "Save as".  
Information about the selected backup file is displayed under "File information".
4. Click "Start Restore".

This starts the restoration. This operation takes some time, depending on the connection selected.

### Backup/Restore from the "Backup/Restore" dialog in the control panel of the HMI device

The "Backup/Restore" function is enabled for MMC, SD memory cards and USB mass storage devices.

### See also

Backup of HMI data (Page 5997)

Overview of HMI device maintenance (Basic Panels) (Page 5995)

### 10.13.3.6 Updating the operating system

#### Introduction

Update the HMI device image if the version is incompatible with the configuration. The image version matches the device version.

Update the operating system and Runtime software of the HMI device with the help of the device version. While loading the project, you may be prompted to run an automatic update of the device version, depending on the protocol used.

Loading will then continue. Loading of the project is otherwise aborted. In this case, perform the update of the device version manually.

---

#### Note

A device version can only be updated on HMI devices that are not PC-based.

---

## Updating the device version

Connect the HMI device to the configuration PC to update the device version. If possible, use the interface providing the highest bandwidth for this connection, e.g. Ethernet. An update of the device version via serial connection may take up to an hour.

---

### Note

#### Transfer of operating systems for MP 377 via PROFIBUS

The size of the image and the baud rates available with PROFIBUS mean image transfer with an MP 377 via PROFIBUS can take up to an hour.

Updating the operating system via USB or Ethernet.

---

## "Reset to factory settings"

If the operating system on the HMI device is no longer operational, update the operating system and reset the HMI device to the factory settings.

---

### Note

#### Resetting to factory settings via Ethernet for Basic Panels

You require the following to reset the HMI device to the factory settings via Ethernet:

- the MAC address of the HMI device
- the available IP address
- the programming device/PC interface of the configuration PC set to Ethernet TCP/IP

The programming device/PC interface is configured using the control panel of the configuration PC. Select "S7ONLINE (STEP7) -> TCP/IP" in the "Access point of the application" field.

---

## See also

Updating the operating system on the HMI device (Page 6003)

Overview of HMI device maintenance (Basic Panels) (Page 5995)

### 10.13.3.7 Updating the operating system on the HMI device

If possible, you should use the interface with the highest bandwidth for this connection, such as Ethernet. Updating the operating system via a serial connection can take up to an hour.

When you update the operating system, the Runtime software on the HMI device is also updated and the device version is changed.

**NOTICE**

**Updating the operating system deletes all data on the HMI device**

When you update the operating system you delete data on the target system. For this reason, you should back up the following data beforehand:

- User administration
- Recipes

Resetting to factory settings also deletes the License Keys. Back up the License Keys before you reset the system to factory settings.

**Requirement**

- The HMI device is connected to the configuration PC.
- The HMI device is selected in the project tree.

**Updating the operating system**

Proceed as follows to update the operating system:

1. Select the "Update operating system" command from the "Online > HMI Device maintenance" menu.  
The "Update operating system" dialog box opens.
2. Select the type of the PG/PC interface and the target device, and click "Update".  
The "SIMATIC ProSave [OS-Update]" dialog opens. The path to the image is preset.
3. If required, you can select a different path for the image that you want to transfer to the HMI device.
4. Click "Update OS".

This starts the update. The update operation can take time, depending on the connection selected.

**Resetting the HMI device to factory settings**

To reset the HMI device to factory settings, proceed as follows:

1. Switch off power to the HMI device.
2. Connect the HMI device to the Engineering Station.
3. Select the "Update operating system" command from the menu under "Online > HMI Device maintenance" on the configuration PC in WinCC.  
The "Update operating system" dialog box opens.
4. Select the type of the PG/PC interface and the target device, and click "Update".  
The "SIMATIC ProSave [OS-Update]" dialog opens. The path to the image is preset.

5. If required, you can select a different path for the image that you want to transfer to the HMI device.
6. Activate "Reset to factory settings".
7. Click "Update OS".
8. To reset to factory settings, switch on the power to the HMI device again.  
This operation can take time.

## Result

The operating system of the HMI device is operational and up-to-date.

### 10.13.3.8 Transferring license keys

## Introduction

You need a license for certain WinCC Runtime options you may want to install on an HMI device. Usually, the necessary licenses supplied as "License Keys" on a data medium, e.g. USB stick. The "License Keys" can also be made available on a license server.

Use "Automation License Manager" to transfer the "License Keys" to or from an HMI device. The "Automation License Manager" is included automatically when you install WinCC.

### NOTICE

#### Backing up License Keys

In the following cases you have to backup the "License Keys" in order to prevent deletion of the "License Keys":

- Prior to the update of the operating system of a Windows CE HMI device
  - Prior to restoring the data from a full backup
- "License Keys" on an HMI device are backed up depending on the HMI device configuration. For more information, refer to the operating instructions of the corresponding HMI device.

## See also

Managing licenses (Page 6006)

### 10.13.3.9 Managing licenses

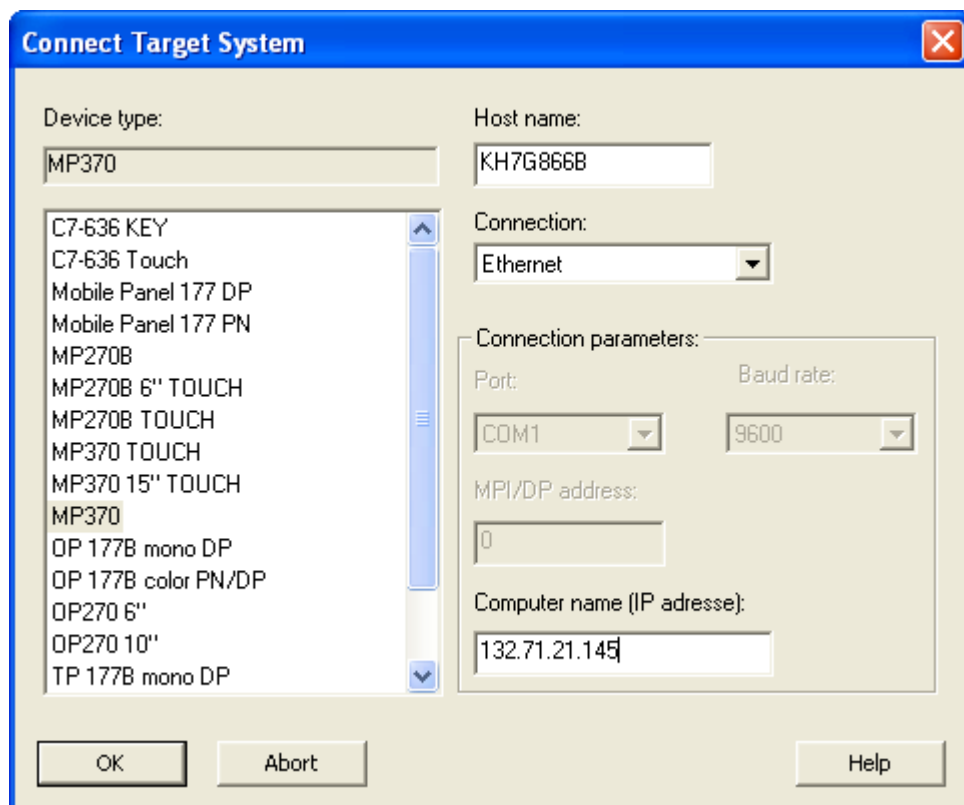

#### Requirement

- The HMI device is connected to the configuration PC or the PC running the "Automation License Manager".
- If you are using the configuration PC: The HMI device is selected in the project tree.

#### Procedure

To transfer license keys, follow these steps:

1. Open the "Automation License Manager". Go to the Windows Start menu and start "Automation License Manager" on a PC on which WinCC is not installed. The "Automation License Manager" starts.
2. Select the "Connect HMI device" command from the "Edit > Connect target system" menu. The "Connect target system" dialog opens.
3. Select the HMI device type in the "Device type" area.
4. Select the "Connection".
5. Configure the "connection parameters" associated with the selected connection.

6. Click "OK".  
The connection to the HMI device is now set up. The connected HMI device is displayed in the left pane of "Automation License Manager".
  7. Transfer the "License Keys" to the HMI device:
    - In the left pane, select the drive on which the "License Keys" are located. The "License Keys" are displayed on the right pane.
    - Select the "License Keys"
    - Drag-and-drop the "License Keys" to the HMI device.
- You can also remove License Keys from the HMI device using drag-and-drop.

### Alternative procedure

You can also start the "Automation License Manager" from WinCC on a PC with a WinCC installation: Select the "Authorize/License" command in the "Online > HMI Device maintenance" menu.

### Result

The "License Keys" are transferred to the HMI device.

To backup the "License Keys" from the HMI device, drag-and-drop the "License Keys" from the HMI device to an available drive.

Installing and uninstalling an option (Page 6007)

#### 10.13.3.1 Installing and uninstalling an option 0

### Introduction

You can install the following options on an HMI device:

- Additional options supplied with WinCC
- Options purchased in addition to WinCC

Which options you can install depends on the HMI device type.

### Requirement

- The HMI device is connected to the Engineering Station, or to the PC with ProSave.
- The HMI device is selected in the project tree.

## Procedure

To install an option on the HMI device, proceed as follows:

1. Select the "Options" command from the "Online > HMI Device maintenance" menu.  
The "Load options" dialog opens.
2. Select the type of the PG/PC interface and the target device, and click "Load".  
The "SIMATIC ProSave" dialog box opens.  
All available options and the previously installed options are displayed.
3. To display the installed options on the HMI device, click "Device status".
4. To install an option on the HMI device, select the option under "Available options" and click ">>".
5. To uninstall an option from the HMI device, select the option under "Available options" and click "<<".

## Result

The selected options are installed on or uninstalled from the HMI device.

ProSave (Page 5997)

## 10.13.4 Printer driver

### 10.13.4.1 Validity

#### Validity

This document includes a description of the enhancements made possible with optional package printer driver.

Install the optional package to implement the extended functionality. The installation provides new printer drivers for several HMI devices.

If necessary you can install individual printer drivers with the tool SIMATIC ProSave on your HMI device. For more details on which printer drivers are available for which HMI devices please refer to the section "Supported HMI devices".

#### Installation

Please follow the instructions in the "Installation" section to install the "Optional package printer driver V1.3".

### Application example

You can find an application example on the subject "Printing with HMI Panels" on the internet at

Auto-Hotspot

### 10.13.4.2 Supported HMI devices

#### Contents of the Optional Package

The "Optional package printer driver V1.3" contains the following printer drivers for the specified HMI devices.

The printer driver supports all printer options of the HMI device.

HMI device	Brother P-Touch QL 650 TD <sup>1)</sup>	Postscript	PDF	HTML
KP400 Comfort KTP400 Comfort	USB	Yes	Yes	Yes
KP700 Comfort TP700 Comfort	USB	Yes	Yes	Yes
KP900 Comfort TP900 Comfort	USB	Yes	Yes	Yes
KP1200 Comfort TP1200 Comfort	USB	Yes	Yes	Yes
KP1500 Comfort TP1500 Comfort	USB	Yes	Yes	Yes
TP1900 Comfort	USB	Yes	Yes	Yes
TP2200 Comfort	USB	Yes	Yes	Yes
USB: Connect printer directly to HMI device via USB port				
<sup>1)</sup> Report printout only.				

### 10.13.4.3 Installation

#### Requirements

ProSave is installed on the PC.

#### Procedure

1. Double click the "PROSAVE-OPT.exe" file.
2. Select "<Setup>" in the "WinZip Self-Extractor" dialog.

3. Select the language for the installation menu.
4. Select "<Continue>" in the "Optional package printer driver setup" dialog.
5. Confirm the next box with "<Install>".
6. Confirm the "Optional package printer driver setup" message with "<Finish>".

---

**Note**

Please follow the instructions in the "Transferring the Options" chapter to transfer the printer driver onto the HMI device.

---

#### 10.13.4.4 Transferring the Options

##### Requirements

The HMI device is connected to a PC on which ProSave is installed.

##### Procedure

1. Restart ProSave on your PC.
2. Select the corresponding HMI device type in the "General" tab.
3. Select the type of connection between the HMI device and the PC.
4. Set the connection parameters.
5. Select the "Options" tab.
6. Select the desired printer driver under "Available options".
7. Set "Transfer" mode on the HMI device.  
If automatic transfer mode is enabled on the HMI device, the device automatically sets "Transfer" mode when a transfer is initiated.
8. Select ">>" on the PC to start the transfer.
9. Follow the ProSave instructions and the instructions which appear on the HMI device.  
During the installation of the printer driver, a status display appears indicating the progress of the operation.

##### Result

When the installation is complete, the new printer driver is displayed in ProSave in the "Installed options" area. The new printer driver can now be used on the HMI device.

#### 10.13.4.5 Setting up the printer driver

##### Postscript

##### Define PostScript V1.3 as printer on the HMI device

1. Open the Control Panel.
2. Start the "Printer" application.
3. In the "Printer Properties" dialog under "Printer Language:" select the entry "PostScript V1.3".

---

**Note**

Not all printers support PostScript. Make sure that your printer supports this printer language.

Select the "Draft mode" option to increase the print speed.

---

##### HTML

##### Introduction

The application "HTMLSettings.exe" is available on the desktop of the HMI device after installation of the "HMTL V1.3" printer driver.

##### Selecting the storage location

1. Open the application "HTMLSettings.exe" on the desktop of your HMI device.
2. Open "Storage Location" in the tab.
3. Under "Primary Location", select "USB-Stick", for example, for the storage location.
4. Select the directory in which the file is to be saved after printing.

##### Selecting the file name

1. Open the "HTMLSettings.exe" application
2. Open the "HTML File Names" tab
3. Select the settings for the names of the HTML file for the print-out.
4. Click on "Apply" to confirm your settings.
5. Select "Default" to retain the default settings for file name assignment.

### Selecting columns for printing reports

1. Open the "HTMLSettings.exe" application
2. Open the "Columns Attributes" tab.
3. Select an attribute in the "Available Columns" category:
4. Add this attribute to your selection with the ">>" button.
5. If required, define whether the selected attribute is to be displayed as an image or as a hyperlink in the HTML file.
6. To deselect attributes from the "Selected Columns" category, select an attribute and click the "<<" button.

### Selecting style sheets

1. Open the "HTMLSettings.exe" application
2. Open the "Advanced Options" tab.
3. Under "Enter Style Sheet File Path", select the storage location of the style sheets you wish to use.
4. Select the file to be used.
5. Select the directory for links.
6. Select the directory for images.

### Defining HTML V1.3 as printer on the HMI device

1. Open the Control Panel.
2. Start the "Printer" application.
3. Under "Printer Language" in the "Printer Properties" dialog, select: the entry "HTML V1.3".
4. Select "Draft Mode" for rapid storage of the HTML file.

## PDF

### Introduction

The application "PDFSettings.exe" is available on the desktop of the HMI device after installation of the "PDF V1.3" printer driver.

### Selecting the storage location

1. Start the application "PDFSettings.exe" on the desktop of your HMI device.
2. Open "Storage Location" in the tab.

3. Under "Primary Location", select "USB-Stick", for example, for the storage location.
4. Select the directory in which the file is to be saved after printing.

### **Selecting the file name**

1. Open the "PDFSettings.exe" application
2. Open the "PDF File Names" tab
3. Select the settings for the names of the PDF file for the print-out.
4. Click on "Apply" to confirm your settings.
5. Select "Default" to retain the default settings for file name assignment.

### **Define PDF V1.3 as printer on the HMI device**

1. Open the Control Panel.
2. Start the "Printer" application.
3. Under "Printer Language" in the "Printer Properties" dialog, select: the entry "PDF V1.3".
4. Select "Draft Mode" for rapid storage of the PDF file.

## **10.13.5 Reference**

### **10.13.5.1 Error messages during the download of projects**

#### **Possible problems during the download**

When a project is being downloaded to the HMI device, status messages regarding the download progress are displayed in the output window.

Usually, problems arising during the download of the project to the HMI device are caused by one of the following errors:

- Wrong operating system version on the HMI device
- Incorrect download settings on the HMI device
- Incorrect HMI device type in the project
- The HMI device is not connected to the configuration PC.

The most common download failures and possible causes and remedies are listed below.

#### **The serial download is cancelled**

Possible remedy: Select a lower baud rate.

**The download is cancelled due to a compatibility conflict**

Possible cause	Remedy
Conflict between versions of the configuration software and the operating system of the HMI device	<p>Synchronize the operating system of the HMI device with the version of the configuration software.</p> <p>To update the operating system on the HMI device, select the "Update operating system" command from the "Online &gt; HMI device maintenance" menu in WinCC. You can also use ProSave.</p> <p>For additional information, refer to the operating instructions for the HMI device.</p>
The configuration PC is connected to the wrong device, e.g. a controller.	<p>Check the cabling.</p> <p>Correct the communication parameters.</p>

**Project download fails**

Possible cause	Remedy
Connection to the HMI device cannot be established (alarm in the output window)	<p>Check the physical connection between the configuration PC and the HMI device.</p> <p>Check whether the HMI device is in transfer mode. Exception: Remote control</p>
The default communication driver is not listed in the Windows Device Manager.	Check the device status of the COM connection in the properties window of the Device Manager.

**Download over MPI/DP interface fails**

Possible cause	Remedy
"Configured mode" is set on the CP, for example, if you are using the SIMATIC NET CD.	<p>Set the CP to "PG mode" using the "Set PC station" application.</p> <p>Check the "baud rate" and "MPI address" network parameters.</p> <p>Download the project from WinCC to the CP.</p> <p>Set the CP back to "configured mode".</p>
On the programming device/PC panel, the "S7ONLINE" access point is not set to a hardware device such as CP5611 (MPI). This may be due to the installation of "SIMATIC NET CD".	<p>Set the access point "S7ONLINE" on the selected device using the "PG/PC Panel" or "Set PC station" application.</p> <p>Check the "baud rate" and "MPI address" network parameters.</p> <p>Download the project from WinCC to the HMI device.</p> <p>Restore the "S7ONLINE" access point to the original device.</p>

## The configuration is too complex

Possible cause	Remedy
The configuration contains too many different objects or options for the HMI device selected.	Remove all objects of a specific type, for example all HTML browsers. Alternatively, remove options such as Sm@rtServer or OPC server.

### 10.13.5.2 Adapting the project for another HMI device

#### Introduction

When you download a WinCC project to an HMI device, WinCC checks whether this is compatible with the HMI device type used in the project. If the types of HMI device do not match, you will see a message before the download starts.

The download is aborted.

#### Adapting the project for the HMI device

You need to adapt the project accordingly to be able to download the project to the connected HMI device.

- Add a new HMI device in the project tree. Select the correct type of HMI device from the HMI device selection.
- Copy the configured components from the previous to the new HMI device. Copy large amounts of components directly in the project navigation and details view. For example, copy the "Screens" folder to the screens folder of the new HMI device with the help of the shortcut menu.
- Use the detail view to copy entries in the project tree for which the "Copy" command is not available in the shortcut menu.
- Select the "Recipes" entry in the project tree, for example. The recipes are displayed in the detail view.
- Select the recipes in the detail view and drag them to the "Recipes" entry of the new HMI device. The recipes are copied. You can also select multiple objects in the detail view.
- Configure the components that cannot be copied, e.g. connections, area pointers, and alarms.
- Save the project at various points in time.
- Compile the full project.
- When the compilation is successfully completed, download the project to the HMI device.

#### Linking references

References to linked objects are included in the copying. The references are linked again once the linked objects are copied.

Example:

You copy a screen in which objects are linked to tags. The tag names are entered at the individual objects after the screen is added to the new HMI device. The tag names are marked in red because the references are open. When you then copy the tags and insert them into the new HMI device, the open references are closed. The red marking for the tag names disappears.

For complete references to connected objects in the PLC, you first need to configure a connection to the PLC.

### Using the information area

When you compile the project for the HMI device, errors and warnings are displayed in the "Info" tab of the Inspector window. You can use the shortcut menu command "Go to" to go directly to the location where the error or warning can be corrected.

Work through the list of errors and warnings from top to bottom.

When the compilation is successfully completed, download the project to the HMI device.

### See also

Loading a project (Page 5973)

### 10.13.5.3 Establishing a connection to the HMI device

#### Introduction

To download a WinCC project to an HMI device, a properly configured connection must be set up between the configuration PC and HMI device. The connection cannot be set up, the download is cancelled.

#### Setting up a connection between the configuration PC and HMI device

1. Check the cable connection between the HMI device and configuration PC.
2. Open the "Devices & Networks" editor in WinCC and start the network view.
3. Select the subnet in the network view and check the settings for the subnet.
4. Select the interface of the HMI device in the network view or device view and check the connection parameters in the Inspector window.
5. Switch on the HMI device and press the "Control Panel" button in the loader.  
The Control Panel opens.
6. Press "Transfer" twice in the Control Panel.  
The "Transfer Settings" dialog box opens.
7. Check the settings and then press "Advanced".  
The [Protocol\*] Settings" dialog opens.  
\*: The title of the dialog depends on the protocol used, for example, "PROFIBUS Settings".
8. Check the advanced settings and close the dialog with "OK".

## Important settings

Check the connection settings and in particular the following parameters:

- Network and station addresses
- Selected transmission rate
- Master on the bus; as a general rule, only one master is permitted.

If using a configurable adapter for the connection, check the adapter settings, for example, transmission rate, master on the bus.

## See also

Loading a project (Page 5973)

## 10.14 Operating in Runtime

### 10.14.1 Basics

#### 10.14.1.1 Overview

### Configuration and process control phases

HMI devices are used to operate and monitor tasks in process and production automation. The plant screens on the HMI devices provide a clear overview of active processes. The HMI device project, which includes the plant screens, is created during the configuration phase.

Transfer the project to the HMI device for the process control phase. Another requirement for the process control phase is that the HMI device must be connected online to a PLC. The process control phase, operator control, and monitoring can then be carried out during an ongoing work process.

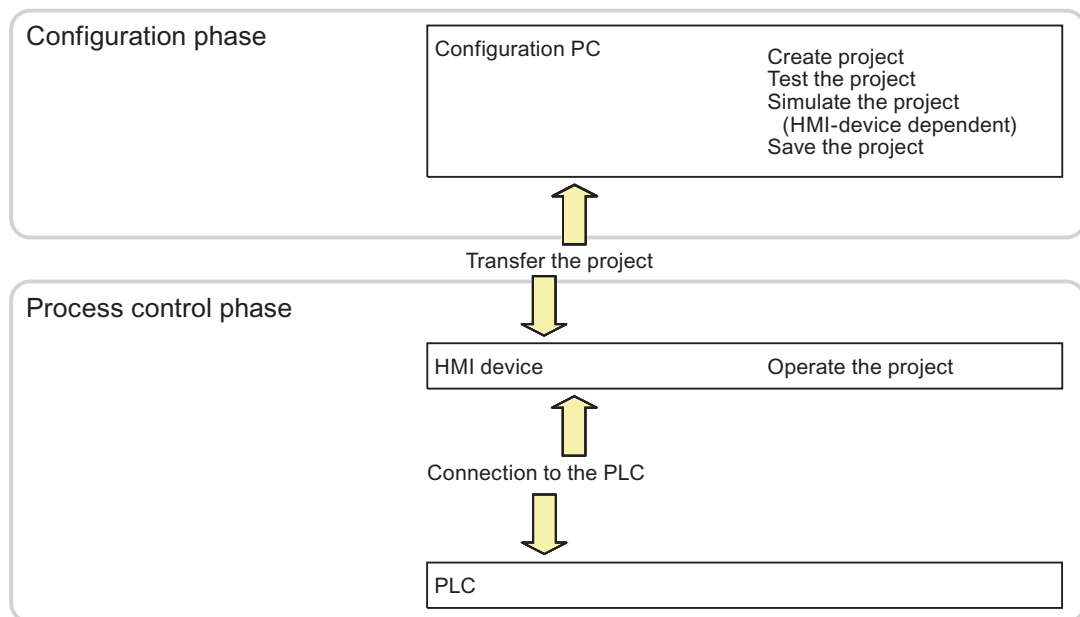

Figure 10-9 Configuration and process control phases

### Downloading the project to the HMI device

The following procedures are available to download a project to an HMI device:

- Downloading from the configuration PC
- Restore the project from a PC using ProSave  
In this case, an archived project is downloaded from a PC to the HMI device. The configuration software need not be installed on this PC.

These procedures are available for commissioning and recommissioning a project.

### Commissioning and Recommissioning

- When the HMI device is commissioned there is no project at first. The HMI device is also in this state after the operating system has been updated.
- When recommissioning, any project on the HMI device is replaced.

### 10.14.1.2 System behavior

#### System functions and scripts

##### Use

System functions and user-defined functions are used in Runtime for the following purposes:

- To control the process.
- To utilize the properties of the HMI device.
- To configure system settings on the HMI device in online mode.

Each system function and user-defined function within WinCC is linked to an object and an event. As soon as the event occurs, the system function is triggered.

##### System functions

These default system functions are used to implement many tasks in Runtime, such as:

- Calculations, e.g. increasing a tag value by a specific or variable amount.
- Logging functions, e.g. starting a process value log.
- Settings, e.g. PLC changes or setting a bit in the PLC.
- Alarms, e.g. after a different user logs on.

##### User-defined functions

User-defined functions may also be included in the project for specific applications which may require additional functions. WinCC provides an interface to Microsoft Visual Basic Script (VBScript or VBS for short) for creating user-defined functions.

##### Examples:

- Conversion of values, e.g. between different physical units (temperatures).
- Automation of production sequences  
The user-defined function controls a production sequence by transferring values to a PLC. The status is checked based on return values and corresponding measures are initiated.

##### Events

The object and the selected function determine which events can be defined as triggers for executing a system function.

For example, the "Value change", "On exceeding" and "On falling below" events are associated with the "Tag" object. The "Loaded" and "Cleared" events are associated with the "Screen" object.

## Reports

### Overview

Logs are used to document process data and completed production cycles. The report content and layout are specified in the project, as is the event triggering the printout of the report.

For example, a report can be configured for output at the end of a shift to record downtimes. A log can also be configured for the purpose of the documentation of product testing or quality inspections (ISO 9000).

### Output

Reports are printed in Runtime either automatically, e.g. by means of a scheduler, or manually by means of a softkey.

### Printing reports

Reports are output to the printer in graphic mode. The use of a serial printer is not recommended because of the accumulated data volume.

For proper output, the printer must support the paper format and page layout of the report.

---

#### Note

The value of a tag in the report is read and output at the moment of printing. A substantial time may elapse between printing out the first and the last page of a report consisting of several pages. This may lead to the same tag on the last page being output with a different value from that on the first page.

---

## Logs

### Overview

Alarm events and process values can be saved to log files. Alarm events are, for example, the "Incoming", "Acknowledged" and "Outgoing" events contained in an alarm message.

Data logging can be used for the following purposes:

- Early detection of danger / fault states
- Increase of productivity
- Enhancement of product quality
- Optimization of maintenance cycles
- Documentation of processes
- Quality assurance

## Memory options

Depending on the configuration, the logs are written to a file or stored in a database set up for this purpose.

- Data logging to File – CSV(ASCII)  
In CSV format, table columns are separated by separators and the table rows are terminated by a line break. This allows you to evaluate or edit your log data, for example, using an external text editor or a spreadsheet program.

---

### Note

Double quotation marks or multiple characters cannot be used as list separators for the storage location "File - CSV (ASCII)". The setting for list separators can be found under "Start > Settings > Control Panel > Regional and Language Options".

---

- Data logging to File – TXT (Unicode)  
The data is saved in the Unicode format. This file format supports all characters than can be used in WinCC Runtime. For processing, you require a software that can save Unicode, such as Notepad.

---

### Note

To save Asian languages, use the storage location "File - TXT (Unicode)".

---

- Data logging to a File - RDB  
Log files of this format can only be read or visualized in WinCC Runtime Advanced. If you want to evaluate the logged data in a different manner, convert the data to the CSV format using the "CopyLog" system function.
- Data logging to a database  
Data is saved in a database for which ODBC access was set up by the PC administrator.

## Logging methods

Logging methods used in WinCC:

- Circular log
- Segmented circular log
- Log with level-dependent system alarms
- Log with level-dependent triggering of an event

## Alarm logs

Alarms in the project indicate fault states and operating states of a process. They are generally triggered by the controller. Alarms are output on the HMI device in form of screen objects. All the data associated with an alarm and configuration data are saved in an alarm log, for example, alarm class, time stamp and alarm text. All alarm classes can be logged separately. Alarms can be logged either automatically or by operator intervention. For additional information, refer to "Logging alarms".

## Data logs

In Runtime, the process values are logged, processed and, depending on the project, written either to files or to the log database.

Data logging is controlled by means of cyclic operations and events. Logging cycles are used to ensure continuous acquisition and storage of the process values. Data logging can also be triggered by events, for example, when a value has changed. For additional information, refer to "Logging tags".

## Storing logs on network drives

Close all logs with the system function "CloseAllLogs" before disconnecting the HMI device from the network.

End Runtime if an unexpected network failure occurs. The logs will be available again after restarting Runtime.

## Storing files on a Windows 2003 server

Log files and recipes can only be stored on a Windows 2003 server with Active Directory for the following HMI devices:

- MP 277
- MP 377
- Mobile Panel 277
- Mobile Panel 277 IWLAN

## Tags

### Definition

Tags correspond to defined memory areas on the HMI device, to which values are written and/or from which values are read. This action can be initiated by the PLC, or by the operator at the HMI device.

## 10.14.2 Commissioning projects

### 10.14.2.1 Runtime Advanced and Panels

#### Introduction

Modern automation concepts are extremely demanding on process visualization. Process control close to machines must in particular meet the demands for simple, high-performance control of the processes. The objective is to present quick, clear and comprehensible information to operators, for example, by means of a trend view. This increasingly requires

process displays that simplify understanding of the actual process. There is an increasing demand for data logging functionality, e.g. for QC. This makes it necessary to log process data at machine level.

Runtime Advanced and Panels is designed for visualizing and operating machines and small-scale plants. The Runtime software has a window-based pixel-graphics user interface. Due to its short response times, the software features secure process operation, jogging at the machine and secure data acquisition.

## Licensing

A License Key is required to install Runtime Advanced and Panels on a standard PC or on a Panel PC. Runtime Advanced and Panels only runs in demo mode if not licensed.

- PC: The license is included with your Runtime Advanced and Panels package.
- Panel PCs: The "Runtime Advanced and Panels" license is shipped with the device.

## WinCC components

The WinCC configuration software is used to create your project data on a PC or PG that is operating on a Windows platform.

The Runtime software lets you visualize the process. You use Runtime to test and simulate the compiled project file on the configuration PC.

You can order several options with enhanced functions for Runtime Advanced and Panels.

### 10.14.2.2 Settings for Runtime Advanced and Panels

#### Settings in the Runtime software

Open the WinCC configuration software and make the following settings for the Runtime software:

#### Display on the PLC

In WinCC, configure the visual representation of the generated project in Runtime: Select the full-screen or window mode for the project. The window has a smaller size than the screen. In full-screen mode, the project is zoomed to the full screen. There will be no window and operator control elements for this view.

Click "Screens" in the "Settings" editor to define activation of the full-screen at startup. Activate the "Full-screen mode" check box in the "Screen" field.

You can hide the taskbar in Windows as required. Select "Start > Settings > Taskbar" and then deactivate the "Always on Top" and "Auto hide" check boxes in the "Taskbar properties" dialog.

---

**Note**

**Truncated view**

If the HMI screen does not match the configured size (in pixels), the project opened in full-screen mode only appears on a part of the screen.

---

## Dialog fonts

The dialog text will be shown in the standard font. Define the default font by selecting "Languages and fonts" in the "Settings" editor.

## Disabling program switching

You lock program switching to prevent operators from calling other applications in Runtime.

Click "Screens" in the "Settings" editor and then activate the "Disable program switching" and "Full-screen mode" check boxes. Also hide the Windows taskbar.

---

**Note**

**Stop runtime**

If you lock program switching, always configure in your project the system function "StopRuntime" for an object, e.g. a softkey or button. Otherwise, you cannot close Runtime or Windows.

The <CTRL+ALT+DEL> key shortcut is not available if program switching is disabled. On a Windows 2000 operating system this effect prevents you from logging on to your device again after the screensaver was started. Windows 2000 allows you to disable the <CTRL+ALT+DEL> key shortcut required for logon. Open the "Control Panel > Users > Passwords > Advanced" tab and deactivate the "Press CTRL + ALT + DEL before logon" check box.

---

## Screen saver

A screensaver is no longer required for most modern screens and can, in fact, even cause damage. These monitors switch to hibernate mode as soon as the video signal has not changed for a specified time. A conventional screensaver would prevent this and thus reduce the service life of your monitor.

---

**Note**

**Approved screensavers**

If you do want to use a screensaver, note that only the standard Windows screensavers are approved for use in Runtime.

---

Make sure that the correct time zone is set on the PC on which the runtime software is installed. To set the time zone in Windows, select Start > Settings > Control Panel > Date and Time.

## Additional operating options

### Print functions

Print functions available in online mode: :

- **Hardcopy**  
You can print the content of the currently displayed screen if you utilize the "Print screen" system function in your configuration.
- **Printing alarms**  
Each alarm event that occurs (incoming, outgoing, acknowledgment) is also sent to a printer.
- **Printing reports**

### LED control

The light-emitting diodes (LEDs) in the function keys of the HMI devices can be controlled from the PLC. For example, a lit or flashing LED can signal the operator to press a specific function key on the device.

#### 10.14.2.3 Loading a project

### Overview

Various scenarios are possible for loading the project:

- The Runtime software is installed on the same system as the configuration software.
- The Runtime software and the configuration software are installed on different systems. The project must be loaded from the configuration computer to the target system. The HMI devices must be connected to the configuration PC for the transfer. Another requirement is that the transfer mode must match on the HMI devices and in WinCC.

---

#### **Note**

Security prompts may appear during the loading process, depending on the configuration. The recipe data and password list on the HMI device are overwritten following a prompt.

---

### The configuration software and the Runtime software are installed on the same system

If the configuration software and the Runtime software are installed on the same system, proceed as follows:

1. Create and compile your project.
2. Start Runtime directly from the active configuration software. Select the "Start Runtime" command from the "Online" menu.
3. You may test and operate the project online with the controller if you have configured the corresponding communication.

### The configuration software and the Runtime software are installed on different systems

If the configuration software and the Runtime software are installed on different systems, proceed as follows:

1. Create and compile your project. For additional information, refer to "Compiling a project".
2. To download the file via cable:  
Connect the HMI device to the configuration computer using a standard cable to match the desired transfer mode and then switch on the HMI device.
3. Set the HMI device to transfer mode.  
To start transfer mode, press the "Transfer" button in the Loader. You can also assign the system function "SetDeviceMode" to an operator control.
4. Load the project from the configuration computer to your target device. For further information, refer to "Loading projects".

---

#### Note

If the HMI device is a PC, you can transfer the compiled file without using the loader, for example, via Ethernet. Double-click the corresponding file on your PC to start Runtime.

---

#### 10.14.2.4 Testing a project

##### Introduction

You have the following options for testing a WinCC project:

##### Testing projects on the configuration computer.

- Simulator  
The Simulator is used to test WinCC projects with internal tags and process tags. For additional information, refer to "Simulating projects".  
Tests supported by the Simulator:
  - Offline testing of a configuration without connection to a PLC.
  - Online testing of a configuration with connection to a PLC and inactive process.
  - Implementation of a demo project.
- Script debugger  
The script debugger tests your scripts in Runtime to find logical programming errors. For additional information, refer to "Working with the Debugger".

## Testing projects on the HMI device

- Offline testing of the project on the HMI device  
Offline testing means that communication between the HMI device and the PLC is down for the duration of the test. You can operate the HMI device, however, without being able to exchange data with the PLC. Set the "Offline" mode on the HMI device by assigning the system function "SetDeviceMode" to an operating element.
- Online testing of the project on the HMI device  
Online testing means that communication between the HMI device and the PLC is up for the duration of the test. You can use the HMI device to control the plant as configured. Set the "Online" mode on the HMI device by assigning the system function "SetDeviceMode" to an operating element.

## Procedure

The following steps show the basic procedures for simulating a project offline on the configuration computer without PLC connection.

1. Start by creating a project as it is going to be run later with an interconnected PLC.
2. Save and compile the project.
3. Start the Simulator directly from the active configuration software. Select "Online > Simulate Runtime > With tag simulator".  
If simulating the project for the first time, the simulator is started with a new, empty simulation table. If you have already created a simulation table for your project, it will be opened.  
The simulation table "\*.six" contains all your settings for the simulation of tags and area pointers.
4. Make any changes to the tags and area pointers of your project in the simulation table. Toggle between the simulation table and Runtime using the <ALT+TAB> key shortcut. Save your simulation settings with "File > Save." Assign the file a meaningful name. The file name is automatically assigned the extension "\*.six".

### 10.14.2.5 Backup and restoring projects

#### Introduction

Backup and restore operations transfer the relevant data between flash memory on the HMI device and a configuration computer.

#### Requirement

- The HMI device is connected to a configuration computer.
- No project is open in WinCC.
- Relevant only for backup or for restore operations without reset to factory setting:  
The data channel is configured on the HMI device.

## Project backup

Proceed as follows to backup the project:

1. Select "Project ► Transfer ► Communication Settings" in WinCC on the configuration computer.  
The "Communication Settings" dialog opens.
2. Select the HMI device type.
3. Select the type of connection between the HMI device and the configuration computer, then set the communication parameters.
4. Close the dialog with "OK".
5. In WinCC, select the menu command "Project ► Transfer ► Backup".  
The "Backup Settings" dialog opens.
6. Select the data to be backed up.
7. Select a destination folder and a file name for the \*.psb backup file.
8. Set "Transfer" mode on the HMI device.  
If automatic transfer mode is enabled on the HMI device, the device automatically sets "Transfer" mode when a backup is initiated.
9. Start the backup operation in WinCC with "OK" on the configuration computer.  
Follow the instructions in WinCC flexible.  
A status view opens to indicate the progress of the operation.

## Result

The system outputs a message when the backup is completed.

The relevant data is now backed up on the configuration computer.

## Restoring projects

Proceed as follows to restore projects:

1. Select "Project ► Transfer ► Communication Settings" in WinCC on the configuration computer.  
The "Communication Settings" dialog opens.
2. Select the HMI device type.
3. Select the type of connection between the HMI device and the configuration computer, then set the communication parameters.
4. Close the dialog with "OK".
5. In WinCC, select the menu command "Project ► Transfer ► Backup".  
The "Restore Settings" dialog opens.
6. Select the \*.psb backup file to be restored from the "Open" dialog.  
The view shows from which HMI device the backup file originates and the type of data it contains.

7. Set "Transfer" mode on the HMI device.  
If automatic transfer mode is enabled on the HMI device, the device automatically sets "Transfer" mode when a restore operation is initiated.
8. Start the backup operation in WinCC with "OK" on the configuration computer.  
Follow the instructions in WinCC.  
A status view opens to indicate the progress of the operation.

## Result

The transfer is completed when the backup data is restored from the configuration computer to the HMI device.

### 10.14.2.6 Starting the project

#### Project start modes

Options of starting a WinCC project on a Runtime PC:

- Running it from the Explorer  
You can run the project by double-clicking its file name in Windows Explorer.
- Starting together with Runtime  
If you enter a project file in the "HmiRT.ini" file, it will start as soon as WinCC Runtime is started from the Windows Start menu.
- Run from the command line  
To run your project, type in one command either at the MS-DOS prompt, or on the "Start > Run" command line in Windows, and then press <Enter>. Note that the following command line may diverge from its installation path:  

```
c:\Programs\Siemens\SIMATIC WinCC flexible\WinCC flexible 2007  
Runtime\HmiRTm.exe c:\project\myproject.fwx
```
- Autostart
  - If your project is linked to the Autostart directory of the Windows start menu, it will be automatically upon system startup.
  - You can also make the settings for the automatic startup in the "Settings" dialog of the WinCC Runtime Loader.

---

#### Note

Start the loader from the Windows Start menu "SIMATIC\WinCC flexible Runtime > WinCC flexible Runtime Loader".

---

## 10.14.3 Operating projects

### 10.14.3.1 Setting the project language

#### Introduction

The HMI device supports multilingual projects. You must have configured a corresponding operating element which lets you change the language setting on the HMI device during runtime.

The project always starts with the language set in the previous session.

#### Requirement

- The required language for the project must be available on the HMI device.
- The language switching function must be logically linked to a configured operating element such as a button.

#### Selecting a language

You can change project languages at any time. Language-specific objects are immediately output to the screen in the new language when you switch languages.

The following options are available for switching the language:

- A configured operating element switches from one language to the next in a list.
- A configured operating element directly sets the desired language.

### 10.14.3.2 Operating recipes

#### Structure of a recipe

#### Recipes

The recipe collection for the production of a product family can be compared to a file cabinet. A recipe which is used to manufacture a product corresponds to a drawer in a file cabinet.

Example:

In a plant for producing fruit juice, recipes are required for different flavors. There is a recipe, for example, for the flavors orange, grape, apple and cherry.

① File cabinet	Recipe collection	Recipes for a fruit juice plant
② Drawer	Recipe	Orange flavored drinks
③ Drawer	Recipe	Grape flavored drinks
④ Drawer	Recipe	Apple flavored drinks
⑤ Drawer	Recipe	Cherry flavored drinks

### Recipe data records

The drawers of the file cabinet are filled with suspension folders. The suspension folders in the drawers represent records required for manufacturing various product variants.

Example:

Product variants of the flavor apple might be a soft drink, a juice or nectar, for example.

① Drawer	Recipe	Product variants of apple flavored drinks
② Suspension folder	Recipe data record	Apple drink
③ Suspension folder	Recipe data record	Apple nectar
④ Suspension folder	Recipe data record	Apple juice

## Elements

In the figure showing the file cabinet, each suspension folder contains the same number of sheets. Each sheet in the suspension folder corresponds to an element of the recipe data record. All the records of a recipe contain the same elements. The records differ, however, in the value of the individual elements.

Example:

All drinks contain the same components: water, concentrate, sugar and flavoring. The records for soft drink, fruit juice or nectar differ, however, in the quantity of sugar used in production.

## Recipes in the project

### Overview

If recipes are used in a project, the following components interact:

- HMI device recipe memory  
Recipes are saved in the form of data records in the HMI device recipe memory.
- Recipe view / recipe screen  
On the HMI device, recipes are displayed and edited in the recipe view or in a recipe screen.
  - The recipe data records from the internal memory of the HMI device are displayed and edited in the recipe view.
  - The values of the recipe tags are displayed and edited in the recipe screen.

---

#### Note

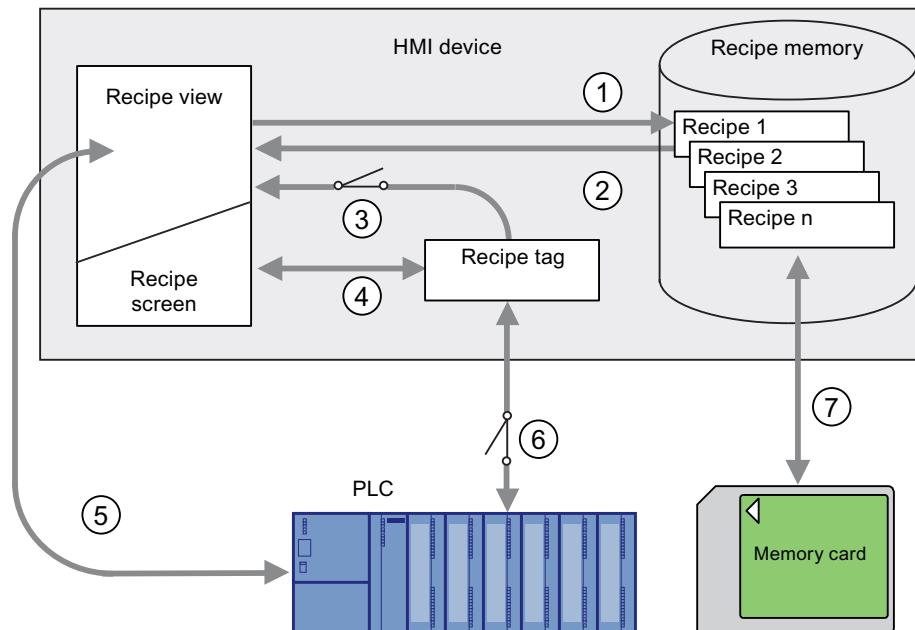

The same recipe tags can be configured in a variety of recipes. If you modify the value of a recipe tag, the synchronization changes the value of the recipe tag in all recipes.

---

- Recipe tags  
The recipe tags contain recipe data. When you edit recipes in a recipe screen, the recipe values are stored in recipe tags. The point at which the recipe tag values are exchanged with the PLC depends on the configuration.

## Data flow

The following figure shows the data flow in a project with recipes:

- ① Editing, saving or deleting a recipe data record
- ② Display recipe data record
- ③ Synchronize or do not synchronize recipe tags
- ④ Display and edit recipe tags in the recipe screen
- ⑤ Write records from the recipe view to the PLC or read records from the PLC and display them in the recipe view.
- ⑥ Recipe tags are to the PLC online or offline
- ⑦ Export or import recipe data record to memory card

## Displaying a Recipe

### Displaying Recipes

You can display and edit recipes on the HMI device with a recipe view or recipe screen.

### Recipe view

A recipe view is a screen object used to manage recipe data records. The recipe view shows recipe data records in tabular form.

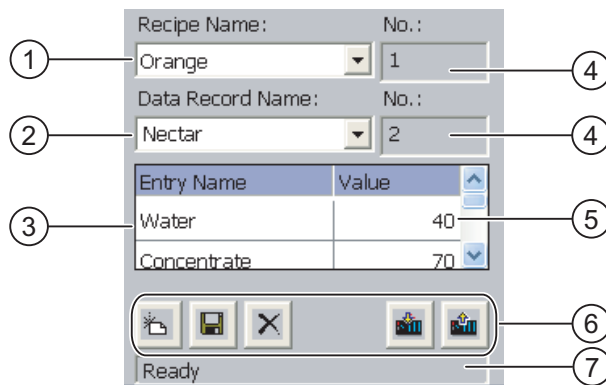

Depending on the configuration, the recipe view is displayed as follows:

- As enhanced recipe view
- As simple recipe view

The configuration engineer also defines which operator controls are displayed in the recipe view. Only the simple recipe view can be configured on the TP 177A.

### Enhanced Recipe View

The figure below shows an example of the enhanced recipe view:

- ① Selection field for the recipe
- ② Selection field for the recipe data record
- ③ Element name  
The element name designates a specific element in the recipe data record.
- ④ Display field  
This show the number of the selected recipe or the selected recipe data record.
- ⑤ Value of the element
- ⑥ Buttons for editing a recipe data record
- ⑦ Status bar for display of the status messages

### Simple recipe view

The simple recipe view consists of three areas:

- Recipe list
- Data record list
- Element list

In the simple recipe view, each area is shown separately on the HMI device. Depending on the configuration, the simple recipe view starts with the recipe list or data record list.

The figure below shows an example of the data record list:

- ① Number of the recipe data record
- ② Recipe data records
- ③ Buttons for changing the displayed list and calling the menu

## Display of Values

### Note

#### Changing the recipe data record in the background

Applies to the processing of a recipe data record:

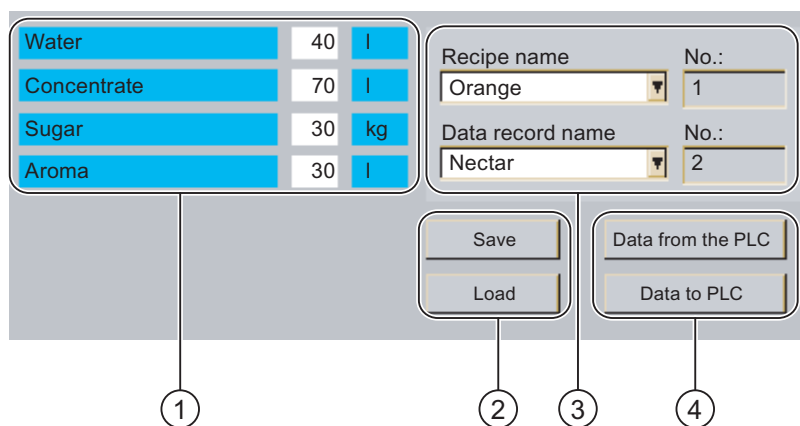

If values of the corresponding recipe data record are changed by a PLC job, the recipe view is not updated automatically.

To update the recipe view, reactivate the respective recipe data record.

## Recipe screen

A recipe screen allows the correlation between the plant and the recipe data to be displayed in graphic form. The configuration engineer combines I/O fields and screen objects to form a custom input screen. The configuration engineer can distribute the I/O fields of a recipe over several recipe screens, thus allowing recipe elements to be arranged by subject. The recipe screen can be operated using buttons configured accordingly.

The figure below shows an example of the recipe screen:

- ① Element names and corresponding values  
The element name designates a specific element in the recipe data record.
- ② Buttons for editing a recipe data record
- ③ Modified recipe view
- ④ Buttons for transferring recipe data

The values displayed or entered in the recipe screen are saved in recipe tags. The recipe values are exchanged with the PLC immediately or later via these tags.

A configured recipe view can itself be a component of a recipe screen. You must synchronize the tags in order to synchronize data between the tags of the recipe screen and the recipe data records displayed in the recipe view.

## Recipe Values in the HMI Device and the PLC

### Introduction

You can change the values of a recipe on the HMI device and therefore influence the manufacturing process or a machine.

Depending on the configuration, the recipe values are displayed, edited and saved in different ways.

- If you are editing recipes with a recipe view in your project, the values are saved in recipe data records.
- If you are editing recipes in a recipe screen in your project, the values are saved in recipe tags.

Differences may occur between the display values in the recipe view and the values saved in the associated tags in an ongoing project when you edit recipes with a recipe view and in a recipe screen. Synchronize the values of the recipe data records with the values of the recipe tags to prevent this effect.

### Synchronizing recipe tags

---

#### Note

Recipe tags can only be synchronized in the advanced recipe view.

---

Synchronization of the recipe tags depends on the configuration of the enhanced recipe view:

- **Automatic synchronization:**  
The values of the recipe view are synchronized with the associated recipe tags. In this case, changes to values in the recipe view have an immediate effect on the values of the associated recipe tags. The values are only synchronized, when an operating element that is outside the recipe view is operated.
- **Synchronization by the user:**  
The values of the recipe view and the associated recipe tags are not synchronized automatically. The project engineer has assigned the same function to the  button or to a different operator control in the recipe view. The recipe tags and the recipe view are only synchronized when you operate the buttons or the appropriate operator control.

## Recipe Tags Online / Offline

The configuration engineer can configure a recipe so that changes to the values of the recipe tags do not have an immediate effect on the current process.

Synchronization of the recipe values between the HMI device and the PLC depends on whether the configuration engineer has selected the settings "Tags online" or the setting "Tags offline" for a recipe.

- **"Tags online":**  
This setting has the following effect:
  - When you change recipe values in the recipe screen, these changes are applied immediately by the PLC and immediately influence the process.
  - If recipe values are changed in the PLC, the changed values are displayed immediately in the recipe screen.
- **"Tags offline":**  
With this setting, changed recipe values are not synchronized immediately between the HMI device and the PLC.  
In this case, the configuration engineer must configure operating elements for transferring the values to the PLC or reading them from the PLC in a recipe screen. The recipe values are only synchronized between HMI device and PLC when you operate the appropriate operator control.

## Exporting a recipe data record

### Introduction

You can export one or more recipe data records to a CSV file, depending on the configuration. After export, the values in the recipe data record can be further processed in a spreadsheet program such as MS Excel. The degree to which you can influence the export depends on the configuration:

## Requirement

- A screen with a recipe view is displayed.
- An operating element with the function "Export record" has been configured.
- The following tags are configured equally in the recipe view and for the "Export record" operating element.
  - Recipe number
  - Data record number

## Procedure

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the relevant recipe data record.
2. Select the recipe data record you want to export.
3. Operate the operator control which was configured for export, for example the "Export data record" button.  
The data record is exported as a CSV file to an external data medium.

## Result

The recipe data record is exported.

## Importing a recipe data record

### Introduction

You can import values from a CSV file to a recipe data record, depending on the configuration.

## Requirement

- An operator control with the function "Import data record" has been configured, for example a button
- A screen with a recipe view is displayed.

## Procedure

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the recipe data record to be imported.
2. Operate the operator control with the function "Import data record".  
The record is imported from an external data medium as a CSV file and then displayed in the recipe view after import.

## Result

The imported recipe data record is saved on the HMI device.

## Deviating structure

If the structure of the CSV file differs from the structure of the recipe, deviations are handled as follows:

- Any additional values in the CSV file will be rejected
- The system applies the configured default value to the recipe data record if the CSV file contains an insufficient number of values
- If the CSV file contains values of the wrong data type, the configured default value is set in the recipe data record

Example:

The imported CSV file contains values that were entered as floating point numbers

However, the corresponding tag expects an integer value. In this case, the system discards the imported value and uses the configured default

## Operating the recipe view

### Overview

### Use

The recipe view is used to display, edit and manage data records.

The screenshot shows a software interface for managing recipes. It features two dropdown menus for 'Recipe Name' (set to 'Orange') and 'Data Record Name' (set to 'Nectar'), each with a 'No.:' field set to '2'. Below these is a table with two columns: 'Entry Name' and 'Value'. The table contains two rows: 'Water' with a value of 50, and 'Concentrat' with a value of 50. At the bottom of the interface, there are several icons for file operations (new, save, delete) and a status bar displaying 'Ready'.

Entry Name	Value
Water	50
Concentrat	50

## Operation

Depending on the configuration you can:

- Creating, editing, copying or deleting recipe data records
- Synchronize recipe data records with the associated recipe tags
- Read recipe data records from or transfer to the PLC

## Operator controls

The following operating elements can be configured in the recipe view:

Button	Hotkey	Function
		The configured tooltip is displayed.
	CTRL + 	Creates a new recipe data record. If a start value is configured, it is displayed in the input field.
	CTRL + ENTER	Saves the displayed values of the recipe data record. The storage location is predefined by the project.
	CTRL + *	The recipe data record is saved under a different name regardless of the recipe view. A dialog box opens where you can enter the name.
	CTRL + 	The displayed recipe data record is deleted.
	CTRL + =	The system always updates the current value of the recipe view with the latest recipe tag value. When the value shown in the recipe view is more recent than the current recipe tag value, the system writes this value to the recipe tag. "Synchronize tags" must be enabled in the recipe properties before you can use this function.
	CTRL + 	The values of the set recipe data record displayed in the recipe view are transferred to the PLC.
	CTRL + 	The recipe values from the PLC are displayed in the recipe view.

## Mouse control or touchscreen control of the recipe view

1. Select the recipe you want to use.  
The data records of the recipe are displayed.
2. Click on the data record you wish to edit.
3. Press the button whose function you wish to execute.

## Using the keyboard with the recipe view

1. Press the <Tab> key until the "Recipe name" or "Data record name" field is activated.
2. Press <Enter>.  
The selection list for the recipes or data records opens.

3. Select a recipe or a data record from the list. Toggle between the next or previous entry by using the cursor keys <Left>, <Right>, <Up> and <Down>.
4. Press the <Tab> key until the operating element you wish to use is selected. You can also operate the recipe view via hotkeys.

## Creating a recipe data record

### Touch and key operation

#### Introduction

Create a new recipe data record by editing an existing data record. Save this data record under a new name.

#### Requirement

A screen with a recipe view is displayed.

#### Procedure for touch operation

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe for which you want to create a new recipe data record.
2. Touch .  
A new recipe data record with the next available number is created.  
An existing data record is overwritten if you assign its number to a new data record.
3. Enter values for the data record elements.  
The data record elements can be assigned default values, depending on the configuration.
4. Touch the button .
5. Enter a name for the data record.  
The data record is saved under the new name.  
A dialog will open if the recipe data record already exists. In this dialog, define whether to overwrite the existing data record.

#### Procedure for key operation

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe for which you want to create a new recipe data record.
2. Press  + .
3. Enter values for the data record elements.  
The data record elements can be assigned default values, depending on the configuration.

4. Press  + .
5. Enter a name for the data record.
6. Confirm your input.  
The data record is saved under the new name.  
A dialog will open if the recipe data record already exists. In this dialog, define whether to overwrite the existing data record.

## Result

The new recipe data records will be saved to the selected recipe.

## Mouse and keyboard operation

### Introduction

Create a new recipe data record by editing an existing data record. Save this data record under a new name.

### Requirement

A screen with a recipe view is displayed.

### Procedure for mouse operation

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe for which you want to create a new recipe data record.
2. Click the  button.  
A new recipe data record with the next available number is created.  
An existing data record is overwritten if you assign its number to a new data record.
3. Enter values for the data record elements.  
The data record elements can be assigned default values, depending on the configuration.
4. Click the  button.
5. Enter a name for the data record.  
The data record is saved under the new name.  
A dialog will open if the recipe data record already exists. In this dialog, define whether to overwrite the existing data record.

### Procedure for keyboard operation

Proceed as follows:

1. Press the <TAB> key until the recipe view is selected.
2. If the recipe view contains several recipes: Press the <TAB> key until the recipe for which you are going to create a new data record is selected.

3. Press the <CTRL+Space> key shortcut to create a new recipe data record with the next available number.  
An existing data record is overwritten if you assign its number to a new data record.
4. Enter values for the data record elements. The data record elements can be assigned default values, depending on the configuration.
5. Press the <CTRL+ENTER> key shortcut to save the recipe data record.
6. Enter a name for the data record. The data record is saved under the new name.  
A dialog will open if the recipe data record already exists. In this dialog, define whether to overwrite the existing data record.

## Result

The new recipe data records will be saved to the selected recipe.

## Editing recipe data records

### Touch and key operation

#### Introduction

Edit the values of the recipe data records and save them in a recipe view.

#### Synchronization with the PLC

If you want to display the current recipe values from the PLC in the recipe view, you first have to read the current values from the PLC with .

You must transfer the data record to the PLC by pressing the  button to activate the changes you have made in the recipe view.

#### Requirement

A screen with a recipe view is displayed.

#### Procedure for touch operation

Proceed as follows:

1. If the recipe list contains several recipes: Select the recipe which contains the recipe data record required.
2. Select the recipe data record you want to edit.
3. Edit the data record as required.
4. Press  to save the changes.  
Touch the  key to save the recipe data record under a different name.

### Procedure for key operation

Proceed as follows:

1. If the recipe list contains several recipes: Press the <TAB> key until the recipe which contains the relevant data record is selected.
2. Press the <TAB> key until the desired recipe data record is selected.
3. Edit the data record.
4. Press  to save the changes.  
Touch the  key to save the recipe data record under a different name.

### Result

The edited recipe data record is saved to the selected recipe.

### Mouse and keyboard operation

#### Introduction

Edit the values of the recipe data records and save them to a recipe view.

#### Synchronization with the PLC

You must read the current values from the PLC by pressing the  button or the <CTRL+UP> key shortcut to display the current recipe values from the PLC in the recipe view.

You must transfer the data record you have edited to the PLC to activate the changes you have made in the recipe view by pressing the  button or the <CTRL+DOWN> key shortcut.

#### Requirement

A screen with a recipe view is displayed.

### Procedure for mouse operation

Proceed as follows:

1. If the recipe list contains several recipes: Select the recipe which contains the recipe data record required.
2. Select the recipe data record to be edited.
3. Edit the data record.
4. Click on  to save your changes.  
Click the  button to save the recipe data record under a different name.

## Procedure for keyboard operation

Proceed as follows:

1. If the recipe list contains several recipes: Press the <TAB> key until the recipe which contains the relevant data record is selected.
2. Press the <TAB> key until the desired recipe data record is selected.
3. Edit the data record.
4. Press the <CTRL+ENTER> key shortcut to save your changes.  
Use the <CTRL + \*> shortcut to save the recipe data record under a different name.

## Result

The edited recipe data record is saved to the selected recipe.

## Deleting recipe data records

### Touch and key operation

#### Introduction

You can delete all recipe data records which are not required.

#### Requirement

A screen with a recipe view is displayed.

## Procedure using the touch screen

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the relevant recipe data record.
2. Select the recipe data record to be deleted.
3. Touch the button .

## Procedure using the keys

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the relevant recipe data record.
2. Select the recipe data record to be deleted.
3. Press  + .

## Result

The recipe data record is deleted.

## Mouse and keyboard operation

### Introduction

You can delete all recipe data records which are not required.

### Requirement

A screen with a recipe view is displayed.

### Procedure for mouse operation

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the relevant recipe data record.
2. Select the recipe data record to be deleted.
3. Touch the button .

### Procedure for keyboard operation

Proceed as follows:

1. Press the <TAB> key until the recipe view is selected.
2. If the recipe view contains several recipes: Press the <TAB> key until the recipe which contains the relevant data record is selected.
3. Select the recipe data record to be deleted.
4. Press the <CTRL+DEL> key shortcut to delete the data record.

## Result

The recipe data record is deleted.

## Synchronizing tags

## Touch and key operation

### Introduction

You can save the values of recipe elements to recipe tags, depending on your configuration.

Differences may develop in your active project between the values displayed in the recipe view and the actual values of the tags. Synchronize the tags to compensate for such differences. Synchronization encompasses all tags of a recipe data record.

---

**Note**

**Renamed tag**

The tag and the value of the recipe data record cannot be associated if you have renamed the tag you want to synchronize. The tags in question are not synchronized.

---

**Note**

Recipe tags can only be synchronized in the advanced recipe view.

---

## Requirement

A screen with a recipe view is displayed.

## Procedure for touch operation

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record to be synchronized.
3. Touch the button .

## Procedure for key operation

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record to be synchronized.
3. Press  + .

## Result

The values of the recipe data record are synchronized with the tag values.

The most recently updated value is accepted if there is a difference between the values of the recipe view and the tag.

## Mouse and keyboard operation

### Introduction

You can save the values of recipe elements to recipe tags, depending on your configuration. Differences may develop in your active project between the values displayed in the recipe view and the actual values of the tags. Synchronize the tags to compensate for such differences. Synchronization encompasses all tags of a recipe data record.

---

#### Note

##### Renamed tag

The tag and the value of the recipe data record cannot be associated if you have renamed the tag you want to synchronize. The tags in question are not synchronized.

---

#### Note

Recipe tags can only be synchronized in the advanced recipe view.

---

### Requirement

A screen with a recipe view is displayed.

### Procedure for mouse operation

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record to be synchronized.
3. Click the  button.

### Procedure for keyboard operation

Proceed as follows:

1. Press the <TAB> key until the recipe view is selected.
2. Press <Enter>. The selection list opens. Select the recipe data record from the list.
3. Press the <TAB> key until the  button is selected. You could also use the <CTRL+=> key shortcut for synchronizing.

## Reading recipe data records from the PLC

### Touch and key operation

#### Introduction

You can edit values which were saved to the recipes in the HMI device directly at plant level within the active project; this may be the case if a valve in the plant opens more than is indicated in the recipe. Inconsistency could have developed between the values of the recipe data records stored in the HMI device and the values in the PLC.

Read the values from the PLC and output these to the recipe view to synchronize the recipe values.

#### Requirement

A screen with a recipe view is displayed.

#### Procedure for touch operation

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record which is to receive the values from the PLC.
3. Touch the button .  
The values are read from the PLC.
4. Touch the button  to store the displayed values in the HMI device.

#### Procedure for key operation

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record which is to receive the values from the PLC.
3. Press  + .
4. Press the  +  keys to store the displayed values in the HMI device.

#### Result

The values were read from the PLC, are visible on the HMI device and were saved to the selected recipe data record.

## Mouse and keyboard operation

### Requirement

A screen with a recipe view is displayed.

### Procedure for mouse operation

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record which is to receive the values from the PLC.
3. Click the  button.  
The values are read from the PLC.
4. Click on  to store the displayed values in the HMI device.

### Procedure for keyboard operation

Proceed as follows:

1. Press the <TAB> key until the recipe view is selected.
2. Press <Enter>. The selection list opens. Select the recipe data record from the list.
3. Press the <TAB> key until the  button is selected. Press <Enter>.  
You could also use the <CTRL+Down> key shortcut.

### Result

The values were read from the PLC, are visible on the HMI device and were saved to the selected recipe data record.

## Transferring recipe data records to the PLC

### Touch and key operation

#### Introduction

You must transfer the values to the PLC to activate a changed recipe data record for the process.

The values displayed in the recipe view are transferred to the PLC.

#### Requirement

A screen with a recipe view is displayed.

### Procedure for touch operation

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record which contains the values to be transferred to the PLC.
3. Touch the button .  
The values are transferred to the PLC.

### Procedure for key operation

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record which contains the values to be transferred to the PLC.
3. Press  + .  
The values are transferred to the PLC.

### Result

The values of the recipe data record were transferred to the PLC and are active in the process.

### Mouse and keyboard operation

#### Requirement

A screen with a recipe view is displayed.

#### Operation with the mouse

1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record which contains the values to be transferred to the PLC.
3. Click the  button.  
The values are transferred to the PLC.

#### Operation with the keyboard

1. Press the <TAB> key until the recipe view is selected.
2. Press <Enter>. The selection list opens. Select the recipe data record from the list.
3. Press the <TAB> key until the  button is selected. Press <Enter>. You could also use the <CTRL+Down> key shortcut.  
The values are transferred to the PLC.

**Result**

The values of the recipe data record were transferred to the PLC and are active in the process.

**Using the simple recipe view**

**Overview**

**Layout**

The simple recipe view consists of three areas:

- Recipe list
- Data record list
- Element list

Figure 10-10 Simple recipe view - example with data record list

In the simple recipe view, each area is shown separately on the HMI device. You can use the shortcut menu to operate each of these display areas.

The simple recipe view always begins with the recipe list.

**Operation**

You can use the simple recipe view as follows, depending on the configuration:

- Create, change, copy or delete recipe data records
- Read recipe data records from the PLC or transfer to the PLC

**Operator controls of the simple recipe view**

Toggle between the display areas and the shortcut menus to operate the simple recipe views.

The table below shows the operation of the display area.

	Key	Function
Touching an entry		The next lowest display area is opened, i.e. the data record list or the element list.
		The previous display area opens.
		The shortcut menu of the display area opens.

The table below shows the operation of the shortcut menu:

	Key	Function
		The menu is closed. The display area opens.
Touching the menu command	Input of the number of the menu command	The menu command is executed.

### Shortcut menus of the simple recipe view

A shortcut menu can be called for each view area by pressing the  button or the  key. The shortcut menu lists the commands that are available in the active view area. A number is assigned to each command. You execute the command by entering its number. You can also use the system keys to execute certain commands.

The scope depends on the HMI device.

- Recipe list

No.	Menu command	Keys	Function
0	New	 + 	A new recipe data record is created for the selected recipe. If a start value is configured, it is displayed in the input field.
1	Displaying infotext		Displays the infotext configured for the simple recipe view.
2	Open		The record list of the selected recipe opens.

- Data record list

	Menu command	Keys	Function
	New	 + 	Creates a new recipe data record. If a start value is configured, it is displayed in the input field.
	Deleting		The displayed record is deleted.
	Save as		The selected data record is saved under a different name. A dialog box opens where you can enter the name.
	Rename		Renames the selected data record. A dialog box opens where you can enter the name.
	Open		The element list of the selected data record opens.
	Previous		The recipe list opens.
	To PLC		The displayed values of the selected data record are transferred from the HMI device to the PLC.
	From PLC		The recipe values from the PLC are displayed in the recipe view of the HMI device.
	Displaying infotext		Displays the infotext configured for the simple recipe view.

- Element list

	Menu command	Keys	Function
	Save		The selected record is renamed.
	To PLC		The displayed values of the selected data record are transferred from the HMI device to the PLC.

	Menu command	Keys	Function
	From PLC		The recipe values from the PLC are displayed in the recipe view of the HMI device.
	Save as		The data record is saved under a new name. A dialog box opens where you can enter the name.
	Displaying infotext		Displays the infotext configured for the simple recipe view.
	Rename		Renames the selected data record. A dialog box opens where you can enter the name.
	Previous		The data record list opens.

### Mouse control or touchscreen control of the simple recipe view

1. Select the desired recipe from the recipe view.
2. Click on the  button.  
The shortcut menu is opened.
3. Select the desired menu command.  
The menu command is executed.
4. Alternatively, open the desired recipe in the recipe view.  
The data record list is displayed.
5. Open the desired data record. You could also use the  button to open the shortcut menu and select a menu command.  
The menu command is executed.

### Using the keyboard with the simple recipe view

1. Press the  key as many times as required to select the simple recipe view.
2. Select the desired recipe with the cursor keys.
3. Press the  key.  
The shortcut menu is opened.
4. Press the  cursor key as many times as required to select the menu command.
5. Confirm the menu command by pressing the key .
6. Alternatively, press the number of the desired menu command.  
The menu command is executed.

### Creating a recipe data record

#### Introduction

Create a new recipe data record in the recipe list or in the record list. Then enter the values for the new record in the element list and save the record.

## Requirement

A screen with a simple recipe view is displayed.

## Procedure

Proceed as follows to create a recipe data record:

1. If the recipe list contains several recipes: Select the recipe for which you want to create a new recipe data record.
2. Open the recipe list menu.
3. Select the "0 new" menu command.  
Creates a new record.  
The element list of the new record opens.
4. Enter values for the data record elements.  
The tags of the record can be assigned default values depending on the configuration.
5. Open the menu of the element list and select the "0 Save" menu command.
6. Enter a name for the new record.
7. Confirm your entries.  
An existing data record is overwritten if you assign its number to a new data record.

## Result

The new recipe data record is saved to the selected recipe.

## Editing a recipe data record

### Introduction

Edit the values of the recipe data records and save them to a recipe view.

### Synchronization with the PLC

To display the current recipe values from the PLC in the simple recipe view, you first have to read the actual values in the element list from the PLC using menu command "2 From PLC".

Values changed in the recipe view are only activated after you transferred the modified data record to the PLC by means of menu command "1 To PLC".

## Requirement

A screen with a recipe view is displayed.

## Procedure

Proceed as follows to copy a recipe data record:

1. If the recipe list contains several recipes: Select the recipe which contains the relevant recipe data record.
2. Open the data record list.
3. Select the recipe data record you want to edit.
4. Open the element list.
5. Edit the element values as required.
6. Save your changes using menu command "0 Save".

## Result

The edited recipe data record is saved to the selected recipe.

## Deleting a recipe data record

### Introduction

You can delete all the data records which are not required.

### Requirement

A screen with a simple recipe view is displayed.

### Procedure for touch operation

Proceed as follows to delete a new recipe data record:

1. If the recipe list contains several recipes: Select the recipe which contains the relevant recipe data record.
2. Open the data record list.
3. Select the data record you want to delete.
4. Open the menu.
5. Select the menu command "1 Delete".

### Procedure for key operation

Proceed as follows to delete a new recipe data record:

1. If the recipe list contains several recipes: Select the recipe which contains the relevant recipe data record.
2. Open the data record list.

3. Select the data record you want to delete.
4. Press .

## Result

The data record is deleted.

## Transferring recipe data records to the PLC

### Introduction

You must transfer the values to the PLC to activate a changed recipe data record for the process.

The values displayed in the recipe view are transferred to the PLC.

### Requirement

A screen with a simple recipe view is displayed.

### Procedure

To transfer a recipe data record to the PLC, proceed as follows:

1. If the recipe list contains several recipes: Select the recipe which contains the relevant recipe data record.
2. Select the element list of the recipe data record whose values you want to transfer to the PLC.
3. Open the menu.
4. Select menu command "1 To PLC".

## Result

The values of the recipe data record were transferred to the PLC and are active in the process.

---

### Note

#### Basic Panels

With Basic Panels, the "To PLC" menu command can also be configured for the data record list: In this case, you can also select the "To PLC" menu command in the data record list.

---

## Reading a recipe data record from the PLC

### Introduction

The values of recipe elements are exchanged with the PLC via tags.

You can edit values which were saved to the recipes in the HMI device directly at plant level within the active project; this may be the case if a valve in the plant opens more than is indicated in the recipe. The values of the tags on the HMI device possibly no longer match the values in the PLC.

Read the values from the PLC and output these to the recipe view to synchronize the recipe values.

### Requirement

A screen with a simple recipe view is displayed.

### Procedure

To transfer a recipe data record to the PLC, proceed as follows:

1. If the recipe list contains several recipes: Select the recipe which contains the relevant recipe data record.
2. Select the element list of the recipe data record to which you want to apply the values from the PLC.
3. Open the menu.
4. Select menu command "2 From PLC".  
The values are read from the PLC.
5. Save the displayed values to the HMI device using menu command "0 Save".

### Result

The values were read from the PLC, are visible on the HMI device and were saved to the selected recipe data record.

---

#### Note

##### Basic Panels

With Basic Panels, the "From PLC" menu command can also be configured for the data record list: In this case, you can also select the "From PLC" menu command in the data record list.

---

### 10.14.3.3 Operating alarms

#### Overview

#### Alarms

Alarms indicate events and states on the HMI device which have occurred in the plant, in the process or on the HMI device itself. A status is reported when it is received.

An alarm could trigger one of the following alarm events:

- Incoming
- Outgoing
- Acknowledge

The configuration engineer defines which alarms must be acknowledged by the user.

An alarm may contain the following information:

- Date
- Time
- Alarm text
- Event text
- Location of fault
- Status
- Alarm class
- Alarm number
- Alarm group
- Supports diagnostics

#### Alarm classes

Alarms are assigned to various alarm classes. The selection depends on the HMI device.

- "Warnings"  
Alarms of this class usually indicate states of a plant such as "Motor switched on." Alarms in this class do not require acknowledgment.
- "Errors"  
Alarms in this class must always be acknowledged. Alarms normally indicate critical errors within the plant such as "Motor temperature too high".
- "System"  
System alarms indicate states or events which occur on the HMI device. System alarms provide information on occurrences such as operator errors or communication faults.
- "Diagnosis Events"  
SIMATIC diagnostic alarms show states and events in the SIMATIC S7 controllers.

---

**Note**

**Availability for specific devices**

Diagnostic alarms are not available for Basic Panels.

---

- STEP 7 alarm classes  
The alarm classes configured in STEP 7 are also available to the HMI device.
- 

**Note**

**Availability for specific devices**

STEP 7 alarm classes are not available for Basic Panels.

---

- Custom alarm classes  
The properties of this alarm class must be defined in the configuration.

## Alarm buffer

Alarm events are saved to an internal buffer. The size of this alarm buffer depends on the HMI device type.

## Alarm report

When alarm report is enabled in the project, alarm events are output directly to the connected printer.

You can set the reporting function separately for each alarm. The system outputs "Incoming" and "Outgoing" alarm events to the printer.

The output of alarms of the "System" alarm class to a printer must be initiated by means of the corresponding alarm buffer. This outputs the complete content of the alarm buffer to the printer. To be able to initiate this print function, you need to configure a corresponding control object in the project.

---

**Note**

**Availability for specific devices**

Alarm reports are not available for Basic Panels.

---

## Alarm log

Alarm events are stored in an alarm log, provided this log file is configured. The capacity of the log file is limited by the storage medium and system limits.

---

**Note**

**Availability for specific devices**

Alarm logs are not available for Basic Panels.

---

## Alarm view

The alarm view shows selected alarms or alarm events from the alarm buffer or alarm log. Whether alarms have to be acknowledged or not is specified in your configuration. By means of configuration, the display can be filtered in such a way that only alarms that contain a specific character string will be shown.

## Alarm window

If configured, an alarm window shows all pending alarms or alarms awaiting acknowledgment of a particular alarm class. The alarm window is displayed as soon as a new alarm occurs.

You can configure the order in which the alarms are displayed. Either the current alarm or the oldest alarm is displayed. The alarm window can also be set to indicate the exact location of the fault, including the date and time of the alarm event. By means of configuration, the display can be filtered in such a way that only alarms that contain a specific character string will be shown.

## Alarm indicator

The alarm indicator is a graphic icon that is displayed on the screen when an alarm of the specified alarm class is incoming.

The alarm indicator can assume one of two states:

- Flashing: At least one unacknowledged alarm is pending.
- Static: The alarms are acknowledged but at least one of them is not yet deactivated. The number displayed indicates the number of pending alarms.

## Detecting pending alarms

### Introduction

You can recognize the presence of alarms which must be acknowledged by the following:

- For an HMI device with keys: The LED of the key  is lit.
- Depending on the configuration: An alarm indicator is displayed on screen.

The configuration determines whether an alarm has to be acknowledged or not. This is also defined by the alarm class which an alarm belongs to.

### LED in the "ACK" key

An LED is integrated in the  key on HMI devices with keyboard. The LED is lit if there are alarms requiring acknowledgment which must still be acknowledged.

The LED goes out when you acknowledge all alarms requiring acknowledgment.

## Alarm indicator

The alarm indicator is a graphic symbol indicating pending alarms or alarms requiring acknowledgment, depending on the configuration.

Figure 10-11 Alarm indicator with three pending alarms

## Layout

The alarm indicator can assume one of two states:

- **Flashing:**  
The alarm indicator flashes as long as alarms are pending for acknowledgment. The number displayed indicates the number of pending alarms. The project engineer can configure specific functions to be executed by operating the alarm indicator.
- **Static:** The alarms are acknowledged but at least one of them is not yet deactivated.

## Displaying dialogs

The displayed alarm indicator view is covered, for example, by the logon dialog, help dialog or alarm text windows. The alarm indicator is visible once you close these dialogs.

## Viewing alarms

### Alarm view, alarm window

## Use

Alarms are displayed in the alarm view or in the alarm window on the HMI device. The layout and operation of the alarm window corresponds to that of the alarm view.

The alarm window is independent of the process screen. Depending on the configuration, the alarm window appears automatically as soon as a new, unacknowledged alarm has been received. The alarm window can be configured so that it only closes after all the alarms have been acknowledged.

No	Time	Date	Status	Text	
!	1	2:59:51 PM	4/18/2008	I	The value has exceeded the high limit.
!	2	2:59:50 PM	4/18/2008	I	The value exceeds the high limit warning.
!	3	2:59:42 PM	4/18/2008	IO	The value is less than the low warning limit.

## Control elements

The buttons have the following functions:

Button	Function
	Display tooltip for an alarm
	Edit alarms
	Acknowledge alarm

## Layout of the alarm classes

Depending on the configuration, in the alarm view different columns with information regarding an alarm or an alarm event are displayed. If a filter is configured, only alarms that contain a specific character string are displayed in the alarm text.

To differentiate between the different alarm classes, the first column in the alarm view contains an icon:

Icon	Alarm class
!	"Errors"
(empty)	"Warnings"
(depends on the configuration)	Custom alarm classes
\$	"System"
S7	"Diagnosis Events"

## Operation

Depending on the configuration you can:

- Change the column sequence
- Change the order in which the alarms are displayed

- Acknowledge alarms
- Edit alarms

## Runtime behavior

### Linked alarm windows for touch panels

When you configure the alarm window for a keyboard unit, select the property "Modal" under "Properties > Mode". This ensures that the alarm window does not lose its focus during screen changes. This is important, as the switching between the screen and different windows with <Ctrl+TAB> is not supported. If the linked alarm window has the focus, the buttons in the screen behind it cannot be operated. The functions configured on a function key are carried out.

### Changing the order of the displayed alarms

Click in the column to sort the alarms by date and time.

### Simple alarm view, alarm window

#### Use

The simple alarm view shows selected alarms or alarm events from the alarm buffer or alarm log. The layout and operation of the simple alarm window correspond to that of the simple alarm view.

---

#### Note

The "Single alarm view" object cannot be operated dynamically with a script.

In the Engineering System you can dynamically control the visibility of an object, for example, in the "Animations" tab of the Inspector window. In Runtime, the "Simple alarm view" does not support animations. If you have configured an animation and wish to perform a consistency check of the project, for example, then an error alarm is issued in the Output window.

---

#### Layout

Depending on the configuration, in the alarm view different columns with information regarding an alarm or an alarm event are displayed.

To differentiate between the different alarm classes, the first column in the alarm view contains an icon:

Icon	Alarm class
!	"Errors"
(empty)	"Warnings"
(depends on the configuration)	Custom alarm classes
\$	"System"

## Operation

Depending on the configuration you can:

- Acknowledge alarms
- Edit alarms

## Control elements

The buttons have the following functions:

Button	Function
	Acknowledge alarm
	Edit alarm
	Display tooltip for an alarm
	Shows the full text of the selected alarm in a separate window, the alarm text window. In the alarm text window, you can view alarm text that requires more space than is available in the alarm view. Close the alarm text window with  .
	Scrolls one alarm up
	Scrolls one page up in the alarm view
	Scrolls one page down in the alarm view
	Scrolls one alarm down

## Layout of the control elements

On the OP 73micro and TP 177micro HMI devices the simple alarm view has a button that displays the message text in a separate window. This button is not displayed during configuration of the simple alarm view in the Engineering System.

The layout of the buttons for operating the simple alarm view depends on the configured size. You should therefore check on the HMI device whether all required buttons are available.

## Display tooltip for alarm

### Touch and key operation

#### Procedure for touch operation

Proceed as follows to display the info text:

1. Touch the relevant alarm in the alarm view or in the alarm window.  
The alarm is selected.
2. Touch the  button in the simple alarm view or  in the advanced alarm view.  
If configured, the info text assigned to this alarm is displayed.
3. Close the screen for displaying the Info text by means of the  button.

#### Procedure for key operation

Proceed as follows to display the info text:

1. Select the desired alarm in the alarm view.
2. Press the key .
3. Close the info text by pressing the  key.

### Mouse and keyboard operation

#### Procedure for mouse operation

Proceed as follows:

1. Click on the alarm to be edited.
2. Click the  button in the simple alarm view or  in the advanced alarm view.

#### Procedure for keyboard operation

1. Press the <Tab> key until the list of displayed alarms is selected in the alarm view.
2. Click on the alarm to be edited. Use the <Home>, <END>, <Up> and <Down> keys accordingly.
3. Press the <TAB> key until the  button is selected in the simple alarm view or until  is selected in the advanced alarm view.
4. Press <ENTER>.

## Acknowledge alarm

### Touch and key operation

#### Requirement

The alarm to be acknowledged is displayed in the alarm window or the alarm view.

#### Procedure for touch operation

To acknowledge an alarm, proceed as follows:

1. Touch the relevant alarm in the alarm view or in the alarm window.  
The alarm is selected.
2. Touch the  button in the simple alarm view or  in the advanced alarm view.

#### Procedure for key operation

The alarm view and the alarm window have a tab sequence with which you can select operator controls and the last selected alarm using the keyboard.

To acknowledge an alarm, proceed as follows:

1. Select the desired alarm view or alarm window using the  key.
2. Select the desired alarm. Use the , ,  or  keys accordingly.
3. Press the key .

#### Alternative operation

Depending on the configuration, you can also acknowledge an alarm with a function key.

#### Result

The alarm is acknowledged. If the alarm belongs to an alarm group, all the alarms of the associated group are acknowledged.

### Mouse and keyboard operation

#### Procedure for mouse operation

Proceed as follows:

1. Click on the alarm to be edited.
2. Click the  button in the simple alarm view or  in the advanced alarm view.

### Procedure for keyboard operation

Proceed as follows:

1. Press the <Tab> key until the list of displayed alarms is selected in the alarm view.
2. Click on the alarm to be edited. Use the <Home>, <END>, <Up> and <Down> keys accordingly.
3. Press the <Tab> key until the  button is selected in the simple alarm view or until  is selected in the advanced alarm view.
4. Press <Enter>.

### Edit alarm

### Touch and key operation

### Introduction

The configuration engineer can assign additional functions to each alarm. These functions are executed when the alarm is processed.

---

#### Note

When you edit an unacknowledged alarm, it is acknowledged automatically.

---

### Requirement

The alarm to be edited is displayed in the alarm window or the alarm view.

### Procedure for touch operation

Proceed as follows to edit an alarm:

1. Touch the relevant alarm in the alarm view or in the alarm window. The alarm is selected.
2. Touch the  button in the simple alarm view or  in the enhanced alarm view.

### Procedure for key operation

Proceed as follows to edit an alarm:

1. Select the desired alarm view or alarm window with .
2. Select the desired alarm. Use the , ,  or  keys.
3. Continue to press the key  until the button  is selected in the simple alarm view or  in the extended alarm view.
4. Confirm your entry by pressing the key .

## Result

The system executes the additional functions of the alarm. Additional information on this topic may be available in your plant documentation.

## Mouse and keyboard operation

### Procedure for mouse operation

Proceed as follows:

1. Click on the alarm to be edited.
2. Click the  button in the simple alarm view or  in the advanced alarm view.

### Procedure for keyboard operation

Proceed as follows:

1. Press the <Tab> key until the list of displayed alarms is selected in the alarm view.
2. Click on the alarm to be edited. Use the <Home>, <END>, <Up> and <Down> keys accordingly.
3. Press the <Tab> key until the  button is selected in the simple alarm view or until  is selected in the advanced alarm view.
4. Press <Enter>.

## Alternative operation

Depending on the configuration, you can also operate the alarm view via the function keys.

### 10.14.3.4 Basics

## Overview

### Operation options

The hardware determines how you can operate the HMI device:

- Touch screen  
The operating elements shown in the dialogs are touch-sensitive. Touch objects are basically operated in the same way as mechanical keys. You activate operating elements by touching them with your finger. To double-click them, touch an operating element twice in succession.
- HMI device keyboard  
The operating elements shown in the screens are selected and operated using the keys of the HMI device.

- External keyboard
- External mouse

### Operation feedback from operating elements

The HMI device provides optical feedback as soon as it detects that an operating element has been selected. The operating element receives the focus and is selected. This selection is independent of any communication with the PLC. Therefore this selection does not indicate whether the relevant action is actually executed or not.

The configuration engineer can also configure the selection of an operating element so that it deviates from the standard.

### Optical feedback from operating elements

The type of optical feedback depends on the operating element:

- Buttons  
The HMI device outputs different views of the "Pressed" and "Unpressed" states, provided the configuration engineer has configured a 3D effect:

– "Pressed" state:

– "Unpressed" state:

The configuration engineer determines the appearance of a selected field, for example, line width and color for the focus.

- Invisible buttons  
By default, invisible buttons are not displayed as pressed when they are touched. No optical operation feedback is provided in this case.  
The configuration engineer may, however, configure invisible buttons so that their outline appears as lines when touched. This outline remains visible until you select another operating element.
- I/O fields  
When you select an I/O field, the content of the I/O field is displayed against a colored background. With touch operation, a screen keyboard is displayed for the entering of values.

### Direct keys

### Introduction

Direct keys on the HMI device are used to set bits in the I/O area of a SIMATIC S7.

Direct keys enable operations with short reaction times that are, for example, a jog mode requirement.

---

**Note**

Direct keys are still active when the HMI device is in "offline" mode.

---

**Note**

If you operate a function key with direct key functionality in a running project, the direct key function is always executed, independent of the current screen contents.

---

**Note**

You can only use direct keys when there is a connection via PROFIBUS DP or PROFINET IO. Direct keys result in additional basic load on the HMI device.

---

## Direct keys

The following objects can be configured as a direct key:

- Buttons
- Function keys

You can also define image numbers in the case of HMI devices with touch operation. In this way, the project engineer can configure the direct keys on an image-specific basis.

For additional information on configuring direct keys, refer to "WinCC Communication."

## Touch operation

### Overview

#### Screen keyboard

When you touch an operating element requiring entry on the HMI device touch screen, a screen keyboard appears. The screen keyboard is displayed in the following cases:

- An I/O field is selected for input.
- A password must be entered for accessing a password-protected function.

The screen keyboard is automatically hidden again when input is complete.

Based on the configuration of the operating element, the system displays different screen keyboards for entering numerical or alphanumerical values.

---

**Note**

The screen keyboard display is independent of the configured project language.

---

## General procedure

The operating elements of a screen are operated by touching the touch screen.

Proceed as follows:

1. Touch the desired operating element within the screen.
2. Depending on the operating element, perform further actions. Detailed descriptions can be found under the respective operating element.

Examples:

- I/O field: Enter numerical, alphanumeric or symbolic values in the I/O field.
- Symbolic I/O field: Select an entry from the drop down list box.
- Slider control: Move the slider control.

## Procedure for input fields

Values are entered in the project input fields. Based on your configuration, the values are saved to tags and transferred, for example, to the PLC.

Proceed as follows:

1. Touch the desired input field within the screen.

The screen keyboard opens.

Depending on your configuration, you can enter values in the input field in the following manner:

- Numerical values, for example decimal numbers, hexadecimal numbers, binary values
- Alphanumerical values, for example digits and letters
- Date/time

2. Enter the value.

3. Confirm your entry with  or discard your entry using the button .

## Entering and editing numerical values

### Numerical screen keyboard

When you touch an operating element for numerical input on the HMI device touch screen, the numerical screen keyboard appears. This is the case, for example, for an input field. The screen keyboard is automatically hidden again when input is complete.

Figure 10-12 Numerical screen keyboard

---

#### Note

##### Opened screen keyboard

When the screen keyboard is open, PLC job 51, "Select Screen", has no effect.

---

## Display formats for numerical values

You can enter values of the following format type in numerical input fields:

- Decimal
- Hexadecimal
- Binary

## Limit test of numerical values

Tags can be assigned limits. The current limits are indicated in the numerical screen keyboard. If you enter a value that lies outside of this limit, it will not be accepted, for example, 80 with a limit value of 78. In this case the HMI device will deliver a system event, if an alarm window is configured. The original value is displayed again.

## Decimal places for numerical values

The configuration engineer can define the number of decimal places for a numerical input field. The number of decimal places is checked when you enter a value in this type of I/O field.

- Decimal places in excess of the limit are ignored.
- Empty decimal places are filled with "0".

## Procedure

Numerical and hexadecimal values can be entered character-by-character via the buttons on the numerical screen keyboard.

Proceed as follows:

1. Touch the desired operating element within the screen.  
The numerical screen keyboard opens. The existing value is displayed in the screen keyboard and is selected.
2. Enter the value.  
You can only operate keys that are required for entering values. The keys with letters cannot be used, for example, for entering a decimal value. Which keys can be operated can be seen from the appearance of the keys.  
You have the following options to enter a value:
  - The selected value is deleted when you enter the first character. Completely reenter the value.
  - Use the  and  keys to move the cursor within the current value. You can now edit characters of the current value or add characters.  
Use the  key to delete the next character to the left of the cursor. If the value is selected, use this key to delete the selected part of the value.
  - Change the sign of the value using the  key.
  - Use the  key to display the tooltip of the I/O field.  
This key is only enabled if a tooltip was configured for the input object or for the current screen.
3. Use the  key to confirm your entry or cancel it with . Either action closes the screen keyboard.

## Result

You have changed the numerical value or entered a new one.

## Entering and editing alphanumerical values

### Alphanumerical screen keyboard

When you touch an operating element for numerical input on the HMI device touch screen, the alphanumerical screen keyboard appears. This is the case, for example, for an input field. The screen keyboard is automatically hidden again when input is complete.

Figure 10-13 Alphanumerical screen keyboard, normal level

---

#### Note

##### Opened screen keyboard

When the screen keyboard is open, PLC job 51, "Select Screen", has no effect.

##### Language change

Language change in the project has no influence on the alphanumerical screen keyboard. The entry of Cyrillic or Asian characters is therefore not possible.

---

### Keyboard levels

The alphanumerical screen keyboard has various levels.

- Normal level
- Shift level

The key labels change when you change levels with the **Shift** key.

### Procedure

Alphanumerical values can be entered character-by-character via the buttons on the alphanumerical screen keyboard.

Proceed as follows:

1. Touch the desired operating element within the screen.  
The alphanumerical screen keyboard opens. The existing value is displayed in the screen keyboard and is selected.
2. Enter the value.  
You have the following options to enter a value:
  - The selected value is deleted when you enter the first character. Completely reenter the value.
  - Use the  and  keys to move the cursor within the current value. You can now edit characters of the current value or add characters.  
Use the  key to delete the next character to the left of the cursor. If the value is selected, use this key to delete the selected part of the value.
  - Use the  key to toggle between keyboard levels of the screen keyboard. On switchover, the key assignment of the screen keyboard changes.
  - Use the  key to display the tooltip of the I/O field.  
This key is only enabled if a tooltip was configured for the input object or for the current screen.
3. Use the  key to confirm your entry or cancel it with . Either action closes the screen keyboard.

## Result

You have changed the alphanumeric value or entered a new one.

## Display tooltip for touch control

### Purpose

The configuration engineer uses tooltips to provide additional information and operating instructions. The configuration engineer can configure tooltips for screens and operating elements.

The tooltip of an I/O field may, for example, contain information about the value to be entered.

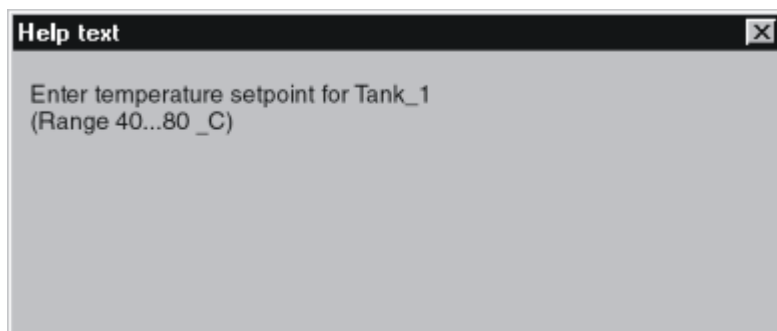

Figure 10-14 Tooltip for an I/O field, example

## Opening tooltips for operating elements

1. Touch the required operating element.  
The screen keyboard opens. The representation of the  key indicates whether a tooltip was configured for the operating element or for the current screen.
2. Touch the  key of the on-screen keyboard.  
The tooltip for the operating element is displayed. If there is no tooltip for the selected screen object, the tooltip for the current screen is displayed if it has been configured.  
You can scroll through the contents of long tooltips using the  and  buttons.

---

### Note

#### Switching between displayed tooltips

The configuration engineer can configure a tooltip for an I/O field and the associated screen. You can switch between two tooltips by touching the tooltip window.

---

3. Close the displayed tooltip by pressing .

## Alternative procedure

Depending on your configuration, tooltips can also be called via a configured operating element.

Additional information on this topic may be available in your plant documentation.

## Key operation

## Control keys

## Introduction

The following tables list the control keys available to operate the project. For detailed information, refer to the description of the individual operating elements.

---

### Note

The availability of system keys is determined by the HMI device used.

---

### Selecting operating elements

Key	Function	Description
 	Tabulator	Selects the next or previous operating element based on the configured tab sequence.
   	Cursor keys	Selects the next operating element on the left, right, above or below the current screen object. Navigates in the operating element.

### Operating operating elements

Key	Function	Description
   	Positioning cursor	Positions the cursor within an operating element, for example, in an I/O field.
	Scrolling back	Scrolls the list back by one page.
	Scroll to start	Scrolls to the start page of a list.
	Scrolling up	Scrolls the list up by one page.
	Scroll to end	Scrolls to the end of a list.
	ENTER key	<ul style="list-style-type: none"> <li>Controls buttons.</li> <li>Applies and ends an entry.</li> <li>Opens a selection list.</li> <li>Toggles between character mode and standard mode within an input field.</li> </ul> A single character is selected in character mode. In this mode, you can scroll within the character set using the cursor keys.
	Cancel	<ul style="list-style-type: none"> <li>Deletes the input characters of a value and restores the original value.</li> <li>Closes the active dialog.</li> </ul>
	Delete characters	Deletes the next character to the right of the current cursor position.
	Delete characters	Deletes the character to the left of the current cursor position.
	Open selection list	Opens a selection list.
	Accept value	Accepts the value selected in the selection list without closing the list.

## Enter hotkey

Key	Function	Purpose
	Toggle (numbers/letters)	<p>Toggles the assignment from numbers to letters.</p> <ul style="list-style-type: none"> <li>No LED is lit: The number assignment is enabled. Pressing the key once switches to letter assignment.</li> <li>An LED is lit: The left or right letter assignment is enabled.</li> </ul> <p>Each time the key is pressed, the system toggles between the left letter assignment, the right letter assignment and the number assignment.</p>
	Shift (upper/lower case)	Use in hotkeys, for example, for switching to uppercase letters.
	Toggle to additional keyboard layout	Some of the keys contain a blue special character on their bottom left corner, for example, the "%" character. To input these characters, press the relevant key in combination with the special character key shown on the left.
	General control function	Used in hotkeys, for example, for navigating trend views.
	General control function	Used in hotkeys, for example, for the "Status/Force" screen object.

## Acknowledge alarms

Key	Function	Purpose
	Acknowledge	<p>Acknowledges the currently displayed error alarm or all alarms of an alarm group (group acknowledgment).</p> <p>The LED is lit as long as an unacknowledged alarm is active.</p>

## Displaying infotext

Key	Function	Description
	Display tooltip	Opens the configured tooltip for the selected object, for example, alarm or I/O field. The LED is lit if a tooltip is available for the selected object.

## Function keys

### Function keys

Function key assignment is defined during configuration. The configuration engineer can assign function keys globally and locally.

### Function keys with global function assignment

A globally assigned function key always triggers the same action on the HMI device or in the PLC irrespective of the screen displayed. Such an action could be, for example, the activation of a screen or the closure of an alarm window.

### Function keys with local function assignment

A function key with local function assignment is screen-specific and is therefore only effective within the active screen.

The function assigned locally to a function key can vary from screen to screen.

The function key of a screen can be assigned one function only, either a global or local one. The local assignment function takes priority over the global setting.

The configuration engineer can assign function keys in such a way that you can operate operating elements with function keys, for example, the alarm view, trend view, recipe view or status / force.

## General procedures

### Introduction

The control keys and function keys of the HMI device are available for key operation.

### General procedure

The operating elements of a screen are operated using the control keys of the HMI device.

Proceed as follows:

1. Continue pressing the  key or the cursor keys until the required operating element is selected in the screen.
2. Depending on the operating element, perform further actions. Detailed descriptions can be found under the respective operating element.  
Examples:
  - I/O field: Enter numerical, alphanumeric or symbolic values in the I/O field.
  - Slider control: Move the slider control.
3. Confirm your entry with  or cancel it with .

## Entering and editing numerical values

### Display formats for numerical values

You can enter values of the following format type in numerical input fields:

- Decimal
- Hexadecimal
- Binary

### Limit test of numerical values

Tags can be assigned limits. If you enter a value that lies outside of this limit, it will not be accepted, for example, 80 with a limit value of 78. In this case the HMI device will deliver a system event, if an alarm window is configured. The original value is displayed again.

### Procedure

Numerical and hexadecimal values can be entered in character mode using the system keys.

Proceed as follows:

1. Select the input field within the screen using the  key.  
The existing value is selected in the input field.
2. Enter the value using the numerical keypad.  
You have the following options to enter a value:
  - The existing value is deleted when you enter the first character. Completely reenter the value.
  - Press  and a cursor key simultaneously. This step cancels the field content selection. Move the cursor in the existing value. You can now edit the characters of the current value or add characters.  
The  key deletes the next character to the right of the cursor. Use the  key to delete the next character to the left of the cursor.  
To enter the hexadecimal characters "A" to "F", switch the numerical keypad to alphabet mode using the  key.
  - The lit LED of the  key indicates that a tooltip is available for the selected object or the active screen.  
Use the key  to view the tooltip for the operating element or active screen.
3. Confirm your entry with the  key.

### Result

You have changed the numerical value or entered a new one.

## Entering and editing alphanumerical values

### Procedure

Alphanumerical values can be entered in character mode using the system keys.

Proceed as follows:

1. Select the input field within the screen using the  key.  
The existing value is selected in the input field.
2. Enter the value using the system keys.  
You have the following options to enter a value:
  - The existing value is deleted when you enter the first character. Completely reenter the value.
  - Press  and a cursor key simultaneously. This step cancels the field content selection. Move the cursor in the existing value. You can now edit the characters of the current value or add characters.  
The  key deletes the next character to the right of the cursor. Use the  key to delete the next character to the left of the cursor.  
Switch the numerical keypad to alphabet mode using the  key to enter letters.
  - The lit LED of the  key indicates that a tooltip is available for the selected object or the active screen.  
Use the key  to view the tooltip for the operating element or active screen.
3. Confirm your entry with the  key.

### Result

You have changed the alphanumeric value or entered a new one.

### Enter characters using the alphanumeric keyboard

Using the same keys of the alphanumeric keyboard you can enter up to six different characters. The entry result depends on the combination of the keys pressed.

The values "5", "m", "N", "M" and "%" are entered using the same key  of the keyboard. Use the keys ,  and  to select the key mode.

The following table shows the entry options using the key .

Key 	Key 	Key 	Result
No LED is lit.	Not pressed	Not pressed	5
Left LED is illuminated.	Not pressed	Not pressed	m
Left LED is illuminated.	Pressed	Not pressed	M
Right LED is illuminated.	Not pressed	Not pressed	n
Right LED is illuminated.	Pressed	Not pressed	N
Not relevant	Not relevant	Pressed	%

## Display tooltip for key operation

### Use

The configuration engineer uses tooltips to provide additional information and operating instructions. The configuration engineer can configure tooltips for screens and operating elements.

The tooltip of an I/O field may, for example, contain information about the value to be entered.

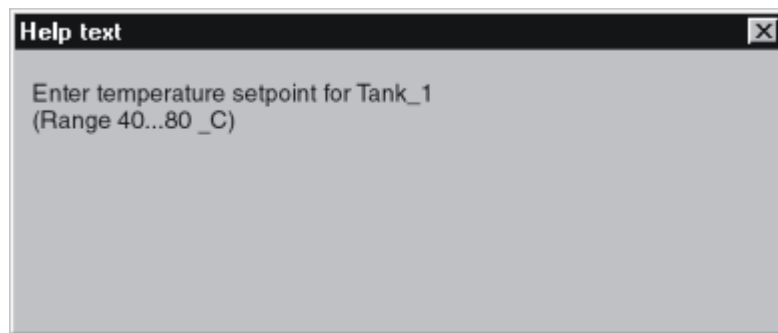

Figure 10-15 Tooltip for an I/O field, example

The lit LED of the  key indicates that a tooltip was configured for the selected screen object or for the active screen.

### Procedure

Proceed as follows:

1. Press the  key.  
The tooltip for the selected screen object is displayed. If there is no tooltip for the selected screen object, the tooltip for the current screen is displayed if it has been configured. You can scroll the contents of longer tooltips using the cursor keys  and .

---

#### Note

##### Switching between displayed infotext

The configuration engineer can configure a tooltip for an I/O field and the associated screen. You can switch between two tooltips by pressing the  key.

---

2. Close the tooltip by pressing the  key.

### Alternative procedure

Depending on your configuration, tooltips can also be opened with a function key or via an existing operating element.

Additional information on this topic may be available in your plant documentation.

## Mouse and keyboard operation

### Operation with the keyboard

The navigation options listed in the table can be used for keyboard operations in a screen.

Navigation	PC	SIMATIC Panel PC
Next field right/left	<Shift+Right> / <Shift+Left>	<Right> / <Left>
Next field up/down	<Shift+Down> / <Shift+Up>	<Down> / <Up>
To the right/left in the field	<Right> / <Left>	<Shift+Right> / <Shift+Left>

The other keys have identical functions on the PC and the SIMATIC Panel PC:

Key	Function
<Enter>	Applies a value (e.g. in unmarked input fields) or opens a selection list.  If the I/O field is marked (highlighted in color), WinCC Runtime will switch to the special editing mode. Only one character at any time is marked in the field.  Use the cursor keys <Up>/<Down> to scroll through a character table.  Use the cursor keys Right/Left to move the cursor to the next or previous entry position.  Press <Enter> or <Esc> to exit from the entry mode. The characters entered up to this point will be either applied or discarded.
<Esc>	Interrupts the input.
<Tab>	Selects the next available screen object in the configured tab sequence.
<Shift+Tab>	Selects the previously available screen object in the configured tab sequence.
<F1> -... <F12>, <Shift+F1>, ..., <Shift+F12>	On the PC: Triggers a function, e.g. screen selection.
<F1>, ... or <S1>, ... or <K1>, ...	On the SIMATIC Panel PC: triggers a global or local function.

### CAUTION

If you press a function key after a screen change, the associated function in the new screen may be triggered before the new screen is fully displayed.

## Controlling Windows with the keyboard

You may also use the keyboard to control the operating system of your HMI device. See your Windows manual for detailed information. The most important key combinations for SIMATIC Panel PCs are listed in the following table.

Navigation	HMI device
Open start menu	<Ctrl+Esc>
Show the shortcut menu of the selected element	<Shift+F10>
Select all	<Ctrl+A>
Display properties of the selected element	<Ctrl+Enter>
Explorer:	
Change folder	<F4>
Change display areas	<F6>
Enable menu bar	<F10>
Dialogs:	
Go to next field	<Tab>
Back to previous field	<Shift+Tab>
Open next tab	<Ctrl+Tab>
Open previous tab	<Ctrl+Shift+Tab>

## Operation with the mouse

A lightning symbol attached to the mouse pointer indicates that the screen object, for example a switch, may be operated with the mouse.

### Note

If a screen object is covered by another, e.g. a button from a rectangle with a transparent fill, it is not possible to operate with the mouse in runtime.

The screen object can be operated with the keyboard.

### 10.14.3.5 Project security

#### Overview

#### Design of the security system

The configuration engineer can protect the operation of a project by implementing a security system.

The security system is based on authorizations, user groups and users.

If you use an operator control with access protection, the HMI device first requests that you log on. A logon screen is displayed in which you enter your user name and password. After logging on, you can operate the operator controls for which you have the necessary authorizations.

The logon dialog can be set up by the configuration engineer via an individual operator control.

In the same way, the configuration engineer can set up an operator control to log off. After logging off, objects assigned access protection can no longer be operated; to do so, log on again.

#### User groups and authorizations

Project-specific user groups are created by the configuration engineer. The "Administrators" and "Users" groups are included in all projects by default. User groups are assigned authorizations. Authorization required for an operation is specifically defined for each individual object and function in the project.

#### Users and passwords

Each user is assigned to exactly one user group.

The following people are allowed to create users and assign them passwords:

- The configuration engineer during configuration
- The administrator on the HMI device
- A user with user administration authorization on the HMI device

Irrespective of the user group, each user is allowed to change his own password.

#### Logoff times

A logoff time is specified in the system for each user. If the time between any two user actions, such as entering a value or changing screens, exceeds this logoff time, the user is automatically logged off. The user must then log on again to continue to operate objects assigned access protection.

## Backup and restore

The user data is encrypted and saved on the HMI device to protect it from loss due to power failure.

The users, passwords, group assignments and logoff times set up on the HMI device can be backed up and restored. This prevents you having to enter all of the data again on another HMI device.

---

### Note

The currently valid user data is overwritten in the following cases:

- Depending on settings for a new download of the project.
  - Upon restore of a backed-up project
  - Upon import of the user administration via an operator control. The newly downloaded or restored user data and passwords take effect immediately.
- 

## Displaying users

### User view

### Use

The user view is used by the administrator to manage user accounts, group assignments and user passwords.

Users can change their passwords and logoff times.

User	Password	Group	Logoff time
Administrator	*****	Administrator gr...	5
PLC User	*****	Unauthorized	5
User_2	*****	Users	5

### Layout

The user view contains four columns for the user, password, group and logoff time. The passwords are encrypted by means of asterisks.

- All users on the HMI device are displayed in the User view to the administrator or to a user with administrator authorizations.
- When user administration authorization is lacking, only the personal user entry is displayed.

## Operation

Depending on the configuration you can:

- Manage users, e.g. create, delete.
- Change existing user data.
- Export or import user data.

---

### Note

On an HMI device the number is limited to 100 users and one PLC user. This restriction does not apply to PCs. On a PC, the maximum number of users is restricted by the physical memory.

---

## Runtime behavior

The user view on the HMI devices OP 73, OP 77A and TP 177A also displays the "PLC User" with administrator privileges who is logged on in Runtime.

## Changing existing user data

The following options are available for the changes that can be made:

- The administrator or a user with user administration authorization can change the data for all users on the HMI device system in the user view.
  - User name
  - Group assignment
  - Password
  - Logoff times
- A user without user administration authorization can only change their own user data:
  - Password
  - Logoff time

---

### Note

If you enter the value "0" in the logoff time, user is not logged off automatically.

---

## Export or import user data

A user view contains all users, passwords, group assignments and logoff times set up on the HMI device. To not have to enter all data again on another HMI device, you can export the

user view and then import it to another device. But you can only do this if this function has been configured.

---

**Note**

Do not export the password list immediately after changing it. Exit the "User view" object after making changes and wait until the changes have been written to the internal Flash memory before performing the export.

---

**Note**

The currently valid user data are overwritten during an import. The imported user data and passwords are valid immediately.

---

## Simple user view

### Use

On HMI devices with a small display, the simple user view is used to display users on the HMI device.

Administrator	Administrator group	▲
Foreman	Users	▲
Miller	Programmer	
PLC User	Unauthorized	
Smith	Users	
<New user >		▼
		▼

---

**Note**

The "Simple user view" object cannot be operated dynamically with a script.

---

## Layout

The appearance depends on the authorizations.

- All users on the HMI device are displayed in the User view to the administrator or to a user with administrator authorizations.
- When user administration authorization is lacking, only the personal user entry is displayed.

## Operation

Depending on the configuration you can:

- Manage users, e.g. create, delete.
- Change existing user data.
- Export or import user data.

---

### Note

On an HMI device the number is limited to 100 users and one PLC user. This restriction does not apply to PCs. On a PC, the maximum number of users is restricted by the physical memory.

---

## User logon

## Touch and key operation

## Logon dialog

Use the logon dialog to log on to the security system of the HMI device. Enter your user name and password in the logon dialog.

The logon dialog opens in the following cases:

- You use an operator control with access protection.
- You press an operator control that was configured for displaying the logon dialog.
- You enable the "<ENTER>" entry in the simple user view.
- You enable a blank entry in the extended user view.
- The logon dialog will be automatically displayed when the project is started, depending on the configuration.

## Requirement

The logon dialog is open.

### Procedure for touch operation

Proceed as follows:

1. Enter the user name and password.  
Touch the corresponding input field. The alphanumerical screen keyboard is displayed.
2. Select "OK" to confirm logon.

### Procedure for key operation

Proceed as follows:

1. Select the "User" input field within the logon dialog by pressing the  key.
2. Enter the user name using the system keys.  
Switch the numerical keypad to alphabet mode using the  key to enter letters.
3. Use the  key to select the "Password" input field.
4. Enter the password using the system keys.
5. Confirm your entries with "OK".

---

#### Note

The user name is not case sensitive.

The password is case sensitive.

---

### Result

After successful logon to the security system, you can execute functions on the HMI device which are access protected and for which you have authorization.

An alarm is output if an incorrect password has been entered and if an alarm view was configured.

### Mouse and keyboard operation

#### Requirement

The logon dialog is open.

#### Procedure for mouse operation

Proceed as follows:

1. Click in the input field. The alphanumerical on-screen keyboard is displayed.
2. Enter the user name and the password.
3. Click "OK" in the logon dialog.

### Procedure for keyboard operation

Proceed as follows:

1. Press the <Tab> key until the "Users" input field is selected.
2. Enter the user name and the password.
3. Confirm your entries with "ENTER."

---

#### Note

The user name is not case-sensitive.

The password is case-sensitive.

---

### Result

After successful logon to the security system, you can execute functions on the HMI device which are access protected and for which you have authorization.

An alarm is output if an incorrect password has been entered and if an alarm view was configured.

### User logoff

### Requirement

You have logged into the security system of the HMI device.

### Procedure

You have the following options for logging off:

- You press an operator control that was configured for logoff.
- You will be logged off automatically if you are not operating the project and if the logoff time has been exceeded.

You will also be automatically logged off if you enter an incorrect password.

### Result

You are no longer logged into the project. In order to use an operator control with access protection, you first have to log on again.

## Creating users

## Touch operation

## Requirement

- The user view is open.
- You are either authorized for user administration or you are an administrator.
- A user group has been created.

---

### Note

Runtime users must be assigned to a user group. The user group is created in the Engineering System. The designation of the user group is language-dependent.

---

### Note

The following characters cannot be used in passwords:

- Blanks
  - Special characters \* ? . % / \ ' "
- 

## Creating users in the simple user view

Proceed as follows:

1. Click the "<New user>" entry in the user view. A dialog opens.

The image shows a dialog box for creating a user. It has a blue title bar with a close button (X). The dialog contains the following fields and controls:

- User:** A text input field.
- Password:** A text input field.
- Group:** A dropdown menu with 'Administrator group' selected.
- Logoff time:** A text input field with the value '5'.
- Buttons:** 'OK' and 'Cancel' buttons at the bottom.

2. Enter the desired user name and password.  
Touch the corresponding text box. The alphanumerical on-screen keyboard is displayed.
3. Click on the text box of the group. A dialog opens.
4. Assign the user to a group. Select ▲ and ▼ to scroll the selection list.
5. Touch the required entry in the drop down list box.  
The selected entry is accepted as input.
6. Touch the text box "Logoff time". The on-screen keyboard is displayed.
7. Enter a logoff time between 0 and 60 minutes. The value 0 stands for "no automatic logoff."
8. Confirm your entries with "OK."

## Result

The new user is created.

## Key operation

## Requirement

- The user view is open.
- You are either authorized for user administration or you are an administrator.
- A user group has been created.

---

### Note

Runtime users must be assigned to a user group. The user group is set up in the Engineering System. The user group name is language-specific.

---

### Note

The following characters cannot be used in passwords:

- Blanks
  - Special characters \* ? . % / \ ' "
- 

## Creating users in the simple user view

Proceed as follows:

1. Select the user view using the key  or using the cursor keys.
2. Select the entry "<New user>" in the user view with the cursor keys and confirm with .

The following dialog opens:

3. Enter the desired user name using the system keys.
4. Select the next text box with the  key and enter a password using the system keys.

5. Confirm your entries with "OK."

The following dialog opens:

6. Select the "Group" selection box with .
7. Assign the user to a group.
  - Select to open the drop down list box. The drop down list box opens.
  - Select the required entry using or .
  - Confirm your entry by pressing the key .
8. Select the text box "Logoff time" with .
9. Enter the desired logoff time using the system keys.  
Enter a logoff time between 0 and 60 minutes. The value 0 stands for "no automatic logoff."
10. Confirm your entries with "OK."

## Creating users in the advanced user view

Proceed as follows:

1. Select the user view with the key via the configured tab order.
2. Select a blank line with the or keys.
3. Select the desired field in the blank line of the user view with the or keys.
4. Confirm your entry by pressing the key .
5. Enter the desired user data:
  - Enter the data using the system keyboard. To enter letters, switch the numerical keypad to letter assignment using the key .
  - Assign the user to one of the groups from the drop down list box. Open the drop down list box with the key and select the desired entry with the or keys.
  - Enter a logoff time between 0 and 60 minutes. The value 0 stands for "no automatic logoff."
6. Confirm your entry by pressing the key .

## Result

The new user is created.

## Operation with the mouse

### Requirement

- The user view is open.
- You are either authorized for user administration or you are an administrator.
- A user group has been created.

---

#### Note

Runtime users must be assigned to a user group. The user group is set up in the Engineering System. The user group name is language-specific.

---

#### Note

The following characters cannot be used in passwords:

- Blanks
  - Special characters \* ? . % / \ ' "
- 

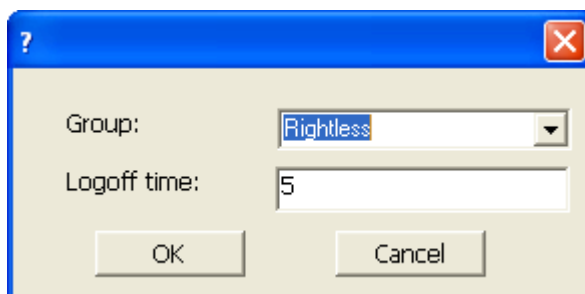

### Creating users in the simple user view

Proceed as follows:

1. Click the "<New User>" entry in the user view.  
The following dialog opens:

2. Enter the desired user name and password.  
Click in the corresponding input field. The alphanumerical on-screen keyboard is displayed.
3. Click "OK".  
The following dialog opens:

4. Assign the user to a group.
5. Click the required entry in the selection list.  
The selected entry is accepted as input.

6. Click in the "Logoff time" input field. The on-screen keyboard is displayed.
7. Enter a logoff time between 0 and 60 minutes. The value 0 stands for "no automatic logoff."
8. Confirm your entries with "OK."

### Creating users in the advanced user view

Proceed as follows:

1. Double-click the desired field in the blank line of the user view.  
The corresponding on-screen keyboard is displayed.
2. Enter the respective user data in the field:
  - Assign the user to one of the groups from the drop down list box.
  - Enter a logoff time between 0 and 60 minutes. The value 0 stands for "no automatic logoff."

### Result

The new user is created.

### Operation with the keyboard

### Requirement

- The user view is open.
- You are either authorized for user administration or you are an administrator.
- A user group has been created.

---

#### Note

Runtime users must be assigned to a user group. The user group is set up in the Engineering System. The user group name is language-specific.

---

#### Note

The following characters cannot be used in passwords:

- Blanks
  - Special characters \* ? . % / \ ' "
-

### Creating users in the simple user view

Proceed as follows:

1. Press the <TAB> key until the user view is selected.
2. Select the "<New user>" entry in the user view using the cursor keys and confirm it with <ENTER>.

The following dialog opens:

3. Enter the user name.
4. Press the <Tab> key to move to the next input field and enter a password.
5. Confirm your entries with <ENTER>.

The following dialog opens:

6. Select the "Group" selection list using the <TAB> key.
7. Assign the user to a group.
  - Press <ENTER> to open the selection list. The drop down list box opens.
  - Select the entry. Use the <Home>, <End>, <Up> and <Down> keys accordingly.
  - Confirm the selection with <ENTER>.
8. Change to the "Logoff time" input field using the <TAB> key.
9. Enter the desired logoff time.  
Enter a logoff time between 0 and 60 minutes. The value 0 stands for "no automatic logoff."
10. Confirm your entries with <ENTER>.

### Creating users in the advanced user view

Proceed as follows:

1. Press the <TAB> key until the user view is selected.
2. Select an empty line in the user view using the cursor keys.
3. Select the desired field in the empty line of the user view. Use the <Up> and <Down> keys accordingly.
4. Confirm the selection with <ENTER>.

5. Enter the desired user data:
  - Enter the user name and the password.
  - Assign the user to one of the groups from the drop down list box. Open the selection list by pressing <ENTER> and then select the entry using the <Up> and <Down> cursor keys.
  - Enter a logoff time between 0 and 60 minutes. The value 0 stands for "no automatic logoff."
6. Confirm your entries with <ENTER>.

## Result

The new user is created.

## Changing user data

## Key operation

## Requirement

The user view is open.

Your authorization level determines the data you can edit:

- You are an administrator or a user with user administration authorization. In these cases you are allowed to change the data for all the users on the HMI device in the user view:
  - User name
  - Group assignment
  - Password
  - Logoff time
- You are a user without user administration authorization. In this case you are only allowed to change your personal user data:
  - Password
  - Logoff time, if configured

---

**Note**

You can only change the logoff time and password for the "Admin" user.

You can only change the logoff time for the "PLC\_User". This user is used for logging on via the PLC.

---

**Note**

Changes in the user view are effective immediately in Runtime. Changes in Runtime are not updated in the Engineering System.

When the user management is downloaded to the HMI device, all changes in the user view are overwritten.

---

### Changing user data in the simple user view

Proceed as follows:

1. Confirm your entry by pressing the key .
2. In the user view, use the cursor keys to select the user whose user data you want to change. Confirm your entry by pressing the key .
3. When entering the data, use exactly the same procedure as for creating a user.

### Changing user data in the advanced user view

Proceed as follows:

1. Confirm your entry by pressing the key .
2. Use the cursor keys to select the field in which you want to change data. Confirm your entry by pressing the key .
3. When entering the data, use exactly the same procedure as for creating a user.

### Result

User data have been changed.

## Touch operation

### Requirement

The user view is open.

Your authorization level determines the data you can change:

- You are an administrator or a user with user administration authorization. In these cases you are allowed to change the data for all the users on the HMI device in the user view:
  - User name
  - Group assignment
  - Password
  - Logoff time
- You are a user without user management authorization. In this case you are only allowed to change your personal user data:
  - Password
  - Logoff time, if configured

---

#### Note

You can only change the logoff time and password for the "Admin" user.

You can only change the logoff time for the "PLC\_User". This user is used for logging on via the PLC.

---

#### Note

Changes in the user view are effective immediately in Runtime. Changes in Runtime are not updated in the Engineering System.

When the user management is downloaded to the HMI device, all changes in the user view are overwritten.

---

### Changing user data in the simple user view

Proceed as follows:

1. In the user view, touch the user whose user data you want to change.
2. When entering the data, use exactly the same procedure as for creating a user.

### Changing user data in the advanced user view

Proceed as follows:

1. In the user view, touch the user whose user data you want to change.
2. When entering the data, use exactly the same procedure as for creating a user.

## Result

User data have been changed.

## Mouse and keyboard operation

### Requirement

- The user view is open.
- You are either authorized for user administration or you are an administrator.

---

#### Note

Changes in the user view are effective immediately in Runtime. Changes in Runtime are not updated in the Engineering System.

When the user management is downloaded to the HMI device, all changes in the user view are overwritten.

---

### Procedure for mouse operation

Proceed as follows:

1. Click the user to be deleted in the user view.
2. Delete the user name.

### Procedure for keyboard operation

Proceed as follows:

1. Select the user view using the <TAB> key or the cursor keys.
2. Select the user in the user view by means of cursor keys.
3. Press <DEL> to delete the user.

## Result

The user has been deleted and may no longer log onto the project.

## Deleting users

### Touch and key operation

#### Requirement

- You have opened a screen that contains the user view.
- You must be logged on with administrator rights or be authorized for user management to delete users.

---

#### Note

Changes in the user view are effective immediately in Runtime. Changes in Runtime are not updated in the Engineering System.

When the user management is downloaded to the HMI device, all changes in the user view are overwritten.

---

#### Procedure for touch operation

Proceed as follows:

1. Touch the user to be deleted in the user view.
2. Delete the user name.

#### Procedure for key operation

Proceed as follows:

1. Select the user view using the  key or the cursor keys.
2. Select the user in the user view by means of cursor keys.
3. Press  to delete the user.

#### Result

The user has been deleted and may no longer log onto the project.

## Mouse and keyboard operation

### Requirement

- The user view is open.
- You are either authorized for user administration or you are an administrator.

---

#### Note

Changes in the user view are effective immediately in Runtime. Changes in Runtime are not updated in the Engineering System.

When the user management is downloaded to the HMI device, all changes in the user view are overwritten.

---

### Procedure for mouse operation

Proceed as follows:

1. Click the user to be deleted in the user view.
2. Delete the user name.

### Procedure for keyboard operation

Proceed as follows:

1. Select the user view using the <TAB> key or the cursor keys.
2. Select the user in the user view by means of cursor keys.
3. Press <DEL> to delete the user.

### Result

The user has been deleted and may no longer log onto the project.

## 10.15 Performance features

### 10.15.1 Engineering system

#### Engineering system

The following tables help you assess whether your project still meets the performance specifications of the engineering system.

In addition to the specified limits, allowances must also be made for restrictions imposed by main memory resources. WinCC uses up to 2 GB of RAM, depending on the operating system.

It is nonetheless useful to install more than 2 GB of main memory on the PC if running many applications with high memory requirements in parallel.

### Project system limits

Different system limits apply for the engineering system, depending on whether a 32-bit or 64-bit operating system is used.

	32-bit operating system	64-bit operating system
Number of HMI devices in the project	20	40
Number of HMI tags <sup>1)</sup>	80,000	260,000
Number of logging tags	8,000	20,000
Number of blocks (faceplates, user data types) <sup>3)</sup>	10,000	20,000
Number of screens	3,000	6,000
Number of screen objects per screen	3,200	3,200
Number of screen objects	320,000	640,000
Number of alarms <sup>2) 3)</sup>	20,000	60,000
Number of texts <sup>3)</sup>	300,000	600,000
Number of text lists and graphic lists <sup>3)</sup>	10,000	20,000
Number of entries per text list	3,000	3,000
Number of languages	32	32
Number of global libraries <sup>3)</sup>	20	20
Number of objects in the project library <sup>3)</sup>	300,000	800,000

- 1) Including logging tags.
- 2) With an average of 3 texts and a dynamic parameter
- 3) Including the objects configured in the "Program PLC" area

### WinCC system limits for an HMI device

	32-bit operating system	64-bit operating system
Number of HMI tags <sup>1)</sup>	80,000	260,000
Number of logging tags	8,000	20,000
Number of logs	500	1,000
Number of screens	1000	2,000
Number of screen objects per screen	3,200	3,200
Number of screen objects	320,000	640,000
Number of function lists	30,000	60,000
Number of animations and local scripts	50,000	100,000
Number of user-defined functions	1,000	2,000
Number of tasks	500	1,000
Number of alarms <sup>2)</sup>	20,000	60,000

	32-bit operating system	64-bit operating system
Number of recipes	1,000	2,000
Number of recipe elements	10,000	20,000
Number of texts	300,000	600,000
Number of text lists and graphic lists	1,000	2,000
Number of entries per text list	5,000	10,000
Number of users	200	200
Number of reports	300	600

- 1) Including logging tags.
- 2) With an average of 3 texts and a dynamic parameter

### System limits during migration

You can migrate projects which are beyond the specified system limits in one or more areas.

An alarm will be output if migration creates a project whose limits are beyond the specified system limits. You must then adapt the project after migration to within the specified system limits to ensure safe operation in WinCC.

### 10.15.4 Panel

#### Introduction

The following tables of system limits help you assess whether your project conforms to the system limits of a given HMI device.

The specified maximum values are not additive. It cannot be guaranteed that configurations running on the devices at the full system limits will be functional.

In addition to the specified limits, allowances must be made for restrictions imposed by configuration memory resources.

## Tags

	OP 73	OP 77A	OP 77B	TP 177A	TP 177B OP 177B	TP 277 OP 277

## 10.15.5 Mobile Panel

### Mobile Panel

The following tables of system limits help you assess whether your project conforms to the system limits of a given HMI device.

The specified maximum values are not additive. It cannot be guaranteed that configurations running on the devices at the full system limits will be functional.

In addition to the specified limits, allowances must be made for restrictions imposed by configuration memory resources.

## 10.15.7 Comfort Panel

### Comfort Panel

The following tables of system limits help you assess whether your project conforms to the system limits of a given HMI device.

The specified maximum values are not additive. It cannot be guaranteed that configurations running on the devices at the full system limits will be functional.

In addition to the specified limits, allowances must be made for restrictions imposed by configuration memory resources.

---

#### **Note**

##### **Graphic objects on Comfort Panels**

The use of 32-bit graphic objects increases memory requirements for the project file on Comfort Panels.

The use of jpeg graphic objects reduces memory requirements for the project file on Comfort Panels.

---

Number of screens	500	750
Number of fields per screen	400	600

	WinCC Runtime Advanced Device version prior to 13	WinCC Runtime Advanced Device version as of 13
Number of tags per screen	400	400
Number of complex objects per screen <sup>1)</sup>	40	40

- 1) Complex objects include: Bars, sliders, symbol library, clock, and all objects from the Controls area.

## Recipes

	WinCC Runtime Advanced Device version prior to 13	WinCC Runtime Advanced Device version as of 13
Number of recipes	999	1000
Number of elements per recipe <sup>1)</sup>	2000	2000
User data length in KB per data record	256	512
Number of data records per recipe	5000	5000
Reserved memory for data records in the internal Flash	--	--

- 1) If arrays are used, each array element counts as one recipe element

## Logs

	WinCC Runtime Advanced Device version prior to 13	WinCC Runtime Advanced Device version as of 13
Number of logs	100	100
Number of entries per log (including all log segments) <sup>1)</sup>	500000	500000
Number of log segments	400	400
Cyclic trigger for tag logging	1 s	1 s
Number of tags that can be logged per log	6144	12288

- 1) The number of entries for the "segmented circular log" logging method is the total number for all sequential logs. The product of the number of sequential logs and the number of data records per sequential log may not exceed the system limit

## Trends

	WinCC Runtime Advanced Device version prior to 13	WinCC Runtime Advanced Device version as of 13
Number of trends	800	800

### Text lists and graphics lists

	WinCC Runtime Advanced Device version prior to 13	WinCC Runtime Advanced Device version as of 13
Number of graphics lists	500	500
Number of text lists	500	500
Number of entries per text or graphics list	3500	500
Number of graphic objects	2000	4000
Number of text elements	30000	40000

### Scripts

	WinCC Runtime Advanced Device version prior to 13	WinCC Runtime Advanced Device version as of 13
Number of scripts	200	200

### Communication

	WinCC Runtime Advanced Device version prior to 13	WinCC Runtime Advanced Device version as of 13
Number of connections	8	8
Number of OPC connections including OPC UA	8	8
Number of connections based on "SIMATIC HMI HTTP"	16	16
Maximum number of connected Sm@rtClients (including a service client)	4 <sup>1)</sup>	4 <sup>1)</sup>

### Help system

	KTP400 KP400	TP700, KP700 TP900, KP900 TP1200, KP1200	TP1500 KP1500	TP1900	TP2200
Number of characters in a help text	320 <sup>1)</sup> 500 <sup>2)</sup>	320 <sup>1)</sup> 500 <sup>2)</sup>	320 <sup>1)</sup> 500 <sup>2)</sup>	320 <sup>1)</sup> 500 <sup>2)</sup>	320 <sup>1)</sup> 500 <sup>2)</sup>

- 1) For devices with HMI device version 12 or lower
- 2) For devices with HMI device version higher than 12

## Languages

	WinCC Runtime Advanced Device version prior to 13	WinCC Runtime Advanced Device version as of 13
Number of runtime languages	32	32

## Scheduler

	WinCC Runtime Advanced Device version prior to 13	WinCC Runtime Advanced Device version as of 13
Time-triggered tasks <sup>1)</sup>	48	48

- 1) Event-triggered tasks are not relevant for the system limits

## User administration

	WinCC Runtime Advanced Device version prior to 13	WinCC Runtime Advanced Device version as of 13
Number of user groups	50	50
Number of authorizations	32	32
Number of users	100	100

## Project

	WinCC Runtime Advanced Device version prior to 13	WinCC Runtime Advanced Device version as of 13
Size of the project file "*.fwc"	No limiting	No limiting

## 10.15.9 General technical specifications

### 10.15.9.1 Permitted characters

#### Introduction

The following table shows the restrictions that must be observed when allocating names and passwords.

#### Permitted characters

Names / passwords	Restriction
Names of objects	Do not use the special characters ? " / \ * < > %
Names and passwords in user view	Do not use the special characters ? " / \ § & \$ %
Names of alarm logs	In the storage location file - RDB, file - CSV (ASCII) and file -TXT (Unicode) do not use the characters \ / * ? : " < >   For the storage location database, use only the characters a-z A-Z 0-9 _ @ # \$ The characters _ @ # \$ may not be used as the first character of a name
Name of HMI tags	HMI tag names may not start with the @ character
Names of screens	Do not use the special characters ? " / \ * < >
Names of AuditTrails	Do not use any special characters
Names of connections	Do not use spaces or special characters
Name of VB functions	Do not use spaces, special characters or VB keywords
Name of Windows user groups and Windows users when using SIMATIC Logon	Do not use the special characters / \

### 10.15.9.2 Recommended printers

#### Recommended printers

The current list of printers recommended for use with the HMI devices is available on the Internet at:

Link to the current printer list (<http://support.automation.siemens.com/WW/llisapi.dll?aktprim=0&lang=en&referer=%2fWW>)

[%2f&func=cslib.csinfo&siteid=csius&caller=view&extranet=standard&viewreg=WW&nodeid0=10805558&objaction=csopen\)](#)

---

**Note**

All HMI devices except for a PC and Panel PC support only one printer at their USB port, even if several ports are available.

---

**See also**

Printer list (<http://support.automation.siemens.com/WW/llisapi.dll?aktprim=0&lang=en&referer=%2fWW%2f&func=cslib.csinfo&siteid=csius&caller=view&extranet=standard&viewreg=WW&nodeid0=10805558&objaction=csopen>)

### 10.15.9.3 Printing via print server

#### Introduction

Print servers enable access to network printers. Print jobs are routed to a corresponding printer via the print server.

---

**Note**

Printing takes place via the print server for the following HMI devices:

- xP 177, Mobile Panel 177
  - xP 277, Mobile Panel 277, Mobile Panel 277 IWLAN, Mobile Panel 277F IWLAN
  - Mobile Panel 277 IWLAN V2, Mobile Panel 277F IWLAN V2, Mobile Panel 277F IWLAN (RFID Tag)
  - MP 377
  - PC with WinCC Runtime Advanced
- 

#### Requirements

- The print server deploys the "RAW" mode.
- 

**Note**

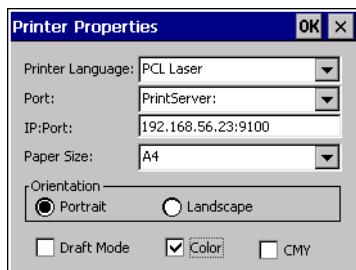

For additional information on settings, refer to the relevant print server documentation.

---

- The device is interconnected via Ethernet with the print server or with a printer featuring an integrated print server.
- External print servers are interconnected with a printer via USB port.
- The IP address and port used are identical in the "Printer Properties" of the HMI device and on the print server.

## Procedure

1. Open the "Control Panel" on your HMI device.
2. Select "Printer". The "Printer Properties" dialog box opens.

3. Select a printer from the "Printer Language" selection list.
4. Select the "PrintServer" entry from the "Port" selection list.
5. Enter the IP address and the port used for communication with the printer in the "IP:Port" input field.

---

### Note

Use the ":" character as delimiter between the IP address and the port number. For example: "192.168.56.23:9100".

---

6. Select any additional printer settings.

## 10.15.9.4 Memory requirement of recipes

### Introduction

The following calculation of memory requirements of recipes is only valid for Windows CE devices.

### Calculation of memory requirements

The memory space required by each recipe (in KB) is derived from the sum of D1 + D2 + D3.

Valid is:

- $D1 = (\text{number of entries} \times 5 + M + 8) : 1024$   
Applies to M:  
M = Accumulated length of all tag names = sum of characters in all tag names (UTF8 coded, max. 255 bytes per tag name) used in the entries.
- $D2 = [(\text{number of data records} \times 12) + 4] : 1024$
- $D3 = [\text{number of data records} \times (\text{data record length} + N) + 4] : 1024$   
Applies to N:

The total length of the name of the corresponding data record in all languages (max. 255 bytes per language) + overhead per data record (1 byte + number of languages \* 3 bytes).

D1, D2 and D3 are rounded to the next higher number.

## Memory requirements for using arrays

The memory required by each recipe (in KB) is derived from the sum of D1 + D2 + D3.

Valid is:

- $D1 = (\text{number of entries} \times 5 + M + 8) : 1024$   
Each element of the tag array used counts as a single entry.  
Applies to M:  
 $M = (\text{length of the array tag name} + K) \times \text{number of array elements}$   
Applies to K:  
K = 3: 2 to 9 elements in the array  
K = 4: 10 to 99 elements in the array  
K = 5: 100 to 999 elements in the array  
K = 6: 1000 to 9999 elements in the array  
K = 7: 10000 to 12000 elements in the array
- $D2 = [(\text{number of data records} \times 12) + 4] : 1024$
- $D3 = [\text{number of data records} \times (\text{data record length} + N) + 4] : 1024$   
Applies to N:

The total length of the name of the corresponding data record in all languages (max. 255 bytes per language) + overhead per data record (1 byte + number of languages \* 3 bytes).

D1, D2 and D3 are rounded to the next higher number.

---

### Note

If you use both tags and arrays in a recipe, you have to add the results of both formulas to calculate the total memory required.

---

## 10.15.9.5 Memory requirements of recipes for Basic Panels, OP 77A, and TP 177A

### Introduction

The following calculation of memory requirements of recipes is valid for Basic Panels, OP 77A, and TP 177A devices.

### Restrictions

The HMI device provides 39 KB of memory space for recipes. This memory space may not be exceeded. The total memory space for recipes is calculated as follows: Total of all recipes + recipe with highest memory requirement.

Each recipe may not exceed a maximum memory space of 19 KB.

### Calculation of memory requirements

The memory space requirement of each recipe (in KB) is calculated based on the three addends D1 + D2 + D3.

