## SIMATIC

### WinCC Comfort/Advanced V13.0

#### System Manual

System overview of STEP 7 and WinCC	1
Readme	2
Installation	3
Migrating projects and programs	4
First steps	5
Introduction to the TIA Portal	6
Editing projects	7
Editing devices and networks	8
Programming the PLC	9
Visualize processes	10
Using technology functions	11
Using Team Engineering	12
Using online and diagnostics functions	13
Hardware documentation	14

Printout of the online help

## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

 <b>DANGER</b>
indicates that death or severe personal injury <b>will</b> result if proper precautions are not taken.
 <b>WARNING</b>
indicates that death or severe personal injury <b>may</b> result if proper precautions are not taken.
 <b>CAUTION</b>
indicates that minor personal injury can result if proper precautions are not taken.
<b>NOTICE</b>
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

 <b>WARNING</b>
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

7.3.8	Deleting projects.....	307
7.3.9	Working with multi-language projects.....	308
7.3.9.1	Project text basics.....	308
7.3.9.2	Select project languages.....	310
7.3.9.3	Setting the editing language.....	310
7.3.9.4	Translating all project texts in tabular form.....	311
7.3.9.5	Translating text associated with individual objects.....	312
7.3.9.6	Translating texts using reference texts.....	312
7.3.9.7	Exporting and importing project texts.....	313
7.3.9.8	Application examples for multilanguage projects.....	315
7.3.10	Archiving and retrieving projects.....	316
7.3.10.1	Working with project archives.....	316

7.3.10.2	Archiving projects.....	317
7.3.10.3	Retrieving projects.....	318
7.4	Using reference projects.....	319
7.4.1	Basics of reference projects.....	319
7.4.2	Opening and closing a reference project.....	319
7.4.3	Comparing reference projects.....	320
7.5	Editing project data.....	321
7.5.1	Compiling and loading project data.....	321
7.5.1.1	Compiling project data.....	321
7.5.1.2	Loading project data.....	323
7.5.2	Comparing project data.....	331
7.5.2.1	Basics of project data comparison.....	331
7.5.2.2	Carrying out an online/offline comparison.....	332
7.5.2.3	Carrying out offline/offline comparisons.....	332
7.5.2.4	Using the compare editor .....	333
7.5.3	Protecting project data.....	346
7.5.3.1	Protection concept for project data.....	346
7.5.3.2	Revoking access rights for devices.....	347
7.5.4	Printing project contents.....	348
7.5.4.1	Printing project documentation.....	348
7.5.4.2	Printing module labels.....	367
7.6	Undoing and redoing actions.....	370
7.6.1	Basics of undoing and redoing actions.....	370
7.6.2	Undoing an action.....	372
7.6.3	Redoing an action.....	373
7.7	Finding and replacing in projects.....	374
7.7.1	Information on the search function.....	374
7.7.2	Search and replace.....	375
7.8	Working with text lists.....	377
7.8.1	Text lists.....	377
7.8.2	Creating user-defined text lists.....	378
7.8.3	Editing user-defined text lists.....	379
7.8.4	Editing system-defined text lists.....	379
7.9	Using memory cards.....	380
7.9.1	Basics about memory cards.....	380
7.9.2	Adding a user-defined card reader.....	381
7.9.3	Accessing memory cards.....	382
7.9.4	Displaying properties of memory cards.....	382
7.10	Using libraries.....	383
7.10.1	Library basics.....	383
7.10.2	Using the "Libraries" task card.....	385
7.10.2.1	Overview of the "Libraries" task card.....	385
7.10.2.2	Using the element view.....	387
7.10.3	Using the library view.....	388
7.10.3.1	Overview of the library view.....	388
7.10.3.2	Opening and closing the library view.....	390
7.10.4	Using library management.....	391
7.10.4.1	Overview of the library management.....	391
7.10.4.2	Opening library management.....	393

7.10.4.3	Filtering the display of types.....	394
7.10.4.4	Displaying instances in the project.....	394
7.10.4.5	Displaying cross references of an instance.....	395
7.10.4.6	Displaying relations to other library objects.....	395
7.10.5	Using global libraries.....	396
7.10.5.1	Creating a global library.....	396
7.10.5.2	Compatibility of global libraries.....	397
7.10.5.3	Opening a global library.....	398
7.10.5.4	Upgrading global libraries.....	399
7.10.5.5	Displaying properties of global libraries.....	401
7.10.5.6	Displaying logs of global libraries.....	401
7.10.5.7	Saving a global library.....	402
7.10.5.8	Closing a global library.....	403
7.10.5.9	Deleting a global library.....	404
7.10.5.10	Archiving and disabling global libraries.....	404
7.10.5.11	Using global corporate libraries.....	407
7.10.6	Creating folders in a library.....	409
7.10.7	Using master copies.....	409
7.10.7.1	Basics on master copies.....	409
7.10.7.2	Adding master copies.....	410
7.10.7.3	Filtering master copies.....	411
7.10.7.4	Using master copies.....	412
7.10.8	Using types and their versions.....	412
7.10.8.1	Basics on types.....	412
7.10.8.2	State of type versions.....	414
7.10.8.3	Displaying a released type version.....	415
7.10.8.4	Displaying properties of a type or version.....	416

10.7.4.5	Configuring access protection.....	3856
10.7.5	Reference.....	3857
10.7.5.1	Objects with access protection.....	3857
10.7.5.2	Objects with access protection.....	3857
10.7.5.3	Default user groups and authorizations.....	3858
10.7.6	Examples.....	3858
10.7.6.1	Example: Configuring a button with logon dialog box.....	3858
10.7.6.2	Example: Logging the logon and logoff events.....	3859
10.7.6.3	Example of a user administration.....	3860
10.8	Working with system functions and Runtime scripting.....	3868
10.8.1	Basics.....	3868
10.8.1.1	Runtime scripting.....	3868
10.8.1.2	System functions.....	3869
10.8.1.3	User-defined functions.....	3871
10.8.2	Working with function lists.....	3872
10.8.2.1	Basics of the function list.....	3872
10.8.2.2	Properties of a function list.....	3873
10.8.2.3	Configuring a function list.....	3874
10.8.2.4	Editing a function list.....	3876
10.8.3	Working with user-defined VB functions.....	3877
10.8.3.1	"Scripts" editor.....	3877
10.8.3.2	Access to HMI tags.....	3879
10.8.3.3	Access to objects.....	3880
10.8.3.4	Calling system functions.....	3881
10.8.3.5	Calling user-defined VB functions.....	3882
10.8.3.6	Transfer and return of values in VBS.....	3884
10.8.3.7	Create customized VB functions.....	3885
10.8.3.8	Testing the syntax of customized functions.....	3887
10.8.3.9	Renaming customized VB functions.....	3888
10.8.3.10	Executing customized VB functions.....	3888
10.8.3.11	Protecting user-defined functions.....	3889
10.8.4	Debugging user-defined VB functions.....	3891
10.8.4.1	Debugging user-defined VB functions.....	3891
10.8.4.2	Integrating the Debugger.....	3894
10.8.4.3	Starting and stopping the debugger.....	3899
10.8.5	Runtime behavior in Runtime.....	3900
10.8.5.1	Executing a function list in Runtime.....	3900
10.8.5.2	Executing user-defined functions in Runtime.....	3900
10.8.5.3	Processing sequence for user-defined functions and system functions.....	3901
10.8.5.4	Making object properties dynamic in Runtime.....	3903
10.8.6	Examples.....	3904
10.8.6.1	Example: Converting Fahrenheit into degrees Celsius.....	3904
10.8.6.2	Example: Converting inches into meters.....	3906
10.8.6.3	Example: Changing the operating mode on the HMI device with the current display.....	3908
10.8.7	Reference.....	3910
10.8.7.1	Function list.....	3910
10.8.7.2	Events.....	4103
10.8.7.3	VB scripts.....	4125
10.9	Mobile Wireless.....	5188

10.9.1	Field of application of the Mobile Panel Wireless.....	5188
10.9.2	How does the transponder system work?.....	5189
10.9.3	How does the RFID system work?.....	5191
10.9.4	Configuring the Mobile Panel V2 for fail-safe operation.....	5193
10.9.4.1	Configuration overview.....	5193
10.9.4.2	Creating PLC for fail-safe operation.....	5194
10.9.4.3	Installing a general station description (GSD).....	5195
10.9.4.4	Creating a module from the GSD file.....	5195
10.9.4.5	Creating a connection between a module and the PLC.....	5198
10.9.4.6	Creating Mobile Panel.....	5199
10.9.5	Basics.....	5200
10.9.5.1	Zones.....	5200
10.9.5.2	Zones working area.....	5200
10.9.5.3	Effective ranges.....	5201
10.9.5.4	Effective ranges working area.....	5202
10.9.5.5	Effective ranges (RFID).....	5204
10.9.5.6	Work area for effective ranges (RFID).....	5204
10.9.6	Working with zones.....	5206
10.9.6.1	Configuring a zone.....	5206
10.9.6.2	Displaying the screen on entering a zone.....	5207
10.9.6.3	Displaying an object in relation to the zone.....	5208
10.9.7	Working with effective ranges.....	5209
10.9.7.1	Overview.....	5209
10.9.7.2	Configure effective range.....	5210
10.9.7.3	Configuring the effective range name.....	5211
10.9.7.4	Configuring additional Mobile Wireless objects.....	5212
10.9.8	Working with effective ranges (RFID).....	5212
10.9.8.1	Overview.....	5212
10.9.8.2	Configuring effective range (RFID).....	5213
10.9.8.3	Configuring the effective range name (RFID).....	5214
10.9.9	Reference.....	5215
10.9.9.1	PROFIsafe address.....	5215
10.9.9.2	Power Management.....	5216
10.9.9.3	Zone ID / connection point ID.....	5217
10.10	Planning tasks.....	5217
10.10.1	Field of application of the Scheduler.....	5217
10.10.2	Working with tasks and triggers.....	5219
10.10.3	Basics.....	5220
10.10.3.1	Work area of the "Scheduler" editor.....	5220
10.10.3.2	Function list.....	5221
10.10.3.3	Function list.....	5221
10.10.3.4	Triggers.....	5222
10.10.4	Planning jobs.....	5224
10.10.4.1	Planning tasks with acyclic triggers.....	5224
10.10.4.2	Planning tasks with cyclic triggers.....	5226
10.10.4.3	Planning tasks with event triggers.....	5227
10.10.4.4	Administer task.....	5228
10.10.5	Examples.....	5229
10.10.5.1	Example: Terminating Runtime every day.....	5229
10.10.5.2	Example: Update user following change of user.....	5230
10.10.5.3	Example: Changing the starting point of a job in Runtime.....	5231

10.11	Communicating with PLCs.....	5236
10.11.1	Basics of communication.....	5236
10.11.1.1	Communication between devices.....	5236
10.11.1.2	Devices and networks in the automation system.....	5237
10.11.1.3	Data exchange using tags.....	5242
10.11.1.4	Data exchange using area pointers.....	5243
10.11.1.5	Communication drivers.....	5243
10.11.2	Editors for communication.....	5244
10.11.2.1	"Devices & networks" editor.....	5244
10.11.2.2	Network view.....	5245
10.11.2.3	Network data.....	5248
10.11.2.4	Diagnostics of online connections.....	5250
10.11.2.5	Device view.....	5251
10.11.2.6	Topology view.....	5253
10.11.2.7	Inspector window .....	5255
10.11.2.8	Hardware catalog .....	5257
10.11.2.9	Information on hardware components.....	5259
10.11.3	Networks and connections.....	5260
10.11.3.1	SIMATIC communication networks.....	5260
10.11.3.2	Configuring networks and connections.....	5265
10.11.4	Data exchange.....	5273
10.11.4.1	Data exchange using tags.....	5273
10.11.4.2	Data exchange using area pointers.....	5280
10.11.5	Device dependency.....	5286
10.11.5.1	Basic Panel.....	5286
10.11.5.2	Panel.....	5292
10.11.5.3	Comfort Panel.....	5296
10.11.5.4	Multi Panel.....	5303
10.11.5.5	Mobile Panel.....	5307
10.11.5.6	PC systems.....	5312
10.11.5.7	Parallel communication .....	5316
10.11.6	Communicating with SIMATIC S7 1500.....	5317
10.11.6.1	Communication with SIMATIC S7 1500.....	5317
10.11.6.2	Communication via PROFINET.....	5318
10.11.6.3	Communication via PROFIBUS.....	5337
10.11.6.4	Data exchange.....	5350
10.11.6.5	Performance features of communication.....	5369
10.11.6.6	Configuring connections in the "Connections" editor.....	5375
10.11.6.7	Configuring connections in the "Connections" editor.....	5382
10.11.6.8	Configuring time synchronization.....	5387
10.11.7	Communicating with SIMATIC S7 1200.....	5390
10.11.7.1	Communication with SIMATIC S7 1200.....	5390
10.11.7.2	Communication via PROFINET.....	5391
10.11.7.3	Communication via PROFIBUS.....	5413
10.11.7.4	Data exchange.....	5428
10.11.7.5	Performance features of communication.....	5451
10.11.7.6	Creating connections in the "Connections" editor.....	5457
10.11.7.7	Time synchronization.....	5466
10.11.8	Communicating with SIMATIC S7 300/400.....	5470
10.11.8.1	Communication with SIMATIC S7 300/400.....	5470
10.11.8.2	Communication via PROFINET.....	5471
10.11.8.3	Communication via PROFIBUS.....	5490

10.11.8.4	Communication via MPI.....	5504
10.11.8.5	Data exchange.....	5516
10.11.8.6	Performance features of communication.....	5536
10.11.8.7	Creating connections in the "Connections" editor.....	5536
10.11.9	Communicating with SIMATIC S7 200.....	5549
10.11.9.1	Communication with SIMATIC S7 200.....	5549
10.11.9.2	Creating a connection to SIMATIC S7 200.....	5549
10.11.9.3	Parameters for the connection.....	5551
10.11.9.4	Data exchange.....	5559
10.11.9.5	Performance features of communication.....	5578
10.11.10	Communicating with SIMATIC LOGO!.....	5579
10.11.10.1	Communication with SIMATIC LOGO!.....	5579
10.11.10.2	Creating a connection to SIMATIC LOGO!.....	5580
10.11.10.3	Connection parameters.....	5581
10.11.10.4	Data exchange.....	5585
10.11.10.5	Performance features of communication.....	5590
10.11.11	Configuring direct keys.....	5590
10.11.11.1	Direct keys.....	5590
10.11.11.2	Changing the operating mode of the HMI device.....	5591
10.11.11.3	Configuring direct keys.....	5592
10.11.11.4	PROFINET IO direct keys.....	5594
10.11.11.5	PROFIBUS DP direct keys.....	5611
10.11.12	Communication via SIMATIC HMI HTTP.....	5629
10.11.12.1	Basic information on SIMATIC HMI HTTP.....	5629
10.11.12.2	Configuring a connection via SIMATIC HMI HTTP.....	5631
10.11.12.3	Performance features of communication.....	5644
10.11.13	Communication via OPC.....	5645
10.11.13.1	Communication via OPC.....	5645
10.11.13.2	Configuring a connection via OPC.....	5645
10.11.13.3	Performance features of communication.....	5647
10.11.14	Communication via routing.....	5649
10.11.14.1	Communication via routing.....	5649
10.11.14.2	Example for communication via routing.....	5651
10.11.14.3	Configuring communication via routing.....	5653
10.11.15	PROFINET IO and IRT.....	5654
10.11.15.1	PROFINET IO.....	5654
10.11.15.2	IRT communication.....	5656
10.11.15.3	Configuring the HMI device as IO device.....	5659
10.11.15.4	Parameters for PROFINET IO and IRT.....	5660
10.11.15.5	Performance characteristics of PROFINET IO and IRT.....	5662
10.11.16	Media redundancy.....	5663
10.11.16.1	Restrictions with media redundancy.....	5663
10.11.16.2	Media redundancy.....	5664
10.11.16.3	Media Redundancy Protocol (MRP).....	5665
10.11.16.4	Configuring media redundancy for HMI devices .....	5666
10.11.16.5	Parameters for media redundancy.....	5668
10.11.16.6	Managing MRP domains.....	5669
10.11.17	Communication with other PLCs.....	5671
10.11.17.1	Communication with other PLCs.....	5671
10.11.17.2	Distinctive features when configuring.....	5672
10.11.17.3	Parallel communication .....	5672
10.11.17.4	Communication drivers.....	5674

10.11.17.5	Data exchange using area pointers.....	5795
10.11.18	Special features of WinAC MP.....	5810
10.11.18.1	WinAC MP basics.....	5810
10.11.18.2	Communication options with WinAC MP.....	5812
10.11.18.3	Standard procedure for communication with WinAC MP.....	5816
10.11.18.4	Configuring the WinAC MP communications driver.....	5817
10.11.18.5	Transferring WinAC MP to the HMI device.....	5828
10.11.18.6	Transferring authorization to the HMI device.....	5833
10.11.18.7	WinAC MP system library.....	5834
10.12	Using global functions.....	5834
10.12.1	HMI device wizard basics.....	5834
10.12.2	HMI device wizard basics.....	5836
10.12.3	Working with libraries.....	5837
10.12.3.1	Basics on libraries.....	5837
10.12.3.2	Overview of the library view.....	5839
10.12.3.3	Copy templates and types.....	5840
10.12.3.4	Libraries in WinCC.....	5841
10.12.3.5	Managing libraries.....	5842
10.12.3.6	Managing objects in a library.....	5850
10.12.3.7	Using types and their versions.....	5854
10.12.4	Using controller data from other projects.....	5858
10.12.4.1	Basics of Inter Project Engineering (IPE).....	5858
10.12.4.2	Controller data.....	5859
10.12.4.3	Initializing a device proxy via an IPE file.....	5859
10.12.4.4	Initializing a device proxy via a project file.....	5865
10.12.5	Importing and exporting project data.....	5870
10.12.5.1	Importing and exporting project data.....	5870
10.12.5.2	Importing and exporting recipes.....	5871
10.12.5.3	Importing and exporting alarms.....	5875
10.12.5.4	Importing and exporting tags.....	5882
10.12.5.5	Importing and exporting text lists.....	5888
10.12.6	Using cross-references.....	5892
10.12.6.1	General information about cross references.....	5892
10.12.6.2	Displaying the cross-reference list.....	5892
10.12.6.3	Structure of the cross-reference list.....	5893
10.12.6.4	Displaying cross-references in the Inspector window.....	5894
10.12.6.5	Rewiring tags in the screens.....	5895
10.12.7	Managing languages.....	5898
10.12.7.1	Languages in WinCC.....	5898
10.12.7.2	Language settings in the operating system.....	5899
10.12.7.3	Operating system settings for Asian languages.....	5900
10.12.7.4	Setting project languages.....	5901
10.12.7.5	Creating one project in multiple languages.....	5904
10.12.7.6	Using language-specific graphics.....	5912
10.12.7.7	Languages in runtime.....	5916
10.12.7.8	Example of multilingual configuration.....	5923
10.12.8	Replacing devices.....	5926
10.12.8.1	Basics.....	5926
10.12.8.2	Device-specific functions.....	5927
10.12.8.3	Adjust screens to the new device.....	5932
10.12.8.4	Example: Replacing devices.....	5937
10.12.9	Copying between devices and editors.....	5941

10.12.9.1	Basics.....	5941
10.12.9.2	Copy and paste.....	5944
10.12.9.3	Copying between different RT and ES versions.....	5948
10.12.10	Using WinCC version compatibility.....	5950
10.12.10.1	Basics on version compatibility.....	5950
10.12.10.2	Editing projects of a previous WinCC version.....	5952
10.12.10.3	Upgrading projects.....	5953
10.12.10.4	Upgrading a global library.....	5954
10.12.10.5	Changing between device versions.....	5955
10.12.10.6	Changing the device version.....	5956
10.12.11	Viewing memory card data.....	5957
10.12.11.1	Basics.....	5957
10.12.11.2	Working with backups.....	5957
10.12.11.3	Working with HMI device images.....	5960
10.12.12	Using multi-touch functions.....	5964
10.12.12.1	Multi-touch operation.....	5964
10.12.12.2	Supported gestures.....	5965
10.12.12.3	Two-hand operation of operator controls.....	5966
10.12.12.4	Restrictions in Sm@rtServer/Client mode.....	5970
10.13	Compiling and loading.....	5970
10.13.1	Compiling and loading projects.....	5970
10.13.1.1	Overview of compiling and loading projects.....	5970
10.13.1.2	Compiling a project.....	5972
10.13.1.3	Loading projects.....	5973
10.13.1.4	Runtime start.....	5987
10.13.2	Simulating projects.....	5990
10.13.2.1	Simulation basics.....	5990
10.13.2.2	WinCC Runtime Advanced simulation.....	5991
10.13.2.3	Simulating a project.....	5992
10.13.2.4	Simulating a screen.....	5994
10.13.2.5	Working with the tag simulator.....	5994
10.13.2.6	Simulation restrictions.....	5996
10.13.2.7	Start debugger.....	5996
10.13.3	Servicing the HMI device.....	5997
10.13.3.1	Overview of HMI device maintenance (Basic Panels).....	5997
10.13.3.2	Overview of HMI device maintenance tasks (Basic Panels).....	5998
10.13.3.3	ProSave.....	5999
10.13.3.4	Backup of HMI data.....	5999
10.13.3.5	Backing up and restoring data of the HMI device.....	6001
10.13.3.6	Updating the operating system.....	6002
10.13.3.7	Updating the operating system on the HMI device.....	6003
10.13.3.8	Transferring license keys.....	6005
10.13.3.9	Managing licenses.....	6006
10.13.3.10	Installing and uninstalling an option.....	6007
10.13.4	Printer driver.....	6008
10.13.4.1	Validity.....	6008
10.13.4.2	Supported HMI devices.....	6009
10.13.4.3	Installation.....	6009
10.13.4.4	Transferring the Options.....	6010
10.13.4.5	Setting up the printer driver.....	6011
10.13.5	Reference.....	6013
10.13.5.1	Error messages during the download of projects.....	6013

10.13.5.2	Adapting the project for another HMI device.....	6015
10.13.5.3	Establishing a connection to the HMI device.....	6016
10.14	Operating in Runtime.....	6017
10.14.1	Basics.....	6017
10.14.1.1	Overview.....	6017
10.14.1.2	System behavior.....	6019
10.14.2	Commissioning projects.....	6022
10.14.2.1	Runtime Advanced and Panels.....	6022
10.14.2.2	Settings for Runtime Advanced and Panels.....	6023
10.14.2.3	Loading a project.....	6025
10.14.2.4	Testing a project.....	6026
10.14.2.5	Backup and restoring projects.....	6027
10.14.2.6	Starting the project.....	6029
10.14.3	Operating projects.....	6030
10.14.3.1	Setting the project language.....	6030
10.14.3.2	Operating recipes.....	6030
10.14.3.3	Operating alarms.....	6059
10.14.3.4	Basics.....	6069
10.14.3.5	Project security.....	6086
10.15	Performance features.....	6104
10.15.1	Engineering system.....	6104
10.15.2	Basic Panel.....	6106
10.15.3	Basic Panel 2nd Generation.....	6110
10.15.4	Panel.....	6113
10.15.5	Mobile Panel.....	6117
10.15.6	Multi Panel.....	6122
10.15.7	Comfort Panel.....	6125
10.15.8	WinCC Runtime Advanced.....	6130
10.15.9	General technical specifications.....	6134
10.15.9.1	Permitted characters.....	6134
10.15.9.2	Recommended printers.....	6134
10.15.9.3	Printing via print server.....	6135
10.15.9.4	Memory requirement of recipes.....	6136
10.15.9.5	Memory requirements of recipes for Basic Panels, OP 77A, and TP 177A.....	6137
10.16	Options.....	6139
10.16.1	WinCC Audit.....	6139
10.16.1.1	Basics.....	6139
10.16.1.2	Enabling GMP compliant configuration.....	6143
10.16.1.3	Using the Audit trail.....	6145
10.16.1.4	Configuring audit functions.....	6166
10.16.1.5	Performance features of GMP relevant configuration.....	6180
10.16.2	WinCC Sm@rtServer.....	6181
10.16.2.1	Basics.....	6181
10.16.2.2	Remote control via Sm@rtServer.....	6213
10.16.2.3	E-mail notification from runtime.....	6226

## System overview of STEP 7 and WinCC

### 1.1 Scaling of STEP 7 and WinCC in the TIA Portal

#### Scope of performance of the products

The following graphic shows the scope of performance of the individual products of STEP 7 and WinCC:

\* Only with STEP 7 Professional for S7-300/400/WinAC and S7-1500

\*\* With installed optional package "STEP 7 Safety Advanced"

#### STEP 7

STEP 7 (TIA Portal) is the engineering software for configuring the SIMATIC S7-1200, S7-1500, S7-300/400 and WinAC controller families. STEP 7 (TIA Portal) is available in two editions, depending on the configurable controller families:

- STEP 7 Basic for configuring the S7-1200
- STEP 7 Professional for configuring S7-1200, S7-1500, S7-300/400 and WinAC

## WinCC

WinCC (TIA Portal) is an engineering software for configuring SIMATIC Panels, SIMATIC Industrial PCs, and Standard PCs with the WinCC Runtime Advanced or the SCADA System WinCC Runtime Professional visualization software.

WinCC (TIA Portal) is available in four editions, depending on the configurable operator control systems:

- WinCC Basic for configuring Basic Panels  
WinCC Basic is included with every STEP 7 Basic and STEP 7 Professional product.
- WinCC Comfort for configuring all panels (including Comfort Panels, Mobile Panels)
- WinCC Advanced for configuring all panels and PCs with the WinCC Runtime Advanced visualization software  
WinCC Runtime Advanced is a visualization software for PC-based single-station systems. WinCC Runtime Advanced can be purchased with licenses for 128, 512, 2k, 4k as well as 8k PowerTags (tags with a process interface).
- WinCC Professional for configuring panels and PCs with WinCC Runtime Advanced or SCADA System WinCC Runtime Professional. WinCC Professional is available in the following editions: WinCC Professional for 512 and 4096 PowerTags as well as "WinCC Professional max. PowerTags".  
WinCC Runtime Professional is a SCADA system for structuring a configuration ranging from single-station systems to multi-station systems including standard clients or web clients. WinCC Runtime Professional can be purchased with licenses for 128, 512, 2k, 4k, 8k, and 64k PowerTags (tags with a process interface).

With WinCC (TIA Portal), it is also possible to configure a SINUMERIK PC with WinCC Runtime Advanced or WinCC Runtime Professional and HMI devices with SINUMERIK HMI Pro sl RT or SINUMERIK Operate WinCC RT Basic.

## 1.2 Options for STEP 7 Engineering System

### Additional STEP 7 products

For applications with increased safety requirements, STEP 7 Professional can be supplemented with the STEP 7 Safety Advanced option.

When using the STEP 7 Safety Advanced option, you can configure failsafe I/O and program safety programs for F-CPU's in LAD and FBD.

## 1.3 Options for WinCC Engineering and Runtime systems

SIMATIC Panels as well as WinCC Runtime Advanced and WinCC Runtime Professional contain all essential functions for operator control and monitoring of machines or plants. Additional options allow you to extend the functionality in some cases to increase the range of available tasks.

### Options for Comfort Panels, Mobile Panels, Multi Panels

The following possible extensions are available for Comfort Panels, Mobile Panels, and Multi Panels:

- WinCC SmartServer (remote operation)
- WinCC Audit (audit trail and electronic signature for regulated applications)

---

#### Note

In contrast to WinCC flexible 2008, functions from the WinCC flexible /Sm@rtService, WinCC flexible /Sm@rtAccess options as well as the WinCC flexible /OPC Server option are incorporated into the basic functionality.

---

### Options for WinCC Runtime Advanced

The following possible extensions are available for WinCC Runtime Advanced:

- WinCC SmartServer (remote operation)
- WinCC Recipes (recipe system)
- WinCC Logging (logging of process values and alarms)
- WinCC Audit (audit trail for regulated applications)
- WinCC ControlDevelopment (extension by means of customer-specific controls)

---

#### Note

In contrast to WinCC flexible 2008, functions from the WinCC flexible /Sm@rtService, WinCC flexible /Sm@rtAccess options as well as the WinCC flexible /OPC Server option are incorporated into the basic functionality.

---

### Options for WinCC Runtime Professional

The following possible extensions are available for WinCC Runtime Professional:

- WinCC Client (standard client for structuring multi-station systems)
- WinCC Server (supplements WinCC Runtime to include server functionality)
- WinCC Recipes (recipe system, formerly WinCC /UserArchives)
- WinCC WebNavigator (Web-based operator control and monitoring)
- WinCC DataMonitor (display and evaluation of process states and historical data)
- WinCC ControlDevelopment (extension by means of customer-specific controls)

---

**Note**

In contrast to WinCC V7, functions from the WinCC /OPC-Server and WinCC /ConnectivityPack options are incorporated into the basic functionality. Likewise, the basic functionality includes the Runtime API from WinCC /ODK.

---

# Readme

## 2.1 General notes

The information in this readme file supersedes statements made in other documents.

Read the following notes carefully because they include important information for installation and use. Read these notes prior to installation.

### Notes on the information system

The following function is already described in the information system, but is not available in TIA Portal V13:

- Hardware comparison of devices

### Functions for S7-1200 as of firmware version V4

In the information system for the TIA Portal V13, functions are documented for S7-1200 as of firmware version V4 which are not yet available in the software.

The 64-bit data types will be available for an S7-1200 as of firmware version V4.

### User-defined documentation

On the product DVD under "Documents\UserDocumentation", you will find instructions for creating and using user-defined documentation.

### Display of interfaces via online access

If the Ethernet interfaces for online access are not displayed sporadically, install hotfix KB2588507 (for Microsoft Windows) from the Microsoft Support website.

Internet link: <http://support.microsoft.com/kb/2588507> (<http://support.microsoft.com/kb/2588507/en-us>)

### Display of Asian characters in the TIA Portal

If the Chinese TIA Portal is installed on a different Asian Windows operating system (for example Korean) and texts are not displayed correctly in the TIA Portal, select English as the "Language for non-Unicode programs" in the Windows Control Panel.

### Instruction "GET\_NAME: Read out name of a module"

According to the online help, the read name depends on the IO device type.

For an HMI Panel, however, it is not the name of the station that is output – as described in the online help – but the name of the interface module.

### Online operation in hibernate mode

We recommend that you do not use the two options "Hibernate" and "Sleep" in online operation; if you do, communication problems could occur. If necessary, adapt the computer's energy options.

### Installing new .Net versions or .Net service packs

- Close the TIA Portal before installing a new .Net version or a new .Net service pack on your programming device/PC.
- Restart the TIA Portal only after successful installation of the new .Net version or the new .Net service pack.

### Notes on handling

- If a project in the list of projects last used is located on a network drive that is not connected, you may experience delays when opening the "Project" menu.
- When you insert a CPU, you may need to wait for some time if the project editor is open at the same time. This generally takes longer when you insert the first CPU in a newly created project. To be able to continue working more quickly, you should close the project editor before inserting a CPU.
- The alarm "Application is not responding" may appear in Windows 7 with functions that take a long time to run (loading the CPU for example). If this occurs, wait until the function has correctly finished.
- If you have installed a Microsoft mouse with IntelliPoint, you may find that it superimposes components over the buttons of the title bar. If this is the case, uninstall the IntelliPoint software from Microsoft.
- Enabling the "Virtual Desktop" options with NVIDIA graphics cards can cause problems. In this case, disable the "nView virtual desktop manager" of your NVIDIA graphics driver.

### Using the TIA Portal via a remote desktop

In principle, it is possible to use the TIA Portal via a remote desktop connection. During configuration, you should, however, avoid disconnecting the connection to the desktop client. In rare cases, this can lead to the software user interface being blocked.

If you experience this blockage, follow these steps on the desktop client.

1. Open the Windows Task-Manager and close the "rdpclip.exe" process.
2. Type in "rdpclip.exe" in the command prompt to restart the process.

Note that the current content of the clipboard will be lost. You can, however, then continue configuration as usual. To be on the safe side, you should restart the TIA Portal at the next opportunity.

### Notes on SIMATIC memory cards

The SIMATIC memory cards have been formatted and set up by Siemens for use with S7-1200 and S7-1500 modules. This format must not be overwritten; otherwise, the card will no longer be accepted by the modules. Formatting with Windows tools is therefore not permitted.

### Behavior in case of open force job

Note that an active force job is retained even after you have loaded a new project to the SIMATIC memory card. This means you should first delete the active force job before you remove a SIMATIC memory card from the CPU and before you overwrite the card in the PC with a new project. If you use a SIMATIC memory card with unknown content, you should format the SIMATIC memory card before the next download.

### Subnet addressing for CP 1613 and CP 1623

CP 1613 and CP 1623 are communication modules with microprocessor. To ensure secure management of communication links, these are processed on the module. The protocol stack in your PC is used for diagnostic purposes (SNMP, DCP). To allow both protocol stacks (i.e. CP 1613/23 Firmware and CP 1613/23 NDIS access) access to the same partners, is recommended to place both stacks of a module in the same subnet.

### Editing a device IP address

Do not use the address range from 192.168.x.241 to 192.168.x.250 when editing a device IP address. If necessary, this address range is automatically assigned by the system to a programming device. Depending on the subnet mask, this applies also for all network classes.

### Migrating projects with the TIA Portal

After the migration of hardware configurations and program blocks from earlier automation solutions, first check the functionality of the migrated project before you use it in productive operation.

### Working with automatically synchronized network drives

Automatic synchronization after a network interruption can result in current (local) project data being stored as a "backup" on the network drive through user interactions. This could cause outdated project data to be loaded from the network drive when opening the project. For this reason, we do not recommend that you store TIA Portal projects on synchronized network drives.

If, however, you do work on synchronized drives, you can continue working locally in the event of a network interruption. In this case, you must always ensure that the TIA Portal application is closed while data is synchronized. The synchronization itself must be implemented in such a way that the current (local) project data replaces the project data on the network drive.

## 2.1 General notes

### Entry of decimal places

With certain Windows language settings, it may occur that the entry of values with a comma as decimal place is not recognized (entering "1,23" leads to an error). Instead, use the international format ("1.23").

### Access protection for memory cards in USB card readers

By improving the security mechanisms for online access and engineering of S7-1500 CPUs, the data storage on memory cards has been changed. For this reason, this version of STEP 7 cannot evaluate the passwords of the configured protection level when reading project data from memory cards that is accessed via a USB card reader. The changed behavior affects the memory cards for CPUs of the S7-1200/1500 series. Therefore, use physical safeguards to protect critical project data on memory cards for these devices.

---

#### Note

This restriction is not related to online access to devices or the know-how protection of program blocks.

---

### Information on the TIA Portal in online support

Overview of the most important technical information and solutions for the TIA Portal in the Siemens Industry online support.

Internet link: TIA Portal in Siemens Industry online support ([www.siemens.com/industry/onlinesupport/tiaportal](http://www.siemens.com/industry/onlinesupport/tiaportal))

All information on service and support in the Siemens Industry online support:

Internet link: Service and support in Siemens Industry online support (<http://support.automation.siemens.com>)

Here, you can also subscribe to the newsletter that provides you with latest information relating to your products.

### Starting the TIA Portal

When you start the TIA Portal, Windows attempts to update the Certificate Revocation List (CRL) of "windowsupdate.com".

If no Internet access is available and there are multiple DNS servers, a timeout may occur and delay the start of the TIA Portal.

### Compatibility with V12 SP1

An empty V12 SP1 project with the name "TIA\_Portal\_Project\_V12.0.1.3.ap12" is installed in the installation directory under ..\Portal V13\SampleProjects to allow TIA Portal V13 to be opened in compatibility mode V12 SP1. This project must be copied to a local directory with full access before it can be used. For more information on this, refer to FAQ ID 835846.

## FAQs on the TIA Portal

FAQs on the TIA Portal are available at FAQs (<http://support.automation.siemens.com/WW/view/en/28919804/133000>).

## 2.2 STEP 7 Basic

### 2.2.1 Security information

#### Upgrades and updates

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. For more information about industrial security, visit

<http://www.siemens.com/industrialsecurity> (<http://www.industry.siemens.com/topics/global/en/industrial-security/Pages/Default.aspx>)

To stay informed about product updates as they occur, sign up for a product-specific newsletter. For more information, visit

<http://support.automation.siemens.com> (<http://support.automation.siemens.com/WW/llisapi.dll?aktprim=99&lang=en&referer=%2fWW%2f&func=cslib.csinfo2&siteid=csius&extranet=standard&viewreg=WW&groupid=4000002>)

#### Network settings

The following tables show the network settings of each product you need to analyze the network security and to configure external firewalls:

STEP 7 Basic					
Name	Port number	Transport protocol	Direction	Function	Description
ALM	4410*	TCP	Inbound/ outbound	License service	This service provides the complete functionality for software licenses and is used by both the Automation License Manager as well as all license-related software products.
RFC 1006	102	TCP	Outbound	S7 communication	Communication to the S7 controller via Ethernet/PROFINET for programming and diagnostic purposes.

2.2 STEP 7 Basic

STEP 7 Basic					
DCP	---	Ethernet	Outbound	PROFINET	The DCP protocol (Discovery and Basic Configuration Protocol) is used by PROFINET and provides the basic functionality for locating and configuring PROFINET devices.
SNMP	161	UDP	Outbound	PROFINET	The SNMP client functionality is used by STEP 7 to read status information from PROFINET devices.

\* Default port that can be changed by user configuration

WinCC ES Basic (without simulation)					
Name	Port number	Transport protocol	Direction	Function	Description
ALM	4410*	TCP	Inbound/ outbound	License service	This service provides the complete functionality for software licenses and is used by both the Automation License Manager as well as all license-related software products.
HMI Load	1033	TCP	Outbound	HMI Load (RT Basic)	This service is used to transmit images and configuration data to Basic Panels.

\* Default port that can be changed by user configuration

Simulation RT Basic					
Name	Port number	Transport protocol	Direction	Function	Description
HMI Load	1033	TCP	Inbound	HMI Load (RT Basic)	This service is used to transmit images and configuration data to Basic Panels.
Ethernet/ IP	44818	TCP	Outbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
	2222	UDP	Inbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
Modbus TCP	502	TCP	Outbound	Modbus TCP channel	The Modbus TCP protocol is used for connections to Schneider PLCs.
RFC 1006	102	TCP	Outbound	S7 channel	Communication to the S7 controller via Ethernet/PROFINET
Mitsubishi MC	5002	TCP	Outbound	Mitsubishi MC channel	The Mitsubishi protocol is used for connections to Mitsubishi PLCs.

## 2.2.2 News

### News in the TIA Portal

To keep you up-to-date with the latest news, Siemens Industry Online Support now offers a website with the latest news on a variety of topics of the TIA Portal.

All news on STEP 7 Basic are available at a glance at this link:

<http://support.automation.siemens.com/WW/view/84047138> (<http://support.automation.siemens.com/WW/view/en/84047138>)

## 2.2.3 Notes on use

### Contents

Information that could not be included in the online help and important information about product characteristics.

### Online operation

The simultaneous online operation of STEP 7 V5.5 or earlier and STEP 7 Basic V13 has not been approved.

### Simultaneous online connections on an S7-1200 CPU

It is not possible to establish an online connection from multiple TIA Portal instances simultaneously to the same S7-1200 CPU.

### Configuring and assigning module parameters

You will find an overview of the modules that can be configured and assigned parameters with STEP 7 Basic V13 at <http://support.automation.siemens.com> (<http://support.automation.siemens.com/WW/view/en/28919804/133000>).

### Removing/inserting the memory card

After removing or inserting a memory card, always perform a memory reset on the CPU in order to restore the CPU to a functional condition.

### Removing and inserting Ethernet modules

If Ethernet modules are removed and re-inserted during operation, you must boot the PC; otherwise, the "Accessible devices" functionality in STEP 7 or NCM PC will not display all devices. While the PC boots, Ethernet modules must be activated.

## Comparing project data

The comparison functions (online/offline, offline/offline) currently do not take hardware into consideration.

## Loading project data with TIA Portal V12 and V13 (S7-1200)

If you load the project data of an S7-1200 CPU with the TIA Portal V13, you can no longer use TIA Portal V12 to access this data. To do this, first restore the factory settings of the CPU. Read the additional information on this in the online help under "How to reset a CPU to factory settings".

## Using project data of distributed IO-Link master modules from TIA Portal V12 in V13

The following procedure applies if you are using distributed IO-Link master modules in TIA Portal V12 that are not GSD devices and were configured with PCT: To continue using your project data from TIA Portal V12.0 in TIA Portal V13.0, you have to export them in the PCT before you upgrade the project. After the upgrade, you must import the project data once again using the PCT.

## Compatibility

The device configuration and program of an S7-1200 CPU must always be configured with the same STEP 7 version. Usually, the TIA Portal makes sure that no version conflicts occur by outputting appropriate notifications during loading to the device.

This automatic verification is not possible with S7-1200 CPUs with firmware version V1.x. In this case, users themselves must ensure that no version conflicts occur.

## 2.2.4 Editing devices and networks

### 2.2.4.1 General information on devices and networks

#### Contents

General information on devices and networks.

#### S7 PCT IO-Link

The S7 Port Configuration Tool is available for free download at the following link.

<http://support.automation.siemens.com/WW/view/37936752> (<http://support.automation.siemens.com/WW/llisapi.dll?aktprim=0&lang=en&referer=%2fWW%2f&func=cslib.csinfo&siteid=csius&groupid=4000002&extranet=standard&viewreg=WW&nodeid=33102519&objaction=csopen>)

## 2.2.4.2 Use of modules on the S7-1200

### Contents

Information that could not be included in the online help and important information about product characteristics.

### Use of modules on the S7-1200

The modules listed below are not supported on the S7-1200.

Family	Module	Order number
S7-300 FMs	SM 338	6ES7 338-4BC01-0AB0
	FM 350-1	6ES7 350-1AH03-0AE0
	FM 350-2	6ES7 350-2AH00-0AE0, 6ES7 350-2AH01-0AE0
	FM 351	6ES7 351-1AH01-0AE0, 6ES7 351-1AH02-0AE0
	FM 352	6ES7 352-1AH02-0AE0
	FM 355 S	6ES7 355-1VH10-0AE0
	FM 355 C	6ES7 355-0VH10-0AE0
	FM 355-2 C	6ES7 355-2CH00-0AE0
	FM 355-2 S	6ES7 355-2SH00-0AE0
S7-300 PtP-CP	CP 340	6ES7 340-1AH02-0AE0, 6ES7 340-1BH02-0AE0, 6ES7 340-1CH02-0AE0
	CP 341	6ES7 341-1AH01-0AE0, 6ES7 341-1AH02-0AE0, 6ES7 341-1BH01-0AE0, 6ES7 341-1BH02-0AE0, 6ES7 341-1CH01-0AE0, 6ES7 341-1CH02-0AE0
Network component	Diagnostics repeater	6ES7 972-0AB01-0XA0
ET 200S	1 Count 24 V	6ES7 138-4DA04-0AB0
	1 Count 5 V	6ES7 138-4DE02-0AB0
	1 Step 5 V	6ES7 138-4DC00-0AB0, 6ES7 138-4DC01-0AB0
	2 pulses	6ES7 138-4DD00-0AB0, 6ES7 138-4DD01-0AB0
	1 SI	6ES7 138-4DF01-0AB0
	1 SI Modbus	6ES7 138-4DF11-0AB0
	1 SSI	6ES7 138-4DB02-0AB0, 6ES7 138-4DB03-0AB0
	1 Pos Universal	6ES7 138-4DL00-0AB0
	SIWAREX	7MH4910-0AA01, 7MH4912-0AA01, 7MH4920-0AA01
ET 200M	SIWAREX	7MH4 900-2AA01, 7MH4 900-3AA01, 7MH4 950-1AA01, 7MH4 950-2AA01

### Loading S7-1200 module comments to the PG/PC

In central configurations with S7-1200, comments of modules, submodules and signal boards are not loaded. With CPs/CMs, only the comments of the IE interface or DP interface are loaded. In distributed configurations with ET 200SP or ET 200MP, only the comment of the channels is loaded from the I/O modules.

### 2.2.4.3 Replacing ET 200S positioning modules

#### Contents

Information that could not be included in the online help and important information about product characteristics.

#### Replacing ET 200S positioning modules

This information relates to the positioning module "1 Step 5V" (6ES7 138-4DC00-0AB0) from a project which was created with TIA Portal V11.0. When replacing these modules from the TIA Portal V11.0 with a new version of these modules, the parameter settings are reset to the default values.

This is the case with one of the following procedures:

- Replace the positioning module 6ES7 138-4DC00-0AB0 with its successor module 6ES7 138-4DC01-0AB0 by means of a device exchange.
- Updating the module version using the appropriate button in the device properties in the Inspector window.

### 2.2.4.4 CP 343-2 on SIMATIC S7 Embedded Controller EC31-RTX

#### Contents

Information that could not be included in the online help and important information about product characteristics.

#### CP 343-2 on SIMATIC S7 Embedded Controller EC31-RTX

The module AS-Interface CP 343-2 (order no.: 6GK7 343-2AH01) can be inserted in an expansion rack of the SIMATIC S7 Embedded Controller EC31-RTX (order no.: 6ES7 677-1DDxx-0BB0), but the CP 343-2 cannot be operated with the EC31-RTX.

### 2.2.4.5 Notes on online and diagnostics

#### Contents

Information that could not be included in the online help and important information about product characteristics.

#### Hardware detection followed by online connection

When the "Online > Hardware detection" command is performed for an unspecified CPU, the online configuration is not loaded from the CPU. If you do not load the configuration resulting from the hardware detection to the CPU, the device and network views will always show a difference between the offline and online configurations. It will appear that there are different

configurations in the online and diagnostic views, although the MLFBs are identical in the actual CPU and the offline CPU.

#### 2.2.4.6 Network components

##### Network components

##### CP 1242-7

##### Copying the CP 1242-7 into another project

If you copy a CP 1242-7 from one project into another project, the following parameters in the parameter group "CP identification" are changed on the target station:

- Project number of the CP
- Station number of the CP

##### Download to device

Only use the "Download to device" function with the CP 1242-7 via a TeleService connection as follows:

1. Select the CP in STEP 7.
2. Select the "Online" > "Download to device" menu.
3. In the "Extended download" dialog that appears, select the TeleService interface.
4. Download the project data from the "Extended download" dialog.

##### Upload from device

The function "Upload from device" is not supported by the CP 1242-7.

##### PC CPs

##### PC CPs for VMware vSphere Hypervisor ESXi

The following communications processors have been released for operation with VMware vSphere 5.1 Hypervisor ESXi:

- CP 5622
- CP 5711
- VMware E1000 network adapter

The following communications processors have not been released for operation with VMware vSphere 5.1 Hypervisor ESXi:

- CP 5611
- CP 5612
- CP 5621
- CP 5512

Other communications processors such as the CP 1613, CP 1623, CP 5613, CP 5614, CP 5623, CP 5624 are released following installation of the SIMATIC NET PC software. You will find information on this in the readme file of the SIMATIC NET PC software.

## Media converters

When you migrate a project, you need to reconfigure the media converters.

## 2.2.5 Programming a PLC

### 2.2.5.1 General notes on PLC programming

#### Contents

Information that could not be included in the online help and important information about product characteristics.

#### Information about network security

For communications access between the TIA Portal and CPU or between HMI (except for HMI access using "GET/PUT communication") and CPU, there are integrated security functions. They provide greater protection from manipulation and higher access protection. To protect against unauthorized network access to a CPU with standardized communications access such as "GET/PUT", "TSEND/TRCV", "Modbus", "FETCH/WRITE", you should also take suitable additional measures (e.g. cell protection concept).

#### Renumbering PLC data types

For better performance, the CPUs of the S7-1200 module process PLC data types with numbers. The user is not aware of these numbers, because the system processes the numbers independently. This means number conflicts are automatically resolved. When using know-how protected blocks that use PLC data types, it may be useful to set up your own numbering system (recommended > 5000) because the automatic resolution of numbering conflicts may result in a password prompt (compilation required).

To renumber the default number of a PLC data type, follow these steps:

1. Open the project library in the "Libraries" task card.
2. Drag the compilable PLC data type to the "Types" folder.  
The "Add type" dialog opens.
3. Enter the properties of the new type.

4. Click "OK" to confirm.
5. Right-click the PLC data type.  
The shortcut menu opens.
6. Select "Edit type" in the shortcut menu.
7. Open the "PLC programming" task card once again.  
The extension "in testing" is now added to the name of the PLC data type.
8. Right-click the PLC data type.  
The shortcut menu opens.
9. Select "Properties" in the shortcut menu.
10. Change the number of the PLC data type in the "General" section.
11. Select "Release version" from the shortcut menu of the library.

The PLC data type now has the new number and can be used. The assigned number is retained even if the type of the PLC data type is revoked.