Valid is::

- $D1 = \text{number of data records} \times M$

Rule for M (size of a data record):

$M = 1 \times \text{number of elements of a byte} + 2 \times \text{number of elements of 2 bytes} + 4 \times \text{number of elements of 4 bytes} + 8 \times \text{number of elements of 8 bytes} + K$

Rule for K (size of the string elements):

$K = \text{number of string elements} \times (\text{string length} + 1) \times 2$

- D2 - data record size

$D2 = 4 + \text{number of languages} \times 8 + \text{number of languages} \times (4 + 4 \times \text{number of data records} + (\text{length of the data record name} + 1) \times 2 \times \text{number of data records}) + 8 + 8 \times \text{number of data records}$

Or rewritten:

$D2 = 12 + 8 \times \text{number of data records} + \text{number of languages} \times (12 + \text{number of data records} \times (4 + (\text{length of the data record name} + 1) \times 2))$

- D3 - shared memory  
 $D3 = 14 + \text{number of elements}$

---

**Note**

Arrays and single elements can be calculated as described above.

---

## 10.16 Options

### 10.16.1 WinCC Audit

#### 10.16.1.1 Basics

#### GMP compliance

#### GMP compliant projects with WinCC

Traceability and therefore the documentation of production data is becoming increasingly important in many industrial sectors such as the pharmaceuticals industry, the food and beverage industry, and in the related mechanical engineering sector.

Storage of production data in electronic form offers many advantages compared to paper documents, such as simple acquisition and logging of data.

However, it is also important to ensure that data cannot be falsified and that it can be read at any time.

Industry-specific and general standards for electronic documentation of production data have been developed for this purpose.

The most important set of regulations is the FDA guideline 21 CFR Part 11 for electronic data records and electronic signatures issued by the FDA, the US Food and Drug Administration. The various EU regulations, such as EU 178/2002, also apply for particular industries.

Requirements for production systems in these industries have been developed on the basis of 21 CFR Part 11 and the corresponding layout to comply with GMP (Good Manufacturing Practice). They are also required for other industries.

The following primary requirements are derived from these directives and rules:

- Creation of an Audit Trail or operating trace in runtime  
This document can be used to trace a complete log of which user has run what control function on the machine at what time.
- Important process stages must also be traceable to a specific responsibility, for example with an electronic signature.

#### GMP-compliant configuration

##### Introduction

"GMP compliant configuration" means creating projects in accordance with "Good Manufacturing Practice". The requirements are set out in FDA rules "21 CFR Part 11". The FDA is the U.S. Food and Drug Administration.

GMP-compliant configuration means HMI devices have electronic production data documentation functionalities.

## GMP relevant and the audit trail

WinCC offers the "Audit" option for implementing GMP compliance. Using the audit option, the "GMP compliant configuration" function can be enabled.

Enable the "GMP compliant configuration" function directly in the runtime settings of the HMI device. GMP relevant functionalities are then added to WinCC. These functionalities are:

- Audit Trail
- Electronic signature
- Option to label tags as "GMP relevant".
- Option to label tags as "GMP relevant" for recipes.
- NotifyUserAction system function
- Logging of tags using checksum
- Logging of alarms using checksum
- Audit trail record for printing logged changes

A license is required to convert the GMP-relevant functions configured in WinCC in runtime.

Depending on the edition of WinCC, use one of the following licenses:

- WinCC Audit for RT Advanced
- WinCC Audit for SIMATIC Panel

If the labeled objects are executed or changed, then it is saved in a special log, the "Audit Trail".

## See also

Configuring a checksum for a log (Page 3560)

Evaluating the checksum of log data (Page 3561)

Configuring a checksum for a log (Page 3648)

## Audit option

### Advanced functions

The Audit option adds functions to WinCC to ensure that your project is GMP compliant.

The following functions are added:

- **Audit Trail**  
For every HMI device, you can create an Audit Trail .  
Operator actions and system processes that are relevant for the FDA-compliance of the process are recorded in an Audit Trail during runtime.
  - User actions such as changes in the values of GMP relevant tags or recipes or the acknowledgment of alarms.
  - Actions by the system, such as starting up runtime or rejection of logon attempts.
- **Electronic signature**  
You can set mandatory acknowledgement of important user actions in runtime, such as changing recipe data records or tag values.  
All Audit-relevant user actions must be protected by authorization in the user administration. The user will then only be able to run these actions if an electronic signature and, if configured appropriately, a comment have been input. The electronic signature and the comment are logged in the audit trail.

### Extension of the WinCC engineering system

For all HMI devices that support "GMP-compliant configuration", the WinCC engineering system is extended to include the following configuration options when GMP is enabled:

- The entry "AuditTrail" is added to the "Logs" editor.
- A "Good Manufacturing Practice Settings" entry is added to "HMI tags" editor in the inspector window of a "Properties > Properties" tag.
- A "Good Manufacturing Practice" entry is added to "Recipes" editor in the inspector window of a "Properties > Properties" recipe.
- "NotifyUserAction" system function

### Scope of logging

#### Introduction

It is important to ensure that audit-related processes are always logged in runtime in the audit trail in a project with the option "Audit".

## Scope of logging

The following operations are Audit-relevant and are automatically saved in the Audit Trail:

- Runtime sequence
  - Runtime start and runtime stop
  - Project information: Version and project name, of the configuration environment, device, and current runtime configuration
  - Failure of the voltage supply of an active Uninterruptible Power Supply (UPS).
- User administration
  - Logon and logoff of users
  - Invalid logon attempts
  - Import of user administration
  - Changes of user administration
- Alarm system
  - All alarms that are acknowledged by the user.
  - All acknowledgment attempts of the user

---

### Note

#### Logging alarm text

To log alarm texts, select the "Log alarm text in Audit Trail" option in the Audit Trail editor:

"Audit trail > Properties > Settings" in the "Settings" area

---

- Log operations
  - Starting, stopping and copying a log
  - Opening and closing all logs
  - Deleting a log
  - Starting a sequence log
  - Long-term logging of a log
- Running specific system functions depending on their functionality and the triggering event

The following audit processes are logged depending on the configuration of the recipes and the tags of the project:

- Change values of GMP-relevant tags by the user
- for GMP-relevant recipes:
  - Storing after changing and creating recipe data records
  - Transfer of recipe data records to the PLC and from the PLC
  - For recipe tags: Changing the setting for the synchronization of the tag values with the PLC ("offline"/"online")
- "NotifyUserAction" system function  
You use the system function "NotifyUserAction" to record user actions that are not automatically recorded by the audit trail.  
You can configure this system function for screen calls, for example You can also configure function lists containing system functions that do not require signature or acknowledgement.

### 10.16.1.2 Enabling GMP compliant configuration

#### Introduction

The Audit Trail and "Electronic Signature" functions are qualified as "GMP compliant configuration".

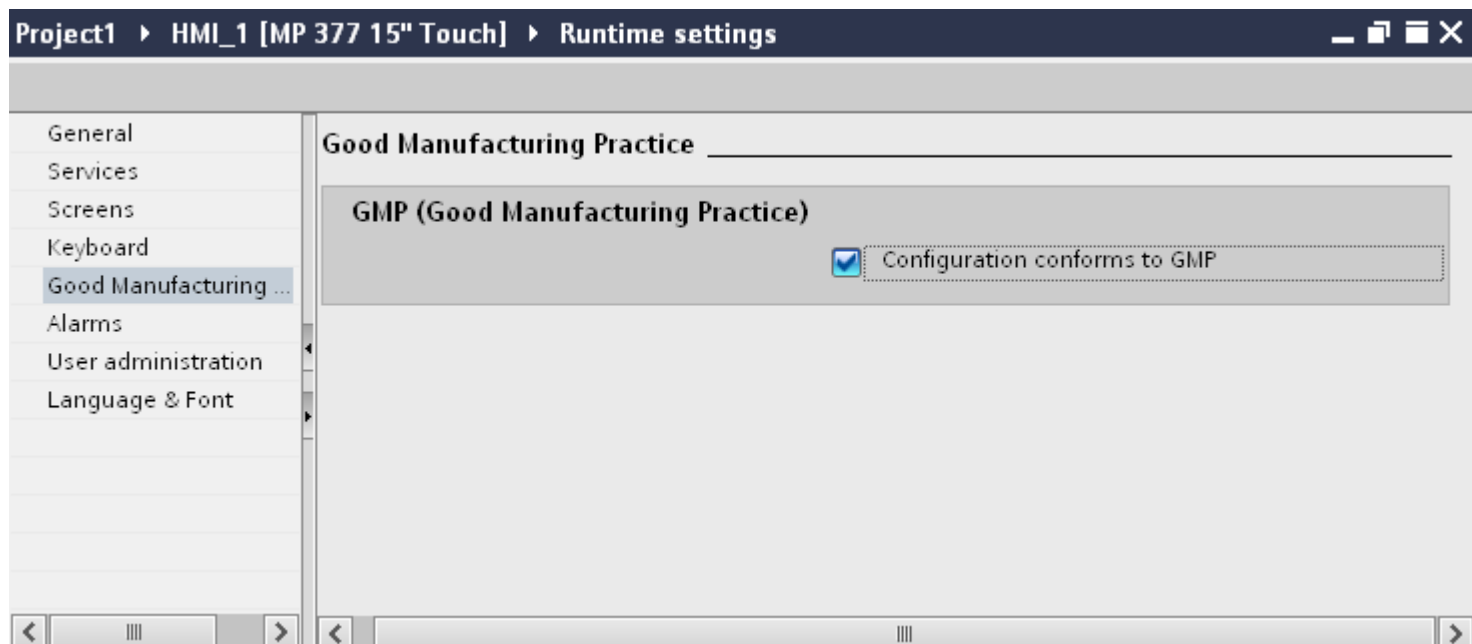

#### Requirements

- A project is created.
- A GMP compatible HMI device has been created.

#### Procedure

1. Double-click on the HMI device in the project tree.
2. Double-click "Runtime settings".

3. Click on "GMP".
4. Select "GMP compliant configuration".

## Result

The Audit option is now enabled for the HMI device.

The following functions can now be configured:

- Audit Trail log
- "NotifyUserAction" system function
- GMP relevant tags
- GMP relevant recipes

## See also

Configuring a checksum for a log (Page 3560)

Evaluating the checksum of log data (Page 3561)

Configuring a checksum for a log (Page 3648)

Evaluating the checksum of log data (Page 3650)

### 10.16.1.3 Using the Audit trail

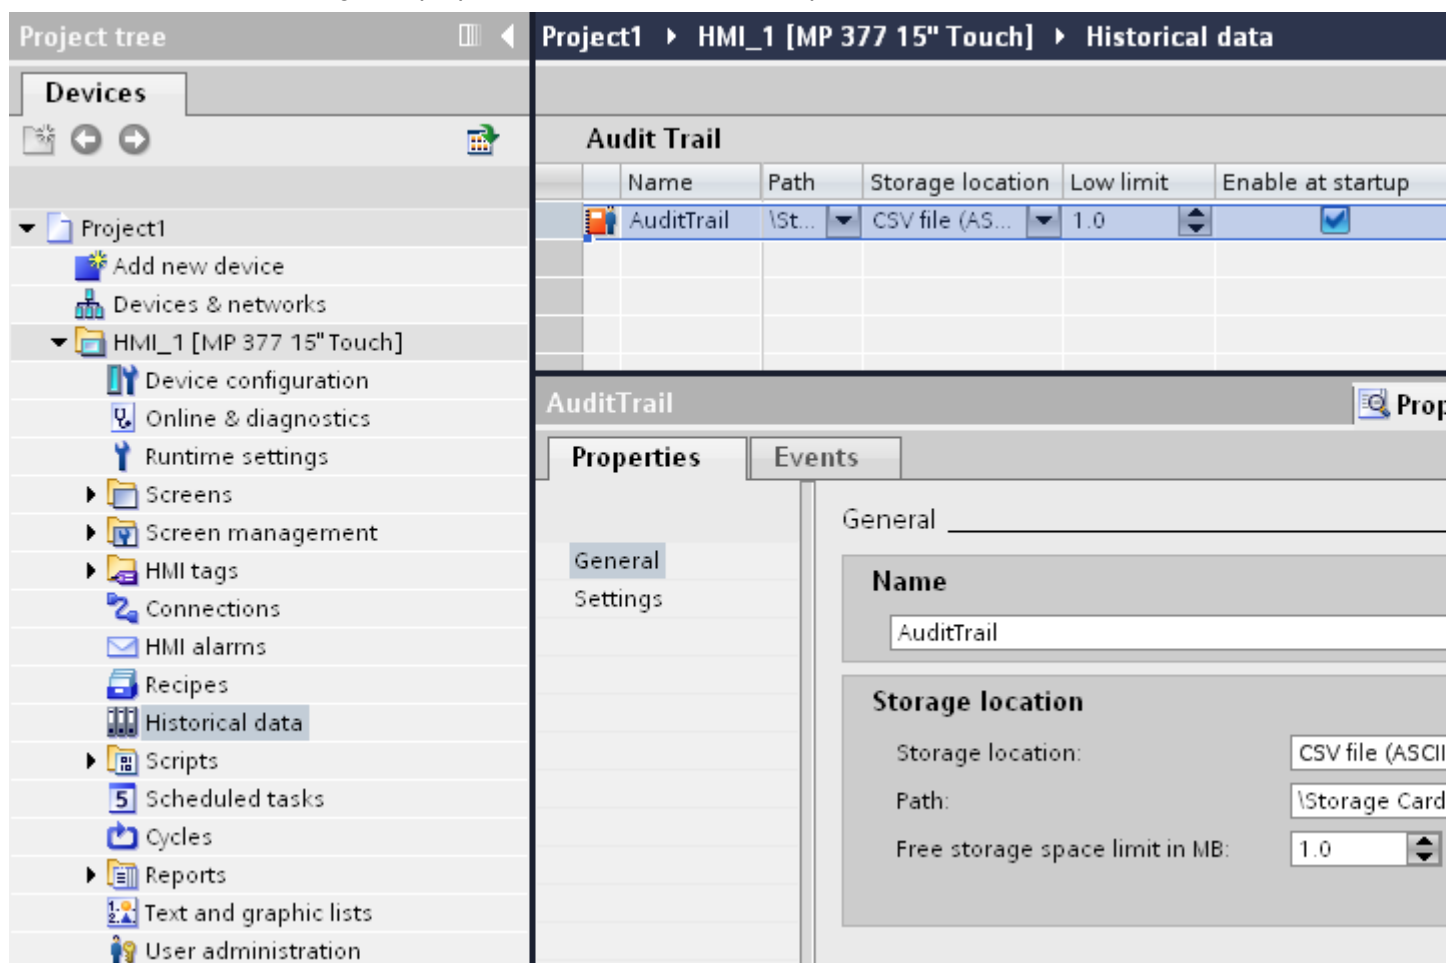

## Audit Trail

### Introduction

Configure a log in the settings for Audit Trail editor. This log is used to store changes in tag or recipe values made by the user and other user actions in runtime.

### "Settings for audit trail" editor

1. In the project view, double-click "AuditTrail" in the "Log" group.
2. Click on the "Settings for audit trail" tab.
3. Change the properties of Audit Trail in the inspector window.

### Audit trail work area

You define the settings for the Audit Trail in the "Properties > Properties" inspector window.

### *10.16 Options*

You set the name of the log and the storage location and decide whether logging will begin on startup. Also determine if "Forcing" is permitted.

"Forcing" is a function for administrators. It allows the administrator to continue the process even if the maximum log storage space has been exceeded.

Thus, the Audit Trail switches off and must be rebooted using the "StartLogging" system function.

## **Creating an audit trail**

### **Requirements**

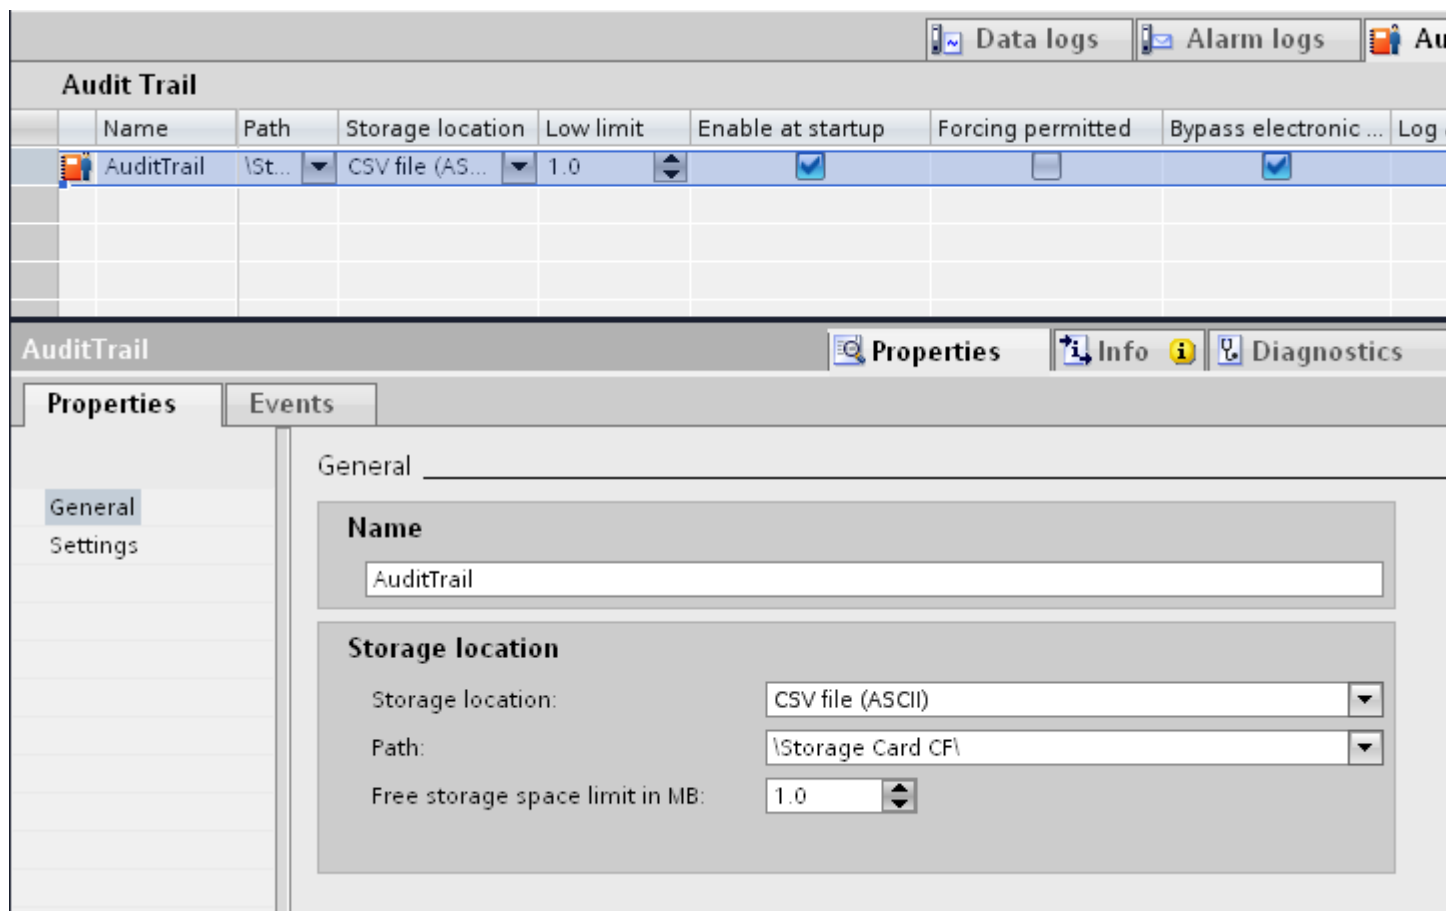

"GMP compliant configuration" has been selected on the HMI device.

### **Procedure**

1. Double-click on the HMI device in the project tree.
2. Double-click "Logs".  
The "Logs" editor will open.

3. Change to the "Audit Trail" tab.  
An audit trail has been created.

4. Define the following in the inspector window:
  - Name
  - Storage location
  - Logging with runtime start-up
  - Forcing

---

#### Note

No audit-related user actions are permitted in GMP relevant projects if there is insufficient storage space available for the audit trail.

If the check box "Forcing permitted" is activated and, because of the hardware, there is insufficient storage space in runtime, the administrator can interrupt audit trail logging. The administrator can prevent the process from stopping in this way.

If the administrator enables the "Forcing" function, the interruption of the audit trail by the administrator will be entered in the audit trail as the last entry.

At the end of "Forcing" restart the audit trail using the "StartLogging" system function.

---

### Configuring a function list

If necessary, configure a function list for the events "Low free storage space" and "Free space critically low".

The "Low free storage space" event is triggered if the amount of free storage space available for the audit trail in runtime is less than the amount configured in "Minimum storage space in MB".

The "Free space critically low" event is triggered if there is no longer sufficient free storage space for the audit trail in runtime. The value depends on the HMI device.

For more information refer to chapter: Configuring the "Low free storage space" event

### Result

Audit relevant user actions are entered in the configured audit trail in runtime.

### Parameters for the audit trail

#### Introduction

Configure Audit Trail in the "Logs" editor if you have enabled "GMP compliant configuration" in the runtime settings.

There are two ways of assigning parameters for the audit trail:

- "Settings for audit trail" editor
- "Audit Trail" inspector window

#### Editor "Audit Trail"

The "Audit Trail" editor is an overview of the Audit Trail created.

Only one Audit Trail can be created per HMI device.

Parameters that are assigned for the Audit Trail can be seen in the line. You can select or deselect the parameters displayed.

The parameters of an Audit Trail are also displayed and described in more detail in the inspector window.

### General inspector window

You can set the following parameters under "Audit trail > Properties > General":

Name	Path	Storage location	Low limit	Enable at startup	Forcing permitted	Bypass electronic ...	Log
AuditTrail	\\St...	CSV file (AS...	1.0	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	

**AuditTrail Properties**

**General**

**Name**

**Storage location**

Storage location:

Path:

Free storage space limit in MB:

### Name

- Under "Name", assign a name for the Audit Trail .  
Special characters are not permitted when assigning the name.

### Storage location

- Storage location  
You can choose between:
  - RDB file
  - a CSV file (ASCII)
  - a TXT file (Unicode)

---

#### Note

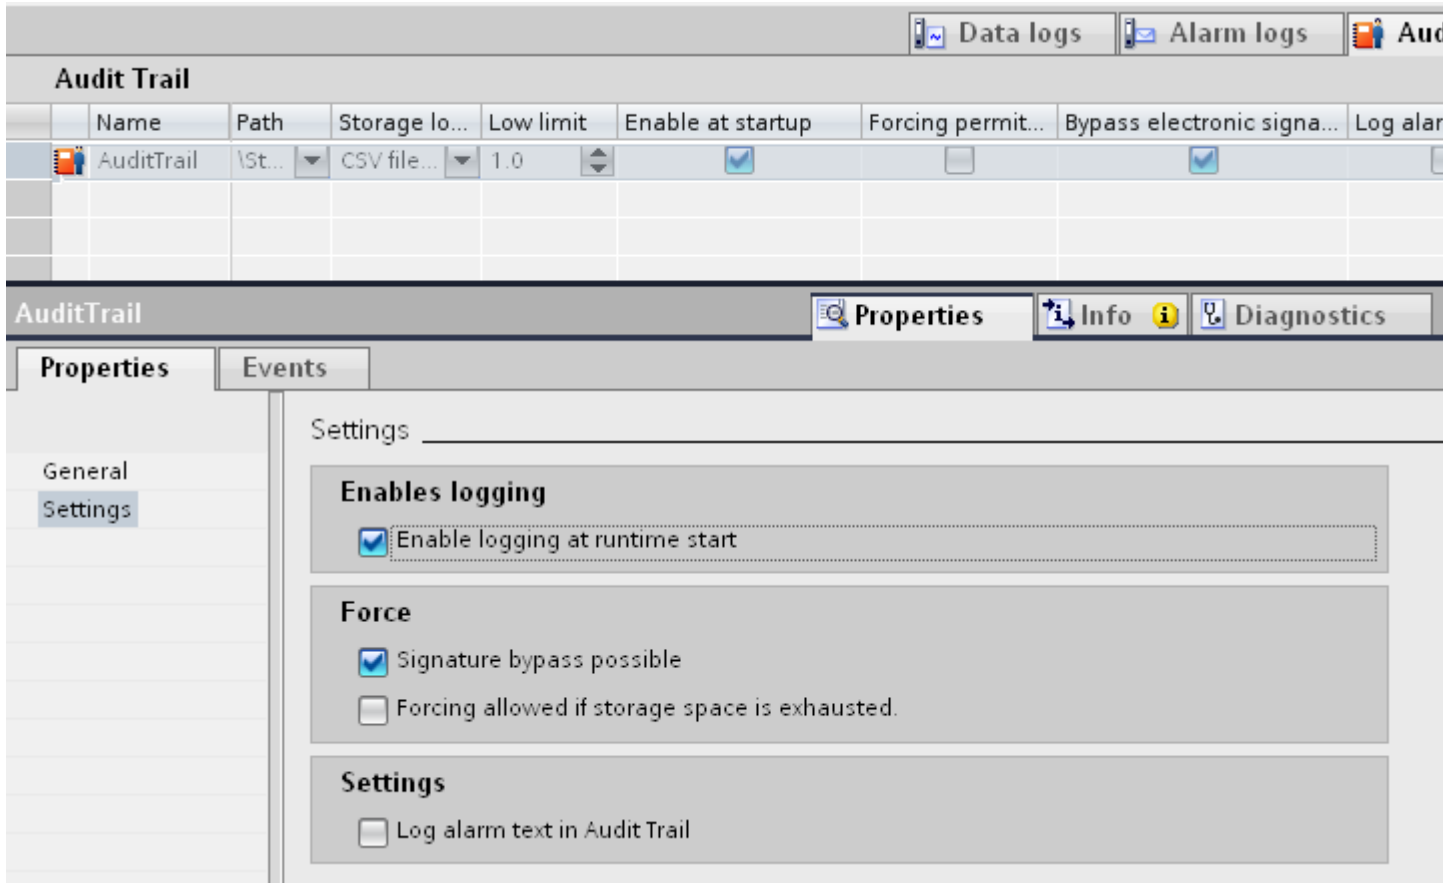

Use "TXT (Unicode)" as storage location for logging Asian languages.

---

- Path  
Depending on the HMI device, enter the storage location of the Audit Trail under "Path".
- Minimum space in MB  
Specify the size of remaining storage space that triggers the "Little available memory" event.

### Inspector window settings

You can set the following parameters under "Audit trail > Properties > Properties > Settings":

### Logging activation

- Enable logging at runtime start

### Forcing

- Bypass electronic signature  
Specifies whether the administrator is permitted to run operator actions without entering an electronic signature or comments.
- Forcing allowed if storage space is exhausted  
This function allows the administrator to interrupt audit trail logging in the following scenarios:
  - There is no free storage space available.
  - The storage medium is missing.
  - Access to required storage medium is not possible.

You can thus prevent the process from stopping.

After Forcing was carried out, the audit trail log switches off.

After the end of "Forcing", the audit trail must be restarted with the system function "StartLogging".

### Settings

- Logging alarm texts in the audit trail.

---

#### Note

Use "TXT (Unicode)" as storage location for logging Asian languages.

---

For further details on setting the logging language, refer to the following section:  
Setting the audit trail language

### See also

Format (Page 6162)

### Setting the audit trail language

#### Introduction

The logging language for an Audit Trail is set in the runtime settings.

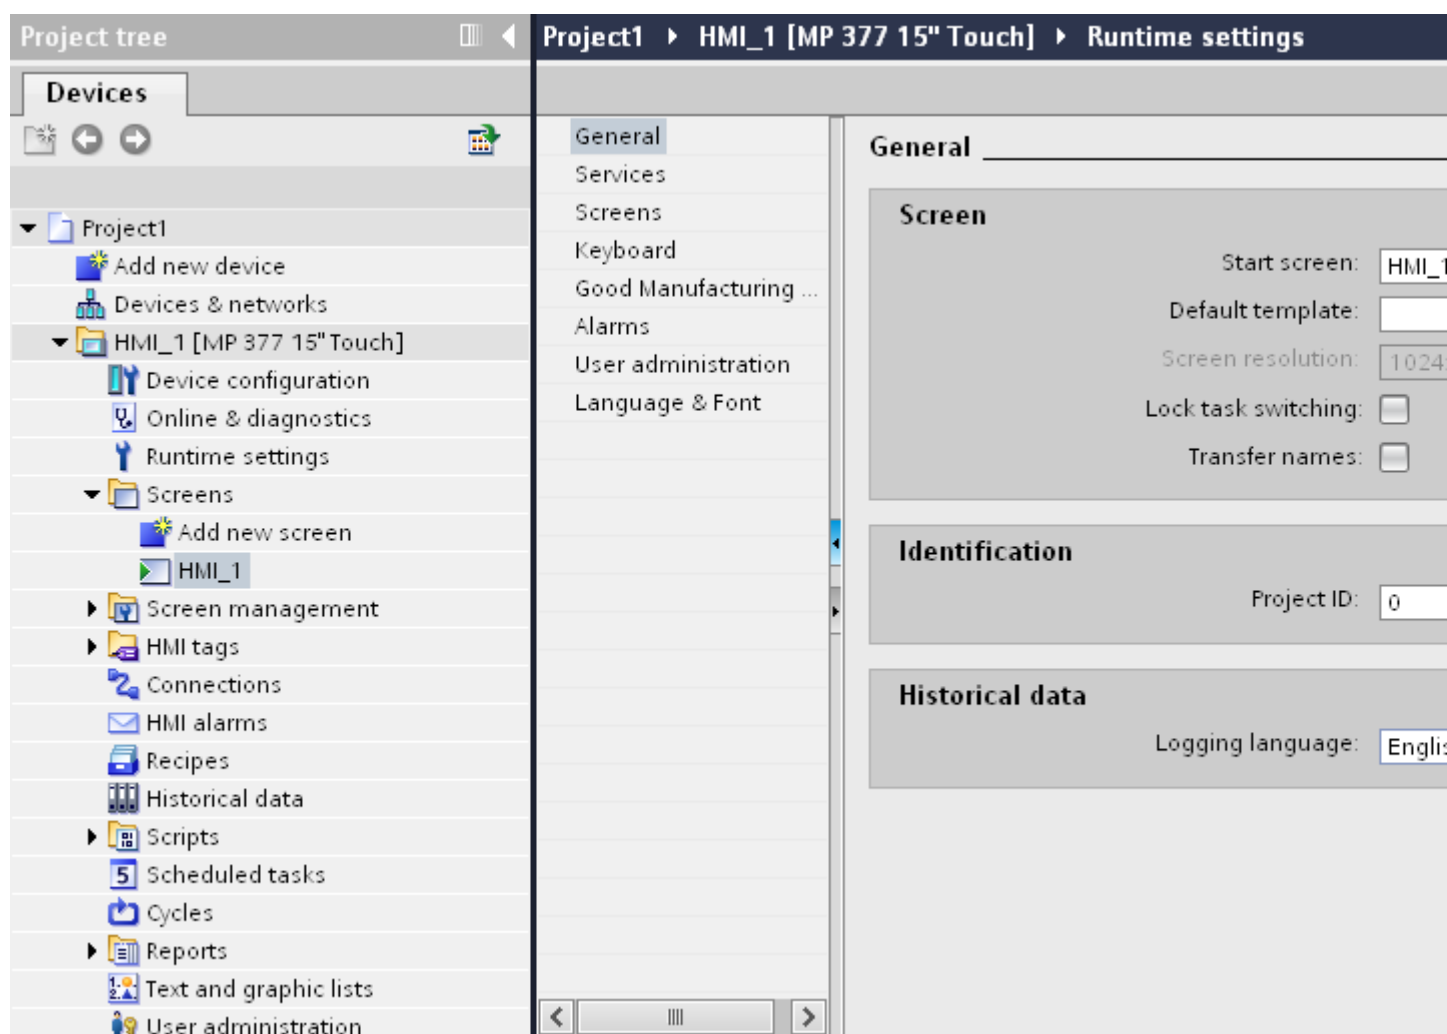

#### Procedure

1. Double-click on the HMI device in the project tree.
2. Double-click "Runtime settings".

3. Click "General".
4. Select the logging language in the "Logs" area.

**Note**

If an Asian language was selected, use the "TXT (Unicode)" storage location in the "Audit trail" editor.

**Low free storage space****Low free storage space****Description**

This event is triggered if the storage space available on the medium to which the Audit Trail is less than the configured minimum.

## Free space critically low

### Description

This event is triggered if the storage medium to which an Audit Trail is saved provides insufficient storage space due to hardware restrictions.

### Configuring the "Low free storage space" event

#### Requirements

- A GMP- compliant configuration is enabled
- An Audit Trail is created

#### Procedure

1. Click on the Audit Trail in the "Audit Trail" editor.
2. In the Inspector window, click "Properties > General".
3. In the "Free storage space limit in MB" area, select a value that triggers the "Little free space" event.
4. Click on Events in the Inspector window.
5. Click on the "Low free storage space" event.
6. In the function list, specify a system function to execute when an "Overflow" event is triggered.

## Logging the audit trail

## Reporting an audit trail

### Introduction

You can print a report of the operations saved in an Audit Trail. All recorded actions are included in the printout.

### Requirements for reporting

The "Audit trail report" report object is available for the printout of an Audit Trail.

You can configure the report in the "Report" editor. The report object is only available if the "GMP-compliant configuration" option is set in the runtime settings of the HMI device.

If an Audit must be printed in runtime, initially the logging of Audit Trail must be stopped using the "StopLogging" system function.

Whilst an Audit Trail is being printed, no user actions are recorded. Ensure that no GMP-relevant user actions are executed whilst the logging is stopped.

After printing is complete without any errors, restart the audit trail using the "StartLogging" system function.

The header of the report is printed in the current runtime language. Change the runtime language to the logging language accordingly.

The logged data from Audit are printed in the configured runtime logging language.

In order to receive a complete report, the report object can also be used in a report in conjunction with the "Print alarm" and "Print recipe" report objects.

## **Audit Trail reporting**

### **Introduction**

You use the "Audit Trail" report object to configure a report for the output of Audit Trail contents to a printer.

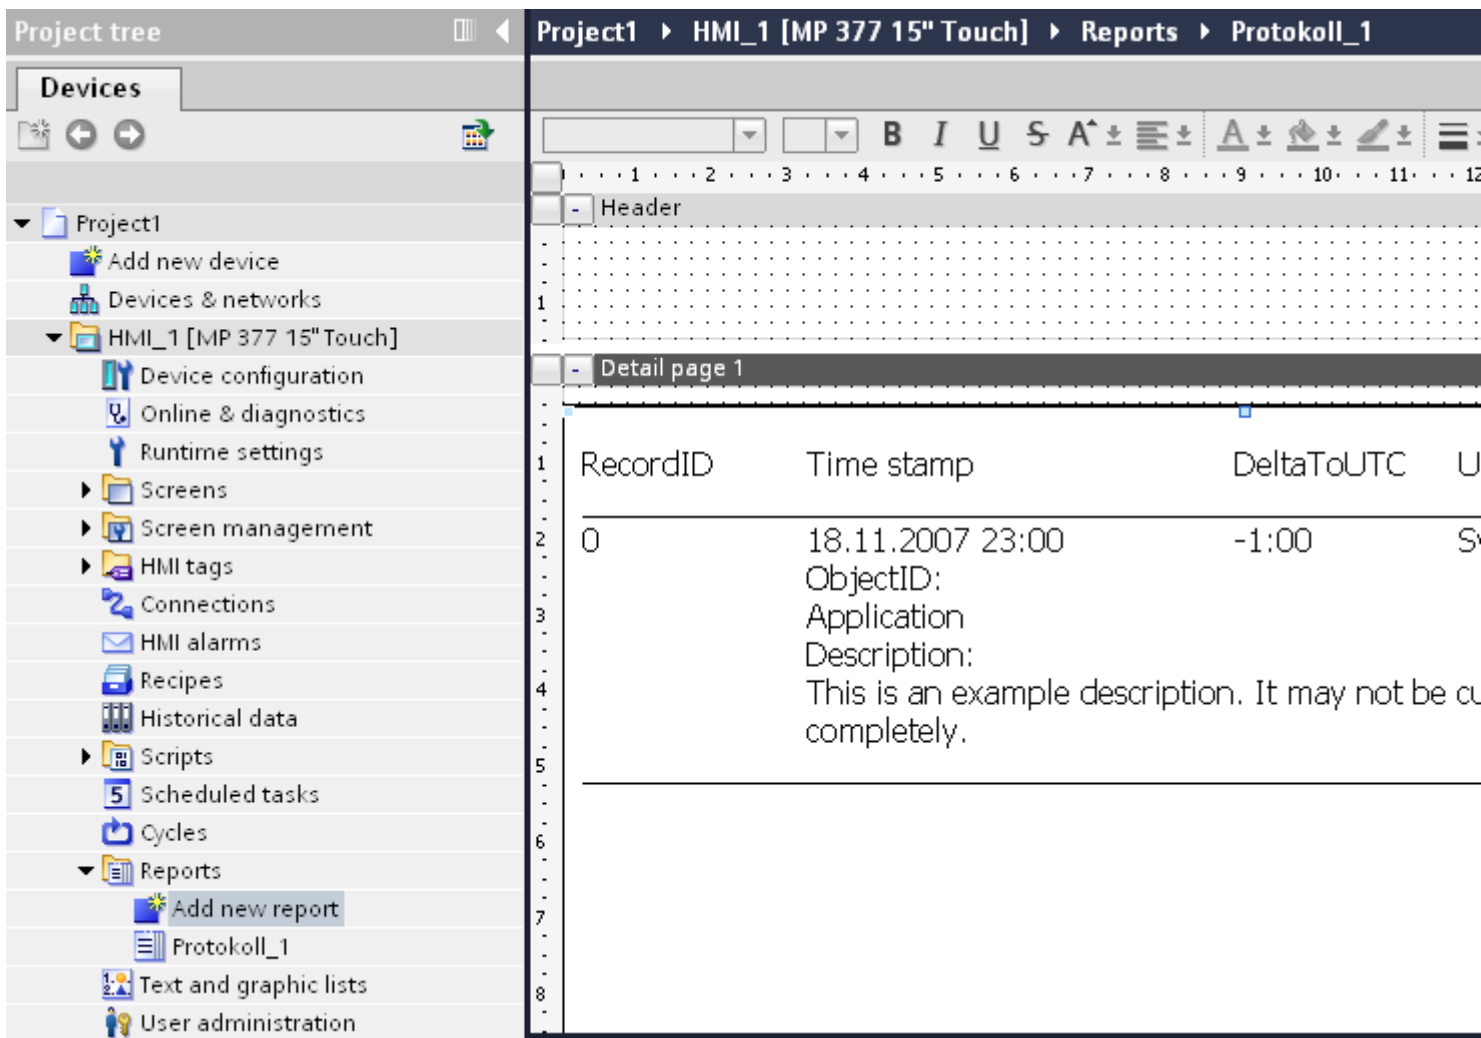

Once the printout is started in runtime, all entries currently contained in the Audit Trail are printed out.

### **Procedure**

To create a report, proceed as follows:

1. Double-click on the "Reports" entry in the project tree.
2. Double-click "Add new report".  
A new report is created and opened in the "Report" editor.

3. Drag & drop the "Audit trail report" object under "Tools > Controls" to the report created.

4. Click on the "Audit trail report" object.
5. Change the object properties of the "Audit trail report" object in the inspector window.

## Result

You have created a report for the printout Audit Trail.

## Parameters for the audit trail report

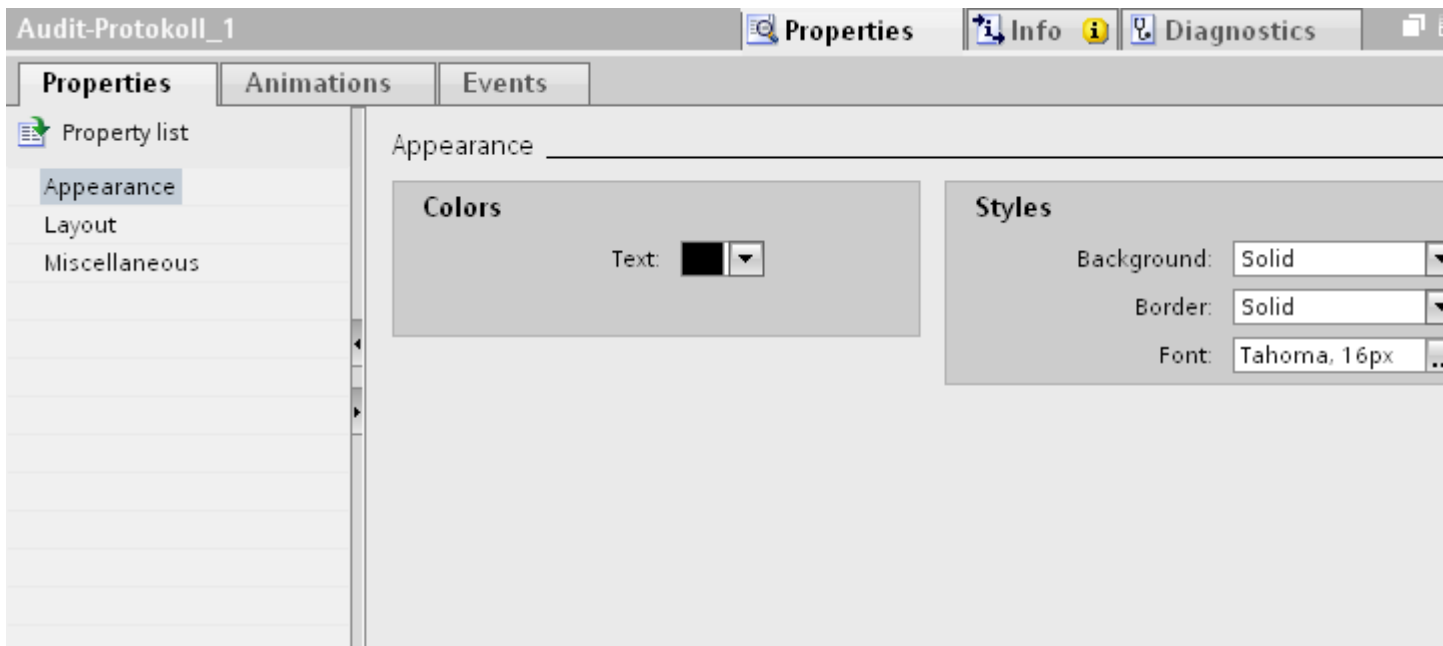

### Introduction

The "Audit trail report" parameters can be edited in the inspector window.

## Inspector window appearance

Click on the "Audit trail report" object.

Change the appearance of the "Audit trail report" object in the appearance area of the Inspector window under "Properties > Properties > Layout".

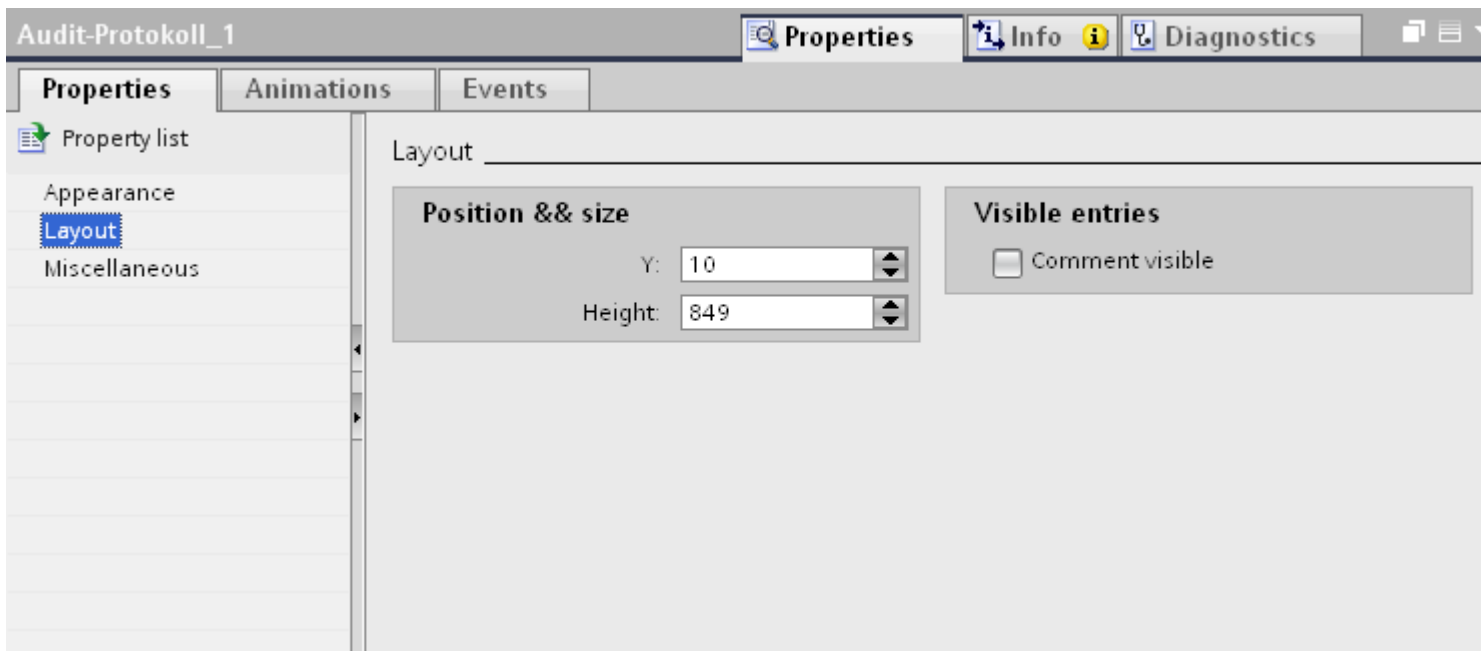

You can configure the foreground color, the background color, the style, and the font settings.

It is recommended to set a font size of 16 px for the output.

## Inspector window layout

Click on the "Audit trail report" object.

Change the position and size of the "Audit trail report" object in the appearance area of the Inspector window under "Properties > Properties > Layout".

The "Audit trail report" object always fills the space down to the footer on the report page. If you change the height of the object, then you only change the distance of the object to the header. The report printout can involve a large amount of data.

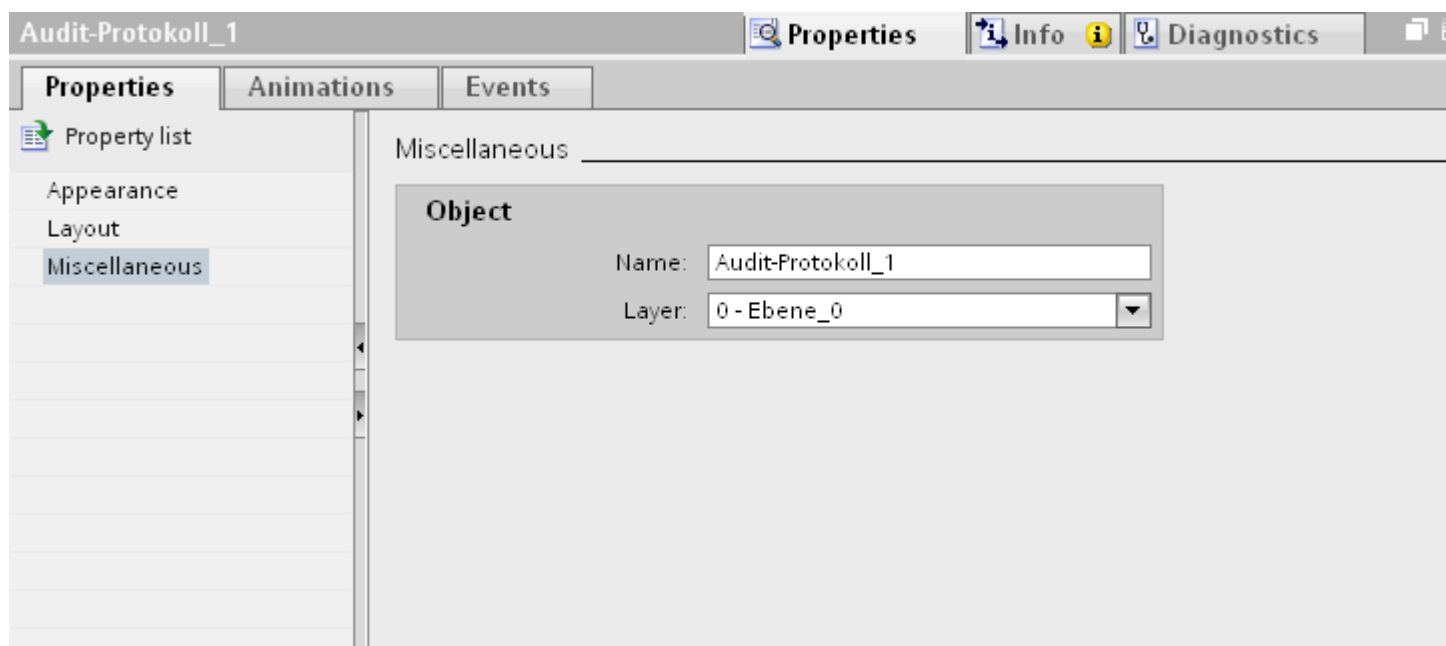

A page break is automatically inserted when the length of the page is exceeded to print out all data.

In the "Visible entries" area, it is determined whether comments are visible on the printed report.

### Inspector window miscellaneous

Click on the "Audit trail report" object.

Change the name and layer position of the "Audit trail report" object in the appearance area in the Inspector window under "Properties > Properties > Miscellaneous".

## Printing out an audit trail report

### Introduction

Since logging of the Audit must be stopped in order to print out an Audit Trail, a few details regarding this procedure must be noted.

The following steps must be taken to print out an audit trail in a report file on a printer:

- Stop logging using the "StopLogging" system function.
- Start the printout using the "PrintReport" system function.
- Check if the printing is successfully completed.
- If needed, move or delete the Audit Trail using the system functions "ArchiveLogFile" or "DeleteLog".
- Start the logging of Audit by selecting the "StartLogging" system function.

---

#### Note

Make sure that the Audit Trail has been printed completely before you delete the Audit Trail.

---

### Requirements

- "GMP compliant configuration" has been enabled.
- A report for the printout of an Audit Trail has been configured.
- The screen for the operator control to be configured is open.

## Procedure

1. Add a button to the screen and select "Events > Click" in the Properties window.
2. In the function list, assign the "StopLogging" system function to the "Click" event and select your Audit Trail log.
3. Insert an additional button and assign the "PrintReport" system function to the "Click" event of this button.
4. Configure the "StartLogging" system function in the same function list.
5. Assign unique labels to the buttons.
6. Save the project.

## Result

You have configured the required buttons and system functions. The operator can perform the operating tasks described in the introduction during runtime to print out an Audit Trail report.

---

### Note

You can also insert the report objects for the output of alarms and recipes in the report for the printout of an Audit Trail. However, since GMP-relevant operations and system processes are not recorded while you are printing, you should preferably print the Audit Trail in a separate operation.

---

## Evaluating an audit trail

### Evaluating audit trails

#### Introduction

The Audit Trail has been saved to the memory card of the HMI device and is also read only.

The Audit Trail is protected by a checksum. This checksum ensures that the entry has not been modified at any later time.

There are two possible ways to evaluate the Audit Trail:

- Use the "Audit Viewer":  
You can easily evaluate the Audit Viewer for external analysis on an Office PC with the help of the Audit Trail.
- Use the "HmiCheckLogIntegrity" DOS program:  
The DOS program makes it possible to carry out an automatic check of the Audit Trail using the return values.

## Evaluating Audit Trails in AuditViewer

### Introduction

The Audit Viewer allows you to evaluate all Audit Trail data in a table.

### Requirements

- Audit Viewer is installed
- The Audit Traillog is located on the computer which has Audit Viewer installed.

### Procedure

1. Start the Audit Viewer on the configuration PC:  
"Start > SIMATIC > Audit Viewer > Audit Viewer"  
This path may be different on your operating system version.
2. Click the  button.
3. Load the Audit Trail:

RecordID	TimeStamp	DeltaToUTC	UserID	ObjectID	Description
0	3/4/2008 3:56:50 PM	-1:00	System	Anwendung	Ende des Programr
0	3/4/2008 5:11:27 PM	-1:00	System	Anwendung	Runtime-Start von \

67	3/4/2008 5:26:33 PM	-1:00	Rodriguez	Rezeptur: Orange_1	Signiert: Datensatz
68	3/4/2008 5:29:07 PM	-1:00	Rodriguez	Variable: Operation_Mode	Signiert: Änderung c
0	3/4/2008 5:41:12 PM	-1:00	System	Anwendung	Ende des Programr

The "Data Validity Indicator" is lit up in green to indicate that the loaded Audit Trail has not been manipulated.

Each entry in the Audit Trail is time-stamped to allow precise tracking of operator actions. In addition to system events, such as the attempt to import a password list, the system also records failed logon attempts:

Evaluating the checksum of log data (Page 3561)

Evaluating the checksum of log data (Page 3650)

## Evaluating Audit Trails with DOS program

### Introduction

Long-term archiving on a server allows an Audit Trail to be checked automatically using return values in a script.

In addition the programmer can integrate the check using the DOS program "HmiCheckLogIntegrity" into the archiving process. "HmiCheckLogIntegrity" then provides the following return values:

- < 0: Different errors, for example, wrong file format or no file exists.
- 1: The checked Audit Trail is valid.
- > 0: The first line that was manipulated will be returned.

Audit Trail logging is only continued if the return value is "1". In both error cases, the administrator or the shift supervisor can be informed.

### HmiCheckLogIntegrity

The "HmiCheckLogIntegrity.exe" DOS program is in the installation directory under:  
"SIEMENS > Automation > WinCC Runtime Advanced"

### Audit trail logging concept

### Format

#### Format - Audit Trail

On an HMI device with "GMP compliant configuration", all events which are relevant to the audit are recorded at runtime in the Audit Trail. You have several format options.

Selection is dependent on the display program and the runtime language used:

- RDB file  
Data is saved with quick access in a proprietary database.  
If you require maximum read performance in Runtime, use the "RDB file" storage location.

- CSV file  
To view and evaluate a CSV file use, e.g. Microsoft Excel on your PC.

---

**Note**

Double quotation marks or several characters are not permitted as list separators for the storage site "File - CSV (ASCII)". You can find the settings for list separators under "Start > Settings > Control Panel > Regional and Language Options".

---

- TXT file  
This file format supports all characters that can be used in WinCC. For editing, you will need software that can save files in Unicode, such as Notepad.

---

**Note**

Use "File - TXT (Unicode)" to log Asian languages.

---

## Audit Trail with checksum

The following files are generated under special circumstances:

- \*.keep
  - If a log is started without checksum and will be continued with a checksum.
  - If you update WinCC with a service pack or a new version and the Audit Trail or the log is continued with the checksum.
  - The content of the keep file will remain the same when compared with the original log file.

---

**Note**

Before you update WinCC with a Service Pack or a new version, exit and save the Audit Trail or the logs using checksum. After WinCC is updated, the audit trail or logs will be continued with new files using checksum.

---

- \*.bak
  - If runtime has determined a serious, irregular problem in the file.

## Storage location and medium

### Storage location and medium

Depending on the hardware configuration of the HMI device, the data may be logged locally (on the hard disk of a PC or on the storage card of a panel) or, if present, on a network drive.

---

#### Note

##### Logging on network drives

We do not recommend that you log audit trails directly on a network drive. Power supply can be interrupted at any time. This means there is no guarantee for a reliable operation of logs and audit trails.

We recommend you save the logs on your local hard drive, or on a storage medium of the HMI device. Use the system function "ArchiveLogFile" to save the logs long-term on a network drive.

---

A "GMP compliant configuration" cannot be operated at runtime to the full extent unless it is possible to save all user actions which are relevant to the audit to the Audit Trail. It must be ensured that sufficient storage space is available for the Audit Trail and that the connection to the storage location for the Audit Trail is not disturbed.

### Error-handling with insufficient free storage space

If there is insufficient storage space, your project can be configured so that the administrator has an option of continuing the process without logging in the audit trail (forcing).

### Error-handling if there is no storage medium or the connection to the server is interrupted

All audit-relevant user actions are blocked if insufficient storage space is available for the Audit Trail, e.g. due to missing storage medium.

Blocking is canceled as soon as the storage location for the Audit Trail is available again. The block can be skipped by "forcing".

### Error-handling with long-term logging

If the audit trail must be moved to a server for long-term logging and the connection to the server is interrupted at this time, the following error-handling is required:

The system closes the audit trail and renames it. The system attempts to send the renamed audit trail to the server again in the background.

If disruption in the connection to the server persists, you receive a system alarm telling you that the connection is down. Then the system attempts to send the renamed audit trail every 300 seconds.

The attempt to transmit the data is repeated until successfully completed. The data is also transmitted after a restart of the HMI device.

## "Forcing"

If the storage space for the audit trail is insufficient, for example if there is no storage medium or it is full, all audit-relevant user actions are automatically blocked.

In this case the audit trail logging can be configured to give an administrator the option of continuing to operate the system without logging the audit trail (forcing).

The administrator can also be given the option of running the system quickly out of a critical state in case of emergency. In this case the administrator can operate the system without the requirement to input the required electronic signatures or comments.

If the administrator uses the "forcing" function, this is logged as the last entry in the audit trail.

After the end of forcing, the audit trail must be restarted with the system function "StartLogging".

## Protection mechanisms

### Protective mechanisms to prevent changes to audit trail data

The audit trail data are protected against deliberate or accidental changes:

- The directory in which the audit trail is saved can only be accessed with special rights.
- The audit trail files are write-protected.
- Each data record contains a checksum that can be used to detect a change of its contents. This checksum also ensures that the number of lines has not changed in the audit trail file.

Use the "HmiCheckLogIntegrity" tool, included in the audit option, to check whether an audit trail has been changed:

Evaluating Audit Trails with DOS program

## WinCC upgrade

### WinCC upgrade

Before you update WinCC with a Service Pack or a new version, you will have to exit and save the Audit Trail or the logs with checksum. After WinCC is updated, the audit trail or logs with checksum will be continued with new files.

Make sure that the logs are started at a defined state with the new version.

## Audit trail behavior in runtime

### Effects in runtime

The configuration in Audit Trail has the following effects in runtime, depending on the configuration:

- Audit relevant user actions (such as tag changes and recipe changes) are recorded in an audit trail.
- "Enable logging at runtime start" check box enabled:  
The audit trail is started with runtime.
- "Forcing" group, "Allowed if storage space has been exhausted" check box enabled:  
A user with administrator rights can use "forcing" to run operations on the plant even though the audit trail can no longer be logged because of storage space limitations. Interrupting the audit trail prevents the process from being stopped.  
If the check box "Signing may be bypassed" is enabled, the administrator is not required to input electronic signatures, acknowledgments or comments for operator actions that would normally require signing, acknowledgment or comment.
- If the storage space available for the Audit Trail is less than the configured "Minimum storage space in MB", the function list configured for the "Low free storage space" event will be processed.
- If there is insufficient storage space for the audit trail because of hardware limits, the function list configured for the "Free space critically low" event will be processed.

### 10.16.1.4 Configuring audit functions

#### Logging tag value changes

#### Tag value change

#### Changes to tag values

User actions in runtime are recorded in a Audit Trail once "GMP compliant configuration" has been enabled.

When you configure a GMP compliant project, you specify which tags must meet the requirements of Good Manufacturing Practice (GMP).

If the user changes the value of a GMP-relevant tag in runtime, the value change action is logged in the Audit Trail .

---

**Note**

The action of changing the value of GMP-relevant tags made by the PLC, or a system function, is not logged in the Audit Trail.

The system functions used to change the values of GMP-relevant tags which are assigned to events that identify a direct user action will be logged.

In addition, configure the "NotifyUserAction" system function to make a manual entry in the Audit Trail or to prompt the user for an electronic signature, an acknowledgment, or a comment.

With the "NotifyUserAction" system function only the value changes that are directly triggered by the event to which the system function is configured are entered in the Audit Trail. For example, if additional tags are changed by changing the value of one tag, the additional value changes are not logged in the Audit Trail.

---

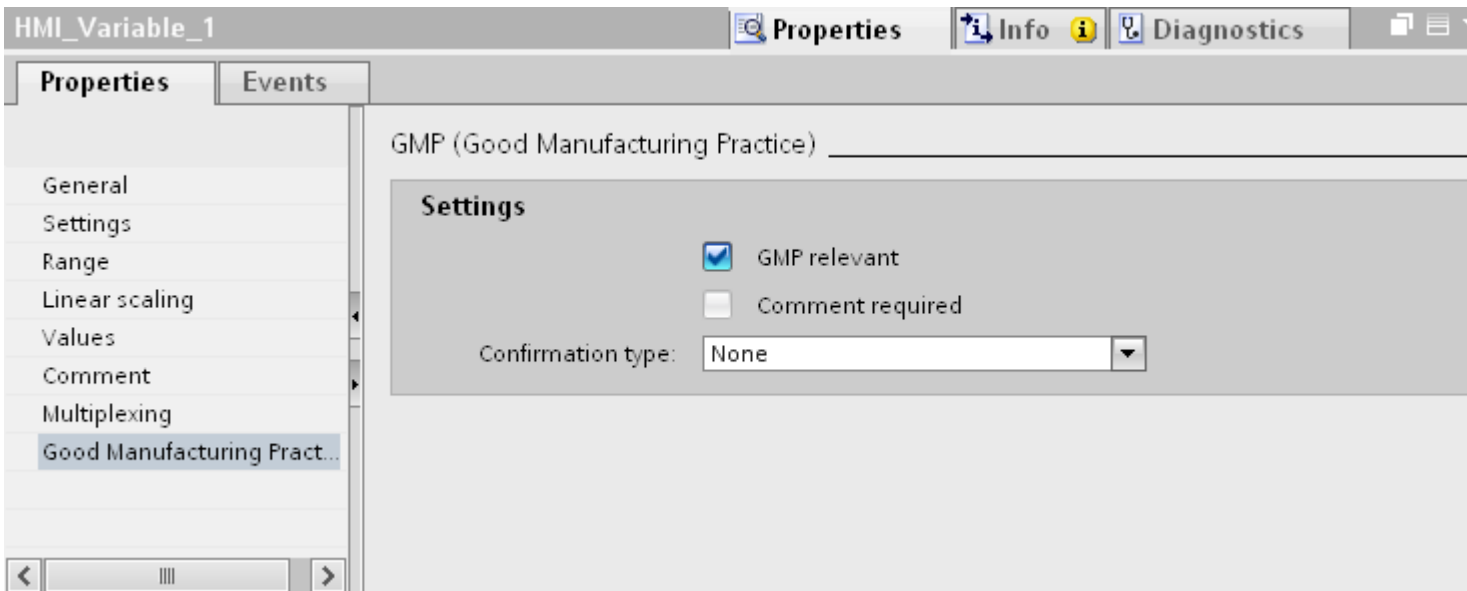

## Logging tag value changes

### Requirement

- "GMP compliant configuration" has been enabled.
- The tags for which you want to configure the GMP settings are created.
- The property view is open.

## Procedure

1. Open the HMI tags editor and select the tag for which you want to make GMP settings.

2. Click "GMP relevant" under "Properties > Properties > GMP" in the Inspector window.
3. Specify how the user must confirm a value change in the "Confirmation type" selection field:
  - "Electronic signature"  
If the user's electronic signature is required.
  - "None"  
If the value change is to be logged in the Audit Trail without user confirmation.
  - "Acknowledgment"  
If user acknowledgement of the value change is required.
4. Enable the "Comment required" check box if the user is required to input a comment as well as an electronic signature or acknowledgment.  
This check box is only enabled if "Electronic signature" or "Acknowledgment" is specified under "Type of confirmation".

## Result

If the user changes the value of a GMP-relevant tag in runtime, the value change is entered in the Audit Trail.

## Effects of tag change

### Effects in runtime

The configuration has the following effects in runtime depending on the properties of the GMP-relevant tags:

- If the user changes the value of a GMP-relevant tag in runtime, the value change is entered in the Audit Trail.
- Electronic signature  
If "Electronic signature" is specified as the "Type of confirmation", the user must log every user-related value change of the tags using an electronic signature. Otherwise the value change will be rejected.  
The user name used to sign the change is logged in the audit trail.
- Acknowledgement  
If "Acknowledgment" is specified as the "Type of confirmation", the user must acknowledge every user-related value change of the tags. Otherwise the value change will be rejected.  
The acknowledgement is logged in the Audit Trail.
- Comments  
If the "Comment required" check box is enabled, the user must also comment every user-related value change of the tags, in addition to acknowledgment or input of the electronic signature. Otherwise the value change will be rejected.  
The entered comment is logged in the Audit Trail.

## Logging recipe data record changes

### Recipe data changes

#### Changes to recipe data

User actions in runtime that are relevant to the quality of the process, such as changes of tag values or recipe values, are recorded in an Audit Trail once "GMP compliant configuration" has been enabled.

You specify during configuration which recipes must meet the requirements of "Good Manufacturing Practice" (GMP).

For GMP-relevant recipes, the following operations during runtime are recorded in the Audit Trail:

- Storing after changing and creating recipe data records
- Transfer of recipe data records to the PLC and from the PLC
- For recipe tags: Changing the setting for the synchronization of the tag values with the PLC ("offline"/"online") if the recipe tags are configured as "GMP-relevant".

---

**Note**

**Differences in the Audit Trail with recipe display and recipe screen**

If you use a recipe screen to save recipe data, enable the "GMP-relevant" property for the recipe tags. If the user changes the value of a GMP-relevant recipe tag in runtime, the changed value is recorded in the Audit Trail. You can also configure for the tag to require the user to confirm the value change with an electronic signature and enter a comment.

If you use a recipe display to edit data records of a GMP-relevant recipe, the Audit Trail includes a record of which recipe data records were saved or sent to the PLC. The value changes to the recipe tags are not logged in the Audit Trail. Use the "ExportDataRecords" system function to save the value change to data records in a csv file.

If you want to make changes to recipe data records in conformance to the FDA, disable "Enable edit mode" in the recipe view. Use the recipe screen and "GMP relevant" recipe tags.

---

If you export recipe data records in a regulated project, you can assign the recipe data with a checksum. When you later import the recipe data back, you can use the checksum to determine if the recipe data has changed. The following system functions are available for exporting and importing recipe data with a checksum:

- "ExportDataRecordsWithChecksum"
- "ImportDataRecordsWithChecksum"

## Logging recipe data changes

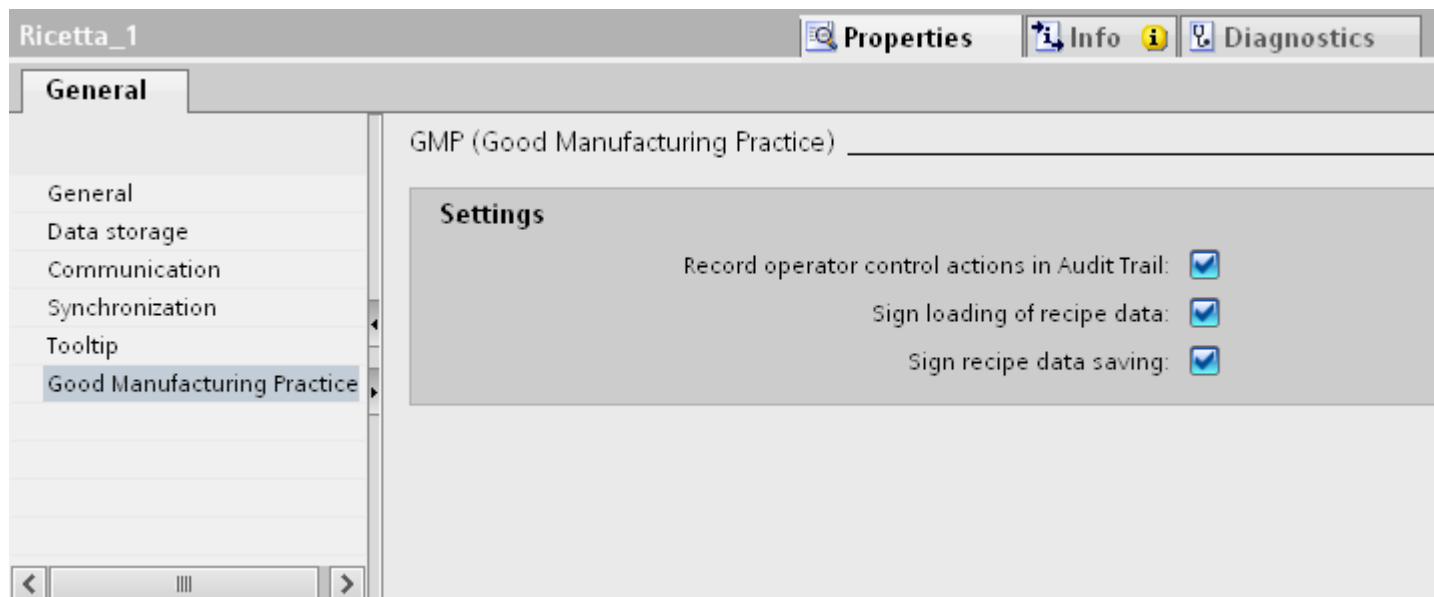

### Requirement

- "GMP compliant configuration" has been enabled.
- The recipes for which you want to configure the GMP settings are created.
- The property view is open.

## Procedure

1. Open the recipe editor and select the recipe for which you want to make GMP settings.

2. Click "GMP relevant" under "Properties > Properties > GMP" in the Inspector window.
3. Under "Settings", select the following:
  - "Record operations in audit trail:"  
If all user actions in runtime that affect this recipe are to be recorded in the Audit Trail.
  - "Sign loading of recipe data":  
If the user is required to confirm the transfer of recipe data records to or from the PLC using an electronic signature.
  - "Signature for saving recipe data: "  
If the user is required to confirm recipe data record saving with an electronic signature.

## Result

If the user works with the GMP-relevant recipe in runtime, the change is entered in the Audit Trail.

## Effects of recipe data change

### Effects in runtime

The configuration has the following effects in runtime depending on the properties of the GMP-relevant recipes:

## Entries in the Audit Trail

Entries are made in the following cases:

- You create and save new recipe data records of a GMP-relevant recipe at runtime.
- You edit recipe data records of a GMP-relevant recipe and save your changes at runtime.
- Recipe data records are transferred to the PLC or recipe data are read from the PLC.
- The "SetRecipeTags" system function is used to change the setting for synchronization of the tag values with the PLC.  
This concerns the following changes:
  - "offline" to "online"
  - "online" to "offline"

## Electronic signature

The user must enter an electronic signature in the following cases depending on the configuration:

- The "Sign loading of recipe data" check box is set:  
Signature for the transfer of recipe data records to the PLC. Signing is always required if the transfer is triggered with the recipe display functions and even if it is triggered with "SetDataRecordToPLC" system functions.
- The "Sign saving of recipe data" check box is set:  
Sign saving of recipe data records. The signature is always required if the save is triggered with the system functions of the recipe display, and even if it is triggered with the "SetDataRecordToPLC" or "SaveDataRecord" system function.
- The user name used to sign the change is logged in the audit trail.

---

### Note

The triggering of the "ImportDataRecords" system function is entered in the Audit Trail but does not require a signature or a comment. In addition, call the "NotifyUserAction" system function to request an electronic signature with or without user comment.

---

## Logging user actions

### User actions with GMP-compliant configuration

#### Introduction

In GMP compliant configuration, user actions and system operations in runtime that are relevant for the quality of the process are recorded in an Audit Trail .

For example, a user logon to the system or the change of a tag value are saved in the log.

In runtime, user actions are saved in an Audit Trail under the following conditions:

- "GMP compliant configuration" has been enabled
- A user is logged on to the system

## Logging modes

### Automatic logging of user actions

The following user actions are recorded in runtime without the need for additional configuration steps if "GMP compliant configuration" is enabled:

- User Administration
  - Logon and logoff of users
  - Import of user administration
- Alarm system
  - All alarms that are acknowledged by the user.  
If an alarm from an alarm group is acknowledged, an entry is made in the Audit Trail indicating that all other alarms of this group have been acknowledged.
  - All acknowledgment attempts of the user

---

**Note****Logging alarm text**

To log alarm texts, select the "Log alarm texts in Audit Trail" option in the Audit Trail editor.

---

- Log operations
  - Starting and stopping a log
  - Opening and closing all logs
  - Deleting a log
  - Starting a sequence log
  - Copying a log
  - Long-term logging of a log

## Configuration-dependent logging

The following processes are logged depending on the configuration of the recipes and the tags of the project:

- Change values of GMP-relevant tags by the user
- for GMP-relevant recipes
  - You create and save new recipe data records of a GMP-relevant recipe at runtime.
  - You edit recipe data records of a GMP-relevant recipe and save your changes at runtime.
  - Transfer of recipe data records to the PLC and from the PLC
  - For recipe tags: Changing the setting for the synchronization of the tag values with the PLC ("offline"/"online")

In addition to logging user actions you can configure tags and recipes to require the user to confirm or acknowledge specific actions with an electronic signature or add a comment to the change.

## Manual logging by means of "NotifyUserAction" system function

This system function is used to record actions in the Audit Trail that are not automatically entered in the Audit Trail. This system function is also used to request the user to enter an electronic signature for the action.

## Configuring the "NotifyUserAction" system function

### Introduction

This system function is used to log user actions that are not entered automatically entered in the Audit Trail. This system function can also used to request an acknowledgment, or an electronic signature for the user's action.

In this example, the system function is assigned to a button. All operations with this button are logged to the Audit Trail.

### Requirements

- "GMP-compliant configuration" has been enabled.
- You created the object that is to be assigned the system function.  
A button is used in this example.
- The properties window is open.

### Procedure

1. Click the button.
2. Click on "Events" in the Inspector window.
3. Assign the "NotifyUserAction" system function to the "Click" event.

## GMP-compliant user administration

### SIMATIC Logon

To run a central user and user group administration for several applications or HMI devices, activate SIMATIC Logon.

For more information on user administration and SIMATIC Logon, refer to the following chapter:

Managing users on the server (Page 3843)

## Logging system functions

### Introduction

If system functions are triggered in runtime, this is recorded in the Audit Trail for some system functions. If specific system functions are used on a GMP-relevant object, the user must confirm the triggering.

Some system functions are not supported when using Audit. If you use these system functions in your project, you are solely responsible for them.

The following table shows which system functions are Audit-relevant and whether the user's signature is required:

### System functions and Audit

Function (call in script)	Effect of /Audit
StartLogging (StartLogging)	entered in Audit Trail
StopLogging (StopLogging)	entered in Audit Trail
ClearLog (ClearLog)	entered in Audit Trail
StartNextLog (StartNextLog)	entered in Audit Trail
CloseAllLogs (CloseAllLogs)	entered in Audit Trail
OpenAllLogs (OpenAllLogs)	entered in Audit Trail
LogTag (---)	---
CopyLog (CopyLog)	entered in Audit Trail
ActivateScreen (ActivateScreen)	---
ActivateScreenByNumber (ActivateScreenByNumber)	---
ActivatePreviousScreen (ActivatePreviousScreen)	---
SetBitInTag (SetBitInTag)	entered in Audit Trail when tag is GMP-relevant Signature is mandatory, depending on the tag configuration
ResetBitInTag (ResetBitInTag)	entered in Audit Trail when tag is GMP-relevant Signature is mandatory, depending on the tag configuration

Function (call in script)	Effect of /Audit
InvertBitInTag (InvertBitInTag)	entered in Audit Trail when tag is GMP-relevant Signature is mandatory, depending on the tag configuration
SetBit (SetBit)	entered in Audit Trail when tag is GMP-relevant Signature is mandatory, depending on the tag configuration
ResetBit (ResetBit)	entered in Audit Trail when tag is GMP-relevant Signature is mandatory, depending on the tag configuration
InvertBit (InvertBit)	entered in Audit Trail when tag is GMP-relevant System function must not be applied to tags that require signing or comment.
SetBitWhileKeyPressed (---)	entered in Audit Trail when tag is GMP-relevant Signature is mandatory, depending on the tag configuration
SetDataRecordToPLC (SetDataRecordToPLC)	entered in Audit Trail if the recipe is GMP-relevant Signing required depending on recipe configuration
GetDataRecordTagsFromPLC (GetDataRecordFromPLC)	entered in Audit Trail if the recipe is GMP-relevant
ImportDataRecords (ImportDataRecords)	entered in Audit Trail if the recipe is GMP-relevant
ImportDataRecordsWithChecksum (ImportDataRecordsWithChecksum)	entered in Audit Trail if the recipe is GMP-relevant
ExportDataRecords (ExportDataRecords)	---
ExportDataRecordsWithChecksum (ExportDataRecordsWithChecksum)	---
LoadDataRecord (LoadDataRecord)	entered in Audit Trail if the recipe is GMP-relevant Signing required depending on recipe configuration
SaveDataRecord (SaveDataRecord)	entered in Audit Trail if the recipe is GMP-relevant Signing required depending on recipe configuration
SetDataRecordTagsToPLC (SetDataRecordTagsToPLC)	entered in Audit Trail if the recipe is GMP-relevant Signing required depending on recipe configuration
GetDataRecordTagsFromPLC (GetDataRecordTagsFromPLC)	entered in Audit Trail if the recipe is GMP-relevant

Function (call in script)	Effect of /Audit
SetRecipeTags (SetRecipeTags)	entered in Audit Trail if the recipe is GMP-relevant
GetDataRecordName (GetDataRecordName)	---
ClearDataRecordMemory (ClearDataRecordMemory)	Not supported
ClearDataRecord (ClearDataRecord)	entered in Audit Trail if the recipe is GMP-relevant
PrintScreen (PrintScreen)	---
PrintReport (PrintReport)	---
RecipeViewSaveDataRecord (---)	entered in Audit Trail if the recipe is GMP-relevant Signing required depending on recipe configuration
RecipeViewSaveAsDataRecord (---)	entered in Audit Trail if the recipe is GMP-relevant Signing required depending on recipe configuration
RecipeViewNewDataRecord (---)	---
RecipeViewClearDataRecord (---)	entered in Audit Trail if the recipe is GMP-relevant
RecipeViewGetDataRecordFromPLC (---)	entered in Audit Trail if the recipe is GMP-relevant
RecipeViewSetDataRecordToPLC (---)	entered in Audit Trail if the recipe is GMP-relevant Signing required depending on recipe configuration
RecipeViewSynchronizeDataRecordWithTags (---)	entered in Audit Trail if the recipe is GMP-relevant Signing required depending on recipe configuration

ShowSoftwareVersion (ShowSoftwareVersion)	---
SimulateTag (---)	Not supported
StopRuntime (StopRuntime)	entered in Audit Trail
ControlWebServer (ControlWebServer)	Not supported
ControlSmartServer (ControlSmartServer)	Not supported
OpenInternetExplorer (OpenInternetExplorer)	---
SendEMail (SendEMail)	---
UpdateTag (---)	---
ClearAlarmBufferProTool (ClearAlarmBufferProtoolLegacy)	Not supported
Encoding(Encode)	entered in Audit Trail when tag is GMP-relevant Signature is mandatory, depending on the tag configuration
EncodeEx(Encode)	entered in Audit Trail when tag is GMP-relevant Signature is mandatory, depending on the tag configuration

### 10.16.1.5 Performance features of GMP relevant configuration

#### Supported HMI devices

#### Supported HMI devices

The qualification "GMP relevant configuration" can be configured for the following HMI devices:

- TP 277
- OP 277
- MP 277
- Mobile Panels 277
- MP 377
- Comfort Panels
- Panel PCs with WinCC RT Advanced
- WinCC RT Advanced

---

#### Note

The qualification "GMP" is not supported by WinCC RT Professional.

---

#### Restrictions

#### Restrictions

The following functions and configurations cannot be used simultaneously with the qualification "GMP relevant configuration":

- "Status/Force" object
- PN direct keys
- DP DirectKey
- Option /Sm@rtServer
- /Sinumerik option
- The functional scope of the HMI devices is only available to a restricted degree in some circumstances because of the limited storage space

- **Events of screen objects**  
You can set mandatory acknowledgement of important user actions in runtime, such as changing tag values. If you assign an event which has to be acknowledged to a screen object, you may not assign any other events to this graphic object.  
When the event of a screen object is assigned actions which open a user dialog (such as change of a tag value with mandatory acknowledgement), you may not be able to execute these actions at other events.
- **Controlling GMP-relevant tags using a slider**  
The slider is not suitable for controlling GMP-relevant tags. Any operation of the slider will continuously change the tag value. If this is a GMP-relevant tag, a flood of entries will be generated in the AuditTrail.

## 10.16.2 WinCC Sm@rtServer

### 10.16.2.1 Basics

#### Sm@rt Options

##### Introduction

Using the Sm@rt Options from WinCC, you can communicate between HMI-systems or to an HMI-System by means of TCP/IP-connections (e.g.LAN).

##### Use of the Sm@rt Options

- Distributed operator stations with Sm@rtClients for controlling large machines or machines that are spread out over a large area.
- Operator stations with system-wide access to current process data via the communication driver "SIMATIC HTTP Protocol".
- Local servicing solution for the central archiving, analysis and additional processing of process data.
- Provision of current process data for higher-level systems (SCADA, production management systems, office applications).
- Remote control of an HMI-System by means of Internet, Intranet and LAN.
- Sending of E-Mails on the basis of messages and events
- Provisioning of Standard-HTML-Pages in HMI-system with service-and maintenance information as well as diagnostic functions.

User benefits:

- Flexible solution for access to HMI systems and process data from any location
- Reduction of load on the field bus:  
For example, the combination of WinCC Runtime and SIMATIC panels enables a factory control system to have access to process data. No load is placed by the factory level on the sensitive field level with respect to the necessary communication requirements. These requirements are handled by HMI Runtime along with the SIMATIC-panels.
- Expensive on-site service visits to be avoided by using the remote control. Unplanned non-operation periods are reduced and the system productivity is increased.

**Note**

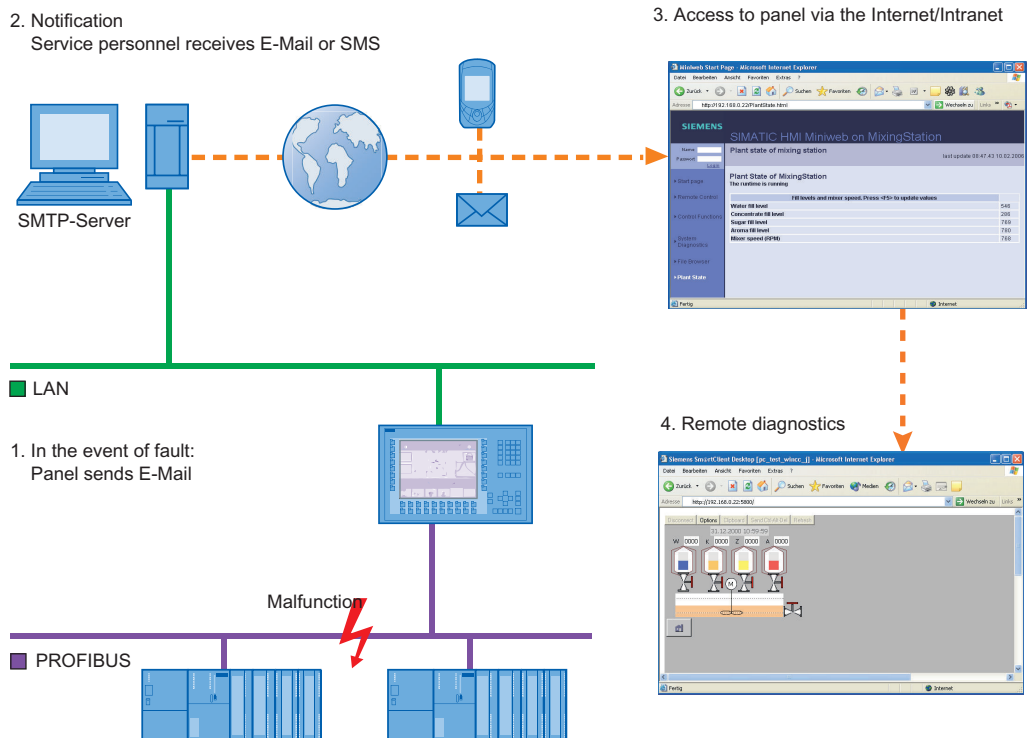

On devices with version V11 or V12, the password "100" is preset for the Sm@rtServer and for the integrated Web server. This password should be changed for security reasons.

On devices with version V13, no passwords are preset.

**Application scenarios**

**E-Mailing and remote diagnostics**

A factory has a service contract with an external service company. The HMI device and the service technician's PC are linked together over a TCP/IP-ready network. E-mail delivery of certain alarms to the service technician was configured in the project. The service technician accesses the HMI device via the Internet and executes remote diagnostics.

**Application example:**

Amongst other things, flow rates are measured in the process control of a cooling unit. Contamination in a feed line reduces the flow of coolant. When the flow rate drops below the configured threshold value, the operating device displays a warning. In addition, this warning is also dispatched as an e-mail to the assigned service technician.

The service technician then establishes a connection with the remote device and takes the appropriate actions.

Advantage: An alarm that reaches the service technician in a timely manner helps to minimize unplanned downtime.

**Distributed operator stations**

Distributed operator systems, the Sm@rtClients are used for controlling large machines or machines that are spread out over a large area.

The Client-HMI device connects to Sm@rtServer via the Sm@rtClient-Display.

The operator can operate and monitor the system from various locations. The operator sees the same image at each operator station, whereby only one station can be operated at one point of time.

The type of operation is also named as a coordinated operation. Then you must change the configuration only at Sm@rtServer.

**Access to the tags via SIMATIC HMI HTTP Protocol****Operator stations with system-wide access**

For use of the SIMATIC HMI HTTP Protocol, you can provide tags of HMI-device (HTTP-Server) to another device (HTTP-Client).

Thus the local as well as centrally used HMI-systems have access to the tags of other stations. Cell-concepts or line-concepts can be simply implemented. De-centrally obtained information is available centrally.

This concept also permits the setting of cost-effective and small central servicing. There are additional options for archiving, analysis and additional processing of registered process data, if a PC is used for that.

**Remote monitoring and remote control- servicing solution**

If you connect the use of the SIMATIC HMI HTTP Protocol and the Sm@rtServer with each other, you can implement a complex servicing solution.

For this, display the interested tags of the HMI-devices on the Service-PC. If necessary, use the PC for the remote monitoring and remote control of a specific HMI-device.

The locally used HMI-devices are connected with each other and the total process is controlled comprehensively.

The concept of the remote servicing is possible by using the Sm@rtClient-Display in the servicing HMI-Application. The operator has access to the respectively desired local HMI-device through flexible configuration of the Sm@rtClient-Display.

### Connection to the Office-world

The possibility of data exchange exists between HMI-device and office-applications, e.g. MS Excel, with help of VBA-Macro.

For this, the HMI-device must support the Web-Service(SOAP). A script or macro is called in the external application, which has only read or write access to the concerned tags according to provided syntax.

### HMI devices suitable for use

### HMI devices suitable for use

The following table shows the HMI-devices that are suitable for the use of Sm@rt Options.

The number of the connections based on "SIMATIC HMI HTTP Protocol" and the number of maximum connected Sm@rtClients depends on the HMI-device. For additional information see the "Performance features" documentation and in the technical manual of your HMI-device.

Technical data subject to change.

HMI device	Sm@rt Options
270 series	Yes
370 series	Yes
OP 177B PN/DP TP 177B PN/DP	Yes
Mobile Panel 177 PN Mobile Panel 277	Yes
In view mode only: <ul style="list-style-type: none"> <li>• Mobile Panel 277 IWLAN</li> <li>• Mobile Panel 277 IWLAN V2</li> <li>• Mobile Panel 277F IWLAN (RFID Tag)</li> </ul>	Yes
Comfort Panels	Yes
WinCC Runtime Advanced	Yes

### Combining options on panels

The following table shows which options and functions on the panels can be combined with each other.

Technical data subject to change.

	SIMATIC HMI HTTP Protocol	Sm@rt Options	HTML browser	WinAC/ MP
SIMATIC HMI HTTP Protocol	--	Yes	Yes	Yes
Sm@rtServer	Yes	--	No	No
HTML browser	Yes	No	--	No
WinAC/ MP	Yes	No	No	--

## Settings for Sm@rt Options

### Configuration in WinCC

#### Introduction

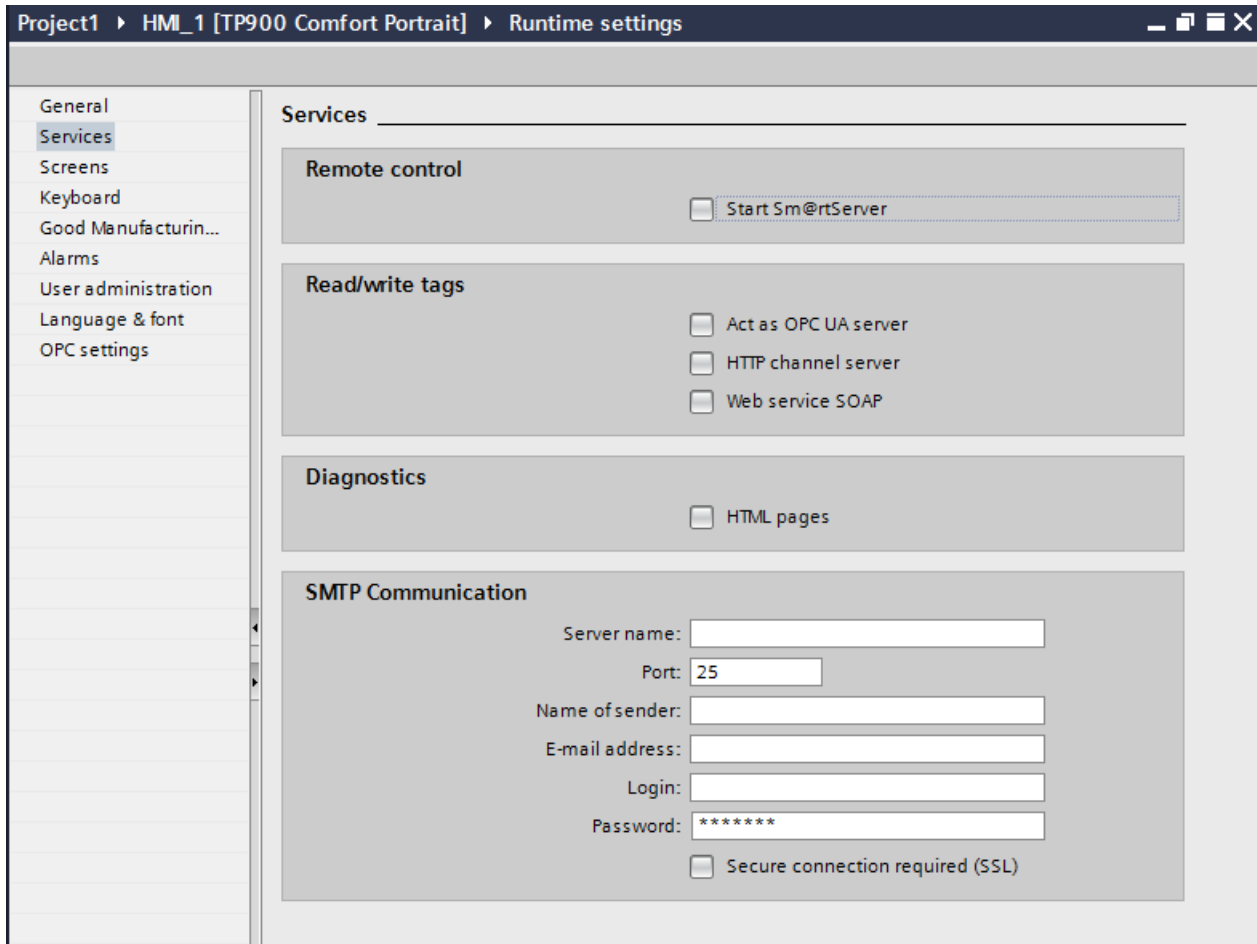

In the "Runtime-Settings" Editor, configure the requirements for using the Sm@rt Options.

As an alternative, configure the settings in the Control Panel of the HMI-device.

Note that the settings on the control unit have a higher priority than the settings in the WinCC-project.

### Open

Double-click on the "Runtime-settings" entry in the project tree. In the "Runtime-settings" editor, click on the "Services".

**"Remote control" Group.**

Enter the settings for the selected HMI device in the work area:

- "Remote control" Group.
  - Start Sm@rtServer  
Configures the HMI-device as Sm@rtServer.

**"Read/write tags" group for Panels**

- Operate as OPC server  
Configures the HMI device as an OPC server.
- SIMATIC HMI HTTP server  
Configures the HMI device as HTTP server.
- Web service SOAP  
Activates tag access via SOAP.

**"Read/write tags" group for Comfort Panels**

- Operate as OPC UA server  
Configures the HMI device as an OPC UA server.
- SIMATIC HMI HTTP server  
Configures the HMI device as HTTP server.
- Web service SOAP  
Activates tag access via SOAP.

**"Read/write tags" group for RT Advanced**

- Operate as OPC server
  - Operate as OPC DCOM server  
Configures the HMI device as an OPC DCOM server.
  - Operate as OPC UA server  
Configures the HMI device as an OPC UA server.
- SIMATIC HMI HTTP server  
Configures the HMI device as HTTP server.
- Web service SOAP  
Activates tag access via SOAP.

### "Diagnostics" Group

- HTML pages  
Activates service pages of the HMI device.

### "SMTP Communication" Group

Activates service pages of the HMI device. "SMTP Communication" Group

- Server name  
Enter the name of SMTP server, through which you want to send E-mails.
- Name of the sender  
Enter the sender name. The recipient sees in the E-Mail from which device the E-mail originates, e.g. "HMI device Production line 2". If the function is not supported by the SMTP-Server, delete the entry. You can obtain more detailed information for this from your service provider.
- E-mail address  
If you use an SMTP server that requires a valid e-mail address for authentication, enter it here, for example, "John.Doe@gmx.net."
- User name  
If you use an SMTP server that requires a user name for authentication, enter it here. You can obtain the user name from your service provider.
- Password  
If you are using an SMTP server that requires a password for authentication, enter this password. You can obtain the user name from your service provider.
- The server requires a secure connection (SSL).  
The data are sent via an SSL connection. Your service provider can tell you if your mail server supports an SSL connection.

## Configurations on the HMI device

### Settings on the HMI device

#### Introduction

The Sm@rt Options settings in the HMI device are configured in the dialog box "WinCC Runtime Advanced Internet".

Additional tabs may be included in the dialog "WinCC Runtime Advanced Internet". This depends on which options are activated for the network operation in the project.

Note that the settings on the control unit have a higher priority than the settings in the WinCC-project.

#### Tabs

You have opened the dialog "WinCC Runtime Advanced Internet" with the symbol "WinCC Runtime Advanced Internet" .

The "WinCC Runtime Advanced Internet" dialog of the control panel can contain the following tabs:

- WinCC Runtime Advanced Internet, "Email" tab (Page 6189)
- WinCC Runtime Advanced Internet, "Proxy" tab (Page 6190)
- WinCC Runtime Advanced Internet, "Web Server" tab (Page 6191)
- WinCC Runtime Advanced Internet, "Remote" tab (Page 6192)

## Input area plan

At Sm@rtServer and Sm@rtClient, the same input area plan must be set.

The Sm@rtServer uses the Standard-Input area plan of the operating system: (Start>Settings>Control Panel> Country settings>Tab "Entry"). These changes become effective after system restart.

At Sm@rtClient, the same input area plan must be set like at Sm@rtServer. No restart is necessary after the switchover of input area plan at Sm@rtClient.

## WinCC Runtime Advanced Internet, "Email" tab

### Purpose of the dialog box

Specifies the settings for the E-Mailing.

### Settings

- SMTP server
  - Enter the SMTP-server name.
  - Use the default of project file  
The SMTP-Server name from the WinCC-Project is used.
- Name
  - Name of sender  
Enter the sender name. The recipient sees in the E-Mail, from which device the E-mail originates, e.g. "HMI-device Production line 2".  
If the function is not supported by the SMTP-Server, delete the entry. You can obtain more detailed information for this from your service provider.
  - eMail Adress of sender  
If you use an SMTP server that requires a valid e-mail address for authentication, enter it here, for example, "John.Doe@gmx.net."

### Dialog "Advanced Email Settings"

## 10.16 Options

- Authentication
  - Use the default of project file  
The user name and the password from the WinCc-Project are used.
  - Disable authentication  
Authentication is not required.
  - Use panel settings for authentication  
The settings of the HMI-device are used. Enter the user name under "Login" and the password under "Password". You can obtain the user name and the password from your service provider.
- Encryption
  - Use the default of project file  
The setting from the WinCC-Project is used.
  - Enable SSL  
The user information and e-mail are encrypted for transmission.
  - Disable SSL  
The user data and e-mail are sent un-encrypted.

### See also

Settings on the HMI device (Page 6186)

## WinCC Runtime Advanced Internet, "Proxy" tab

### Purpose of the dialog box

Settings for utilizing the Proxy-Server.

---

#### Note

Enter the Proxy-Server in "Internet Options" at PC.

---

### Settings

- Use proxy server  
Activate the "Use Proxy Server" if access is given in your network via Proxy-server.
- Proxy  
Enter the name or the address of the proxy-server.
- Port  
Enter the port of the proxy-server.

## WinCC Runtime Advanced Internet, "Web Server" tab

### Purpose of the dialog

The following is configured:

- The utilization of the integrated web server and of the HTTP-Server
- User and user web authorizations

### Settings

#### Tag access

Governs the access to tags via the "SIMATIC HMI HTTP protocol":

- "Read/write": Read/write access
- "Read only": read access only

#### Tag authenticate

Governs the authentication in case of access to variables via the SIMATIC HMI HTTP Protocol":

- "No authentication": No authentication is required for access.
- "Authentication required": An authentication is required for access.  
Specify the user name and password when configuring the communication driver "SIMATIC HMI HTTP Protocol".

#### Enable Remote-Transfer for Projects

This setting enables remote transfer of project files.

#### Start automatically after booting

(on panel only)

The web server is automatically started after the HMI device boots. As a result, the web server is utilized independent of the runtime.

---

#### Note

##### Start web server automatically on PC

Add a link with the program "Miniweb.exe" in the Autostart-Organizer in order to start the web server automatically after the PC starts. The program is located in the installation index of runtime.

---

#### Close with Runtime

The web server is closed along with Runtime.

#### User Administration

After entering the password, the "UserDatabase-Edit". dialog opens. The "UserDatabase-Edit" dialog is the user administration of the web server.

#### Start Webserver

Starts the web server.

**Close Webservice**

Ends the web server.

**WinCC Runtime Advanced Internet, "Remote" tab**

**Purpose of the dialog box**

Settings for the Sm@rtServer

**Settings**

**Start automatically after booting**

The Sm@rtServer is automatically started after the HMI device boots. Otherwise the Sm@rtServer starts together with the Runtime.

**Close with runtime**

The Sm@rtServer is closed together with Runtime.

**Change settings**

Opens the "Sm@rtServer: Current User Properties" dialog for specifying the passwords, authorizations, the screen update mechanism and the behavior when connections are disconnected.

---

**Note**

This dialog is titled "Sm@rtServer: Default Local System Properties" on the panel.

---

The dialog contains the following tabs:

- "Server" tab (Page 6193)
- "Polling" tab (Page 6194)
- "Display" tab (Page 6195)
- "Query" tab (Page 6196)
- "Administration" tab (Page 6197)

**Start Remoting**

Starts the Sm@rt Server explicitly.

**Stop Remoting**

Ends the Sm@rt Server explicitly.

## "Sm@rtServer Dialog: Current User Properties"

### "Server" tab

#### Purpose of the dialog

Specifying passwords, web authorizations and the disconnection.

#### Incoming connections

Settings for handling an attempt to establish a connection.

- **Accept socket connections**  
This setting enables the connection to the HMI device. It is a basic requirement for using the Sm@rtServers from the outside.  
If this check box is deactivated, no remote monitoring and no remote control is possible.
- **Encrypt communication**  
Allows an encrypted connection between Sm@rtClient and Sm@rtServer.
- **Password 1**  
First password for remote access. "View only" is disabled as default.
- **Password 2**  
Second password for remote access. "View only" is selected by default.  
This password can be provided as a reserve password for third-party users (such as service technicians); it can be modified when necessary without significant effort within the organization.
- **View only**  
If this check box is enabled, read access (monitoring mode) is the only access available when the corresponding password is entered.  
Default: Enabled

---

#### Note

For devices with HMI device version prior to V13, both passwords are preset as "100".  
Change this password during commissioning according to your requirements.

---

#### Enable network packets queuing (slower)

This setting enables splitting of data into multiple data packets, which are sent separately over the network. It is useful when multiple clients are connected.

### Display or port numbers to use

Here, you select the TCP/IP port in the network where the Sm@rtServer waits for attempts to establish a connection.

- "Auto": The Sm@rtServer automatically searches for the appropriate port by itself.
- "Display": The server uses port 5900 plus display number. For HTTP, the server utilizes Port 5800 plus display number.
- "Ports": You enter the port numbers for the "main" and "HTTP" yourself.

### No local input during client session

The keyboard and mouse on the server-HMI device are disabled as long as connections are active.

For example, this setting is useful when an HMI device is being administered from outside.

### Remove desktop wallpaper (on PC only)

This setting removes the screen background on the PC, thus saving transmission effort.

Default: Enabled

### When last client disconnects (on PC only)

This setting governs the behavior after disconnection of the last client connection:

- "Do nothing": no response.
- "Lock workstation": Server PC is locked.
- "Logoff workstation": Server PC is logged off.

The latter two settings are only useful if the Sm@rtServer is running as a service.

### "Polling" tab

#### Purpose of the dialog

Specifying the screen update and the use of virtual graphics driver.

#### Polling modes(on PC only)

The settings govern the screen update.

Most changes are recognized automatically by the server. In case of problems, you can enter additional settings here.

The update method cannot be set on the panel. The settings is always "Poll Full Screen".

- Poll foreground window (On PC only)  
Updates the current window.  
It increases the load on the server.
- Poll window under cursor (On PC only)  
Updates the window that is located under the mouse cursor. The window is updated when a change occurs in the operator control element under the mouse cursor.  
Default: Enabled
- Poll full screen (On PC only)  
This setting specifies an update each time the screen changes. This setting provides you the lowest display error but places a maximum load on the server.
- Polling cycle  
Determine the suitable setting for your configuration. Make sure that the selected update cycle is not too short, since it affects the computer load.

### Window polling

- Poll console windows Only (On PC only)  
This setting specifies an additional update when changes occur in a console window (MS input requirement).
- Poll on event received only (Only on the PC)  
This setting specifies an additional update each time an entry is made.  
Default: Enabled
- Mirror driver status  
(Only on the PC with a mirror driver installed)  
Provides information about the status of the virtual graphics driver.

### Mirror driver options (only on a PC with installed mirror driver)

Enable direct access to display driver's mirror screen

The shared-memory area of the virtual graphics driver is used for the display. The setting improves the performance.

### Troubleshooting (on PC only)

- Don't use VNCHooks.DLL while polling full screen  
VNCHooks.dll is used by default for the screen update. If VNCHooks.dll causes problems when using other program, select this setting.
- Don't use mirror display driver even if available  
(Only on the PC with a mirror driver installed)  
Use this setting only for troubleshooting.

### "Display" tab

#### Purpose of the dialog

Setting of the screen display.

### Sharing area(on PC only)

- Full desktop  
The entire desktop of the server is accessed.
- Primary display  
The main screen of the multi-monitor configuration is displayed.

### Downscale to(on PC only)

Scales the screen to be transferred according your inputs. Servers with Windows CE ignore this setting.

### "Query" tab

#### Purpose of the dialog

Settings for incoming connection attempts.

---

#### Note

This dialog is titled "Default Local System Advanced" on the panel.

---

### Query settings

These settings govern acceptance of incoming attempts to establish a connection.

- Query console on incoming connections  
The Sm@rtServer registers the incoming attempts to establish a connection and displays a dialog on the screen in which the connection attempt is accepted or rejected.
- Query timeout  
Set the waiting time.
- Default action  
Select the response to an attempt to establish a connection once the waiting time expires:
  - "Refuse": Reject attempt (operator control mode - single mode)
  - "Accept": Accept attempt (operator control mode – shared mode)

### Allow option to accept without authentication

The dialog for handling attempts to establish connections also contains the button "Accept without password" . This gives you the option to accept an attempt to establish connection without a password.

## "Administration" tab

### Purpose of the dialog

Specifications for session management.

---

#### Note

This dialog is titled "Default Local System Advanced" on the panel.

---

### Administration

- **Disable empty passwords**  
Select this check box in order to allow an empty "Password 1".  
Default: Enabled
- **Allow loopback connections**  
This setting allows connections to your own HMI device. It is useful and necessary when security software is used for secure (encoded) connections.
- **Allow only loopback**  
This setting allows only connections to your own HMI device.

### Logging

- **Log info to SmartServer.log**  
(On the panel: Log information to file)  
This setting writes information to the server logbook.
- **Log detailed debugging information**  
This setting writes expanded information to the server logbook (for locating errors).

With HMI devices operating with Windows CE, the log is only created when the MMC card is inserted. If the MMC card is inserted, the log is created directly on the card.

The log files are created in the following path on a PC: C:\Documents and Settings\All Users\Application Data\Siemens\HmiRTm

### Forced write access

This setting governs forced access in an emergency contrary to normal session management.

- Password needed

If this check box is not selected, every operator can force access in emergencies as follows:

- Pressing the <Shift> key four times
- Clicking four times
- Touching the screen four times

If this check box is enabled, to force access an attempt must be made to gain access and a password must also be entered.

In this case, enter the applicable password in the input field underneath. If a password is not entered, it is not possible to force access in an emergency.

Default: Enabled

---

#### Note

On the server, access can only be forced by pressing the <Shift> key four times, clicking four times, or touching the screen four times.

---

### HTTP-Server

- Enable built-in HTTP server

If this check box is activated, the Java-Applet is automatically downloaded on the PC when the connection is first established.

The Java applet accesses the Java VM that is installed on the client and enables remote monitoring and remote control using Internet Explorer.

Default: Enabled

- Enable applet params in URLs

Forwards all parameters of the URL to the Sm@rtClient application.

### Connection priority

These settings govern handling of attempts to establish a connection by non-shared clients.

- Disconnect existing connections

When an attempt is made to establish a connection by a non-shared client, the attempt is accepted; the existing connections are disconnected (single mode).

- Automatic shared sessions

When an attempt is made to establish a connection by a non-shared client, the attempt is accepted; the prior existing connections are retained. Access is controlled using session management in shared mode.

Default: Enabled

- **Active user timeout**  
For shared mode, enter the time that must elapse without any actions on the active HMI device before access can be changed.  
Default setting: 10 seconds
- **Refuse concurrent connections**  
If a non-shared client is already connected to the server, attempts to establish a connection by other non-shared clients are rejected.

### See also

Remote control by means of Internet Explorer (Page 6214)

## User administration for web server

### Introduction

Different web authorizations for the operation and monitoring are allocated to the users in the user administration.

### Requirement

- The "WinCC Runtime Advanced Internet" dialog is open.
- The "Web Server" tab is displayed.

### Entries and settings

Click "User Administration" in the "Web Server" tab and enter the password.

---

#### Note

By default, the password is set to "100" and all web authorizations are granted to users with "Administrator" rights. Change this password during commissioning according to your requirements.

---

The "UserDatabase-Edit" dialog is opened.

The "UserDatabase-Edit" dialog has three tabs:

- Tab "User Manager"  
User administration for creation or deletion of users.  
Create a new user using "New"; Delete a user using "Remove". The recreation and deletion become effective using "Apply".
- Tab "Description"  
You can store a description of or comments on the users selected on the "User Manager" tab.
- Tab "Authorizations"  
Specify the web authorizations for the users selected on the "User Manager" tab. You use "Add" to activate a web authorization and "Remove" to deactivate one.  
By default, the password is initially preset to "100" and all web authorizations are granted to users with "Administrator" rights.  
For read and write access to the file browser, the user must possess the web authorizations "FileBrowserAdministrator" and "FileBrowserUser".

---

**Note**

In principle, every user who has access to the control panel can manage users and web authorizations. If necessary, protect the control panel from unwanted access.

---

**List of web authorizations**

The following web authorizations exist:

Web authorization	Authorized for:
UserData	Import and export of recipes
UserAdministrator	Import and export of password lists
RuntimeAccess	Starting and stopping of runtime
Engineering	HTTP transfer from ES to the target device
FileBrowserUser	Read access to the file browser
FileBrowserAdministrator	Read/write access to the file browser
RTCommunication	Utilization of the SIMATIC HMI HTTP server
SoapUser	Read/write access via web service (SOAP)

## Settings for remote control

### Session management for remote control

#### Introduction

WinCC enables remote monitoring and remote control of HMI devices over a TCP/IP-ready network such as a LAN or the Internet. Remote monitoring and remote control is implemented in different ways:

- Remote control by means of Internet Explorer
- Remote control by means of the Sm@rtClient-application
- Remote control by means of the Sm@rtClient-display in

Only one device can ever have access to the HMI-device. Which device is permitted access is determined by the session management.

#### Session management options

Session management is used to control access. The client-server connection can be in one of two modes:

- Monitoring mode
- Control mode

#### Monitoring mode

If the client accesses the server in monitoring mode, the operator can see the current screen of the HMI device and track all changes. He can monitor the server but cannot operate.

In the monitoring mode, all the keys on the client retain their standard functions.

If remote control was started from the Sm@rtClient display, the operator uses the <Tab> key or the cursor keys to go to the next object in the current screen of the client project.

#### Control mode

If the client accesses the server in operator control mode, the operator can use the mouse and the keyboard to control the server from the client. If an access attempt is made from another client, the assignment of operating permission depends on the settings at the server and at the clients.

In operator control mode, the client keys act on the server screen. Thus, the operator uses the <Tab> key to go to the next object in the current screen of the project running on the server.

If remote control was started from the Sm@rtClient display, the operator can only go to another object or screen in the project on the client by using an additionally configured function or an additional menu command. The operator to this menu command as follows:

- On the Touch-device, in which he touches the screen longer than 1 sec.
- On the keyboard =device, in which he masks on the menu with <Shift+Control> and operates it with <Alt> and the keyboard.

In both operating modes, the Sm@rtServer is set so that the operator at the remotely controlled device, the server, can be prevented from performing any activities.

In an emergency, the operator can exact the user rights on a remotely controlled HMI device as well as on an inactive HMI device. If no password is specified, he must click the user interface four times consecutively, touch the screen four times consecutively, or press the <Shift> key four times consecutively. If a password is specified, he must click once or press a key on the client and then enter the specified password.

### Settings for session management

You make settings for session management on the server and on the client in the Control Panel "WinCC Internet Settings".

### Configuring Sm@rtServer for remote control

#### Introduction

The Sm@rtServer has an internal security concept based on passwords and special settings for session management.

#### Security concept for the Sm@rtServer

Remote monitoring and remote control of the Sm@rtServer from the Sm@rtClient is protected by two functions:

- Encrypt encryption of communication to the server
- Passwords

#### Encrypt communication to the Sm@rtServer

The "Encrypt communication" function provides a secure connection between Sm@rtClient and Sm@rtServer.

After you have activated the "Encrypt communication" function, the Sm@rtServer sends a Sm@rtServer-specific certificate to the Sm@rtClient.

The Sm@rtClient must support the "Encrypt communication" function for encrypted communication.

The certificate sent by the Sm@rtServer must be accepted to establish communication on the Sm@rtClient.

All connections between Sm@rtClient and Sm@rtServer are then only possible on the basis of the exchanged certificate.

## Passwords for the Sm@rtServer

Remote monitoring and remote control of the Sm@rtServer at the Sm@rtClient is protected by two passwords.

The second password is used as a further password for additional access, for example, as a service password.

### Note

#### Passwords for the Sm@rtServer

No default passwords are set.

Therefore, assign the passwords before you use the Sm@rtServer.

## Settings on the Sm@rtServer

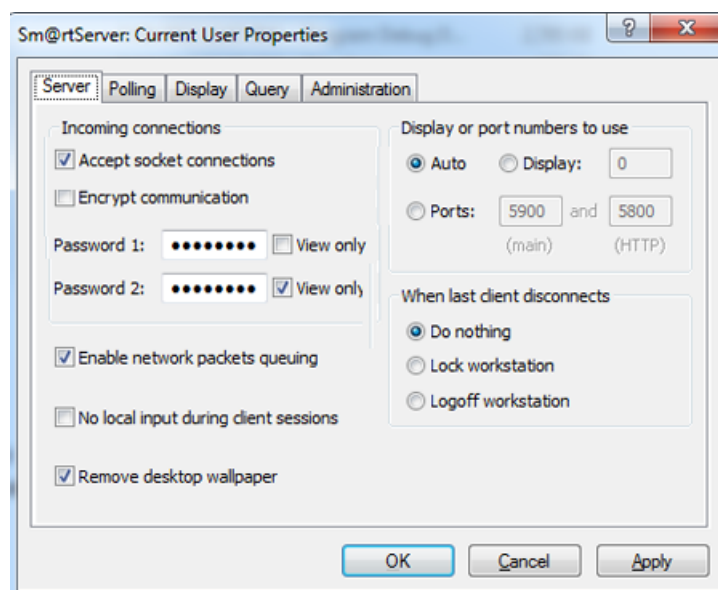

The settings on the server govern which remote operators can access the runtime of the server.

The passwords for access are set on the server. Open "WinCC Runtime Advanced Internet" in the control panel. On the "Remote" tab, click "Change Settings". On the following Server tab of the subsequent dialog, enter the passwords of the Sm@rtClient. For both passwords, you can use "View only" to set the monitoring mode and to exclude operator control mode.

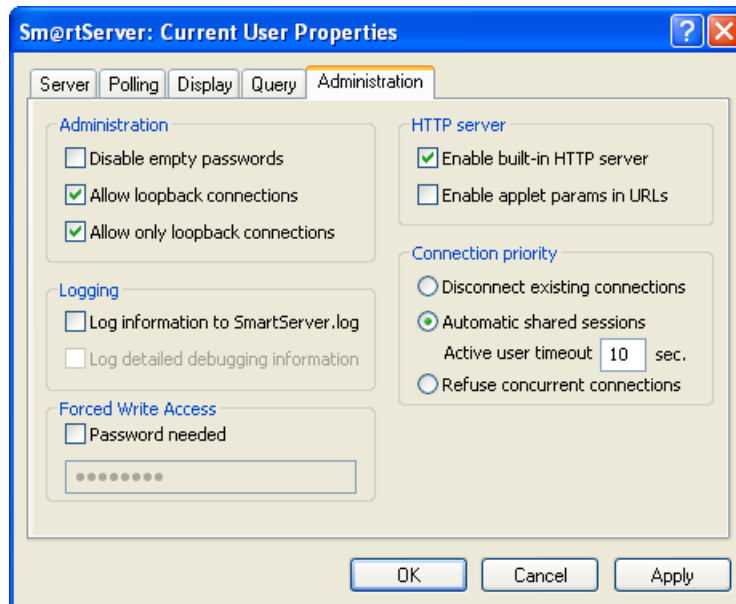

On the panel, this dialog is called "Sm@rtServer: Default Local System Properties" and contains fewer dialog elements than the dialog on the PC.

## Control mode

To enable control mode, the "View only" check box must be cleared, at least for "Password 1" (Password 1).

The manner in which the individual remote control station can access the server is set on the "Administration" tab.

- "Disconnect existing connections"  
When an access attempt is made by a non-shared client, the previous connection is automatically disconnected and control is transferred to the new client.  
When an attempt is made to access by a shared client, the behavior is the same as described for "Automatic shared sessions".
- "Automatic shared sessions"  
When an access attempt is made, control is transferred to the new client.  
The condition for transferring control is that no action has been undertaken by the previously active client for a period of time (in seconds) as specified in the "Active user timeout" setting.
- "Refuse concurrent connections"  
When an attempt is made to access by a non-shared client, this access attempt is rejected so long as the operator station that currently has access is still connected to the server.  
When an attempt is made to access by a shared client, the behavior is the same as described for "Automatic shared sessions".

### Disabling local operator control of the server

To do so, open the "WinCC Internet Settings" in the Control Panel. On the "Remote" tab, click "Change Settings". On the "Server" tab in the subsequent dialog, select "No local input during client session".

### Password for forced access

A password can be specified in "Forced Write Access" for forced access in an emergency.

## Sm@rtServer as a service

You can let the Sm@rtServer run as a service. The operator can then also access the service-HMI device from the client-HMI device, for example, the screen saver is active with a password.

Select the check box "Start automatically after booting" in "WinCC Runtime Advanced Internet" on the "Remote" tab.

## Sm@rtServer as service in Windows 7

The Sm@rtServer always runs as a service under Windows 7. You cannot stop the Sm@rtServer in Runtime with the Notification Area in the taskbar. You have the following options for stopping the Sm@rtServer:

- Stop using the "ControlSmartServer" system function  
Configure the "ControlSmartServer" system function to a button, for example. Select the "Stop" mode at the system function. You can stop the Sm@rtServer in Runtime by clicking the button.
- Stopping the Sm@rtServer in the Control Panel:  
Open "WinCC Runtime Advanced Internet" in the Control Panel and select the "Remote" tab. Click on the "Stop" button. Sm@rtServer is stopped.
- Stopping Sm@rtServer by stopping Runtime:  
Open "WinCC Runtime Advanced Internet" in the Control Panel and select the "Remote" tab. Activate the "Close with Runtime" option. The Sm@rtServer is stopped at the stop of Runtime.

## Configure Sm@rtClient for remote control

### Settings on the client PC

- **Monitoring mode**

At the client-PC you limit the connection to observation mode, if required. This allows you to prevent unintended control operations.

  - If connection is via the Sm@rtClient application  
In the following "Sm@rtClient Connection" of Sm@rtClient-application, click "Options..." button.  
In the "Sm@rtclient Options" dialog, select the setting "View only (inputs ignored)".
  - If connection is via Internet Explorer  
Click on the button "Options..." and select "View only" in the subsequent dialog.
- **Layout**

You can also specify whether or not the HMI-device is to be displayed with the same layout in the Sm@rtClient application. This is useful if you access from a PC on a touch device. In order to suppress the layout, select the "Sm@rtclient Options" setting in the "Suppress Device Layout" dialog.  
In addition, you can use "Scale by" to zoom in or out of the layout. To use "Scale by", the Suppress Device Layout setting must be selected or the HMI-device must not supply any layout. Otherwise, the desktop is always displayed with a zoom setting of 100%.

---

#### Note

If you scale the display, the performance may be impaired in some situations:

- Strong scaling, for example from 1600 x 1200 px to 640 x 480 px.
  - Scaling with non-matching scaling factors, for example from a 4:3 resolution to 16:10 resolution.
- 

### Configuring of the Sm@rtClient-display

You can configure the Sm@rtClient display in different ways, and thereby set certain inputs: The server name, the password for accessing Sm@rtServer or the restriction to the monitoring mode.

## Encrypted communication

You must enable the "Encrypt communication" function for encrypted communication with the Sm@rtServer.

- Support for the "Encrypt communication" function on the Sm@rtClient  
If the Sm@rtClient does not support the "Encrypt communication" function, no communication is possible with a Sm@rtServer which has enabled the "Encrypt communication" function.  
Enable the "Encrypt communication" function on the Sm@rtServer.
- Enabling the "Encrypt communication" function on the Sm@rtServer by the Sm@rtClient  
You can also enable the "Encrypt communication" function on the Sm@rtServer from the Sm@rtClient:
  - Establish a connection to the server.
  - Enable the "Encrypt communication" function in the "Standard VNC Authentication" dialog.
  - Certificates are exchanged between the Sm@rtServer and Sm@rtClient.
  - The certificate sent by the Sm@rtServer must be accepted by the Sm@rtClient.

## Sm@rtClient-Application

### Dialog "New Sm@rtServer: Connection"

#### Introduction

This dialog opens when you click the "Sm@rtClient" button in the taskbar.

#### Purpose of the dialog box

This dialog is used for selecting the server and the connection method.

##### **Sm@rtServer:**

Enter the address of the server to which the connection is to be established. The various options for entering the address can be found in "Remote control by means of the Sm@rtClient application (Page 6215)".

##### **Connection profil**

Select the type of connection to the server according to the network you are using.

##### **Listening mode**

If you enable this function, the Sm@rtClient application is minimized and appears as a button in the Windows taskbar. The Sm@rtClient waits for the Sm@rtServer to establish a connection. To establish the connection, click the "Sm@rtServer" button in the Windows taskbar of the server. Select "Add new client" in the context menu.

##### **Options**

The "Sm@rtClient Options" dialog containing the technical settings for the Sm@rtClient-application is displayed.

## See also

"Options" dialog, "Globals" tab (Page 6210)

"Options" dialog, "Connections" tab (Page 6208)

## "Options" dialog, "Connections" tab

### Purpose of the dialog box

Technical settings for the Sm@rtClient-application are specified in this dialog box.

Only change the settings here in special cases.

---

#### Note

You can also specify these settings in the Java Applet. Note that some of the dialog elements are named differently there.

---

### Format and encodings

Settings for compressing (encoding) the screen data of the server.

- Use encoding  
Preassigned based on the selection under "Connection profile".  
Select the desired compression or "Raw" (no compression).
- User 8-bit color  
(Only in the Java-Applet): Reduces the color depth at the client to 8 bits (256 colors). The data are then transferred faster. However, incorrect colors may result.
- Custom Compression level  
Allows individual customizing of the compression level in the "Level" input field:  
1 = least compression (faster); 9 = maximum compression (slower).
- Allow JPEG compression  
Allows the use of JPEG compression (involves losses).  
Enter the "Screen quality" in the input field underneath:  
1 = least compression (faster); 9 = maximum compression (slower).
- Allow CopyRect encoding  
(In the Java-Applet: Use CopyRect. Encoding)  
Allows compression while using "similar rectangles".

### Restrictions

- Viewonly (inputs ignored)  
Sets the view mode for this client irrespective of the settings on the server.
- Disable clipboard transfer  
Disables the clipboard that is used to transfer data from one PC to another. Applies only to the copying and pasting of texts.  
This functionality is not available at a Windows CE server.

### Display

Settings for the screen display

- **Scale by**  
Zooms in or zooms out the desktop to be displayed. To use "Scale by", the Suppress Device Layout setting must be selected or the HMI-device must not supply any layout. Otherwise, the desktop is displayed with a zoom setting of 100%.
- **Fullscreen Mode**  
Displays the desktop to be shown in full-screen mode. If the server screen is larger than the screen of the client, it is scrolled automatically by the mouse movement.
- **Suppress Device Layout**  
In the Sm@rtClient application window, the entire layout of remote HMI-device is not shown.
- **Use CTRL + Cursor Key for Scrolling**  
The key combinations <CTRL> + cursor key are used to scroll within the local screen. They are no longer transferred to the server.

### Mouse

(In the Java-Applet: Mouse buttons 2 and 3)

Settings for the evaluation of mouse actions

- **Emulate 3 Buttons (with 2-button click)**  
Emulation of a three-button mouse by a two-button mouse.
- **Swap mouse buttons 2 and 3**  
(In the Java-Applet: reversed/normal)  
Mouse buttons 2 and 3 are swapped.

### Mouse cursor

(In the Java-Applet: Cursor shape updates)

Settings for the display of the cursor

Select the type of transfer of the mouse actions:

- **Track remote cursor locally**  
The information on the location of the cursor is transferred separately from the screen information. This speeds up the transfer of the cursor. (JavaApplet: Enabled)
- **Let remote server deal with mouse cursor**  
Tracks the server cursor to the client cursor. This allows more accurate cursor positioning. (YES: Ignore)
- **Don't show remote cursor**  
The cursor at the server is not included in the transfer. (YES: Disable)

### Request shared session

(In the Java-Applet: Share desktop)

Declares this client to be a non-exclusive client.

## See also

Dialog "New Sm@rtServer: Connection" (Page 6205)

## "Options" dialog, "Globals" tab

### Purpose of the dialog box

Technical settings for the Sm@rtClient-application are carried out in this dialog box.

Only change the settings here in special cases.

---

#### Note

You can also carry out these settings in the Java Applet. Note that some of the dialog elements are named differently there.

---

#### Interface options

- Show toolbars by default  
Displays the toolbar.
- Warn at switching to the full-screen mode  
Outputs a message before the full-screen mode is activated.
- Enable Onscreen keyboard  
Enables the display of the on-screen keyboard
- Number of connection to remember  
The client creates a list of the recently used connections. This setting specifies the number of connections listed.
- Clear the list of saved connections  
The list is cleared.

#### Local cursor shape

Specifies the appearance of the local cursor. This allows you to better differentiate between the local cursor and remote cursor.

#### Listening mode

- Accept reverse VNC connections on TCP port  
Specifies the TCP port number. The Sm@rtClient waits for the Sm@rtServer to establish the connection over this TCP port number.

#### Logging

- Write log to a file  
Writes information in the logbook of the Sm@rtClient-application.
- Verbosity level  
Writes expanded information to the server logbook of the Sm@rtClient-application (for locating faults). The amount of detail in the information is dependent on the verbosity level setting.

## Remote control of key devices

### Mapping of the function keys

HMI devices are equipped with a variety of function keys.

Example:

From the PC keyboard, you want to remotely control key F20 on the "MP 377 key" of HMI-device.

You can control the F20 key with the PC-keyboard shortcut <SHIFT + F8>.

The table provides you with an overview for controlling the keys.

xP177/277	xP377	PC keyboard shortcut
F13	F13	SHIFT + F1
F14	F14	SHIFT + F2
F15	F15	SHIFT + F3
F16	F16	SHIFT + F4
F17	F17	SHIFT + F5
F18	F18	SHIFT + F6
F19	F19	SHIFT + F7
F20	F20	SHIFT + F8
K1	S1	SHIFT + F9
K2	S2	SHIFT + F10
K3	S3	SHIFT + F11
K4	S4	SHIFT + F12
K5	S5	CTRL + F1
K6	S6	CTRL + F2
K7	S7	CTRL + F3
K8	S8	CTRL + F4
K9	S9	CTRL + F5
K10	S10	CTRL + F6
K11	S11	CTRL + F7
K12	S12	CTRL + F8
K13	S13	CTRL + F9
K14	S14	CTRL + F10
K15	S15	CTRL + F11
K16	S16	CTRL + F12
HELP	HELP	ALT + H
ACK	ACK	ALT + F1

## Use and restrictions of Sm@rt Options

### Use restrictions

While using the Sm@rt Options, observe the following instructions:

- HMI devices suitable for use  
For additional information, refer to "Usable HMI devices".
- Sm@rtServer and Sm@rtClient
  - If a PC is used as a Sm@rtServer, select the highest-performance platform available.
  - Use only simple projects.
  - Avoid photographs and color gradients in screens.
  - Avoid heavy background loads during operation, for example, those from user-defined functions or logs.
  - The number of the maximum connected Sm@rt Clients depends on the Server-HMI device. For additional information, see the "Performance features" documentation.
  - To improve the performance of the Sm@rtServer, you can disable hardware acceleration of the graphics card .
  - You inevitably loose performance at the HMI when you access the HMI-device using the Sm@rtClient functionality.
- SIMATIC HMI HTTP Protocol
  - Tag exchange via the SIMATIC HMI HTTP Protocol is not suitable for exchanging bulk data.
  - The maximum number of connections depends on the HMI device: For additional information, see the "Performance features" documentation
- Access protection  
To protect access to an HMI-device using different passwords, you must use the first password for the protected, and the second password for the unprotected access e.g. remote control with a password, remote monitoring without password.
- Port  
The web server connects to the network at the port 80. To run it without problems, make sure port 80 is not in use by any other application, such as IIS World Wide Web Publishing Service.
- Integrated HTML-pages
  - The size of the HTML pages must not exceed 100 Kb in case of Windows CE. In case of exceeding of the given value, these pages are spooled on external storage media.
  - If you display tags on HTML-pages using the entry type "Cyclic on use", it can lead to data-inconsistency.

- E-mailing  
The E-mailing function is not suitable for the mass dispatch of E-Mails. It is meant for sending important messages.
- Timeout  
If the connection between server and client is interrupted, the server will register this disconnection only with a certain delay. The delay is based on the Windows standard configuration of TCP/IP Timeout.

### Use-requirements in the company network

In order to implement the mentioned scenario, the accesses to the company network must be enabled. If the company network is protected by a Firewall, the system administrator must release the appropriate ports for that.

- Access to the integrated HTML-pages  
The web server connects to the network at the port 80.
- Access to Sm@rtServer for downloading the Java-Applet using the Internet Explorer  
The Sm@rtServer is connected to the network at the Port 5800 for downloading the Java-applet.
- Access to the Sm@rtServer using the Internet Explorer for remote monitoring and remote control  
The Sm@rtServer is connected to the network at the port 5900.

---

#### Note

If you change the ports of the Sm@rtServer you must customize the links in the used Html-pages accordingly. Additional information to modify the Html-pages is provided in "Example: "Configure integrated webserver".

---

### 10.16.2.2 Remote control via Sm@rtServer

#### Types of the remote control

#### Remote control and remote monitoring by means of Sm@rtServer

#### Introduction

The Sm@rtOptions of WinCC enable the access from HMI device or PC to a remote HMI device via Ethernet.

## Requirement

- The License Key "Sm@rtServer" is available at the Server-HMI device.

---

### Note

The 14-day license is not supported by Windows CE devices.

---

- Both devices are linked via a TCP/IP-ready network, that is via a LAN or the Internet.
- "Sm@rtServer" is activated in the WinCC-Project of the Server-HMI device for the "Services in Runtime".
- Additional requirements must be satisfied according to the type of implementation.

## Implementing remote access

The Sm@rtServer supports remote monitoring or remote control on the remote device (server). Remote monitoring or remote control can be implemented on the local device (client) in various ways:

- By means of Internet Explorer
- By means of the Sm@rtClient-application

## Access via HTML pages

The Sm@rt Options enable access for remote control with Microsoft Internet Explorer and by means of integrated HTML pages of the server.

### CAUTION

#### Ethernet communication

In Ethernet-based communication, such as PROFINET IO, HTTP, Sm@rt Options and OPC, it is the end user who is responsible for the security of his data network. The proper functioning of the device cannot be guaranteed in all circumstances; targeted attacks, for example, can lead to an overloading of the device.

## Remote control by means of Internet Explorer

### Introduction

On the client HMI device, the connection to the remote HMI device is established by means of Internet Explorer.

The window of the Internet Explorer displays only the screen of the remote HMI device, of the server HMI device. If task switching is not disabled at the server HMI device, you can access the complete desktop.

## Requirement

- The Client-HMI device is a PC.
- Internet Explorer from V6.0 SP1 is installed.
- The Client-and Server-certificates are installed to ensure the data security when transferred via internet.
- The Java-Applet is installed. The Java applet accesses the Java runtime environment that is installed on the client.

---

### Note

You achieve the best results in Internet Explorer by installing the current Java Runtime Environment (JRETM) of Sun Microsystems. Go to [www.java.com](http://www.java.com) to download this program.

---

## Process flow

Enter the address of the remote device in Internet Explorer. The address consists of the server name and the HTTP port number that is set on the server. The default setting is: 5800.

Examples of addressing: "http://MyPanel:5800" or "http://192.168.168.1:5800".

## Restrictions

The "Force write access with password" function cannot be implemented using the Java applet.

## See also

"Administration" tab (Page 6195)

## Remote control by means of the Sm@rtClient application

### Introduction

The Sm@rtClient application provides the connection to the remote HMI device on the remote HMI device.

## Requirement

- The Client-and Server-certificates are installed to ensure the data security when transferred via internet.
- The Client-HMI device is a PC.

## Process flow

The remote control via the Sm@rtClient-application works as follows:

- Start Sm@rtClient application
- Establish connection
- Password input
- Perform operator control or monitoring on the HMI device

## Start Sm@rtClient application

You can access the Sm@rtClient application, the program "SmartClient.exe", in various ways:

- By installing WinCC Runtime on the client device you have automatically installed the Sm@rtClient application.
- You have several options if WinCC Runtime is not installed on the client device:
  - Copy the Sm@rtClient application from the WinCC product-DVD from the folder "Support \SmartClient".
  - Copy the Sm@rtClient application from the "...\\Siemens\\Automation\\WinCC RT Advanced" folder of another PC using a floppy disk or the Intranet.

## Establish connection

In order to establish the connection to the remote HMI device, call the Sm@rtClient application and enter the IP address of the server.

- IP address or server name:port number
- IP address or server name:display number

Example: "192.168.0.1::5800"

You can also start the Sm@rtClient application with the command line input: "smartclient.exe 192.168.0.1". The logon dialog box opens.

You can include the password in the command line entry to start the Sm@rtClient application: "smartclient.exe 192.168.0.1 /password 100".

---

### Note

If the Sm@rtServer at the server HMI device does not run as a service, the connection established with the Sm@rtClient application is interrupted automatically as soon as the keyboard shortcut CTRL+ALT+DEL is pressed at the server HMI device or the screen saver is activated. In order for the Sm@rtServer to run as a service, the "Start automatically after booting" check box in the "Remote" tab in the "WinCC Runtime Advanced Internet Settings" dialog must be activated.

---

## Password input

### Password input at the Sm@rtServer

Instead of the on-screen keyboard, the following message is displayed on the Sm@rtClient if you enter the password directly at the Sm@rtServer: "Remote access by Sm@rt Options is in Progress. Please wait until the input of values has been ended." This measure prevents keyboard input for entering the password from being displayed on the Sm@rtClient.

### Password input at the Sm@rtClient

The on-screen keyboard is hidden on the Sm@rtServer due to the actions carried out on the Sm@rtClient. Use the local on-screen keyboard for entries at the Sm@rtClient.

The local on-screen keyboard will be displayed automatically on the Sm@rtClient or in the Sm@rtClient view.

Close the on-screen keyboard manually. Select "Input > Hide Input Panel" to hide the local on-screen keyboard.

---

#### Note

The entries with full-screen keyboard are not protected on HMI devices with a screen size of  $\leq 6"$ .

Entries in Control Panel Applets which do not use the full-screen keyboard are protected.

---

#### Note

Hidden password input is not supported by the on-screen keyboards of third-party products.

---

#### Note

You cannot enter special characters with the keyboard shortcut Alt Gr.

---

## Perform operator control or monitoring on the HMI device

In the Sm@rtClient application window, the entire layout of the remote HMI device is shown. Depending on the configuration, you can specify monitoring only or operator control of all keys, including the function keys, with the mouse. In addition, the entire desktop can be accessed in the case of a PC.

For operator control via the keyboard, the following is available:

Keyboard shortcut	Function
<ALT+CTRL+SHIFT+O>	Opens the "Sm@rtClient Options" dialog
<ALT+CTRL+SHIFT+F>	Switches over to full screen mode
<ALT+CTRL+SHIFT+R>	Updates the display
<ALT+CTRL+SHIFT+N>	Opens the "New Sm@rtServer Connection" dialog

Keyboard shortcut	Function
<ALT+CTRL+SHIFT+S>	Save as
<ALT+CTRL+SHIFT+T>	Displays and hides the toolbar

## Remote control via the Sm@rtClient display during runtime

### Introduction

The Sm@rt options of WinCC enables access from the HMI device or PC to a remote HMI device via Ethernet.

### Requirement

- The License Key "Sm@rtServer" is available at the Server-HMI device.
- Both devices are linked via a TCP/IP-ready network, that is, via a LAN or the Internet.
- HMI-device is configured as Sm@rtServer. For detailed instructions on this, refer to "Configure Sm@rtServer (Page 6222)".
- The Sm@rtClient-Display in an image is added in the client-HMI device project. For detailed information on this, refer to "Project Sm@rtClient (Page 6224)".

### Implementing remote access

The Sm@rtServer supports remote monitoring or remote control on the remote device (server).

On the client HMI device, the connection to the Sm@rtServer is made during runtime by means of the Sm@rtClient display.

On the HMI device only the screen of the server, and not the soft keys, is displayed.

The form of the cursor is not a part of the screen and is therefore not transmitted. Only the coordinates of the cursor are transmitted.

---

#### Note

If a soft-key is activated on the client HMI device, then observe the following:

This signal is transferred to the Server-HMI device and becomes effective there, only if no function was configured at the soft-key.

Otherwise, the function projected on the client-HMI device is executed.

---

## Use of direct keys for remote access

You can only operate direct keys locally on the server. Although the key for the direct key can be operated on the Sm@rtClient, no bit is set in the I/O range of the PLC.