### Generating external sources from blocks

When generating external sources from blocks, the changes made directly in the block interface to the default values of PLC data types are not exported to the sources. This means these values are not available when the sources are imported once again. The default values are applied instead. To prevent this loss of data for the modified default values, the changes must be made directly in the PLC data type and not in the block interface. In this case, the changes are also exported when generating external sources.

### Indirect indexing of ARRAY components of data type bit string in SCL

In TIA Portal V13, you can address the components of an ARRAY for a CPU of the S7-1200 series in SCL with a tag of the data type BYTE, WORD or DWORD as index in addition to a tag of the integer data type if the IEC check is not set.

### Explicit data type conversion in SCL

As of TIA Portal V13, the string is displayed with a leading sign during explicit data type conversion of SINT/INT/DINT/LINT\_TO\_STRING or WSTRING in SCL and transferred aligned to the left.

The result is an incompatibility with TIA Portal V12 SP1, in which the string was transferred aligned to the right during conversion.

### Start value behavior during "Upload from device"

The start values that you have changed with the instruction "WRIT\_DBL: Write to data block in the load memory" will be lost during execution of the action "Upload from device".

### Loading inconsistent programs to a device

In TIA Portal, it is not possible to download inconsistent programs to a device without a consistency check. During the loading process, all blocks of the program are implicitly checked and are compiled again in the event of inconsistencies. If, however, there are programs on your CPU which were loaded with earlier versions of STEP 7, these programs could demonstrate inconsistencies.

In this case, note the following:

If you load an inconsistent program from a device, you will not be able to load the program unchanged to the device afterwards, because a consistency check always takes place during the loading process and existing inconsistencies are corrected.

### Process image of PTO/PWM outputs

Do not use PTO/PWM outputs in the process image (for example, for access in the user program, for online functions or in HMI). The update rate of the process image is much slower than the rate of the signal changes. The display in the process image therefore does not reflect the signal flow.

### Monitoring blocks in LAD and FBD

If the start of the current path is outside the visible range, it may not be possible to determine the input value. In this case, the current path is shown grayed out.

### Avoid using PLC data types generated by the system in libraries

Some instructions generate their own PLC data types during instancing which are saved in the "PLC data types" project folder. However, you should not use these system-generated PLC data types in any library, because they may be recreated by the system at any time and may result in an unfavorable system behavior.

### Using global data blocks in assignments

It is not possible to assign the contents of a global data block to a structurally identical data block, e.g. using a move box.

## 2.2.5.2 Instructions

### Contents

Information that could not be included in the online help and important information about product characteristics.

## Notes on the information system

The following function is already described in the information system, but is not available in TIA Portal V13:

- "ASI\_CTRL" instruction for CPUs of the S7-1200 module

## Instruction "TRCV\_C: Receive data via Ethernet"

Contrary to the information provided in the online help, the communication connection is terminated immediately, and not after sending data, when the CONT parameter is set to the value "0".

## Instruction "T\_CONFIG: Configure interface"

The CPU is restarted after you have executed the "Configure interface" instruction in order to change an IP parameter. The CPU goes to STOP mode, a warm restart is carried out and the CPU starts up again (RUN mode). Make sure that the control process is in a secure operating mode after the CPU has been restarted following execution of the "Configure interface" instruction. Uncontrolled operation can result in serious material damage or personal injury due to malfunctions or programming errors, for example. Non-retentive data could be lost.

Parameters ERROR and STATUS

ERROR	STATUS (DW#16#..)	ERR_LOC	Explanation
0	00000000	0	After the instruction has been executed successfully, the STATUS parameter "00000000" does not return any value.

## Instruction "GET\_DIAG: Read diagnostics information"

MODE 3 at the MODE parameter is not supported by the S7-1200 CPU.

## Using instructions with parameters of type VARIANT in code blocks with different access types (S7-1200)

Code blocks (FBs/FCs) and data blocks (DBs) can be created with different access types ("standard" and "optimized"). In code blocks, you can call any instructions. Certain instructions (for example, "WRIT\_DBL" and "READ\_DBL") use pointers of type VARIANT at input and output parameters to address data blocks.

Ensure that you do not use these instructions in programs in which code blocks of different access types are called reciprocally. This could cause the following to occur:

## 2.2 STEP 7 Basic

- A structure from a standard data block is directly or indirectly passed to an optimized code block, which forwards this structure directly or indirectly to one of the blocks mentioned above.
- The reverse scenario, whereby a structure from an optimized code block is directly or indirectly passed to a standard data block, which forwards this structure directly or indirectly to one of the blocks mentioned above.

### 2.2.5.3 Testing the user program

#### Testing with the watch table

##### Contents

Information that could not be included in the online help and important information about product characteristics.

#### Multiple access to the same CPU

Access to a CPU from a PG/PC is permitted only when a TIA Portal is open. Multiple access to the same CPU is not permitted and can lead to errors.

#### Loading data blocks during an active control job

---

##### Note

Loading changed data blocks during an active control job can result in unforeseen operating states. The control job continues to control the specified address, although the address allocation may have changed in the data block. Complete active control jobs before loading data blocks.

---

#### Testing programs converted from STEP 7 V10.5/V11.0

To monitor and test a program converted from STEP 7 V10.5, you have to first compile and load with STEP 7 V13.0.

#### Testing with the force table

##### Contents

Information that could not be included in the online help and important information about product characteristics.

## Example

If I/O access to the address "IB0:P" takes place in the user program, it is not permitted to force the following I/O address areas: IO.0:P, IB0:P, IW0:P and ID0:P.

## 2.2.6 Inter Project Engineering (IPE)

### 2.2.6.1 Notes on IPE

#### Contents

Information that could not be included in the online help and important information about product characteristics.

#### Comment box of the device proxy

Contrary to the description in the information system for the TIA Portal V13, with the "Inter Project Engineering" functionality, the comment field for a device proxy cannot be edited.

#### Restricted functionality

In the TIA-Portal V13, the "S7 GRAPH overview" and "PLC code display" functionality cannot be used in conjunction with the IPE device proxy.

## 2.2.7 Technological functions

### 2.2.7.1 Notes on technological functions

There are no notes about the technology functions.

## 2.3 WinCC Advanced

### 2.3.1 Security information

#### Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are

important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Any third-party products that may be in use must also be taken into account. For more information about industrial security, visit

<http://www.siemens.com/industrialsecurity> (<http://www.industry.siemens.com/topics/global/en/industrial-security/Pages/Default.aspx>)

To stay informed about product updates as they occur, sign up for a product-specific newsletter. For more information, visit

<http://support.automation.siemens.com> (<http://support.automation.siemens.com>)

## Passwords

Various passwords are set by default in WinCC. For security reasons, you should change these passwords.

- On HMI devices with version V11 or V12, the password "100" is preset for the Sm@rtServer and for the integrated Web server. A default password is not preset for HMI devices with version V13.
- For the user "Administrator", the default password is "administrator".

## Integrated Web server

It is always possible on a PC to access HTML pages in Runtime, even though the option "HTML pages" is disabled. Setup always installs the standard pages of the Web Server on the PC. Assign an administrator password to prevent unauthorized access to the pages.

## Communication via Ethernet

In Ethernet-based communication, end users themselves are responsible for the security of their data network. The proper functioning of the device cannot be guaranteed in all circumstances; targeted attacks, for example, can lead to overload of the device.

## Ending Runtime automatically

If automatic transfer is enabled on the HMI device and a transfer is started on the configuration PC, the running project is automatically stopped on the HMI device. The HMI device then switches autonomously to "Transfer" mode. Transfer mode may cause undesired reactions in the system.

After the commissioning phase, disable the automatic transfer function to prevent the HMI device from switching inadvertently to transfer mode. To block access to the transfer settings and thus avoid unauthorized changes, assign a password in the Control Panel.

## Network settings

The following tables show the network settings of each product which you need in order to analyze the network security and for the configuration of external firewalls:

WinCC Advanced (without simulation)					
Name	Port number	Transport protocol	Direction	Function	Description
ALM	4410*	TCP	Inbound, Outbound	License service	This service provides the complete functionality for software licenses and is used by both the Automation License Manager as well as all license-related software products.
HMI Load	1033	TCP	Outbound	HMI Load (RT Basic)	This service is used to transmit images and configuration data to Basic Panels.
HMI Load	2308	TCP	Outbound	HMI Load (RT Advanced)	This service is used to transmit images and configuration data to panels.

\* Default port that can be changed by user configuration

WinCC Simulation for Basic Panels					
Name	Port number	Transport protocol	Direction	Function	Description
HMI Load	1033	TCP	Inbound	HMI Load (RT Basic)	This service is used to transmit images and configuration data to Basic Panels.
EtherNet/IP	44818	TCP	Outbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
	2222	UDP	Inbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
Modbus TCP	502	TCP	Outbound	Modbus TCP channel	The Modbus TCP protocol is used for connections to Schneider PLCs.
RFC 1006	102	TCP	Outbound	S7 channel	Communication with the S7 controller via Ethernet/PROFINET
Mitsubishi MC	5002	TCP	Outbound	Mitsubishi MC channel	The Mitsubishi protocol is used for connections to Mitsubishi PLCs.

WinCC Simulation for Panels and Runtime Advanced					
Name	Port number	Transport protocol	Direction	Function	Description
DCP	---	Ethernet	Outbound	PROFINET	The DCP protocol (Discovery and basic Configuration Protocol) is used by PROFINET and provides the basic functionality for locating and configuring PROFINET devices.
LLDP	---	Ethernet	Inbound, Outbound	PROFINET	The LLDP protocol (Link Layer Discover Protocol) is used by PROFINET for topology detection.
SMTP	25	TCP	Outbound	SMTP Communication	This service is used by WinCC Runtime Advanced to send e-mails.

WinCC Simulation for Panels and Runtime Advanced					
HTTP	80*	TCP	Inbound	Sm@rtServer	The Web server is only available when Sm@rtService is activated. The used port may differ depending on automatically selected settings.
RFC 1006	102	TCP	Outbound	S7 channel	Communication with the S7 controller via Ethernet/PROFINET
NTP	123	UDP	Outbound	Time synchronization	The NTP protocol (Network Time Protocol) is used for time synchronization in IP-based networks.
SNMP	161	UDP	Outbound	PROFINET	The SNMP client functionality is used by STEP 7 to read status information from PROFINET devices.
HMI Load	2308	TCP	Outbound	HMI Load (RT Advanced)	This service is used to transmit images and configuration data to panels.
HTTPS	443*	TCP	Inbound	Sm@rtServer	The Web server with HTTPS protocol is only available when Sm@rtService is activated. The used port may differ depending on automatically selected settings.
VNC server	5900*	TCP	Inbound	Sm@rtServer	This service is only available when Sm@rtService is activated.
	5800*	TCP	Inbound	Sm@rtServer	This service is only available when Sm@rtService is activated.
VNC client	5500	TCP	Outbound	Sm@rtServer	This service is only available when Sm@rtService is activated.

\* Default port that can be changed by user configuration

PROFINET protocols for Panels and Runtime Advanced					
Name	Port number	Transport protocol	Direction	Function	Description
DCP	---	Ethernet	Outbound	Lifelist, PROFINET Discovery and configuration	The DCP protocol (Discovery and basic Configuration Protocol) is used by PROFINET and provides the basic functionality for locating and configuring PROFINET devices.
LLDP	---	Ethernet	Inbound, Outbound	PROFINET Link Layer Discovery protocol	The LLDP protocol (Link Layer Discover Protocol) is used by PROFINET for topology detection.
MRP	---	Ethernet	Outbound	PROFINET medium redundancy	The MRP protocol (Medium redundancy protocol) enables control of redundant transmission paths using a ring topology.
PROFINET IO Data	---	Ethernet	Inbound, Outbound	PROFINET Cyclic IO data transfer	Cyclic data exchange is used by panels for direct keys and LEDs.
NARE	---	Ethernet	Inbound, Outbound	Name Address Resolution	This protocol is used to resolve network names and assign IP addresses.
PROFINET Context Manager	34964	UDP	Inbound, Outbound	PROFINET connection less RPC	The PROFINET Context Manager provides an endpoint mapper in order to establish an application relation (PROFINET AR).

Communication connections for Panels and WinCC Runtime Advanced					
Name	Port number	Transport protocol	Direction	Function	Description
Telnet	23	TCP	Inbound	Telnet	This service can be used for maintenance.
SMTP	**	TCP	Outbound	SendEmail	This service is used by Windows CE / PC Runtime to send e-mails.
HTTP	80*	TCP	Inbound	Hypertext Transfer Protocol	The HTTP protocol is used for communication with the internal Web server.
RFC 1006	**	TCP	Outbound	S7 channel	Communication with the S7 controller via Ethernet/PROFINET.
HMI Load	102	TCP	Inbound	Transfer	This service is used to transmit images, Runtime, and configuration data to the panel via PN/IE
NTP	**	UDP	Outbound	Time synchronization	The NTP protocol (Network Time Protocol) is used for time synchronization in IP-based networks.
DCOM***	135	TCP	Inbound	OPC server	This service is a component of the Microsoft Windows operating system. Communication via OPC (DA) is based on DCOM. Therefore, this service is required to initialize OPC (DA) connections.
DCOM***	**	TCP	Outbound	OPC server	The communication via OPC (DA) is based on DCOM and uses unspecified ports assigned by the system. This should be taken into consideration when using OPC (DA) and creating rules for the firewall.
NetBIOS over TCP/IP	**	UDP	Outbound	With the use of Remote File Share	Register / log on to a remote server.
NetBIOS over TCP/IP	**	UDP	Outbound	With the use of Remote File Share	Register / log on to a remote server.
SNMP	161	UDP	Inbound	Simple Network Management Protocol	The SNMP client functionality is used by STEP 7 to read status information from PROFINET devices.
HTTPS	443*	TCP	Inbound	Secure Hypertext Transfer Protocol	The HTTP protocol is used for communication with the panel-internal Web server via Secure Socket Layer (SSL).
Modbus TCP	**	TCP	Outbound	Modbus TCP channel	The Modbus TCP protocol is used for connections to Schneider PLCs.
Mitsubishi MC	**	TCP	Outbound	Mitsubishi MC channel	The Mitsubishi protocol is used for connections to Mitsubishi PLCs.
Printing	**	TCP	Outbound	Printing	Printing on the control panel (via Ethernet).
HMI Load	2308	TCP	Inbound	Transfer	This service is used to transmit images and configuration data to panels. On Comfort Panels, this service is replaced by DeviceManager and SCS in V13 and higher. This service is used to transmit configuration data to WinCC Runtime Advanced.

Communication connections for Panels and WinCC Runtime Advanced					
HMI Load	50523	TCP	Inbound	Transfer	This port is used if port 2308 is not available. This service is used to transmit images and configuration data to panels. On Comfort Panels, this service is replaced by DeviceManager and SCS in V13 and higher. This service is used to transmit configuration data to WinCC Runtime Advanced.
ALM	4410*	TCP	Inbound, Outbound	Application License Manager	This service of RT Advanced makes available the complete functionalities for software licenses and is used by the Automation License Manager.
OPC UA	4870*	TCP	Inbound	OPC UA server	This service is required for communication via OPC UA.
HMI Load	5001	TCP	Inbound	Device Manager	This service is used to transmit images and Runtime to panels.
HMI Load	5002	TCP	Inbound	SCS (System Configuration Server)	This service is used to transmit configuration data to panels.
VNC client	5500	TCP	Inbound	Sm@rtServer	Reverse VNC server connection. Receive mode is set for the VNC client.
VNC server	5800*	TCP	Inbound	Sm@rtServer	VNC server connection HTTP
	5900*	TCP	Inbound	Sm@rtServer	VNC server connection
SIMATIC Logon	**	TCP	Outbound	UMAC (User Management to the Access Control)	Register / log on to a remote server.
Allen Bradley Ethernet IP	**	TCP	Outbound	Ethernet/IP channel	The Ethernet/IP protocol is used for connections to Allen Bradley PLCs.
Reserved	49152 ... 65535	TCP/UDP	Outbound		Dynamic port range is used, for example, to connect to the remote file sharing.
* Default port that can be changed by user configuration ** Port is assigned automatically. *** Supported by WinCC Runtime Advanced only.					

### 2.3.2 News

#### News about the TIA Portal

You can learn about the latest news about various topic areas of the TIA Portal in Siemens Industry Online Support.

All news concerning WinCC can be found here: News (<http://support.automation.siemens.com/WW/view/en/88360672>)

### 2.3.3 Notes on use

#### Contents

Information that could no longer be included in the online help and important information about product features.

#### Working with standard user rights

If you are working with standard user rights in Windows 7, "User Account Control (UAC)" must not be disabled. The "User Account Control" is enabled in Windows 7 by default.

For more information on the "User Account Control", refer to the online help for Windows 7.

#### On-screen keyboard

Once you have opened the TIA Portal, you can no longer call the on-screen keyboard.

To call the on-screen keyboard in Windows, use the following command: "Start > All Programs > Accessories > Ease of Access > On-screen keyboard".

#### Copying HMI devices with HMI connections

If you copy an HMI device with HMI connections to a PLC, the HMI connection in the new HMI device is not automatically connected to an existing PLC with the same name. This applies to copying within a project as well as copying across projects.

To access the PLC tag via HMI tag in the new HMI device, you have to complete the configuration of the HMI connection immediately after copying. Proceed as follows:

1. Open the "Devices & Networks" editor.
2. Connect the new HMI device to the desired network.
3. Open the connection table.
4. Select the HMI connection of the new HMI device.
5. Select the desired PLC under "Partner".

If you compile the new HMI device or connect additional PLC tags in between copying the HMI device and completing the connection, there may be some instances in which an additional HMI connection to the same PLC is created. This is especially true if you connect HMI tags with DB array elements.

#### Device replacement

After an HMI device has been replaced, you should check the appearance of the configured screens. Changing the size of the display may result in changes to the position and appearance of screen objects, e.g. recipe view and alarm view.

### Device replacement - communication

If an HMI device is replaced, error messages of the type "... are not supported in the new configuration. and will therefore be removed" may be generated. These alarms refer to configured connections of the device and are triggered, for example, if the HMI devices have a different number of interfaces. These connections are marked red after a device replacement. If you would like to continue to use these connections, you have change the configuration of the connection. Proceed as follows:

1. Open the "Devices and Networks" editor.
2. Click "Network" in the toolbar of the network view.
3. Network the interface of the HMI device with the interface of the CPU.
4. Click in the table area of the network view on the "Connections" table.
5. Select the connection marked red.
6. Enter the new interface under "Properties > General > Interface" in the Inspector window.

### Specifying the time of modification in the overview window

The times of modification displayed in the overview window only refer to changes to the object itself. Changes to subordinate objects, e.g. screen objects in a screen, do not cause the time of the last change to the screen to change in the overview window.

### HMI device wizard

When you create a device with a color display using the HMI device wizard, the graphics of the navigation buttons may be displayed in black and white. This error only occurs, however, if the new device is created with the same name as a device with a monochrome display which has been deleted in the meantime.

You can avoid this error by always deleting the associated graphics in the Graphics collection whenever you delete a device from the project.

### Objects with object references in the project library

Two copying methods can be used in WinCC flexible.

- With "simple copy" a WinCC flexible screen including an IO field, for example is copied. Only the object name of a tag configured on the IO field is copied, as this is a reference.
- With "copy", a screen, an IO field contained there and a tag configured on the IO field together with its properties are copied.

These two methods can also be used for storing an object in a library. Project libraries and the objects contained there are migrated during migration and can be used in WinCC.

In WinCC, however, only one copying method is available. With regard to tags, it functions like "simple copy" in WinCC flexible. With regard to graphics, graphics lists and text lists, it functions like "copy" in WinCC flexible.

If you stored objects with references to tags in a library in WinCC flexible, you must reconfigure the referenced objects when using them in WinCC.

## Reports with Asian character sets on Windows CE devices

If Asian character sets are displayed in an illegible manner in a report on a Windows CE device, you must change the character sets for the objects in the report. It is sufficient to change to a different character set and then reset the original character set.

## Installation sequence for Startdrive

When you install Startdrive on a PC, adhere to the following installation sequence:

- Install STEP 7 V13.0.
- Install Startdrive.

## Compatibility with V12

An empty V12.0.1.3 project with the name "TIA\_Portal\_Project\_V12.0.1.3.ap12" is installed in the installation directory under ..\Portal V13\SampleProjects to allow TIA Portal V13 to be opened in compatibility mode V12. This project must be copied to a local directory with full access before it can be used. For more information on this, refer to FAQ ID 66027369.

## File browser on a Windows 8 PC with touch screen

You can only operate the file browser dialog with a mouse, keyboard or on-screen keyboard (without using the touch function) on a Windows 8 PC with touch screen. We recommend using the file browser dialog of the Windows operating system with the help of a script on a touch screen PC with Windows 8.

## 2.3.4 Migration

### Contents

Information that could no longer be included in the online help and important information about product features.

### Project languages in WinCC

WinCC V13 does not support all project languages that were available in WinCC flexible, such as Arabic. If you receive an empty project as the result of your migration, you may want to check the set editing language. Do not set the project languages that are not supported as editing language in the source project. Proceed as follows:

1. Open the project with WinCC flexible.
2. Change the editing language to English, for example.
3. Save the project.
4. Restart the migration.

### Migrating an integrated project with ProTool objects

The "PROTOOL option package(s) missing in STEP 7" error message output during migration of a WinCC flexible project that is integrated in STEP 7 indicates that WinCC flexible 2008 SP3 is installed on your system. Moreover, the project still contains objects that were configured using ProTool. Do not open the project with WinCC flexible 2008 SP3! Proceed as follows to migrate the project:

1. Copy the project to a computer on which WinCC flexible 2008 SP2 and STEP 7 are installed.
2. Open the project in the SIMATIC Manager.
3. Remove all ProTool objects from the project.
4. Execute the "Save as" command in the "File" menu.
5. Enable the option "With reorganization" in the "Save project as" dialog.
6. Click OK.
7. Copy the project back to the original computer.
8. Restart the migration.

### Migrating a WinCC V7 project: Border line of rectangles

In a WinCC V7 project, you have configured a rectangle with the settings "Line weight = 1" and "Draw insider border = yes".

You then migrate the WinCC V7 project to WinCC V13. To have the rectangle displayed correctly, follow these steps.

1. Open the Inspector window of the rectangle.
2. Open the property list.
3. Disable "Widen border line inwards".

### Progress bar

As long as the progress bar still shows a value of 100%, the software is still busy running remaining tasks such as the closing of references. The software will not respond to user input while this status is given.

### Open a project created with WinCC V11

When you open a V11 project with a WinCC V13 version, it is no longer possible to open this project with an older version afterwards.

### Managing third-party ActiveX controls

The migration also supports third-party ActiveX controls. However, the controls must be registered in the operating system. If an ActiveX control is not registered, migration is canceled.

If you save a project with the migration tool and perform the migration yourself on another PC, the controls must also be registered on this PC.

### Migrating integrated projects with alarm views

An alarm view is enabled with all alarm classes in an integrated project. The alarm classes are disabled during migration of the project.

Once the migration of the project is completed, check the settings in the alarm view.

Enable the require alarm classes in the Inspector window of the alarm view if needed under "Properties > General".

### Migrating more extensive projects from WinCC V7

We recommend the use of a 64-bit operating system for the migration of more extensive projects from WinCC V7.

### Migrating projects from WinCC V7

In TIA Portal V13, you can continue to use projects from WinCC V7.2 after migration. Projects from earlier WinCC versions cannot be migrated directly to WinCC TIA Portal version V13. If you wish to continue using such projects in TIA Portal V13, you must first migrate them to the WinCC V7.2 Classic page. To do so, use WinCC V7.2 with the latest update.

### Migration log

As of TIA Portal V13.0 alarms are sorted into a tree structure in the migration log. This means all alarms that are part of a specific subsystem are stored in one folder. The result is an increase in the number of folders in the tree structure. Press the shortcut <NUM+ X> to expand the currently selected folder and all subfolders in one single step.

### Restrictions for user-specific project data

1. Folders and files you have created in the WinCC V7.2 project directory are not copied to the new project directory during the migration. You must adapt all scripts that access such directories and files after the migration.
2. C standard functions of WinCC V7 are not migrated. If you have made changes to the C standard functions in the WinCC V7 project, you must apply these changes manually to the TIA Portal after the migration.

### Migration of texts in Spanish (international sorting) and Spanish (traditional sorting)

If the WinCC V7 project includes texts in Spanish (traditional sorting), these texts are migrated as Spanish (Spain) in WinCC V13.

If the WinCC V7 project includes texts in Spanish (international sorting), these texts are migrated as Spanish (Spain) in WinCC V13.

If the WinCC V7 project includes texts in Spanish (international sorting) as well as Spanish (traditional sorting), only the texts from Spanish (traditional sorting) are migrated as Spanish (Spain) in WinCC V13. The texts from Spanish (international sorting) are not taken into consideration.

Object support during migration

## 2.3.5 Engineering System

### 2.3.5.1 Screens and Screen Objects

### Contents

Information that could no longer be included in the online help and important information about product features.

### Display objects after HMI device replacement

If you upgrade a device to the new HMI device versions, you should check the screens contained in the project. Because of the new appearance and improved operability, texts of symbolic I/O fields may not be completely legible and may be concealed by operator controls.

### Copying display objects between two projects or two devices

In Project\_1 configure an alarm window in the Global Screen, for example. You copy the alarm window and paste it in the Global Screen in Project\_2.

The enabled alarm classes are partly not enabled in the alarm window after pasting.

This behavior applies to the following display objects:

- Alarm window
- Alarm indicator
- Alarm view

### Display of the cross-references in the Inspector window

The Inspector window displays objects used by a screen object in the "About > Cross-reference" tab.

A screen is open and an object selected. You are using an HMI tag at the object as process tag.

The object and the linked HMI tag are displayed in the cross-references. All locations of use of the object and the HMI tags are listed.

If the HMI tag is interconnected with a PLC tag or a DB tag, the locations of use of the interconnected PLC tag or DB tag are displayed.

### Event names in case of alarms in the "Info" tab of the Inspector window

In some alarms of the Inspector window the event names in the "Info" tab will deviate from the names in the "Properties" tab.

Name in the "Properties" tab of the Inspector window	Name in the "Info" tab of the Inspector window
Cleared	ClearScreen
Loaded	GenerateScreen
Enable	Activate
Change	Change
When a dialog is opened	ONMODALBEGIN
When a dialog is closed	ONMODALEND
User change	PASSWORD
Screen change	SCREEN
Disable	Deactivate
Press	Press
Outgoing	Going
Incoming	Coming
Limit "high limit error" violated	AboveUpperLimit
Limit "low limit error" violated	BelowLowerLimit
Click	Click
Loop-in alarm	LoopInAlarm
Release	Release
Alarm buffer overflow	OVERFLOW
Acknowledge	Acknowledgement

Name in the "Properties" tab of the Inspector window	Name in the "Info" tab of the Inspector window
Runtime stop	Shutdown
Press key	KeyDown
Release key	KeyUp
Toggle ON	SwitchOn
Toggle OFF	SwitchOff
Value change	Change value

## Faceplates

Faceplates cannot be rotated or mirrored.

## Tab sequence in screens with faceplates

If you have configured a tab sequence in screens with faceplates in WinCC V12 or WinCC V12 SP1, you should check the tab sequence of these screens in WinCC V13. The tab sequence may have been changed in both the screen and the faceplate.

## Tag prefix of a screen window in WinCC Runtime Professional

The objects of the "Controls" palette do not support the tag prefix that can be configured for a screen window.

## I/O field with "decimal" display format and format pattern without "s" prefix

You have linked a process tag to an I/O field. The I/O field is assigned the "decimal" display format.

You may select a signed or an unsigned display format.

A "Format pattern" setting without "s", e.g., "999" has the following effects:

1. You cannot set negative values using the I/O field in Runtime.
2. If the tag assumes a negative value, the I/O field generates a two's complement and a corrupted positive value is output.

## Trend view on Basic Panels

The trend view buttons are not displayed on Basic Panels. You can operate the trend view using the function keys of the HMI device that are assigned corresponding system functions.

## Grouping of screen objects

When you group screen objects in WinCC, performance problems can arise in WinCC in the case of large nesting depths.

### ActiveX and .NET controls

ActiveX and .NET controls are always positioned in the foreground in runtime.

The configuration of ActiveX and .NET controls on levels is not supported.

### Use of bitmaps as icons

In Windows 8 and Windows 8.1, the use of bitmaps with a size of 48x48 pixels and a color depth of 32 bits as icons is not supported.

### Border line of rectangles

In a WinCC V7 project, you have configured a rectangle with the settings "Line weight = 1" and "Draw insider border = yes".

You then migrate the WinCC V7 project to WinCC V12. To have the rectangle displayed correctly, follow these steps.

1. Open the Inspector window of the rectangle.
2. Open the property list.
3. Disable "Widen border line inwards".

### Border line of "Graphic I/O field" object

In WinCC V13, the dynamization of the border line of the "Graphic I/O field" object in "Two states" mode has no effect during runtime.

### Dynamization of instances of a faceplate type in a group

You are using the instance of a faceplate type in an object group. The properties of the instance are also displayed as properties of the group. Any dynamization with tags, scripts or animations of the group is not displayed in Runtime.

### Preview in screen window

You use your own designs with shadows for screen objects. The screen objects can be displayed in a screen window.

The shadows of the screen objects are not displayed in the preview of the screen window. The response occurs only in the engineering system. It is displayed correctly in Runtime.

### Assigning graphics to a softkey

A graphic can only be assigned to a softkey if the bottom edge of the permanent window does not conceal the area of the softkey graphic.

## Renaming a PLC in Runtime

If a PLC is connected to the PLC code display in WinCC Professional and Runtime is running, changing the name of the PLC during runtime will trigger a error. Do not change the PLC name, the IP address, or other properties of the HMI connection during runtime.

## Panels and RT Advanced with device version V13: many visually different screen objects

The use of screen objects with very many visually different properties (e.g., very many different styles) can reduce the performance of the user interface in Runtime and can increase the amount of available memory space used. Avoid using, for example, very many different corner radii: 0 pixel, 1 pixel, 2 pixels, 3 pixels, etc.

The use of many differently sized "Gauge" objects can have the same effect. Avoid "Gauge" of height 48 pixels, 49 pixels, 51 pixels, etc. Instead, use sizes such as 50 pixels, 70 pixels, 100 pixels.

## Dynamization of grouped objects

For groupings with multiple nestings (group in group, faceplate in group, group in faceplate, etc.), only the events of the outermost group and the innermost objects can be used for dynamization with system functions. System functions that are configured at events of the lower-level group or lower-level faceplate are not executed.

## Number of characters in text fields, lists and alarm texts

The number of available characters in the text of a screen object is dynamic and depends on the HMI device and the memory format. Control instructions and formatting are taken into consideration when entering text data and the maximum number of characters is reduced accordingly.

## Transparency in WinCC V13

Transparent screens can be displayed without any problems in Runtime. This is true for all Comfort Panels and WinCC Runtime Advanced with version 13.0.0.0.

To use the transparency in a graphic view or in a graphic I/O field, the "Fill pattern" property must be set to "Transparent" and the property "Use transparent color" must be disabled.

If the property "Use transparent color" is enabled in a device with version 13.0.0.0, the transparency of the screen is lost and the transparent screen areas are displayed in black. We recommend that you check the "Use transparent color" property at the points of use of transparent screens after upgrading existing projects to device version 13.0.0.0. If the screens are not displayed correctly, disable this property.

### 2.3.5.2 Tags and connections

#### Contents

Information that could no longer be included in the online help and important information about product features.

## Display of deleted array elements at location of use of HMI tags

The locations of use of HMI tags, such as the process value of IO fields, are usually indicated by the tag name. If the element of an array tag is used, then the tag name will be extended by the index of the array element indicated in brackets.

If a used tag is no longer included in the project, then the tag name will still be displayed at the location of use. The field will be displayed with a red background to indicate the missing tag. If a used array element or the array tag is no longer present, then only the index of the array element will be displayed in brackets. The tag name will not be displayed. The field is highlighted in red. You can no longer identify the name of the associated array tag based on the location of use in this instance.

If you do not know which array tag was linked to this location of use, then it may be necessary to link the array element once again.

If a tag or array tag was created based on a reference, then the selected reference will be closed automatically.

If an HMI tag is connected with an array element of a PLC tag and the PLC tag does no longer exist in the project, then the same behavior will take place in the "HMI tags" editor.

## Array tags as list entry of multiplex tags

You can use the array tags of the Char data type just like the tags of the String data type.

The use of an array tag of the Char data type as list entry of a multiplex tag in the "HMI tags" editor is not supported.

## Multiplexing tags on a Basic Panel

If you multiplex a tag with an external tag on a Basic Panel, the address is read from the PLC in runtime during the first read cycle. The value of the address read is not available until the second read cycle.

## Runtime Advanced and Panels: Importing array elements and structure elements

Array tags and structure tags are always imported in full with all elements. The elements of the array tags and structure tags are not filled further during import.

A new tag is created if the name of a tag corresponds to the name of an array or structure element in the import file.

Example:

The import file contains an array tag called "Otto" with 10 array elements. The array elements are then called Otto[1], Otto[2], for example.

If the import file contains a tag named "Otto[1]", the first element of the array tag will not be filled. Instead, a new tag will be created in the engineering system.

### Local ID of HMI connections

You cannot edit the "Local ID" value in the HMI connection properties. You need the local ID, for example, for communication by way of AR\_SEND. To enable usage of the "Local ID" for communication, proceed as follows:

1. Open the network view in the "Devices & Networks" editor.
2. Click "Connections".
3. Select an S7 connection.
4. Select the "Add new connection" command in the shortcut menu of the PLC.
5. Click on the interface.
6. Specify the "Local ID (hex)".
7. Click "Add" and then "Close".
8. Select "Properties > General" from the partner area of the Inspector window and enter the IP address of the HMI device for the new connection.
9. Configure the necessary raw data tags for communication in the HMI device.

### Tags with the DTL data type

Tags that use the "DTL" data type element by element, can only be used as read-only.

### Tag names in faceplates

Use of the "." or "@" character in names of tags in faceplate types is not permitted. Do not use these special characters in the tag names in faceplates.

### RT Professional: Tags with symbolic addressing and "Char Array" data type

Tags with symbolic addressing and the "Char Array" data type are not released for communication of RT Professional and SIMATIC S7-1200 V3.

### Array elements in WinCC

If you have connected an HMI tag with an array from a STEP 7 data block which does not start with a low limit of 0, the array elements are mapped in WinCC to the low limit of 0.

To ensure that you do not have to rethink between the STEP 7 indices and the WinCC indices when accessing the individual array elements, the low limits of arrays should also start at 0 in STEP 7.

### 2.3.5.3 Alarm system and alarm displays

#### Contents

Information that could not be included in the online help and important information about product properties.

### Displaying special characters in alarm texts

When configuring alarm texts, a fixed character set is used in the Engineering System. This character set allows you to use numerous special characters in alarm texts.

Language-dependent fonts are used in runtime to display the texts, for example MS P Gothic, SimSun. The fonts used in runtime do not support all special characters. As a result, some special characters are not displayed in runtime.

### Use of multiplex tags in output boxes with alarm texts

It is also possible to use multiplex tags in the output boxes of alarm texts in the engineering system. During runtime, this leads to an incorrect display of the alarm, because the use of multiplex tags is not supported by the basic panels.

### Parameters in user alarms

Contrary to the information in the online help, it is not possible to configure parameters for user alarms.

The menu command "Properties > Properties > Alarm parameters" is not available in the Inspector window.

### Tags in alarm texts of RT Advanced

Tags of data type WChar or WString cannot be displayed in the alarm view in RT Advanced.

## 2.3.5.4 System functions and scripts

### Contents

Information that could no longer be included in the online help and important information about product features.

### Runtime error on startup on TP 277 and OP 277

At the start of the runtime on a TP 277 or OP 277, the error "Global unknown error with VBScript: 'Expected statement' in script ..." can be reported.

This error is triggered on devices with the Windows CE 3.0 operating system by user functions of the following type:

```
Sub VBFunction_1()  
With HmiRuntime.Screens("Screen_1").ScreenItems("Button_1")  
    .backcolor = vbred  
    .visible = not .visible  
End With  
End Sub
```

If the error occurs, you need to re-program the user function as follows:

```
Sub VBFunction_1()  
    HmiRuntime.Screens("Screen_1").ScreenItems("Button_1").backcolor = vbred  
    HmiRuntime.Screens("Screen_1").ScreenItems("Button_1").visible = not .visible  
End Sub
```

### Hiding warnings for scripts

Enable "Runtime settings > General > Settings > Also start with faulty scripts".

As a result, Runtime is started irrespective of faulty scripts. In addition, script warnings will not be displayed during a complete compilation

### Graphics in faceplates

You have added a graphic view in a faceplate and defined the "Graphic" property as the interface of the faceplate. The "Graphic" property can be made dynamic using the interface of the faceplate instance.

Use the following notation to address the graphic property via a script: "..\..\Graphic name".

### Scripts for service projects

Since no interactive user is usually logged in service projects, C scripts and VB scripts lead to problems in the following cases:

- When the scripts require interaction, for example, operator input.
- When the scripts show message boxes.

There is no common data area for C scripting in service mode. Thus, for example, no global C variables can be exchanged between the "Scheduled tasks" and "Screens".

### Find and Replace in local scripts in WinCC Professional

Use the "Find and Replace" function to find and replace texts within editors. It is not possible to use Find and Replace in local scripts.

### System functions in local scripts

System functions can be converted into local C scripts or VB scripts.

If a WString type tag is used in a SetTag system function that was converted into a C script, an error message is generated in the Global Script diagnostics window when the function is executed. The message does not affect the execution of the function.

This concerns the following SetTag functions:

- SetTagWithOperatorEvent
- SetTagIndirect
- SetTagByTagIndirect
- SetTagIndirectByTagIndirect

- SetTagByProperty
- SetTagIndirectByProperty

### Properties no longer used in Comfort Panels and RT Advanced

In WinCC V13, many new visual properties have been introduced and many existing properties have been harmonized.

In the course of revision of the object properties, some properties that could be used in VB scripts in earlier versions of WinCC are no longer supported for use in WinCC V13. Scripts that use properties that are no longer supported remain valid, but the relevant calls within the scripts have no function. These limitations pertain exclusively to Comfort Panels and RT Advanced in device version V13.0.

The following table shows the properties of screen objects that are no longer being used:

Property	Screen object
BorderBrightColor3D	Slider
BorderColor	Text field, I/O field, symbolic I/O field, date/time field
BorderInnerWidth3D	Slider
BorderOuterWidth3D	Slider
BorderShadeColor3D	Slider
BorderStyle3D	Text field, I/O field, button, symbolic I/O field, graphic I/O field, date/time field, bar, switch
BorderWidth	Text field, symbolic I/O field
CenterColor	Gauge
DialColor	Gauge
EdgeStyle	Text field, I/O field

### System function "ChangeConnection"

Contrary to the description in the online help, the system function "ChangeConnection" is released for the following devices:

- SIMATIC S7-300/400
- SIMATIC S7-NC
- SIMOTION

The system function "ChangeConnection" is not released for SIMATIC S7-1200.

### 2.3.5.5 Reports

#### Contents

Information that could not be included in the online help and important information about product features.

#### Displaying controls in protocols

A project with WinCC V11 SP2 with Update 4 or earlier is upgraded to WinCC V13.

In this process, it may happen that archive data is not displayed in controls for protocols.

The following controls are affected:

- f(t) trend view
- f(x) trend view
- Table view

Remedial measures for f(t) trend view and f(x) trend view

1. In the control, select "Properties > Properties > General > Display > Online".
2. Recompile your project.
3. Load the project onto your HMI device.

Remedial measures for Table view:

1. In the control, select "Properties > Properties > General > Upon opening screen > Start update".
2. Recompile your project.
3. Load the project onto your HMI device.

### 2.3.5.6 Recipes

#### Contents

Information that could not be included in the online help and important information about product features.

#### Arrays in recipe elements

If you have configured both an array as well as the elements of this array for recipe elements of a recipe, the loading of data records aborts with the following error message: "290055: Import of data records aborted with error"

Use either the array or just the array elements for recipe elements of a single recipe.

### 2.3.5.7 User administration

#### Contents

Information that could not be included in the online help and important information about product features.

### 2.3.5.8 Communication

#### Contents

Information that could no longer be included in the online help and important information about product features.

#### Connection interruptions with Mitsubishi PLCs

After multiple connection interruptions, a situation may arise where all the connection resources of the Mitsubishi PLC are in use and the connection can no longer be established. It is recommended to check these connection resources in the PLC program of the PLC and also to enable them again.

#### Limited number of possible HMI connections

An error message is displayed during compilation of a device indicating that the configuration of the HMI connection in the "Devices & Networks" editor is invalid. The reason may be that the maximum number of possible connections of the HMI device or PLC has been exceeded.

Check the maximum number of available connections. Consult the device manuals of the devices you are using.

#### Communication by means of routing with S7 300/400

Communication of connection partners in different subnets is possible via routing with the following connections: PROFINET, PROFIBUS, MPI.

#### Use of PROFINET IO with panel HMI devices

When using PROFINET IO to connect the direct keys and LEDs of HMI devices to the PLC, you can define an offset for the address area of the inputs and outputs during configuration in HW Config.

The following restriction applies when a PROFINET IO-capable S7-400 CPU is used with one of the HMI devices listed below:

The offset for the start of the address area of the inputs must not be greater than the offset for the start of the address area of the outputs.

The restriction applies to the following HMI devices:

- OP 177B
- OP 277
- Mobile Panel 177

For the configuration of the address parameters, open the PLC with the S7-400 CPU in HW Config. Select the HMI device connected via PROFINET IO in the station window of HW Config. A table with the properties of the HMI device is displayed at the bottom of the station window in the detail view. Select the line containing the addresses of the HMI device in the table and open the object properties using the shortcut menu.

Enable the "Addresses" tab in the "Object properties" dialog. Configure the offset for the inputs under "Inputs > Start". Configure the offset for the outputs under "Outputs > Start".

### Exceeding value ranges with Mitsubishi MC and Mitsubishi FX

With some data types, the Mitsubishi MC and Mitsubishi FX communication drivers do not check whether the value of a recipe tag exceeds the value range of the PLC tags. The data types affected are:

- 4-bit block
- 12-bit block
- 20-bit block
- 24-bit block
- 28-bit block

### Coordination area pointer in an OPC connection

In principle, the coordination area pointer can be used eight times in an OPC connection. If you have configured an OPC connection and you automatically create another OPC connection using "Add", the coordination area pointer is only displayed once in the newly created connection. In this case, you should change the communication driver of the connection. If you then set OPC again as the communication driver, the coordination area pointer can again be used eight times.

### RT Advanced communication via Station Manager (SIMATIC NET) with an S7-1200

For communication of a SIMATIC S7-1200 with a PC with WinCC RT Advanced via a router, the following restrictions apply to the PC:

- Windows 7: Only with installed SIMATIC NET 8.1
- Windows XP: Communication via Station Manager (SIMATIC NET) is not supported

These restrictions also apply if you are using WinAC MP or Station Manager. Connections with the help of the Station Manager of Runtime Advanced are always treated as routed connections.

## Communication between S7-1200 and a multi panel

Communication between an S7-1200 and a multi panel with the "WinAC MP" option installed via ProSave is not possible. The HMI devices affected are:

- SIMATIC MP 177 6" Touch
- SIMATIC MP 277 8" Touch
- SIMATIC MP 277 8" Key
- SIMATIC MP 277 10" Touch
- SIMATIC MP 277 10" Key
- SIMATIC MP 377 12" Touch
- SIMATIC MP 377 12" Key
- SIMATIC MP 377 15" Touch
- SIMATIC MP 377 19" Touch

## HMI connections in WinCC V13

HMI connections to SIMATIC S7-1200 PLCs with firmware versions earlier than V2.0 are not possible in WinCC V13.

## Connections via PROFIBUS DP

When a connection between a PLC and an HMI device via PROFIBUS DP is interrupted and then re-established, sporadically all other PROFIBUS DP connections in the communication network are interrupted and re-established.

De-energize the disconnected station before reconnecting it.

## "Set the IP suite (address) of the PLC in the Control Panel" with SIMATIC S7-1200 V1

The function "Set the IP suite (address) of the PLC in the Control Panel" has not been approved for the following PLCs:

- SIMATIC S7-1200 V1

## Switching a connection

A connection may be interrupted when it is switched from an HMI device to a SIMATIC S7-300/400, to a SIMATIC S7-1500 or to a SIMATIC S7-1200 PLC.

Note the following settings in the SIMATIC S7-1500 or SIMATIC S7-1200 controllers:

- Absolute addressing of tags
- The "Disable PUT-GET communication" option must be selected
- The "Complete protection" protection level may not be set

## RT Advanced in the Station Manager

If RT Advanced and WinAC RTX use the same communication processor of a PC, HMI communication with SIMATIC S7-1200 and SIMATIC S7-1500 is not possible.

## Raw data communication in redundant projects

Simatic.NET, Named Connections and various communication blocks, such as BSEND/BRCV, for example, can only be used to a limited extent in a redundantly configured PC station because the connection parameters for the redundant partner server cannot be configured.

## 2.3.6 System-wide functions

### Contents

Information that could no longer be included in the online help and important information about product features.

### Inter Project Engineering: Displaying alarms of system diagnostics

If you do not enable "PLC alarms" when you create device proxy data, system diagnostic alarms are not applied to the device proxy data.

System diagnostic alarms of the device proxy are not displayed after initialization of device proxy data without "PLC alarms".

## 2.3.7 Compiling and loading

### Contents

Information that could no longer be included in the online help and important information about product features.

### Compiling and loading

If internal errors or warnings occur during compiling, compile the complete project using the command "Compile > Software (rebuild all)" in the shortcut menu of the HMI device.

Before you start productive operation with your project, compile the entire project using the "Compile > Software (rebuild all)" command from the shortcut menu of the HMI device.

If you are using HMI tags that are connected to the control tags in your project, compile all modified blocks with the command "Compile > Software" in the shortcut menu before you compile the HMI device.

### Settings for update of operating system

If you select the command "Online > HMI device maintenance > Update operating system" from WinCC, you cannot change the settings such as the type of PG/PC interface or baud rate. The settings used during the last download are always used.

To make changes to the settings, open the "Extended download" dialog using the "Online > Extended download to device" command and change the settings. When you click the "Load" button the changed settings are saved.

Alternatively, you can perform an update of the operating system with changed settings with ProSave. You start ProSave via the Windows Start menu "Siemens Automation > Options and Tools > HMI Tools > SIMATIC ProSave".

### Incorrect installation of ProSave

If you receive an error message during installation of ProSave when loading data to a target device or maintenance of an HMI device, then you cannot remedy this error using the repair function of setup. Remove ProSave via the Control Panel. Then start setup and install the "ProSave" component again.

### Checking the address parameters

During compilation of an HMI device in the project tree with the command "Compile > Software" in the shortcut menu, the address parameters of the HMI device, such as the IP address, will not be checked. If you want to ensure that the address parameters are checked as well, you will have to compile the HMI device using the "Compile" button in the "Devices & Networks" editor of the toolbar.

### Error message when downloading data to the PLC

A panel and a PLC are connected and communicating with other.

If a tag is accessed while downloading data from the panel to the PLC, an error message is displayed on the panel.

### Delayed reaction in the "Extended download to device" dialog

If the settings in the "Extended download to device" dialog for "Type of the PG/PC interface" and "PG/PC interface" do not match the settings on the HMI device, this can result in the application not responding for up to a minute.

### Extended download with an S7-1200 and a Comfort Panel

An S7-1200 PLC and a Comfort Panel are located in the same physical network as the PG/PC. You open the "Extended download to device" dialog for the Comfort Panel.

If you enable the option "Show all accessible devices", it may occur that the application stops responding.

### OP77A, OP73, TP177A: Loading projects

When loading a project to an HMI device, it can happen that Runtime is not automatically ended, even though "Remote Transfers" is activated in the Panel.

If this happens, stop Runtime and manually set the transfer mode on the HMI device.

### Loading a SIMATIC HMI application to a PC station

The following circumstances can lead to an error message during the first load of a SIMATIC PC station:

- A SIMATIC HMI application is configured in a PC station in the project
  - WinCC Runtime Advanced
  - WinCC Runtime Professional
  - WinCC Standby
  - or WinCC Client
- The property "S7RTM is installed" is activated.

Before you load a SIMATIC PC station for the first time, select the configured device HMI\_RT (WinCC...) in the project tree. Open the "Extended download to device" dialog and select the appropriate interface and parameter settings. Click "Load".

You then load the PC station as normal.

### Project transfer via USB

If you have connected more than one HMI device via USB to your configuration PC, project transfer is only possible to the last connected device.

### Opening project files

When you run "HmiIrtm.exe", a dialog opens asking if you want to open the project file (.fwc).

The following options are available to you:

- "Yes": A dialog opens allowing you to select a project file (.fwc).
- "No": The dialog closes.