### CAUTION

#### Ethernet communication

In Ethernet-based communication, such as PROFINET IO, HTTP, Sm@rt Options and OPC, it is the end user who is responsible for the security of his data network. The proper functioning of the device cannot be guaranteed in all circumstances; targeted attacks, for example, can lead to an overloading of the device.

## Password input

### Password input at the Sm@rtServer

Instead of the on-screen keyboard, the following message is displayed on the Sm@rtClient if you enter the password directly at the Sm@rtServer: "Remote access by Sm@rt Options is in Progress. Please wait until the input of values has been ended." This measure prevents keyboard input for entering the password from being displayed on the Sm@rtClient.

### Password input at the Sm@rtClient

The on-screen keyboard is hidden on the Sm@rtServer due to the actions carried out on the Sm@rtClient. Use the local on-screen keyboard for entries at the Sm@rtClient. The local on-screen keyboard will be displayed automatically on the Sm@rtClient or in the Sm@rtClient view.

Close the local on-screen keyboard manually. Select "Input > Hide Input Panel" to hide the local on-screen keyboard.

---

#### Note

The entries with full-screen keyboard are not protected on HMI devices with a screen size of  $\leq 6"$ .

Entries in Control Panel Applets which do not use the full-screen keyboard are protected.

---

#### Note

Hidden password input is not supported by the on-screen keyboards of third-party products.

---

#### Note

You cannot enter special characters with the keyboard shortcut Alt Gr.

---

## Distributed operator stations

### Configuration

### Configuration

Multiple HMI devices are used as decentralized, coordinated operator stations that have access to a centralized HMI device connected to the PLC.

The HMI devices are linked via a TCP/IP-network, (LAN or Intranet /Internet).

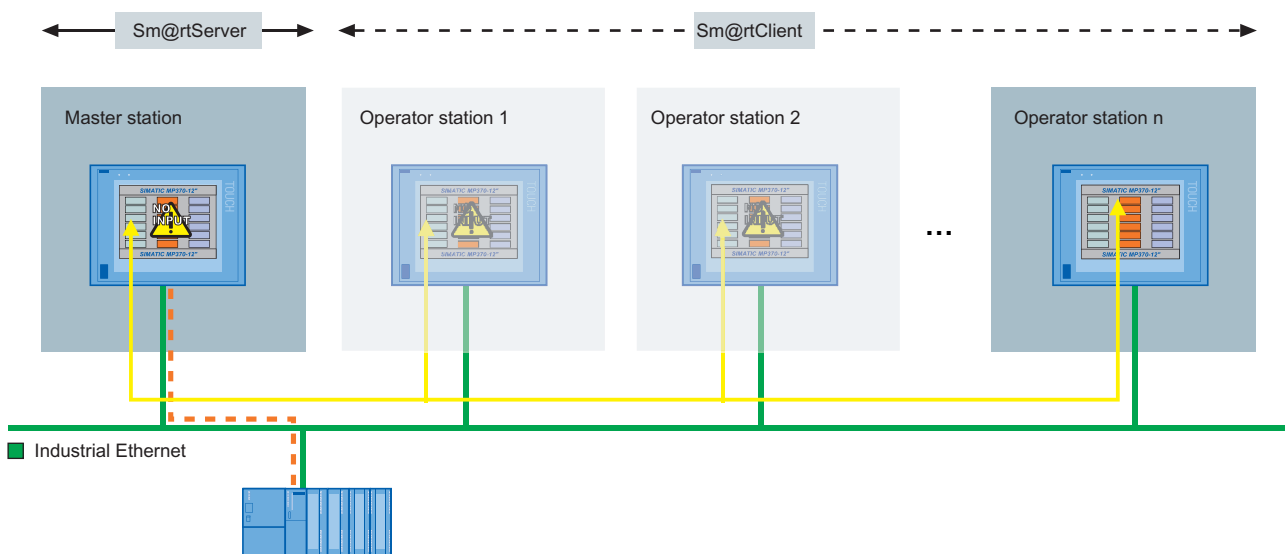

Figure 10-16 Distributed HMI

Only one HMI device, the Sm@rtServer contains the configuration data. The Sm@rtServer is controlled from the HMI devices.

The decentralized operator stations are the Sm@rtClients. These operator stations display the same process screen of the server. A Sm@rtClient-Display is configured in the process screen for the operation and monitoring.

All devices have the same screen resolution.

The operator stations are in shared mode. As soon as a defined period of time elapses without any action on an operator station, another operator station can become active. If Sm@rtClient display is configured accordingly, the user can also log off directly.

## Advantages

- Operator control and monitoring can be performed from various locations without significant efforts.  
The project only has to run on one HMI device configured as a server. The same client project runs on all other HMI devices; the Sm@rtClient display object is contained in a screen on these devices. The screen of the server is displayed via the Sm@rtClient display.
- The server is situated remotely from the machine and is thus not exposed to the environmental conditions of the machinery room.
- Coordinated operation is provided by the Sm@rtServer. Additional PLC investments are not required. For example, the load on the field bus is also reduced – the communication load on the bus is removed due to the interlocking mechanisms on the PLC side.

## Configure distributed operator stations

### Introduction

Operator control of an extensive printing machine need to have the option to exercise control, when necessary, at multiple locations along the machinery. Depending on his current location, the operator must be able to access the process from an operator station in the vicinity.

### Requirement

- The HMI-device with the configuration data is connected with the control.
- The server-HMI device and the Client-HMI devices are networked with each other via TCP/IP-Network.
- The License Key "Sm@rtServer" is available.

### Configuration steps

The following basic steps are necessary for configuring the distributed operator stations:

Step	
1	Configuring Sm@rtServer (Page 6222)
2	Setting WinCC Runtime Advanced Internet (Page 6222)
3	Project Sm@rtClient (Page 6224)

## Configure Sm@rtServer

### Configuring Sm@rtServer

#### Requirement

- The WinCC-Project for the Server-HMI device is configured.

#### Procedure

Proceed as follows to configure the Sm@rtServer in WinCC:

1. Double-click on the "Runtime-settings" entry in the project tree.
2. In the "Runtime-settings" editor, click on the "Services".
3. Enable "Sm@rtServer" in the group "RemoteControl".
4. Transfer the compiled WinCC-project to the Server-HMI-device.

#### Result

The Server-HMI device is configured as Sm@rtServer .

## Setting WinCC Runtime Advanced Internet

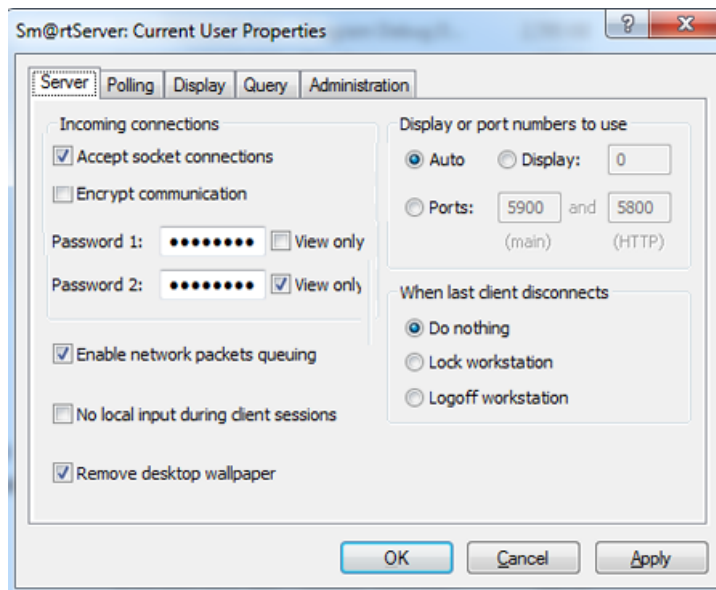

#### Requirement

- The "Control Panel" opens.
- The "WinCC Runtime Advanced Internet" dialog is open.
- The "Remote" tab is displayed.

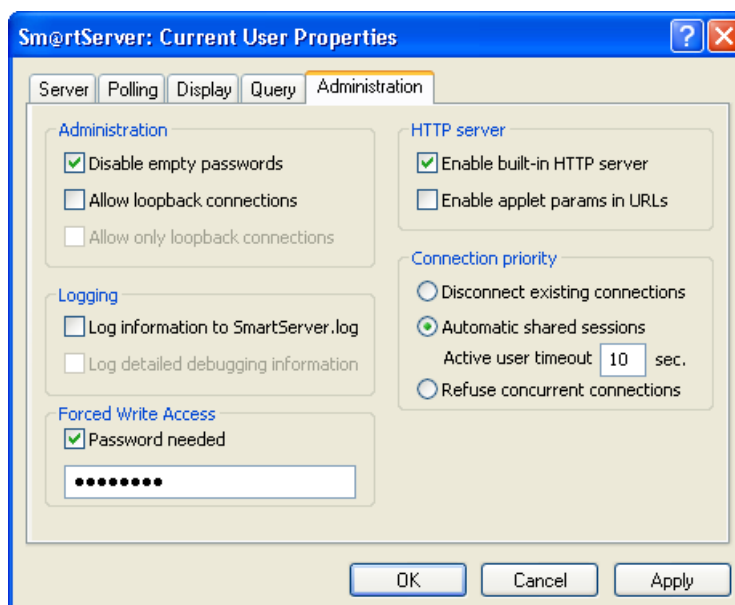

## Procedure

Proceed as follows to change the "WinCC Runtime Advanced Internet" settings on the Sm@rtServer:

1. On the "Remote" tab, select Start automatically after booting".
2. Click on the button "Change settings". The dialogue "Sm@rtServer: Current User Properties" is opened.

3. On the "Server" tab, select "Accept socket connections".
4. Enable "Encrypt communication" to establish an encrypted connection to the server.
5. Enter a password for "Password 1 "and "Password 2". Click "Apply".
6. Click on the "Administration" tab.

## 10.16 Options

7. In the area "Connection priority", select "Automatic shared sessions". For "Active user timeout" enter time that must elapse without any actions on the active HMI device before access can be changed.
8. Under the "Forced write access", clear "Password needed" for the forced access to the HMI device. Click "Apply". Click "OK" to close all opened dialogs.

### Result

The settings were changed. The changes will be effective after restarting the Sm@rtServer.

### See also

Project Sm@rtClient (Page 6224)

## Project Sm@rtClient

### Requirement

- The WinCC project for the client HMI device is configured.
- The "Screens" editor is open.
- The Inspector window is shown.
- The "Tools" task card is open.

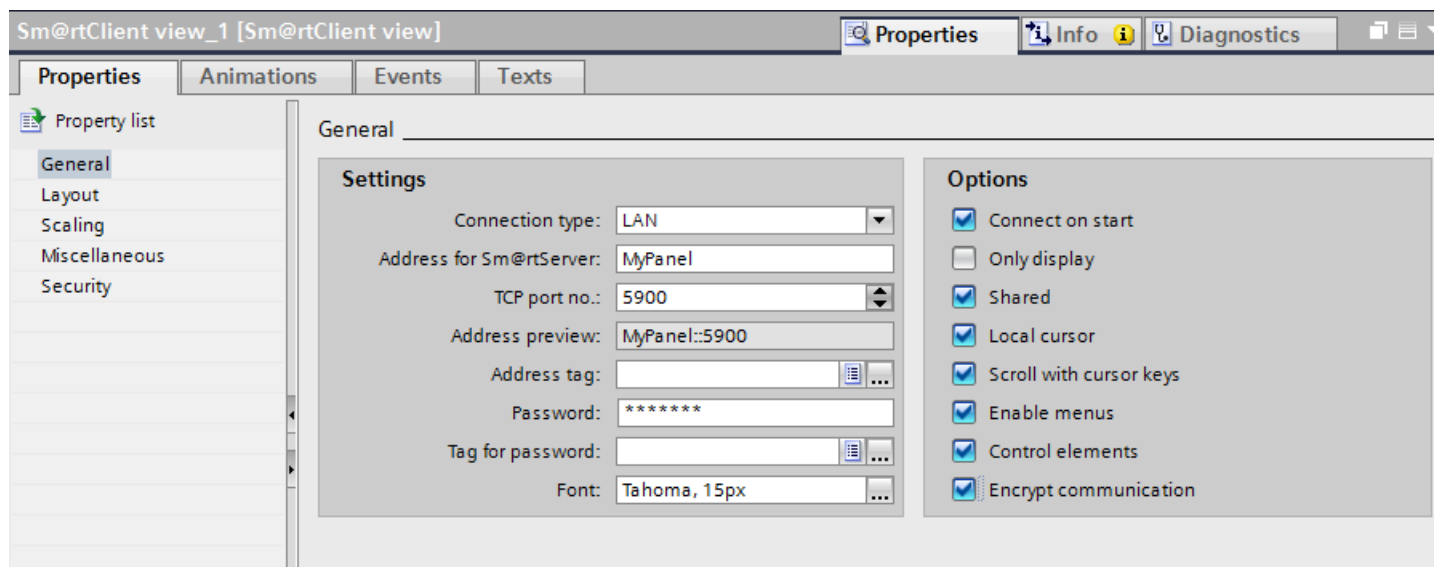

### Procedure

Proceed as follows to configure the Sm@rtClient:

1. Insert the Sm@rtClient display in the start screen.
2. In the Inspector window, click "Properties > Properties > General".
3. Enter the IP address or the name of the server HMI device in the "Address Sm@rtServer" field.
4. Enter "Password 1" configured on the server in the "Password" field.
5. Activate the "Encrypt communication" function in the "Options" area. When the "Encrypt communication" function is enabled, the connection to the server is encrypted through the exchange of certificates.

## 6. Activate the setting "Allow Menu".

This provides the operator with the option of logging off using the menu.

## 7. Transfer the compiled project to all operator stations.

## Result

The Sm@rtClient display was added to the start screen in the WinCC project of the Sm@rtClient.

After the Sm@rtServer and the operator stations are started for the first time, a check is carried out as to whether communication is encrypted.

- If communication is encrypted, save the certificate of the Sm@rtServers on the HMI device. Afterwards, you connect the Sm@rtClient with the Sm@rtServer using encrypted communication.
- If communication is not encrypted, you connect the Sm@rtClient with the Sm@rtServer without a certificate.

In order to control the server from an operator station, the operator must wait a specified amount of time following the last action on another HMI device.

If the operator uses the menu of the Sm@rtClient display to log off at the previously used HMI device, he can immediately control the server at the next HMI device.

Setting WinCC Runtime Advanced Internet (Page 6220)

### 10.16.2.3 E-mail notification from runtime

#### Process flow

#### Introduction

WinCC Runtime Advanced with the Sm@rtService offers the option of sending messages automatically via email.

The automatic e-mailing feature ensures that all people affected by the machine status (for example, shift engineer and sales manager) are informed in a timely manner.

#### Contents and triggers for e-mailing

The following events can trigger an e-mail to be sent:

- Alarm of a certain alarm class
- Event in which a standard function has been configured, such as a tag value change, etc.

Such an e-mail can have the following contents:

- Alarm text with process tags (maximum of 256 characters)
- Date/time
- E-mail address for replies

If you use e-mail gateways or SMS gateways, you receive access to standard networks, which requires external service providers. If configured accordingly, in critical situations the operator station sends an SMS to your mobile phone.

#### Enabling e-mailing and SMS

The HMI device can send e-mails to an SMTP server only. The server sends the e-mails to the addresses configured in the server.

Nothing else is required to send e-mails to addresses in the company network. However, an external service provider is required to access standard networks.

If an SMS communication is to be sent to service personnel, an SMS gateway is required as well.

#### Settings on the HMI device

The settings for emailing on the HMI device are made in the "Email" tab under "WinCC Runtime Advanced Internet" on the control panel.

The "Sender" entry field is assigned the default value "Automation HMI device." A change is useful if you want the recipient to be able to identify the device from which the e-mail originated, e.g. "HMI device on production line 2"

You can also use an SMTP server that support authentication to send e-mail.

The following authentication modes can be configured:

- Authentication by means of a valid e-mail address
- Authentication by means of user name and password

Data can also be encrypted and sent via an SSL connection. This means the data cannot be manipulated or read.

## Specify trigger for E-Mailing

### Requirement

- You have to create WinCC project.

### Procedure

Proceed as follows to send a message when an alarm is triggered:

1. Double-click on the "HMI-Alarms" entry in the project tree.
2. Click the "Alarm classes" tab in the "HMI-Alarms" editor.
3. Select the alarm class, e.g. "Errors".
4. Enter the E-Mail-Address in the inspector window under "Properties > Properties > General".
5. Create an analog or discrete message with this alarm class.

### Result

The trigger to send a message was configured. A message is automatically sent when a message of this alarm class is triggered.

## Configure secure e-mail notification from Runtime

### Introduction

If you send e-mail via the SMTP protocol, the sender is not verified. To ensure secure transmission of e-mails, you can use SMTP servers that support SMTP AUTH (authentication).

You must log on to the SMTP server to send e-mails. The following authentication modes can be configured:

- Authentication by means of a valid e-mail address
- Authentication by means of user name and password

The data can also be sent via an SSL connection. SSL (Secure Socket Layer) encrypts e-mails and user data for transmission. This means the e-mail cannot be manipulated or read during transmission.

## Requirement

- The SMTP server supports SMTP AUTH and STARTTLS. You can obtain more detailed information from your service provider.
- User name and password or a valid e-mail address for logon to the SMTP Server. You can obtain this data from your service provider.
- The SMTP server is available.
- The e-mail address of the service technician is entered in the alarm class.
- An analog or discrete alarm has been created for this alarm class.

## Procedure in WinCC

1. Double-click on the "Runtime-settings" entry in the project tree.
2. In the "Runtime-settings" editor, click on the "Services".
3. Enter the sender name to be shown in e-mail under "Sender name". If the SMTP server does not support the function, delete the entry.
4. Assign a port number.  
Port number 25 is assigned by default.  
The port number in WinCC must match the port number in the "WinCC Internet Settings" on the HMI device.

---

### Note

You can only configure the port number with the following HMI devices:

- Comfort Panels
  - RT Advanced
- 

5. Enter the authentication data.
  - Authentication by means of user name and password:  
Enter the user name and click on  at the "Password" input field. Enter the password in the "Enter password" box in the next dialog. Enter the password again in the "Confirm password" box. Close the dialog.
  - Authentication by means of a valid e-mail address  
Type in the e-mail address required for SMTP authentication in the "E-mail address" input field.
6. Enable "The server requires a secure connection (SSL)".

## Procedure on the HMI device

---

### Note

Note that the settings on the HMI device have a higher priority than the settings in the WinCC project.

---

1. Open the "WinCC Runtime Advanced Internet " dialog in the control panel of the HMI device.
2. Click on the "E-mail" tab.
3. Specify the SMTP server.
  - Select "Use the default project file" if you want to use the SMTP server defined in the project.
  - Deactivate "Use the default project file" if you do not want to use the SMTP server defined in the project. Specify the required SMTP server. For HMI devices with Windows CE, specify the computer name or the FQDN (Fully Qualified Domain Name).
4. Assign a port number.

Port number 25 is assigned by default.  
The port number must match the port number in the WinCC Internet Settings in the HMI device.

---

**Note**

You can only configure the port number with the following HMI devices:

- Comfort Panels
  - RT Advanced
- 

5. Enter the sender name given in the e-mail under "Name of the sender". If the SMTP server does not support the function, delete the entry.
6. Enter the authentication data.
7. Enter a valid e-mail address at "eMail adress of sender" if required for authentication.
  - Click "Advanced" if you need a user name and password for authentication. The "Advanced Email Settings" dialog opens.
8. Type in the user name and password in the "Advanced Email Settings" dialog.
  - Enable "Use the default of the project file" to use default user data you have defined in the project.
  - Select "Use panel settings for authentication" if you do not want to use the user data defined in the project. Enter the user name and password.
9. Enable transmission via SSL.
  - To use the project settings, enable "Use the default of project file" and SSL in WinCC.

**Result**

If a tag such as a mixer speed exceeds configured limits, a corresponding alarm is displayed on the HMI device. The data is sent to the SMTP server via SSL connection. The e-mail is sent to the field service technician after successful logon.

## 10.16.2.4 Display integrated Service-Pages

### Integrated Webserver

#### Introduction

The operator can display and navigate between web pages during runtime using the web server integrated in the HMI device.

The integrated web server displays the integrated service-pages. Depending on the configuration, own configured HTML-pages or Service-pages of a server accessible over Ethernet are displayed.

#### Requirement

- "HTML-Pages" is activated in the WinCC-Project of the Server-HMI device for the "Services in Runtime".

---

#### Note

It is always possible on a PC to access HTML-pages in runtime, although the option "HTML-pages" is cleared. Setup always installs the standard pages of the Web Server on the PC. Assign an administrator password to prevent unauthorized access to the pages.

---

#### Purpose of the web server

The integrated web server permits HTML pages to be displayed during runtime over one of the following routes:

- Internet Explorer
- HTML browser screen object during runtime (not on Windows CE devices)

The following are displayed:

- internal Service-Pages available by default on the HMI-device
- Other pages that you configure
- Other Internet pages

An operator or service technician can access service-critical information via the HTML pages. The standard HTML pages provide the following options:

- Remote control (if the HMI device is configured as a Sm@rtServer)
- Remote control using Microsoft Internet Explorer
- Starting and stopping of runtime
- Remote access to recipe data records and password lists
- Display of system information
- File management using a file browser
- Downloading of configuration data

- A "DATETIME" tag always returns a date within the range from 1.1.1970 00:00:00 to 31.12.2037 23:59:59.
- The "Export recipes" function requires the following authorizations:
  - PC: "UserData"
  - other HMI devices: "UserData" and "FileBrowserUser"

## HTML browser for HTML pages

The HTML-pages are also displayed using the configured "HTML browser" screen object (not on Windows-CE devices).

You can also arrange for input or activation of an Internet address. As soon as the operator enters or activates an address, the HTML browser opens the relevant page.

The appearance and functionality of the HTML browser screen object depends on the HMI device type. On PCs, the HTML browser corresponds to the Internet Explorer installed.

---

### **Note**

Note that the HTML browser options during runtime are restricted due to operating device capacities and options.

---

## Service-pages of the web server

### Introduction

The operator can use Internet Explorer or the HTML browser screen object during runtime to display service-pages without any additional configuration.

You can also create own service-pages. For detailed information, refer to "Configure In-house service-pages".

## Requirement

- "HTML-Pages" is activated in the WinCC-Project of the Server-HMI device for the "Services in Runtime".

---

### Note

It is always possible on a PC to access HTML-pages in runtime, although the option "HTML-pages" is cleared. Setup always installs the standard pages of the Web Server on the PC. Assign an administrator password to prevent unauthorized access to the pages.

---

## Service-pages

WINCC Runtime has the following service-pages:

- start.html: Home page
- RemoteControl.html: Remote control (only for Internet Explorer)
- Control.html: Control functions
- StatusDetails.html: System diagnostics
- Browse.html: File browser (only for Internet Explorer)

## Home page: Start.html

The start page contains the links to all other pages and displays current information about the project: Mode, software versions, device data, etc.

## "Remote control": RemoteControl.html

The "Remote control" page enables operator control of the HMI device for which a page is to be displayed. This page can only be displayed by using the Internet Explorer.

### "Control functions": Control.html

The "Control functions" page enables the following options on the HMI device for which a page is to be displayed:

- Starting and stopping of HMI runtime

---

**Note**

The transfer mode must be set in the Loader-menu on the HMI-device.

---

- Exporting and importing of recipes

---

**Note**

After importing recipes with Sm@rtService (HTML pages), restart Runtime. The imported recipes only become active the next time Runtime is started.

---

- Exporting and importing of password lists

---

**Note**

The password list must be named "pdata.pwl." It is exported to the following directory:

On Windows CE-devices: In the "\\Flash\\simatic\\" target directory

On PCs: the folder that was set in the file "HMILoader.exe".

The password list is exported and becomes active the next time Runtime is started.

---

### "System diagnostics": StatusDetails.html

The "System diagnostics" page contains system alarms from the alarm buffer.

### "File Browser" – Browse.html

The "File Browser" page is used to administer directories and files on the remote device. This page can be displayed with any Internet browser.

## Installing the client and server certificates for SSL

### Introduction

To ensure data security, data are encoded for transmission over the Internet. Encoding and decoding is performed by appropriate software – the certificates for SSL (Secure Sockets Layer).

- The client certificate for SSL must be installed on devices that are to be used to control a remote device.
- The server certificate for SSL must be installed on HMI devices that are to allow remote control.

## Configure access to service-pages

## Configure integrated web server

## Configure WinCC-Project

### Requirement

- The WinCC-Project of the server-HMI-device is configured.

### Procedure

Proceed as follows to configure the HMI device in such a way that other HMI devices or PCs can be connected to it:

1. Double-click on the "Runtime-settings" entry in the project tree.
2. In the "Runtime-settings" editor, click on the "Services".
3. Enable the "HTML-Pages" in the "Diagnostics" group.
4. Transfer the compiled WinCC-project to the Server-HMI-device.

### Result

The Server-HMI-device is configured as web server.

## Setting WinCC Runtime Advanced Internet

### Requirement

- The "WinCC Runtime Advanced Internet" dialog is open.
- The "Web Server" tab is displayed.

### Procedure

Proceed as follows to change the "WinCC Runtime Advanced Internet" settings on the HMI device:

1. Click "User Administration" in the "Web Server" tab.
2. Open the "UserDatabase-Edit" dialog.
3. Click "Add" in the "User manager" tab to create a new user.
4. Enter a user name and specify a password.
5. Click on "Apply".
6. Click the "Authorizations" tab.

7. Specify on the "Authorizations" tab, which functions can the user carry out on the HTML-pages of an HMI-device. See the section "User administration for web server (Page 6197)" for additional details.
8. Close the "UserDatabase-Edit" dialog.
9. On the "Remote" tab, select the "Start automatically after booting" check box.
10. Click "Change settings" and enable in the "Sm@rtServer dialog: Current User Properties", select the checkbox "Enable connections".
11. Specify a password for "Password2" so that the HMI device can be remotely controlled by the service technician.

## Result

A user was created on the HMI-device in the user administration of the web server and configured for the remote control.

The service technician can be connected to the HMI-device by means of the Internet Explorer and the Sm@rtClient Application. After disconnecting the connection, the HMI-device can be operated from his PC.

## See also

WinCC Runtime Advanced Internet, "Web Server" tab (Page 6189)

"Server" tab (Page 6191)

## Display and remote-control Service-Pages

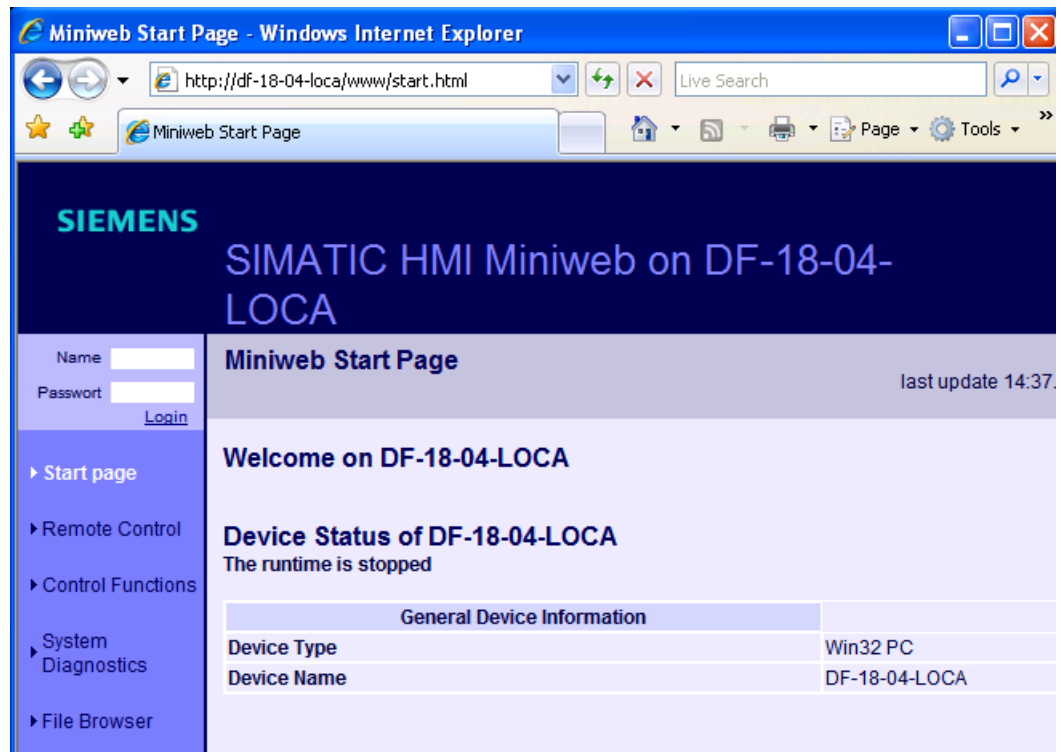

## Requirement

- A user is created on the HMI-device in the user administration for the web server.
- The web server is started.
- The Client-and Server-certificates are installed to ensure the data security when transferred via internet.

## Procedure

To display and control the service-pages, follow these steps:

1. Start the Internet Explorer on the configuration-PC and connect with the "Homepage" of the HMI-device.

2. For "Name" and for "Password", enter the data of the user configured in the user administration of the web server. Click "Login".
3. Click "System Diagnostics". The system alarms from the alarm buffer are displayed on this page.
4. Click "Remote Control" to remotely control the HMI-device.

## Result

The service-pages are displayed. The HMI-device can be operated or monitored via the service-pages.

A keyboard units cannot be operated completely in the Internet Explorer, since only the screen content is displayed. Use the Sm@rtClient-Application to remotely control the keys of HMI-device. The Sm@rtClient-Application can be located under "Start > Program > Siemens Automation > Runtime Systems > WinCC Runtime Advanced > Sm@rtClient"

## Create own Service-pages

### Basics

#### Introduction

The basic framework of the service-pages corresponds to a normal HTML-file.

- Declaration of the document type
- Header with data for the title
- Body - content to be displayed.

#### Variable parameters in Service-pages

You can specify variable parameters in HTML documents. As soon as a page with variable parameters is opened, the parameters are replaced by specific values.

```
<BODY > Welcome on <MWSL><!-- write(GetVar("[Parameter]")); --></MWSL></BODY>
```

#### Available variable parameter

Parameters	Meaning
ProgramMemoryComplete	CE only: Total program memory
ProgramMemoryFree	CE only: Program memory available
ProgramMemoryUsed	CE only: Program memory utilized
FlashComplete	CE only: Total flash memory
ObjStrComplete	CE only: Total available flash memory
ObjStrFree	CE only: Volatile memory available
ObjStrUsed	CE only: Volatile memory utilized
DeviceType	Type of target device as specified in the control panel.
BtLdVer	CE only: Bootloader-version, as specified in the control panel.
BtLdRelDate	CE only: Bootloader release date
ImageVersion	CE only: Image version as it appears on the loader
DramSize	CE only: Size of DRAM
HostName	The name by which the device is logged on/identified in the network.
RtState	Indicates whether Runtime is running on the target device.
SystemMessageTable	Outputs a table containing the current system events.

In the example below, the "HostName" parameter is replaced by the network-name of the device.

```
<BODY > Welcome on <MWSL><!-- write(GetVar("[HostName]")); --></MWSL></BODY>
```

## Process tag

Process tag values can also be displayed in HTML pages. The syntax is the same as for device tags. Use the tag name as a placeholder for the tag value, , e.g. Tag\_1.

```
<BODY > Welcome on <MWSL><!-- write(GetVar("[Tag_1"]); --></MWSL></BODY>
```

### CAUTION

#### Data inconsistency caused by HTML pages

Note the information below if the "Cyclic in operation" acquisition mode is set at tag:

1. If this tag is not displayed on the HMI device, the HTML page displays the incorrect tag value in the following situations:
  - The HTML page display a "0" value at its first call. The HTML page only displays the correct value after it is called again or updated.
  - The last value is displayed if the connection to the PLC goes down.
2. The HTML page also displays the correct tag value if the tag is displayed on the HMI device.

Situation 1 is based on standard behavior: If a tag is currently not in use currently and its value is not acquired in "Cyclic continuous" mode, the tag is loaded with its initial value in Runtime. Instead of reading the values from the PLC, however, the HTML page receives these from Runtime.

## Link own Service-pages

If a user connects to an HMI device, he is automatically forwarded to the start page `http://<Device name>/www/start.html`. This page represents the starting point for the HTML-pages of the web server. Every standard page is accessible from the start page via a link. For this reason, you insert a link for each of your HTML pages in the start page.

### Note

When inserting links in the HTML page, you must differentiate between relative and absolute links. Make sure that absolute links start with `"/www"` to ensure that the document will be searched for in the correct directory. Example: `"/www/MyDocument.HTML"`.

## Storage location of the service-pages

If files are to be located during a transfer, they must be in a specific directory:

- on a PC with Windows 7: "C:\ProgramData\Siemens\CoRtHmiRTm\MiniWeb11.x.x\WebContent"
- on a PC with Windows XP: "C:\Documents and Settings\All Users\Application Data\Siemens\CoRtHmiRTm\MiniWeb11.x.x\WebContent"
- On xP 177B: "<ES-Installationspath>\Transfer\11.0\XP177B\WebContent.zip"
- On xP 277: "<ES-Installationspath>\Transfer\11.0\XP277\WebContent.zip"
- On MP 177: "<ES-Installationspath>\Transfer\11.0\MP177\WebContent.zip"

- On MP 377: "<ES-Installationspath>\Transfer\11.0\MP377\WebContent.zip"
- on Mobile Panel 177 PN: "<ES-Installationspath>\Transfer\11.0\XP177B\WebContent.zip"
- On Mobile Panel 277: "<ES-Installationspath>\Transfer\11.0\XP277\WebContent.zip"
- On the Mobile Panel 277 (F) IWLAN: "<ES-Installationspath>\Transfer\11.0\XP277\_W\WebContent.zip"
- On the Mobile Panel 277 (F) IWLAN V2: "<ES-Installationspath>\Transfer\11.0\XP277\_W2\WebContent.zip"

## Create service-page for displaying process values

### Requirement

The Ta\_1 and Tag\_2 tags are created in the WinCc-Project.

### Procedure

To create an own Service-page, follow these steps:

1. Copy the "WebContents" ZIP-file in a random work directory on your Configuration-PC and un-zip the ZIP-file.
2. Create a copy of start.html and rename the copy in "tag.html".
3. Open the "tag.html" in a text editor, e.g. Notepad.
4. Replace the existing table with a new table, in which the process values of "Tag\_1" and "Tag\_2" tags are displayed. Save the file "tag.html".

```
<font class="ad_headline2">Device Status of <MWSL><!-- write(GetVar("HostName")); --></MWSL></font><br>
<b>The runtime is <MWSL><!-- write(GetVar("RtState")); --></MWSL></b><br><br>
<table border="1" class="sph_table" cellspacing="0" width="600">
<tr><th class="sph_th"><b>Display of process tags </b></th></tr>
<tr><td class="sph_td"><b> "Tags1" </b></td><td class="sph_td"><MWSL><!-- write(GetVar("Tag_1")); --></MWSL>&nbsp;</td></tr>
<tr><td class="sph_td"><b>"Tags2" </b></td><td class="sph_td"><MWSL><!-- write(GetVar("Tag_2")); --></MWSL>&nbsp;</td></tr>
</table>
```

5. Open the "start.html" file and add a hyperlink to page "tag.html". Expand the available navigation bar, in which you supplement the existing table by an entry.

```
<tr>
<td width="8"></td>
<td width="7"></td>
<td width="101" class="ad_nav_link"><a href="tag.html" class="ad_nav_link">Process value</a></td>
</tr>
```

6. Save start.html.

### Result

You have created the service-page "tag.html". You have added a hyperlink on the start page in order to navigate to the service-page from the start-page.

## Transfer Service-pages

### Transfer files using the standard-path (Active Sync/CF- card)

Proceed as follows to transfer files via the standard-path:

1. Copy the changed HTML pages and pictures according to "\Flash\Simatic\WebContent". Access then takes place with "http://<device>/www/<HTML page>".

### Transfer files via the project transfer

Proceed as follows to transfer the files via the project transfer:

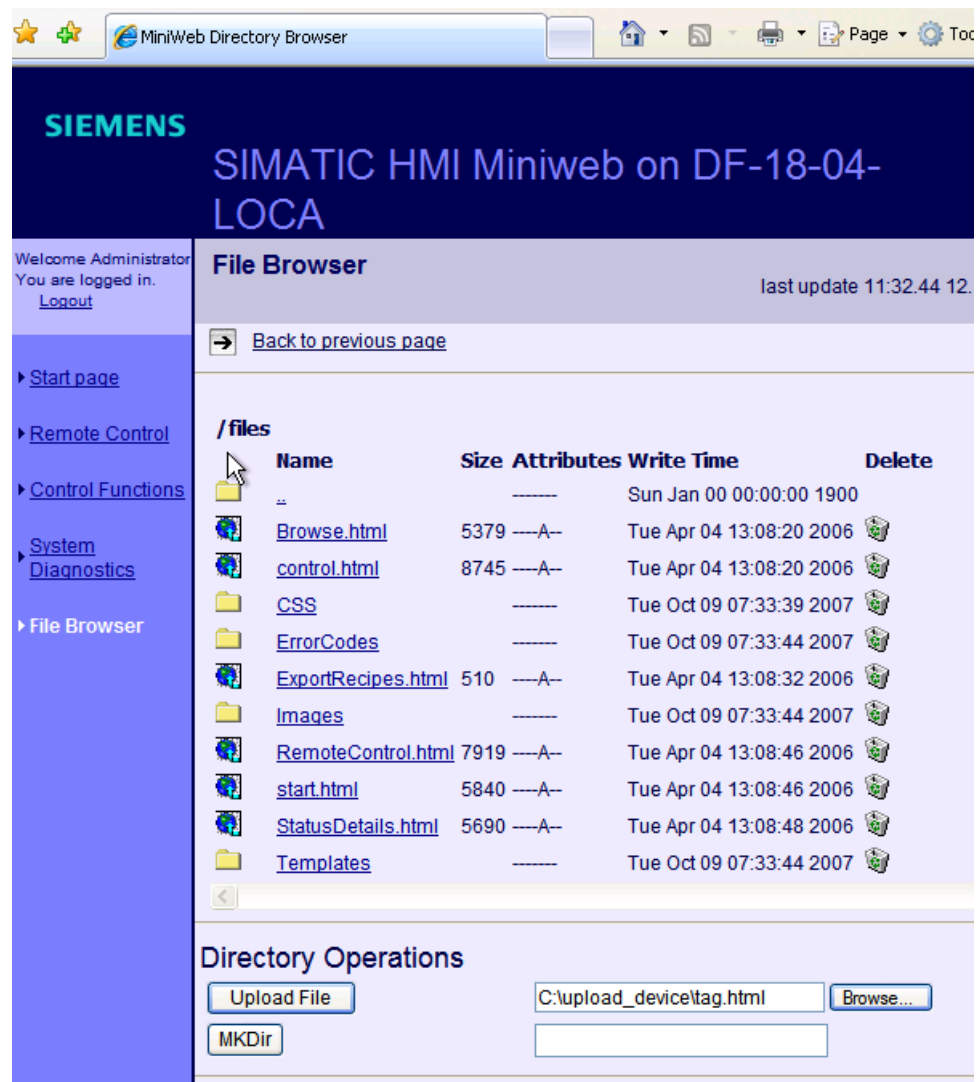

1. Add the changed files to the ZIP-file "WebContents". This file must contain all HTML pages and associated pictures.  
Make sure to provide the correct path information because the files are unpacked in the directories specified in the zip file. Incorrect path information results in errors in direct addressing or due to links.
2. In order to transfer the ZIP-file "WebContents", copy this in a certain directory, e.g. for the transfer to an MP377 "<ES-Installationspath>\Transfer\1.3\MP377\WebContent.zip".
3. Transfer the project to the HMI device.  
The ZIP-file "WebContents" is transferred to the Windows CE device where it is unzipped.

### Transfer files using the File Browser

Proceed as follows in order to transfer files using the file transfer:

1. Start the Internet Explorer on the configuration-PC and connect with the "Homepage" of the HMI-device.
2. Log-on to the internal Web Server to work with the File Browser.  
For read and write access to the file browser, the user must possess the web authorizations "FileBrowserAdministrator" and "FileBrowserUser" .
3. Click on "Browse" in the File Browser . The file selection dialog opens.

- Navigate to the file storage location by means of this dialog. Select the desired file and click "Open."

- Click "Upload File". The file is copied in the directory of the internal web server.

### 10.16.2.5 Access via SIMATIC HMI HTTP Protocol

#### Configuration

#### Configuration

During the communication via SIMATIC HMI HTTP Protocol, an HMI-device accesses the tags of a different HMI-device. The access is "read-only" or "read and write" depending on the configuration of the concerned HMI-device.

The HMI device providing the tags is the HTTP-server; the other HMI-device is the HTTP-client. However, access to tags functions in both directions.

### Configure access via SIMATIC HTTP Protocol

#### Introduction

The tags in service-application should be illustrated in an overview for a configuration from multiple HMI-devices.

The panels in the machine level are used as tag server. The service-application illustrating tags of machines in an overview image runs on a PC.

**Requirement**

- The HMI-devices are networked via a TCP/IP-network with each other.

**Configuration steps**

The following basic steps are required to configure the access via "SIMATIC HMI Protocol".

Step	
1	Configure WinCC-Project (Page 6244)
2	Setting WinCC Runtime Advanced Internet (Page 6244)
3	Configuring HTTP connections in the client (Page 6245)
4	Configure the HTTP-Client tags (Page 6247)

**Permissible data types (SIMATIC HMI HTTP protocol)****Permitted data types**

When configuring tags, the data types listed below can be used.

Data types in the HTTP Protocol	Length	Signs	Range of values
Bool	0	No	true (-1) or false (0)
Char	1 byte	Yes	-128 to 127
Byte	1 byte	No	0 to 255
Int	2 bytes	Yes	-32768 to 32767
UInt	2 bytes	No	0 to 65535
Long	4 bytes	Yes	-2,147,483,648 to 2,147,483,647
ULong	4 bytes	No	0 to 4,294,967,295
Float	4 bytes	Yes	-3.402823E38 to -1.401298E-45 for negative values and 1.401298E-45 to 3.402823E38 for positive values
Double	8 bytes	Yes	-1.79769313486231E308 to -4.94065645841247E-324 for negative values and 4.94065645841247E-324 to 1.79769313486232E308 for positive values
String	1 to 255 byte	—	
DateTime	8 bytes	—	1.1.1970 00:00:00 up to 31.12.2037 23:59:59

Please note that data types may be defined in external controllers which have different names in WinCC. To ensure correct assignment, please observe the tag definition in the external controllers.

---

**Note**

It is not possible to access array tags from an HTTP client.

---

**See also**

Configure WinCC-Project (Page 6244)

**Configure HTTP server**

**Configure WinCC-Project**

**Requirement**

- The WinCC-Project for the Server-HMI device is configured.

**Procedure**

Proceed as follows to configure the HTTP-Server:

1. Double-click on the "Runtime-settings" entry in the project tree.
2. In the "Runtime-settings" editor, click on the "Services".
3. Select "SIMATIC HMI HTTP Server" in the group "Read/write tags".
4. Check the data types of the tags. The HTTP-client can access only those tags, whose data type is supported by communication driver "SIMATIC HMI HTTP Protocol". For additional information, refer to "Permissible data types (SIMATIC HMI HTTP Protocol) (Page 6241)".
5. Transfer the compiled WinCC-project to the Server-HMI-device.

**Result**

The HMI-device is HTTP-server configured.

**Setting WinCC Runtime Advanced Internet**

**Requirement**

- The "Control Panel" opens.
- The "WinCC Runtime Advanced Internet " dialog is open.
- The "Web Server" tab is displayed.

## Procedure

Proceed as follows to change the "WinCC Runtime Advanced Internet" settings on the HTTP server:

1. Specify the access to tags in case of "Tag access".
  - "Read/write": read and write access
  - "Read only": read access
2. Specify the authentication for access in case of "Tag authenticate":
  - "No authentication": No authentication required.
  - "Authentication required": A password is required for the access. Specify the password for configuring the connection via the SIMATIC HMI HTTP Protocol .
3. Click "User Administration" in the "Web Server" tab. Enter "100" as password. The "UserDatabase-Edit" dialog is opened. For detail instructions, refer to "User administration for Webserver (Page 6197) ".
4. Click "Add" in the "User manager" tab to create a new user. Enter a user name and specify a password. Click on "Apply".
5. Click the "Authorizations" tab.
6. Specify the web-authorizations on the tab "Authorizations". The user must have the Web-authorization "RTCommunication" for utilizing the SIMATIC HTTP Server.
7. Close all open dialog boxes.

## Result

The settings were changed. The changes will be effective after the restart of the WebServer.

## See also

Settings on the HMI device (Page 6186)

WinCC Runtime Advanced Internet, "Web Server" tab (Page 6189)

User administration for web server (Page 6197)

## Configuring HTTP clients

### Configuring HTTP connections in the client

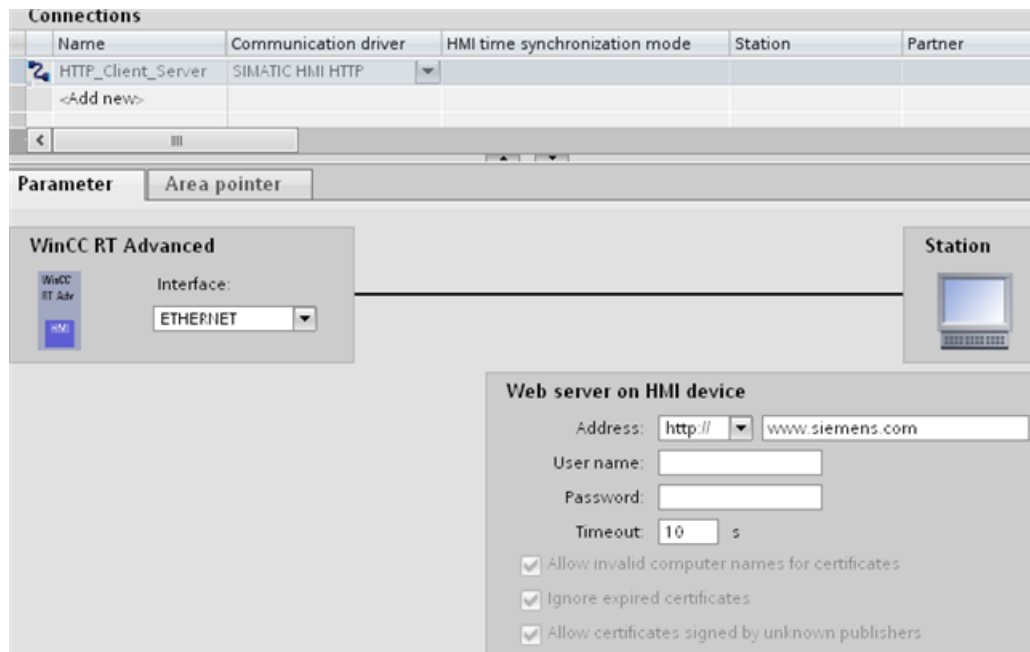

## Requirement

The communication driver "SIMATIC HMI HTTP Protocol" is installed.

## Procedure

Proceed as follows to create an HTTP-connection:

1. Double-click on the "Connections" entry in the project tree. The "Connections" editor opens.
2. Create a connection. Select "SIMATIC HMI HTTP Protocol" for "Communication driver".

3. Select "Ethernet" for "Interface". Select the protocol type "http://" or "https://" for address.
4. Enter the name of the HTTP-server or its IP address.  
Ask your network administrator for the specific name or parameters of your network. If the server has already been commissioned, you can read out the IP address on the server as well:
  - Panel  
Click "Start > Programs > Command Prompt" on the server and enter the "ipconfig" command using the screen keyboard. Press <Enter> to display the IP-address.
  - For PC/Panel PC  
Click on the server on "Start > Run", enter "Cmd", and press <Enter>. The command interpreter is displayed. Enter the "ipconfig" command. Press <Enter> to display the IP-address.
5. If the "HTTPS" protocol type is selected, you can establish how the HTTPS-client verifies the properties of the server-certificate and how it should react in the event of error:
  - "Allow invalid computer names for certificates"
  - "Allow expired certificates"
  - "Allow certificates signed by unknown publishers"
6. If the "Authentication required" option is selected on the HTTP-server, enter the user name and the password.
7. Enter the time for "Timeout" after which disconnection is identified.

## Result

A connection was created in the WinCC-Project of the HTTP-Client. For detail information for HTTPS-connection, refer to "Commissioning an HTTP- connection (Page 6248)".

## Configure the HTTP-Client tags

### Requirement

- An HTTP-connection was created in the WinCC-Project of the HTTP-Client.
- A tag is created in the WinCC-Project of the HTTP-Server. The data type of the tags is supported by SIMATIC HMI HTTP Protocols .

### Procedure

To create tags on the HTTP-client, proceed as follows:

1. Open the "HMI- tags" folder in the project tree and double-click the entry "Standard-tag table". The "Tags" editor opens.
2. Enter a clear tag-name for "Name" in the Inspector window under "Properties > Properties > General".
3. Select the HTTP-connection for "Connection".
4. Select the data type for "data type".  
The client does not check any verification of the tag name and the data type. Pay attention that the selected data type here matches the data type of the tags in the HTTP-server. For additional information, refer to "Permissible data types (SIMATIC HMI HTTP Protocol)". Array tags are not permitted.
5. Enter the exact name of the tag that is to be communicated with on the HTTP-server in the "Address" field.  
If the tag to be addressed is in a sub-folder, the complete path along with tag name must be given as address, e.g.[folder name]\[Tag name].

## Result

A tag was created in the WinCC-Project of the Client-HMI-device. The tag has access to the HTTP-server tag via an HTTP-connection. You can use an "E/A-Field" in an image to display the process value of this tag.

## Commissioning an HTTP- connection

### Introduction

To establish an HTTP connection, you must perform the following actions:

- In the "Connections" editor of WinCC ES, configure the connection as an "https://" protocol type and define how the HTTPS client should verify the properties of the server certificate and respond to errors.
- Install a valid certificate on the HTTPS client.  
Certificates are necessary for server authentication. Using certificates you can ensure that the server with which the connection is to be developed is actually the server for which it is outputting.

### Principle of an HTTPS connection

After runtime start, the HTTPS client establishes a connection to the HTTPS server. The HTTPS server presents its certificate, which the client verifies for authenticity. The session code that can only be read by the HTTPS server is then transmitted. The session code is now available on both sides and enables a symmetrical data encryption.

---

#### Note

The certificate contains the current time. The current time can lead to problems if the time zones of the server and client are different. For example, a certificate generated on a server with an Asian time zone only becomes valid on a client with European time zone in the future (8 hours).

---

### Preparation for installing a certificate on the client

With the first HTTPS client access, the HTTPS server generates the certificate itself and then saves it in the "Cert.cer" memory. The file is stored in the following directory:

- On a PC / Panel PC (with Windows XP) in the directory "<Runtime-Verzeichnis>\SystemRoot\SSL"
- On Windows CE-based devices in the directory "Flash\Simatic\SystemRoot\SSL"

The certificate must be stored on the HTTPS client on a storage medium from which it can be launched with a double click. You can select from the following transfer options:

Server	Client	Possible file transfer
with Windows XP (PC, Panel PC)	with Windows XP (PC, Panel PC)	<ul style="list-style-type: none"> <li>• Diskette</li> <li>• USB stick</li> <li>• LAN (Ethernet)</li> <li>• Internet Explorer (via TCP/IP if service is already running)</li> </ul>
with Windows CE ( xP 277, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	with Windows XP (PC, Panel PC)	<ul style="list-style-type: none"> <li>• Memory card</li> <li>• ActiveSync (serial)</li> </ul>
with Windows XP (PC, Panel PC)	with Windows CE ( xP 277, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	
with Windows CE ( xP 277, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	with Windows CE ( xP 277, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	<ul style="list-style-type: none"> <li>• Memory card</li> </ul>

### Installing a certificate on a client with Windows XP

Insert the storage medium on which you have saved the "Cert.cer" file into the HTTPS client or open the directory in which the file is located. Double click on the file and follow the instructions in the Windows dialog.

Tip: The Internet Explorer provides an easy way to install a certificate. Connect to this device via HTTPS (e.g.: <https://<my device>>). The browser establishes if a certificate has not yet been imported. In this case, the browser asks if you want to install the certificate. Any faults in the certificate are displayed.

### Installing a certificate on a client with Windows CE

Insert the memory card on which you have saved the converted "Cert.cer" file into the HTTPS client. WinCC includes the "InstallCert.exe" tool for importing certificates with Windows CE.

You can implement the installation as follows:

- In Explorer:  
Double click the "Cert.cer" file to install the certificate.
- At the command prompt:  
Enter "InstallCert /[command parameter] [filename]".
  - command parameters:  
Parameter /r must be specified because the certificate used in WinCC Runtime Advanced is a root certificate.  
A root certificate is the main certificate and is used to verify the authenticity of all other certificates transferred.
  - filename  
You must specify the certificate file with its complete path (e.g. "\\Storage Card\Cert.cer")

A status alarm is output when you completed the installation. Runtime has to be restarted after the installation of a certificate on Windows CE- HMI devices with HTTPS clients. It is necessary to restart Runtime so that an HTTPS connection can be established.

#### **The file "Cert.cer" cannot be opened.**

The "Cert.cer" file generated at the HTTPS server cannot be opened on HMI devices based on Windows CE 5.0 by double-clicking the client.

1. Open the Control Panel.
2. Select "Certificates > My Certificates".
3. Click the "Import" button.  
A dialog box opens.
4. Select the "From a File" menu in the file browser and select the "Cert.cer" file.

#### **10.16.2.6 Connection to the Office-world**

##### **Configuration**

##### **Data access via web service (SOAP)**

WinCC provides options for utilization of web-service (SOAP). Web service (SOAP) is based on the Simple Object Access Protocol. Use of this protocol enables an external application to

access tags of an HMI device via Ethernet. If the company network is protected by a Firewall, the system administrator must release the appropriate ports.

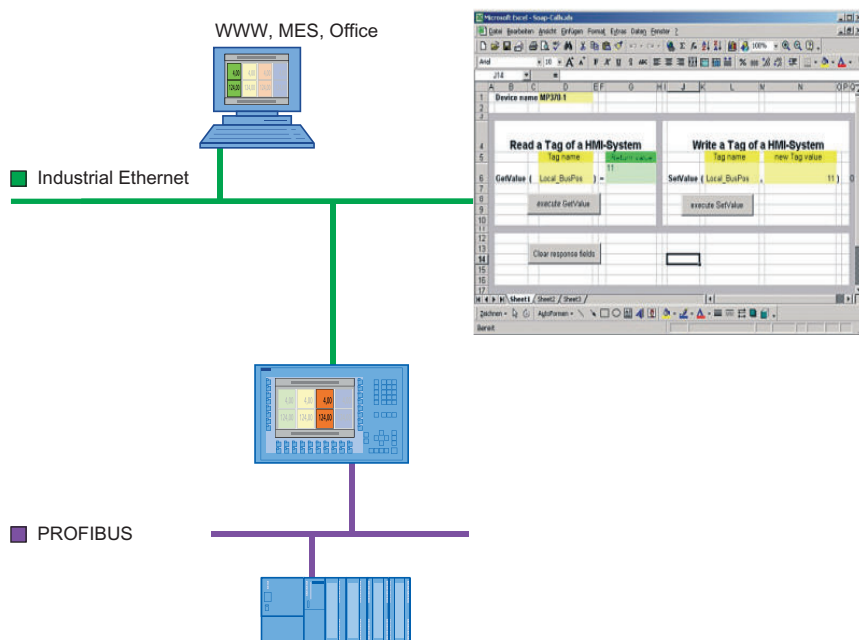

Figure 10-17 Communication with other applications

For example, a device is accessing two HMI devices. The operator sees the values of certain tags and can modify them.

You can use Microsoft Excel, for example, to display tags. You will require the latest version of "MS SOAP Toolkit V2.0" for this purpose. This version is available from Microsoft as a download.

The data access via SOAP is not supported by Windows 7. Use OPC to display the tags in MS Excel. For more information, refer to "Configuring OPC clients (Page 6260)".

### Data access to Windows CE HMI-devices

The data access via the Web-service(SOAP) on Windows CE-HMI-devices functions using only the device name and not via the IP-address.

Enter the device name of the HMI-device with the appropriate IP-address in the hosts-file. The hosts-file is given in the directory "%windir%\system32\drivers\etc", z. B. C:\WINNT\system32\drivers\etc.

The device name, e.g. DEVICEMP377, must be set in the control panel on the HMI device under "System > Device Name". Please change the default device name to ensure that the device name is unique for the network.

### Example for the entry in the hosts-file:

192.168.56.198 DEVICEMP377

Replace the IP-address by the device name in the SOAP-client:

objRuntime.mssoapinit http://DEVICEMP377/soap/RuntimeAccess?wsdl

### Data access with GetValue, SetValue

Access to a tag in SOAP using GetValue or SetValue functions require a special syntax.

- GetValue: "Sinus\_1"
- SetValue: Sinus\_1

The tag name must be given in inverted commas for GetValue. The message "Runtime is offline" will otherwise be output when runtime is accessed.

---

#### Note

Note that the tag name entry is case-sensitive.

---

## Create VBA-Marko in MS Excel

### Introduction

Data access over the network via web service (SOAP) is to be used to permit certain tags of an HMI device to be displayed and reset.

For this purpose, macros are written in Excel, which: 1) obtain the relevant tags on the PC over the network and display them, and 2) transfer reset values back to the HMI device.

The task can be solved using VBA macros "ReadTagValue" and "WriteTagValue," which obtain and display the relevant tags in Excel over an appropriate interface and return them to the HMI device over the network. Note that the tag name entry is case-sensitive.

### Requirement

- The SOAP toolkit is installed.
- "Web-Service (SOAP)" is selected in the WinCC-Project under "Services in Runtime".

### Procedure

1. Insert the "Control element toolbox" toolbar in your workbook in Microsoft Excel.
2. Create a command button. Label the button "ReadTagValue" and name it "Read value".
3. Double-click this command button.  
The macro editor is displayed. The "Click" event is already preset.
4. Write the "ReadTagValue" macro ("intVarTag\_1" designates the actual tag value):

```

'-----
Private Sub ReadTagValue_Click()

Dim objRuntime
Dim intVarTag_1
Dim objWorksheet

Set objWorksheet = Excel.Worksheets("Sheet1")
Set objRuntime = CreateObject("MSSOAP.SoapClient")
objRuntime.mssoapinit "HTTP://servername/soap/RuntimeAccess?wsdl"
objRuntime.ConnectorProperty("AuthUser") = "Administrator"
objRuntime.ConnectorProperty("AuthPassword") = "100"
Var = objWorksheet.Cells(1, 3)
intVarTag_1 = objRuntime.GetValue(Var)
objWorksheet.Cells(1, 1) = intVarTag_1

End Sub
'-----

```

1. Insert a command button. Label the command button "WriteTagValue" and name it "Write value".
2. Double-click this button.
3. Write the "WriteTagValue" macro ("intVarTag\_1" designates the return value of the operation):

```

'-----
Private Sub WriteTagValue()

Dim objRuntime
Dim intVarTag_1
Dim objWorksheet

Set objWorksheet = Excel.Worksheets("Sheet1")
Set objRuntime = CreateObject("MSSOAP.SoapClient")
objRuntime.mssoapinit "HTTP://servername/soap/RuntimeAccess?wsdl"
objRuntime.ConnectorProperty("AuthUser") = "Administrator"
objRuntime.ConnectorProperty("AuthPassword") = "100"
Var = objWorksheet.Cells(2,3)
Value = objWorksheet.Cells(2,5)
intVarTag_1 = objRuntime.SetValue(Var,Value)
objWorksheet.Cells(2,8) = intVarTag_1

End Sub
'-----

```

## Result

As soon as you call "ReadTagValue\_Click" macro by clicking the button "Read-value", the specified intVarTag\_1 tag is obtained from the HMI device using the specified device address and displayed in the cell (1,1).

As soon as you call Macro "WriteTagValue" by clicking the "Write value" button, the tag name is read from the cell (2,3), and the tag value is transferred from cell (2,5) to the HMI device.

Configuration in WinCC (Page 6183)

## 10.17 Interfaces

### 10.17.1 OPC

#### 10.17.1.1 Basics

## OPC

### Introduction

OPC refers to standardized manufacturer-specific software interfaces for data exchange in automation engineering.

The OPC interfaces provide a standardized environment in which devices and applications from various manufacturers can be linked.

OPC is based on the Windows technology COM (Component Object Model) and DCOM (Distributed Component Object Model).

OPC UA (Unified Architecture) is the technology succeeding OPC. OPC UA is platform-independent and can use different reports as a communication medium.

### Principle of operation

In WinCC, you can configure HMI devices as OPC servers or OPC clients. The particular HMI device determines which OPC servers and OPC clients are available.

### OPC Specifications

OPC specifies interfaces to gain access to the following objects in WinCC:

- Process values (OPC Data Access 1.0, 2.05a)
- Process values (DataAccess ClientFacet (OPC UA))
- Process values (OPC XML-Data Access 1.01)

You can find additional information about the individual OPC specifications in the Internet at the website of OPC Foundation:.

- [www.opcfoundation.org](http://www.opcfoundation.org) ([www.opcfoundation.org](http://www.opcfoundation.org))

## See also

Supported OPC UA services of the OPC UA client (Page 6268)

## Compatibility

Support of the mentioned specifications is checked regularly by the "Compliance Test Tool" (CTT) of the OPC Foundation. Interoperability with OPC products of other manufacturers is ensured through the participation in "OPC Interoperability Workshops".

The test results submitted are published on the website of the OPC Foundation. The results can be called up from there using the search term "OPC Self-Certified Products".

## Using OPC in WinCC

### Configuration option

HMI devices configured with WinCC feature an OPC interface for data communication between automation devices or automation systems using the OPC communication driver.

You can use an HMI device as an OPC server and/or as an OPC client. As an OPC client, the HMI device can be connected to a maximum of eight OPC servers.

The software ensures up to eight client HTTP connections for an OPC XML DA server on a Multi Panel. For the exchange of data via an XML connection, some OPC XML DA clients create several HTTP connections to the OPC XML DA server.

HMI device	Data exchange over	Operating system	OPC server	OPC client
PC, Panel PC (with WinCC Runtime Advanced)	DCOM or OPC UA binary (TCP/IP)	Windows XP / 7	OPC DA server OPC UA server (DA only)	OPC DA client OPC UA client*
HMI devices with version V11.0 and V12.0: <ul style="list-style-type: none"> <li>• MP 277</li> <li>• MP 377</li> <li>• Mobile Panel 277</li> <li>• Comfort Panels</li> </ul>	SOAP	Windows CE	OPC XML DA server	-
Comfort Panel with version V13.0	SOAP or OPC UA binary (TCP/IP)	Windows CE	OPC UA server (DA only)	OPC UA client

\*: The OPC UA client exchanges data via TCP/IP.

A communication via DCOM is only possible between HMI devices of the "PC" or the "Panel PC" type. In order for a control room PC to display the process values of Windows CE HMI devices in the plant, for example, install "OPC-XML-Gateway" on the control room PC using the WinCC Runtime Advanced Setup. The "OPC-XML-Gateway" supports the communication within the SIMATIC HMI devices family between an OPC DA client and an OPC XML DA server.

The area pointer is supported by any OPC connection.

### OPC server accessibility

The following table lists the available OPC servers and how you can access them:

OPC server	OPC server name
OPC DA server	OPC.SimaticHMI.CoRtHmiRTm (ProgID)
OPC XML DA server	http://<xxx>/soap/OpcXml (URL) <sup>1</sup> <xxx>: IP address or DNS name of the HMI device
OPC DA server	OPC.Siemens.XML (ProgID) for accessing the OPC XML DA server via the OPC XML gateway from an OPC DA client
OPC UA server	Server URL: opc.tcp://[HostName]:4870
<sup>1</sup> : For the access of an external OPC DA XML client.	

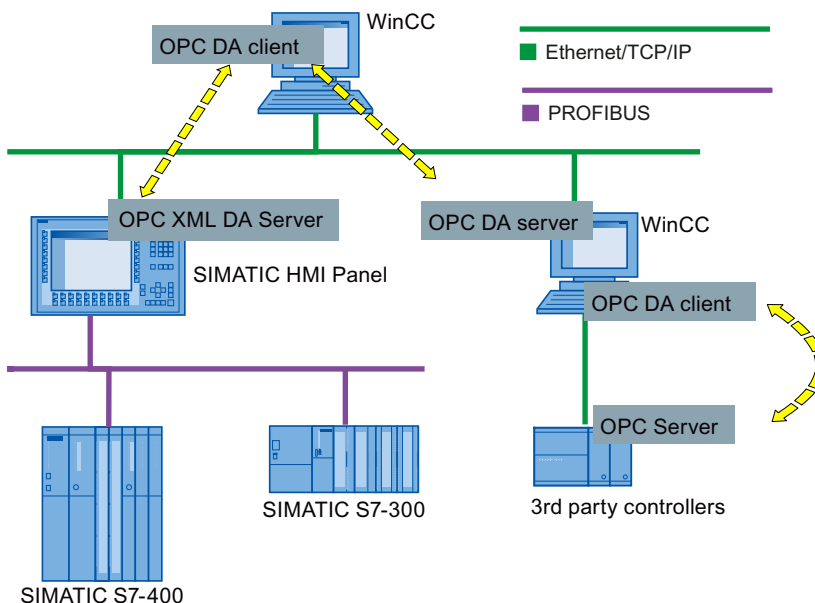

### HMI device as OPC client

To use an HMI device as an OPC client, create an "OPC" connection in the WinCC project. The OPC client accesses the tags of the OPC server over this connection. You need a separate connection for each OPC server.

The following exception applies here:

If you want to connect your OPC DA client to multiple panels, you only need one OPC connection to the OPC XML gateway in your project. The multiplexing of this connection to multiple OPC XML connections to individual panels takes place in the OPC XML gateway. You configure the connections to the panels using the OPC XML Manager.

The following figure shows the use of an HMI device as a central operator control and monitoring device:

## HMI device as OPC server

An HMI device as OPC server makes the data available to other applications. The applications can run on the same HMI device or on HMI devices in the connected network environment.

The following schematic diagram shows the use of MS Excel as an OPC client that displays process values of the OPC server:

## See also

Configuring an HMI device as OPC DA server (Page 6257)

Creating a connection to a WinCC OPC DA server (Page 6260)

OPC XML Gateway (Page 6263)

### 10.17.1.2 Configuring an OPC server

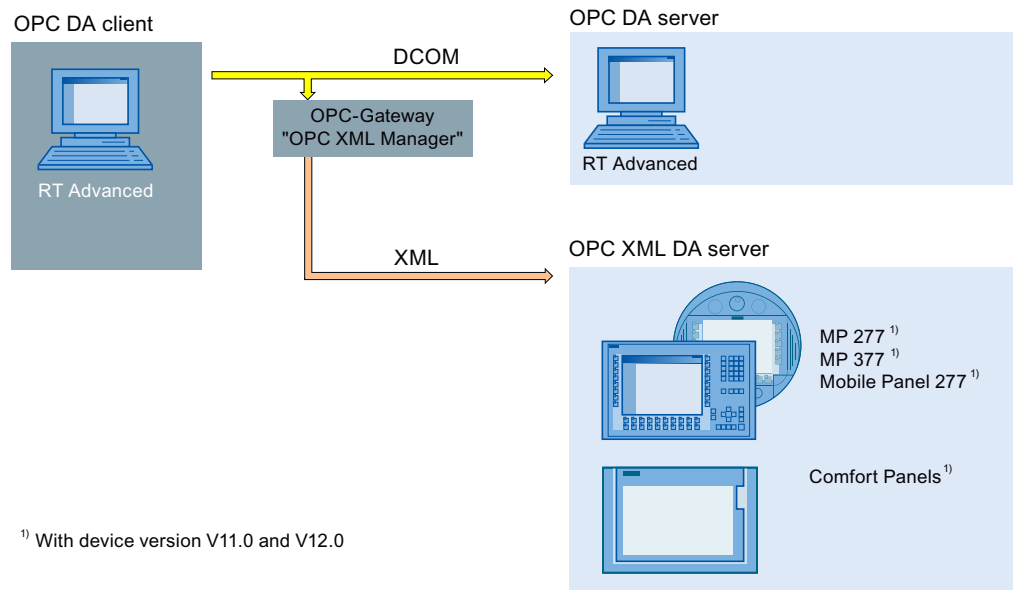

#### Configuring an HMI device as OPC DA server

##### Introduction

Which OPC server is used depends on the HMI device:

- HMI devices with RT Advanced as OPC DA server
- HMI devices with version V11.0 and V12.0 as OPC XML DA server
- HMI devices with version V13.0 as OPC XML DA server

The following figure shows the two methods of accessing an OPC server:

## Procedure

To configure an HMI device as an OPC server, proceed as follows:

1. Open the "Runtime settings" of the HMI device in the project tree.
2. Select the "Operate as OPC server" option in the "Runtime settings" under "Services > Write/read tags".
3. Save the project.
4. Download the project to the HMI device.
5. Start runtime on the HMI device.

## Result

The OPC server is accessible. If an OPC client connects to the OPC server, the OPC server on the HMI device is started.

## See also

Loading a project (Page 5973)

Starting Runtime Advanced and Panels (Page 5986)

Using OPC in WinCC (Page 6253)

Creating a connection to a WinCC OPC DA server (Page 6260)

## Configuring an HMI device as an OPC UA server

### Introduction

The following HMI devices can be used as OPC UA servers:

- Comfort Panels
- RT Advanced

### Procedure

1. Open the "Runtime settings" of the HMI device in the project tree.
2. Select the "Operate as OPC server" option under "Service" in the "Runtime settings".
3. Configure the server settings at "OPC settings > OPC Unified Architecture Server configuration":
  - Change the "Port number", if required.
  - Activate at least one "SecurityPolicy" and the respective "Message security mode".

---

**Note****Unsecured communication between client and server possible**

Use the "none" setting only for test and diagnostics purposes.

---

4. Save the project.
5. Download the project to the HMI device.
6. Start runtime on the HMI device.

### Result

The OPC server is accessible.

If an OPC client connects to the OPC server, the OPC server on the HMI device is started.

## Configuring DCOM user permissions in Windows

### Introduction

The OPC DA client and OPC DA server are DCOM applications, whose security settings must be set in compliance with the DCOM security mechanisms:

- The OPC client needs launch/activation rights and access rights for the OPC DA server.
- The OPC DA server only needs access rights for the OPC DA client

The following must be known on the PCs of the OPC DA server and the OPC DA client respectively:

- The user account for which the OPC DA client is executed

## Requirement

You have administrator rights.

## Procedure

The procedure for configuring DCOM user rights is described in the document (<http://www.opcfoundation.org/DownloadFile.aspx?CM=3&RI=326&CN=KEY&CI=282&CU=14>) of the OPC-Foundation.

For additional information on granting user rights, refer to the documentation for Windows XP, Windows Vista, or Windows 7.

### 10.17.1.3 Configuring an OPC client

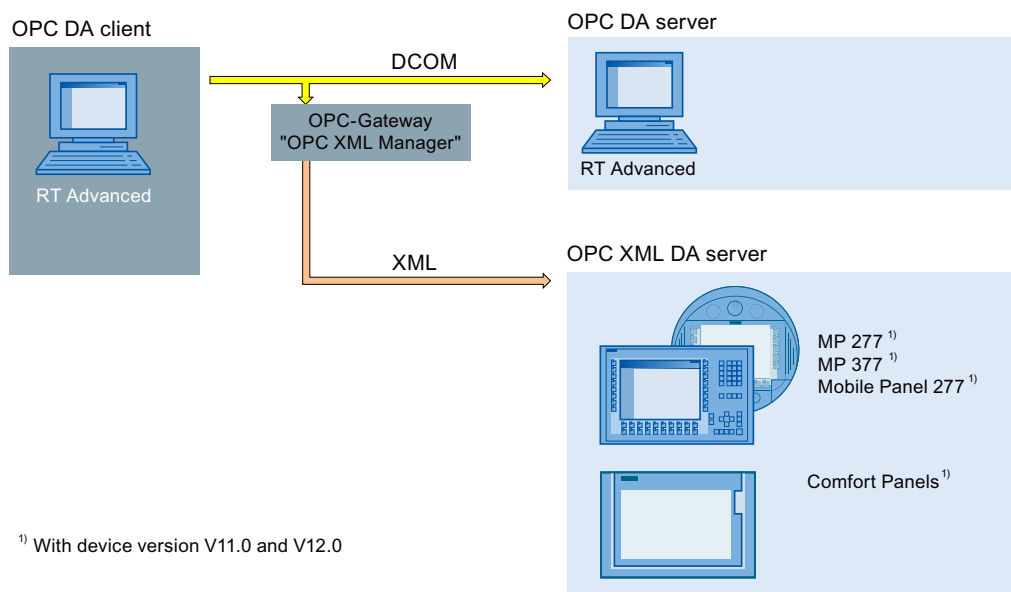

#### Creating a connection to a WinCC OPC DA server

#### Introduction

For an HMI device to access the OPC server data of another HMI device, you need to create a connection to this OPC server in the WinCC project.

Depending on the target HMI device used, either an OPC DA server or an OPC XML DA server is employed.

The following figure shows the two methods for accessing the OPC servers of the HMI devices:

<sup>1)</sup> With device version V11.0 and V12.0

If a connection to one or more OPC XML DA servers is created using an OPC XML gateway, also enter the OPC XML DA servers in the "OPC XML Manager".

## Requirement

- An HMI device is configured as an OPC server.
- The project on the HMI device is in runtime.
- For connections to a OPC XML DA server: "OPC-XML-Gateway" is installed on the configuration PC and the HMI device with the OPC client.

## Procedure

To create a connection to an OPC server of an HMI device, follow these steps:

1. Open the "Connections" editor on the configuration PC in the WinCC project of the OPC client.
2. Create a new connection and enter a meaningful name.
3. Select the entry "OPC" as the "Communication driver".
4. Enter the communication partner under "Parameters > OPC server" in the work area:
  - If the connection communicates directly with the OPC server or with the OPC server on a PC-based HMI device, select the "OPC.SimaticHMI.CoRtHmiRTm" item from the list.
  - If the connection communicates directly with the OPC server of a Windows CE HMI device, select "OPC.Siemens.XML" from the list.
  - If the OPC server is installed on a remote computer, enter the computer's IP address or name under "Remote computer name".

## Result

The OPC connection is configured. To access the data on the WinCC OPC DA server, create tags.

## See also

Using OPC in WinCC (Page 6253)  
Configuring an HMI device as OPC DA server (Page 6255)  
OPC XML Gateway (Page 6263)  
Configuring an OPC XML Manager (Page 6264)

## Creating a connection to an OPC UA server

### Introduction

The OPC UA client can access process data in the hierarchical name space of an OPC UA server.

For the OPC UA client to access the process values of an OPC UA server, the OPC UA server and the OPC UA client authorize each other by exchanging certificates. In addition, you can encode the data transfer.

The OPC UA client usually classifies each certificate of an OPC UA server as a "trustworthy". How an OPC UA server responds to a connection request of the OPC UA client depends on the configuration of the OPC UA server.

In order to establish communication to an OPC UA server, inform yourself from the OPC UA server operator about the following:

- URL of the OPC UA server
- Security settings
- Required certificates

### Requirement

URL and security settings of the OPC UA server are known.

### Procedure

To create a connection to an OPC UA server, proceed as follows:

1. Open the "Connections" editor on the HMI device.
2. Create a new connection and enter a meaningful name.
3. Select the entry "OPC UA" as the "Communication driver".
4. In the work area, under "Parameters", configure the "OPC server":
  - Specify the "Discovery URL" of the OPC UA server or select the OPC UA server from the list.
  - Select the "Security policy"
  - Select the "Message security mode"

### Result

The OPC UA connection is configured. You create tags to access data from the OPC UA server.

### See also

Supported OPC UA services of the OPC UA client (Page 6268)

### Accessing process values of an OPC server

#### Requirement

- The OPC server to be addressed is ready-to-operate and in the "running" status
- A connection to the OPC-Server is created

## Procedure

To access process values of an OPC-Server via the OPC connection, follow these steps:

1. On the configuration PC in the project navigation, open the "HMI tags" editor under the HMI device that you use as an OPC client.
2. Create a tag with the same data type as the tag on the OPC server.
3. Select the OPC connection for "Connection".
4. Enter the "Address", or select the desired tag on the OPC server via the object list.

## Result

If you launch Runtime on the HMI device, the process value from the OPC server will be written to the tag on the HMI device via the OPC connection.

## See also

Permitted data types (OPC) (Page 6266)

Access to tags with OPC (Page 6267)

## OPC XML Gateway

### Usage

The OPC DA client uses the "OPC XML Gateway" so that the OPC DA client can communicate with the OPC XML DA server. The "OPC XML Gateway" compiles the data in the respective "language" of the corresponding standard. The "OPC XML Gateway" communicates exclusively with the OPC XML DA server which runs on an SIMATIC HMI device.

### Installation

To install "OPC XML Gateway", activate the "OPC XML Gateway" entry during installation of WinCC runtime advanced in the component selection. To install "OPC XML Gateway" afterwards, re-execute the setup of WinCC Runtime Advanced.

### Proxy setting for the OPC XML Gateway

The configuration settings for the OPC XML Gateway can be found in the "SOPCSRVR.ini" file in the section "[Configuration]". The OPC XML Gateway is configured by default on the PC as the HMI device, so that a proxy server configured in the Internet settings of Internet Explorer is ignored:

```
NOPROXY=1
```

If this entry is set to "0", the OPC XML Gateway uses a configured proxy server for HTTP connections.

You can find the "SOPCSRVR.ini" file in the folder "C:\Program Files\Siemens\Automation\WinCC RT Advanced".

---

**Note**

When data is requested from an HMI device that cannot be accessed over the configured proxy server, the OPC XML Gateway uses a direct connection after a Timeout. The direct connection is set up again on every request for data and slows down OPC communication significantly.

---

**See also**

Configuring an OPC XML Manager (Page 6264)

Using OPC in WinCC (Page 6253)

**Configuring an OPC XML Manager**

**Introduction**

The OPC XML DA server, to which the OPC DA client has access, is administered in the "OPC XML Manager". The OPC XML Manager can be found in the Windows Start menu under "SIMATIC > OPC-XML-Gateway > OPC XML Manager".

To enter an OPC server, you need the following information:

- Server prefix  
Any string that is used in the name of the OPC tag. Use an abbreviation of the server, for example. You can find the characters permitted for tag names in the reference.
- Name or IP address of the OPC XML DA server

**Requirement**

"OPC XML Manager" is open.

**Procedure**

To configure the OPC XML Manager, proceed as follows:

1. To enter a new OPC XML DA server, click on the button "Add".  
The "Add/Edit Webservice" dialog is opened.
2. Enter the server prefix and the name or IP address of the OPC XML DA server.
3. Close the two dialogs with "OK".

## Result

The OPC XML DA server is entered. The OPC DA client can now access the data of the OPC XML DA server via the "OPC XML Gateway".

## Editing or removing an OPC server

To edit or delete a configured OPC XML DA server, select the required OPC XML DA server. Then click either "Edit" or "Remove" .

## See also

OPC XML Gateway (Page 6261)

### 10.17.1.4 Security concept of OPC UA

#### Introduction

The WinCC OPC UA server uses the TCP/IP protocol for data exchange. For authorization between WinCC OPC UA server and OPC UA client certificates are exchanged. In addition, you can encode the data transfer.

#### Security concept

The WinCC OPC UA server and each OPC UA client authorize themselves mutually by exchanging certificates.

By default, the WinCC OPC UA server creates during installation a self signed instance certificate. You can alternatively replace this instance certificate with a project-specific instance certificate.

---

#### Note

##### Private key and own certificates

If you have an own certification center, you can create your own certificates and make them available for all communication partners. In this case, delete the instance certificate created by WinCC OPC UA server.

---

The instance certificate is stored under the following path:

- On PCs: \ProgramData\Siemens\CoRtHmiRTm\MiniWeb13.0.0\SystemRoot\SSL
- On Panels: \flash\simatic\SystemRoot\SSL

### Security settings

The following table lists the security settings supported by the WinCC OPC UA server:

SecurityPolicy	Message Security Mode		
None <sup>1</sup>	None		
Basic128Rsa15 <sup>2</sup>	None <sup>3</sup>	Sign <sup>4</sup>	SignAndEncrypt <sup>5</sup>
1: The certificate exchange is switched off. Every OPC UA client can log on to the WinCC OPC UA server.			
2: Certificate exchange with depth of encryption of 128 bit.			
3: The data packages are exchanged after certificate check unsecured between client and server.			
4: The data packages are signed with the certificates, but not encoded			
5: The data packages are signed with the certificates and encoded			

#### 10.17.1.5 Reference

### Permitted data types (OPC)

#### Permitted data types

The following table lists the data types supported by the WinCC OPC servers:

OPC data type	WinCC data type
VT_BOOL	BOOL
VT_I1	CHAR
VT_UI1	BYTE
VT_I2	SHORT
VT_UI2	WORD
VT_UI4	DWORD
VT_I4	LONG
VT_R4	FLOAT
VT_R8	DOUBLE
VT_DATE	DATE
VT_BSTR	STRING

The following table lists the ranges of values of the OPC data types:

OPC data type	Range of values
VT_BOOL	0 or -1
VT_I1	-128 to 127
VT_UI1	0 to 255
VT_I2	-32768 to 32767
VT_UI2	0 to 65535
VT_I4	-2147483648 to 2147483647

OPC data type	Range of values
VT_UI4	0 to 4294967295
VT_R4	3.402823466 e-38 through 3.402823466 e+38
VT_R8	1.7976931486231e-308 to 1.7976931486231e+308
VT_Date	1 January 100 to 31 December 9999

### Special features in communication with the OPC-DA server

The array tag in the OPC-DA server belonging to the area pointer must be of the data type SHORT (VT\_I2).

### Special features in communication with the OPC-XML server

Array tags are not supported by OPC-XML servers.

## Access to tags with OPC

### Introduction

When accessing tags with OPC, note the following when configuring tags:

- Permitted characters in tag names
- Permitted cycle times (OPC XML)
- Special features of the data type "STRING" (OPC XML)
- Special features of the data type "Date/Time" (OPC XML)

The OPC XML DA server is tested and enabled for eight connections, each with 2 groups and consisting of 35 tags.

### Permitted characters in tag names

Only use the following characters in tag names:

- Letters from "a" to "z" (no umlauts)
- Numbers from "0" to "9"
- Special characters: "-" and "\_"

### Permitted cycle times (OPC XML)

OPC XML connections are designed for the exchange of small volumes of data:

- For this reason use cycle times that are greater than one second
- In general, only request a small number of tags; a maximum of 30 per screen

### Special features of the data type "STRING" (OPC XML)

Only valid ASCII values from 0x20hex to 0x7Fhex are supported in the data type "STRING".

### Special features of the data type "Date/Time" (OPC XML)

Values of the data type "Date/Time" are always expected as UTC (Universal Time Coordinated) by the OPC-Gateway. If a tag of the type "Date/Time" is read by the OPC client, the returned value is a time in UTC. If a value is written to the tag, the value is treated as UTC. The time including the time zone and daylight saving time are shown as "local time" on an HMI device.

Example:

The time zone GMT+1 and daylight saving time is set on the HMI device.

OPC DA client (UTC time): 01.01.2005 16:00

Display on the HMI device (OPC server): 01.01.2005 18:00

### Supported OPC UA services of the OPC UA client

#### OPC UA Services support

The OPC UA client supports the following OPC UA services:

- SecurityPolicy - Basic128Rsa15
- SecurityPolicy - Basic256
- SecurityPolicy - None
- DataAccess ClientFacet

You can additional information about OPC UA services in the "OPC UA Part 3 - Address Space Model 1.01 Specification" document under "§5.6".

### Explanation of the security settings

The following table lists the security settings supported by the OPC UA client:

SecurityPolicy	Message Security Mode		
None <sup>1</sup>	None		
Basic128Rsa15 <sup>2</sup>	None <sup>4</sup>	Sign <sup>5</sup>	SignAndEncrypt <sup>6</sup>
Basic256 <sup>3</sup>	None	Sign	SignAndEncrypt
1: The certificate exchange is disabled. Every OPC UA client can log on to the WinCC OPC UA server. This setting can be disabled on each OPC UA server.			
2: Certificate exchange with depth of encryption of 128 bit.			
3: Certificate exchange with depth of encryption of 256 bit.			
4: The data packages are exchanged after certificate check unsecured between client and server.			
5: The data packages are signed with the certificates, but not encoded			
6: The data packages are signed with the certificates and encoded			

**Note****Unsecured communication between client and server possible**

Use the "none" setting only for test and diagnostics purposes.

For a secure communication between client and server, use in operating mode at least the following settings:

- SecurityPolicy: Basic128Rsa15
  - Message Security Mode: Sign
-

Creating a connection to an OPC UA server (Page 6259)

**10.17.2 Customer controls****10.17.2.1 Overview****Introduction**

User-specific controls are used to create and standardize complex, frequently used screen objects. The WinCC Control Development add-on is required to develop controls. Programming is carried out in Visual Studio 2008 or Visual Studio 2010 with .NET Framework 2.0, 3.0 or 3.5.

You can, for example, place several motors of a similar type in a plant. In a customer control, you can summarize motor data such as operating mode, setpoint, actual value, rotational speed, operational status, frequency.

When the customer control is finished, you can integrate it an unlimited number of times into WinCC screens, as well as in other applications.

Central changes to the customer control are automatically adopted at all usage locations. In this way, you can later expand a customer control with additional functionality. The changes are effective on all customer controls of this type used in WinCC screens that are already configured.

### Target group of this documentation

This documentation is aimed at configuration engineers with knowledge of VB.net or C#.

### Service & Support on the Internet

In addition to our documentation, we offer a comprehensive knowledge base on the Internet at: [www.siemens.com/automation/service&support](http://www.siemens.com/automation/service&support)

## 10.17.2.2 Interfaces

### Introduction

To access the WinCC tag value, WinCC makes interfaces available for access to the WinCC data provider. The connection to the WinCC data provider is established or disconnected using methods. Methods are also used to read or write tag values synchronously or asynchronously.

- **Synchronous:**  
The customer control sends a request to the data provider for which a reply is expected immediately. The customer control waits until a reply comes from the data provider.
- **Asynchronous:**  
The customer control sends a request to the data provider for which a reply is not expected immediately. Sending the request and receiving the reply occur at separate times.

### Interfaces

- **ITag**  
The ITag object supports the following methods:

Method	Description
Register	Registers the customer control as a consumer at the data provider. The consumer receives a cookie from the data provider. The cookie is used to assign a request from the data provider to a consumer.
ReadTag	Reads the value of one or more tags at the same time
ReadTagAsync	Reads the tag value asynchronously
ReadTagCyclic	Cyclic reading of the tag values. The update cycle is used to determine how often the value is updated.
RemoveCyclicTag	Removes one or more tags
Cancel	Cancel the cyclic reading of the tag values

Method	Description
WriteTag	Writes values to one or more tags synchronously
WriteTagAsync	Writes values to one or more tags asynchronously
Unregister	Removes the consumer

- ITagSink  
The ITagSink object reacts to specific events using methods.

Method	Description
OnCanceled	Occurs when the ITag method "Cancel" has ended.
OnDataChanged	Occurs when a tag value is changed by the following ITag methods: <ul style="list-style-type: none"> <li>• ReadTagAsync</li> <li>• ReadTagCyclic</li> </ul>
OnError	Occurs as an event of an error with the following methods: <ul style="list-style-type: none"> <li>• ReadTagAsync</li> <li>• ReadTagCyclic</li> <li>• WriteTagAsync</li> <li>• OnDataChanged</li> <li>• OnWriteComplete</li> </ul>
OnRemoved	Occurs when the ITag method "RemoveCyclicTag" has ended.
OnWriteComplete	Occurs when the ITag method "WriteTagAsync" has finished.

## Requirement

- This documentation is aimed at configuration engineers with knowledge of VB.net or C#.
- The "Siemens.Runtime.ControlDev.dll" reference is set. For further details, refer to "Setting the reference "Siemens.Runtime.ControlDev.dll".  
Storage of file:
  - WinCC Runtime Professional: ...\\Siemens\\WinCC\\bin
  - WinCC Runtime Advanced: ...\\WinCC Runtime Advanced

## Basic procedure

1. Create an ITag object to connect to the data provider.
2. The "Register" method is used to register the customer control as a consumer of the data provider. The consumer receives a cookie from the data provider. The cookie is used to identify the access by the consumer to the data provider.
3. When the connection is established, you can access the tag values using the methods of the ITag object.

### 10.17.2.3 Demo project

#### Requirement

- You need WinCC RT Professional or WinCC RT Advanced in order to test the demo projects.
- Correspondingly installed configuration software (Visual Studio 2008 or Visual Studio 2010) is required to open the demo projects.

#### Demo project "CCITagTestLibrary"

In the directory "%Program Files%\Siemens\Automation search for the folder "samples". The demo projects "CCITagTestLibrary" are contained there. The various methods of iTag-Interfaces are used in these demo projects.

- "VB100\CCITagTest\ CCITagTestLibrary" is the demo project for Visual Studio 2010.

Use the demo project as a template for your own customer controls. This demo project includes the interface to the data provider of WinCC.

To use the demo project, proceed as follows:

1. Copy the entire "CCITagTestLibrary" folder to a local destination directory.
2. Double-click on the "CCITagTestLibrary.sln" file.

#### See also

Creating and testing customer controls (Page 6274)

## 10.17.2.4 Creating and testing customer controls

### Creating and testing customer controls

#### Introduction

This section shows the basic procedure for creating and testing a customer control in VB.net.

To follow the configuration steps, use a VB.net project that uses the provided "CCITagTestLibrary" demo project as a template.

#### Requirement

- Visual Studio 2008 or Visual Studio 2010
- WinCC RT Advanced or WinCC RT Professional
- WinCC project for WinCC RT Professional or WinCC RT Advanced has been created. For additional information, refer to "Editing a project".

#### Basic procedure

To create and test the "ITagUserControl" customer control, proceed as follows:

1. Check the reference "Siemens.Runtime.ControlDev.dll" (Page 6274)
2. Create a user interface (Page 6276).
3. Create the program code (Page 6277).
4. Create customer controls (Page 6278).
5. Test customer controls in Visual Studio (Page 6279).
6. Test customer controls in WinCC (Page 6281).

#### See also

Demo project (Page 6271)

Creating a WinCC project (Page 6279)

### Check the reference "Siemens.Runtime.ControlDev.dll"

#### Introduction

To access the data provider of WinCC, the VB.net project is linked to the "Siemens.Runtime.ControlDev.dll" library.

## Requirement

- Visual Studio 2008 or Visual Studio 2010 is installed.
- A VB.net project is open. The VB.net project uses the demo project as a template.

## Procedure

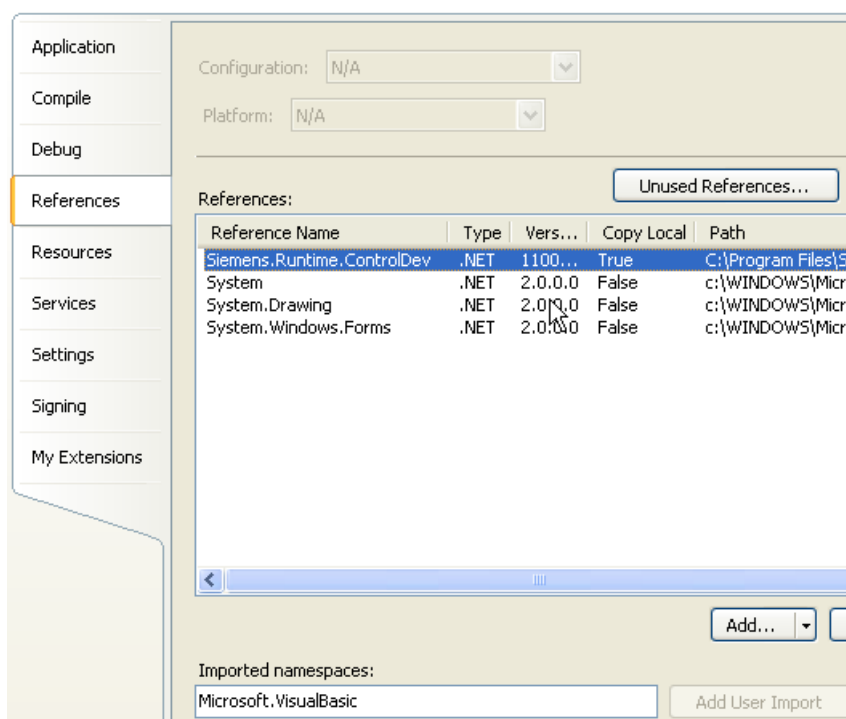

Proceed as follows to verify the reference:

1. In Solution-Explorer, double-click the "CCITagTestLibrary > My Project" item.

The Project Designer opens.

2. Click on "References" in the Project Designer.

3. If the reference is not set, click on "Add...". In the "Add Reference" dialog, click "Browse".
4. In WinCC Runtime Professional, navigate to the directory "...\\Siemens\\WinCC\\bin". In WinCC Runtime Advanced, navigate to the directory "...\\WinCC Runtime Advanced".
5. Select the entry "Siemens.Runtime.ControlDev.dll". Click "OK".

**See also**

Interfaces (Page 6269)

**Creating a user interface**

**Settings**

For the configuration you require objects with the following settings:

Object	Quantity	Property	Setting
 GroupBox	1	Text	ReadTag
 Label	2	Text Text	TagName Value
 Textbox	2	(Name)	txtReadTagTagName
		(Name) ReadOnly	txtReadTagValue True
 Button	1	Text (Name)	Read btnReadTagStart

**Requirement**

- A VB.net project is open. The VB.net project uses the demo project as a template.
- The toolbox is displayed.
- The properties window is displayed.

**Procedure**

To create the user interface, follow these steps:

1. In Solution-Explorer, double-click the "CCITagTestLibrary > ITagUserControl.vb" item. The Form Designer opens.
2. Insert a GroupBox into the form from the tool window. Configure the GroupBox with the settings described above.
3. Insert two text box objects into the form from the tool window. Configure the objects with the settings described above.
4. Add two labels to the form. Configure the labels with the settings described above.
5. Add a button to the form. Configure the button with the settings described above.

## Result

The user interface for the "ITagUserControl" customer control has been created.

## Creating program code

### Introduction

To use customer control to access the WinCC tag values, implement the access to the ITag interface.

### Procedure

To create the program code, proceed as follows:

1. For access to the ITag interface, enter the following:

```
' ITag interface
Dim m_ITag As ITag ' get the Tagset Object from the container
m_ITag = Site.GetService(GetType(ITag))
' Connect to server
m_RegisterCookie = m_ITag.Register(Me)
```

1. Double-click the "btnReadTagStart" button in the Form Designer. The code window with the "btnReadTagStart\_click" subprocedure opens automatically.
2. Insert the following code between "Sub btnReadTagStart\_Click" and "End Sub".

```
Private Sub btnReadTagStart_Click(ByVal sender As Object, ByVal e As EventArgs)
    _Handles btnReadTagStart.Click
    Try
        Dim TagName As Object = "Tag_Test" ' name of the tag, e.g. coming from TextBox
        Dim Values As Object = m_ITag.ReadTag(m_RegisterCookie, TagName)
        Dim Value
```

```
Dim strResult
For Each Value In Values
    strResult = CStr(Value) ' the result of the ReadTag could be written in a TextBox
(Enabled = False)
Next
Catch ex As Exception
    MsgBox("ReadTag:" & vbCrLf & ex.Message)
End Try
End Sub
```

## Result

Access to the ITag interface is implemented and the code for the button "btnReadTagStart" is created.

To access the ITag interface from Visual Studio, the ProgID of the data provider must be transferred.

- ProgID for WinCC Runtime Professional: CCITagControl.ITagControl.1
- ProgID for WinCC Runtime Advanced: FwTagDataProvider.FwTagDataProvider

Example:

```
' Create the TagServer Object
Dim oTagServer As Object = CreateObject("CCITagControl.ITagControl.1")
' Set the Tagset Object
m_ITag = oTagServer
```

You can find the full program code in the demo project "CCITagTestLibrary".

## Creating customer controls

### Procedure

To create the customer control, proceed as follows.

1. Double-click the "My Project" entry in the project folder explorer. The Project Designer opens.
2. Click on the "Compile" button in the Project Designer. Specify the destination directory for the DLL file for "Build output path".
3. Save the change in the VB.net project "CCITagTestLibrary".
4. Select the "CCITagTestLibrary" entry in the project folder explorer. Select the "Build" command in the shortcut menu.

## Result

The "ITagUserControl.dll" file is now located in the destination directory. The customer control "ITagUserControl" will be displayed in the toolbox.

## Testing customer controls in Visual Studio

### Creating a WinCC project

#### Introduction

To test the "ITagUserControl" customer control, you will have to create the "HMI\_Variable\_1" tag and the "CC\_ITagUserControl" screen in WinCC.

#### Requirement

- WinCC project for WinCC RT Professional or WinCC RT Advanced has been created.
- The "CC\_ITagUserControl" screen has been created and opened.
- The internal tag "HMI\_Variable\_1" has been created.

#### Procedure

To create the WinCC project for the test, proceed as follows:

1. Add an I/O field in the "CC\_ITagUserControl" screen. Link the I/O field to the "HMI\_Variable\_1" tag.
2. Add a slider to the screen. Link the slider to the "HMI\_Variable\_1" tag.
3. Configure the "SetTag" system function at the "Change" event with the following settings.

Parameter	Setting
Tag (output)	HMI_Variable_1
Value	HMI_Variable_1

## Result

The "CC\_ITagUserControl" screen has been created. The tag value in the I/O field will be displayed when you use the slider in Runtime.

## Creating a test form

### Introduction

You cannot test the "ITagUserControl" customer control in the Visual Studio Form Designer. You need a test form to test the customer control.

### Requirement

"ITagUserControl" customer control has been created.

### Procedure

Proceed as follows to create a test form:

1. In Solution-Explorer " select the project folder "CCITagTestLibrary". Select "Add > New Project..." in the shortcut menu. The "Add new project" dialog opens.
2. In the left window "Project types" under "Other languages > Visual Basic", select the entry "Windows". In the right window "Templates" select the entry "Windows Forms Application".
3. Enter "TestCustomControl" as the "Name". Click "OK".
4. A test form opens. Insert the "ITagUserControl" control into the test form.
5. Double-click the "TestCustomControl > My Project" entry in the project folder explorer. The Project Designer opens.
6. Click on "References" in the Project Designer. Verify that the reference to "Siemens.Runtime.ControlDev.dll" has been set.  
Storage of file:
  - WinCC Runtime Professional: ...\\Siemens\\WinCC\\bin
  - WinCC Runtime Advanced: ...\\WinCC Runtime Advanced
7. Save the project

### Result

You have created the test form for testing the "ITagUserControl" customer control.

## Testing customer controls in Visual Studio

### Requirement

- WinCC runtime is started.
- Test form is created.

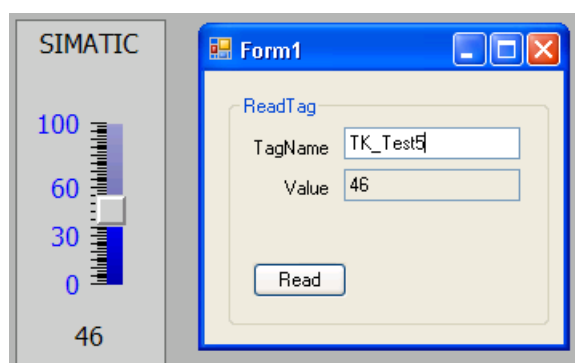

## Procedure

To test the customer control in Visual Studio, proceed as follows:

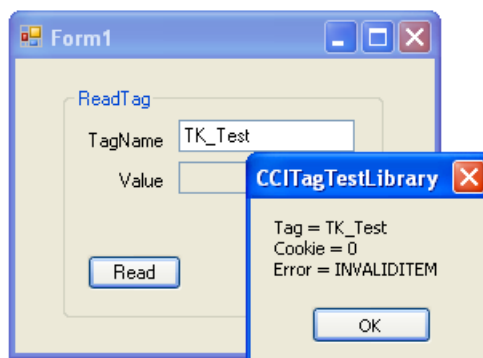

1. Start the test of the customer control with <F5>. The "Form1" form opens.
2. Enter "TK\_Test5" in the "TagName" field. Click "Read".

## Result

The tag value "TK\_Test5" will be displayed in the "Value" field. Move the slider to change the tag value in WinCC. The current tag value will be displayed in the I/O field. Click on "Read" to update the tag value in the customer control.

An error message will appear if you enter an incorrect tag name in the "TagName" field.

## Testing customer controls in WinCC

## Adding customer control in WinCC

## Introduction

To use customer controls in WinCC, you need to add them to the "My Controls" palette.

## Procedure

To add customer controls, proceed as follows:

1. Open a screen.
2. Select the "Select object" command in the shortcut menu of the "Tools" task card.
3. Click "Specific .Net Controls" in the "Select control" dialog. Navigate to the desired customer control, for example "ITagUserControl", in the "Select assembly" field.
4. Select the "ITagUserControl" customer control.
5. Click "OK".

## Result

The "ITagUserControl" customer control is displayed in the "My Controls" palette.

## Testing customer controls in WinCC

### Requirement

- The "CC\_ITagUserControl" screen has been created and opened.

## Procedure

To test the "ITagUserControl" customer control, proceed as follows:

1. Add a "ITagUserControl" to the screen.
2. Start WinCC Runtime with the start screen "CC\_ITagUserControl".
3. Move the slider. The new value is displayed in the I/O field.
4. Enter "TK\_Test5" in the "TagName" field.
5. Click on the button "Read".

## Result

The "ITagUserControl" customer control has been added. If you activate WinCC Runtime, the tag value is displayed in the "Value" field.

### 10.17.2.5 Reference

#### ITag methods

##### Register

##### Description

Registers the customer control as a consumer at the data provider. The consumer receives a cookie from the data provider. The cookie is used to assign a request from the data provider to a consumer.

##### Syntax

RegisterCookie Object.**Register** (CustomerControl)

##### Parameter

###### Object

Name of the ITag object

###### Customer Control

Name of the customer controls

##### Return value

###### RegisterCookie

Cookie to identify the consumer

##### ReadTag

##### Description

Reads the value of one or more tags at the same time.

##### Syntax

Values Object.**ReadTag**(RegisterCookie, TagNames)

##### Parameter

###### Object

Name of the ITag object

**RegisterCookie**

Cookie to identify the consumer

**TagNames**

Tag name

**Return value**

**Values**

Tag value

**ReadTagAsync**

**Description**

Reads the value of one or more tags asynchronously.

**Syntax**

Object.**ReadTagAsync** (RegisterCookie, TagNames, ClientCookies, CacheDevice)

**Parameter**

**Object**

Name of the ITag object

**RegisterCookie**

Cookie to identify the consumer

**TagNames**

Tag name

**ClientCookies**

Cookie for identification of tags

**CacheDevice**

This parameter is only evaluated by WinCC RT Professional.

0 = The tag value is read from the process image (cache).

1 = The tag value is read directly from the AS.

**See also**

[OnDataChanged \(Page 6289\)](#)

[OnError \(Page 6290\)](#)

## ReadTagCyclic

### Description

Cyclic reading of the tag values. The update cycle is used to determine how often the value is updated.

### Syntax

Object.**ReadTagCyclic** (RegisterCookie, TagNames, UpdateRates, ClientCookies, ServerCookies)

### Parameter

**Object**

Name of the ITag object

**RegisterCookie**

Cookie to identify the consumer

**TagNames**

Tag name

**UpdateRates**

Update cycle of the tags. The value is entered in milliseconds.

**ClientCookies**

Cookie for identification of tags

### Return value

**ServerCookies**

Cookie for identification of tags The return value is used by the ITag method "RemoveCyclicTag (Page 6285)".

### See also

OnDataChanged (Page 6289)

OnError (Page 6290)

## RemoveCyclicTag

### Description

Removes one or more tags.

## Syntax

Object.**RemoveCyclicTag** (RegisterCookie, ServerCookies)

## Parameter

### Object

Name of the ITag object.

### ServerCookies

Cookie for identification of tags

## See also

ReadTagCyclic (Page 6283)

OnRemoved (Page 6290)

## Cancel

## Description

Cancels the cyclic reading of the tag values.

## Syntax

Object.**Cancel** (RegisterCookie)

## Parameter

### Object

Name of the ITag object

### RegisterCookie

Cookie to identify the consumer

## See also

OnCanceled (Page 6288)

## WriteTag

## Description

Writes values to one or more tags at the same time.

**Syntax**

Object.**WriteTag**(RegisterCookie, TagNames, Values)

**Parameter****Object**

Name of the ITag object

**RegisterCookie**

Cookie to identify the consumer

**TagNames**

Tag name

**Values**

Values written to the tags

**WriteTagAsync****Description**

Writes values to one or more tags asynchronously.

**Syntax**

Object.**WriteTagAsync**(RegisterCookie, TagNames, ClientCookies, Values)

**Parameter****Object**

Name of the ITag object

**RegisterCookie**

Cookie to identify the consumer

**TagNames**

Tag name

**ClientCookies**

Cookie for identification of tags

**Values**

Values written to the tags

### See also

OnError (Page 6290)

### Unregister

#### Description

Removes the consumer.

#### Syntax

Object.**Unregister** (RegisterCookie)

#### Parameter

##### Object

Name of the ITag object

##### RegisterCookie

Cookie to identify the consumer

### ITag methods

#### OnCanceled

#### Description

Occurs when the ITag method "Cancel (Page 6284)" has ended.

#### Syntax

Object.**OnCanceled** (RegisterCookie)

#### Parameter

##### Object

Name of the ITagSink object

##### RegisterCookie

Cookie to identify the consumer

## OnDataChanged

### Description

Occurs when a tag is changed by the following ITag methods.

- ReadTagAsync (Page 6282)
- ReadTagCyclic (Page 6283)

### Syntax

Object.**OnDataChanged** (RegisterCookie, TagNames, Values, Qualities, VarStates, TimeStamps, ClientCookies)

### Parameter

**Object**

Name of the ITagSink object

**RegisterCookie**

Cookie to identify the consumer

**TagNames**

Tag names

**Qualities**

Quality code of the tags

**VarStates**

Tag status of the tags

**TimeStamps**

Time stamp

**ClientCookies**

Cookie for identification of tags

### See also

OnError (Page 6290)

## OnError

### Description

Occurs as an event of an error with the following methods:

- ReadTagAsync (Page 6282)
- ReadTagCyclic (Page 6283)
- WriteTagAsync (Page 6285)
- OnDataChanged (Page 6287)
- OnWriteComplete (Page 6291)

### Syntax

Object.**OnError** (RegisterCookie, TagNames, ClientCookies, Errors)

#### Object

Name of the ITagSink object

#### RegisterCookie

Cookie to identify the consumer

#### TagNames

Tag names

#### ClientCookies

Cookie for identification of tags

#### Errors

Error code

## OnRemoved

### Description

Occurs when the ITag method "RemoveCyclicTag (Page 6283)" has ended.

### Syntax

Object.**Remove**(RegisterCookie, ClientCookies)

### Parameter

#### Object

Name of the ITagSink object

**RegisterCookie**

Cookie to identify the consumer

**ClientCookies**

Cookie for identification of tags

**OnWriteComplete**

**Description**

Occurs when the ITag method "WriteTagAsync (Page 6285)" has finished.

**Syntax**

Object.**OnWriteComplete**(RegisterCookies, TagNames, ClientCookies)

**Parameter**

**Object**

Name of the ITagSink object

**RegisterCookie**

Cookie to identify the consumer

**TagNames**

Tag names

**ClientCookies**

Cookie for identification of tags

**See also**

OnError (Page 6288)

## 10.18 Migrating to WinCC in the TIA Portal

### 10.18.1 Overview of migration to WinCC V12

#### Overview of the section "Migration to WinCC in the TIA Portal"

SIMATIC WinCC offers a number of functional changes in the TIA Portal. Some functions differ from the functions that you know from familiar environments such as WinCC V7 or WinCC flexible.

This document provides an overview of the special functions and procedures in SIMATIC WinCC in the TIA Portal.

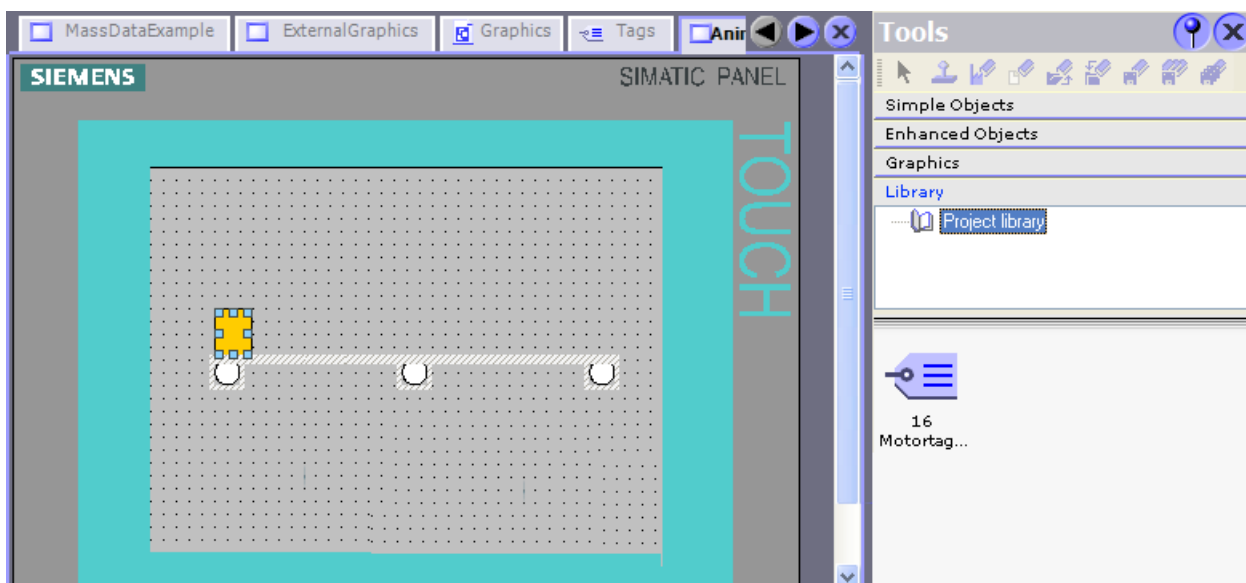

These functions and procedures are fundamentally different from the WinCC V7 and WinCC flexible version, or have a different name.

### 10.18.2 WinCC flexible

#### 10.18.2.1 Libraries

##### Libraries in WinCC flexible

Libraries are a collection of pre-configured screen objects. They expand the number of available screen objects and increase engineering efficiency, because library objects are always available for reuse; there is no need to reconfigure them.

WinCC flexible enables you to create two library types:

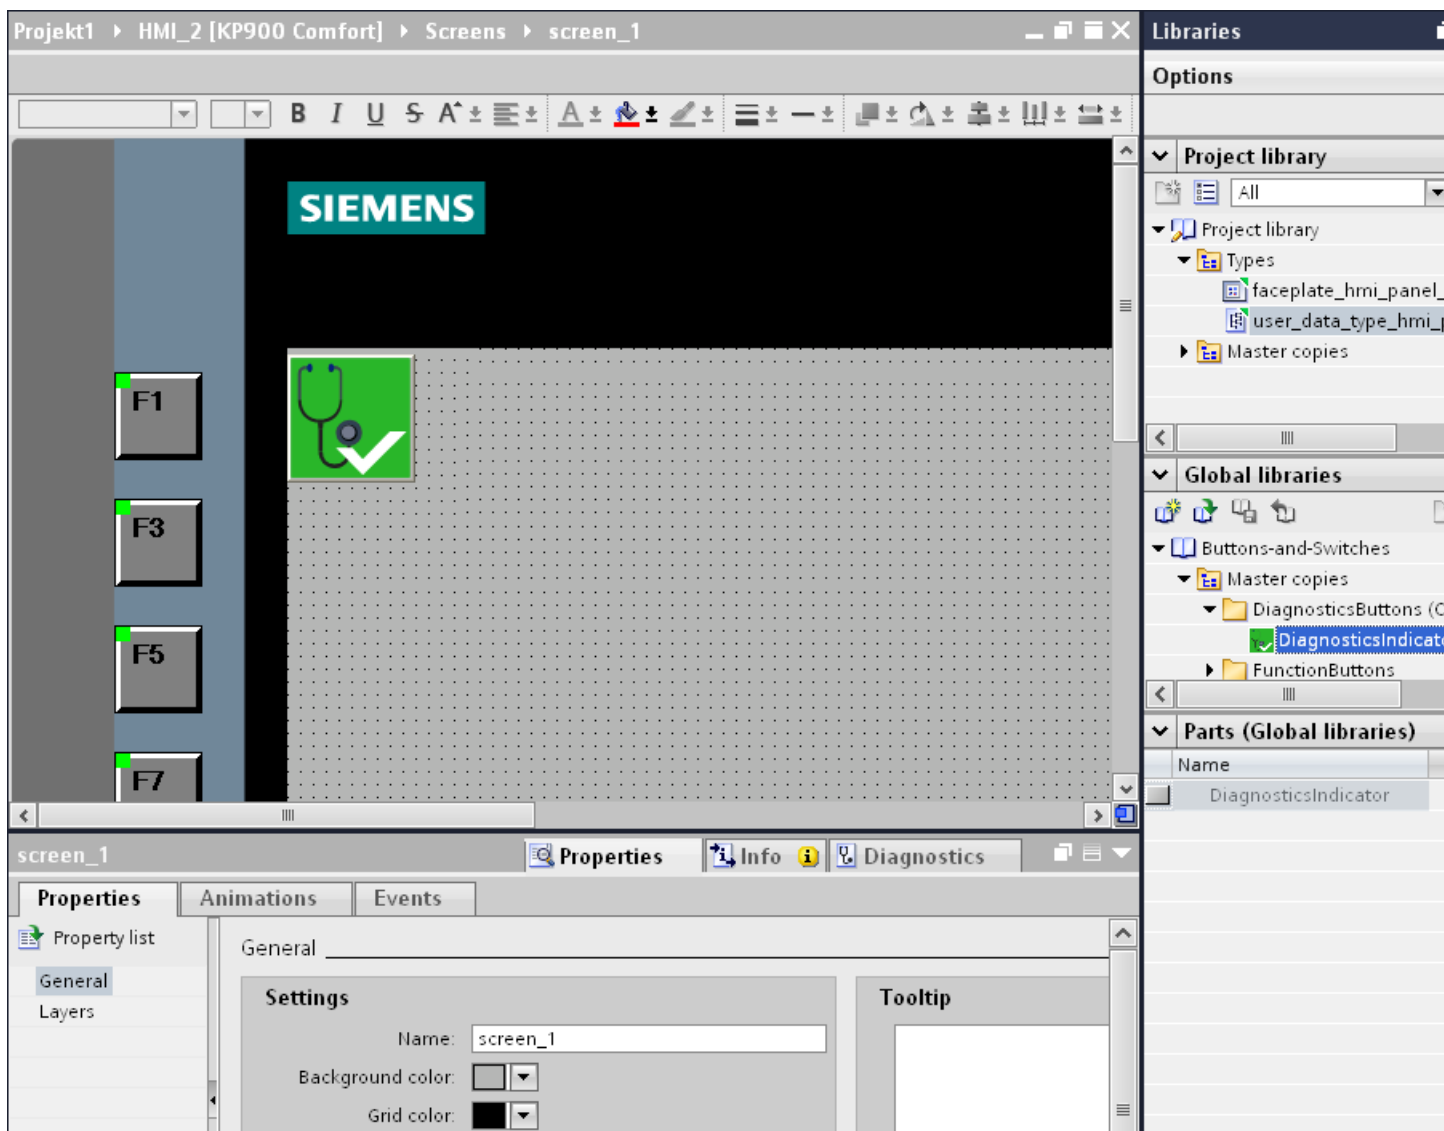

- Project library
- Global library

A library can contain all the WinCC flexible objects, such as screens, tags, graphic objects, or alarms.

### How do I configure libraries with WinCC in the TIA Portal?

In WinCC, you also configure the "Project library" and the "Global library".

You can no longer store any system functions in libraries, as was the case in WinCC flexible.

Both the "Project library" and the "Global library" contain the two folders, "Copy templates" and "Types". You can create or use the library objects as a copy template, or as a type.

- Copy templates  
Use copy templates to create independent copies of the library object.
- Types  
Create instances of objects of the "Types" folder and use the instances in your project. The instances are bound to their respective type. Changes to an instance also change all other instances. Types are marked by a green triangle in the "Libraries" task card.
- Managing the library objects  
You can only copy and move library objects within the same library.

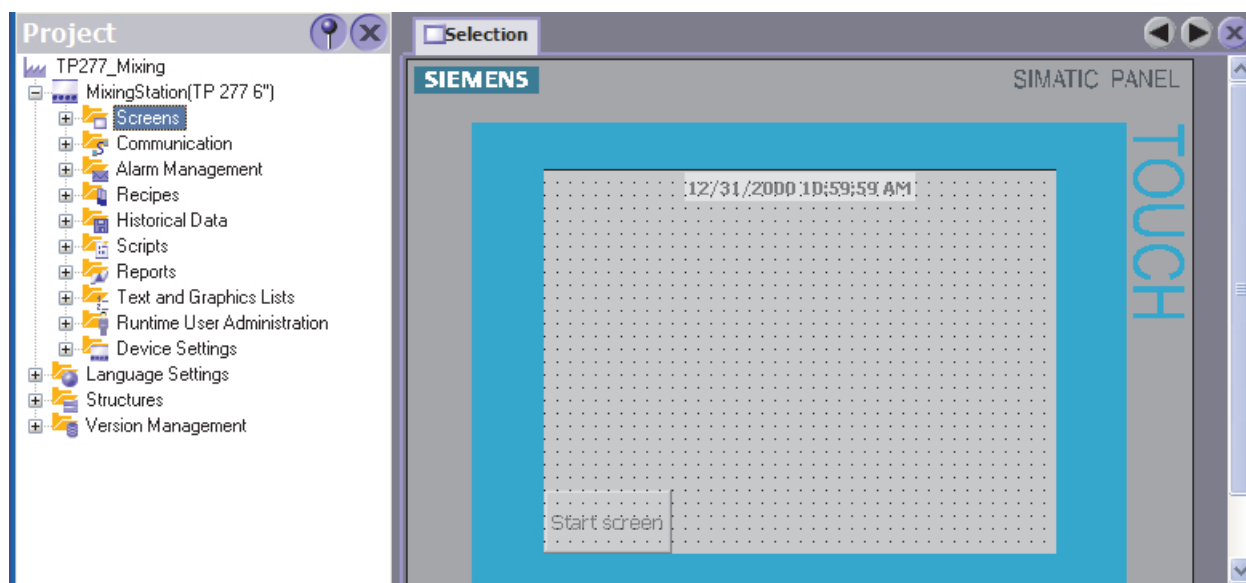

For more detailed information, see:

Libraries in WinCC (Page 5839)

### 10.18.2.2 Screens and templates

#### Screens and templates in WinCC flexible

In WinCC flexible, you create screens that an operator can use to control and monitor machines and plants. When you create your screens, the object templates provided support you in visualizing your plant, displaying processes and defining process values.

The project has a template for every HMI device. You can centrally configure the function keys and objects for your project in these templates.

Every screen based on this template will contain the function keys and objects that you configured in the template. Changes to an object or of a function key assignment in the template are applied to the object in all the screens, which are based on this template.

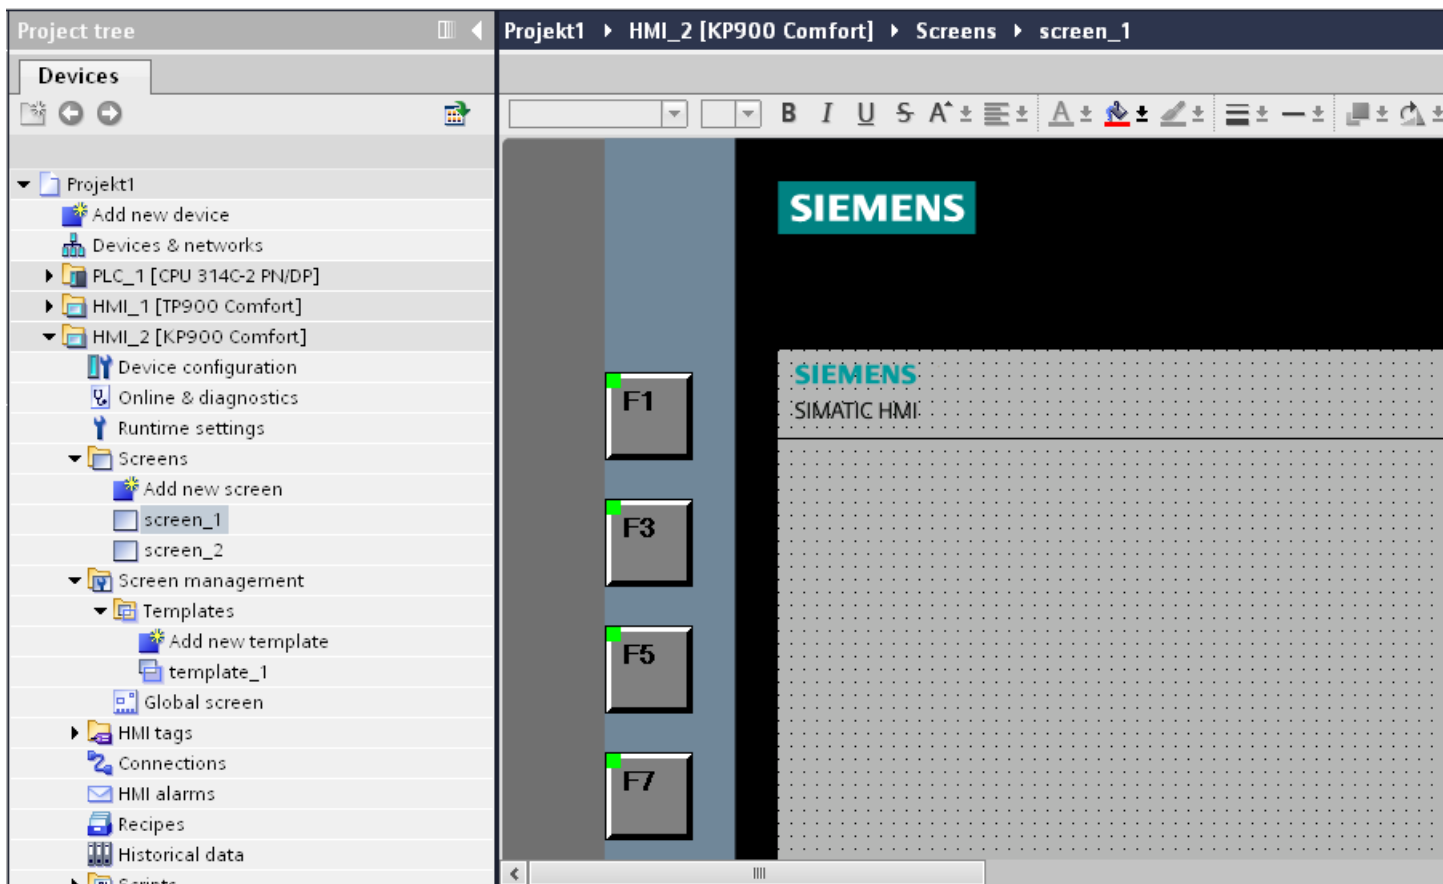

#### How do I configure screens and templates with WinCC in the TIA Portal?

In WinCC, you also configure "Templates" and a "Global screen" along with the "Screens".

You determine functions and objects in the template which then apply to all screens based on this template. You can create multiple templates in WinCC.

In the "Global screen", define the elements which are independent of the template used for all screens of an HMI device. The "Alarm window" and "Alarm indicator" objects are available for use as global objects. For HMI devices with function keys, configure the function keys in the "Global Screen" editor.

You can also configure a "System Diagnostics Window" in the global screen of Comfort Panels.

Excluding the controls, the screens are displayed in runtime in the following order:

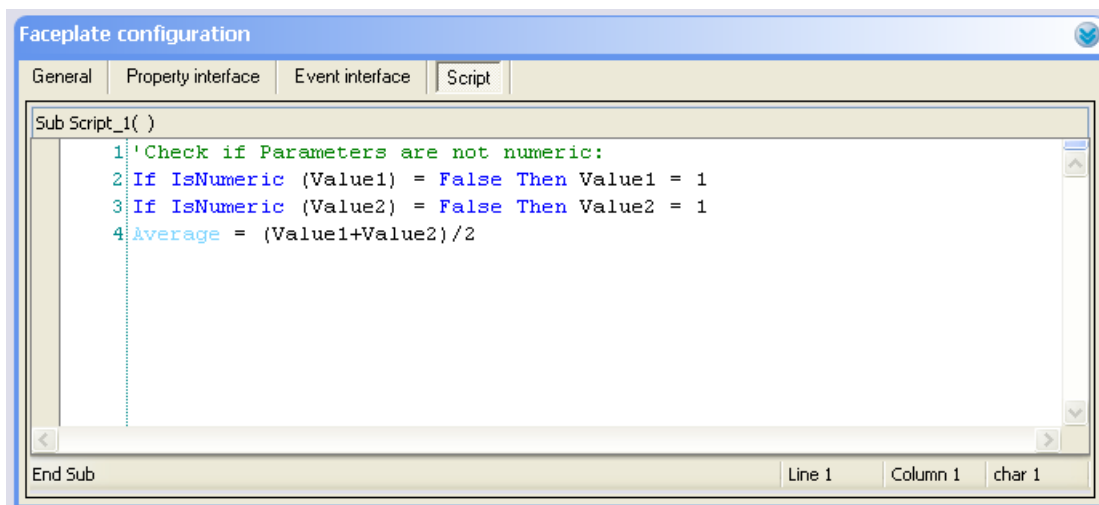

For more detailed information, see:  
Screen basics (Page 3241)

### 10.18.2.3 Scripts in faceplates

#### Scripts in faceplates in WinCC flexible

You configure a script in the "Scripts" tab of the "Faceplate configuration" dialog. This script is only available within the faceplate.

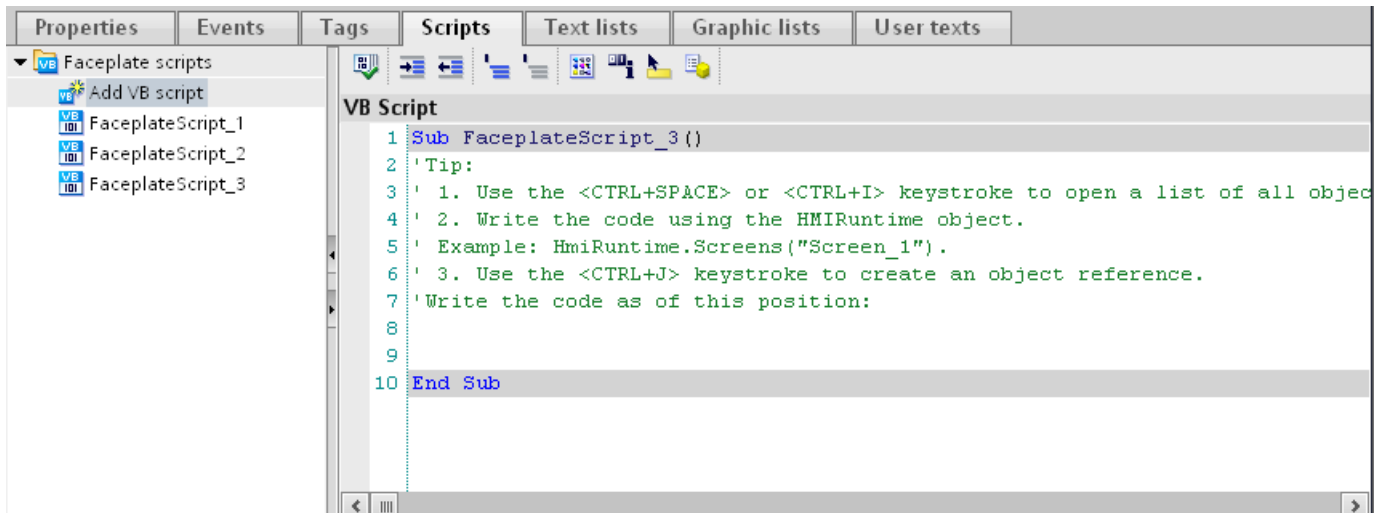

Interconnect the script directly to the events of the objects contained in the faceplate, for example, with the "Click" event of a button. If you use the faceplate in a screen, a faceplate instance is generated.

## How do I configure scripts in faceplates with WinCC in the TIA Portal?

In the configuration area of the "Faceplates" editor, you create scripts that you only use within a faceplate type.

In contrast to WinCC flexible, WinCC allows you to configure several scripts for a faceplate.

For more detailed information, see:

Example: Creating a script in the faceplate type (Page 3404)

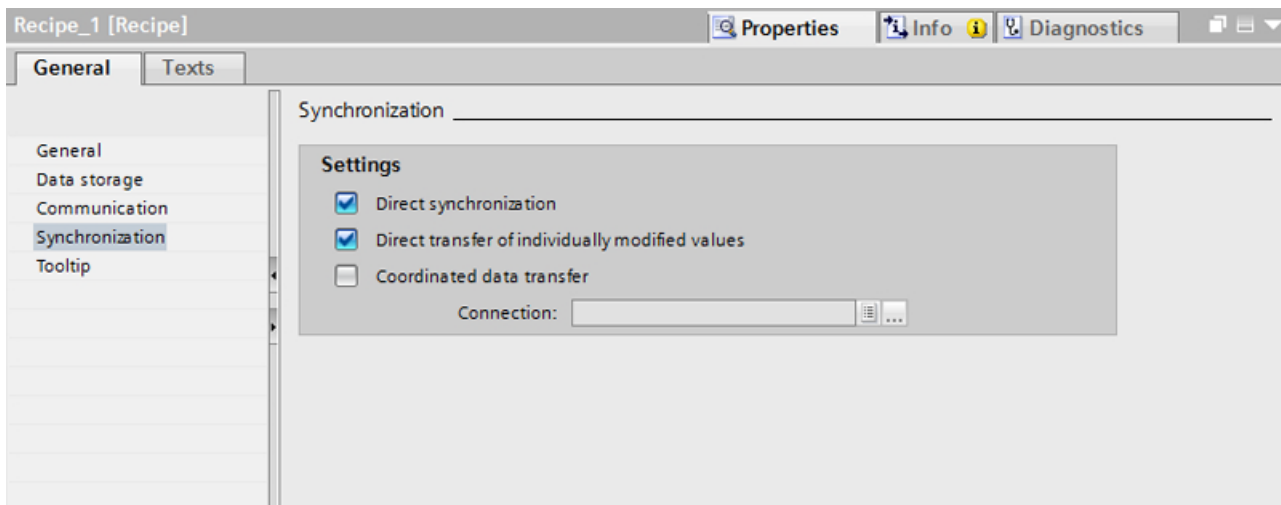

### 10.18.2.4 Synchronization of recipes

## How do I configure a synchronization of recipes with WinCC in the TIA Portal?

You configure the synchronization of recipes in the "Recipes" editor in WinCC.

A few terms have changed in WinCC as compared to WinCC flexible.

**Synchronization for Panels and RT Advanced**

- To synchronize recipe tags that are configured in I/O fields with the recipe view in Runtime, activate "Synchronize recipe view and recipe tags".
- Deactivate "Direct transfer of individually modified values" to specify that the recipe tags are automatically transferred to the PLC when you edit the I/O fields (teach-in mode).
- Activate "Coordinated data transfer" to monitor the transfer of recipe data in Runtime using area pointers.

For more detailed information, see:

Synchronization of recipe data records with the PLC (Page 3735)

### 10.18.2.5 Special considerations for converting

#### Objects with object references in the project library

Two copying methods can be used in WinCC flexible.

- With "simple copy", a WinCC flexible screen including an IO field is copied, for example. Only the object name of a tag configured on the IO field is copied, as this is a reference.
- With "copy", a screen, an IO field contained there and a tag configured on the IO field together with its properties are copied.

These two methods can also be used for storing an object in a library. Project libraries and the objects contained there are migrated during migration and can be used in WinCC.

In WinCC, however, only one copying method is available. With regard to tags, it functions like "simple copy" in WinCC flexible. With regard to graphics, graphics lists and text lists, it functions like "copy" in WinCC flexible.

If you stored objects with references to tags in a library in WinCC flexible, you must reconfigure the referenced objects when using them in WinCC.

## Changing the names of alarm classes

In contrast to WinCC flexible, the names of the predefined alarm classes are not dependent on the user interface language currently in use. During migration, the names of the alarm classes are assigned as follows:

WinCC flexible	WinCC
Errors	Errors
System	System
Warnings	Warnings

The display names of the alarm classes can be changed as necessary after migration.

## Objects with object references in the project library

Two copying methods can be used in WinCC flexible.

- With "simple copy", a WinCC flexible screen including an IO field is copied, for example. Only the object name of a tag configured on the IO field is copied, as this is a reference.
- With "copy", a screen, an IO field contained there and a tag configured on the IO field together with its properties are copied.

These two methods can also be used for storing an object in a library. Project libraries and the objects contained there are migrated during migration and can be used in WinCC.

In WinCC, however, only one copying method is available. It functions like "simple copy" in WinCC flexible.

If you have stored objects with references to other objects in a library in WinCC flexible, you must reconfigure the referenced objects when using them in WinCC.

## Using technology functions

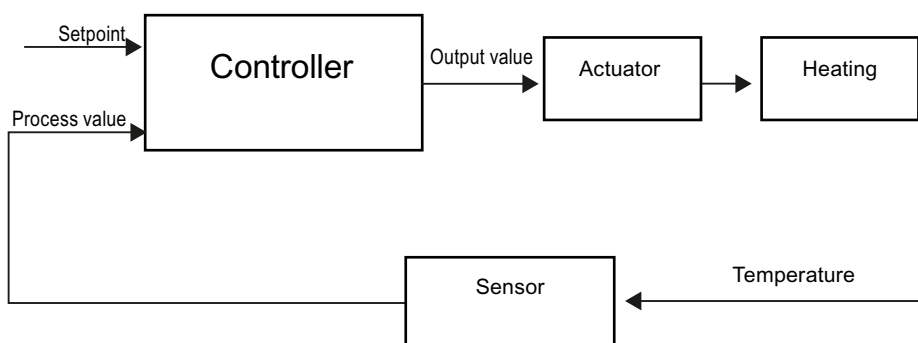

### 11.1 PID control

#### 11.1.1 Principles for control

##### 11.1.1.1 Controlled system and actuators

#### Controlled system

Room temperature control by means of a heating system is a simple example of a controlled system. A sensor measures the room temperature and transfers the value to a controller. The controller compares the current room temperature with a setpoint and calculates an output value (manipulated variable) for heating control.

A properly set PID controller reaches this setpoint as quickly as possible and then holds it a constant value. After a change in the output value, the process value often changes only with a time delay. The controller has to compensate for this response.

#### Actuators

The actuator is an element of the controlled system and is influenced by the controller. Its function modifies mass and energy flows.

The table below provides an overview of actuator applications.

Application	Actuator
Liquid and gaseous mass flow	Valve, shutter, gate valve
Solid mass flow, e.g., bulk material	Articulated baffle, conveyor, vibrator channel
Flow of electrical power	Switching contact, contactor, relay, thyristor
	Variable resistor, variable transformer, transistor

Actuators are distinguished as follows:

- Proportional actuators with constant actuating signal  
These elements set degrees of opening, angular positions or positions in proportion to the output value. The output value has an analog effect on the process within the control range. Actuators in this group include spring-loaded pneumatic drives, as well as motorized drives with position feedback for which a position control system is formed.  
An continuous controller, such as PID\_Compact, generates the output value.
- Proportional actuators with pulse-width modulated signal  
These actuators are used to generate the output of pulses with a length proportional to the output value within the sampling time intervals. The actuator - e.g. a heating resistor or cooling apparatus - is switched on in isochronous mode for durations that differ depending on the output value.  
The actuating signal can assume unipolar "On" or "Off" states, or represent bipolar states such as "open/close", "forward/backward", "accelerate/brake".  
The output value is generated by a two-step controller such as PID\_Compact with pulse-width modulation.
- Actuators with integral action and three-step actuating signal  
Actuators are frequently operated by motors with an on period that is proportional to the actuator travel of the choke element. This includes elements such as valves, shutters, and gate valves. In spite of their different design, all of these actuators follow the effect of an integral action at the input of the controlled system.  
A step controller, such as PID\_3Step, generates the output value.

### 11.1.1.2 Controlled systems

The properties of a controlled system can hardly be influenced as these are determined by the technical requirements of the process and machinery. Acceptable control results can only be achieved by selecting a suitable controller type for the specific controlled system and adapting the controller to the time response of the controlled system. Therefore, it is indispensable for the configuration of the proportional, integral and derivative actions of the controller to have precise knowledge of the type and parameters of the controlled system.

### Controlled system types

Controlled systems are classified based on their time response to step changes of the output value.

We distinguish between the following controlled systems:

- Self-regulating controlled systems
  - Proportional-action controlled systems
  - PT1 controlled systems
  - PT2 controlled systems
- Non-self-regulating controlled systems
- Controlled systems with and without dead time

## Self-regulating controlled systems

### Proportional-action controlled systems

In proportional-action controlled systems, the process value follows the output value almost immediately. The ratio between the process value and output value is defined by the proportional Gain of the controlled system.

Examples:

- Gate valve in a piping system
- Voltage dividers
- Step-down function in hydraulic systems

### PT1 controlled systems

In a PT1 controlled system, the process value initially changes in proportion to the change of the output value. The rate of change of the process value is reduced as a function of the time until the end value is reached, i.e., it is delayed.

Examples:

- Spring damping system
- Charge of RC elements
- Water container that is heated with steam.

The time constants are often identical for heating and cooling processes, or for charging and discharge characteristics. With different time constants, controlling is clearly more complex.

### PT2 controlled systems

In a PT2 controlled system, the process value does not immediately follow a step change of the output value, i.e., it increases in proportion to the positive rate of rise and then approaches the setpoint at a decreasing rate of rise. The controlled system shows a proportional response characteristic with second order delay element.

Examples:

- Pressure control
- Flow rate control
- Temperature control

## Non-self-regulating controlled systems

Non-self-regulating controlled systems have an integral response. The process value approaches an infinite maximum value.

Example:

- Liquid flow into a container

## Controlled systems with dead time

A dead time always represents the runtime or transport time that has to expire before a change to the system input can be measured at the system output.

In controlled systems with dead time, the process value change is delayed by the amount of the dead time.

Example:

Conveyor

### 11.1.1.3 Characteristic values of the control section

#### Determining the time response from the step response

Time response of the controlled system can be determined based on the time characteristic of process value  $x$  following a step change of output value  $y$ . Most controlled systems are self-regulating controlled systems.

The time response can be determined by approximation using the variables Delay time  $T_u$ , Recovery time  $T_g$  and Maximum value  $X_{max}$ . The variables are determined by applying tangents

to the maximum value and the inflection point of the step response. In many situations, it is not possible to record the response characteristic up to the maximum value because the process value cannot exceed specific values. In this case, the rate of rise  $v_{\max}$  is used to identify the controlled system ( $v_{\max} = \Delta_x/\Delta_t$ ).

The controllability of the controlled system can be estimated based on the ratio  $T_u/T_g$ , or  $T_u \times v_{\max}/X_{\max}$ . Rule:

Process type	$T_u / T_g$	Suitability of the controlled system for controlling
I	< 0,1	can be controlled well
II	0.1 to 0.3	can still be controlled
III	> 0,3	difficult to control

### Influence of the dead time on the controllability of a controlled system

A controlled system with dead time and recovery reacts as follows to a jump of the output value.

$T_t$	Dead time
$T_u$	Delay time
$T_g$	Recovery time
$y$	Output value
$x$	Process value

The controllability of a self-regulating controlled system with dead time is determined by the ratio of  $T_t$  to  $T_g$ .  $T_t$  must be small compared to  $T_g$ . Rule:

$$T_t/T_g \leq 1$$

### Response rate of controlled systems

Controlled systems can be judged on the basis of the following values:

$T_u < 0.5$  min,  $T_g < 5$  min = fast controlled system

$T_u > 0.5$  min,  $T_g > 5$  min = slow controlled system

### Parameters of certain controlled systems

Physical quantity	Controlled system	Delay time $T_u$	Recovery time $T_g$	Rate of rise $v_{max}$
Temperature	Small electrically heated furnace	0.5 to 1 min	5 to 15 min	Up to 60 K/min.
	Large electrically heated annealing furnace	1 to 5 min	10 to 20 min	Up to 20 K/min.
	Large gas-heated annealing furnace	0.2 to 5 min	3 to 60 min	1 to 30 K/min
	Distillation tower	1 to 7 min	40 to 60 min	0.1 to 0.5° C/s
	Autoclaves (2.5 m <sup>3</sup> )	0.5 to 0.7 min	10 to 20 min	Not specified
	High-pressure autoclaves	12 to 15 min	200 to 300 min	Not specified
	Steam superheater	30 s to 2.5 min	1 to 4 min	2° C/s
	Injection molding machines	0.5 to 3 min	3 to 30 min	5 to 20 K/min
	Extruders	1 to 6 min	5 to 60 min	
	Packaging machines	0.5 to 4 min	3 to 40 min	2 to 35 K/min
	Room heating	1 to 5 min	10 to 60 min	1° C/min
Flow rate	Pipeline with gas	0 to 5 s	0.2 to 10 s	Not relevant
	Pipeline with liquid	None	None	
Pressure	Gas pipeline	None	0.1 s	Not relevant
	Drum boiler with gas or oil firing	None	150 s	Not relevant
	Drum boiler with impact grinding mills	1 to 2 min	2 to 5 min	Not relevant
Vessel level	Drum boiler	0.6 to 1 min	Not specified	0.1 to 0.3 cm/s
Speed	Small electric drive	None	0.2 to 10 s	Not relevant
	Large electric drive	None	5 to 40 s	Not relevant
	Steam turbine	None	Not specified	50 min <sup>-1</sup>
Voltage	Small generators	None	1 to 5 s	Not relevant
	Large generators	None	5 to 10 s	Not relevant

#### 11.1.1.4 Pulse controller

##### Two-step controllers without feedback

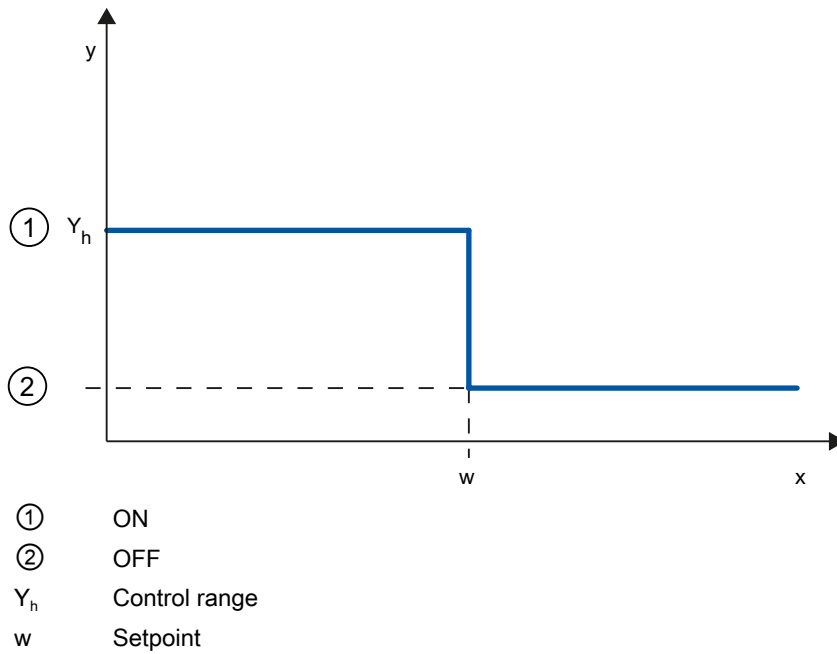

Two-step controllers have the state "ON" and "OFF" as the switching function. This corresponds to 100% or 0% output. This behavior generates a sustained oscillation of process value  $x$  around setpoint  $w$ .

The amplitude and duration of the oscillation increase in proportion to the ratio between the delay time  $T_u$  and recovery time  $T_g$  of the controlled system. These controllers are used mainly

for simple temperature control systems (such as electrically directly heated furnaces) or as limit-value signaling units.

The following diagram shows the characteristic of a two-step controller

The following diagram shows the control function of a two-step controller

### Two-step controllers with feedback

The behavior of two-step controllers in the case of controlled systems with larger delay times, such as furnaces where the functional space is separated from the heating, can be improved by the use of electronic feedback.

The feedback is used to increase the switching frequency of the controller, which reduces the amplitude of the process value. In addition, the control-action results can be improved substantially in dynamic operation. The limit for the switching frequency is set by the output level. It should not exceed 1 to 5 switches per minute at mechanical actuators, such as relays and contactors. In the case of voltage and current outputs with downstream thyristor or Triac controllers high switching frequencies can be selected that exceed the limit frequency of the controlled system by far.

Since the switching pulses can no longer be determined at the output of the controlled system, results comparable with those of continuous controllers are obtained.

The output value is generated by pulse-width modulation of the output value of a continuous controller.

Two-step controllers with feedback are used for temperature control in furnaces, at processing machines in the plastics, textile, paper, rubber and foodstuff industries as well as for heating and cooling devices.

### Three-step controllers

Three-step controllers are used for heating / cooling. These controllers have two switching points as their output. The control-action results are optimized through electronic feedback structures. Fields of applications for such controllers are heating, low-temperature, climatic chambers and tool heating units for plastic-processing machines.

The following diagram shows the characteristic of a three-step controller

y	Output value, e.g. y11 = 100% heating y12 = 0% heating y21 = 0% cooling y22 = 100% cooling
x	Physical quantity of the process value, e.g., temperature in °C
w	Setpoint
$x_{Sh}$	Distance between Switching Point 1 and Switching Point 2

### 11.1.1.5 Response to setpoint changes and disturbances

#### Response to setpoint changes

The process value should follow a setpoint change as quickly as possible. The response to setpoint changes is improved by minimizing fluctuation of the process value and the time required to reach the new setpoint.

x	Process value
w	Setpoint

#### Response to disturbances

The setpoint is influenced by disturbance variables. The controller has to eliminate the resulting control deviations in the shortest time possible. The response to disturbances is improved by minimizing fluctuation of the process value and the time required to reach the new setpoint.

x	Process value
w	Setpoint
①	Influencing a disturbance variable

Disturbance variables are corrected by a controller with integral action. A persistent disturbance variable does not reduce control quality because the control deviation is relatively constant. Dynamic disturbance variables have a more significant impact on control quality because of control deviation fluctuation. The control deviation is eliminated again only by means of the slow acting integral action.

A measurable disturbance variable can be included in the controlled system. This inclusion would significantly accelerated the response of the controller.

#### **11.1.1.6 Control Response at Different Feedback Structures**

##### **Control behavior of controllers**

A precise adaptation of the controller to the time response of the controlled system is decisive for the controller's precise settling to the setpoint and optimum response to disturbance variables.

The feedback circuit can have a proportional action (P), proportional-derivative action (PD), proportional-integral action (PI), or proportional-integral-derivative action (PID).

If step functions are to be triggered by control deviations, the step responses of the controllers differ depending on their type.

### Step response of a proportional action controller

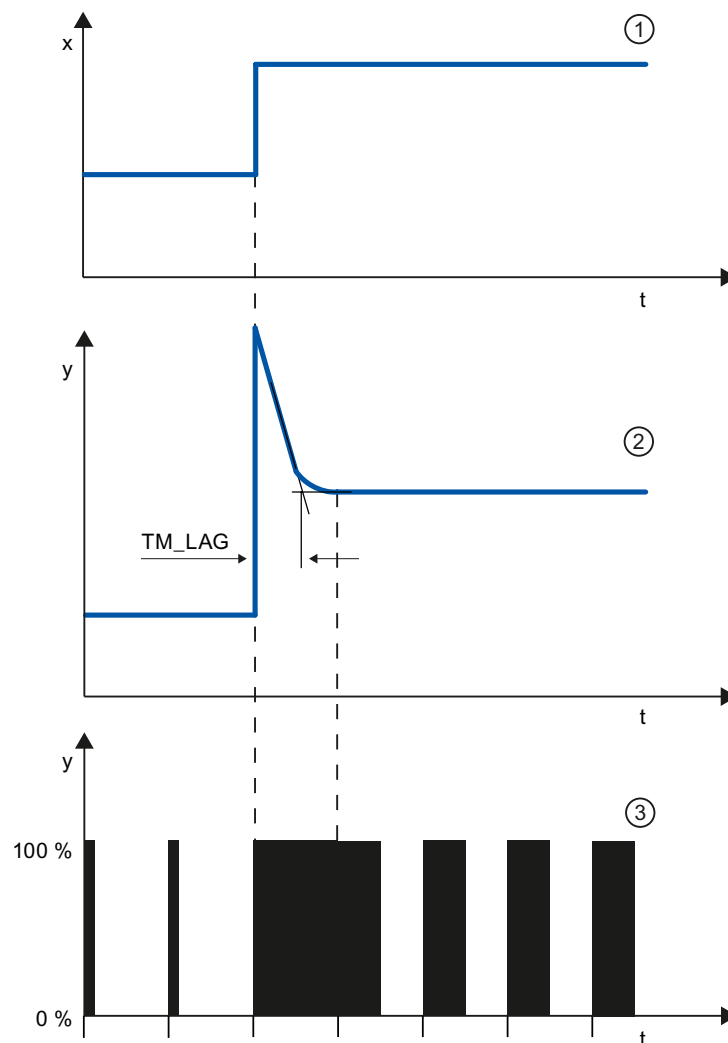

#### Equation for proportional action controller

Output value and control deviation are directly proportional, meaning:

Output value = proportional gain × control deviation

$$y = \text{GAIN} \times x$$

## Step response of a PD-action controller

- ① Control deviation  
 ② Output value of a continuous controller  
 ③ Output value of a pulse controller  
 TM\_LAG Delay of the Derivative action

## Equation for PD-action controller

The following applies for the step response of the PD-action controller in the time range:

$$y = \text{GAIN} \cdot X_W \cdot \left( 1 + \frac{\text{TD}}{\text{TM\_LAG}} \cdot e^{-\frac{t}{\text{TM\_LAG}}} \right)$$

t = time interval since the step of the control deviation

The derivative action generates a output value as a function of the rate of change of the process value. A derivative action by itself is not suitable for controlling because the output value only

*11.1 PID control*

follows a step of the process value. As long as the process value remains constant, the output value will no longer change.

The response to disturbances of the derivative action is improved in combination with a proportional action. Disturbances are not corrected completely. The good dynamic response is advantageous. A well attenuated, non-oscillating response is achieved during approach and setpoint change.

A controller with derivative action is not appropriate if a controlled system has pulsing measured quantities, for example, in the case of pressure or flow control systems.

## Step response of a PI-action controller

- ① Control deviation
- ② Output value of a continuous controller
- ③ Output value of a pulse controller

An integral action in the controller adds the control deviation as a function of the time. This means that the controller corrects the system until the control deviation is eliminated. A sustained control deviation is generated at controllers with proportional action only. This effect can be eliminated by means of an integral action in the controller.

In practical experience, a combination of the proportional, integral and derivative actions is ideal, depending on the requirements placed on the control response. The time response of the individual components can be described by the controller parameters proportional gain GAIN, integral action time TI (integral action), and derivative action time TD (derivative action).

## Equation for PI-action controller

The following applies for the step response of the PI-action controller in the time range:

$$y = \text{GAIN} \cdot X_W \cdot \left( 1 + \frac{1}{\text{TI} \cdot t} \right)$$

t = time interval since the step of the control deviation

## Step response of a PID controller

- ① Control deviation
- ② Output value of a continuous controller
- ③ Output value of a pulse controller
- $TM\_LAG$  Delay of the Derivative action
- $T_i$  Integral action time

**Equation for PID controller**

The following applies for the step response of the PID controller in the time range:

$$y = \text{GAIN} \cdot X_w \cdot \left( 1 + \frac{1}{\text{TI} \cdot t} + \frac{\text{TD}}{\text{TM\_LAG}} \cdot e^{-\frac{t}{\text{TM\_LAG}}} \right)$$

t = time interval since the step of the control deviation

### Response of a controlled system with different controller structures

Most of the controller systems occurring in process engineering can be controlled by means of a controller with PI-action response. In the case of slow controlled system with a large dead time, for example temperature control systems, the control result can be improved by means of a controller with PID action.

- ① No controller
- ② PID controller
- ③ PD-action controller
- w Setpoint
- x Process value

Controllers with PI and PID action have the advantage that the process value does not have any deviation from the setpoint value after settling. The process value oscillates over the setpoint during approach.

### 11.1.1.7 Selection of the controller structure for specified controlled systems

#### Selection of the Suitable Controller Structures

To achieve optimum control results, select a controller structure that is suitable for the controlled system and that you can adapt to the controlled system within specific limits.

The table below provides an overview of suitable combinations of a controller structure and controlled system.

Controlled system		Controller structure			
		P	PD	PI	PID
	With dead time only	Unsuitable	Unsuitable	Suitable	Unsuitable
	PT1 with dead time	Unsuitable	Unsuitable	Well suited	Well suited
	PT2 with dead time	Unsuitable	Suited conditionally	Well suited	Well suited
	Higher order	Unsuitable	Unsuitable	Suited conditionally	Well suited
	Not self-regulating	Well suited	Well suited	Well suited	Well suited

The table below provides an overview of suitable combinations of a controller structure and physical quantity.

Physical quantity	Controller structure			
	P	PD	PI	PID
	Sustained control deviation		No sustained control deviation	
Temperature	For low performance requirements and proportional action controlled systems with $T_u/T_g < 0,1$	Well suited	The most suitable controller structures for high performance requirements (except for specially adapted special controllers)	
Pressure	Suitable, if the delay time is inconsiderable	Unsuitable	The most suitable controller structures for high performance requirements (except for specially adapted special controllers)	
Flow rate	Unsuitable, because required GAIN range is usually too large	Unsuitable	Suitable, but integral action controller alone often better	Hardly required

### 11.1.1.8 PID parameter settings

#### Rule of Thumb for the Parameter Setting

Controller structure	Setting
P	$GAIN \approx v_{max} \times T_u [^{\circ} C]$
PI	$GAIN \approx 1.2 \times v_{max} \times T_u [^{\circ} C]$
PD	$GAIN \approx 0.83 \times v_{max} \times T_u [^{\circ} C]$ $TD \approx 0.25 \times v_{max} \times T_u [min]$ $TM\_LAG \approx 0.5 \times TD [min]$
PID	$GAIN \approx 0.83 \times v_{max} \times T_u [^{\circ} C]$ $TI \approx 2 \times T_u [min]$ $TD \approx 0.4 \times T_u [min]$ $TM\_LAG \approx 0.5 \times TD [min]$
PD/PID	$GAIN \approx 0.4 \times v_{max} \times T_u [^{\circ} C]$ $TI \approx 2 \times T_u [min]$ $TD \approx 0.4 \times T_u [min]$ $TM\_LAG \approx 0.5 \times TD [min]$

Instead of  $v_{max} = \Delta_x / \Delta_t$ , you can use  $X_{max} / T_g$ .

In the case of controllers with PID structure the setting of the integral action time and differential-action time is usually coupled with each other.

The ratio  $TI / TD$  lies between 4 and 5 and is optimal for most controlled systems.

Non-observance of the differential-action time  $TD$  is uncritical at PD controllers.

In the case of PI and PID controllers, control oscillations occur if the integral action time  $TI$  has been select by more than half too small.

An integral action time that is too large slows down the settling times of disturbances. One cannot expect that the control loops operate "optimally" after the first parameter settings. Experience shows that adjusting is always necessary, when a system exists that is "difficult to control" with  $T_u / T_g > 0.3$ .

## 11.1.2 Configuring a software controller

### 11.1.2.1 Overview of software controller

For the configuration of a software controller, you need an instruction with the control algorithm and a technology object. The technology object for a software controller corresponds with the instance DB of the instruction. The configuration of the controller is saved in the technology object. In contrast to the instance DBs of other instructions, technology objects are not stored for the program resources, but rather under CPU > Technology objects.

## Technology objects and instructions

CPU	Library	Instruction	Technology object	Description
S7-1200	Compact PID	PID_Compact V1.X	PID_Compact V1.X	Universal PID controller with integrated tuning
S7-1200		PID_3Step V1.X	PID_3Step V1.X	PID controller with integrated tuning for valves
S7-1500 S7-1200 V4.x		PID_Compact V2.X	PID_Compact V2.X	Universal PID controller with integrated tuning
S7-1500 S7-1200 V4.x		PID_3Step V2.X	PID_3Step V2.X	PID controller with integrated tuning for valves
S7-1500/300/400	PID basic functions	CONT_C	CONT_C	Continuous controller
S7-1500/300/400		CONT_S	CONT_S	Step controller for actuators with integrating behavior
S7-1500/300/400		PULSEGEN	-	Pulse generator for actuators with proportional behavior
S7-1500/300/400		TCONT_CP	TCONT_CP	Continuous temperature controller with pulse generator
S7-1500/300/400		TCONT_S	TCONT_S	Temperature controller for actuators with integrating behavior
S7-300/400	PID Self Tuner	TUN_EC	TUN_EC	Optimization of a continuous controller
S7-300/400		TUN_ES	TUN_ES	Optimization of a step controller
S7-300/400	Standard PID Control (PID Professional optional package)	PID_CP	PID_CP	Continuous controller with pulse generator
S7-300/400		PID_ES	PID_ES	Step controller for actuators with integrating behavior
S7-300/400		LP_SCHED	-	Distribute controller calls
S7-300/400	Modular PID Control (PID Professional optional package)	A_DEAD_B	-	Filter interfering signal from control deviation
S7-300/400		CRP_IN	-	Scale analog input signal
S7-300/400		CRP_OUT	-	Scale analog output signal
S7-300/400		DEAD_T	-	Delay output of input signal
S7-300/400		DEADBAND	-	Suppress small fluctuations to the process value
S7-300/400		DIF	-	Differentiate input signals over time
S7-300/400		ERR_MON	-	Monitor control deviation
S7-300/400		INTEG	-	Integrate input signals over time
S7-300/400		LAG1ST	-	First-order delay element
S7-300/400		LAG2ND	-	Second-order delay element
S7-300/400		LIMALARM	-	Report limit values
S7-300/400		LIMITER	-	Limiting the manipulated variable
S7-300/400		LMNGEN_C	-	Determine manipulated variable for continuous controller
S7-300/400		LMNGEN_S	-	Determine manipulated variable for step controller
S7-300/400	NONLIN	-	Linearize encoder signal	

CPU	Library	Instruction	Technology object	Description
S7-300/400		NORM	-	Scale process value physically
S7-300/400		OVERRIDE	-	Switch manipulated variable from 2 PID controllers to 1 actuator
S7-300/400		PARA_CTL	-	Switch parameter sets
S7-300/400		PID	-	PID algorithm
S7-300/400		PUSLEGEN_M	-	Generate pulse for proportional actuators
S7-300/400		RMP_SOAK	-	Specify setpoint according to ramp / soak
S7-300/400		ROC_LIM	-	Limit rate of change
S7-300/400		SCALE_M	-	Scale process value
S7-300/400		SP_GEN	-	Specify setpoint manually
S7-300/400		SPLT_RAN	-	Split manipulated variable range
S7-300/400		SWITCH	-	Switch analog values
S7-300/400		LP_SCHED_M	-	Distribute controller calls

### 11.1.2.2 Steps for the configuration of a software controller

All SW-controllers are configured according to the same scheme:

Step	Description
1	Add technology object (Page 6322)
2	Configure technology object (Page 6323)
3	Call instruction in the user program (Page 6324)
4	Download technology object to device (Page 6325)
5	Commission software controller (Page 6326)
6	Save optimized PID parameters in the project (Page 6327)
7	Comparing values (Page 6328)
8	Display instances of a technology object (Page 6347)

### 11.1.2.3 Add technology objects

#### Add technology object in the project navigator

When a technology object is added, an instance DB is created for the instruction of this technology object. The configuration of the technology object is stored in this instance DB.

#### Requirement

A project with a CPU has been created.

## Procedure

To add a technology object, proceed as follows:

1. Open the CPU folder in the project tree.
2. Open the "Technology objects" folder.
3. Double-click "Add new object".  
The "Add new object" dialog box opens.
4. Click on the "PID" button.  
All available PID-controllers for this CPU are displayed.
5. Select the instruction for the technology object, for example, PID\_Compact.
6. Enter an individual name for the technology object in the "Name" input field.
7. Select the "Manual" option if you want to change the suggested data block number of the instance DB.
8. Click "Further information" if you want to add own information to the technology object.
9. Confirm with "OK".

## Result

The new technology object has been created and stored in the project tree in the "Technology objects" folder. The technology object is used if the instruction for this technology object is called in a cyclic interrupt OB.

---

### Note

You can select the "Add new and open" check box at the bottom of the dialog box. This opens the configuration of the technology object after adding has been completed.

---

### 11.1.2.4 Configure technology objects

The properties of a technology object on a S7-1200 CPU can be configured in two ways.

- In the Inspector window of the programming editor
- In the configuration editor

The properties of a technology object on a S7-300/400 CPU can only be configured in the configuration editor.

### Inspector window of the programming editor

In the Inspector window of the programming editor you can only configure the parameters required for operation.

The offline values of the parameters are also shown in online mode. You can only change the online values in the commissioning window.

To open the Inspector window of the technology object, follow these steps:

1. Open the "Program blocks" folder in the project tree.
2. Double click the block (cyclic interrupt OB) in which you open the instruction of the SW-controller.  
The block is opened in the work area.
3. Click on the instruction of the SW-controller.
4. In the Inspector window, select the "Properties" and "Configuration" tabs consecutively.

### Configuration window

For each technology object, there is a specific configuration window in which you can configure all properties.

To open the configuration window of the technology object, follow these steps:

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click the "Configuration" object.

### Symbols

Icons in the area navigation of the configuration and in the Inspector window show additional details about the completeness of the configuration:

	<b>The configuration contains default values and is complete.</b> The configuration exclusively contains default values. With these default values the use of the technology object is possible without further changes.
	<b>The configuration contains values defined by the user and is complete</b> All input fields of the configuration contain valid values and at least one default setting was changed.
	<b>The configuration is incomplete or faulty</b> At least one input field or a collapsible list contains no or one invalid value. The corresponding field or the drop-down list box has a red background. When clicked the roll-out error message indicates the cause of the error.

The properties of a technology object are described in detail in the chapter for the technology object.

#### 11.1.2.5 Call instruction in the user program

The instruction of the software controller must be called in a cyclic interrupt OB. The sampling time of the software controller is determined by the interval between the calls in the cyclic interrupt OB.

### Requirement

The cyclic interrupt OB is created and the cycle time of the cyclic interrupt OB is correctly configured.

## Procedure

Proceed as follows to call the instruction in the user program:

1. Open the CPU folder in the project tree.
2. Open the "Program blocks" folder.
3. Double-click the cyclic interrupt OB.  
The block is opened in the work area.
4. Open the "Technology" group in the "Instructions" window and the "PID Control" folder.  
The folder contains all instructions for software controllers that can be configured on the CPU.
5. Select the instruction and drag it to your cyclic interrupt OB.  
The "Call options" dialog box opens.
6. Select a technology object or type the name for a new technology object from the "Name" list.

## Result

If the technology object does not exist yet, it is added. The instruction is added in the cyclic interrupt OB. The technology object is assigned to this call of the instruction.

### 11.1.2.6 Downloading technology objects to device

A new or modified configuration of the technology object must be downloaded to the CPU for the online mode. The following characteristics apply when downloading retentive data:

- **Software (changes only)**
  - S7-1200, S7-1500:  
Retentive data is retained.
  - S7-300/400:  
Retentive data is updated immediately. CPU does not change to Stop.
- **Download PLC program to device and reset**
  - S7-1200, S7-1500:  
Retentive data is updated at the next change from Stop to RUN. The PLC program can only be downloaded completely.
  - S7-300/400:  
Retentive data is updated at the next change from Stop to RUN.

## Downloading retentive data to an S7-1200 or S7-1500 CPU

---

### Note

The download and reset of the PLC program during ongoing system operation can result in serious damages or injuries in the case of malfunctions or program errors.

Make sure that dangerous states cannot occur before you download and reset the PLC program.

---

Proceed as follows to download the retentive data:

1. Select the entry of the CPU in the project tree.
2. Select the command "Download and reset PLC program" from the "Online" menu.
  - If you have not established an online connection yet, the "Extended download" dialog opens. In this case, set all required parameters for the connection and click "Download".
  - If the online connection has been defined, the project data is compiled, if necessary, and the dialog "Load preview" opens. This dialog displays messages and recommends actions necessary for download.
3. Check the messages.  
As soon as download is possible, the "Download" button becomes active.
4. Click on "Download".  
The complete PLC program is downloaded and the "Load results" dialog opens. This dialog displays the status and the actions after the download.
5. If the modules are to restart immediately after the download, select the check box "Start all".
6. Close the dialog "Download results" with "Finish".

### Result

The complete PLC program is downloaded to the device. Blocks that only exist online in the device are deleted. By downloading all affected blocks and by deleting any blocks in the device that are not required, you avoid inconsistencies between the blocks in the user program.

The messages under "Info > General" in the Inspector window indicate whether the download was successful.

### 11.1.2.7 Commissioning software controller

#### Procedure

To open the "Commissioning" work area of the technology object, follow these steps:

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click the "Commissioning" object.

The commissioning functions are specific for each controller and are described there.

### 11.1.2.8 Save optimized PID parameter in the project

The software controller is optimized in the CPU. Through this, the values in the instance-DB on the CPU no longer agree with those in the project.

To update the PID parameter in the project with the optimized PID parameters, proceed as follows:

#### Requirement

- An online connection to the CPU is established and the CPU is in "RUN" mode.
- The functions of the commissioning window have been enabled by means of the "Start" button.

#### Procedure

1. Open the CPU folder in the project tree.
2. Open the "Technology objects" folder.
3. Open a technology object.
4. Double click on "Commissioning".
5. Click on the  icon "Upload PID parameters".
6. Save the project.

#### Result

The currently active PID parameters are stored in the project data. When reloading the project data in the CPU, the optimized parameters are used.

### 11.1.2.9 Comparing values

#### Comparison display and boundary conditions

The "Compare values" function provides the following options:

- Comparison of configured start values of the project with the start values in the CPU and the actual values
- Direct editing of actual values and the start values of the project
- Immediate detection and display of input errors with suggested corrections
- Backup of actual values in the project
- Transfer of start values of the project to the CPU as actual values

### Icons and operator controls

The following icons and operator controls are available:

Icon	Function
	Start value PLC matches the configured Start value project
	Start value PLC does not match the configured Start value project
	The comparison of the Start value PLC with the configured Start value project cannot be performed
	At least one of the two comparison values has a process-related or syntax error.
	Transfers actual values to the offline project
	Transfers updated start values in the project to the CPU (initialize setting values)
	Opens the "Compare values" dialog

### Boundary conditions

The "Compare values" function is available for S7-1200 and S7-1500 without limitations.

The following limitation applies to S7-300 and S7-400:

In monitoring mode, an S7-300/S7-400 cannot transfer the start values to the CPU. These values cannot be displayed online with "Compare values".

The actual values of the technology object are displayed and can be changed directly.

### Comparing values

The procedure is shown in the following using "PID Parameters" as an example.

### Requirements

- A project with a software controller is configured.
- The project is downloaded to the CPU.
- The configuration dialog is open in the project navigator.

### Procedure

1. Open the desired software controller in the project navigation.
2. Double-click the "Configuration" object.
3. Navigate within the configuration window to the "PID Parameters" dialog.
4. Click the  icon to activate monitoring mode.  
The icons and operator controls (Page 6325) of the "Compare values" function are shown behind the parameters.

5. Click the desired parameter in the input box and change the parameter values manually by entering them directly.
  - If the background of the input box is gray, this value is a read-only value and cannot be changed.
  - To change the values in the "PID Parameters" dialog, enable manual entry by selecting the "Enable manual entry" check box beforehand.
6. Click the  icon to open the dialog for the start values. This dialog indicates two values of the parameter:
  - Start value in CPU: The start value in the CPU is shown in the top part.
  - Start value in the project: The configured start value in the project is shown in the bottom part.
7. Enter the desired value in the input box for the project.

## Error detection

The input of incorrect values is detected. Corrections are suggested in this case.

If you enter a value with incorrect syntax, a rollout containing the corresponding error message opens below the parameter. The incorrect value is not applied.

If you enter a value that is incorrect for the process, a dialog opens containing the error message and a suggested correction:

- Click "No" to accept this suggested correction and correct your input.
- Click "OK" to apply the incorrect value.

<b>NOTICE</b>
<b>Malfunctions of the controller</b>
Values incorrect for the process can result in controller malfunctions.

## Backing up actual values

Click the  icon to transfer the actual controller values to the start values of your configured project.

### Transferring project values to the CPU

Click the  icon to transfer the configured values of your project to the CPU.

**⚠ CAUTION**

**Prevent personal injury and property damage!**

Downloading and resetting of the user program while the plant is operating may result in significant property damage and severe personal injuries in the event of malfunctions or program errors.

Make sure that dangerous states cannot occur before you download and reset the user program.

#### 11.1.2.10 Parameter view

##### Introduction to the parameter view

The Parameter view provides you with a general overview of all relevant parameters of a technology object. You obtain an overview of the parameter settings and can easily change them in offline and online mode.

Name in functional view	Name in DB	Start value project	Data type	Comment
Invert the control logic	../InvertControl	FALSE	Bool	Enables i...
Enable last mode after CPU ..	RunModeBySta...	TRUE	Bool	Activates
Physical quantity	PhysicalQuantity	General	Int	Selection
Unit of measurement	PhysicalUnit	%	Int	Selection
Set Mode to	Mode	Manual mode	Int	Selection
Selection Input	../InputPerOn	Input_PER (analog)	Bool	Selection
Process value high limit	../InputUpperLi...	120.0 %	Real	Entry for p...
Process value low limit	../InputLowerLi...	0.0 %	Real	Entry for p...
Scaled high process value	../UpperPointOut	100.0 %	Real	Entry for s...
Scaled low process value	../LowerPointOut	0.0 %	Real	Entry for s...
Input_PER low	../LowerPointIn	0	Real	Entry for l...
Input_PER high	../UpperPointIn	27648	Real	Entry for h...
Warning low limit	../InputLowerW...	-3.402822e+38 %	Real	Entry for v...
Warning high limit	../InputUpperW...	3.402822e+38 %	Real	Entry for v...
Minimum OFF time	../MinimumOff...	0.0	Real	Entry for r...
Proportional gain	../Gain	1.0	Real	Entry for p...
Integral action time	../Ti	20.0 s	Real	Entry for i...
Derivative action time	../Td	0.0	Real	Entry for d...

- ① "Parameter view" tab
- ② Toolbar (Page 6332)
- ③ Navigation (Page 6333)
- ④ Parameter table (Page 6333)

## Function scope

The following functions are available for analyzing the parameters of the technology objects and for enabling targeted monitoring and modification.

Display functions:

- Display of parameter values in offline and online mode
- Display of status information of the parameters
- Display of value deviations and option for direct correction
- Display of configuration errors
- Display of value changes as a result of parameter dependencies
- Display of all memory values of a parameter: Start value PLC, Start value project, Monitor value
- Display of the parameter comparison of the memory values of a parameter

Operator control functions:

- Navigation for quickly changing between the parameters and parameter structures.
- Text filter for faster searches for particular parameters.
- Sorting function for customizing the order of parameters and parameter groups to requirements.
- Memory function for backing up structural settings of the Parameter view.
- Monitoring and modifying of parameter values online.
- Function for saving a snapshot of parameter values of the CPU in order to capture momentary situations and to respond to them.
- Function for applying a snapshot of parameter values as start values.
- Download of modified start values to the CPU.
- Comparison functions for comparing parameter values with one another.

## Validity

The Parameter view is available for the following technology objects:

- PID\_Compact
- PID\_3Step
- CONT\_C (S7-1500 only)
- CONT\_S (S7-1500 only)

- TCONT\_CP (S7-1500 only)
- TCONT\_S (S7-1500 only)
- TO\_Axis\_PTO (S7-1200 Motion Control)
- TO\_Positioning\_Axis (S7-1200 Motion Control)
- TO\_CommandTable\_PTO (S7-1200 Motion Control)
- TO\_CommandTable (S7-1200 Motion Control)

### Structure of the parameter view

#### Toolbar

The following functions can be selected in the toolbar of the parameter view.

Icon	Function	Explanation
	Monitor all	Starts the monitoring of visible parameters in the active Parameter view (online mode).
	Create snapshot of monitor values and accept setpoints of this snapshot as start values	Applies the current monitor values to the "Snapshot" column and updates the start values in the project. Only in online mode for PID_Compact and PID_3Step.
	Initialize setpoints	Transfers the start values updated in the project to the CPU. Only in online mode for PID_Compact and PID_3Step.
	Create snapshot of monitor values	Applies the current monitor values to the "Snapshot" column. Only in online mode.
	Modify all selected parameters immediately and once	This command is executed once and as quickly as possible without reference to any particular point in the user program. Only in online mode.
	Select navigation structure	Toggles between functional navigation and data navigation.
	Text filter...	After entry of a character string: Display of all parameters containing the specified string in one of the currently visible columns.
	Selection of compare values	Selection of parameter values that are to be compared with one another in online mode (Start value project, Start value PLC, Snapshot) Only in online mode.
	Save window settings	Saves your display settings for the Parameter view (e.g., selected navigation structure, activated table columns, etc.)

## Navigation

Within the "Parameter view" tab, the following alternative navigation structures can be selected.

Navigation		Explanation
Functional navigation	<ul style="list-style-type: none"> <li>▼ All parameters               <ul style="list-style-type: none"> <li>▶ Configuration parameters</li> <li>▶ Commissioning parameters</li> <li>Other parameters</li> </ul> </li> </ul>	<p>In the functional navigation, the structure of the parameters is based on the structure in the configuration dialog ("Functional view" tab), commissioning dialog, and diagnostics dialog.</p> <p>The last group "Other parameters" contains all other parameters of the technology object.</p>
Data navigation	<ul style="list-style-type: none"> <li>▼ All parameters               <ul style="list-style-type: none"> <li>Input</li> <li>Output</li> <li>InOut</li> <li>▶ Static</li> <li>Other parameters</li> </ul> </li> </ul>	<p>In the data navigation, the structure of the parameters is based on the structure in the instance DB.</p> <p>The last group "Other parameters" contains the parameters that are not contained in the instance DB.</p>

You can use the "Select navigation structure" drop-down list to toggle the navigation structure.

## Parameter table

The table below shows the meaning of the individual columns of the parameter table. You can show or hide the columns as required.

- Column "Offline" = X: Column is visible in offline mode.
- Column "Online" = X: Column is visible in online mode (online connection to the CPU).

Column	Explanation	Offline	Online
Name in functional view	Name of the parameter in the functional view. The display field is empty for parameters that are not configured via the technology object.	X	X
Full name in DB	Complete path of the parameter in the instance DB. The display field is empty for parameters that are not contained in the instance DB.	X	X
Name in DB	Name of the parameter in the instance DB. If the parameter is part of a structure or UDT, the prefix ". ." is added. The display field is empty for parameters that are not contained in the instance DB.	X	X
Status of configuration	Display of the completeness of the configuration using status symbols. see Status of configuration (offline) (Page 6341)	X	
Compare result	Result of the "Compare values" function. This column is shown if there is an online connection and the "Monitor all" button  is selected. see Comparing values (Page 6325)		X

11.1 PID control

Column	Explanation	Offline	Online
Start value project	Configured start value in the project. Error indication if entered values have a syntax or process-related error.	X	X
Default value	Value that is pre-assigned to the parameter. The display field is empty for parameters that are not contained in the instance DB.	X	X
Snapshot	Snapshot of the current values in the CPU (monitor values). Error indication if values have a process-related error.	X	X
Start value PLC	Start value in the CPU. This column is shown if there is an online connection and the "Monitor all" button  is selected. Error indication if values have a process-related error.		X
Monitor value	Current value in the CPU. This column is shown if there is an online connection and the "Monitor all" button  is selected. Error indication if values have a process-related error.		X
Modify value	Value that is to be used to change the monitor value. This column is shown if there is an online connection and the "Monitor all" button  is selected. Error indication if entered values have a syntax or process-related error.		X
Selection for transmission 	Selection of the Modify values that are to be transmitted using the "Modify all selected parameters immediately and once" button. This column is displayed together with the "Modify value" column.		X
Minimum value	Minimum process-related value of the parameter. If the minimum value is dependent on other parameters, it is defined: <ul style="list-style-type: none"> <li>Offline: By the Start value project.</li> <li>Online: By the Monitor values.</li> </ul>	X	X
Maximum value	Maximum process-related value of the parameter. If the maximum value is dependent on other parameters, it is defined: <ul style="list-style-type: none"> <li>Offline: By the Start value project.</li> <li>Online: By the Monitor values.</li> </ul>	X	X
Setpoint	Designates the parameter as a setpoint. These parameters can be initialized online.	X	X
Data type	Data type of the parameter. The display field is empty for parameters that are not contained in the instance DB.	X	X
Retain	Designates the value as a retentive value. The values of retentive parameters are retained even after the voltage supply is switched off.	X	X
Accessible from HMI	Indicates whether the HMI can access this parameter during runtime.	X	X
Visible in HMI	Indicates whether the parameter is visible in the selection list of the HMI by default.	X	X
Comment	Brief description of the parameter.	X	X

## Opening the parameter view

### Requirement

The technology object has been added in the project tree, i.e., the associated instance DB of the instruction has been created.

### Procedure

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click the "Configuration" object.
4. Select the "Parameter view" tab in the top right corner.

### Result

The Parameter view opens. Each displayed parameter is represented by one row in the parameter table.

The displayable parameter properties (table columns) vary depending on whether you are working with the Parameter view in offline or online mode.

In addition, you can selectively display and hide individual table columns.

### See also

Default setting of the parameter view (Page 6335)

## Default setting of the parameter view

### Default settings

To enable you to work efficiently with the Parameter view, you can customize the parameter display and save your settings.

The following customizations are possible and can be saved:

- Show and hide columns
- Change column width
- Change order of the columns
- Toggle navigation
- Select parameter group in the navigation
- Selection of compare values

### Show and hide columns

To show or hide columns in the parameter table, follow these steps:

1. Position the cursor in the header of the parameter table.
2. Select the "Show/Hide" command in the shortcut menu.  
The selection of available columns is displayed.
3. To show a column, select the check box for the column.
4. To hide a column, clear the check box for the column.

or

1. Position the cursor in the header of the parameter table.
2. Select the "Show all columns" command in the shortcut menu if all columns of the offline or online mode are to be displayed.

Some columns can only be displayed in online mode: see Parameter table (Page 6331).

### Change column width

To customize the width of a column so that all texts in the rows can be read, follow these steps:

1. Position the cursor in the header of the parameter table to the right of the column to be customized until the shape of the cursor changes to a cross.
2. Then double-click this location.

or

1. Open the shortcut menu on the header of the parameter table.
2. Click
  - "Optimize column width" or
  - "Optimize width of all columns".

If the column width setting is too narrow, the complete content of individual fields are shown if you hover the cursor briefly over the relevant field.

### Change order of the columns

The columns of the parameter table can be arranged in any way.

To change the order of the columns, follow these steps:

1. Click on the column header and use a drag-and-drop operation to move it to the desired location.  
When you release the mouse button, the column is anchored to the new position.

### Toggle navigation

To toggle the display form of the parameters, follow these steps:

1. Select the desired navigation in the "Select navigation structure" drop-down list.
  - Data navigation
  - Functional navigation

See also Navigation (Page 6331).

### Select parameter group in the navigation

Within the selected navigation, you choose between the "All parameters" display or the display of a subordinate parameter group of your choice.

1. Click the desired parameter group in the navigation.  
The parameter table only displays the parameters of the parameter group.

### Selection of compare values (online)

To set the compare values for the "Compare values" function, follow these steps:

1. Select the desired compare values in the "Selection of compare values" drop-down list.
  - Start value project / Start value PLC
  - Start value project / Snapshot
  - Start value PLC / Snapshot

The "Start value project / Start value PLC" option is set by default.

### Save default setting of the Parameter view

To save the above customizations of the Parameter view, follow these steps:

1. Customize the Parameter view according to your requirements.
2. Click the "Save window settings" button  at the top right of the Parameter view.

### Working with the parameter view

#### Overview

The following table provides an overview of the functions of the Parameter view in online and offline mode described in the following.

- Column "Offline" = X: This function is possible in offline mode.
- Column "Online" = X: This function is possible in online mode.

Function/action	Offline	Online
Filtering the parameter table (Page 6338)	X	X
Sorting the parameter table (Page 6339)	X	X
Transferring parameter data to other editors (Page 6339)	X	X
Indicating errors (Page 6339)	X	X
Editing start values in the project (Page 6340)	X	X
Status of configuration (offline) (Page 6341)	X	
Monitoring values online in the parameter view (Page 6342)		X
Create snapshot of monitor values (Page 6342)		X
Modifying values (Page 6343)		X
Comparing values (Page 6344)		X
Applying values from the online program as start values (Page 6345)		X
Initializing setpoints in the online program (Page 6346)		X

### Filtering the parameter table

You can filter the parameters in the parameter table in the following ways:

- With the text filter
- With the subgroups of the navigation

Both filter methods can be used simultaneously.

#### With the text filter

Texts that are visible in the parameter table can be filtered. This means only texts in displayed parameter rows and columns can be filtered.

1. Enter the desired character string for filtering in the "Text filter..." input box.  
The parameter table displays only the parameters containing the character string.

The text filtering is reset.

- When another parameter group is selected in the navigation.
- When navigation is changed from data navigation to functional navigation, or vice versa.

#### With the subgroups of the navigation

1. Click the desired parameter group in the navigation, e.g., "Static".  
The parameter table only shows the static parameters. You can select further subgroups for some groups of the navigation.
2. Click "All parameters" in the navigation if all parameters are to be shown again.

## Sorting the parameter table

The values of the parameters are arranged in rows. The parameter table can be sorted by any displayed column.

- In columns containing numerical values, sorting is based on the magnitude of the numerical value.
- In text columns, sorting is alphabetical.

## Sorting by column

1. Position the cursor in the header cell of the desired column.  
The background of this cell turns blue.
2. Click the column header.

## Result

The entire parameter table is sorted by the selected column. A triangle with tip facing up appears in the column header.

Clicking the column header again changes the sorting as follows:

- Symbol “▲”: Parameter table is sorted in ascending order.
- Symbol “▼”: Parameter table is sorted in descending order.
- No symbol: The sorting is removed again. The parameter table assumes the default display.

The “../” prefix in the “Name in DB” column is ignored when sorting.

## Transferring parameter data to other editors

After selecting an entire parameter row of the parameter table, you can use the following:

- Drag-and-drop
- <Ctrl+C>/<Ctrl+V>
- Copy/Paste via shortcut menu

Transfer parameters to the following editors of the TIA Portal:

- Program editor
- Watch table
- Signal table for trace function

The parameter is inserted with its full name: See information in “Full name in DB” column.

## Indicating errors

### Error indication

Parameter assignment errors that result in compilation errors (e.g., limit violation) are indicated in the Parameter view.

Every time a value is input in the Parameter view, a check is made for process-related and syntax errors and the result is indicated.

Bad values are indicated by:

- Red error symbol in the "Status of configuration" (offline mode) or "Compare result" (online mode, depending on the selected comparison type) columns

and/or

- Table field with red background  
If you click the bad field, a roll-out error message appears with information of the permissible value range or the required syntax (format)

### Compilation error

From the error message of the compiler, you can directly open the Parameter view (functional navigation) containing the parameter causing the error in situations where the parameter is not displayed in the configuration dialog.

### Editing start values in the project

With the Parameter view, you can edit the start values in the project in offline mode and online mode.

- You make value changes in the "Start value project" column of the parameter table.
- In the "Status of configuration" column of the parameter table, the progress of the configuration is indicated by the familiar status symbols from the configuration dialog of the technology object.

### Boundary conditions

- If other parameters depend on the parameter whose start value was changed, the start value of the dependent parameters are also adapted.
- If a parameter of a technology object is not editable, it is also not editable in the parameter view. The ability to edit a parameter can also depend on the values of other parameters.

### Defining new start values

To define start values for parameters in the Parameter view, follow these steps:

1. Open the Parameter view of the technology object.
2. Enter the desired start values in the "Start value project" column. The value must match the data type of the parameter and must not exceed the value range of the parameter. The limits of the value range can be seen in the "Maximum value" and "Minimum value" columns.

The "Status of configuration" column indicates the progress of the configuration with colored symbols.

See also Status of configuration (offline) (Page 6341)

Following adaptation of the start values and downloading of the technology object to the CPU, the parameters take the defined value at startup if they are not declared as retentive ("Retain" column).

## Error indication

When a start value is input, a check is made for process-related and syntax errors and the result is indicated.

Bad start values are indicated by:

- Red error symbol in the "Status of configuration" (offline mode) or "Compare result" (online mode, depending on the selected comparison type) columns

and/or

- Red background in the "Start value project" field  
If you click on the bad field, a roll-out error message appears with information of the permissible value range or the necessary syntax (format)

## Correcting bad start values

1. Correct bad start values using information from the roll-out error message.  
Red error symbol, red field background, and roll-out error message are no longer displayed.

The project cannot be successfully compiled unless the start values are error-free.

## Status of configuration (offline)

The status of the configuration is indicated by icons:

- In the "Status of configuration" column in the parameter table
- In the navigation structure of the functional navigation and data navigation

## Symbol in "Status of configuration" column

Symbol	Meaning
	The start value of the parameter corresponds to the default value and is valid. A start value has not yet been defined by the user.
	The start value of the parameter contains a value defined by the user. The start value is different than the default value. The start value is error-free and valid.
	The start value of the parameter is invalid (syntax or process-related error). The input box has a red background. When clicked, the roll-out error message indicates the cause of the error.
	Only for S7-1200 Motion Control: The start value of the parameter is valid but contains warnings. The input box has a yellow background.

## Symbol in the navigation

The symbols in the navigation indicate the progress of the configuration in the same way as in the configuration dialog of the technology object.

See Configure technology objects (Page 6321)

## Monitoring values online in the parameter view

You can monitor the values currently taken by the parameters of the technology object in the CPU (monitor values) directly in the Parameter view.

## Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.

## Procedure

1. Start the monitoring by clicking .  
As soon as the Parameter view is online, the following columns are additionally displayed:
  - Compare result
  - Start value PLC
  - Monitor value
  - Modify value
  - Selection for transmissionThe "Monitor value" column shows the current parameter values on the CPU.  
Meaning of the additional columns: see Parameter table (Page 6331)
2. Stop the monitoring by clicking  again.

## Display

All columns that are only available online have an orange background:

- Values in light-orange cells  can be changed.
- Values in cells with a dark orange background  cannot be changed.

## Create snapshot of monitor values

You can back up the current values of the technology object on the CPU (monitor values) and display them in the Parameter view.

## Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.
- The "Monitor all" button  is selected.

## Procedure

To show the current parameter values, follow these steps:

1. In the Parameter view, click the "Create snapshot of monitor values" icon .

## Result

The current monitor values are transferred once to the "Snapshot" column of the parameter table.

You can analyze the values "frozen" in this way while the monitor values continue to be updated in the "Monitor values" column.

## Modifying values

With the Parameter view, you can modify values of the technology object in the CPU.

You can assign values to the parameter once (Modify value) and modify them immediately. The modify request is executed as quickly as possible without reference to any particular point in the user program.

 <b>DANGER</b>
<b>Danger when modifying:</b> Changing the parameter values while the plant is operating may result in severe damage to property and personal injury in the event of malfunctions or program errors. Make sure that dangerous states cannot occur before you use the "Modify" function.

## Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.

- The “Monitor all” button  is selected.
- The parameter can be modified (associated field in the "Modify value" column has a light-orange background).

## Procedure

To modify parameters immediately, follow these steps:

1. Enter the desired modify values in the “Modify values” column of the parameter table.
2. Check whether the check box for modifying is selected in the "Select for transmission" column.  
The modify values and associated check boxes of dependent parameters are automatically adapted at the same time.
3. Click the “Modify all selected parameters immediately and once” icon .

The selected parameters are modified once and immediately with the specified values and can be monitored in the "Modify values" column. The check boxes for modifying in the "Selection for transmission" column are automatically cleared after the modify request is complete.

## Error indication

When a start value is input, a check is made immediately for process-related and syntax errors and the result is indicated.

Bad start values are indicated by:

- Red background in the “Modify value” field
- and
- If you click the bad field, a roll-out error message appears with information of the permissible value range or the necessary syntax (format)

## Bad modify values

- Modify values with process-related errors can be transmitted.
- Modify values with syntax errors **cannot** be transmitted.

## Comparing values

You can use comparison functions to compare the following memory values of a parameter:

- Start value project
- Start value PLC
- Snapshot

## Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.
- The "Monitor all" button  is selected.

## Procedure

To compare the start values on the various target systems, follow these steps:

1. Click the "Selection of compare values" icon .
 

A selection list containing the comparison options opens:

  - Start value project - Start value PLC (default setting)
  - Start value project - Snapshot
  - Start value PLC - Snapshot
2. Select the desired comparison option.
 

The selected comparison option is executed as follows:

  - A scales symbol appears in the header cells of the two columns selected for comparison.
  - Symbols are used in the "Compare result" column to indicate the result of the comparison of the selected columns.

## Symbol in "Compare result" column

Symbol	Meaning
	The compare values are equal and error-free.
	The compare values are not equal and error-free.
	At least one of the two compare values has a process-related or syntax error.
	The comparison cannot be performed. At least one of the two compare values is not available (e.g., snapshot).

## Symbol in the navigation

The symbols are shown in the same way in the navigation if the comparison result applies to at least one of the parameters below the displayed navigation structure.

## Applying values from the online program as start values

In order to apply optimized values from the CPU to the project as start values, you create a snapshot of the monitor values. Values of the snapshot marked as a "Setpoint" are then applied to the project as start values.

## Requirements

- The technology object is of type "PID\_Compact" or "PID\_3Step".
- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.
- The "Monitor all" button  is selected.

## Procedure

To apply optimized values from the CPU, follow these steps:

1. Click the "Create snapshot of monitor values and accept setpoints of this snapshot as start values" icon .

## Result

The current monitor values are applied to the "Snapshot" column and their setpoints are copied to the "Start value project" column as new start values.

---

### Note

#### Applying values of individual parameters

You can also apply the values of individual parameters that are not marked as a setpoint from the "Snapshot" column to the "Start values project" column. To do so, copy the values and insert them into the "Start value project" column using the "Copy" and "Paste" commands in the shortcut menu.

---

## Initializing setpoints in the online program

You can initialize all parameters that are marked as a "Setpoint" in the Parameter view with new values in the CPU in one step. In so doing, the start values are downloaded from the project to the CPU. The CPU remains in "RUN" mode.

To avoid data loss on the CPU during a cold restart or warm restart, you must also download the technology object to the CPU.

### DANGER

#### Danger when changing parameter values

Changing the parameter values while the plant is operating may result in severe damage to property and personal injury in the event of malfunctions or program errors.

Make sure that dangerous states cannot occur before you reinitialize the setpoints.

## Requirements

- The technology object is of type "PID\_Compact" or "PID\_3Step".
- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.
- The "Monitor all" button  is selected.
- The parameters marked as a "Setpoint" have a "Start value project" that is free of process-related and syntax errors

## Procedure

To initialize all setpoints, follow these steps:

1. Enter the desired values in the "Start value project" column.  
Ensure that the start values are free of process-related and syntax errors.
2. Click the "Initialize setpoints" icon .

## Result

The setpoints in the CPU are initialized with the start values from the project.

### 11.1.2.11 Display instance DB of a technology object.

An instance DB, in which the parameter and static variables are saved, is created for each technology object.

## Procedure

To display the instance DB of a technology object, proceed as follows:

1. Open the CPU folder in the project tree.
2. Open the "Technology objects" folder.
3. Highlight a technology object.
4. Select the command "Open DB editor" in the shortcut menu.

## 11.1.3 Using PID\_Compact

### 11.1.3.1 Technology object PID\_Compact

The technology object PID\_Compact provides a continuous PID controller with integrated optimization. You can alternatively configure a pulse controller. Both manual and automatic mode are possible.

PID-Compact continuously acquires the measured process value within a control loop and compares it with the required setpoint. From the resulting control deviation, the instruction PID\_Compact calculates an output value by which the process value is adapted as quickly and stable as possible to the setpoint. The output value for the PID controller consists of three actions:

- **P action**  
The proportional action of the output value increases in proportion to the control deviation.
- **I action**  
The integral action of the output value increases until the control deviation has been balanced.
- **D action**  
The derivative action increases with the rate of change of control deviation. The process value is corrected to the setpoint as quickly as possible. The derivative action will be reduced again if the rate of change of control deviation drops.

The instruction PID\_Compact calculates the proportional, integral and derivative parameters for your controlled system during pretuning. Fine tuning can be used to tune the parameters further. You do not need to manually determine the parameters.

#### Additional information

- Overview of software controller (Page 6318)
- Add technology objects (Page 6320)
- Configure technology objects (Page 6321)
- Configuring PID\_Compact V2 (Page 6348)
- Configuring PID\_Compact V1 (Page 6364)

#### 11.1.3.2 PID\_Compact V2

#### Configuring PID\_Compact V2

#### Basic settings

#### Introduction

Configure the following properties of the "PID\_Compact" technology object under "Basic settings" in the Inspector window or in the configuration window:

- Physical quantity
- Control logic
- Start-up behavior after reset
- Setpoint (only in the Inspector window)

- Process value (only in the Inspector window)
- Output value (only in the Inspector window)

### Setpoint, process value and output value

You can only configure the setpoint, process value and output value in the Inspector window of the programming editor. Select the source for each value:

- Instance DB  
The value saved in the instance DB is used.  
Value must be updated in the instance DB by the user program.  
There should be no value at the instruction.  
Change via HMI possible.
- Instruction  
The value connected to the instruction is used.  
The value is written to the instance DB each time the instruction is called.  
No change via HMI possible.

### Controller type

#### Physical quantity

Select the physical quantity and unit of measurement for setpoint, process value, and disturbance variable in the "Controller type" group. Setpoint, process value, and disturbance variable is displayed in this unit of measurement.

### Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic.

PID\_Compact does not work with negative proportional gain. Select the check box "Invert control logic" to reduce the process value with a higher output value.

#### Examples

- Opening the drain valve will reduce the level of a container's contents.
- Increasing cooling will reduce the temperature.

## Startup characteristics

1. To switch to "Inactive" mode after CPU restart, clear the "Activate Mode after CPU restart" check box.  
To switch to the operating mode saved in the Mode parameter after CPU restart, select the "Activate Mode after CPU restart" check box.
2. In the "Set Mode to" drop-down list, select the mode that is to be enabled after a complete download to the device.  
After a complete download to the device, PID\_Compact starts in the selected operating mode. With each additional restart, PID\_Compact starts in the mode that was last saved in Mode.

### Example

You have selected the "Activate Mode after CPU restart" check box and the entry "Pretuning" in the "Set Mode to" list. After a complete download to the device, PID\_Compact starts in the "Pretuning" mode. If pretuning is still active, PID\_Compact starts in "Pretuning" mode again after restart of the CPU. If pretuning was successfully completed and automatic mode is active, PID\_Compact starts in "Automatic mode" after restart of the CPU.

## Setpoint

### Procedure

Proceed as follows to define a fixed setpoint:

1. Select "Instance DB".
2. Enter a setpoint, e.g. 80° C.
3. Delete any entry in the instruction.

Proceed as follows to define a variable setpoint:

1. Select "Instruction".
2. Enter the name of the REAL variable in which the setpoint is saved.  
Program-controlled assignment of various values to the REAL variable is possible, for example for the time controlled change of the setpoint.

## Process value

PID\_Compact will scale the value of the analog input to the physical quantity if you use the analog input value directly.

You will need to write a program for processing if you wish first to process the analog input value. The process value is, for example, not directly proportional to the value at the analog input. The processed process value must be in floating point format.

## Procedure

Proceed as follows to use the analog input value without processing:

1. Select the entry "Input\_PER" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the address of the analog input.

Proceed as follows to use the processed process value in floating point format:

1. Select the entry "Input" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the name of the variable in which the processed process value is saved.

## Output value

PID\_Compact offers three output values. Your actuator will determine which output value you use.

- Output\_PER  
The actuator is triggered via an analog output and controlled with a continuous signal, e.g. 0...10V, 4...20mA.
- Output  
The output value needs to be processed by the user program, for example because of nonlinear actuator response.
- Output\_PWM  
The actuator is controlled via a digital output. Pulse width modulation creates minimum ON and minimum OFF times.

## Procedure

Proceed as follows to use the analog output value:

1. Select the entry "Output\_PER (analog)" in the drop-down list "Output".
2. Select "Instruction".
3. Enter the address of the analog output.

Proceed as follows to process the output value using the user program:

1. Select the entry "Output" in the drop-down list "Output".
2. Select "Instance DB".  
The calculated output value is saved in the instance data block.
3. For the preparation of the output value, use the output parameter Output.
4. Transfer the processed output value to the actuator via a digital or analog CPU output.

Proceed as follows to use the digital output value:

1. Select the entry "Output\_PWM" in the drop-down list "Output".
2. Select "Instruction".
3. Enter the address of the digital output.

## Process value settings

### Scaling the process value

If you have configured the use of Input\_PER in the basic setting, you must convert the value of the analog input to the physical quantity of the process value. The current configuration is displayed in the Input\_PER display.

Input\_PER will be scaled using a low and high value pair if the process value is directly proportional to the value of the analog input.

### Procedure

To scale the process value, follow these steps:

1. Enter the low pair of values in the "Scaled low process value" and "Low" input fields.
2. Enter the high pair of values in the "Scaled high process value" and "High" input boxes.

Default settings for the value pairs are stored in the hardware configuration. To use the value pairs from the hardware configuration, follow these steps:

1. Select the PID\_Compact instruction in the programming editor.
2. Interconnect Input\_PER with an analog input in the basic settings.
3. Click the "Automatic setting" button in the process value settings.

The existing values will be overwritten with the values from the hardware configuration.

### Process value limits

You must specify an appropriate absolute high limit and low limit for the process value as limit values for your controlled system. As soon as the process value violates these limits, an error occurs (ErrorBits = 0001h). Tuning is canceled when the process value limits are violated. You can configure how PID\_Compact reacts to an error in automatic mode in the output value settings.

### Advanced settings

#### Monitoring process value

Configure a warning high and low limit for the process value in the "Process value monitoring" configuration window. If one of the warning limits is exceeded or undershot during operation, a warning will be displayed at the PID\_Compact instruction:

- At the InputWarning\_H output parameter if the warning high limit has been exceeded
- At the InputWarning\_L output parameter if the warning low limit has been undershot

The warning limits must be within the process value high and low limits.

The process value high and low limits will be used if you do not enter values.

**Example**

Process value high limit = 98 °C; warning high limit = 90 °C

Warning low limit = 10 °C; process value low limit = 0 °C

PID\_Compact will respond as follows:

Process value	InputWarning_H	InputWarning_L	ErrorBits	Operating mode
> 98 °C	TRUE	FALSE	0001h	Inactive or Substitute output value with error monitoring
≤ 98 °C and > 90 °C	TRUE	FALSE	0000h	Automatic mode
≤ 90 °C and ≥ 10 °C	FALSE	FALSE	0000h	Automatic mode
< 10 °C and ≥ 0 °C	FALSE	TRUE	0000h	Automatic mode
< 0 °C	FALSE	TRUE	0001h	Inactive or Substitute output value with error monitoring

In the output value settings, you can specify the reaction of PID\_Compact when the process value high limit or low limit is violated.

**See also**

Parameters State and Mode V2 (Page 2962)

**PWM limits**

The value at the output parameter Output is transformed into a pulse sequence that is output at output parameter Output\_PWM by means of a pulse width modulation. Output is calculated in the PID algorithm sampling time, Output\_PWM is output in the PID\_Compact sampling time.

The PID algorithm sampling time is determined during pretuning or fine tuning. If manually setting the PID parameters, you will also need to configure the PID algorithm sampling time. The PID\_Compact sampling time is equivalent to the cycle time of the calling OB.

The pulse duration is proportional to the value at Output and is always an integer multiple of the PID\_Compact sampling time.

- ① PID\_Compact sampling time
- ② PID algorithm sampling time
- ③ Pulse duration
- ④ Break time

The "Minimum ON time" and the "Minimum OFF time" are rounded to an integer multiple of the PID\_Compact sampling time.

A pulse or a break is never shorter than the minimum ON or OFF time. The inaccuracies this causes are added up and compensated in the next cycle.

**Example**

PID\_Compact sampling time = 100 ms

PID algorithm sampling time = 1000 ms

Minimum ON time = 200 ms

Output is a constant 15%. The smallest pulse that PID\_Compact can output is 20%. In the first cycle, no pulse is output. In the second cycle, the pulse not output in the first cycle is added to the pulse of the second cycle.

In order to minimize operation frequency and conserve the actuator, extend the minimum ON and OFF times.

If you are using "Output" or "Output\_PER", you must configure the value 0.0 for the minimum ON and OFF times.

#### Note

The minimum ON and OFF times only affect the output parameter Output\_PWM and are not used for any pulse generators integrated in the CPU.

## Output value

### Output value limits

In the "Output value limits" configuration window, configure the absolute limits of your output value in percent. Absolute output value limits are not violated in neither manual mode nor automatic mode. If an output value outside the limits is specified in manual mode, the effective value is limited in the CPU to the configured limits.

The output value limits must match the control logic.

The valid output value limit values depend on the Output used.

Output	-100.0 to 100.0%
Output_PER	-100.0 to 100.0%
Output_PWM	0.0 to 100.0%

## Reaction to error

<b>NOTICE</b>
<b>Your system may be damaged.</b>
If you output "Current value while error pending " or "Substitute output value while error pending" in the event of an error, PID_Compact remains in automatic mode. This may cause a violation of the process value limits and damage your system.
It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.

PID\_Compact is preset so that the controller stays active in most cases in the event of an error. If errors occur frequently in controller mode, this default reaction has a negative effect on the control response. In this case, check the Errorbits parameter and eliminate the cause of the error.

PID\_Compact generates a programmable output value in response to an error:

- Zero (inactive)  
PID\_Compact outputs 0.0 as output value for all errors and switches to "Inactive" mode. The controller is only reactivated by a falling edge at Reset or a rising edge at ModeActivate.
- Current value while error is pending  
If the following errors occur in **automatic mode**, PID\_Compact returns to automatic mode as soon as the errors are no longer pending.  
If one or more of the following errors occur, PID\_Compact stays in automatic mode:
  - 0001h: The "Input" parameter is outside the process value limits.
  - 0800h: Sampling time error
  - 40000h: Invalid value at Disturbance parameter.  
If one or more of the following errors occur in **automatic mode**, PID\_Compact switches to "Substitute output value with error monitoring" mode and outputs the last valid output value:
  - 0002h: Invalid value at Input\_PER parameter.
  - 0200h: Invalid value at Input parameter.
  - 0400h: Calculation of output value failed.
  - 1000h: Invalid value at Setpoint parameter.  
If an error occurs in **manual mode**, PID\_Compact continues using the manual value as the output value. If the manual value is invalid, the substitute output value is used. If the manual value and substitute output value are invalid, the output value low limit is used.  
If the following error occurs during a **pretuning or fine tuning**, PID\_Compact remains in active mode:
  - 0020h: Pretuning is not permitted during fine tuning.  
When any other error occurs, PID\_Compact cancels the tuning and switches to the mode from which tuning was started.  
As soon as no errors are pending, PID\_Compact returns to automatic mode.
- Substitute output value while error is pending  
PID\_Compact outputs the substitute output value.  
If the following error occurs, PID\_Compact stays in "Substitute output value with error monitoring" mode and outputs the output value low limit:
  - 20000h: Invalid value at SubstituteOutput tag.  
For all other errors, PID\_Compact reacts as described for "Current value while error is pending".

Parameters State and Mode V2 (Page 2962)

## PID parameters

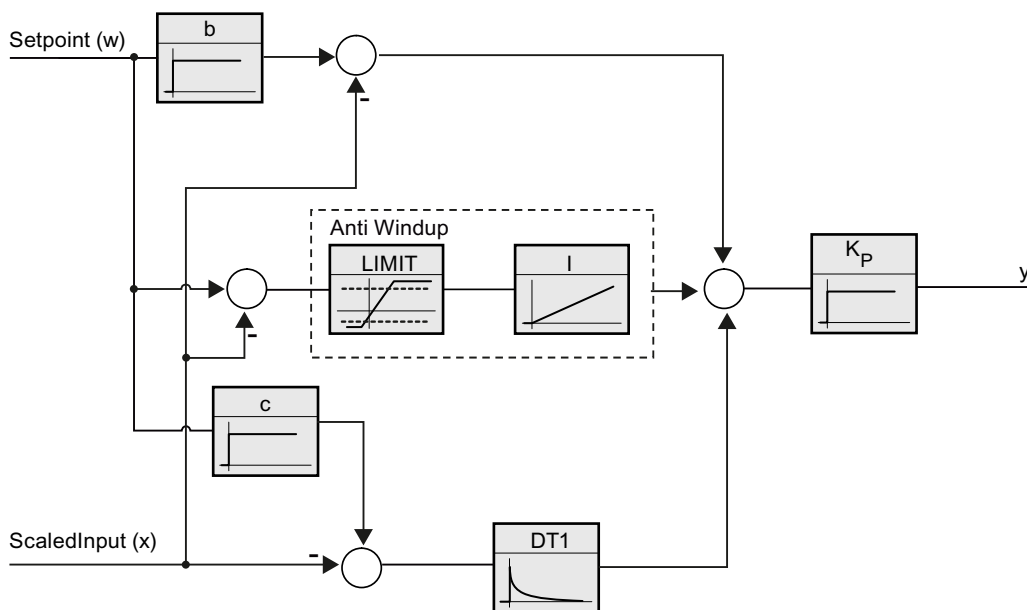

The PID parameters are displayed in the "PID Parameters" configuration window. The PID parameters will be adapted to your controlled system during controller tuning. You do not need to enter the PID parameters manually.

The PID algorithm operates according to the following equation:

$$y = K_p \left[ (b \cdot w - x) + \frac{1}{T_i \cdot s} (w - x) + \frac{T_d \cdot s}{a \cdot T_d \cdot s + 1} (c \cdot w - x) \right]$$

Symbol	Description
y	Output value of the PID algorithm
K <sub>p</sub>	Proportional gain
s	Laplace operator
b	Proportional action weighting
w	Setpoint
x	Process value
T <sub>i</sub>	Integral action time
a	Derivative delay coefficient (derivative delay T1 = a × T <sub>D</sub> )
T <sub>D</sub>	Derivative action time
c	Derivative action weighting

The diagram below illustrates the integration of the parameters into the PID algorithm:

All PID parameters are retentive. If you enter the PID parameters manually, you must completely download PID\_Compact.

Downloading technology objects to device (Page 6323)

### Proportional gain

The value specifies the proportional gain of the controller. PID\_Compact does not work with a negative proportional gain. Control logic is inverted under Basic settings > Controller type.

### Integral action time

The integral action time determines the time behavior of the integral action. The integral action is deactivated with integral action time = 0.0.

### Derivative action time

The derivative action time determines the time behavior of the derivative action. Derivative action is deactivated with derivative action time = 0.0.

### Derivative delay coefficient

The derivative delay coefficient delays the effect of the derivative action.

Derivative delay = derivative action time × derivative delay coefficient

- 0.0: Derivative action is effective for one cycle only and therefore almost not effective.
- 0.5: This value has proved useful in practice for controlled systems with **one** dominant time constant.
- > 1.0: The greater the coefficient, the longer the effect of the derivative action is delayed.

### Proportional action weighting

The proportional action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Proportional action for setpoint change is fully effective
- 0.0: Proportional action for setpoint change is not effective

The proportional action is always fully effective when the process value is changed.

### Derivative action weighting

The derivative action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Derivative action is fully effective upon setpoint change
- 0.0: Derivative action is not effective upon setpoint change

The derivative action is always fully effective when the process value is changed.

### PID algorithm sampling time

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the cycle time. All other functions of PID\_Compact are executed at every call.

If you use Output\_PWM, the accuracy of the output signal is determined by the ratio of the PID algorithm sampling time to the cycle time of the OB. The PID algorithm sampling time

corresponds to the time period of the pulse width modulation. The cycle time should be at least 10 times the PID algorithm sampling time.

### Rule for tuning

Select whether PI or PID parameters are to be calculated in the "Controller structure" drop-down list.

- **PID**  
Calculates PID parameters during pretuning and fine tuning.
- **PI**  
Calculates PI parameters during pretuning and fine tuning.
- **User-defined**  
The drop-down list displays "User-defined" if you have configured different controller structures for pretuning and fine tuning via a user program.

### Commissioning PID\_Compact V2

#### Pretuning

The pretuning determines the process response to a jump change of the output value and searches for the point of inflection. The PID parameters are calculated from the maximum rate of rise and dead time of the controlled system. You obtain the best PID parameters when you perform pretuning and fine tuning.

The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise. This is most likely the case in operating modes "Inactive" and "manual mode". The PID parameters are backed up before being recalculated.

#### Requirement

- The "PID\_Compact" instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- Reset = FALSE
- PID\_Compact is in one of the following modes: "Inactive", "Manual mode", or "Automatic mode".
- The setpoint and the process value lie within the configured limits (see "Process value monitoring" configuration).
- The difference between setpoint and process value is greater than 30% of the difference between process value high limit and process value low limit.
- The distance between the setpoint and the process value is > 50% of the setpoint.

## Procedure

To perform pretuning, follow these steps:

1. Double-click the "PID\_Compact > Commissioning" entry in the project tree.
2. Select the entry "Pretuning" in the "Tuning mode" drop-down list.
3. Click the "Start" icon.
  - An online connection will be established.
  - Value recording is started.
  - Pretuning is started.
  - The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

---

### Note

Click the "Stop" icon when the progress bar has reached 100% and it can be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

---

## Result

If pretuning was performed without an error message, the PID parameters have been tuned. PID\_Compact switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If pretuning is not possible, PID\_Compact responds with the configured reaction to errors.

## See also

Parameters State and Mode V2 (Page 2962)

## Fine tuning

Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are tuned for the operating point from the amplitude and frequency of this oscillation. All PID parameters are recalculated from the results. PID parameters from fine tuning usually have better master control and disturbance characteristics than PID parameters from pretuning. You obtain the best PID parameters when you perform pretuning and fine tuning.

PID\_Compact automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. The PID parameters are backed up before being recalculated.

## Requirement

- The PID\_Compact instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- Reset = FALSE

## 11.1 PID control

- The setpoint and the process value lie within the configured limits.
- The control loop has stabilized at the operating point. The operating point is reached when the process value corresponds to the setpoint.
- No disturbances are expected.
- PID\_Compact is in one of the following operating modes: Inactive, automatic mode, or manual mode.

### Process depends on initial situation

Fine tuning can be started from the following operating modes: "Inactive", "automatic mode", or "manual mode". Fine tuning proceeds as follows when started from:

- Automatic mode  
Start fine tuning from automatic mode if you wish to improve the existing PID parameters through tuning.  
PID\_Compact controls the system using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.
- Inactive or manual mode  
If the requirements for pretuning are met, pretuning is started. The determined PID parameters will be used for control until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start. If pretuning is not possible, PID\_Compact responds with the configured reaction to errors.  
An attempt is made to reach the setpoint with the minimum or maximum output value if the process value for pretuning is already too near the setpoint. This can produce increased overshoot.

### Procedure

To perform fine tuning, follow these steps:

1. Select the entry "Fine tuning" in the "Tuning mode" drop-down list.
2. Click the "Start" icon.
  - An online connection will be established.
  - Value recording is started.
  - The process of fine tuning is started.
  - The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

---

#### Note

Click the "Stop" icon in the "Tuning mode" group when the progress bar has reached 100% and it is to be assumed that tuning is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

---

## Result

If no errors occurred during fine tuning, the PID parameters have been tuned. PID\_Compact switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If errors occurred during "fine tuning", PID\_Compact responds with the configured response to errors.

## See also

Parameters State and Mode V2 (Page 2962)

## "Manual" mode

The following section describes how you can use the "manual mode" operating mode in the commissioning window of the "PID\_Compact" technology object. Manual mode is also possible when an error is pending.

## Requirement

- The "PID\_Compact" instruction is called in a cyclic interrupt OB.
- An online connection to the CPU has been established and the CPU is in the "RUN" mode.

## Procedure

Use "Manual mode" in the commissioning window if you want to test the controlled system by specifying a manual value. To define a manual value, follow these steps:

1. Click the "Start" icon.
2. Select the "Manual mode" check box in the "Online status of controller" area. PID\_Compact operates in manual mode. The most recent current output value remains in effect.
3. Enter the manual value in the "Output" field as a % value.
4. Click the  icon.

## Result

The manual value is written to the CPU and immediately goes into effect.

Clear the "Manual mode" check box if the output value is to be specified again by the PID controller. The switchover to automatic mode is bumpless.

### 11.1.3.3 PID\_Compact V1

## Configuring PID\_Compact V1

### Basic settings

#### Introduction

Configure the following properties of the "PID\_Compact" technology object under "Basic settings" in the Inspector window or in the configuration window:

- Physical quantity
- Control logic
- Start-up behavior after reset
- Setpoint (only in the Inspector window)
- Process value (only in the Inspector window)
- Output value (only in the Inspector window)

#### Setpoint, process value and output value

You can only configure the setpoint, process value and output value in the Inspector window of the programming editor. Select the source for each value:

- Instance DB  
The value saved in the instance DB is used.  
Value must be updated in the instance DB by the user program.  
There should be no value at the instruction.  
Change via HMI possible.
- Instruction  
The value connected to the instruction is used.  
The value is written to the instance DB each time the instruction is called.  
No change via HMI possible.

#### Controller type

#### Physical quantity

Select the unit of measurement and physical quantity for the setpoint and process value in the "Controller type" group. The setpoint and process value will be displayed in this unit.

#### Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic.

PID\_Compact does not work with negative proportional gain. Select the check box "Invert control logic" to reduce the process value with a higher output value.

Examples

- Opening the drain valve will reduce the level of a container's contents.
- Increasing cooling will reduce the temperature.

### Start-up behavior after reset

To change straight to the last active mode after restarting the CPU, select the "Enable last mode after CPU restart" check box.

PID\_Compact will remain in "Inactive" mode if the check box is cleared.

### Setpoint

#### Procedure

Proceed as follows to define a fixed setpoint:

1. Select "Instance DB".
2. Enter a setpoint, e.g. 80° C.
3. Delete any entry in the instruction.

Proceed as follows to define a variable setpoint:

1. Select "Instruction".
2. Enter the name of the REAL variable in which the setpoint is saved.  
Program-controlled assignment of various values to the REAL variable is possible, for example for the time controlled change of the setpoint.

### Process value

PID\_Compact will scale the value of the analog input to the physical quantity if you use the analog input value directly.

You will need to write a program for processing if you wish first to process the analog input value. The process value is, for example, not directly proportional to the value at the analog input. The processed process value must be in floating point format.

#### Procedure

Proceed as follows to use the analog input value without processing:

1. Select the entry "Input\_PER" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the address of the analog input.

Proceed as follows to use the processed process value in floating point format:

1. Select the entry "Input" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the name of the variable in which the processed process value is saved.

## Output value

PID\_Compact offers three output values. Your actuator will determine which output value you use.

- **Output\_PER**  
The actuator is triggered via an analog output and controlled with a continuous signal, e.g. 0...10V, 4...20mA.
- **Output**  
The output value needs to be processed by the user program, for example because of nonlinear actuator response.
- **Output\_PWM**  
The actuator is controlled via a digital output. Pulse width modulation creates minimum ON and minimum OFF times.

## Procedure

Proceed as follows to use the analog output value:

1. Select the entry "Output\_PER (analog)" in the drop-down list "Output".
2. Select "Instruction".
3. Enter the address of the analog output.

Proceed as follows to process the output value using the user program:

1. Select the entry "Output" in the drop-down list "Output".
2. Select "Instance DB".  
The calculated output value is saved in the instance data block.
3. For the preparation of the output value, use the output parameter Output.
4. Transfer the processed output value to the actuator via a digital or analog CPU output.

Proceed as follows to use the digital output value:

1. Select the entry "Output\_PWM" in the drop-down list "Output".
2. Select "Instruction".
3. Enter the address of the digital output.

## Process value settings

Configure the scaling of your process value and specify the process value absolute limits in the "Process value settings" configuration window.

## Scaling the process value

If you have configured the use of Input\_PER in the basic settings, you will need to convert the value of the analog input into the physical quantity of the process value. The current configuration will be displayed in the Input\_PER display.

Input\_PER will be scaled using a low and high value pair if the process value is directly proportional to the value of the analog input.

1. Enter the low pair of values in the "Scaled low process value" and "Low" input fields.
2. Enter the high pair of values in the "Scaled high process value" and "High" input boxes.

Default settings for the value pairs are saved in the hardware configuration. Proceed as follows to use the value pairs from the hardware configuration:

1. Select the instruction PID\_Compact in the programming editor.
2. Connect Input\_PER with an analog input in the basic settings.
3. Click on the "Automatic setting" button in the process value settings.

The existing values will be overwritten with the values from the hardware configuration.

## Monitoring process value

Specify the absolute high and low limit of the process value. As soon as these limits are violated during operation, the controller switches off and the output value is set to 0%. You must enter reasonable limits for your controlled system. Reasonable limits are important during optimization to obtain optimal PID parameters.

The default for the "High limit process value" is 120 %. At the I/O input, the process value can be a maximum of 18% higher than the standard range (overrange). An error is no longer reported for a violation of the "High limit process value". Only a wire-break and a short-circuit are recognized and the PID\_Compact switches to "Inactive" mode.

 <b>WARNING</b>
--

If you set very high process value limits (for example $-3.4 \cdot 10^{38} \dots +3.4 \cdot 10^{38}$ ), process value monitoring will be disabled. Your system may then be damaged if an error occurs.
--

Monitoring process value (Page 6368)

PWM limits (Page 6368)

Output value limits (Page 6370)

PID parameters (Page 6371)

## Advanced settings

### Monitoring process value

Configure a warning high and low limit for the process value in the "Process value monitoring" configuration window. If one of the warning limits is exceeded or undershot during operation, a warning will be displayed at the PID\_Compact instruction:

- At the InputWarning\_H output parameter if the warning high limit has been exceeded
- At the InputWarning\_L output parameter if the warning low limit has been undershot

The warning limits must be within the process value high and low limits.

The process value high and low limits will be used if you do not enter values.

### Example

Process value high limit = 98° C; warning high limit = 90° C

Warning low limit = 10° C; process value low limit = 0° C

PID\_Compact will respond as follows:

Process value	InputWarning_H	InputWarning_L	Operating mode
> 98° C	TRUE	FALSE	Inactive
≤ 98° C and > 90° C	TRUE	FALSE	Automatic mode
≤ 90° C and ≥ 10° C	FALSE	FALSE	Automatic mode
< 10° C and ≥ 0° C	FALSE	TRUE	Automatic mode
< 0° C	FALSE	TRUE	Inactive

### See also

Process value settings (Page 6364)

PWM limits (Page 6368)

Output value limits (Page 6370)

PID parameters (Page 6371)

### PWM limits

The value at the output parameter Output is transformed into a pulse sequence that is output at output parameter Output\_PWM by means of a pulse width modulation. Output is calculated in the PID algorithm sampling time, Output\_PWM is output in the PID\_Compact sampling time.

The PID algorithm sampling time is determined during pretuning or fine tuning. If manually setting the PID parameters, you will also need to configure the PID algorithm sampling time. The PID\_Compact sampling time is equivalent to the cycle time of the calling OB.

The pulse duration is proportional to the value at Output and is always an integer multiple of the PID\_Compact sampling time.

- ① PID\_Compact sampling time
- ② PID algorithm sampling time
- ③ Pulse duration
- ④ Break time

The "Minimum ON time" and the "Minimum OFF time" are rounded to an integer multiple of the PID\_Compact sampling time.

A pulse or a break is never shorter than the minimum ON or OFF time. The inaccuracies this causes are added up and compensated in the next cycle.

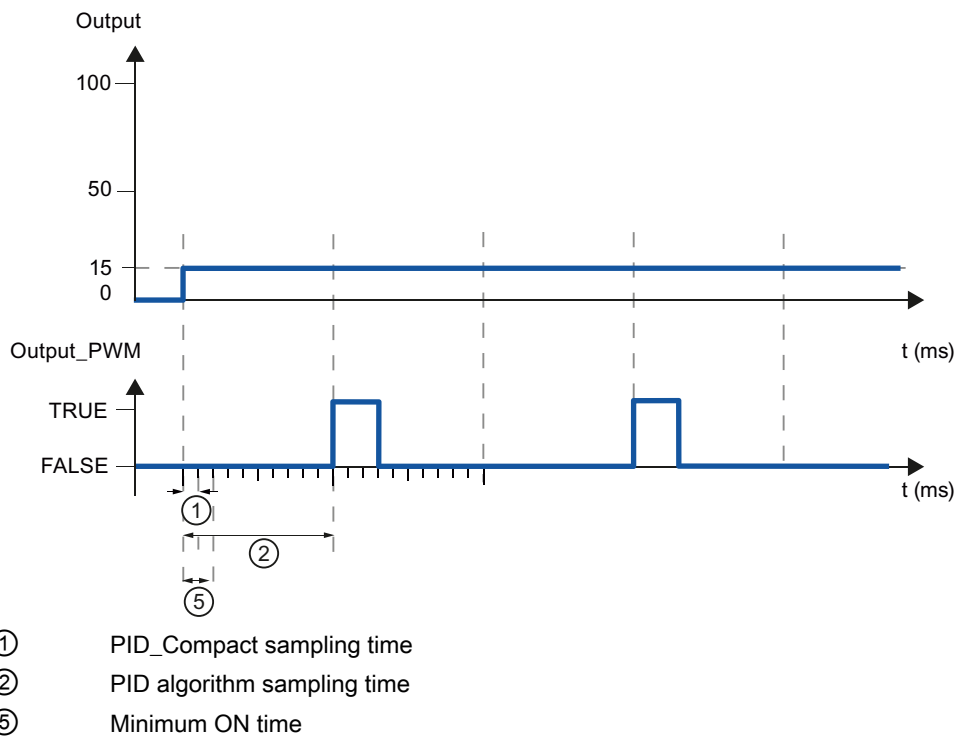

### Example

PID\_Compact sampling time = 100 ms

PID algorithm sampling time = 1000 ms

Minimum ON time = 200 ms

Output is a constant 15%. The smallest pulse that PID\_Compact can output is 20%. In the first cycle, no pulse is output. In the second cycle, the pulse not output in the first cycle is added to the pulse of the second cycle.

In order to minimize operation frequency and conserve the actuator, extend the minimum ON and OFF times.

If you are using "Output" or "Output\_PER", you must configure the value 0.0 for the minimum ON and OFF times.

**Note**

The minimum ON and OFF times only affect the output parameter Output\_PWM and are not used for any pulse generators integrated in the CPU.

**See also**

- Process value settings (Page 6364)
- Monitoring process value (Page 6366)
- Output value limits (Page 6370)
- PID parameters (Page 6371)

**Output value limits**

In the "Output value limits" configuration window, configure the absolute limits of your output value in percent. Absolute output value limits are not violated in neither manual mode nor in automatic mode. If a output value outside the limits is specified in manual mode, the effective value is limited in the CPU to the configured limits.

The valid output value limit values depend on the Output used.

Output	-100.0 to 100.0
Output_PER	-100.0 to 100.0
Output_PWM	0.0 to 100.0

PID\_Compact sets the output value to 0.0 if an error occurs. 0.0 must therefore always be within the output value limits. You will need to add an offset to Output and Output\_PER in the user program if you want an output value low limit of greater than 0.0.

Process value settings (Page 6364)

Monitoring process value (Page 6366)

PWM limits (Page 6366)

PID parameters (Page 6371)

## PID parameters

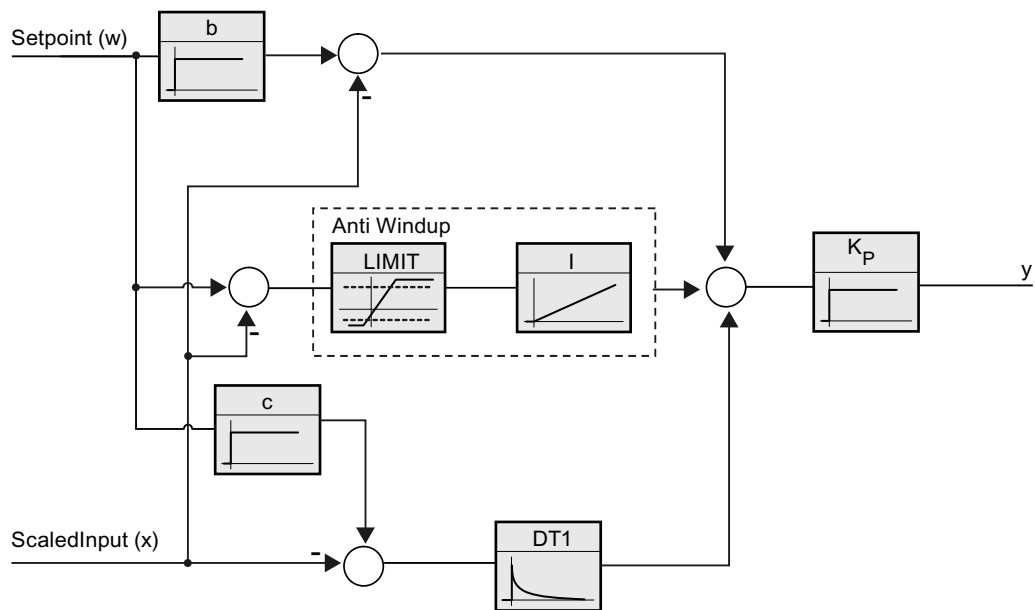

The PID parameters are displayed in the "PID Parameters" configuration window. The PID parameters will be adapted to your controlled system during controller tuning. You do not need to enter the PID parameters manually.

The PID algorithm operates according to the following equation:

$$y = K_p \left[ (b \cdot w - x) + \frac{1}{T_i \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

Symbol	Description
y	Output value of the PID algorithm
$K_p$	Proportional gain
s	Laplace operator
b	Proportional action weighting
w	Setpoint
x	Process value
$T_i$	Integral action time
a	Derivative delay coefficient (derivative delay $T_1 = a \times T_D$ )
$T_D$	Derivative action time
c	Derivative action weighting

The diagram below illustrates the integration of the parameters into the PID algorithm:

All PID parameters are retentive. If you enter the PID parameters manually, you must completely download PID\_Compact.

Auto-Hotspot

### Proportional gain

The value specifies the proportional gain of the controller. PID\_Compact does not work with a negative proportional gain. Control logic is inverted under Basic settings > Controller type.

### Integral action time

The integral action time determines the time behavior of the integral action. The integral action is deactivated with integral action time = 0.0.

### Derivative action time

The derivative action time determines the time behavior of the derivative action. Derivative action is deactivated with derivative action time = 0.0.

### Derivative delay coefficient

The derivative delay coefficient delays the effect of the derivative action.

Derivative delay = derivative action time × derivative delay coefficient

- 0.0: Derivative action is effective for one cycle only and therefore almost not effective.
- 0.5: This value has proved useful in practice for controlled systems with **one** dominant time constant.
- > 1.0: The greater the coefficient, the longer the effect of the derivative action is delayed.

### Proportional action weighting

The proportional action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Proportional action for setpoint change is fully effective
- 0.0: Proportional action for setpoint change is not effective

The proportional action is always fully effective when the process value is changed.

### Derivative action weighting

The derivative action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Derivative action is fully effective upon setpoint change
- 0.0: Derivative action is not effective upon setpoint change

The derivative action is always fully effective when the process value is changed.

### PID algorithm sampling time

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the cycle time. All other functions of PID\_Compact are executed at every call.

If you use Output\_PWM, the accuracy of the output signal is determined by the ratio of the PID algorithm sampling time to the cycle time of the OB. The PID algorithm sampling time corresponds to the time period of the pulse width modulation. The cycle time should be at least 10 times the PID algorithm sampling time.

### Rule for tuning

Select whether PI or PID parameters are to be calculated in the "Controller structure" drop-down list.

- **PID**  
Calculates PID parameters during pretuning and fine tuning.
- **PI**  
Calculates PI parameters during pretuning and fine tuning.
- **User-defined**  
The drop-down list displays "User-defined" if you have configured different controller structures for pretuning and fine tuning via a user program.

## Commissioning PID\_Compact V1

### Commissioning

The commissioning window helps you commission the PID controller. You can monitor the values for the setpoint, process value and output value along the time axis in the trend view. The following functions are supported in the commissioning window:

- Controller pretuning
- Controller fine tuning  
Use fine tuning for fine adjustments to the PID parameters.
- Monitoring the current closed-loop control in the trend view
- Testing the controlled system by specifying a manual output value

All functions require an online connection to the CPU to have been established.

### Basic handling

- Select the desired sampling time in the "Sampling time" drop-down list.  
All values in the commissioning window are updated in the selected update time.
- Click the "Start" icon in the measuring group if you want to use the commissioning functions.  
Value recording is started. The current values for the setpoint, process value and output value are entered in the trend view. Operation of the commissioning window is enabled.
- Click the "Stop" icon if you want to end the commissioning functions.  
The values recorded in the trend view can continue to be analyzed.

Closing the commissioning window will terminate recording in the trend view and delete the recorded values.

### See also

Pretuning (Page 6374)

Fine tuning (Page 6376)

"Manual" mode (Page 6377)

### Pretuning

The pretuning determines the process response to a jump change of the output value and searches for the point of inflection. The tuned PID parameters are calculated as a function of the maximum slope and dead time of the controlled system.

The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise. The PID parameters are backed up before being recalculated.

## Requirement

- The "PID\_Compact" instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- PID\_Compact is in "inactive" or "manual" mode.
- The setpoint may not be changed during controller tuning. PID\_Compact will otherwise be deactivated.
- The setpoint and the process value lie within the configured limits (see "Process value monitoring" configuration).
- The difference between setpoint and process value is greater than 30% of the difference between process value high limit and process value low limit.
- The distance between the setpoint and the process value is > 50% of the setpoint.

## Procedure

To perform pretuning, follow these steps:

1. Double-click the "PID\_Compact > Commissioning" entry in the project tree.
2. Select the entry "Pretuning" in the "Tuning mode" drop-down list.
3. Click the "Start" icon.
  - An online connection will be established.
  - Value recording is started.
  - Pretuning is started.
  - The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

---

### Note

Click the "Stop" icon when the progress bar has reached 100% and it is to be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

---

## Result

If pretuning was performed without an error message, the PID parameters have been tuned. PID\_Compact switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If pretuning is not possible, PID\_Compact will change to "Inactive" mode.

## See also

Parameters State and sRet.i\_Mode V1 (Page 2980)

Commissioning (Page 6372)

Fine tuning (Page 6376)

"Manual" mode (Page 6377)

## Fine tuning

Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are optimized for the operating point from the amplitude and frequency of this oscillation. All PID parameters are recalculated on the basis of the findings. PID parameters from fine tuning usually have better master control and disturbance behavior than PID parameters from pretuning.

PID\_Compact automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. The PID parameters are backed up before being recalculated.

## Requirement

- The PID\_Compact instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- The setpoint and the process value lie within the configured limits (see "Process value monitoring" configuration).
- The control loop has stabilized at the operating point. The operating point is reached when the process value corresponds to the setpoint.
- No disturbances are expected.
- The setpoint may not be changed during controller tuning.
- PID\_Compact is in inactive mode, automatic mode or manual mode.

## Process depends on initial situation

Fine tuning can be started in "inactive", "automatic" or "manual" mode. Fine tuning proceeds as follows when started in:

- Automatic mode  
Start fine tuning in automatic mode if you wish to improve the existing PID parameters using controller tuning.  
PID\_Compact will regulate using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.
- Inactive or manual mode  
If the requirements for pretuning are met, pretuning is started. The PID parameters established will be used for adjustment until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start. If pretuning is not possible, PID\_Compact will change to "Inactive" mode.  
An attempt is made to reach the setpoint with a minimum or maximum output value if the process value for pretuning is already too near the setpoint. This can produce increased overshoot.

## Procedure

Proceed as follows to carry out "fine tuning":

1. Select the entry "Fine tuning" in the "Tuning mode" drop-down list.
2. Click the "Start" icon.
  - An online connection will be established.
  - Value recording is started.
  - The process of fine tuning is started.
  - The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

---

### Note

Click the "Stop" icon in the "Tuning mode" group when the progress bar has reached 100% and it is to be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

---

## Result

The PID parameters will have been optimized if fine tuning has been executed without errors. PID\_Compact changes to automatic mode and uses the optimized parameters. The optimized PID parameters will be retained during power OFF and a restart of the CPU.

If errors occurred during "fine tuning", PID\_Compact will change to "inactive" mode.

## See also

Parameters State and sRet.i\_Mode V1 (Page 2980)

Commissioning (Page 6372)

Pretuning (Page 6372)

"Manual" mode (Page 6377)

## "Manual" mode

The following section describes how you can use the "Manual" operating mode in the commissioning window of the "PID Compact" technology object.

## Requirement

- The "PID\_Compact" instruction is called in a cyclic interrupt OB.
- An online connection to the CPU has been established and the CPU is in the "RUN" mode.
- The functions of the commissioning window have been enabled via the "Start" icon.

## Procedure

Use "Manual mode" in the commissioning window if you want to test the process by specifying a manual value. To define a manual value, proceed as follows:

1. Select the check box "Manual mode" in the "Online status of the controller" area.  
PID\_Compact operates in manual mode. The most recent current output value remains in effect.
2. Enter the manual value in the "Output" field as a % value.
3. Click the control icon .

## Result

The manual value is written to the CPU and immediately goes into effect.

---

### Note

PID\_Compact continues to monitor the process value. If the process value limits are exceeded, PID\_Compact is deactivated.

---

Clear the "Manual mode" check box if the output value is to be specified again by the PID controller. The change to automatic mode is bumpless.

## 11.1.4 Using PID\_3Step

### 11.1.4.1 Technology object PID\_3Step

The technology object PID\_3Step provides a PID controller with tuning for valves or actuators with integral response.

You can configure the following controllers:

- Three-point step controller with position feedback
- Three-point step controller without position feedback
- Valve controller with analog output value

PID\_3Step continuously acquires the measured process value within a control loop and compares it with the setpoint. From the resulting control deviation, PID\_3Step calculates an output value through which the process value reaches the setpoint as quickly and steadily as possible. The output value for the PID controller consists of three actions:

- **P action**  
The proportional action of the output value increases in proportion to the control deviation.
- **I action**  
The integral action of the output value increases until the control deviation has been balanced.
- **D action**  
The derivative action increases with the rate of change of control deviation. The process value is corrected to the setpoint as quickly as possible. The derivative action will be reduced again if the rate of change of control deviation drops.

The instruction PID\_3Step calculates the proportional, integral and derivative parameters for your controlled system during pretuning. Fine tuning can be used to tune the parameters further. You do not need to manually determine the parameters.

### Additional information

- Overview of software controller (Page 6318)
- Add technology objects (Page 6320)
- Configure technology objects (Page 6321)
- Configuring PID\_3Step V2 (Page 6379)
- Configuring PID\_3Step V1 (Page 6396)

#### 11.1.4.2 PID\_3Step V2

### Configuring PID\_3Step V2

#### Basic settings

#### Introduction

Configure the following properties of the "PID\_3Step" technology object under "Basic settings" in the Inspector window or in the configuration window:

- Physical quantity
- Control logic
- Start-up behavior after reset
- Setpoint (only in the Inspector window)
- Process value (only in the Inspector window)
- Output value (only in the Inspector window)
- Position feedback (only in the Inspector window)

### Setpoint, process value, output value and position feedback

You can only configure the setpoint, process value, output value and position feedback in the Inspector window of the programming editor. Select the source for each value:

- Instance DB  
The value saved in the instance DB is used.  
Value must be updated in the instance DB by the user program.  
There should be no value at the instruction.  
Change via HMI possible.
- Instruction  
The value connected to the instruction is used.  
The value is written to the instance DB each time the instruction is called.  
No change via HMI possible.

### Controller type

#### Physical quantity

Select the physical quantity and unit of measurement for setpoint, process value, and disturbance variable in the "Controller type" group. Setpoint, process value, and disturbance variable is displayed in this unit of measurement.

### Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic.

PID\_3Step does not work with negative proportional gain. Select the check box "Invert control logic" to reduce the process value with a higher output value.

Examples

- Opening the drain valve will reduce the level of a container's contents.
- Increasing cooling will reduce the temperature.

### Startup characteristics

1. To switch to "Inactive" mode after CPU restart, clear the "Activate Mode after CPU restart" check box.  
To switch to the operating mode saved in the Mode parameter after CPU restart, select the "Activate Mode after CPU restart" check box.
2. In the "Set Mode to" drop-down list, select the mode that is to be enabled after a complete download to the device.  
After a complete download to the device, PID\_3Step starts in the selected operating mode.  
With each additional restart, PID\_3Step starts in the mode that was last saved in Mode.

Example

You have selected the "Activate Mode after CPU restart" check box and the entry "Pretuning" in the "Set Mode to" list. After a complete download to the device, PID\_3Step starts in the "Pretuning" mode. If pretuning is still active, PID\_3Step starts in "Pretuning" mode again after

restart of the CPU. If pretuning was successfully completed and automatic mode is active, PID\_3Step starts in "Automatic mode" after restart of the CPU.

## Setpoint

### Procedure

Proceed as follows to define a fixed setpoint:

1. Select "Instance DB".
2. Enter a setpoint, e.g. 80° C.
3. Delete any entry in the instruction.

Proceed as follows to define a variable setpoint:

1. Select "Instruction".
2. Enter the name of the REAL variable in which the setpoint is saved.  
Program-controlled assignment of various values to the REAL variable is possible, for example for the time controlled change of the setpoint.

## Process value

PID\_3Step will scale the value of the analog input to the physical quantity if you use the analog input value directly.

You will need to write a program for processing if you wish first to process the analog input value. The process value is, for example, not directly proportional to the value at the analog input. The processed process value must be in floating point format.

### Procedure

Proceed as follows to use the analog input value without processing:

1. Select the entry "Input\_PER" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the address of the analog input.

Proceed as follows to use the processed process value in floating point format:

1. Select the entry "Input" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the name of the variable in which the processed process value is saved.

## Position feedback

Position feedback configuration depends upon the actuator used.

- Actuator without position feedback
- Actuator with digital endstop signals

- Actuator with analog position feedback
- Actuator with analog position feedback and endstop signals

### Actuator without position feedback

Proceed as follows to configure PID\_3Step for an actuator without position feedback:

1. Select the entry "No Feedback" in the drop-down list "Feedback".

### Actuator with digital endstop signals

Proceed as follows to configure PID\_3Step for an actuator with endstop signals:

1. Select the entry "No Feedback" in the drop-down list "Feedback".
2. Activate the "Actuator endstop signals" check box.
3. Select "Instruction" as source for Actuator\_H and Actuator\_L.
4. Enter the addresses of the digital inputs for Actuator\_H and Actuator\_L.

### Actuator with analog position feedback

Proceed as follows to configure PID\_3Step for an actuator with analog position feedback:

1. Select the entry "Feedback" or "Feedback\_PER" in the drop-down list "Feedback".
  - Use the analog input value for Feedback\_PER. Configure Feedback\_PER scaling in the actuator settings.
  - Process the analog input value for Feedback using your user program.
2. Select "Instruction" as source.
3. Enter the address of the analog input or the variable of your user program.

### Actuator with analog position feedback and endstop signals

Proceed as follows to configure PID\_3Step for an actuator with analog position feedback and endstop signals:

1. Select the entry "Feedback" or "Feedback\_PER" in the drop-down list "Feedback".
2. Select "Instruction" as source.
3. Enter the address of the analog input or the variable of your user program.
4. Activate the "Actuator endstop signals" check box.
5. Select "Instruction" as source for Actuator\_H and Actuator\_L.
6. Enter the addresses of the digital inputs for Actuator\_H and Actuator\_L.

## Output value

PID\_3Step offers an analog output value (Output\_PER) and digital output values (Output\_UP, Output\_DN). Your actuator will determine which output value you use.

- Output\_PER  
The actuator is triggered via an analog output and controlled with a continuous signal, e.g. 0...10V, 4...20mA.
- Output\_UP, Output\_DN  
The actuator is controlled via two digital outputs.

## Procedure

Proceed as follows to use the analog output value:

1. Select the entry "Output (analog)" in the drop-down list "Output".
2. Select "Instruction".
3. Enter the address of the analog output.

Proceed as follows to use the digital output value:

1. Select the entry "Output (digital)" in the drop-down list "Output".
2. Select "Instruction" for Output\_UP and Output\_DN.
3. Enter the addresses of the digital outputs.

Proceed as follows to process the output value using the user program:

1. Select the entry corresponding to the actuator in the drop-down list "Output".
2. Select "Instruction".
3. Enter the name of the variable you are using to process the output value.
4. Transfer the processed output value to the actuator by means of an analog or digital CPU output.

## Process value settings

### Scaling the process value

If you have configured the use of Input\_PER in the basic setting, you must convert the value of the analog input to the physical quantity of the process value. The current configuration is displayed in the Input\_PER display.

Input\_PER will be scaled using a low and high value pair if the process value is directly proportional to the value of the analog input.

## Procedure

To scale the process value, follow these steps:

1. Enter the low pair of values in the "Scaled low process value" and "Low" text boxes.
2. Enter the high pair of values in the "Scaled high process value" and "High" input boxes.

## 11.1 PID control

Default settings for the value pairs are stored in the hardware configuration. To use the value pairs from the hardware configuration, follow these steps:

1. Select the PID\_3Step instruction in the programming editor.
2. Interconnect Input\_PER with an analog input in the basic settings.
3. Click the "Automatic setting" button in the process value settings.

The existing values will be overwritten with the values from the hardware configuration.

### Process value limits

You must specify an appropriate absolute high limit and low limit for the process value as limit values for your controlled system. As soon as the process value violates these limits, an error occurs (ErrorBits = 0001h). Tuning is canceled when the process value limits are violated. You can specify how PID\_3Step responds to errors in automatic mode in the actuator settings.

### Actuator settings

#### Actuator

#### Actuator-specific times

Configure the motor transition time and the minimum ON and OFF times to prevent damage to the actuator. You can find the specifications in the actuator data sheet.

The motor transition time is the time in seconds the motor requires to move the actuator from the closed to the opened state. You can measure the motor transition time during commissioning.

The motor transition time is retentive. If you enter the motor transition time manually, you must completely download PID\_3Step.

Downloading technology objects to device (Page 6323)

If you are using "Output\_UP" or "Output\_DN", you can reduce the switching frequency with the minimum on and minimum OFF time.

The on or off times calculated are totaled in automatic mode and only become effective when the sum is greater than or equal to the minimum on or OFF time.

Manual\_UP = TRUE or Manual\_DN = TRUE in manual mode operates the actuator for at least the minimum ON or OFF time.

#### Reaction to error

PID\_3Step is preset so that the controller stays active in most cases in the event of an error. If errors occur frequently in controller mode, this default reaction has a negative effect on the

control response. In this case, check the Errorbits parameter and eliminate the cause of the error.

**NOTICE****Your system may be damaged.**

If you output "Current value while error pending" or "Substitute output value while error pending" in the event of an error, PID\_3Step remains in automatic mode even if the process value limits are violated. This may damage your system.

It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.

PID\_3Step generates a programmable output value in response to an error:

- Current value  
PID\_3Step is switched off and no longer modifies the actuator position.
- Current value for error while error is pending  
The controller functions of PID\_3Step are switched off and the position of the actuator is no longer changed.  
If the following errors occur in automatic mode, PID\_3Step returns to automatic mode as soon as the errors are no longer pending.
  - 0002h: Invalid value at Input\_PER parameter.
  - 0200h: Invalid value at Input parameter.
  - 0400h: Calculation of output value failed.
  - 1000h: Invalid value at Setpoint parameter.
  - 2000h: Invalid value at Feedback\_PER parameter.
  - 4000h: Invalid value at Feedback parameter.
  - 8000h: Error during digital position feedback.
  - 20000h: Invalid value at SavePosition tag.

If one or more of the following errors occur, PID\_3Step stays in automatic mode:

- 0001h: The Input parameter is outside the process value limits.
- 0800h: Sampling time error
- 40000h: Invalid value at Disturbance parameter.

PID\_3Step remains in manual mode if an error occurs in manual mode.

If an error occurs during tuning or transition time measurement, PID\_3Step switches to the mode in which tuning or transition time measurement was started. Only in the event of the following error is tuning not aborted:

- 0020h: Pretuning is not permitted during fine tuning.

- Substitute output value  
PID\_3Step moves the actuator to the substitute output value and then switches off.
- Substitute output value while error is pending  
PID\_3Step moves the actuator to the substitute output value. When the substitute output value is reached, PID\_3Step reacts as it does with "Current value for while error is pending".

Enter the substitute output value in "%".

Only substitute output values 0% and 100% can be approached precisely in the case of actuators without analog position feedback. A substitute output value not equal to 0% or 100% is approached via an internally simulated position feedback. This procedure does not, however, allow the exact approach of substitute output value.

All substitute output values can be approached precisely with actuators with analog position feedback.

### Scaling position feedback

#### Scaling position feedback

If you have configured the use of Feedback\_PER in the basic settings, you will need to convert the value of the analog input into %. The current configuration will be displayed in the "Feedback" display.

Feedback\_PER is scaled using a low and high value pair.

1. Enter the low pair of values in the "Low endstop" and "Low" input boxes.
2. Enter the high pair of values in the "High endstop" and "High" input boxes.

"Low endstop" must be less than "High endstop"; "Low" must be less than "High".

The valid values for "High endstop" and "Low endstop" depend upon:

- No Feedback, Feedback, Feedback\_PER
- Output (analog), Output (digital)

Output	Feedback	Low endstop	High endstop
Output (digital)	No Feedback	Cannot be set (0.0%)	Cannot be set (100.0%)
Output (digital)	Feedback	-100.0% or 0.0%	0.0% or +100.0%
Output (digital)	Feedback_PER	-100.0% or 0.0%	0.0% or +100.0%
Output (analog)	No Feedback	Cannot be set (0.0%)	Cannot be set (100.0%)
Output (analog)	Feedback	-100.0% or 0.0%	0.0% or +100.0%
Output (analog)	Feedback_PER	-100.0% or 0.0%	0.0% or +100.0%

### Output value limits

#### Limiting the output value

You can exceed or undershoot the output value limits during the transition time measurement and with mode = 10. The output value is limited to these values in all other modes.

Enter the absolute output value limits in the "Output value high limit" and "Output value low limit" input boxes. The output value limits must be within "Low endstop" and "High endstop".

If no Feedback is available and Output (digital) is set, you cannot limit the output value. Output\_UP and Output\_DN are then reset upon Actuator\_H = TRUE or Actuator\_L = TRUE. If no endstop signals are available, Output\_UP and Output\_DN are reset after a travel time of 150% of the motor actuating time.

## Advanced settings

### Monitoring process value

Configure a warning high and low limit for the process value in the "Process value monitoring" configuration window. If one of the warning limits is exceeded or undershot during operation, a warning will be displayed at the PID\_3Step instruction:

- At the InputWarning\_H output parameter if the warning high limit has been exceeded
- At the InputWarning\_L output parameter if the warning low limit has been undershot

The warning limits must be within the process value high and low limits.

The process value high and low limits will be used if you do not enter values.

### Example

Process value high limit = 98° C; warning high limit = 90° C

Warning low limit = 10° C; process value low limit = 0° C

PID\_3Step will respond as follows:

Process value	InputWarning_H	InputWarning_L	ErrorBits	Operating mode
> 98° C	TRUE	FALSE	0001h	As configured
≤ 98° C and > 90° C	TRUE	FALSE	0000h	Automatic mode
≤ 90° C and ≥ 10° C	FALSE	FALSE	0000h	Automatic mode
< 10° C and ≥ 0° C	FALSE	TRUE	0000h	Automatic mode
< 0° C	FALSE	TRUE	0001h	As configured

In the actuator settings, you can configure the response of PID\_3Step when the process value high limit or low limit is violated.

### PID parameters

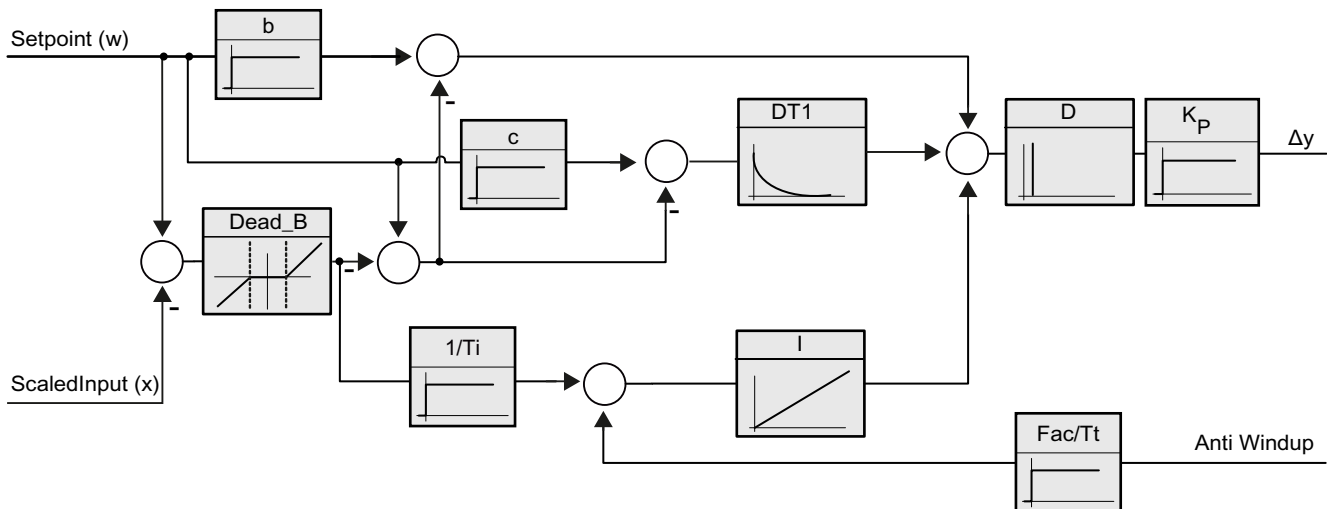

The PID parameters are displayed in the "PID Parameters" configuration window. The PID parameters will be adapted to your controlled system during controller tuning. You do not need to enter the PID parameters manually.

The PID algorithm operates according to the following equation:

$$\Delta y = K_p \cdot s \cdot \left[ (b \cdot w - x) + \frac{1}{T_i \cdot s} (w - x) + \frac{T_d \cdot s}{a \cdot T_d \cdot s + 1} (c \cdot w - x) \right]$$

Symbol	Description
$\Delta y$	Output value of the PID algorithm
$K_p$	Proportional gain
$s$	Laplace operator
$b$	Proportional action weighting
$w$	Setpoint
$x$	Process value
$T_i$	Integral action time
$a$	Derivative delay coefficient (derivative delay $T_1 = a \times T_D$ )
$T_D$	Derivative action time
$c$	Derivative action weighting

The diagram below illustrates the integration of the parameters into the PID algorithm:

All PID parameters are retentive. If you enter the PID parameters manually, you must completely download PID\_3Step.

Downloading technology objects to device (Page 6323)

### Proportional gain

The value specifies the proportional gain of the controller. PID\_3Step does not work with a negative proportional gain. Control logic is inverted under Basic settings > Controller type.

### Integral action time

The integral action time determines the time behavior of the integral action. The integral action is deactivated with integral action time = 0.0.

### Derivative action time

The derivative action time determines the time behavior of the derivative action. Derivative action is deactivated with derivative action time = 0.0.

### Derivative delay coefficient

The derivative delay coefficient delays the effect of the derivative action.

Derivative delay = derivative action time × derivative delay coefficient

- 0.0: Derivative action is effective for one cycle only and therefore almost not effective.
- 0.5: This value has proved useful in practice for controlled systems with **one** dominant time constant.
- > 1.0: The greater the coefficient, the longer the effect of the derivative action is delayed.

### Proportional action weighting

The proportional action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Proportional action for setpoint change is fully effective
- 0.0: Proportional action for setpoint change is not effective

The proportional action is always fully effective when the process value is changed.

### Derivative action weighting

The derivative action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Derivative action is fully effective upon setpoint change
- 0.0: Derivative action is not effective upon setpoint change

The derivative action is always fully effective when the process value is changed.

### PID algorithm sampling time

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the PID\_3Step sampling time. All other functions of PID\_3Step are executed at every call.

## Deadband width

The deadband suppresses the noise component in the steady controller state. The deadband width specifies the size of the deadband. The deadband is off if the deadband width is 0.0.

## Commissioning PID\_3Step V2

### Pretuning

The pretuning determines the process response to a pulse of the output value and searches for the point of inflection. The tuned PID parameters are calculated as a function of the maximum slope and dead time of the controlled system. You obtain the best PID parameters when you perform pretuning and fine tuning.

The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise. This is most likely the case in operating modes "Inactive" and "manual mode". The PID parameters are backed up before being recalculated.

The setpoint is frozen during pretuning.

### Requirement

- The PID\_3Step instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- Reset = FALSE
- The motor transition time has been configured or measured.
- PID\_3Step is in one of the following modes: "Inactive", "Manual mode", or "Automatic mode".
- The setpoint and the process value lie within the configured limits (see "Process value settings" configuration).

## Procedure

To perform pretuning, follow these steps:

1. Double-click the "PID\_3Step > Commissioning" entry in the project tree.
2. Select the entry "Pretuning" in the "Tuning mode" drop-down list in the working area "Tuning".
3. Click the "Start" icon.
  - An online connection will be established.
  - Value recording is started.
  - Pretuning is started.
  - The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

---

### Note

Click the "Stop" icon when the progress bar has reached 100% and it is to be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

---

## Result

If pretuning was performed without an error message, the PID parameters have been tuned. PID\_3Step switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If pretuning is not possible, PID\_3Step responds with the configured reaction to errors.

## Fine tuning

Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are tuned for the operating point from the amplitude and frequency of this oscillation. All PID parameters are recalculated from the results. PID parameters from fine tuning usually have better master control and disturbance characteristics than PID parameters from pretuning. You obtain the best PID parameters when you perform pretuning and fine tuning.

PID\_3Step automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. The PID parameters are backed up before being recalculated.

The setpoint is frozen during fine tuning.

## Requirement

- The PID\_3Step instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- Reset = FALSE
- The motor transition time has been configured or measured.

### 11.1 PID control

- The setpoint and the process value lie within the configured limits (see "Process value settings" configuration).
- The control loop has stabilized at the operating point. The operating point is reached when the process value corresponds to the setpoint.
- No disturbances are expected.
- PID\_3Step is in inactive mode, automatic mode or manual mode.

#### Process depends on initial situation

Fine tuning proceeds as follows when started from:

- Automatic mode  
Start fine tuning from automatic mode if you wish to improve the existing PID parameters through tuning.  
PID\_3Step controls the system using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.
- Inactive or manual mode  
Pretuning is always started first. The determined PID parameters will be used for control until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.

#### Procedure

To perform fine tuning, follow these steps:

1. Select the entry "Fine tuning" in the "Tuning mode" drop-down list.
2. Click the "Start" icon.
  - An online connection will be established.
  - Value recording is started.
  - The process of fine tuning is started.
  - The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

---

#### Note

Click the "Stop" icon in the "Tuning mode" group when the progress bar has reached 100% and it is to be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

---

#### Result

If no errors occurred during fine tuning, the PID parameters have been tuned. PID\_3Step switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If errors occurred during fine tuning, PID\_3Step responds with the configured response to errors.

## Commissioning with manual PID parameters

### Requirement

- The PID\_3Step instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- Reset = FALSE
- The motor transition time has been configured or measured.
- PID\_3Step is in "inactive" mode.
- The setpoint and the process value lie within the configured limits (see "Process value settings" configuration).

### Procedure

Proceed as follows to commission PID\_3Step with manual PID parameters:

1. Double-click on "PID\_3Step > Configuration" in the project tree.
2. Click on "Advanced settings > PID Parameters" in the configuration window.
3. Select the check box "Enable direct input".
4. Enter the PID parameters.
5. Double-click the "PID\_3Step > Commissioning" entry in the project tree.
6. Establish an online connection to the CPU.
7. Load the PID parameters to the CPU.
8. Click the "Start PID\_3Step" icon.

### Result

PID\_3Step changes to automatic mode and controls using the current PID parameters.

### See also

PID parameters (Page 6385)

## Measuring the motor transition time

### Introduction

PID\_3Step requires the motor transition time to be as accurate as possible for good controller results. The data in the actuator documentation contains average values for this type of actuator. The value for the specific actuator used may differ.

You can measure the motor transition time during commissioning if you are using actuators with position feedback or endstop signals. The output value limits are not taken into consideration during the motor transition time measurement. The actuator can travel to the high or the low endstop.

The motor transition time cannot be measured if neither position feedback nor endstop signals are available.

### Actuators with analog position feedback

Proceed as follows to measure motor transition time with position feedback:

#### Requirement

- Feedback or Feedback\_PER has been selected in the basic settings and the signal has been connected.
  - An online connection to the CPU has been established.
1. Select the "Use position feedback" check box.
  2. Enter the position to which the actuator is to be moved in the "Target position" input field. The current position feedback (starting position) will be displayed. The difference between "Target position" and "Position feedback" must be at least 50% of the valid output value range.
  3. Click the "Start" icon.

### Result

The actuator is moved from the starting position to the target position. Time measurement starts immediately and ends when the actuator reaches the target position. The motor transition time is calculated according to the following equation:

Motor transition time = (output value high limit – output value low limit) × Measuring time / AMOUNT (target position – starting position).

The progress and status of transition time measurement are displayed. The transition time measured is saved in the instance data block on the CPU and displayed in the "Measured transition time" field. When the transition time measurement is ended and ActivateRecoverMode = TRUE, PID\_3Step switches to the operating mode from which the

transition time measurement was started. If the transition time measurement is ended and ActivateRecoverMode = FALSE, PID\_3Step changes to "Inactive" mode.

---

**Note**

Click on the icon  "Upload measured transition time" to load the motor transition time measured to the project.

---

## Actuators with endstop signals

Proceed as follows to measure the transition time of actuators with endstop signals:

**Requirement**

- The "Endstop signals" check box in the basic settings has been selected and Actuator\_H and Actuator\_L are connected.
- An online connection to the CPU has been established.

Proceed as follows to measure motor transition time with endstop signals:

1. Select the "Use actuator endstop signals" check box.
2. Select the direction in which the actuator is to be moved.
  - Open - Close - Open  
The actuator is moved first to the high endstop, then to the low endstop and then back to the high endstop.
  - Close - Open - Close  
The actuator is moved first to the low endstop, then to the high endstop and then back to the low endstop.
3. Click the "Start" icon.

## Result

The actuator is moved in the selected direction. Time measurement will start once the actuator has reached the first endstop and will end when the actuator reaches this endstop for the second time. The motor transition time is equal to the time measured divided by two.

The progress and status of transition time measurement are displayed. The transition time measured is saved in the instance data block on the CPU and displayed in the "Measured transition time" field. When the transition time measurement is ended and ActivateRecoverMode = TRUE, PID\_3Step switches to the operating mode from which the transition time measurement was started. If the transition time measurement is ended and ActivateRecoverMode = FALSE, PID\_3Step changes to "Inactive" mode.

## Cancelling transition time measurement

PID\_3Step switches to "Inactive" mode if you cancel transition time measurement by pressing the Stop button.

### 11.1.4.3 PID\_3Step V1

## Configuring PID\_3Step V1

### Basic settings

#### Introduction

Configure the following properties of the "PID\_3Step" technology object under "Basic settings" in the Inspector window or in the configuration window:

- Physical quantity
- Control logic
- Start-up behavior after reset
- Setpoint (only in the Inspector window)
- Process value (only in the Inspector window)
- Output value (only in the Inspector window)
- Position feedback (only in the Inspector window)

#### Setpoint, process value, output value and position feedback

You can only configure the setpoint, process value, output value and position feedback in the Inspector window of the programming editor. Select the source for each value:

- Instance DB  
The value saved in the instance DB is used.  
Value must be updated in the instance DB by the user program.  
There should be no value at the instruction.  
Change via HMI possible.
- Instruction  
The value connected to the instruction is used.  
The value is written to the instance DB each time the instruction is called.  
No change via HMI possible.

#### Controller type

#### Physical quantity

Select the unit of measurement and physical quantity for the setpoint and process value in the "Controller type" group. The setpoint and process value will be displayed in this unit.

#### Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic.

PID\_3Step does not work with negative proportional gain. Select the check box "Invert control logic" to reduce the process value with a higher output value.

Examples

- Opening the drain valve will reduce the level of a container's contents.
- Increasing cooling will reduce the temperature.

### Start-up behavior after reset

To change straight to the last active mode after restarting the CPU, select the "Enable last mode after CPU restart" check box.

PID\_3Step will remain in "Inactive" mode if the check box is cleared.

### Setpoint

#### Procedure

Proceed as follows to define a fixed setpoint:

1. Select "Instance DB".
2. Enter a setpoint, e.g. 80° C.
3. Delete any entry in the instruction.

Proceed as follows to define a variable setpoint:

1. Select "Instruction".
2. Enter the name of the REAL variable in which the setpoint is saved.  
Program-controlled assignment of various values to the REAL variable is possible, for example for the time controlled change of the setpoint.

### Process value

PID\_3Step will scale the value of the analog input to the physical quantity if you use the analog input value directly.

You will need to write a program for processing if you wish first to process the analog input value. The process value is, for example, not directly proportional to the value at the analog input. The processed process value must be in floating point format.

#### Procedure

Proceed as follows to use the analog input value without processing:

1. Select the entry "Input\_PER" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the address of the analog input.

Proceed as follows to use the processed process value in floating point format:

1. Select the entry "Input" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the name of the variable in which the processed process value is saved.

### Position feedback

Position feedback configuration depends upon the actuator used.

- Actuator without position feedback
- Actuator with digital endstop signals
- Actuator with analog position feedback
- Actuator with analog position feedback and endstop signals

### Actuator without position feedback

Proceed as follows to configure PID\_3Step for an actuator without position feedback:

1. Select the entry "No Feedback" in the drop-down list "Feedback".

### Actuator with digital endstop signals

Proceed as follows to configure PID\_3Step for an actuator with endstop signals:

1. Select the entry "No Feedback" in the drop-down list "Feedback".
2. Activate the "Actuator endstop signals" check box.
3. Select "Instruction" as source for Actuator\_H and Actuator\_L.
4. Enter the addresses of the digital inputs for Actuator\_H and Actuator\_L.

### Actuator with analog position feedback

Proceed as follows to configure PID\_3Step for an actuator with analog position feedback:

1. Select the entry "Feedback" or "Feedback\_PER" in the drop-down list "Feedback".
  - Use the analog input value for Feedback\_PER. Configure Feedback\_PER scaling in the actuator settings.
  - Process the analog input value for Feedback using your user program.
2. Select "Instruction" as source.
3. Enter the address of the analog input or the variable of your user program.

### Actuator with analog position feedback and endstop signals

Proceed as follows to configure PID\_3Step for an actuator with analog position feedback and endstop signals:

1. Select the entry "Feedback" or "Feedback\_PER" in the drop-down list "Feedback".
2. Select "Instruction" as source.

3. Enter the address of the analog input or the variable of your user program.
4. Activate the "Actuator endstop signals" check box.
5. Select "Instruction" as source for Actuator\_H and Actuator\_L.
6. Enter the addresses of the digital inputs for Actuator\_H and Actuator\_L.

## Output value

PID\_3Step offers an analog output value (Output\_PER) and digital output values (Output\_UP, Output\_DN). Your actuator will determine which output value you use.

- Output\_PER  
The actuator is triggered via an analog output and controlled with a continuous signal, e.g. 0...10V, 4...20mA.
- Output\_UP, Output\_DN  
The actuator is controlled via two digital outputs.

## Procedure

Proceed as follows to use the analog output value:

1. Select the entry "Output (analog)" in the drop-down list "Output".
2. Select "Instruction".
3. Enter the address of the analog output.

Proceed as follows to use the digital output value:

1. Select the entry "Output (digital)" in the drop-down list "Output".
2. Select "Instruction" for Output\_UP and Output\_DN.
3. Enter the addresses of the digital outputs.

Proceed as follows to process the output value using the user program:

1. Select the entry corresponding to the actuator in the drop-down list "Output".
2. Select "Instruction".
3. Enter the name of the variable you are using to process the output value.
4. Transfer the processed output value to the actuator by means of an analog or digital CPU output.

## Process value settings

Configure the scaling of your process value and specify the process value absolute limits in the "Process value settings" configuration window.

## Scaling the process value

If you have configured the use of Input\_PER in the basic settings, you will need to convert the value of the analog input into the physical quantity of the process value. The current configuration will be displayed in the Input\_PER display.

Input\_PER will be scaled using a low and high value pair if the process value is directly proportional to the value of the analog input.

1. Enter the low pair of values in the "Scaled low process value" and "Low" input fields.
2. Enter the high pair of values in the "Scaled high process value" and "High" input boxes.

Default settings for the value pairs are saved in the hardware configuration. Proceed as follows to use the value pairs from the hardware configuration:

1. Select the instruction PID\_3Step in the programming editor.
2. Connect Input\_PER to an analog input in the basic settings.
3. Click on the "Automatic setting" button in the process value settings.  
The existing values will be overwritten with the values from the hardware configuration.

### Monitoring process value

Specify the absolute high and low limit of the process value. You must enter reasonable limits for your controlled system. Reasonable limits are important during optimization to obtain optimal PID parameters. The default for the "High limit process value" is 120 %. At the I/O input, the process value can be a maximum of 18% higher than the standard range (overrange). This setting ensures that an error is no longer signaled due to a violation of the "Process value high limit". Only a wire-break and a short-circuit are recognized and PID\_3Step reacts according to the configured reaction to error.

#### NOTICE

##### Your system may be damaged.

If you set very high process value limits (for example  $-3.4 \cdot 10^{38} \dots +3.4 \cdot 10^{38}$ ), process value monitoring will be disabled. Your system may then be damaged if an error occurs. You need to configure useful process value limits for your controlled system.

### Actuator settings

#### Actuator-specific times

Configure the motor transition time and the minimum ON and OFF times to prevent damage to the actuator. You can find the specifications in the actuator data sheet.

The motor transition time is the time in seconds the motor requires to move the actuator from the closed to the opened state. The maximum time that the actuator is moved in one direction is 110% of the motor transition time. You can measure the motor transition time during commissioning.

If you are using "Output\_UP" or "Output\_DN", you can reduce the switching frequency with the minimum on and minimum OFF time.

The on or off times calculated are totaled in automatic mode and only become effective when the sum is greater than or equal to the minimum on or OFF time.

A rising edge at Manual\_UP or Manual\_DN in manual mode will operate the actuator for at least the minimum on or OFF time.

## Reaction to error

PID\_3Step is preset so that the controller stays active in most cases in the event of an error. If errors occur frequently in controller mode, this default reaction has a negative effect on the control response. In this case, check the Errorbits parameter and eliminate the cause of the error.

PID\_3Step generates a programmable output value in response to an error:

- Current value  
PID\_3Step is switched off and no longer modifies the actuator position.
- Current value for error while error is pending  
The controller functions of PID\_3Step are switched off and the position of the actuator is no longer changed.  
If the following errors occur in automatic mode, PID\_3Step returns to automatic mode as soon as the errors are no longer pending.
  - 0002h: Invalid value at Input\_PER parameter.
  - 0200h: Invalid value at Input parameter.
  - 0800h: Sampling time error
  - 1000h: Invalid value at Setpoint parameter.
  - 2000h: Invalid value at Feedback\_PER parameter.
  - 4000h: Invalid value at Feedback parameter.
  - 8000h: Error during digital position feedback.

If one of these error occurs in manual mode, PID\_3Step remains in manual mode.

If an error occurs during the tuning or transition time measurement, PID\_3Step is switched off.

- Substitute output value  
PID\_3Step moves the actuator to the substitute output value and then switches off.
- Substitute output value while error is pending  
PID\_3Step moves the actuator to the substitute output value. When the substitute output value is reached, PID\_3Step reacts as it does with "Current value for while error is pending".

Enter the substitute output value in "%".

Only substitute output values 0% and 100% can be approached precisely in the case of actuators without analog position feedback. The actuator is moved in one direction at 110% of the motor transition time to ensure the high or low endstop is reached. There endstop signals take priority. A substitute output value not equal to 0% or 100% is approached via an internally simulated position feedback. This procedure does not, however, allow the exact approach of substitute output value.

All substitute output values can be approached precisely with actuators with analog position feedback.

## Scaling position feedback

If you have configured the use of Feedback\_PER in the basic settings, you will need to convert the value of the analog input into %. The current configuration will be displayed in the "Feedback" display.

Feedback\_PER is scaled using a low and high value pair.

1. Enter the low pair of values in the "Low endstop" and "Low" input boxes.
2. Enter the high pair of values in the "High endstop" and "High" input boxes.

"Low endstop" must be less than "High endstop"; "Low" must be less than "High".

The valid values for "High endstop" and "Low endstop" depend upon:

- No Feedback, Feedback, Feedback\_PER
- Output (analog), Output (digital)

Output	Feedback	Low endstop	High endstop
Output (digital)	No Feedback	Cannot be set (0.0%)	Cannot be set (100.0%)
Output (digital)	Feedback	-100.0% or 0.0%	0.0% or +100.0%
Output (digital)	Feedback_PER	-100.0% or 0.0%	0.0% or +100.0%
Output (analog)	No Feedback	Cannot be set (0.0%)	Cannot be set (100.0%)
Output (analog)	Feedback	-100.0% or 0.0%	0.0% or +100.0%
Output (analog)	Feedback_PER	-100.0% or 0.0%	0.0% or +100.0%

### Limiting the output value

You can only exceed or undershoot the output value limits during the transition time measurement. The output value is limited to these values in all other modes.

Enter the absolute output value limits in the "Output value high limit" and "Output value low limit" input boxes. The output value limits must be within "Low endstop" and "High endstop".

If no Feedback is available and Output (digital) is set, you cannot limit the output value. The digital outputs are reset with Actuator\_H = TRUE or Actuator\_L = TRUE, or after a travel time amounting to 110% of the motor transition time.

### Advanced settings

#### Monitoring process value

Configure a warning high and low limit for the process value in the "Process value monitoring" configuration window. If one of the warning limits is exceeded or undershot during operation, a warning will be displayed at the PID\_3Step instruction:

- At the InputWarning\_H output parameter if the warning high limit has been exceeded
- At the InputWarning\_L output parameter if the warning low limit has been undershot

The warning limits must be within the process value high and low limits.

The process value high and low limits will be used if you do not enter values.