### Tag simulator in WinCC Professional does not start

If the tag simulator does not start in WinCC Professional, it may be because the fm20.dll file has not been installed in the system yet. The fm20.dll file cannot be distributed and must be installed as part of a Microsoft application:

[http://support.microsoft.com \(http://support.microsoft.com/default.aspx?scid=kb;EN-US;224305\)](http://support.microsoft.com/http://support.microsoft.com/default.aspx?scid=kb;EN-US;224305)

You have the following two options for installing the fm20.dll file:

- Install an application, such as Microsoft Office 97, on the destination system. The installation routine also installs the fm20.dll file.
- You can also download and install the Microsoft ActiveX Control Pad free of charge. The fm20.dll file is also installed in this case. Additional information on the ActiveX Control Pad is available on the Microsoft Developer Network website:  
<http://msdn.microsoft.com/en-us/library/ms968493.aspx> (<http://msdn.microsoft.com/en-us/library/ms968493.aspx>)

## 2.3.8 Runtime

### 2.3.8.1 Notes on operation in Runtime

#### Contents

Information that could no longer be included in the online help and important information about product features.

#### Focus in Runtime

If you have configured a low-contrast combination of focus color and border color in a V12 project, the focus may no longer be identifiable after changing the HMI device version in Runtime. Change one of the two colors.

#### Language behavior - Layout of on-screen keyboard

The layout of the on-screen keyboard is not switched when the runtime language changes.

#### Tag values exceed the maximum length

You enter a character string in a string tag via an I/O field. If the character string exceeds the configured number of tags, the character string will be shortened to the configured length.

#### Empty message texts

Runtime is running with a project. The project is saved on a network drive.

In the event of interruptions to the network drive connection, Runtime may attempt to load message texts from the network drive.

In the event of disconnection, the alarm window or the alarm view remains empty.

To avoid this, copy the project to a local drive before the starting the project in Runtime.

#### Complete download in Service mode

If you need to perform a "complete download" to the OS in Service mode from the engineering station, Runtime automatically stops and then starts again.

The project is then no longer in Service mode.

In this state, the power supply is interrupted and WinCC Runtime no longer starts automatically on the OS.

Remedy:

1. Switch the project manually to Service mode after you have performed the "complete download".
2. Close the project manually.
3. Enable Service mode.
4. Start Runtime again using the surrogate icon in the taskbar.

### Slow response from the screen keyboard and SmartServer

The following programs may start and respond very slowly under Windows 7 and Windows 2008 servers:

- Microsoft OSK screen keyboard and HMI TouchInputPC
- SmartServer: <Ctrl+Alt+Del> shortcut in the logon dialog

The delay is caused by the callback for the Internet certificate validation.

Remedy:

You can find the following files on the product DVD under:

Support\Windows7\CRL\_Check or CD\_RT\ Support\Windows7\CRL\_Check\:

- DisableCRLCheck\_LocalSystem.cmd
  - DisableCRLCheck\_CurrentUser.cmd
1. Run the "DisableCRLCheck\_LocalSystem.cmd" file with administrator rights. Select the command "Run as administrator" from the shortcut menu of the file.
  2. Reboot the PC.

If the problem persists, follow these steps:

1. Double-click the file and run the "DisableCRLCheck\_CurrentUser.cmd" file with user rights.
2. Reboot the PC.

---

#### Note

The callback for the certificate validation is disabled for all users or PCs. To restore the original state, perform the following files:

- RestoreDefaults\_LocalSystem.cmd
- RestoreDefaults\_CurrentUser.cmd

You can find the files in the following directory of the product DVD:

- Support\Windows7\CRL\_Check or CD\_RT\Support\Windows7\CRL\_Check\
-

## Starting Runtime

Only WinCC Runtime V13 can be started in TIA Portal V13. WinCC Runtime V11.02, V12 or V13 can be simulated in TIA Portal V13.

### 2.3.8.2 Notes on operation of panels in Runtime

#### Contents

Information that could not be included in the online help and important information about product features.

#### License transfer via S7USB

You always need to run WinCC to transfer a license to a panel via S7USB.

#### Transferring licenses to a panel on 64-bit operating systems

If you are running a 64-bit operating system and the "Edit > Connect target systems > Connect HMI device" menu command is not available in Automation License Manager, open command line input and run the following command with administrator rights:

```
"%WINDIR%\system32\RegSvr32.exe" "%CommonProgramFiles%\siemens\AlmPanelPlugin\ALMPanelParam.dll"
```

#### Using the mouse wheel in Runtime

The use of the mouse wheel in Runtime is not supported on all panels.

#### Basic Panels, OP73, OP77A and TP177A: Displaying texts in runtime

The default font selected in the "Runtime settings > Languages & font" editor has an effect on the display of texts in runtime.

Text entries may be truncated if you selected an unfavorable font size or style.

This setting possibly has an effect on the following text entries:

- Tooltips
- long alarm text
- text in the dialogs

#### Basic Panels: Connections to S7-1200 and S7-1500 with Backup/Restore

If you use the "Backup/Restore" function, a maximum of two connections from Basic Panels to the controllers are possible at any given time.

- SIMATIC S7-1200
- SIMATIC S7-1500

### Basic Panels: Backup on the memory card of the PLC

Create the backup file "A.psb" on the memory card of the PLC. An error, for example a connection break, occurs when creating the backup.  
This will create a corrupt file on the memory card of the PLC. Such a file has "~\$" as prefix. Delete the file with the prefix "~\$" if you want to save a backup again under the same name "A.psb".

### Basic Panels: Panel Data Storage and S7-1500F

The "Panel Data Storage" PDS function cannot be used on Basic Panels in conjunction with S7-1500F when the password for the protection level "Full access incl. fail-safe" is used.

### 2.3.8.3 Notes on operation of Runtime Advanced

#### Contents

Information that could not be included in the online help and important information about product features.

#### Permission for starting Runtime

On a computer running the 32-bit version of Windows 7, WinCC Runtime Professional or WinCC Runtime Advanced can only be started when a user is a member of the automatically created group, "Siemens TIA Engineer".

#### .Net-Controls in Runtime

If you have incorporated a .Net Control in your project as "Specific .Net-Control", you have to copy the files belonging to these controls to the installation directory of WinCC Runtime, e.g. "C:\ProgramFiles\Siemens\Automation\WinCC RT Advanced". Otherwise, the control cannot be loaded in Runtime.

### 2.3.9 HMI devices

#### 2.3.9.1 Notes on HMI devices

#### Contents

Information that could no longer be included in the online help and important information about product features.

If the PC goes into standby or hibernate mode while the transfer is in progress, the panel status after interruption of the transfer is not defined.

## Multi-key operation

Unintentional actions can be triggered by multi-key operation:

- When you are using a key device, you cannot press more than two function keys at the same time.
- When you are using a touch device, a standard PC or a panel PC, you can only press one function key or button at the same time.

## TS Adapter with Ethernet interface

If an HMI device is connected via Ethernet and a TS adapter, it can not be reset to factory settings.

## Simulation of the Basic Panels

Use an output field in an alarm text to output an external tag. The content of the output field will always be displayed with "0" during simulation.

## Simulation with real PLC connection

The access point used by the simulation is independent from the settings of the engineering system and can only be altered in the Control Panel with the "Setting PG/PC Interface" tool. If the PLC connection is terminated right after the start of the simulation with alarm 140001, you should check the access point used by the simulation with "Setting PG/PC Interface".

1. Double-click "Setting PG/PC Interface" in the Control Panel. A dialog opens.
2. Select "S7ONLINE" in the "Access point of application" field as standard for HMI.
3. Select the interface in the "Interface Parameter Assignment Used" area.
4. Exit the dialog "Setting PG/PC Interface" with OK

## Loading of projects without recipe data records

You are using recipes in a project. You transfer the project to a Basic Panel without recipe data records.

You may encounter inconsistencies if you have altered the structure of the recipe in the engineering system and the device already held recipe data records.

Check the consistency of the data records in this case. The device will not issue a note for all structural changes.

## Floating point numbers on MP 277, MP 377, TP 177B 4" and CP4

Only floating point numbers in the range from  $10^{-293}$  ...  $10^{+307}$  are displayed correctly on the HMI devices MP 277, MP 377, TP 177B 4" and CP4. If the tag value is outside this range, it is displayed as 0.

## Mobile Panels V2

If you use Mobile Panels V2 in a project, it is not possible to open the project with WinCC V11 SP1. This affects projects with the following devices:

- Mobile Panel 277F IWLAN (RFID Tag)
- Mobile Panel 277F IWLAN V2
- Mobile Panel 277 IWLAN V2

## "Zone ID/Connection point ID" tag of a Mobile Panel 277 IWLAN V2

The tag used for the "Zone ID/Connection point ID" must be of data type INT for Mobile Panel 277 IWLAN V2 devices. Adapt this data type if necessary when migrating a project.

## HMI devices with operating system Windows CE 5.0 or higher

Owing to a modified client-server communication security setting, the time difference between the HMI device (client) and PC (server) must not exceed 1 day. If you back up recipe data from the HMI device on a network drive, for example, make sure that the time is set correctly on the PC (server) and the HMI device (client).

## HMI devices with high communication load

S7 Diagnostics should be enabled if a Panel is assigned many connections to PLCs or other HMI devices. Otherwise, you will risk overload on the Panel.

## Device replacement in the engineering system

In the engineering system, you replace a device with configured LED keys with a device without LED keys. Runtime start fails after you have transferred the project data to the device.

For this reason, delete the LED key configuration before you replace the device.

## Restrictions for the HMI device, MP 377 15" Touch daylight readable

The following functions are not supported in WinCC V12 for the MP 377 15" Touch daylight readable HMI device:

- Option: Sm@rtServer
- System function: SetAndGetBrightness
- Direct keys

## Upgrading Basic Panels to WinCC V13

Before you upgrade Basic Panels from version V12 to version V13, transfer the image of the V12 SP2 Update 5 or higher to the devices.

In the "SIMATIC ProSave [OS Update]" dialog, select the setting "Reset to factory settings".

In this way, you always start a functional update of the image.

Affected devices:

- KP300 Basic mono PN
- KP400 Basic color PN
- KTP400 Basic color PN

### Connection switch in the Control Panel with Basic Panels

If you use the "Override protected connection information" function, the following restriction applies:

You cannot perform a connection switch in the Control Panel of a Basic Panel from a PLC without a protection level to a PLC with a "Complete protection" level.

### Mobile Panels 277F 8" IWLAN

Mobile Panels 277F 8" IWLAN V2 and 277F 8" IWLAN (RFID Tag) cannot be configured with WinCC V13.

### Basic Panels 2nd Generation

Basic Panel KTP1200 Basic can currently not be configured with WinCC V13.

The following maximum values are in effect for Basic Panels 2nd Generation.

#### Alarms

	KTP400 Basic	KTP700 Basic	KTP900 Basic	KTP1200 Basic
Number of discrete alarms	1000	1000	1000	1000

#### Screens

	KTP400 Basic	KTP700 Basic	KTP900 Basic	KTP1200 Basic
Number of complex objects per screen <sup>1)</sup>	This information is not relevant for Basic Panels 2nd Generation.			
Number of system diagnostic displays per screen	5	5	5	5
Number of array elements per screen <sup>2)</sup>	100	100	100	100

1) Complex objects include: Bars, sliders, symbol library, clock, and all objects from the Controls area.

2) Array elements contained in recipes are included in the count.

#### Logs

	<b>KTP400 Basic</b>	<b>KTP700 Basic</b>	<b>KTP900 Basic</b>	<b>KTP1200 Basic</b>
Number of entries per log (including all log segments) <sup>1)</sup>	10000	10000	10000	10000
Number of log segments	400	400	400	400
Number of tags that can be logged per log	10	10	10	10
Cyclic trigger for tag logging	1 s	1 s	1 s	1 s

# Installation

## 3.1 Notes on the installation

### Contents

Information that could not be included in the online help and important information about product characteristics.

### Automated Installation

A description of automated installation is available on the product DVD in the directory "Documents\Readme\<Language directory>".

### Using the same versions of TIA Portal products

The TIA Portal products STEP 7 (incl. PLCSIM), WinCC and Startdrive must be upgraded to the same version (V13). If the versions are different, you will no longer be able to start the TIA Portal. Even uninstalling a product will not restore an operational status. Please ensure that you have the service packs for these products to hand before you start the installation. You can download the service packs from the Internet under Siemens Industry online support (<http://support.automation.siemens.com/WW/llisapi.dll?aktprim=99&lang=en&referer=%2fWW%2f&func=cslib.csinfo2&siteid=csius&extranet=standard&viewreg=WW&groupid=4000002>).

### Target directory of the installation

Do not use any UNICODE characters (for example, Chinese characters) in the installation path.

### Use of antivirus programs

During the installation, read and write access to already installed files is necessary. Some antivirus programs block this access. We therefore recommend that you disable antivirus programs during the installation of the TIA Portal and enable them again afterwards.

## 3.2 System requirements for installation

### 3.2.1 Notes on licenses

#### Availability of licenses

The licenses for the products of the TIA Portal are usually supplied on the installation data medium and installed automatically by the Automation Licence Manager during the installation process of the TIA Portal.

Before you uninstall the TIA Portal, you must transfer and back up the licenses still required. Use the Automation License Manager for this purpose.

#### Provision of the Automation License Manager

The Automation License Manager is supplied on the installation data medium and is transferred automatically during the installation process.

If you remove the TIA Portal, the Automation License Manager remains installed on your system.

#### Working with the Automation License Manager

The Automation License Manager is a product of Siemens AG, which is used for handling license keys (technical representatives of licenses).

Software products that require license keys for operation, such as the TIA-Portal, register the required license key automatically with the Automation License Manager. If the Automation License Manager finds a valid license key for this software, the software can be used according to the license usage terms associated with this license key.

---

#### Note

For additional information on how to manage your licenses with the Automation License Manager, refer to the documentation supplied with the Automation License Manager.

---

#### See also

Notes on the system requirements (Page 89)

Starting installation (Page 112)

Displaying the installed software (Page 116)

Modifying or updating installed products (Page 116)

Repairing installed products (Page 118)

Starting to uninstall (Page 119)

Installation log (Page 111)

## **3.2.2 Notes on the system requirements**

### **System requirements for individual products**

The system requirements may differ depending on the products you want to install. You should therefore check the individual system requirements of your products.

If you want to install several products, make sure that your system meets the demands of the product with the highest requirements.

### **Displaying PDF files**

To be able to read the supplied PDF files, you require a PDF reader that is compatible with PDF 1.7 e.g. Adobe (R) Reader version 9.

### **Displaying the Welcome Tour**

You require the Adobe (R) Reader as of version 9 to start the Welcome Tour for the TIA portal.

### **See also**

Notes on licenses (Page 88)

Repairing installed products (Page 118)

Starting to uninstall (Page 119)

### **3.2.3 System requirements STEP 7 Basic**

#### **3.2.3.1 Licensing of STEP 7**

##### **Introduction**

You require a License Key to license the following STEP 7 editions:

- STEP 7 Basic
- STEP 7 Professional

You can install the corresponding License Key when you are installing STEP 7 or transfer it using the Automation License Manager after the installation has been completed.

##### **Licenses for STEP 7**

The following licenses with the corresponding license keys are available:

- STEP 7 Basic
- STEP 7 Professional
- STEP 7 Professional Combo

### Validity of license keys for older versions of STEP 7

With a valid License Key for V13.x of STEP 7 Professional and STEP 7 Professional Combo, you can also operate older versions of STEP 7 without restrictions. The following table provides more detailed information about this:

Edition	License	Valid for
STEP 7 Basic V13.x	STEP 7 Basic	<ul style="list-style-type: none"> <li>• STEP 7 Basic V13.x</li> <li>• STEP 7 Basic V12.x</li> <li>• STEP 7 Basic V11.x</li> <li>• STEP 7 Basic V10.5</li> </ul>
STEP 7 Professional V13.x	STEP 7 Professional	<ul style="list-style-type: none"> <li>• STEP 7 Professional V13.x</li> <li>• STEP 7 Professional V12.x</li> <li>• STEP 7 Professional V11.x</li> <li>• STEP 7 Basic V13.x</li> <li>• STEP 7 Basic V12.x</li> <li>• STEP 7 Basic V11.x</li> <li>• STEP 7 Basic V10.5</li> </ul>
STEP 7 Professional V13.x	STEP 7 Professional Combo	<ul style="list-style-type: none"> <li>• STEP 7 Professional V13.x</li> <li>• STEP 7 Professional V12.x</li> <li>• STEP 7 Professional V11.x</li> <li>• STEP 7 Basic V13.x</li> <li>• STEP 7 Basic V12.x</li> <li>• STEP 7 Basic V11.x</li> <li>• STEP 7 Basic V10.5</li> <li>• STEP 7 V5.5</li> <li>• STEP 7 V5.4</li> <li>• STEP 7 Professional 2010</li> <li>• STEP 7 Professional 2006</li> </ul>

### Starting without a valid license key

If you start an edition of STEP 7 without a valid License Key, the system alerts you that you are working in non-licensed mode. You have the one-time option of activating a Trial License. However, this license is valid for a limited period only and expires after 21 days.

When the Trial License expires, the following scenarios can occur:

- STEP 7 has never been licensed on the PC in question:
  - Operations requiring a license can no longer be performed in STEP 7.
- STEP 7 was already licensed on the PC in question:
  - A window requiring acknowledgment presents an alert for non-licensed mode every 10 minutes and for every action requiring a license.

### 3.2 System requirements for installation

#### License requirements for simulation

You do not require additional licenses when you use the menu command "Online > Simulation" to start the simulation in STEP 7.

If the following conditions are met, the appropriate licenses for the edition of STEP 7 you have installed are also required for the simulation.

- The engineering station is connected to a PLC.
- The connection to the PLC is configured and active.

#### See also

Handling licenses and license keys (Page 92)

### 3.2.3.2 Handling licenses and license keys

#### Introduction

In each case, you require a valid License Key to use STEP 7 Basic and STEP 7 Professional.

#### Installing license keys

When you install STEP 7 Basic, the License Key is installed automatically during setup. When you install STEP 7 Professional you will be prompted at the end of the setup to transfer the license from the supplied storage medium to your PC.

If you want to install additional License Keys, you have to use the Automation License Manager to do this.

When you install a license, the associated license key is removed from the license key storage location.

<b>NOTICE</b>
<b>Destruction of license keys by copying</b>
It is not possible to copy a License Key. The copy protection prevents the license keys from being copied. If you attempt to copy a License Key this will be destroyed.

#### Uninstalling license keys

License keys are always uninstalled using the Automation License Manager. You uninstall a License Key in the following cases:

- When backing up data.
- If you no longer require the license.

You can then use a valid license on another PC or HMI device.

## Data backup

When backing up data on the HMI device or creating a backup during device replacement, remove the License Keys on the HMI device. To do this, open the Automation License Manager and back up the uninstalled license key to another storage location.

### NOTICE

#### Destruction of license keys on PCs

Start by removing all license keys in the following situations:

- Before you format the hard disk.
- Before you compress the hard disk.
- Before you restore the hard disk.
- Before you start an optimization program that moves fixed blocks.
- Before you install a new operating system.

Read the description of Automation License Manager ("Start > Siemens Automation > Documentation"). Observe all warnings and notices.

On PC-based HMI devices and on non-PC-based HMI devices where Automation License Manager is used, the license key storage location may contain multiple license keys. This capability means you can store multiple licenses of the same type at one location. Save all license keys of an HMI device to the same storage location.

### NOTICE

Always keep the original storage location of the license keys.

## Invalid license after time zone change

The installed license no longer functions in the following case.

- If you change the time zone on a PC as follows:  
From a time based on a complete hour to a time not based on a complete hour.  
**Example:** You change the time zone from GMT +3:00 to GMT +3:30.

To avoid this inconvenience, uninstall the license key using the Automation License Manager under the time zone setting that was set when the license key was installed.

This behavior does not apply to the Trial License.

## Defective license

A license is defective in the following cases:

- If the license key is no longer accessible at the storage location.
- If the license key disappears during its transfer to the destination drive.

You can use the Automation License Manager to repair the defective license. To do this, use the "Restore" function or the "Restore wizard" of the Automation License Manager. To perform this restore operation you must contact Customer Support.

3.2 System requirements for installation

You can find more detailed information on the Internet: <http://support.automation.siemens.com> (<http://support.automation.siemens.com/WW/llisapi.dll?aktprim=99&lang=en&referer=%2fWW%2f&func=cslib.csinfo2&siteid=csius&extranet=standard&viewreg=WW&groupid=4000002>)

Licensing of STEP 7 (Page 90)

3.2.3.3 Software and hardware requirements STEP 7

System requirements for installation

The following table shows the minimum software and hardware requirements for installation of the "SIMATIC STEP 7 Basic" software package:

Hardware/software	Requirement
Processor	Intel® Celeron® Dual Core 2.2 GHz (Ivy/Sandy Bridge)
RAM	4 GB
Available hard disk space	5 GB
Operating systems *	<p><b>Windows 7 (32-bit)</b></p> <ul style="list-style-type: none"> <li>• Windows 7 Home Premium SP1</li> <li>• Windows 7 Professional SP1</li> <li>• Windows 7 Enterprise SP1</li> <li>• Windows 7 Ultimate SP1</li> </ul> <p><b>Windows 7 (64-bit)</b></p> <ul style="list-style-type: none"> <li>• Windows 7 Home Premium SP1</li> <li>• Windows 7 Professional SP1</li> <li>• Windows 7 Enterprise SP1</li> <li>• Windows 7 Ultimate SP1</li> </ul> <p><b>Windows 8.1 (64-bit)</b></p> <ul style="list-style-type: none"> <li>• Windows 8.1</li> <li>• Windows 8.1 Professional</li> <li>• Windows 8.1 Enterprise</li> </ul> <p><b>Windows Server (64-bit)</b></p> <ul style="list-style-type: none"> <li>• Windows Server 2012 R2 StdE (full installation)</li> </ul>
Screen resolution	1024 x 768

\* For more detailed information on operating systems, refer to the help on Microsoft Windows or the Microsoft homepage.

## Recommended software and hardware requirements

The following table shows the recommended software and hardware for the operation of STEP 7.

Hardware/software	Requirement
Computer	From SIMATIC FIELD PG M4 PREMIUM (or similar PC)
Processor	From Intel® Core™ i5-3320M 3.3 GHz
RAM	8 GB or more
Hard disk	300 GB SSD
Monitor	15.6" Wide Screen Display (1920 x 1080)
Operating systems *	<p><b>Windows 7 (64-bit)</b></p> <ul style="list-style-type: none"> <li>• Windows 7 Home Premium SP1</li> <li>• Windows 7 Professional SP1</li> <li>• Windows 7 Enterprise SP1</li> <li>• Windows 7 Ultimate SP1</li> </ul> <p><b>Windows 8.1 (64-bit)</b></p> <ul style="list-style-type: none"> <li>• Windows 8.1</li> <li>• Windows 8.1 Professional</li> <li>• Windows 8.1 Enterprise</li> </ul> <p><b>Windows Server (64-bit)</b></p> <ul style="list-style-type: none"> <li>• Windows Server 2012 R2 StdE (full installation)</li> </ul>

\* For more detailed information on operating systems, refer to the help on Microsoft Windows or the Microsoft homepage

## Supported virtualization platforms

You can install the "SIMATIC STEP 7 Basic" software package on a virtual machine. For this purpose, use one of the following virtualization platforms in the specified version or a newer version:

- VMware vSphere Hypervisor (ESXi) 5.5
- VMware Workstation 10
- VMware Player 6.0
- Microsoft Windows Server 2012 R2 Hyper-V

These virtualization platforms can use the following operating systems as host operating system:

- Windows 7 Professional/Ultimate/Enterprise (64-bit)
- Windows Server 2008 R2 (64-bit)
- Windows Server 2012 R2 (64-bit)
- Windows 8.1 Professional/Enterprise (64-bit)

You can use the following host operating systems to install "SIMATIC STEP 7 Basic" within the selected virtualization platform:

### 3.2 System requirements for installation

- Windows 7 Professional/Ultimate/Enterprise (64-bit)
- Windows 8.1 Professional/Enterprise (64-bit)

---

#### Note

- The same hardware requirements apply to the host operating system as for the respective TIA products.
  - The plant operator must ensure that sufficient system resources are available for the host operating systems.
  - The hardware certified by the manufacturers is recommended for the use of HyperV server and ESXi.
  - When you use Microsoft Hyper-V, accessible stations cannot be displayed.
- 

### Supported security programs

The following security programs are compatible with "SIMATIC STEP 7 Basic":

- Antivirus programs:
  - Symantec Endpoint Protection 12.1
  - Trend Micro Office Scan Corporate Edition 10.6
  - McAfee VirusScan Enterprise 8.8
  - Kaspersky Anti-Virus 2014
  - Windows Defender (as of Windows 8.1)
- Encryption software:
  - Microsoft Bitlocker
- Host-based Intrusion Detection System:
  - McAfee Application Control 6.0

## 3.2.4 System requirement for WinCC Advanced

### 3.2.4.1 Software and hardware requirements

#### Introduction

Specific requirements for the operating system and software configuration must be met for the installation.

---

#### Note

WinCC is generally authorized for use in a domain or workgroup.

However, be aware that domain group policies and restrictions of the domain may hinder the installation. In this happens, remove the computer from the domain prior to installing Microsoft Message Queuing, Microsoft SQL Server and WinCC. Log onto the computer in question locally with administrative rights. Then perform the installation. After successful installation, you can enter the WinCC computer back into the domain. If the domain group policies and restrictions of the domain do not impede the installation, the computer need not be removed from the domain during the installation.

Be aware that domain group policies and restrictions of the domain may also hinder operation. If you cannot avoid these restrictions, run the WinCC computer in a workgroup.

Consult with the domain administrator if needed.

---

#### Installation requirements

The following table shows the minimum software and hardware requirements that have to be met for the installation of the "SIMATIC WinCC Comfort/Advanced" software package:

Hardware/software	Requirement
Processor type	Intel® Celeron® Dual Core 2.2 GHz (Ivy/Sandy Bridge)
RAM	4 GB
Free hard disk space	5 GB

3.2 System requirements for installation

Hardware/software	Requirement
Operating systems *	<p><b>Windows 7 (32 bit)</b></p> <ul style="list-style-type: none"> <li>• Windows 7 Professional SP1</li> <li>• Windows 7 Enterprise SP1</li> <li>• Windows 7 Ultimate SP1</li> </ul> <p><b>Windows 7 (64 bit)</b></p> <ul style="list-style-type: none"> <li>• Windows 7 Professional SP1</li> <li>• Windows 7 Enterprise SP1</li> <li>• Windows 7 Ultimate SP1</li> </ul> <p><b>Windows 8 (64 bit)</b></p> <ul style="list-style-type: none"> <li>• Windows 8.1 Professional</li> <li>• Windows 8.1 Enterprise</li> </ul> <p><b>Windows Server (64 bit)</b></p> <ul style="list-style-type: none"> <li>• Windows Server 2008 R2 Standard Edition SP1</li> <li>• Windows Server 2012 R2 Standard Edition</li> </ul>
Screen resolution	1024x768
Network	Ethernet 10 Mbps or faster
Optical drive	DVD-ROM
Software	Microsoft .Net Framework 4.5

\* For additional information on the operating systems, refer to the Microsoft Windows help or the Microsoft homepage.

Simultaneously opening multiple instances of WinCC on a configuration PC can also increase the hardware capacity required.

**Note**

**"Aero Glass Style" of Microsoft Windows 7**

A powerful graphics card is required for "Aero Glass Style". It requires DirectX9 capabilities and 128 MB of dedicated graphics memory.

The performance of the architecture of the graphics system can significantly influence the performance of WinCC.

**Recommended hardware**

The following table shows the recommended hardware for the operation of SIMATIC WinCC.

Hardware	Requirement
Computer	SIMATIC FIELD PG M4 PREMIUM or higher (or comparable PC)
Processor	Intel® Core™ i5-3320M 3.3 GHz or higher
RAM	8 GB or more
Hard disk	300 GB SSD
Monitor	15.6" Wide Screen Display (1920 X 1080)
Optical drive	DL MULTISTANDARD DVD RW

## Supported virtualization platforms

You can install the "SIMATIC WinCC Comfort/Advanced" software package on a virtual machine. To do this, use one of the following virtualization platforms:

- VMware vSphere Hypervisor (ESXi) 5.5
- VMware Workstation 10
- VMware Player 6
- Microsoft Windows Server 2012 R2 Hyper-V

The following operating systems can serve as a host operating system for these virtualization platforms:

- Windows 7 Professional/Ultimate/Enterprise (64-bit)
- Windows 8.1 Professional/Enterprise (64-bit)
- Windows Server 2008 R2 (64-bit)
- Windows Server 2012 R2 (64-bit)

You can use the following guest operating systems to install "SIMATIC WinCC Comfort/Advanced" on the selected virtualization platform:

- Windows 7 Professional/Ultimate/Enterprise (64-bit)
- Windows 8.1 Professional/Enterprise (64-bit)

---

### Note

- The same hardware requirements apply to the guest operating system as to the respective TIA products.
  - The plant operator must provide sufficient system resources for the guest operating systems.
  - The hardware certified by the manufacturers is recommended for the use of HyperV server and ESXi.
-

### Supported security programs

The following security programs are compatible with "SIMATIC WinCC Comfort/Advanced".

- Virus scanners:
  - Symantec Endpoint Protection 12.1
  - Trend Micro Office Scan Corporate Edition 10.6
  - McAfee VirusScan Enterprise 8.8
  - Kaspersky Anti-Virus 2014
  - Windows Defender (Windows 8.1 and higher)
- Encryption software:
  - Microsoft Bitlocker
- Host-based Intrusion Detection System:
  - McAfee Application Control 6.0

### Installing Microsoft .Net Framework

The software requires .Net Framework 4.5; it is automatically installed and activated.

You will be prompted to install the required .Net Framework version if this cannot be performed by the software package installation. A restart may be necessary after installation of .Net Framework.

### Online help for Windows 7 / Windows Server 2008

Windows 7 and Windows Server 2008 no longer support all online help formats by default. These online help formats are used in WinCC in the following scenarios:

- Call-up of WinCC Direct Help
- Call-up of the WinCC Information System from the WinCC editors or via the Direct Help links

In order to still call WinCC Direct Help, the following component is installed during the installation of WinCC:

- Microsoft Help Engine

You can also call the WinCC Information System in Windows 7 and Windows Server 2008 from the Windows Start menu or from the installation folder.

To call the WinCC Information System from the WinCC editors or via the Direct Help links, some changes have to be made to the operating system. You can find more information on this in the section "More information for advanced users" of Microsoft Support article "917607": <http://support.microsoft.com/kb/917607> (<http://support.microsoft.com/kb/917607>)

### Security settings during installation

When you install WinCC V13, security settings are changed in your operating system.

The security settings in question are listed during the installation.

You must confirm the changes to the security settings.

If you make changes to your operating system after the installation, the changes to the security settings made by the installation of the TIA Portal could be changed.

You can restore the changes to the security settings made by the installation of the TIA Portal: "Start > All Programs > Siemens Automation > Security Controller > Restore settings".

### SQL instance of WinCC V13

If you have installed a WinCC V11 product and you wish to install WinCC V13, you must uninstall the WinCC instance of SQL Server 2005 before the installation.

A new WinCC SQL 2008 instance is installed with the installation of WinCC V13.

### See also

Options for WinCC Engineering and Runtime systems (Page 102)

Licensing of WinCC Engineering System (Page 104)

### 3.2.4.2 Parallel installation

#### Parallel installations in TIA Portal V13

You will be prevented from starting the TIA Portal if you perform a non-permitted parallel installation of STEP 7 and WinCC. The following parallel installations are permitted in the TIA portal:

- STEP 7 V13 and WinCC V13

A dialog opens during installation to inform you of any inconsistencies in your parallel installation. The following parallel installations are permitted:

- WinCC V13 and RT Advanced V13
- WinCC V13 and RT Professional V13

The engineering system and Runtime must always be of the same version after an installation.

#### Parallel installation of WinCC V13 and other SIMATIC HMI products

Parallel installation of WinCC V13 and versions of WinCC flexible earlier than WinCC flexible 2008 SP1 is not allowed.

Parallel installation of WinCC V13 with versions of WinCC earlier than WinCC V7.0 SP2 is not allowed. Parallel installation of WinCC V13 with WinCC V7.0 SP2 or WinCC V7.0 SP3 is only allowed for:

- WinCC V 13 Professional
- WinCC V 13 Professional

### 3.2 System requirements for installation

#### Parallel use

If the term "Combo" appears in the name or license key of the software after installation, the use of the following products/versions is permitted in accordance with paragraph 1.6 of the General Terms and Conditions (see also setup text):

- With license for "WinCC V13 Comfort Combo": WinCC flexible 2008 Standard
- With license for "WinCC V13 Advanced Combo": WinCC flexible 2008 Advanced

#### 3.2.4.3 Add-ons

##### Options for WinCC Engineering and Runtime systems

SIMATIC Panels as well as WinCC Runtime Advanced and WinCC Runtime Professional contain all essential functions for operator control and monitoring of machines or plants. Additional add-ons allow you to extend the functionality in some cases to increase the range of available tasks.

##### Add-ons for Comfort Panels, Mobile Panels, Multi Panels

The following add-ons are available for Comfort Panels, Mobile Panels, and Multi Panels:

- WinCC SmartServer (remote operation)
- WinCC Audit (audit trail and electronic signature for regulated applications)

---

##### Note

In contrast to WinCC flexible 2008, functions from the WinCC flexible /Sm@rtService, WinCC flexible /Sm@rtAccess add-ons as well as the WinCC flexible /OPC Server add-on are incorporated into the basic functionality.

---

##### Add-ons for WinCC Runtime Advanced

The following add-ons are available for WinCC Runtime Advanced:

- WinCC Recipes (recipe system)
- WinCC Logging (logging of process values and alarms)

- WinCC SmartServer (remote operation)
- WinCC Audit (audit trail for regulated applications)

---

**Note**

For use of the WinCC SmartServer and WinCC Audit add-ons, one license each is required.

---

**Note**

In contrast to WinCC flexible 2008, functions from the WinCC flexible /Sm@rtService, WinCC flexible /Sm@rtAccess add-ons as well as the WinCC flexible /OPC Server add-on are incorporated into the basic functionality.

---

### Add-ons for WinCC Runtime Professional

WinCC Runtime Professional contains the following components, which you can activate with a corresponding license:

- WinCC Server (supplements WinCC Runtime to include server functionality)
- WinCC Recipes (recipe system, formerly WinCC /UserArchives)
- WinCC Logging (logging system, previously WinCC/TagLogging)

You can select and install the following add-ons in the installation dialog:

- WinCC Client (standard client for building multiple-station systems)
- WinCC WebNavigator (Web-based operator control and monitoring)
- WinCC DataMonitor (display and evaluation of process states and historical data)

---

**Note**

To use the add-ons, one license each is required.

---

**Note**

In contrast to WinCC V7, functions from the WinCC / OPC Server add-on have been incorporated into the basic functionality. Likewise, the basic functionality includes the Runtime API from WinCC /ODK.

---

In addition to the Runtime add-ons, you can also expand WinCC Runtime Professional with customized controls. The WinCC ControlDevelopment add-on is required to develop controls.

### See also

Software and hardware requirements (Page 97)

Installing and uninstalling options (Page 104)

## Installing and uninstalling options

### Introduction

Some add-ons are included in standard WinCC installation and are installed automatically.

During the installation of WinCC Engineering System, the following add-ons are available for you to select for installation:

- Simulation for WinCC Runtime Advanced

During the installation of WinCC Runtime Advanced, the following add-ons are available for you to select for installation:

- OPC XML Gateway
- WinCC Audit Viewer

### Add-ons for non-PC-based HMI devices

The required Runtime add-ons are installed on the HMI device as follows:

- During the transfer of the project to the HMI device  
Add-ons that are no longer required are removed automatically.
- With ProSave

### Procedure - activating add-ons

To activate an add-on for use, install the appropriate license key using the Automation License Manager.

In order to backup the license key of an add-on or use it on a different configuration PC or HMI device, you must uninstall this license key using the Automation License Manager.

---

#### Note

When no valid license key is installed on a PC with WinCC Runtime, Runtime runs in Demo mode.

---

### See also

Options for WinCC Engineering and Runtime systems (Page 102)

### 3.2.4.4 Licenses and Powerpacks

#### Licensing of WinCC Engineering System

You require a license key for the following:

- WinCC Engineering System, for example, WinCC Professional
- Add-ons for WinCC Engineering System

You can transfer the license key for WinCC simultaneously with the WinCC installation. You transfer licenses for the WinCC add-ons after installation with the Automation License Manager.

### Starting without a valid license key

If you start WinCC without a valid license, the system alerts you that you are working in non-licensed mode. You have the one-time option of activating a trial license. The trial license for Engineering editions WinCC Basic, Comfort/Advanced, and Professional expires after 21 days.

When the trial license has expired, the following scenarios may occur:

- WinCC was never licensed on the PC in question.
  - Operations requiring a license can no longer be performed in WinCC.
- WinCC was already licensed on the PC in question.
  - Non-licensed mode is indicated every 10 minutes and at every action requiring a license by a window, which you must acknowledge.

### License requirements for simulation

When you want to start simulation in WinCC using the "Online > Simulation > With tag simulator" menu command, you do not need licenses for WinCC Runtime or for add-ons that require a license.

If the following conditions are met, you will need the appropriate licenses for WinCC Runtime and add-ons that require a license even for simulation:

- The engineering station is connected to a PLC.
- The connection to the PLC is configured and active.

You start the simulation with the "Online > Simulation > Start" menu command.

### See also

Software and hardware requirements (Page 97)

Licensing WinCC Runtime on PC-based HMI devices (Page 105)

Licensing of HMI devices (Page 106)

Working with license keys (Page 107)

Powerpack (Page 110)

Installing a Powerpack (Page 110)

### Licensing WinCC Runtime on PC-based HMI devices

With PC-based HMI devices, you require a license key for the following:

- WinCC Runtime with 128 tags, for example.
- WinCC add-ons

### 3.2 System requirements for installation

You can install the license key for WinCC Runtime during the installation of WinCC. You transfer licenses for the WinCC add-ons after installation with the Automation License Manager.

---

#### Note

Only the Certificate of License for WinCC Runtime V13 authorizes operation of WinCC Runtime V13.

---

The appropriate new license is required to license WinCC Runtime.

You can upgrade the runtime licenses of WinCC flexible 2008 and WinCC V7 with an upgrade to WinCC Runtime V13.

Productive operation of the software is only allowed with a valid Certificate of License that matches the version listed on it.

#### Non-licensed mode

WinCC Runtime and the Runtime add-ons can be used freely without license. Non-licensed mode is indicated every 10 minutes by a window, which you must acknowledge.

#### See also

Licensing of WinCC Engineering System (Page 104)

#### Licensing of HMI devices

Non-PC-based HMI devices are always equipped with Runtime licenses. A license key is not required for runtime operation.

A license may be required for an add-on for non-PC-based HMI devices. The license key of the respective license always activates one add-on for use.

#### License key

In order to license non-PC-based HMI devices with license keys, the "SIMATIC HMI License Manager Panel Plugin" add-on is needed.

WinCC Setup installs this add-on by default. You open the License Manager Panel Plugin in the Automation License Manager with the "Edit > Connect Target System > Connect HMI Device" menu command.

If WinCC is not installed, an installation of ProSave 7.2 or higher is required.

---

#### Note

Further information on license handling can be found in the Automation License Manager help.

---

**Note**

Verify that the current version of the operating system (or higher) is installed on the HMI device before you start licensing. If necessary, update the operating system using ProSave.

---

**Non-licensed mode**

Runtime add-ons can be used for a short time without restrictions without a valid license. Non-licensed mode is indicated every 10 minutes by a window, which you must acknowledge.

**See also**

Licensing of WinCC Engineering System (Page 104)

**Working with license keys****Introduction**

You transfer a license key to the HMI device in the following cases:

- To use the WinCC engineering system
- To operate WinCC Runtime
- To use add-ons for WinCC Runtime on PC-based HMI devices
- To use add-ons on non-PC-based HMI devices

You transfer a license key from the HMI device in the following cases:

- When backing up data
- If you no longer require the license

You can then use this license on another PC or HMI device.

When you transfer a license to an HMI device, the associated license key is removed from the license key storage location.

---

**Note**

A license key cannot be copied. The copy protection employed prevents the license keys from being copied.

---

**Data backup**

You transfer the license keys from the HMI device for data backup on the HMI device or as a backup for device replacement.

You use the Automation License Manager to back up license keys from an HMI device to the storage area of the license keys.

**NOTICE**

**Destruction of license keys on non-PC-based HMI devices**

License keys transferred as a result of backup/restore operations are destroyed in the case of the following HMI devices:

- 270 series
- 370 series

Carry out the following before beginning restoring:

- Use the Automation License Manager and ProSave to check whether license keys are on the HMI device.
- Transfer the license keys present from the HMI device  
After restoring has been carried out, transfer the license keys back to the HMI device.

**Note**

**Destruction of license keys on PCs**

Transfer all license keys to a storage location in the following cases:

- Before you format the hard disk
- Before you compress the hard disk
- Before you restore the hard disk
- Starting an optimization program that moves fixed blocks
- Installing a new operating system

Read the description of Automation License Manager ("Start > Simatic Automation > Documentation"). Observe all warnings and notices.

The license key storage location on PC-based HMI devices and on non-PC-based HMI devices where Automation License Manager is used may contain multiple license keys. This capability means you can store multiple licenses of the same type at one location. For the backup, use a single storage location for all license keys present on an HMI device.

**Note**

Always keep the original storage location of the license keys.

**Invalid license after time zone change**

The transferred license no longer functions in the following case.

- If you change the time zone on a WinCC PC as follows:
  - From a time based on a complete hour to a time not based on a complete hour.  
Example: You change the time zone from GMT +3:00 to GMT +3:30.

To work around this, transfer the license key from the HMI device with a time zone setting that was set when the license key was transferred to the HMI device.

Example:

You transferred the license key with a time zone setting based on a full hour. Then, also transfer the license key to a storage location with a time zone setting based on a full hour.

This behavior does not apply to the trial license.

## Defective license

A license is defective in the following cases:

- If the license key is no longer accessible at the storage area.
- If the license key disappears during its transfer to the destination drive.

---

### Note

Resetting of the system date to an earlier time causes all licenses to become defective.

---

You can use the Automation License Manager to repair the defective license. Use the "Restore" function or the "Restore Wizard" of the Automation License Manager for this purpose. You must contact Customer Support in order to restore the license. For additional information see: <http://support.automation.siemens.com> (<http://support.automation.siemens.com>)

---

### Note

The Runtime software can also be operated without errors if the license is missing or defective. The system alerts you at brief intervals that you are working in non-licensed mode.

---

### Note

If you start the WinCC Engineering System without a valid license key, the system alerts you that you are working in non-licensed mode. You have the one-time option of activating a trial license. The trial license expires after 21 days.

When the trial license has expired, the following scenarios may occur:

- WinCC was never licensed on the PC in question.  
WinCC can no longer be started.
  - WinCC was already licensed on the PC in question.  
WinCC can be started. Non-licensed mode is indicated every 10 minutes by a window, which you must acknowledge.
- 

## See also

Licensing of WinCC Engineering System (Page 104)

## Powerpack

### Introduction

The following upgrades are possible with a Powerpack:

- From a smaller to a larger edition of WinCC Engineering System
- To a runtime system with a larger tag volume

A Powerpack also includes a special license that you can use at any time to activate a higher level of WinCC for use.

### Engineering system

You own WinCC Comfort, for example. You can use the "SIMATIC WinCC Advanced Powerpack WinCC Comfort -> WinCC Advanced V13" Powerpack to activate WinCC Advanced for use.

### Runtime

You own WinCC Runtime Advanced with 128 tags, for example. You use the "SIMATIC WinCC Runtime Advanced Powerpack 128 PowerTags -> 512 PowerTags V13" Powerpack to increase the tag volume from 128 to 512 tags.

You own WinCC Runtime Advanced with 128 tags, for example. You use the "SIMATIC WinCC Runtime Professional Powerpack Runtime Advanced 128 PowerTags -> Runtime Professional 128 PowerTags V13" Powerpack to activate WinCC Runtime Professional with 128 tags for use.

### See also

Licensing of WinCC Engineering System (Page 104)

## Installing a Powerpack

### Introduction

Install a Powerpack by transferring the corresponding license key. The Powerpack license key replaces the license key of an existing installation.

### Requirement

- The conditions described in the "System requirements" section must be fulfilled.
- The license key for the license for which you have purchased a Powerpack is available on the PC.

### Installing a Powerpack

1. Open the Automation License Manager.
2. Select the license key.
3. Select "License Key > Upgrade" in the menu.

### Result

The Powerpack license key replaces the former license key. You cannot reverse this process.

### See also

Licensing of WinCC Engineering System (Page 104)

## 3.3 Installation log

### Function of the installation log

The progress during the following installation processes is logged in a file:

- Installing products
- Modifying or updating already installed products
- Repairing an existing installation
- Uninstalling products

If errors occur during the installation process or warnings are issued, these can be evaluated with the help of the log file. You can do this yourself or contact product support.

### Installation logs storage location

The log file is the most recent file with the file extension ".log" and the name of which that starts with "SIA".

The location of the log file is stored in the environment variable "%autinstlog%". You can enter this environment variable in the address bar of Windows Explorer to open the folder with the log files. Alternatively, you can navigate to the corresponding directory by entering "CD %autinstlog%" in the command line.

The location depends on the operating system, e.g. "C:\Documents and Settings\All Users\Application Data\Siemens\Automation\Logfiles\Setup" in the English version of Windows XP.

### Setup\_Report (CAB file)

To make it easier to provide Product Support with all necessary files, an archive file that contains the installation log and all other required files is saved in CAB format. This archive can be found at "%autinstlog%\Reports\Setup\_report.cab". Send this CAB file to Product Support if you need assistance with installation. With this information, Product Support can

### 3.4 Starting installation

determine whether the installation was executed properly. CAB files that were generated during earlier installation processes are saved with a date ID in the "Reports" directory.

Starting to uninstall (Page 119)

## 3.4 Starting installation

### Introduction

Software packages are installed automatically by the setup program. The setup program starts once the installation medium has been inserted in the drive.

### Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

### Procedure

To install the software packages, follow these steps:

1. Insert the installation medium in the relevant drive.  
The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.  
The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.  
The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.  
The dialog for selecting the product languages opens.

6. Select the languages for the product user interface, and click the "Next" button.

---

**Note**

"English" is always installed as the basic product language.

---

The dialog for selecting the product configuration opens.

7. Select the products you want to install:
  - If you wish to install the program in a minimal configuration, click on the "Minimal" button.
  - If you wish to install the program in a typical configuration, click on the "Typical" button.
  - If you wish to personally select the products to be installed, click on the "User-defined" button. Then select the check boxes for the products you wish to install.
8. If you want to create a shortcut on the desktop, select the "Create desktop shortcut" check box.
9. Click the "Browse" button if you want to change the target directory for the installation. Note that the length of the installation path must not exceed 89 characters.
10. Click the "Next" button.

The dialog for the license terms opens.
11. To continue the installation, read and accept all license agreements and click "Next".

If changes to the security and permissions settings are required in order to install the TIA Portal, the security settings dialog opens.
12. To continue the installation, accept the changes to the security and permissions settings, and click the "Next" button.

The next dialog displays an overview of the installation settings.
13. Check the selected installation settings. If you want to make any changes, click the "Back" button until you reach the point in the dialog where you want to make changes. Once you have completed the desired changes, return to the overview by clicking on "Next".
14. Click the "Install" button.

Installation is started.

---

**Note**

If no license key is found during installation, you have the chance to transfer it to your PC. If you skip the license transfer, you can register it later with the Automation License Manager.

Following installation, you will receive a message indicating whether the installation was successful.

---

15. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
16. If the computer does not reboot, click "Exit".

## Result

The TIA Portal along with the products and licenses you have ordered and the Automation License Manager have been installed on your computer.

**See also**

- Installation log (Page 111)
- Notes on the system requirements (Page 89)
- Notes on licenses (Page 88)
- Displaying the installed software (Page 116)
- Modifying or updating installed products (Page 116)
- Repairing installed products (Page 118)
- Starting to uninstall (Page 119)

### 3.5 Checking availability of updates and support packages and installing them

In the TIA Portal, you have the option of checking whether new software updates or support packages are available, for example, Hardware Support Packages (HSPs). If this is the case, you can then install the software.

---

**Note**

Updates and support packages from TIA Portal V13 or higher are supported.

---

**Procedure**

To check the availability of software updates and support packages and then install these, follow these steps:

1. Use one of the two following methods to start the installation process:
  - Click "Installed software" in the "Help" menu in the TIA Portal.  
The "Installed software" dialog opens.
  - Open the "Siemens TIA Updater" program using the program link on your computer.  
The "Siemens TIA Updater" dialog is opened and the available software packages are displayed.
2. Click "Check for updates". This step is optional if the "Siemens TIA Updater" dialog is already open.  
If you started the installation procedure in the TIA Portal, the "Siemens TIA Updater" dialog is opened and the available updates are displayed.