### Example

Process value high limit = 98° C; warning high limit = 90° C

Warning low limit = 10° C; process value low limit = 0° C

PID\_3Step will respond as follows:

Process value	InputWarning_H	InputWarning_L	Operating mode
> 98° C	TRUE	FALSE	Inactive
≤ 98° C and > 90° C	TRUE	FALSE	Automatic mode
≤ 90° C and ≥ 10° C	FALSE	FALSE	Automatic mode
< 10° C and ≥ 0° C	FALSE	TRUE	Automatic mode
< 0° C	FALSE	TRUE	Inactive

## PID parameters

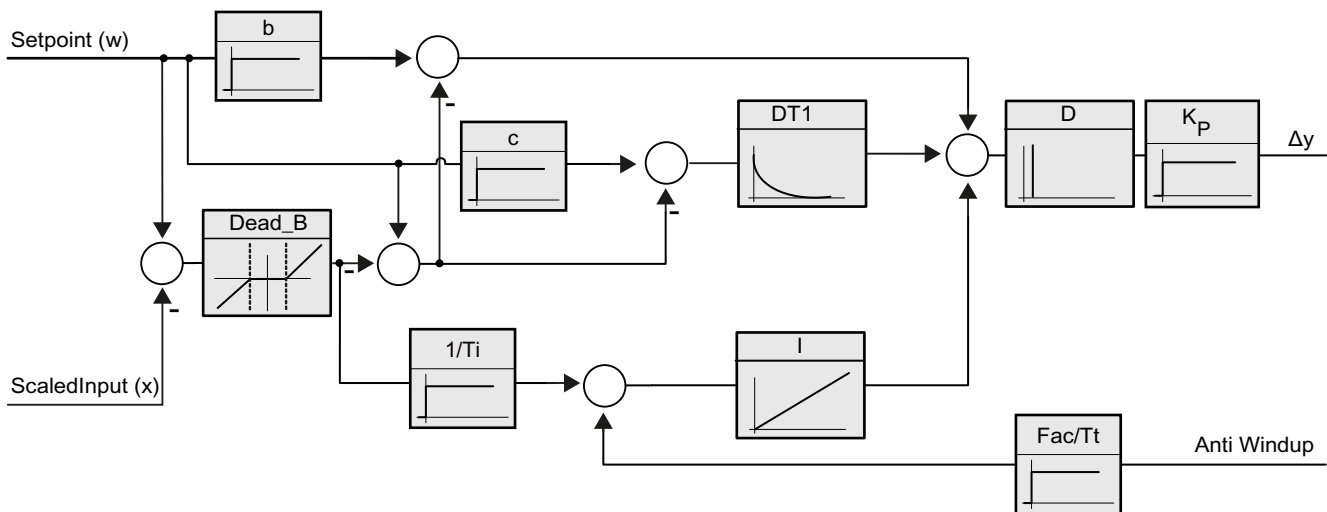

The PID parameters are displayed in the "PID Parameters" configuration window. The PID parameters will be adapted to your controlled system during controller tuning. You do not need to enter the PID parameters manually.

The PID algorithm operates according to the following equation:

$$\Delta y = K_p \cdot s \cdot \left[ (b \cdot w - x) + \frac{1}{T_i \cdot s} (w - x) + \frac{T_d \cdot s}{a \cdot T_d \cdot s + 1} (c \cdot w - x) \right]$$

Symbol	Description
$\Delta y$	Output value of the PID algorithm
$K_p$	Proportional gain
$s$	Laplace operator
$b$	Proportional action weighting
$w$	Setpoint
$x$	Process value
$T_i$	Integral action time
$a$	Derivative delay coefficient (derivative delay $T_1 = a \times T_D$ )
$T_D$	Derivative action time
$c$	Derivative action weighting

The diagram below illustrates the integration of the parameters into the PID algorithm:

All PID parameters are retentive. If you enter the PID parameters manually, you must completely download PID\_3Step.

Auto-Hotspot

### Proportional gain

The value specifies the proportional gain of the controller. PID\_3Step does not work with a negative proportional gain. Control logic is inverted under Basic settings > Controller type.

### Integral action time

The integral action time determines the time behavior of the integral action. The integral action is deactivated with integral action time = 0.0.

### Derivative action time

The derivative action time determines the time behavior of the derivative action. Derivative action is deactivated with derivative action time = 0.0.

### Derivative delay coefficient

The derivative delay coefficient delays the effect of the derivative action.

Derivative delay = derivative action time × derivative delay coefficient

- 0.0: Derivative action is effective for one cycle only and therefore almost not effective.
- 0.5: This value has proved useful in practice for controlled systems with **one** dominant time constant.
- > 1.0: The greater the coefficient, the longer the effect of the derivative action is delayed.

### Proportional action weighting

The proportional action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Proportional action for setpoint change is fully effective
- 0.0: Proportional action for setpoint change is not effective

The proportional action is always fully effective when the process value is changed.

### Derivative action weighting

The derivative action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Derivative action is fully effective upon setpoint change
- 0.0: Derivative action is not effective upon setpoint change

The derivative action is always fully effective when the process value is changed.

### PID algorithm sampling time

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the PID\_3Step sampling time. All other functions of PID\_3Step are executed at every call.

### Deadband width

The deadband suppresses the noise component in the steady controller state. The deadband width specifies the size of the deadband. The deadband is off if the deadband width is 0.0.

Downloading technology objects to device (Page 6323)

### Commissioning PID\_3Step V1

#### Commissioning

You can monitor the setpoint, process value and output value over time in the "Tuning" working area. The following commissioning functions are supported in the curve plotter:

- Controller pretuning
- Controller fine tuning
- Monitoring the current closed-loop control in the trend view

All functions require an online connection to the CPU to have been established.

### Basic handling

- Select the desired sampling time in the "Sampling time" drop-down list. All values in the tuning working area are updated in the selected update time.
- Click the "Start" icon in the measuring group if you want to use the commissioning functions. Value recording is started. The current values for the setpoint, process value and output value are entered in the trend view. Operation of the commissioning window is enabled.
- Click the "Stop" icon if you want to end the commissioning functions. The values recorded in the trend view can continue to be analyzed.
- Closing the commissioning window will terminate recording in the trend view and delete the recorded values.

### Pretuning

The pretuning determines the process response to a pulse of the output value and searches for the point of inflection. The tuned PID parameters are calculated as a function of the maximum slope and dead time of the controlled system.

The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise. The PID parameters are backed up before being recalculated.

The setpoint is frozen during pretuning.

### Requirement

- The PID\_3Step instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- PID\_3Step is in "inactive" or "manual" mode.
- The setpoint and the process value lie within the configured limits (see "Process value settings" configuration).

## Procedure

To perform pretuning, follow these steps:

1. Double-click the "PID\_3Step > Commissioning" entry in the project tree.
2. Select the entry "Pretuning" in the "Tuning mode" drop-down list in the working area "Tuning".
3. Click the "Start" icon.
  - An online connection will be established.
  - Value recording is started.
  - Pretuning is started.
  - The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

---

### Note

Click the "Stop" icon when the progress bar has reached 100% and it is to be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

---

## Result

If pretuning was performed without an error message, the PID parameters have been tuned. PID\_3Step switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If pretuning is not possible, PID\_3Step changes to "Inactive" mode.

## Fine tuning

Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are optimized for the operating point from the amplitude and frequency of this oscillation. All PID parameters are recalculated on the basis of the findings. PID parameters from fine tuning usually have better master control and disturbance behavior than PID parameters from pretuning.

PID\_3Step automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. The PID parameters are backed up before being recalculated.

The setpoint is frozen during fine tuning.

## Requirement

- The PID\_3Step instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- The motor transition time has been configured or measured.
- The setpoint and the process value lie within the configured limits (see "Process value settings" configuration).

## 11.1 PID control

- The control loop has stabilized at the operating point. The operating point is reached when the process value corresponds to the setpoint.
- No disturbances are expected.
- PID\_3Step is in inactive mode, automatic mode or manual mode.

### Process depends on initial situation

Fine tuning proceeds as follows when started in:

- Automatic mode  
Start fine tuning in automatic mode if you wish to improve the existing PID parameters using controller tuning.  
PID\_3Step will regulate using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.
- Inactive or manual mode  
Pretuning is always started first. The PID parameters established will be used for adjustment until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.

### Procedure

Proceed as follows to carry out "fine tuning":

1. Select the entry "Fine tuning" in the "Tuning mode" drop-down list.
2. Click the "Start" icon.
  - An online connection will be established.
  - Value recording is started.
  - The process of fine tuning is started.
  - The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

---

#### Note

Click the "Stop" icon in the "Tuning mode" group when the progress bar has reached 100% and it is to be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

---

### Result

The PID parameters will have been optimized if fine tuning has been executed without errors. PID\_3Step changes to automatic mode and uses the optimized parameters. The optimized PID parameters will be retained during power OFF and a restart of the CPU.

If errors occurred during fine tuning, PID\_3Step will change to "inactive" mode.

## Commissioning with manual PID parameters

### Procedure

Proceed as follows to commission PID\_3Step with manual PID parameters:

1. Double-click on "PID\_3Step > Configuration" in the project tree.
2. Click on "Advanced settings > PID Parameters" in the configuration window.
3. Select the check box "Enable direct input".
4. Enter the PID parameters.
5. Double-click on "PID\_3Step > Commissioning" in the project tree.
6. Establish an online connection to the CPU.
7. Load the PID parameters to the CPU.
8. Click on the "Activate controller" icon.

### Result

PID\_3Step changes to automatic mode and controls using the current PID parameters.

## Measuring the motor transition time

### Introduction

PID\_3Step requires the motor transition time to be as accurate as possible for good controller results. The data in the actuator documentation contains average values for this type of actuator. The value for the specific actuator used may differ.

You can measure the motor transition time during commissioning if you are using actuators with position feedback or endstop signals. The output value limits are not taken into consideration during the motor transition time measurement. The actuator can travel to the high or the low endstop.

The motor transition time cannot be measured if neither position feedback nor endstop signals are available.

### Actuators with analog position feedback

Proceed as follows to measure motor transition time with position feedback:

#### Requirement

- Feedback or Feedback\_PER has been selected in the basic settings and the signal has been connected.
- An online connection to the CPU has been established.

1. Select the "Use position feedback" check box.
2. Enter the position to which the actuator is to be moved in the "Target position" input field. The current position feedback (starting position) will be displayed. The difference between "Target position" and "Position feedback" must be at least 50% of the valid output value range.
3. Click the  "Start transition time measurement" icon.

## Result

The actuator is moved from the starting position to the target position. Time measurement starts immediately and ends when the actuator reaches the target position. The motor transition time is calculated according to the following equation:

Motor transition time = (output value high limit – output value low limit) × Measuring time / AMOUNT (target position – starting position).

The progress and status of transition time measurement are displayed. The transition time measured is saved in the instance data block on the CPU and displayed in the "Measured transition time" field. PID\_3Step will change to "Inactive" mode once transition time measurement is complete.

---

### Note

Click on the icon  "Upload measured transition time" to load the motor transition time measured to the project.

---

## Actuators with endstop signals

Proceed as follows to measure the transition time of actuators with endstop signals:

### Requirement

- The "Endstop signals" check box in the basic settings has been selected and Actuator\_H and Actuator\_L are connected.
- An online connection to the CPU has been established.

Proceed as follows to measure motor transition time with endstop signals:

1. Select the "Use actuator endstop signals" check box.
2. Select the direction in which the actuator is to be moved.
  - Open - Close - Open  
The actuator is moved first to the high endstop, then to the low endstop and then back to the high endstop.
  - Close - Open - Close  
The actuator is moved first to the low endstop, then to the high endstop and then back to the low endstop.
3. Click the  "Start transition time measurement" icon.

## Result

The actuator is moved in the selected direction. Time measurement will start once the actuator has reached the first endstop and will end when the actuator reaches this endstop for the second time. The motor transition time is equal to the time measured divided by two.

The progress and status of transition time measurement are displayed. The transition time measured is saved in the instance data block on the CPU and displayed in the "Measured transition time" field. PID\_3Step will change to "Inactive" mode once transition time measurement is complete.

## Cancelling transition time measurement

PID\_3Step will change to "Inactive" mode immediately if you cancel transition time measurement. The actuator will stop being moved. You can reactive PID-3Step in the curve plotter.

## 11.2 Using S7-1200 Motion Control

### 11.2.1 Introduction

#### 11.2.1.1 Motion functionality of the CPU S7-1200

The TIA Portal, together with the "Motion Control" functionality of the CPU S7-1200, supports you in controlling stepper motors and servo motors with pulse interface:

- You configure the positioning axis and command table technology objects in the TIA Portal. The CPU S7-1200 uses these technology objects to control the pulse generator outputs that control the drives.
- In the user program you control the axis by means of Motion Control instructions and initiate motion commands of your drive.

You can find a multi-media introduction on the Internet (<http://www.automation.siemens.com/mcms/topics/en/simatic/simatic-technology/integrated-functions/simatic-s7-1200/Pages/Default.aspx>).

## See also

Command table technology object tools (Page 6461)

### 11.2.1.2 Hardware components for motion control

The representation below shows the basic hardware configuration for a motion control application with the CPU S7-1200.

#### CPU S7-1200:

CPU S7-1200 combines the functionality of a programmable logic controller with motion control functionality for operation of stepper motors and servo motors with pulse interface. The motion control functionality takes over the control and monitoring of the drives.

The DC/DC/DC variants of the CPU S7-1200 have on-board outputs for direct control of drives. The relay variants of the CPU require one of the signal boards described below to control a drive.

#### Signal board

You add further inputs and outputs to the CPU with the signal boards. The digital outputs can be used as pulse generator outputs for controlling drives as required.

In CPUs with relay outputs, the pulse signal cannot be output on the on-board outputs because the relays do not support the necessary switching frequencies. A signal board with digital outputs must be used to enable you to work with the PTO (Pulse Train Output) on these CPUs.

## PROFINET

Use the PROFINET interface to establish the online connection between the CPU S7-1200 and the programming device. In addition to the online functions of the CPU, additional commissioning and diagnostic functions are available for motion control.

### Ordering information for CPU Firmware V4

The order information listed below applies to the currently installed product phase (without any installed Hardware Support Packages) of the TIA Portal.

Name	MLFB (order number)
CPU 1211C DC/DC/DC	6ES7211-1AE40-0XB0
CPU 1211C AC/DC/RLY	6ES7211-1BE40-0XB0
CPU 1211C DC/DC/RLY	6ES7211-1HE40-0XB0
CPU 1212C DC/DC/DC	6ES7212-1AE40-0XB0
CPU 1212C AC/DC/RLY	6ES7212-1BE40-0XB0
CPU 1212C DC/DC/RLY	6ES7212-1HE40-0XB0
CPU 1214C DC/DC/DC	6ES7214-1AG40-0XB0
CPU 1214C AC/DC/RLY	6ES7214-1BG40-0XB0
CPU 1214C DC/DC/RLY	6ES7214-1HG40-0XB0
CPU 1214FC DC/DC/DC	6ES7214-1AF40-0XB0
CPU 1214FC DC/DC/RLY	6ES7214-1HF40-0XB0
CPU 1215C DC/DC/DC	6ES7215-1AG40-0XB0
CPU 1215C AC/DC/RLY	6ES7215-1BG40-0XB0
CPU 1215C DC/DC/RLY	6ES7215-1HG40-0XB0
CPU 1215FC DC/DC/DC	6ES7215-1AF40-0XB0
CPU 1215FC DC/DC/RLY	6ES7215-1HF40-0XB0
CPU 1217C DC/DC/DC	6ES7217-1AG40-0XB0
Signal board DI2/DO2 x DC24V 20kHz	6ES7223-0BD30-0XB0
Signal board DI2/DO2 x DC24V 200kHz	6ES7223-3BD30-0XB0
Signal board DO4 x DC24V 200kHz	6ES7222-1BD30-0XB0
Signal board DI2/DO2 x DC5V 200kHz	6ES7223-3AD30-0XB0
Signal board DO4 x DC5V 200kHz	6ES7222-1AD30-0XB0

Use a Hardware Support Package (HSP) to install new hardware components. The hardware component will then be available in the hardware catalog.

## 11.2.2 Basics for working with S7-1200 Motion Control

### 11.2.2.1 CPU outputs relevant for motion control (technology version V4)

The number of usable drives depends on the number of PTOs (pulse train outputs) and the number of available pulse generator outputs.

The following tables provide information about the relevant dependencies:

#### Maximum number of PTOs

4 PTOs are available for each CPU with technology version V4. This means a maximum of 4 drives can be controlled.

#### Signal type of the PTO

Depending on the signal type of the PTO, 1-2 pulse generator outputs are required per PTO (drive):

Signal type	Number of pulse generator outputs
Pulse A and direction B (direction output disabled *)	1
Pulse A and direction B *)	2
Count up A, count down B	2
A/B phase offset	2
A/B phase offset - quadruple	2

\*) The direction output must be on-board or on a signal board.

#### Usable pulse generator outputs and limit frequencies

The relay variants of the CPUs can only access the pulse generator outputs of a signal board.

Depending on the CPU and signal board, the following pulse signal generator outputs can be used with the following limit frequencies:

On-board	Q0.0	Q0.1	Q0.2	Q0.3	Q0.4	Q0.5	Q0.6	Q0.7	Q1.0	Q1.1
CPU 1211 (DC/DC/DC)	100 kHz	100 kHz	100 kHz	100 kHz	-	-	-	-	-	-
CPU 1212 (DC/DC/DC)	100 kHz	100 kHz	100 kHz	100 kHz	30 kHz	30 kHz	-	-	-	-
CPU 1214(F) (DC/DC/DC)	100 kHz	100 kHz	100 kHz	100 kHz	30 kHz	30 kHz	30 kHz	30 kHz	30 kHz	30 kHz
CPU 1215(F) (DC/DC/DC)	100 kHz	100 kHz	100 kHz	100 kHz	30 kHz	30 kHz	30 kHz	30 kHz	30 kHz	30 kHz
CPU 1217 (DC/DC/DC)	1 MHz	1 MHz	1 MHz	1 MHz	100 kHz	100 kHz	100 kHz	100 kHz	100 kHz	100 kHz
Signal board	Qx.0	Qx.1	Qx.2	Qx.3	-	-	-	-	-	-

On-board	Q0.0	Q0.1	Q0.2	Q0.3	Q0.4	Q0.5	Q0.6	Q0.7	Q1.0	Q1.1
Signal board DI2/DO2 x DC24V 20kHz	20 kHz	20 kHz	-	-	-	-	-	-	-	-
Signal board DI2/DO2 x DC24V 200kHz	200 kHz	200 kHz	-	-	-	-	-	-	-	-
Signal board DO4 x DC24V 200kHz	200 kHz	200 kHz	200 kHz	200 kHz	-	-	-	-	-	-
Signal board DI2/DO2 x DC5V 200kHz	200 kHz	200 kHz	-	-	-	-	-	-	-	-
Signal board DO4 x DC5V 200kHz	200 kHz	200 kHz	200 kHz	200 kHz	-	-	-	-	-	-

The low limit frequency is always 1Hz.

The pulse generator outputs can be freely assigned to the PTOs.

---

#### Note

If pulse generator outputs with different limit frequencies are used in accordance with the signal type, the low limit frequency is used in each case.

Signal type "Pulse A and direction B" is an exception. With this type of signal, the limit frequency of the pulse generator output is always used.

---

#### Note

##### Access to pulse generator outputs via the process image

The firmware takes control via the corresponding pulse generator and direction outputs if the PTO (Pulse Train Output) is selected and assigned to an axis.

With this takeover of the control function, the connection between the process image and I/O output is also disconnected. Although the user has the option of writing the process image of pulse generator and direction outputs via the user program or watch table, this is not transferred to the I/O output. Accordingly, it is also not possible to monitor the I/O output via the user program or watch table. The information read reflects the value of the process image and does not match the real status of the I/O output.

For all other CPU outputs that are not used permanently by the CPU firmware, the status of the I/O output can be controlled or monitored via the process image, as usual.

---

## Outputs for drive signals

For motion control, you can optionally parameterize a drive interface for "Drive enabled" and "Drive ready".

When using the drive interface the digital output for the drive enable and the digital input for "drive ready" can be freely selected.

### Acceleration/deceleration limits

The following limits apply to acceleration and deceleration:

Acceleration/deceleration	Value
Minimum acceleration/deceleration	5.0E-3 pulses/s <sup>2</sup>
Maximum acceleration/deceleration	9.5E+9 pulses/s <sup>2</sup>

### Jerk limits

The following limits apply to the jerk:

Jerk	Value
Minimum jerk	4.0E-3 pulses/s <sup>3</sup>
Maximum jerk	1.0E+10 pulses/s <sup>3</sup>

### See also

Tools of the positioning axis technology object (Page 6435)

#### 11.2.2.2 How the pulse interface works

Depending on the settings of the stepper motor, each pulse affects the movement of the stepper motor by a specific angle. If the stepper motor is set to 1000 pulses per revolution, for example, it moves 0.36° per pulse.

The speed of the stepper motor is determined by the number of pulses per time unit.

(The statements made here also apply to servo motors with pulse interface.)

Hardware and software limit switches (Page 6421)

Jerk limit (Page 6422)

Homing (Page 6423)

Integration of the positioning axis technology object (Page 6432)

Tools of the positioning axis technology object (Page 6435)

### 11.2.2.3 Relationship between the signal type and the direction of travel

The CPU outputs the velocity and direction of travel via two outputs.

The relationships between the configuration and direction of travel differ depending on the selected signal type. You can configure the following signal types in the axis configuration under "Basic parameters > General":

- "PTO (pulse A and direction B)"
- "PTO (count up A, count down B)" (as of V4)
- "PTO (A/B phase offset)" (as of V4)
- "PTO (A/B phase offset - quadruple)" (as of V4)

You configure the direction under "Extended Parameters > Mechanics" in the axis configuration. If you select the "Invert direction" option, the direction logic described below for the respective signal type is inverted.

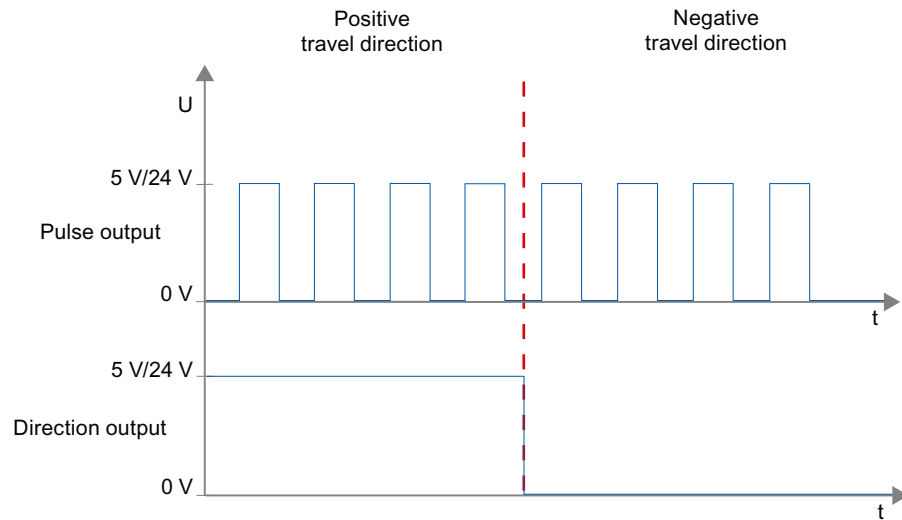

#### PTO (pulse A and direction B)

The pulse output pulses and the direction output level are evaluated for this signal type.

The pulses are output via the pulse output of the CPU. The direction output of the CPU specifies the direction of rotation of the drive:

- 5 V/24 V at direction output ⇒ positive direction of rotation
- 0 V at direction output ⇒ negative direction of rotation

The specified voltage depends on the hardware used. The indicated values do not apply to the differential outputs of CPU 1217.

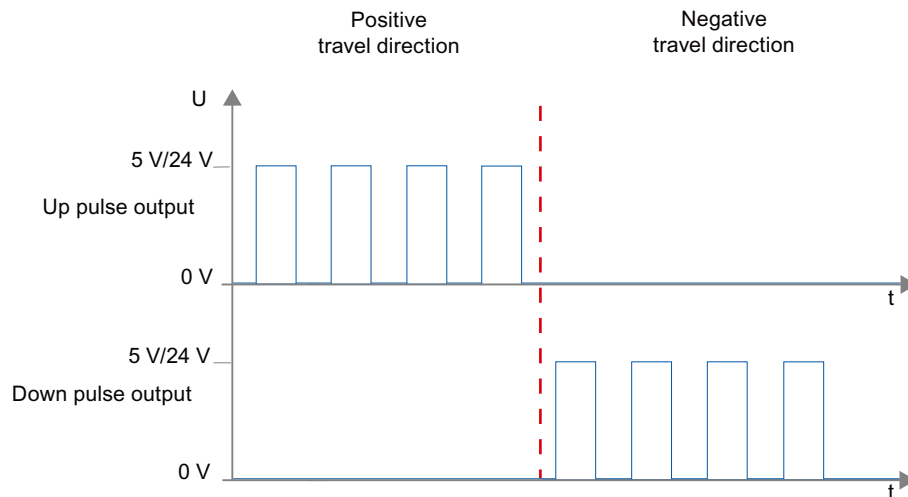

**PTO (count up A, count down B) (as of V4)**

The pulses of an output are evaluated for this signal type.

The pulse for the positive direction is output via the "Up pulse output" The pulse for the negative direction is output via the "Down pulse output"

The specified voltage depends on the hardware used. The values indicated do not apply to the differential outputs of CPU 1217.

**PTO (A/B phase offset) (as of V4)**

The positive edges of one output in each case are evaluated for this signal type.

The pulse is output via the "Phase A" output and phase-shifted via the "Phase B" output. The phase shifting between the outputs defines the direction of rotation:

- Phase A leads phase B by  $90^\circ$   $\Rightarrow$  positive direction of rotation
- Phase B leads phase A by  $90^\circ$   $\Rightarrow$  negative direction of rotation

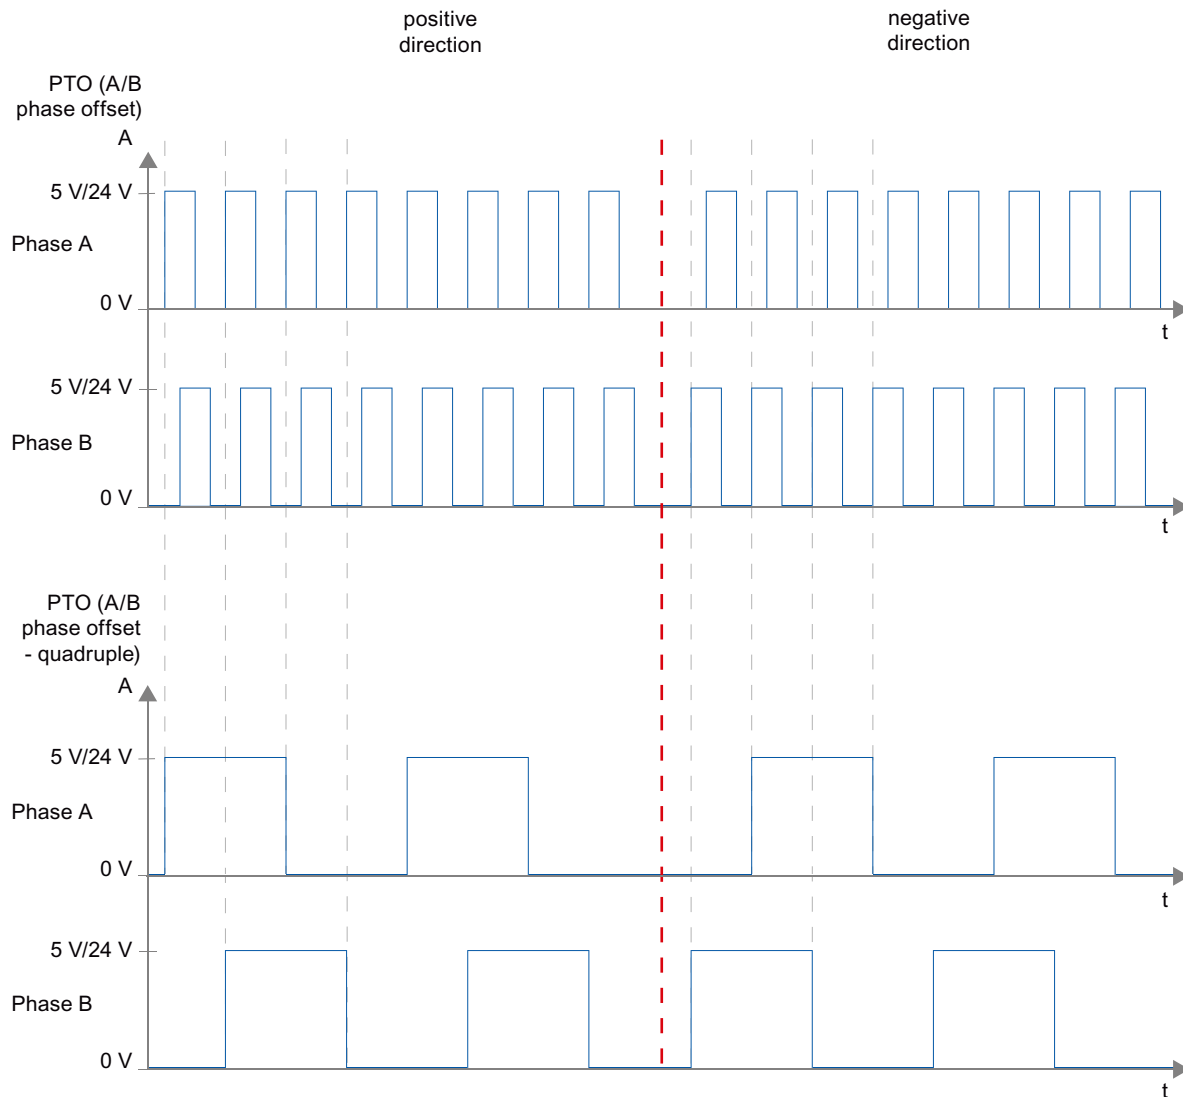

#### **PTO (A/B phase offset - quadruple) (as of V4)**

The positive and negative edges of both outputs are evaluated for this signal type. A pulse period has four edges with two phases (A and B). The pulse frequency at the output is therefore reduced to a quarter.

The pulse is output via the "Phase A" output and phase-shifted via the "Phase B" output. The phase shifting between the outputs defines the direction of rotation:

- Phase A leads phase B by  $90^\circ$   $\Rightarrow$  positive direction of rotation
- Phase B leads phase A by  $90^\circ$   $\Rightarrow$  negative direction of rotation

The specified voltage depends on the hardware used. The indicated values do not apply to the differential outputs of CPU 1217.

### Invert direction

If you select the "Invert rotation signal" option, the direction logic is inverted:

- **PTO (pulse A and direction B)**
  - 0 V at direction output (low level) ⇒ positive direction of rotation
  - 5 V/24 V at direction output (high level) ⇒ negative direction of rotation

The specified voltage depends on the hardware used. The voltages indicated do not apply to the differential outputs of CPU 1217.

- **PTO (count up A, count down B)**  
The outputs "Pulse output down" and "Pulse output up" are swapped.

- **PTO (A/B phase offset)**  
The "Phase A" and "Phase B" outputs are swapped.
- **"PTO (A/B phase offset - quadruple)**  
The "Phase A" and "Phase B" outputs are swapped.

Tools of the positioning axis technology object (Page 6435)

#### 11.2.2.4 Hardware and software limit switches

Use the hardware and software limit switches to limit the "permitted traversing range" and the "working range" of your positioning axis technology object. The relationships are shown in the following diagram:

Hardware limit switches are limit switches that limit the maximum "permitted traversing range" of the axis. Hardware limit switches are physical switching elements that must be connected to interrupt-capable inputs of the CPU.

Software limit switches limit the "working range" of the axis. They should fall inside the hardware limit switches relative to the traversing range. Since the positions of the software limit switches can be flexibly set, the working range of the axis can be adapted on an individual basis, depending on the current traversing profile. In contrast to hardware limit switches, software limit switches are implemented exclusively via the software and do not require their own switching elements.

Hardware and software limit switches must be activated prior to use in the configuration or in the user program.. Software limit switches are only active after homing the axis.

- Homing (Page 6423)
- Integration of the positioning axis technology object (Page 6432)
- Tools of the positioning axis technology object (Page 6435)
- Position limits (Page 6443)

**11.2.2.5 Jerk limit**

With the jerk limit you can reduce the stresses on your mechanics during an acceleration and deceleration ramp. The acceleration and deceleration value is not changed abruptly when the jerk limiter is active; it is gradually increased and decreased. The figure below shows the velocity and acceleration curve without and with jerk limit.

The jerk limit gives a "smoothed" velocity profile of the axis motion. This ensures, for example, soft starting and braking of a conveyor belt.

### 11.2.2.6 Homing

Homing means matching the axis coordinates of the technology object to the real, physical location of the drive. For position-controlled axes the entries and displays for the position refer exactly to these axis coordinates. Therefore, agreement between the axis coordinates and the real situation is extremely important. This step is necessary to ensure that the absolute target position of the axis is also achieved exactly with the drive.

In the S7-1200 CPU, axis homing is implemented with the motion control instruction, "MC\_Home". The following homing modes exist

#### Homing modes

- **Active homing**  
In active homing mode, the motion control instruction "MC\_Home" performs the required reference point approach. When the homing switch is detected, the axis is homed according to the configuration. Active traversing motions are aborted.
- **Passive homing**  
During passive homing, the motion control instruction "MC\_Home" does not carry out any homing motion. The traversing motion required for this step must be implemented by the user via other motion control instructions. When the homing switch is detected, the axis is homed according to the configuration. Active traversing motions are not aborted upon start of passive homing.
- **Direct homing absolute**  
The axis position is set regardless of the homing switch. Active traversing motions are not aborted. The value of input parameter "Position" of motion control instruction "MC\_Home" is set immediately as the reference point of the axis.
- **Direct homing relative**  
The axis position is set regardless of the homing switch. Active traversing motions are not aborted. The following statement applies to the axis position after homing:  
New axis position = current axis position + value of parameter "Position" of instruction "MC\_Home".

### 11.2.3 Guidelines on use of motion control

The guidelines described here present the basic procedure for using motion control with the CPU S7-1200.

#### Requirements

To use the positioning axis technology object, a project with a CPU S7-1200 must be created.

#### Procedure

Follow the steps below in the order given to use motion control with the CPU S7-1200. Use the following links for this purpose:

1. Adding a positioning axis technology object (Page 6437)
2. Working with the configuration dialog (Page 6437)
3. Download to CPU (Page 6480)
4. Function test of the axis in the commissioning window (Page 6481)
5. Programming (Page 6502)
6. Diagnostics of the axis control (Page 6520)

### 11.2.4 Using versions

#### 11.2.4.1 Overview of versions

The relationship between the relevant versions for S7-1200 Motion Control can be found in the following table:

#### Technology version

You can check the currently selected technology version in the "Instructions" task card in folder "Technology > Motion Control > S7-1200 Motion Control" and in the "Add new object" dialog.

Select the technology version in the "Instructions" task card in folder "Technology > Motion Control > S7-1200 Motion Control".

If a technology object with an alternative version is added in the "Add new object" dialog, the technology version will also be changed.

---

#### Note

The selection of an alternative technology version will also affect the Motion Control Instructions version (task card).

The technology objects and Motion Control instructions will only be converted to the selected version upon compilation or "Load to device".

---

### Version of the technology object

The version of a technology object can be checked in the inspector window under "Properties > General > Information" in the "Version" box.

### Motion Control instruction version

The Motion Control instruction version can be checked in the inspector window under "Properties > General > Information" in the "Version" box.

If the Motion Control instruction version used is not in line with the following compatibility list, the relevant Motion Control instructions will be highlighted in the program editor.

### Compatibility list

Technology	CPU	Technology object	Motion Control Instruction
V1.0	V1.0, V2.0, V2.1, V2.2, V3.0	Axis V1.0	MC_Power V1.0 MC_Reset V1.0 MC_Home V1.0 MC_Halt V1.0 MC_MoveAbsolute V1.0 MC_MoveRelative V1.0 MC_MoveVelocity V1.0 MC_MoveJog V1.0
V2.0 Innovations: <ul style="list-style-type: none"> <li>• Jerk limit</li> <li>• Command table</li> <li>• MC_ChangeDynamic</li> </ul>	V2.1, V2.2, V3.0	Axis V2.0, Command table V2.0	MC_Power V2.0 MC_Reset V2.0 MC_Home V2.0 MC_Halt V2.0 MC_MoveAbsolute V2.0 MC_MoveRelative V2.0 MC_MoveVelocity V2.0 MC_MoveJog V2.0 MC_CommandTable V2.0 MC_ChangeDynamic V2.0

Technology		CPU	Technology object	Motion Control Instruction
V3.0	Innovation: Load in RUN operating mode	V2.2, V3.0, V4.0	Axis V3.0, Command table V3.0	MC_Power V3.0 MC_Reset V3.0 MC_Home V3.0 MC_Stop V3.0 MC_MoveAbsolute V3.0 MC_MoveRelative V3.0 MC_MoveVelocity V3.0 MC_MoveJog V3.0 MC_CommandTable V3.0 MC_ChangeDynamic V3.0

Changing a technology version (Page 6426)

Compatibility list of tags (Page 6427)

Status of limit switch (Page 6430)

**11.2.4.2 Changing a technology version**

Before you can access all the benefits of a new technology version, you may need to set / modify the technology version for existing projects.

**Note**

**Compatibility of the technology object tags**

If you are switching from V1...3 and V4, please see the compatibility list (Page 6427) if you are using tags of the technology object in your user program, monitoring tables, etc.

## Setting/changing a technology version

To set or change the technology version, follow these steps:

1. Open the programming editor (e.g., by opening the OB1).
2. In the "Instructions" task card, open the desired technology version in the "Technology > Motion Control > S7-1200 Motion Control" folder.
3. Save and compile the project. Pay attention to any error information that is displayed during compilation. Deal with the causes of the errors indicated.
4. Check the configuration of the technology objects.
5. If necessary, adapt the tag names in the following objects in line with the compatibility list.
  - User program
  - Monitoring tables
  - Force tables
  - HMI configuration
  - Trace configuration

## See also

Overview of versions (Page 6422)

Status of limit switch (Page 6430)

### 11.2.4.3 Compatibility list of tags

The technology data blocks for S7-1200 Motion Control and S7-1500 Motion Control have been standardized within the framework of the V4 technology. This has resulted in new tags and tag names for the V4 positioning axis and V4 command table technology objects.

Note the following tables if you have used tags of the technology objects in the user program and you want to convert the project from V1...3 to V4 (or vice versa).

The tags listed in the "Automatic conversion V1...3 to V4" column are converted automatically when the project is compiled. Tag names in monitoring and force tables or the HMI or trace configuration are not converted.

The following tags are new or have been adapted and may have to be corrected in the user program, monitoring tables, etc.:

## Config tags (positioning axis)

Tag name V1.0 to V3.0	Tag name V4.0	Automatic conversion V1..3 to V4
<Axis name>.Config.DynamicDefaults.Acceleration	<Axis name>.DynamicDefaults.Acceleration	Yes
<Axis name>.Config.DynamicDefaults.Deceleration	<Axis name>.DynamicDefaults.Deceleration	Yes
<Axis name>.Config.DynamicDefaults.EmergencyDeceleration	<Axis name>.DynamicDefaults.EmergencyDeceleration	Yes
<Axis name>.Config.DynamicDefaults.Jerk	<Axis name>.DynamicDefaults.Jerk	Yes
<Axis name>.Config.DynamicDefaults.JerkActive	Not available The jerk is activated if the configured jerk is > 0.004 pulse/s <sup>3</sup> .	No
<Axis name>.Config.DynamicLimits.MaxVelocity	<Axis name>.DynamicLimits.MaxVelocity	Yes
<Axis name>.Config.DynamicLimits.MinVelocity	<Axis name>.DynamicLimits.MinVelocity	Yes
<Axis name>.Config.General.LengthUnit	<Axis name>.Units.LengthUnit	Yes
<Axis name>.Config.Homing.AutoReversal	<Axis name>.Homing.AutoReversal	Yes
<Axis name>.Config.Homing.Direction	<Axis name>.Homing.ApproachDirection	Yes
<Axis name>.Config.Homing.FastVelocity	<Axis name>.Homing.ApproachVelocity	Yes
<Axis name>.Config.Homing.Offset	<Axis name>.Sensor[1].ActiveHoming.HomePositionOffset	Yes
<Axis name>.Config.Homing.SideActiveHoming	<Axis name>.Sensor[1].ActiveHoming.SidelInput	Yes
<Axis name>.Config.Homing.SidePassiveHoming	<Axis name>.Sensor[1].PassiveHoming.SidelInput	Yes
<Axis name>.Config.Homing.SlowVelocity	<Axis name>.Homing.ReferencingVelocity	Yes
<Axis name>.Config.Homing.SwitchedLevel	<Axis name>.Sensor[1].ActiveHoming.SwitchLevel <Axis name>.Sensor[1].PassiveHoming.SwitchLevel	No
<Axis name>.Config.Mechanics.InverseDirection	<Axis name>.Actor.InverseDirection	Yes
<Axis name>.Config.Mechanics.LeadScrew	<Axis name>.Mechanics.LeadScrew	Yes
<Axis name>.Config.Mechanics.PulsesPerDriveRevolution	<Axis name>.Actor.DriveParameter.PulsesPerDriveRevolution	Yes
<Axis name>.Config.PositionLimits_HW.Active	<Axis name>.PositionLimitsHW.Active	Yes
<Axis name>.Config.PositionLimits_HW.MaxSwitchedLevel	<Axis name>.PositionLimitsHW.MaxSwitchLevel	Yes
<Axis name>.Config.PositionLimits_HW.MinSwitchedLevel	<Axis name>.PositionLimitsHW.MinSwitchLevel	Yes

Tag name V1.0 to V3.0	Tag name V4.0	Automatic conversion V1..3 to V4
<Axis name>.Config.PositionLimits_SW.Active	<Axis name>.PositionLimitsSW.Active	Yes
<Axis name>.Config.PositionLimits_SW.MaxPosition	<Axis name>.PositionLimitsSW.MaxPosition	Yes
<Axis name>.Config.PositionLimits_SW.MinPosition	<Axis name>.PositionLimitsSW.MinPosition	Yes
Not available	<Axis name>.Actor.DirectionMode	No
Not available	<Axis name>.Actor.Type	No
Not available	<Axis name>.Sensor[1].ActiveHoming.Mode	No
Not available	<Axis name>.Sensor[1].PassiveHoming.Mode	No

### ErrorBits tags (positioning axis)

Tag name V1.0 to V3.0	Tag name V4.0	Automatic conversion V1..3 to V4
<Axis name>.ErrorBits.HwLimitMax	<Axis name>.ErrorBits.HWLimit	No
<Axis name>.ErrorBits.HwLimitMin	(Note the new status bits and the section Status of the limit switch (Page 6430).)	
<Axis name>.ErrorBits.SwLimitMaxExceeded	<Axis name>.ErrorBits.SWLimit (Note the new status bits and the section Status of the limit switch (Page 6430).)	No
<Axis name>.ErrorBits.SwLimitMaxReached		
<Axis name>.ErrorBits.SwLimitMinExceeded		
<Axis name>.ErrorBits.SwLimitMinReached		
Not available	<Axis name>.ErrorBits.DirectionFault	No

### MotionStatus tags (positioning axis)

Tag name V1.0 to V3.0	Tag name V4.0	Automatic conversion V1..3 to V4
<Axis name>.MotionStatus.Distance	<Axis name>.StatusPositioning.Distance	Yes
<Axis name>.MotionStatus.Position	<Axis name>.Position	Yes
<Axis name>.MotionStatus.TargetPosition	<Axis name>.StatusPositioning.TargetPosition	Yes
<Axis name>.MotionStatus.Velocity	<Axis name>.Velocity	Yes

**StatusBits tags (positioning axis)**

Tag name V1.0 to V3.0	Tag name V4.0	Automatic conversion V1..3 to V4
<Axis name>.StatusBits.Homing	<Axis name>.StatusBits.HomingCommand	Yes
<Axis name>.StatusBits.SpeedCommand	<Axis name>.StatusBits.VelocityCommand	Yes
Not available	<Axis name>.StatusBits.HWLlimitMaxActive	No
Not available	<Axis name>.StatusBits.HWLlimitMinActive	No
Not available	<Axis name>.StatusBits.SWLlimitMaxActive	No
Not available	<Axis name>.StatusBits.SWLlimitMinActive	No

**Tags (command table)**

Tag name V1.0 to V3.0	Tag name V4.0	Automatic conversion V1..3 to V4
<Command table>.Config.Command[n].Position	<Command table>.Command[n].Position	Yes
<Command table>.Config.Command[n].Velocity	<Command table>.Command[n].Velocity	Yes
<Command table>.Config.Command[n].Duration	<Command table>.Command[n].Duration	Yes
<Command table>.Config.Command[n].NextStep	<Command table>.Command[n].NextStep	Yes
<Command table>.Config.Command[n].StepCode	<Command table>.Command[n].StepCode	Yes

Tags of the positioning axis technology object as of V4 (Page 6548)

**11.2.4.4 Status of limit switch**

The status and error bits for the display of the reached limit switch have been adapted in version V4.

In order to replicate the behavior of the error bits of versions V1...3, use the following logical operators:

V1...3	V4
<Axis name>.ErrorBits.HwLimitMin	<Axis name>.ErrorBits.HWLimit AND <Axis name>.StatusBits.HWLimitMinActive
<Axis name>.ErrorBits.HwLimitMax	<Axis name>.ErrorBits.HWLimit AND <Axis name>.StatusBits.HWLimitMaxActive
<Axis name>.ErrorBits.SwLimitMinReached	<Axis name>.ErrorBits.SWLimit AND (<Axis name>.Position = <Axis name>.PositioningLimits_SW.MinPosition)
<Axis name>.ErrorBits.SwLimitMinExceeded	<Axis name>.ErrorBits.SWLimit AND (<Axis name>.Position < <Axis name>.PositioningLimits_SW.MinPosition)
<Axis name>.ErrorBits.SwLimitMaxReached	<Axis name>.ErrorBits.SWLimit AND (<Axis name>.Position = <Axis name>.PositioningLimits_SW.MaxPosition)
<Axis name>.ErrorBits.SwLimitMaxExceeded	<Axis name>.ErrorBits.SWLimit AND (<Axis name>.Position > <Axis name>.PositioningLimits_SW.MaxPosition)

### 11.2.5 Positioning axis technology object

#### 11.2.5.1 Integration of the positioning axis technology object

The following representation shows the relationships between the hardware and software components that are implemented when using the positioning axis technology object:

## CPU hardware

The physical drive is controlled and monitored by the CPU hardware.

## Drive

The drive represents the unit of power unit and motor. Stepper motors or servo motors with a pulse interface may be used.

## Positioning axis technology object

The physical drive including mechanics is mapped in the TIA Portal as a positioning axis technology object. To do this, configure the positioning axis technology object with the following parameters:

- Selection of the PTOs (Pulse Train Output) to be used and configuration of the drive interface
- Parameter for mechanics and gear transmission of the drive (or the machine or system)
- Parameter for position monitoring, for dynamic parameters and for homing

The configuration of the positioning axis technology object is saved in the technology object (data block). This data block also forms the interface between the user program and the CPU firmware. The current axis data is saved in the data block of the technology object at the runtime of the user program.

## User program

You start Motion Control instructions jobs in the CPU firmware with the user program. The following jobs for controlling the axis are possible:

- Enable and disable axis
- Position axis absolutely
- Position axis relatively
- Move axis with velocity set point
- Run axis commands as motion sequence (technology as of V2)
- Moving axes in jog mode
- Stop axis
- Reference axis; set reference point
- Change dynamic settings of axis
- Continuously read motion data of the axis
- Write tag of axis
- Acknowledge error

You determine the command parameters with the input parameters of the Motion Control instructions and the axis configuration. The output parameters of the instruction give you up to date information about the status and any errors of the command.

Before starting a command for the axis, you must enable the axis with the Motion Control instruction "MC\_Power".

You can read out configuration data and current axis data with the tags of the technology object. You can change individual, changeable tags of the technology object (e.g. the current acceleration) from the user program.

You can also change the dynamic settings of the axis with the Motion Control instruction "MC\_ChangeDynamic" and write additional configuration data with "MC\_WriteParam". You can read the current motion status of the axis with the Motion Control instruction "MC\_ReadParam".

## CPU firmware

The motion control jobs started in the user program are processed in the CPU firmware. When using the axis control table, Motion Control jobs are triggered by operating the axis control table. The CPU firmware performs the following jobs depending on the configuration:

- Calculate the exact motion profile for motion jobs and emergency stop situations
- Control the drive enable and the pulse and direction signal
- Monitor the drive and the hardware and software limit switches
- Up to date feedback of status and error information to the Motion Control instructions in the user program
- Writing of current axis data into the data block of the technology object

Homing (Page 6421)

### 11.2.5.2 Tools of the positioning axis technology object

The TIA Portal provides the "Configuration", "Commissioning", and "Diagnostics" tools for the positioning axis technology object. The following representation shows the interaction of the three tools with the technology object and the drive:

①	Reading and writing of configuration data of the technology object;
②	Drive control via the technology object; Reading axis status for display on the control panel
③	Readout of the current status and error information of the technology object.

## Configuration

Use the "Configuration" tool to configure the following properties of the positioning axis technology object:

- Selection of the PTO to be used and configuration of the drive interface
- Properties of the mechanics and the transmission ratio of the drive (or machine or system)
- Properties for position monitoring, dynamics, and homing

Save the configuration in the data block of the technology object.

## Commissioning

Use the "Commissioning" tool to test the function of your axis without having to create a user program. When the tool is started, the axis control table will be displayed. The following commands are available on the axis control table:

- Enabling and disabling the axis
- Move axis in jog mode
- Position axis in absolute and relative terms
- Home axis
- Acknowledge errors

The dynamic values can be adjusted accordingly for the motion commands. The axis control table also shows the current axis status.

## Diagnostics

Use the "Diagnostics" tool to keep track of the current status and error information for the axis and drive.

### **11.2.5.3 Adding a positioning axis technology object**

#### **Requirements**

A project with a CPU S7-1200 has been created.

#### **Procedure**

To add a positioning axis technology object in the project tree, follow these steps:

1. Open the "CPU > Technology objects" folder in the project tree.
2. Double-click the "Add new object" command.  
The "Add new object" dialog opens.
3. Select the "Motion Control" technology.
4. Open the "Motion Control > S7-1200 Motion Control" folder.
5. Select the desired technology version in the "Version" column.
6. Select the "TO\_PositioningAxis" object.
7. Enter the name of the axis in the "Name" input box.
8. To change the automatically assigned data block number, select the "Manual" option.
9. To display additional information about the technology object, click "Additional information".
10. Confirm your entry with "OK".

#### **Result**

The new technology object is created and saved to the "Technology objects" folder in the project tree.

#### **See also**

Guidelines on use of motion control (Page 6422)

### **11.2.5.4 Configuring the positioning axis technology object**

#### **Working with the configuration dialog**

You configure the properties of the technology object in the configuration window. Proceed as follows to open the configuration window of the technology object:

1. Open the group of the required technology object in the project tree.
2. Double-click the "Configuration" object.

The configuration is divided into the following categories:

- **Basic parameters**  
The basic parameters contain all the parameters which must be configured for a functioning axis.
- **Extended parameters**  
The advanced parameters include parameters to adapt to your drive or your plant.

### Configuration window icons

Icons in the area navigation of the configuration show additional details about the status of the configuration:

	<p><b>The configuration contains default values and is complete.</b></p> <p>The configuration contains only default values. With these default values you can use the technology object without additional changes.</p>
	<p><b>The configuration contains values set by the user and is complete.</b></p> <p>All input boxes of the configuration contain valid values and at least one preset value has changed.</p>
	<p><b>The configuration is incomplete or incorrect</b></p> <p>At least one input box or drop-down list contains an invalid value. The corresponding box or the drop-down list is displayed on a red background. Click the roll-out error message to indicate the cause of error.</p>
	<p><b>The configuration is valid but contains warnings</b></p> <p>For example, only one hardware limit switch is configured. Depending on the plant, the lacking configuration of a hardware limit switch may result in a hazard. The corresponding box or the drop-down list is displayed on a yellow background.</p>

### See also

Guidelines on use of motion control (Page 6422)

Basic parameters (Page 6439)

Extended parameters (Page 6441)

### Compare values

The "Compare values" function provides the following options:

- Comparison of configured start values of the project with the start values in the CPU and the actual values
- Direct editing of actual values and the start values of the project
- Immediate detection and display of input errors with suggested corrections
- Backup of actual values in the project
- Transfer of start values of the project to the CPU as actual values

## Icons and operator controls

The following icons and operator controls are available:

Icon	Function
	Start value in CPU matches the configured Start value in the project
	Start value in CPU does not match the configured Start value in the project
	The comparison of the Start value in CPU with the configured Start value in the project cannot be performed
	Backs up the actual values in the project
	Transfers updated start values in the project to the CPU (initialize setting values)
	Opens the "Compare values" dialog

## Basic parameters

### Configuration - General (positioning axis technology object as of V4)

Configure the basic properties of the positioning axis technology object in the "General" configuration window.

#### Axis name

Define the name of the axis or the name of the positioning axis technology object in this box. The technology object is listed under this name in the project navigation.

#### Hardware interface

The pulses are output to the power unit of the drive by fixed assigned digital outputs.

In CPUs with relay outputs, the pulse signal cannot be output on these outputs because the relays do not support the necessary switching frequencies. A signal board with digital outputs must be used to enable you to work with the PTO (Pulse Train Output) on these CPUs.

---

#### Note

The PTO requires the functionality of a fast counter (HSC). An internal HSC is used for this, the count of which cannot be evaluated.

---

### Selecting the pulse generator

In the drop-down list, select the PTO (Pulse Train Output) which is to provide the pulses for controlling the stepper motors or servo motors with pulse interface. If the pulse generators and high-speed counters are not used elsewhere in the device configuration, the hardware

interface can be configured automatically. In this case, the PTO selected in the drop-down list is displayed with a white background.

### "Device configuration" button

This button takes you to the settings for the pulse options in the device configuration of the CPU.

### Signal type

Select the desired signal type in the drop-down list. The following signal types are available:

- **PTO (pulse A and direction B)**  
A pulse output and a direction output are used for controlling the stepper motor.
- **PTO (count up A, count down B)**  
One pulse output each for motion in positive direction and negative direction is used for controlling the stepper motor.
- **PTO (A/B phase offset)**  
Both pulse outputs for Phase A and for Phase B run at the same frequency.  
The period of the pulse outputs is evaluated at the drive end as a step.  
The phase offset between Phase A and Phase B determines the direction of the motion.
- **PTO (A/B phase offset - quadruple)**  
Both pulse outputs for Phase A and for Phase B run at the same frequency.  
All positive edges and all negative edges of Phase A and Phase B are evaluated as a step at the drive end.  
The phase offset between Phase A and Phase B determines the direction of the motion.

### Pulse output (signal type "PTO (pulse A and direction B)")

Select the desired output for the pulse output in this box.

You can select the output using a symbolic address or assign an absolute address.

### Activate direction output (signal type "PTO (pulse A and direction B)")

You can deactivate and activate the direction output in "pulse and direction" mode. This option enables you to limit the motion direction.

### Direction output (signal type "PTO (pulse A and direction B)")

Select the desired output for the direction output in this box.

You can select the output using a symbolic address or assign an absolute address.

### Pulse output up (signal type "PTO (count up A, count down B)")

Select the desired pulse output for motions in positive direction in this box.

You can select the output using a symbolic address or assign an absolute address.

### **Pulse output down (signal type "PTO (count up A, count down B)")**

Select the desired pulse output for motions in negative direction in this box.  
You can select the output using a symbolic address or assign an absolute address.

### **Phase A (signal types "PTO (A/B phase offset)" and "PTO (A/B phase offset - quadruple)")**

Select the desired pulse output for Phase A signals in this box.  
You can select the output using a symbolic address or assign an absolute address.

### **Phase B (signal types "PTO (A/B phase offset)" and "PTO (A/B phase offset - quadruple)")**

Select the desired pulse output for Phase B signals in this box.  
You can select the output using a symbolic address or assign an absolute address.

### **User unit**

Select the desired unit for the dimension system of the axis in the dropdown list. The selected unit is used for further configuration of the positioning axis technology object and for displaying the current axis data.

The values at the input parameters (Position, Distance, Velocity, ...) of the Motion Control instructions also refer to this unit.

---

#### **Note**

Later changing of the dimension system may not be converted correctly in all the configuration windows of the technology object. In this case check the configuration of all axis parameters.

The values of the input parameters of the Motion Control instructions may have to be adapted to the new unit of measurement in the user program.

---

CPU outputs relevant for motion control (technology version V4) (Page 6412)  
Relationship between the signal type and the direction of travel (Page 6415)  
Configuration - General ("Axis" technology object V1...3) (Page 6572)

### **Extended parameters**

#### **Configuration - Drive interface**

Configure the output for drive enable and the input for the "Drive ready" feedback signal of the drive in the "Drive signals" configuration window.

Drive enable is controlled by Motion Control instruction "MC\_Power" and enables power to the drive. The signal is provided to the drive via the output to be configured.

The drive signals "Drive ready" to the CPU if it is ready to start executing travel after receipt of drive enable. The "Drive ready" signal is reported back to the CPU via the input to be configured.

If the drive does not have any interfaces of this type, you will not have to configure the parameters. In this case, select the value TRUE for the ready input.

Configuration - Mechanics (Page 6442)

Position limits (Page 6443)

Dynamics (Page 6447)

Homing (positioning axis technology object as of V2) (Page 6454)

### Configuration - Mechanics

Configure the mechanical properties of the drive in the "Mechanics" configuration window.

### Increments per motor revolution

Configure the number of pulses required for one revolution of the motor in this box.

Limits (independent of the selected unit of measurement):

- $0 < \text{Pulse per motor revolution} \leq 2147483647$

### Distance per revolution

In this box, configure the load distance per motor revolution covered by the mechanical system of your unit.

Limits (independent of the selected unit of measurement):

- $0.0 < \text{Distance per revolution} \leq 1.0e12$

### Permitted direction of rotation (technology version as of V4)

Configure this box to determine whether the mechanics of your system are to move in both directions or only in the positive or negative direction.

If you have not activated the direction output of the pulse generator in the "PTO (pulse A and direction B)" mode, the selection is limited to the positive or negative direction.

### Invert direction

You can use the "Invert direction" check box to adapt the control system to the direction logic of the drive.

The direction logic is inverted according to the selected mode of the pulse generator:

- **PTO (pulse A and direction B)**
  - 0 V at direction output ⇒ positive direction of rotation
  - 5 V/24 V at direction output ⇒ negative direction of rotation

The specified voltage depends on the hardware used. The indicated values do not apply to the differential outputs of CPU 1217.
- **PTO (count up A, count down B)**

The outputs "Pulse output down" and "Pulse output up" are swapped.
- **PTO (A/B phase offset)**

The "Phase A" and "Phase B" outputs are swapped.
- **"PTO (A/B phase offset - quadruple)**

The "Phase A" and "Phase B" outputs are swapped.

Relationship between the signal type and the direction of travel (Page 6415)

### Position limits

#### Requirements for hardware limit switches

Use only hardware limit switches that remain permanently switched after being approached. This switching status may only be revoked after a return to the valid travel range.

### See also

Configuration - Position limits (Page 6443)

Behavior of axis when position limits is tripped (Page 6445)

Changing the position limits configuration in the user program (Page 6446)

#### Configuration - Position limits

Configure the hardware and software limit switches of the axis in the "Position limits" configuration window.

#### Enable hardware limit switch

Activate the function of the low and upper hardware limit switch with this check box. The hardware limit switches can be used for purposes of direction reversal during a homing procedure. For details, refer to the configuration description for homing.

### Lower / upper HW limit switch input

Select the digital input for the low or upper hardware limit switch from the drop-down list. The input must be interrupt-capable. The digital onboard CPU inputs and the digital inputs of a plugged signal board can be selected as inputs for the HW limit switches.

---

#### Note

The digital inputs are set to a filter time of 6.4 ms by default. If these are used as hardware limit switches, undesired decelerations may occur. If this occurs, reduce the filter time for the relevant digital inputs.

The filter time can be set under "Input filter" in the device configuration of the digital inputs.

---

### Active level

In the drop-down list, select the signal level available at the CPU when the hardware limit switch is approached.

- "Lower level" selected  
0 V (FALSE) at CPU input corresponds to hardware limit switch approached
- "High level" selected  
5 V / 24 V (TRUE) at the CPU input = hardware limit switch approached (the actual voltage depends on the hardware used)

### Enable software limit switch

Activate the function of the low and upper software limit switch with this check box.

---

#### Note

The enabled software limit switch only affects a homed axis.

---

### High and lower software limit switch

Enter the position value of the low and upper software limit switch in these boxes.

Limits (independent of the selected unit of measurement):

- $-1.0e12 \leq \text{lower software limit switch} \leq 1.0e12$
- $-1.0e12 \leq \text{upper software limit switch} \leq 1.0e12$

The value of the upper software limit switch must be greater than or equal to the value of the lower software limit switch.

### See also

Requirements for hardware limit switches (Page 6441)

Behavior of axis when position limits is tripped (Page 6445)

Changing the position limits configuration in the user program (Page 6446)

Configuration - Homing - Active (Page 6455)

## Behavior of axis when position limits is tripped

### Behavior of axis when hardware limit switches are approached

When the hardware limit switches are approached, the axis brakes to a standstill at the configured emergency stop deceleration. The specified emergency stop deceleration must be sufficient to reliably stop the axis before the mechanical stop. The following diagram presents the behavior of the axis after it approaches the hardware limit switches:

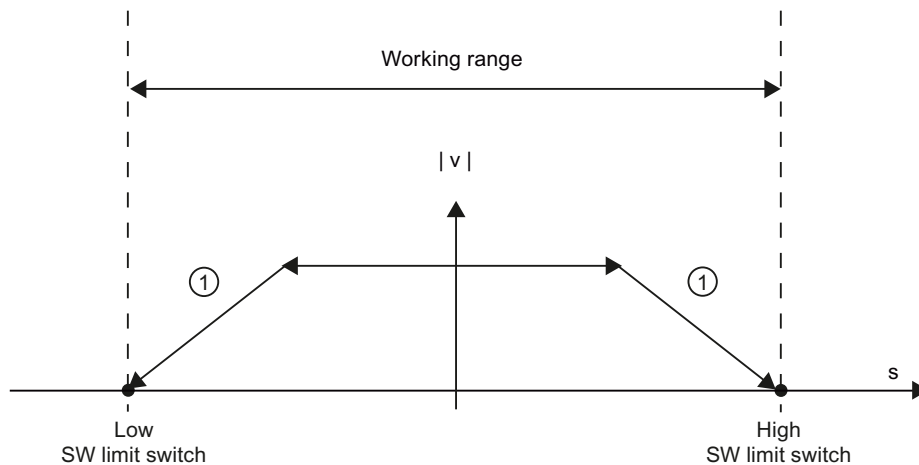

①	The axis brakes to a standstill at the configured emergency stop deceleration.
②	Range in which the HW limit switches signal the status "approached".

The "HW limit switch approached" error is displayed in the motion control instruction to be initiated, in "MC\_Power", and in the technology object tags. Instructions for eliminating errors can be found in the Appendix under "List of ErrorIDs and ErrorInfos".

### Behavior of axis when software limit switches are reached

If software limit switches are activated, an active motion is stopped at the position of the software limit switch. The axis is braked at the configured deceleration.

The following diagram presents the behavior of the axis until it reaches the software limit switches:

① The axis brakes to a standstill at the configured deceleration.

The "SW limit switch approached" error is displayed in the initiating Motion Control instruction, at "MC\_Power", and in the technology object tags. Instructions for eliminating errors can be found in the Appendix under "List of ErrorIDs and ErrorInfos".

You can learn about the circumstances that can lead to exceeding the software limit switches in the sections "Software limit switches in conjunction with a homing operation (Page 6531)" and "Software limit switches in conjunction with dynamic changes (Page 6536)".

Use additional hardware limit switches if a mechanical endstop is located after the software limit switches and there is a risk of mechanical damage.

### See also

Configuration - Position limits (Page 6441)

Changing the position limits configuration in the user program (Page 6446)

### Changing the position limits configuration in the user program

You can change the following configuration parameters during runtime of the user program in the CPU:

### Hardware limit switches

You can also activate and deactivate the hardware limit switches during runtime of the user program. Use the following technology object tag for this purpose:

- <Axis name>.PositionLimitsHW.Active

Refer to the description of the technology object tags (Page 6548) in the appendix for information on when changes to the configuration parameter take effect.

## Software limit switches

You can also activate and deactivate the software limit switches and change their position values during runtime of the user program. Use the following technology object tags for this purpose:

- <Axis name>.PositionLimitsSW.Active  
for activating and deactivating the software limit switches
- <Axis name>.PositionLimitsSW.MinPosition  
for changing the position of the lower software limit switch
- <Axis name>.PositionLimitsSW.MaxPosition  
for changing the position of the upper software limit switch

Refer to the description of technology object tags in the appendix for information on when changes to the configuration parameters take effect.

## See also

Compatibility list of tags (Page 6425)

Requirements for hardware limit switches (Page 6441)

Configuration - Position limits (Page 6441)

Behavior of axis when position limits is tripped (Page 6443)

## Dynamics

### Configuration - General dynamics

Configure the maximum velocity, the start/stop velocity, the acceleration and deceleration, and the jerk limit (positioning axis technology object as of V2) of the axis in the "General dynamics" configuration window.

### Velocity limiting unit

Select the unit of measurement with which you want to set the velocity limits in the dropdown list. The unit set here depends on the unit of measurement set under "Configuration - General" and serves only for easier input.

### Maximum velocity / Start/stop velocity

Define the maximum permissible velocity and the start/stop velocity of the axis in these boxes. The start/stop velocity is the minimum permissible velocity of the axis.

Limit values:

The limits indicated below refer to the "Pulses/s" unit of measurement:

- **Positioning axis technology object V4**

- $1 \leq \text{start/stop velocity} \leq 20000$  (signal board 20 kHz)  
 $1 \leq \text{start/stop velocity} \leq 200000$  (signal board 200 kHz)  
 $1 \leq \text{start/stop velocity} \leq 100000$  (on-board CPU outputs 100 kHz)  
 $1 \leq \text{start/stop velocity} \leq 30000$  (on-board CPU outputs 30 kHz)  
 $1 \leq \text{start/stop velocity} \leq 1000000$  (on-board CPU outputs 1 MHz CPU 1217)
- $1 \leq \text{maximum velocity} \leq 20000$  (signal board 20 kHz)  
 $1 \leq \text{maximum velocity} \leq 200000$  (signal board 200 kHz)  
 $1 \leq \text{maximum velocity} \leq 100000$  (on-board CPU outputs 100 kHz)  
 $1 \leq \text{maximum velocity} \leq 30000$  (on-board CPU outputs 30 kHz)  
 $1 \leq \text{maximum velocity} \leq 1000000$  (on-board CPU outputs 1 MHz CPU 1217)

You can learn about the limits for the technology object positioning axis < V4 in the appendix Outputs of the CPU relevant for Motion Control (technology version V1...3) (Page 6568).

The value of the maximum velocity must be greater or equal to the value of the start/stop velocity.

The limits for other units of measurement must be converted by the user to conform to the given mechanics.

### Acceleration / Delay - Ramp-up time / Ramp-down time

Set the desired acceleration in the "Ramp-up time" or "Acceleration" boxes. The desired deceleration can be set in the "Deceleration time" or "Deceleration" boxes.

The relation between the ramp-up time and acceleration and the deceleration time and deceleration is shown in the following equations:

$$\text{Rampup time} = \frac{\text{Maximum velocity} - \text{Start/stop velocity}}{\text{Acceleration}}$$

$$\text{Deceleration time} = \frac{\text{Maximum velocity} - \text{Start/stop velocity}}{\text{Deceleration}}$$

Motion jobs started in the user program are performed with the selected acceleration / deceleration.

The limits for acceleration and deceleration can be found in section Hardware components for motion control (Page 6410).

---

#### Note

Changes to the velocity limits ("start/stop velocity" and "maximum velocity") influence the acceleration and deceleration values of the axis. The ramp-up and deceleration times are retained.

---

**Activate the jerk limit (positioning axis technology object as of V2)**

Activate the jerk limit with this check box.

**Note**

If an error occurs, the axis decelerates with the configured emergency stop deceleration. An activated jerk limit is not considered here.

**Smoothing time / jerk (positioning axis technology object as of V2)**

You can input the parameters of the jerk limit in the "Smoothing time" box or alternatively in the "Jerk" box.

- Set the desired jerk for acceleration and deceleration ramp in the "Jerk" box.
- Set the desired smoothing time for the acceleration ramp in the "Rounding time" box.

**Note****Smoothing time V2...3**

The set smoothing time visible in the configuration only applies to the acceleration ramp.

If the values for acceleration and deceleration differ, the smoothing time of the deceleration ramp is calculated according to the jerk of the acceleration ramp and used. (See also Behavior of the axis when using the jerk limit (Page 6452))

The smoothing time of the deceleration is adapted as follows:

- **Acceleration > deceleration**  
The smoothing time used for the deceleration ramp is shorter than that for the acceleration ramp.
- **Acceleration < deceleration**  
The smoothing time used for the deceleration ramp is greater than that for the acceleration ramp.
- **Acceleration = deceleration**  
The smoothing times of the acceleration and deceleration ramp are equal.

The relation between smoothing times and jerk is shown in the following equation:

$$\text{Rounding off time (acceleration ramp)} = \frac{\text{Acceleration}}{\text{Jerk}}$$

$$\text{Rounding off time (deceleration ramp)} = \frac{\text{Deceleration}}{\text{Jerk}}$$

Motion jobs started in the user program are performed with the selected jerk.

The limits for the jerk can be found in section Hardware components for motion control (Page 6410).

### See also

Behavior of the axis when using the jerk limit (Page 6452)

Hardware components for motion control (Page 6410)

Configuration - Dynamics emergency stop (Page 6450)

Changing the configuration of dynamics in the user program (Page 6453)

### Configuration - Dynamics emergency stop

Configure the emergency stop deceleration of the axis in the "Dynamics emergency stop" configuration window. In the event of an error, and when disabling the axis, the axis is brought to a standstill with this deceleration using the Motion Control instruction "MC\_Power" (input parameter StopMode = 0 or 2).

### Velocity limits

The velocity values configured in the "General dynamics" configuration window are once again displayed in this information area.

### Deceleration

Set the deceleration value for emergency stop in the "Emergency stop deceleration" or "Emergency stop ramp-down time" field.

The relation between emergency stop deceleration time and emergency stop deceleration is shown in the following equation:

$$\text{Emergency stop ramp-down} = \frac{\text{Maximum velocity} - \text{Start/stop velocity}}{\text{Emergency stop deceleration}}$$

The specified emergency stop deceleration must be sufficient to bring the axis to a standstill in a timely manner in the event of an emergency (for example, when the hardware limit switch is approached prior to reaching the mechanical endstop).

The configured maximum velocity of the axis must be used as a basis for selecting the emergency stop deceleration.

Limit values:

The limits indicated below refer to the "Pulses/s<sup>2</sup>" unit of measurement:

- As of CPU firmware V3  
0.005 ≤ emergency stop deceleration ≤ 9.5E9
- CPU Firmware V1...2  
0.28 ≤ emergency stop deceleration ≤ 9.5E9

The limits for other units of measurement must be converted to conform to the given mechanics.

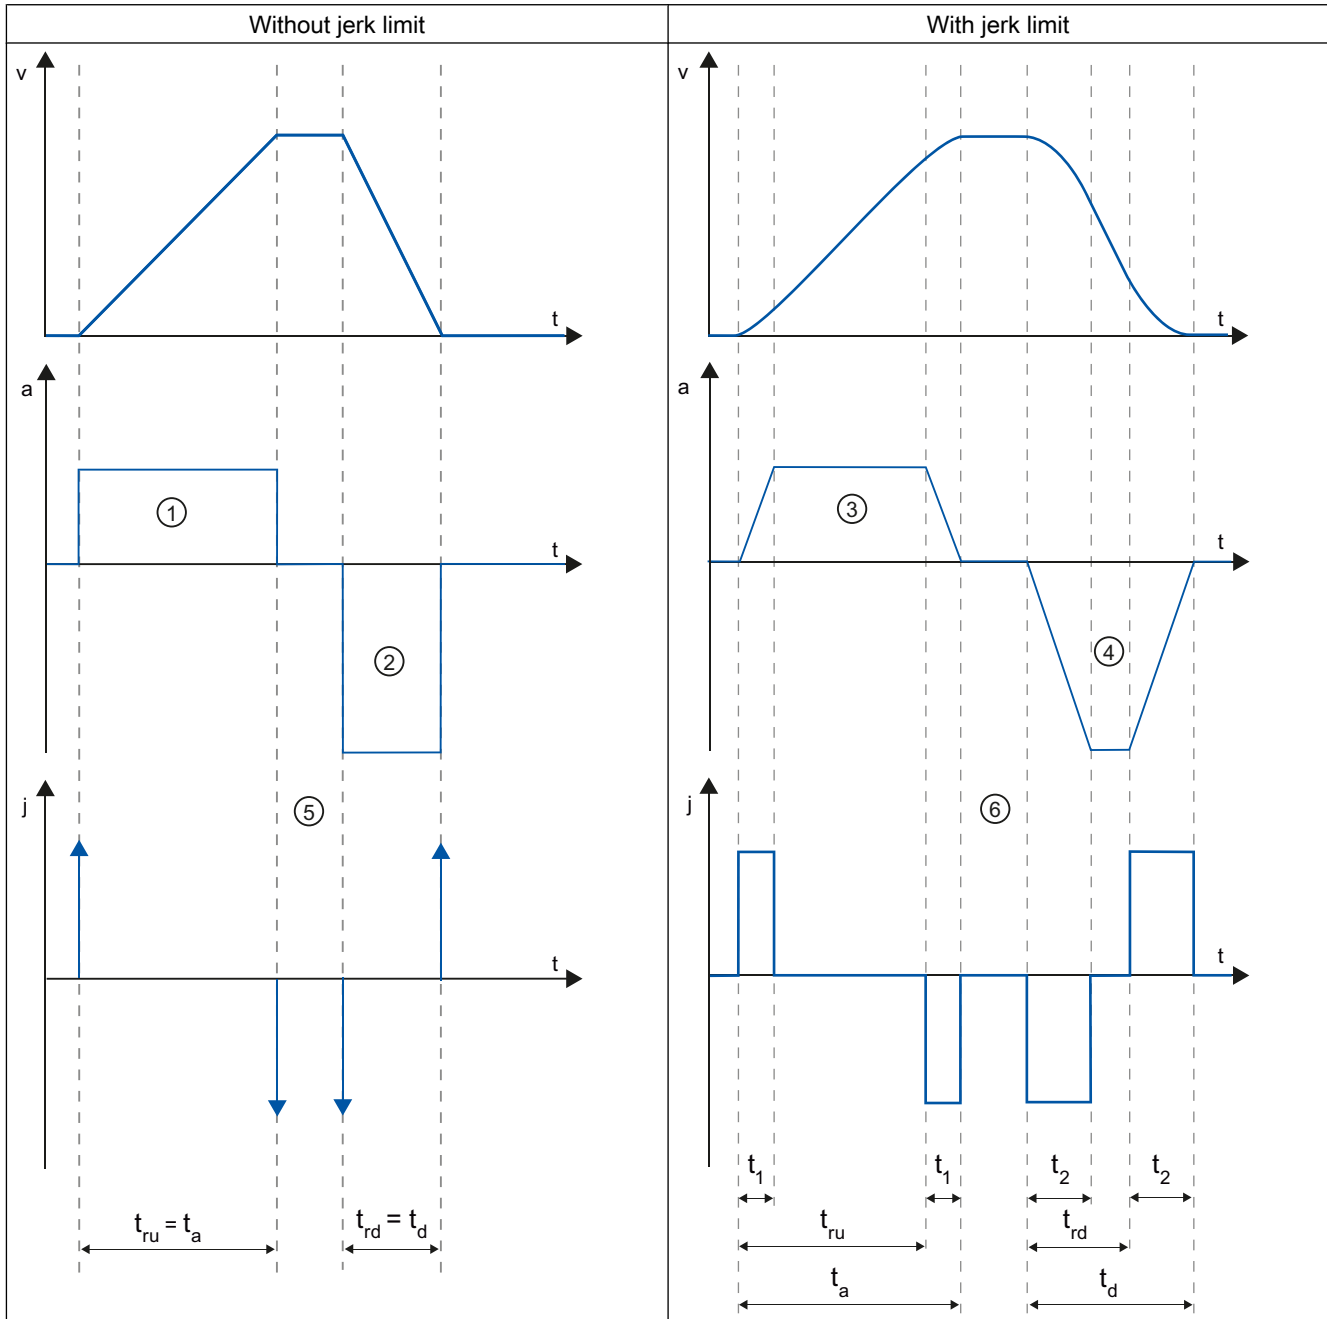

**See also**

Configuration - General dynamics (Page 6445)

Changing the configuration of dynamics in the user program (Page 6453)

### Behavior of the axis when using the jerk limit

Axis acceleration and deceleration is not stopped abruptly when the jerk limit is activated; it is adjusted gently according to the set step or smoothing time. The diagram below details the behavior of the axis with and without activated jerk limit:

t	Time axis
v	Velocity
a	Acceleration

j	Jerk
$t_{ru}$	Rampup time
$t_a$	Time taken for the axis to accelerate
$t_{rd}$	Deceleration time
$t_d$	Time taken for the axis to decelerate
$t_1$	Smoothing time of the acceleration ramp
$t_2$	Smoothing time of the deceleration ramp

The example shows travel in which the deceleration value ② is twice the acceleration value ①. The resulting ramp-down time  $t_{rd}$  is therefore only half the length of the ramp-up time  $t_{ru}$ .

Acceleration ① and deceleration ② change abruptly without a jerk limit. Acceleration ① and deceleration ② change gradually with activated jerk limiter. As the jerk applies to entire motion, the rate is the same for the increase and decrease in acceleration and deceleration.

The step value j becomes infinitely high ⑤ as soon as the change is made without jerk limit. The step is limited to the configured value ⑥ when the jerk limit is activated.

The smoothing time  $t_1$  given in the configuration applies to the acceleration ramp. The deceleration ramp smoothing time  $t_2$  is calculated from the configured jerk value and the configured deceleration.

## See also

Configuration - General dynamics (Page 6445)

## Changing the configuration of dynamics in the user program

You can change the following configuration parameters during runtime of the user program in the CPU:

### Acceleration and deceleration

You can also change the values for acceleration and deceleration during runtime of the user program. Use the following technology object tags for this purpose:

- <Axis name>.DynamicDefaults.Acceleration  
for changing acceleration
- <Axis name>.DynamicDefaults.Deceleration  
for changing deceleration

Refer to the description of the technology object tags (Page 6548) in the appendix for information on when changes to the configuration parameters take effect.

## Emergency stop deceleration

You can also change the value for the emergency stop deceleration during runtime of the user program. Use the following technology object tag for this purpose:

- <Axis name>.DynamicDefaults.EmergencyDeceleration

Refer to the description of the technology object tags in the appendix for information on when changes to the configuration parameter take effect.

---

### Note

After changes to this parameter, it may be necessary to adapt the positions of the hardware limit switches and other safety-relevant settings.

---

## Jerk limit

You can also activate and deactivate the jerk limit at runtime of the user program and change the value for the jerk. To do this, use the technology object tag <Axis name>.DynamicDefaults.Jerk.

If you enter a value  $> 0.004$  pulse/s<sup>3</sup> for the jerk, the jerk limit is activated with the specified value.

If you enter a value = 0.0 for the jerk, the jerk limit is deactivated.

Refer to the description of the technology object tags in the appendix for information on when changes to the configuration parameter take effect.

Compatibility list of tags (Page 6425)

MC\_ChangeDynamic: Change dynamic settings of axis V4 (Page 2906)

Configuration - General dynamics (Page 6445)

Configuration - Dynamics emergency stop (Page 6448)

## Homing (positioning axis technology object as of V2)

### Configuration - Homing - Passive

Configure the necessary parameters for passive homing in the "Homing - Passive" configuration window.

The movement for passive homing must be triggered by the user (e.g. using an axis motion command). Passive homing is started using Motion Control instruction "MC\_Home" with input parameter "Mode" = 2.

### Homing switch input

Select the digital input for the homing switch from the drop-down list. The input must be interrupt-capable. The on-board CPU inputs and the inputs of an inserted signal board can be selected as inputs for the homing switch.

---

#### Note

The digital inputs are set to a filter time of 6.4 ms by default.

When the digital inputs are used as a homing switch, this can result in undesired decelerations and thus inaccuracies. Depending on the homing velocity and extent of the homing switch, the home position may not be detected. The filter time can be set under "Input filter" in the device configuration of the digital inputs.

The specified filter time must be less than the duration of the input signal at the homing switch.

---

### Active level

In the drop-list, select the level of the homing switch that is to be used for homing.

### Side of the homing switch

This is where you select whether the axis is to be homed on the low or high end of the homing switch.

### Home position

The position configured in the Motion Control instruction "MC\_Home" is used as the home position.

---

#### Note

If passive homing is carried out without an axis motion command (axis at a standstill), homing will be executed upon the next rising or falling edge at the homing switch.

---

### Configuration - Homing - Active

Configure the necessary parameters for active homing in the "Active homing" configuration window. Active homing is started using Motion Control instruction "MC\_Home" with input parameter "Mode" = 3.

### Homing switch input

Select the digital input for the homing switch from the drop-down list. The input must be interrupt-capable. The on-board CPU inputs and the inputs of an inserted signal board can be selected as inputs for the homing switch.

---

#### Note

The digital inputs are set to a filter time of 6.4 ms by default.

When the digital inputs are used as a homing switch, this can result in undesired decelerations and thus inaccuracies. Depending on the homing velocity and extent of the homing switch, the home position may not be detected. The filter time can be set under "Input filter" in the device configuration of the digital inputs.

The specified filter time must be less than the duration of the input signal at the homing switch.

---

### Active level

In the drop-list, select the level of the homing switch that is to be used for homing.

### Allowing direction reversal at the hardware limit switch

Activate the check box to use the hardware limit switch as a reversing cam for the homing procedure. The hardware limit switches must be enabled for the reversal of direction (at least the hardware limit switch in the direction of approach must be configured).

If the hardware limit switch is reached during active homing, the axis brakes at the configured deceleration (not with the emergency stop deceleration) and reverses direction. The homing switch is then sensed in reverse direction.

If the direction reversal is not active and the axis reaches the hardware limit switch during active homing, the homing procedure is aborted with an error and the axis is braked at the emergency stop deceleration.

---

#### Note

If possible, use one of the following measures to ensure that the machine does not travel to a mechanical endstop in the event of a direction reversal:

- Keep the approach velocity low.
  - Increase the configured acceleration/deceleration.
  - Increase the distance between the hardware limit switch and the mechanical endstop.
- 

### Approach/homing direction

With the direction selection, you determine the approach direction used during active homing to search for the homing switch, as well as the homing direction. The homing direction specifies the travel direction the axis uses to approach the configured end of the homing switch to carry out the homing operation.

### Side of the homing switch

This is where you select whether the axis is to be homed on the low or high end of the homing switch.

### Approach velocity

In this box, specify the velocity at which the homing switch is to be searched for during the homing procedure.

Limits (independent of the selected unit of measurement):

- Start/stop velocity  $\leq$  approach velocity  $\leq$  maximum velocity

### Homing velocity

In this box, specify the velocity at which the homing switch is to be approached for homing.

Limits (independent of the selected unit of measurement):

- Start/stop velocity  $\leq$  Homing velocity  $\leq$  Maximum velocity

### Home position offset

If the desired home position deviates from the position of the homing switch, the home position offset can be specified in this box.

If the value does not equal 0, the axis executes the following actions following homing at the homing switch:

1. Move the axis at the homing velocity by the value of the home position offset
2. Upon reaching the "home position offset", the axis is at the home position that was specified in input parameter "Position" of the "MC\_Home" Motion Control instruction.

Limits (independent of the selected unit of measurement):

- $-1.0e12 \leq$  home position offset  $\leq 1.0e12$

### Home position

The position configured in the Motion Control instruction "MC\_Home" is used as the home position.

### Sequence - Passive homing

Passive homing is started with Motion Control instruction "MC\_Home" (input parameter Mode = 2). Input parameter "Position" specifies the absolute reference point position.

The diagram below shows an example of a characteristic curve for passive homing with the following configuration parameters:

- "Reference point switch side" = "High side"

### Movement towards reference point switch (red section of curve)

The Motion Control instruction "MC\_Home" does not itself carry out any homing motion when passive homing is started. The travel required for reaching the reference point switch must be implemented by the user via other motion control instructions such as "MC\_MoveRelative". The tag <axis name>.StatusBits.HomingDone remains TRUE during passive homing if the axis has already been homed.

### Axis homing (transition from red to green section of curve)

The axis is homed when the configured side of the reference point switch is reached. The current position of the axis is set to the reference point position. This is specified at the "Position" parameter of the "MC\_Home" Motion Control instruction. The variable <axis name>.StatusBits.HomingDone will be set to "TRUE" if the axis has not been homed before. The travel previously started is not cancelled.

### Movement beyond reference point switch (green section of curve)

Following homing at the reference point switch, the axis continues and completes the previously started travel with the corrected axis position.

## Sequence - Active homing

You start active homing with motion control instruction "MC\_Home" (input parameter Mode = 3). The "Position" input parameter specifies the absolute home position. Alternatively, you can start active homing on the axis command table for test purposes.

The diagram below shows an example of a characteristic curve for an active reference point approach with the following configuration parameters:

- "Approach/homing direction" = "Positive direction"
- "Side of the homing switch" = "Top side"
- Value of "home position offset" > 0

### Search for homing switch (blue curve section)

When active homing starts, the axis accelerates to the configured "approach velocity" and searches at this velocity for the homing switch. The tag <axis name>.StatusBits.HomingDone is set to FALSE.

### Reference point approach (red curve section)

When the homing switch is detected, the axis in this example brakes and reverses, to be homed to the configured side of the homing switch at the configured homing velocity. Homing causes the tag <axis name>.StatusBits.HomingDone to change to TRUE.

### Travel to home position offset (green curve segment)

After homing, the axis moves at the homing velocity along the path to the home position offset. There the axis is at the homing point position that was specified in input parameter "Position" of the "MC\_Home" Motion Control instruction.

## See also

Configuration - Homing - General (Axis technology object V2...3) (Page 6578)

## Changing the homing configuration in the user program

With positioning axis technology object as of V2, you can change the following configuration parameters during runtime of the user program in the CPU:

### Passive homing

You can change the end of the homing switch for passive homing during the user program runtime. Use the following technology object tag for this purpose:

- <Axis name>.Sensor[1].PassiveHoming.SideInput  
for changing the end of the homing switch

Refer to the description of the technology object tags (Page 6548) in the appendix for information on when changes to the configuration parameter take effect.

### Active homing

You can change the direction of approach, the end of the homing switch, the approach velocity, the homing velocity, and the home position offset for active homing during the program runtime of the user program. Use the following technology object tags for this purpose:

- <Axis name>.Homing.AutoReversal  
for changing the auto reverse at the HW limit switch
- <Axis name>.Homing.ApproachDirection  
for changing the approach/homing direction
- <Axis name>.Sensor[1].ActiveHoming.SideInput  
for changing the end of the homing switch
- <Axis name>.Homing.ApproachVelocity  
for changing the approach velocity
- <Axis name>.Homing.ReferencingVelocity  
for changing the homing velocity
- <Axis name>.Sensor[1].ActiveHoming.HomePositionOffset  
for changing the home position offset

Refer to the description of the technology object tags in the appendix for information on when changes to the configuration parameter take effect.

## See also

Compatibility list of tags (Page 6425)

MC\_ChangeDynamic: Change dynamic settings of axis V4 (Page 2906)

## 11.2.6 Technology object command table

### 11.2.6.1 Use of the command table technology object

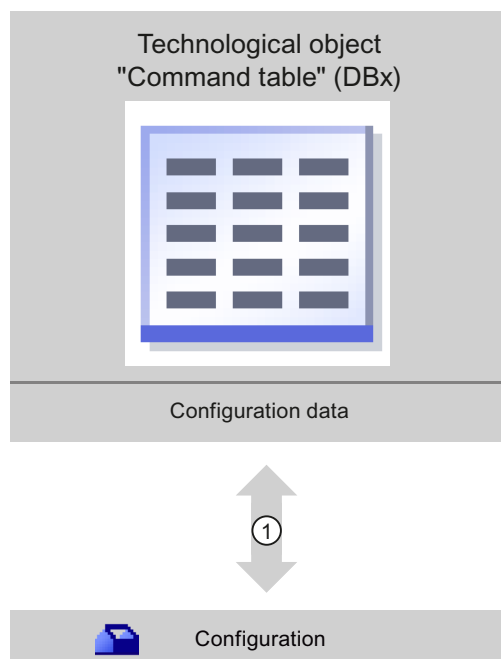

The Motion Control instruction "Command table" allows you to combine multiple individual axis control commands in one movement sequence. The technology object can be used with technology version as of V2.

You configure the movement sequence as a table in a configuration dialog.

The motion profile of the movement sequences can be checked on a graph before the project is loaded to the CPU. The command tables created are then linked to an axis and used in the user program with the "MC\_CommandTable" Motion Control instruction. You can process part or all of the command table.

### 11.2.6.2 Command table technology object tools

The "Configuration" tool is provided in the TIA Portal for the "Command Table" technology object. The representation below shows the interaction of the tool with the technology object:

① Writing and reading the configuration of the technology object

## Configuration

Configure the following properties of the "Command Table" technology object with the "Configuration" tool:

- You can create one or more movement sequences by configuring individual jobs.
- You can configure the graphic display to check your movement sequence using an axis already configured or a configurable default axis.

The movement sequence data are saved in the data block of the technology object.

### 11.2.6.3 Adding the technological object command table

#### Requirements

- A project with a CPU S7-1200 has been created.
- The CPU firmware version is V2.1 or higher

#### Procedure

Proceed as follows to add a "Command table" technology object in the project tree:

1. Open the "CPU > Technology objects" folder in the project tree.
2. Double-click the "Add new object" command.  
The "Add new object" dialog opens.
3. Select the "Motion Control" technology.
4. Open the "Motion Control > S7-1200 Motion Control" folder.
5. Select the desired technology version in the "Version" column.
6. Select the "TO\_CommandTable" object.
7. Enter the name of the command table in the "Name" input box.
8. To change the automatically assigned data block number, select the "Manual" option.
9. To display additional information about the technology object, click "Additional information".
10. Confirm your entry with "OK".

#### Result

The new technology object is created and saved to the "Technology objects" folder in the project tree.

#### 11.2.6.4 Configuring the command table technology object

##### Working with the configuration dialog

You configure the properties of the technology object in the configuration window. Proceed as follows to open the configuration window of the technology object:

1. Open the group of the required technology object in the project tree.
2. Double-click the "Configuration" object.

The configuration is divided into the following categories:

- **Basic parameters**  
The basic parameters contain all parameters which must be configured for a functional command table.
- **Extended parameters**  
The extended parameters contain the parameters of the default axis or display the parameter values of the axis selected.

##### Configuration window icons

Icons in the area navigation of the configuration show additional details about the status of the configuration:

	<b>The configuration contains default values and is complete.</b> The configuration contains only default values. With these default values, you can use the technology object without additional changes.
	<b>The configuration contains values set by the user and is complete.</b> All input fields of the configuration contain valid values and at least one preset value has changed.
	<b>The configuration is incomplete or incorrect</b> At least one input field or drop-down list contains an invalid value. The corresponding field or the drop-down list is displayed on a red background. Click the roll-out error message to display the cause of the error.
	<b>The configuration contains mutually incompatible parameter values</b> The configuration contains parameter values that contradict each other either in size or logic. The corresponding field or the drop-down list is displayed on a yellow background.

##### See also

Guidelines on use of motion control (Page 6422)

Basic parameters (Page 6464)

Extended parameters (Page 6477)

### Compare values

The "Compare values" function provides the following options:

- Comparison of configured start values of the project with the start values in the CPU and the actual values
- Direct editing of actual values and the start values of the project
- Immediate detection and display of input errors with suggested corrections
- Backup of actual values in the project
- Transfer of start values of the project to the CPU as actual values

### Icons and operator controls

The following icons and operator controls are available:

Icon	Function
	Start value in CPU matches the configured Start value in the project
	Start value in CPU does not match the configured Start value in the project
	The comparison of the Start value in CPU with the configured Start value in the project cannot be performed
	Backs up the actual values in the project
	Transfers updated start values in the project to the CPU (initialize setting values)
	Opens the "Compare values" dialog

### Basic parameters

#### Configuration - General

Configure the name of the technology object in the "General" configuration window.

#### Name

Define the name of the command table or the name of the "Command table" technology object in this field. The technology object will be listed under this name in the project tree.

#### See also

Configuration - Command table (Page 6465)

Shortcut menu commands - Curve chart (Page 6473)

Transition from "Complete command" to "Blend motion" (Page 6474)

Changing the command table configuration in the user program (Page 6476)

## Configuration - Command table

Create the desired movement sequence in the "Command Table" configuration window and check the result against the graphic view in the trend diagram.

---

### Note

Small deviations are possible between the time behavior and position in the trend shown and the real movement of the axis. Movements in response to software limit switches being reached are not shown.

---

## Activate warnings

Activate the display of warnings in the command table with this checkbox.

## Use axis parameters of

From the drop-down list, select which axis parameters are to be used for selecting the graphic view of and checking the movement sequence. Select "Default axis" if you have yet to add an axis to the "Technology object" folder or wish to use value which have not been configured in any of the available axes. You configure the properties of the default axis under "Advanced parameters".

The axis parameters of the axis selected at the "Axis" parameter are used to process the command table in the user program.

## Column: Step

Shows the step number of the command.

## Column: Command type

In this column, select the command types which are to be used for processing the command table. Up to 32 commands can be entered. The commands will be processed in sequence. You can choose between the following entries and command types:

- **Empty**  
The entry serves as a placeholder for any commands to be added. The empty entry is ignored when the command table is processed.
- **Halt**  
Stop axis  
(the command only takes effect after a "Velocity set point" command)
- **Positioning Relative**  
Position axis relatively

- **Positioning Absolute**  
Position axis absolutely
- **Velocity set point**  
Move axis at set velocity
- **Wait**  
Waits until the given period is over. Wait does not stop active traversing.
- **Separator**  
Adds a Separator line above the selected line. The Separator line acts as a range limit for the graphic display of the trend view.  
Use the Separator lines if you wish to process parts of the command table.

### Column: Position

Enter the position or travel path for the selected command in this column:

- **Command "Positioning Relative"**  
The command will move the axis by the the given travel path.
- **Command "Positioning Absolute"**  
The command will move the axis by the the given position.
- **Separator**  
The value given specifies the start position for the graphic display.

Limit values (independent of the selected user unit):

- $-1.0e12 \leq \text{position / distance} \leq -1.0e-12$
- $1.0e-12 \leq \text{position / distance} \leq 1.0e12$
- Position / travel path = 0.0

### Column: Velocity

In this column, you enter the velocity for the selected command:

- **Command "Positioning Relative"**  
The command will move the axis at the the given velocity.  
The given velocity will not be reached if the travel path selected is not large enough.
- **Command "Positioning Absolute"**  
The command will move the axis at the the given velocity.  
The given velocity will not be reached if the target position is too close to the starting position.
- **Command " Velocity set point"**  
The command will move the axis at the the given velocity.  
The given velocity will not be reached during the command if too short a runtime is selected.

Limit values (independent of the selected user unit):

- For the commands: "Positioning Relative" and "Positioning Absolute"
  - $1.0e-12 \leq \text{velocity} \leq 1.0e12$
- For the command: "Velocity set point"
  - $-1.0e12 \leq \text{velocity} \leq -1.0e-12$
  - $1.0e-12 \leq \text{velocity} \leq 1.0e12$
  - Velocity = 0.0

### Column: Duration

Enter the duration of the selected command in this column:

- **Command "Velocity set point"**

The command will move the axis for the specified duration. The duration includes both the acceleration phase and the constant travel phase. The next command will be processed once the duration is over.
- **Command "Wait"**

Waits until the given duration is over.

Limit values (independent of the selected user unit):

- $0.001s \leq \text{duration} \leq 64800s$

### Column: Next step

Select the mode of transition to the next step from the drop-down list:

- **Complete command**

The command will be completed. The next command will be processed immediately.
- **Blend motion**

The motion of the current command will be blended with the motion of the following command. The transition mode "Blend motion" is available with command types "Positioning Relative" and "Positioning Absolute".  
Motion will be blended with motions of the following command types:

  - Positioning Relative
  - Positioning Absolute
  - Velocity set point

No blending occurs with other command types.

For the exact behavior of the axis when a command is appended or overlapped, see: Transition from "Complete command" to "Blend motion" (Page 6474)

### Column: Step code

Enter a numerical value / bit pattern in this column which is to be output at the "StepCode" output parameter of the "MC\_CommandTable" Motion Control instruction while the command is being processed.

Limit values:

- $0 \leq \text{code number} \leq 65535$

Changing the command table configuration in the user program (Page 6476)

### Shortcut menu commands - Command table

The following shortcut menu commands are available in the command table:

#### Insert empty line

Adds an empty line above the selected line.

This shortcut menu command can only be executed if there are enough empty lines at the end of the command table.

#### Add empty line

Adds an empty line below the selected line.

This shortcut menu command can only be executed if there are enough empty lines at the end of the command table.

#### Insert separator line

Adds a separator line above the selected line.

You cannot have two consecutive separator lines.

#### Add separator line

Adds a separator line below the selected line.

You cannot have two consecutive separator lines, nor can you add a separator line at the end of the command table.

#### Cut

Removes the selected lines or content of the selected cell and saves them/it in the clipboard.

Selected lines will be deleted and the subsequent lines of the command table shifted up.

## **Copy**

Copies the selected lines or content of the selected cell and saves them/it in the clipboard.

## **Paste**

- Selected lines:  
Pastes the lines from the clipboard into the table above the selected line.
- Selected cell:  
Pastes the content of the clipboard into the selected line.

This shortcut menu command can only be executed if there are enough empty lines at the end of the command table.

## **Replace**

Replaces the selected lines with the lines in the clipboard.

## **Delete**

Deletes the selected lines. The lines below in the command table shift up.

## **See also**

Changing the command table configuration in the user program (Page 6476)

## **Working with the trend diagram**

The following tools and information are available in the trend view.

### Trend view and components

①	Trend view
②	Position curve
③	Velocity curve
④	Curve section of a selected command
⑤	Ruler
⑥	Ruler position marking
⑦	Software limit switch position
⑧	Start/stop velocity
⑨	Position axis scale range
⑩	Time axis scale range
⑪	Velocity axis scale range
⑫	Scroll bar, position axis
⑬	Scroll bar time axis
⑭	Scroll bar, velocity axis
⑮	Selecting the grid

### Selecting separator sections

If the command table consists of multiple sections separated by separators, you can select these sections in the trend view by selecting a command in the section.

## Selecting commands

Commands can be selected in the trend view and in the command table:

- Click on a point on the velocity or position curve in the trend view. The corresponding command will be highlighted in the command table.
- Select a command in the command table.  
The corresponding section of curve will be highlighted.

## Selecting the visible range of the trend view

Follow the steps below to adjust the section of the trend view to be displayed:

Select the scaling in the shortcut menu:

- Scale to curves:  
Scales the axes so the position and velocity curves are visible.
- Scale to curves and limits:  
Scales the axes so the position and velocity curves, the positions of the activated software limit switches and the minimum and maximum velocity limits are visible.

The view selected will be marked in the shortcut menu with a tick.

Selecting the section to be shown within the range:

①	Range which the curve values and / or limits are within. (see Selecting in the shortcut menu)
②	<p>Selected range to be shown in the trend window.                  You set the range with the margin cursor at the right-hand and left-hand margin.</p>  <p>You set the position within range ① with the drag cursor.</p>  <p>You can also define the position by clicking in range ①.</p> 

Selecting the section to be shown with the mouse:

Drag a section of the trend view by clicking and dragging with the mouse. The section of curve selected will be enlarged once you release the mouse.

Undoing the last change to the section:

Select the shortcut command "Undo zoom" to undo the last change to the section.

### Synchronizing the grid

Click on the axis scales to select whether the grid is to be synchronized with the position axis or velocity axis.

### Reading off curve values from the ruler

Activate the ruler using the shortcut menu command "Show ruler".

You can move the ruler to any point on the curves using the ruler cursor.

### See also

Configuration - General (Page 6462)

Configuration - Command table (Page 6463)

Shortcut menu commands - Command table (Page 6466)

Shortcut menu commands - Curve chart (Page 6473)

Transition from "Complete command" to "Blend motion" (Page 6474)

Changing the command table configuration in the user program (Page 6476)

### Shortcut menu commands - Curve chart

The following shortcut menu commands are available in the curve window:

#### Zoom 100%

Selects a zoom factor which will show 100% of the curve values and / or limits.

#### Undo zoom

Undoes the last zoom change.

#### Scale to curves

Scales the axes so the position and velocity curves are visible.

#### Scale to curves and limits

Scales the axes so the position and velocity curves, the positions of the activated software limit switches and the minimum and maximum velocity limits are visible.

#### Show velocity limits

Shows the lines of the velocity limits.

### **Show software limit switches**

Shows the lines of the software limit switches.

### **Show ruler**

Fades the ruler in / out

Use the ruler when you want to see the individual values of the curves.

### **See also**

Configuration - General (Page 6462)

Shortcut menu commands - Command table (Page 6466)

Working with the trend diagram (Page 6467)

Transition from "Complete command" to "Blend motion" (Page 6474)

Changing the command table configuration in the user program (Page 6476)

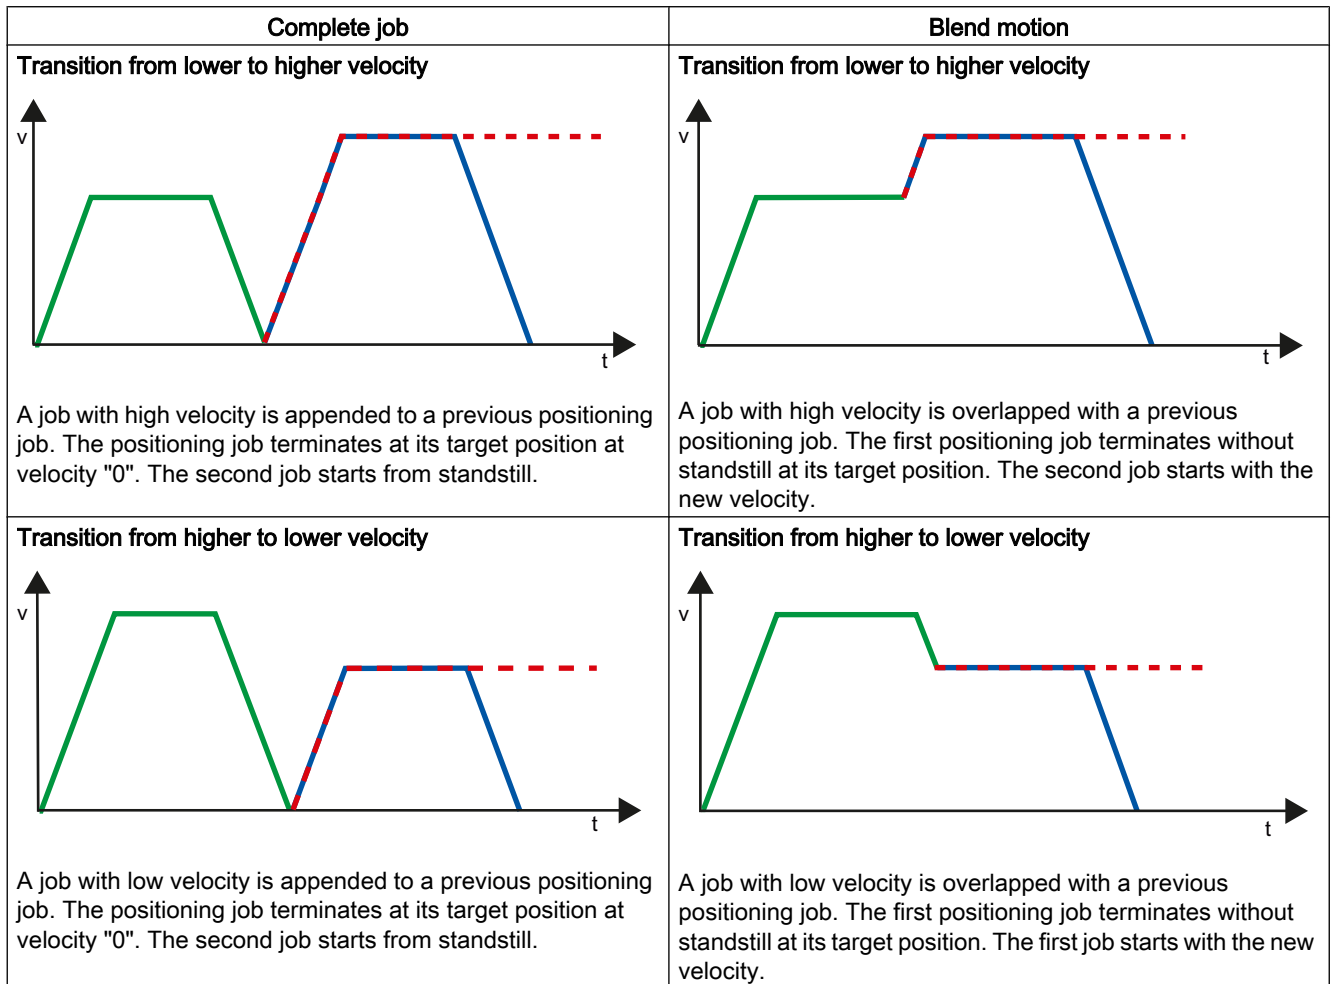

### **Transition from "Complete command" to "Blend motion"**

The charts below show the transition between movements in various different transition modes in the "Next step" column:

### Motion transition with preceding positioning jobs

The following diagrams show a command sequence with two motion tasks. The first command is for positioning (green). The second command is for velocity (red) or positioning (blue):

	1. Job "Positioning Relative" or "Positioning Absolute"
	2. Job "Velocity set point"
	2. Job "Positioning Relative" or "Positioning Absolute"

### Motion transition with preceding velocity jobs

The following diagrams show a command sequence with two motion tasks. The first command is for velocity (violet). The second command is for velocity (red) or positioning (blue):

- - -	1 Job "Velocity set point"
- - -	2 Job "Velocity set point"
— — —	2 Job "Positioning Relative" or "Positioning Absolute"

- Changing the command table configuration in the user program (Page 6476)

### Changing the command table configuration in the user program

You can change the following configuration parameters during runtime of the user program in the CPU:

### Commands and corresponding values

You can also change the parameters of the command table during the runtime of the user program. Use the following technology object tags for this purpose:

- <Table name>.Command[1..32].Type  
for changing the command type
- <Table name>.Command[1..32].Position  
for changing the position/travel distance

- <Table name>.Command[1..32].Velocity  
for changing the velocity
- <Table name>.Command[1..32].Duration  
for changing the duration
- <Table name>.Command[1..32].NextStep  
for changing the parameter "Next step"
- <Table name>.Command[1..32].StepCode  
for changing the step code

Refer to the description of the technology object tags (Page 6567) in the appendix for information on when changes to the configuration parameters take effect.

### Extended parameters

### Chart parameters

### Configuration - General

Configure the basic properties of the chart view of the "Command table" technology object in the "General" configuration window.

---

#### Note

If the default axis has been selected under "Use axis parameters of", the unit of measurement can be edited. If a configured axis has been selected, the unit of measurement for this axis will be displayed.

---

### Use axis parameters of

From the drop-down list, select which axis parameters are to be used for selecting the graphic view of and checking the movement sequence. Select "Default axis" if you have yet to add an axis to the "Technology object" folder or wish to use values which have not been configured in any of the available axes.

The axis parameters of the axis selected at the "Axis" parameter will be used to process the command table in the user program.

### Unit of measurement

Enter the unit of measurement for the default axis in this field. If a preconfigured axis has been selected under "Use axis parameters of", the unit of measurement configured in these parameter will be displayed.

### Configuration - Dynamics

Configure the acceleration and deceleration and the jerk limit for the default axis in the "Dynamics" configuration window.

---

#### Note

If the default axis has been selected under "Use axis parameters of", the following fields can be edited. If a configured axis has been selected, the values of this axis will be displayed.

---

### Acceleration / deceleration

Set the desired acceleration of the default axis in the "Acceleration" field. The desired deceleration can be set in the "Deceleration" field.

Motion jobs configured in the command table will be calculated with the selected acceleration / deceleration.

Limit values:

- $1.0e-12 \leq \text{acceleration} \leq 1.0e12$
- $1.0e-12 \leq \text{deceleration} \leq 1.0e12$

### Activate jerk limit

Activate the jerk limit with this checkbox.

### Step

Set the desired step for ramping up and ramping down in the "Step" field.

Motion jobs configured in the command table will be calculated with the selected step.

Limit values:

- $1.0e-12 \leq \text{jerk} \leq 1.0e12$

### Configuration - Limit values

Configure the maximum velocity, the start/stop velocity and the software limit switches of the default axis in the "Limits" configuration window.

---

#### Note

If the default axis has been selected under "Use axis parameters of", the following fields can be edited. If a configured axis has been selected, the values of this axis will be displayed.

---

### Maximum velocity / Start/stop velocity

Define the maximum permissible velocity and the start/stop velocity of the default axis in these fields. The start/stop velocity is the minimum permissible velocity of the default axis.

Limit values:

- $1.0e-12 \leq \text{start/stop velocity} \leq 1.0e12$   
Start/stop velocity = 0.0
- $1.0e-12 \leq \text{maximum velocity} \leq 1.0e12$   
Maximum velocity = 0.0

The value of the maximum velocity must be greater or equal to the value of the start/stop velocity.

### Enable software limit switches

Activate the function of the low and high software limit switch with this checkbox. Movements in response to software limit switches being reached are not shown in the trend view.

### Low / high software limit switch

Enter the position value of the low and high software limit switches in these fields.

Limits:

- $-1.0e12 \leq \text{low software limit switch} \leq -1.0e-12$   
 $1.0e-12 \leq \text{low software limit switch} \leq 1.0e12$   
Low software limit switch = 0.0
- $-1.0e12 \leq \text{high software limit switch} \leq -1.0e-12$   
 $1.0e-12 \leq \text{high software limit switch} \leq 1.0e12$   
High software limit switch = 0.0

The value of the high software limit switch must be greater than or equal to the value of the low software limit switch.

### 11.2.7 Download to CPU

When loading to the CPU S7-1200 always ensure that the project files are consistent after the online and offline loading. It is not possible to load single blocks. When selecting single blocks, all new and modified blocks are always loaded.

The following object groups can be loaded to the CPU:

Context menu command "Download to device"	Description
All	Download all new and modified blocks and a new or modified hardware configuration
Hardware configuration	Download a new or modified hardware configuration
Software	Download all new and modified blocks
Software (all blocks)	Download all blocks

The data of the Motion Control technology objects are saved in the data blocks. The conditions for downloading of "blocks" thus apply when loading a new or modified technology object.

 <b>CAUTION</b>
<p><b>Possible malfunctions of the axis when loading without hardware configuration</b></p> <p>The hardware configuration is modified when the following modifications are made to the axis configuration:</p> <ul style="list-style-type: none"> <li>• Modification of the pulse generator (PTO)</li> <li>• Modification of the HW limit switch address</li> <li>• Modification of the homing switch address</li> </ul> <p>If the modified configuration of the axis is loaded with the context menu commands "Software" or "Software (all blocks)" without downloading the hardware configuration, this can lead to malfunctions of the axis.</p> <p>Ensure that the current hardware configuration is downloaded to the CPU under the conditions listed below.</p>

#### Download in CPU S7-1200 RUN operating mode (from firmware version V2.2)

For CPU S7-1200 from firmware version V2.2, when loading in CPU RUN operating mode it is checked whether it is possible to load without stopping the CPU.

The following conditions apply when loading data blocks in RUN operating mode:

	Download to load memory	Download to work memory
Data block modified values	Yes	No
Data block modified structure	Yes (as of firmware V4)	Yes (as of firmware V4) <ul style="list-style-type: none"> <li>• When downloading with reinitialization</li> <li>• For tags in reserve for downloading without reinitialization</li> </ul>
	No (firmware V2.2...3)	No (firmware V2.2...3)

	Download to load memory	Download to work memory
New data block	Yes	Yes
Data block deleted	Yes	Yes

Also note the following when deleting data blocks and downloading data blocks with reinitialization:

- The axis must be locked when downloading a positioning axis technology object.
- When downloading a command table technology object, no MC\_CommandTable command with this command table must be active (parameter "Busy" = FALSE).
- When downloading an MC\_Power instance data block, no MC\_Power instruction must be active (parameter "Busy" = FALSE).

From technology version V3.0, Motion Control technology objects (data blocks) can also be downloaded in CPU RUN operating mode.

Technology objects after V3.0 cannot be downloaded in CPU RUN operating mode.

Select one of the actions described below to download the modified version of a Motion Control technology object (from version V3.0) to the work memory:

- **Technology object axis and command table**  
Change the CPU operating mode from STOP to RUN.
- **Technology object axis**  
Disable the axis and execute a "Restart" using the Motion Control instruction "MC\_Reset".
- **Technology object command table**  
Ensure that the command table is not being used. Download the data block of the command table to the work memory using the extended instruction "READ\_DBL".

## See also

Guidelines on use of motion control (Page 6422)

MC\_Reset: Acknowledge fault V4 (Page 2882)

## 11.2.8 Commissioning the axis - Axis control panel

Use the axis command table to move the axis in manual mode, to optimize the axis settings, and to test your system.

The axis control table can only be used if an online connection to the CPU is established.

---

### Note

#### Response times of the axis control panel

The response time during axis control table operation depends on the communication load of the CPU. Close all other online windows of the TIA Portal to minimize the response time.

---

### "Manual control" button

Click "Manual control" to move the axis in manual control mode. Start by disabling the axis in the user program using Motion Control instruction "MC\_Power". In "Manual control" mode, the axis control table takes over control priority for the axis functions. The user program has no influence on the axis functions until manual control is ended.

#### CAUTION

##### **Additional axes in automatic mode**

The Manual control is active for one axis only. If additional axes are in automatic mode, dangerous situations may arise as a result.

In this happens, disable all other axes.

### "Automatic mode" button

Click "Automatic mode" to end the "Manual control" mode. The axis control table passes back the control priority and the axis can be controlled by the user program again. The axis must be re-enabled in the user program and homed, if required.

Complete all active traversing motions before switching to automatic control; otherwise, the axis will be braked with the emergency stop deceleration.

### "Enable" button

Click "Enable" to enable the axis in "Manual control" mode. When the axis is enabled, the axis control panel functions can be used.

If the axis cannot be enabled because certain conditions are not met, note the error message in the "Error message" box. Information on eliminating errors is available in the appendix under "List of ErrorIDs and ErrorInfos". After the error has been corrected, enable the axis again.

### "Disable" button

Click "Disable" if you want to temporarily disable the axis in "Manual control" mode.

## "Command" area

Operation in the "Command" area is only possible if the axis is enabled. You can select one of the following command inputs:

- **Jogging**  
This command is equivalent to Motion Control command "MC\_MoveJog" in the user program.
- **Positioning**  
This command is equivalent to the Motion Control commands "MC\_MoveAbsolute" and "MC\_MoveRelative" in the user program. The axis must be homed for absolute positioning.
- **Homing**  
This command is equivalent to Motion Control command "MC\_Home" in the user program.
  - The "Set reference point" button corresponds to Mode = 0 (direct homing absolute)
  - The "Active homing" button corresponds to Mode = 3 (active homing)

For active homing, the homing switch must be configured in the axis configuration. The values for approach velocity, homing velocity, and reference position offset are taken from the axis configuration unchanged.

Depending on the selection, the relevant boxes for entry of setpoints and the buttons for starting the command are displayed.

Jerk limitation can be activated and deactivated using the "Activate jerk limit" button. By default, the jerk is applied with 10% of the configured value. This value can be changed as required.

## "Axis status" area

If "Manual control" mode is activated, the current axis status and drive status are shown in the "Axis status" area. The current position and velocity of the axis are displayed at "Process values".

Click "Acknowledge" to acknowledge all cleared errors.

The "Info message" box displays advanced information about the status of the axis.

## "Current values" area

This area displays the current position and velocity of the axis.

## Error message

The "Error message" box shows the current error. In "Manual control" mode, the error entry can be deleted by pressing the "Acknowledge" button once the error is eliminated.

---

### Note

#### Initial values for velocity, acceleration / deceleration and jerk

For safety reasons, the "Velocity", "Acceleration/deceleration" and "Jerk" parameters are initialized with values equivalent to only 10% of the configured values when the axis command table is activated. The "Jerk" parameter is only used for technology object "Axis" V2.0 and higher.

The values in the configuration view displayed when you select "Extended parameters > Dynamics > General" are used for initialization.

The "Velocity" parameter on the control panel is derived from the "Maximum velocity" and the "Acceleration/deceleration" parameters from "Acceleration" in the configuration.

The "Velocity", "Acceleration/deceleration" and "Jerk" parameters can be changed in the axis command table; this does not affect the values in the configuration.

---

## See also

Guidelines on use of motion control (Page 6422)

## 11.2.9 Parameter view

### 11.2.9.1 Introduction to the parameter view

The Parameter view provides you with a general overview of all relevant parameters of a technology object. You obtain an overview of the parameter settings and can easily change them in offline and online mode.

Name in functional view	Name in DB	...	Start value project	Data type	Comm
Invert the control logic	../InvertControl	<input checked="" type="checkbox"/>	FALSE	Bool	Enabl
Enable last mode after CPU ..	RunModeBySta...	<input checked="" type="checkbox"/>	TRUE	Bool	Activa
Physical quantity	PhysicalQuantity	<input checked="" type="checkbox"/>	General	Int	Select

- ① "Parameter view" tab
- ② Toolbar (Page 6330)
- ③ Navigation (Page 6331)
- ④ Parameter table (Page 6331)

### Function scope

The following functions are available for analyzing the parameters of the technology objects and for enabling targeted monitoring and modification.

Display functions:

- Display of parameter values in offline and online mode
- Display of status information of the parameters
- Display of value deviations and option for direct correction
- Display of configuration errors
- Display of value changes as a result of parameter dependencies
- Display of all memory values of a parameter: Start value PLC, Start value project, Monitor value
- Display of the parameter comparison of the memory values of a parameter

Operator control functions:

- Navigation for quickly changing between the parameters and parameter structures.
- Text filter for faster searches for particular parameters.
- Sorting function for customizing the order of parameters and parameter groups to requirements.
- Memory function for backing up structural settings of the Parameter view.
- Monitoring and modifying of parameter values online.
- Function for saving a snapshot of parameter values of the CPU in order to capture momentary situations and to respond to them.
- Function for applying a snapshot of parameter values as start values.
- Download of modified start values to the CPU.
- Comparison functions for comparing parameter values with one another.

## Validity

The Parameter view is available for the following technology objects:

- PID\_Compact
- PID\_3Step
- CONT\_C (S7-1500 only)
- CONT\_S (S7-1500 only)
- TCONT\_CP (S7-1500 only)
- TCONT\_S (S7-1500 only)
- TO\_Axis\_PTO (S7-1200 Motion Control)
- TO\_Positioning\_Axis (S7-1200 Motion Control)
- TO\_CommandTable\_PTO (S7-1200 Motion Control)
- TO\_CommandTable (S7-1200 Motion Control)

### 11.2.9.2 Structure of the parameter view

#### Toolbar

The following functions can be selected in the toolbar of the parameter view.

Icon	Function	Explanation
	Monitor all	Starts the monitoring of visible parameters in the active Parameter view (online mode).
	Create snapshot of monitor values and accept setpoints of this snapshot as start values	Applies the current monitor values to the "Snapshot" column and updates the start values in the project. Only in online mode for PID_Compact and PID_3Step.
	Initialize setpoints	Transfers the start values updated in the project to the CPU. Only in online mode for PID_Compact and PID_3Step.
	Create snapshot of monitor values	Applies the current monitor values to the "Snapshot" column. Only in online mode.
	Modify all selected parameters immediately and once	This command is executed once and as quickly as possible without reference to any particular point in the user program. Only in online mode.
	Select navigation structure	Toggles between functional navigation and data navigation.
	Text filter...	After entry of a character string: Display of all parameters containing the specified string in one of the currently visible columns.
	Selection of compare values	Selection of parameter values that are to be compared with one another in online mode (Start value project, Start value PLC, Snapshot) Only in online mode.
	Save window settings	Saves your display settings for the Parameter view (e.g., selected navigation structure, activated table columns, etc.)

## Navigation

Within the "Parameter view" tab, the following alternative navigation structures can be selected.

Navigation		Explanation
Functional navigation		<p>In the functional navigation, the structure of the parameters is based on the structure in the configuration dialog ("Functional view" tab), commissioning dialog, and diagnostics dialog.</p> <p>The last group "Other parameters" contains all other parameters of the technology object.</p>
Data navigation		<p>In the data navigation, the structure of the parameters is based on the structure in the instance DB.</p> <p>The last group "Other parameters" contains the parameters that are not contained in the instance DB.</p>

You can use the "Select navigation structure" drop-down list to toggle the navigation structure.

## Parameter table

The table below shows the meaning of the individual columns of the parameter table. You can show or hide the columns as required.

- Column "Offline" = X: Column is visible in offline mode.
- Column "Online" = X: Column is visible in online mode (online connection to the CPU).

Column	Explanation	Offline	Online
Name in functional view	Name of the parameter in the functional view. The display field is empty for parameters that are not configured via the technology object.	X	X
Full name in DB	Complete path of the parameter in the instance DB. The display field is empty for parameters that are not contained in the instance DB.	X	X
Name in DB	Name of the parameter in the instance DB. If the parameter is part of a structure or UDT, the prefix ". /" is added. The display field is empty for parameters that are not contained in the instance DB.	X	X
Status of configuration	Display of the completeness of the configuration using status symbols. see Status of configuration (offline) (Page 6339)	X	
Compare result	Result of the "Compare values" function. This column is shown if there is an online connection and the "Monitor all" button  is selected. see Comparing values (Page 6325)		X

Column	Explanation	Offline	Online
Start value project	Configured start value in the project. Error indication if entered values have a syntax or process-related error.	X	X
Default value	Value that is pre-assigned to the parameter. The display field is empty for parameters that are not contained in the instance DB.	X	X
Snapshot	Snapshot of the current values in the CPU (monitor values). Error indication if values have a process-related error.	X	X
Start value PLC	Start value in the CPU. This column is shown if there is an online connection and the "Monitor all" button  is selected. Error indication if values have a process-related error.		X
Monitor value	Current value in the CPU. This column is shown if there is an online connection and the "Monitor all" button  is selected. Error indication if values have a process-related error.		X
Modify value	Value that is to be used to change the monitor value. This column is shown if there is an online connection and the "Monitor all" button  is selected. Error indication if entered values have a syntax or process-related error.		X
Selection for transmission 	Selection of the Modify values that are to be transmitted using the "Modify all selected parameters immediately and once" button. This column is displayed together with the "Modify value" column.		X
Minimum value	Minimum process-related value of the parameter. If the minimum value is dependent on other parameters, it is defined: <ul style="list-style-type: none"> <li>• Offline: By the Start value project.</li> <li>• Online: By the Monitor values.</li> </ul>	X	X
Maximum value	Maximum process-related value of the parameter. If the maximum value is dependent on other parameters, it is defined: <ul style="list-style-type: none"> <li>• Offline: By the Start value project.</li> <li>• Online: By the Monitor values.</li> </ul>	X	X
Setpoint	Designates the parameter as a setpoint. These parameters can be initialized online.	X	X
Data type	Data type of the parameter. The display field is empty for parameters that are not contained in the instance DB.	X	X
Retain	Designates the value as a retentive value. The values of retentive parameters are retained even after the voltage supply is switched off.	X	X
Accessible from HMI	Indicates whether the HMI can access this parameter during runtime.	X	X
Visible in HMI	Indicates whether the parameter is visible in the selection list of the HMI by default.	X	X
Comment	Brief description of the parameter.	X	X

### 11.2.9.3 Opening the parameter view

#### Requirement

The technology object has been added in the project tree, i.e., the associated instance DB of the instruction has been created.

#### Procedure

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click the "Configuration" object.
4. Select the "Parameter view" tab in the top right corner.

#### Result

The Parameter view opens. Each displayed parameter is represented by one row in the parameter table.

The displayable parameter properties (table columns) vary depending on whether you are working with the Parameter view in offline or online mode.

In addition, you can selectively display and hide individual table columns.

#### See also

Default setting of the parameter view (Page 6333)

### 11.2.9.4 Default setting of the parameter view

#### Default settings

To enable you to work efficiently with the Parameter view, you can customize the parameter display and save your settings.

The following customizations are possible and can be saved:

- Show and hide columns
- Change column width
- Change order of the columns
- Toggle navigation
- Select parameter group in the navigation
- Selection of compare values

## Show and hide columns

To show or hide columns in the parameter table, follow these steps:

1. Position the cursor in the header of the parameter table.
2. Select the "Show/Hide" command in the shortcut menu.  
The selection of available columns is displayed.
3. To show a column, select the check box for the column.
4. To hide a column, clear the check box for the column.

or

1. Position the cursor in the header of the parameter table.
2. Select the "Show all columns" command in the shortcut menu if all columns of the offline or online mode are to be displayed.

Some columns can only be displayed in online mode: see Parameter table (Page 6331).

## Change column width

To customize the width of a column so that all texts in the rows can be read, follow these steps:

1. Position the cursor in the header of the parameter table to the right of the column to be customized until the shape of the cursor changes to a cross.
2. Then double-click this location.

or

1. Open the shortcut menu on the header of the parameter table.
2. Click
  - "Optimize column width" or
  - "Optimize width of all columns".

If the column width setting is too narrow, the complete content of individual fields are shown if you hover the cursor briefly over the relevant field.

## Change order of the columns

The columns of the parameter table can be arranged in any way.

To change the order of the columns, follow these steps:

1. Click on the column header and use a drag-and-drop operation to move it to the desired location.  
When you release the mouse button, the column is anchored to the new position.

### Toggle navigation

To toggle the display form of the parameters, follow these steps:

1. Select the desired navigation in the "Select navigation structure" drop-down list.
  - Data navigation
  - Functional navigation

See also Navigation (Page 6331).

### Select parameter group in the navigation

Within the selected navigation, you choose between the "All parameters" display or the display of a subordinate parameter group of your choice.

1. Click the desired parameter group in the navigation.  
The parameter table only displays the parameters of the parameter group.

### Selection of compare values (online)

To set the compare values for the "Compare values" function, follow these steps:

1. Select the desired compare values in the "Selection of compare values" drop-down list.
  - Start value project / Start value PLC
  - Start value project / Snapshot
  - Start value PLC / Snapshot

The "Start value project / Start value PLC" option is set by default.

### Save default setting of the Parameter view

To save the above customizations of the Parameter view, follow these steps:

1. Customize the Parameter view according to your requirements.
2. Click the "Save window settings" button  at the top right of the Parameter view.

## 11.2.9.5 Working with the parameter view

### Overview

The following table provides an overview of the functions of the Parameter view in online and offline mode described in the following.

- Column "Offline" = X: This function is possible in offline mode.
- Column "Online" = X: This function is possible in online mode.

Function/action	Offline	Online
Filtering the parameter table (Page 6336)	X	X
Sorting the parameter table (Page 6337)	X	X
Transferring parameter data to other editors (Page 6337)	X	X
Indicating errors (Page 6337)	X	X
Editing start values in the project (Page 6338)	X	X
Status of configuration (offline) (Page 6339)	X	
Monitoring values online in the parameter view (Page 6340)		X
Create snapshot of monitor values (Page 6340)		X
Modifying values (Page 6341)		X
Comparing values (Page 6342)		X
Applying values from the online program as start values (Page 6343)		X
Initializing setpoints in the online program (Page 6344)		X

### Filtering the parameter table

You can filter the parameters in the parameter table in the following ways:

- With the text filter
- With the subgroups of the navigation

Both filter methods can be used simultaneously.

#### With the text filter

Texts that are visible in the parameter table can be filtered. This means only texts in displayed parameter rows and columns can be filtered.

1. Enter the desired character string for filtering in the "Text filter..." input box.  
The parameter table displays only the parameters containing the character string.

The text filtering is reset.

- When another parameter group is selected in the navigation.
- When navigation is changed from data navigation to functional navigation, or vice versa.

#### With the subgroups of the navigation

1. Click the desired parameter group in the navigation, e.g., "Static".  
The parameter table only shows the static parameters. You can select further subgroups for some groups of the navigation.
2. Click "All parameters" in the navigation if all parameters are to be shown again.

## Sorting the parameter table

The values of the parameters are arranged in rows. The parameter table can be sorted by any displayed column.

- In columns containing numerical values, sorting is based on the magnitude of the numerical value.
- In text columns, sorting is alphabetical.

## Sorting by column

1. Position the cursor in the header cell of the desired column.  
The background of this cell turns blue.
2. Click the column header.

## Result

The entire parameter table is sorted by the selected column. A triangle with tip facing up appears in the column header.

Clicking the column header again changes the sorting as follows:

- Symbol “▲”: Parameter table is sorted in ascending order.
- Symbol “▼”: Parameter table is sorted in descending order.
- No symbol: The sorting is removed again. The parameter table assumes the default display.

The “../” prefix in the “Name in DB” column is ignored when sorting.

## Transferring parameter data to other editors

After selecting an entire parameter row of the parameter table, you can use the following:

- Drag-and-drop
- <Ctrl+C>/<Ctrl+V>
- Copy/Paste via shortcut menu

Transfer parameters to the following editors of the TIA Portal:

- Program editor
- Watch table
- Signal table for trace function

The parameter is inserted with its full name: See information in “Full name in DB” column.

## Indicating errors

### Error indication

Parameter assignment errors that result in compilation errors (e.g., limit violation) are indicated in the Parameter view.

Every time a value is input in the Parameter view, a check is made for process-related and syntax errors and the result is indicated.

Bad values are indicated by:

- Red error symbol in the "Status of configuration" (offline mode) or "Compare result" (online mode, depending on the selected comparison type) columns

and/or

- Table field with red background  
If you click the bad field, a roll-out error message appears with information of the permissible value range or the required syntax (format)

### Compilation error

From the error message of the compiler, you can directly open the Parameter view (functional navigation) containing the parameter causing the error in situations where the parameter is not displayed in the configuration dialog.

### Editing start values in the project

With the Parameter view, you can edit the start values in the project in offline mode and online mode.

- You make value changes in the "Start value project" column of the parameter table.
- In the "Status of configuration" column of the parameter table, the progress of the configuration is indicated by the familiar status symbols from the configuration dialog of the technology object.

### Boundary conditions

- If other parameters depend on the parameter whose start value was changed, the start value of the dependent parameters are also adapted.
- If a parameter of a technology object is not editable, it is also not editable in the parameter view. The ability to edit a parameter can also depend on the values of other parameters.

### Defining new start values

To define start values for parameters in the Parameter view, follow these steps:

1. Open the Parameter view of the technology object.
2. Enter the desired start values in the "Start value project" column. The value must match the data type of the parameter and must not exceed the value range of the parameter. The limits of the value range can be seen in the "Maximum value" and "Minimum value" columns.

The "Status of configuration" column indicates the progress of the configuration with colored symbols.

See also Status of configuration (offline) (Page 6339)

Following adaptation of the start values and downloading of the technology object to the CPU, the parameters take the defined value at startup if they are not declared as retentive (“Retain” column).

### Error indication

When a start value is input, a check is made for process-related and syntax errors and the result is indicated.

Bad start values are indicated by:

- Red error symbol in the "Status of configuration" (offline mode) or "Compare result" (online mode, depending on the selected comparison type) columns

and/or

- Red background in the “Start value project” field  
If you click on the bad field, a roll-out error message appears with information of the permissible value range or the necessary syntax (format)

### Correcting bad start values

1. Correct bad start values using information from the roll-out error message.  
Red error symbol, red field background, and roll-out error message are no longer displayed.

The project cannot be successfully compiled unless the start values are error-free.

### Status of configuration (offline)

The status of the configuration is indicated by icons:

- In the “Status of configuration” column in the parameter table
- In the navigation structure of the functional navigation and data navigation

### Symbol in “Status of configuration” column

Symbol	Meaning
	The start value of the parameter corresponds to the default value and is valid. A start value has not yet been defined by the user.
	The start value of the parameter contains a value defined by the user. The start value is different than the default value. The start value is error-free and valid.
	The start value of the parameter is invalid (syntax or process-related error). The input box has a red background. When clicked, the roll-out error message indicates the cause of the error.
	Only for S7-1200 Motion Control: The start value of the parameter is valid but contains warnings. The input box has a yellow background.

## Symbol in the navigation

The symbols in the navigation indicate the progress of the configuration in the same way as in the configuration dialog of the technology object.

See Configure technology objects (Page 6321)

## Monitoring values online in the parameter view

You can monitor the values currently taken by the parameters of the technology object in the CPU (monitor values) directly in the Parameter view.

## Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.

## Procedure

1. Start the monitoring by clicking   
As soon as the Parameter view is online, the following columns are additionally displayed:
  - Compare result
  - Start value PLC
  - Monitor value
  - Modify value
  - Selection for transmissionThe "Monitor value" column shows the current parameter values on the CPU.  
Meaning of the additional columns: see Parameter table (Page 6331)
2. Stop the monitoring by clicking  again.

## Display

All columns that are only available online have an orange background:

- Values in light-orange cells  can be changed.
- Values in cells with a dark orange background  cannot be changed.

## Create snapshot of monitor values

You can back up the current values of the technology object on the CPU (monitor values) and display them in the Parameter view.

## Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.
- The "Monitor all" button  is selected.

## Procedure

To show the current parameter values, follow these steps:

1. In the Parameter view, click the "Create snapshot of monitor values" icon .

## Result

The current monitor values are transferred once to the "Snapshot" column of the parameter table.

You can analyze the values "frozen" in this way while the monitor values continue to be updated in the "Monitor values" column.

## Modifying values

With the Parameter view, you can modify values of the technology object in the CPU.

You can assign values to the parameter once (Modify value) and modify them immediately. The modify request is executed as quickly as possible without reference to any particular point in the user program.

 <b>DANGER</b>
<b>Danger when modifying:</b>
Changing the parameter values while the plant is operating may result in severe damage to property and personal injury in the event of malfunctions or program errors.
Make sure that dangerous states cannot occur before you use the "Modify" function.

## Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.

- The “Monitor all” button  is selected.
- The parameter can be modified (associated field in the "Modify value" column has a light-orange background).

## Procedure

To modify parameters immediately, follow these steps:

1. Enter the desired modify values in the “Modify values” column of the parameter table.
2. Check whether the check box for modifying is selected in the "Select for transmission" column.  
The modify values and associated check boxes of dependent parameters are automatically adapted at the same time.
3. Click the “Modify all selected parameters immediately and once” icon .

The selected parameters are modified once and immediately with the specified values and can be monitored in the "Modify values" column. The check boxes for modifying in the "Selection for transmission" column are automatically cleared after the modify request is complete.

## Error indication

When a start value is input, a check is made immediately for process-related and syntax errors and the result is indicated.

Bad start values are indicated by:

- Red background in the “Modify value” field
- and
- If you click the bad field, a roll-out error message appears with information of the permissible value range or the necessary syntax (format)

## Bad modify values

- Modify values with process-related errors can be transmitted.
- Modify values with syntax errors **cannot** be transmitted.

## Comparing values

You can use comparison functions to compare the following memory values of a parameter:

- Start value project
- Start value PLC
- Snapshot

## Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.
- The "Monitor all" button  is selected.

## Procedure

To compare the start values on the various target systems, follow these steps:

1. Click the "Selection of compare values" icon .
 

A selection list containing the comparison options opens:

  - Start value project - Start value PLC (default setting)
  - Start value project - Snapshot
  - Start value PLC - Snapshot
2. Select the desired comparison option.
 

The selected comparison option is executed as follows:

  - A scales symbol appears in the header cells of the two columns selected for comparison.
  - Symbols are used in the "Compare result" column to indicate the result of the comparison of the selected columns.

## Symbol in "Compare result" column

Symbol	Meaning
	The compare values are equal and error-free.
	The compare values are not equal and error-free.
	At least one of the two compare values has a process-related or syntax error.
	The comparison cannot be performed. At least one of the two compare values is not available (e.g., snapshot).

## Symbol in the navigation

The symbols are shown in the same way in the navigation if the comparison result applies to at least one of the parameters below the displayed navigation structure.

## Applying values from the online program as start values

In order to apply optimized values from the CPU to the project as start values, you create a snapshot of the monitor values. Values of the snapshot marked as a "Setpoint" are then applied to the project as start values.

## Requirements

- The technology object is of type "PID\_Compact" or "PID\_3Step".
- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.
- The "Monitor all" button  is selected.

## Procedure

To apply optimized values from the CPU, follow these steps:

1. Click the "Create snapshot of monitor values and accept setpoints of this snapshot as start values" icon .

## Result

The current monitor values are applied to the "Snapshot" column and their setpoints are copied to the "Start value project" column as new start values.

---

### Note

#### Applying values of individual parameters

You can also apply the values of individual parameters that are not marked as a setpoint from the "Snapshot" column to the "Start values project" column. To do so, copy the values and insert them into the "Start value project" column using the "Copy" and "Paste" commands in the shortcut menu.

---

## Initializing setpoints in the online program

You can initialize all parameters that are marked as a "Setpoint" in the Parameter view with new values in the CPU in one step. In so doing, the start values are downloaded from the project to the CPU. The CPU remains in "RUN" mode.

To avoid data loss on the CPU during a cold restart or warm restart, you must also download the technology object to the CPU.

### DANGER

#### Danger when changing parameter values

Changing the parameter values while the plant is operating may result in severe damage to property and personal injury in the event of malfunctions or program errors.

Make sure that dangerous states cannot occur before you reinitialize the setpoints.

## Requirements

- The technology object is of type "PID\_Compact" or "PID\_3Step".
- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.
- The "Monitor all" button  is selected.
- The parameters marked as a "Setpoint" have a "Start value project" that is free of process-related and syntax errors

## Procedure

To initialize all setpoints, follow these steps:

1. Enter the desired values in the "Start value project" column.  
Ensure that the start values are free of process-related and syntax errors.
2. Click the "Initialize setpoints" icon .

## Result

The setpoints in the CPU are initialized with the start values from the project.

## 11.2.10 Programming

### 11.2.10.1 Overview of the Motion Control statements

You control the axis with the user program using Motion Control instructions. The instructions start Motion Control commands that execute the desired functions.

The status of the Motion Control commands and any errors that occur during their execution can be obtained from the output parameters of the Motion Control instructions. The following Motion Control instructions are available:

- MC\_Power: Enable, disable axis V4 (Page 2878)
- MC\_Reset: Acknowledge fault V4 (Page 2882)
- MC\_Home: Home axes, set reference point V4 (Page 2884)
- MC\_Halt: Halt axes V4 (Page 2887)
- MC\_MoveAbsolute: Absolute positioning of axes V4 (Page 2890)
- MC\_MoveRelative: Relative positioning of axes V4 (Page 2893)
- MC\_MoveVelocity: Move axes at preset rotational speed V4 (Page 2897)
- MC\_MoveJog: Move axes in jog mode V4 (Page 2901)
- MC\_CommandTable: Run axis commands as motion sequence V4 (Page 2904)

- MC\_ChangeDynamic: Change dynamic settings of axis V4 (Page 2906)
- MC\_ReadParam: Continuously read motion data of a positioning axis V4 (Page 2908)
- MC\_WriteParam: Write tag of positioning axis V4 (Page 2910)

## See also

Creating a user program (Page 6503)

Programming notes (Page 6506)

Behavior of the Motion Control commands after POWER OFF and restart (Page 6508)

Monitoring active commands (Page 6508)

Error displays of the Motion Control statements (Page 6519)

### 11.2.10.2 Creating a user program

In the section below you learn how to create a user program with the basic configuration for controlling your axis. All available axis functions are controlled using the Motion Control instructions to be inserted.

## Requirement

- The technology object has been created and configured without errors.

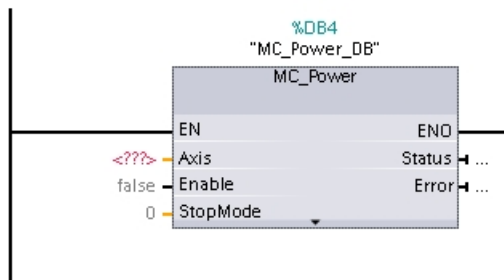

Before creating and testing the user program, it is advisable to test the function of the axis and the corresponding parts of the system with the axis command table.

## Procedure

Proceed as follows to create the user program in accordance with the principles described below:

1. In the project tree, double-click your code block (the code block must be called in the cyclic program).  
The code block is opened in the programming editor and all available instructions are displayed.
2. Open the "Technology" category and the "Motion Control" and "S7-1200 Motion Control" folders.
3. Use a drag-and-drop operation to move the "MC\_Power" instruction to the desired network of the code block.  
The dialog box for defining the instance DB opens.
4. In the next dialog box, select from the following alternatives:  
**Single instance**  
Click "Single instance" and select whether you want to define the name and number of the instance DB automatically or manually.  
**Multi-instance**  
Click "Multi-instance" and select whether you want to define the name of the multi-instance automatically or manually.

- 5. Click "OK".  
The Motion Control instruction "MC\_Power" is inserted into the network.

Parameters marked with "<???" must be initialized; all other parameters are assigned default values.  
Parameters displayed in black are required for use of the Motion Control instruction.

6. Select technology object in the project tree and drag-and-drop it on <???.>

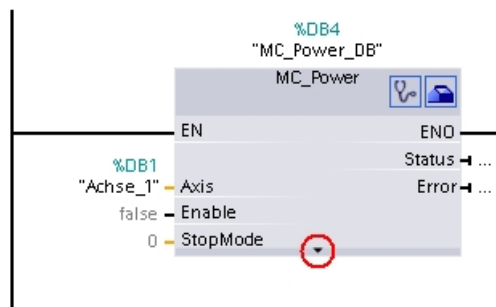

Following selection of the technology object data block, the following buttons are available:

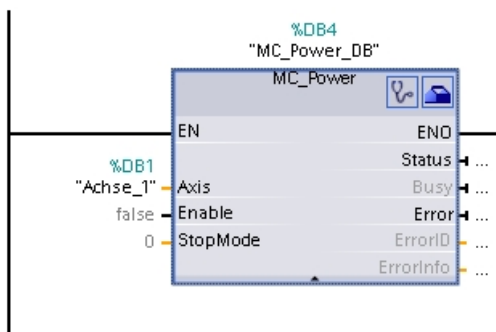

Click the stethoscope icon if you want to open the diagnostics dialog for the technology object.

Click the toolbox icon if you want to open the configuration view of the technology object.

Click the arrow down icon to view additional parameters of the Motion Control instruction.

The grayed-out parameters now visible can be used optionally.

7. Add your choice of Motion Control instructions in accordance with steps 3 to 6.

## Result

You have created the basic configuration for axis control in the user program.

Initialize the input parameters of Motion Control instructions in other parts of the user program to initiate the desired jobs for the "Axis" technology object.

Evaluate the output parameters of the Motion Control instructions and the tags of the data block to track the initiated jobs and the status of the axis.

Refer to the detailed description for details on the parameters of Motion Control instructions.

### 11.2.10.3 Programming notes

When creating your user program, note the following information:

- **Cyclic call of utilized motion control instructions**  
The current status of command execution is available via the output parameters of the motion control instruction. The status is updated with every call of the motion control instruction. Therefore, make sure that the utilized motion control instructions are called cyclically.
- **Transfer of parameter values of a motion control instruction**  
The parameter values pending for the input parameters are transferred with a positive edge at input parameter "Execute" when the block is called.  
The motion control command is started with these parameter values. Parameter values that are subsequently changed for the motion control instruction are not transferred until the next start of the motion control command.  
Exceptions to this are input parameters "StopMode" of motion control instruction "MC\_Power" and "Velocity" of motion control instruction "MC\_MoveJog". A change in the input parameter is also applied when "Enable" = TRUE, or "JogForward" and "JogBackward". .

- **Programming under consideration of the status information**

In a stepwise execution of motion control jobs, make sure to wait for the active command to finish before starting a new command. Use the status messages of the motion control instruction and the "StatusBits" tag of the technology object to check for completion of the active command.

In the examples below, observe the indicated sequence. Failure to observe the sequence will display an axis or command error.

  - **Axis enable with motion control instruction "MC\_Power"**

You must enable the axis before it can take on motion jobs. Use an AND operation of tag <Axis name>.StatusBits.Enable = TRUE with output parameter Status = TRUE of motion control instruction "MC\_Power" to verify that the axis is enabled.
  - **Acknowledge error with motion control instruction "MC\_Reset"**

Prior to starting a motion control command, errors requiring acknowledgement must be acknowledged with "MC\_Reset". Eliminate the cause of the error and acknowledge the error with motion control instruction "MC\_Reset". Verify that the error has been successfully acknowledged before initiating a new command. For this purpose, use an AND operation of tag <Axis name>.StatusBits.Error = FALSE with output parameter Done = TRUE of motion control instruction "MC\_Reset".
  - **Home axis with motion control instruction "MC\_Home"**

Before you can start an MC\_MoveAbsolute command, the axis must be homed. Use an AND operation of tag <Axis name>.StatusBits.HomingDone = TRUE with output parameter Done = TRUE of motion control instruction "MC\_Home" to verify that the axis has been homed.
- **Override of motion control command processing**

Motion control jobs for moving an axis can also be executed as overriding jobs. If a new motion control command is started for an axis while another motion control command is active, the active command is overridden by the new command before the existing command is completely executed. The overridden command signals this using CommandAborted = TRUE in the motion control instruction. It is possible to override an active MC\_MoveRelative command with a MC\_MoveAbsolute command.
- **Avoiding multiple use of the same instance**

All relevant information of a motion control command is stored in its instance. Do not start a new command using this instance, if you want to track the status of the current command. Use different instances if you want to track the commands separately. If the same instance is used for multiple motion control commands, the status and error information of the individual commands will overwrite each other.
- **Call of motion control instructions in different priority classes (run levels)**

Motion Control instructions with the same instance may not be called in different priority classes without interlocking. To learn how to call locked motion control instructions, refer to "Tracking commands from higher priority classes (run levels) (Page 6529)".

#### 11.2.10.4 Behavior of the Motion Control commands after POWER OFF and restart

A POWER OFF or CPU-STOP aborts all active motion control jobs. All CPU outputs, including pulse and direction outputs, are reset.

After a subsequent POWER ON or CPU restart (CPU RUN), the technology objects and the motion control jobs will be reinitialized.

All actual data of the technology objects as well as all status and error information of the previously active motion control jobs are reset to their initial values.

Before the axis can be reused, it must be enabled again using the Motion Control instruction "MC\_Power". If homing is required, the axis must be homed again with Motion Control instruction "MC\_Home".

Monitoring active commands (Page 6508)

Error displays of the Motion Control statements (Page 6519)

#### 11.2.10.5 Monitoring active commands

##### Monitoring active commands

There are three typical groups for tracking active Motion Control commands:

- Motion control instructions with output parameter "Done"
- Motion control instruction "MC\_MoveVelocity"
- Motion control instruction "MC\_MoveJog"

##### Motion control instructions with "Done" output parameter

Motion control instructions with the output parameter "Done" are started via input parameter "Execute" and have a defined conclusion (for example, with Motion Control instruction "MC\_Home": Homing was successful). The command is complete and the axis is at a standstill.

The commands of the following Motion Control instructions have a defined conclusion:

- MC\_Reset
- MC\_Home
- MC\_Halt

- MC\_MoveAbsolute
- MC\_MoveRelative
- MC\_CommandTable (technology object as of V2)
- MC\_ChangeDynamic (technology object as of V2)
- MC\_WriteParam (as of technology object V4)
- MC\_ReadParam (as of technology object V4)

The output parameter "Done" indicates the value TRUE, if the command has been successfully completed.

The output parameters "Busy", "CommandAborted", and "Error" signal that the command is still being processed, has been aborted or an error is pending. The Motion Control instruction "MC\_Reset" cannot be aborted and thus has no "CommandAborted" output parameter. The Motion Control instruction "MC\_ChangeDynamic" is completed immediately and therefore has no "Busy" or "CommandAborted" output parameters.

During execution of the Motion Control command, the output parameter "Busy" indicates the value TRUE. If the command has been completed, aborted, or stopped by an error, the output parameter "Busy" changes its value to FALSE. This change occurs regardless of the signal at input parameter "Execute".

Output parameters "Done", "CommandAborted", and "Error" indicate the value TRUE for at least one cycle. These status messages are latched while input parameter "Execute" is set to TRUE.

The behavior of the status bits is presented below for various example situations:

### Complete execution of command

If the Motion Control command has been completely executed by the time of its conclusion, this is indicated by the value TRUE in output parameter "Done". The signal status of the input parameter "Execute" influences the display duration at the output parameter "Done":

①	The command is started with a positive edge at the input parameter "Execute". Depending on the programming, "Execute" can still be reset to the value FALSE during the command, or the value TRUE can be retained until after completion of the command.
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	With conclusion of the command (for example, for Motion Control instruction "MC_Home": Homing was successful), output parameter "Busy" changes to FALSE and "Done" to TRUE.
④	If "Execute" retains the value TRUE until after completion of the command, then "Done" also remains TRUE and changes its value to FALSE together with "Execute".
⑤	If "Execute" has been set to FALSE before the command is complete, "Done" indicates the value TRUE for only one execution cycle.

## Abort command

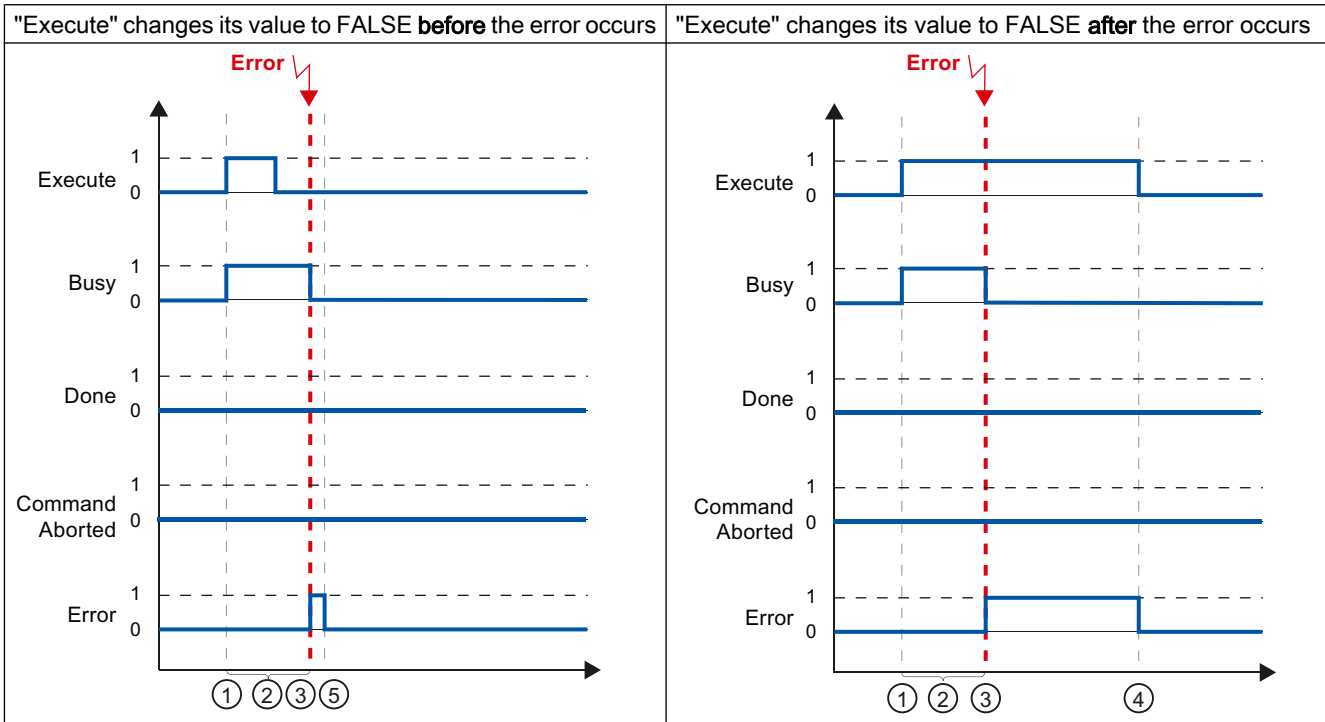

If the Motion Control command is aborted during execution, this is indicated by the value TRUE in output parameter "CommandAborted". The signal status of the input parameter "Execute" influences the display duration at the output parameter "CommandAborted":

①	The command is started with a positive edge at the input parameter "Execute". Depending on the programming, "Execute" can still be reset to the value FALSE during the command, or the value TRUE can be retained until after completion of the command.
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	During command execution, the command is aborted by another Motion Control command. If the command is aborted, output parameter "Busy" changes to FALSE and "CommandAborted" to TRUE.
④	If "Execute" retains the value TRUE until after the command is aborted, then "CommandAborted" also remains TRUE and changes its value to FALSE together with "Execute".
⑤	If "Execute" has been set to FALSE before the command is aborted, "CommandAborted" indicates the value TRUE for only one execution cycle.

### Error during command execution

If an error occurs during execution of the Motion Control command, this is indicated by the value TRUE in the output parameter "Error". The signal status of the input parameter "Execute" influences the display duration at the output parameter "Error":

①	The command is started with a positive edge at the input parameter "Execute". Depending on the programming, "Execute" can still be reset to the value FALSE during the command, or the value TRUE can be retained until after completion of the command.
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	An error occurred during command execution. When the error occurs, the output parameter "Busy" changes to FALSE and "Error" to TRUE.
④	If "Execute" retains the value TRUE until after the error occurs, then "Error" also remains TRUE and only changes its value to FALSE together with "Execute".
⑤	If "Execute" has been set to FALSE before the error occurs, "Error" indicates the value TRUE for only one execution cycle.

### Motion control instruction MC\_MoveVelocity

A "MC\_MoveVelocity" command is started with a positive edge at the "Execute" parameter. The command objective is fulfilled when the assigned velocity is reached and the axis travels at constant velocity. When the assigned velocity is reached and maintained, this is indicated in the "InVelocity" parameter with the value TRUE.

The motion of the axis can, for example, be stopped with an "MC\_Halt" command.

The output parameters "Busy", "CommandAborted", and "Error" signal that the command is still being processed, has been aborted or an error is pending.

During execution of the Motion Control command, the output parameter "Busy" indicates the value TRUE. If the command has been stopped by another command or by an error, the output parameter "Busy" changes its value to FALSE. This change occurs regardless of the signal at the input parameter "Execute".

The output parameters "CommandAborted" and "Error" show the value TRUE for at least one cycle. These status messages are latched while input parameter "Execute" is set to TRUE.

The behavior of the status bits is presented below for various example situations:

### The parameterized velocity is reached

If the Motion Control command has been executed by the time the parameterized velocity is reached, this is indicated by the value TRUE in output parameter "InVelocity". The parameter "Execute" has no effect on the indication duration in the "InVelocity" parameter.

①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the FALSE value before or after the parameterized velocity has been reached. While the job is active, the parameter "Busy" shows the value TRUE.
②	When the assigned velocity is reached, the "InVelocity" parameter changes to TRUE. The "Busy" and "InVelocity" parameters retain the TRUE value until the "MC_MoveVelocity" command is overridden by another Motion Control command or stopped by an error.

### The command is aborted prior to reaching the parameterized velocity

If the Motion Control command is aborted before the parameterized velocity is reached, this is indicated by the value TRUE in output parameter "CommandAborted". The signal status of

input parameter "Execute" influences the display duration at the output parameter "CommandAborted".

- |   |   |
|---|---|
| ① | The command is started with a positive edge at the input parameter "Execute". Depending on the programming, "Execute" can still be reset to the value FALSE during the command, or the value TRUE can be retained until after the command is aborted. |
| ② | While the command is active, the output parameter "Busy" indicates the value TRUE.  |
| ③ | During command execution, the command is aborted by another Motion Control command. If the command is aborted, output parameter "Busy" changes to FALSE and "CommandAborted" to TRUE.   |
| ④ | If "Execute" retains the value TRUE until after the command is aborted, then "CommandAborted" also remains TRUE and changes its status to FALSE together with "Execute".  |
| ⑤ | If "Execute" has been reset to FALSE before the command is aborted, "CommandAborted" indicates the value TRUE for only one execution cycle.   |

**Note**

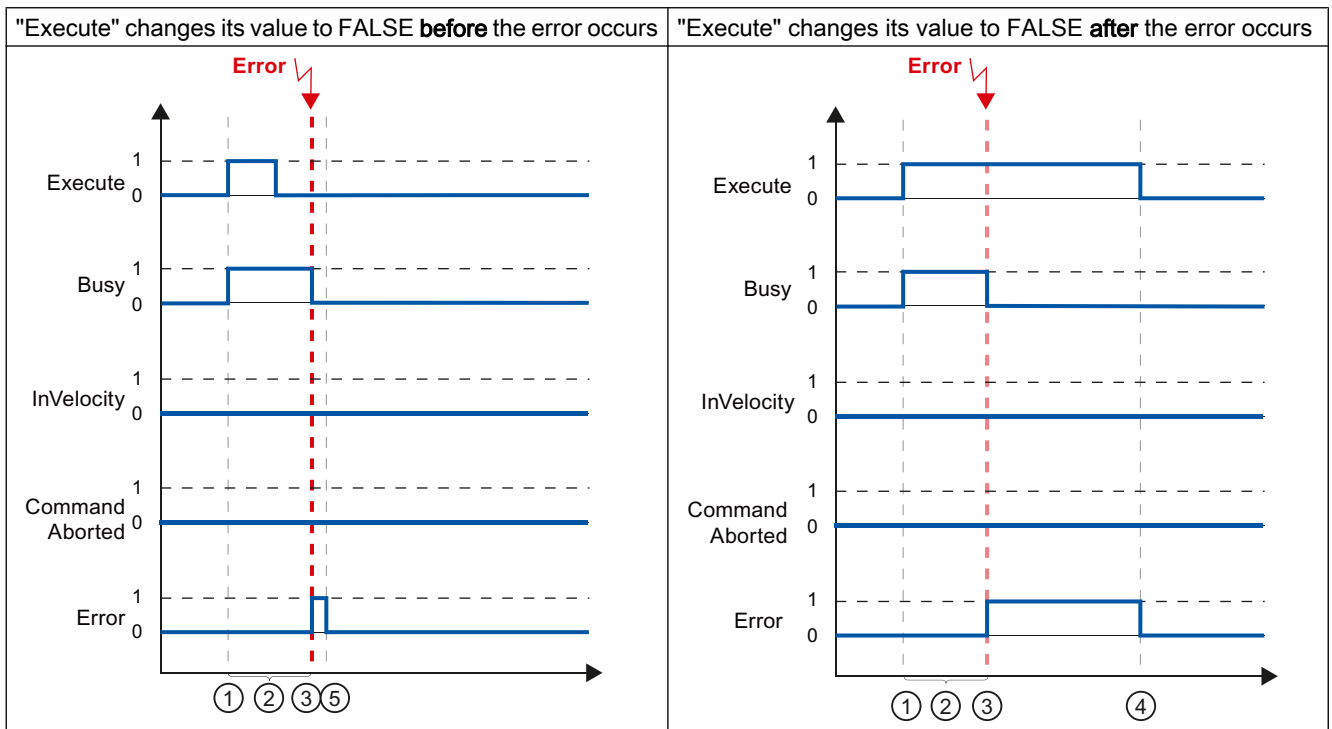

Under the following conditions, an abort is not indicated in output parameter "CommandAborted":

The parameterized velocity has been reached, input parameter "Execute" has the value FALSE, and a new Motion Control command is initiated.

### An error has occurred prior to reaching the parameterized velocity

If an error occurs during execution of the Motion Control command before the parameterized velocity has been reached, this is indicated by the value TRUE in the output parameter "Error". The signal status of the input parameter "Execute" influences the display duration at the output parameter "Error":

①	The command is started with a positive edge at the input parameter "Execute". Depending on the programming, "Execute" can still be reset to the value FALSE during the command, or the value TRUE can be retained until after the error has occurred.
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	An error occurred during command execution. When the error occurs, the output parameter "Busy" changes to FALSE and "Error" to TRUE.
④	If "Execute" retains the value TRUE until after the error has occurred, then "Error" also remains TRUE and only changes its status to FALSE together with "Execute".
⑤	If "Execute" has been reset to FALSE before the error occurs, "Error" indicates the value TRUE for only one execution cycle.

#### Note

Under the following conditions, an error is not indicated in output parameter "Error":

The parameterized velocity has been reached, input parameter "Execute" has the value FALSE, and an axis error occurs (software limit switch is approached, for example).

The error of the axis is only indicated in the "MC\_Power" Motion Control instruction.

### Motion control instruction MC\_MoveJog

The commands of Motion Control instruction "MC\_MoveJog" implement a jog operation.

The motion control commands "MC\_MoveJog" do not have a defined end. The command objective is fulfilled when the parameterized velocity is reached for the first time and the axis travels at constant velocity. When the parameterized velocity is reached, this is indicated by the value TRUE in output parameter "InVelocity".

The order is complete when input parameter "JogForward" or "JogBackward" has been set to the value FALSE and the axis has come to a standstill.

The output parameters "Busy", "CommandAborted", and "Error" signal that the command is still being processed, has been aborted or an error is pending.

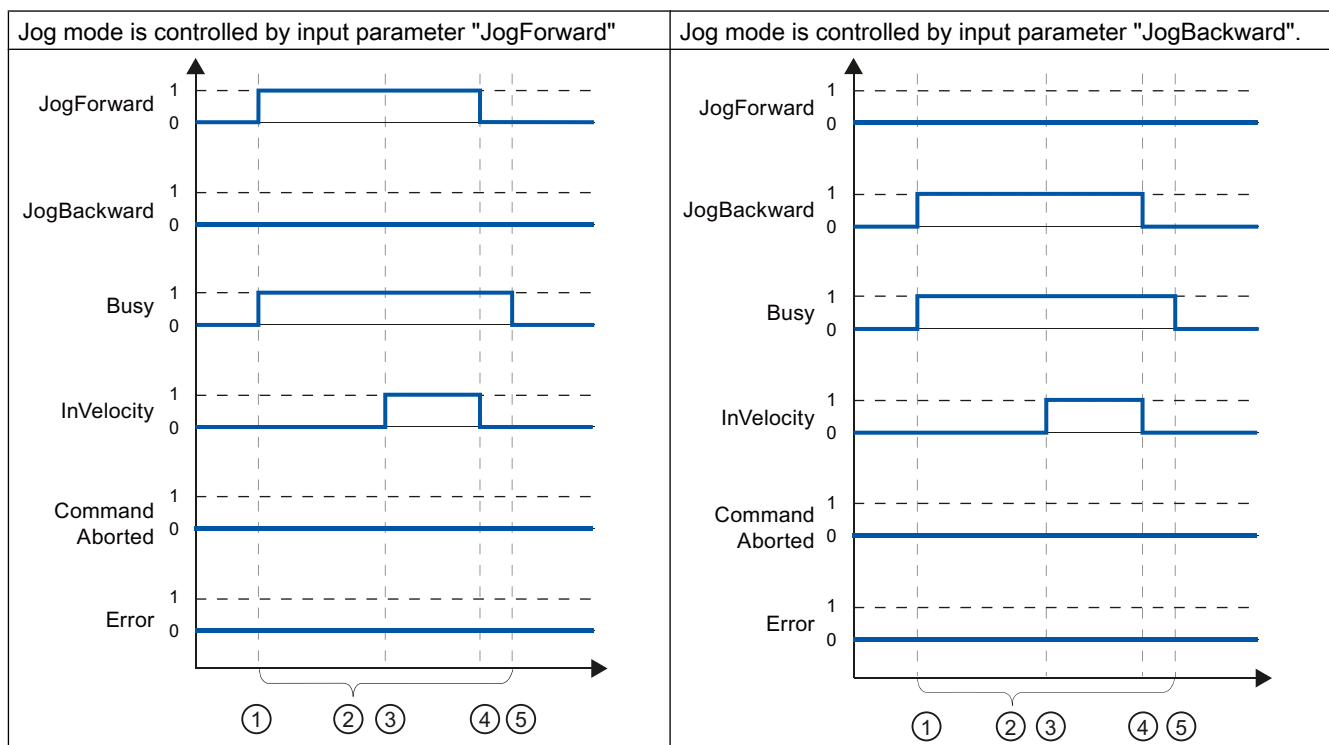

During processing of the motion control command, the output parameter "Busy" indicates the value TRUE. If the command has been completed, aborted, or stopped by an error, the output parameter "Busy" changes its value to FALSE.

The output parameter "InVelocity" indicates the status TRUE, as long as the axis is moving at the parameterized velocity. The output parameters "CommandAborted" and "Error" indicate the status for at least one cycle. These status messages are latched as long as either input parameter "JogForward" or "JogBackward" is set to TRUE.

The behavior of the status bits is presented below for various example situations:

#### The parameterized velocity is reached and maintained

If the motion control command has been executed by the time the parameterized velocity is reached, this is indicated by the value TRUE in output parameter "InVelocity".

①	The command is started with a positive edge at the input parameter "JogForward" or "JogBackward".
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	When the parameterized velocity is reached, the output parameter "InVelocity" changes to TRUE.
④	When the input parameter "JogForward" or "JogBackward" is reset to the value FALSE, the axis motion ends. The axis starts to decelerate. As a result, the axis no longer moves at constant velocity and the output parameter "InVelocity" changes its status to FALSE.
⑤	If the axis has come to a standstill, the motion control command is complete and the output parameter "Busy" changes its value to FALSE.

### The command is aborted during execution

If the motion control command is aborted during execution, this is indicated by the value TRUE in output parameter "CommandAborted". The behavior is independent of whether or not the parameterized velocity has been reached.

①	The command is started with a positive edge at the input parameter "JogForward" or "JogBackward".
②	While the command is active, the output parameter "Busy" indicates the value TRUE.
③	During command execution, the command is aborted by another motion control command. If the command is aborted, output parameter "Busy" changes to FALSE and "CommandAborted" to TRUE.
④	When the input parameter "JogForward" or "JogBackward" is reset to the value FALSE, the output parameter "CommandAborted" changes its value to FALSE.

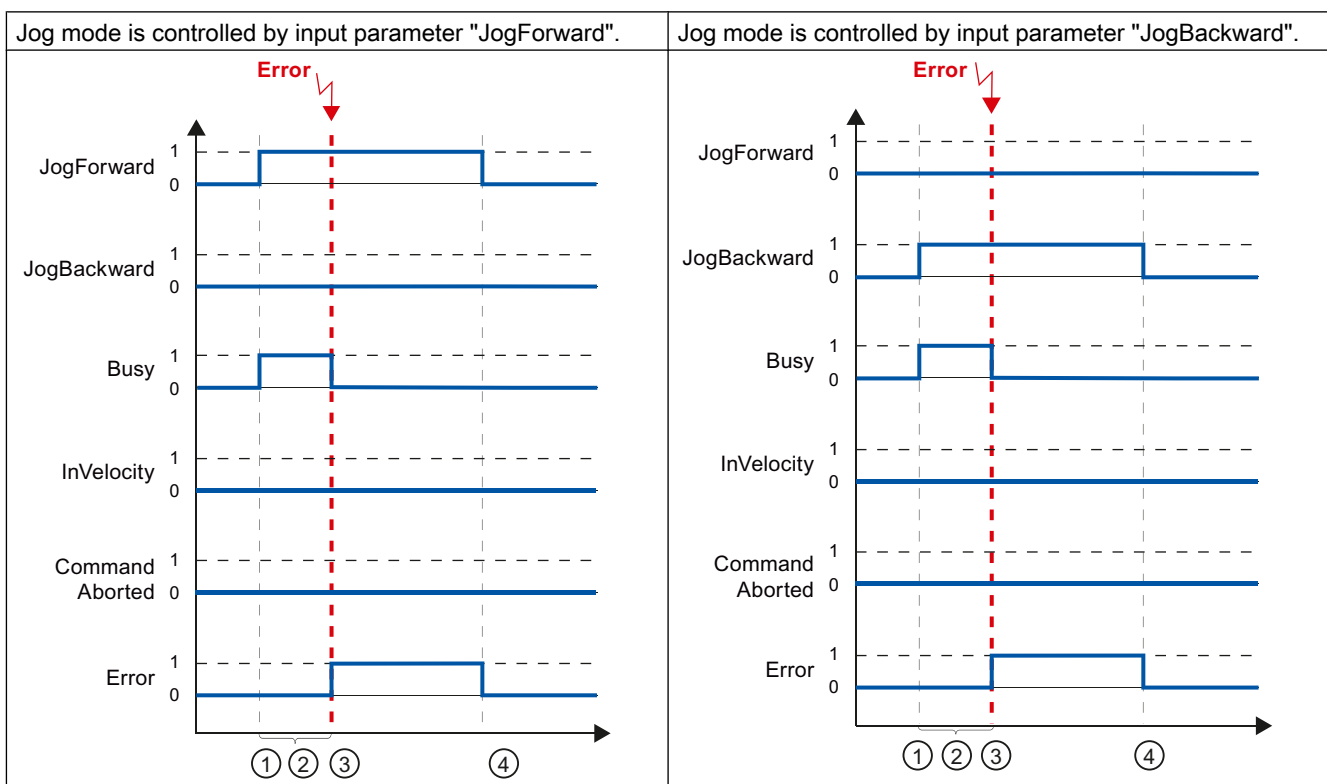

**Note**

The command abort is indicated in the output parameter "CommandAborted" for only one execution cycle, if all conditions below are met:

The input parameters "JogForward" and "JogBackward" have the value FALSE (but the axis is still decelerating) and a new motion control command is initiated.

**An error has occurred during command execution**

If an error occurs during execution of the motion control command, this is indicated by the value TRUE in output parameter "Error". The behavior is independent of whether or not the parameterized velocity has been reached.

- |   |   |
|---|---|
| ① | The command is started with a positive edge at the input parameter "JogForward" or "JogBackward". |
| ② | While the command is active, the output parameter "Busy" indicates the value TRUE.                |

③	An error occurred during command execution. When the error occurs, the output parameter "Busy" changes to FALSE and "Error" to TRUE.
④	When the input parameter "JogForward" or "JogBackward" is reset to the value FALSE, the output parameter "Error" changes its value to FALSE.

---

### Note

An error occurrence is indicated in the output parameter "Error" for only one execution cycle, if all the conditions below are met:

The input parameters "JogForward" and "JogBackward" have the value FALSE (but the axis is still decelerating) and a new error occurs (software limit switch is approached, for example).

---

#### 11.2.10.6 Error displays of the Motion Control statements

The Motion Control instructions indicate any errors in motion control commands and the technology object at the output parameters "Error", "ErrorID" and "ErrorInfo" of the Motion Control instructions.

#### Error display at output parameters "Error", "ErrorID" and "ErrorInfo"

If the output parameter "Error" indicates the value TRUE, the complete command, or portions thereof, could not be executed. The cause of the error is indicated by the value in output parameter "ErrorID". Detailed information about the cause of the error is returned by the value in output parameter ErrorInfo. We distinguish between the following error classes for error indication:

- **Operating error with axis stop (for example, "HW limit switch was approached")**  
Operating errors with axis stop are errors that occur during runtime of the user program. If the axis is in motion, it is stopped with the configured deceleration or emergency stop deceleration, depending on the error. The errors are indicated in the error-triggering Motion Control instruction and in the Motion Control instruction "MC\_Power".
- **Operating error without axis stop (for example, "Axis is not homed")**  
Operating errors without axis stop are errors that occur during runtime of the user program. If the axis is in motion, the motion is continued. The errors are only indicated in the Motion Control instruction which triggers the error.
- **Configuration error in Motion Control instruction (for example "Incorrect value in parameter "Velocity")**  
Parameterization errors occur when incorrect information is specified in the input parameters of Motion Control instructions. If the axis is in motion, the motion is continued. The errors are only indicated in the Motion Control instruction which triggers the error.

- **Configuration error on technology object "Axis" (for example, "Value for "Acceleration" is invalid")**  
A configuration error exists if one or more parameters are incorrectly configured in the axis configuration or if editable configuration data have been modified incorrectly during runtime of the program. An axis in motion is stopped with the configured emergency stop deceleration. The error is indicated in the error-triggering Motion Control instruction and in Motion Control instruction "MC\_Power".
- **Configuration error on technology object "Command table" (for example "Value for "Velocity" is invalid")**  
There is a configuration error if one or more parameters are incorrectly set in the axis command table or if programmable configuration data have been modified incorrectly during runtime of the program. If the axis is in motion, the motion is continued. The errors are only indicated in the "MC\_CommandTable" Motion Control instruction.
- **Internal error**  
When an internal error occurs, the axis is stopped. The errors are indicated in the error-triggering Motion Control instruction and, in some cases, in the Motion Control instruction "MC\_Power".

A detailed description of the ErrorIDs and ErrorInfos, as well as their remedies, is available in the Appendix (Page 6538).

## 11.2.11 Axis - Diagnostics

### 11.2.11.1 Status and error bits (technology objects as of V4)

You use the "Status and error bits" diagnostic function to monitor the most important status and error messages for the axis in the TIA Portal. The diagnostic function display is available in online mode in "Manual control" mode and in "Automatic control" when the axis is active. The status error messages have the following meaning:

## Status messages

Status message - Axis	Description
Enabled	The axis is enabled and ready to be controlled via Motion Control commands. (Tag of technology object: <Axis name>.StatusBits.Enable)
Homed	The axis is homed and is capable of executing absolute positioning commands of Motion Control instruction "MC_MoveAbsolute". The axis does not have to be homed for relative positioning. Special situations: <ul style="list-style-type: none"> <li>• During active homing, the status is FALSE.</li> <li>• If a homed axis undergoes passive homing, the status is set to TRUE during passive homing.</li> </ul> (Tag of technology object: <Axis name>.StatusBits.HomingDone)
Axis error	An error has occurred in the "Axis" technology object. Additional information about the error is available in automatic control at the ErrorID and ErrorInfo parameters of the Motion Control instructions. In manual mode, the "Error message" box of the axis control panel displays detailed information about the cause of error. (Tag of technology object: <Axis name>.StatusBits.Error)
Control panel active	The "Manual control" mode was enabled in the axis control panel. The axis control panel has control priority over the "Axis" technology object. The axis cannot be controlled from the user program. (Tag of technology object: <Axis name>.StatusBits.ControlPanelActive)
Restart necessary	A modified configuration of the axis was downloaded to the load memory in CPU RUN operating mode. To download the modified configuration to the work memory, you need to restart the axis. Use the Motion Control instruction MC_Reset to do this. (Tag of technology object: <Axis name>.StatusBits.RestartRequired)

Status message - Drive	Description
Ready	The drive is ready for operation. (Tag of technology object: <Axis name>.StatusBits.DriveReady)
Drive error	The drive has reported an error due to loss of its "Drive ready" signal. (Tag of technology object: <Axis name>.ErrorBits.DriveFault)

Status message - Motion	Description
Standstill	The axis is at a standstill. (Tag of technology object: <Axis name>.StatusBits.StandStill)
Acceleration	The axis accelerates. (Tag of technology object: <Axis name>.StatusBits.Accelerating)
Constant velocity	The axis travels at constant velocity. (Tag of technology object: <Axis name>.StatusBits.ConstantVelocity)
Deceleration	The axis decelerates (slows down). (Tag of technology object: <Axis name>.StatusBits.Decelerating)

Status message - Motion type	Description
Positioning	The axis executes a positioning command of the Motion Control instruction "MC_MoveAbsolute", "MC_MoveRelative" or the axis control panel. (Tag of technology object: <Axis name>.StatusBits.PositioningCommand)
Travel with velocity specification	The axis executes a command with velocity specification of the Motion Control instruction "MC_MoveVelocity", "MC_MoveJog" or the axis control panel. (Tag of technology object: <Axis name>.StatusBits.VelocityCommand)
Homing	The axis executes a homing command of the Motion Control instruction "MC_Home" or the axis control panel. (Tag of technology object: <Axis name>.StatusBits.HomingCommand)
Command table active	The axis is controlled by Motion Control instruction "MC_CommandTable". (Tag of technology object: <Axis name>.StatusBits.CommandTableActive)

### Limit switch status messages

Limit switch status message	Description
Lower SW limit switch has been reached	A software limit switch was reached or exceeded. (Tag of technology object: <Axis name>.StatusBits.SWLimitMinActive)
Upper SW limit switch has been reached	A hardware limit switch was reached or exceeded. (Tag of technology object: <Axis name>.StatusBits.SWLimitMaxActive)
Lower HW limit switch was reached	The lower hardware limit switch was reached or exceeded. (Tag of technology object: <Axis name>.StatusBits.HWLimitMinActive)
Upper HW limit switch was reached	The upper hardware limit switch was reached or exceeded. (Tag of technology object: <Axis name>.StatusBits.HWLimitMaxActive)

### Error messages

Error message	Description
SW limit switch has been reached	A software limit switch was reached or exceeded. (Tag of technology object: <Axis name>.ErrorBits.SWLimit)
HW limit switch has been reached	A hardware limit switch was reached or exceeded. (Tag of technology object: <Axis name>.ErrorBits.HWLimit)
Impermissible motion direction	The motion direction of the command does not match the configured motion direction. (Tag of technology object: <Axis name>.ErrorBits.DirectionFault)
PTO already in use	A second axis is using the same PTO (Pulse Train Output) and HSC (High Speed Counter) and is enabled with "MC_Power". (Tag of technology object: <Axis name>.ErrorBits.HWUsed)
Configuration error	The "Axis" technology object was incorrectly configured or editable configuration data were modified incorrectly during runtime of the user program. (Tag of technology object: <Axis name>.ErrorBits.ConfigFault)
Internal error	An internal error has occurred. (Tag of technology object: <Axis name>.ErrorBits.SystemFault)

The output window below shows the first reported and still unacknowledged error.

**11.2.11.2 Motion status**

Use the "Motion status" diagnostic function to monitor the motion status of the axis in the TIA Portal. The diagnostic function display is available in online mode in "Manual control" mode and in "Automatic control" when the axis is active. The displayed status information has the following meaning:

Status	Description
Current position	The "Current position" box indicates the current axis position. If the axis is not homed, the value indicates the position value relative to the enable position of the axis. (Tag of technology object: <Axis name>.Position)
Current velocity	The "Current velocity" box indicates the current axis velocity. (Tag of technology object: <Axis name>.Velocity)
Target position	The "Target position" box indicates the current target position of an active positioning command or of the axis command table. The value of the "Target position" is only valid during execution of a positioning command. (Tag of technology object: <Axis name>.StatusPositioning.TargetPosition)
Remaining traversing distance	The "Remaining traversing distance" box indicates the traversing distance currently remaining for an active positioning command or the axis command table. The "Remaining traversing distance" value is only valid during execution of a positioning command. (Tag of technology object: <Axis name>.StatusPositioning.Distance)

**11.2.11.3 Dynamics settings**

Use the "Dynamics settings" diagnostic function to monitor the dynamic limits of the axis in the TIA Portal. The diagnostic function display is available in online mode in "Manual control" mode

and in "Automatic control" when the axis is active. The displayed status information has the following meaning:

Dynamic limit	Description
Acceleration	The "Acceleration" box indicates the currently configured acceleration of the axis. (Tag of technology object: <Axis name>.DynamicDefaults.Acceleration)
Deceleration	The "Deceleration" box indicates the currently configured deceleration of the axis. (Tag of technology object: <Axis name>.DynamicDefaults.Deceleration)
Emergency stop deceleration	The "Emergency stop deceleration" box indicates the currently configured emergency stop deceleration of the axis. (Tag of technology object: <Axis name>.DynamicDefaults.EmergencyDeceleration)
Jerk (axis technology object as of V2)	The "Velocity" box indicates the current axis step velocity configured. (Tag of technology object: <Axis name>.DynamicDefaults.Jerk)

Compatibility list of tags (Page 6425)

**11.2.12 Appendix**

**11.2.12.1 Using multiple axes with the same PTO**

Use the Motion Control functionality of the CPU S7-1200 to run multiple positioning axis technology objects with the same PTO (Pulse Train Output) and thus with the same CPU outputs. This is appropriate, for example, if different axis configurations are to be used for different production sequences via one PTO. As described below, it is possible to switch

between these axis configurations as often as necessary. The following diagram presents the basic functional relationships:

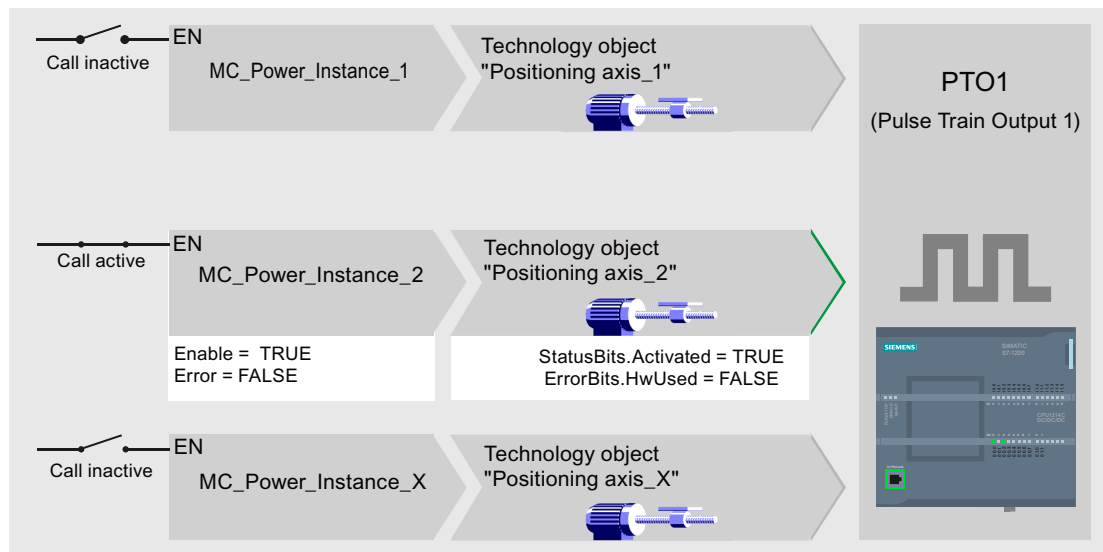

In this example, several positioning axis technology objects, each with its own axis configuration, use the same PTO. Each axis must be called in the user program with a separate call of Motion Control instruction "MC\_Power" with a separate instance data block. Only one axis at a time may use the PTO. The axis that is currently using the PTO indicates this with tag <Axis name>.StatusBits.Activated = TRUE.

### Switchover of the positioning axis technology object

The program scheme described below shows you how to switch between different technology objects and, thus, between different axis configurations. To use the same PTO with multiple axes without error indications, only the Motion Control instructions of the axis currently being used may be called.

The following diagram presents this principle using Motion Control instruction "MC\_Power" as an example:

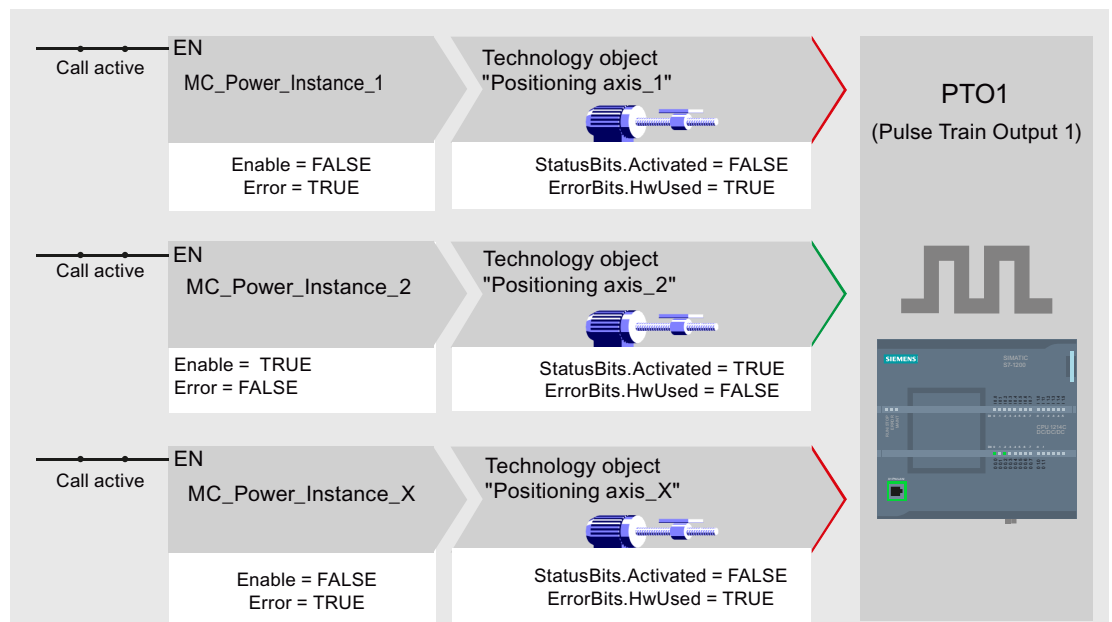

The tags of the activated axis ("Positioning axis\_2" here) show the following typical indicators in the user program:

- <Axis name>.StatusBits.Activated = TRUE
- <Axis name>.ErrorBits.HWUsed = FALSE

To switch from one positioning axis technology object to another, follow the steps described below. In the example, a switch is made from "Positioning axis\_2" to "Positioning axis\_1":

1. End any active traversing motions of activated "Positioning axis\_2"
2. Disable "Positioning axis\_2" with the associated Motion Control instruction "MC\_Power" using input parameter Enable = FALSE
3. To verify that "Positioning axis\_2" has been disabled, use an AND operation of output parameter Status = FALSE of Motion Control instruction "MC\_Power" and technology object tag <Axis name>.StatusBits.Enable = FALSE.
4. Deactivate the conditional call of the Motion Control instructions for "Positioning axis\_2".
5. Activate the conditional call of the Motion Control instruction for "Positioning axis\_1". At the first call of the corresponding Motion Control instruction "MC\_Power", "Positioning axis\_2" is deactivated and "Positioning axis\_1" is activated.
6. Enable "Positioning axis\_1" with the associated Motion Control instruction "MC\_Power" using input parameter Enable = TRUE.
7. To verify that "Positioning axis\_1" has been enabled, use an AND operation of output parameter Status = TRUE of Motion Control instruction "MC\_Power" and technology object tag <Axis name>.StatusBits.Enable = TRUE.

It is also always possible to cyclically call all Motion Control instructions of all axes working with a single PTO.

When an axis is enabled (here "Positioning axis\_2"), this axis becomes active.

In contrast to the conditional call, the Motion Control instructions of the deactivated axes (here "Positioning axis\_1" and "Positioning axis\_x") indicate errors. The tags of these axes indicate the status `<Axis name>.StatusBits.Activated = FALSE` and `<Axis name>.ErrorBits.HWUsed = TRUE`.

Use the conditional call of the Motion Control instructions if you want to implement the user program without error indicators.

### 11.2.12.2 Using multiple drives with the same PTO

If multiple drives are to be used, they can be run with a common PTO (Pulse Train Output) using changeover. The following diagram represents the basic circuit design:

The changeover between drives can be controlled, if required, by the user program via a digital output. If different axis configurations are required for the different drives, a changeover between these configurations is required for the PTO. For additional information on this topic, refer to "Using multiple axes with the same PTO (Page 6522)".

### **11.2.12.3 Tracking jobs from higher priority classes (execution levels)**

Depending on the application, it may be necessary to start Motion Control commands (for example, interrupt-controlled) in a higher priority class (execution level).

The Motion Control instructions must be called at short intervals for status monitoring. Motion Control commands cannot be sufficiently closely monitored if the higher priority Motion Control commands are called only once or at too great an interval. Tracking in such cases can be carried out in the cycle OB. An instance data block that is not currently being utilized must be available for each start of a higher priority Motion Control command. Refer to the following flow chart to see how you start Motion Control commands in a higher priority class (for example, hardware interrupt OB) and continue tracking in the program cycle OB:

Depending on the frequency of the Motion Control commands you want to start, you will have to generate a sufficient number of instance data blocks. Users determine which instance data block is currently used in the DBx\_used tags.

### **Start of Motion Control command in the hardware interrupt OB**

Binary queries of the DBx\_used tags (orange) are used to find an instance data block not currently in use. If such an instance data block is found, the utilized instance data block is marked as "used" (green) and the Motion Control command is started with this instance data block (blue).

Any other program sections of the hardware interrupt OB are then executed, followed by a return to the program cycle OB.

### **Tracking of started Motion Control commands in the program cycle OB**

All instance data blocks available in the cycle OB are checked to determine if they are currently in use by means of the DBx\_used tag (violet).

If an instance data block is in use (Motion Control command is being processed), the Motion Control instruction with this instance data block and input parameter Execute = TRUE is called to read out the status messages (red).

If the command is complete or has been aborted, the following actions are taken next (blue green):

- Call of Motion Control instruction with input parameter Execute = FALSE
- Resetting the DBx\_used tag

This completes the command tracking, and the instance data block is now available for use again.

#### **11.2.12.4 Special cases for use of software limit switches**

### **Software limit switches in conjunction with a homing operation**

Due to unfavorably parameterized homing jobs, the braking action of the axis may be influenced at the software limit switch. Take the following examples into consideration when developing your program.

**Example 1:**

During a travel command, a homing job (for example, Set reference point) offsets the current axis position in the direction of the software limit switch. It is still possible to bring the axis to a standstill before reaching the software limit switch:

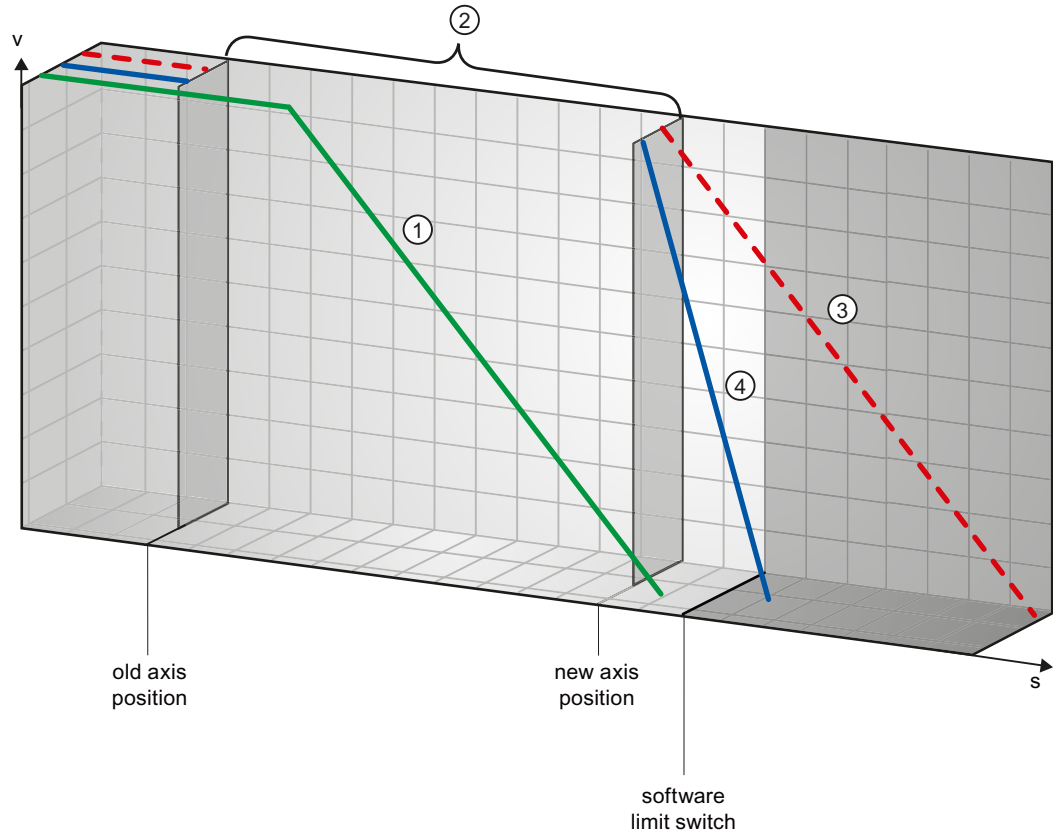

①	The green curve shows the motion <b>without</b> the homing job. The axis brakes at the configured deceleration and comes to a standstill at a position before the software limit switch.
②	A new axis position is set as a result of the homing job. The area between the old and new axis position is thus "skipped".
③	Based on the new axis position, the axis would theoretically be stopped with the configured deceleration at a position after the software limit switch (red curve).
④	Because braking with the configured deceleration is no longer sufficient, the axis actually follows the blue curve. Following constant motion, the axis brakes at the configured emergency stop deceleration and comes to a standstill at the position of the software limit switch.

**Example 2:**

During a travel command, a homing job (for example, Set reference point) offsets the current axis position in the direction of the software limit switch. In contrast to example 1, it is no longer

possible to bring the axis to a standstill before reaching the software limit switch. The axis overruns the position of the software limit switch.

①	The green curve shows the motion <b>without</b> the homing job. The axis brakes at the configured deceleration and comes to a standstill at a position before the software limit switch.
②	A new axis position is set as a result of the homing job. The area between the old and new axis position is thus "skipped".
③	Based on the new axis position, the axis would theoretically be stopped with the configured deceleration at a position well after the software limit switch (red curve).
④	Because braking with the configured deceleration is no longer sufficient, the axis actually follows the blue curve. The axis brakes with the configured emergency stop deceleration. However, the emergency stop deceleration is not sufficient to stop the axis at the position of the software limit switch. The position of the software limit switch is overrun.

**Example 3:**

During a braking operation, a homing job (for example, Set reference point) offsets the current axis position in the direction of the software limit switch. It is still possible to bring the axis to a standstill before reaching the software limit switch:

①	The green curve shows the motion <b>without</b> the homing job. The axis brakes at the configured deceleration and comes to a standstill at a position before the software limit switch.
②	A new axis position is set as a result of the homing job. The area between the old and new axis position is thus "skipped".
③	Based on the new axis position, the axis would theoretically be stopped with the configured deceleration at a position after the software limit switch (red curve).
④	Because braking with the configured deceleration is no longer sufficient, the axis actually follows the blue curve. Following constant motion, the axis brakes at the configured emergency stop deceleration and comes to a standstill at the position of the software limit switch.

**Example 4:**

During a braking operation, a homing job (for example, Set reference point) offsets the current axis position in the direction of the software limit switch. In contrast to example 3, it is no longer possible to bring the axis to a standstill before reaching the software limit switch. The axis overruns the position of the software limit switch.

①	The green curve shows the motion <b>without</b> the homing job. The axis brakes at the configured deceleration and comes to a standstill at a position before the software limit switch.
②	A new axis position is set as a result of the homing job. The area between the old and new axis position is thus "skipped".
③	Based on the new axis position, the axis would theoretically be stopped with the configured deceleration at a position well after the software limit switch (red curve).
④	Because braking with the configured deceleration is no longer sufficient, the axis actually follows the blue curve. The axis brakes with the configured emergency stop deceleration. However, the emergency stop deceleration is not sufficient to stop the axis at the position of the software limit switch. The position of the software limit switch is overrun.

- Software limit switches in conjunction with dynamic changes (Page 6536)
- Behavior of axis when position limits is tripped (Page 6443)

**Software limit switches and software limit switch position changes.**

An incorrect change in the position of the software limit switch during the runtime of the user program can abruptly reduce the distance between the current axis position and the position of the software limit switch.

The axis response is similar to that described in Software limit switches in conjunction with a homing operation (Page 6529).

Software limit switches in conjunction with a homing operation (Page 6529)

Software limit switches in conjunction with dynamic changes (Page 6536)

Behavior of axis when position limits is tripped (Page 6443)

**Software limit switches in conjunction with dynamic changes**

It is possible to influence the deceleration of the axis in the area of the software limit switches in conjunction with overriding motion commands. This applies when the overriding motion command is started with a lower deceleration (tag <Axis name>.DynamicDefaults.Deceleration). Take the following examples into consideration when developing your program.

**Example 1:**

During axis motion, an active motion command is overridden by another motion command with a lower deceleration:

①	The green curve shows the motion of an active command <b>without</b> this command being overridden. The axis brakes at the configured deceleration and comes to a standstill at a position before the software limit switch.
②	Based on the overriding motion command with lower deceleration, the axis would theoretically be stopped with the configured deceleration at a position after the software limit switch (red curve).
③	Because braking with the configured deceleration of the overriding motion command is no longer sufficient, the axis actually follows the blue curve. Following a constant motion, the axis brakes at the emergency stop deceleration and comes to a standstill at the position of the software limit switch.

### Example 2:

During braking of the axis, an active motion command is overridden by another motion command with a lower deceleration:

①	The green curve shows the motion of an active command <b>without</b> this command being overridden. The axis brakes at the configured deceleration and comes to a standstill at a position before the software limit switch.
②	Based on the overriding motion command with lower deceleration, the axis would theoretically be stopped at a position well after the software limit switch (red curve).
③	Because braking with the configured deceleration of the overriding motion command is no longer sufficient, the axis actually follows the blue curve. Following a constant motion, the axis brakes at the emergency stop deceleration and comes to a standstill at the position of the software limit switch.

Behavior of axis when position limits is tripped (Page 6443)

**11.2.12.5 Reducing velocity for a short positioning duration**

The CPU can reduce the velocity of a positioning command when the planned positioning duration is < 2 ms.

The velocity of command execution will then be reduced for the entire duration. The reduced velocity (pulses per s) is calculated as follows:

- Reduced velocity = Number of pulses to be output \* 500Hz

Velocity is **not** reduced if the planned positioning duration is >= 2 ms.

**11.2.12.6 Dynamic adjustment of start/stop velocity**

The configuration of your velocity limits (start/stop velocity and maximum velocity), the dynamic values (acceleration, deceleration and jerk) and the target speed of the traversing command may under certain circumstances result in the start/stop velocity being dynamically adjusted by the CPU.

This is for example the case when, due to a low configured start/stop velocity, the time required for the first pulses would be longer than that possible for the entire acceleration. The first pulse is in these cases output at a greater velocity than the configured start/stop velocity. The subsequent pulses are also dynamically adjusted to ensure the acceleration process can be completed in the specified time.

Ensure in the event of any pulse loss that the hardware (drive) you use is adjusted to this situation, or change the dynamic settings of your axis to avoid dynamic adjustment of the start/stop velocity.

**11.2.12.7 List of ErrorIDs and ErrorInfos (technology objects as of V4)**

The following table lists all ErrorIDs and ErrorInfos that can be indicated in Motion Control instructions. In addition to the cause of the error, remedies for eliminating the error are also listed:

**Operating error with axis stop**

ErrorID	ErrorInfo	Description	Remedy
16#8000		Drive error, loss of "Drive ready"	
	16#0001	-	Acknowledge error with instruction "MC_Reset"; provide drive signal; restart command, if necessary
16#8001		Lower SW limit switch has been tripped	

ErrorID	ErrorInfo	Description	Remedy
	16#000E	The position of the lower SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the SW limit switch
	16#000F	The position of the lower SW limit switch was reached with the emergency stop deceleration	
	16#0010	The position of the lower SW limit switch was exceeded with the emergency stop deceleration	
<b>16#8002</b>		<b>Upper SW limit switch has been tripped</b>	
	16#000E	The position of the upper SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the SW limit switch
	16#000F	The position of the upper SW limit switch was reached with the emergency stop deceleration	
	16#0010	The position of the upper SW limit switch was exceeded with the emergency stop deceleration	
<b>16#8003</b>		<b>Lower HW limit switch was reached</b>	
	16#000E	The lower HW limit switch was reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the homing switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the HW limit switch.
<b>16#8004</b>		<b>Upper HW limit switch was reached</b>	
	16#000E	The upper HW limit switch has been reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the homing switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the HW limit switch.
<b>16#8005</b>		<b>PTO/HSC are already being used by another axis</b>	
	16#0001	-	<p><b>The axis was configured incorrectly:</b> Correct the configuration of the PTO (Pulse Train Output) / HSC (High Speed Counter) and download it to the controller</p> <p><b>More than one axis is to run with one PTO:</b> Another axis is using the PTO / HSC. If the current axis is to assume the control, the other axis must be disabled with "MC_Power" Enable = FALSE. (see also Using multiple axes with the same PTO (Page 6522))</p>
<b>16#8006</b>		<b>A communication error in the control panel has occurred</b>	
	16#0012	A timeout has occurred	Check the cable connection and press the "Manual control" button again.
<b>16#8007</b>		<b>The axis cannot be enabled.</b>	
	16#0025	Restarting	Wait until the axis restart is complete.
	16#0026	Executing loading process in RUN mode	Wait until the loading process is complete.
<b>16#8008</b>		<b>Impermissible motion direction</b>	

ErrorID	ErrorInfo	Description	Remedy
	16#002E	The selected motion direction is not allowed.	<ul style="list-style-type: none"> <li>Adjust the motion direction and restart the command.</li> <li>Adjust the allowed direction of rotation in the technology object configuration under "Extended parameters &gt; Mechanics" Restart the command.</li> </ul>
	16#002F	A reversing motion is not possible with the selected motion direction.	

### Operating error without axis stop

ErrorID	ErrorInfo	Description	Remedy
<b>16#8200</b>		<b>Axis is not enabled</b>	
	16#0001	-	Enable the axis; restart the command
<b>16#8201</b>		<b>Axis has already been enabled by another "MC_Power" instance</b>	
	16#0001	-	Enable the axis with only one "MC_Power" instance
<b>16#8202</b>		<b>The maximum number of simultaneously active Motion Control commands has been exceeded (maximum of 200 commands for all motion control technology objects)</b>	
	16#0001	-	Reduce the number of simultaneously active commands; restart the command A command is active if parameter "Busy" = TRUE in the Motion Control instruction.
<b>16#8203</b>		<b>Axis is currently operated in "Manual control" (axis control panel)</b>	
	16#0001	-	Exit "Manual control"; restart the command
<b>16#8204</b>		<b>Axis is not homed</b>	
	16#0001	-	Home the axis with instruction "MC_Home"; restart the command
<b>16#8205</b>		<b>The axis is currently controlled by the user program (the error is only displayed in the axis control panel)</b>	
	16#0013	The axis is enabled in the user program.	Disable axis with instruction "MC_Power" and select "Manual control" again in the axis control panel
<b>16#8206</b>		<b>Technology object not activated yet</b>	
	16#0001	-	Enable the axis with instruction "MC_Power" Enable = TRUE or enable the axis in the axis control panel.
<b>16#8207</b>		<b>Command rejected</b>	
	16#0016	Active homing is running; another homing method cannot be started.	Wait for active homing to finish or abort the active homing with a motion command, for example, "MC_Halt".
	16#0018	The axis cannot be moved with a command table while it is being actively or passively homed.	Wait until direct or passive homing is complete.
	16#0019	The axis cannot be actively or passively homed while a command table is being processed.	Wait for command table to finish or abort the command table with a motion command, for example, "MC_Halt".
<b>16#8208</b>		<b>Difference between maximum and start/stop velocity is invalid</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command

ErrorID	ErrorInfo	Description	Remedy
	16#000A	Value is less than or equal to 0	
<b>16#8209</b>		<b>Invalid acceleration for technology object "Axis"</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#000A	Value is less than or equal to 0	
<b>16#820A</b>		<b>It is not possible to restart the axis</b>	
	16#0013	The axis is enabled in the user program.	Disable the axis with the "MC_Power" instruction; restart again
	16#0027	The axis is currently being operated in "Manual control" (axis control panel)	
<b>16#820B</b>		<b>It is not possible to execute the command table</b>	
	16#0026	Executing loading process in RUN mode	Wait until the loading process is complete.

### Block parameter error

ErrorID	ErrorInfo	Description	Remedy
<b>16#8400</b>		<b>Invalid value at parameter "Position" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#0006	The value is outside the number range (less than $-1e^{12}$ )	
<b>16#8401</b>		<b>Invalid value at parameter "Distance" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#0006	The value is outside the number range (less than $-1e^{12}$ )	
<b>16#8402</b>		<b>Invalid value at parameter "Velocity" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#0008	Value is greater than the configured maximum velocity	
	16#0009	Value is less than the configured start/stop velocity	
	16#0024	Value is less than 0	
<b>16#8403</b>		<b>Invalid value at parameter "Direction" of the Motion Control instruction</b>	
	16#0011	The selection value is invalid	Correct the selection value; restart the command
<b>16#8404</b>		<b>Invalid value at parameter "Mode" of the Motion Control instruction</b>	
	16#0011	The selection value is invalid	Correct the selection value; restart the command
	16#0015	Active/passive homing is not configured	Correct the configuration and download it to the controller; enable the axis and restart the command

ErrorID	ErrorInfo	Description	Remedy
	16#0017	The direction reversal is activated at the hardware limit switch, despite the fact that the hardware limit switches are disabled	<ul style="list-style-type: none"> <li>• Activate the HW limit switch using the tag &lt;Axis name&gt;.PositionLimitsHW.Active = TRUE, restart the command</li> <li>• Correct the configuration and download it to the controller; enable the axis and restart the command</li> </ul>
<b>16#8405</b>		<b>Invalid value at parameter "StopMode" of the Motion Control instruction</b>	
	16#0011	The selection value is invalid	Correct the selection value; enable the axis again
<b>16#8406</b>		<b>Simultaneous forward and backward jogging is not allowed</b>	
	16#0001	-	Take steps to ensure that parameters "JogForward" and "JogBackward" do not have signal status TRUE simultaneously; restart the command.
<b>16#8407</b>		<b>Switching to another axis with instruction "MC_Power" is only permitted after disabling the active axis.</b>	
	16#0001	-	Disable the active axis; it is then possible to switch to the other axis and enable it.
<b>16#8408</b>		<b>Invalid value at parameter "Axis" of the Motion Control instruction</b>	
	16#001A	The specified value does not match the required technology object version	Correct the value; restart the command
	16#001B	The specified value does not match the required technology object type	
	16#001C	The specified value is not a Motion Control technology data block	
<b>16#8409</b>		<b>Invalid value at parameter "CommandTable" of the Motion Control instruction</b>	
	16#001A	The specified value does not match the required technology object version	Correct the value; restart the command
	16#001B	The specified value does not match the required technology object type	
	16#001C	The specified value is not a Motion Control technology data block	
<b>16#840A</b>		<b>Invalid value at parameter "StartStep" of the Motion Control instruction</b>	
	16#000A	Value is less than or equal to 0	Correct the value; restart the command
	16#001D	The start step is greater than the end step	
	16#001E	Value is greater than 32	
<b>16#840B</b>		<b>Invalid value at parameter "EndStep" of the Motion Control instruction</b>	
	16#000A	Value is less than or equal to 0	Correct the value; restart the command
	16#001E	Value is greater than 32	
<b>16#840C</b>		<b>Invalid value at parameter "RampUpTime" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#000A	Value is less than or equal to 0	
<b>16#840D</b>		<b>Invalid value at parameter "RampDownTime" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#000A	Value is less than or equal to 0	
<b>16#840E</b>		<b>Invalid value at parameter "EmergencyRampTime" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#000A	Value is less than or equal to 0	

ErrorID	ErrorInfo	Description	Remedy
<b>16#840F</b>		<b>Invalid value at parameter "JerkTime" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#000A	Value is less than or equal to 0	
<b>16#8410</b>		<b>Invalid value at parameter "Parameter" of the Motion Control instruction</b>	
	16#0028	Data types of VARIANT pointer "Parameter" and "Value" do not match.	Use a suitable data type; restart command
	16#0029	VARIANT pointer "Parameter" does not point to a data block of the technology object.	Correct the VARIANT pointer; restart the command
	16#002A	The value at the VARIANT pointer "Parameter" cannot be read.	Correct the VARIANT pointer; restart the command
	16#002B	The value at the VARIANT pointer "Parameter" cannot be written.	Correct the VARIANT pointer or value; restart the command
	16#002C	The axis is not disabled.	Disable the axis; restart the command
<b>16#8411</b>		<b>Invalid value at parameter "Value" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command

### Configuration error of the axis

ErrorID	ErrorInfo	Description	Remedy
<b>16#8600</b>		<b>Parameter assignment of pulse generator (PTO) is invalid</b>	
	16#000B	The address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0014	The selected hardware is used by another application	
<b>16#8601</b>		<b>Parameter assignment of the high-speed counter (HSC) is invalid</b>	
	16#000B	The address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0014	The selected hardware is used by another application	
<b>16#8602</b>		<b>Invalid parameter assignment of "Enable output"</b>	
	16#000B	The address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
<b>16#8603</b>		<b>Invalid parameter assignment of "Ready input"</b>	
	16#000B	The address is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
<b>16#8604</b>		<b>Invalid "Pulses per motor revolution" value</b>	
	16#000A	Value is less than or equal to zero	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
<b>16#8605</b>		<b>Invalid "Distance per revolution" value</b>	
	16#0002	Number format of value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#000A	Value is less than or equal to zero	
<b>16#8606</b>		<b>Invalid "Start/stop velocity" value</b>	
	16#0002	Number format of value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0003	Value exceeds the upper hardware limit	

ErrorID	ErrorInfo	Description	Remedy
	16#0004	Value is less than the lower hardware limit	
	16#0007	The start/stop velocity is greater than the maximum velocity	
<b>16#8607</b>		<b>Invalid "maximum velocity" value</b>	
	16#0002	Number format of value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"
	16#0003	Value exceeds the upper hardware limit	
	16#0004	Value is less than the lower hardware limit	
<b>16#8608</b>		<b>Invalid "Acceleration" value</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0003	Value exceeds the upper hardware limit	
	16#0004	Value is less than the lower hardware limit	
<b>16#8609</b>		<b>Invalid "Deceleration" value</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0003	Value exceeds the upper hardware limit	
	16#0004	Value is less than the lower hardware limit	
<b>16#860A</b>		<b>Invalid "Emergency stop deceleration" value</b>

### 11.2.12.8 Tags of the positioning axis technology object as of V4

#### Position tag as of V4

##### Legend

<b>Data type</b>	Data type of tag	
<b>Start value</b>	Start value of tag	
<b>Access</b>	Access to the tag in the user program:	
	RCC P	The tag can be read in the user program and is updated at each cycle checkpoint.
	RP	The tag can be read with the Motion Control instruction "MC_ReadParam". The current value of the corresponding tag is determined at the start of the command.
<b>Effective</b>	Specifies when a change to the tag takes effect.	
<b>HMI</b>	The tag can be used in an HMI system (according to the access to the tag in the user program).	

<b>&lt;Axis name&gt;.Position</b>				
Current position of the axis (indicated in the configured unit of measurement) If the axis is not homed, the tag indicates the position value relative to the enable position of the axis.				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Real	0.0	RCCP, RP	-	X

### Actor tags as of V4

#### Legend

<b>Data type</b>	Data type of tag			
<b>Start value</b>	Start value of tag			
<b>Access</b>	Access to the tag in the user program:			
	R	The tag can be read in the user program.		
	WP	If the axis is disabled (MC_Power.Status = FALSE), the tag can be written with the Motion Control instruction "MC_WriteParam".		
	-	The tag cannot be used in the user program.		
<b>Effective</b>	Specifies when a change to the tag takes effect:			
	2	When axis is enabled		
<b>HMI</b>	The tag can be used in an HMI system (according to the access to the tag in the user program).			

<b>&lt;Axis name&gt;.Actor.Type</b>				
Drive connection The drive is connected via a pulse interface.				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
DInt	2	R	-	X

<b>&lt;Axis name&gt;.Actor.InverseDirection</b>				
Invert direction FALSE = The direction is not inverted. TRUE = The direction is inverted.				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Bool	FALSE	R	-	X
		WP	2	-

<b>&lt;Axis name&gt;.Actor.DirectionMode</b>				
Permitted direction of rotation				
0 = Both directions				
1 = Positive direction				
2 = Negative direction				
Data type	Start value	Access	Effective	HMI
Int	0	R	-	X
		WP	2	-

<b>&lt;Axis name&gt;.Actor.Interface.EnableDriveOutput</b>				
Enable output (internal parameter)				
Data type	Start value	Access	Effective	HMI
VREF	-	-	-	-

<b>&lt;Axis name&gt;.Actor.Interface.DriveReadyInput</b>				
Ready input (internal parameter)				
Data type	Start value	Access	Effective	HMI
VREF	-	-	-	-

<b>&lt;Axis name&gt;.Actor.Interface.PTO</b>				
Pulse output (internal parameter)				
Data type	Start value	Access	Effective	HMI
DWord	0	-	-	-

<b>&lt;Axis name&gt;.Actor.DriveParameter.PulsesPerDriveRevolution</b>				
Pulses per motor revolution				
Data type	Start value	Access	Effective	HMI
DInt	1000	R	-	X
		WP	2	-

## Sensor[1] tags as of V4

### ActiveHoming tags as of V4

#### Legend

<b>Data type</b>	Data type of tag	
<b>Start value</b>	Start value of tag The start value can be overwritten by the axis configuration.	
<b>Access</b>	Access to the tag in the user program:	
	RW	The tag can be read and written in the user program. The tag can be written with Motion Control instruction "MC_WriteParam".
	R	The tag can be read in the user program.
	WP	If the axis is disabled (MC_Power.Status = FALSE), the tag can be written with the Motion Control instruction "MC_WriteParam".
	-	The tag cannot be used in the user program.
<b>Effective</b>	Specifies when a change to the tag takes effect:	
	1	When axis is activated (<Axis name>.StatusBits.Activated tag changes from FALSE → TRUE), disabled, or enabled
	2	When axis is enabled
	8	When an active homing command is started
<b>HMI</b>	The tag can be used in an HMI system (according to the access to the tag in the user program).	

<b>&lt;Axis name&gt;.Sensor[1].ActiveHoming.Mode</b>				
Active homing mode 2 = Homing via digital input				
Data type	Start value	Access	Effective	HMI
DInt	2	R	-	X
		WP	2	-

<b>&lt;Axis name&gt;.Sensor[1].ActiveHoming.SideInput</b>				
End of the homing switch to which the axis is homed during active homing FALSE = Lower end TRUE = Upper end				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RW	1, 8	X

<b>&lt;Axis name&gt;.Sensor[1].ActiveHoming.DigitalInputAddress</b>				
Symbolic input address of the homing switch (internal parameter)				
Data type	Start value	Access	Effective	HMI
VREF	-	-	-	-

<b>&lt;Axis name&gt;.Sensor[1].ActiveHoming.HomePositionOffset</b>				
Home position offset (active homing) (indicated in the configured unit of measurement)				
Data type	Start value	Access	Effective	HMI
Real	0.0	RW	1, 8	X

<b>&lt;Axis name&gt;.Sensor[1].ActiveHoming.SwitchLevel</b>				
Selection of signal level that is present at the CPU input when the homing switch is reached FALSE = Low level (Low-active) TRUE = High level (High-active)				
Data type	Start value	Access	Effective	HMI
Bool	TRUE	RW	1, 8	X

## DynamicDefaults tags as of V4

### Legend

<b>Data type</b>	Data type of tag
<b>Start value</b>	Start value of tag The start value can be overwritten by the axis configuration.
<b>Access</b>	Access to the tag in the user program:
	RW    The tag can be read and written in the user program. The tag can be written with Motion Control instruction "MC_WriteParam".
<b>Effective</b>	Specifies when a change to the tag takes effect:

	1	When axis is activated (<Axis name>.StatusBits.Activated tag changes from FALSE -> TRUE), disabled, or enabled
	5	The next time an MC_MoveAbsolute, MC_MoveRelative, MC_MoveVelocity, MC_MoveJog, MC_Halt, MC_CommandTable, or active MC_Home command is started (Mode = 3).
	6	When a MC_MoveJog command is stopped
<b>HMI</b>	The tag can be used in an HMI system (according to the access to the tag in the user program).	

<b>&lt;Axis name&gt;.DynamicDefaults.Acceleration</b>				
Acceleration of the axis (indicated in the configured unit of measurement)				
Data type	Start value	Access	Effective	HMI
Real	48.0	RW	1, 5, 6	X

<b>&lt;Axis name&gt;.DynamicDefaults.Deceleration</b>				
Deceleration of the axis (indicated in the configured unit of measurement)				
Data type	Start value	Access	Effective	HMI
Real	48.0	RW	1, 5, 6	X

<b>&lt;Axis name&gt;.DynamicDefaults.EmergencyDeceleration</b>				
Emergency stop deceleration of the axis (indicated in the configured unit of measurement)				
Data type	Start value	Access	Effective	HMI
Real	120.0	RW	1, 5, 6	X

<b>&lt;Axis name&gt;.DynamicDefaults.Jerk</b>				
Jerk during acceleration and deceleration ramp of the axis (indicated in the configured unit of measurement) The jerk is activated if the configured jerk is greater than 0.00004 mm/s <sup>2</sup> .				
Data type	Start value	Access	Effective	HMI
Real	192.0	RW	1, 5	X

Tag of the axis technology object V1...3 (Page 6596)

**PositionLimitsHW tags as of V4****Legend**

<b>Data type</b>	Data type of tag
<b>Start value</b>	Start value of tag The start value can be overwritten by the axis configuration.
<b>Access</b>	Access to tag in the user program:
	RW The tag can be read and written in the user program. The tag can be written with Motion Control instruction "MC_WriteParam".

	R	The tag can be read in the user program.
	WP	If the axis is disabled (MC_Power.Status = FALSE), the tag can be written with Motion Control instruction "MC_WriteParam".
	-	The tag cannot be used in the user program.
<b>Effective</b>	Specifies when a change to the tag takes effect:	
	1	When axis is activated (<Axis name>.StatusBits.Activated tag changes from FALSE -> TRUE), disabled, or enabled
	2	When axis is enabled
	5	The next time an MC_MoveAbsolute, MC_MoveRelative, MC_MoveVelocity, MC_MoveJog, MC_Halt, MC_CommandTable, or active MC_Home command is started (Mode = 3).
	6	When a MC_MoveJog command is stopped
<b>HMI</b>	The tag can be used in an HMI system (according to the access to the tag in the user program).	

<b>&lt;Axis name&gt;.PositionLimitsHW.Active</b>				
Activation of the hardware limit switches FALSE = The hardware limit switches are deactivated. TRUE = The hardware limit switches are activated.				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Bool	FALSE	RW	1, 5, 6	X

<b>&lt;Axis name&gt;.PositionLimitsHW.MinSwitchLevel</b>				
Selection of signal level that is present at the CPU input when the lower hardware limit switch is reached FALSE = Low level (Low-active) TRUE = High level (High-active)				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Bool	FALSE	R	-	X
		WP	2	-

<b>&lt;Axis name&gt;.PositionLimitsHW.MinSwitchAddress</b>				
Symbolic input address of the lower hardware limit switch (internal parameter)				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
VREF	-	-	-	-

<b>&lt;Axis name&gt;.PositionLimitsHW.MaxSwitchLevel</b>				
Selection of signal level that is present at the CPU input when the upper hardware limit switch is reached FALSE = Low level (Low-active) TRUE = High level (High-active)				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Bool	FALSE	R	-	X
		WP	2	-

<b>&lt;Axis name&gt;.PositionLimitsHW.MaxSwitchAddress</b>				
Input address of the upper hardware limit switch (internal parameter)				
Data type	Start value	Access	Effective	HMI
VREF	-	-	-	-

<b>Data type</b>	Data type of tag
<b>Start value</b>	Start value of tag
<b>Access</b>	Access to the tag in the user program: RCC P The tag can be read in the user program and is updated at each cycle checkpoint.
<b>Effective</b>	Specifies when a change to the tag takes effect.
<b>HMI</b>	The tag can be used in an HMI system.

<b>&lt;Axis name&gt;.StatusBits.Activated</b>				
Activation of the axis FALSE = The axis is not activated. TRUE = The axis is activated. It is connected to the assigned PTO (Pulse Train Output). The data of the technology data block will be updated cyclically.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.Enable</b>				
Enable status of the axis FALSE = The axis is not enabled. TRUE = The axis is enabled and ready to accept Motion Control commands.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.HomingDone</b>				
Homing status of the axis FALSE = The axis is not homed. TRUE = The axis is homed and is capable of executing absolute positioning commands. The axis does not have to be homed for relative positioning. The status is FALSE during active homing. The status remains TRUE during passive homing if the axis was already homed beforehand.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.Done</b>				
Command execution on the axis FALSE = A Motion Control command is active on the axis. TRUE = A Motion Control command is not active on the axis.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.Error</b>				
Error status on the axis FALSE = No error is active on the axis. TRUE = An error occurred on the axis. Additional information about the error is available in automatic control at the "ErrorID" and "ErrorInfo" parameters of the Motion Control instructions. In manual mode, the "Error message" box of the axis control panel displays detailed information about the cause of error.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.StandStill</b>				
Standstill of the axis FALSE = The axis is in motion. TRUE = The axis is at a standstill.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.PositioningCommand</b>				
Execution of a positioning command FALSE = A positioning command is not active on the axis. TRUE = The axis is executing a positioning command of the "MC_MoveRelative" or MC_MoveAbsolute Motion Control instruction.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.VelocityCommand</b>				
Execution of a command with velocity specification				
FALSE = A command with velocity specification is not active on the axis.				
TRUE = The axis is executing a motion command with velocity specification of the "MC_MoveVelocity" or MC_MoveJog Motion Control instruction.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.HomingCommand</b>				
Execution of a homing command				
FALSE = A homing command is not active on the axis.				
TRUE = The axis is executing a homing command of the "MC_Home" Motion Control instruction.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.CommandTableActive</b>				
Execution of a command table				
FALSE = A command table is not active on the axis.				
TRUE = The axis is controlled by "MC_CommandTable" Motion Control instruction.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.ConstantVelocity</b>				
Constant velocity				
FALSE = The axis is accelerating, decelerating, or at a standstill.				
TRUE = The setpoint velocity has been reached. The axis is moving at constant velocity.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.Accelerating</b>				
Acceleration process				
FALSE = The axis is decelerating, moving at constant velocity, or at a standstill.				
TRUE = The axis is accelerating.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.Decelerating</b>				
Deceleration process				
FALSE = The axis is accelerating, moving at constant velocity, or at a standstill.				
TRUE = The axis is decelerating.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.ControlPanelActive</b>				
Activation status of the axis control panel FALSE = "Automatic mode" is activated. The user program has control priority over the axis. TRUE = The "Manual control" mode was enabled in the axis control panel. The axis control panel has control priority over the axis. The axis cannot be controlled from the user program.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.DriveReady</b>				
Operational status of the drive FALSE = The drive is not ready. Setpoints will not be executed. TRUE = The drive is ready. Setpoints can be executed.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.RestartRequired</b>				
Restart of axis required FALSE = A restart of the axis is not required. TRUE = Values were modified in the load memory. To download the values to the work memory while the CPU is in RUN mode, the axis must be restarted. Use the MC_Reset Motion Control instruction to do this.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.SWLimitMinActive</b>				
Status of the lower software limit switch FALSE = The axis is kept within its configured working range. TRUE = The lower software limit switch was reached or exceeded.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.SWLimitMaxActive</b>				
Status of the upper software limit switch FALSE = The axis is kept within its configured working range. TRUE = The upper software limit switch was reached or exceeded.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.HWLimitMinActive</b>				
Status of the lower hardware limit switch FALSE = The axis is kept within its configured permitted traversing range. TRUE = The lower hardware limit switch was reached or exceeded.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

<b>&lt;Axis name&gt;.StatusBits.HWLimitMaxActive</b>				
Status of the upper hardware limit switch FALSE = The axis is kept within its configured permitted traversing range. TRUE = The upper hardware limit switch was reached or exceeded.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	RCCP	-	X

**11.2.12.1 Versions V1...3**

0

**CPU outputs relevant for motion control (technology version V1...3)**

The number of usable drives depends on the CPU, the number of PTOs (pulse train outputs) and the number of available pulse generator outputs.

The following tables provide information about the relevant dependencies:

**Maximum number of PTOs**

The maximum number of controllable PTOs (drives) depends on the order number of CPU:

Order number CPU	Number of PTOs
xxxxxxx-1xx <b>30</b> -xxxx	2
xxxxxxx-1xx <b>31</b> -xxxx	4

The maximum number of controllable PTOs (drives) applies regardless of the use of a signal board.

**Usable pulse generator outputs**

The CPU provides one pulse output and one direction output for controlling a stepper motor drive or a servo motor drive with pulse interface. The pulse output provides the drive with the pulses required for motor motion. The direction output controls the travel direction of the drive.

Pulse and direction outputs are permanently assigned to one another and form a pulse generator output. On-board CPU outputs or outputs of a signal board can be used as pulse generator outputs. You select between on-board CPU outputs and outputs of the signal board during device configuration under Pulse generators (PTO/PWM) on the "Properties" tab.

The following table shows the number of usable drives per CPU or signal board:

CPU		On-board	Signal board				
			DI2/DO2 x DC24V 20kHz	DI2/DO2 x DC24V 200kHz	DO4 x DC24V 200kHz	DI2/DO2 x DC5V 200kHz	DO4 x DC5V 200kHz
CPU 1211C, CPU 1212C, CPU 1214C (MLFB - order number xxxxxxx-1xx30-xxxx)	DC/DC/DC	2	2	2	2	2	2
	AC/DC/RLY	-	1	1	2	1	2
	DC/DC/RLY	-	1	1	2	1	2
CPU 1211C (MLFB - order number xxxxxxx-1xx31-xxxx)	DC/DC/DC	2	3	3	4	3	4
	AC/DC/RLY	-	1	1	2	1	2
	DC/DC/RLY	-	1	1	2	1	2
CPU 1212C (MLFB - order number xxxxxxx-1xx31-xxxx)	DC/DC/DC	3	4	4	4	4	4
	AC/DC/RLY	-	1	1	2	1	2
	DC/DC/RLY	-	1	1	2	1	2
CPU 1214C (MLFB - order number xxxxxxx-1xx31-xxxx)	DC/DC/DC	4	4	4	4	4	4
	AC/DC/RLY	-	1	1	2	1	2
	DC/DC/RLY	-	1	1	2	1	2
CPU 1215C	DC/DC/DC	4	4	4	4	4	4
	AC/DC/RLY	-	1	1	2	1	2
	DC/DC/RLY	-	1	1	2	1	2

The following table shows the address assignment of the pulse and direction outputs:

CPU S7-1200:		Outputs PTO1 *)		Outputs PTO2 **)		Outputs PTO3 *)		Outputs PTO4 **)	
		Pls.	Dir.	Pls.	Dir.	Pls.	Dir.	Pls.	Dir.
CPU 1211C, CPU 1212C, CPU 1214C, CPU1215C (DC/DC/DC)	CPU	Ax.0	Ax.1	Ax.2	Ax.3	Ax.4	Ax.5	Ax.6	Ax.7
	Signal board	Ay.0	Ay.1	Ay.2	Ay.3	Ay.0	Ay.1	Ay.2	Ay.3
CPU 1211C, CPU 1212C, CPU 1214C,	CPU	-	-	-	-	-	-	-	-

CPU S7-1200:		Outputs PTO1 *)		Outputs PTO2 **)		Outputs PTO3 *)		Outputs PTO4 **)	
		Pls.	Dir.	Pls.	Dir.	Pls.	Dir.	Pls.	Dir.
CPU 1215C (AC/DC/RLY)	Signal board	Ay.0	Ay.1	Ay.2	Ay.3	Ay.0	Ay.1	Ay.2	Ay.3
CPU 1211C, CPU 1212C, CPU 1214C, CPU 1215C (DC/DC/RLY)	CPU	-	-	-	-	-	-	-	-
	Signal board	Ay.0	Ay.1	Ay.2	Ay.3	Ay.0	Ay.1	Ay.2	Ay.3

x = Initial byte address of on-board CPU outputs (default value = 0)

y = Initial byte address of signal board outputs (default value = 4)

\* If a DC/DC/DC CPU variant is used together with a DI2/DO2 signal board, the signals of the PTO1/3 can be generated via the on-board CPU outputs or via the signal board.

\*\* If a DC/DC/DC CPU variant is used together with a DO4 signal board, the signals for PTO1/3 or PTO2/4 can be generated via the on-board CPU outputs or via the signal board.

PTO3 and PTO4 are only available for CPUs with the order numbers xxxxxxx-1xx31-xxxx.

**Note**

**Access to pulse generator outputs via the process image**

The firmware takes control via the corresponding pulse generator outputs if the PTO (Pulse Train Output) is selected and assigned to an axis.

With this takeover of the control function, the connection between the process image and I/O output is also disconnected. Although the user has the option of writing the process image of pulse generator outputs via the user program or watch table, this is not transferred to the I/O output. Accordingly, it is also not possible to monitor the I/O output via the user program or watch table. The information read reflects the value of the process image and does not match the real status of the I/O output.

For all other CPU outputs that are not used permanently by the CPU firmware, the status of the I/O output can be controlled or monitored via the process image, as usual.

## Limit frequencies of pulse outputs

The following limit frequencies apply to the pulse outputs:

Pulse output	Limit frequencies for technology object positioning axis V1	Limiting frequencies of the technology object positioning axis V2/V3 with CPU < V3.0	Limiting frequencies of the technology object positioning axis V2/V3 with CPU V3.0
On-board (MLFB - order number xxxxxxx-1xx30-xxxx)	$2 \text{ Hz} \leq f \leq 100 \text{ kHz}$	$2 \text{ Hz} \leq f \leq 100 \text{ kHz}$	$1 \text{ Hz} \leq f \leq 100 \text{ kHz}$
On-board (MLFB - order number xxxxxxx-1xx31xxxx)	$2 \text{ Hz} \leq f \leq 100 \text{ kHz}$ (PTO 1+2) $2 \text{ Hz} \leq f \leq 20 \text{ kHz}$ (PTO 3+4)	$2 \text{ Hz} \leq f \leq 100 \text{ kHz}$ (PTO 1+2) $2 \text{ Hz} \leq f \leq 20 \text{ kHz}$ (PTO 3+4)	$1 \text{ Hz} \leq f \leq 100 \text{ kHz}$ (PTO 1+2) $1 \text{ Hz} \leq f \leq 20 \text{ kHz}$ (PTO 3+4)
Signal board DI2/DO2 x DC24V 20kHz	$2 \text{ Hz} \leq f \leq 20 \text{ kHz}$	$2 \text{ Hz} \leq f \leq 20 \text{ kHz}$	$1 \text{ Hz} \leq f \leq 20 \text{ kHz}$
Signal board DI2/DO2 x DC24V 200kHz	$2 \text{ Hz} \leq f \leq 100 \text{ kHz}$	$2 \text{ Hz} \leq f \leq 200 \text{ kHz}$	$1 \text{ Hz} \leq f \leq 200 \text{ kHz}$
Signal board DO4 x DC24V 200kHz	$2 \text{ Hz} \leq f \leq 100 \text{ kHz}$	$2 \text{ Hz} \leq f \leq 200 \text{ kHz}$	$1 \text{ Hz} \leq f \leq 200 \text{ kHz}$
Signal board DI2/DO2 x DC5V 200kHz	$2 \text{ Hz} \leq f \leq 100 \text{ kHz}$	$2 \text{ Hz} \leq f \leq 200 \text{ kHz}$	$1 \text{ Hz} \leq f \leq 200 \text{ kHz}$
Signal board DO4 x DC5V 200kHz	$2 \text{ Hz} \leq f \leq 100 \text{ kHz}$	$2 \text{ Hz} \leq f \leq 200 \text{ kHz}$	$1 \text{ Hz} \leq f \leq 200 \text{ kHz}$

## Drive signals

For motion control, you can optionally parameterize a drive interface for "Drive enabled" and "Drive ready". When using the drive interface the digital output for the drive enable and the digital input for "drive ready" can be freely selected.

## Acceleration/deceleration limits

The following limits apply to acceleration and deceleration:

Acceleration/deceleration	Value (CPU < V3.0)	Value (CPU V3.0)
Minimum acceleration/deceleration	$2.8\text{E-}1 \text{ pulses/s}^2$	$5.0\text{E-}3 \text{ pulses/s}^2$
Maximum acceleration/deceleration	$9.5\text{E+}9 \text{ pulses/s}^2$	$9.5\text{E+}9 \text{ pulses/s}^2$

## Jerk limits

The following limits apply to the jerk:

Jerk	Value (CPU < V3.0)	Value (CPU V3.0)
Minimum jerk	$4.0\text{E-}2 \text{ pulses/s}^3$	$4.0\text{E-}3 \text{ pulses/s}^3$
Maximum jerk	$1.5\text{E+}8 \text{ pulses/s}^3$	$1.0\text{E+}10 \text{ pulses/s}^3$

## See also

CPU outputs relevant for motion control (technology version V4) (Page 6412)

## Configuration dialogs

### Configuration - General ("Axis" technology object V1...3)

Configure the basic properties of the "Axis" technology object in the "General" configuration window.

#### Axis name:

Define the name of the axis or the name of the "Axis" technology object in this box. The technology object is listed under this name in the project navigation.

## Hardware interface

The pulses are output to the power unit of the drive by fixed assigned digital outputs.

In CPUs with relay outputs, the pulse signal cannot be output on these outputs because the relays do not support the necessary switching frequencies. A signal board with digital outputs must be used to enable you to work with the PTO (Pulse Train Output) on these CPUs.

---

#### Note

The PTO requires the functionality of a fast counter (HSC). An HSC is used for this purpose with CPU version <V3.0. The HSC is then no longer available to the user. An internal HSC is used for this with CPU version  $\geq$  V3.0.

The count can not be evaluated from its input address.

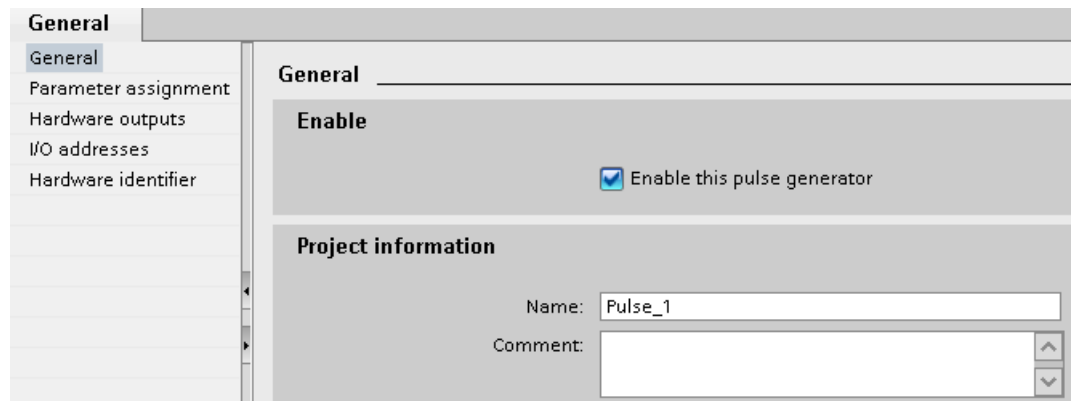

The assignment between PTO and HSC is fixed. When the user activates PTO1, it is connected to the HSC1. If the PTO2 is activated, this is connected with the HSC2.

---

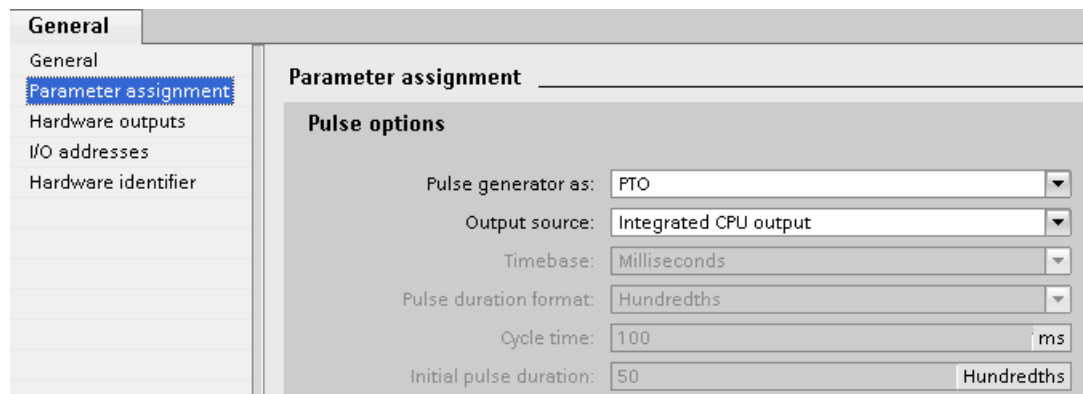

In the "Pulse generator selection" drop-down list, select the PTO (Pulse Train Output) which is to provide the pulses for controlling the stepper motors or servo motors with pulse interface. If the pulse generators and high-speed counters are not used elsewhere in the device configuration, the hardware interface can be configured automatically. In this case, the PTO selected in the drop-down list is displayed with a white background. The interfaces used are listed in the output boxes "Output source", "Pulse output", "Direction output" and "Assigned fast counter".

Proceed as follows if you wish to change the interfaces or if the PTO could not be automatically configured (entry in the "Pulse generator selection" drop-down list is highlighted in red):

1. Click on the "Device configuration" button.  
The pulse generator device configuration opens.  
Enlarge the property window of the device configuration if the configuration of the pulse generator is not visible.

2. Select the "Enable this pulse generator" check box.
3. Select the "Parameter assignment" entry in the area navigation.  
The "Parameter assignment" opens.

4. In the "Pulse generator as:" dropdown list select the "PTO" entry.
5. In the "Output source:" dropdown list select the "Integrated CPU output" or "Signal board output" entry. The "Signal board output" entry can only be selected for PTO1 or for PTO1 and PTO2 depending on the installed signal board. For more detailed information, see section: CPU outputs relevant for motion control (technology version V4) (Page 6412)
6. Go back to the axis configuration.  
Unless the corresponding fast counter has already been used elsewhere, the PTO boxes of the "General" axis configuration are not shaded red. If this is not the case, correct the configuration based on the error messages.

## User unit

Select the desired unit for the dimension system of the axis in the dropdown list. The selected unit is used for additional configuration of the "Axis" technology object and for displaying the current axis data.

The values at the input parameters (Position, Distance, Velocity, ...) of the Motion Control instructions also refer to this unit.

---

**Note**

Later changing of the dimension system may not be converted correctly in all the configuration windows of the technology object. In this case check the configuration of all axis parameters.

The values of the input parameters of the Motion Control instructions may have to be adapted to the new unit of measurement in the user program.

---

**See also**

Configuration - General (positioning axis technology object as of V4) (Page 6437)

**Changing configuration of dynamic values in user program ("Axis" technology object V1...3)**

You can change the following configuration parameters during runtime of the user program in the CPU:

**Acceleration and deceleration**

You can also change the values for acceleration and deceleration during runtime of the user program. Use the following technology object tags for this purpose:

- <Axis name>.Config.DynamicDefaults.Acceleration  
for changing acceleration
- <Axis name>.Config.DynamicDefaults.Deceleration  
for changing deceleration

Refer to the description of the technology object tags (Page 6596) in the appendix for information on when changes to the configuration parameters take effect.

**Emergency stop deceleration**

You can also change the value for the emergency stop deceleration during runtime of the user program. Use the following technology object tag for this purpose:

- <Axis name>.Config.DynamicDefaults.EmergencyDeceleration

Refer to the description of the technology object tags in the appendix for information on when changes to the configuration parameter take effect.

<b>NOTICE</b>
---------------

After changes to this parameter, it may be necessary to adapt the positions of the hardware limit switches and other safety-relevant settings.
--

### **Jerk limit (as of technology object "Axis" V2.0)**

You can also activate and deactivate the jerk limit at runtime of the user program and change the value for the jerk. Use the following technology object tags for this purpose:

- <Axis name>.Config.DynamicDefaults.JerkActive  
for activating and deactivating the jerk limit
- <Axis name>.Config.DynamicDefaults.Jerk  
for changing the jerk

Refer to the description of the technology object tags in the appendix for information on when changes to the configuration parameter take effect.

### **See also**

Changing the configuration of dynamics in the user program (Page 6451)

### **Configuration - Homing ("Axis" technology object V1)**

Configure the parameters for active and passive homing in the "Homing" configuration window. The homing method is set using the "Mode" input parameter of the Motion Control instruction. Here, Mode = 2 means passive homing and Mode = 3 means active homing.

### **Reference point switch input**

Select the digital input for the reference point switch from the drop-down list. The input must be interrupt-capable. The onboard CPU inputs and the inputs of an inserted signal board can be selected as inputs for the reference point switch.

---

#### **Note**

The digital inputs are set to a filter time of 6.4 ms by default.

When the digital inputs are used as a reference point switch, this can result in undesired decelerations and thus inaccuracies. Depending on the homing velocity and extent of the reference point switch, the reference point may not be detected. The filter time can be set under "Input filter" in the device configuration of the digital inputs.

The specified filter time must be less than the duration of the input signal at the reference point switch.

---

### **Permitting direction reversal after reaching the HW limit switch (active homing only)**

Activate the check box to use the hardware limit switch as a reversing cam for the homing procedure. The hardware limit switches must be activated for direction reversal. If the CPU firmware V1.0 is used, both hardware limit switches must be configured. If CPU firmware as of V2.0 is used, only the hardware limit switch in the approach direction must be configured.

If the hardware limit switch is reached during active homing, the axis brakes at the configured deceleration (not with the emergency stop deceleration) and reverses direction. The reference point switch is then sensed in reverse direction.

If the direction reversal is not active and the axis reaches the hardware limit switch during active homing, the homing procedure is aborted with an error and the axis is braked at the emergency stop deceleration.

**Note**

Use one of the following measures to ensure that the machine does not travel to a mechanical endstop in the event of a direction reversal:

- Keep the approach velocity low
- Increase the configured acceleration/deceleration
- Increase the distance between hardware limit switch and mechanical stop

**Approach / homing direction (active and passive homing)**

With the direction selection, you determine the "approach direction" used during active homing to search for the reference point switch, as well as the homing direction. The homing direction specifies the travel direction the axis uses to approach the configured end of the reference point switch to carry out the homing operation.

Refer to the table under "Reference point switches" for the effect of the approach direction setting on passive homing.

**Side of the reference point switch (active and passive homing)**

- **Active homing**  
This is where you select whether the axis is homed on the low or high end of the reference point switch.

**Note**

Depending on the start position of the axis and the configuration of the homing parameters, the homing procedure sequence can differ from the diagram in the configuration window.

- **Passive homing**  
With passive homing, the traversing motions for purposes of homing must be implemented by the user via motion commands. The end of the reference point switch on which homing occurs depends on the following factors:
  - "Approach direction" configuration
  - "Reference point switch" configuration
  - Current travel direction during passive homing

The table below presents details on the effect of factors:

Influencing factors:			Result:
Configuration Approach direction	Configuration Reference point switch	Current travel direction	Homing on Reference point switch
Positive	"Bottom side"	Positive direction	<b>Top side</b>
		Negative direction	<b>Bottom side</b>

Influencing factors:			Result:
Configuration Approach direction	Configuration Reference point switch	Current travel direction	Homing on Reference point switch
Positive	"Top side"	Positive direction	<b>Bottom side</b>
		Negative direction	<b>Top side</b>
Negative	"Bottom side"	Positive direction	<b>Bottom side</b>
		Negative direction	<b>Top side</b>
Negative	"Top side"	Positive direction	<b>Top side</b>
		Negative direction	<b>Bottom side</b>

### Velocity (active homing only)

In this box, specify the velocity at which the reference point switch is to be searched for during the homing procedure.

Limits (independent of the selected unit of measurement):

- Start/stop velocity  $\leq$  approach velocity  $\leq$  maximum velocity

### Homing velocity (active homing only)

In this box, specify the velocity at which the axis approaches the reference point switch for homing.

Limits (independent of the selected unit of measurement):

- Start/stop velocity  $\leq$  Homing velocity  $\leq$  Maximum velocity

### Home position offset (active homing only)

If the desired home position deviates from the position of the reference point switch, the home position offset can be specified in this box.

If the value does not equal 0, the axis executes the following actions following homing at the reference point switch:

1. Move the axis at the homing velocity by the value of the home position offset
2. Upon reaching the "home position offset", the axis is at the home position that was specified in input parameter "Position" of the "MC\_Home" Motion Control instruction.

Limits (independent of the selected unit of measurement):

- $-1.0e12 \leq$  home position offset  $\leq 1.0e12$

### Home position

The position configured in the Motion Control instruction "MC\_Home" is used as the home position.

## Configuration - Homing ("Axis" technology object V2...3)

### Configuration - Homing - General (Axis technology object V2...3)

Configure the reference point switch input for active and passive homing in the "Homing - General" configuration window.

#### Reference point switch input

Select the digital input for the homing switch from the drop-down list. The input must be interrupt-capable. The on-board CPU inputs and the inputs of an inserted signal board can be selected as inputs for the homing switch.

---

#### Note

The digital inputs are set to a filter time of 6.4 ms by default.

When the digital inputs are used as a homing switch, this can result in undesired decelerations and thus inaccuracies. Depending on the homing velocity and extent of the homing switch, the home position may not be detected. The filter time can be set under "Input filter" in the device configuration of the digital inputs.

The specified filter time must be less than the duration of the input signal at the homing switch.

---

#### Active level

In the drop-list, select the level of the homing switch that is to be used for homing.

#### See also

Sequence - Active homing (Page 6457)

### Configuration - Homing - Passive (Axis technology object V2...3)

Configure the necessary parameters for passive homing in the "Homing - Passive" configuration window.

The movement for passive homing must be triggered by the user (e.g. using an axis motion command). Passive homing is started using Motion Control instruction "MC\_Home" with input parameter "Mode" = 2.

#### Side of the homing switch

This is where you select whether the axis is to be homed on the low or high end of the homing switch.

## Home position

The position configured in the Motion Control instruction "MC\_Home" is used as the home position.

---

### Note

If passive homing is carried out without an axis motion command (axis at a standstill), homing will be executed upon the next rising or falling edge at the homing switch.

---

## Configuration - Homing - Active (Axis technology object V2...3)

Configure the necessary parameters for active homing in the "Active homing" configuration window. Active homing is started using Motion Control instruction "MC\_Home" with input parameter "Mode" = 3.

## Permit auto reverse at the hardware limit switch

Activate the check box to use the hardware limit switch as a reversing cam for the homing procedure. The hardware limit switches must be enabled for the reversal of direction (at least the hardware limit switch in the direction of approach must be configured).

If the hardware limit switch is reached during active homing, the axis brakes at the configured deceleration (not with the emergency stop deceleration) and reverses direction. The homing switch is then sensed in reverse direction.

If the direction reversal is not active and the axis reaches the hardware limit switch during active homing, the homing procedure is aborted with an error and the axis is braked at the emergency stop deceleration.

---

### Note

If possible, use one of the following measures to ensure that the machine does not travel to a mechanical endstop in the event of a direction reversal:

- Keep the approach velocity low.
  - Increase the configured acceleration/deceleration.
  - Increase the distance between the hardware limit switch and the mechanical endstop.
- 

## Approach/homing direction

With the direction selection, you determine the approach direction used during active homing to search for the homing switch, as well as the homing direction. The homing direction specifies the travel direction the axis uses to approach the configured end of the homing switch to carry out the homing operation.

## Side of the homing switch

This is where you select whether the axis is to be homed on the low or high end of the homing switch.

## Velocity

In this box, specify the velocity at which the homing switch is to be searched for during the homing procedure.

Limits (independent of the selected unit of measurement):

- Start/stop velocity  $\leq$  approach velocity  $\leq$  maximum velocity

## Homing velocity

In this box, specify the velocity at which the reference point switch is to be approached for homing.

Limits (independent of the selected unit of measurement):

- Start/stop velocity  $\leq$  Homing velocity  $\leq$  Maximum velocity

## Home position offset

If the desired home position deviates from the position of the homing switch, the home position offset can be specified in this box.

If the value does not equal 0, the axis executes the following actions following homing at the homing switch:

1. Move the axis at the homing velocity by the value of the home position offset
2. Upon reaching the "home position offset", the axis is at the home position that was specified in input parameter "Position" of the "MC\_Home" Motion Control instruction.

Limits (independent of the selected unit of measurement):

- $-1.0e12 \leq$  home position offset  $\leq 1.0e12$

## Home position

The position configured in the Motion Control instruction "MC\_Home" is used as the home position.

## Diagnostics - Status and error bits ("Axis" technology object V1...3)

You use the "Status and error bits" diagnostic function to monitor the most important status and error messages for the axis in the TIA Portal. The diagnostic function display is available in online mode in "Manual control" mode and in "Automatic control" when the axis is active. The status error messages have the following meaning:

## Status of the axis

Status	Description
Enabled	The axis is enabled and ready to be controlled via Motion Control commands. (Tag of technology object: <Axis name>.StatusBits.Enable)
Homed	The axis is homed and is capable of executing absolute positioning commands of Motion Control instruction "MC_MoveAbsolute". The axis does not have to be homed for relative positioning. Special situations: <ul style="list-style-type: none"> <li>• During active homing, the status is FALSE.</li> <li>• If a homed axis undergoes passive homing, the status is set to TRUE during passive homing.</li> </ul> (Tag of technology object: <Axis name>.StatusBits.HomingDone)
Axis error	An error has occurred in the "Axis" technology object. Additional information about the error is available in automatic control at the ErrorID and ErrorInfo parameters of the Motion Control instructions. In manual mode, the "Error message" box of the axis control panel displays detailed information about the cause of error. (Tag of technology object: <Axis name>.StatusBits.Error)
Axis control panel enabled	The "Manual control" mode was enabled in the axis control panel. The axis control panel has control priority over the "Axis" technology object. The axis cannot be controlled from the user program. (Tag of technology object: <Axis name>.StatusBits.ControlPanelActive)
Restart necessary	A modified configuration of the axis was downloaded to the load memory in CPU RUN operating mode. To download the modified configuration to the work memory, you need to restart the axis. Use the Motion Control instruction MC_Reset to do this.

## Drive status

Status	Description
Drive ready	The drive is ready for operation. (Tag of technology object: <Axis name>.StatusBits.DriveReady)
Drive error	The drive has reported an error due to loss of its "Drive ready" signal. (Tag of technology object: <Axis name>.ErrorBits.DriveFault)

## Status of the axis motion

Status	Description
Standstill	The axis is at a standstill. (Tag of technology object: <Axis name>.StatusBits.StandStill)
Acceleration	The axis accelerates. (Tag of technology object: <Axis name>.StatusBits.Acceleration)
Constant velocity	The axis travels at constant velocity. (Tag of technology object: <Axis name>.StatusBits.ConstantVelocity)
Deceleration	The axis decelerates (slows down). (Tag of technology object: <Axis name>.StatusBits.Deceleration)

### Status of the motion mode

Status	Description
Positioning	The axis executes a positioning command of the Motion Control instruction "MC_MoveAbsolute", "MC_MoveRelative" or the axis control panel. (Tag of technology object: <Axis name>.StatusBits.PositioningCommand)
Travel with velocity specification	The axis executes a command with velocity specification of the Motion Control instruction "MC_MoveVelocity", "MC_MoveJog" or the axis control panel. (Tag of technology object: <Axis name>.StatusBits.SpeedCommand)
Homing	The axis executes a homing command of the Motion Control instruction "MC_Home" or the axis control panel. (Tag of technology object: <Axis name>.StatusBits.Homing)
Command table active (as of technology object Axis V2.0)	The axis is controlled by Motion Control instruction "MC_CommandTable". (Tag of technology object: <Axis name>.StatusBits.CommandTableActive)

### Error messages

Error	Description
Lower SW limit switch was reached	The lower software limit switch has been reached. (Tag of technology object: <Axis name>.ErrorBits.SwLimitMinReached)
Lower SW limit switch was exceeded	The lower software limit switch has been exceeded. (Tag of technology object: <Axis name>.ErrorBits.SwLimitMinExceeded)
Upper SW limit switch was reached	The upper software limit switch has been reached. (Tag of technology object: <Axis name>.ErrorBits.SwLimitMaxReached)
Upper SW limit switch was exceeded	The upper software limit switch has been exceeded. (Tag of technology object: <Axis name>.ErrorBits.SwLimitMaxExceeded)
Lower HW limit switch was reached	The lower hardware limit switch has been reached. (Tag of technology object: <Axis name>.ErrorBits.HwLimitMin)
Upper HW limit switch was reached	The upper hardware limit switch has been reached. (Tag of technology object: <Axis name>.ErrorBits.HwLimitMax)
PTO and HSC already in use	A second axis is using the same PTO (Pulse Train Output) and HSC (High Speed Counter) and is enabled with "MC_Power". (Tag of technology object: <Axis name>.ErrorBits.HwUsed)
Configuration error	The "Axis" technology object was incorrectly configured or editable configuration data were modified incorrectly during runtime of the user program. (Tag of technology object: <Axis name>.ErrorBits.ConfigFault)
Internal error	An internal error has occurred. (Tag of technology object: <Axis name>.ErrorBits.SystemFault)

## ErrorIDs and ErrorInfos

### List of ErrorIDs and ErrorInfos (technology objects V2...3)

The following table lists all ErrorIDs and ErrorInfos that can be indicated in Motion Control instructions. In addition to the cause of the error, remedies for eliminating the error are also listed:

#### Operating error with axis stop

ErrorID	ErrorInfo	Description	Remedy
<b>16#8000</b>		<b>Drive error, loss of "Drive ready"</b>	
	16#0001	-	Acknowledge error with instruction "MC_Reset"; provide drive signal; restart command, if necessary
<b>16#8001</b>		<b>Lower SW limit switch has been tripped</b>	
	16#000E	The position of the lower SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the SW limit switch
	16#000F	The position of the lower SW limit switch was reached with the emergency stop deceleration	
	16#0010	The position of the lower SW limit switch was exceeded with the emergency stop deceleration	
<b>16#8002</b>		<b>Upper SW limit switch has been tripped</b>	
	16#000E	The position of the upper SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the SW limit switch
	16#000F	The position of the upper SW limit switch was reached with the emergency stop deceleration	
	16#0010	The position of the upper SW limit switch was exceeded with the emergency stop deceleration	
<b>16#8003</b>		<b>Lower HW limit switch was reached</b>	
	16#000E	The lower HW limit switch was reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the reference point switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the HW limit switch.
<b>16#8004</b>		<b>Upper HW limit switch was reached</b>	
	16#000E	The upper HW limit switch has been reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the reference point switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the HW limit switch.
<b>16#8005</b>		<b>PTO/HSC are already being used by another axis</b>	
	16#0001	-	<b>The axis was configured incorrectly:</b> Correct the configuration of the PTO (Pulse Train Output) / HSC (High Speed Counter) and download it to the controller

ErrorID	ErrorInfo	Description	Remedy
			<b>More than one axis is to run with one PTO:</b> Another axis is using the PTO / HSC. If the current axis is to assume the control, the other axis must be disabled with "MC_Power" Enable = FALSE. (see also Using multiple axes with the same PTO (Page 6522))
<b>16#8006</b>		<b>A communication error in the control panel has occurred</b>	
	16#0012	A timeout has occurred	Check the cable connection and press the "Manual control" button again.
<b>16#8007</b>		<b>The axis cannot be enabled.</b>	
	16#0025	Restarting	Wait until the axis restart is complete.
	16#0026	Executing loading process in RUN mode	Wait until the loading process is complete.

## Operating error without axis stop

ErrorID	ErrorInfo	Description	Remedy
<b>16#8200</b>		<b>Axis is not enabled</b>	
	16#0001	-	Enable the axis; restart the command
<b>16#8201</b>		<b>Axis has already been enabled by another "MC_Power" instance</b>	
	16#0001	-	Enable the axis with only one "MC_Power" instance
<b>16#8202</b>		<b>The maximum number of simultaneously active Motion Control commands has been exceeded (maximum of 200 commands for all motion control technology objects)</b>	
	16#0001	-	Reduce the number of simultaneously active commands; restart the command  A command is active if parameter "Busy" = TRUE in the Motion Control instruction.
<b>16#8203</b>		<b>Axis is currently operated in "Manual control" (axis control panel)</b>	
	16#0001	-	Exit "Manual control"; restart the command
<b>16#8204</b>		<b>Axis is not homed</b>	
	16#0001	-	Home the axis with instruction "MC_Home"; restart the command
<b>16#8205</b>		<b>The axis is currently controlled by the user program (the error is only displayed in the axis control panel)</b>	
	16#0013	The axis is enabled in the user program.	Disable axis with instruction "MC_Power" and select "Manual control" again in the axis control panel
<b>16#8206</b>		<b>Technology object not activated yet</b>	
	16#0001	-	Enable the axis with instruction "MC_Power" Enable = TRUE or enable the axis in the axis control panel.
<b>16#8207</b>		<b>Command rejected</b>	
	16#0016	Active homing is running; another homing method cannot be started.	Wait for active homing to finish or abort the active homing with a motion command, for example, "MC_Halt".

ErrorID	ErrorInfo	Description	Remedy
	16#0018	The axis cannot be moved with a command table while it is being actively or passively homed.	Wait until direct or passive homing is complete.
	16#0019	The axis cannot be actively or passively homed while a command table is being processed.	Wait for command table to finish or abort the command table with a motion command, for example, "MC_Halt".
<b>16#8208</b>		<b>Difference between maximum and start/stop velocity is invalid</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#000A	Value is less than or equal to 0	
<b>16#8209</b>		<b>Invalid acceleration for technology object "Axis"</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#000A	Value is less than or equal to 0	
<b>16#820A</b>		<b>It is not possible to restart the axis</b>	
	16#0013	The axis is enabled in the user program.	Disable the axis with the "MC_Power" instruction; restart again
	16#0027	The axis is currently being operated in "Manual control" (axis control panel)	Exit "Manual control"; restart again
<b>16#820B</b>		<b>It is not possible to execute the command table</b>	
	16#0026	Executing loading process in RUN mode	Wait until the loading process is complete.

### Block parameter error

ErrorID	ErrorInfo	Description	Remedy
<b>16#8400</b>		<b>Invalid value at parameter "Position" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#0006	The value is outside the number range (less than $-1e^{12}$ )	
<b>16#8401</b>		<b>Invalid value at parameter "Distance" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#0006	The value is outside the number range (less than $-1e^{12}$ )	
<b>16#8402</b>		<b>Invalid value at parameter "Velocity" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#0008	Value is greater than the configured maximum velocity	
	16#0009	Value is less than the configured start/stop velocity	
	16#0024	Value is less than 0	
<b>16#8403</b>		<b>Invalid value at parameter "Direction" of the Motion Control instruction</b>	
	16#0011	The selection value is invalid	Correct the selection value; restart the command
<b>16#8404</b>		<b>Invalid value at parameter "Mode" of the Motion Control instruction</b>	

ErrorID	ErrorInfo	Description	Remedy
	16#0011	The selection value is invalid	Correct the selection value; restart the command
	16#0015	Active/passive homing is not configured	Correct the configuration and download it to the controller; enable the axis and restart the command
	16#0017	The direction reversal is activated at the hardware limit switch, despite the fact that the hardware limit switches are disabled	<ul style="list-style-type: none"> <li>• Activate the hardware limit switch using the tag &lt;axis&gt;.Config.PositionLimits_HW.Active = TRUE, restart the command</li> <li>• Correct the configuration and download it to the controller; enable the axis and restart the command</li> </ul>
<b>16#8405</b>		<b>Invalid value at parameter "StopMode" of the Motion Control instruction</b>	
	16#0011	The selection value is invalid	Correct the selection value; enable the axis again
<b>16#8406</b>		<b>Simultaneous forward and backward jogging is not allowed</b>	
	16#0001	-	Take steps to ensure that parameters "JogForward" and "JogBackward" do not have signal status TRUE simultaneously; restart the command.
<b>16#8407</b>		<b>Switching to another axis with instruction "MC_Power" is only permitted after disabling the active axis.</b>	
	16#0001	-	Disable the active axis; it is then possible to switch to the other axis and enable it.
<b>16#8408</b>		<b>Invalid value at parameter "Axis" of the Motion Control instruction</b>	
	16#001A	The specified value does not match the required technology object version	Correct the value; restart the command
	16#001B	The specified value does not match the required technology object type	
	16#001C	The specified value is not a Motion Control technology data block	
<b>16#8409</b>		<b>Invalid value at parameter "CommandTable" of the Motion Control instruction</b>	
	16#001A	The specified value does not match the required technology object version	Correct the value; restart the command
	16#001B	The specified value does not match the required technology object type	
	16#001C	The specified value is not a Motion Control technology data block	
<b>16#840A</b>		<b>Invalid value at parameter "StartStep" of the Motion Control instruction</b>	
	16#000A	Value is less than or equal to 0	Correct the value; restart the command
	16#001D	The start step is greater than the end step	
	16#001E	Value is greater than 32	
<b>16#840B</b>		<b>Invalid value at parameter "EndStep" of the Motion Control instruction</b>	
	16#000A	Value is less than or equal to 0	Correct the value; restart the command
	16#001E	Value is greater than 32	
<b>16#840C</b>		<b>Invalid value at parameter "RampUpTime" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#000A	Value is less than or equal to 0	
<b>16#840D</b>		<b>Invalid value at parameter "RampDownTime" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#000A	Value is less than or equal to 0	

ErrorID	ErrorInfo	Description	Remedy
<b>16#840E</b>		<b>Invalid value at parameter "EmergencyRampTime" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#000A	Value is less than or equal to 0	
<b>16#840F</b>		<b>Invalid value at parameter "JerkTime" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the value; restart the command
	16#000A	Value is less than or equal to 0	

### Configuration error of the axis

ErrorID	ErrorInfo	Description	Remedy
<b>16#8600</b>		<b>Parameter assignment of pulse generator (PTO) is invalid</b>	
	16#000B	The address is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> </ul>
	16#0014	The selected hardware is used by another application	
<b>16#8601</b>		<b>Parameter assignment of the high-speed counter (HSC) is invalid</b>	
	16#000B	The address is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> </ul>
	16#0014	The selected hardware is used by another application	
<b>16#8602</b>		<b>Invalid parameter assignment of "Enable output"</b>	
	16#000B	The address is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> </ul>
<b>16#8603</b>		<b>Invalid parameter assignment of "Ready input"</b>	
	16#000B	The address is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> </ul>
<b>16#8604</b>		<b>Invalid "Pulses per motor revolution" value</b>	
	16#000A	Value is less than or equal to zero	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> </ul>
<b>16#8605</b>		<b>Invalid "Distance per revolution" value</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> </ul>
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#000A	Value is less than or equal to zero	
<b>16#8606</b>		<b>Invalid "Start/stop velocity" value</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> </ul>
	16#0003	Value exceeds the upper hardware limit	
	16#0004	Value is less than the lower hardware limit	
	16#0007	The start/stop velocity is greater than the maximum velocity	
<b>16#8607</b>		<b>Invalid "maximum velocity" value</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> </ul>
	16#0003	Value exceeds the upper hardware limit	

ErrorID	ErrorInfo	Description	Remedy
	16#0004	Value is less than the lower hardware limit	
<b>16#8608</b>		<b>Invalid "Acceleration" value</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0003	Value exceeds the upper hardware limit	
	16#0004	Value is less than the lower hardware limit

	16#0004	Value is less than the lower hardware limit	
<b>16#860A</b>		<b>Invalid "Emergency stop deceleration" value</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0003	Value exceeds the upper hardware limit	
	16#0004	Value is less than the lower hardware limit	
<b>16#860B</b>		<b>Value for position of the lower SW limit switch is invalid</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#0006	The value is outside the number range (less than $-1e^{12}$ )	
	16#0007	The position value of the lower software limit switch is greater than that of the upper software limit switch	
<b>16#860C</b>		<b>Value for position of the upper SW limit switch is invalid</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#0006	The value is outside the number range (less than $-1e^{12}$ )	
<b>16#860D</b>		<b>Invalid address of the lower HW limit switch</b>	
	16#000C	The address of the falling edge is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> </ul>
	16#000D	The address of the rising edge is invalid	
<b>16#860E</b>		<b>Invalid address of the upper HW limit switch</b>	
	16#000C	The address of the falling edge is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> </ul>
	16#000D	The address of the rising edge is invalid	
<b>16#860F</b>		<b>Invalid "home position offset" value</b>	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#0006	The value is outside the number range (less than $-1e^{12}$ )	
<b>16#8610</b>		<b>Invalid "approach velocity" value</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0008	The velocity is greater than the maximum velocity	
	16#0009	The velocity is less than the start/stop velocity	
<b>16#8611</b>		<b>Invalid "Homing velocity" value</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0008	The velocity is greater than the maximum velocity	
	16#0009	The velocity is less than the start/stop velocity	
<b>16#8612</b>		<b>Invalid address of the reference point switch</b>	
	16#000C	The address of the falling edge is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> </ul>
	16#000D	The address of the rising edge is invalid	
<b>16#8613</b>		<b>During active homing, direction reversal at the hardware limit switch is activated although the hardware limit switches are not configured</b>	
	16#0001	-	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
<b>16#8614</b>		<b>Invalid "Jerk" value</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#001F	Value is greater than the maximum jerk	
	16#0020	Value is less than the minimum jerk	
<b>16#8615</b>		<b>Value for "Unit of measurement" is invalid</b>	
	16#0011	The selection value is invalid	Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"

## Configuration error of the command table

ErrorID	ErrorInfo	Description	Remedy
<b>16#8700</b>		<b>Value for "Command type" in the command table is invalid</b>	
	16#0001	-	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online and restart the command, if necessary</li> </ul>
<b>16#8701</b>		<b>Value for "Position / travel path" in the command table is invalid</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online and restart the command, if necessary</li> </ul>
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#0006	The value is outside the number range (less than $-1e^{12}$ )	
<b>16#8702</b>		<b>Value for "Velocity" in the command table is invalid</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online and restart the command, if necessary</li> </ul>
	16#0008	Value is greater than the configured maximum velocity	
	16#0009	Value is less than the configured start/stop velocity	
<b>16#8703</b>		<b>Value for "Duration" in the command table is invalid</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online and restart the command, if necessary</li> </ul>
	16#0021	Value is greater than 64800 s	
	16#0022	Value is less than 0.001 s	
<b>16#8704</b>		<b>Value for "Next step" in the command table is invalid</b>	
	16#0011	The selection value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online and restart the command, if necessary</li> </ul>
	16#0023	The command transition is not permitted for this command	

## Internal errors

ErrorID	ErrorInfo	Description	Remedy
<b>16#8FFF</b>		<b>Internal error</b>	
	16#F0**	-	<p>POWER OFF and POWER ON the CPU</p> <p>If this does not work, contact Customer Support. Have the following information ready:</p> <ul style="list-style-type: none"> <li>ErrorID</li> <li>ErrorInfo</li> <li>Diagnostic buffer entries</li> </ul>

**See also**

List of ErrorIDs and ErrorInfos (technology objects as of V4) (Page 6536)

Using multiple axes with the same PTO (Page 6522)

**List of ErrorIDs and ErrorInfos (technology objects V1)**

The following table lists all ErrorIDs and ErrorInfos that can be indicated in Motion Control instructions. In addition to the cause of the error, remedies for eliminating the error are also listed:

**Operating error with axis stop**

ErrorID	ErrorInfo	Description	Remedy
<b>16#8000</b>		<b>Drive error, loss of "Drive ready"</b>	
	16#0001	-	Acknowledge error with instruction "MC_Reset"; provide drive signal; restart command, if necessary
<b>16#8001</b>		<b>Lower SW limit switch has been tripped</b>	
	16#000E	The position of the lower SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the SW limit switch
	16#000F	The position of the lower SW limit switch was reached with the emergency stop deceleration	
	16#0010	The position of the lower SW limit switch was exceeded with the emergency stop deceleration	
<b>16#8002</b>		<b>Upper SW limit switch has been tripped</b>	
	16#000E	The position of the upper SW limit switch was reached with the currently configured deceleration	Acknowledge the error with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the SW limit switch
	16#000F	The position of the upper SW limit switch was reached with the emergency stop deceleration	
	16#0010	The position of the upper SW limit switch was exceeded with the emergency stop deceleration	
<b>16#8003</b>		<b>Lower HW limit switch was reached</b>	
	16#000E	The lower HW limit switch was reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the reference point switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the positive direction out of the range of the HW limit switch.
<b>16#8004</b>		<b>Upper HW limit switch was reached</b>	
	16#000E	The upper HW limit switch has been reached. The axis was stopped with the emergency stop deceleration. (During an active homing procedure, the reference point switch was not found)	Acknowledge the error for an enabled axis with instruction "MC_Reset"; use a motion command to move the axis in the negative direction out of the range of the HW limit switch.
<b>16#8005</b>		<b>PTO/HSC are already being used by another axis</b>	

ErrorID	ErrorInfo	Description	Remedy
	16#0001	-	<p><b>The axis was configured incorrectly:</b> Correct the configuration of the PTO (Pulse Train Output) / HSC (High Speed Counter) and download it to the controller</p> <p><b>More than one axis is to run with one PTO:</b> Another axis is using the PTO / HSC. If the current axis is to assume the control, the other axis must be disabled with "MC_Power" Enable = FALSE. (see also Using multiple axes with the same PTO (Page 6522))</p>

## Operating error without axis stop

ErrorID	ErrorInfo	Description	Remedy
<b>16#8200</b>		<b>Axis is not enabled</b>	
	16#0001	-	Enable the axis; restart the command
<b>16#8201</b>		<b>Axis has already been enabled by another "MC_Power" instance</b>	
	16#0001	-	Enable the axis with only one "MC_Power" instruction
<b>16#8202</b>		<b>The maximum number of simultaneously active Motion Control commands was exceeded (maximum of 200 commands for all motion control technology objects)</b>	
	16#0001	-	Reduce the number of simultaneously active commands; restart the command A command is active if parameter "Busy" = TRUE in the Motion Control instruction.
<b>16#8203</b>		<b>Axis is currently operated in "Manual control" (axis control panel)</b>	
	16#0001	-	Exit "Manual control"; restart the command
<b>16#8204</b>		<b>Axis is not homed</b>	
	16#0001	-	Home the axis with instruction "MC_Home"; restart the command
<b>16#8205</b>		<b>The axis is currently controlled by the user program (the error is only displayed in the axis control panel)</b>	
	16#0001	-	Disable axis with instruction "MC_Power" and select "Manual control" again in the axis control panel
<b>16#8206</b>		<b>Technology object Axis not yet enabled</b>	
	16#0001	-	Enable the axis with instruction "MC_Power" Enable = TRUE or enable the axis in the axis control panel.
<b>16#8207</b>		<b>Command rejected</b>	
	16#0016	Active homing is running; another homing method cannot be started.	Wait for active homing to finish or abort the active homing with a motion command, for example, "MC_Halt". The other homing type can then be started.

## Block parameter error

ErrorID	ErrorInfo	Description	Remedy
<b>16#8400</b>		<b>Invalid value at parameter "Position" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the "position" value; restart the command
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#0006	The value is outside the number range (less than $-1e^{12}$ )	
<b>16#8401</b>		<b>Invalid value at parameter "Distance" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the "Distance" value; restart the command
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#0006	The value is outside the number range (less than $-1e^{12}$ )	
<b>16#8402</b>		<b>Invalid value at parameter "Velocity" of the Motion Control instruction</b>	
	16#0002	Number format of value is invalid	Correct the "Velocity" value; restart the command
	16#0008	Velocity is greater than the maximum velocity	
	16#0009	Velocity is less than the start/stop velocity	
<b>16#8403</b>		<b>Invalid value at parameter "Direction" of the Motion Control instruction</b>	
	16#0011	Invalid selection value	Correct the selection value; restart the command
<b>16#8404</b>		<b>Invalid value at parameter "Mode" of the Motion Control instruction</b>	
	16#0011	Invalid selection value	Correct the selection value; restart the command
	16#0015	Active/passive homing is not configured	Correct the configuration and download it to the controller; enable the axis and restart the command
	16#0017	Axis reversal is activated at the HW limit switch, despite the fact that the hardware limit switches are disabled	<ul style="list-style-type: none"> <li>• Activate the hardware limit switch using the tag &lt;axis&gt;.Config.PositionLimits_HW.Active = TRUE, restart the command</li> <li>• Correct the configuration and download it to the controller; enable the axis and restart the command</li> </ul>
<b>16#8405</b>		<b>Invalid value at parameter "StopMode" of the Motion Control instruction</b>	
	16#0011	Invalid selection value	Correct the selection value; enable the axis again
<b>16#8406</b>		<b>Simultaneous forward and backward jogging is not allowed</b>	
	16#0001	-	Take steps to ensure that parameters "JogForward" and "JogBackward" do not have signal status TRUE simultaneously; restart the command.
<b>16#8407</b>		<b>Switching the axis with Motion Control instruction "MC_Power" is only permitted after disabling the axis.</b>	
	16#0001	-	Disable the active axis; it is then possible to switch to the other axis and enable it.