---

### 3.5 Checking availability of updates and support packages and installing them

3. Click "Download" in the line of the update or support package that you want to install. The update or support package is downloaded. The associated "Install" button becomes active as soon as the download process has been completed.

---

**Note****Please note the following:**

1. You can initiate multiple download processes simultaneously.
  2. You can log off or also shut down the computer while the download process is running. In such cases, the download process continues in the background as soon as you log on again.
- 

4. Close the TIA Portal if it is still open.
  5. In the "Siemens TIA Updater" dialog, click the "Install" button of the software package you want to install. The installation dialog appears.
- 

**Note****Please note the following:**

1. It is not possible to install multiple updates simultaneously.
  2. Do not log off during an installation and do not shut down the computer. This avoids inconsistent versions of the software on your computer.
- 

6. Click "Next". The selected product is installed.

### Alternative procedures for the installation of support packages

Another procedure is available for the installation of a support package. To do this, follow these steps:

1. Click "Support packages" in the "Options" menu in the TIA Portal. The "Detailed information" dialog opens. A table lists all support packages from the directory that you selected as the storage location for support packages in the settings.
2. If you want to install a support package that is not in the list, you have the following options:
  - If the support package is already on your computer, you can add it to the list by selecting "Add from the file system".
  - If you add a support package from the "Service & Support" page on the Internet, first you download it by selecting "Download from the Internet". Then you can add it from the file system.
3. Select the support package that you want to install.
4. Click "Install".
5. Close and then restart the TIA Portal.

### See also

Installation log (Page 111)

## 3.6 Displaying the installed software

You can find out which software is installed at any time. In addition, you can display more information on the installed software.

### Procedure

To display an overview of the software installed, follow these steps:

1. Click "Installed software" in the "Help" menu.  
The "Installed software" dialog opens. You will see the installed software products in the dialog. Expand the entries to see which version is installed in each case.
2. If you would like to display additional information on the installed automation software, click the link on the "Detailed information about installed software" dialog.  
The "Detailed information" dialog opens.
3. Chose the topic you want more information about in the area navigation.

### See also

Starting installation (Page 112)

Modifying or updating installed products (Page 116)

Repairing installed products (Page 118)

Starting to uninstall (Page 119)

Installation log (Page 111)

## 3.7 Modifying or updating installed products

You have the option to modify installed products using the setup program or to update to a new version.

### Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

## Procedure

To modify or update installed products, follow these steps:

1. Insert the installation medium in the relevant drive.  
The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.  
The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.  
The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.  
The dialog for selecting the installation variant opens.
6. Select the "Modify/Upgrade" option button and click the "Next" button.  
The dialog for selecting the product languages opens.
7. Select the check boxes of the product languages that you want to install. You can remove previously installed product languages by clearing the corresponding check boxes.

---

**Note**

Note that the product language "English" cannot be removed.

---

8. Click the "Next" button.  
The dialog for selecting the product configuration opens.
9. Select the check boxes of the components that you want to install. You can remove previously installed components by clearing the corresponding check boxes.
10. Click the "Next" button.

---

**Note**

Note that you cannot change the target directory because the existing installation is being modified.

---

If changes to the security and permissions settings are required in order to install the TIA Portal, the security settings dialog opens.

11. To continue the installation, accept the changes to the security and permissions settings, and click the "Next" button.  
The next dialog displays an overview of the installation settings.
12. Click the "Modify" button.  
This starts the installation of the additional components.

---

**Note**

Following installation, you will receive a message indicating whether the existing installation was successfully changed.

---

### 3.8 Repairing installed products

13. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
14. If the computer does not reboot, click "Exit".

#### Result

The existing installation has been modified on your computer.

#### See also

- Notes on the system requirements (Page 89)

- Starting installation (Page 112)
- Displaying the installed software (Page 116)
- Repairing installed products (Page 118)
- Starting to uninstall (Page 119)
- Installation log (Page 111)

## 3.8 Repairing installed products

You have the option to repair installed products by completely reinstalling them using the setup program.

#### Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

#### Procedure

To repair installed products, follow these steps:

1. Insert the installation medium in the relevant drive.  
The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.  
The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.  
The help file containing the notes opens.

5. Once you have read the notes, close the help file and click the "Next" button.  
The dialog for selecting the installation variant opens.
6. Select the "Repair" option button, and click the "Next" button.  
The next dialog displays an overview of the installation settings.
7. Click the "Repair" button.  
This starts the repair of the existing installation.

---

**Note**

Following installation, you will receive a message indicating whether the existing installation was successfully repaired.

---

8. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

**Result**

The installed products have been reinstalled.

## 3.9 Starting to uninstall

**Introduction**

Software packages are removed automatically by the setup program. Once started, the setup program guides you step-by-step through the entire removal procedure.

You have two options for removing:

- Removing selected components via the Control Panel
- Removing a product using the installation medium

---

**Note**

The Automation License Manager will not be removed automatically when you remove the software packages, because it is used for the administration of several license keys for products supplied by Siemens AG.

---

### Removing selected components via the Control Panel

To remove selected software packages, follow these steps:

1. Open the Control Panel with "Start > Settings > Control Panel".
2. Double click on "Add or Remove Programs" in the control panel.  
The "Add or Remove Programs" dialog opens.
3. Select the software package to be removed in the dialog "Add or Remove Programs", and click "Remove".  
The dialog for selecting the setup language opens.
4. Select the language in which you want the dialogs of the setup program to be displayed and click "Next".  
The dialog for selecting the products you want to remove opens.
5. Select the check boxes for the products that you want to remove and click "Next".  
The next dialog displays an overview of the installation settings.
6. Check the list with the products to be removed. If you want to make any changes, click the "Back" button.
7. Click the "Uninstall" button.  
Removal begins.
8. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

### Removing a product using the installation medium

To remove all software packages, follow these steps:

1. Insert the installation medium in the relevant drive.  
The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.  
The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click "Read product information" or "Read installation notes".  
The help file containing the notes opens.

5. Once you have read the notes, close the help file and click the "Next" button.  
The dialog for selecting the installation variant opens.
6. Select the "Uninstall" option button and click the "Next" button.  
The next dialog displays an overview of the installation settings.
7. Click the "Uninstall" button.  
Removal begins.
8. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

## 3.10 Installing and uninstalling the migration tool

### 3.10.1 System requirements

#### System requirements for the migration tool

The following system requirements apply to the use of the migration tool:

- All products used to create the source project must be installed. The following products are supported:
  - WinCC flexible 2008 SP2 and SP3
  - WinCC V7.0 SP3
  - STEP 7 V5.5
  - Integrated projects from STEP 7 V5.5 and the WinCC products listed above
  - SINUMERIK
  - STARTER and Startdrives
  - SIMOTION SCOUT V4.4  
You need the SCOUT Migration Tool PlugIn V4.4 to migrate SIMOTION SCOUT V4.4 projects.
- All optional packages needed to process the STEP 7 project are installed. For example, all HSPs for the devices used in the source project are required.

### 3.10.2 Installing the migration tool

#### Distribution of the migration tool

You can find the migration tool in the "Support" directory on the installation DVD of the TIA Portal. Alternatively, it can be downloaded from the Service & Support area of the Siemens website. For some products, (such as SIMATIC Failsafe or SIMOTION) additional plug-ins are required for the migration tool. These plug-ins can also be downloaded from the Service & Support page or installed from the installation DVD of the specific products.

Normally, the migration tool is installed without the TIA Portal. Because the TIA Portal has its own integrated migration function, a separate installation of the migration tool is not necessary.

## Procedure

To install the migration tool, proceed as follows:

1. Download the installation DVD from the Service & Support area of the Siemens website or use the installation file from the "Support" directory of the installation DVD of the TIA portal to perform the installation.
2. Run the installation file.  
The setup program for the migration tool will open.
3. First, select the language in which the setup should be displayed and click the "Next" button.  
The page for selecting the software language is displayed.
4. Since the migration tool is provided exclusively in English, you cannot choose any other language for the installation. Therefore, click "Next" to proceed to the next step.  
The page for selecting the product is displayed.
5. The migration tool consists solely of a software component. Therefore, the migration tool is already selected.  
To create a Desktop icon for starting the migration tool, select the check box "Create Desktop icon". Then click the "Next" button.  
The page for confirming the licensing terms is shown.
6. Click on an entry in the list of license terms to read the selected license term. If you agree with all license terms, select the check box "I accept the terms of the displayed license agreement". Then click the "Next" button.  
An overview of the installation is displayed.
7. Click the "Install" button.  
The installation is performed with the displayed settings.

### 3.10.3 Uninstalling the migration tool

The migration tool can be removed using the Control Panel.

## Procedure

To remove the migration tool, follow these steps:

1. Open the Control Panel.
2. Double click on "Add or Remove Programs" in the Control Panel.  
The "Add or Remove Programs" dialog opens.
3. Select the entry for the migration tool in the "Add or Remove Programs" dialog, and click the "Remove" button.  
A security prompt appears.
4. Click the "Uninstall" button to confirm this prompt.  
The migration tool will be removed.

# Migrating projects and programs

## 4.1 Migrating projects in a TIA portal project

### 4.1.1 Migration of projects with the TIA Portal

#### Migration of existing projects

You can migrate projects from earlier automation solutions to the TIA Portal. Each time you migrate, a new project is created for the migrated data with which you can then work. Any TIA Portal projects already open are closed first.

The migration is then displayed in the table of the project history. From there, you have access to the migration log that is created automatically for the migration.

#### Supported products for migration

The chapter "System overview STEP 7 and WinCC" includes information on the products that are available for the TIA Portal. In principle, all products listed there are supported by the TIA Portal during migration.

Any additional requirements that must be met depend on the initial products that were used and the currently installed products. For more information on the migration options for your products, you can, for example, refer to the Siemens Industry Online Support and the documentation of your software products.

See also: Scaling of STEP 7 and WinCC in the TIA Portal (Page 31)

#### Procedure during migration

The migration process is divided into the following basic steps:

1. Preparing the initial project

If the software for editing the initial project is not or not fully installed on the programming device/PC with the TIA Portal, or if the initial project is an integrated project, the initial project must first be converted into a migration file. To do this, install the migration tool on a programming device/PC on which the required software for editing the initial project is installed. Then, use the migration tool to convert the initial project, and copy the file to the programming device/PC on which the TIA Portal is installed. You can omit this step if the initial project and its associated software are on the same programming device/PC as the TIA Portal, and if the initial project is not an integrated project.

2. Performing migration

Perform the actual migration within the TIA Portal. For the migration, specify as source either the migration file which you created with the migration tool or the initial project when all required software has been installed.

*4.1 Migrating projects in a TIA portal project*

3. Checking the migration log

A migration log is created for each migration. It contains information about modified project parts. You can call the log under "Common data > Logs" in the project tree or in the project history. After completion of the migration, the migration log will be displayed in the TIA Portal. Check the log following completion of the migration.

If the migration failed, an XML file is created as a log under "\Logs" in the project directory. You can use any XML editor to open this log and view the reasons why the migration failed.

4. Correcting the migrated project

Because the configurations of the initial project may not always be completely compatible with the TIA Portal, not all configurations are transferred in identical form in the migrated project. You should therefore work through the points in the migration log systematically.

If you have not included the hardware configuration in the migration, you also have to convert the unspecified devices to the appropriate hardware.

### **Including the hardware configuration in the migration**

By default, only the software parts of the project are included in the migration. An unspecified device is generated in the migrated project for the devices contained in the initial project. The hardware and network configurations and the connection are not migrated. You can convert the unspecified devices into suitable devices after the migration and create any network configurations and connections manually.

If you are certain that the hardware used in the initial project has a corresponding equivalent in the TIA Portal, you can include the hardware configuration in the migration. In this case, both the hardware configuration and the software are migrated.

### **See also**

Display migration log (Page 131)

Scaling of STEP 7 and WinCC in the TIA Portal (Page 31)

## **4.1.2 Preparing projects with the migration tool**

### **4.1.2.1 Migrating projects with the migration tool**

#### **Preparation for migration**

In many cases, a project that you wish to migrate will not be located on the same programming device/PC on which the latest version of the TIA Portal is installed. Therefore, the initial project must first be converted to a compatible format for the migration. The same applies to integrated projects.

After creation of the migration file, you copy the migration file to the programming device/PC on which the current version of the TIA Portal is installed. In the TIA Portal, enter the migration file as source for the migration. You can now create a project in the current file format of the TIA Portal.

## **Procedure for migration with the migration tool**

The following steps are necessary to prepare a migration with the migration tool:

1. Install the migration tool on the programming device/PC where the source project is located. To do this, download the installation file from the Siemens Industry Online Support or install the migration tool from the setup DVD of the TIA Portal.
2. Start the migration tool, and use it to convert the source project to the migration file format with file extension ".am13".  
For this step, make sure that all software needed to process the source project is installed on the programming device/PC. This also includes all necessary service packs, hardware support packages and all expansion software that is needed to process the initial project. If individual products are not installed it may not be possible to perform the migration or the migration may be incomplete.
3. Copy the migration file to the target system on which a current version of the TIA Portal is installed.  
Note that the target system must have been installed with all software needed to configure the complete set of devices contained in the migration.
4. Perform the migration within the TIA Portal, and specify the migration file with the extension ".am13" as the source.
5. Once migration is complete, check the migration log and systematically work through the information provided there for the newly created project. Read the information in the Inspector window with special care after the first compilation of the configuration.

## **Including the hardware configuration in the migration**

By default, only the software parts of the project are included in the migration. An unspecified device is generated in the migrated project for the devices contained in the initial project. The hardware and network configurations and the connection are not migrated. You can convert the unspecified devices into suitable devices after the migration and create any network configurations and connections manually.

If you are certain that the hardware used in the initial project has a corresponding equivalent in the TIA Portal, you can include the hardware configuration in the migration. In this case, both the hardware configuration and the software are migrated.

## **See also**

Migration of projects with the TIA Portal (Page 125)

Migrating projects (Page 129)

Calling the migration tool (Page 128)

Creating a migration file (Page 128)

### 4.1.2.2 Calling the migration tool

#### Starting the migration tool

During the installation, a "Migration to TIA Portal V13" shortcut is created as standard in the Start menu under "Siemens Automation > Migration Tool". Click this shortcut.

Alternatively, you can call the migration tool directly in Windows Explorer. During the installation, the migration tool is saved by default in one of the following folders:

- On a 64-bit operating system:  
C:\Program Files (x86)\Siemens\Automation\MIGTOOL\_V13\Bin
- On a 32-bit operating system:  
C:\Program Files\Siemens\Automation\MIGTOOL\_V13\Bin

To start the migration tool, click the "Siemens.Automation.MigrationApplication.exe" file in one of the directories.

#### See also

Creating a migration file (Page 128)

### 4.1.2.3 Creating a migration file

The section below describes how you can use the migration tool to convert the initial project into a migration file that can be read by the TIA Portal. Following conversion, this file is transferred to the target system and migrated there.

You can specify whether the migration file should contain the entire project, including the complete hardware configuration and the associated software, or whether you want to migrate the software only.

#### Requirements

- The suitable, original software with a valid license is installed for all configurations used in the initial project.
- The initial project is not provided with access protection.
- The initial project must be consistent, otherwise problem-free migration cannot be assured.

## Procedure

To create the migration file, proceed as follows:

1. Choose the path of the source file for the migration in the "Storage Location (Path)" field.
2. Specify which project parts are to be migrated:
  - Select the "Include HW and Network data during the migration" check box to migrate not only the software but also the complete hardware parts and the network configuration of the project.
  - Select the "Copy SCADA runtime data" check box if you also want to migrate the runtime data, such as alarm archives, tag archives and user archives, in addition to the data of the engineering system.
3. Choose the path and the file name for the migration file in the "Intermediate file" field.
4. Click the "Migrate" button.

## Result:

A migration file is created. Finally, copy this file to the target system and migrate this file in the TIA Portal.

Migrating projects (Page 129)

Calling the migration tool (Page 128)

Migrating projects with the migration tool (Page 126)

### 4.1.3 Migrating projects

#### Requirements

- A converted file in the format ".am13" is already available or the original software with a valid license is installed for all configurations used in the initial project.
- The initial project is not provided with access protection.
- The initial project must be consistent, otherwise problem-free migration cannot be assured.

Read the additional information on the requirements in the help for the respective products installed.

---

#### Note

##### System hibernation during the migration

While a migration is running, the system should not be changed to the standby or hibernate mode. Otherwise the migration will be aborted.

---

## Procedure

To migrate a project, follow these steps:

1. Select the "Migrate project" command in the "Project" menu.  
The "Migrate project" dialog opens.
2. Specify the path and the file name for the project to be migrated in the "Source path" field.  
Choose either a project in the ".am12" migration format or in the format of the initial project.
3. To include the hardware configuration in the migration, select the "Include hardware configuration" check box.  
If you have selected a migration file that was created with the migration tool, the check box cannot be selected. In this case, you must specify if you wish to include the hardware configuration in the migration before the conversion with the migration tool .
4. Select the "Copy WinCC Runtime Professional data" check box, if you also want to migrate the runtime data, such as alarm archives, tag archives and user archives, in addition to the data of the engineering system.  
If you have selected a migration file that was created with the migration tool, the check box cannot be selected. In this case, you must specify if you wish to include the SCADA runtime data in the migration before the conversion with the migration tool .
5. Choose a name for the new project in the "Project name" box.
6. Choose a path in the "Target path" box where the new project will be created.
7. Enter your name or the name of another person responsible for the project in the "Author" field.
8. Enter a comment in the "Comment" box, if you require one.
9. Click "Migrate".

## Result

The initial project is converted and a message appears after conversion is complete. The newly created project is then opened in the project view and the migration log is opened in the TIA Portal.

Even if the migration failed, a project directory is created and a migration log in the form of an XML file is generated in this directory. The completion message that appears after the migration contains a link to this XML file. Click the link to open the XML file. Alternatively, you can find the XML file in the project directory under "\Logs".

Creating a migration file (Page 128)

#### **4.1.4 Displaying the history of the migration**

If a project was created by migration, the migration will be listed in the table of the project history. You can open the migration log in the table. The time of the migration is also shown.

##### **Procedure**

To display the migration in an overview table, follow these steps:

1. Select the open project in the project tree.
2. Select "Properties" in the shortcut menu of the project.  
The dialog with the properties of the project opens.
3. Select the "Project history" group in the area navigation.  
The overview table is displayed.

##### **See also**

Displaying properties of the project (Page 305)

#### **4.1.5 Display migration log**

A log is created for each successful migration. The log contains the following information:

- Migrated objects
- Modifications to objects made during migration
- Errors that occurred during migration
- In certain cases a link to more help with specific events.  
In this case, click the question mark to obtain more help.

##### **Procedure**

To display the log file of the migration, follow these steps:

1. Open the "Common data > Logs" folder in the project tree.
2. Double-click the desired log in the list.  
The contents of the log are displayed in the work area.

## **4.1.6 Migrating STEP 7 projects**

### **4.1.6.1 Migration of STEP 7 projects**

#### **Introduction**

You can migrate a project from SIMATIC STEP 7 V5.4 SP5, or from SIMATIC STEP 7 V5.5 to be able to continue to use it in the TIA Portal. If you want to migrate projects from older STEP 7 versions, you have to open, compile and save these projects first in STEP 7 V5.4 SP5 or V5.5. It is also possible to migrate integrated projects with devices from other software products.

#### **Scope of migration**

Generally, you can migrate all of the configurations and objects from SIMATIC STEP 7 V5.4 SP5 or V5.5 which also support the installed version of the TIA Portal. This includes, for example, the following devices and configurations:

- Devices of the S7-300 and S7-400 family.
- PROFIBUS configurations with connected distributed I/O. These include GSD-based slaves, I-slaves as well as direct data exchange.
- PROFINET configurations with distributed I/O. These include GSD-based devices and I-devices.
- Network configurations
- Connections
- Blocks created in the programming languages LAD, FBD or STL, S7-SCL, S7-GRAPH
- PLC tags
- User-defined data types (UDT)
- Alarms and alarm classes
- Interrupts
- User-defined attributes (UDA)
- User text libraries

#### **Including the hardware configuration in the migration**

By default, only the software parts of the project are included in the migration. An unspecified device is generated in the migrated project for the devices contained in the initial project. The hardware and network configurations and the connection are not migrated. You can convert the unspecified devices into suitable devices after the migration and create any network configurations and connections manually.

If you are certain that the hardware used in the initial project has a corresponding equivalent in the TIA Portal, you can include the hardware configuration in the migration. In this case, both the hardware configuration and the software are migrated.

Reporting system errors (Page 140)

General notes on migrating program blocks (Page 140)

### 4.1.6.2 Requirements for the migration of STEP 7 projects

Various requirements for the software installed on the original PG/PC and for the initial project apply to the migration.

#### Requirements for the original PG/PC

The following requirements apply to the PG/PC:

- A licensed version of STEP 7 V5.4 SP5 or V5.5 must be installed. For projects that only contain PC stations, it is sufficient if the SIMATIC NET PC software is installed.
- For all of the configurations used in the project, the corresponding additional software must be installed with a valid license, for example, optional packages.
- All HSPs for modules not included in the hardware catalog must be installed.
- All GSD files used in the project must comply with the specifications.
- You must be logged on to the operating system with administrative rights.
- One of the following software products must be installed:
  - The TIA Portal with STEP 7 Professional V13 or higher  
If you do not migrate with the most recent version of the TIA Portal to the original programming device/PC, the functional scope of the project in the more recent version of the TIA Portal is initially limited. You first have to upgrade the project before you can use the full functional scope of more recent versions.
  - The migration tool

#### Requirements for the initial project

- The initial project must not be configured with access protection.
- The hardware and software must be consistent.
- The alarm number assignment must be set to CPU-oriented.
- It must contain no protected blocks with time stamp conflict.
- It must be possible to compile all programs and their sources without errors.
- All called blocks must be available in the block folder.

*4.1 Migrating projects in a TIA portal project*

- The block folder must contain no blocks that are not called, in particular no instance data blocks.
- We recommend that you migrate blocks unencrypted, because blocks encrypted with KNOW\_HOW\_PROTECT (from STEP 7 V5.x) or S7-Block Privacy (from STEP 7 V5.5) cannot be read or modified in the TIA Portal.

### Requirements for the PG/PC with STEP 7 Professional

- One of the following software products must be installed:
  - STEP 7 Professional V13 or later
  - STEP 7 Professional V13 or later (without license) when the project to be migrated only contains components that have been configured with the SIMATIC NET PC software.
- For all of the configurations used in the project, the corresponding additional software must be installed with a valid license, for example, optional packages.
- All HSPs for modules that are not contained in the hardware catalog and all GSD files used in the project must be installed.

#### 4.1.6.3 Checking whether STEP 7 projects can be migrated

Before you launch migration, you can check if all necessary requirements for migration have been met.

---

#### Note

Note that the actual values are reset in the original project when the following steps are carried out. Also note that running the block consistency check in STEP 7 V5.x resets the initial values in the instance DBs to the default values. If you are using technology functions, this behavior is not desired.

---

### Procedure

To check whether a project can be migrated, follow these steps:

1. Open the original project in SIMATIC STEP 7 V5.4 SP5 or V5.5. For a correct update, it is necessary that only the optional packages and modules, including HSPs and GSD files, that are contained in the TIA Portal are installed.
2. Open the individual stations. If no messages indicating missing components are displayed when the stations are opened, all the components necessary for migration are available.
3. Perform a block consistency check for each block container contained in the project. For more information on the consistency check, refer to Chapter "Consistency check in initial project prior to the migration (Page 135)".
4. Compile the entire project. If no errors are displayed during the compilation, the programs can be migrated.
5. Check whether all modules with an identical MLFB and the same firmware version are contained in the TIA Portal hardware catalog.

6. Check whether the CPU-oriented message number assignment is activated for each CPU.
7. Compile the project in NetPro. Here too, no errors should be reported.

Consistency check in initial project prior to the migration (Page 135)

FAQ entry on consistency check (<http://support.automation.siemens.com/WW/view/en/5416540>)

### 4.1.6.4 Consistency check in initial project prior to the migration

#### Consistent initial project

A consistent initial project is a requirement for the successful migration of a SIMATIC STEP 7 V5.x project to the TIA Portal. It is therefore advisable to perform a consistency check on the initial project before migration. You can find a guide to the consistency check in SIMATIC STEP 7 V5.x in an FAQ entry (<http://support.automation.siemens.com/WW/view/en/5416540>) on the Service and Support page or in the SIMATIC STEP 7 V5.x help.

#### Migrate start values in instance DBs for technology blocks

The compilation in the block consistency check causes the tags in instance DBs to be reset to the default values. The set start values are lost in the process.

To migrate the start values anyway, we recommend one of the following procedures:

- For smaller projects: Backup the instance DBs outside the block folder.  
Backup the instance DBs before you start the consistency check. After the consistency check has been completed, copy the instance DBs back to the block folder.
- For larger projects: Create a copy of the project  
Make a copy of the project and then carry out the check on the copy of the project. Correct any errors found during the consistency check in the initial project.

You can then migrate the project with the configured values. In this way, the configuration of the technology functions is also retained.

### 4.1.6.5 Removing unsupported hardware components

If you have created configurations in the initial project for which not all of the right software is installed, then you can still migrate the project by manually deleting the unsupported configurations from the project. Alternatively, you can use the "Reorganize" function.

## **Procedure**

To clean the original project, follow these steps:

1. Use an Installation of SIMATIC STEP 7 V5.4 or V5.5 that contains only the optional packages contained in the TIA Portal and all required modules.
2. Save the project again and select the "With reorganization" option when saving. Any unsupported configurations will be removed from the project.

For modules that are only available in a new version or with a new firmware version in the TIA Portal, use the "Exchange object" function in the station to exchange an older module for one that can be migrated.

### **4.1.6.6 Special points to observe during migration**

#### **Device names**

##### **Device names of PROFINET IO devices**

In STEP 7 V5.5 the device name of a PROFINET IO device is used as the name of the IO devices. After the migration to a TIA Portal project, the device name of the PROFINET IO device from the initial project is used as follows:

- As the PROFINET device name
- As the name for the interface module
- As the name of the station

A maximum of 24 characters is permitted for the name of the station in the TIA Portal. The name of the station is therefore truncated to a maximum of 24 characters where required. If truncating of the station name would result in several stations with the same name, the last characters of the station name are used to number the stations consecutively.

#### **Names of modules and racks**

In SIMATIC STEP 7 V5.5, the names of modules and racks do not have to be unique. In the TIA Portal, however, unique names are required. Therefore, the names of the modules and racks are incremented during the migration to make sure that unique names are assigned. This does not apply to PROFINET IO devices and PROFINET CPs. You must provide unique names for these yourself.

#### **PROFINET IO configurations**

##### **Unique name assignment required**

The names of PROFINET IO devices must be unique within the subnet. The same applies to the names of PROFINET CPs. For this reason, ensure that the name assignment is unique before the migration into the initial project or provide unique names after migration and before the first compilation.

## **Media redundancy with sync domains**

If a sync domain with activated media redundancy is found in the initial project, the sync domain configuration is imported during migration. If, however, several sync domains with activated media redundancy are found in the initial project, they are removed and the project is migrated without the sync domains. In any case, you will receive a message which sync domains were imported.

In any case, use SIMATIC STEP 7 V5.5 to configure the media redundancy in the initial project.

## **Isochronous mode with PROFINET IO**

Observe the following for PROFINET IO configurations in isochronous mode:

- **IRT with high performance**  
If you have configured IRT with high performance when planning the topology in the initial project, the option is changed to "RT" during migration. You will receive a message informing you of the change.
- **Use of OB 61**  
If the isochronous mode for PROFINET IO with OB 61 is activated in the original configuration in the STEP 7 project, it will be deactivated by the migration. The devices will still be imported. PROFINET IRT configurations with the option "high flexibility" without the use of OB 61 can be migrated.

## **CBA for IO controllers**

If you have used the cyclical service CBA (Component Based Automation) in the initial project, it is deactivated during migration. You will receive a message informing you of the change.

## **Use of Shared Devices**

If Shared Devices are configured in the initial project, they are removed during migration. You will receive a message informing you of their removal.

## **Transfer areas**

If transfer areas for data exchange between the IO controller and I-device are configured in the initial project, they are removed during migration. You will receive a message informing you when a transfer area is removed during migration.

## **Update groups for PROFINET IO**

If necessary, also remove update groups from the STEP 7 project before you start the migration. If any update groups are still configured, then the migration can not be carried out.

## **I slaves and I-devices**

Only connected and consistent I slave and I-device configurations can be migrated. If the configuration is inconsistent, then the configurations in question will be excluded from the migration.

## PROFINET IO systems that are not connected

Devices with PROFINET IO systems that are not connected can be migrated. The IO devices and the PROFINET IO systems are located in the network view without connection after migration. Connect these IO devices after migration with an IO controller or delete any unnecessary IO devices.

## PROFIBUS configurations

### Isochronous PROFIBUS

It is possible to migrate isochronous PROFIBUS configurations. You should compile the project again after the migration, however, to rule out any possible inconsistencies. Also pay attention to slightly changed SDBs.

### Orphaned master systems

Devices with orphaned DP master systems can be migrated. The DP slaves of the abandoned DP master system are located in the network view without connection after migration. Connect these DP slaves after migration with a DP master or delete any unnecessary DP slaves.

## GSD and GSDML devices

For devices that were configured with PROFIBUS GSD or PROFINET GSD files, the corresponding GSD files must also be installed in the TIA Portal. If GSD files are not yet installed in the TIA Portal, they will be installed automatically during the migration. The GSD files must comply with the specifications (e.g., GSDML Specification for PROFINET IO, see [www.profinet.com](http://www.profinet.com) (<http://www.profinet.com>)), in order for the project to be migrated successfully. If GSD files of a device manufacturer do not comply with the specification, the project cannot be migrated. In the migration log, you receive alarms notifying you of non-compliant GSD files.

If the GSD files do not comply with specifications, check whether a newer version of the GSD file is available from the manufacturer. Install the current version. If a version of the GSD file that complies with the specification is not available, contact the device manufacturer.

## Connections

Connections from SIMATIC STEP 7 projects can usually be migrated if they are also supported by the installed version of the TIA Portal.

### Migratable types of connection

The following connection types can be migrated:

- S7 connection one-way
- S7 connection two-way
- Failsafe S7 connection

- TCP connection
- ISO-on-TCP connection
- ISO connection
- UDP connection
- E-mail connection
- FDL connection
- Point-to-point connection

FMS connections on the PROFIBUS are not accepted during the migration. Adapt the connections or modify the user program.

## **Multiprojects**

### **Multiprojects in SIMATIC STEP 7**

In SIMATIC STEP 7, you can organize projects into a multiproject if, for example, a project is very large or if several people are working on it. The subprojects may contain cross-project references, for example connections. All subprojects of a multiproject and the associated libraries are stored in the same directory.

### **Migration of parts of a multiproject**

You can migrate the subprojects of a multiproject. To do this, select one of the subprojects during the migration. All of the devices and configurations contained in the respective subproject will be imported during the migration.

Observe the following when migrating a subproject:

- Cross-project connections  
Cross-project connections between subprojects are created as unspecified connections.
- Cross-project networking  
Information on networking of devices across project boundaries will be lost during the migration. Links between devices in the same subproject will be retained however.

### **Grouping a multiproject for the migration.**

It is only possible to migrate an entire multiproject with all of its associated subprojects if you manually regroup the different subprojects prior to the migration. This is possible, for example, by copying the individual devices and pasting them back into a single project.

## **Messages**

PLC alarms are migrated with all parameters and including all alarm classes. Alarm types and alarm instances are also migrated and stored under the PLC alarms in the TIA Portal.

## Requirement

Requirement is that the CPU-wide assignment of alarm numbers is selected in the initial project. Before the migration, select the "Always assign CPU-oriented unique message numbers" option in the initial project, if necessary, and perform "Save As > With Reorganization".

## Restrictions

- Symbol-based alarms cannot be migrated.
- The keywords "\$\$AKZ\$\$", "\$\$BlockComment\$\$", and "\$\$Area\$\$" are transferred but no replacement takes place during runtime.

## Reporting system errors

In principle, you can migrate system error messages that you have configured using SIMATIC STEP 7.

## Restrictions

When migrating the "Report system errors" application, only the settings that were set by the user in the SIMATIC STEP 7 project will be migrated (e.g. basic settings, block numbers, block names).

The following elements are not migrated:

- SFM blocks
- SFM messages and the settings that were made to configure the message texts
- System text libraries

After migration, the settings can be manually adjusted once again. The missing elements will be recreated during the first compilation of the hardware configuration.

## Migrating program blocks

### General notes on migrating program blocks

You can generally migrate all blocks created in LAD, FBD, SCL, STL, and GRAPH. Please note the following:

### Programs with absolute addressing

In the TIA Portal, symbolic operands are automatically declared for all absolute addresses. If absolute addressing was used in the STEP 7 program to be migrated, symbolic operands are also declared for the absolute addresses during the migration. This automatic declaration can lead to data type conflicts, particularly if the IEC check is activated in the TIA Portal. A data type conflict could occur, for example, if a 32-bit data value is declared as a DWORD type tag but a REAL data type tag is expected later in the program.

In this case, it is not enough to deactivate the IEC check. Instead, you must correct the declaration in the PLC tag table.

### **Migration of communication blocks**

During the migration of communication instructions from STEP 7 V5.x, pointers of the data type ANY are replaced by PLC tags within the own S7 station.

- After the migration a warning is displayed at the affected parameters.
- Replace the PLC tags with a pointer at the affected parameters.  
For absolute addressing of a data block with data type ANY, the data block must have been created with standard access, since symbolic addressing with data type ANY is not possible.  
Example: To input values, use the appropriate parameters of instruction P#M10.0 BYTE 4 instead of %MD10.

### **Symbolic names for blocks and user-defined data types (UDT)**

In the TIA Portal, each block or UDT has a number and a name. It is therefore no longer necessary to declare symbolic names. If the migrated program contains symbol declarations for blocks or UDTs, they will be used as names after the migration.

### **Blocks from STEP 7 libraries**

In the TIA Portal, standard functions and function blocks are not provided in libraries. Instead, they are available as instructions in the "Instructions" task card. The instructions are sorted by function and can be found under their symbolic name.

If calls of standard functions or function blocks are contained in the migrated program, they are replaced during the migration by the instructions that correspond to the original standard function or the original standard function block.

If the library block is no longer supported in the TIA Portal, you have the following options:

- Replace the library block with a compatible instruction. In this case, you will receive an alarm informing you that you have to compile the program after migration. Note that the calling block may not carry any know-how protection, as the block call has to be adapted during compilation.
- If there is no compatible instruction, the block is migrated as user block. It is then available as know-how protected block in the folder "Program blocks" with the extension "\_LF" (legacy function).

### **User-defined block libraries**

User-defined block libraries are no longer available in the familiar form in the TIA Portal. However, you can migrate user-defined libraries by integrating these into a project prior to migration and then migrating the project. After this, you can copy these from this project in the TIA Portal and use them.

### Instructions in a modified display

The display of some of the LAD, FBD, STL, SCL and GRAPH commands in the TIA Portal differs from the display in earlier versions of STEP 7. Thus, for example, the mathematical functions and the comparators are no longer specific for data types. Instead, there is a central instruction, which can be used for all types of data. The "ADD\_I" command is no longer permitted, for example; the instruction "ADD" is used instead.

Some other commands also have a new display in the TIA Portal, e.g., edge commands, word logic operations, conversions, IEC timers, IEC counters, etc.

The commands will be converted for the new display during the migration.

### Stricter IEC check

Stricter rules for checking data type compatibility will be used in the TIA Portal. In addition, errors that can lead to runtime errors are already detected during the syntax check. It is no longer permitted to write your own input parameters or to read your own output parameters in functions (FC). Observe the following rules to avoid syntax errors:

- Only use tags with compatible data types when transferring the parameters.
- In comparison instructions or arithmetic instructions, only use tags with compatible data types.
- You may not write to input parameters or read from output parameters.

For more information on the block interface and on data type conversion with IEC check, refer to "See also".

### Peripheral access ID ":P"

In the TIA Portal, the access ID ":P" is used for direct addressing of the peripherals. The following notation is not permitted, for example:

```
%PIW3
```

The following notation is used instead:

```
%IW3:P //absolute display  
MyTag:P //symbolic display
```

The accesses are converted into the new notation during the migration. However, symbolic names, which were declared to be peripheral tags in the original program, cannot be accepted. New declarations will be created instead. For additional information on peripheral access, refer to "See also".

### No distinction is made between upper and lower case for jump marks

No distinction is made between upper and lower case for jump marks in the TIA Portal. If the source program contains jump labels that differ only through upper/lower case, these will be converted into unique jump labels. The log file provides information on the modified jump labels.

## **German special character "ß" is not distinguished from "ss"**

In tag names, the German special character "ß" is not distinguished from "ss" in the TIA Portal. If, for example, the source program contains tag names that differ only in these two characters, they will be converted into unique tag names.

## **Migration of global data blocks**

The display and handling of data values in data blocks is different in the TIA Portal than in SIMATIC STEP 7. In global data blocks which are not derived from a high-level object, for example a UDT, the tags are always assigned the default value of the data type as the default value, for example FALSE for the data type BOOL. This default value is not editable. If offline initial values were assigned in the declaration view, they are not imported during the migration. If you require user-specific default values in the program, use a global data block based on a PLC data type. You can assign user-specific default values for tag values in a PLC data type.

For additional information on data values, refer to "See also".

## **Migration of LAD/FBD/STL programs**

LAD, FBD and STL blocks can run after the migration without being recompiled or reloaded.

## **Know-how protection**

Blocks that were know-how protected before the migration remain know-how protected after the migration. Because the sources are not migrated, the know-how protection cannot be canceled. The blocks can thus not be opened or edited. It is possible, however, to load the blocks into the CPU and to run them.

The following options are available for disabling the a block's know-how protection:

- Prior to the migration, remove the KNOW\_HOW\_PROTECT attribute from the source and create a block without know-how protection from this. Then migrate this block.
- Import the source into the TIA Portal and create a block without know-how protection from this. Then use the "Edit > Know-how protection" menu command to provide the block with a password.

## **Switch-over from LAD/FBD to STL**

As determined by the system, programs that were created in LAD or FBD and contain jump operations to subsequent networks will be displayed in STL after the migration. In the block properties, however, the language is still set as LAD or FBD.

In the block properties, change the program again to STL. Then reset the language to LAD or FBD.

## Migrating GRAPH programs

### Requirement

The prerequisite for migrating GRAPH blocks is to have the "S7-GRAPH" optional package, version 5.3 SP6 or later, installed on the original device.

### GRAPH-specific block settings

The GRAPH-specific block settings have been significantly reduced in the TIA Portal. The following table gives an overview of how the original block settings will be transferred to the TIA Portal.

Setting in the initial project		Setting in the TIA Portal
FB parameter	Minimum	Existing parameters will be migrated
	Standard	
	Maximum	
	Definable	
Interface description	Minimized memory space	Generate DB with minimized memory space
	Structure fields	Individual structures are always created
	Individual structures	
Run capability	FC70/71	FC 73 if the option "Generate DB with minimized memory space" is active; otherwise FC 72
	FC72	
	FC73	
Criteria analysis in the DB		Setting not relevant in the TIA Portal
Skip steps		Skip steps
Acknowledgment of errors required		Acknowledge supervision errors
Synchronization		Always activated in the TIA Portal
Permanent processing of all interlocks in manual mode		Permanent processing of all interlocks in manual mode
Disable operating mode selection		Disable operating mode selection
Safeguarded switching behavior		Always activated in the TIA Portal
Warnings	None	Always activated in the TIA Portal
	Any	
Activate messages		Activate messages
Messages with WR_USMSG		Messages in the TIA Portal always with ALARM_SQ/ALARM_S

### Step name extension

Step name extensions are not supported in the TIA Portal. They are converted to step-specific text during the migration.

### Compiling the migrated block

GRAPH blocks must be recompiled and reloaded after the migration.

The following errors may occur when compiling:

- Data type conflicts may occur due to the stricter IEC check. In this case, change the declaration.
- Since the "structure fields" setting for the interface is no longer available in the TIA Portal, interface elements can no longer be addressed with G7S[1].X, for example. Access to the element must therefore be corrected, e.g. to STEP1.X.

### Changing the interface of the GRAPH block

The changed settings can lead to interface changes of the block. Therefore, it may be necessary to regenerate the instance DB or to update block calls.

### Migrating SCL programs

The prerequisite for migrating SCL blocks is to have the "S7-SCL" option package, version 5.3 SP5 or later, installed on the original device.

SCL blocks must be recompiled and reloaded after the migration.

### Basic procedure for the migration

A complete migration of SCL blocks is only carried out if the associated sources exist in the initial project.

The table below gives you an overview of the basic procedure.

Existing in the initial project	Existing after migration
SCL blocks with source	Editable SCL blocks
Know-how protected SCL blocks with source	Editable SCL blocks. After the migration, the blocks no longer have know-how protection but can be re-protected, if necessary.
SCL blocks without source	Know-how protected SCL blocks
Know-how protected SCL blocks without source	Know-how protected SCL blocks

### SCL-specific compiler options

Only the compiler options that are defined directly in an SCL source are adopted as block properties in the TIA Portal during migration. If no compiler options are defined in the original SCL source, the options in the properties of the migrated block are deactivated.

Compiler options defined as settings in the SCL Editor or in an SCL compile control file are not migrated.

The following table gives an overview of the compiler options that are transferred as block property to the TIA Portal.

Compiler option in the SCL source	Block property in the TIA Portal
scl_monitorarraylimits	Check ARRAY limits
scl_createdebuginfo	Create extended status information
scl_setokflag	Set ENO automatically

### New EN/ENO mechanism

SCL uses the EN/ENO mechanism of the TIA Portal. For this reason, all usages of the OK flag are replaced by ENO during the migration. The points where ENO was used in the original program are highlighted. You must check these points after the migration and adapt them to the new mechanism.

For additional information on the EN/ENO mechanism of the TIA Portal, refer to "See also".

### Operator "DIV"

The "DIV" operator is no longer available in the TIA Portal. All usages of "DIV" will be converted to the standard notation "/" during the migration.

### Nested ARRAYS

In the TIA Portal it is not possible to nest ARRAYS. The following declaration is not permitted, for example:

```
ARRAY[1..5] OF ARRAY[0..3] OF INT
```

Nested ARRAYS are converted into multi-dimensional ARRAYS during migration. The example would look as follows after the migration:

```
ARRAY[1..5, 0..3] OF INT
```

### Declaration of jump labels (LABEL)

The declaration of jump labels is not possible in the TIA Portal. The following declaration would not be accepted from the initial project, for example:

```
LABEL  
MARKE1, MARKE2, MARKE3 ;  
END_LABEL
```

Set jump labels, however, will be retained in the program code and can be used for GOTO operations.

### Declaration of symbolic constants in the block interface

In the TIA Portal, symbolic constants always have a data type. If symbolic constants are declared without data type in the source program, an appropriate data type will be assigned to them during the migration.

### Indexed peripheral accesses

In the TIA Portal, the syntax with rounded parentheses is used for indexed peripheral accesses. The following notation is not permitted, for example:

PEB [ 1 ]

The following notation is used instead:

EB ( 1 ) : P

The accesses are converted into the new notation during the migration. For additional information on peripheral access, refer to "See also".

### Indexed memory accesses

In the TIA Portal, the syntax with rounded parentheses is used for indexed memory accesses.

The following notation is not permitted, for example:

EB [ 2 ]

The following notation is used instead:

EB ( 2 )

The accesses are converted into the new notation during the migration. For additional information on addressing, refer to "See also".

### Indexed access to data blocks

In the TIA Portal, the syntax with rounded parentheses is used for indexed data block accesses.

The following notation is not permitted, for example:

%DB100 . DW [ 5 ]

The following notation is used instead:

%DB100 . DW ( 5 )

The accesses are converted into the new notation during the migration. For additional information on addressing, refer to "See also".

### Absolute access to data blocks

For an absolute access, the absolute designator of the data block must be used. Access using the symbolic designator is not permitted in the TIA Portal.

The following notation is not permitted, for example:

DB100 . DW3

The following notation is used instead:

%DB100 . DW3

During the migration, the marker "%" will be added for a detected absolute data block access. For additional information on addressing, refer to "See also".

### Logarithmic functions "EXPD" and "LOG"

Logarithmic functions "EXPD" and "LOG" are no longer available in the TIA Portal. All usages of "EXPD" are converted to the standard notation "10\*\*(<expression>)" during the migration. All usages of "LOG" are converted to the standard notation "LN(<expression>)" during the migration.

## Mathematical instruction "MAX"

The "MAX" instruction cannot process any time data types in the TIA Portal. However, you can use comparators instead.

The following example shows how you can find the "larger" of two time data types using comparators.

### SCL

```
#xs_tod := #xi_tod + #xi_time;
// statt #xstod1 := MAX(IN1:=#xtod1, IN2:=#xstod1);
IF #xs_tod < #xi_tod THEN
    #xs_tod := #xi_tod;
END_IF;

// statt #xsd1 := MAX(IN1:=#xd1, IN2:=#xsd1);
IF #xi_date < #xs_date THEN
    #xs_date := #xi_date;
END_IF;

#xs_date_time := #xi_date_time + #xi_time;
// statt #xs_date_time := MAX(IN1:=#xi_date_time, IN2:=#xs_date_time);
IF #xi_date_time < #xs_date_time THEN
    #xs_date_time := #xi_date_time;
END_IF;
```

## Floating point numbers - exponential display

The exponential notation of floating point numbers without a decimal point is no longer permitted in the TIA Portal. The following notation is not permitted, for example:

3E10

The following notation is used instead:

3.0E10

During the migration, all usages of "3E10" will be converted to the standard notation "3.0E10". For additional information on floating point numbers, refer to "See also".

## Blocks from STEP 7 libraries

The functions FC 1 to FC 40 from the STEP 7 classic library "IEC standard functions" are no longer available in the TIA Portal. Calls to the standard functions are converted to calls to the corresponding extended instructions during the migration. If there is no clear conversion possibility, a system error is issued.

In this case, change the SCL block after the migration and use SCL instructions or operators instead of IEC standard functions.

Examples:

Use S5TIME\_TO\_TIME instead of S5TI\_TIM (FC 33)

```
"TAG_TIME" := S5TIME_TO_TIME ("TAG_S5TIME");
```

Use the comparator operator <> instead of NE\_DT (FC 9):

```
IF #D1 <> #D2 THEN "MyOutput" := 10;
END_IF;
```

Use the comparator operator = instead of EQ\_STRING (FC 10):

```
IF #My_String1 = #MyString2 THEN "MyOutput" := 10;
END_IF;
```

### Interruption of strings with "\$"

In STEP 7 Classic, strings in SCL could be interrupted by special characters, e.g., control characters or non-printable characters. These characters were identified by the interruption sequences "\$>" and "\$<".

Example:

```
#myString := 'Test1$>          $<Test1';
```

This option no longer exists in the TIA Portal. String interruptions will be deleted during the migration.

### NULL pointer

Null pointers are no longer specified in the TIA Portal with "NIL" but instead with "NULL". The notation is replaced automatically during the migration.

### Comments

Comments from the migrated source are transferred when possible. The following rules apply:

- Comments in the output block directly after the block definition are converted as block comments.
- Comments that appear as line comments after a tag declaration are transferred to the "Comment" column in the block interface.
- All other comments are not transferred.

Example:

```
// Comment that is not transferred.
FUNCTION_BLOCK FB57
// Comment that is transferred to the block properties.
(*Comment that is transferred to the block properties. *)
VAR_TEMP
    myVar1 : INT; // Comment that is transferred to the interface.
    myVar2 : INT; (* Comment that is not transferred because it is a
comment segment. *)
END_VAR
// Comment that is not transferred.
BEGIN
    ;
END_FUNCTION_BLOCK
```

## **4.1.7 Migrating WinCC flexible projects (Advanced)**

### **4.1.7.1 Principles (WinCC flexible)**

#### **Migration (WinCC flexible)**

##### **Introduction**

You can continue to use projects in WinCC from WinCC flexible. The following versions of WinCC flexible are supported:

- WinCC flexible 2008 SP2
- WinCC flexible 2008 SP3

The following sections describe the HMI devices that are supported and the required basic conditions for a successful migration.

Projects from ProTool Pro and earlier WinCC flexible versions cannot be migrated directly to WinCC. If you want to continue using such projects in WinCC, you have to migrate these to a supported version of WinCC flexible first and change the HMI device type.

If the project to be migrated contains components of a supported option package, the option package must be installed for successful migration to WinCC. If the option package is not installed, migration is canceled. This concerns the following option packages:

- SINUMERIK

The following option packages are not supported by the migration:

- ProAgent
- Open Platform Program - OPP

Supported HMI devices (Page 156)

Migration of connections (WinCC flexible) (Page 165)

Migration of tags (WinCC flexible) (Page 168)

Migration of runtime data (WinCC flexible) (Page 177)

Migration of integrated projects (WinCC flexible) (Page 180)

## Migration principles (WinCC flexible)

### Introduction

In the migration the project data are converted from a WinCC flexible project into the new data format of WinCC. The data will not be evaluated to see if they are consistent in the project you want to migrate. If errors or warnings are output in a source project during compilation, these will not be resolved as part of the migration. This means you should be able to compile the project without errors prior to migration. Note the scope of a project during migration. The features of WinCC apply for migration. For additional information refer to the online help in chapter "Process visualization > Performance features > Engineering System".

### Unique object names

The objects are clearly identified by the folders in which they are contained in WinCC flexible. Screen objects in groups are clearly identified by the group name.

In WinCC, an object name must be unique within an HMI device. The name of screen objects must be unique within a screen.

The uniqueness of the name is verified during migration. If a name is not unique according to the new rule, the object in question will be renamed. A renamed object will receive the suffix "#Mign", where "n" stands for a sequential number.

---

#### Note

##### Changed OPC DA server name

If you have configured an OPC-DA server in the WinCC flexible project, the OPC-DA server is no longer available under the old name after migration.

In the migrated project, change the name of the OPC-DA server to the following value for the OPC clients concerned: "OPC.SimaticHMI.CoRtHmiRTm".

---

### Points to note when renaming tags

If you have structured tags in folders in WinCC flexible, the name of the tag will be formed during migration from the folder name and the tag name. The names of the folders and tags are separated by the character \. The name of the tag after migration is then, for example: Plant1\Line3\Tag17.

If the name would otherwise be longer than 128 characters after migration, the name is formed by the character string #mig, a consecutive number, the character # and the tag name from WinCC flexible, for example #mig2#Tag17.

If you dynamically compose tag names in scripts, you must check the tags whose names were changed during migration with "#mig".

## **Affected objects**

The following objects are renamed if necessary:

- Screens
- Faceplates
- Screen objects
- Graphics
- Recipes
- Structures
- Structural elements
- Alarm logs
- Tags
- Data logs
- Connections

## **Cancelling migration**

The migration is cancelled in the following cases:

- If the project to be migrated is opened in the engineering system or in Runtime.
- If not enough memory space is available on the hard disk to create a copy for migration of the project.
- If the migration cannot address the project database due to problems with the installed SQL-Server.
- If the migration cannot address the project database due to missing user authorization.
- If you select the "\*.hmi" file for the migration in an integrated project. You must select the "\*.s7" file for the migration in an integrated project.
- If the project was created with a version not supported by the migration.

## **Saving the project in the migration format**

You do not have to execute the migration of a WinCC flexible project completely on the PC on which the project is available. You can prepare the migration by saving the project in the migration format. The migration tool is available for saving a WinCC flexible project in the migration format. The migration tool exports the engineering data from the WinCC flexible project and saves the data in the migration format "\*.AM11".

For the actual migration, copy the data in the migration format to a PC on which the TIA-Portal is installed.

For more detailed information, please refer to the migration tool documentation.

## **Migrating projects from WinCC flexible**

### **Introduction**

When you migrate a project, data from a WinCC flexible project is loaded into a new project for WinCC. A new project is therefore created automatically for project migration. You cannot migrate to an existing project.

The migration can be started in both the Portal view and the Project view.

You should only migrate a project in a newly started TIA portal.

Information on the migration of an integrated project can be found in the section Migration of integrated projects (WinCC flexible) (Page 180).

If you only want to save the project in migration format, you can use the migration tool. See Migration principles (WinCC flexible) (Page 151) for additional information.

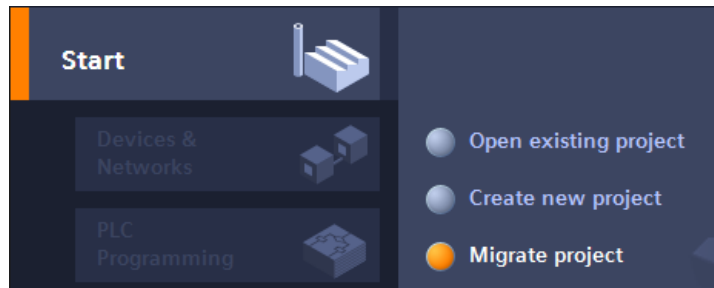

### **Requirement**

- A project from WinCC flexible is available.
- The project is not open in WinCC flexible.

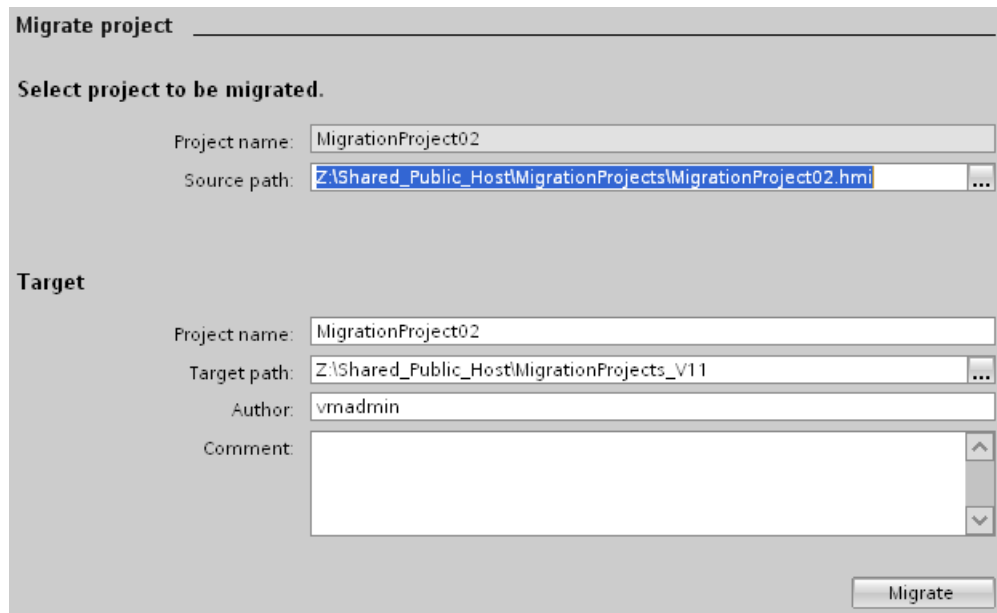

### Procedure

Migrate a project in the Portal view as follows:

1. Select the action "Start > Migrate Project".

2. In the "Source path" box, navigate to the project you want to migrate.

3. Select the WinCC flexible project file "\*.hmi".
4. Change the information for the project to be created, if necessary. For example, change the project name or project path. The data to be migrated is created in the new project.
5. Click "Migrate".
  - A new project is created and migration of the data is started:
    - The Project view opens.
    - The progress of the migration is shown in a migration window.
    - Warnings and errors about the migration process are displayed in the Inspector window under "Info > General".
    - All information about the migration is saved in a log file.
    - The project is saved and a message displayed upon completion of the migration. The message contains a link that you can use to open the log.

When migration is complete, you will find a newly created device for each migrated HMI device in the project tree. These devices contain the migrated data, such as screens, alarms and tags.

### **Opening the migration log at a later point in time**

The migration log is saved together with the migrated project. You can view the log at a later point in time. Open the log as follows:

1. Open the "Common data > Logs" folder in the project tree. It contains the logs of all previously performed migrations.
2. Double-click the required migration log.  
The log is opened.

### **See also**

Migration (WinCC flexible) (Page 150)

Migration of integrated projects (WinCC flexible) (Page 180)

Migration principles (WinCC flexible) (Page 151)

### **Compiling and loading a migrated project (WinCC flexible)**

#### **Compiling a migrated project**

Once you have successfully migrated a WinCC flexible project, you need to recompile it before loading it to the HMI device. The project will only compile successfully if it was capable of error-free compiling prior to migration.

If errors occur during compilation of the migrated project, they have to be eliminated.

Once compiling is successfully completed, load the project to the HMI device.

#### **Settings for download to the HMI device**

The settings for loading the HMI device are not included in the migration. Once you have migrated the project, you must configure the settings for loading.

Select the HMI device in the project tree and select "Loading in device > Software (complete loading)" from the shortcut menu. The dialog "Advanced Loading" is opened. Configure the required settings for the interface. Click the "Load" button. The project is recompiled and the dialog "Load preview" is opened.

Expand the "Overwrite" entry and verify the settings for the following options:

- Would you like to overwrite the existing user administration data from this device
- Would you like to overwrite the existing recipe data on HMI system

Configure the options as you want to use them in the project in the future. Subsequently, load the project to the HMI device.

### 4.1.7.2 Migrating engineering data (WinCC flexible)

## HMI devices (WinCC flexible)

### Supported HMI devices

#### Introduction

When migrating projects from WinCC flexible you must bear in mind that WinCC does not support all HMI devices. You have to distinguish between the following cases:

- HMI device is supported by WinCC.  
The project is migrated 1:1 and gets the same HMI device after migration as before migration.
- The HMI device is replaced by a compatible successor model.  
The project is migrated. The migration replaces the HMI device with a compatible successor model. See HMI device change as a result of migration (WinCC flexible) (Page 158) for additional information.
- HMI device is not supported.  
If your WinCC flexible project contains an HMI device that is not supported by WinCC, the migration process is cancelled. To migrate the project, you must change the HMI device in WinCC flexible to a HMI device type supported by WinCC.

The following HMI device types are supported both by WinCC flexible and WinCC:

#### Basic Panels

- KTP400 Basic mono PN
- KTP400 Basic mono PN Portrait
- KTP600 Basic DP
- KTP600 Basic DP Portrait
- KTP600 Basic PN
- KTP600 Basic PN Portrait
- KTP600 Basic mono PN
- KTP600 Basic mono PN Portrait
- KTP1000 Basic DP
- KTP1000 Basic PN
- TP1500 Basic PN

## **Mobile Panels**

- Mobile Panel 177 6" DP
- Mobile Panel 177 6" PN
- Mobile Panel 277 8"
- Mobile Panel 277 8" IWLAN V2
- Mobile Panel 277F 8" IWLAN V2
- Mobile Panel 277F 8" IWLAN (RFID Tag)
- Mobile Panel 277 10"

## **Panels**

- OP 73
- OP 77A
- OP 77B
- OP 177B 6" mono
- OP 177B 6" color PN/DP
- TP 177B 4" color PN/DP
- TP 177A
- TP 177A Portrait
- TP 177B 6" mono DP
- TP 177B 6" color PN/DP
- OP 277 6"
- TP 277 6"

## **Multi Panels**

- MP 177 6" Touch
- MP 277 8" Key
- MP 277 8" Touch
- MP 277 10" Key
- MP 277 10" Touch
- MP 377 12" Key
- MP 377 12" Touch
- MP 377 15" Touch
- MP 377 15" Touch daylight readable
- MP 377 19" Touch

## **Sinumerik PC**

- OP 010 Key
- OP 012 Key
- OP 015 Key
- OP 015A Key
- TP 015A Touch+Key

## **HMI applications**

- WinCC flexible Runtime

WinCC only supports the functions provided by these HMI device types.

Other functions which are not migrated because of the restricted device selection are documented in the following sections.

## **Adaptations before migration**

If the HMI device was changed to an HMI device with a different screen size in the project to be migrated, you must recompile and save the project in WinCC flexible before the migration. The compilation process will adjust the size of the screens and screen elements.

## **See also**

Migration (WinCC flexible) (Page 150)

HMI device change as a result of migration (WinCC flexible) (Page 158)

Configuration change after HMI device change (WinCC flexible) (Page 161)

Migration of connections (WinCC flexible) (Page 165)

## **HMI device change as a result of migration (WinCC flexible)**

### **Introduction**

WinCC flexible supports some HMI devices which are discontinued in the future. These HMI devices are no longer supported by WinCC. When migrating a WinCC flexible project, an HMI device that is not supported is replaced by a compatible successor device.

Only the HMI device type is changed during the migration. HMI device-specific data are not changed by the migration.

Inconsistencies in the project may occur due to a change in the HMI device. In a project which was compilable before the migration, errors may occur in the project compilation after changing the HMI device. E.g. because the changed HMI device supports different memory media to the previous HMI device.

## HMI device change by the migration

The following table provides information about which successors replace the HMI devices that are not supported.

Unsupported HMI devices	Successors
C7-635 6" Key	MP 177 6" Touch
C7-635 6" Touch	MP 177 6" Touch
C7-636 6" Key	MP 177 6" Touch

**HMI device change by the user**

If a project contains an HMI device that is not supported by WinCC and no compatible successor model exists, the migration is cancelled. If you want to migrate the project, you must change the HMI device to WinCC yourself before the migration. Use an HMI device which is supported both by WinCC flexible and WinCC for this.

**See also**

Supported HMI devices (Page 156)

## Configuration change after HMI device change (WinCC flexible)

---

### Note

If you migrate a project with embedded screens, this can result in the project file becoming larger than the old project file.

---

## HMI device replacement by the migration

If the migration makes an HMI device replacement, it replaces the existing HMI device with a compatible successor model. The successor models are further developed and therefore more efficient than their predecessors. The new models therefore support all the properties of their predecessors. Therefore only a little rework is to be expected on the project due to the HMI device replacement.

## HMI device replacement by the user

if you change an HMI device yourself before the migration, you must ensure that the HMI device used supports all properties which are used in the project. Compile the project after the HMI device replacement in WinCC flexible. The project must be perfectly compilable before the migration. Then migrate the project to WinCC.

## See also

Supported HMI devices (Page 156)

## Object support during migration

### Introduction

When migrating projects from WinCC flexible, all configuration data involving an HMI device supported by WinCC will be migrated. Basically, all object types and functions that are available and can be mapped to the new project environment will be fully migrated.

Some global object types are not migrated, for example, dictionaries and global libraries.

## Supported object types

The following object types are supported for migration:

- Animations  
Disabled animations are not migrated.
- Audit settings
- Audit reports
- Scheduler
- User administration

*4.1 Migrating projects in a TIA portal project*

- Area pointers
- Faceplates
- Screens
- Screen template
- Data types
- Function lists
- Graphics lists
- Display and operating elements  
All display and operating elements that are available on the supported HMI devices are supported for migration.
- Alarms
- Alarm classes
- Alarm groups
- Project library
- Project languages
- Reports
- Recipes
- Runtime languages
- Runtime scripting
- Sm@rtAccess/Sm@rtService
- Structures
- System events
- System functions
- Texts
- Text lists
- Tags
- Connections
- Effective ranges
- Zones
- Cycles

**Unsupported object types**

The following object types are not supported by migration:

- Global libraries
- Dictionaries

- Project versions
- Change log

### Mapping of the screen navigation

WinCC does not support the screen navigation from WinCC flexible. The data of the screen hierarchy from WinCC flexible are not migrated. To map the functionality of a screen navigation from WinCC flexible, the navigation buttons are migrated to the button available in WinCC. The system functions migrated to the "ActivateScreen" system function are migrated to the "Click" event of the respective button. The following system functions used in WinCC flexible are not available for the screen navigation in WinCC:

- ActivateRootScreen
- ActivateLeftScreen
- ActivateRightScreen
- ActivateParentScreen
- ActivateFirstChildScreen

These system functions are migrated to the "ActivateScreen" system function. The "Screen name" parameter is taken from the data of the screen hierarchy. If one of the named system functions is called from a screen which is not contained in the screen hierarchy, the "ActivateScreen" function is created without parameters. You must configure the desired screen to this system function after the migration.

### Tab sequence in pictures with faceplates

In pictures with faceplates, the tab sequence is changed in both the screen and the faceplate as a result of the migration.

### Migration of the screen template

WinCC offers an extended concept for working with screen templates. WinCC offers a global screen and several templates for each device. During migration of a template from WinCC flexible, the objects contained there and the properties configured in the template are migrated to the extended concept of the screen templates of WinCC.

The following objects are migrated to the "global screen" of WinCC:

- Alarm window
- Alarm indicator
- Help indicator
- Function keys of HMI devices with function keys

All other objects and properties are migrated to a template of WinCC.

The connection of the objects and properties to the respective template is automatically adapted.

**See also**

Changes of values of object properties by the migration (WinCC flexible) (Page 164)

**Changes of values of object properties by the migration (WinCC flexible)**

**Introduction**

The standardization of object properties from WinCC V7 and WinCC flexible requires changes to the object properties during the migration process. The migration calculates the changes in such a way that the representation of the objects after migration is the same as prior to migration. Changes made during migration result in different units of measurements and values in the configuration for some object properties.

**Migrating the font settings of an object**

In WinCC V7 and WinCC flexible, the unit of measurement "point" is used to denote the size of the fonts used for an object. In WinCC, the unit of measurement "pixel" is used to denote the size of the fonts used for an object. During migration, the font size is converted accordingly to ensure that the representation of the font is the same size at zoom level 100%. The different units of measurement result in changes to the numerical values for the font sizes after migration.

**Example:**

Font style before migration	Font style after migration
Arial 10 points	Arial 13 pixels
Arial 16 points	Arial 21 pixels
Tahoma 10 points	Tahoma 13 pixels
Tahoma 16 points	Tahoma 21 pixels

**Migration of object margins**

In WinCC flexible, some objects permit the entry of values <0 and >127 for setup of the object margins for the configuration of the representation. In WinCC, the range of values for object margins is limited to values between 0 and 127. The migration changes values <0 to the value "0" and values >127 to the value "127".

Object support during migration (Page 161)

## **Connections (WinCC flexible)**

### **Migration of connections (WinCC flexible)**

#### **Introduction**

If you migrate a project in which a supported communication driver is used, this driver is used further in WinCC. Objects which communicate via this driver are migrated 1:1. No rework is necessary.

Not all communication drivers which are available in WinCC flexible are supported in WinCC. If an unsupported driver is used in the project to be migrated, there are two possible scenarios:

1. A compatible spare driver is available for the used driver.
2. No compatible spare driver is available for the used driver.

#### **Compatible spare driver is available**

If a driver is available in WinCC which addresses the used PLC or a compatible PLC, the driver is automatically replaced during the migration.

You get an appropriate warning if the used driver is replaced.

In this case, check whether all the external tags and area pointers are valid after the migration by means of the migration report.

If the used driver is replaced, all the connection parameters are reset to the standard values. The CPU type is adapted to the appropriate PLC. The properties of the connected tags and area pointers are not changed.

#### **Compatible spare driver is not available**

If no driver is available in WinCC which addresses the used PLC or a compatible PLC, the configured connection is not migrated. All external tags which were connected to the PLC by this driver are converted into internal tags. External tag properties are lost in the conversion, e.g. the address in the PLC. All changes to the tags are recorded in the migration report.

You must reconnect the tags with the PLC after the migration and configuring of a connection.

You get an appropriate warning if the driver is not migrated.

#### **Converting the communication driver**

The following tables show the mapping of communication drivers from WinCC flexible to WinCC.

**Supported communication drivers**

<b>WinCC flexible</b>	<b>WinCC</b>
Allen Bradley DF1	Allen Bradley DF1
Mitsubishi FX	Mitsubishi FX
Modicon MODBUS	Modicon MODBUS RTU
Modicon MODBUS TCP/IP	Modicon MODBUS TCP/IP
Omron Hostlink/Multilink	Omron HostLink
OPC	OPC
SIMATIC HMI HTTP Protocol	SIMATIC HMI HTTP Protocol
SIMATIC S7 200	SIMATIC S7 200
SIMATIC S7 300/400	SIMATIC S7 300/400

**Compatible communication drivers**

<b>WinCC flexible</b>	<b>WinCC</b>
Allen Bradley DH485	Allen Bradley DF1
Allen Bradley E/IP C.Logix	Allen Bradley EtherNet/IP
Mitsubishi Protocol 4	Mitsubishi MC TCP/IP

**Not supported communication drivers**

<b>WinCC flexible</b>	<b>WinCC</b>
GE Fanuc SNP	Not supported
ISAC	Not supported
LG GLOFA-GM	Not supported
SIMATIC 500/505 DP	Not supported
SIMATIC 500/505 serial	Not supported
SIMATIC S5 AS511	Not supported
SIMATIC S5 DP	Not supported
Telemecanique Uni-Telway	Not supported

- Migration (WinCC flexible) (Page 150)
- Supported HMI devices (Page 156)
- Adapting configuration for non-migrated connection (WinCC flexible) (Page 167)
- Migration of area pointers (WinCC flexible) (Page 168)
- Migration of tags (WinCC flexible) (Page 168)

## **Adapting configuration for non-migrated connection (WinCC flexible)**

### **Introduction**

If a connection cannot be migrated you have the following options:

- Change the configuration in WinCC flexible before the migration
- Change the configuration after the migration

### **Change a connection before the migration**

If the communication driver selected for the connection is not supported by the migration, you must select a driver which is supported by the migration. The HMI device must also support the selected communication driver.

If no suitable driver is available for the used HMI device, you must use a suitable HMI device. Then adapt the configuration in WinCC flexible and recompile the project. Migrate the project after successful adaptation and compiling. The connection is then also migrated.

### **Changing a connection before the migration**

If you migrate a WinCC flexible project in which the connection is not migrated, all external tags of this connection are mapped to internal tags. You receive an appropriate entry in the migration protocol for every tag concerned.

You must configure a new connection after the migration. For this connection you select a communication driver which supports the used HMI device. If no suitable driver is available for the used HMI device, you must use a suitable HMI device.

If you have configured the new connection, you must reconnect all tags which were mapped to internal tags before the migration. Open the migration report to make reconfiguration easier. Reconfigure the tags according to the log entry.

If the project contained area pointers, you must also reconfigure these. You will also find corresponding entries for the area pointers in the migration log.

See the section Migrating projects from WinCC flexible (Page 153) for further information about the migration log.

### **See also**

Migrating projects from WinCC flexible (Page 153)

Migration of connections (WinCC flexible) (Page 165)

## **Migration of area pointers (WinCC flexible)**

### **Introduction**

The migration of area pointers depends on the used communication driver.

- If the used communication driver is supported by the migration, area pointers from WinCC flexible are taken over unchanged in the migration.
- if the used communication driver is not supported by the migration, area pointers are not migrated.

### **Migration of the area pointers**

If the connection used by the area pointers is fully migrated, the area pointers are also fully migrated. The parameters of the area pointers are taken over unchanged.

If you replace the communication driver of the connection before the migration, check whether all the parameters of the area pointers are still valid after the migration.

If the connection used by the area pointer is not migrated, the area pointers are not migrated either. See *Adapting configuration for non-migrated connection (WinCC flexible) (Page 167)* for additional information.

### **See also**

*Adapting configuration for non-migrated connection (WinCC flexible) (Page 167)*

*Migration of connections (WinCC flexible) (Page 165)*

## **Migration of tags (WinCC flexible)**

### **Introduction**

You need to make some special considerations when migrating tags. The following aspects should be distinguished:

- Migrating data types of tags
- Migrating internal tags
- Migrating external tags
- Tag names
- Tag limits

### **Migrating data types**

WinCC features some other data types and uses different data type names than WinCC flexible. When migrating a relevant tag, the data type from WinCC flexible is mapped to the corresponding data type in WinCC. See *Migration of data types (WinCC flexible) (Page 184)* for additional information.

### **Migrating internal tags**

Internal tags are always migrated completely. Only the data type names and tag names may change due to migration.

### **Migrating external tags**

If the connection used by the external tags is migrated, the external tags are also fully migrated. The migration of external tags depends on whether the used communication driver is supported by the migration. See *Migration of connections (WinCC flexible) (Page 165)* for additional information.

If the connection used by the external tags is not migrated, the external tags are not migrated either. The external tags are then mapped to internal tags. You must configure a new connection and reconnect the tags with the tags of the PLC after the migration.

### **Migrating names of tags**

In WinCC flexible, tags located in different folders can have the same name. In WinCC, the tag name must be unique on the configured HMI device. This means that tags with the same name from different folders will be renamed during migration. See *Migration principles (WinCC flexible) (Page 151)* for additional information.

### **See also**

*Migration (WinCC flexible) (Page 150)*

*Migration of alarm classes and alarm groups (WinCC flexible) (Page 170)*

*Migrating scripts (Page 173)*

*Migration of language-specific content (WinCC flexible) (Page 174)*

*Migration of libraries (WinCC flexible) (Page 176)*

### **Migration of structures**

In WinCC V12, the "StringChar" data type is not supported in HMI user data types.

If you have used this data type in a structure in a WinCC flexible project, an invalid element is created by the migration in the HMI user data type.

After migration, you must re-work this user data type in WinCC and enable the user data type.

At the same time, check the offset of the following elements and any existing interconnections between a faceplate and the elements of the user data type. Adapt the elements if required.

## Migration of logs

### Storage location of logs

WinCC flexible allowed you to store logs in a database which was automatically set up upon WinCC flexible installation ("System-defined data source" setting). This option is not available in WinCC.

If you have used this setting in your WinCC flexible project, it will be changed to "User-defined name of data source" during migration. Before you can store logs in a database, you must configure an ODBC data source in the Windows control panel and configure the name of the user data source specified there as the "name of the data source" in the log in WinCC.

## Migration of alarm classes and alarm groups (WinCC flexible)

### Changing the names of alarm classes

In contrast to WinCC flexible, the names of the predefined alarm classes are not dependent on the user interface language currently in use. During migration, the names of the alarm classes are assigned as follows:

WinCC flexible	WinCC
Error	Alarms
System	System
Warnings	Events

The names of the alarm classes can be changed as necessary after migration.

### Migrating alarm groups

Migration will migrate only those alarm groups actually in use.

Alarm groups with an ID from 1-31 will be migrated 1:1.

A corresponding alarm group is created in WinCC for each alarm class in the system. These alarm groups created by the system are assigned IDs beginning with the number 32 and consecutively incremented. The 4 pre-defined message classes in every WinCC project are automatically given IDs 32-35 by their alarm groups. Additionally created alarm group and an additional ID is assigned to each user-defined alarm class. Therefore, the IDs for alarms groups with IDs > 31 may be changed after migration. This step also changes the assignment of the alarm group names to the IDs.

Example:

In the example, you can see the assignment of the IDs in WinCC for the migration.

Alarm groups	ID in WinCC flexible	ID in WinCC	
Alarm group 1-16	1-16	1-16	Default for alarm groups from system alarms
Alarm group 17-31	17-31	17-31	Custom alarm groups

Alarm groups	ID in WinCC flexible	ID in WinCC	
		32-35	Default in WinCC for alarm groups of predefined alarm classes.
Alarm group 32	32	36	Changed assignment of ID to alarm group in WinCC
Alarm group 33	33	37	Changed assignment of ID to alarm group in WinCC

Also note:

When migrating alarm groups that supposedly have the same group name, the migration adapts the name. This occurs, for example, when a group name contains a space at the end of the name. The migration deletes all existing spaces at the end of names. If two groups obtained the same group names due to this deletion, the migration adds the suffix "# Mign" to the group name of the following alarm groups, where "n" stands for a sequential number.

Example:

The following alarm groups exist in WinCC flexible:

"AlarmGroup\_18"

"AlarmGroup\_18 " - group name contains one space

"AlarmGroup\_18 " - group name contains two spaces

"AlarmGroup\_18" is the alarm group with the highest number.

Result after migration:

"AlarmGroup\_18"

"AlarmGroup\_18#Mig1"

"AlarmGroup\_18#Mig1.1"

## Changing the names of alarm classes

In contrast to WinCC flexible, the names of the predefined alarm classes are not dependent on the user interface language currently in use. During migration, the names of the alarm classes are assigned as follows:

WinCC flexible	WinCC
Error	Errors
System	System
Warnings	Warnings

The names of the alarm classes can be changed as necessary after migration.

## Display of ALARM\_S messages and SIMATIC SFM messages

In WinCC flexible you can activate the display classes for ALARM\_S messages in integrated projects. In WinCC flexible, you activate the display of SIMATIC SFM messages via a separate setting. The separate setting for activating the display of SIMATIC SFM messages is not required in WinCC. You control the display of SIMATIC SFM messages, and also the display of ALARM\_S messages in WinCC only by activating the corresponding display class.

4.1 Migrating projects in a TIA portal project

The changed concept may cause the display of messages to change following migration.

If all the display classes for ALARM\_S messages are activated and the display of SIMATIC SFM messages is deactivated in the WinCC flexible project , ALARM\_S messages and SIMATIC SFM messages are displayed following migration.

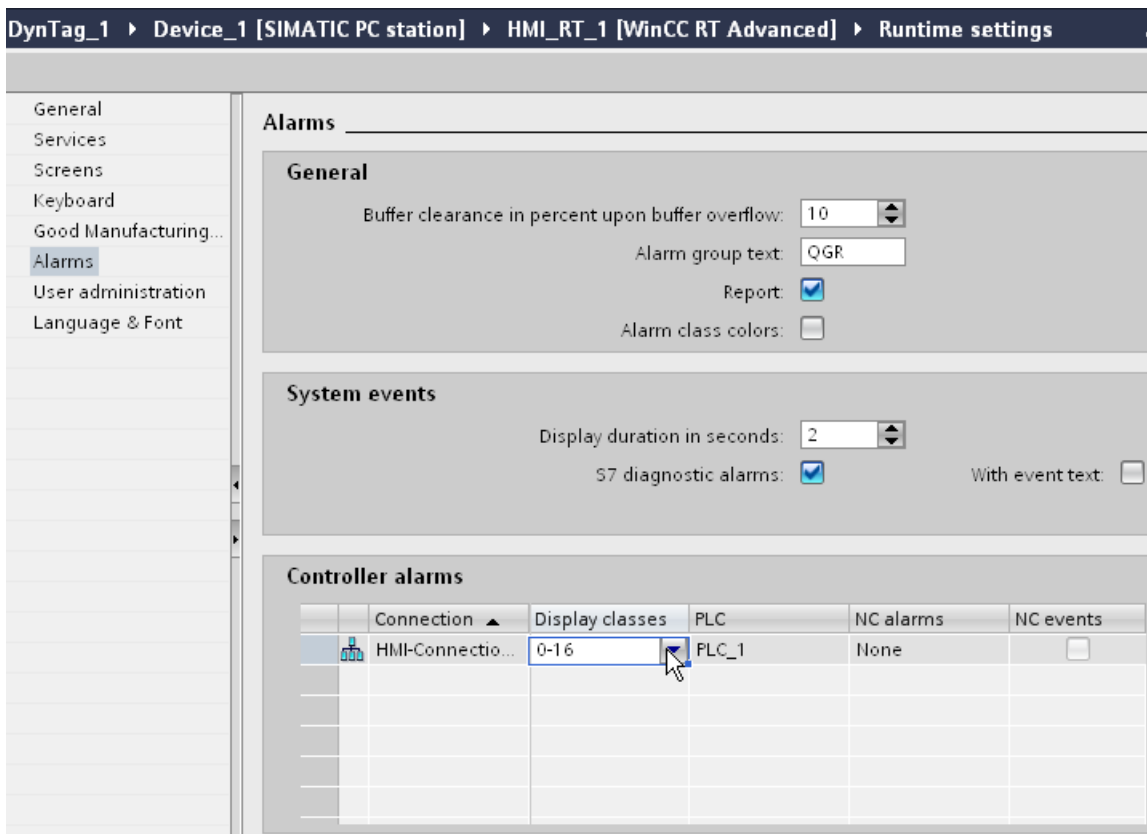

To ensure that only ALARM\_S messages are displayed following migration, you have to assign the SIMATIC SFM messages to an unused display class after migration to STEP 7. You then have to deactivate this display class in WinCC.

If all the display classes for ALARM\_S messages are deactivated and the display of SIMATIC SFM messages is activated in the WinCC flexible project , ALARM\_S messages and SIMATIC SFM messages are not displayed following migration.

To ensure that only SIMATIC SFM messages are displayed following migration, you have to assign the SIMATIC SFM messages to an unused display class after migration to STEP 7. You then have to activate this display class in WinCC.

The display class is dependent on the settings in STEP 7. The default setting for SIMATIC SFM messages in Step 7 is the display class "0". To activate the display in WinCC, the display class "0" must be activated.

You activate the display class in WinCC in the Runtime settings of the respective HMI device in the "Messages" category.

Migration of tags (WinCC flexible) (Page 168)

**Migrating scripts**

**Introduction**

The migration supports VB-scripts which were created in WinCC flexible. For a VB-script to be migrated successfully it must be functional in WinCC flexible first.

---

**Note**

**Script errors**

The most efficient way to locate scripting errors in the course of the initial test run after migration is to use an installed Script Debugger and the diagnostics controls.

---

**Migration of a VB script**

A script is analyzed in the migration and adapted to the system behavior of WinCC if necessary. The following is adapted:

- System functions which have changed their names are renamed.  
This concerns the following system functions:

Function name in WinCC flexible	Function name in WinCC
IncreaseValue	IncreaseTag
DecreaseValue	DecreaseTag
SetBrightness	SetAndGetBrightness
SetValue	SetTag

- The access to tags as parameters of system functions is adapted to the system behavior of WinCC. In WinCC scripts are no longer transformed as in WinCC flexible. The scripts are executed directly as a source code. Therefore the stricter rules for the VBS syntax apply. A tag call is always migrated with inverted commas. If several parameter types are allowed for a system function, these are migrated with the keyword "SmartTags".

Example 1:

The value of the "temperature" tag should be incremented by the value "1".

Valid expressions in WinCC flexible:

IncreaseValue temperature, 1

IncreaseValue "temperature", 1

IncreaseValue SmartTags("temperature"), 1

Valid expression in WinCC:

IncreaseTag "temperature", 1

Example 2:

You use a system function on which several parameters are allowed. The value of the "temperature" tag should be incremented by the value of the "heatcontrol" tag.

Valid expression for WinCC flexible:

IncreaseValue "temperature", "heatcontrol"

Valid expression for WinCC:

IncreaseTag "temperature", SmartTags("heatcontrol")

- Objects renamed by the migration are also renamed in the script when using in a script. See the section Migration principles (WinCC flexible) for further information about the renaming objects. You only have to observe the following rules when renaming objects: If you address objects whose names are dynamically generated by the script with the help of a script, the object names in the script can not be automatically changed by the migration. In such a case, you have to correct the generation of the object names in the script after migration.

## See also

Migration of tags (WinCC flexible) (Page 168)

## Migration of language-specific content (WinCC flexible)

### Introduction

WinCC offers the same options for configuring projects in different languages as those available in WinCC flexible. All languages supported by WinCC are included in the migration of a project.

### Migrating language-dependent content

The following language-dependent content is migrated:

- Project languages
- Project texts

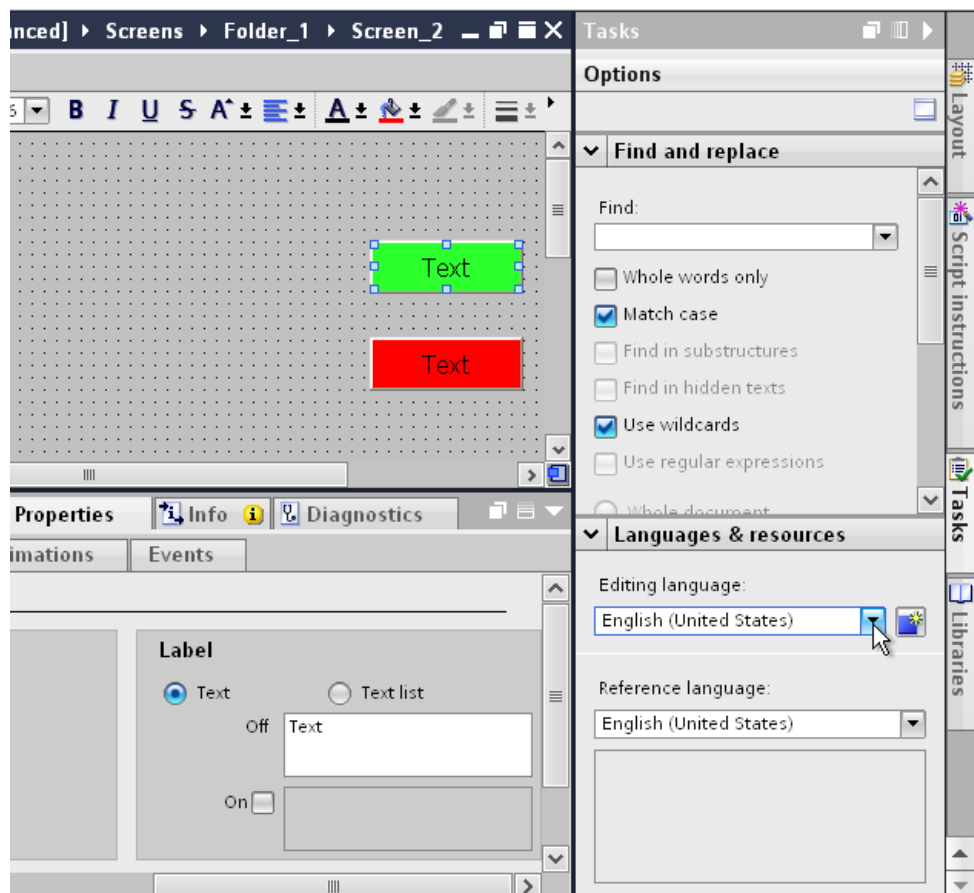

- Fonts for display in runtime
- Language-dependent graphics

You need to consider the following when migrating language-dependent content:

- The operating system on the PC performing the migration must support the project languages used in the project.
- The fonts used for runtime display must be installed on the PC performing the migration.
- Dictionaries are not supported by the migration.

### Editing language of integrated projects following migration

During migration of an integrated project, the project components to be migrated from STEP 7 and WinCC flexible also bring their respective settings for the editing language. In WinCC there is only one editing language for all project components. Migration activates for the migrated project the editing language which was set in STEP 7 prior to migration. If this setting is not the same as the setting from WinCC flexible, the configured texts are no longer visible in WinCC. No text is displayed at the usage locations, or only the entry "Text" can be seen. To make the texts visible, you must change the editing language. Click the "Tasks" taskcard at the right-hand edge of the TIA portal and select the correct editing language in the "Language & Resources" area.

## **Unsupported languages**

The migration of language-dependent content depends on whether or not WinCC supports the respective language.

If a project only contains project languages not supported by WinCC, the project will not be migrated.

If a project contains supported and unsupported project languages, only the supported languages will be migrated. The editing language and reference language are set to a supported language.

The following languages are not supported by WinCC:

- Arabic
- Hebrew
- Dhivehi
- Gujarati
- Kannada
- Tamil
- Telugu
- Urdu
- Punjabi
- Persian
- Syrian

## **See also**

Migration of tags (WinCC flexible) (Page 168)

## **Migration of libraries (WinCC flexible)**

### **Introduction**

You need to consider two different cases when migrating from libraries:

1. Migrating a project library
2. Migrating a global library

### **Migrating a project library**

A project library is stored together with the project data in the project file. For this reason, a project library is migrated with the same restrictions as the project data.

## Migrating a global library

Global libraries are not supported by the migration. The library objects used in the project will be migrated, however. The library objects are copied when used in the project and then no longer have a connection to the library.

To migrate a global library, you must copy or move the objects contained in the library to the project library. The objects are then included in the migration. In WinCC, you move the migrated objects to a new global library that is created. You can copy or move both individual objects or entire library categories.

## See also

Migration of tags (WinCC flexible) (Page 168)

### 4.1.7.3 Migrating runtime data (WinCC flexible)

## Migration of runtime data (WinCC flexible)

### Introduction

Only the configuration data are migrated by the migration when migrating a project. The runtime data are not affected. You need to update the runtime data following migration.

The runtime data consists of the following:

- Runtime project  
The runtime project contains the compiled project data.
- Recipe data and user administration  
The recipe data and user administration are data that can be changed in runtime.
- Log data  
The data of tag logs and alarm logs are acquired and logged in runtime.

## Migrating recipe data and user administration

If the recipe data and user administration were changed in runtime, you need to back up this information from the HMI device before you load the migrated project.

Depending on the used HMI device, you have different options for saving the above data.

If the HMI device supports external memory media and the recipe data are saved there, the data remain on the memory medium. External memory media are for example StorageCard or a network drive. You use the data again after the migration. The user administration is not saved on an external memory medium so you have to save these data, e.g. with ProSave.

If the recipe data are saved in the internal memory of the HMI device, save these data on an external memory medium. Use ProSave to save the recipe data. If you have already configured appropriate system functions in your project, use the system functions. The following system functions are available for the recipe data:

*4.1 Migrating projects in a TIA portal project*

- "ExportDataRecords" for the backup
- "ImportDataRecords" for the restore

You update the runtime project by compiling the project in WinCC again and loading it to the HMI device.

After you have loaded the migrated project on the HMI device, restore the recipe data and the user administration to the HMI device.

**See also**

Migration (WinCC flexible) (Page 150)

Backing up recipe data and user administration (WinCC flexible) (Page 178)

Restoring recipe data and user administration (WinCC flexible) (Page 179)

**Backing up recipe data and user administration (WinCC flexible)**

**Introduction**

To continue using the recipe data and user administration in a migrated project, you first need to back up this data from the HMI device. Then load the data into the migrated WinCC project. Use ProSave to back up the data.

**Requirement**

- The WinCC flexible project is running on the HMI device in Runtime.
- The HMI device is connected to a PC on which ProSave is installed.

**Procedure**

Proceed as follows to back up the recipe data and user administration:

1. Start ProSave.
2. Select the device type and the connection parameters in the "General" tab.
3. Open the "Backup" tab.
4. Select the "Recipes from the device memory" entry in the "Data type" box.  
Do not select "Complete backup" because otherwise you will not be able to select separately when restoring the recipe data.
5. Navigate to the desired location in the "Save as" box and click "Start Backup".  
The recipe data are saved.
6. Select "User administration" in the "Data type" box and click "Start Backup".  
The user administration is saved.

For additional information refer to the online help for ProSave.

## Alternative procedure

ProSave is automatically installed with WinCC flexible. The entire functional range of ProSave is available on the configuration PC within WinCC flexible via the menu command "Project > Transfer".

Alternatively, you can back up the recipe data and user administration via the ProSave integrated in WinCC flexible. Start WinCC flexible and select the menu command "Project > Transfer > Backup". Back up the recipe data and user administration as described in steps 4-6.

## See also

Migration of runtime data (WinCC flexible) (Page 177)

## Restoring recipe data and user administration (WinCC flexible)

### Introduction

To continue using saved recipe data and user administration after the migration, you first need to compile the migrated project and load it to the HMI device. You can then transfer the saved data to the HMI device. Use ProSave to restore the data.

### Requirement

- The migrated project has been transferred to the HMI device and is running in runtime.
- The HMI device is connected to a PC on which ProSave is installed.

### Procedure

Proceed as follows to load the saved recipe data and user administration to the HMI device:

1. Start ProSave.
2. Select the device type and the connection parameters in the "General" tab.
3. Open the "Restore" tab.
4. Navigate to the location of the saved recipe data in the "Opening..." box and select the file.
5. Click "Start Restore".  
The recipe data will be transferred to the HMI device..
6. Repeat steps 4-5 to restore the user administration.  
The user administration will be transferred to the HMI device.

For additional information refer to the online help for ProSave.

## Alternative procedure

ProSave is automatically installed with WinCC. The entire functional range of ProSave is available on the configuration PC within WinCC flexible via the menu command "Project > Transfer".

#### *4.1 Migrating projects in a TIA portal project*

You can also restore the recipe data and user administration via the ProSave integrated in WinCC. Start WinCC and select the menu command "Online > Device maintenance > Restore". Restore the recipe data and user administration as described in steps 4-6.

#### **See also**

Migration of runtime data (WinCC flexible) (Page 177)

### **Backing up log data (WinCC flexible)**

#### **Introduction**

If an HMI device supports external memory media and the log data are saved there, the data remain on the memory medium. External memory media are for example StorageCard or a network drive. If a log is saved on an external memory medium, the migrated project accesses this storage location again after the migration. In this case the log data must not be backed up.

#### **Backing up log data**

If you want to back up the log data externally before the migration, you have the following options:

- Backup with the "ArchiveLogFile".  
If you have already configured the "ArchiveLogFile" function in the WinCC flexible project, use this function to back up the data.
- Copy the log files by Copy&Paste with the Windows Explorer to an external memory medium or network drive.

#### **See also**

Migration of runtime data (WinCC flexible) (Page 177)

#### **4.1.7.4 Migrating integrated projects (WinCC flexible)**

### **Migration of integrated projects (WinCC flexible)**

#### **Introduction**

The controllers and HMI devices contained in a project integrated in STEP 7 are linked together by the configuration. The configuration data of WinCC flexible and STEP 7 are also connected. When an integrated project is migrated, the complete project will be migrated with components from WinCC flexible and STEP 7. The connections remain intact.

---

### Note

It is advisable to compile and save an integrated project in WinCC flexible before you migrate it. You can be sure that the data in WinCC flexible and STEP 7 is synchronized if compilation was completed without errors.

---

## Migrating an integrated project

When migrating an integrated project, the same requirements apply for the WinCC flexible component as those for the migration of a non-integrated WinCC flexible project. The objects and properties contained in the WinCC flexible component must be supported by WinCC, for example, the HMI device or the communication driver. The "Online" property must be activated on the configured connection. A connection with deactivated "Online" property is not migrated.

In addition to the requirements for the WinCC flexible component, there are also requirements for the STEP 7 component of the integrated project. The objects and properties contained in the STEP 7 V5.4 SP5 or V5.5 component must be supported in STEP 7. For detailed information, refer to the documentation for STEP 7.

To fully migrate an integrated project and then edit it, the following components must be installed on the PC performing the migration:

- STEP 7 V5.4 SP5 or STEP 7 V5.5
- WinCC flexible 2008 SP2 or WinCC flexible 2008 SP3
- STEP 7

If you only want to save the project in migration format, you can use the migration tool. See Migration principles (WinCC flexible) (Page 151) for additional information.

An integrated project is always fully migrated. If you only want to migrate the WinCC flexible project it contains, you need to separate it from the STEP 7 project before the migration. To separate the project from the integrated form, open the project in STEP 7 V5.4 SP5 or V5.5. Open the WinCC flexible project in the SIMATIC Manager. The project is opened with WinCC flexible. In WinCC flexible, select the menu command "Project > Copy project from STEP 7". WinCC flexible saves a non-integrated copy of the project.

Migration (WinCC flexible) (Page 150)

Migrating an integrated project (Page 182)

Migration principles (WinCC flexible) (Page 151)

## **Migrating an integrated project**

### **Introduction**

When migrating an integrated project, the components from both the WinCC flexible project and the STEP 7 project will be migrated. This means you need to select the project file with the file extension ".s7p" for migration. During migration, the data is copied from the existing project and migrated to a new project. You cannot migrate to an existing project.

The migration can be started in both the Portal view and the Project view.

You should only migrate a project in a newly started TIA portal.

If you only want to save the project in migration format, you can use the migration tool. For more information, refer to basics of migration (WinCC flexible).

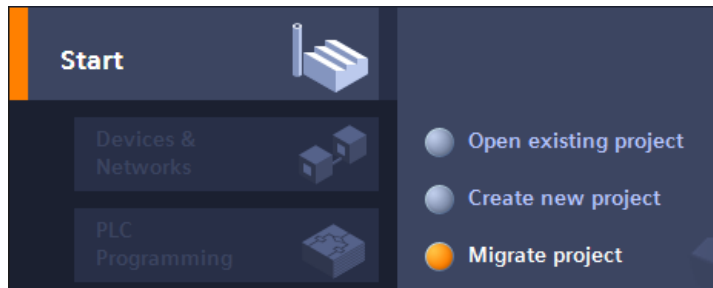

### **Requirement**

- STEP 7 V5.4 SP5 or STEP 7 V5.5 and all add-on packages used are installed.
- STEP 7 and all add-on packages used are installed.
- The TIA portal is newly started.
- No project is open in WinCC.
- An integrated project is available.
- The integrated project is not open.

## Procedure

To migrate an integrated project in the portal view, follow these steps:

1. Select the action "Start > Migrate Project".

2. In the "Source path" box, navigate to the project you want to migrate.

**Migrate project**

---

**Select project to be migrated.**

Project name:

Source path:

Include hardware configuration

**Target**

Project name:

Target path:

Author:

Comment:

3. Select the "\*.s7p" project file.
4. Change the information for the project to be created, if necessary. For example, change the project name or project path. The data to be migrated is created in the new project.
5. To migrate the project with hardware configuration, activate "Include hardware configuration".

#### *4.1 Migrating projects in a TIA portal project*

6. Click "Migrate".

A new project is created and migration of the data is started:

- The Project view opens.
- The progress of the migration is shown in a migration window.
- Warnings and errors about the migration process are displayed in the Inspector window under "Info > General".
- All information about the migration is saved in a log file.
- A message is displayed upon completion of the migration. The message contains a link that you can use to open the log.

7. Once migration is completed, save the project.

Once the migration is complete, you will find a newly created device for each migrated HMI device and controller in the project tree. These devices include the migrated data.