## Configuration error

ErrorID	ErrorInfo	Description	Remedy
<b>16#8600</b>		<b>Parameter assignment of pulse generator (PTO is invalid)</b>	
	16#000B	Address is invalid	Correct the configuration of the PTO (Pulse Train Output) and download it to the controller
<b>16#8601</b>		<b>Parameter assignment of the high-speed counter (HSC) is invalid</b>	
	16#000B	Address is invalid	Correct the configuration of the HSC (High Speed Counter) and download it to the controller
<b>16#8602</b>		<b>Invalid parameter assignment of "Enable output"</b>	
	16#000D	Address is invalid	Correct the configuration and download it to the controller
<b>16#8603</b>		<b>Invalid parameter assignment of "Ready input"</b>	
	16#000D	Address is invalid	Correct the configuration and download it to the controller
<b>16#8604</b>		<b>Invalid "Pulses per motor revolution" value</b>	
	16#000A	Value is less than or equal to zero	Correct the configuration and download it to the controller
<b>16#8605</b>		<b>Invalid "Distance per revolution" value</b>	
	16#0002	Number format of value is invalid	Correct the configuration and download it to the controller
	16#000A	Value is less than or equal to zero	
<b>16#8606</b>		<b>Invalid "Start/stop velocity" value</b>	
	16#0002	Number format of value is invalid	Correct the configuration and download it to the controller
	16#0003	Value exceeds the hardware limit	
	16#0004	Value is less than the hardware limit	
	16#0007	The start/stop velocity is greater than the maximum velocity	
<b>16#8607</b>		<b>Invalid "Maximum velocity" value</b>	
	16#0002	Number format of value is invalid	Correct the configuration and download it to the controller
	16#0003	Value exceeds the hardware limit	
	16#0004	Value is less than the hardware limit	
<b>16#8608</b>		<b>Invalid "Acceleration" value</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0003	Value exceeds the hardware limit	
	16#0004	Value is less than the hardware limit	
<b>16#8609</b>		<b>Invalid "Deceleration" value</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0003	Value exceeds the hardware limit	
	16#0004	Value is less than the hardware limit	
<b>16#860A</b>		<b>Invalid "Emergency stop deceleration" value</b>	

ErrorID	ErrorInfo	Description	Remedy
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0003	Value exceeds the hardware limit	
	16#0004	Value is less than the hardware limit	
<b>16#860B</b>		<b>Value for position of the lower SW limit switch is invalid</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#0006	The value is outside the number range (less than $-1e^{12}$ )	
	16#0007	The position value of the lower SW limit switch is greater than that of the upper SW limit switch	
<b>16#860C</b>		<b>Value for position of the upper SW limit switch is invalid</b>	
	16#0002	Number format of value is invalid	<ul style="list-style-type: none"> <li>Download error-free configuration to the controller; enable the axis again with instruction "MC_Power"</li> <li>Correct the incorrect value online; acknowledge error with instruction "MC_Reset" and restart the command, if necessary</li> </ul>
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#0006	The value is outside the number range (less than $-1e^{12}$ )	
<b>16#860D</b>		<b>Invalid address of the lower HW limit switch</b>	
	16#000C	Address of falling edge is invalid	Correct the configuration and download it to the controller
	16#000D	Address of rising edge is invalid	
<b>16#860E</b>		<b>Invalid address of the upper HW limit switch</b>	
	16#000C	Address of falling edge is invalid	Correct the configuration and download it to the controller
	16#000D	Address of rising edge is invalid	
<b>16#860F</b>		<b>Invalid "home position offset" value</b>	
	16#0002	Number format of value is invalid	Correct the configuration and download it to the controller
	16#0005	The value is outside the number range (greater than $1e^{12}$ )	
	16#0006	The value is outside the number range (less than $-1e^{12}$ )	
<b>16#8610</b>		<b>Invalid "approach velocity" value</b>	
	16#0002	Number format of value is invalid	Correct the configuration and download it to the controller
	16#0008	Velocity is greater than the maximum velocity	
	16#0009	Velocity is less than the start/stop velocity	
<b>16#8611</b>		<b>Invalid "Homing velocity" value</b>	
	16#0002	Number format of value is invalid	Correct the configuration and download it to the controller
	16#0008	Velocity is greater than the maximum velocity	
	16#0009	Velocity is less than the start/stop velocity	
<b>16#8612</b>		<b>Invalid address of the reference point switch</b>	
	16#000C	Address of falling edge is invalid	Correct the configuration and download it to the controller
	16#000D	Address of rising edge is invalid	

ErrorID	ErrorInfo	Description	Remedy
16#8613		During active homing, direction reversal at the hardware limit switch is activated although the hardware limit switches are not configured	
	16#0001	-	Correct the configuration and download it to the controller

### Config.PositionLimits\_SW tags V1...3

#### Legend

<b>Data type</b>	Data type of tag
<b>Start value</b>	Start value of tag The start value can be overwritten by the axis configuration.
<b>Access</b>	Access to tag in the user program:
	RW The tag can be read and written in the user program.
	R The tag can be read in the user program.
	- The tag cannot be used in the user program.
<b>Effective</b>	Specifies when a change to the tag takes effect.
	1 When axis is activated (<Axis name>.StatusBits.Activated tag changes from FALSE -> TRUE), disabled, or enabled
	4 Upon the next start of a Motion Control command after a standstill of the axis. The axis standstill can be checked with tag <Axis name>. StatusBits.Standstill.
	5 The next time an MC_MoveAbsolute, MC_MoveRelative, MC_MoveVelocity, MC_MoveJog, MC_Halt, MC_CommandTable or active MC_Home command is started (Mode = 3).
<b>HMI</b>	The tag can be used in an HMI system.

<Axis name>.Config.PositionLimits_SW.Active					
TRUE = The software limit switches are activated					
Data type	Start value	Access	Effective		HMI
Bool	FALSE	RW	4	CPU Firmware V1.0	X
			1, 5, 6	CPU firmware as of V2.0	

<Axis name>.Config.PositionLimits_SW.MinPosition					
Position of lower software limit switch (specified in the configured unit of measurement)					
Data type	Start value	Access	Effective		HMI
Real	-1.0E+004	RW	4	CPU Firmware V1.0	X
			1, 5, 6	CPU firmware as of V2.0	

<Axis name>.Config.PositionLimits_SW.MaxPosition					
Position of upper software limit switch (specified in the configured unit of measurement)					
Data type	Start value	Access	Effective		HMI
Real	1.0E+004	RW	4	CPU Firmware V1.0	X
			1, 5, 6	CPU firmware as of V2.0

### Config.Homing tags V1...3

#### Legend

<b>Data type</b>	Data type of tag
<b>Start value</b>	Start value of tag The start value can be overwritten by the axis configuration.
<b>Access</b>	Access to tag in the user program:
	RW The tag can be read and written in the user program.
	R The tag can be read in the user program.
	- The tag cannot be used in the user program.
<b>Effective</b>	Specifies when a change to the tag takes effect.
	1 When axis is activated (<Axis name>.StatusBits.Activated tag changes from FALSE -> TRUE), disabled, or enabled
	7 When a passive homing command is started
	8 When an active homing command is started
<b>HMI</b>	The tag can be used in an HMI system.

<b>&lt;Axis name&gt;.Config.Homing.AutoReversal</b>					
TRUE = Direction reversal at hardware limit switch enabled (active homing)					
FALSE = Direction reversal at hardware limit switch disabled (active homing)					
Data type	Start value	Access	Effective		HMI
Bool	TRUE	R	-	Technology object "Axis" V1.0	X
		RW	1, 8	Technology object "Axis" V2.0	

<b>&lt;Axis name&gt;.Config.Homing.Direction</b>					
TRUE = Positive approach direction to search for reference point switch and positive homing direction (active homing)					
FALSE = Negative approach direction to search for reference point switch and positive homing direction (active homing)					
Data type	Start value	Access	Effective		HMI
Bool	TRUE	R	-	Technology object "Axis" V1.0	X
		RW	1, 8	Technology object "Axis" V2.0	

<b>&lt;Axis name&gt;.Config.Homing.SideActiveHoming ("Axis" technology object as of V2.0)</b>					
TRUE = Homing on high end of the reference point switch (active homing)					
TRUE = Homing on lower end of the reference point switch (active homing)					
Data type	Start value	Access	Effective		HMI
Bool	TRUE	RW	1, 8		X

<b>&lt;Axis name&gt;.Config.Homing.SidePassiveHoming ("Axis" technology object as of V2.0)</b>					
TRUE = Homing on high end of the reference point switch (passive homing)					
TRUE = Homing on lower end of the reference point switch (passive homing)					
Data type	Start value	Access	Effective		HMI
Bool	TRUE	RW	1, 7		X

<b>&lt;Axis name&gt;.Config.Homing.RisingEdge (as of technology object "Axis" V1.0)</b>					
TRUE = Homing with negative signal edge of the reference point switch (active homing)					
FALSE = Homing with positive signal edge of the reference point switch (active homing)					
For information on the effect of the tag on passive homing, refer to the description in "Configuration - Homing".					
Data type	Start value	Access	Effective		HMI
Bool	FALSE	R	-		X

<b>&lt;Axis name&gt;.Config.Homing.Offset</b>					
Home position offset /specified in the configured unit of measurement (active homing)					
Data type	Start value	Access	Effective		HMI

<Axis name>.Config.Homing.Offset					
Real	0.0	R RW	-	Technology object "Axis" V1.0	X
			1, 8	Technology object "Axis" V2.0	

<Axis name>.Config.Homing.FastVelocity					
Approach velocity / specified in the configured unit of measurement (active homing)					
Data type	Start value	Access	Effective		HMI
Real	2.0E+002	R	-	Technology object "Axis" V1.0	X
		RW	1, 8	Technology object "Axis" V2.0	

<Axis name>.Config.Homing.SlowVelocity					
Homing velocity / specified in the configured unit of measurement (active homing)					
Data type	Start value	Access	Effective		HMI
Real	4.0E+001	R	-	Technology object "Axis" V1.0	X
		RW	1, 8	Technology object "Axis" V2.0

## MotionStatus tags V1...3

### Legend

<b>Data type</b>	Data type of tag
<b>Start value</b>	Start value of tag
<b>Access</b>	Access to tag in the user program:
	RW   The tag can be read and written in the user program.

	R	The tag can be read in the user program.
	-	The tag cannot be used in the user program.
<b>Effective</b>	Specifies when a change to the tag takes effect.	
<b>HMI</b>	The tag can be used in an HMI system.	

<b>&lt;Axis name&gt;.MotionStatus.Position</b>				
Current position of the axis (specified in the configured unit of measurement) If the axis is not homed, the tag indicates the position value relative to the enable position of the axis.				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Real	0.0	R	-	X

<b>&lt;Axis name&gt;.MotionStatus.Velocity</b>				
Current velocity of the axis (specified in the configured unit of measurement)				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Real	0.0	R	-	X

<b>&lt;Axis name&gt;.MotionStatus.Distance</b>				
Current distance to the target position of the axis (specified in the configured unit of measurement) The value of the tag is only valid during execution of a positioning command with "MC_MoveAbsolute" or "MC_MoveRelative" or of the axis command table.				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Real	0.0	R	-	X

<b>&lt;Axis name&gt;.MotionStatus.TargetPosition</b>				
Target position of axis (specified in the configured unit of measurement) The value of the tag is only valid during execution of a positioning command with "MC_MoveAbsolute" or "MC_MoveRelative" or of the axis command table.				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Real	0.0	R	-	X

Motion status (Page 6521)

Tags of the positioning axis technology object as of V4 (Page 6546)

**StatusBits tags V1...3**

**Legend**

<b>Data type</b>	Data type of tag	
<b>Start value</b>	Start value of tag	
<b>Access</b>	Access to tag in the user program:	
	RW	The tag can be read and written in the user program.
	R	The tag can be read in the user program.

	-	The tag cannot be used in the user program.
<b>Effective</b>	Specifies when a change to the tag takes effect.	
<b>HMI</b>	The tag can be used in an HMI system.	

<b>&lt;Axis name&gt;.StatusBits.Activated</b>				
TRUE = The axis is activated. It is connected to the assigned PTO (Pulse Train Output). The data of the technology data block will be updated cyclically.				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.Enable</b>				
TRUE = The axis is enabled and ready to take on Motion Control commands.				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.HomingDone</b>				
TRUE = The axis is homed and is capable of executing absolute positioning commands. The axis does not have to be homed for relative positioning. The status is FALSE during active homing. The status remains TRUE during passive homing if the axis has already been homed.				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.Done</b>				
TRUE = No Motion Control command is active on the axis.				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.Error</b>				
TRUE = An error occurred in the axis technology object. Detailed information about the error is available in automatic mode in the "ErrorID" and "ErrorInfo" parameters of the Motion Control instructions. In manual mode, the "Error message" box of the axis control panel displays detailed information about the cause of error.				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.StandStill</b>				
TRUE = The axis is at a standstill.				
<b>Data type</b>	<b>Start value</b>	<b>Access</b>	<b>Effective</b>	<b>HMI</b>
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.PositioningCommand</b>				
TRUE = The axis is executing a positioning command.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.SpeedCommand</b>				
TRUE = The axis is executing a travel command at predefined velocity.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.Homing</b>				
TRUE = The axis is executing a homing command of the "MC_Home" Motion Control instruction or axis command table.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.CommandTableActive</b>				
TRUE = The axis is controlled by Motion Control instruction "MC_CommandTable".				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.ConstantVelocity</b>				
TRUE = The axis travels at constant velocity.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.Acceleration</b>				
TRUE = The axis accelerates.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.Deceleration</b>				
TRUE = The axis decelerates (slows down).				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.ControlPanelActive</b>				
TRUE = The "Manual control" mode has been enabled in the axis command table. The axis command table has control priority over the "Axis" technology object. The axis cannot be controlled from the user program.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.DriveReady</b>				
TRUE = The drive is ready.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	R	-	X

<b>&lt;Axis name&gt;.StatusBits.RestartRequired</b>				
TRUE = Values were modified in the load memory.				
To download the values in the CPU RUN operating mode to the work memory, you need to restart the axis. Use the Motion Control instruction MC_Reset to do this.				
Data type	Start value	Access	Effective	HMI
Bool	FALSE	R	-	X

## Using Team Engineering

### 12.1 Shared commissioning of projects

#### 12.1.1 Basics for shared commissioning

##### Introduction

As part of Team Engineering, you have the option to perform shared commissioning of projects. Several editors can access one CPU at the same time with up to five engineering systems (ES) in this process.

A special advantage is that parts of a master project can be edited independently and offline at the same time during the commissioning phase. The changes of the other editors are displayed in the dialog "Software synchronization" during loading and synchronized automatically, if possible.

Certain online functions can also be executed at the same time from several engineering systems on the shared CPU, for example:

- Monitoring blocks on the CPU
- Controlling blocks on the CPU
- Trace functions

The following online functions cannot be executed at the same time:

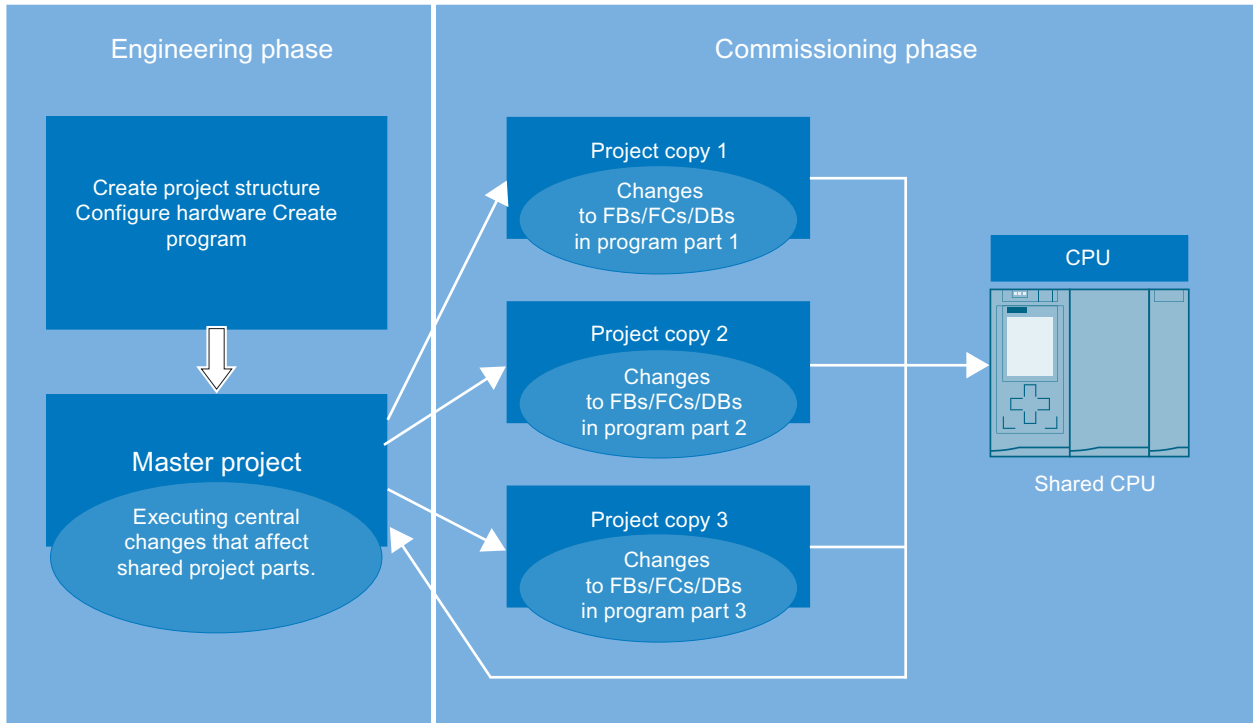

- Forcing: Only one ES can force on the CPU.
- Loading: Only one ES can load to the CPU.

You can also find additional information on the topic of Team Engineering at Service and support in Siemens Industry online support (<http://support.automation.siemens.com/WW/view/en/82142829>).

##### Creating a master project

A "master project" structured according to the specified rules (Page 6621), which already contains the complete configured hardware configuration with all required tags and blocks, is used as the basis for the shared commissioning. This project is loaded in the jointly used CPU

and then distributed as "master project" by means of project copies to up to five participating engineering systems.

### Working with project copies

Each engineering system only processes the parts it was assigned within the specific project copy. This is especially important to avoid conflicts during loading and unintentional overwriting of blocks that were already modified by other engineering systems.

Each ES loads its parts to the shared CPU after editing. The TIA Portal helps you during download to the CPU. The changes made since the last download are displayed in the dialog "Software synchronization before loading to a device" (hereafter referred to as "synchronization dialog"), by means of an online-offline comparison. You are provided recommendations during download to the CPU about how you can synchronize the offline data you have edited with the existing online data.

If there are "competing changes", you may have to synchronize them manually.

Competing changes are:

- when different editors edit the same block in different project copies at the same time.
- when PLC tags (I, Q, M, T, C) are added, changed or deleted in the project copies.
- when blocks that have relations to the hardware configuration are edited in the project copies.
- when F blocks are edited in the project copies.

Each editor loads their changes only after all conflicts have been removed.

The procedure for editing and loading of project copies can be repeated as often as necessary by the individual engineering systems until the shared commissioning is complete.

### Integrating project copies into the master project once again

The individual project copies must once again be integrated into the master project at the end of commissioning at the same time. This way you also back up the data that only exist in the offline projects and have not been downloaded to the CPU. These include, for example, the project languages and text lists created in the project copies.

To do this, open the master project and one project copy as reference object. You determine the differences between the two projects by performing an offline/offline comparison using the comparison editor. Copy the edited objects from the respective project copy to the master project. Repeat this step for all project copies.

When the shared commissioning is completed, you have an executable master project with all created project data.

The integration of the project data into the master project is required even if you determine during the commissioning phase that the shared central elements need to be expanded or corrected, for example, the PLC tag table needs to be expanded, or a new hardware component needs to be added.

### Notes on compatibility

The following compatibility rules apply to shared commissioning:

- If an engineering system with TIA Portal V13 or later is online on the CPU and performs a download, a second ES cannot establish an online connection regardless of the version.
- If an engineering system with TIA Portal < V13 is online on the CPU, a second ES cannot establish an online connection regardless of the version.

### See also

Requirements for shared commissioning (Page 6617)

Procedure for shared commissioning (Page 6618)

## 12.1.2 Requirements for shared commissioning

### Software and hardware requirements

For shared commissioning of projects, the minimum software and hardware requirements for the installation of TIA Portal V13 or later must be met.

The following requirements also apply:

Software:

### 12.1 Shared commissioning of projects

- You have installed TIA Portal V13 or later and the "SIMATIC STEP 7 Professional" software package on the involved engineering systems.
- The same software version must be installed on all engineering systems.
- The master project must be one created with V13 or later.

Hardware:

- You have access to a fully configured CPU S7-1500 as of firmware version V1.5.
- The involved engineering systems (max. 5) can establish an online connection to this CPU.

#### Requirements for shared, parallel working on the project

The following requirements are in effect for shared commissioning of projects:

- You have created a project with complete hardware configuration and fully programmed user program that can be commissioned.
- The project was downloaded to the CPU and defined as "master project".
- Multiple engineering systems have access to this CPU and can establish an online connection to this CPU.
- You are familiar with the defined rules and procedures for working together on one CPU.

#### Note on compatibility mode

The functions for shared commissioning are not available in compatibility mode.

#### See also

Basics for shared commissioning (Page 6613)

Procedure for shared commissioning (Page 6618)

Rules for shared commissioning (Page 6621)

### 12.1.3 Procedure for shared commissioning

#### Introduction

If you are performing shared commissioning a project as part of team engineering, it is very important that all editors of the project observe a defined procedure.

Only when the specified procedure is observed are changes and corrections in the project automatically synchronized and applied, and changes of individual editors not unintentionally overwritten during loading or even lost in case of competing changes.

### Procedure for creating the master project

The master project is created in the following steps:

1. Create a master project that includes the entire project structure.
2. Fully configure the hardware for the master project.
3. Define a language as project language, which must also be used exclusively by all participating engineering systems.
4. Create all tags and blocks that are required in the master project.
5. Create your own folders and groups for the blocks to be edited by the individual engineering systems.
6. Create a fully programmed and executable user program.
7. Download the master project to the shared CPU.
8. Save the master project following every download.

For this, also observe the Rules for shared commissioning (Page 6621).

### Procedure for shared commissioning

Shared commissioning takes place with the following steps:

1. Download the master project to the shared CPU.
2. Create copies of the master project and distribute them to the editors involved in the project on the associated engineering systems.
3. Inform all editors who is to edit the specific parts of the project copies and who may download to the CPU.
4. Have the project copies edited in the individual engineering systems.
5. After editing, the individual engineering systems download the changes one after the other to the CPU.
6. All changes are automatically detected during loading by means of an online-offline comparison. The displayed synchronization dialog offer you recommendations for synchronizing the modified data when possible. You may first have to download blocks that were edited by other editors to your ES before you can download your changes to the CPU. This may be needed to update the corrections of the other editors that have already been downloaded to the CPU in your project copy.

The following synchronization options are available:

- Download block: There are edited blocks on the CPU that must be updated in your project copy.
  - Download block: There are new blocks on the CPU that must be downloaded to your project copy.
  - Blocks with competing changes: System-supported synchronization is not possible in this case; the conflict must be resolved manually.
7. Manually resolve any conflicts that may occur due to competing changes or changes to central objects.
  8. Download your project copy to the CPU when all conflicts have been removed.

### 12.1 Shared commissioning of projects

9. Save your project copy following every download.
10. Repeat editing of project copies and download to the CPU as often as necessary until shared commissioning is complete.
11. Integrate the completely edited project copies into the master project once again in order to also back up the project data that only exist offline.

You should also observe the Rules for shared commissioning (Page 6621).

#### Procedure for manual synchronization of competing changes

Manual synchronization of competing changes is performed in the following steps:

1. Start the comparison editor to manually resolve a conflict displayed in the synchronization dialog during download to the CPU. Select the shared CPU in the project tree and select the "Compare > Offline/Online" command in the shortcut menu. You can define certain actions depending on the status of the objects. Note, however, that you can only perform actions in one direction during synchronizing.
2. First, select the action "Upload from device" for all blocks that were changed by other editors on the CPU and which you want to apply.
3. If necessary, perform a detailed comparison of the blocks to identify differences between your offline blocks and the online blocks loaded on the CPU.
4. Manually correct the competing changes to the blocks.
5. Then download the affected blocks to the CPU using the "Continue without synchronization" command.
6. Save your project or project copy following every download.

For this, also observe the Rules for shared commissioning (Page 6621).

---

#### Note

To prevent online changes occurring again while an engineering system is being manually synchronized, no downloading to the shared CPU should be performed by another participating engineering system during the manual synchronizing.

---

#### Procedure for integrating project copies into the master project

You integrate project copies into the master project with the following steps:

1. Open the master project and the project copy to be integrated as a reference object.
2. Copy the program parts you have edited from the respective project copy to the master project and confirm overwriting the existing objects. You can also use the comparison editor to apply your program parts to the master project.
3. Save the master project and download it to the shared CPU with the "Continue without synchronization" command.
4. Save the master project following every download.

For this, also observe the Rules for shared commissioning (Page 6621).

### Procedure for modifying central objects within the master project

Modification of central objects that have an effect on all program parts is performed with the following steps:

1. Stop further processing of the project copies.
2. Integrate all existing project copies one after the other into the master project as described above.
3. Download the master project to the shared CPU with the "Continue without synchronization" command.
4. Make the required modification on the shared objects such as in the hardware configuration, for example, or in the PLC tag table. The procedure is the same for modification of other central objects such as technology objects, F blocks, OBs, etc.
5. Download the master project into the CPU once again when modification is complete.
6. Save the master project following every download.
7. Distribute the updated project copies to the respective engineering systems for further processing.

For this, also observe the Rules for shared commissioning (Page 6621).

### See also

Basics for shared commissioning (Page 6613)

Requirements for shared commissioning (Page 6615)

Rules for shared commissioning (Page 6621)

## 12.1.4 Rules for shared commissioning

### Introduction

If you are performing shared commissioning a project as part of team engineering, it is very important that all editors of the project observe predefined rules for successful cooperation.

### Rules for the master project

The following rules are to be observed:

- Create a master project that is suitable for shared editing.
- Divide the user program into program parts that are independent of each other.
- Use "Groups" to visually separate the program parts from each other.
- Use a main OB and a central FC for each program part which calls the functions of the part program.
- If possible, create a separate PLC tag table for each part.
- In the master project, specify a project language which cannot be changed in the project copies.
- If you want to exchange data between the program parts, use the FC and FB interface parameters (IN, OUT, INOUT) or global data blocks.
- Use global data blocks to save the data for the individual program parts, no bit memories.
- Do not assign different names for blocks with identical addresses.
- Do not assign identical names for blocks with different addresses.

### Example of the program structure in the master project

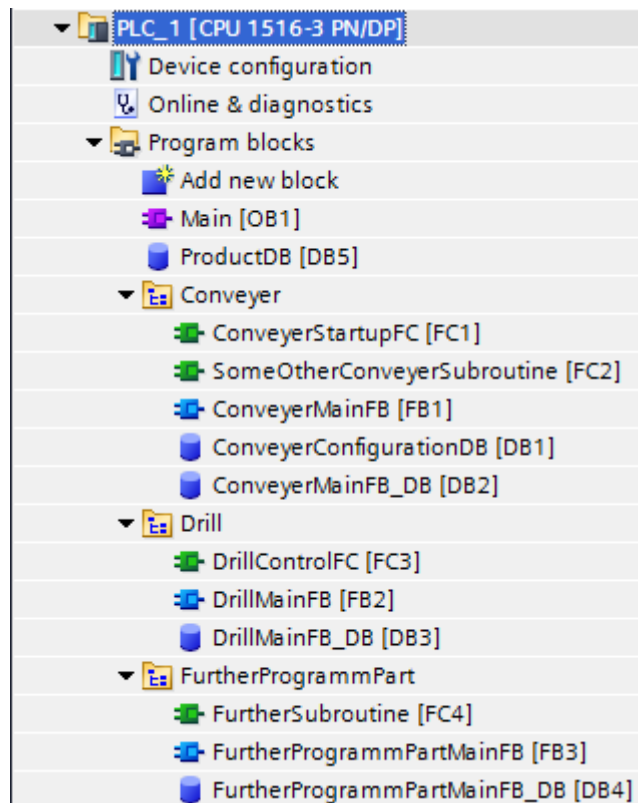

Here is an example of a team-capable, structured master project that is suitable for parallel editing during shared commissioning.

The program parts edited by the individual Engineering Systems are:

- Program part 1: "Conveyer"
- Program part 2: "Drill"
- Program part 3: "FurtherProgramPart"

Each program part contains a "main FB", which calls the specific lower-level functions for this program part.

Example: in the "Conveyer" program part, the "ConveyerMainFB" calls the "ConveyerStartup" function.

In team engineering, this subdivision within the project structure allows the parallel editing of individual program parts and the automatic synchronization of changes during the shared commissioning phase.

### Rules for shared working on one CPU

Observe the following rules for shared working:

- Editor only edits the blocks they have been assigned in the project copy in the assigned groups.
- Only FBs, DBs, FCs and UDTs may be changed in the project copies, i.e. the following program elements should **not** be edited in the project copies:
  - Hardware configurations
  - PLC tag table
  - Organization blocks
  - Technological objects
  - Text lists and project language
  - F blocks
- Global data blocks should be used in programming instead of bit memories.

### 12.1 Shared commissioning of projects

- IEC timers and counters should be used during programming instead of SIMATIC timers and counters.
- The project language specified in the master project may not be changed in the project copies.

#### Rules for editing shared, central objects

Observe the following rules for shared central objects:

- Changes to shared central objects always have to be made by means of the master project. These objects include:
  - Hardware configurations
  - PLC tag table
  - Organization blocks
  - Technological objects
  - Text lists and project language
  - F blocks
- Before the shared central objects can be modified in the master project, the various working versions within the project copies must first be integrated into the master project once again.
- The modification can then be made within the master project, and the master project can then be downloaded to the shared CPU.
- Once modification is complete, new project copies can be created and distributed to the engineering systems for further processing.

#### Rules for downloading to the CPU

Observe the following rules for downloading:

- Editors may only download the project copies one after the other; only one engineering system can download at any given time.
- No other engineering system may be connected online with the CPU during download.
- Perform the synchronization that is offered automatically in the synchronization dialog. This ensures that changes from other editors are not unintentionally overwritten.
- Correct the name conflicts that are shown in the synchronization dialog, which you rename in your offline block before downloading to the CPU. A name conflict is indicated if you want to download to the CPU a block that already exists with identical name on the CPU.

- So-called "competing changes" must be corrected manually. Competing changes come about when two editors work on the same block on two engineering systems at the same time. The first editor can still download his or her changes to the CPU without any problems. However, if the second editor wants to download the same block with the changes the editor has made, the synchronization dialog displays a conflict that cannot be removed automatically. The previous changes made to this block would be undone by overwriting during download. The editors have to decide in this case which change is to be applied and which one is to be discarded. Alternatively, you can manually merge the changes with the help of the detailed comparison of the blocks in the comparison editor. Such changes should always be avoided by implementing a good project structure and corresponding agreements between the editors.
- Changes to central objects are displayed in the synchronization dialog but cannot be synchronized automatically. Changes to central objects always have to be made by means of the master project.
- Save your project or project copy following every download.

---

**Note****Creating and subsequent deleting of objects in the project copies**

Please note that a software synchronization is also required before downloading when you create a new object in a project copy and then delete this again immediately afterwards.

The creation of an object causes a change in the internal data management which cannot be undone by the subsequent deleting of the object. As a result it is necessary to perform a synchronization before the next loading if the newly created object was deleted immediately thereafter and no change in the existing object is visible within the project copy.

---

## Rules for online functions

The following rules are to be observed when using online functions:

Monitoring and controlling:

- Up to five Engineering Systems can be monitored and controlled simultaneously on the CPU blocks.
- A specific code block can only be monitored and controlled by one Engineering System at a time.
- However, additional Engineering Systems can simultaneously monitor and control other code blocks.

Force

- Forcing can only be implemented on the CPU from one Engineering System at a time.
- The Engineering Systems that starts the forcing has taken over the forcing job exclusively. Although the other Engineering Systems receive the information that a forcing job is running, they cannot access this job and cannot also see any results.
- As soon as the Engineering System to which the force job belongs ends the online connection, the force job can be applied by another ES that establishes an online connection to the CPU and changes the existing force job.

Trace functions:

- Up to four Engineering Systems can perform trace functions simultaneously.
- The Engineering Systems that starts the tracing has taken over the trace job exclusively. Although the other Engineering Systems can see this job in the trace editor, they cannot access it.
- As soon as the Engineering System to which the trace job belongs closes the trace editor, the trace job can be taken over by another ES that re-opens the trace editor.

## 12.2 Exchanging data with Inter Project Engineering (IPE)

### 12.2.1 Basics of Inter Project Engineering (IPE)

#### Introduction to Inter Project Engineering (IPE)

The functionality of Inter Project Engineering, hereinafter referred to as IPE, is used to exchange the controller data in a source project between different projects with the help of a device proxy.

You can then transfer this data to other projects, for visualization in HMI, for example, and use it there for further configuration.

Inter Project Engineering gives you a simple way of providing controller data from a PLC programming across multiple projects for an HMI configuration.

Using the object "Device Proxy Data", you exchange controller data across multiple projects consistently and easily without redundant configuration overheads.

This makes it possible for HMI project engineers to work on a project without the hardware configuration having to be present in their project. This means they can work on the PLC project and on the HMI project at the same time.

You can exchange the following controller data between projects via the device proxy:

- Program blocks
- Technological objects
- PLC tags
- PLC alarms

The following data is automatically included in the exchange:

- Controller interfaces
- Configured communication processors and communication modules

This automatic data exchange ensures that the interfaces and the configured communication processors and modules are transferred along with the data you selected. This data is required to allow you to continue working consistently and without problems in your target project.

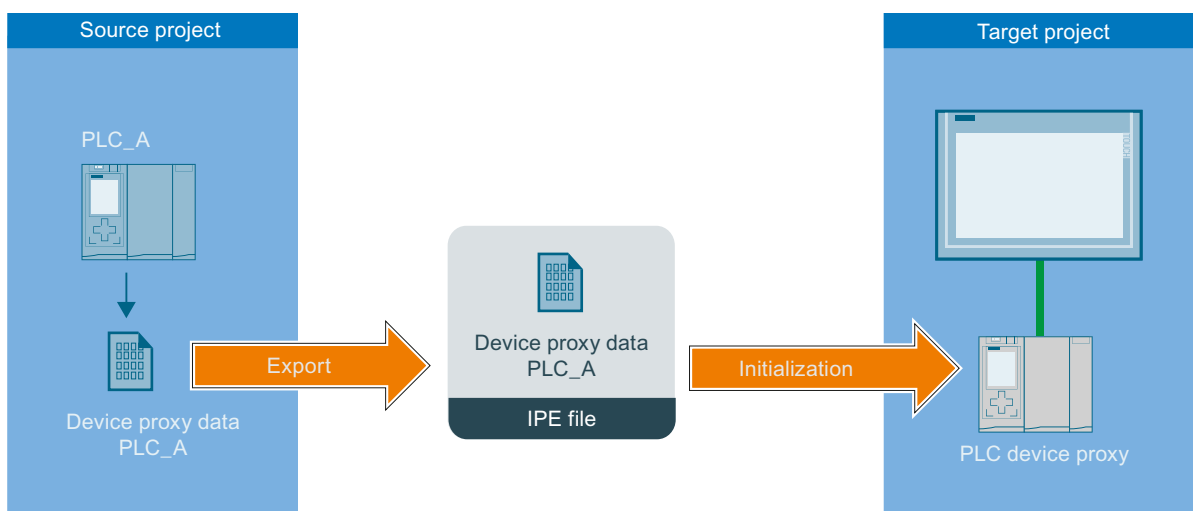

### Cross-project data exchange

The following options are available for cross-project data exchange with Inter Project Engineering:

- Exchanging controller data via IPE file
- Exchanging controller data via project file

### Exchanging controller data via IPE file

The figure below shows cross-project data exchange via an IPE file.

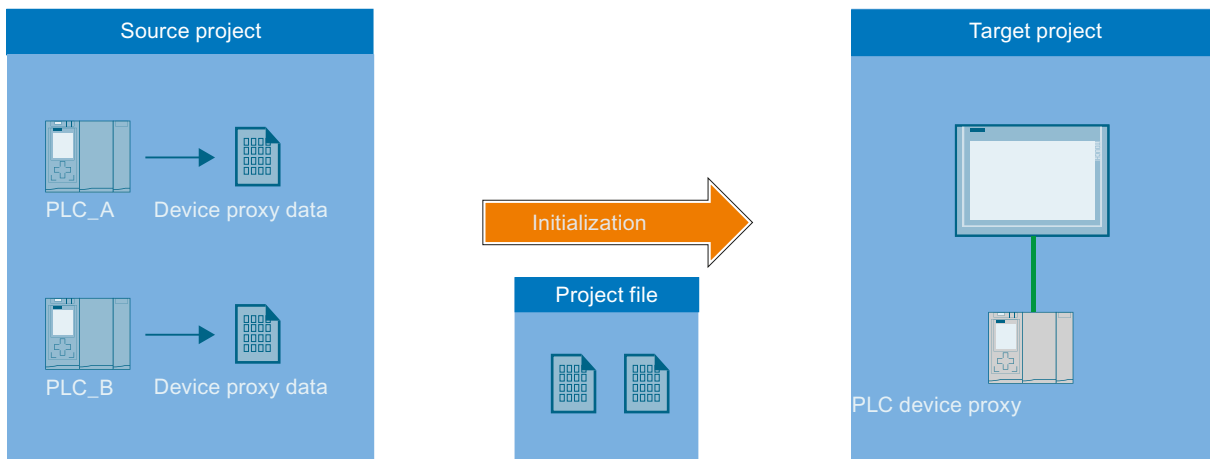

The PLC controller data from the source project is transferred to the PLC in the target project via the object "Device Proxy Data".

Controller data that is exchanged via an IPE file must originate from TIA Portal Projects V13 or higher.

### Exchanging controller data via a project file

The figure below shows cross-project data exchange via a project file.

The PLC controller data from the source project is transferred to the PLC in the target project via a project file.

You can easily transfer and continue to use controller data from older TIA Portal projects as well as STEP 7 Classic projects that are not integrated in TIA Portal in your current TIA Portal projects.

### See also

Requirements for Inter Project Engineering (IPE) (Page 6628)

Procedure for working with Inter Project Engineering (IPE) (Page 6629)

## 12.2.2 Requirements for Inter Project Engineering (IPE)

### Software and hardware requirements

To use the functionality of Inter Project Engineering, the minimum software and hardware requirements for the installation of TIA Portal V13 or higher must be met.

The following requirements also apply:

- You have installed TIA Portal V13 or higher and the "SIMATIC STEP 7 Professional" software package.
- You are using a CPU of the S7-1200/1500 or S7-300/400 series.
- The same software version must be installed on all involved controllers.

## Requirements for IPE

The requirements for accepting controller data from projects are as follows:

- You have created a project with hardware configuration and PLC data that can be transferred to another project.
- You have made sure that the project is consistent before you transfer the controller data by means of the device proxy data.
- You are familiar with the defined procedures for Inter Project Engineering.

## Notes on compatibility mode

The functions for Inter Project Engineering are not available in compatibility mode.

## See also

Basics of Inter Project Engineering (IPE) (Page 6624)

Procedure for working with Inter Project Engineering (IPE) (Page 6629)

## 12.2.3 Procedure for working with Inter Project Engineering (IPE)

### Exchanging controller data across projects

You can use the functionality of Inter Project Engineering to exchange existing controller data between different projects with the help of a device proxy and to continue using this data in another project. The device proxy provides you with a consistent and convenient way of exchanging data between projects without redundant configuration overheads.

### Procedure for exchanging controller data via an IPE file

To exchange data via an IPE file, follow these steps:

1. Using TIA Portal V13 or higher, create a project with all required controller data and an executable user program.
2. Configure the hardware required for the project.
3. Compile the project to ensure consistency in your project.
4. In your project, create the object "Device Proxy Data" below the required CPU by clicking the corresponding command "Add device proxy data" in the "Device Proxy Data" folder.  
**Result:** The "Device Proxy Data" object has been created.
5. Select the required device proxy data in the project tree and double-click the object to open it in the editor.

6. Enter the required data for the device proxy data in the editor under "General" or apply the default setting. You can change the name and enter a comment for export of the controller data.  
In the "Define content" area of the editor select which of the existing controller data you wish to export as IPE file and click "Export device proxy data".
7. In the subsequent dialog, enter the name and storage location for the IPE file to be created and click "Save". You will be notified as soon as the export has been completed successfully.  
**Result:** The selected controller data are exported as IPE file.
8. In your target project, create a device proxy to be able to import the controller data contained in the IPE file. To do so, click the command "Add new device" and select the required device proxy in the dialog that opens.
9. Click the newly created device proxy and select the "Initialize device proxy" command from the shortcut menu.
10. Select the previously created IPE file to be used for the initialization, and confirm the selection in the following dialog with "OK". This starts the initialization.  
**Result:** The controller data from the source project contained in the IPE file is transferred to the device proxy in the target project.

After the successful exchange of controller data, you can continue with the configuration in your target project and, for example, connect PLC tags with HMI tags. The controller data can be updated as often as required when it is changed in the source project.

### Procedure for exchanging controller data via a project file

When exchanging controller data via a project file, device proxy data can either be predefined in the source project or it can be defined and selected from the target project.

Follow these steps to exchange data via a project file:

1. Using TIA Portal V13 or higher, create a project with all required controller data and an executable user program.
2. Configure the hardware required for the project.
3. Compile the project to ensure consistency in your project.
4. Open the TIA Portal project from which you want to import the controller data into the target project.
5. In your project, create the object "Device Proxy Data" below the required CPU by clicking the corresponding command "Add device proxy data" in the "Device Proxy Data" folder.  
**Result:** The "Device Proxy Data" object has been created.
6. Enter the required data for the device proxy data in the editor under "General" or apply the default setting. You can change the name and enter a comment for the device proxy data.
7. In the "Define content" area of the editor select which of the existing controller data you want to provide by means of the device proxy data.
8. Click "Save" to save the changes in the project.  
**Result:** You have successfully saved the selected controller data in your device proxy data.

9. In your target project, create a device proxy to import the controller data contained in the project file. To do so, click the command "Add new device" and select the required device proxy in the dialog that opens.
10. Click the newly created device proxy and select the "Initialize device proxy" command from the shortcut menu.
11. Select the previously created project file with the prepared device proxy data to be used for the initialization, and confirm the selection in the following dialog with "OK". This starts the initialization.  
**Result:** The controller data from the source project contained in the project file is transferred to the device proxy in the target project.

After the successful exchange of controller data, you can continue with the configuration in your target project and, for example, connect PLC tags with HMI tags. The controller data can be updated as often as required when it is changed in the source project.

### Procedure for updating already transferred controller data

#### System requirements for the update:

The following requirements must be met for updating already transferred controller data with the help of the already created "Device Proxy Data" object:

- You are using the same project for the update as for the previous transfer of the controller data.
- You are using the already created "Device Proxy Data" for transfer of the controller data.
- You have not made any changes to the hardware configuration or the communication interfaces in the meantime. You can add new hardware components.

#### Updating procedure:

1. Open the TIA Portal project from which you want to update the controller data in the target project.
2. Double-click the existing "Device Proxy Data" object and select under content which controller data you want to make available for the update.
3. Save the project or export the IPE file once again.
4. Open the required target project in the TIA Portal.
5. Click the existing device proxy in the target project and select the "Update device proxy" command from the shortcut menu.
6. Select the source which is to be used for the update, and confirm the selection.
7. In the following dialog, select under "Device" the CPU that was previously used as source, from which the controller data is to be re-imported.
8. Under "Defined device proxy data", select the required object and exit the dialog with "OK".
9. The update is then started and the selected device proxy data is transferred from the source project to the device proxy in the target project.

After the successful update of the controller data, you can continue with the configuration in your target object and, for example, connect PLC tags with HMI tags. The controller data can be updated as often as required when it is changed in the source project.

Exchange of controller data via IPE file (Page 1772)

## Using online and diagnostics functions

### 13.1 Displaying accessible devices

#### Accessible devices

Accessible devices are all devices connected to an interface of the programming device / PC and that are turned on. Devices that allow only restricted configuration using the currently installed products or that cannot be configured at all can also be displayed.

#### Displaying accessible devices on an interface of the programming device / PC in the project tree

To display accessible devices on a single interface of the programming device / PC, follow these steps:

1. Open the "Online access" folder in the project tree.
2. Click on the arrow to the left of the interface to show all the objects arranged below the interface.
3. Double-click on the "Update accessible devices" command below the interface.  
All devices that are accessible over this interface are displayed in the project tree. When there is a large number of connected devices, the update process may take some time. You can see the progress of the update in the status bar. If you have found the desired device before the update is completed, you can cancel the update of accessible devices. To do this, click on the cross to the right of the progress bar.

#### Displaying accessible devices in a list

To display the accessible devices on all available interfaces in an overview list, follow these steps:

1. Select the "Accessible devices" command in the "Online" menu.  
The "Accessible devices" dialog is displayed.
2. Select the type of interface from the "Type of the PG/PC interface" drop-down list. The "PG/PC interface" drop-down list then shows only the interfaces of the programming device / PC that match the selected interface type.
3. Select the required interface of the programming device / PC from the "PG/PC interface" drop-down list, for example an Industrial Ethernet adapter.  
If no devices are available on an interface, an unbroken connecting line is displayed between the programming device / PC and the device. If devices are accessible, an unbroken connecting line is shown and the devices accessible on the selected interface of the programming device / PC are displayed in a list.

4. If you have connected a new device in the meantime, click the "Refresh" button to refresh the list of accessible devices.
5. To go to a device in the project tree, select the device from the list of accessible devices and click the "Show" button.  
The interface to which the selected device is connected is shown as selected in the project tree.

### Displaying additional information about the accessible devices in the project tree

To display additional information on the accessible devices in the project tree, follow these steps:

1. Click on the arrow to the left of one of the accessible devices in the project tree.  
All data available online, for example blocks and system data, is displayed for known devices. Objects that you cannot edit directly at this point are grayed out. If additional editing options are available for a device, for example, downloading using the shortcut menu, the device is shown in black text.

### See also

Changing the device configuration online (Page 6634)

## 13.2 Changing the device configuration online

You can assign parameters to some devices, preferably in small hardware setups, directly online. You do not need to create a project or have offline data to do this. In this way, you can quickly and easily change the device configuration. You do not need to compile the hardware configuration or perform a download. Depending on the device, either all changes become active immediately or they are written to the device only after confirmation.

### Requirement

- The device must support online parameter assignment. You can learn whether or not your specific devices support this function in the device manual.
- The device must be connected to the PG/PC and available in the list of accessible devices.

### Procedure

To change the device configuration online, follow these steps:

1. Show the accessible devices on the interface via which the device is connected. To learn how to show the accessible devices, see the previous chapter "Showing accessible devices (Page 6631)".
2. Expand the device to display the lower-level elements.
3. Double-click the "Parametrize device" item.  
A configuration page for the device opens in the work area.

4. Make all required settings.  
With some devices, the new settings take effect immediately.
5. Optionally, depending on the device: Click on the "Upload to device" button.  
The settings are transferred to the device.

## 13.3 Connecting devices online

### 13.3.1 General information about online mode

#### Online mode

In online mode, there is an online connection between your programming device / PC and one or more devices.

An online connection between the programming device/PC and the device is required, for example, for the following tasks:

- Testing user programs
- Displaying and changing the operating mode of the CPU
- Displaying and setting the date and time of day of the CPU
- Displaying module information
- Comparing blocks
- Hardware diagnostics

Before you can establish an online connection, the programming device/PC and the device must be physically or remotely connected. As an alternative, some devices support a simulation mode. In this case, a connection to the device is simulated via the PLCSIM virtual interface.

After establishing a connection, you can use the Online and Diagnostics view or the "Online tools" task card to access the data on the device. The current online status of a device is indicated by an icon to the right of the device in the project tree. You will find the meaning of the individual status icons in the relevant tooltip.

---

#### Note

Some online functions depend on the scope of the installed software or whether a project is open.

---

#### Standby or hibernation of the programming device / PC

If the programming device / PC is changed to the standby or hibernation mode when there is an online connection, all online connections are terminated. When the programming device / PC wakes up from hibernation, the online connections are not automatically re-established.

Note that suddenly terminating an online connection can lead to loss of data or a connected device may interrupt program execution.

### **Performing an LED flash test**

In many online dialogs you can perform an LED flash test, if the device connected online supports this feature. If you select the "Flash LED" check box, an LED flashes on the currently selected device. This feature is useful, for example, when you are not sure which device in the hardware configuration corresponds to the station currently selected in the software.

Read any additional information and learn about the possible limitations to the LED flash test in the respective device documentation.

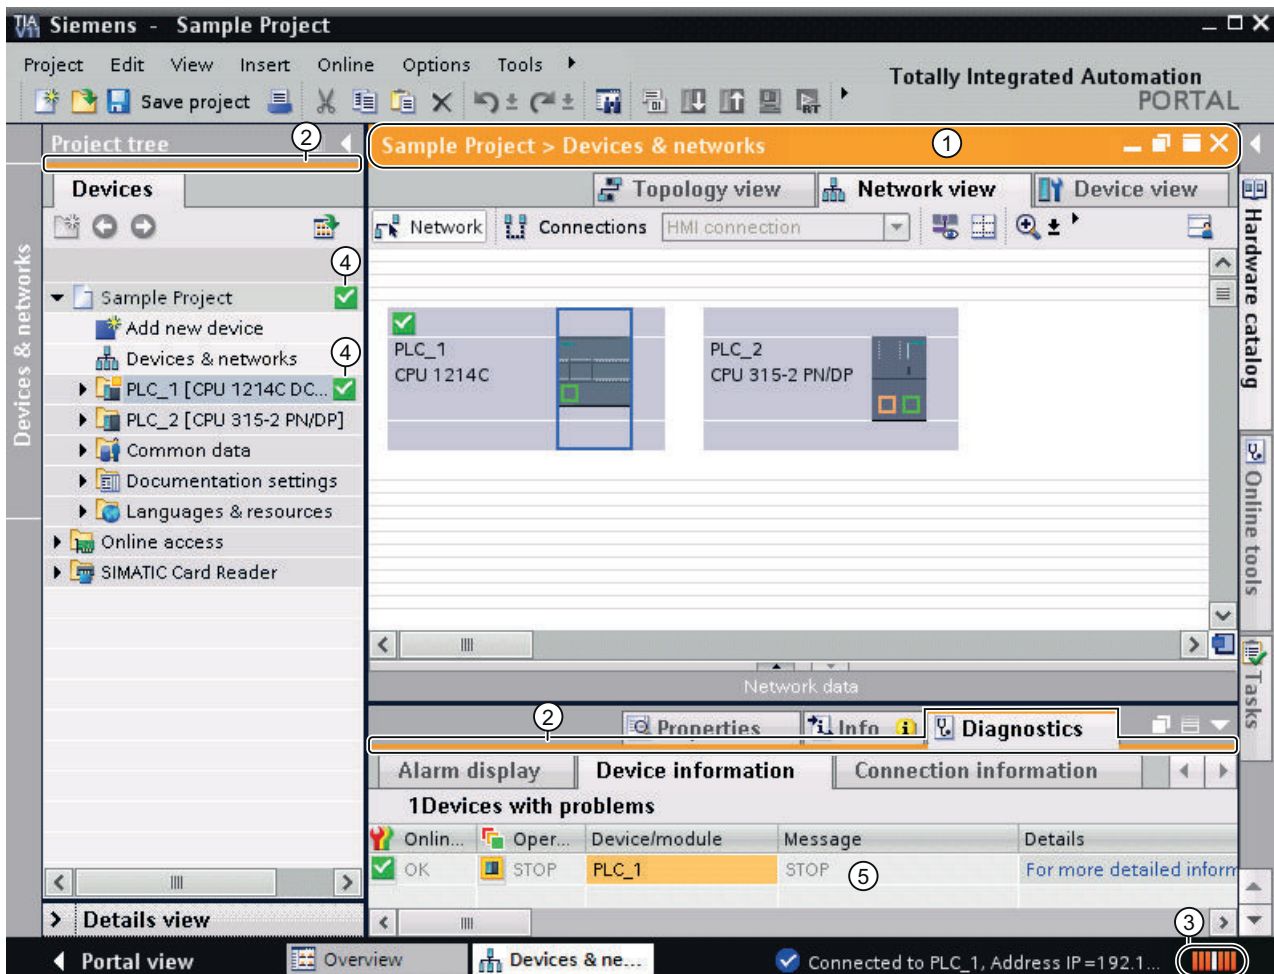

### **See also**

View in online mode (Page 6637)

### 13.3.2 View in online mode

#### Online displays

After the online connection has been established successfully, the user interface changes. If a device is unavailable, this is indicated by a symbol. The following figure shows a device connected online and the corresponding user interface:

- ① The title bar of the active window gets an orange background as soon as at least one of the devices currently displayed in the editor has been successfully connected online. If one or more devices are unavailable, a symbol for a broken connection appears in the title bar of the editor.
- ② The title bars of inactive windows for the relevant station now have an orange line below them.
- ③ An orange, pulsing bar appears at the right-hand edge of the status bar. If the connection has been established but is functioning incorrectly, an icon for an interrupted connection is displayed instead of the bar. You will find more information on the error in "Diagnostics" in the Inspector window.

### 13.3 Connecting devices online

- ④ Operating mode symbols or diagnostics symbols for the stations connected online and their underlying objects are shown in the project tree. A comparison of the online and offline status is also made automatically. Differences between online and offline objects are also displayed in the form of symbols.
- ⑤ The "Diagnostics > Device information" area is brought to the foreground in the Inspector window.

#### Online connection abort

The online mode and its display are retained as long as at least one device is connected online. If the online connection to one or more devices aborts, the TIA Portal remains in online mode. The display of the TIA Portal changes to offline mode only when there is no longer an online connection to any device.

#### See also

General information about online mode (Page 6633)

Basics of project data comparison (Page 331)

### 13.3.3 Establishing and canceling an online connection

#### Requirement

At least one PG/PC interface is installed and is physically connected to a device, for example with an Ethernet cable. As an alternative, it is also possible to establish a virtual connection using PLCSIM.

#### Go online

To establish an online connection, follow these steps:

1. In the project tree, select one or more devices to which you want an online connection to be established.
2. Select the "Go online" command in the "Online" menu.  
If the device was already connected to a specific PG/PC interface, the online connection is automatically established to the previous PG/PC interface. In this case, you can ignore the following steps. If there was no previous connection, the "Go online" dialog opens.
3. Select the type of interface from the "Type of the PG/PC interface" drop-down list. The "PG/PC interface" drop-down list then shows only the interfaces of the programming device / PC that match the selected interface type.
4. Select the required interface of the programming device / PC from the "PG/PC interface" drop-down list, for example an Industrial Ethernet adapter.

5. In the "Connection to subnet" drop-down list, select the interface via which the device is connected to the programming device or PC. In this case, a direct connection is established to the device, without a network node, for example, an interposed switch. Alternatively, select the appropriate subnet for the connection to the programming device or PC if the device can be accessed via a network node. If you do not know how the device is connected to the programming device or PC, choose the "Try all interfaces" entry.  
If you selected an MPI or PROFIBUS subnet, the bus parameters configured in the programming device/PC interface are applied at this point.
6. If the device is accessible via a gateway, select the gateway that connects the two subnets involved in the "1st gateway" drop-down list.  
If no devices are available on the interface, a broken connecting line is displayed between the programming device / PC and the device. If devices are accessible, an unbroken connecting line is shown and the devices accessible on the selected interface of the programming device/PC are displayed in the "Compatible devices in target subnet" list.
7. Optional: Click the "Update" button to update the "Compatible devices in target subnet" list.
8. Optional: Select the "Flash LED" check box to the left of the graphic to run an LED flash test. With this function, you can check that you have selected the correct device. The LED flash test is not supported by all devices.
9. Select your device in the "Compatible devices in target subnet" table, and confirm your selection with "Go online".  
The online connection to the selected target device is established.

## Result

After the online connection has been established, the title bars of the editors change to orange. An orange activity bar is also shown in the title bar of an editor and in the status bar. In the project tree, status symbols show the difference between online and offline objects.

The connection path is stored for future connection attempts. It is no longer necessary to open the "Go online" dialog unless you want to select a new connection path.

---

### Note

If no accessible device is displayed, select a different network access for the PG/PC interface or check the settings of the interface.

---

## Canceling an online connection

To disconnect the existing online connection, follow these steps:

1. Select the device you want to disconnect from in the project tree.
2. Select the "Go offline" command in the "Online" menu.

## See also

Connecting online with several devices (Page 6640)

View in online mode (Page 6635)

Assigning a temporary IP address (Page 6652)

Influence of user rights (Page 286)

### 13.3.4 Connecting online with several devices

You can establish an online connection to several devices at the same time without needing to select individual devices previously in the network view.

#### Requirement

- No device must be selected
- At least one PG/PC interface is installed and is physically connected to a device, for example with an Ethernet cable. As an alternative, it is also possible to establish a virtual online connection using PLCSIM or a remote connection.

#### Procedure

To establish an online connection to several devices at the same time, follow these steps:

1. Select the project in the project tree.
2. Select the "Go online" command in the "Online" menu.  
The "Select device for opening the online connection" dialog opens with a table of all available devices.
3. Select the devices to which you want to establish an online connection in the "Go online" column.
4. Click the "Go online" button.

#### Result

Without any further prompt for confirmation, a connection is established to all selected devices if a connection was already established to the selected devices at least once. If there was no previous online connection, the "Go online" dialog opens. In this case, first configure the online connection as described in the section "Go online and Go offline (Page 6636)".

#### See also

Establishing and canceling an online connection (Page 6636)

Assigning a temporary IP address (Page 6652)

### 13.3.5 Disconnecting online connections of multiple devices

You can disconnect the online connections to multiple devices at one time without needing to select individual devices beforehand in the network view.

## Requirement

- No device is selected.
- There is currently an online connection to at least one device.

## Procedure

To terminate the online connections to multiple devices at one time, follow these steps:

1. Select the "Go offline" command in the "Online" menu.  
The "Select devices" dialog opens with a table of all available devices.
2. Select the device for which you want to terminate the online connection in the "Go offline" column.
3. Click the "Go offline" button.

## Result

The online connection to the all the selected devices is terminated.

## 13.4 Backing up the software and hardware configuration of a device

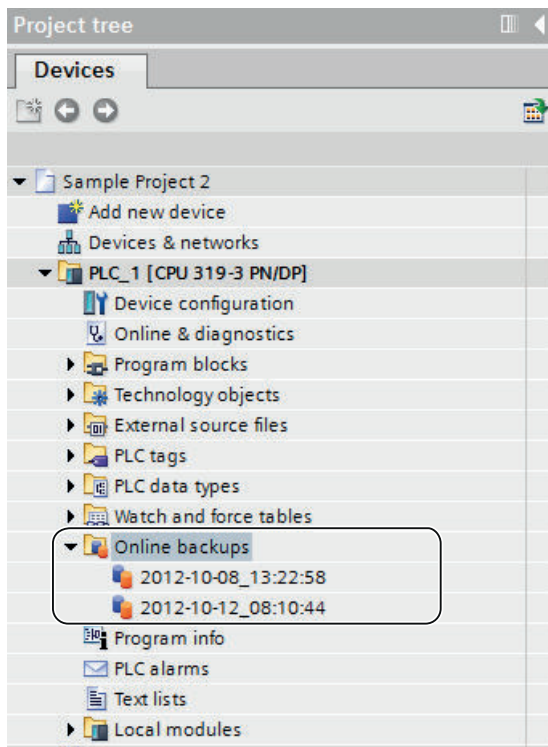

### 13.4.1 Creating a backup of a device

#### Backing up the software and hardware configuration of an S7-300/400 CPU

If you have already downloaded a configuration to an S7-300/400 CPU, it is advisable to make a backup. You may have modified the configuration and want to test the new configuration. Before you download the new configuration to the CPU, you can create a backup of the current device state and then restore the current configuration at a later date. The backup is performed with the current values of the CPU. In the case of S7-400 CPUs with fail-safe function, the initial values are backed up.

You can create as many backups as you want and store a variety of configurations for a CPU. The backups are named with the name of the CPU and the time and date of the backup. You can find the backup in the project tree under the CPU in the "Online backups" folder.

The following figure shows an S7-319 CPU for which two backups were created:

### See also

- Restoring the software and hardware configuration of a device (Page 6643)
- Backing up a device configuration (Page 6642)
- General information on loading (Page 323)

## 13.4.2 Backing up a device configuration

You can back up the configuration of a S7-300/400 CPU in the TIA Portal. So you can download and test a new configuration to a device without any risk. If needed, you can restore the initial configuration of the CPU.

### Requirement

- The CPU must already be created in the project.
- It must be an S7-300/400 CPU.
- The CPU must be online. If there is no online connection, an online connection is established during the backup.

## Procedure

To create a backup of the current configuration of a CPU, follow these steps:

1. Select the CPU in the project tree.
2. Select the "Backup from online device" command in the "Online" menu.

## Result:

A backup of the entire hardware configuration and software is created. The backup is stored in the project tree in the "Name of the CPU > Online backups" folder. The backup is assigned the name of the CPU with the time and date of the backup. You can rename the backup, but you cannot make any changes to the contents of the backup.

## See also

Establishing and canceling an online connection (Page 6636)

Restoring the software and hardware configuration of a device (Page 6643)

Creating a backup of a device (Page 6639)

### 13.4.3 Restoring the software and hardware configuration of a device

If you have backed up the configuration of a device at an earlier point in time, you can transfer the backup back to the device. The saved configuration is then restored on the device.

## Requirement

You must have previously configure the device and stored a backup of the device in the project.

## Procedure

To restore older software and hardware state on a device, follow these steps:

1. Open up the folder of the device in the project tree to display the lower-level objects.
2. Open the "Online backups" folder.
3. Select the backup you want to restore.
4. In the "Online" menu, select the "Download to device" command.
  - If you had previously established an online connection, the "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for downloading.
  - If you had not previously established an online connection, the "Extended download to device" dialog opens, and you must first select the interfaces via which you want to establish the online connection to the device.  
See also: Establishing and terminating an online connection (Page 6636)

5. Check the messages in the "Load preview" dialog, and select the actions in the "Action" column, if necessary.

---

**Note**

Performing the proposed actions while the plant is in operation can cause serious bodily injury and property damage in the event of malfunctions or program errors.

---

6. As soon as loading becomes possible, the "Load" button is enabled.
7. Click the "Load" button.  
The backup is transferred to the device and device is restored. The "Load results" dialog then opens. In this dialog, you can check whether or not the loading operation was successful and take any further action that may be necessary.
8. Click the "Finish" button.

**See also**

Creating a backup of a device (Page 6639)

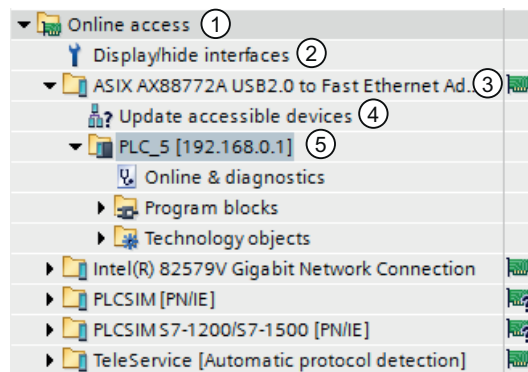

## 13.5 Configuring the PG/PC interface

### 13.5.1 Online access

#### Online access of the project

In the "Online access" folder of the project tree, you will find all active interfaces of your programming device/PC. Each interface icon provides you with information on the status of the interface. You can also display the accessible devices and display and edit the properties of an interface using the shortcut menu.

The following figure shows the "Online access" folder in the project tree:

- ① "Online access" folder in the project tree  
All interfaces installed in the programming device/PC are displayed in the "Online access" folder.
- ② Show/hide interfaces  
Use the function "Show/hide interfaces" to show or hide individual interfaces.
- ③ Status display for the interfaces  
The current status of an interface is indicated by an icon to the right of the name. You can see the meaning of the icon in the tooltip.
- ④ Updating the list of accessible devices.  
This function is available for each hardware interface of the programming device/PC. Software interfaces, such as a remote connection, do not offer this function.
- ⑤ Devices connected via the respective interface with the programming device/PC  
The type of the respective device and its status are displayed by the preceding icon.

### Displaying or updating accessible devices

You have the following options if you want to display all devices accessible online on your programming device/PC:

- Display of the accessible devices on a single interface of the programming device / PC in the project tree. In the project tree, you can also display additional information about the individual accessible devices.
- Display of the accessible devices of all interfaces in a list.

See also: Displaying accessible devices

### Overview of icons for accessible devices

The accessible devices are identified with an icon according to their type and status. The following is an overview of all icons and their meaning.

	<p>Icon for unidentified modules</p> <p>This icon is displayed whenever the identification of a module is not yet complete or when the identification of a module was not successful, for example, because the required online data could not be read.</p>
	<p>Icon for the following device types:</p> <ul style="list-style-type: none"> <li>• PLCs</li> <li>• SIMOCODE pro devices</li> <li>• IE/PB links</li> <li>• CPs of PC systems</li> <li>• SCALANCE head modules</li> <li>• S7-300 and S7-400 CPs</li> <li>• PROFINET IO devices and PROFINET CPs</li> <li>• SCALANCE modules and gateways that could not be identified</li> </ul>
	<p>PROFINET IO devices, encoders, switchgear, sensors and identification systems that were replaced by similar devices because these could not be identified</p>
	<p>Icon for the following device types:</p> <ul style="list-style-type: none"> <li>• HMI devices</li> <li>• PROFINET IO devices of the HMI type if these could not be identified and were therefore replaced by a similar device</li> </ul>
	<p>PROFINET IO devices of the drive type that could not be identified and were therefore replaced by a similar device</p>
	<p>PROFINET IO devices of the type development kit and network components that could not be identified and were therefore replaced by a similar device</p>
	<p>PROFINET IO devices of the type TeleService adapter that could not be identified and were therefore replaced by a similar device</p>

### See also

Displaying and modifying interface properties (Page 6647)

## 13.5.2 Basics of assigning parameters for the PG/PC interface

### Options for connecting to target systems

If the devices of the project are connected via different subnets, you assign a suitable network access to each PG/PC interface to be able to establish online connections to the target systems. The following interfaces are automatically supported:

- MPI
- PROFIBUS
- Industrial Ethernet (ISO and TCP/IP)

You can make various settings for the interfaces. The following sections explain the parameter settings you can make.

---

**Note**

Note that changes to interface parameters have a direct influence on the operating system and the programming device / PC. Remember that some parameter settings can only be changed if you have adequate user rights.

---

**See also**

Setting parameters for the Industrial Ethernet interface (Page 6649)

Setting parameters for the MPI and PROFIBUS interfaces (Page 6653)

### 13.5.3 Showing or hiding interfaces

To improve clarity, it is possible to hide individual interfaces of the PG/PC in the project tree and to show them again when necessary.

**Procedure**

To show or hide individual interfaces, follow the steps below:

1. Open the "Online access" folder in the project tree.
2. Double click on the "Display/hide interfaces" icon.  
The "Display/hide interfaces" dialog opens.
3. Enable or disable the required interfaces in the "Display in the project tree" column.
4. Click the "Apply" button.  
The changes are applied. The view of the interfaces in the "Online access" folder is refreshed.

### 13.5.4 Displaying and modifying interface properties

**Introduction**

For each interface, you can display and, in some cases, modify properties, for example the network type, address, and status.

## Procedure

To open the properties, follow these steps:

1. Right-click on the required interface below "Online access" in the project tree.
2. Select the "Properties" command from the shortcut menu.  
A dialog containing the properties of the interface opens. On the left of the dialog, you will see the area navigation. You can view the current parameter settings in the individual entries in the area navigation and, if necessary, change them.

### 13.5.5 Adding interfaces

You have the option of installing additional interfaces after installation of the TIA Portal.

## Procedure

To install an interface at a later time and add it to the TIA Portal, follow these steps:

1. Install or update the drivers in the operating system once you have installed the interface hardware.
2. Close the TIA Portal if it is still open.
3. Open the Windows control panel.
4. Open the entry "Setting the PG/PC Interface" in the Control Panel.  
The "Setting the PG/PC Interface" dialog opens.
5. Make any necessary changes to the interface configuration and confirm them with "OK".  
You have to click "OK", even if you have not made any changes.
6. Restart the TIA Portal.

## Result

The newly installed interface is now displayed in the project tree under the "Online access" folder.

## 13.5.6 Setting parameters for the Ethernet interface

### 13.5.6.1 Setting parameters for the Industrial Ethernet interface

#### Options in the parameter settings for the Industrial Ethernet interface

When setting parameters for the Industrial Ethernet interface, you have the following options:

- Parameters dependent on the operating system  
The Industrial Ethernet interface has parameters that are set in the operating system and are valid for all connected devices. These parameter settings are only displayed here, they can, however, be changed in the network settings of the operating system.
- Parameters that can be set in the software

---

#### Note

Note that changes to interface parameters have a direct influence on the operating system and the programming device / PC. Remember that some parameter settings can only be changed if you have adequate user rights.

---

#### Parameters for the Industrial Ethernet interface

The following table contains an overview of the parameters of the Industrial Ethernet interface that are set by the operating system and can be changed by the user.

Parameter settings that cannot be changed	Parameters that can be set
MAC address	Fast acknowledge at the IE-PG access and for TCP/IP
DHCP server activated/deactivated	Timeout at the IE-PG access and for TCP/IP
APIPA activated/deactivated	LLDP
IP address	Additional, dynamic IP addresses for the network adapter
Subnet mask	-
DNS addresses	-
DHCP addresses	-

#### See also

Basics of assigning parameters for the PG/PC interface (Page 6644)

Displaying operating system parameters (Page 6650)

Connecting the PG/PC interface to a subnet (Page 6650)

Setting parameters for the Ethernet interface (Page 6651)

Assigning a temporary IP address (Page 6652)

Managing temporary IP addresses (Page 6652)

Influence of user rights (Page 286)

### 13.5.6.2 Displaying operating system parameters

The Ethernet interface is part of the operating system. All parameters of the network adapter can therefore be adapted in the network settings of the operating system.

You can display the following parameters in the software:

- Physical address of the network adapter
- Assignment of the IP address by a DHCP server activated or deactivated
- Assignment of a private IP address by the operating system activated or deactivated
- Current static IP address
- Assigned subnet mask
- DNS addresses
- DHCP addresses

If you want to modify the parameter settings, please refer to the documentation of the operating system or the network adapter.

### Displaying current parameters of the Ethernet interface

To display the current parameters of the Ethernet interface, follow these steps:

1. Select the Ethernet interface in the project tree in "Online access".
2. Select the "Properties" command in the shortcut menu of the interface.  
The dialog for configuring the interface opens.
3. Select "Configurations > Industrial Ethernet" in the area navigation.

### See also

Setting parameters for the Ethernet interface (Page 6651)

### 13.5.6.3 Connecting the PG/PC interface to a subnet

If you have created several subnets, you can specify the subnet to which the Ethernet interface is connected.

### Procedure

To select the subnet to which the Ethernet interface is connected, follow these steps:

1. Select the Ethernet interface in the project tree in "Online access".
2. Select the "Properties" command in the shortcut menu of the interface.  
The dialog for configuring the interface opens.

3. Go to "General > Assignment" and select the subnet to which you want to connect the Ethernet interface of the programming device / PC in the "Connection to subnet" drop-down list.
4. Close the dialog with "OK".

#### 13.5.6.4 Setting parameters for the Ethernet interface

You can adapt some parameter settings relating to the network protocol directly in the software.

#### Requirement

You must have adequate user rights.

See also: Influence of user rights (Page 286).

#### Procedure

To change parameter settings relating to the network protocol, follow these steps:

1. Select the Ethernet interface in the project tree in "Online access".
2. Select the "Properties" command in the shortcut menu of the interface.  
The dialog for configuring the interface opens.
3. Select "Configurations > IE-PG access" to adapt the protocol settings relevant to network management.
  - Select the "Fast acknowledge" check box to achieve faster reaction times with smaller network packets.
  - From the "Timeout" drop-down list, select the maximum time that can elapse before a network node is detected.
4. To activate the LLDP protocol and discover the network topology more accurately, set the "LLDP active" check box in "Configurations > LLDP".
5. Select "Configurations > TCP/IP" to adapt the TCP/IP protocol for network traffic during runtime.
  - Select the "Fast acknowledge" check box to achieve faster reaction times with smaller network packets.
  - From the "Timeout" drop-down list, select the maximum time that can elapse before there is a timeout during communication with a network node.

#### See also

Influence of user rights (Page 286)

Displaying operating system parameters (Page 6648)

### 13.5.6.5 Assigning a temporary IP address

#### Adding a dynamic IP address

If the IP address of a device is located in a different subnet from the IP address of the network adapter, you will first need to assign an additional IP address with the same subnet address as the device. Only then is communication between the device and the programming device / PC possible.

The assignment of an additional temporary IP address is also proposed automatically if you want to perform an online action and the current IP address of the programming device/PC is not yet in the correct subnet.

A temporarily assigned IP address remains valid until the next time the programming device/PC is restarted or until you delete it manually.

---

#### Note

You require adequate permissions to be able to assign a temporary IP address.

See also: Influence of user rights (Page 286)

---

#### See also

Managing temporary IP addresses (Page 6652)

### 13.5.6.6 Managing temporary IP addresses

If the IP address of a device is located in a different subnet from the current static IP address of the network adapter, the network adapter temporarily assigns a suitable IP address from the subnet of the device.

You can display all temporarily assigned addresses and delete them. Note that IP addresses that you manually assigned in the operating system are not displayed in the TIA Portal.

#### Requirement

To delete, you require adequate permissions.

#### Procedure

To display and delete temporarily assigned addresses, follow these steps:

1. Select the Ethernet interface in the project tree in "Online access".
2. Select the "Properties" command in the shortcut menu of the interface.  
The dialog for configuring the interface opens.

3. Select "Configurations > IE-PG access".  
A table with the assigned IP addresses is displayed.
4. Click the "Delete project-specific IP addresses" button to delete all the IP addresses at one time.

## See also

Influence of user rights (Page 286)

### 13.5.6.7 Resetting the TCP/IP configuration

If you have changed the TCP/IP protocol settings, you can reset them to the defaults.

## Procedure

To restore the TCP/IP configuration to the default settings, follow these steps:

1. Select the Ethernet interface in the project tree in "Online access".
2. Select the "Properties" command in the shortcut menu of the interface.  
The dialog for configuring the interface opens.
3. Select "Configurations > TCP/IP".
4. Click the "Standard" button to reset all the settings.

## 13.5.7 Setting parameters for the MPI and PROFIBUS interfaces

### 13.5.7.1 Setting parameters for the MPI and PROFIBUS interfaces

#### Possible parameter settings for the MPI and PROFIBUS interfaces

The following parameter settings can be made for the MPI and PROFIBUS interfaces:

- Automatic configuration: You can use automatic detection functions to find out whether a device is connected to the PG/PC interface over PROFIBUS or MPI.
- Selecting a default configuration for PROFIBUS or MPI that can be adapted later.

#### Device- and network-related settings for MPI and PROFIBUS

You can set device- and network-related parameters for MPI and PROFIBUS interfaces. Device-related parameters are local settings for the interface. Network-related parameters, on the other hand, must match up on all devices.

### MPI interface parameters you can modify

You can adapt the following default parameters for the MPI interface:

Device-related parameters	Network-related parameters
Is the only master	Highest address
Own address	Transmission rate
Timeout	

### PROFIBUS interface parameters you can modify

You can adapt the following default parameters for the PROFIBUS interface:

Device-related parameters	Network-related parameters
Is the only master	Highest address
Own address	Transmission rate
Timeout	Profile
	Bus parameters
	Number of masters on bus
	Number of slaves on bus

### See also

Basics of assigning parameters for the PG/PC interface (Page 6644)

### 13.5.7.2 Setting MPI or PROFIBUS interface parameters automatically

#### Setting up automatic bus parameter detection

If you select an interface with automatic detection of the bus parameters (for example CP 5611 (Auto)), you can connect the programming device or PC to MPI or PROFIBUS without needing to set bus parameters. At a transmission speed lower than 187.5 Kbps, you may, however, have waiting times of up to one minute.

#### Requirement

- Masters that distribute bus parameters cyclically are connected to the bus.
- In PROFIBUS networks, the cyclic distribution of the bus parameters must be enabled.

## Procedure

To enable automatic bus parameter detection, follow these steps:

1. Select the interface in the project tree.
2. Select the "Properties" command in the shortcut menu of the interface.  
The dialog for configuring the interface opens.
3. Go to "General > Configurations > Active configuration" and select the setting "Automatic protocol detection".
4. Go to "Configurations > Auto configuration > Local settings" and select the address of the PG/PC interface in the "Own address" drop-down list.
5. If you then want to display the current bus settings, click the "Network detection" button.

## See also

Setting parameters for the MPI interface (Page 6655)

Setting parameters for the PROFIBUS interface (Page 6657)

### 13.5.7.3 Setting parameters for the MPI interface

#### Changing the parameter settings of the MPI interface

The network-related parameters and bus parameters for the MPI network can be adapted. You should first select a default setting and then adapt this to the specific situation.

#### Setting defaults for the MPI interface

To adapt the parameters of the MPI interface, follow these steps:

1. Select the interface in the project tree.
2. Select the "Properties" command in the shortcut menu of the interface.  
The dialog for configuring the interface opens.

3. Go to "General > Assignment" and select the subnet with which you want to connect the interface in the "Connection to subnet" drop-down list.
4. Under "General > Configuration", select a default for the device and network-related parameters. The defaults are suitable for most configurations. Select one of the following settings:
  - Automatic protocol detection  
You can connect the programming device to MPI or PROFIBUS without having to set bus parameters. At a transmission speed lower than 187.5 Kbps, you may, however, have waiting times of up to one minute. Prerequisite for the automatic detection is a connection to the bus master, which distributes the bus parameters cyclically. With PROFIBUS subnets, cyclic distribution of bus parameters may not be deactivated (default PROFIBUS network setting).
  - MPI  
The "MPI" transmission protocol is selected. Typical parameters are set that are adequate for most configurations. You can change the parameters to your needs, however.
  - PROFIBUS  
The "PROFIBUS" transmission protocol is selected. Typical parameters are set that are adequate for most configurations. You can change the parameters to your needs, however.

### Changing the default parameter settings

To adapt the default settings to your requirements, change the parameter setting where necessary in "Configurations > MPI".

You can set the following device-related parameters:

- Is only master  
An additional verification function to prevent bus disruptions when connecting the PG/PC to the network is disabled because the programming device or PC is the only master on the bus.
  - Do not enable this option unless you have only connected slaves to your programming device or PC.
  - If the "Is only master" check box is enabled, it is not possible to identify the directly connected device in the "Accessible devices" window.
- Own address  
This setting relates to the programming device or PC on which you call up the parameter settings of the interface. Set the local device address of your programming device or PC here.
  - This address must be unique throughout the network.
  - The programming device or PC is addressed using this address in the MPI network.

- **Check**  
This enables an additional safety function to prevent bus disruptions when connecting the PG/PC to the network. The driver checks whether the local address is already being used by another station. Active as well as passive stations are taken into consideration in this case. The driver monitors this on the PROFIBUS. The connection of the PG/PC to the network will take longer with the automatic check. To use the check, the driver must support the function. Furthermore, the "Is only master" option must not be selected.
- **Timeout**  
Set a higher timeout value if, for example, you have problems with long response times on the network.

You can set the following network-related parameters:

- **Highest address:**  
Select the configured highest device address. Make sure that the same highest device address is set for all devices of a PROFIBUS or MPI network.
- **Transfer rate:**  
Here, you select the transmission speed to be used on the MPI network.

### 13.5.7.4 Setting parameters for the PROFIBUS interface

#### Changing the parameter settings of the PROFIBUS interface

The network-related parameters and bus parameters for the PROFIBUS network can be adapted more precisely. You should first select a default setting and then adapt this to the specific situation.

#### Setting defaults for the PROFIBUS interface

To adapt the parameters of the PROFIBUS interface, follow these steps:

1. Select the interface in the project tree.
2. Select the "Properties" command in the shortcut menu of the interface.  
The dialog for configuring the interface opens.

3. Go to "General > Assignment" and select the subnet with which you want to connect the interface in the "Connection to subnet" drop-down list.
4. Under "General > Configuration", select a default for the device and network-related parameters. The defaults are suitable for most configurations. Select one of the following settings:
  - Automatic protocol detection  
You can connect the programming device to MPI or PROFIBUS without having to set bus parameters. At a transmission speed lower than 187.5 Kbps, you may, however, have waiting times of up to one minute. Prerequisite for the automatic detection is a connection to the bus master, which distributes the bus parameters cyclically. With PROFIBUS subnets, cyclic distribution of bus parameters may not be deactivated (default PROFIBUS network setting).
  - MPI  
The "MPI" transmission protocol is selected. Typical parameters are set that are adequate for most configurations. You can change the parameters to your needs, however.
  - PROFIBUS  
The "PROFIBUS" transmission protocol is selected. Typical parameters are set that are adequate for most configurations. You can change the parameters to your needs, however.

### Changing the default parameter settings

To adapt the default settings to your requirements, change the parameter setting where necessary in "Configurations > PROFIBUS".

You can set the following device-related parameters:

- Is only master  
An additional verification function to prevent bus disruptions when connecting the PG/PC to the network is disabled because the programming device or PC is the only master on the bus.
  - Do not enable this option unless you have only connected slaves to your programming device or PC.
  - If the "Is only master" check box is enabled, it is not possible to identify the directly connected device in the "Accessible devices" window.
- Own address  
This setting relates to the programming device or PC on which you call up the parameter settings of the interface. Set the local device address of your programming device or PC here.
  - This address must be unique throughout the network.
  - The programming device or PC is addressed using this address in the PROFIBUS network.

- **Check**  
This enables an additional safety function to prevent bus disruptions when connecting the PG/PC to the network. The driver checks whether the local address is already being used by another station. Active as well as passive stations are taken into consideration in this case. The driver monitors this on the PROFIBUS. The connection of the PG/PC to the network will take longer with the automatic check. To use the check, the driver must support the function. Furthermore, the "Is only master" option must not be selected.
- **Timeout**  
Set a higher timeout value if, for example, you have problems with long response times on the network.

You can set the following network-related parameters:

- **Highest address:**  
Select the configured highest device address. Make sure that the same highest station address is set for all devices of a PROFIBUS network.
- **Transfer rate:**  
Here, you select the transmission speed to be used on the PROFIBUS network.
- **Profile:**  
You have a choice of four alternatives for the PROFIBUS settings. "DP", "Standard" and "Universal (DP/FMS)" are predefined settings that you cannot change. If you select "User-defined", you can adapt the bus parameters yourself.
  - If you have selected "User-defined", go to "Configurations > PROFIBUS > Bus parameters" in area navigation.
  - If you have selected one of the defaults (DP, Standard or Universal (DP/FMS)), you should select the "Include" check box in "Configurations > PROFIBUS > Bus parameters > Additional parameters". You can then set the number of masters and slaves on the bus. This allows a more precise calculation of the bus parameters and potential bus disruptions can be prevented. The option cannot be selected with a user-defined profile.

Overview of the bus parameters for PROFIBUS (Page 6659)

Setting MPI or PROFIBUS interface parameters automatically (Page 6652)

### 13.5.7.5 Overview of the bus parameters for PROFIBUS

#### Introduction

The PROFIBUS subnet will only function problem-free if the parameters for the bus profile are matched to one another. You should therefore only change the default values if you are familiar with how to configure the bus profile for PROFIBUS.

It may be possible for the bus parameters to be adjusted depending on the bus profile. The offline values of the bus parameters are always shown even if you are online and linked to the target system.

The displayed parameters are valid for the entire PROFIBUS subnet.

### Meaning of the individual parameters

- **Tslot: Wait-to-receive time (slot time)**  
The wait-to-receive time (slot time) defines the maximum time the sender will wait to receive a response from the addressed partner.
- **Max. Tsd: Maximum protocol processing time (max. station delay responder)**  
The maximum protocol processing time defines the time after which the responding device must have processed the protocol.
- **Min. Tsd: Minimum protocol processing time (min. station delay responder)**  
The minimum protocol processing time specifies the minimum time required by the responding device to process the protocol.
- **Tset: Trigger time (setup time)**  
The trigger time is the time that may lapse between the reception of a data frame frame and the reaction to it.
- **Tqui: Quiet time for modulator**  
The quiet time for modulator specifies the time required to change from sending to receiving.
- **GAP factor: GAP update factor (GAP factor)**  
The GAP factor specifies the number of token rotations before a new device is included in the token ring.
- **Retry limit: Maximum number of repeated call attempts (retry limit)**  
This parameter defines the maximum number of attempts made to reach a device.
- **Trdy: Ready time**  
The ready time is the time for an acknowledgment or response.
- **Tid1: Idle time 1**  
Idle time 1 specifies the delay time after receiving a response.
- **Tid2: Idle time 2**  
Idle time 2 specifies the delay time after sending a call without a response.
- **Ttr: Target rotation time**  
The target rotation time is the maximum time made available for a token rotation. During this time, all active devices (masters) receive the token once. The difference between the desired token round-trip time and the actual token round-trip time decides how much time is left for masters to send data frames to the slaves.  
As the minimum target rotation time (Ttr), select a value = 5000 times the HSA (Highest Station Address).
- **Watchdog: Watchdog**  
The watchdog time specifies the time after which a device must be addressed.  
As the minimum watchdog time, select a value = 6250 times the HSA.

---

#### Note

If you want to create a user-defined bus profile, please note that the minimum target rotation time (Ttr) should be 5000 times the HSA (highest PROFIBUS address). The minimum watchdog time should also be 6250 times the HSA.

---

Setting parameters for the PROFIBUS interface (Page 6655)

### 13.5.7.6 Resetting the MPI or PROFIBUS configuration

If you have changed the MPI or PROFIBUS protocol settings, you can reset them to the defaults.

## Procedure

To restore the MPI or PROFIBUS configuration to the default settings, follow these steps:

1. Select the MPI/PROFIBUS interface in the project tree in "Online access".
2. Select the "Properties" command in the shortcut menu of the interface.  
The dialog for configuring the interface opens.
3. Select "Configurations > MPI" or "Configurations > PROFIBUS", depending on the interface properties you want to reset.
4. Click the "Standard" button to reset all the settings.

## 13.6 Using the trace and logic analyzer function

### Preface

#### Purpose of the documentation

The diagnostics options available with the trace and logic analyzer function are described in this documentation. Depending on the device used, the recording options can vary.

#### Required basic knowledge

In order to understand this documentation, the following knowledge is required:

- General knowledge in the field of automation
- Knowledge about the use of Windows-based computers
- S7-1200/1500 CPUs
  - Knowledge of working with the SIMATIC industrial automation system
  - Knowledge of working with TIA Portal >= V12.0
- SINAMICS G120
  - Knowledge of working with the drive

## Validity of the documentation

This documentation applies to all products of the S7-1200, S7-1500 and SINAMICS G120 product family.

## Conventions

This documentation contains pictures of the devices described. The pictures may differ slightly from the devices supplied.

Please also observe notes marked as follows:

---

### Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

---

## Further support

- The range of technical documentation for the individual SIMATIC products and systems is available on the Internet (<http://www.siemens.com/simatic-tech-doku-portal>).
- The online catalog and the online ordering system is available on the Internet (<http://mall.automation.siemens.com>).

### 13.6.1 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (<http://www.siemens.com/industrialsecurity>).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (<http://support.automation.siemens.com>).

## 13.6.1 Description

### 13.6.1.1 Supported hardware

The following devices (Page 6688) support the trace and logic analyzer function:

- SIMATIC S7-1200 CPUs (as of firmware version V4.0)
- SIMATIC S7-1500 CPUs
- SINAMICS G120

### 13.6.1.2 Recording of measured values with the trace function

#### Introduction

The trace and logic analyzer function can be called in the device folder in the project navigator under the name "Traces" (Page 6666).

You record device tags and evaluate the recordings with the trace and logic analyzer function. Tags are, for example, drive parameters or system and user tags of a CPU. The maximum recording duration is limited by the memory size. How much memory is available for the recording depends on the hardware used.

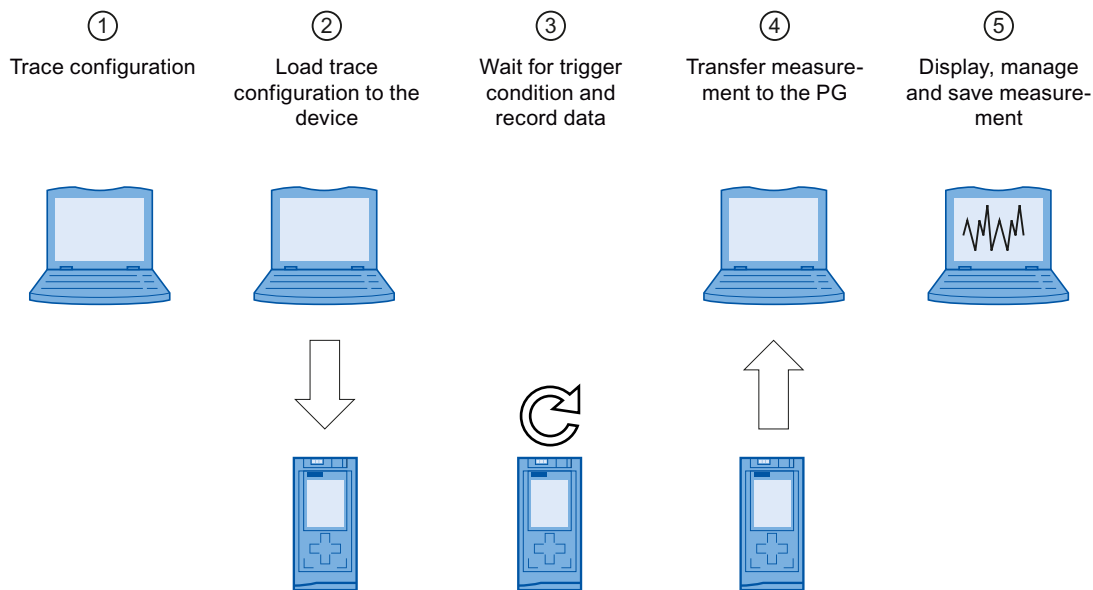

The recordings are saved on the device and, when required, can be read out with the engineering system (ES) and saved permanently. The trace and logic analyzer function is therefore suitable for monitoring highly dynamic processes. The recorded values are overwritten when "Installed traces" is activated again.

Active recordings from the axis control panel or from the PID are displayed at "Installed traces". These recordings can be added to the measurements in the curve diagram of the axis control panel or the PID via a shortcut menu command.

Depending on the device (Page 6688) used, the recording options can vary.

A quick start (Page 6676) for working with the trace and logic analyzer function can be found in the Operation section.

The following figure shows the method of operation of the "Traces":

**① Trace configuration on the programming device (PG) in the TIA Portal**

You can specify the signals to be recorded, the duration of the recording and the trigger condition in the trace configuration. The trace configuration depends on the device and is described at the respective device (Page 6688).

**② Transferring the trace configuration from the PG to the device**

You can transfer the complete trace configuration (Page 6683) to the device when an online connection is established.

**③ Waiting for the recording**

If the installed trace configuration is activated (Page 6683), then the recording is performed independently of the PG. The recording is started as soon as the trigger condition is satisfied.

**④ Transferring the measurement from the device to the PG**

The saving of the measurement in the project (Page 6685) stores the measurement in the opened project of the TIA Portal. The measurement can be saved at any time after completing the recording, irrespective of the time of the measurement.

**⑤ Evaluating, managing and saving the measurement**

Numerous options are available for the evaluation of the measurement in the curve diagram and in the signal table (Page 6684). Various display types are possible, for example, a bit representation for binary signals.

Measurements can also be exported and imported as a file.

With the saving of the project (Page 6685) in the TIA Portal, the measurements transferred to the project are also saved.

**13.6.1.3 Trace configuration, recording and measurement**

This section explains the meaning of the terms: trace configuration, recording and measurement.

## Trace configuration

You can make the following settings in the trace configuration :

- Signals to be recorded
- Recording conditions
  - Sampling
  - Trigger

## Recording

A recording is performed in the device. There is only one recording for each installed trace configuration. When a new recording is started, the old recording is overwritten.

An installed recording is not retentive (it is lost when the device is switched off/on) and can be saved permanently in the project as a measurement.

## Installed traces

An installed trace  consists of a trace configuration and optionally a recording. The maximum number of installed traces depends on the device.

The status of an installed trace can be viewed online.

## Measurement

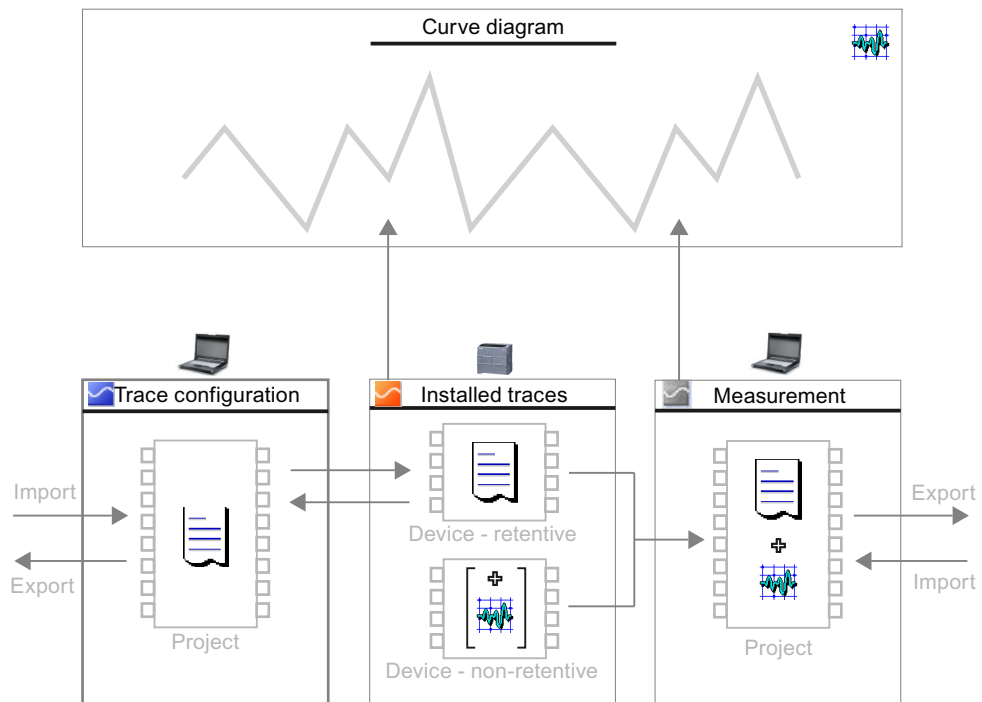

A measurement  always consists of a trace configuration with an associated recording. If an installed trace contains a recording, it can be saved in the project as a measurement.

The recording of a measurement can be viewed offline.

### 13.6.1.4 Data storage

The trace handling and the curve diagram also enable the transfer of the trace configuration and the viewing of the recording.

The following figure is a schematic diagram of the data storage:

**Note**

**Saving the trace configuration and measurement**

You save the trace configuration and measurement with the project in the TIA Portal.

If you close the project without saving, the trace configurations and the measurements transferred to the project are discarded. The trace editor can be closed and reopened without loss of data until the project is closed.

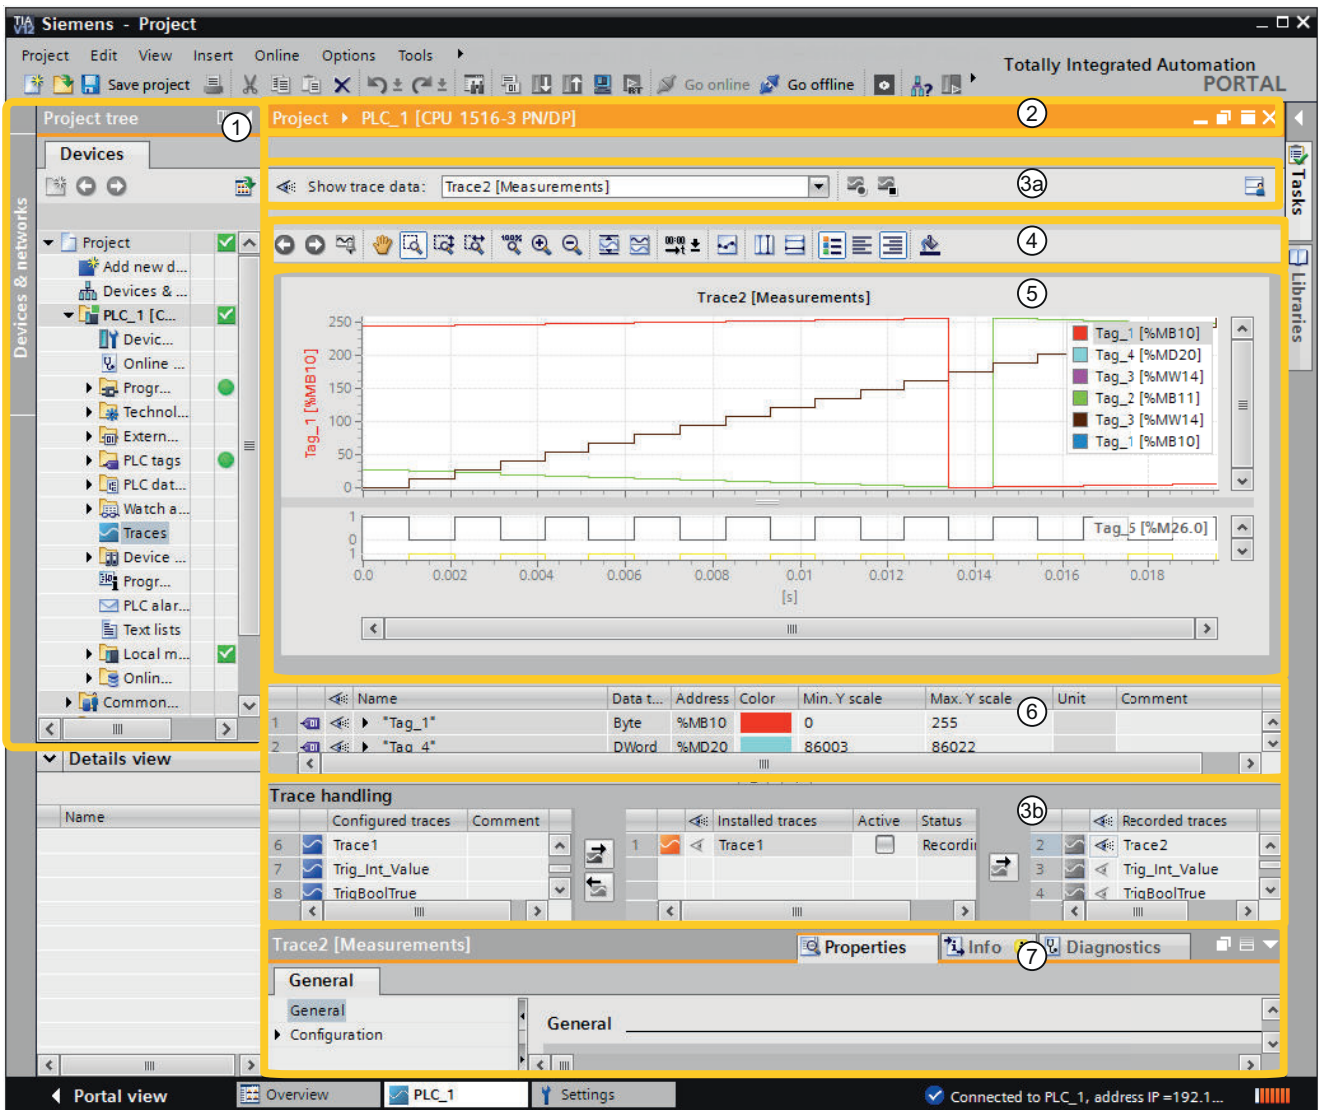

**13.6.2 Software user interface**

**Display areas**

The user interface of the trace and logic analyzer function consists of several areas.

The example in the figure below shows the division of the user interface in the TIA Portal:

1	Project navigator
	Working area
2	Title bar of the working area Shows the device to which the current display belongs.
3a	Toolbar of the trace handling (Page 6672) Selection of recordings for display in the curve diagram and buttons for activation/deactivation of installed traces.
4	Toolbar of the curve diagram (Page 6668) Tools for editing the measurement and for adapting the display in the curve diagram.
5	Curve diagram (Page 6668) Display of the recorded values.
6	Signal table (Page 6670) Signals of the shown measurement.

13.6 Using the trace and logic analyzer function

3b		Trace handling (Page 6672) Creation of new trace configurations and the handling of the measurements.
Device-specific area (see Devices (Page 6688))		
7		Properties area in the Inspector window Configuration dialog boxes for the recording duration, trigger condition and signal selection.

13.6.2.1 Project navigator

If a device supports the trace and logic analyzer function,  "Traces" is offered for selection in the project navigator below the device.

Double-clicking  "Traces" opens the trace editor.

13.6.2.2 Working area

User interface - curve diagram

The curve diagram displays the selected signals of a recording. Bits are shown in the lower diagram as a bit track. You can adjust the display of the signals in the signal table (Page 6670) and with the aid of the toolbar of the curve diagram.

Setting options and displays in the curve diagram

The following figure shows an example of the display in the TIA Portal:

The scale in the diagram applies to the selected (highlighted in gray) signal in the legend. The legend can be moved laterally with the mouse.

## Shortcut menu commands

The following table shows the shortcut menu commands in the curve diagram:

Shortcut menu command	Description
"Save diagram as image"	Exports the current display as a bitmap.
"Copy image to clipboard"	Copies the current display to the clipboard.
"Center measurement cursors"	Positions the activated measurement cursors at a central point in the current display.
"Add to measurements" (only axis control panel and PID)	Adds the shown recording to the "Measurements" table.

## Toolbar of the curve diagram

Tools are available for adapting the display via buttons.

The following table shows the functions of the buttons:

Icon	Function	Description
	Undo zoom	Undoes the zoom function executed last. If several zoom functions have been executed, they can be undone step-by-step.
	Redo zoom	Redoes the last undone zoom function. If several zoom functions have been undone, they can be redone step-by-step.
	Standard view	Uses the current view as standard for this recording. If the trace recording is shown again later, the standard view is restored.
	Move view	Moves the display with the mouse button pressed.
	Zoom selection	Selection of an arbitrary range with the mouse button pressed. The display is scaled to the range selection.
	Vertical zoom selection	Selection of a vertical range with the mouse button pressed. The display is scaled to the range selection.
	Horizontal zoom selection	Selection of a horizontal range with the mouse button pressed. The display is scaled to the range selection.
	Display all	Scales the display of the available data so that the entire time range and all values are displayed. <b>Note</b> The dynamic progress indicator of a running trace is stopped when a zoom function is activated. This button activates the progress indicator again.
	Zoom in	Enlargement of the display. The ranges of the time axis and value axis are reduced every time the button is clicked. The curves are displayed larger.
	Zoom out	Reduction of the display. The ranges of the time axis and value axis are increased every time the button is clicked. The curves are displayed smaller.
	Scale automatically	Scaling of the display so that all values are displayed for the currently displayed time range.

13.6 Using the trace and logic analyzer function

Icon	Function	Description
	Arrange in tracks	Arranges signals one beneath the other without overlaps.
	Unit changeover of the time axis	Changeover of the unit between time and cycles.
	Display samples	The samples are displayed as small circles on the curves.
	Display vertical measurement cursors	Display of the vertical measurement cursors. The vertical position of the two measurement cursors can be moved with the mouse. The associated measured values and the difference of the measurement cursors corresponding to the position are shown in the signal table.
	Display horizontal measurement cursors	Display of the horizontal measurement cursors. The horizontal position of the two measurement cursors can be moved with the mouse.
	Display chart legend	Display or hiding of the chart legend in the curve diagram.
	Align the chart legend to the left	Display of the chart legend on the left side of the curve diagram.
	Align the chart legend to the right	Display of the chart legend on the right side of the curve diagram.
	Change background color	Changeover between various background colors.

User interface - signal table

The signal table lists the signals of the selected measurement and provides setting options for some properties. If recording data of "Installed traces" is displayed and the settings are changed in the signal table, these settings are retained until there is a change to the offline mode. If the "Installed trace" is added to the measurements, the current settings of the signal table are saved in the measurement.

The signals can be sorted using drag-and-drop. The bits of a signal can be resorted within a signal.

Setting options and displays in the signal table

The following figure shows an example of the display in the TIA Portal:

		Name	Data type	Address	Color	Min. Y scale	Max. Y scale	Y(t1)	Y(t2)	DeltaY	Unit	Comment
1		▶ "Tag_1"	Byte	%MB10		1	20	7	13	6		
2		▶ "Tag_4"	DWord	%MD20		1	20	7	13	6		
3		▶ "Tag_3"	Word	%MW...		3	60	21	39	18		

The following table shows the settings and displays of the recorded signals:

Column	Description																																								
	Static display of the signal icon																																								
 	Selection for the display in the curve diagram The point indicates that at least one bit has been selected for display as bit track for the signal in the bit selection.																																								
"Name"	Display of the signal name A click on the name of a displayed signal updates the scale in the curve diagram.																																								
	Open bit selection Individual bits can also be selected for the following data types for display as a bit track in the lower curve diagram. <ul style="list-style-type: none"> <li>• Byte, Word, DWord, LWord</li> <li>• SInt, USInt, Int, UInt, DInt, UDInt, LInt, UInt</li> </ul> Example of an opened bit selection for the DWORD data type: <table border="1" data-bbox="598 786 1281 936"> <tbody> <tr> <td>1</td> <td></td> <td></td> <td></td> <td>▶ "Tag_1"</td> <td>Byte</td> <td>%MB10</td> <td></td> </tr> <tr> <td>2</td> <td></td> <td></td> <td></td> <td>▼ "Tag_4"</td> <td>DWord</td> <td>%MD20</td> <td></td> </tr> <tr> <td>3</td> <td></td> <td></td> <td></td> <td></td> <td>Bool</td> <td>%M23.0</td> <td></td> </tr> <tr> <td>4</td> <td></td> <td></td> <td></td> <td></td> <td>Bool</td> <td>%M23.1</td> <td></td> </tr> <tr> <td>5</td> <td></td> <td></td> <td></td> <td></td> <td>Bool</td> <td>%M23.2</td> <td></td> </tr> </tbody> </table> Select or deselect the relevant bit for display by clicking the  icon.	1				▶ "Tag_1"	Byte	%MB10		2				▼ "Tag_4"	DWord	%MD20		3					Bool	%M23.0		4					Bool	%M23.1		5					Bool	%M23.2	
1				▶ "Tag_1"	Byte	%MB10																																			
2				▼ "Tag_4"	DWord	%MD20																																			
3					Bool	%M23.0																																			
4					Bool	%M23.1																																			
5					Bool	%M23.2																																			
"Data type"	Display of the data type																																								
"Address"	Display of the address (not for symbolic tags)																																								
"Color"	Display and setting option for the color of the signal																																								
"Min. Y-scale"	Display or input of the minimum value for the scaling of the signal																																								
"Max. Y-scale"	Display or input of the maximum value for the scaling of the signal																																								
"Signal group"	Display or input of the signal group name for one signal group The Y-scales are scaled identically for all signals of one signal group. Enter an identical signal group name for those signals that are to be scaled identically. Signals can be removed from the signal group by deleting the signal group name. The signal groups can be saved via the function "Use current view as standard" (button  ).																																								
"Y(t1)"	Display of the value at the position of the first measurement cursor																																								
"Y(t2)"	Display of the value at the position of the second measurement cursor																																								
"ΔY"	Display of the value difference between the first and the second measurement cursor																																								
"Unit"	Display of the unit (e.g. for technology objects)																																								
"Comment"	Display and input option for a comment about the signal																																								

## Shortcut menu commands

The following table shows the shortcut menu commands of the signal table:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.

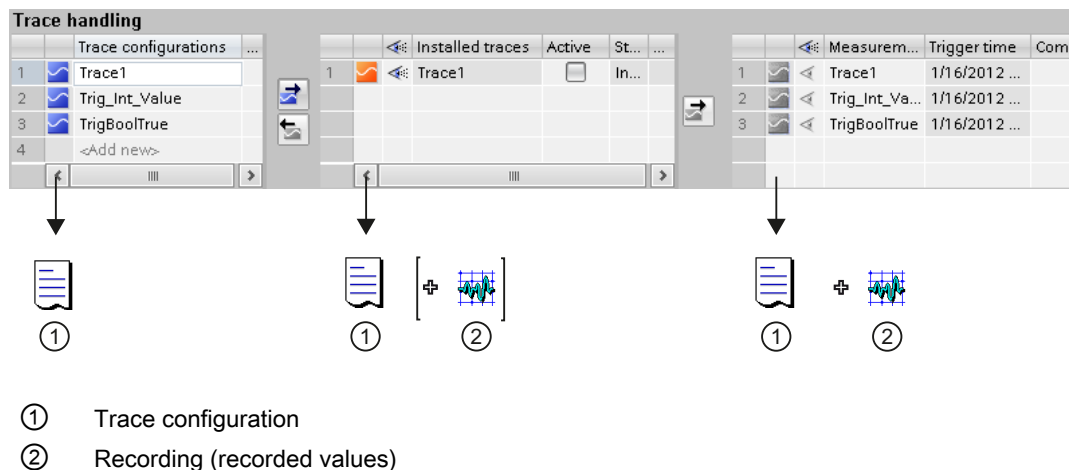

Shortcut menu command	Description
"Paste"	Cannot be selected.
"Show/hide signal"	Shows/hides the signal in the curve diagram.
"Bring to foreground"	Displays the selected signal in the foreground. The other signals are hidden.

### User interface - trace management

The trace handling enables the configuration and handling of trace configurations.

### Setting options and displays in the trace handling

The following figure shows an example of the display in the TIA Portal:

### Toolbar of the trace handling

A recording can be selected for display via a drop-down list and buttons, and activated or deactivated.

The example in the figure below shows the toolbar of the trace handling

The following table describes the functions of the buttons:

Icon	Description
	Static icon display of the drop-down list selection in the curve diagram
	Selection of an "Installed trace" or a "Measurement" for display in the curve diagram
	Activation of the recording The button is available for "Installed traces".
	Deactivation of the recording The button is available for "Installed traces".

**"Trace configurations" table**

The table contains all the trace configurations of the project that can be transferred to the device. Each trace configuration contains the tags to be recorded and the required recording settings. The data is displayed in offline and online mode.

The following table shows the settings and displays:

Column	Icon	Description
-	 	Display of the icon for the trace configuration Incorrect trace configurations are shown with a red border and cannot be transferred to the device. Check the configuration in the Inspector window. Double-clicking the icon brings the Inspector window with the properties to the foreground.
"Trace configuration"	-	Name of the trace configuration. The name can be changed after double-clicking the field.
"Comment"	-	Input field for a comment.

**Shortcut menu commands**

The following table shows the shortcut menu commands of the "Trace configurations" table when a line is selected:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Pastes the contents of the clipboard.
"Delete"	Deletes the selected lines from the table or deletes the name of the selected cell.
"Rename"	Switches the selected cell to the editing mode.
"Transfer trace configuration to device"	Transfers the trace configuration selected in the "Trace configurations" table to the device. The button is active when all the required settings in the device-specific configuration have been configured correctly in the Inspector window and there is an online connection.
"Export trace configuration"	Exports a trace configuration as a file with the ".ttcfgx" file extension. For compatibility reasons, the ".ttcfg" file extension will be supported in V12, but does not contain any information about the device family.
"Import trace configuration"	Imports a trace configuration from a file.
"Properties"	Brings the Inspector window with the device-specific properties to the foreground.

**"Installed traces" table**

The table contains the trace configurations already transferred to the device and their current status. The data is displayed in the online mode.

The following table shows the settings and displays:

Column	Icon	Description
-		Static display of the online icon Double-clicking the icon brings the Inspector window with the device-specific properties to the foreground.
		Selection for the display in the curve diagram A click on the icon shows/hides the recording in the curve diagram.
"Installed traces"	-	Name of the trace configuration.
"Active"		Activation of the recording and feedback of the status. The checkbox is reset at the end of the recording. If the recording of an installed trace is repeated, then the settings relevant for the display (curve diagram and signal table) are also retained for the new recording.
"Status"	-	Status display of the trace configuration The following states are possible: <ul style="list-style-type: none"> <li>• "Installing"</li> <li>• "Waiting for trigger"</li> <li>• "Recording"</li> <li>• "Recording completed"</li> <li>• "Aborted"</li> <li>• "Fault"</li> </ul>
"Comment"	-	Display of the trace configuration comment

**Shortcut menu commands**

The following table shows the shortcut menu commands of the "Installed traces" table when a line is selected:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Cannot be selected.
"Delete"	Deletes the selected lines from the table.
"Rename"	Cannot be selected.
"Add to trace configurations"	Transfers the installed trace configuration to the "Trace configurations" table.
"Add to measurements"	Adds the selected "Installed trace" to the "Measurements" table. <b>Note</b> The "Installed trace" data can be saved as a measurement after being displayed once in the curve diagram. The recording data is loaded from the device for the display.
"Activate"	Activates the recording and shows the status in the table
"Show/hide in curve diagram"	Shows/hides the recording in the curve diagram.
"Properties"	Brings the Inspector window with the device-specific properties to the foreground.

**"Measurements" table**

The table contains the trace configurations with recordings. The data is displayed in offline and online mode.

Measurements can also be exported and imported, see Exporting and importing measurements (Page 6685).

The following table shows the settings and displays:

Column	Icon	Description
-		Static display of the icon for a measurement Double-clicking the icon brings the Inspector window with the device-specific properties to the foreground.
		Selection for the display in the curve diagram A click on the icon shows/hides the recording in the curve diagram.
"Measurements"	-	Name of the measurement The name can be changed after double-clicking the field.
"Trigger time"	-	The meaning of the time stamp depends on the device Examples: <ul style="list-style-type: none"> <li>• SIMATIC S7-1200/1500 CPUs The absolute time of the controller is entered at the start of the recording.</li> <li>• SINAMICS G120 The transfer time is entered with the transfer of the trace configuration to the device.</li> </ul>
"Comment"	-	Input field for a comment.

**Shortcut menu commands**

The following table shows the shortcut menu commands of the "Measurements" table when a line is selected:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Pastes the contents of the clipboard.
"Delete"	Deletes the selected lines from the table or deletes the name of the selected cell.
"Rename"	Switches the selected cell to the editing mode.
"Add to trace configurations"	Transfers the trace configuration of the measurement to the "Trace configurations" table.
"Show/hide in curve diagram"	Shows/hides the recording in the curve diagram.
"Export measurement"	Exports a measurement as a file with the ".ttrecx" or ".csv" file extension. For compatibility reasons, the ".ttrec" file extension will be supported in V12, but does not contain any information about the device family.

Shortcut menu command	Description
"Import measurement"	Imports a measurement from a file with the "*.ttrecx" file extension. For compatibility reasons, the "*.ttrec" file extension will be supported in V12, but does not contain any information about the device family.
"Properties"	Brings the Inspector window with the device-specific properties to the foreground.

## Buttons

The following table shows the functions available via buttons:

Icon	Description
	Button to transfer a selected trace configuration to the device The selected trace configuration in the "Trace configurations" table is transferred to the device. The button is active when all the required settings in the configuration have been correctly configured in the Inspector window and there is an online connection.
	Button to transfer a selected trace configuration from the device The trace configuration selected in the "Installed traces" table is transferred from the device to the "Trace configurations" table.
	Button to transfer a selected measurement from the device to the project The selection in the "Installed traces" table is added to the "Measurements" table. <b>Note for S7 CPUs</b> In order to be able to save the "Installed trace" data as a measurement, it must first have been displayed once in the curve diagram. The recording data is loaded from the device when displayed.

### 13.6.2.3 Device-specific area

The device-specific area enables the trace configuration.

The signals to be recorded and the trigger condition are specified here. These and other configuration options are described in the device-specific part (Page 6688) for the individual devices.

## 13.6.3 Operation

### 13.6.3.1 Quick start

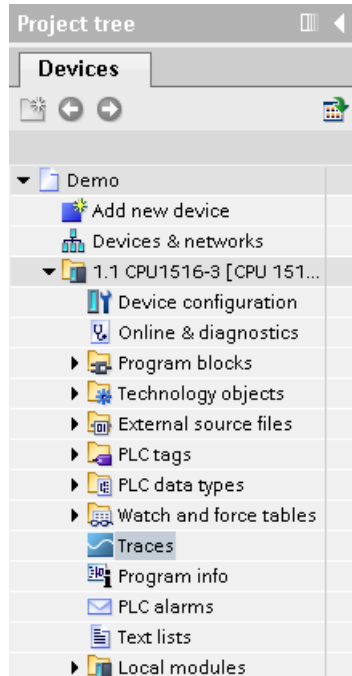

This description shows the steps for a recording of the S7-1500 CPU as an example. The displayed settings can differ depending on the device.

## Requirement

A device is configured that supports the trace and logic analyzer function.

## Calling the trace editor

The following figure shows the project navigator with "Traces" below the device:

Procedure:

1. Open the trace editor by double-clicking the "Traces" entry.

## Creating a trace configuration

The following figure shows the "Trace configurations" table:

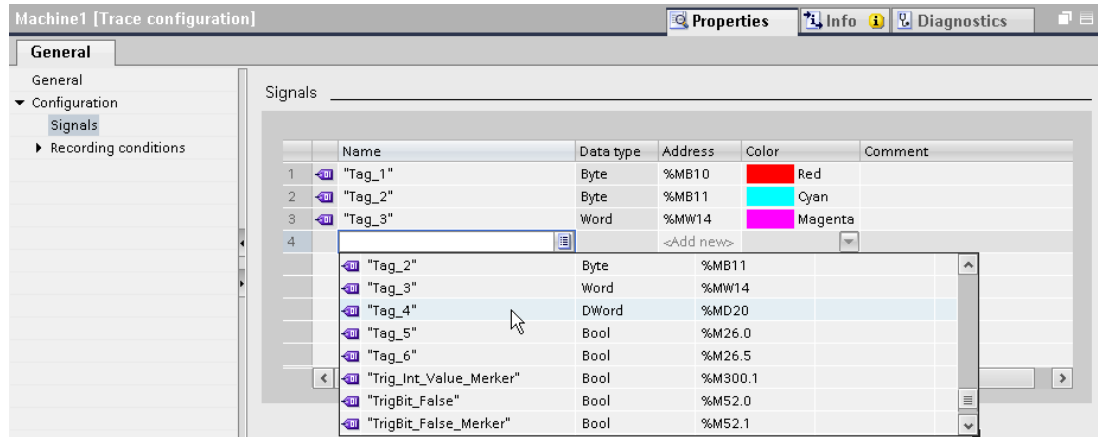

Trace handling		
	Trace configurations	Comment
1	 Machine1	
2	<Add new>	

Procedure:

1. Enter the name of the trace configuration in the "Trace configurations" table.

### Selecting signals

The following figure shows the configuration of the signals:

Procedure:

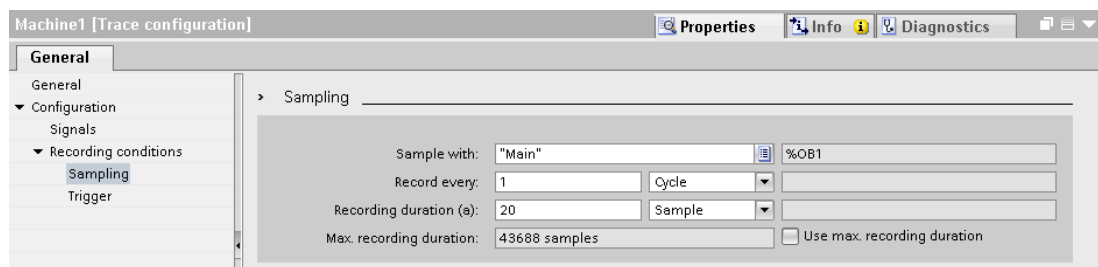

1. Select the signals to be recorded in the "Signals" area of the Inspector window.

Or:

1. Drag a signal to the table using drag-and-drop.

### Configuring the recording cycle

The following figure shows the configuration of the sampling:

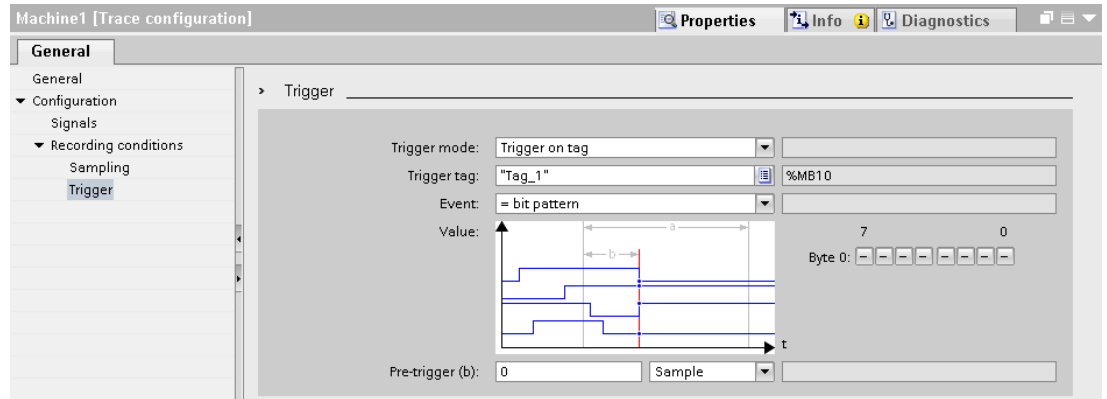

Procedure:

1. Configure the sampling.

## Configuring the trigger

The following figure shows the configuration of the trigger:

Procedure:

1. Configure the trigger mode and the condition for the selected trigger.

## Transferring the trace configuration to the device

The following figure shows the trace handling in online mode:

Procedure:

1. Check whether the configuration is correct based on the icon in the "Trace configurations" table.  
The  icon indicates a correct trace configuration.  
The  icon indicates a faulty trace configuration.  
Only correct trace configurations can be transferred to the device.
2. Establish an online connection to the device.
3. Select the trace configuration in the "Trace configurations" table and transfer it to the device with the  button.

### Activating a recording

The following figure shows the trace handling with an installed trace configuration:

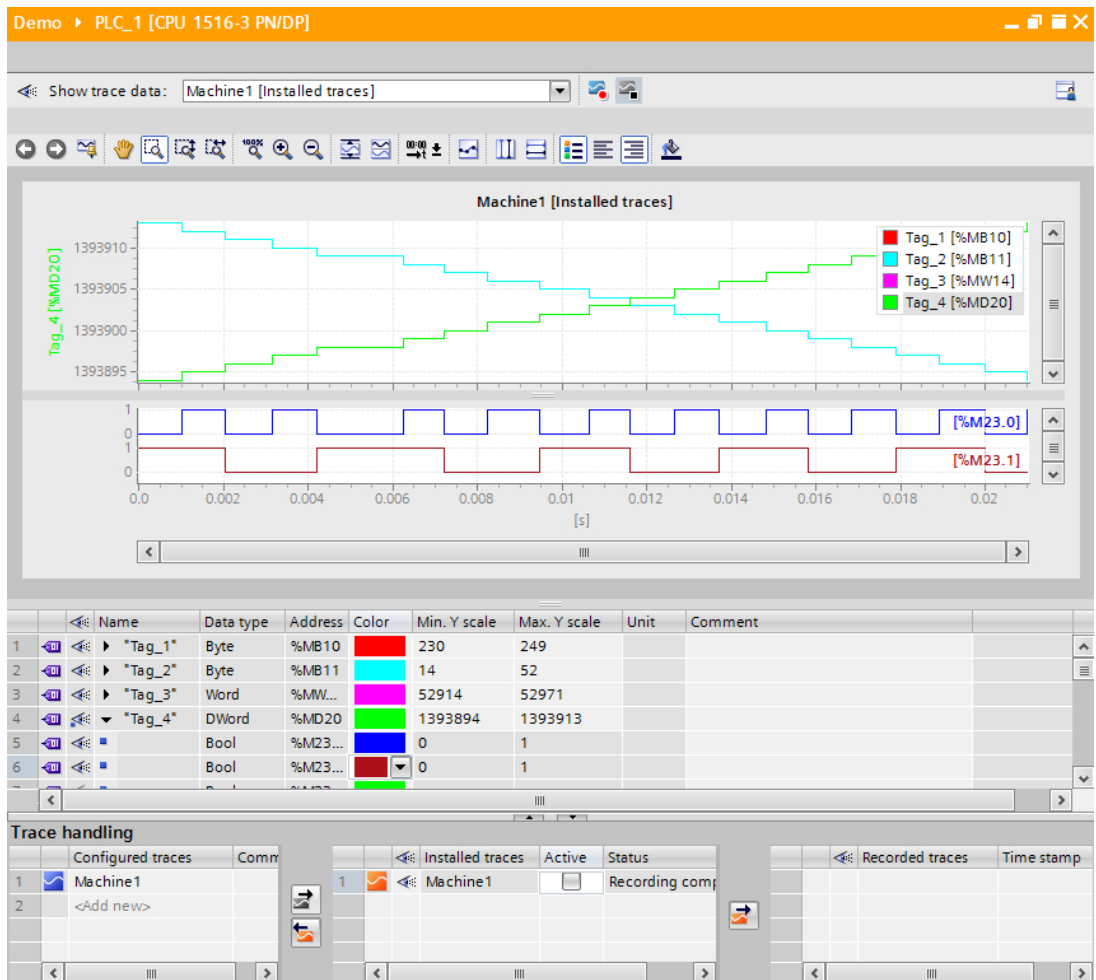

Procedure:

1. Click the checkbox in the "Active" column in the "Installed traces" table.

### Displaying the recording

The following figure shows the curve diagram with the recording of the "Installed trace":

Procedure:

1. Wait until the "Recording" or "Recording completed" status is displayed in the "Installed traces" table.
2. Click the  icon in the "Installed traces" table to display the recording in the curve diagram.
3. Click the  icon of a signal in the signal table.  
The individual bits of the signal are offered for display as a bit track.
4. In the signal table, select or deselect the individual signals and bits for display with the   icon.

### Saving the measurement in the project

The following figure shows the measurement saved in the project:

Procedure:

1. Select the measurement in the "Installed traces" table and transfer it to the project with the  button.

### 13.6.3.2 Using the trace function - overview

#### Requirement

A device is configured in the TIA Portal that supports the trace and logic analyzer function and to which an online connection has been established.

#### Procedure

The following table shows a procedural overview with typical steps when working with the trace and logic analyzer function.

Step	Description
1	Calling the trace editor (Page 6682)
2	Configuring the trace (Page 6682)
3	Transferring the trace configuration to the device (Page 6683)
4	Activating/deactivating an installed trace (Page 6683)
5	Monitoring the recording (Page 6684)
6	Saving measurements in the project (Page 6685)
7	Displaying the recording (Page 6684)

### 13.6.3.3 Calling the trace editor

A trace editor can be opened for each device in the project navigator.

The following instructions describe how you call the trace editor in the work area of the TIA Portal.

#### Requirement

A device is configured that supports the trace and logic analyzer function.

#### Procedure

To call the trace editor, proceed as follows:

1. In the project navigator, double-click the device.  
The device folder opens.
2. Double-click "Traces".

### 13.6.3.4 Trace handling

#### Configuring the trace

#### Requirement

The trace editor is open.

#### Creating and deleting the trace configuration

To create a new trace configuration, proceed as follows:

1. Click the "<Add>" entry in the "Trace configurations" table in the Trace handling (Page 6670).
2. Enter the name for the trace configuration.  
The new trace configuration is created.

To delete a trace configuration, proceed as follows:

1. Right-click a trace configuration in the "Trace configurations" table and select the shortcut menu command "Delete".  
The trace configuration is deleted.

#### Configuring the trace

In the configuration, you specify the recording and trigger conditions and select the signals to be recorded.

See Section "Configuration" below the respective device (Page 6688).

---

#### Note

##### Saving the trace configuration

You save the trace configuration with the project in the TIA Portal.

If you close the project without saving, the configuration is discarded. The trace editor can be closed and reopened without loss of data until the project is closed.

---

## Transferring the trace configuration to the device

### Requirement

- A valid trace configuration  is located in the "Trace configurations" table.
- The maximum number of "Installed traces" has not been reached yet.
- There is an online connection to the device.

### Procedure

To transfer a trace configuration to the device, proceed as follows:

1. Select a trace configuration  in the "Trace configurations" table.
2. Click the  button to transfer the trace configuration to the device.

### Result

The trace configuration is transferred to the device and displayed in the "Installed traces" table.

## Activating/deactivating an installed trace

### Requirement

A trace configuration is installed and there is an online connection to the device.

### Activating an installed trace

To activate the recording for an installed trace, proceed as follows:

1. Activate the checkbox of the "Active" column in the "Installed traces" table.  
The installed trace is activated and starts the recording according to the configured trigger condition. The trigger condition is device-specific and described in Section "Configuration" below the respective device (Page 6688).

---

#### Note

When a recording is restarted, the previously recorded values are lost.

To save the recorded values, save the measurement in the project (Page 6685) before you activate the recording again.

---

### Deactivating an installed trace

To deactivate an activated installed trace, proceed as follows:

1. Deactivate the checkbox of the "Active" column in the "Installed traces" table.  
The installed trace is deactivated.

### Displaying the recording

#### Requirement

A trace configuration with recording is in the device and there is an online connection to the device or there is an entry in the "Measurements" table.

#### Procedure

To display the recording, proceed as follows:

1. Select an entry in the "Installed traces" table.
2. Click  in the column for the selected entry.

Or:

1. Select an entry in the "Measurements" table.
2. Click  in the column for the selected entry.

#### Result

The recording is displayed in the curve diagram and the signal table.

## Saving measurements in the project

### Requirement

A trace configuration with recording is installed and there is an online connection to the device.  
The "Installed trace" data must have been displayed at least once in the curve diagram. The recording data is loaded from the device for the display.

### Procedure

To save a recording in the project, proceed as follows:

1. Click an entry in the "Installed traces" table in the trace handling.
2. Click the  button to transfer the selected entry.  
The selected entry in the "Installed traces" table is added to the "Measurements" table.
3. Save the project in the TIA Portal.

## Exporting and importing measurements

### Requirement

There is at least one measurement in the "Measurements" table.

### Exporting measurements

To export a measurement, proceed as follows:

1. Right-click an entry in the "Measurements" table and select the shortcut menu command "Export measurement".
2. Select a folder, a file name and a data type to save the measurement.
3. Click the "Save" button.

### Importing measurements

To import a measurement, proceed as follows:

1. Right-click in the "Measurements" table and select the shortcut menu command "Import measurement".
2. Select the file of the "\*.ttrecx" file type with the measurement to be imported.
3. Click the "Open" button.  
The imported measurement is displayed with the file name in the "Measurements" table.

## Transferring the trace configuration from the device to the project

### Requirement

A trace configuration is installed and there is an online connection to the device.

### Procedure

To transfer a trace configuration to the project, proceed as follows:

1. Select an entry in the "Installed traces" table.
2. Click the  button to transfer the trace configuration from the device.

### Result

The configuration of the "installed trace" is transferred to the "Trace configurations" table.

## Deleting installed traces

### Requirement

A trace is installed and there is an online connection to the device.

### Deleting an installed trace

To delete an installed trace, proceed as follows:

1. Select one or more lines to be deleted in the "Installed traces" table.
2. Press <Del> to delete the "Installed traces".

### 13.6.3.5 Signal table

#### Use of the signal table

The signal table shows the signals of an installed trace or a measurement. You can show or hide individual signals for the display in the table and adapt the properties for the display. Individual bits can be selected for some data types and displayed as a bit track.

The following operating instructions describe the operation of the signal table.

### Requirement

- An entry is selected in the  column in the "Installed traces" or "Measurements" table.
- For the display of individual bits as a bit track:  
At least one recorded signal supports the display as a bit track.

### Selecting individual signals in the signal table and changing the format

To adapt the display to suit your requirements, proceed as follows:

1. Click the icon of the respective signal in the  column to select or deselect it for the display.
2. Click in the "Color" column for the respective signal to change the default color of the signal.
3. Click the "Bring to foreground" entry in the shortcut menu of a signal to display it in the foreground.

### Selecting individual bits in the signal table for display as a bit track

To display individual bits as a bit track in the lower curve diagram, proceed as follows:

1. Click the  icon of a signal in the signal table.
2. Click the  icon in the opened bit selection of the signal to select or deselect individual bits for the display.

## 13.6.3.6 Curve diagram

### Use of the curve diagram

The curve diagram shows the signals of a recording selected in the signal table. Select the recording in the "Installed traces" or "Measurements" table of the trace handling.

The display area can be zoomed as required. Measurement cursors can be used to select individual values for display in the signal table.

The following operating instructions describe the use of the measurement cursors.

### Requirement

A recording has been selected for display.

### Evaluation of a certain instant of a recording

To display the values for a specific sample, proceed as follows:

1. Display the vertical measurement cursors via the  button.
2. Move a measurement cursor with the mouse to the required position in the recording. The values of the signals are displayed in the signal table. The time or sample for the measurement cursors is displayed in the lower area of the curve diagram.

### Evaluation of the difference between two samples

To display the difference, proceed as follows:

1. Display the vertical measurement cursors via the  button.
2. Move both measurement cursors with the mouse to the required samples in the recording. The values of the signals and the difference are displayed in the signal table. The time or sample for the measurement cursors is displayed in the lower area of the curve diagram.

### Using horizontal measurement cursors

To check whether a certain value has been reached, proceed as follows:

1. Display the horizontal measurement cursors via the  button.
2. Move a measurement cursor with the mouse to the required value of the recording.  
The values of the measurement cursor for the selected signal are displayed in the lower area of the curve diagram.

### Printing a recording

The curve diagram supports the saving of the display as a bitmap and the copying of the display to the clipboard. Also use these functions (Page 6666) for printing.

## 13.6.4 Devices

### 13.6.4.1 S7-1200/1500 CPUs

#### Recordable variables

#### Device-dependent recording of tags

The following list shows the operand areas from which tags can be recorded:

- Process image input
- Process image output
- Bit memory
- Data blocks

#### Data types

Elementary data types can be recorded. The availability of the individual data types depends on the device used:

The following table lists the elementary data types:

Data types	Note
<b>Binary numbers</b>	
BOOL	-
<b>Bit strings</b>	
BYTE	-
WORD	-
DWORD	-
LWORD	Symbolic name required

Data types	Note
<b>Integers</b>	
SINT	-
USINT	-
INT	-
UINT	-
DINT	-
UDINT	-
LINT	Symbolic name required
ULINT	Symbolic name required
<b>Floating-point numbers</b>	
REAL	-
LREAL	Symbolic name required

### Lifetime of the installed trace configuration and recorded values

Installed trace configurations are retained after POWER OFF. The recording is activated again after the restart of the CPU.

Recorded values are lost during the restart.

---

#### Note

##### Downloading a configuration to the device in the "STOP" operating state

Note that after downloading a configuration in the "STOP" operating state, you must check the installed traces and, if required, reactivate them or transfer them again.

---

#### Note

If signals or trigger tags that affect the address are changed, the trace configuration must also be transferred to the device again.

This is the case for example, when a data block is shortened or extended or the data type is changed.

---

### Recording levels

The following list shows the execution levels that can be selected for the recording cycle:

- Program cycle - OB 1
- Time-of-day interrupt - OB 1x
- Time-delay interrupt - OB 2x
- Watchdog interrupt - OB 3x
- Synchronized processing cycles - OB 6x, not OB 60

- Servo task - OB 91 (S7-1500)
- IPO - OB 92 (S7-1500)

---

**Note**

The measured values are recorded at the end of the OB after the processing of the user program.

---

### Quantity structure

The following table shows the maximum quantity structure that can be recorded with the trace and logic analyzer function:

Device	Maximum number of "Installed traces"	Maximum number of signals per trace configuration
S7-1200 (as of firmware version V4.0)	2	16
S7-1500	At least 4 (depending on the CPU type)	16

#### Example of S7-1516

- Maximum of 3854 samples for 16 long tags
- Maximum of 21844 samples for 16 binary tags
- Maximum of 58250 samples for 1 binary tag

Refer to respective manual for more detailed information.

### CPU load through trace recording

A trace recording increases the runtime of the respective recording level that can result in an execution level overflow with high utilization of the CPU.