### **Opening the migration log at a later point in time**

The migration log is saved together with the migrated project. You can view the log at a later point in time. Open the log as follows:

1. Open "Shared data > Logs" in the project navigation.
2. Double-click the log file. The migration log opens.

#### **4.1.7.5 Reference (WinCC flexible)**

### **Migration of data types (WinCC flexible)**

#### **Introduction**

To harmonize the data types used by PLCs and HMI systems, some data types of the internal HMI tags are renamed. The naming takes place in accordance with IEC conventions. Because only the names change, there are no changes to the internal tags for the configuration.

The following table describes the mapping of the internal data types from WinCC flexible to the data types in WinCC.

## Migrating internal data types

The internal data types are mapped as follows during migration:

Internal data types WinCC flexible	Internal data types WinCC
Bool	Bool
Char	SInt
Byte	USInt
Int	Int
UInt	UInt
Long	DInt
ULong	UDInt
Float	Real
Double	LReal
String	WString
DateTime	DateTime

## Migrating external data types

### Migrating data types of Allen-Bradley DF1 (WinCC flexible)

#### Migrating data types Allen-Bradley DF1

The data types of the Allen-Bradley DF1 communication driver are mapped as follows in the migration to WinCC:

Data type in WinCC flexible	Data type in WinCC
ASCII	ASCII
BCD4	UInt
BCD8	UDInt
Bit	Bool
Int	Int
Long	DInt
Real	Real
UInt	UInt
ULong	UDInt

### Migrating data types of Allen-Bradley DF485 (WinCC flexible)

#### Migrating data types Allen-Bradley DH485

The Allen-Bradley DH485 communication driver is not supported by WinCC, it is replaced by the Allen-Bradley DF1 driver. The data types of the Allen-Bradley DH485 communication driver are mapped as follows in the migration to WinCC:

Data type in WinCC flexible	Data type in WinCC
ASCII	ASCII
Bit	Bool
Int	Int
Long	DInt
Real	Real
UInt	UInt
ULong	UDInt

Migration of data types (WinCC flexible) (Page 184)

**Migrating data types of GE Fanuc SNP (WinCC flexible)**

**Migrating data types GE Fanuc SNP**

The GE Fanuc SNP communication driver is not supported by WinCC, the data types are mapped to the internal data types of WinCC. The data types of the GE Fanuc SNP communication driver are mapped as follows in the migration to WinCC:

Data type in WinCC flexible	Data type in WinCC
BCD4	UInt
BCD8	UDInt
Bit	Bool
Byte	USInt
DInt	DInt
Word	UInt
Int	Int
Real	Real

Data type in WinCC flexible	Data type in WinCC
UInt	UInt
DWord	UDInt

**Migrating data types of LG GLOFA GM (WinCC flexible)**

**Migrating data types LG GLOFA GM**

The LG GLOFA GM communication driver is not supported by WinCC, the data types are mapped to the internal data types of WinCC. The data types of the LG GLOFA GM communication driver are mapped as follows in the migration to WinCC:

Data type in WinCC flexible	Data type in WinCC
Bool	Bool
Byte	USInt
DInt	DInt
DWord	UDInt
Int	Int
SInt	SInt
String	WString
Time	UDInt
UDInt	UDInt
UInt	UInt
USInt	USInt
Word	UInt

## Migrating data types of Mitsubishi Protocol 4 (WinCC flexible)

### Migrating data types Mitsubishi Protocol 4

The Mitsubishi Protocol 4 communication driver is not supported by WinCC, it is replaced by the Mitsubishi MC TCP/IP driver. The data types of the Mitsubishi Protocol 4 communication driver are mapped as follows in the migration to WinCC:

Data type in WinCC flexible	Data type in WinCC
4 Bit Block	4-Bit Block
8 Bit Block	8-Bit Block
12 Bit Block	12-Bit Block
16 Bit Block	16-Bit Block
20 Bit Block	20-Bit Block
24 Bit Block	24-Bit Block
28 Bit Block	28-Bit Block
32 Bit Block	32-Bit Block
Bit	Bool

Data type in WinCC flexible	Data type in WinCC
DInt	DInt
DWord	DWord
Int	Int
Real	Real

String	String
StringChar	see below
Time	Time
Time of Day	Time_Of_Day
Timer	see below
Word	Word

### Special considerations for some data types

There are special considerations to be made when migrating external tags that contain data types of a SIMATIC S7-300/400 PLC.

### Mapping of the S7 data type "Char"

The S7 data type "Char" is a data type for mapping characters according to the specification. However, since this data type is often used for reading and writing numerical values, it is mapped in WinCC to the S7 data type "Byte". If this should be the case during migration, an alarm will appear in the output window.

If the S7 data type "Char" is used for numerical values and negative numbers were configured at the point of use, the result is an error in mapping to the S7 data type "Byte". The S7 data type "Byte" cannot map any negative numbers. You have to adapt the configuration accordingly to correct the error. Use a signed data type, such as the data type "Int", for processing positive and negative numerical values.

If the S7 data type "Char" is used for mapping characters, you must change the configuration after migration. To represent characters, use the data type "String".

When an integrated project is migrated, the data type "Char" in WinCC is also migrated to the data type "Byte". With a connected PLC tag, the data type "Char" remains "Char". As a result of changing the data type of the HMI tag, symbolic addressing of the tags in question is not migrated. After migration, the tags are interconnected by absolute addresses and continue to work. If you want to restore symbolic addressing, you have to change the configuration accordingly after the migration.

### Mapping an array of the S7 data type "Char"

An array of the S7 data type "Char" is mapped to an array of the data type "Byte" during migration.

If an array of the S7 data type "Char" is used for numerical values and negative numbers were configured at the point of use, the result is an error in mapping to an array of the S7 data type

"Byte". The S7 data type "Byte" cannot map any negative numbers. You have to adapt the configuration accordingly to correct the error. Use a signed data type, such as the data type "Int", for processing positive and negative numerical values.

### Mapping of the S7 data type "Counter"

An external tag with the S7 data type "Counter" with counter address is mapped to the S7 data type "Counter". The address will be retained.

If an external tag with the S7 data type "Counter" addresses a data block or a bit memory address, it is mapped to the S7 data type "Word". The address will be retained. The migration sets the coding to "SimaticBCDCounter".

The S7 data type "Counter" has a value range of 0-999. When supplied by the S7 data type "Word" the value range may be exceeded on the PLC side. Ensure that you are observing the value range.

Example:

#### WinCC flexible

Tag	S7 data type	Address	Comment
Counter_Actual_Value	Counter	C10	BCD coded counter value
Counter_Setpoint_Value	Counter	DB10.DBW200	BCD coded counter value
Counter_Setpoint_Value#2	Counter	MW20	BCD coded counter value

#### WinCC

Tag	S7 data type	Address	Coding	Comment
Counter_Actual_Value	Counter	%C10	<Standard>	BCD coded counter value
Counter_Setpoint_Value	Word	%DB10.%DBW200	SimaticBCDCounter	BCD coded counter value
Counter_Setpoint_Value#2	Word	%MW20	SimaticBCDCounter	BCD coded counter value

### Mapping of the data type "StringChar"

In WinCC there is no corresponding data type to which the "StringChar" data type can be mapped. Mapping in WinCC depends on the property "Length" of the S7 data type.

A tag of the "StringChar" data type with the "Length" property > 1 is migrated to an array of the S7 data type "Char". The length of the array corresponds to the length of the originally configured data type "StringChar".

If the property "Length" = 1, the data type in WinCC is migrated to an array of the S7 data type "Char" with length = 1. The expression for an array with an element is "Array[0 ..0] of Char".

**Mapping of the S7 data type "Timer"**

An external tag with the S7 data type "Timer" with timer address is mapped to the S7 data type "Timer". The address will be retained.

If an external tag with the S7 data type "Timer" addresses a data block or a bit memory address, it is mapped to the S7 data type "S5 Time". The address will be retained.

Example:

**WinCC flexible**

Tag	S7 data type	Address	Comment
Timer_Actual_Value	Timer	T10	BCD coded timer value
Timer_Setpoint_Value	Timer	DB10.DBW200	BCD coded timer value
Timer_Setpoint_Value#2	Timer	MW20	BCD coded timer value

**WinCC**

Tag	S7 data type	Address	Comment
Timer_Actual_Value	Timer	%T10	BCD coded timer value
Timer_Setpoint_Value	S5Time	%DB10.%DBW200	BCD coded timer value
Timer_Setpoint_Value#2	S5Time	%MW20	BCD coded timer value

**Migrating data types Telemecanique Uni-Telway**

The Telemecanique Uni-Telway communication driver is not supported by WinCC, the data types are mapped to the internal data types of WinCC. The data types of the Telemecanique Uni-Telway communication driver are mapped as follows in the migration to WinCC:

Data type in WinCC flexible	Data type in WinCC
+/-Int	Int
+/-Long	DInt
ASCII	WString
Bool	Bool
Float	Real
Int	UInt
Long	UDInt

Migration of data types (WinCC flexible) (Page 184)

## 4.1.8 Migrating integrated projects

### 4.1.8.1 Migrating an integrated project

#### Introduction

In integrated projects, you use SIMATIC controllers and WinCC components together in a project. When an integrated project is migrated, the complete project will be migrated with components from WinCC and STEP 7. Configured connections between control and visualization remain intact.

#### Migrating an integrated project

When migrating an integrated project, the same requirements apply for the STEP 7 component as those for migration of a non-integrated STEP 7 project. The objects and properties contained in the WinCC component must also be supported in WinCC (TIA Portal). For detailed information, refer to the documentation for WinCC.

Also note that the initial project must be compiled before the migration.

To fully migrate an integrated project, the following components must be installed on the PG/PC performing the migration:

- STEP 7 V5.4 SP5 or STEP 7 V5.5
- WinCC V7.0 SP3 or WinCC Flexible 2008 SP2 and SP3

To be able to fully post-edit an integrated project, the following components must be installed on the PC for post-editing:

- STEP 7 Professional V12 SP1
- WinCC Basic, WinCC Comfort/Advanced or WinCC Professional, depending on the components used

#### Using the migration tool

It is necessary to use the migration tool under the following circumstances:

- The initial project is not located on the same PG/PC as the installation of the TIA Portal.
- SCADA devices are included in the initial project. These can only be migrated with the migration tool.
- WinCC Professional V12 and STEP 7 with WinCC V7.0 SP3 cannot be installed on the same PG / PC. Therefore, integrated projects with WinCC V7.0 SP3 parts must be prepared for migration with the migration tool.

### **Migration of the STEP 7 part of an integrated project**

An integrated project is always fully migrated. Individual components cannot be migrated on their own. You can only migrate the included STEP 7 project alone, if you have previously deleted all HMI stations in the SIMATIC stations in the SIMATIC Manager and then recompiled the project in NetPro.

Alternatively, you can open the project in an installation of STEP 7 V5.4 SP5 or V5.5 without an installation of WinCC. Then, save the project again and select the "Reorganize" function during saving. The WinCC parts are then automatically removed when the copy is saved.

You can then migrate the STEP 7 project without the WinCC project.

### **Migration of an integrated project with the hardware configuration**

In integrated projects, HMI devices are migrated even if the hardware configuration is not included in the migration. The STEP 7 part of the hardware configuration, including network configurations, and connections and interrupts, is migrated only if you include the hardware configuration in the migration. Otherwise, unspecified modules will be created for the STEP 7 devices and you will need to convert them into suitable modules after the migration.

HMI modules that are plugged into a PC station are converted to a separate Station during the migration. If you perform the migration without including the hardware configuration, the migrated project then contains a non-specified SIMATIC PC Station and a SIMATIC PC Station with the HMI devices. References to HMI devices are not imported during migration. When the hardware configuration is included, the migrated project contains two separate stations: the HMI Station and the PC Station.

### **Storage location of an integrated WinCC project**

If you migrate an integrated project, the HMI part of it must be on the same PG/PC as the STEP 7 part of the project. If the HMI part is on a different PG, then only the STEP 7 part will be migrated.

### **Unsupported objects**

The following components are not supported for migration:

- STEP 7 multiproject  
A STEP 7 multiproject cannot be migrated. Migration will be canceled.
- Central Archive Server - CAS  
If a CAS is part of an integrated project, then the migration will be carried out but the CAS data will not be migrated.

### **See also**

Post-editing integrated projects (Page 200)

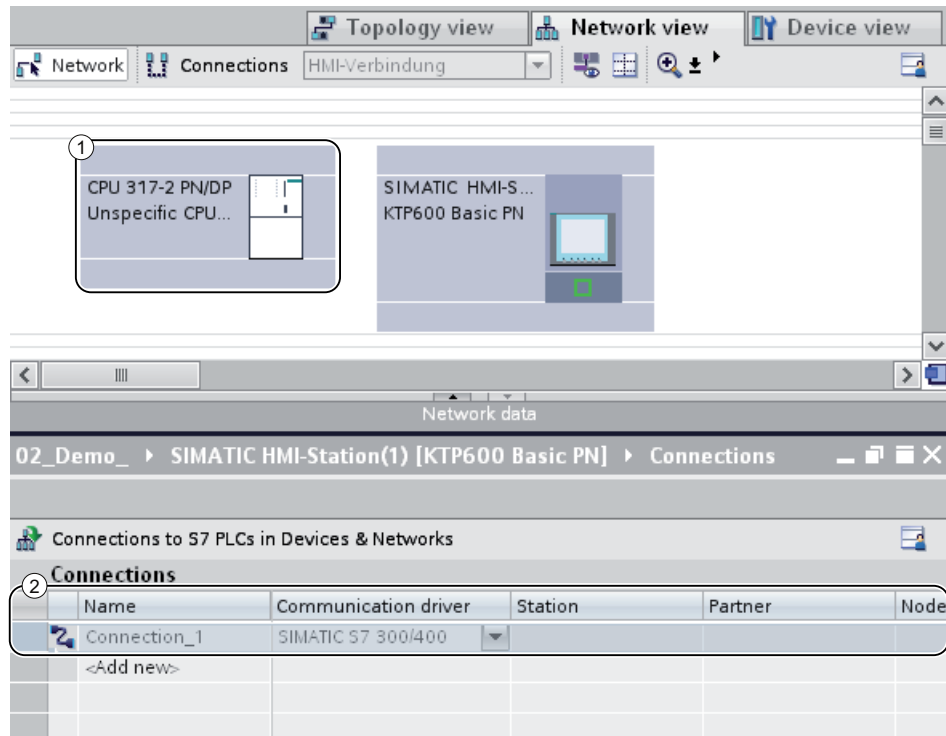

#### **4.1.8.2 Post-editing integrated projects**

If you have migrated an integrated project without hardware configuration, unspecified CPUs are used instead of the CPUs of the original project. Since no connection can exist between

an unspecified CPU and an HMI device, connections from the source project are also imported only unspecified.

The following figure shows the state after a Migration without hardware configuration in an example project:

- ① The original CPU 317-2 PN/DP was replaced with an unspecified CPU during migration.
- ② The link between the CPU and HMI device is also unspecified and must be renewed.

## Procedure

To continue to use an integrated project after the migration, follow these steps:

1. Convert the unspecified devices into suitable devices again.
2. Restore the integrated HMI connection between the HMI device and the PLC.
3. Connect all HMI tags to the newly created integrated connection.
4. Restore the connection between HMI tags and PLC tags.
5. Delete the non-integrated HMI connection.

In the following chapters a sample project is used to describe the individual steps in more detail.

## See also

Converting unspecified CPUs into specified CPUs (Page 202)

Creating an integrated HMI connection (Page 204)

Re-linking HMI tags (Page 206)

Deleting an unspecified connection (Page 207)

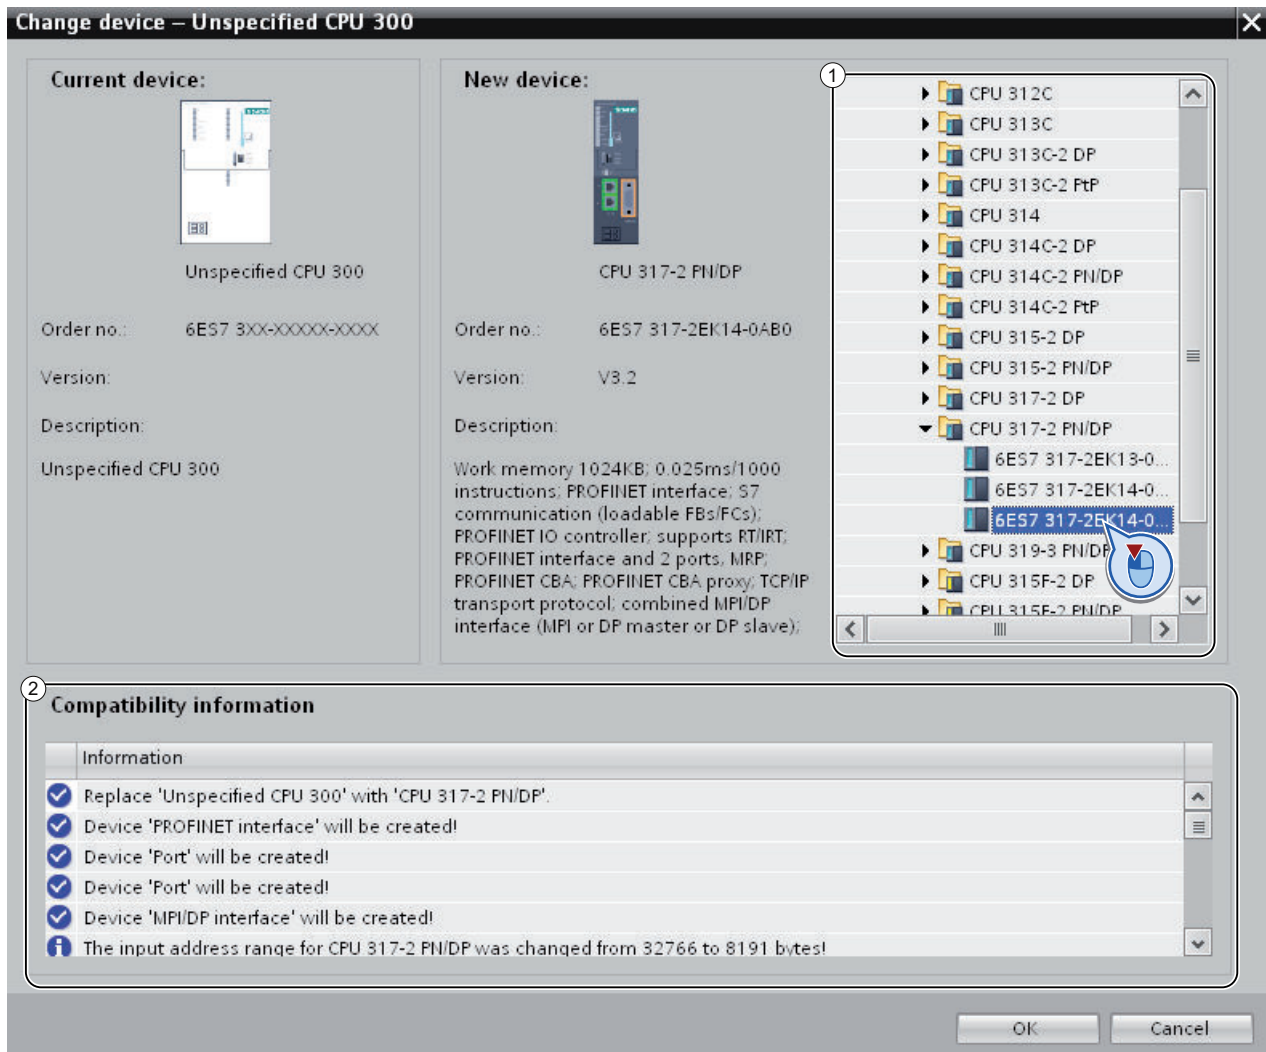

#### **4.1.8.3 Converting unspecified CPUs into specified CPUs**

The first step after the migration without hardware configuration is the conversion of the unspecified CPUs into specified CPUs. Unspecified CPUs are placeholders for certain CPUs from the hardware catalog that are not currently known. You can define general parameters and home the CPUs already in the user program. However, the project is not fully functional until the unspecified CPU has been specified.

### Specifying a CPU using module replacement

To use module replacement to specify an unspecified CPU, follow these steps:

1. Select the unspecified CPU in the network or device view.
2. Select the "Replace device" command in the shortcut menu.  
The "Replace device" dialog opens.

3. Under "New device" in the tree structure, select the module with which you want to replace the unspecified CPU. (Area 1)  
"Compatibility information" provides you with information on the extent to which the selected CPU is compatible with the configuration in source project. (Area 2)
4. Click "OK".
5. Perform the above-described steps for all unspecified CPUs.

### See also

Creating an integrated HMI connection (Page 204)

#### 4.1.8.4 Creating an integrated HMI connection

After you have specified the unspecified CPU, establish the connection to the HMI-device.

#### Procedure

To create a connection graphically, follow these steps:

1. On the toolbar, click the "Connections" icon. This activates connection mode.

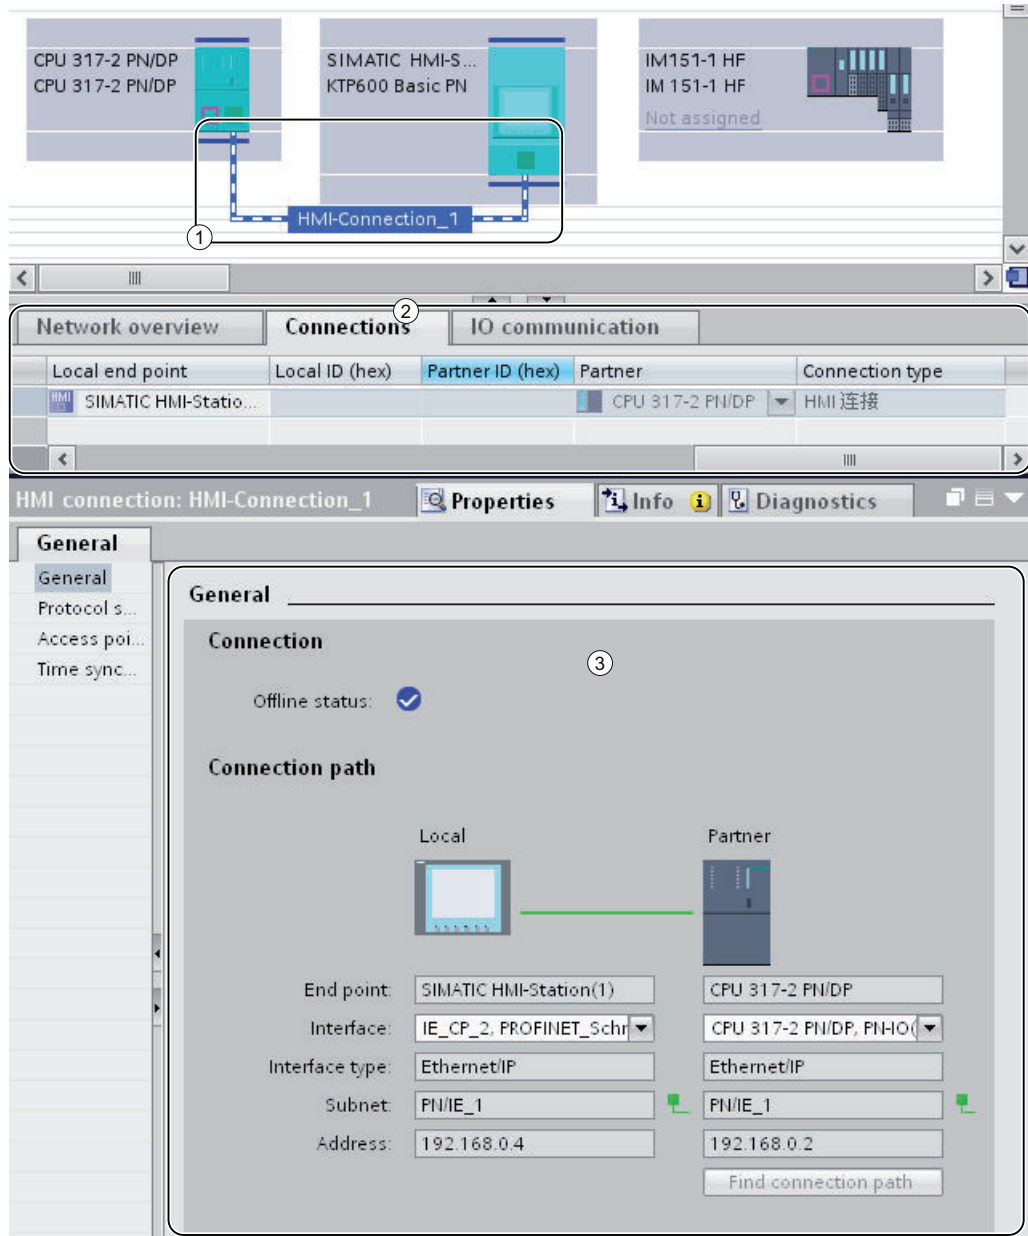

2. Select the connection type "HMI connection" in the adjacent drop-down list. The network view highlights in color all CPUs and HMI devices that can be used for an HMI connection.
3. You can now have the connection path automatically determined, or explicitly select a connection path via specific interfaces:
  - Allow connection path to be automatically determined  
Select the source CPU for a connection. Drag the mouse to the target components. Confirm the connection endpoint with another mouse click.  
Alternatively: While holding down the shift button, select the target components and with the right mouse button select the "Add new connection" command.
  - Selecting an explicit connection path from interface to interface  
Click on the subnet interface in the device for which you want to create a connection. Hold down the mouse button, drag the cursor to the relevant interface in the target device and then release the mouse button.

## Result

The following figure shows the state after the integrated connection has been created:

- ① An integrated HMI connection is created and highlighted in the network view.
- ② The connection is shown in the connection table of the components.
- ③ The connection can be edited in the connection properties.

## See also

Re-linking HMI tags (Page 206)

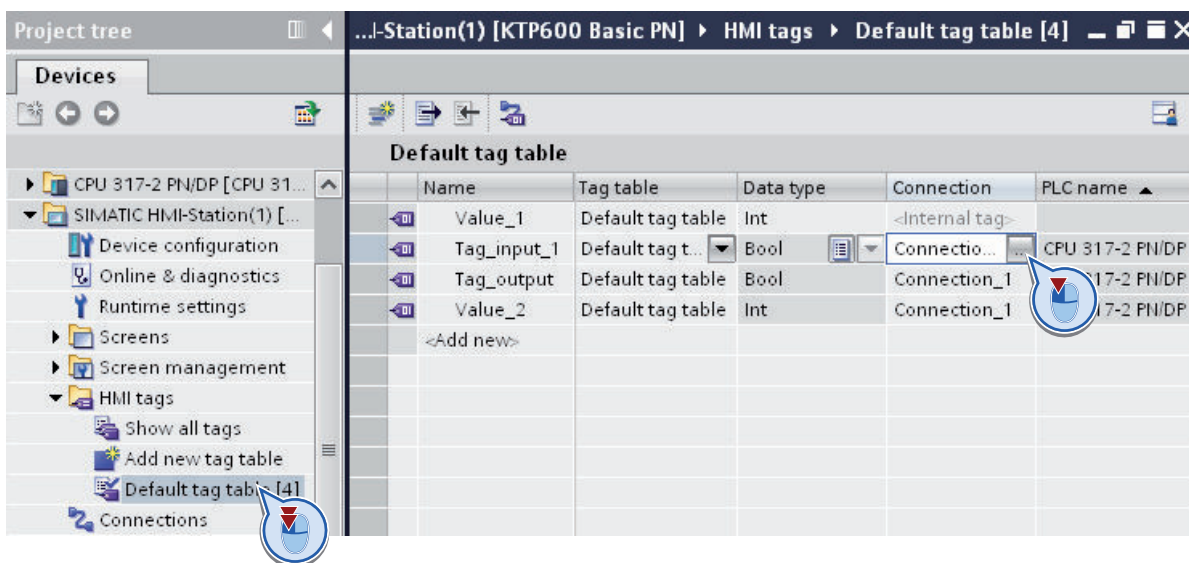

### 4.1.8.5 Re-linking HMI tags

When you have created a new HMI connection between the CPU and HMI device, you have to assign the existing HMI tags to the new connection. Perform the following steps for each line in the relevant tag table.

#### Procedure

To re-link HMI tags, follow these steps:

1. In the project tree, navigate to the HMI tags and double-click the relevant tag table to show this in the work area.  
The tag table opens.

2. Click the " ..." button in the "Connection" column.  
A dialog box for selecting the connection opens.
3. Select the newly established HMI connection.

4. Click the "✓" button to apply the selected connection.
5. On the toolbar, click the "Re-connect PLC tag" button.

**See also**

Deleting an unspecified connection (Page 207)

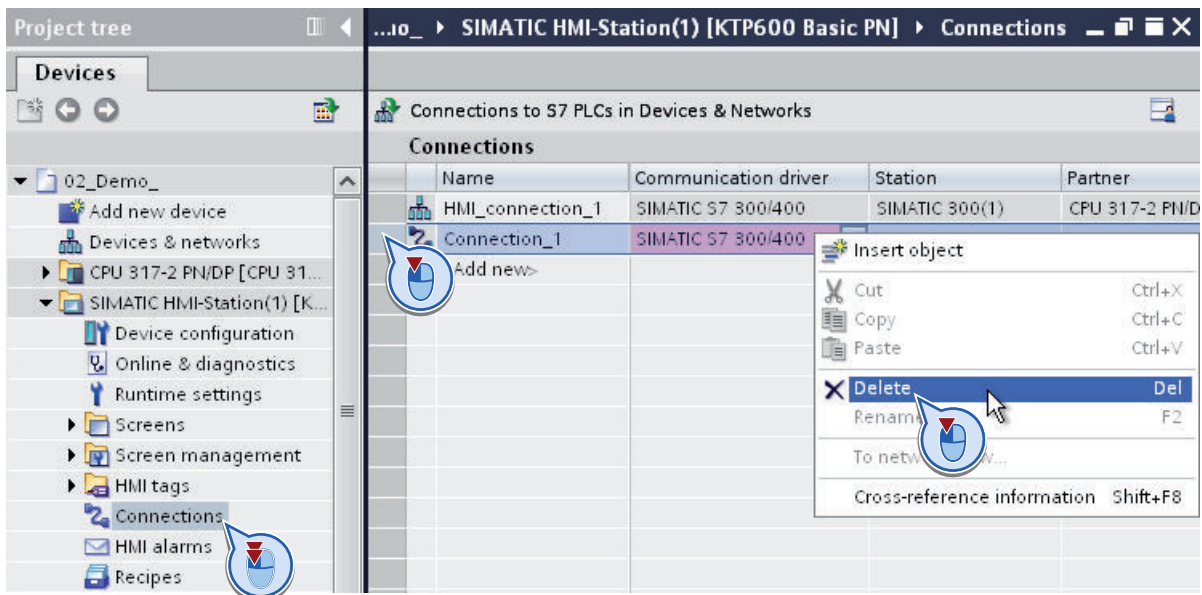

**4.1.8.6 Deleting an unspecified connection**

Finally, you can remove unspecified connections that still remain from the source project.

**Procedure**

To delete unspecified connections, follow these steps:

1. In the project tree, open the HMI device and double-click the "Connections" entry. The connection table opens.

2. Select the row with the old connection in the table.
3. Select the "Delete" command in the shortcut menu of the connection line.
4. Perform the above-described steps for all unspecified connections of the source project.

**4.2 Migrating S7-1200 to firmware as of V4****4.2.1 Basic information on upgrading to V4****Introduction**

If you have used a CPU with firmware version V3 in your project and want to upgrade to a CPU with firmware V4.0 or later, you can easily replace the device.

The TIA Portal offers the "Change device" function for this purpose. The project remains unchanged when the device is replaced. You can continue using the programs that you created with firmware version V3.

## Rules

The following basic rules apply when replacing a device:

- Device replacement is only possible if the CPU used to date has been operating with firmware version V3.0. S7-1200 CPUs with firmware version V1.0 or V2.0 must first be replaced with a V3.0 CPU.
- It is not possible to replace a V4 CPU with a V3 CPU. If you want to continue using the existing V3 CPU, create a copy of this CPU before replacing the device.
- The program cannot be transferred to the new CPU via a memory card. Instead, use the "Change device" function, which is described in the following sections.

## HMI panels

Configured HMI panels are treated differently during device replacement, depending on the firmware version of the panel and the communication mode.

The following table shows the HMI connections that are supported with the migration:

Firmware version of the panel	PUT/GET communication	Migration to V4
V11 or later	No	S7-1200 does not support this configuration. Upgrade the firmware of the HMI panel to V12.0. Then compile and load the configuration.
V11 or later	Yes	S7-1200 supports this configuration. The connection is established automatically while you compile and load the project after replacing the device.
V12 or later	No	S7-1200 supports this configuration. The connection is established automatically while you compile and load the project after replacing the device.

---

### Note

#### HMI TP 177B 4"

The HMI TP 177B 4" with firmware version V11.0.2 cannot be operated with S7-1200 V4. Replace the panel with a new device, if necessary.

---

## S7-1200 expansion modules

If you are already using the following centrally plugged S7-1200 modules in your system, you must perform a firmware update for these modules in order to guarantee operation with S7-1200 V4.

- ASi - Master - CM 1243
- DP - Master - CM 1243-5
- WAN CP - CP1243-1

Newly shipped S7-1200 modules have the latest firmware installed ex works.

## Protected blocks

Blocks equipped with know-how protection or copy protection cannot be converted to V4. If the project contains protected blocks, you must remove the protection prior to migration.

If these are supplied blocks and you do not know the password, ask your supplier either for the password or for a V4-compatible block.

 <b>WARNING</b>
<b>Preventing personal injury and material damage</b>
Changes are made to the program during device replacement in some cases. Therefore, thoroughly check the program in a test environment after replacing the device and before putting it in operation.

---

### Note

#### Additional support

You can find the latest FAQs about migrating to S7-1200 V4 (<http://support.automation.siemens.com/WW/view/en/82140966>) in Siemens Industry Online Support.

If you need further assistance with migrating to S7-1200 V4, please contact SIMATIC Customer Support.

Special considerations after migrating to V4 (Page 211)

## 4.2.2 Migrating to V4

### Requirement

- A CPU with firmware version V3 is available in the project.
- The project contains no protected blocks.

### Procedure

Proceed as follows to replace a CPU:

1. Select the V3 CPU you want to replace.
2. Select the "Change device" command in the shortcut menu.  
The "Change device" dialog box appears.
3. Under "New device" in the tree structure, select the V4 CPU with which you want to replace your current V3 CPU.
4. Click "OK".  
The existing CPU is replaced by the new one.
5. Select the new CPU and select the "Compile > Hardware and software (only changes)" command in the shortcut menu.  
The device configuration and the user program are compiled again.
6. Optional: If necessary, apply know-how protection or copy protection to individual blocks in the program.
7. Select the new CPU and select the "Download to device > Hardware and software (only changes)" command in the shortcut menu.  
The device configuration and the user program are loaded into the new CPU.  
This completes the device replacement.

#### **WARNING**

##### **Preventing personal injury and material damage**

Changes are made to the program during device replacement in some cases. Therefore, thoroughly check the program in a test environment after replacing the device and before putting it in operation.

---

**Note**

**Additional support**

You can find the latest FAQs about migrating to S7-1200 V4 (<http://support.automation.siemens.com/WW/view/en/82140966>) in Siemens Industry Online Support.

If you need further assistance with migrating to S7-1200 V4, please contact SIMATIC Customer Support.

Basic information on upgrading to V4 (Page 207)

Special considerations after migrating to V4 (Page 211)

### 4.2.3 Special considerations after migrating to V4

#### Functional changes in V4

S7-1200 V4 offers significantly enhanced functionality. The most important functional changes that you need to consider after migrating from V3 are described briefly below.

You can find more information on S7-1200 in the "SIMATIC S7-1200 Programmable controller" system manual.

See also:

TIA Portal in Siemens Industry Online Support (<http://support.automation.siemens.com/WW/view/en/65601780>)

#### Organization blocks

With S7-1200 V4, you can specifically set the interruptibility of each organization block used. When a device is replaced, all the organization blocks are configured as non-interruptible, to ensure that the executability of your V3 program remains unchanged. The OB priorities from the V3 program also remain unchanged. After migration, you can change the settings for priority and interruptibility as needed.

The behavior of diagnostic interrupts in V4 has changed as follows:

In V3, the start information always contained information on the triggering module, including the channel number. In V4, this information is only generated for a pending diagnostics event. If no diagnostic event is pending, for example, because the fault has already been corrected, only the triggering module is indicated.

### Access levels

S7-1200 V4 offers an extended access level concept. The following table shows how the protection levels of the V3 firmware are indicated in V4:

V3 protection level	V4 access level
No protection	Full access (no protection)
Read-only	Read access
Write/read protection	HMI access

The access level "No access (complete protection)" has been newly introduced with V4. It was not available in previous versions.

### Instruction libraries

After migrating to S7-1200 V4, instructions from the libraries of the V3 firmware version are still available. This ensures that you can continue to use your program unchanged. In addition, S7-1200 V4 offers many new instructions which are also compatible with the instructions of the S7-1500.

You can find more information on the instruction libraries of S7-1200 in the "SIMATIC S7-1200 Programmable controller" system manual.

See also:

TIA Portal in Siemens Industry Online Support (<http://support.automation.siemens.com/WW/view/en/65601780>)

### Motion Control

When a device is replaced, the Motion Control objects from the libraries of the firmware versions V1 and V2 are replaced with the corresponding objects from the V3 libraries. The objects from V3 libraries are compatible so that you can continue to use the programs unchanged.

The libraries of the S7-1200 V4 offer many new Motion Control functions, which are compatible with the functions of the S7-1500. If you want to use V4 libraries, select them on the "Instructions" task card after replacing the device.

You can find more information on the new Motion Control functions in the "SIMATIC S7-1200 Programmable controller" system manual.

See also:

TIA Portal in Siemens Industry Online Support (<http://support.automation.siemens.com/WW/view/en/65601780>)

### Web server

The following settings for operation via a web server are transferred from the V3 CPU to the V4 CPU during device replacement:

- Activate web server on this module
- Permit access only with HTTPS

If you want to operate the V4 CPU via a web server, you need to set up user accounts with assigned user rights in the user management. Only the standard web pages are available to standard users without any additional rights.

---

**Note**

**Additional support**

You can find the latest FAQs about migrating to S7-1200 V4 (<http://support.automation.siemens.com/WW/view/en/82140966>) in Siemens Industry Online Support.

If you need further assistance with migrating to S7-1200 V4, please contact SIMATIC Customer Support.

---

## Communication via PUT/GET

Communication via PUT/GET is enabled after the device replacement. Note that the new integrated connection types offer a security standard higher than PUT/GET communication. If you do not use PUT/GET communication, you should disable it.

## 4.3 Programming recommendations

### 4.3.1 The new S7-1500 CPU functions at a glance

#### Higher performance

The S7-1500 represents a CPU series that provides much higher performance than the CPUs of the S7-300/400 series. When programming with STEP 7 V5.x, you were probably used to working with programming methods such as absolute addressing to achieve higher performance from the CPU and leaner program code.

Due to the high performance that the S7-1500 provides, these programming methods are made obsolete.

In the paragraphs below we would like to introduce some new programming options of the S7-1500.

### **Universal symbolism**

The S7-1500 allows you to use the symbolism throughout the entire project. Using the auto-complete function, you are given context-dependent support for programming with symbols within the programming editors. The data elements, for example those in a data block, are assigned only a symbolic name in the declaration but no fixed address within the data block. This allows you to fully exploit the high performance of the S7-1500 when accessing these data elements. The absolute addresses of operands need not be known and access errors are avoided.

Your program code will be clearer due to the symbolism and you have to comment less. All points of use are automatically updated when a correction is made to the symbolism.

An example of the use of universal symbols is available at: Symbolic addressing (Page 217)

### **Optimized block access**

With optimized block access, the declared data elements are arranged automatically in the available memory area of the block in a way that makes optimal use of its capacity. The data is structured and saved in way that is optimal for the CPU used. The storage is left to the system. The data elements are assigned only a symbolic name in the declaration by which the

tag within the block can be addressed. This allows you to increase the performance of the CPU. Access errors, from the HMI, for example, are not possible.

Comparison of block accesses Standard < > Optimized		<b>SIEMENS</b>
	Standard block access (S7-1200/1500 compatible with S7-300/400)	Optimized block access (S7-1200/1500 only)
Data management	You can address tags using both symbolic (memory-optimized) and absolute (user-defined) addresses.	The system manages and optimizes the data storage. This results in optimal use of the memory capacity.
Performance	 The access to a CPU of the S7-1200/1500 series does not always occur as fast as possible because the data storage can be inefficient due to absolute addressing.	 The access always occurs as fast as possible because the data storage is optimized by the system and no fixed addresses are assigned.
Susceptibility to errors	 Absolute addressing (e.g., from HMI or when indirect addressing is used) can lead to inconsistencies after a change to the fixed address.	 Access errors, e.g., from HMI or when indirect addressing is used, are not possible because the access is symbolic.
Retentivity	Valid for all tags of a data block	Valid for individual tags
<b>Recommendation:</b> To achieve the best-possible performance, the combining of different block access types within your program is not recommended.		

You can find additional information on blocks with optimized access under "See also".

## New data types

The new data types LWORD, LINT, ULINT, LTIME, LTOD, LDT and the array (32-bit limit) offer much higher calculation accuracy when using mathematical functions. In the area of implicit and explicit data type conversion, you have more options in comparison to the CPUs of the S7-300/400 series.

You can find additional information on the new data types under "See also".

## PLC data types

PLC data types (UDT) are data structures that you define and that can be used multiple times within the program. The structure of a PLC data type is made up of several components, each of which can contain different data types. You define the type of components in the declaration of the PLC data type.

You can use the PLC data type as a base data type for defining tags and as a template for creating global data blocks. If you later make changes to the PLC data type, the changes are automatically updated at all points of use.

You can also symbolically access individual elements of an array within a PLC data type.

You can find additional information on the new data types under "See also".

You can find an example for using PLC data types under: Using PLC data types (UDT) (Page 225)

### Uniform instructions in all programming languages

You are provided with a uniform set of instructions in all programming languages (LAD, FBD, STL, SCL, and GRAPH).

### Slice access

Slice access gives you the option of specifically addressing areas within declared tags. You can implement symbolic access to a single bit up to the level of the tag. The single bit is then addressed absolutely.

You can find additional information on slice access under "See also".

### Indirect addressing

Indirect addressing offers you the option of addressing operands whose address is not calculated until runtime. All programming languages provide general methods for indirect addressing, for example, via POINTER. In the SCL programming language, you can also use PEEK and POKE instructions.

You can find additional information on indirect addressing under "See also".

### Additional programming recommendations

You can find more information about programming recommendations and a programming guide in the Siemens Industry online support under:

- FAQs: Programming recommendations (<http://support.automation.siemens.com/WW/llisapi.dll?aktprim=0&lang=en&referer=%2fWW%2f&func=cslib.csinfo&siteid=csius&Datakey=47071380&extranet=standard&groupid=4000002&viewreg=WW&nodeid0=29156492&objaction=csopen>)
- Background and system descriptions in the Programming Guideline (<http://support.automation.siemens.com/WW/llisapi.dll?aktprim=100&lang=en&referer=%2fWW%2f&func=cslib.cssearch&nodeid0=4000024&viewreg=WW&siteid=csius&extranet=standard&groupid=4000002&objaction=cssearch&content=adsearch%2Fadsearch%2Easpx>)

## 4.3.2 Symbolic addressing

### Advantages of symbolic addressing

The use of universally applied and meaningful symbols in the overall project makes the program code easier to read and understand.

This gives you the following advantages:

- You do not have to write detailed comments.
- Data access is faster.
- No errors occur when accessing data.
- You no longer have to work with absolute addresses.
- The assignment of the symbol to the memory address is monitored by STEP 7, which means all points of use are automatically updated when the name or the address of a tag changes.

### Programming in STEP 7 V5.x

STEP 7 V5.x already gave you the option to write a program that is easier to read by using descriptive names for operands and blocks. You did this by assigning the symbolic operands to memory addresses and blocks in the symbol table. In order for a change in the symbolism to also have an effect on the program code in the programming editor, you had to use the "Operand priority" property to specify whether the symbol or the absolute value had priority.

The use of symbolic addressing allowed you to create a program with greater clarity. However, in some cases, such as when programming with user-defined data types (UDT), this could impair performance.

You could increase the performance by ignoring the symbolism in the UDT and using absolute addressing. This made it necessary, however, to know the data storage. Changes to the UDT were not automatically updated. Using absolute addressing, you could also access parts of a tag and edit these. The only drawback of absolute addressing, however, was that after a certain level the program code was cluttered and you had to insert additional comments for better orientation.

### Procedure in STEP 7 TIA Portal

The S7-1500 CPU offers much higher performance than the S7-300/400 CPUs. To fully use this high performance, we recommend you enable optimized block access for all blocks and use symbolic addressing in the program code.

The programming editor helps you work with symbols through context-sensitive input help, for example, auto-complete. Using it, you can easily access existing tags or instructions during programming.

### Programming example

The following example shows you how to symbolically access individual elements:

Interface				
	Name	Data type	Default value	Retain
1	▼ Input			
2	Start_Input	Bool	false	Non-reta
3	Duration_ON_Delay	Time	T#0ms	Non-reta
4	<Hinzufügen>			
5	▼ Output			
6	Output_Set	Bool	false	Non-reta
7	Timer_Value	Time	T#0ms	Non-reta

▼ Block title: .....

Comment

▼ Network 1: .....

Comment

You can use the tag names that you have defined in the block interface directly at the parameters of the TON instruction without knowing the absolute address of the tag.

### See also

Using VARIANT instructions (Page 231)

### 4.3.3 Using IEC timers and counters

#### Advantages of IEC timers and counters

The universal use of IEC timers and counters makes your program code more efficient.

This gives you the following advantages:

- The blocks can be called multiple times with newly generated instance data blocks.
- The IEC counters have a large counting range.
- Compared to S5 timers, IEC timers have better performance and greater time accuracy.

## Programming in STEP 7 V5.x

The S5 timers and counters in STEP 7 V5.x were addressed absolutely via a number. Due to this dependency on numbers, program blocks were not reusable with S5 timers and counters.

The value range of a timer was limited to 9990 seconds and that of a counter limited to a maximum of 999.

## Procedure in STEP 7 TIA Portal

You declare IEC timers and counters in the program block where they are called or needed. The IEC timer is a structure of data type IEC\_TIMER, IEC\_LTIMER, or TON\_TIME and TON\_LTIME, for example, which you can also declare as a local tag in a block. The IEC counter is a structure of data type IEC\_SCOUNTER, IEC\_USCOUNTER, etc.

## Programming example in the TIA Portal

The following example shows you how to declare an IEC timer and IEC counter as a local tag:

Interface						
	Name	Data type	Default value	Retain	Visible in ...	Setpoint
1	▶ Input				<input type="checkbox"/>	<input type="checkbox"/>
2	▶ Output				<input type="checkbox"/>	<input type="checkbox"/>
3	▶ InOut				<input type="checkbox"/>	<input type="checkbox"/>
4	▼ Static				<input type="checkbox"/>	<input type="checkbox"/>
5	▶ SwitchDelay	TON_TIME		Non-ret...	<input checked="" type="checkbox"/>	<input type="checkbox"/>
6	▶ CountDB	CTU_INT		Non-retain	<input checked="" type="checkbox"/>	<input type="checkbox"/>

▶ Block title: .....

▼ Network 1: .....

Comment

The data of the TON IEC timer and the CTU IEC counter is stored as a local tag (multi-instance) in the block interface.

### 4.3.4 Flexibly using enable output ENO

#### Advantages

You can detect runtime errors and avoid program termination using the EN/ENO mechanism for each instruction and block call. Overflow, for example, is reported via the ENO enable output for mathematical functions.

In STEP 7 TIA Portal, the ENO enable output is disabled by default in the programming languages LAD and FBD. If needed, you can activate the enable output and thereby deliberately target the instructions for which you want to have error evaluation.

This gives you the following advantages:

- The performance increases with ENO disabled.
- Runtime errors do not cause the CPU to go to STOP when ENO is enabled.

#### Procedure in STEP 7 TIA Portal

Proceed as follows to activate the EN/ENO mechanism of an instruction:

1. In your program, right-click the instruction at which you want to activate the EN/ENO mechanism.
2. Select the "Generate ENO" command from the shortcut menu.  
The ENO value is generated for the instruction. Other instructions are inserted with the enable output.

The tables below list the instructions for which ENO enable output can be disabled:

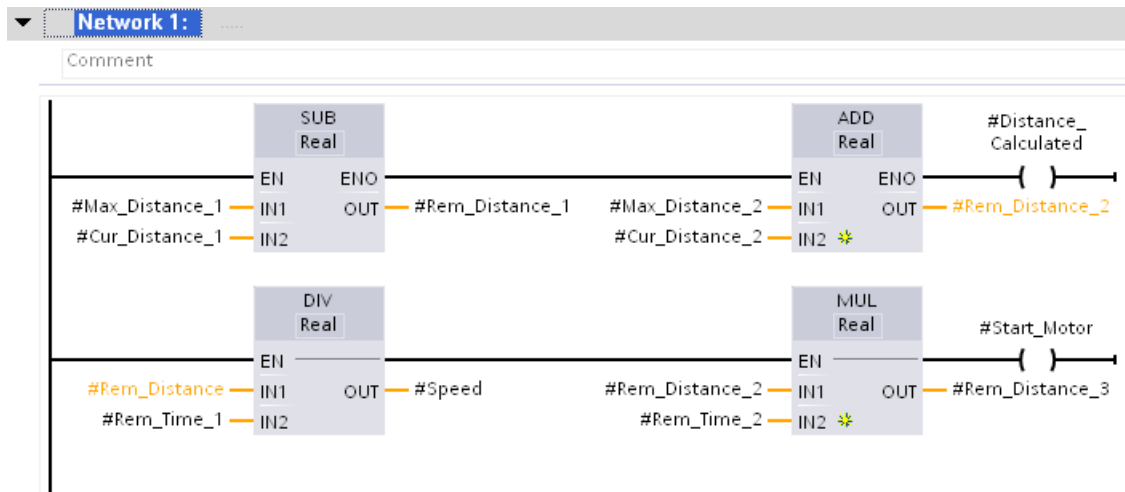

Basic instructions	
Math functions	ADD, SUB, MUL, DIV, MOD, INC, DEC, ABS, NEG, SQR, SQRT, LN, EXP, SIN, COS, TAN, ASIN, ACOS, ATAN, FRAC, EXPT, MIN, MAX, LIMIT, CALCULATE
Move operations	MOVE, SWAP, MOVE_BLK, UMOVE_BLK, FILL_BLK, UFILL_BLK, MOVE_BLK_VARIANT
Conversion operations	CONVERT, ROUND, CEIL, TRUNC, FLOOR, NORM_X, SCALE_X
Word logic operations	AND, OR, XOR, INV, DECO, ENCO
Shift and rotate	SHR, SHL, ROR, ROL

Extended instructions	
String + Char	CONCAT, LEFT, RIGHT, MID, DELETE, INSERT, REPLACE, FIND, LEN, S_CONV
Date and time	T_CONV

You can find additional information on the EN/ENO mechanism in each programming language under "See also".

## Programming example

The following example shows you how to use instructions with the ENO enable output enabled and disabled:

If you have activated the ENO enable output, for example with the SUB instruction, all subsequent instructions are also applied with an activated enable output. If an arithmetic error occurs during the execution of the SUB instruction, the ADD instruction is not executed.

The ENO enable output is disabled for the DIV instruction in the second branch. If a runtime error occurs during execution, the MUL instruction is executed anyway.

### 4.3.5 Using MOVE instructions in STL

#### Possible applications

You can now program with MOVE instructions in STL on an S7-1500 CPU.

This gives you the following advantages:

- The program structure is easier to create.
- The performance of the CPU increases.

#### Programming in STEP 7 V5.x

In STEP 7 V5.x, you used the "BLKMOV: Move block" and "UBLKMOV: Move block uninterruptible" system functions to implement the MOVE functionality.

### Procedure in STEP 7 TIA Portal

The following new MOVE instructions are available in STEP 7 TIA Portal:

- MOVE: Move value
- MOVE\_BLK: Move block
- MOVE\_BLK\_VARIANT: Move block
- UMOVE\_BLK: Move block uninterruptible

You can find additional information on the new MOVE instructions under "See also".

### Programming example

The following example shows you how the "MOVE\_BLK instruction works: Move block". An array block is copied into another array block:

Data_DB		
	Name	Data type
1	Static	
2	Array_1	Array [0..10] of Int
3	Array_1[0]	Int
4	Array_1[1]	Int
5	Array_1[2]	Int
6	Array_1[3]	Int
7	Array_1[4]	Int
8	Array_1[5]	Int
9	Array_1[6]	Int
10	Array_1[7]	Int
11	Array_1[8]	Int
12	Array_1[9]	Int
13	Array_1[10]	Int
14	Array_2	Array [0..10] of Int
15	Array_2[0]	Int
16	Array_2[1]	Int
17	Array_2[2]	Int
18	Array_2[3]	Int
19	Array_2[4]	Int
20	Array_2[5]	Int
21	Array_2[6]	Int
22	Array_2[7]	Int
23	Array_2[8]	Int
24	Array_2[9]	Int
25	Array_2[10]	Int

```
▼ Network 1: .....  
Comment  
-----  
1 | CALL MOVE_BLK  
2 |   Int  UInt  
3 |   IN   := "Data_DB".Array_1[0]  
4 |   COUNT := 10  
5 |   OUT  := "Data_DB".Array_2[0]  
6 |  
7 |
```

Using the MOVE\_BLK instruction, ten elements from "Array\_1" of the "Data\_DB" data block are copied into "Array\_2" of the same data block.

### 4.3.6 Implementing array access with a variable index

#### Advantages of the variable index

For addressing the components of an array, you can specify tags of the integer data type as well as constants as the index. Integers with lengths up to 32 bits are allowed here. When tags are used, the index is calculated during runtime. You can, for example, use a different index for each cycle in program loops. You can also access an array within a PLC data type.

This gives you the following advantages:

- No addressing with address registers or with self-assembled pointers, for example, an ANY pointer, is necessary.
- More flexibility within your program.
- The variable index is available in all STEP 7 programming languages.
- It uses the existing names of data blocks and array tags. This improves readability of the program code.
- The start address of the array does not have to be known.
- The program code is easier to write.
- The compiler generates optimized program code.

#### Procedure in STEP 7 V5.x

In STEP 7 V5.x, you had to use an address register with the help of a self-configured POINTER for indexed addressing of array elements. The SCL programming language already supported indirect addressing with variable index.

**Programming example in STEP 7 V5.x**

The "Data\_classic" data block is required for the following STL example. To address an element of the "Quantities" array, the following commands must be used:

STL	Explanation
OPN "Data_classic"	// The "Data_classic" data block is called.
L #index	// The value of the local tag #index is loading in accumulator 1.
SLD 3	// Move bits 0 to 31 of accumulator 1 by 3 positions to the left. // Fill the now empty bit places with zeros.
LAR1	// Load address register 1 with contents of accumulator 1.
L DBW [AR1, P#10.0]	// Load the array element addressed with #index into accumulator 1. // P#10.0 = Start address of the array

You need to consider the following with this procedure, however:

- The array name is not used. This reduces the readability of the program code and makes it necessary to add a comment.
- The start address of the array (P#10.0) must be known to perform the addressing.
- The indexed addressing must involve the use of the address register.

**Programming example in STEP 7 TIA Portal**

The following syntax is used for indirect indexing of the "Quantities" array that was declared in the "Data\_DB" data block:

"Data_DB".Quantities["i"]	// One-dimensional array
"Data_DB".Quantities["i"].a	// One-dimensional array of STRUCT
"Data_DB".Quantities["i","j"]	// Multi-dimensional array
"Data_DB".Quantities["i","j"].a	// Multi-dimensional array of STRUCT

Part	Description
Data_DB	Name of the data block in which the array is located
Quantities	Tag of the Array data type
i, j	PLC tags of the integer data type that are used as pointers
a	Additional partial tag of the structure

The following example shows indirect indexing of an array component in STL.

You need another program line for addressing an array element:

Addressing in STL	Explanation
L "Data_DB".Quantities[#index]	// The value of the array element #index is loaded directly from the data block into accumulator 1.

Note the following to get the best performance:

- Declare tags that are used as an array index as an integer of less than or equal to 32 bits.
- Store intermediate results and array indexes in the temporary local data area.

### 4.3.7 Using PLC data types (UDT)

#### Advantages of the PLC data types

PLC data types (UDT) are data structures that you define and that can be used multiple times within the program. The structure of a PLC data type is made up of several components, each of which can contain different data types. You define the type of components in the declaration of the PLC data type. By using PLC data types, you can optimally exploit the high performance of the S7-1500 CPU.

Many programs require contiguous data records that have to be processed by different locations in the program. They are optimized or replaced as the program runs. These are, for example:

- Data records for material tracking
- A parameter set for a motor setting
- Various recipes

This gives you the following advantages:

- PLC data type elements can also be addressed indirectly, which means the address is variable and is first calculated in runtime.
- Tags based on a PLC data type inherit all properties of the PLC data type.
- Modifying the PLC data type results in automatic adjustment of all tags derived from it.
- Using universal symbolism makes the program easier to read, because the names of the individual elements of a PLC data type are displayed in the program.
- Increased performance because optimized program code is generated.
- The PLC data type can be passed as a complete structure for a block call.
- Simplified calling interface due to fewer parameters that have to be supplied.

#### Procedure in STEP 7 V5.x

STEP 7 V5.x already gave you the option to create a data record as a structured tag using the STRUCT data type or a PLC data type (UDT). However, the performance was adversely affected by the use of symbolic addressing.

The declaration in the data blocks was mostly implemented as an anonymous structure. The blocks themselves were then programmed to pass the values of the structure as actual

parameters and the calculated values were copied back into the structure. This enabled you to also pass the data block number and use absolute addressing in the block. The number of parameters that you had to supply was often very large. The actual data was stored in the data blocks and the calculated values were passed to other blocks. But no symbolism was available when passing the data block tags.

### Procedure in STEP 7 TIA Portal

If you work with PLC data types in your program, you can assign them to both a formal parameter and an actual parameter. This means you no longer have to declare each individual parameter. If a block has an input parameter that is based on a PLC data type, you must transfer a tag that has the same PLC data type as an actual parameter.

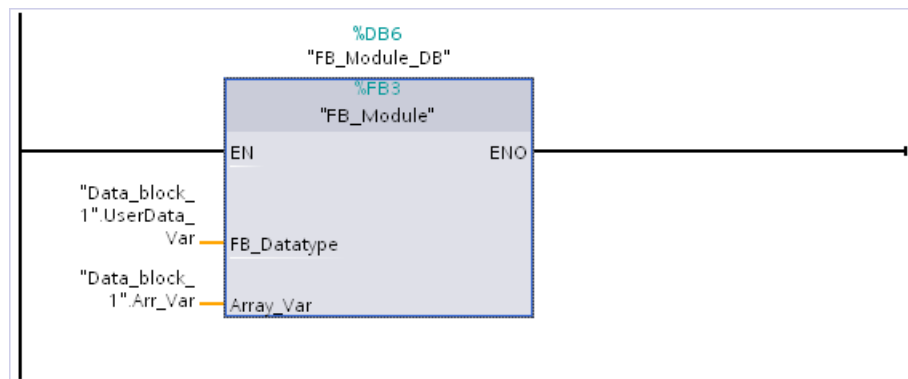

To use a PLC data type, follow these steps:

1. Declare the data records as PLC data type with a suitable name, for example, "Material tracking".
2. Use this data type to declare a data block or a DB tag.
3. Define the formal parameter as VAR\_IN\_OUT / VAR\_IN or VAR\_OUT tag in the block interface.
4. Assign the PLC data type to the formal parameter in the "Data type" column.

### Programming example in the TIA portal

The following example shows the call and the parameter assignment of a function block (FB) with two formal parameters. The data type of the DB tag (Array [1 .. 10] of BOOL) and the PLC data type (UDT) are identical to the data types of the FB parameters.

Data_block_1			
	Name	Data type	Start value
1	Static		
2	Arr_Var	Array [1..10] of Bool	
3	UserData_Var	"UserDataType"	
4	Var1	Bool	false
5	Var2	Bool	false
6	ByteVar1	Byte	16#0
7	WordVar1	Word	16#0
8	IntVar1	Int	0
9	RealVar1	Real	0.0

Declare the "UserData\_Type" PLC data type in the project tree in the "PLC data types" folder. Then use it as a data type for the "UserData\_Var" tag. You declare both tags "UserData\_Var" and "Arr\_Var" in the "Data\_block\_1" data block and use them to supply the parameters of the "FB\_Module" block.

### 4.3.8 Querying and fixing errors in the program code

#### Error handling in the TIA Portal

Various error scenarios can occur within the program code during runtime. These can involve, for example, an access error or an overflow in mathematical operations. If you do not catch such a runtime error using a program code sequence within your program, the CPU reacts as follows in the event of an error, depending on the model:

- CPU S7-1200:
  - The CPU remains in RUN mode and writes an entry to the diagnostic buffer.
- CPU S7-1500:
  - When a programming error occurs, the CPU goes to STOP mode and writes an entry to the diagnostic buffer.
  - With an I/O access error, the CPU remains in RUN mode and writes an entry to the diagnostic buffer.

To be able to respond appropriately to possible errors, in addition to global error handling (for example, the use of the organization blocks "Programming error OB" or "I/O access error OB"), we recommend that you implement local error handling in your program (for example, use an EN/ENO mechanism, the parameters RET\_VAL, STATUS and ERROR, or the instructions "GET\_ERROR"/"GET\_ERR\_ID").

---

#### Note

##### STL programming language

In STL, you use the BR bit of the status word instead of the EN/ENO mechanism.

---

Global error handling intervenes at the end of each program cycle, while local error handling is capable of intervening immediately after an error occurs.

**Note**

**BR bit and EN/ENO mechanism as first indicator**

A first indicator for an error can be either the BR bit of the status word or the ENO enable output. If these return signal state "0", there is an error in the execution of the instruction. Signal state "1" indicates that there is no error and no further error analysis is necessary.

**Options for local error handling**

The following options for local error handling of programming and access errors are available:

Error handling method	Validity	Explanation
EN/ENO mechanism	S7-1200/1500	You can use the ENO enable output to detect and handle runtime errors. Execution of subsequent instructions depends on the signal state of this parameter. You can avoid program crashes by using the EN/ENO mechanism. The block status is passed on in the form of a Boolean tag.
Output parameter RET_VAL	S7-1200/1500	Using the RET_VAL parameter as the return value of system functions (SFCs), you can display general error codes that may relate to any instruction or specific error codes that apply only to the instruction at hand. A maximum of one tag of the data type INT or WORD can be output. This error handling method is suitable for querying a communication error or incorrect data access, for example.
Output parameters STATUS and ERROR	S7-1200/1500	Using the STATUS and ERROR parameters as return values of system function blocks (SFBs), you can query device-specific error information. The error information is output in a pre-defined structure.
Instructions "GET_ERROR" and "GET_ERR_ID"	S7-1200/1500	The instructions give you the opportunity to obtain an error ID or detailed error information. You can use the error information for an access error, for example, to determine the parameter that caused the access error. In order for the instructions to output the required error information, they must be programmed in the user program for each individual block from which potential errors are to be evaluated. This option is ideal especially for custom libraries with error handling. If you work with the "GET_ERROR" or "GET_ERR_ID" instructions, no error OB is called and there is no entry in the diagnostic buffer. With this method of error handling, you actively intervene in the program sequence when an error occurs.
BR bit of the status word	S7-1200/1500	Using the BR bit of the status word, you can determine whether an error occurred when the instruction was executed. (BR bit = "0" => An error has occurred; BR bit = "1" => No error has occurred)

 <b>WARNING</b>
<p><b>Output parameter RET_VAL</b></p> <p>When errors occur in the supply of the input parameters during the execution of the instruction that contains the RET_VAL parameter, an invalid error code is output at the RET_VAL parameter and the output parameters of the instruction cannot be evaluated.</p>

## Example

The above-mentioned local error handling options can be programmed individually or in combination with one another. To ensure that each error scenario that can occur within your program is recognized, we recommend a combination of local error handling options, as shown in the example below.

For a more precise error analysis, in addition to the RET\_VAL output parameter you can also use the instructions "GET\_ERROR" or "GET\_ERR\_ID". These options provide you with error codes, the detailed explanations of which are available in the descriptions of the respective instructions.

There are also error scenarios in which the RET\_VAL output parameter does not output a valid error code. If an access error occurs while reading an input parameter, for example, the outputs of the instruction are no longer written, because the execution of the instruction is interrupted. In this case, we recommend that you integrate the two instructions "GET\_ERROR" and "GET\_ERR\_ID" in your program because they provide reliable error information even when this type of error occurs.

 **WARNING**

**Access error when reading an input parameter**

The RET\_VAL parameter does not return a valid error code and no detailed error information is output to the diagnostic buffer.

The following example shows you how you can recognize an access error when reading an input parameter:

Interface			
	Name	Data type	Default value
1	Input		
2	SrcField	Array [1..100] of Real	
3	index	DInt	0
4	<Add new>		
5	Output		
6	TagOutput	Real	0.0
7	Test2	Bool	false
8	TagRet_Val	Int	0
9	DestField	Array [0..20] of Real	
10	Test3	Bool	false
11	<Add new>		
12	InOut		
13	Static		
14	Temp		
15	TagError_ID	Word	

In network 1, the instruction "MOVE\_BLK\_VARIANT": Move block" is called. The "SrcField" source area is accessed at the SRC parameter using a variable index. If no errors occur during the execution of the instruction, the ENO enable output returns signal state "1", and program execution jumps to network 4 and continues there.

If an access error occurs during the execution of the instruction, for example, due to the variable index, the instruction "GET\_ERR\_ID: Get error ID locally" in network 2 returns an error ID. The comparison of the error ID for "NOT EQUAL" with the value "0" returns the result "Test2" = TRUE.

The #TagRet\_Val operand at the RET\_VAL output parameter returns no valid error code in this case.

Evaluating errors with output parameter RET\_VAL (Page 1796)

## 4.3.9 Using VARIANT instructions

### The VARIANT data type

The VARIANT data type can be used to create generic function blocks or functions. It is used to interconnect the parameters of the block to tags of any type when called. Parameters of the VARIANT data type can be declared in the sections VAR\_IN, VAR\_IN\_OUT and VAR\_TEMP.

When the block is called, the type information of the tag is passed in addition to a pointer to the tag. The code of the block can then be executed according to its type with regard to the tags passed during runtime.

If, for example, a block parameter of a function has the VARIANT data type, then a tag of the integer data type can be passed at one point in the program, and a tag of the PLC data type can be passed at another point in the program. With the help of the VARIANT instructions, the function is then in a position to react to the situation without errors.

### Procedure in the S7-300/400

The ANY data type can be used as follows for CPUs of the S7-300/400 series:

- In SCL and STL, memory of any kind can be passed at a block call when a pointer of the ANY data type has been programmed at a block parameter.  
However, important information about the structure of the memory is lost because the ANY pointer does not store the information that it points to a tag of the PLC data type, for example. The ANY pointer sees this as an ARRAY of BYTE.
- Parameters of the ANY data type can be passed to system function blocks (SFBs) or system functions (SFCs).
- In combination with the ANY data type, you can use the instruction "BLKMOV: Move block" to copy data of any data type in the program.

The ANY data type has the following restrictions:

4.3 Programming recommendations

- The ANY pointer has to manually constructed.
- No data with optimized block access can be passed.
- The ANY pointer cannot point to structures.

**Procedure in S7-1500**

In the TIA Portal, we recommend that you use the VARIANT data type instead of the ANY pointer.

Advantages of the VARIANT data type:

- Using the VARIANT data type, it is possible to write programs that perform dynamic type definition, i.e. integrated type checking during runtime of the program.  
The VARIANT data type loses the information about the data type of the tag to which it points. In other words, if the block parameter of a function of the VARIANT data type is supplied with a PLC data type, you can check within the function during runtime whether VARIANT points, for example, to "myUDTa" or "myUDTb".
- The VARIANT pointer can also be constructed symbolically. This improves the readability of your program code. You can find more information on the advantages of symbolic addressing here: Symbolic addressing (Page 217)
- Any data can be passed at a parameter of the VARIANT data type.
- The data type of the actual parameter to which the VARIANT points is determined during runtime. This gives you the possibility to program different responses in the program code depending on the data type of the actual parameter.

You can find more information about working with the VARIANT data type in the Siemens Industry online support under: Indirect addressing with the VARIANT data type (<http://support.automation.siemens.com/WW/llisapi.dll?aktprim=0&lang=en&referer=%2fWW%2f&func=cslib.csinfo&siteid=csius&groupid=4000002&extranet=standard&viewreg=WW&nodeid=29156492&objaction=csopen>)

The TIA Portal provides, among others, the following instructions of the VARIANT data type as parameters:

Basic instructions		
Programming language	Instruction	Description
LAD/FBD comparator operations	EQ_Type	Compare data type for EQUAL with the data type of a tag
	NE_Type	Compare data type for UNEQUAL with the data type of a tag
	EQ_ElemType	Compare element data type for EQUAL with the data type of a tag
	NE_ElemType	Compare element data type for UNEQUAL with the data type of a tag
	IS_NULL	Compare for EQUALS ZERO
	NOT_NULL	Compare for UNEQUALS ZERO
	IS_ARRAY	Check for ARRAY
SCL comparator operations	TypeOf	Check data type of a VARIANT tag
	TypeOfElements	Check element data type of a VARIANT tag
	IS_ARRAY	Check for ARRAY
LAD/FBD/SCL/GRAPH move operations	VariantGet	Read out VARIANT tag value
	VariantPut	Write VARIANT tag value

Basic instructions		
Programming language	Instruction	Description
	CountOfElements	Get number of ARRAY elements
LAD/FBD/STL/SCL/GRAPH move operations	ReadFromArrayDB	Read from the array data block
	WriteToArrayDB	Write to the array data block
	ReadFromArrayDBL	Read from the array data block in the load memory
	WriteToArrayDBL	Write to array data block in the load memory
	BLKMOV	Move block
	UBLKMOV	Move block uninterruptible
	FILL	Fill block
	Deserialize	Move data type from ARRAY of BYTE (Deserialize)
	Serialize	Move data type to ARRAY of BYTE (Serialize)
	MOVE_BLK_VARIANT	Move block
SCL move operations	READ_LITTLE	Read data in little endian format
	WRITE_LITTLE	Write data in little endian format
	READ_BIG	Read data in big endian format
	WRITE_BIG	Write data in big endian format
LAD/FBD/STL/SCL conversion operations	VARIANT_TO_DB_ANY	Convert VARIANT to DB_ANY
	DB_ANY_TO_VARIANT	Convert DB_ANY to VARIANT

You can find additional instructions with the VARIANT data type in the online help under "Extended instructions".

## Example

The following example in the SCL programming language shows you a queue (FIFO, First In First Out), which works with elements of any data type. Programmed using the instructions described above.

Declaration of the block interface of the "FIFOQueue" function block:

Declaration	Parameters	Data type	Comment
Input	request	BOOL	The instruction is executed when a positive signal edge is detected at the "request" parameter.
	mode	BOOL	0 = The first entry in the ring buffer is returned. 1 = An entry is written at the last position in the ring buffer.
	initialValue	VARIANT	Value with which the ARRAY of the ring buffer is initialized.
Output	error	INT	Error information

4.3 Programming recommendations

Declaration	Parameters	Data type	Comment
InOut	item	VARIANT	The entry that is either returned from the ring buffer or written to the ring buffer.
	buffer	VARIANT	An ARRAY that is used as a ring buffer.
Static	edgeupm	BOOL	Edge memory bit in which the RLO of the previous query is saved.
	firstItemIndex	INT	Index of the oldest entry in the ring buffer
	nextEmptyItemIndex	INT	Index of the next free entry in the ring buffer
Temp	edgeup	BOOL	Result of edge evaluation
	internalError	INT	Error information
	newFirstItemIndex	INT	Variable index
	newNextEmptyItemIndex	INT	Variable index
	bufferSize	UDINT	Number of ARRAY elements in the ring buffer

Program code of the "FIFOQueue" function block:

```
(* This program code section is only executed once after a positive signal edge. If there
is no change in the signal state of the RLO, the program execution of the "FIFOQueue" FB
ends. *)
#edgeup := #request & NOT #edgeupm;
#edgeupm := #request;
IF NOT (#edgeup) THEN
    RETURN;
END_IF;

// -----Validation of whether all parameter inputs are valid.-----
(* This program code section checks whether the ring buffer is an ARRAY. If so, the number
of the ARRAY elements is read out. If it is not an ARRAY, the program execution is
terminated at this point and the error code "-10" is output. *)
IF NOT (IS_ARRAY(#buffer)) THEN
    #error := -10;
    RETURN;
ELSE
    #bufferSize := CountofElements(#buffer);
END_IF;

(* This program code section checks whether the data type of the ARRAY elements matches the
data type of the entry (tag #item). If the data types do not match, the program execution
is terminated at this point and the error code "-11" is output. *)
```

```
IF NOT (TypeOf(#item) = TypeOfElements(#buffer)) THEN
    #error := -11;
    RETURN;
END_IF;

(* This program code section checks whether the initial value of the ring buffer matches
the entry (tag #item). If the data types do not match, the program execution is terminated
at this point and the error code "-12" is output. *)
IF NOT (TypeOf(#item) = TypeOf(#initialValue)) THEN
    #error := -12;
    RETURN;
END_IF;

(* This program code section checks whether the variable indices are within the ARRAY
limits. If they are not, the program execution is terminated at this point and either error
code "-20" or "-21" is output depending on the index. *)
IF (#nextEmptyItemIndex >= #bufferSize) THEN
    #error := -20;
    RETURN;
END_IF;
IF (#firstItemIndex >= #bufferSize) THEN
    #error := -21;
    RETURN;
END_IF;

//-----Program code execution, depending on the Mode parameter-----
// The execution of the instructions depends on the signal state of the Mode parameter.
IF #mode = 0 THEN

// If the Mode parameter has the signal state "0", the first entry from the passed ring
buffer is returned.
(* This program code section checks whether the ring buffer is empty. If this is the case,
program execution is terminated at this point and the error code "-40" is output. *)
    IF (#firstItemIndex = -1) THEN
        #error := -40;
        RETURN;
    END_IF;

// This program code section returns the first entry of the ring buffer.
    #internalError := MOVE_BLK_VARIANT(SRC := #buffer,
        COUNT := 1,
        SRC_INDEX := #firstItemIndex,
        DEST_INDEX := 0,
        DEST => #item);
```

```
IF (#internalError = 0) THEN
(* This program code section checks whether the ring buffer contains ARRAY elements. If it
does, the first entry is passed further on and the index is incremented by 1. *)
  #internalError := MOVE_BLK_VARIANT(SRC := #initialValue,
                                     COUNT := 1,
                                     SRC_INDEX := 0,
                                     DEST_INDEX := #firstItemIndex,
                                     DEST => #buffer);

// This program code section calculates the new index of the first entry.
  #newFirstItemIndex := #firstItemIndex +1;
  #newFirstItemIndex := #newFirstItemIndex MOD #bufferSize;

// This program section checks whether the ring buffer is empty.
  IF (#nextEmptyItemIndex = #newFirstItemIndex) THEN
// If the ring buffer is empty, the index is set to 0.
  #firstItemIndex := -1;
  #nextEmptyItemIndex := 0;
  ELSE
// The index of the first entry is changed.
  #firstItemIndex := #newFirstItemIndex;
  END_IF;
  END_IF;
ELSE

// If the Mode parameter has the signal state "1", the entry is written to the passed ring
buffer.
(* This program code section checks whether the ring buffer is full. If this is the case,
program execution is terminated at this point and the error code "-50" is output. *)
  IF (#nextEmptyItemIndex = #firstItemIndex) THEN
    #error := -50;
    RETURN;
  END_IF;

// This program code section writes the entry to the ring buffer.
  #internalError := MOVE_BLK_VARIANT(SRC := #item,
                                     COUNT := 1,
                                     SRC_INDEX := 0,
                                     DEST_INDEX := #nextEmptyItemIndex,
                                     DEST => #buffer);

  IF (#internalError = 0) THEN
```

```
// This program code section increments the index by 1 and calculates the new empty entry
index.
    #newNextEmptyItemIndex := #nextEmptyItemIndex +1;
    #newNextEmptyItemIndex := #newNextEmptyItemIndex MOD #bufferSize;
    #nextEmptyItemIndex := #newNextEmptyItemIndex;

(* This program code section checks which index the "#firstItemIndex" tag has. If the number
= -1, the ring buffer is initialized and the entry is written to the ring buffer. Therefore,
"0" must be assigned to the tag. *)
    IF (#firstItemIndex = -1) THEN
        #firstItemIndex := 0;
    END_IF;
END_IF;

//-----Local error handling-----
(* This program code section checks whether a local error has occurred. If this is the case,
program execution is terminated at this point and the error code "-100" is output. *)
IF (#internalError > 0) THEN
    #error := -100;
    RETURN;
END_IF;

// If no error occurred during program execution, the error code "0" is output.
#error := 0;
```

## First steps

### 5.1 Getting Started Documentation

#### Getting started with the TIA Portal

The Getting Started documentation is available to help you begin using the TIA portal.

The Getting Started documentation contains instructions which show you, step-by-step how to create a project in the TIA portal and give you the chance to get a quick overview of all the possibilities the TIA portal offers you.

#### Contents

The Getting Started documents describe the creation of a single, continuous project for STEP 7 and WinCC that is extended with each chapter. You start with simple basic functions, and use more complex ones as you continue with the creation of the project.

In addition to the step-by-step instructions, the Getting Started documents also give you background information that explains the functions used and illustrate how they relate to each other.

#### Target audience

The Getting Started documents are intended for beginners, but are also useful for users migrating from a previous version of SIMATIC STEP 7 and WinCC.

#### Download

The documentation is available, free of charge at the Service&Support (<https://support.automation.siemens.com>) portal in PDF form.

You can download the documents here:

- STEP 7 Basic and WinCC Basic (V10.5) (<http://support.automation.siemens.com/WWW/view/en/40263542/0/en>)
- STEP 7 Professional and WinCC Advanced (V11) (<http://support.automation.siemens.com/WWW/view/en/28919804/133300>)
- STEP 7 Professional and WinCC Advanced (V12) ([http://www.automation.siemens.com/salesmaterial-as/interactive-manuals/getting-started\\_simatic-s7-1500/\\_content/EN/content\\_en.html](http://www.automation.siemens.com/salesmaterial-as/interactive-manuals/getting-started_simatic-s7-1500/_content/EN/content_en.html))

## Introduction to the TIA Portal

### 6.1 User interface and operation

#### 6.1.1 Starting, setting and exiting the TIA Portal

##### 6.1.1.1 Starting and exiting the TIA Portal

#### Starting the TIA Portal

Follow the steps below to start the TIA Portal:

1. In Windows, select "Start > Programs > Siemens Automation > TIA Portal V13".  
The TIA Portal opens with the last settings used.

#### Exiting the TIA Portal

Follow the steps below to exit the TIA Portal:

1. In the "Project" menu, select the "Exit" command.  
If the project contains any changes that have not been saved, you will be asked if you wish to save them.
  - Select "Yes" to save the changes in the current project and close the TIA Portal.
  - Select "No" to close the TIA Portal without saving the most recent changes in the project.
  - Select "Cancel" to cancel the closing procedure. The TIA Portal will remain open if you select this option.

##### 6.1.1.2 Overview of the program settings

#### Overview

The following table shows the application settings that you can make:

Group	Setting	Description
General settings	User name	The user name of the user. The user name is stored in the project properties when a new project is created.
	User interface language	Language for the program interface

6.1 User interface and operation

Group	Setting	Description
	Mnemonic	Specifies the mnemonics for programming: "German" uses the German mnemonics, for example, "E1.0". "International" uses international mnemonics, for example, "I1.0". For information on the differences in the mnemonics of the individual commands, refer to the description of the relevant programming language.
	Show list of recently used projects	Number of entries in the list of recently used projects in the "Project" menu
	Load most recent project during startup	The last opened project is opened automatically after the TIA Portal starts.
	Displaying truncated text in full	Texts which are truncated due to their length are displayed in a tooltip.
	Show tooltips (context-sensitive help is available)	Tooltips are displayed and you get context-sensitive help. If this function is disabled, you can open the tooltip with <F1>.
	Open cascade automatically in tooltips	After a brief time, the tooltips automatically expand to display a cascade containing additional help. If this option is cleared, the tooltips must be manually expanded.
Reset to default	All application settings	All changes that you made in the TIA Portal after installation are reversed.
	Layout of the editors	Resets the complete layout of the application to the factory state.
	Show all message windows	All message windows whose appearance was manually suppressed are displayed again.
Start view	Most recent view	Starts the program in the last view that was used. This can be either the portal view or the project view.
	Portal view	The TIA Portal will always be started in the portal view, irrespective of the last view you worked in.
	Project view	The TIA Portal will always be started in the project view, irrespective of the last view you worked in.
View for objects in overview	Details	When several views are available, the detail view opens by default, for example, in the overview window.
	List	When several views are available, the list view opens by default, for example, in the overview window.
	Thumbnails	When several views are available, the symbol view opens by default, for example, in the overview window.
Storage settings	Recently used storage location	When a project is saved the first time, the most recently used file path is set by default.
	Default storage location	Enables the specification of file paths for: <ul style="list-style-type: none"> <li>• Projects</li> <li>• Libraries</li> <li>• Configuration file for corporate libraries</li> </ul>
Data exchange	Storage location for data import	Imported files are searched for at this storage path by default.
	Storage location for data export	This is the default storage path for the data export.
	Storage location for support packages	When support packages are downloaded, they are stored in the specified storage path and can be installed from there.
	Storage location for log files	Log files are stored at the location specified here.

### 6.1.1.3 Overview of the script and text editor settings

#### Overview

The following table shows the available settings for script and text editors:

Group	Setting	Description
Font	Font type and size	Sets the font type and size for the text in text editors.
Font colors	Color settings	You can choose the colors for individual text elements from the respective drop-down lists in the text editors. Optional settings are available for the following text elements: <ul style="list-style-type: none"> <li>• Text</li> <li>• Keywords</li> <li>• Comments</li> <li>• Operands</li> <li>• Scripts</li> <li>• Standard functions</li> <li>• Instructions/system functions</li> <li>• Constant strings</li> <li>• Numeric constants</li> <li>• Constant tags</li> <li>• Tags</li> <li>• Object models</li> <li>• Formal parameters</li> </ul>
	Reset to default	Resets all font colors in editors to their factory settings.
Tabs	Tab width	Sets the width of tabs.
	Use tabs	Enables the use of tabs.
	Use spaces	Specifies use of space characters instead of tabs.
Indent	None	Text entries are not automatically indented.
	Block	The lines or the selected paragraph are automatically indented.
	Smart	The lines or the selected paragraph are automatically indented. All unnecessary spaces are also removed.
View	Show white spaces	Shows control characters within a text.
STL (Statement List)	Font type and size	Sets the font type and size for STL program code.
SCL (Structured Control Language)	Show line numbers	Shows the row numbers in SCL programs.

**See also**

Changing the settings (Page 244)

**6.1.1.4 Overview of the print settings**

**Overview**

The following table shows the available settings for printing:

Group	Setting	Description
General	Always print table data as pairs of values	Tables are printed as a list and not in tabular form. The corresponding values are listed for each column. Enable this option, for example, if you want to print a table that is too large for the print area.
Hardware configuration	Active graphic view	The graphics of network and device view are included in the printout.
	Active table	A table associated with an editor is included when printing with the editor.
PLC Programming	Zoom factor	Specifies the size in which blocks are to be printed out.
	With interface	The interfaces of blocks are included in the printout.
	With comments	Comments on blocks are included in the printout.
	With line numbers	The line numbers of the program code are printed for text-based programming languages.
Motion & Technology	Dialog display/graphic	The content of the editor is printed out as a graphic if the editor supports this.
	Table	The parameters of the technology objects are printed out in the form of a table.
HMI screens	Show tab order	In the printout you can specify the order in which the runtime objects can be selected with the TAB key.

**See also**

Changing the settings (Page 244)

**6.1.1.5 Changing the settings**

**Procedure**

To change the settings, proceed as follows:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. Select the "General" group in the area navigation to change the settings described in the previous sections. Or click on one of the other entries in area navigation to make settings for your installed products.
3. Change the settings.

## **Result**

The change will be adopted immediately, there is no need to save it explicitly.

## **See also**

Overview of the program settings (Page 241)

Overview of the script and text editor settings (Page 243)

Overview of the print settings (Page 244)

## **6.1.2 Layout of the user interface**

### **6.1.2.1 Views**

#### **Views**

Three different views are available for your automation project:

- The portal view is a task-oriented view of the project tasks.
- The project view is a view of the components of the project, as well as the relevant work areas and editors.
- The library view (Page 249) shows the elements of the project library and the open global libraries.

You can change over between the two views using a link.

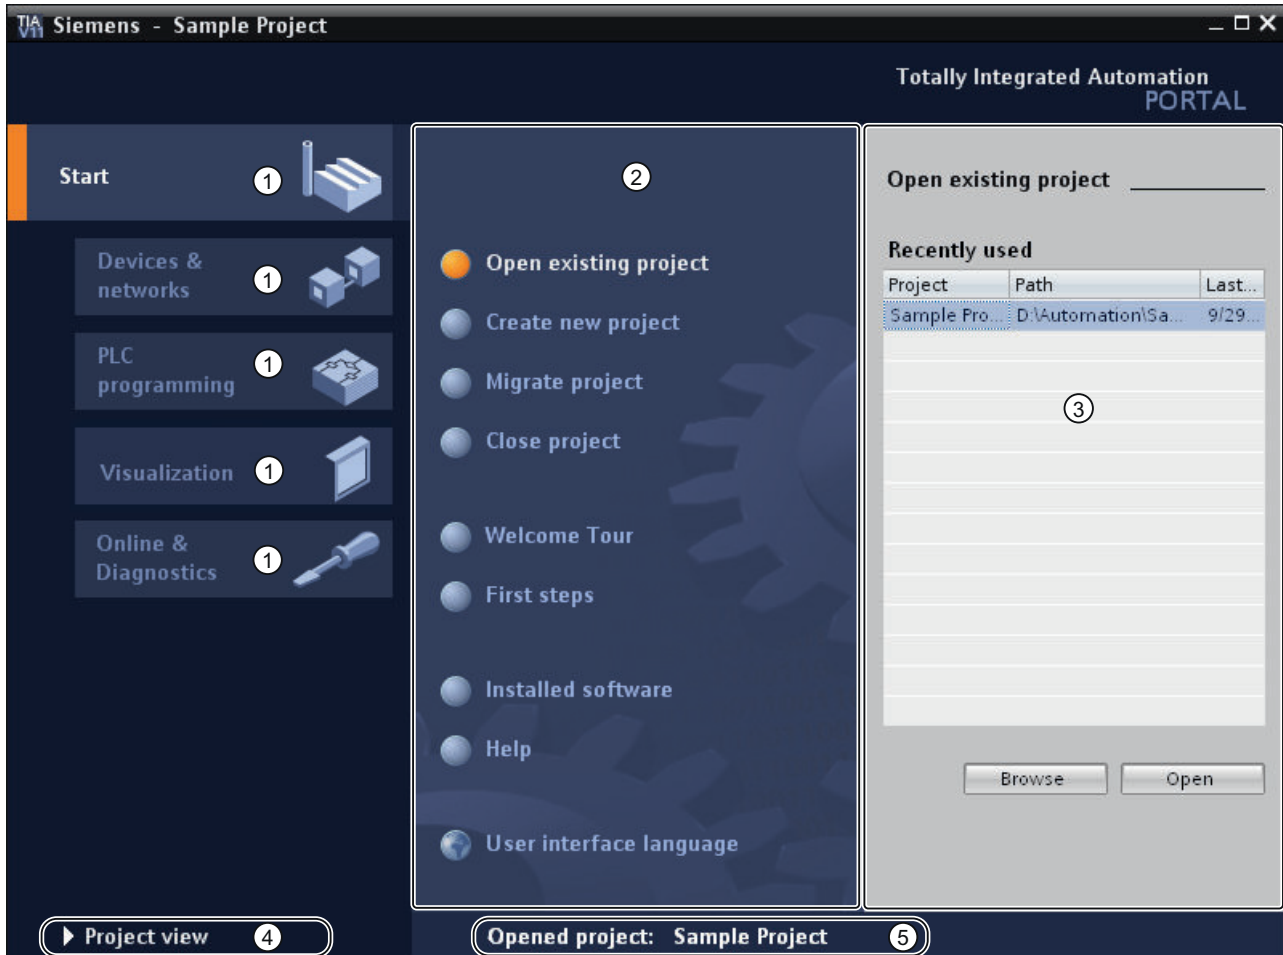

### **6.1.2.2 Portal view**

#### **Purpose of the portal view**

The portal view provides you with a task-oriented view of the tools. Here, you can quickly decide what you want to do and call up the tool for the task in hand. If necessary, the view changes automatically to the project view (Page 247) for the selected task.

### Layout of the portal view

The following figure shows an example of the components in the portal view:

- ① Portals for different tasks
- ② Actions for the selected portal
- ③ Selection panel for the selected action
- ④ Change to the project view
- ⑤ Display of the project that is currently open

### Portals

The portals provide the basic functions for the individual task areas. The portals that are provided in the portal view depends on the products that have been installed.

### Actions for the selected portal

Here, you will find the actions available to you in the portal you have selected. You can call up the help function in every portal on a context-sensitive basis.

### **Selection panel for the selected action**

The selection panel is available in all portals. The content of the panel adapts to your current selection.

### **Change to the project view**

You can use the "Project view" link to change to the project view.

### **Display of the project that is currently open**

Here, you can obtain information about which project is currently open.

### **See also**

- Project tree (Page 250)
- Basics of the work area (Page 253)
- Inspector window (Page 261)
- Basics on task cards (Page 263)
- Details view (Page 267)

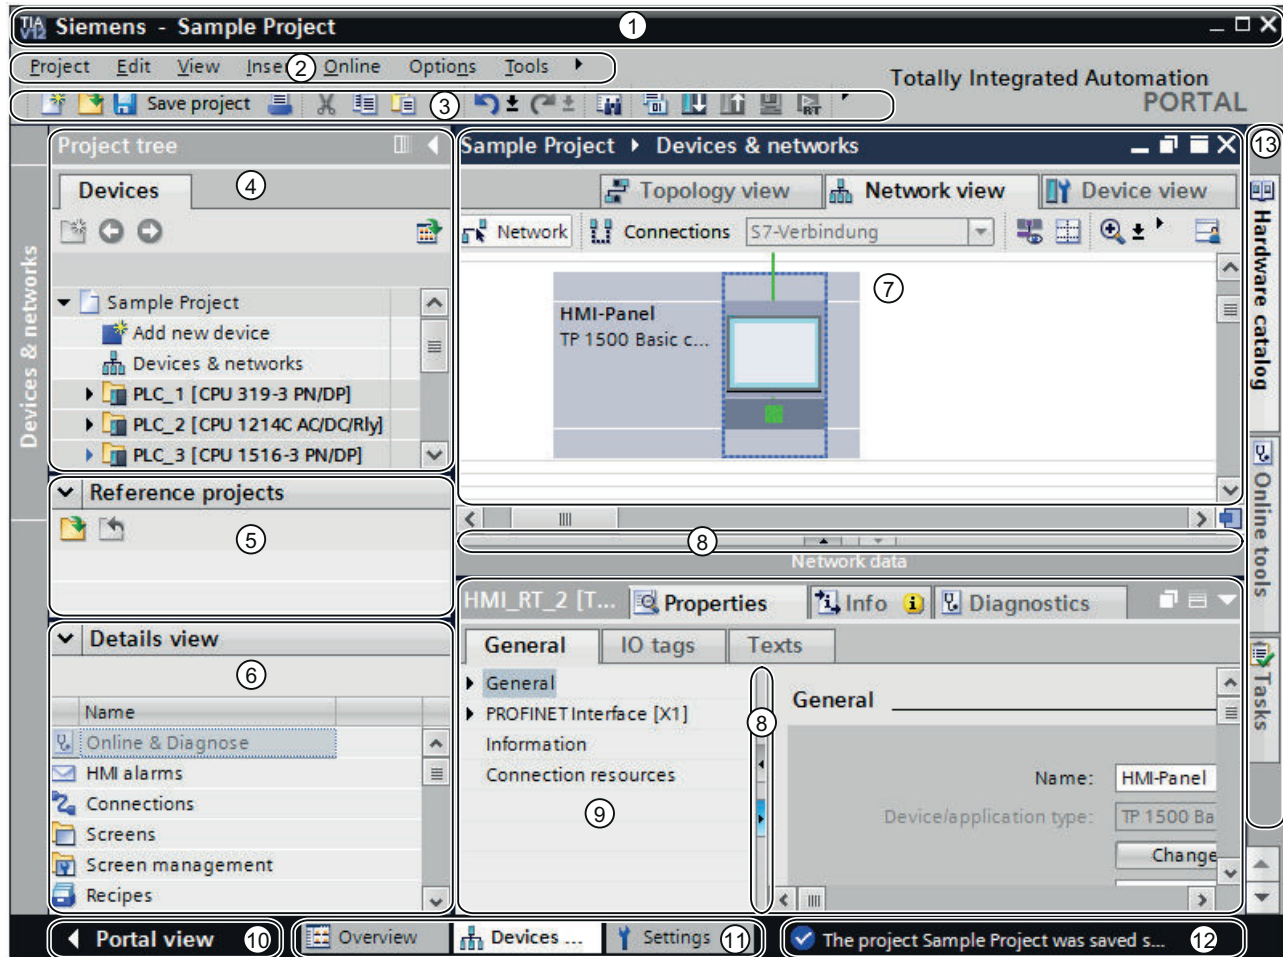

## **6.1.2.3 Project view**

### **Purpose of the project view**

The project view is a structured view of all components of the project.

### Layout of the project view

The following figure shows an example of the components of the project view:

- ① Title bar
- ② Menu bar
- ③ Toolbar
- ④ Project tree (Page 250)
- ⑤ Reference projects (Page 265)
- ⑥ Details view (Page 267)
- ⑦ Work area (Page 263)
- ⑧ Dividers
- ⑨ Inspector window (Page 261)
- ⑩ Changing to the Portal view (Page 245)
- ⑪ Editor bar
- ⑫ Status bar with progress display
- ⑬ Task cards (Page 263)

### **Title bar**

The name of the project is displayed in the title bar.

### **Menu bar**

The menu bar contains all the commands that you require for your work.

### **Toolbar**

The toolbar provides you with buttons for commands you will use frequently. This gives you faster access to these commands.

### **Dividers**

Dividers separate individual components of the program interface. The arrows on the dividers allow you to display and hide the adjacent sections of the user interface.

### **Changing to the portal view**

You can use the "Portal view" link to change to the portal view.

### **Editor bar**

The Editor bar displays the open editors. If you have opened a lot of editors, they are shown grouped together. You can use the Editor bar to change quickly between the open elements.

### **Status bar with progress display**

In the status bar, you will find the progress display for processes that are currently running in the background. This also includes a progress bar that shows the progress graphically. Hover the mouse pointer over the progress bar to display a tooltip providing additional information on the active background process. You can cancel the background processes by clicking the button next to the progress bar.

If no background processes are currently running, the status bar displays the last generated alarm.

### **See also**

Basics of the work area (Page 253)

## **6.1.2.4 Library view**

### **Function of the library view**

The library view provides an overview of the elements in the project library and the open global libraries. You can switch to the library view using the "Libraries" task card.

See also: Overview of the library view (Page 388)

### **6.1.2.5 Project tree**

#### **Function of the project tree**

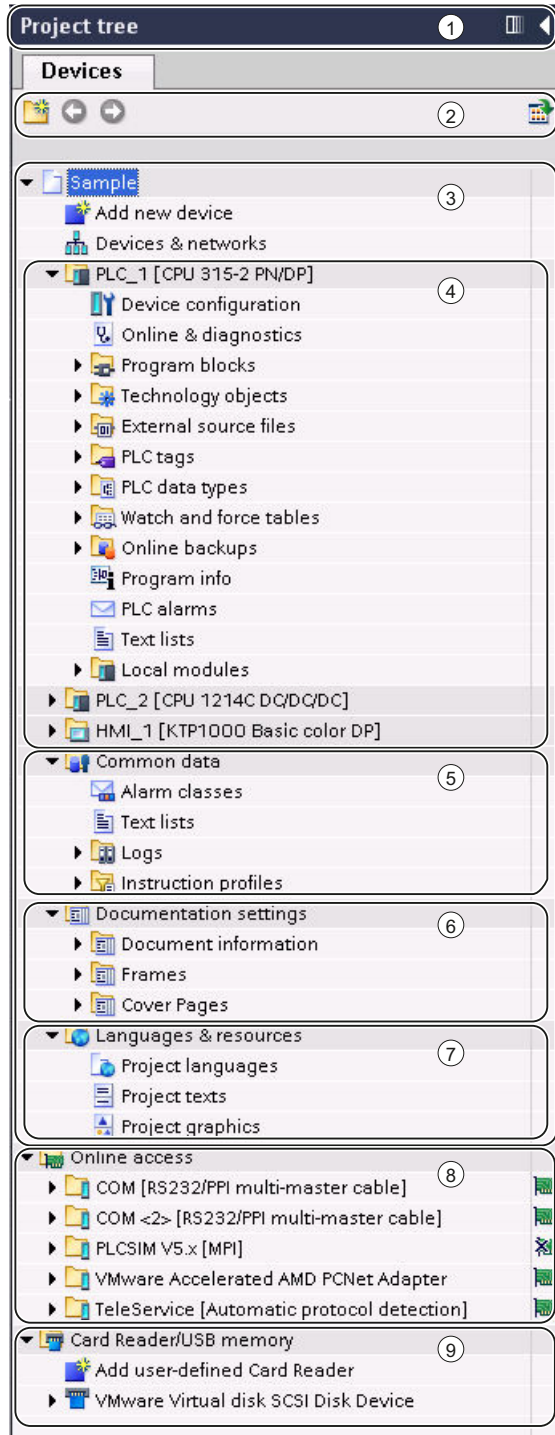

Using the project tree features gives you access to all components and project data. You can perform the following tasks in the project tree:

- Add new components
- Edit existing components
- Scan and modify the properties of existing components

You can select the objects of the project tree either with the mouse or via the keyboard by typing the first letter of the desired object. If more than one object begins with the same letter, the next lower object is selected. The project tree must be the focused user interface element in order for you to select an object with its initial letter.