### Remedy

- **Change the trace configuration**
  - 1) Configure fewer tags and signals.
  - 2) Then increase the number of tags and signals up to the maximum number of signals step-by-step without an execution level overflow.
- **Select a slower recording level**

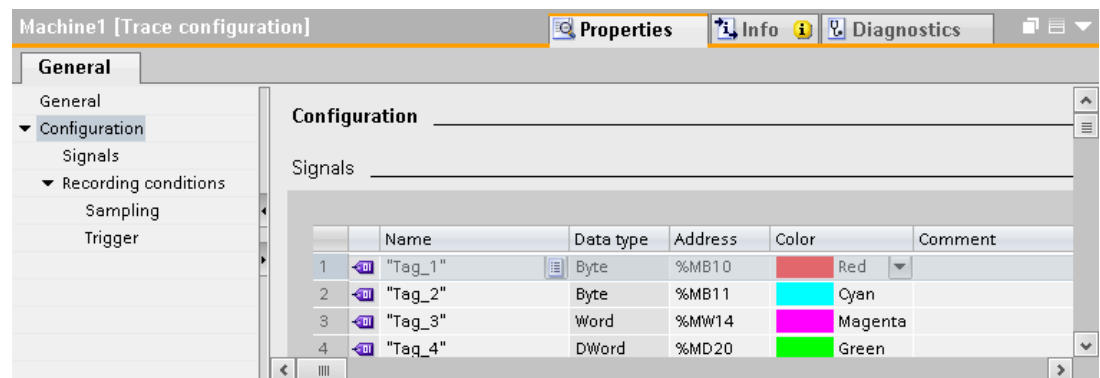

## Software user interface of the device-specific area

### Structure of the user interface

#### Display areas in the Properties window of the Inspector

The settings options differ depending on the configured device.

The following figure shows an example of the display in the TIA Portal:

The area navigation provides the following entries for selection:

- General
- Configuration
  - Signals (Page 6692)
  - Recording conditions (Page 6693)

#### Display of the properties of a trace configuration

The trace configuration is selected in the trace handling:

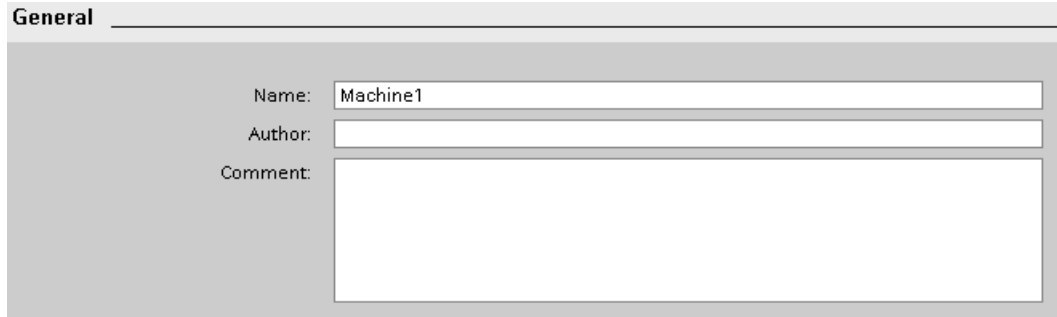

- Selection in the "Trace configurations" table  
The properties are displayed in the Inspector window and can be changed.
- Selection in the the "Installed traces" table or "Measurements" table  
The properties are displayed write-protected in the Inspector window.

#### User interface - General

The "General" area shows the name of the trace configuration and input fields for the author and a comment.

### Input options and displays in General

The following figure shows an example of the display in the TIA Portal:

The following table shows the input fields and displays:

Column	Icon	Description
"Name"	-	Name of the trace configuration
"Author"	-	Author of the trace configuration
"Comment"	-	Input field for a comment

### User interface - Signals

The "Signals" area shows a table in which the signals to be recorded are configured for the selected trace configuration.

Signals can also be inserted in the table using drag-and-drop.  
The signals can be sorted using drag-and-drop.

### Setting options and displays in "Signals"

The following figure shows an example of the display in the TIA Portal:

	Name	Data type	Address	Color	Comment
1	"Tag_1"	Byte	%MB10	Red	
2	"Tag_2"	Byte	%MB11	Cyan	
3	"Tag_3"	Word	%MW14	Magenta	
4	"Tag_4"	DWord	%MD20	Green	

The following table shows the settings and displays:

Column	Icon	Description
		Display of the signal icon for a selected signal.
"Name"	-	Input field for the name or address of the signal. <b>Examples:</b> <ul style="list-style-type: none"> <li>• M0.0</li> <li>• DB1.DBW3</li> <li>• "Data_block_1".pressure</li> </ul>
-		Button to open the signal selection table. The button is displayed when the table line is selected. Clicking the icon opens a table which offers possible signals for selection. The selected signal is displayed in the input field.
"Data type"	-	Text field with display of the data type for the signal.
"Address"	-	Input field for the address of the signal. With purely symbolic signals the field remains empty.
"Color"	-	Text field for display and selection of the color. Click the selected field to display the signal color. Click the signal color to open the color selection dialog.
"Comment"		Input field for a comment on the signal.

### Shortcut menu commands

The following table shows the shortcut menu commands of the table:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Pastes the contents of the clipboard to the selected line. The existing contents are overwritten.
"Delete"	Deletes the selected lines from the table or deletes the name of the selected cell.
"Rename"	Switches the selected cell to the editing mode.

### Recording conditions

### Supported data types

The following table shows the supported data types for the trigger tag:

Memory requirement and format of the number	Data type
1 byte	BOOL
8-bit integers	SINT, USINT, BYTE
16-bit integers	INT, UINT, WORD
32-bit integers	DINT, UDINT, DWORD
64-bit integers	LINT, ULINT, LWORD (device-dependent)

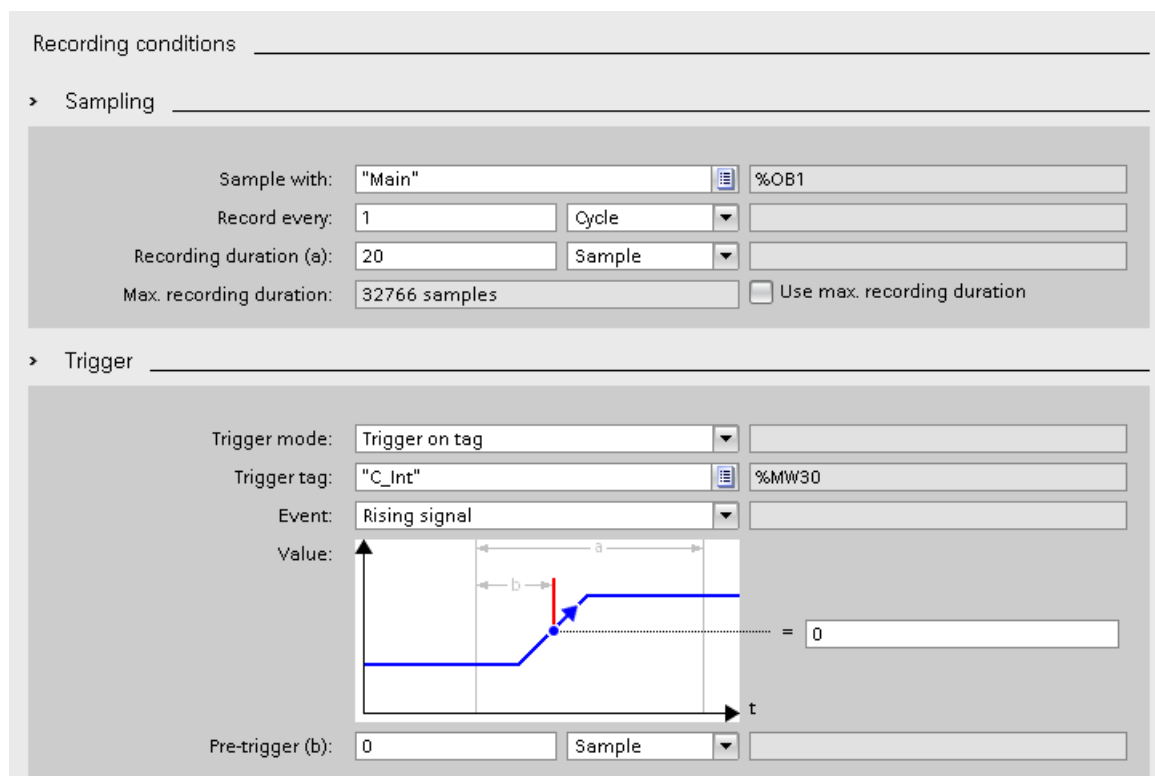

Memory requirement and format of the number	Data type
32-bit floating-point numbers	REAL
64-bit floating-point numbers	LREAL

### User interface - Recording conditions

The "Recording conditions" area shows the trigger condition for the selected trace configuration and in which cycle, how fast and how long the recording is made. The configuration is only possible if the trace configuration has been selected in the "Trace configurations" table of the trace handling.

### Setting options and displays in "Recording conditions"

The following figure shows an example of the display in the TIA Portal:

Setting/display	Description
"Recording time"	
Drop-down list	Selection of the recording time. See Recording levels (Page 6687)
Text field	Detailed information on the selected recording time.
"Record every"	
Input field	Input of the reduction in relation to the cycles.

Setting/display		Description
	Drop-down list	Selection of the reduction factor. The following settings are possible: <ul style="list-style-type: none"> <li>• "Cycle"</li> </ul>
	Text field	Display of the sampling time, taking into account the configured reduction.
<b>"Recording duration"</b>		
	Input field	Input of the recording duration in relation to the samples. If the "Recording duration = max. recording duration" checkbox is activated, entries are overwritten by the value displayed in "Max. recording duration".
	Drop-down list	Select the time unit for the recording duration. The following settings are possible: <ul style="list-style-type: none"> <li>• "Samples"</li> </ul>
	Text field	Displays the calculated recording duration.
<b>"Max. recording duration"</b>		
	Text field	Displays the calculated maximum recording duration. The "Max. recording duration" depends on how many signals are recorded and the data type of these signals.
	"Use max. recording duration"	Set the recording duration to the maximum value. When the checkbox is activated, the recording duration is set to the maximum possible recording duration. The set reduction in the "Record every" input field is taken into account. The recording duration is also adapted when additional signals are added.
<b>"Trigger mode"</b>		
	Drop-down list	The following settings are possible: <ul style="list-style-type: none"> <li>• "Record immediately" The recording is made immediately after the device is activated.</li> <li>• "Trigger on tag" The recording is made as soon as the installed trace is activated and the configured trigger condition is fulfilled.</li> </ul>
	Text field	Display of the trigger type.
<b>"Trigger tag"</b>		
	Input field	Enter a signal. <b>Examples:</b> <ul style="list-style-type: none"> <li>• M0.0</li> <li>• DB1.DBW3</li> <li>• "DataBlock_1".Temperature</li> </ul>
		Opens the signal selection table. Clicking the icon opens a table which offers possible signals for selection as trigger tag. The selected signal is displayed in the input field.
	Text field	Display of the trigger tag address.
<b>"Event"</b>		
		The events that can be used on this trigger tag are offered for selection according to the data type of the trigger tag. The event can only be configured when a valid signal has been entered as trigger tag.

Setting/display	Description
Drop-down list	Event selection for which the trigger tag is checked. The entries in the drop-down list are described in Section Trigger event (Page 6696).
Text field	Display of the comparison type.
"Value"	Configuration of the selected event. The configuration options differ depending on the format of the trigger tag and the selected event. See Trigger event (Page 6696).
"Pre-trigger"	"Pre-trigger" defines the time during which the signals are already recorded before the actual trigger condition is fulfilled. If the trigger event occurs immediately or shortly after the activation of the recording, this may result in a shorter recording duration. Example of "recording duration" = 20 samples and "pre-trigger" = 5 samples: <ul style="list-style-type: none"> <li>• Trigger event occurs 50 samples after activation of the recording Actual recording duration = 20 samples</li> <li>• Trigger event occurs 2 samples after activation of the recording Actual recording duration = 17 samples</li> </ul>
Input field	Input of the duration in relation to the selection in the drop-down list.
Drop-down list	Select the time unit The following settings are possible: <ul style="list-style-type: none"> <li>• "Samples"</li> </ul>
Text field	Displays the calculated "pre-trigger" period

### Trigger event

Depending on the selection in the drop-down list box, the further settings differ for the "event".

The individual events are described below.

#### "=TRUE"

Supported data types: Bit (Page 6691)

The recording starts when the state of the trigger is TRUE.

#### "=FALSE"

Supported data types: Bit (Page 6691)

The recording starts when the state of the trigger is FALSE.

#### "Rising edge"

Supported data types: Bit (Page 6691)

The recording is started when the trigger state changes from FALSE to TRUE.  
After activation of the installed trace, at least two cycles are required to identify the edge.

### **"Rising signal"**

Supported data types: Integers and floating-point numbers (Page 6691)

The recording is started when the rising value of the trigger reaches or exceeds the value configured for this event.

After activation of the installed trace, at least two cycles are required to identify the edge.

### **"Falling edge"**

Supported data types: Bit (Page 6691)

The recording is started when the trigger state changes from TRUE to FALSE.

After activation of the installed trace, at least two cycles are required to identify the edge.

### **"Falling signal"**

Supported data types: Integers and floating-point numbers (Page 6691)

The recording is started when the falling value of the trigger reaches or falls below the value configured for this event.

After activation of the installed trace, at least two cycles are required to identify the edge.

### **"In the range"**

Supported data types: Integers and floating-point numbers (Page 6691)

The recording starts as soon as the value of the trigger is in the value range configured for this event.

### **"Outside of the range"**

Supported data types: Integers and floating-point numbers (Page 6691)

The recording starts as soon as the value of the trigger is outside the value range configured for this event.

### **"= value"**

Supported data types: Integers (Page 6691)

The recording starts when the value of the trigger is equal to the value configured for this event.

### **"<> value"**

Supported data types: Integers (Page 6691)

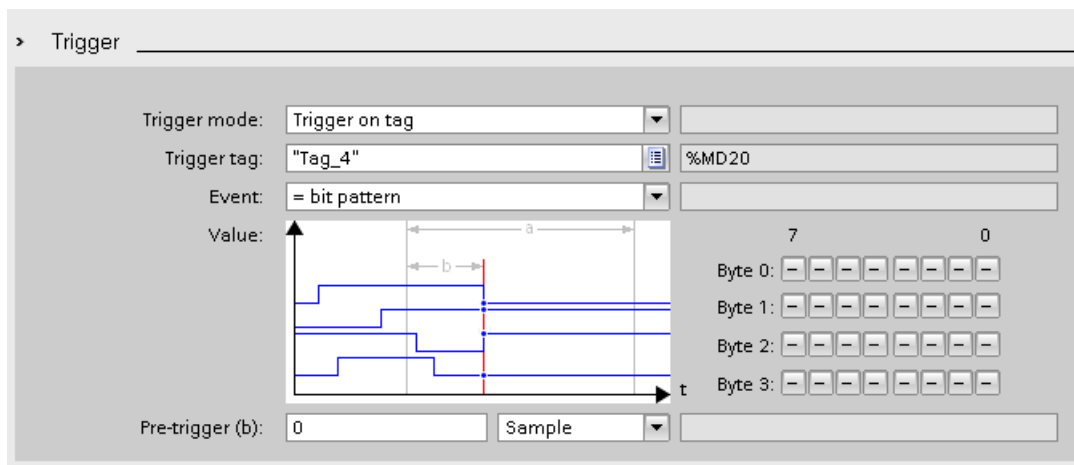

The recording starts when the value of the trigger is not equal to the value configured for this event.

### **"= bit pattern"**

Supported data types: Integers (Page 6691)

The recording starts when the value of the trigger matches the bit pattern configured for this event.

The following figure shows the setting options for a "bit pattern":

It is possible to switch between the icons by clicking the respective button.

The following table shows the icons:

Icon	Description
	Bit is not evaluated
	Bit is checked for FALSE
	Bit is checked for TRUE

### "<> bit pattern"

Supported data types: Integers (Page 6691)

The recording starts when the value of the trigger does not match the bit pattern configured for this event.

### See also

Configuring the trigger conditions (Page 6700)

### Configuration

#### Trace configuration - overview

The configuration of the recording conditions and the signals to be recorded is device-specific.

## Requirement

A trace configuration has been created and selected in the "Trace configurations" table of the trace handling.

## Procedure

The following table shows the procedure for configuring.

Step	Description
1	Documentation of the configuration (optional) Enter a comment and an author for the configuration.
2	Selecting signals (Page 6699) Select the signals to be recorded in the "Signals" area.
3	Configuring the recording cycle and duration Select a recording time, a cycle and the duration in the "Recording conditions" area.
4	Configuring the trigger conditions (Page 6700) In the "Recording conditions" area, select whether the recording is to be performed immediately or depending on a trigger condition.

## Selecting signals

### Requirement

- A trace configuration has been created and selected in the "Trace configurations" table of the trace handling.
- The "Signals" area is open in the Inspector window.

### Procedure

To configure the signals to be recorded, proceed as follows:

1. Click in the first empty line of the table.
2. Click in the first empty line of the "Name" column.
3. Select a signal. The following options are available:
  - In the "Name" column, click the  button and select a tag.
  - Enter the symbolic tag name in the cell in the "Name" column.
  - Enter the address directly in the "Address" column.
  - Drag a signal to the table using drag-and-drop.
4. Click in the "Display color" column and select a color for the display of the signal.
5. Click in the "Comment" column and enter a comment for the signal.
6. Repeat the procedure from step 1 until all the signals to be recorded have been entered in the table.

## Configuring the recording cycle and duration

### Requirement

- A trace configuration has been created and selected in the "Trace configurations" table of the trace handling.
- The "Recording conditions" area is open in the Inspector window.

### Procedure

To configure the cycle and the duration of a recording, proceed as follows:

1. Click the  button for the recording time.
2. Select an OB for the recording time (Page 6687).
3. Select a unit for the reduction factor in the drop-down list box for "Record every".
4. Enter the factor for the reduction in the input field for "Record every".
5. Select a unit in the drop-down list box for "Recording duration".
6. Specify the recording duration.  
The following options are available:
  - Enter a value for the duration in the input field for "Recording duration".
  - Activate the "Use max. recording duration" checkbox.

## Configuring the trigger conditions

### Requirement

- A trace configuration has been created and selected in the "Trace configurations" table of the trace handling.
- The "Recording conditions" area is open in the Inspector window.

### "Record immediately" trigger condition

To start the recording immediately, proceed as follows:

1. Select the "Record immediately" entry in the drop-down list for "Trigger mode".  
The input fields for the trigger tag are hidden.

### "Trigger on tag" trigger condition

To start the recording depending on a condition, proceed as follows:

1. Select the "Trigger on tag" entry in the drop-down list for "Trigger mode".
2. Select a trigger tag. The following options are available:
  - Click the  button for the trigger tag and select a tag.
  - Enter the address or the symbolic name of the tag directly in the input field for the trigger tag.

A drop-down list with events and input fields is displayed. The display depends on the data type of the tag.
3. Configure the event.
4. Select a unit for the pre-trigger in the drop-down list for "Pre-trigger".
5. In order to record a period before the trigger event, enter a value greater than 0 in the input field for the pre-trigger.

---

#### Note

The trigger condition is checked in every cycle irrespective of the setting in "Record every". To reliably identify the trigger, the trigger signal must be present for at least one full cycle.

---

## 13.7 Establishing a remote connection with TeleService

### 13.7.1 Basics of working with TeleService

#### 13.7.1.1 Introduction to TeleService

##### Introduction

TeleService gives your controller telecommunication capability. You can manage, control and monitor distributed plants centrally by means of remote connections.

## Scope of functions

TeleService allows you to use the range of TIA portal functions via a telephone network or an Internet connection by establishing a remote connection to a remote plant. The online connection allows you to edit a remote plant as usual with the TIA Portal.

## Advantages

Using TeleService offers the following advantages:

- You can easily access even remote sections of plants and include them in a complete system.
- You can offer rapid help and support in the event of faults in a remote system without having to go there yourself.
- You can employ your resources effectively.
- It significantly reduces costs.
- It can significantly reduce plant downtimes.
- It improves the efficiency of your plant.

## See also

TeleService functionality (Page 6702)

### 13.7.1.2 TeleService functionality

#### TeleService fields of application

TeleService offers the following the fields of application:

- **Access to remote systems (remote maintenance):**  
You can manage, control, and monitor remote systems centrally by means of remote connections.  
This is possible with an S7-300/400 CPU, an S7-1200 CPU and an S7-1500 CPU and a TS Adapter MPI or a TS Adapter IE.
- **Establishing connections from and to remote systems (PG-AS remote link):**  
You can use PRODAVE MPI V5.0 and newer to establish a remote connection to a remote system, and the communications instruction "PG\_DIAL" to establish a remote connection from a remote system.  
This is possible with an S7-300/400 CPU and a TS Adapter MPI.
- **Data exchange between systems (AS-AS remote link):**  
The communications instruction "AS\_DIAL" allows two automation systems to exchange process data over the telephone network.  
This is possible with an S7-300/400 CPU and a TS Adapter MPI.

- **Sending a text message from a system:**  
An automation system can send a message (SMS) via a GSM wireless modem using the communications instruction "SMS\_SEND" .  
This is possible with an S7-300/400 CPU and a TS Adapter MPI.
- **Sending an email from a system**  
An automation system can also send an email with the following communications instructions and a TS Adapter IE .
  - S7-300/400 CPUs (CPU S7-31x-2PN/DP or CPU 41x-3PN/D) use the instruction "AS\_MAIL"
  - S7-1200 CPUs use the instruction "TM\_MAIL"
  - S7-1500 CPUs use the instruction "TMAIL\_C"

### 13.7.1.3 Telephone book at TeleService

#### Introduction

By double clicking the "phone book" folder in the project tree you open the phone book editor displaying the TeleService phone book.

Each version of the TIA Portal has its own "global phone book". If a global phone book from an earlier version of the TIA Portal is found in a more recent version of the TIA Portal, you will be asked once if you want to import this phone book.

This gives you the advantage of being able to import the system data from the previous version into the more recent version of the TIA Portal.

#### Global phone book properties

The global phone book is used in TeleService to manage specific system data that are required to establish a remote connection.

When you open the phone book for the first time, you will see an empty phone book with all available columns; in all other cases, the last phone book edited is displayed.

You can enter any number of systems in a phone book. Systems contain the data required for establishing a remote connection, for example, the name and location of the device and the phone number to be dialed, along with all country-specific details. With VPN connections, you can enter an IP address or a DNS name instead of the phone number.

The TS adapters used for establishing the connection are distinguished by color, depending on whether a TS Adapter MPI or a TS Adapter IE is used for establishing the connection.

Working with the phone book (Page 6704)

## 13.7.2 Working with the phone book

### 13.7.2.1 Basics on working with the phone book

#### Working with the phone book

You have the following options when working with a phone book:

- Open phone book
- Save phone book
- Import phone book data
- Export phone book data
- Printing the phone book
- Use phone book data to establish a remote connection

You can implement these functions simply and easily by using the buttons in the phone book toolbar.

---

#### Note

##### Access to phone books

The phonebook is user specific in TeleService. However, it is not possible to access the global phone book with more than one instance of the TIA portal at the same time.

---

#### See also

Open phone book (Page 6706)

Saving phone book (Page 6707)

Exporting phone book data (Page 6709)

Printing the phone book (Page 6710)

Structure of the phone book (Page 6704)

### 13.7.2.2 Structure of the phone book

#### Introduction

A global phone book in TeleService is used to manage the data you require for establishing a remote connection. Once you have created the connection data and saved it in the phone book, you can access it each time you want to establish a remote connection.

## Structure of the phone book

The integrated global phone book in TeleService contains the following columns:

Column name	Meaning
System name	Enter a name for your system.
Adapter type	Select the TS Adapter type used in the drop-down list: TS Adapter MPI or TS Adapter IE.
Connection type	Select the required connection type: Dial-up connection or VPN connection.
Area code	Enter the required area code. This column is only active with dial-up connections. This column cannot be edited for VPN connections.
Phone number/remote address	Enter the required connection data for establishing the remote connection. For dial-up connections, this can be a phone number, and for VPN connections a DNS name or an IP address.
Fingerprint	Enter the corresponding fingerprint for establishing a VPN connection to the TS Adapter IE Advanced.
Country	Enter the country code. This column is only active with dial-up connections. This column cannot be edited for VPN connections.
User name	Enter the user name you have logged on under.
Password	Enter the password for this user name.
Group	Enter the group if you have carried out grouping.
Company	Enter the company to be contacted.
Department	Enter the relevant department.
Street	Enter the street.
Town/City	Enter the town or city to which the remote connection is to be established.
Comment	Enter a comment if required.

## Showing or hiding columns

You can show or hide the individual columns. To do so, select the required column header and open the shortcut menu with the right mouse button.

### 13.7.2.3 Symbols in the phone book

#### Meaning of the TeleService icons

The following table shows the meaning of the TeleService icons:

Symbol	Meaning
	Open the global phone book
	Imports a phone book
	Exports a phone book

Symbol	Meaning
	Establishes a remote connection
	Terminates the active remote connection
	Establishes a remote connection or terminates it
	Displays the connection to a TS Adapter IE in the phone book
	Displays the connection to a TS Adapter MPI in the phone book
	Adds a new row to the phone book
	Inserts a new row in the phone book

### 13.7.2.4 Manage phone book

#### Open phone book

#### Opening phone books

To open the phone book, follow these steps:

1. In the project tree, double-click on the "Phone book" folder under "Online access" > "TeleService".
2. The phone book opens so that you can enter or edit the required system data.

#### Inserting rows in the phone book

#### Inserting rows in the phone book

To insert a new row in the phone book, follow these steps:

1. Select the row in front of which you want to insert a new row.
2. Click the "Insert row" button in the toolbar.

#### Result

A new row is inserted in the phone book above the selected row.

## Showing and hiding columns in the phone book

### Showing and hiding columns

To show or hide columns in the phone book, follow these steps:

1. Click a column header.
2. In the shortcut menu, select the "Show/hide columns" command.  
The selection of available columns is displayed.
3. To show a column, select the column's check box.
4. To hide a column, clear the column's check box.

### Result

The respective columns are shown or hidden when displaying the phone book.

## Saving phone book

### Saving phone books

When you exit the phone book editor or leave the TIA portal, you are asked whether you want to save the global phone book.

Click "Yes" to save the phone book.

## Importing phone book data

### Introduction

It is possible to import the phone book data from an external file or from an older version of the TIA Portal.

### Requirement

You have already created an import-capable phone book file.

You have already created a phone book with an older version of the TIA Portal.

### Importing phone book data from a phone book file

To import phone book data from a phone book file, follow these steps:

1. Open the "TeleService" folder under "Online access" in the project tree.
2. Double-click on the "Phone book" folder.
3. Click the "Import" button in the toolbar.

### 13.7 Establishing a remote connection with TeleService

4. Confirm the prompt asking if you want to save the current state of the phone book with "Yes", if applicable, and specify the location for storing the phone book in the dialog that follows.
5. If you do not want to save the current state of the phone book, answer the prompt with "No". In the subsequent dialog, select the phone book file to which the current phone book should be stored.
6. Close the dialog box with "OK".

## Result

The imported phone book data is displayed in the global phone book.

---

### Note

#### Defining dialing rules

Dialing rules must be defined before the "area code" and "country" columns in the imported phone book can be edited for dial-up connections.

To define dialing rules, follow the link in the history.

---

## Importing phone book data from an older version of the TIA Portal

To import phone book data from an older version of the TIA Portal, follow these steps:

1. Open the "TeleService" folder under "Online access" in the project tree.
2. Double-click on the "Phone book" folder.
3. Click the "Import" button in the toolbar.
4. Confirm the prompt asking if you want to save the current state of the phone book with "Yes", if applicable, and specify the location for storing the phone book in the dialog that follows.
5. If you do not want to save the current state of the phone book, answer the prompt with "No".
6. Enter the following path in the dialog that follows: "%appdata%\siemens\automation\TeleService\GlobalTeleServicePhoneBook.tel".
7. Close the dialog box with "OK".

## Result

The phone book data imported from the older version of the TIA Portal is displayed in the global phone book.

---

**Note**

**Defining dialing rules**

Dialing rules must be defined before the "area code" and "country" columns in the imported phone book can be edited for dial-up connections.

To define dialing rules, follow the link in the history.

---

**See also**

Defining dialing rules (Page 6710)

**Exporting phone book data**

**Introduction**

It is possible to export phone book data to an external file.

**Requirement**

You have already created a phone book under TeleService with the corresponding system data.

**Procedure**

Proceed as follows to export the phone book data:

1. Open the "TeleService" folder in project tree.
2. Double-click on the "Phone book" folder.
3. Click the "Export" button in the toolbar.
4. In the next dialog box, select where the current phone book is to be exported.
5. Close the dialog box with "OK".

**Result**

The exported phone book data are saved in the specified export file.

## Printing the phone book

### Printing phone books

You can print out all or some of the data in a phone book.

#### Proceed as follows:

1. Open the phone book.
2. Select the **Phone book > Print** menu command or click on the appropriate button in the toolbar. The "Print" dialog will open.
3. Specify whether you wish to print the complete phone book or just part of it and set all other options.
4. Start the print job with "OK".

#### Result

The phone book data is printed on the default printer. If the printout is more than one page long, an identifier is printed after the page number at the bottom right corner of the page to indicate that there is another page. The last page does not have this symbol, indicating that no more pages are to follow.

## Defining dialing rules

### Procedure

To define location-specific dialing rules, follow these steps:

1. Open the folder "Online access" in the TIA portal and select the "TeleService" folder.
2. Use the shortcut menu to access the "TeleService" properties.
3. In the dialog that follows, open the "Advanced settings" tab and activate the "Use dialing rules" option.
4. Click the "Adapt" button.
5. In the dialog that follows, enter the required location information for connection establishment.
  - For new locations, enter the country or region and the corresponding area code.
  - If required, set the correct destination code and pre-dial line for local/long-distance calls.
  - Select your chosen dialing mode for the location.
6. Exit the dialog by clicking "OK".
7. In the next dialog, select the location from which you wish to dial, and click "OK".

8. In the TeleService dialog that follows, check that the correct location appears under "Location".
9. Confirm your entries by clicking "OK".

---

**Note**

**Modem operation on a local loop or extension**

You do not need to specify a pre-dial line if you operate your modem on a local loop (main telephone line). The fields for the pre-dial lines for local calls and long-distance calls must be empty.

If you operate your modem on an extension, you should enter the pre-dial lines which need to be called to access a local loop.

---

### Example of the use of dialing rules

The following example illustrates the use of location-specific dialing rules for the city of Karlsruhe in Germany.

- In the TeleService phone book, you enter the phone number "1234567", without the area code and without the country code.

**Result:**

The phone number "1234567" is always dialed, irrespective of the location of the caller.

- In addition to the phone number "1234567", you enter the location-specific dial parameters for the Karlsruhe area code "0721" and the country code "+49" for Germany in the TeleService phone book.

**Result:**

"1234567" is dialed from Karlsruhe.

"07211234567" is dialed from other towns in Germany.

"00497211234567" is dialed from other countries.

---

**Note**

**Display in the phone book**

The "area code" and "country" columns in the TeleService phone book can only be edited once you have defined the dialing rules as detailed above.

---

### 13.7.3 Remote connections as dial-up connections

#### 13.7.3.1 Basics for establishing a dial-up connection

##### Using a TS Adapter for dial-up connections

A TS Adapter is needed for establishing a remote dial-up connection using TeleService.

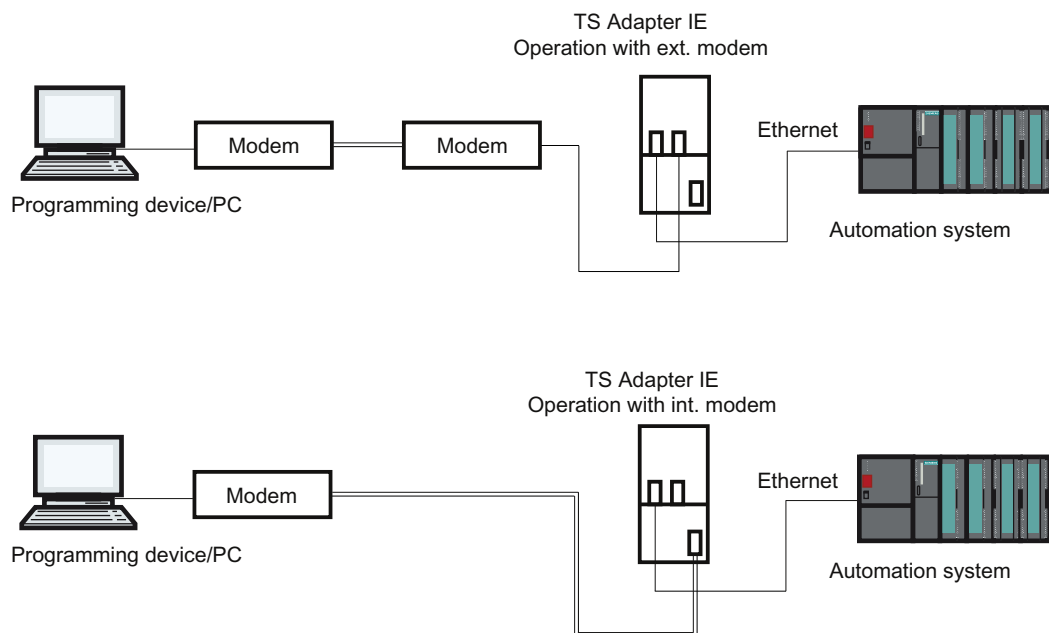

The TS Adapter is used to prepare an automation system for use with TeleService by connecting it to a telephone network via a modem. The TS Adapter has an integrated parameter memory in which a parameter set for TeleService operation is stored.

With the function "export adapter parameter", different parameter sets can be saved in external files, and reloaded in the TS Adapter via the function "import adapter parameter".

##### Establishing a remote dial-up connection

You can choose between a number of different TS Adapters, each of which offers a different functionality and different connection options.

The figure below shows two possible configurations for establishing a dial-up connection to a system with the TS Adapter IE.

### Overview of possible TS Adapter:

The TS Adapter comes in the following versions:

- TS Adapter II (also designated "TS Adapter MPI")
- TS Adapter IE Standard (also designated "TS Adapter IE")
- TS Adapter IE Basic (also designated "TS Adapter IE")

### Designation "TS Adapter"

In the following pages, the designation "TS Adapter" stands for all versions. The relevant product designation is listed beside information which only applies to a specific version, for example, "TS Adapter II" or "TS Adapter IE Standard".

---

#### Note

For more detailed information on your TS Adapter, please refer to the documentation supplied with the TS Adapter.

---

### See also

Short description of the TS adapter MPI (Page 6721)

Short description of the TS adapter IE (Page 6728)

Exporting adapter parameters (Page 6727)

Importing adapter parameters (Page 6728)

## 13.7.3.2 Telephone networks and modems

### Supported telephone networks and modems

#### Telephone networks which can be used

TeleService can be used with digital networks (ISDN), analog networks and wireless networks (with GSM technology). This version supports a remote connection to a TS Adapter.

#### Modem support

TeleService has been implemented to be independent of the modem. This means that all standard modems which can be installed in the Windows Control Panel and are visible as modems can also be used by TeleService.

The choice of modem type is determined primarily by the existing hardware of the programming device/PC and the telephone network to be used.

**The following modem types/media are supported:**

- Modems (external modems at the COM interface, internal modems and PCMCIA cards)
- External ISDN adapter at the COM interface or USB interface
- Internal ISDN adapter with virtual COM interface (for example AVM CAPI port)
- External ISDN modems (ISDN adapter with integrated analog modem functionality) at the COM interface or USB interface
- Radio network modems with GSM technology, PCMCIA adapter card or data cable and mobile phone

**Gateways**

Gateways between the various telephone networks are in principle possible. Remote connections from an ISDN adapter to an analog modem and vice versa only function with special ISDN telephone adapters.

**Performance in telephone networks**

The data throughput of a remote connection depends on the modem and telephone network used and the quality of the telephone line.

**Installing the local modem**

**Introduction**

If you have already installed a modem for data transfer in your operating system, this modem can also be used for TeleService.

If a modem has not yet been installed for your operating system, one must be installed before you can establish a remote connection with TeleService.

**Procedure**

Proceed as follows:

1. Make sure your programming device/PC and the modem are switched off.
2. Physically connect the external modem to a COM or USB interface on your programming device/PC. You can also install an internal modem or a PCMCIA card in accordance with the manufacturer's specifications.
3. Now switch on the modem and then the programming device or the PC.

## Result

Plug-and-play modems are recognized and installed automatically by the operating system. Dialogs will take you through the installation procedure.

---

### Note

#### Modems without plug-and-play

If your modem is not recognized automatically when switched on, you will have to install it yourself using the Control Panel.

Please refer to the information in the documentation supplied with your modem.

---

## Connecting and configuring the remote modem

### Introduction

A modem must also be connected to the remote system before you can work with TeleService. This modem is designated the "remote modem".

### Configuring the remote modem

The modem receives all parameters required for operation from the TS Adapter connected. These include data for initializing the modem and settings for serial transmission between the TS Adapter and the modem.

The data required for the remote modem is specified during the configuration of the TS Adapter.

The modem may be internal or external depending on the TS Adapter used.

### How to connect a TS Adapter with an internal modem

1. Switch off the TS Adapter.
2. Connect the TS Adapter to the automation system.
3. Connect the TS Adapter to the telephone line.
4. Switch on the TS Adapter.

### How to connect a TS Adapter with an external modem

1. Switch off the modem.
2. Connect the TS Adapter to the automation system.
3. Connect the TS Adapter to the modem using a modem cable.
4. Connect the modem to the telephone line.
5. Switch on the modem.
6. Switch on the TS Adapter.

---

**Note**

**Please note the following information on configuring the remote modem:**

- The default parameters for the modem and the serial port set in the TS Adapter should in most cases ensure successful operation; changes in the parameter assignment will only be needed in rare cases.
  - You need only change the parameter assignment of the TS Adapter if a modem connection is not established or if factory settings are to be adapted or optimized.
  - TS Adapter parameter assignment can be changed via either a direct or a remote connection.
- 

### 13.7.3.3 Access protection for dial-up connections

#### Access protection information

##### Introduction

When you assign the parameters for your TS adapter, you can restrict access to the parameters of the TS adapter and access to remote systems.

##### Scope of access protection

Access protection only exists for remote connections; TS adapter parameter assignment can be accessed at any time in direct connection mode.

Access protection also exists in direct connection for the TS adapter IE.

##### Access protection information

The TS Adapter MPI is not delivered with access protection activated. There is a default password for the TS adapter IE.

The first user who assigns the parameters for this adapter can therefore activate access protection by defining the password for a user and/or a callback number.

This is a multi-level access protection with several users, each with or without administrator rights. For the TS adapter MPI there is only one administrator and no more than two users.

For a modem connection, only an administrator can define the two users and change and, if necessary, delete their settings. Those logged in as users can only change their own passwords and their own callback numbers. However, with the TS adapter MP you can access the process of assigning parameters of the TS adapter in direct connection, without restriction.

## Advantages

Access protection offers the following advantages:

- Unauthorized access by persons outside the system is almost impossible.
- The plant operator bears most of the telephone costs.

## TeleService callback options

### Callback variants

The costs of a telephone connection are normally borne by the caller who establishes the dial-up connection.

TeleService can, however, be used so that after a short initial connection the modem connection is established again in the opposite direction, in other words initiated by the TS Adapter (callback). In this case, the plant operator bears the costs of the callback.

### There are two callback variants in TeleService:

1. Callback to a number specified during connection establishment.
2. Callback to a number stored on the TS Adapter.

## Levels of protection

### Introduction

You can set up one of two possible levels of access protection for TeleService access to the TS Adapter. Different options are available with each protection level.

### Access protection options

#### Access protection level 1:

The TS Adapter is protected by the user name and password. You can access the TS Adapter via any telephone line and specify any callback number during connection establishment.

#### Access protection level 2:

The TS Adapter is protected by the user name, password, and the callback number. You can only access the TS Adapter from one telephone connection per user.

The table below sets out the above conditions for the various protection levels:

Level of access protection	Administrator/User password	Callback number
1	enter	do not enter
2	enter	enter

### Logging on to TS Adapter

When you log on to the TS Adapter and after you have set up access protection, enter your user name, the corresponding password and, if desired, a callback number:

Level of access protection	Administrator/User password	Callback number
1	enter	do not enter or enter any callback number
2	enter	do not enter

If you have entered a callback number during connection establishment (access protection level 1) or stored a callback number in the TS Adapter (access protection level 2), the modem connection will be terminated and the TS Adapter will call back the given number.

### Setting up access protection and callback number for the TS adapter

#### Introduction

During the parameter assignment for the TS adapter MPI in TeleService, you can set up access protection and a callback number for the parameter assignment of the adapter and connection to the remote system. The following describes the parameter assignment for a TS adapter MPI. The parameter assignment of a TS adapter IE is carried out in analog. The specific method is described in the web help of this adapter.

#### Requirement

A TS Adapter MPI is connected to your computer and is displayed in the project tree under "Accessible nodes".

#### Procedure

To set up access protection for the TS adapter, proceed as follows:

1. Click on the command "Assign TS Adapter MPI parameters" in the project tree.
2. Open the "Access security" tab.
3. Enter a password for your user name and/or number that you want the modem to call back following logon.
  - If you are an administrator, you can change all the settings for administrators and users, and delete or create users.
  - If you are logged on as a user, you can only change your own settings (password and callback number).
4. Confirm all entries before exiting the dialog with "OK".
5. Click the "Yes" button to confirm the following query.

## Result

The parameter assignment for the access protection and the callback number is saved in the non-volatile memory of the TS adapter MPI.

---

### Note

#### Important points to note when setting up access protection:

- The settings in the "Modem" tab must correspond to the conditions at the plant if callback functionality is to be guaranteed.
  - Entering an incorrect callback number in the role of "ADMIN" user will mean you are no longer able to access the TS Adapter MPI over a remote connection!
  - Test the callback number before you enter it as the "ADMIN" user by calling the given callback number during connection establishment (access protection level 1).
- 

## Complete a callback in TeleService

### Callback options

Two different callback variants can be set up in TeleService.

The following callback options are available:

- Callback to a number specified during connection establishment.
- Callback to a number stored on the TS Adapter

### Callback to a number specified during connection establishment

1. In the project tree of the TIA portal, open the "Online access" folder.
2. Click on the "TeleService" folder it contains.
3. Double-click the "Set up/close remote connection" entry. The "Set up remote connection to the remote system" dialog opens.
4. In the "Adapter type" drop-down list, select the adapter type used.
5. Select the "dial-up connection" under "Connection type" if it is not already selected.
6. Select the modem you are using under "Local Settings".
7. Enter the phone number to be dialed in the appropriate box or open the phone book by clicking on the button behind it and take the desired phone number from the phone book.
8. Enter your user name and associated password of the TS adapter.
9. If you want a "Connection setup with callback", select the appropriate option button.

### 13.7 Establishing a remote connection with TeleService

10. Click the "Connect" button to establish the required remote connection. This button only becomes active when you have entered all the parameters needed to establish a remote connection. Any remote connection is displayed under "Status".
11. Enter the desired callback number in the dialog that follows.

#### Result

The remote connection to the desired system is made with callback.

The connected system is shown with the corresponding icon in the project tree.

---

#### Note

This procedure is useful if the costs of the modem connection are to be borne by the plant operator and if the actual callback number is not fixed, i.e. callback is not always to the same receiver. It is particularly useful for mobile users.

---

#### Callback to a number stored on the TS Adapter

1. Assign the parameters for the desired callback number in the TS adapter.
2. Establish a connection to the TS adapter as described above, and observe the following features:
  - Enter the user name and password for which the callback number parameters are assigned in the TS adapter.
  - The check box "Establish a connection with callback" does not have to be selected, since the callback number is already known by the TS adapter.

#### Result

Callback to a number stored on the TS adapter has been established. If a remote connection is established, the callback occurs from the remote system.

---

#### Note

This procedure offers the highest level of access protection. However, it does pose a risk: if the callback number stored on the TS Adapter is not correct, it will no longer be possible to access the TS Adapter over a modem connection. The device can in such a case only be put back into operation by changing the parameter settings on site.

---

### 13.7.3.4 TS adapter MPI

#### Short description of the TS adapter MPI

#### TS Adapter MPI:

The designation "TS Adapter MPI" is a collective term for all TS Adapter with an MPI/DP interface.

The TS Adapter MPI comes in the following versions:

- As TS Adapter I (parameters cannot be assigned via the TIA Portal)
- as TS Adapter II

The table below provides a short description of the functionalities. For detailed information on your TS Adapter, please refer to the documentation supplied with your TS Adapter.

TS Adapter II:	
Direct connection	Connection via the Universal Serial Bus (USB). The firmware can be replaced. The modem is integrated or can also be connected as external modem. The TS Adapter II switches automatically between the modems. As long as no external modem is connected, the adapter will use the internal modem.
There are two variants	<ul style="list-style-type: none"> <li>• With internal analog modem. An external modem can also be connected to the RS232 port.</li> <li>• With internal ISDN adapter. An external modem can also be connected to the RS232 port.</li> </ul>

#### Use of the designation "TS Adapter"

For TeleService the designation "TS Adapter" is the generalization for all versions. The relevant product designation is listed beside information which only applies to a specific version of a TS Adapter, for example, "TS Adapter II", "TS Adapter IE Standard" or "TS Adapter IE Basic".

#### How the TS adapter MPI works

#### How the TS Adapter MPI Works

In line with the configuration, the TS Adapter MPI connects the serial port or USB port of your programming device/personal computer (direct connection) or the serial port of a modem (modem connection) to the MPI/PROFIBUS network of your automation system.

The TS Adapter MPI has a non-volatile memory. Parameters for the following functions are stored in this memory:

- The MPI/PROFIBUS network (network parameters)
- The mode of the modem used

### 13.7 Establishing a remote connection with TeleService

- The serial port to the modem
- Access protection

#### Default parameter assignment

The TS Adapter comes with default parameter assignment. The parameters can be set and saved to the non-volatile memory of the TS adapter in a parameter assignment session.

When "Direct connection" is configured, the TS Adapter will only use the network parameters for access to the MPI/PROFIBUS network.

In the "Modem connection" configuration, all the parameters stored on the TS Adapter will be activated.

---

#### Note

For more detailed information on the configuration of your TS Adapter, please refer to the documentation supplied with it.

---

#### Operating a TS adapter MPI in direct connection mode

##### Direct connection with TS Adapter MPI

The direct connection is used to assign the parameters of the TS Adapter MPI. The same configuration also allows you to go online in the TIA Portal and thereby check the configured MPI/PROFIBUS parameters for bus compatibility. This means that (as with a PC adapter) SIMATIC S7/C7 systems can be accessed via the MPI/DP interface without an MPI/PROFIBUS module occupying a slot for a programming device/PC.

Access protection for the TS Adapter is not active in direct connection configuration. This means that the parameter assignment of the TS Adapter can be changed without any problems, for example by importing adapter parameters.

---

#### Note

##### Display of the TS Adapter MPI in the TIA Portal

As soon as you have connected a TS Adapter MPI with the PG/PC using the USB port, the "TS Adapter" folder is displayed in the project tree of the TIA Portal.

When you open the folder, you can assign the parameters of the connected TS Adapter MPI via the following dialog.

---

#### Establishing the direct connection for TS Adapter MPI

Direct connection mode means there is a direct connection via the TS Adapter MPI between the programming device/personal computer on which TeleService is installed and the automation system. No modem is required.

The figure below shows the configuration of the TS Adapter MPI with a direct connection.

## Operating a TS adapter MPI in modem connection mode

### Introduction to the modem connection with TS Adapter MPI

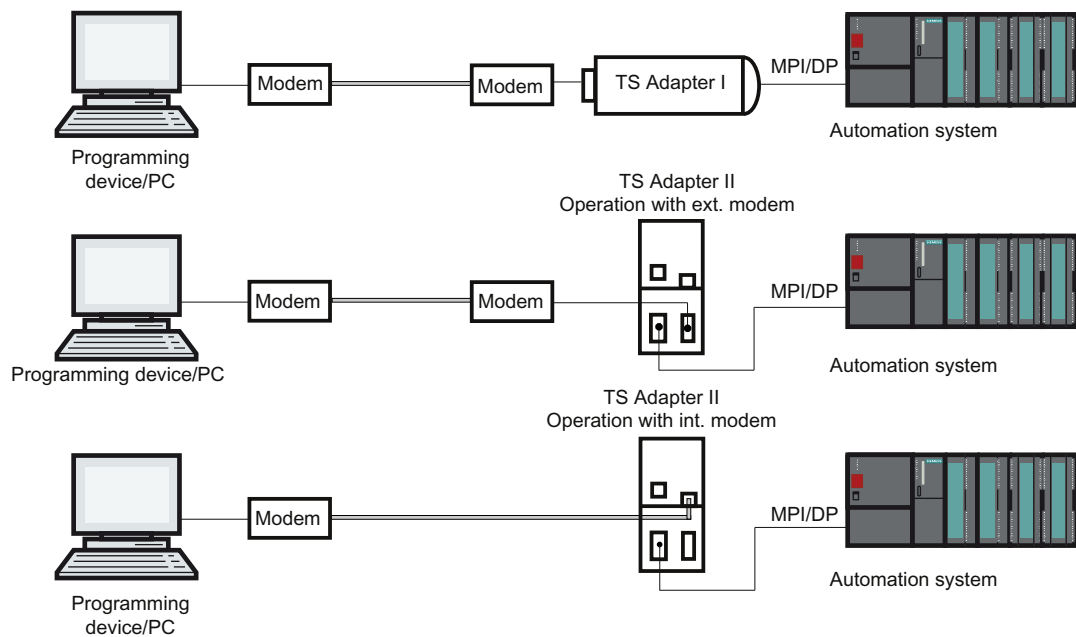

This configuration allows you to dial into a remote system. To do this, you establish a remote connection to a remote system using TeleService on a telephone network. Over the established modem connection, you can then work with the selected plant as usual with the TIA Portal.

### Establishing a modem connection with TS Adapter MPI

This connection between the programming device or PC on which TeleService is installed and the automation system in which the TS Adapter MPI is inserted in the MPI/DP interface is made through a modem route.

The configuration therefore includes the programming device or PC via the telephone network and the TS Adapter MPI on the MPI/DP interface of the automation system.

The figure below shows the structure of the modem connection.

**Note**

**Parallel operation between direct and modem connection**

The TS Adapter II has two connections for communication with PG/PC, both of which can be connected at the same time. At the same time, connect the USB interface with the PG/PC and the modem interface with the telephone network.

In this configuration you can either use the direct or the modem connection.

A parallel operation is **not** possible!

**TS adapter MPI configuration options**

**Useful information on configuring the TS Adapter MPI**

The TS Adapter MPI can be configured in both direct connection mode and via an existing remote connection.

The following parameter assignment options are available:

- Reconfiguration (Page 6725)
- Restoring default parameter assignment (Page 6726)
- Importing adapter parameters (Page 6728)
- Exporting adapter parameters (Page 6727)
- Setting up access protection (Page 6716)

## Parameter assignment

Configure your TS Adapter in accordance with the documentation supplied with the TS Adapter. It will detail the exact procedure for parameter assignment.

---

### Note

#### Please note the following when configuring the TS Adapter MPI

- If you change the current parameter settings when there is an established remote connection, there is a risk it will not subsequently be possible to establish a modem connection with the modified parameters. The TS Adapter MPI can in this case only be configured in direct connection mode.
  - This means that either parameter assignment must be carried out with a programming device/personal computer at the plant location or the TS Adapter MPI must be brought to the location of the local programming device/personal computer in order to be configured.
- 

## Positive acknowledgement

During parameter assignment, the data is written to the non-volatile memory of the TS Adapter MPI. The parameter assignment process is not acknowledged positively until all precautions have been taken to ensure that parameter changes have been carried out correctly and will thus survive a power failure.

## Changes become effective for the TS Adapter MPI as follows:

- The serial parameters, the modem parameters and the parameters for access protection are activated once the remote connection has been terminated.
- The modified network parameters are activated immediately.

## Configuring TS adapter MPI

### Introduction

The TS Adapter MPI can be configured in both direct connection mode and via an existing remote connection in modem connection mode.

The following describes the method for assigning parameters.

### Requirement

A TS Adapter MPI is connected to your computer and the folder "TS Adapter" is displayed in the project tree under "Online access".

## Procedure

To assign the parameters for the TS Adapter MPI im Direktanschluss please proceed as follows:

1. Double-click the "Online access" folder in the project tree.
2. Open the required folder:
  - The "TS Adapter" folder for a direct connection.
  - For an existing remote connection, the "TeleService" folder followed by the folder with the required system name.
3. Select the command "Assign TS Adapter MPI parameters". The "Assign TS Adapter MPI parameters" dialog opens.
4. Set the required parameters in the individual tabs of the dialog.
5. Confirm your entries with "OK".

## Result

The configured parameters are saved in the non-volatile memory of the TS Adapter MPI. Parameter assignment is then complete.

## Restoring default parameter assignment for TS adapter MPI

### Introduction

You can restore the default, factory state parameters of the TS Adapter MPI.

### Requirement

A TS Adapter MPI is connected to your computer and is displayed in the project tree under "Online access" in the "TeleService" folder.

## Procedure

Proceed as follows to restore default parameters for the TS Adapter MPI:

1. Open the "TeleService" folder in project tree.
2. Double-click the "TS Adapter MPI" folder.
3. Select the command "Assign TS Adapter MPI parameters". The "Assign TS Adapter MPI parameters" dialog opens.
4. Click the "Reset" button under "General".
5. Confirm your entries with "OK".

## Result

The TS Adapter MPI default parameters set on delivery are restored.

## See also

TS adapter MPI configuration options (Page 6722)

## Exporting adapter parameters

### Introduction

You can export the configuration of a TS Adapter MPI to an external file. The configuration saved in this file can be imported in turn into any number of TS Adapter MPI.

This can for example be useful if you want to assign identical parameters to multiple TS Adapter MPI or if you want save, document or distribute the parameter set.

### Requirement

A TS Adapter MPI is connected to your computer and is displayed in the project tree under "Online access" in the "TeleService" folder.

### Procedure

To export the adapter parameters of a TS Adapter MPI:

1. Open the "TeleService" folder in project tree.
2. Double-click the "TS Adapter MPI" folder.
3. Select the command "Assign TS Adapter MPI parameters". The "Assign TS Adapter MPI parameters" dialog opens.
4. Click the "Export" button.
5. A window will open in which you can select the file to which you wish to export the configuration of the TS Adapter MPI.
6. Confirm with "Save".

## Result

The parameters of the TS Adapter MPI are saved in the specified file (\*.tap). The export of the adapter parameters is now complete.

## Importing adapter parameters

### Introduction

You can import the configuration of a TS Adapter MPI from a previously created export file (\*.tap).

The configuration saved in this file can be imported into any number of TS Adapter. This can for example be useful if you want to assign identical parameters to multiple TS Adapter MPI.

You can import parameters locally in direct connection mode or via an existing remote connection in modem connection mode.

### Requirement

A TS Adapter MPI is connected to your computer and is displayed in the project tree under "Online access" in the "TeleService" folder.

### Procedure

To import the adapter parameters of a TS Adapter MPI:

1. Open the "TeleService" folder in project tree.
2. Double-click the "TS Adapter MPI" folder.
3. Select the command "Assign TS Adapter MPI parameters". The "Assign TS Adapter MPI parameters" dialog opens.
4. Click the "Import" button.
5. A dialog will open in which you can select the file to which you wish to import the configuration of the TS Adapter MPI.
6. Confirm the next dialog with "Yes".

### Result

The parameters selected are saved in the non-volatile memory of the TS Adapter MPI. Adapter parameter import is then complete.

#### 13.7.3.5 TS adapter IE

### Short description of the TS adapter IE

#### TS Adapter IE

The designation "TS Adapter IE" is a collective term for all TS Adapter with an Ethernet port.

The TS Adapter IE comes in the following versions:

- as TS Adapter IE Standard
- as TS Adapter IE Basic

The tables below provide a short description of the functionalities. For detailed information on your TS Adapter, please refer to the documentation supplied with it.

<b>TS Adapter IE Standard:</b>
Direct connection by means of Industrial Ethernet (IE). Firmware update possible. Modem integrated or external. The TS Adapter IE cannot automatically switch between modems like the TS Adapter II. Parameters are assigned via a Web interface.
<b>There are 2 variants:</b>
<ul style="list-style-type: none"> <li>• With internal analog modem. An external modem can also be connected to the RS232 port.</li> <li>• With internal ISDN adapter. An external modem can also be connected to the RS232 port.</li> </ul>

<b>TS Adapter IE Basic:</b>
Direct connection by means of Industrial Ethernet (IE). Firmware update possible. Plug-in modules. Parameters are assigned via a Web interface.
<b>There are 4 variants:</b>
<ul style="list-style-type: none"> <li>• TS Adapter IE Basic MODEM: Basic device TS Adapter IE Basic with TS Module MODEM for operation on the analog telephone network.</li> <li>• TS Adapter IE Basic ISDN: Basic device TS Adapter IE Basic with TS Module ISDN for operation on ISDN telephone systems.</li> <li>• TS Adapter IE Basic GSM: Basic device TS Adapter IE Basic with TS Module GSM for operation on the GSM radio network.</li> <li>• TS Adapter IE Basic RS232: Basic device TS Adapter IE Basic with TS Module RS232 for connecting an external modem.</li> </ul>

### Use of the designation "TS Adapter"

"TS Adapter" is used in the TeleService online help as a general designation for all versions. The relevant product designation is listed beside information which only applies to a specific version of a TS Adapter, e.g. "TS Adapter I", "TS Adapter II", "TS Adapter IE Standard" or "TS Adapter IE Basic".

### How the TS adapter IE works

### How the TS Adapter IE works

The TS Adapter IE connects the telephone network or the serial port of a modem with the Industrial Ethernet of your automation system.

The TS Adapter IE has a non-volatile memory. Parameters for the following functions are stored in this memory:

- The mode of the modem used
- The serial port to the modem
- Access protection

### Default parameter assignment

The TS Adapter IE comes with default parameter assignment. The parameters can be set and saved to the non-volatile memory of the TS adapter in a parameter assignment session.

---

#### Note

For more detailed information on the configuration of your TS Adapter, please refer to the documentation supplied with it.

---

## Connection Types

### Connection types of the TS Adapter IE Basic

The following diagrams show the connection types possible with the TS Adapter IE Basic.

#### Direct connection

In the direct connection to the PG/PC, you can set the TS Adapter IE Basic through Ethernet.

---

#### Note

The operation of the TS Adapter IE Basic without a TS module is not permitted.

---

Figure 13-1 Direct connection

### Connection to the telephone network

In order to have a direct connection to the telephone network, you must connect the TS Adapter IE Basic together with one of the following TS modules:

- TS Module Modem
- TS Module ISDN

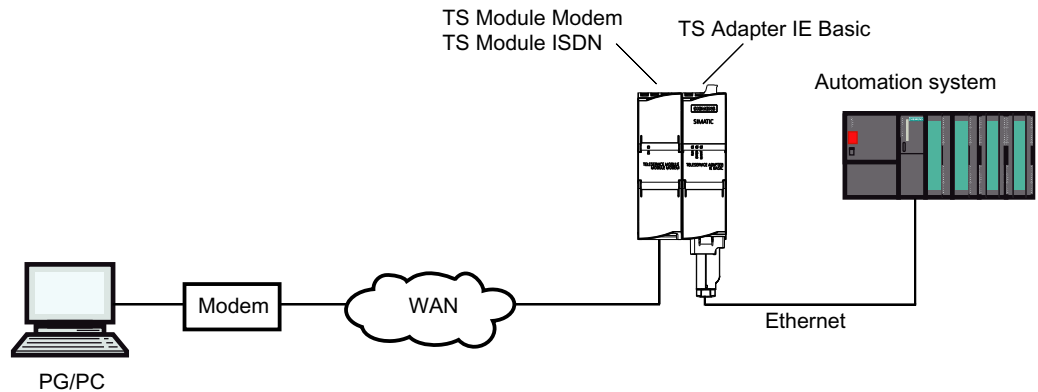

Figure 13-2 Direct connection to the telephone network

More information about the TS modules can be found in the *TS Adapter modular* manual.

### Connection to the GSM network

In order to connect to the GSM network, you must operate the TS Adapter IE Basic together with this TS module:

- TS Module GSM

Figure 13-3 Connection to the GSM network

More information about the TS modules can be found in the *TS Adapter modular* manual.

### Connection to the telephone network through an external modem

For the connection to an external modem, you must operate the TS Adapter IE Basic together with this module:

- TS Module RS232

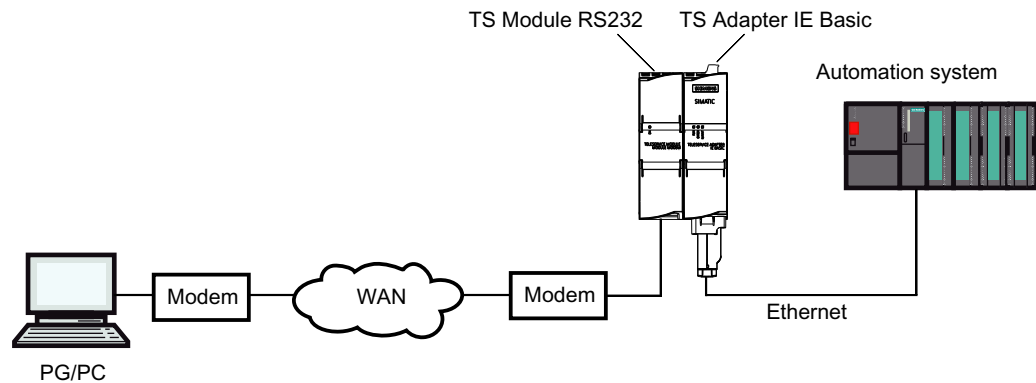

Figure 13-4 Connection to an external modem

More information about the TS modules can be found in the *TS Adapter modular* manual.

### TS Adapter IE parameter assignment options

#### Useful information for configuring the TS Adapter IE

The TS Adapter IE is configured via a Web interface.

Web help associated with the parameter assignment interface is made available for the configuring the TS Adapter IE.

The following parameter assignment options are available:

- Reconfiguration
- Restoring default parameter assignment
- Importing adapter parameters
- Exporting adapter parameters

---

#### Note

##### Parameter assignment

Configure your TS Adapter in accordance with the documentation supplied with the TS Adapter. It will detail the exact procedure for parameter assignments.

---

## Parameter assignment for TS Adapter IE

### Introduction

The TS Adapter IE can be configured in both direct connection mode and via an existing remote connection in modem connection mode.

Both parameter assignment options are described below.

Specific details for assigning parameters of the TS Adapter IE can be obtained from the TS Adapter IE documentation.

### Parameter assignment of the TS Adapter IE in direct connection

#### Requirement

There is a LAN connection to your TS Adapter IE .

The TS Adapter IE Basic is connected to the power supply.

#### Procedure

To assign the parameters for the TS Adapter IE , proceed as follows:

1. In the project tree of the TIA portal, open the "Online access" folder.
2. Double-click on the Ethernet port of your computer.
3. Double-click on the "Display accessible nodes" command. The TS Adapter IE is then displayed.
4. Double-click on the <TS Adapter IE> folder and then on "Online and diagnostic", and assign the desired IP address to the TS Adapter IE in the following dialogs. Please note that the IP address of the PG/PC interface card is located in the same subnet as the IP address that you issue for the TS Adapter IE.
5. Update the view in the project tree for the "Accessible nodes", so that the TS Adapter IE is displayed with the newly allocated IP address.
6. Open the folder <TS Adapter IE> in the device list.
7. Double-click the command "Assign TS Adapter IE parameters". The allocated web interface opens for assigning the TS Adapters IE parameters.
8. Complete the "logon" for the web interface.
9. Set the required parameters in the individual tabs of the dialog.
10. Confirm your entries with "Save settings".

#### Result

The configured parameters are saved in the non-volatile memory of the TS Adapter IE. Parameter assignment is then complete.

## Parameter assignment of the TS Adapter IE using a remote connection

### Requirement

There is an established remote connection to a TS Adapter IE .

### Procedure

1. In the project tree of the TIA portal, open the "Online access" folder.
2. Open the "TeleService" folder followed by the required system folder.
3. Double-click the command "Assign TS Adapter IE parameters". The associated web interface for assignment of the TS Adapter IE parameters opens. The "logon" for the web interface takes place automatically with the login data of the remote connection.
4. Set the required parameters in the individual tabs of the dialog.
5. Confirm your entries with "Save settings".

### Result

The configured parameters are saved in the non-volatile memory of the TS Adapter IE. Parameter assignment is then complete.

### 13.7.3.6 Establishing a dial-up connection to a remote system

#### Establishing a dial-up connection

##### Introduction to establishing a remote dial-up connection

A dial-up connection is established when you use TeleService to dial into a remote system via a telephone network. The programming device/personal computer is connected to the telephone network with TeleService via a modem. At the other end, the automation system is connected to the telephone line via a configured TS Adapter and a modem.

##### Requirements

A local modem is installed and configured.

The TS Adapter is located in the remote system.

A remote modem is installed and parameters have been assigned.

**Proceed as follows:**

1. In the project tree of the TIA portal, open the "Online access" folder.
2. Click on the "TeleService" folder it contains.
3. Double-click the "Set up/close remote connection" entry. The "Set up remote connection to the remote system" dialog opens.
4. In the "Adapter type" drop-down list, select the adapter type used.
5. Under "Connection type", select "Dial-up connection".
6. Select the modem you are using under "Local settings".
7. Enter the phone number to be dialed in the appropriate box or open the phone book by clicking on the button behind it and take the desired phone number from the phone book.
8. Enter your user name and the corresponding password.
9. If you want a "Connection setup with callback", select the appropriate option button.
10. Click the "Connect" button to establish the required remote connection. This button only becomes active when you have entered all the parameters needed to establish a remote connection. Any remote connection is displayed under "Status".

**Result**

The dial-up connection to the desired system is established.

The dialog closes as soon as the dial-up connection is established. The following message appears in the TIA Portal status bar: "Remote connection is established". You can now use the remote connection with TIA Portal and communicate with the automation system.

**Connection cannot be established**

If the connection cannot be established, try to find the cause using the "Notes on troubleshooting".

**Terminating the connection**

Once you have finished editing the remote system, exit the remote connection in the project tree by double-clicking on the entry "Establish/disconnect remote connection".

By exiting the TIA Portal you are also terminating the remote connection.

## Terminating a dial-up connection

### Terminating an active dial-up connection

---

#### Note

##### Terminating the dial-up connection

You should go offline in the TIA Portal before you terminate the remote connection.

---

#### Proceed as follows:

1. Double-click the "Set up/close remote connection" entry in the TIA portal.
2. Confirm the prompt in the dialog that follows with "Yes".

#### Result

The connection is terminated.

## 13.7.4 Remote VPN connections

### 13.7.4.1 Basics for establishing a VPN connection

#### Using a TS Adapter IE Advanced for VPN connections

A TS Adapter IE Advanced is required to establish a VPN connection using TeleService.

#### VPN definition

VPN stands for "Virtual Private Network". This is a private network of computers based on a public network infrastructure.

VPN is used to create a connection that is as secure as possible between devices in a private network at different locations and the gateway of another network.

A VPN device has direct access to the gateway in the other network over an encrypted connection.

## VPN connections

When a VPN connection is established with TeleService, a CA certificate and a unique fingerprint generated from it are used for the unique identification of the TS Adapter IE Advanced. The VPN connection allows a communication that is secure from tapping and manipulation between the remote PC and the TS Adapter.

If you want to establish a VPN connection to multiple remote networks, you will require a separate TS Adapter IE Advanced as an interface for each network. The networks connected by the TS Adapter can use identical IP addresses internally. Only the external IP addresses (WAN) of the TS Adapters need to be different.

Only one VPN connection to a TS Adapter is possible at any one time.

---

### Note

#### Authentication

Please note that the CA certificate exclusively authenticates the TS Adapter IE Advanced.

As in the case of dial-up connections, users are authenticated via the login (user name and password).

Therefore, use only a secure password for the login.

---

## See also

- Establishing VPN connections (Page 6742)
- Terminating VPN connections (Page 6744)

### 13.7.4.2 Basics of CA certificates

#### Introduction

To establish a secure VPN connection with TeleService, you need to generate a CA certificate with a unique fingerprint when you configure the TS Adapter IE Advanced.

You can install this CA certificate as follows on each PC which is to access the TS Adapter IE Advanced:

- Using the automatic download in the TeleService connection dialog, by entering the fingerprint for the CA certificate
- Manually by using the Microsoft® Management Console.

#### Definition of CA certificate

A CA certificate is a digital certificate issued by a "certificate authority" or "certification authority", hereinafter referred to as "CA". In the case of the TS Adapter IE Advanced, self-signed certificates are used; the certification authority in this case is the TS Adapter IE Advanced itself.

### 13.7 Establishing a remote connection with TeleService

Certificates for "SSTP" (Secure Socket Tunneling Protocol) and "HTTPS" (Hypertext Transfer Protocol Secure) are derived from the CA certificate.

CA certificates contain a "key" and additional information used for authentication and for encrypting and decrypting confidential data. Additional information includes the validity period, references to certificate revocation lists, etc. which are included in the certificate by the CA.

#### Using CA certificates with TeleService

A CA certificate with a unique fingerprint is generated by the TS Adapter to uniquely identify the TS Adapter IE Advanced as connection partner for the remote PC.

This CA certificate must be saved in the Windows certificate store of your programming device/PC before you can establish a VPN connection. When you access the Web server using a direct connection, a security warning will appear if no CA certificate exists. In such cases, however, you can choose to ignore the warning and allow the connection.

---

#### Note

##### Handling CA certificates

Specialist knowledge of the operating system is required for handling CA certificates. CA certificates should only be managed by trained personnel!

You require administrator rights to manage CA certificates.

---

#### Definition of fingerprint

The fingerprint is a 20-byte hexadecimal expression. It provides a unique value for a CA certificate and is used to identify a specific CA certificate.

A fingerprint is calculated dynamically using the SHA-1 algorithm and is not physically contained in the CA certificate.

#### Use of fingerprints with TeleService

The CA certificate is used to uniquely identify the TS Adapter IE Advanced as connection partner. A unique 20-byte fingerprint of this certificate is generated each time a CA certificate is generated by the TS Adapter IE Advanced. It is calculated automatically by the TS Adapter IE Advanced when the certificate is generated. Each certificate has a specific, unique fingerprint. This fingerprint must be transferred securely to your computer, for example by phone or in an encrypted e-mail. You need to enter this fingerprint in the connection dialog when establishing a VPN connection with TeleService, unless the CA certificate is already saved on your PC in the Windows certificate store.

You will find the fingerprint for your TS Adapter IE Advanced in the Web interface for the TS Adapter IE Advanced. To open the Web interface, double-click the command "Assign TS Adapter IE Advanced parameters" in the device list in the TIA portal. Carry out the Web login to view the fingerprint in the "Security > Certificates" tab.

### CA certificate download during connection establishment

When the connection is established, TeleService checks whether a suitable CA certificate is installed in the Windows certificate store of your programming device/PC. If an appropriate certificate is found, the VPN connection is established as an SSTP connection (Secure Socket Tunneling Protocol).

If no appropriate CA certificate is found, the CA certificate is first loaded by the corresponding TS Adapter IE Advanced. The TS Adapter IE Advanced is called by the remote address entered in the connection dialog. If this download of the CA certificate is successful, the fingerprint of the downloaded CA certificate is calculated and compared with the fingerprint entered in the connection dialog. If the two fingerprints match, a dialog opens and you are prompted to save the CA certificate in the Windows certificate store of your programming device/PC. You require administrator rights to save the CA certificate.

The VPN connection is then established.

### See also

- Installing CA certificates for VPN connections (Page 6739)
- Deleting CA certificates for VPN connections (Page 6742)

### 13.7.4.3 Installing CA certificates for VPN connections

#### Installing CA certificates

To establish a secure VPN connection between your programming device/PC and a remote system with TeleService, you require a valid CA certificate generated by the TS Adapter IE Advanced. This must be saved in the Windows certificate store of your programming device/PC.

A CA certificate can be installed manually or using an automatic download.

CA certificates are managed with the Microsoft® Management Console.

---

#### Note

##### Handling CA certificates

Specialist knowledge of the operating system is required for handling CA certificates. CA certificates should only be managed by trained personnel!

You require administrator rights to manage CA certificates!

---

### Requirement

A CA certificate has yet to be installed in the Windows certificate store on your computer.

## Installing CA certificates using the automatic download

Proceed as follows:

1. Log on to the system as administrator.
2. Transfer the fingerprint for the CA certificate from the TS Adapter IE Advanced to your computer using a "secure route", for example by phone or in an encrypted e-mail.  
You will find the fingerprint for your TS Adapter IE Advanced in the Web interface for the TS Adapter IE Advanced. To open the Web interface, double-click the command "Assign TS Adapter IE parameters" in the device list in the TIA portal. Perform the Web login to view the fingerprint in the "Security > Certificates" tab.
3. In the project tree of the TIA portal, open the "Online access" folder.
4. Click on the "TeleService" folder it contains.
5. Double-click the "Set up/close remote connection" entry. The "Set up remote connection to the remote system" dialog opens.
6. Select the "TS Adapter IE Advanced" as Adapter type from the drop-down list.
7. Under "Connection type", select "VPN".
8. In the relevant input box, enter the IP address / DNS name for the TS Adapter IE Advanced to be contacted. Alternatively, you can apply any existing data from the phone book by clicking the corresponding button.
9. Enter your user name and the corresponding password.
10. Copy the fingerprint displayed in the Web interface for the TS Adapter IE Advanced to the "Fingerprint" column.
11. Click the "Connect" button to establish the required remote connection. This button only becomes active when you have entered all the parameters needed to establish a remote connection.
12. No valid CA certificate is found, because no CA certificate has been installed on your PC yet.  
A "normal" connection (not a VPN connection) is therefore established and the certificate required is downloaded from the TS Adapter IE Advanced to the working memory of your computer. The fingerprint is then calculated (SHA-1 algorithm) and compared with the fingerprint entered in the connection dialog. If the two fingerprints match, a dialog opens and you are prompted to save the CA certificate in the Windows certificate store of your programming device/PC.
13. Confirm that you want to save the CA certificate.

## Result

The VPN connection to the required TS Adapter IE Advanced is established. The dialog closes once the connection is established.

## Manual installation of CA certificates

Proceed as follows:

1. Log on to the system as administrator.
2. Open the Windows Certificate Manager on your programming device/PC with the Microsoft® Management Console.  
Click "Start", enter "mmc" in the search field and press ENTER.  
The console will open.
3. Open the "File" menu and click "Add/remove snap-in...".  
The "Add/remove snap-in..." dialog will open.
4. Double-click "Certificates" in the "Snap-in" list and select "Computer account" in the dialog that opens.
5. Select "Local computer" in the next dialog and click "Finish" and "OK".  
The console root opens and the "Certificates (local computer)" folder appears.
6. Open the displayed "Certificates (local computer)" folder and click "Trusted certification authorities".
7. Click the "Certificates " folder and use the shortcut menu to access the command "All tasks" > "Import...".
8. Note the information that appears in the "Certificate - Import wizard" dialog and click "Next".
9. In the dialog that follows, click "Browse ..." and select the required CA certificate.
10. Then click "Next" twice and subsequently "Finish" to install the CA certificate.

## Result

The selected CA certificate is installed at the specified location in the Windows certificate memory.

---

### Note

#### Additional information ...

... on installing CA certificates can be found using the "F1" button in the online help of your operating system.

---

#### 13.7.4.4 Deleting CA certificates for VPN connections

##### Deleting CA certificates

Proceed as follows:

1. Log on to the system as administrator.
2. Open the Windows Certificate Manager on your programming device/PC with the Microsoft® Management Console.  
Click "Start", enter "mmc" in the search field and press the ENTER KEY.  
The console will open.
3. Open the "File" menu and click "Add/remove snap-in...".  
The snap-in selection dialog will open.
4. Double-click "Certificates" in the "Snap-in" list and select "Computer account" in the dialog that opens.
5. Select "Local computer" in the next dialog and click "Finish" and "OK".  
The console root opens and the "Certificates (local computer)" folder appears.
6. Open the displayed "Certificates (local computer)" folder and click "Trusted certification authorities".
7. Open the "Certificates" folder, select the required CA certificate and click "Delete" in the shortcut menu.
8. Confirm the next prompt with "Yes".

##### Result

The selected CA certificate is deleted from the list of available certificates.

#### 13.7.4.5 Establishing a VPN connection to a remote system

##### Establishing VPN connections

##### Introduction to establishing VPN connections

A VPN connection is established when you use TeleService to connect to a remote system over the Internet.

To do this, your programming device/PC with installed TIA Portal is connected to the Internet at one end. At the other end, the automation system is connected to the Internet via the WAN (Wide Area Network) interface of the configured TS Adapter IE Advanced.

##### Requirement

Your programming device/PC is connected to the Internet.

There is a TS Adapter IE Advanced in the remote system.

The TS Adapter IE Advanced has been configured and is connected to the Internet.

The CA certificate required for identifying the TS Adapter has been generated and installed in the Windows certificate store of your programming device/PC.

**Proceed as follows:**

1. In the project tree of the TIA portal, open the "Online access" folder.
2. Click on the "TeleService" folder it contains.
3. Double-click the "Set up/close remote connection" entry. The "Set up remote connection to the remote system" dialog opens.
4. Select the "TS Adapter IE Advanced" as "Adapter type" from the drop-down list.
5. Enter "VPN" as "connection type".
6. Enter the IP address / DNS name for the TS Adapter IE Advanced to be contacted in the relevant field. Alternatively, you can apply any existing data from the phone book by clicking the corresponding button.
7. Enter your user name and the corresponding password.
8. Click the "Establish" button to establish the required VPN connection. This button only becomes active once you have entered all the parameters needed for establishing the remote connection.

**Result**

The VPN connection to the required system is established. "Status" indicates the progress in establishing the connection. The dialog closes once the VPN connection is established. The following message appears in the TIA Portal status bar: "Remote connection is established". You can now use the remote connection with TIA Portal and communicate with the automation system.

**Connection cannot be established**

If the connection cannot be established, try to find the cause using the "Notes on troubleshooting".

---

**Note**

**Rules for IP addresses**

- Only use IP addresses which have not yet been assigned in the system network.
  - If the IP address configured for the TS Adapter IE Advanced has already been assigned in the system network, the TS Adapter IE Advanced can only be addressed by its MAC address.
-

## Terminating VPN connections

### Terminating an active VPN connection

---

#### Note

#### Terminating the VPN connection

You should go offline in the TIA portal before you terminate the VPN connection.

---

### Proceed as follows:

1. Double-click the "Set up/close remote connection" entry in the TIA portal.
2. Confirm the prompt in the dialog that follows with "Yes".

### Result

The VPN connection is terminated.

## 13.7.4.6 TS Adapter IE Advanced

### Short description of the TS Adapter IE Advanced

#### TS Adapter IE Advanced

The TS Adapter IE Advanced has the following properties:

- Direct connection over Industrial Ethernet (IE), 2 ports
- WAN (Wide Area Network) interface for VPN connections
- Firmware update supported
- Plug-in modules
- Parameters are assigned via a Web interface.

---

**Note**

**Further information on the TS Adapter IE Advanced**

For detailed information on your TS Adapter, please refer to the documentation supplied with your TS Adapter.

---

## Connection types

### TS Adapter IE Advanced connection types

The following diagrams show the types of connection possible with the TS Adapter IE Advanced.

#### Direct connection

In the direct connection to the programming device/PC, you can set the TS Adapter IE Advanced parameters over the Ethernet.

Figure 13-5 TS Adapter IE Advanced - direct connection

### Connection to the Internet (DSL modem/router)

In order to connect to the Internet, you must operate the DSL modem/router at the WAN connection of the TS Adapter IE Advanced.

Figure 13-6 TS Adapter IE Advanced - connection to the Internet

### Connection to the company network (Intranet)

In order to connect to the Intranet, you must operate system network (Ethernet) at one of the two LAN connections of the TS Adapter IE Advanced.

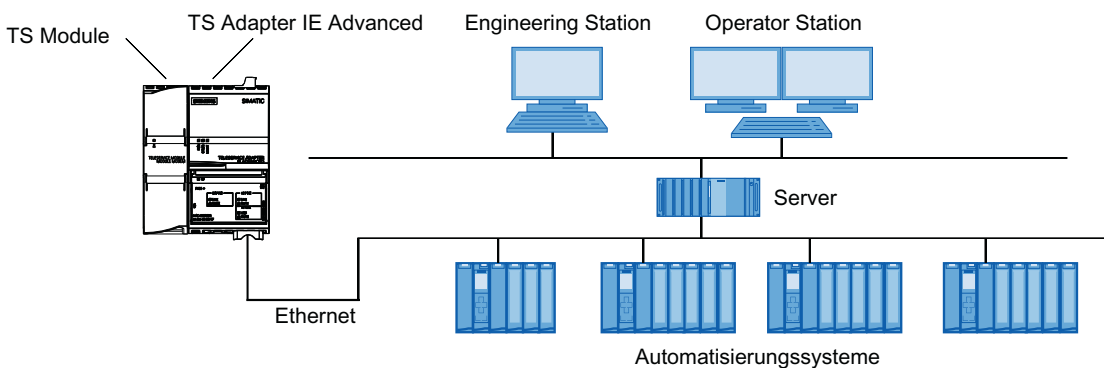

Figure 13-7 TS Adapter IE Advanced - connection to company network (Intranet)

### Additional information

For more detailed information on the TS modules, please refer to the documentation supplied with your TS Adapter IE Advanced.

### TS Adapter IE Advanced parameter assignment options

#### Basics on configuring the TS Adapter IE

The TS Adapter IE Advanced is configured via a Web interface.

Web help in the Web interface is available for assigning TS Adapter IE Advanced parameters.

Parameter assignment options include:

- Reconfiguration
- Restoring default parameter assignment
- Importing adapter parameters
- Exporting adapter parameters

---

**Note**

**Parameter assignment**

Configure your TS Adapter IE Advanced in accordance with the documentation supplied. This details the exact procedure for parameter assignment.

---

## Parameter assignment for TS Adapter IE Advanced

### Introduction

The TS Adapter IE Advanced can be configured in both direct connection mode and via an existing remote connection.

Both parameter assignment options are described below.

Specific details on assigning parameters for the TS Adapter IE Advanced are available in the TS Adapter IE Advanced documentation.

## Assigning parameters for the TS Adapter IE Advanced in direct connection

### Requirement

There is a LAN connection to your TS Adapter IE Advanced.

### Procedure

To assign the parameters for the TS Adapter IE Advanced, proceed as follows:

1. In the project tree of the TIA portal, open the "Online access" folder.
2. Double-click on the Ethernet port of your computer.
3. Double-click on the "Display accessible nodes" command. The TS Adapter IE Advanced is then displayed.
4. Double-click on the "TS Adapter IE Advanced" folder and then on "Online and diagnostics", and assign the desired IP address to the TS Adapter in the dialogs that follow. Please note that the IP address of the programming device/PC interface card must be located in the same subnet as the IP address that you assign for the TS Adapter IE Advanced.
5. Update the view in the project tree for the "Accessible nodes", so that the TS Adapter IE Advanced is displayed with the newly assigned IP address.

*13.7 Establishing a remote connection with TeleService*

6. Open the folder "TS Adapter IE Advanced" in the device list.
7. Double-click the command "Assign TS Adapter IE parameters". The corresponding Web interface opens for assigning TS Adapter IE Advanced parameters.
8. Complete the "logon" for the web interface.
9. Set the required parameters in the individual tabs of the dialog.
10. Confirm your entries with "Save settings".

## **Result**

The configured parameters are saved in the non-volatile memory of the TS Adapter IE Advanced. Parameter assignment is then complete.

## **Assigning parameters for the TS Adapter IE Advanced using a remote connection**

### **Requirement**

There is an established remote connection to a TS Adapter IE Advanced..

### **Procedure**

1. In the project tree of the TIA Portal, open the "Online access" folder.
2. Open the "TeleService" folder followed by the required plant folder.
3. Double-click the command "Assign TS Adapter IE parameters". The associated web interface for assignment of the TS Adapter IE parameters opens. The "logon" for the web interface takes place automatically with the login data of the remote connection.
4. Set the required parameters in the individual tabs of the dialog.
5. Confirm your entries with "Save settings".

## **Result**

The configured parameters are saved in the non-volatile memory of the TS Adapter IE Advanced. Parameter assignment is then complete.

## 13.7.5 CPU controlled TeleService remote connections

### 13.7.5.1 Overview of CPU controlled remote connections

#### Introduction

TeleService offers a range of options for establishing remote connections; these differ according to the CPU used. The initiative for establishing a connection starts from the CPU. The communications instructions given below are used for the individual connection options.

#### Connection establishment with S7-300/400 CPUs

The following communications instructions are available:

- Communications instruction "PG\_DIAL": Establish remote connection to programming device/PC
- Communications instruction "SMS\_SEND": Send text message (SMS)
- Communications instruction "AS\_DIAL": Establish remote connection to AS
- Communications instruction "AS\_MAIL": Transfer email

#### Connection establishment with S7-1200 CPUs

The following communications instruction is available:

- Communications instruction "TM\_MAIL": Transfer email

#### Connection establishment with S7-1500 CPUs

The following communications instruction is available:

- Communications instruction "TMAIL\_C": Transfer email

---

#### Note

##### Description of individual communications instructions

More detailed information on the available communications instructions can be found in the information system of the TIA Portal in the directory "References > Communication > TeleService".

---

#### See also

TS Adapter IE parameter assignment options (Page 6730)

### 13.7.5.2 Establishing a connection from and to remote systems (PG-AS-remote coupling)

#### Remote plant access to a programming device/personal computer

##### Introduction

You can establish a remote connection to and communicate with a remote system using the application TeleService and a TS Adapter MPI. The initiative for establishing the remote connection comes from the programming device/personal computer.

However, events which require rapid intervention often occur at a remote system. In such cases, the automation system can initiate a remote connection to a programming device/personal computer if an asynchronous event occurs.

The graphic below shows the components which are required for establishing a connection from a plant to a programming device/personal computer.

Figure 13-8 How the "PG\_DIAL" communications instruction works

#### Requirements for establishing a connection

##### Introduction

Certain hardware and software requirements must be fulfilled if a remote system is to establish a remote connection to a programming device/personal computer. These requirements are detailed below.

##### Hardware requirements:

The only hardware required for establishing a remote connection from a remote system to a programming device/personal computer is that needed for accessing the remote system from the programming device/personal computer.

Your user program calls the communication instruction "PG\_DIAL" to establish the connection. This can only be executed on an S7-300 or S7-400 CPU on which S7 basic communication is implemented.

A TS Adapter I , version 5.0 or later, or a TS Adapter II must be used.

### Software requirements at the plant end:

Communication instruction "PG\_DIAL" is included in the TeleService scope of delivery and is installed when the TIA portal is installed. You will find the communication instructions installed in the "Communication > TeleService" folder of the block editor task card.

If a remote system is to establish a remote connection to a programming device/personal computer, the plant user program must call the "PG\_DIAL" function block.

### Software requirements for the programming device/personal computer

You require a software product in the programming device/personal computer which, with TeleService, waits for a call from a remote system, recognizes this call and informs your user program.

## 13.7.5.3 Data exchange between remote systems (AS-AS-remote coupling)

### AS-AS remote link basics

#### Introduction

The AS-AS remote link allows two automation systems to exchange process data via the telephone network.

#### Requirement

Communication instruction "AS\_DIAL" is available if you use a CPU from the S7-300/400 family.

#### Definition: Local and remote automation system

- The automation system from which the initiative to establish the remote connection originates is described as **local**.
- The automation system to which the remote connection is to be established is described as **remote**.

#### Data exchange over the AS-AS remote link

Data exchange is carried out using specific communication instructions for non-configured S7 connections. Use the communication instruction "AS\_DIAL" to establish a remote connection to the automation system.

13.7 Establishing a remote connection with TeleService

More detailed information on establishing the connection can be found in the information system in the directory "References > Communication > TeleService".

The following graphic shows the components required for establishing a connection from a local to a remote automation system.

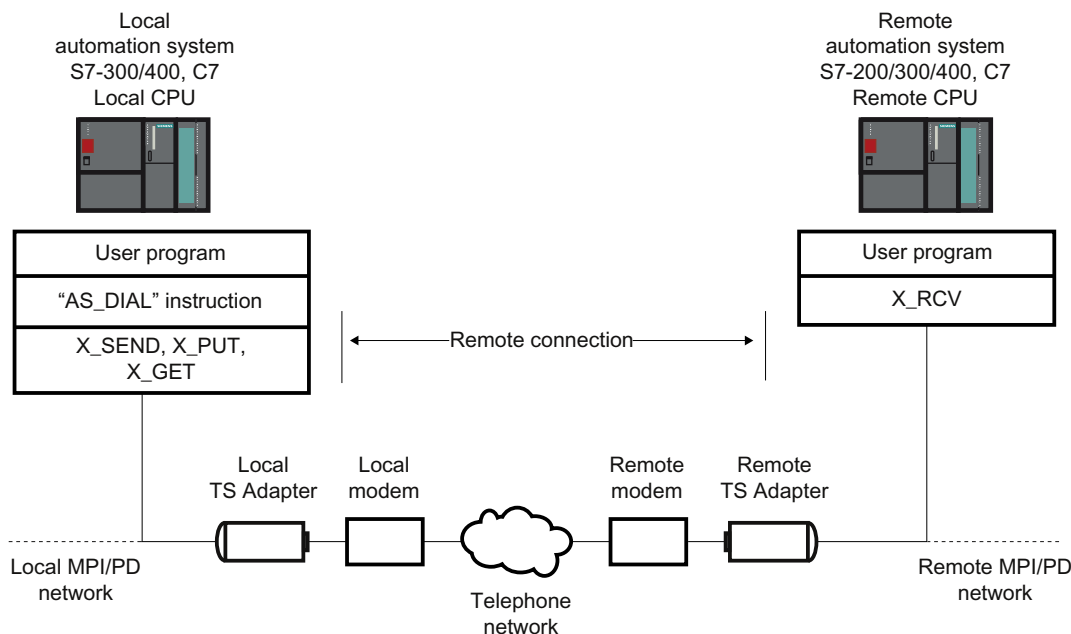

Figure 13-9 Data exchange over the AS-AS remote link

### Hardware and software requirements for AS-AS remote link

#### Introduction

Certain hardware and software requirements must be fulfilled before a local automation system can establish a remote connection to a remote automation system. These requirements are detailed below.

#### Hardware requirements

The only hardware you need for transferring process data from a local to a remote automation system is that also needed for accessing the respective automation system from the programming device/personal computer.

To establish and terminate the remote connection, the TIA Portal user program of the local CPU calls a communication instruction. This communication instruction can be executed on an S7-300/400 CPU or a C7 CPU. The communication instruction requires S7 basic communication to be implemented on the CPU. The remote CPU must also support S7 basic communication.

A TS Adapter I, version V5.1 or later, or a TS Adapter II must be used.

## Software requirements

The "AS\_DIAL" communication instruction is included in the product package of TeleService, and is integrated into the library of the TIA Portal during the installation in the communication instructions folder of the Task Card under TeleService. In order to establish and terminate a remote connection to a remote automation system from a local automation system, call the communication instruction "AS\_DIAL" in the TIA Portal user program of the local CPU.

AS-AS remote link

Automation system  
S7 300/400, C7

Automation system  
S7 300/400, C7

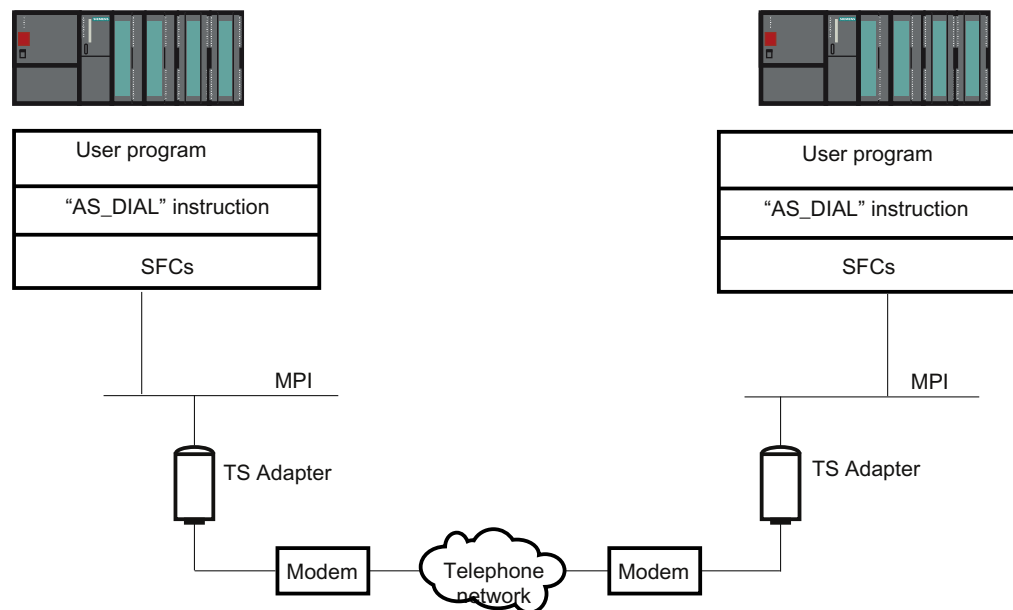

Figure 13-10 Hardware and software requirements for AS-AS remote link

### 13.7.5.4 Send SMS from a system

#### Requirements for sending an SMS

##### Introduction

Certain hardware and software requirements must be fulfilled before a system can send an SMS. These requirements are detailed below.

##### Hardware requirements

To send an SMS from a system, you will require a GSM wireless modem and a TS Adapter MPI.

A TS Adapter I, version V5.2 or later, or a TS Adapter II must be used.

### Software requirements at the system end

The "SMS\_SEND" communications instruction is included in the scope of delivery of TeleService, and is integrated into the library of the TIA Portal during the installation in the communications instructions folder of the Task Card under TeleService. If a system is to send an SMS, the user program of the system must call the communications instruction "SMS\_SEND".

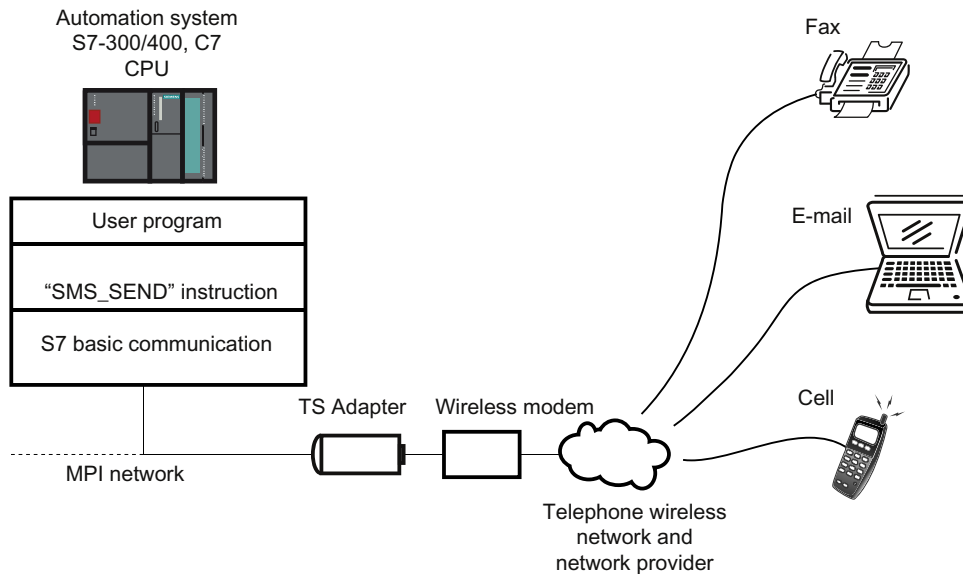

Figure 13-11 How the "SMS\_SEND" communications instruction works

---

#### Note

You may be able to send an SMS not only to a cell phone but also to an email address or a fax device by using additional services offered by the cell phone service provider.

---

### 13.7.5.5 Send an email from a system

#### Requirements for sending e-mails

##### Introduction

The following hardware and software requirements must be fulfilled if a system is to send an email:

## Hardware requirements

You need a TS Adapter IE to send an email from a system and one of the CPUs listed below:

- a CPU 31x2 PN/DP as of firmware version V2.5
- a CPU 41x-3 PN/DP
- a CPU of the S7-1200 series
- a CPU of the S7-1500 series

## Software requirements at the system end

Different communications instructions are included in the scope of delivery of TeleService depending on the CPU that are integrated into the library of the TIA Portal during the installation in the communications instructions folder of the Task Card under TeleService.

If a system is to send an email, the user program of the system must call the corresponding communications instruction for the CPU.

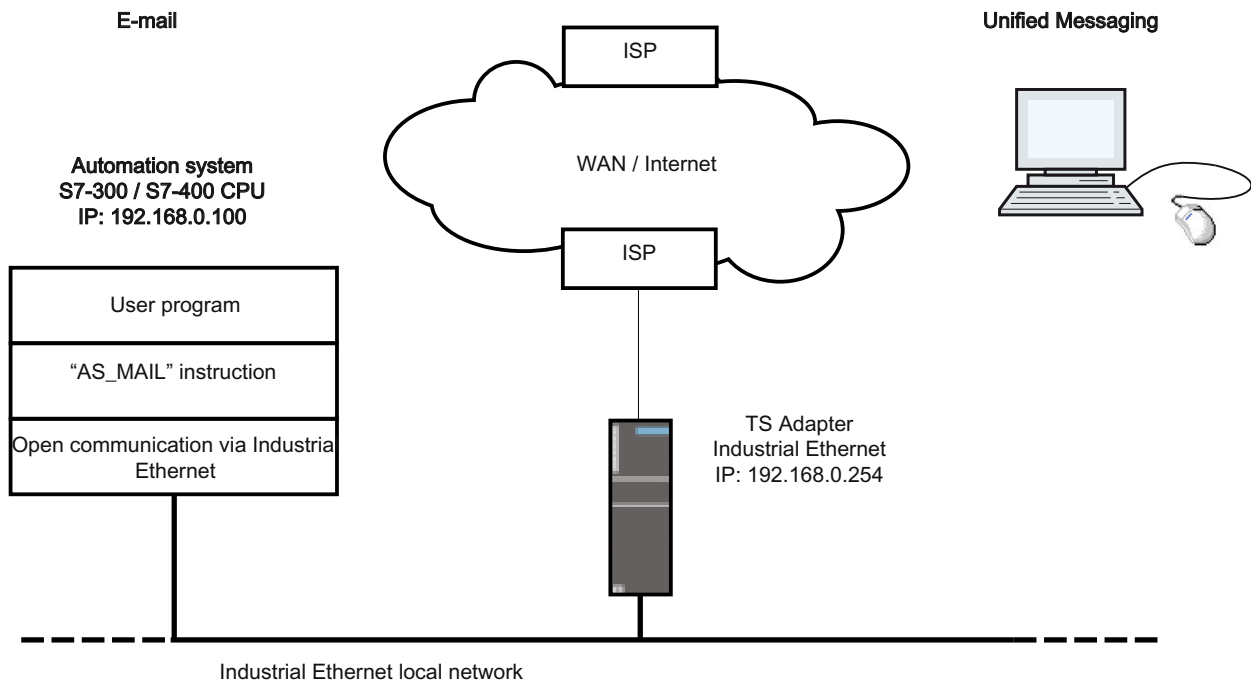

The following communications instructions are available for sending an email:

- S7-300/400 CPUs: use the communications instruction "AS\_MAIL": Transfer email
- S7-1200 CPU V 2.0 and V 3.0: use the communications instruction "TM\_MAIL": Transfer email
- S7-1200 CPU >V3.0: use the communications instruction "TMAIL\_C": Transfer email
- S7-1500 CPUs: use the communications instruction "TMAIL\_C": Transfer email

The respective communications instruction transfers an email from a CPU to a mail server by means of the Simple Mail Transfer Protocol (SMTP) with the "LOGIN" authentication method. The data is transferred unencrypted with this SMTP process.

The figure below shows an example with the communications instruction "AS\_MAIL":

13.7 Establishing a remote connection with TeleService

The "Use gateway/router" property must also be set for the Ethernet interface in the configuration of the CPU on which the communications instruction "AS\_MAIL" runs. (available in the device configuration under Ethernet addresses and there under IP protocol) The IP address of the Ethernet interface of the TS Adapter IE is to be specified as "Address".

**Note**

You can find further information in the task card in the "Communications instructions" folder under TeleService.

## 13.7.6 Notes on troubleshooting

### 13.7.6.1 General information on troubleshooting for modem problems

#### Introduction

The information below should help you establish and eliminate the causes of any modem problems.

1. Enable "Record log file" for data traffic between PG/PC and modem. The entries in this file can provide valuable information for determining the cause of errors.
2. Switch on the loudspeaker on your local modem. Select a volume loud enough to be clearly heard.  
You can then hear whether:
  - there is a dial tone at the connection
  - the modem called is busy
  - the modem called accepts the call.

#### Common modem problems

Modem connection problems are among the most common modem problems:

- Modem connection is not established
- Modem connection is interrupted

The topics below contain tables detailing possible causes and providing information on eliminating the error in question.

#### See also

Dial-up connection to the TS Adapter is not established (Page 6758)

Dial-up connection from the TS Adapter is not established (Page 6759)

Modem connection is interrupted (Page 6760)

Modem alarms (Page 6761)

Recording a log file for the modem (Page 6757)

### 13.7.6.2 Recording a log file for the modem

#### Introduction

It is advisable to record a log file as this makes it easier to find the causes of faults in a modem.

**Procedure:**

Proceed as follows:

1. Activate the properties dialog of the modem used via the "Phone and modem options" option in the Control Panel.
2. Check the settings of the "Log" option in the "Diagnostics" tab and if necessary change the log file settings so that the file is recorded.

**Result:**

Activity between the programming device/personal computer and the modem are entered in the log file. If there are problems establishing the connection, you can evaluate the data recorded in the log file to determine the cause of the error.

**13.7.6.3 Dial-up connection to the TS Adapter is not established**

**Dial-up connection to TS Adapter is not established**

The table below sets out possible causes and how to eliminate them if no remote connection to the TS Adapter can be established.

Possible cause	Check/Remedy
Cabling faulty	<ul style="list-style-type: none"><li>• Are all the connecting cables connected correctly?</li><li>• Are the connectors loose?</li></ul>
Dial parameters for main telephone line and extension incorrectly set	<ul style="list-style-type: none"><li>• Do the properties and dial parameters of your modem match the phone connection to main phone line or extension?</li><li>• Do not specify a dial-out code in the "Dial parameters" dialog if you operate your modem on a local loop (main telephone line). The fields for the dial-out code for local calls and long-distance calls must be empty.</li></ul>
Dialing mode incorrectly set	<ul style="list-style-type: none"><li>• Is the correct dialing mode (tone/pulse) set in the dialog for the dial parameters of your modem?</li><li>• Use a connected telephone to check the connection on which you want to operate the modem. You should hear crackling noises on the telephone during pulse dialing and tones of varying pitches during tone dialing. Set the corresponding dialing mode in the modem dial parameters.</li></ul>

Possible cause	Check/Remedy
Dial disable active	<ul style="list-style-type: none"> <li>The dial disable function is a country-specific modem property which, depending on the modem, becomes effective after one or more unsuccessful attempts to establish a connection.</li> <li>If your modem still does not respond after several attempts to dial, the dial disable function may be active. Characters are still sent to the modem after the dial command but the modem does not start the dialing process. The driver receives a general error message.</li> <li>Refer to the modem documentation for information on how the dial disable function is implemented for your modem.</li> <li>Create a log file (Page 6755) (modemlog.txt) in which the activities between the programming device/personal computer and modem are recorded. Then check whether the file contains an entry caused by dial disable (e.g. DELAYED).</li> </ul>
Phone connection defective or busy	<ul style="list-style-type: none"> <li>Connect a phone and check whether a dial tone can be heard on this connection.</li> <li>Any analog phone connected on the same connection must be hung up. You cannot establish an additional modem connection on this connection if there is an existing phone connection.</li> </ul>
Serial parameters set incorrectly	<ul style="list-style-type: none"> <li>Are the correct values entered in the "Settings" tab for modem properties (8 data bits, no parity, 1 stop bit)?</li> <li>Is the correct COM interface set in the "General" tab for the modem properties?</li> </ul>
Initialization string of the TS Adapter is not suitable for the modem.	<ul style="list-style-type: none"> <li>Familiarize yourself with the modem initialization string requirements and set the string accordingly. Procedure for configuring the TS Adapter IE (Page 6727)</li> </ul>
Settings for error correction between the modem at the TS Adapter and the modem at the PC/programming device are not compatible.	<ul style="list-style-type: none"> <li>Adapt the modem settings. Useful information on configuring the TS Adapter MPI (Page 6722) Restoring the default parameter assignment of a TS Adapter MPI (Page 6724) Procedure for configuring the TS Adapter IE (Page 6723)</li> </ul>

#### 13.7.6.4 Dial-up connection from the TS Adapter is not established

##### No callback from TS Adapter

The table below sets out possible causes and how to eliminate them if there is no callback from the TS Adapter.

Possible cause	Check/Remedy
Errors in the location or call settings in the TS Adapter	Check the TS Adapter parameter assignment: <ul style="list-style-type: none"> <li>Are the dialing mode and dial-out code set correctly for your phone connection?</li> <li>Does the modem at the TS Adapter support the characters configured for the dial-out code?</li> <li>Is "Wait for dial tone before dialing" deactivated for an extension?</li> </ul>
Initialization of modem insufficient	Check the string for modem initialization: <ul style="list-style-type: none"> <li>The modem may require a further initialization in order to establish a remote connection.</li> <li>Properties of the modem initialization string for the TS Adapter MPI</li> </ul>
Callback number is incorrect	Check the configuration of the callback number you assigned.

### No call from TS Adapter MPI

The table below sets out possible causes and how to remedy them if there is no call from the TS Adapter MPI.

Possible cause	Check/Remedy
Phone number is incorrect	Is the required number being transferred to the communication instruction "PG_DIAL" ?
TS Adapter MPI parameter assignment incorrect	Check the TS Adapter MPI parameter assignment: <ul style="list-style-type: none"> <li>• Are the dialing mode and dial-out code set correctly for your phone connection?</li> <li>• Does the modem at the TS Adapter MPI support the characters configured for the dial-out code?</li> <li>• Is "Wait for dial tone before dialing" deactivated for an extension?</li> </ul>

### 13.7.6.5 Modem connection is interrupted

#### Modem connection is interrupted

The table below sets out possible causes and how to remedy them if the modem connection is interrupted.

Possible cause:	Check / Remedy:
Metering pulses in the line	Metering pulses will be generated if you have applied to the phone company for a metering clock. This may mean that the modem no longer recognizes the carrier signal and switches off. <ul style="list-style-type: none"> <li>• Set a longer waiting or switch-off time at the modem.</li> <li>• Have the metering pulse deactivated by the phone company.</li> </ul>
Shielding	<ul style="list-style-type: none"> <li>• Are the connection cables used shielded sufficiently?</li> <li>• Make sure that the modem cables do not run next to power cables and that they are as far as possible from power supply units and monitors.</li> </ul>
Protocol timeout	<ul style="list-style-type: none"> <li>• Set fixed monitoring times.</li> </ul>
Automatic connection termination	<ul style="list-style-type: none"> <li>• Deactivate the option that terminates an existing connection automatically after a specified time without data transfer ("Terminate after idle of ...").</li> </ul>
Data flow control deactivated	<ul style="list-style-type: none"> <li>• Click on the "Extended" button in the "Settings" tab of the modem properties and activate the following options in the dialog displayed (if available and not yet set):                             <ul style="list-style-type: none"> <li>– Data flow control</li> <li>– Hardware (RTS/CTS)</li> <li>– Data compression</li> <li>– Error control</li> </ul> </li> </ul>
Initialization string of the TS Adapter is not suitable for the modem	<ul style="list-style-type: none"> <li>• Set the modem initialization string in accordance with the following requirements. See also: TS Adapter IE parameter assignment options (Page 6730)</li> </ul>

#### See also

TS adapter MPI configuration options (Page 6722)

### 13.7.6.6 Checklist for troubleshooting the modem

#### Introduction

The following list should help you establish the potential cause of any problems with the modem. The help topics below set out how and in which dialogs you define the relevant settings.

#### Modem connection cannot be established:

- Check the cabling and the connections.
- Check whether the correct dialing mode (tone/pulse) is set.
- If your modem does not react after several attempts to dial, a dial disable function may be active. Familiarize yourself with dial disable on your modem.
- Are you operating your modem on a main telephone line or on an extension line? Configure the properties and dialing parameters of the modem accordingly.
- Enable the log file option in the advanced properties. The next attempt to establish a connection will then be recorded in a file in the Windows directory.
- Ensure that the ISDN TAs used work with the same B and D channel protocol.

#### The modem connection is terminated:

- Metering pulses can have a negative affect on a connection. Have the pulses deactivated by your telephone company.
- Set fixed monitoring times.
- Deactivate the option that terminates an existing connection automatically after a specified time without data transfer (idle).
- Make sure that you have activated RTS/CTS for data flow control.

### 13.7.6.7 Modem alarms

#### Information in the log file

The modem alarms are entered in a log file if you have activated the recording function.

The log file contains the following information:

Alarm:	Possible cause:	Remedy:
NO DIALTONE	A phone call may currently be being carried out on this line.	<ul style="list-style-type: none"> <li>• Repeat the process once the phone call is over.</li> </ul>
NO CARRIER	The device dialed is not ready, is not a modem or cannot establish a connection in the set operating mode.	<ul style="list-style-type: none"> <li>• Check the numbers and the settings.</li> </ul>

13.7 Establishing a remote connection with TeleService

Alarm:	Possible cause:	Remedy:
BUSY	The device dialed is busy.	<ul style="list-style-type: none"> <li>• Try again later.</li> </ul>
DELAYED: ...	Dial disable	<ul style="list-style-type: none"> <li>• Refer to the modem documentation for information on how the dial disable function is implemented for your modem and if necessary remove it.</li> </ul>

13.7.6.8 Possible error messages with VPN connections

VPN connection to TS Adapter IE Advanced is not established

The table below sets out possible errors and how to eliminate them if no VPN connection to the TS Adapter IE Advanced can be established.

Possible errors	Check/Remedy
The error message "The webpage cannot be displayed" appears when the Web interface is accessed.	<ul style="list-style-type: none"> <li>• Note: This problem occurs when the Windows certificate store contains a CA certificate with the same name as the CA certificate which has just been generated.</li> <li>• If a CA certificate for this TS Adapter is already installed in the Windows certificate store and you have generated a new CA certificate on the TS Adapter, you need to remove the old CA certificate from the Windows certificate store and install the newly generated CA certificate.</li> <li>• See also: Installing CA certificates for VPN connections (Page 6737)</li> <li>• See also: Deleting CA certificates for VPN connections (Page 6740)</li> </ul>
Error message: "Unexpected error in application".	<ul style="list-style-type: none"> <li>• Check whether other users have been saved in the TS Adapter IE Advanced user database.</li> <li>• The user "Administrator" cannot establish a remote connection.</li> </ul>
Error message: "No corresponding CA certificate was found in the Windows certificate store".	<ul style="list-style-type: none"> <li>• Use the automatic certificate download. Enter the fingerprint in the corresponding field in the connection dialog.</li> <li>• See also: Establishing VPN connections (Page 6740)</li> <li>• Or</li> <li>• Export the CA certificate from the Web interface of the TS Adapter IE Advanced and install it manually in the Windows certificate store.</li> <li>• See also: Installing CA certificates for VPN connections (Page 6737)</li> </ul>
Error message: "The remote address specified does not correspond to the remote address of the TS Adapter".	<ul style="list-style-type: none"> <li>• You must use the remote address which you specified in the TS Adapter IE Advanced to establish the connection.</li> <li>• You cannot use the IP address if you have entered the DNS name (and vice versa).</li> </ul>
Error message: "The signature of the certificate could not be verified".	<ul style="list-style-type: none"> <li>• If you have generated a new CA certificate on the TS Adapter IE Advanced, you need to delete the old CA certificate from the Windows certificate store and install the new one.</li> <li>• See also: Deleting CA certificates for VPN connections (Page 6740)</li> <li>• See also: Installing CA certificates for VPN connections (Page 6737)</li> </ul>
Error message: "Protocol error"	<ul style="list-style-type: none"> <li>• Check to make sure that the IP address of the service PC is set in the configuration of the TS Adapter IE Advanced (Parameter &gt; Plant Network)</li> </ul>

Possible errors	Check/Remedy
Error message: "Connection setup error."	<ul style="list-style-type: none"><li>• Check to make sure that the LAN IP-address of the TS Adapter IE Advanced and the IP address of your network cards are in the same subnet. If this is the case, deactivate this network card before you establish the remote connection.</li></ul>
An e-mail cannot be sent.	<ul style="list-style-type: none"><li>• Check whether there is a network/Internet connection at the WAN port.</li><li>• Check whether the mail server is accessible.</li><li>• Check whether the outgoing connections in the TS Adapter IE Advanced are valid.</li><li>• Check whether the SMTP port in the firewall is open for outgoing connections.</li></ul>

## Hardware documentation

### 14.1 General information on the hardware documentation

#### Additional information on the available hardware

The TIA Portal can be used to configure a wide variety of hardware, depending on the installed products. You can find the available hardware in the hardware catalog. You can find all the current manuals, operating instructions and FAQs as well as updates for your devices in the Siemens Industry Online Support (<https://support.automation.siemens.com/>).

To help you locate the appropriate documents for your hardware in the Siemens Industry Online Support, the following sections list all modules and module families that are available in the current scope of the installation of the TIA Portal. You will find a link for each module that takes you directly to the relevant manuals and operating instructions in the Siemens Industry Online Support.

### 14.2 PLC

#### 14.2.1 SIMATIC S7-1200

### CPU 1214C (6ES7 214-1xxx-0XB0)

Information on the CPUs is available here:

- CPU 1214C AC/DC/Rly (6ES7 214-1BE30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72141BE300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- CPU 1214C AC/DC/Rly (6ES7 214-1BG31-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72141BG310XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- CPU 1214C AC/DC/Rly (6ES7 214-1BG40-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72141BG400XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))

- CPU 1214C DC/DC/DC (6ES7 214-1AE30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72141AE300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- CPU 1214C DC/DC/DC (6ES7 214-1AG31-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72141AG310XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- CPU 1214C DC/DC/DC (6ES7 214-1AG40-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72141AG400XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- CPU 1214C DC/DC/Rly (6ES7 214-1HE30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72141HE300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- CPU 1214C DC/DC/Rly (6ES7 214-1HG31-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72141HG310XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- CPU 1214C DC/DC/Rly (6ES7 214-1HG40-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72141HG400XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))

### CPU 1215C (6ES7 215-1xxx-0XB0)

Information on the CPUs is available here:

- CPU 1215C DC/DC/DC (6ES7 215-1BG31-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72151BG310XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- CPU 1215C DC/DC/DC (6ES7 215-1BG40-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72151BG400XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- CPU 1215C AC/DC/Rly (6ES7 215-1AG31-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72151AG310XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))

- CPU 1215C AC/DC/Rly (6ES7 215-1AG40-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72151AG400XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- CPU 1215C DC/DC/Rly (6ES7 215-1HG31-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72151HG310XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- CPU 1215C DC/DC/Rly (6ES7 215-1HG40-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72151HG400XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))

### CPU 1217C (6ES7 217-1xxx-0XB0)

Information on the 1217C DC/DC/DC CPU is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72171AG400XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### 14.2.1.2 Signal boards

#### Signal boards (6ES7 2xx-xxx30-0XB0)

Information on signal boards for S7-1200 is available here:

- DI 4x24VDC (6ES7 221-3BD30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72233BD300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=viewB>))
- DI 4x5VDC (6ES7 221-3AD30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72213AD300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DQ 4x24VDC (6ES7 222-1BD30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72221BD300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=viewB>))
- DQ 4x5VDC (6ES7 222-1AD30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72221AD300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=viewB>))

- DI 2/DQ 2x24VDC (6ES7 223-0BD30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72230BD300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=viewB>))
- DI 2/DQ 2x24VDC (6ES7 223-3BD30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72213BD300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DI 2/DQ 2x5VDC (6ES7 223-3AD30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72233AD300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=viewB>))
- AI 1x12BIT (6ES7 231-4HA30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72314HA300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=viewB>))
- AI 1xRTD (6ES7 231-5PA30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72315PA300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=viewB>))
- AI 1xTC (6ES7 231-5QA30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72315QA300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=viewB>))
- AQ 1x12BIT (6ES7 232-4HA30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72324HA300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=viewB>))

### 14.2.1.3 Communication boards

#### Point-to-point

#### CB 1241 (6ES7 241-1CH30-1XB0)

Information on the CB 1241 communication board is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72411CH301XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### 14.2.1.4 Battery boards

##### BB 1297 (6ES7 297-0AX30-0XA0)

Information on the BB 1297 communication board is available here (<http://support.automation.siemens.com/WW/llisapi.dll?aktprim=100&lang=en&referer=%2fWW%2f&func=cslib.cssearch&nodeid0=41886045&viewreg=WW&siteid=csius&extranet=standard&groupid=4000002&objaction=cssearch&content=adsearch%2Fadsearch%2Easpx>).

#### 14.2.1.5 Digital input modules

##### Digital input modules (6ES7 221-1Bx3x-0XB0)

Information on the digital input modules is available here:

- DI8 x 24VDC (6ES7 221-1BF30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72211BF300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DI8 x 24VDC (6ES7 221-1BF32-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72211BF320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DI16 x 24VDC (6ES7 221-1BH30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72211BH300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DI16 x 24VDC (6ES7 221-1BH32-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72211BH320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))

### 14.2.1.6 Digital output modules

#### Digital output modules (6ES7 222-1xx3x-0XB0)

Information on the digital output modules is available here:

- DQ 8x24VDC (6ES7 222-1BF30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72221BF300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DQ 8x24VDC (6ES7 222-1BF32-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72221BF320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DQ 16x24VDC (6ES7 222-1BH30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72221BH300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DQ 16x24VDC (6ES7 222-1BH32-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72221BH320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DQ 16xRelay (6ES7 222-1HH30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72221HH300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DQ 16xRelay (6ES7 222-1HH32-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72221HH320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DQ 8xRelay (6ES7 222-1HF30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72221HF300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DQ 8xRelay (6ES7 222-1HF32-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72221HF320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))

- DQ 8xNO/NC Relay (6ES7 222-1XF30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72221XF300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DQ 8xNO/NC Relay (6ES7 222-1XF32-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72221XF320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))

### 14.2.1.7 Digital input and digital output modules

#### Digital input and output modules (6ES7 223-1xx3x-0XB0)

Information on the digital input and output modules is available here:

- DI 8/DQ 8x24VDC (6ES7 223-1BH30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72231BH300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- DI 8/DQ 8x24VDC (6ES7 223-1BH32-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72231BH320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))

### 14.2.1.9 Analog output modules

#### Analog output modules (6ES7 234-4Hx3x-0XB0)

Information on the analog output modules is available here:

- AQ 2x14BIT (6ES7 232-4HB30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72344HB300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- AQ 2x14BIT (6ES7 232-4HB32-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72344HB320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- AQ 4x14BIT (6ES7 232-4HD30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72344HD300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- AQ 4x14BIT (6ES7 232-4HD32-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72344HD320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))

### 14.2.1.10 Analog input and analog output modules

#### Analog input and output module (6ES7 234-4HE3x-0XB0)

Information on the analog input and output modules is available here:

- AI 4x13BIT/AQ 2x14BIT (6ES7 234-4HE30-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72324HB300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))
- AI 4x13BIT/AQ 2x14BIT (6ES7 234-4HE32-0XB0 (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72324HB320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>))

### 14.2.1.11 Communications modules

#### Industrial Remote Communication

##### CP 1242-7 (6GK7 242-7KX30-0XE0)

Information on the CP 1242-7 Telecontrol communication module is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6GK72427KX300XE0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

##### CP 1243-1 (6GK7 243-1JX30-0XE0)

Information on the CP 1243-1 Ethernet communication module is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6GK72431JX300XE0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### PROFIBUS

##### CM 1242-5 (6GK7 242-5DX3x-0XE0)

Information on the CM 1242-5 PROFIBUS communication module is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6GK72425DX300XE0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

##### CM 1243-5 (6GK7 243-5DX3x-0XE0)

Information on the CM 1243-5 PROFIBUS communication module is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6GK72435DX300XE0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### Point-to-point

##### CM 1241 RS232 (6ES7 241-1AH30-0XB0)

Information on the CM 1241 (RS232) communication module for point-to-point connections is available here (<http://support.automation.siemens.com/WW/llisapi.dll>).

[func=cslib.csinfo&lang=en&objid=6ES72411AH300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view](https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72411AH300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view)).

#### CM 1241 RS232 (6ES7 241-1AH32-0XB0)

Information on the CM 1241 (RS232) communication module for point-to-point connections is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72411AH320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### CM 1241 RS485 (6ES7 241-1CH30-0XB0)

Information on the CM 1241 (RS485) communication module for point-to-point connections is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72411CH300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### CM 1241 RS422/485 (6ES7 241-1CH31-0XB0)

Information on the CM 1241 (RS422/485) communication module for point-to-point connections is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72411CH310XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### CM 1241 RS422/485 (6ES7 241-1CH32-0XB0)

Information on the CM 1241 (RS422/485) communication module for point-to-point connections is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72411CH320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### Identification systems

#### RF120C (6GT2 002-0LA00)

Information on the communication module for Ident technology RFC120C is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6GT20020LA00&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

## AS-Interface

### AS-Interface CM 1243-2 (3RK7 243-2AA30-0XB0)

Information on the CM 1243-2 AS-i communication module is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=3RK72432AA300XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### 14.2.1.12 Technology modules

#### SIWAREX WP231 (7MH4 960-2AA01)

Information on the SIWAREX WP231 weighing module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=7MH4960-2AA01&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### SIWAREX WP241 (7MH4 960-4AA01)

Information on the SIWAREX WP241 weighing module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=7MH4960-4AA01&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### 4SI IO-Link (6ES7 278-4BD32-0XB0)

Information on the 4SI IO-Link IO-Link Master technology module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES72784BD320XB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

## 14.3 Distributed I/O

### 14.3.1 ET 200MP

#### 14.3.1.1 Interface modules

##### PROFINET

#### IM 155-5 PN ST (6ES7 155-5AA00-0AB0)

Information on the distributed I/O module IM 155-5 PN ST is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71555AA000AB0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

#### IM 155-5 PN HF (6ES7 155-5AA00-0AC0)

Information on the IM 155-5 PN HF distributed I/O module is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71555AA000AC0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

#### 14.3.1.2 Digital input modules

#### DI 16x24VDC BA (6ES7 521-1BH10-0AA0)

Information on the DI 16x24VDC BA digital input module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75211BH100AA0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

#### DI 16x24VDC HF (6ES7 521-1BH00-0AB0)

Information on the digital input module DI 16x24VDC HF is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75211BH000AB0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

**DI 16x24VDC SRC BA (6xxx 521-1BH50-xAA0)**

Information on the DI 16x24VDC HF digital input module (including SIPLUS variant) is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75211BH500AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

**DI 16x230VAC BA (6xxx 521-1FH00-xAA0)**

Information on the DI 16x24VDC HF digital input module (including SIPLUS variant) is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75211FH000AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

**DI 32x24VDC HF (6ES7 521-1BL00-0AB0)**

Information on the digital input module DI 16x24VDC HF is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75211BL000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

**DI 32x24VDC BA (6ES7 521-1BL10-0AA0)**

Information on the DI 16x24VDC BA digital input module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75211BL100AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

**14.3.1.3 Digital output modules****DQ 8x24VDC/2A HF (6xxx 522-1BF00-xAB0)**

Information on the DQ 8x24VDC/2A HF digital output module (including SIPLUS variant) is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75221BF000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### DQ 8x230VAC/2A ST (6xxx 522-5FF00-xAB0)

Information on the DQ 8x230VAC/2A ST digital output module (including SIPLUS variant) is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75225FF000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### DQ 8x230VAC/5A ST (6xxx 522-5HF00-xAB0)

Information on the 8x230VAC/5A ST digital output module (including SIPLUS variant) is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75225HF000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### DQ 16x24VDC/0.5A BA (6ES7 522-1BH10-0AA0)

Information on the DQ 16x24VDC/0.5A BA digital output module is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75221BH100AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### DQ 16x24VDC/0.5A ST (6ES7 522-1BH00-0AB0)

Information on the digital output module DQ 16x24VDC/0.5A ST is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75221BH000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### DQ 32x24VDC/0.5A BA (6ES7 522-1BL10-0AA0)

Information on the DQ 32x 24VDC/0.5A BA digital output module is available here (<http://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75221BL100AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### DQ 32x24VDC/0.5A ST (6ES7 522-1BL00-0AB0)

Information on the digital output module DQ 32x 24VDC/0.5A is available here (<https://support.automation.siemens.com/WW/llisapi.dll>)

[func=cslib.csinfo&lang=en&objid=6ES75221BL000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view](https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75221BL000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view)).

#### 14.3.1.4 Digital input and digital output modules

##### DI16/DO 16x24VDC (6ES7 523-1BL00-0AA0)

Information on the DI 16/DO 16x24VDC digital input and output module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75231BL000AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### 14.3.1.5 Analog input modules

##### AI 4xU/I/RTD/TC ST (6ES7 531-7QD00-0AB0)

Information on the AI 4xU/I/RTD/TC ST analog input module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75317QD00AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

##### AI 8xU/I/RTD/TC ST (6ES7 531-7KF00-0AB0)

Information on the analog input module AI 8xU/I/RTD/TC ST is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75317KF000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

##### AI 8xU/I HS (6xxx 531-7NF10-xAB0)

Information on the AI 8xU/I HS analog input module (including SIPLUS variant) is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75317NF100AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### 14.3.1.6 Analog output modules

#### AQ 2xU/I ST (6ES7 532-5NB00-0AB0)

Information on the AQ 2xU/I ST analog output module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75325NB000AB0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

#### AQ 4xU/I ST (6ES7 532-5HD00-0AB0)

Information on the analog output module AQ 4xU/I ST is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75325HD000AB0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

#### AQ 8xU/I HS (6xxx 532-5HF00-xAB0)

Information on the AQ 8xU/I HS analog output module (including SIPLUS variant) is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75325HF000AB0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

### 14.3.1.7 Analog input and analog output modules

#### AI/AQ 4xU/I/RTD/TC / 2xU/I ST (6ES7 534-7QE00-0AB0)

Information on the AI/AQ 4xU/I/RTD/TC / 2xU/I ST analog input and output module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75347QE000AB0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

### 14.3.1.8 Communications modules

#### PROFINET/Ethernet

##### CM 1542-1 (6GK7 542-1AX00-0XE)

Information on the CM 1542-1 PROFINET/Ethernet communication module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6GK75421AX000XE0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

##### CP 1543-1 (6GK7 543-1AX00-0XE0)

Information on the CP 1543-1 PROFINET/Ethernet communications processor is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6GK75431AX000XE0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### PROFIBUS

##### CM 1542-5 (6GK7 542-5DX00-0XE0)

Information on the CM 1542-5 PROFIBUS communication module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6GK75425DX000XE0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### Point-to-point

##### RS232

##### CM PtP RS232 BA (6xxx 540-1AD00-xAA0)

Information on the CM PtP RS232 BA point-to-point communication module (including SIPLUS variant) is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75401AD000AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### CM PtP RS232 HF (6ES7 541-1AD00-0AB0)

Information on the CM PtP RS232 HF point-to-point communication module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75411AD000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### RS422/485

#### CM PtP RS422/485 BA (6xxx 540-1AB00-xAA0)

Information on the CM PtP RS422/485 BA point-to-point communication module (including SIPLUS variant) is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75401AB000AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### CM PtP RS422/485 HF (6xxx 541-1AB00-xAB0)

Information on the CM PtP RS422/485 HF point-to-point communication module (including SIPLUS variant) is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75411AB000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### 14.3.1.9 Power supply module

#### PS 25W 24VDC (6ES7 505-0KA00-0AB0)

Information on the PS 25W 24VDC power supply module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75050KA000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### PS 60W 24/48/60VDC (6xxx 505-0RA00-xAB0)

Information on the PS 60W 24/48/60VDC power supply module (including SIPLUS variant) is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75050RA000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### PS 60W 120/230VAC/DC (6xxx 507-0RA00-xAB0)

Information on the power supply module PS 60W 120/230VAC/DC (including SIPLUS variant) is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75070RA000AB0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

### 14.3.1.10 Technology modules

#### TM Count 2x24V (6ES7 550-1AA00-0AB0)

Information on the counter module TM Count 2x24V is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75501AA000AB0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

#### TM PosInput 2 (6ES7 551-1AB00-0AB0)

Information on the positioning module TM PosInput 2 is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75511AB000AB0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

#### CM AS-i Master (3RK7 137-6SA00-0BC1)

Information on the CM AS-i Master module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=3RK71376SA000BC1&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

#### F-CM AS-i (3RK7 136-6SC00-0BC1)

Information on the F-CM AS-i module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=3RK71366SC000BC1&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

## 14.3.2 ET 200SP

### 14.3.2.1 CPU

#### CPU 1510SP-1 (6ES7 510-1DJ00-0AB0)

Information on the 1510SP-1 CPU is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75101DJ000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### CPU 1512SP-1 (6ES7 512-1DK00-0AB0)

Information on the 1512SP-1 CPU is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES75121DK000AB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### 14.3.2.2 Interface modules

#### PROFINET

##### IM 155-6 PN ST (6ES7 155-6AU00-0BN0)

You can find information on the interface module IM 155-6 PN ST here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71556AU000BN0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

##### IM 155-6 PN HF (6ES7 155-6AU00-0CN0)

You can find information on the interface module IM 155-6 PN HF here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71556AU000CN0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

## PROFIBUS

### IM 155-6 DP HF (6ES7 155-6BU00-0CN0)

Information on the IM 155-6 DP HF interface module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71556BU000CN0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

## Other fieldbuses

### IM 155-6 Receive (6ES7 155-6DU00-0BN0)

Information on the IM 155-6 Receive interface module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71556DU000BN0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### 14.3.2.3 Digital input modules

#### DI 4x120..230VAC ST (6ES7 131-6FD00-0BB1)

Information on the DI 4x120..230VAC ST digital input module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71316FD000BB1&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### DI 8x24VDC ST (6ES7 131-6BF00-0BA0)

Information on the digital input module DI 8x24VDC ST is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71316BF000BA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### DI 8x24VDC HF (6ES7 131-6BF00-0CA0)

Information on the digital input module DI 8x24VDC HF is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71316BF000CA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### DI 8xNAMUR HF (6ES7 131-6TF00-0CA0)

Information on the DI 8xNAMUR HF digital input module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71316TF000CA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### DI 8x24VDC SRC BA (6ES7 131-6BF60-0AA0)

Information on the DI 8x24VDC SRC BA digital input module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71316BF6000A0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### DI 16x24VDC ST (6ES7 131-6BH00-0BA0)

Information on the digital input module DI 16x24VDC ST is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71316BH000BA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### 14.3.2.4 Digital output modules

#### DQ 4x24VDC/2A ST (6ES7 132-6BD20-0BA0)

Information on the digital output module DQ 4x24VDC/2A ST is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71326BD200BA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### DQ 4x24..230VAC/2A ST (6ES7 132-6FD00-0BB1)

Information on the DQ 4x24..230VAC/2A ST digital output module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71326FD000BB1&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### DQ 4x24VDC/2A HF (6ES7 132-6BD20-0CA0)

Information on the DQ 4x24VDC/2A HF digital output module is available here (<https://support.automation.siemens.com/WW/llisapi.dll>).

[func=cslib.csinfo&lang=en&objid=6ES71326BD200CA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view](https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71326BD200CA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view)).

#### **RQ 4x120..230VUC/5A NO ST (6ES7 132-6HD00-0BB0)**

Information on the RQ 4x120..230VUC/5A NO ST relay output module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71326HD000BB0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### **RQ 4x24VUC/2A CO ST (6ES7 132-6GD50-0BA0)**

Information on the RQ 4x24VUC/2A CO ST relay output module is available here.

#### **DQ 8x24VDC/0.5A ST (6ES7 132-6BF00-0BA0)**

Information on the digital output module DQ 8x24VDC/0.5A ST is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71326BF000BA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### **DQ 8x24VDC/0.5A SNK BA (6ES7 132-6BF60-0AA0)**

Information on the DQ 8x24VDC/0.5A SNK BA digital output module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71326BF600AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### **DQ 8x24VDC/0.5A HF (6ES7 132-6BF00-0CA0)**

Information on the digital output module DQ 8x24VDC/0.5A HF is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71326BF000CA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### **DQ 16x24VDC/0.5A ST (6ES7 132-6BH00-0BA0)**

Information on the digital output module DQ 16x24VDC/0.5A ST is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71326BH000BA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### 14.3.2.5 Analog input modules

#### AI 2xU/I 2-/4-wire HF (6ES7 134-6HB00-0CA1)

Information on the AI 2xU/I 2-/4-wire HF analog input module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71346HB000CA1&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### AI 2xU/I 2-/4-wire HS (6ES7 134-6HB00-0DA1)

Information on the AI 2xU/I 2-/4-wire HS analog input module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71346HB000DA1&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### AI 4xI 2-/4-wire ST (6ES7 134-6GD00-0BA1)

Information on the analog input module AI 4xI 2-/4-wire ST is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71346GD000BA1&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### AI 4xU/I 2-wire ST (6ES7 134-6HD00-0BA1)

Information on the analog input module AI 4xU/I 2-wire ST is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71346HD000BA1&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

#### AI 4xRTD/TC 2-/3-/4-wire HF (6ES7 134-6JD00-0CA1)

Information on the analog input module AI 4xRTD/TC 2-/3-/4-wire HF is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71346JD000CA1&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

**AI 8xRTD/TC 2-wire HF (6ES7 134-6JF00-0CA1)**

Information on the AI 8xRTD/TC 2-wire HF analog input module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71346JF00CA1&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

**AI EnergyMeter ST (6ES7 134-6PA00-0BD0)**

Information on the AI EnergyMeter ST relay output module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71346PA00BD0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

**14.3.2.6 Analog output modules****AQ 2xU/I HF (6ES7 135-6HB00-0CA1)**

Information on the AQ 2xU/I HF analog output module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71356HB00CA1&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

**AQ 2xU/I HS (6ES7 135-6HB00-0DA1)**

Information on the analog output module AQ 2xU/I HS is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71356HB00DA1&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

**AQ 4xU/I ST (6ES7 135-6HD00-0BA1)**

Information on the analog output module AQ 4xU/I ST is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71356HD00BA1&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### 14.3.2.7 Communication modules

#### CM PtP (6ES7 137-6AA00-0BA0)

Information on the CM PtP communication module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71376AA000BA0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

### 14.3.2.8 Power modules

#### PM 120..230VAC/10A ST (6ES7 133-6AA00-0BC0)

Information on the PM 120..230VAC/10A ST power module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71336AA000BC0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

### 14.3.2.9 Special modules

#### Server module (6ES7 193-6PA00-0AA0)

Information on the server module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71936PA000AA0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>).

#### BusAdapter BA 2xSCRJ (6ES7 193-6AP00-0AA0)

Information on the BA 2xSCRJ BusAdapter is available here.

#### See also

Link to the device manual (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71936AP000AA0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>)

#### BusAdapter BA 2xRJ45 (6ES7 193-6AR00-0AA0)

Information on the BusAdapter BA 2xRJ45 is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71936AR000AA0&objaction=csviewmlfbbeitraege&sbtype=133300&caller=view>)

[func=cslib.csinfo&lang=en&objid=6ES71936AR000AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view](https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71936AR000AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view)).

### BusAdapter FC (6ES7 193-6AF00-0AA0)

Information on the BusAdapter FC is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71936AF000AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### BusAdapter Send (6ES7 193-6AS00-0AA0)

Information on the BusAdapter Send is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71936AS000AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### BusAdapter Receive (6ES7 193-6AE00-0AA0)

Information on the BusAdapter Receive is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71936AE000AA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

## 14.3.2.10 Technology modules

### TM Count 1x24V (6ES7 138-6AA00-0BA0)

Information on the relay output module TMCount 1x24V is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71386AA000BA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### TM PosInput 1 (6ES7 138-6BA00-0BA0)

Information on the positioning module TM PosInput 1 is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71386BA000BA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).

### IO-Link Master Module (6ES7 137-6BD00-0BA0)

Information on the relay output module IO-Link Master Module is available here (<https://support.automation.siemens.com/WW/llisapi.dll?func=cslib.csinfo&lang=en&objid=6ES71376BD000BA0&objaction=csviewmlfbbeitraege&subtype=133300&caller=view>).