## Layout of project tree

The following figure shows an example of the project tree components:

## 6.1 User interface and operation

- ① Title bar
- ② Toolbar
- ③ Project
- ④ Devices
- ⑤ Common data
- ⑥ Documentation settings
- ⑦ Languages & resources
- ⑧ Online access
- ⑨ Card Reader / USB memory

### Title bar

The title bar of the project tree has a button for automatically and manually collapsing the project tree. Once it is collapsed manually, the button is "Reduced" to the left-hand margin. It changes from an arrow pointing left to one that is pointing right, and can now be used to reopen the project tree. You can use the "Reduce automatically" button collapse to project tree automatically when you do not need it.

See also: Maximizing and minimizing the work area (Page 255)

### Toolbar

You can do the following tasks in the toolbar of the project tree:

- Create a new user folder; for example, in order to group blocks in the "Program blocks" folder.
- Navigate forward to the source of a link and back to the link itself.  
There are two buttons for links in the project tree. You can use these to navigate from the link to the source and back.
- Show an overview of the selected object in the work area.  
When the overview is displayed, the lower-level objects and actions of the elements in the project tree are hidden.

### Project

You will find all the objects and actions related to the project in the "Project" folder, e.g.:

- Devices
- Languages & resources
- Online access

### Device

There is a separate folder for each device in the project, which has an internal project name. Objects and actions belonging to the device are arranged inside this folder.

## **Common data**

This folder contains data that you can use across more than one device, such as common message classes, logs, scripts and text lists.

## **Documentation settings**

In this folder, you can specify the layout for project documentation to be printed at a later point.

## **Languages & resources**

You can determine the project languages and texts in this folder.

## **Online access**

This folder contains all the interfaces of the programming device / PC, even if they are not used for communication with a module.

## **Card Reader / USB memory**

This folder is used to manage all card readers and other USB storage media connected to the programming device / PC.

## **See also**

Basics on task cards (Page 263)  
Details view (Page 267)

### **6.1.2.6 Work area**

#### **Basics of the work area**

#### **Function of the work area**

The objects that you can open for editing purposes are displayed in the work area. These objects include, for example:

- Editors and views
- Tables

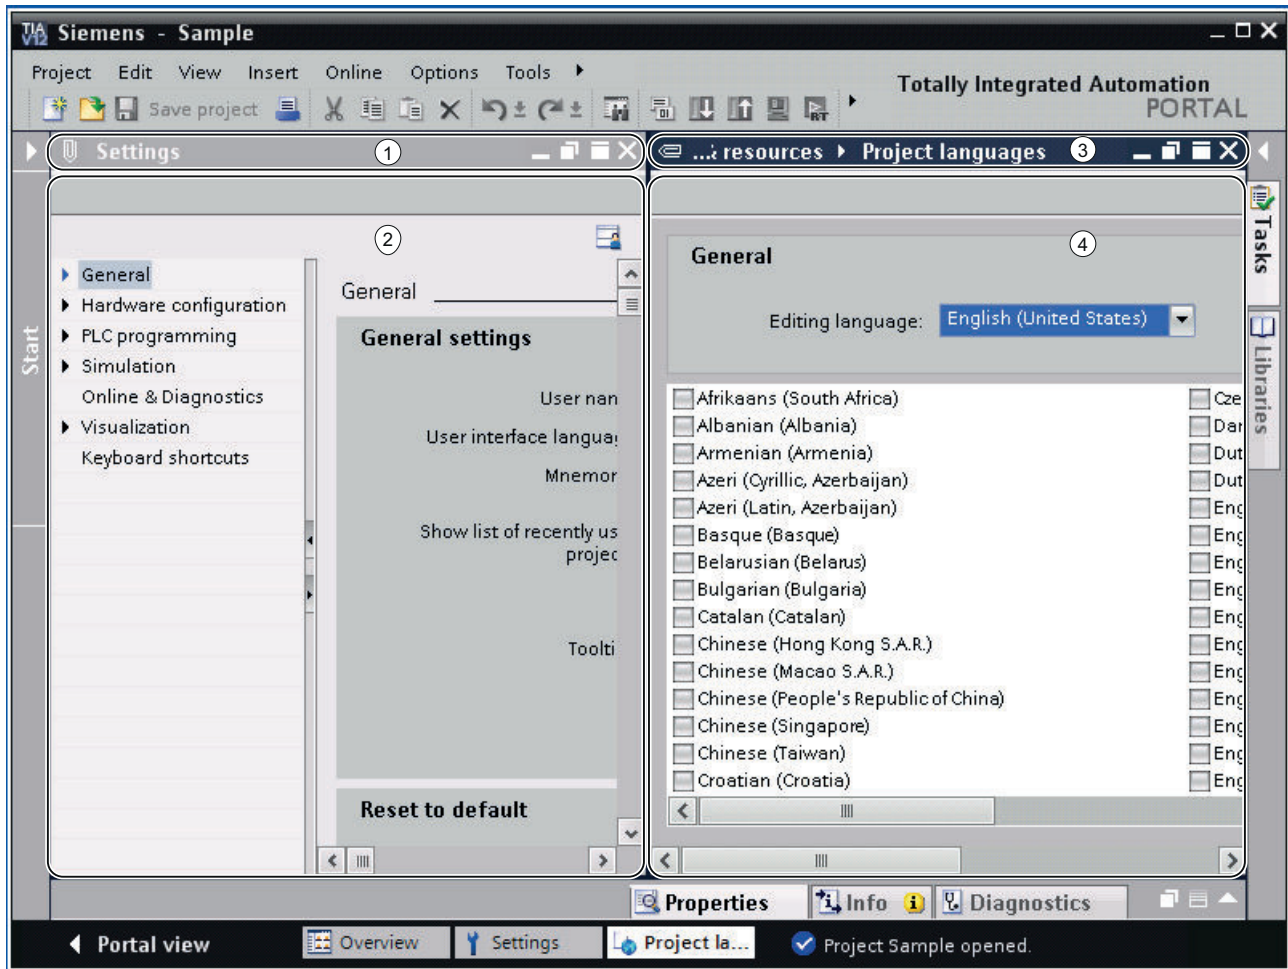

You can open several objects. However, normally it is only possible to see one of these at a time in the work area. All other objects are displayed as tabs in the Editor bar. If, you would

6.1 User interface and operation

like to view two objects at the same time when performing certain tasks, you can tile the work area either horizontally or vertically or undock elements of the work area. If no objects are open, the work area will be empty.

Layout of the work area

The following figure shows an example of a vertically split work area:

- ① Title bar of left-hand editor
- ② Work area of left-hand editor
- ③ Title bar of right-hand editor
- ④ Work area of right-hand editor

## See also

- Maximizing and minimizing the work area (Page 255)
- Splitting the work area (Page 257)
- Floating the work area elements (Page 257)
- Using grouped elements of the work area (Page 258)
- Minimizing and maximizing elements of the work area (Page 260)
- Switching between the elements in the work area (Page 260)
- Saving a layout of editors and tables (Page 274)
- Save user interface layout (Page 272)

## Maximizing and minimizing the work area

You have the option to adapt the work area to make it as large as possible. You can use the following function for this:

- Maximizing the work area  
You can close the task cards, project tree and inspector window with a single click. This increases the size of the work area. You can minimize the work area again at any time in order to return to the previous view.
- Collapsing task cards, project tree, and Inspector window automatically  
You can use the "Collapse automatically" option for the task cards, project tree, and Inspector window. This function causes these items to collapse automatically when you don't need them.

## Maximizing and minimizing the work area

To maximize the work area, follow these steps:

1. Open an element such as an editor or a table.  
The element appears in the work area.
2. Click the "Maximize" button in the title bar of the element.  
The task cards, project tree and inspector window collapse, and the work area is shown with its maximum dimensions.

To minimize the work area again, follow these steps:

## 6.1 User interface and operation

1. Click the "Embed" button in the title bar of the displayed element.  
This restores the view that existed before the work area was maximized. That is, if the task cards, project tree, or Inspector window were expanded before, they will be expanded again.

### Collapsing task cards, project tree, and Inspector window automatically

To collapse the task cards automatically, follow these steps:

1. Click "Collapse automatically" in the title bar of the task cards.  
The task cards collapse when you click anywhere outside the task cards.
2. To use the task cards, click the collapsed task cards.
3. The task cards expand and are available for use. The "Collapse automatically" option remains enabled.

To collapse the project tree automatically, follow these steps:

1. Click "Collapse automatically" in the title bar of the project tree.  
The project tree collapses when you click anywhere outside the project tree.
2. To use the project tree, click the collapsed project tree.  
The project tree expands and is available for use. The "Collapse automatically" option remains enabled.

To collapse the Inspector window automatically, follow these steps:

1. Click "Collapse automatically" in the title bar of the Inspector window.  
The Inspector window collapses when you click anywhere outside the Inspector window.
2. To use the Inspector window, click the collapsed Inspector window.  
The Inspector window expands and is available for use. The "Collapse automatically" option remains enabled.

To disable the automatic collapse option, follow these steps:

1. Click "Expand permanently" again in the relevant window.  
The "Collapse automatically" option is disabled, and the window remains expanded.

### See also

Basics of the work area (Page 253)

Splitting the work area (Page 257)

Using grouped elements of the work area (Page 258)

Minimizing and maximizing elements of the work area (Page 260)

Switching between the elements in the work area (Page 260)

Saving a layout of editors and tables (Page 274)

## Splitting the work area

You can split the work area vertically or horizontally.

### Procedure

To split the work area vertically or horizontally, follow these steps:

1. In the "Window" menu, select the "Split editor space vertically" or "Split editor space horizontally" command.  
The element you have clicked and the next element in the Editor bar will be displayed either next to one another or one above the other.

---

#### Note

If no elements are open in the work area, the "Split editor space vertically" and "Split editor space horizontally" functions will not be available.

---

### See also

Basics of the work area (Page 253)  
Maximizing and minimizing the work area (Page 255)  
Floating the work area elements (Page 257)

Minimizing and maximizing elements of the work area (Page 260)  
Switching between the elements in the work area (Page 260)  
Saving a layout of editors and tables (Page 274)

## Floating the work area elements

You can float work area elements in their own separate window:

- Editors
- Tables
- Setting windows
- Task cards
- Inspector window

You can embed floating elements again in the work area at any time.

---

#### Note

##### Properties of elements in a floating window

The properties of elements that you have selected in a floating window are only displayed in the Inspector window if the Inspector window is floating as well.

---

### Floating the work area elements

To float work area elements, follow these steps:

1. Click the "Float" button in the title bar of the element.  
The element will be released from the work area and displayed in its own window. You can now place the window wherever you wish. If you have minimized the window, you can restore it via the editor bar.

### Embedding elements in the work area

To embed elements in the work area again, follow these steps:

1. Click the "Embed" button in the title bar of the element.  
The element will appear in the work area again.

### See also

Basics of the work area (Page 253)

Using grouped elements of the work area (Page 258)

Minimizing and maximizing elements of the work area (Page 260)

Switching between the elements in the work area (Page 260)

Saving a layout of editors and tables (Page 274)

### Using grouped elements of the work area

If you open more than five elements of the same type, e.g., editors or tables, they are grouped in the editor bar. You can use these groups as follows:

- Displaying individual elements of a group
- Displaying all elements of a group in separate windows
- Embedding all displayed elements of a group in the work area
- Minimizing all displayed elements
- Closing all elements of a group

### Displaying individual elements of a group

To display individual elements of a group, follow these steps:

1. In the editor bar, click the group containing the element you want to display.  
All list of all available elements of the group is displayed.
2. Click the element that you want to display.

### **Displaying all elements of a group in separate windows**

To display all elements of a group in separate windows, follow these steps:

1. In the editor bar, right-click the group whose elements you want to display.
2. Select "Restore group" in the shortcut menu.  
All elements of the group are displayed in separate, overlapping windows. Move the windows in order to see the individual element, or choose an element via the group in the editor bar.

### **Embedding all displayed elements of a group in the work area**

To embed all elements of a group displayed in separate windows in the work area again, follow these steps:

1. In the editor bar, right-click the group whose elements you want to embed.
2. Select "Embed group" in the shortcut menu.  
All elements of the group are embedded in the work area again.

### **Minimizing all displayed elements**

To minimize all elements of a group, follow these steps:

1. In the editor bar, right-click the group whose elements you want to minimize.
2. Select "Minimize group" in the shortcut menu.  
All elements of the group are minimized. However, the minimized elements remain open and can be quickly maximized again via the group in the editor bar.

### **Closing all elements of a group**

To close all elements of a group, follow these steps:

1. In the editor bar, right-click the group whose elements you want to close.
2. Select "Close group" in the shortcut menu.  
All elements of the group are closed. The group is removed.

- Minimizing and maximizing elements of the work area (Page 260)
- Switching between the elements in the work area (Page 260)
- Saving a layout of editors and tables (Page 274)

### Minimizing and maximizing elements of the work area

You can minimize the elements that are open in the work area, such as editors or tables, as needed. However, an element remains open even if it has been minimized, and can quickly be maximized again using the editor bar.

#### Minimizing elements in the work area

To minimize elements in the work area, follow these steps:

1. Click the "Minimize" button in the title bar of the element.  
The element is minimized, but can still be accessed via the editor bar.

To minimize all elements at the same time, follow these steps:

1. In the "Window" menu, select the "Minimize all" command.

#### Maximizing elements in the work area

To maximize elements in the work area again, follow these steps:

1. Click the required element in the editor bar.  
The element is maximized and appears in the work area.

#### See also

#### Switching between the elements in the work area

You can switch between the elements in the work area at any time.

#### Switching between the elements in the work area

To switch to the previous or next editor, follow these steps:

1. In the "Window" menu, select the "Next editor" or "Previous editor" command.  
The next or previous editor will be displayed.

### 6.1.2.7 Inspector window

#### Function of the Inspector window

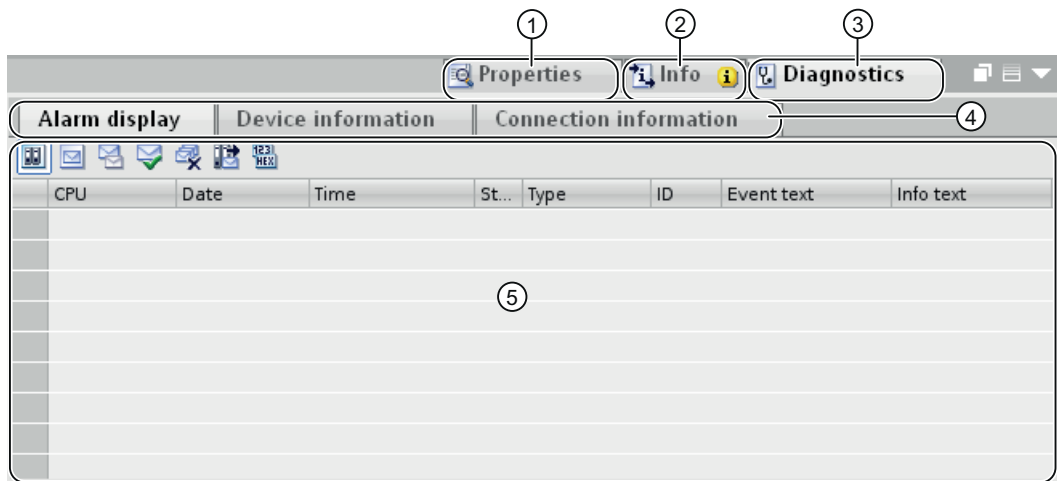

Additional information on an object selected or on actions executed are displayed in the inspector window.

#### Layout of the Inspector window

The following figures show the components of the Inspector window:

- ① "Properties" tab
- ② "Info" tab
- ③ "Diagnostics" tab
- ④ Area navigation within the "Properties" tab
- ⑤ Content of the "Properties" tab

- ① "Properties" tab
- ② "Info" tab
- ③ "Diagnostics" tab
- ④ Navigation within the tabs (only available in the "Info" and "Diagnostics" tabs)
- ⑤ Content of the "Diagnostics" tab

### "Properties" tab

This tab displays the properties of the object selected. You can change editable properties here.

### "Info" tab

This tab displays additional information on the object selected, as well as alarms on the actions executed (such as compiling).

### "Diagnostics" tab

This tab provides information on system diagnostics events, configured alarm events, and connection diagnostics.

### Navigation within the tabs

You can use area navigation and the lower-level tabs to display the information you require within the tabs.

### See also

Details view (Page 267)

### **6.1.2.8 Task cards**

#### **Basics on task cards**

#### **Function of task cards**

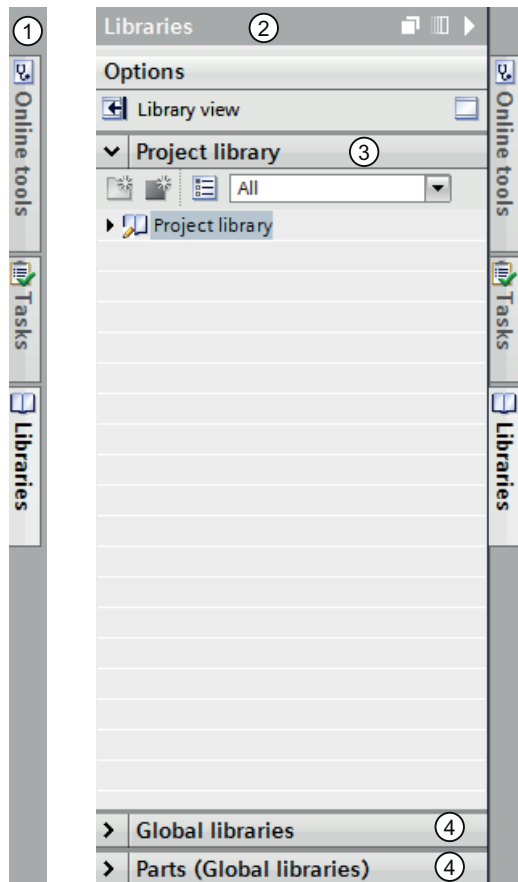

Depending on the edited or selected object, task cards that allow you perform additional actions are available. These actions include:

- Selecting objects from a library or from the hardware catalog
- Searching for and replacing objects in the project
- Dragging predefined objects to the work area

The task cards available can be found in a bar on the right-hand side of the screen. You can collapse and reopen them at any time. Which task cards are available depends on the products installed. More complex task cards are divided into panes that you can also collapse and reopen.

### Layout of task cards

The following figure shows an example of the bar with the task cards:

- ① Task cards closed
- ② Task card open
- ③ Opened palette of a task card
- ④ Closed palette of a task card

### See also

- Changing the pane mode (Page 265)

- Basics of the work area (Page 253)
- Inspector window (Page 261)
- Portal view (Page 245)
- Project view (Page 247)
- Details view (Page 267)

## Changing the pane mode

You can choose between two pane modes:

- **Single pane mode:**  
Only one pane is open at any given time. If you open another pane, the previously opened pane is closed automatically.
- **Multi-pane mode:**  
You can open several panes at the same time.

## Procedure

To change the pane mode, follow these steps:

1. Click the "Change pane mode" button above the panes inside a task card.

## See also

Basics on task cards (Page 263)

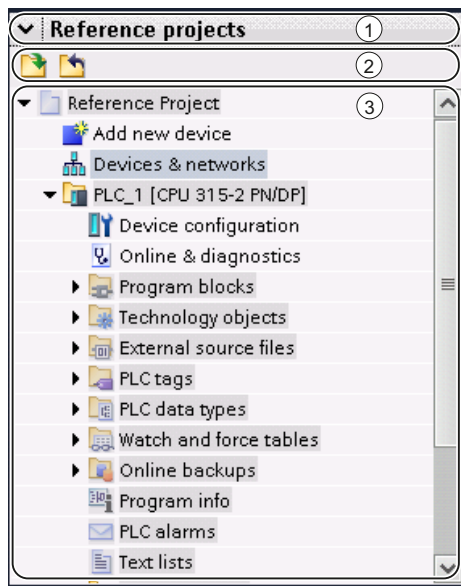

### 6.1.2.9 Reference projects

#### Function of reference projects

In the "Reference projects" palette, you can open other projects in addition to the current project. These reference projects are write-protected and cannot be edited. However, you can drag the objects of a reference project into your current project and further edit them there. You can also compare the objects of a reference project to the objects of your current project.

#### Layout of the "Reference projects" palette

The following figure shows the layout of the "Reference projects" palette:

- ① Title bar
- ② Toolbar
- ③ Opened reference projects

### Title bar

The arrow for closing the palette is located in the title bar of the "Reference projects" palette. Once it is closed, the direction in which the arrow is pointing changes from downwards to right. It can now be used to reopen the palette.

### Toolbar

The toolbar contains buttons for opening and closing reference projects.

### Opened reference projects

Opened reference projects are displayed as read-only with their objects and their hierarchical structure.

### See also

Basics of reference projects (Page 319)

Opening and closing a reference project (Page 319)

### 6.1.2.10 Details view

#### Purpose of the details view

The detail view shows certain content of the selected object is in the overview window or in the project tree. This might include text lists or tags.

The content of folders is not shown, however. To display the content of folders, use the project tree or the Inspector window.

#### Layout of the details view

The following figure shows an example of the details view:

- ① Title bar
- ② Content of the selected object

#### Title bar

The arrow for closing the details view is located in the title bar of the details view. After it has closed, the direction in which the arrow is pointing changes from left to right. It can now be used to reopen the details view.

#### Objects

The displayed content varies depending on the selected object. You can move the content of objects from the details view to the required location using drag-and-drop.

#### See also

- Project tree (Page 250)
- Basics of the work area (Page 253)
- Inspector window (Page 261)
- Basics on task cards (Page 263)

Portal view (Page 245)

Project view (Page 247)

### **6.1.2.11 Overview window**

#### **Overview window**

#### **Functions of the Overview window**

The Overview window supplements the project tree. The Overview window shows the contents of the folder currently selected in the project tree.

In addition, you can perform the following actions in the Overview window:

- Open objects
- Display and edit the properties of objects in the Inspector window
- Rename objects
- Call object-specific actions from the shortcut menu
- Compare objects side by side
- Perform various object operations, such as inserting objects from the library via drag-and-drop and moving, copying, pasting, and deleting objects

## Layout of the Overview window

The following figure shows the components of the Overview window:

- ① Overview window
- ② Switch to the Details view
- ③ Switch to the List view
- ④ Switch to the Icon view
- ⑤ Move to higher level
- ⑥ Split the overview window in two. Either the right or left half of the overview window is synchronized. Clicking again cancels the split.
- ⑦ All elements within a selected folder are displayed even if these are located in lower-level groups. This option is only available in details view.
- ⑧ Contents of the object selected in the project tree.

### Display forms of the Overview window

The content of the Overview window can be displayed as follows:

- Details view  
The objects are displayed in a list with additional information, such as the date of the last change.
- List view  
The objects are displayed in a simple list.
- Icon view  
The objects are displayed as icons according to category.

### See also

Comparing objects in the overview window (Page 270)

Sorting the details view of the overview window (Page 271)

Overview of the library view (Page 388)

### Comparing objects in the overview window

You can display the contents of two folders or objects side by side in the Overview window. The Overview window is split in half and you can display different contents on the left and right sides.

In addition, you can use a drag-and-drop operation to move objects between the split windows. Thus, for example, you can move contents from one window to the other.

### Procedure

To split the Overview window in half or cancel the split, follow these steps:

1. In the toolbar, click on the "Synchronize left side" or "Synchronize right side" icon to split the overview window. Either the left or the right side of the overview window synchronized with the contents of the selected object in the project tree.
2. To cancel the split, click again on the previously selected icon.

### See also

Overview window (Page 268)

### **Sorting the details view of the overview window**

You have several options for adapting the display in the details view of the overview window:

- Adding additional columns  
Some columns are hidden by default to increase clarity. You can display hidden columns if needed. The columns available depend on the selected object.
- Display of folder contents in a flat hierarchy  
Folder contents can be displayed in a flat hierarchy. All the content is displayed at once even if it is located in different groups.
- Sorting the table columns  
You can sort individual columns of the table in ascending or descending order.

### **Showing or hiding columns**

To show or hide additional table columns, follow these steps:

1. Right-click the title bar of the table.
2. Select the "Show/Hide" command in the shortcut menu, and select the columns you want to display.

### **Displaying folder contents in flat hierarchy**

To display the content of a folder in a flat hierarchy, follow these steps:

1. Select the required folder in the project tree or in the library navigation of the library view.
2. Click the "Show subordinate elements" icon in the toolbar.  
All elements are displayed at once in the table even if they are located in subfolders.

### **Sorting a table in ascending or descending order**

To sort the table by a column in ascending or descending order, follow the steps below:

1. Click the table header of a column if you want to sort the column in ascending order.
2. Click again on the same column of the table header to sort the column in descending order.
3. Click a third time on the table header of the same column to cancel the sorting.

### **See also**

Overview window (Page 268)

### 6.1.2.12 User interface layout

#### Save user interface layout

##### Options for saving the user interface layout

When you make a change to the user interface, this is retained even after a restart of the TIA portal. A change to the user interface layout includes, for example, moving a window or adjusting the size of an editor.

In addition to the automatic saving of the user interface layout, you have the option of saving certain layouts:

- **Saving the window layout**  
You can save the layouts of the windows and editors of the TIA portal manually and restore these at a later time. It is possible to call five window layouts using a key combination. Use this function, for example, if you are work with a notebook which you connect to an external monitor when necessary. You can create a window layout for mobile use on the notebook display and another layout for when you work at the office with an external monitor.
- **Save the layout within editors**  
With some editors, you can adjust the display. You can, for example, adjust the width of tables or show or hide individual table columns.

#### See also

Save window layout (Page 272)

Load window layout (Page 273)

Managing window layouts (Page 274)

Saving a layout of editors and tables (Page 274)

Resetting the user interface layout (Page 275)

Basics of the work area (Page 253)

#### Save window layout

You can save the current window layout in order to call it again in the same form at a later time.

#### Procedure

To save a window layout, follow these steps:

1. Arrange all windows in the way in which you want to save them.
2. In the "Window" menu, select the "Save window layout as" command.  
The "Save window layout" dialog box appears.
3. Enter a name for the window layout in the "Name" field.

4. Enter a description of the window layout in the "Description" field in order to be able to identify the window layout more easily later.
5. Click "Save".

## Result

The new window layout is saved in the last position after the existing saved window layouts. The first five window layouts can be called using a key combination.

## See also

Save user interface layout (Page 272)

## Load window layout

If you have already saved a window layout, you can load this, allowing you to quickly adjust your work environment to the respective conditions. You can load the first five window layouts using quick access via the "Window" menu or via a key combination.

If you load a window layout and then make changes to the arrangement of the window, you can restore the originally saved window layout.

## Using quick access to load window layouts 1 to 5

To load one of the first five saved window layouts, follow these steps:

1. In the "Window" menu, select a window layout or select the key combination <Alt+Shift+[1 ... 5]>.

## Loading additional window layouts

To load a window layout that is not among the first five window layouts, follow these steps:

1. In the "Window" menu, select the "Additional window layouts" command.  
The "Manage window layouts" dialog box appears.
2. Select the desired window layout.
3. Click "OK".

## Restore window layout

To go back to a saved window layout, follow these steps:

1. In the "Window" menu, select the "Restore window layout" command or select the key combination <Alt+Shift+0>.

## See also

Save user interface layout (Page 272)

## Managing window layouts

You can carry out the following actions with existing window layouts:

- Changing the order of window layouts  
The order of the window layouts is important, as the first five window layouts can be called directly via the "Window" menu and via a key combination.
- Select a window layout  
If a window layout is not one of the first five window layouts, you can call it using the "Manage window layouts" dialog box.
- Deleting window layouts

## Procedure

To manage the existing window layouts, follow these steps:

1. In the "Window" menu, select the "Manage window layouts" command.  
The "Manage window layouts" dialog box appears.
2. Select the window layout which you want to modify.
3. Click the "Up" or "Down" symbol to move the window layout up or down.
4. Click the "Delete" symbol to delete the selected window layout.
5. Click "OK".  
The selected window layout is activated.

## See also

Save user interface layout (Page 272)

## Saving a layout of editors and tables

You have the option of adapting editors and tables to meet your requirements. For example, you can hide columns in tables that you don't need. You can then save your customized view.

## Procedure

To save the layout of editors and tables in the work area, follow these steps:

1. Adapt the editor or table according to your requirements.
2. Click the "Remember Layout" button in the editor or table.

## Result

The layout is saved. When you reopen the editor or table, this layout will be used.

## **See also**

Splitting the work area (Page 257)  
Floating the work area elements (Page 257)  
Using grouped elements of the work area (Page 258)  
Minimizing and maximizing elements of the work area (Page 260)  
Switching between the elements in the work area (Page 260)  
Save user interface layout (Page 272)

## **Resetting the user interface layout**

Every change you make to the layout of the user interface is saved. The changes are thus available even after a restart of the TIA Portal. For example, if you change the height and width of a text editor or the division of a table, your changes are retained so that you don't have to re-customize elements every time.

In some cases, however, it may be helpful to restore the original layout settings; for example, if another user prefers a different arrangement of the user interface.

## **Procedure**

To reset the user interface settings to the default, follow these steps:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. Select the "General" group in the area navigation.
3. Click the "Reset to default" button under "Reset to default > Editor layout".

## **Result**

The default settings for the user interface are restored.

### 6.1.3 Keyboard operation in the TIA Portal

#### 6.1.3.1 Operating the TIA Portal with the keyboard

You can navigate through the TIA Portal using the keyboard, for example if you do not have a mouse available at the given moment. Many functions are also accessible via keyboard shortcuts. You can find an overview of all keyboard shortcuts in the settings for the TIA Portal.

In the following sections, you will learn how to navigate in the TIA Portal using the keyboard, edit objects and customize the TIA Portal to your needs.

#### See also

Displaying an overview of all keyboard shortcuts (Page 276)

#### 6.1.3.2 Displaying an overview of all keyboard shortcuts

You can display an overview of all keyboard shortcuts.

#### Procedure

To display an overview of all available keyboard shortcuts, follow these steps:

1. Select the "Settings" command in the "Options" menu.  
The settings of the TIA Portal are displayed.
2. Open the "Keyboard shortcuts" entry in the area navigation.  
You can see an overview of all keyboard shortcuts, which are valid for the currently installed products.

#### 6.1.3.3 Basic functions of the TIA Portal

Below, you will learn how you can use the basic functions of the TIA Portal using only your keyboard.

#### Operating basic functions of the TIA Portal with a keyboard

The following table shows how you can access basic functions of the TIA Portal with keyboard shortcuts:

Function	Keyboard shortcuts	Menu command
Switch between the project view and the portal view	<Alt+F7>	
Open the Help system If you need help on the TIA Portal, press <F1>.	<F1>	Help > Show help
Cancel the current action	<Esc>	
Find	<Ctrl+F>	
Replace an object	<Ctrl+H>	

Function	Keyboard shortcuts	Menu command
Find next If you have started a search, you can jump to the next hit with <F3>	<F3>	
Print object	<Ctrl+P>	Project > Print

## Operating menus

The following table shows how you can navigate through menus using the keyboard:

Function	Keyboard shortcuts
Start keyboard operation in the menu You can access the menu using the <Alt> key and then continue to navigate with the arrow keys to scroll through the menu. Confirm your selection of the menu command with <Return>.	<Alt>
Go directly to a specific menu You can go directly to an individual menu command by holding down the <Alt> key. There is an underlined letter for each menu command. Press the <Alt> key along with the underlined letter.	<Alt+underlined letter in respective menu>
Open shortcut menu of an object With the shortcut menu key (on Microsoft Windows compatible keyboards), you can open the shortcut menu of the selected object. Alternatively, you can use <Shift+F10> if you are not using a Microsoft Windows compatible keyboard. You can use the arrow keys to scroll through the shortcut menu and select a menu command with <Return>.	<Shortcut menu key> Alternative: <Shift+F10>

## Operating expandable elements

The following table shows how you can operate expandable elements using the keyboard:

Function	Keyboard shortcuts
Expand a folder in a tree With <Arrow right>, for example, you expand a folder in the project tree.	<Arrow right>
Close a folder in a tree With <Arrow left>, for example, you collapse a folder in the project tree.	<Arrow left>
Open a drop-down list You can open drop-down lists with <F4> and then navigate with the arrow keys to scroll through the drop-down list. Finally, press the <Return> key to confirm your selection.	<F4>
Open autocompletion	<Ctrl+Space> <Ctrl+I>
Show object selection	<Ctrl+J>

### 6.1.3.4 Using project-related functions

#### Editing a project

Function	Keyboard shortcuts	Menu command
Open a project	<Ctrl+O>	Project > Open
Close a project	<Ctrl+W>	Project > Close
Save a project	<Ctrl+S>	Project > Save
Save a project under a different name	<Ctrl+Shift+S>	Project > Save as
Delete a project	<Ctrl+E>	Project > Delete project
Print project	<Ctrl+P>	Project > Print
Undo last action	<Ctrl+Z>	Edit > Undo
Redo last action	<Ctrl+Y>	Edit > Redo

#### Calling up the help function

Function	Keyboard shortcuts	Menu command
Calling up the help function	<F1> or <Shift+F1>	Help > Show help

### 6.1.3.5 Arranging windows

Below, you will learn how to open and close individual windows of the TIA Portal and save window layouts using the keyboard .

#### Opening and closing windows

The following table shows how you can open and close windows with keyboard shortcuts:

Function	Keyboard shortcuts	Menu command
Open/close project tree	<Ctrl+1>	View > Project tree
Opening/closing the detailed view	<Ctrl+4>	View > Details view
Opening/closing the overview	<Ctrl+2>	View > Overview
Opening/closing a task card	<Ctrl+3>	View > Task card
Open libraries	<Ctrl+Shift+L>	
Open hardware catalog If you are in the device or network view, the hardware catalog opens.	<Ctrl+Shift+C>	
Open/close inspector window	<Ctrl+5>	View > Inspector window
Open the "Properties" tab in the inspector window	<Ctrl+6>	
Open the "Info" tab in the Inspector window	<Ctrl+7>	
Open the "Diagnostics" tab in the Inspector window	<Ctrl+8>	
Display or hide reference projects	<Ctrl+9>	

Function	Keyboard shortcuts	Menu command
Display the on-screen keyboard You can display a keyboard on the screen, for example, to operate with a touch screen.	<Ctrl+Shift+K>	
Close all editors	<Ctrl+Shift+F4>	Window > Close all

### Using saved window layouts

You can save individual window arrangements and restore them at a later point in time. The following table shows how you to access saved window layouts with keyboard shortcuts:

Function	Keyboard shortcuts	Menu command
Restore active window layout If you use a saved window layout and have made changes to the program interface in the meantime, you can restore the original state of the active window layout with <Alt+Shift+0>.	<Shift+Alt+0>	Window > Restore window layout
Load window layout You can use <Alt+Shift+[number of the window layout]> to activate the first of the five saved window layouts.	<Shift+Alt+[Number of the window layout]>	Window > Window layout 1 to 5

#### 6.1.3.6 Navigating through the program interface

The TIA Portal is divided into several interface areas, for example, individual windows, toolbars and editors. If you want to work with the keyboard within an interface area, you first have to place the focus on it. Below, you will learn how to place the focus on individual interface areas using the keyboard. You will also learn how to move within an interface area in the TIA Portal using the keyboard.

#### Switching between interface areas and editors

The following table shows how to move between individual interface areas of the TIA Portal:

Function	Keyboard shortcuts
Move clockwise between the interface areas You can use the <F6> key to move clockwise between the various interface areas of the TIA Portal. The interface area currently in focus is highlighted with a blue title bar. If you are in the project tree, for example, and press the <F6> key, you jump to the currently open editor. If you press <F6> again, and the task cards are in focus. If you press <Shift+F6>, on the other hand, you move counterclockwise between the work areas.	<F6>
Move counter-clockwise between the interface areas With <Shift+F6> you move counter-clockwise between the interface areas of the TIA Portal.	<Shift+F6>
Go to the next open editor With <Ctrl+Alt+Arrow right> you move to the next open editor. You can see the open editors in the editor toolbar.	<Ctrl+Alt+Arrow right> Alternative: <Ctrl+F6>

6.1 User interface and operation

Function	Keyboard shortcuts
Go to the previously open editor With <Ctrl+Alt+Arrow left> you move to the most recently open editor.	<Ctrl+Alt+Arrow left> Alternative: <Ctrl+Shift+F6>
Go to the next higher section of the interface area With <Shift+Esc>, you move to the next higher section of the program interface. If, for example, you have selected a device in the project tree and you press <Shift+Esc>, the entire project navigation is put into focus.	<Shift+Esc> Alternative: <Alt+Arrow up>
Go to the next lower section of the interface area With <Return>, you place the focus on the next lower section of the program interface. For example, if you have just opened the properties of a device in the Inspector window in order to assign parameters to the device, press <Return> to go one level deeper in the program interface. You can then navigate to the desired parameter using the Tab key.	<Return> Alternative: <Alt+Arrow down>

Navigation within interface areas and editors

The following table shows how you can navigate within an interface area using the keyboard:

Function	Keyboard shortcuts
Jump to the next element within an interface area You can use the Tab key to jump from one element to the next within a work area. If, for example, you have opened the properties of a device and want to jump from one field to the next, press the Tab key. Any changes you have made to the current text box are applied in this case.	<Tab>
Jump to the previous element within an interface area With <Shift+Tab>, you can jump to the previous element in a work area, for example, a previous text box. Any changes you have made to the current text box are applied in this case.	<Shift+Tab>
Move to the next tab within an interface area If an interface area is divided into separate tabs, you can move between the tabs with the shortcut keys <Ctrl+Tab>. If, for example, you are in the "Properties" tab of the Inspector window and you want to jump to the "Info" tab, press the shortcut keys <Ctrl+Tab>.	<Ctrl+Tab>
Go to the previous tab With <Ctrl+Shift+Tab>, you move to the most recently open tab within an interface area.	<Ctrl+Shift+Tab>
Jumping to the toolbar of an editor You can use the <Alt+F10> key to jump to the toolbar of an editor. For example, if you have opened the print preview and want to switch to the next page of the printout in the toolbar, press <Alt+F10>. Then, use the arrow keys to navigate to the appropriate icon in the toolbar and confirm the selection with <Return>.	<Alt+F10>
Use arrows on the divider to display or hide user interface components The table in the work area can be minimized and maximized. First, navigate to the work area and use the Tab key to place the focus on one of the little arrows on the separator line above the table. The arrows have the focus as soon as they are highlighted in blue. Then, press the space bar to minimize or maximize the table.	<Space>

6.1.3.7 Customizing editors

Below, you will learn how to arrange editors using the keyboard. You will also learn how to select the display size and the area within a graphical editor.

## Arranging and customizing editors

The following table shows how to arrange open editors above and below each other or side-by-side, and how to close an open editor:

Function	Keyboard shortcuts	Menu command
Close active editor	<Ctrl+F4>	
Split editor space vertically If, for example, you have opened the overview window and the network view and want to display them side-by-side, press the <F12> key.	<F12>	Window > Split editor space vertically
Split editor space horizontally You can display two open editors in the work area above and below each other.	<Ctrl+F12>	Window > Split editor space horizontally
Remove window split If you have displayed two editors in the work area horizontally or vertically in split mode, you can remove the split with <Alt+Shift+F12>.	<Alt+Shift+F12>	Window > Unsplit editor space

## Customizing the display in an editor

The following table shows how you how to zoom in and out in graphical editors and how to move the area selection in an editor:

Function	Keyboard shortcuts
Zoom in step-by-step in an editor With <Ctrl> and the <Plus> key on the numeric keypad of the keyboard, you can zoom in on the display of the editor.	<Ctrl+Plus> Alternative: <Ctrl+mousewheel up>
Zoom out step-by-step in an editor Use the <Ctrl> and the <Minus> key on the numeric keypad of the keyboard to zoom out of the display of the editor.	<Ctrl+Minus> Alternative: <Ctrl+mousewheel down>
Set view in editor to 100% You can zoom in or out of the display in a graphical editor to set the current view to 100% by pressing <Ctrl+0>.	<Ctrl+0>
Moving the area selection of the editor If you hold down the spacebar, you can move the displayed section of an editor using the mouse.	<Space>

### 6.1.3.8 Editing objects

#### Selecting objects

The following table shows how to select individual objects, for example, devices in the project tree:

Function	Keyboard shortcuts	Menu command
Select an object located at the left, right, above or below	<Arrow keys>	
Jump to the first object within the current interface area The first object in the interface area currently in focus is selected. In the project tree, this would be the project node at the top, for example.	<Home>	
Jump to the last object within the current interface area The last object in the interface area currently in focus is selected, for example, the last item in the project tree.	<End>	
Select all objects in an area All objects in the work area currently in focus are selected.	<Ctrl+A>	Edit > Select all
Select multiple objects If you want to select several objects that are not located directly next to each other, you first have to move the focus (gray outline of an object) to the next desired object using <Ctrl+Arrow keys>. The current selection is maintained. Then, press the space bar to select the new focused object as well. Repeat this process until all desired objects are selected.	<Ctrl+Arrow keys> + <Space>	

#### Editing objects

The following table provides an overview of all the keyboard shortcuts required for editing objects:

Function	Keyboard shortcuts	Menu command
Insert new object A new object is inserted depending on your current context. If, for example, you are in the device view, the "Add Device" dialog opens for creating a new device.	<Ctrl+N>	
Open object	<Return>	
Rename an object	<F2>	Edit > Rename
Copy an object	<Ctrl+C> Alternative: <Ctrl+Ins>	Edit > Copy
Cut an object	<Ctrl+X> Alternative: <Shift+Del>	Edit > Cut
Paste an object	<Ctrl+V> Alternative: <Shift+Ins>	Edit > Paste
Delete an object	<Del>	Edit > Delete

Function	Keyboard shortcuts	Menu command
Compile an object	<Ctrl+B>	Edit > Compile
Open properties of an object Many objects in the TIA Portal have editable properties. Press the shortcut keys <Alt+Enter> to display the properties of an object.	<Alt+Return>	-

### 6.1.3.9 Text editing

Below, you will learn how to operate text editing functions using only the keyboard.

#### Editing text

The following table shows the basic editing functions for text:

Function	Keyboard shortcuts
Switch to insert or overwrite mode	<Insert>
Exit edit mode	<Esc>
Delete	<Del>
Delete characters	<Backspace>
Confirm entry in a text box and leave the text box	<Return>
Line break in a multiline text box In a multiline text box, hold down the <Shift> button to create a line break.	<Shift+Return>
Reset input in a text box If you are in an text box and press <Esc>, you exit the box and the changes are discarded.	<Esc>

#### Navigating within a text area

The following table shows how to navigate in a text area with the keyboard:

Function	Keyboard shortcuts
Jump to start of line	<Home>
Jump to end of line	<End>
Jump to start of text	<Ctrl+Home>
Jump to end of text	<Ctrl+End>
Jump to the previous page	<PgUp>
Jump to the next page	<PgDn>
Confirm entry in a text box and leave the text box	<Return>
Line break in a multiline text box	<Shift+Return>
Reset input in a text box If you are in an text box and press <Esc>, you exit the box and the changes are discarded.	<Esc>

### Selecting text

The following table shows how to select text with the keyboard:

Function	Keyboard shortcuts
Expand selection to the word at the left or right The text or current text selection is marked up to the end of word. If you are at the beginning or end of a word, the previous or next word is selected.	<Ctrl+Shift+Arrow left or Arrow right>
Expand selection to beginning of line	<Shift+Home>
Expand selection to end of line	<Shift+End>
Expand selection to beginning of text The text is selected up to the beginning or the end.	<Ctrl+Shift+Home>
Expand selection to end of text The text is selected up to the beginning or the end.	<Ctrl+Shift+End>

#### 6.1.3.10 Editing tables

Below, you will learn how to navigate with the keyboard in tables, edit individual fields, and select parts of tables.

#### General keyboard operation in tables

The following table shows how you can edit tables using only the keyboard:

Function	Keyboard shortcuts
Place a cell in edit mode	<F2> or <Return>
Confirm entry and exit edit mode	<Return>
Cancel editing and discard changes	<Esc>
Open drop-down list in a cell Open the drop-down list with <F4>. Use the arrow keys to select the desired entry and then confirm the selection with <Return>.	<F4>
Close drop-down list in a cell and discard changes	<Esc>

#### Navigate in tables

The following table shows how you can navigate within a table using the keyboard:

Function	Keyboard shortcuts
Go to the next cell	<Arrow keys>
Go to the next editable cell on the right	<Tab>
Go to the next editable cell on the left	<Shift+Tab>
Move a screen upwards	<PgUp>
Move a screen downwards	<PgDn>
Go to the first cell in the row	<Home>

Function	Keyboard shortcuts
Go to the last cell in the row	<End>
Go to the first cell in the table	<Ctrl+Home>
Go to the last cell in the table	<Ctrl+End>
Go to the top cell in the column	<Ctrl+Arrow up>
Go to the bottom cell in the column	<Ctrl+Arrow down>

### Selecting areas in tables

The following table shows how you can select areas within a table using the keyboard:

Function	Keyboard shortcuts
Select column	<Ctrl+Space>
Select line	<Shift+Space>
Select all cells	<Ctrl+A>
Expand selection by one cell	<Shift+arrow keys>
Extend selection up one page	<Shift+PgUp>
Extend selection down one page	<Shift+PgDn>
Expand selection up to the first row	<Ctrl+Shift+Arrow up>
Expand selection down to the last row	<Ctrl+Shift+Arrow down>
Expand selection to the first cell in the row	<Ctrl+Shift+Arrow left>
Expand selection to the last cell in the row	<Ctrl+Shift+Arrow right>

#### 6.1.3.11 Using online functions

### Controlling online functions with the keyboard

The following table provides an overview of the shortcut keys that you can use for the online functions of the TIA Portal:

Function	Keyboard shortcuts	Menu command
Establish an online connection	<Ctrl+K>	Online > Go online
Go offline	<Ctrl+M>	Online > Go offline
Download project data to the device	<Ctrl+L>	Online > Download to device
Show accessible devices This opens a dialog showing all devices that are connected to the PG/PC interface of the PG/PC.	<Ctrl+U>	Online > Show accessible devices
Start CPU The CPU is set to "RUN" mode. The CPU must be online for this.	<Ctrl+Shift+E>	Online > Start CPU

6.1 User interface and operation

Function	Keyboard shortcuts	Menu command
Stop CPU The CPU is set to "STOP" mode. The CPU must be online for this.	<Ctrl+Shift+Q>	Online > Stop CPU
Start simulation The hardware and software of the project can be tested in a simulated online environment, without the modules actually being online.	<Ctrl+Shift+X>	Online > Simulation > Start

6.1.3.12 Using the on-screen keyboard

Introduction

When working with the TIA portal, you also have the Microsoft on-screen keyboard available.

Displaying the on-screen keyboard

To display the on-screen keyboard, follow these steps:

1. In the "View" menu, select the "Screen keyboard" command.

Exiting the on-screen keyboard

To exit the on-screen keyboard, follow these steps:

1. In the "File" menu of the on-screen keyboard, select the "Exit" command.

6.1.4 Special features specific to the operating system

6.1.4.1 Influence of user rights

Restrictions when user rights are limited

The software provides several functions that require direct access to the hardware of the programming device / PC and therefore also to the installed operating system. To make full use of the range of functions, the software must cooperate closely with the operating system. To ensure problem-free interaction, you should therefore be logged on to the operating system with adequate user rights.

In particular, you may not be able to use functions requiring an online connection or those that change the settings of interface cards if you work with limited user rights.

## Recognizing restricted functions

You can recognize functions requiring special rights as follows:

-  shield icon is displayed beside the function.  
The function can be used but is regulated by the user account control.
- A box is grayed out and cannot be accessed.  
You require administrator privileges to access the box. In some operating system environments, you can obtain administrator privileges by entering an administrator password.

---

### Note

A box being grayed out does not necessarily mean a lack of rights. You should also check the additional information in the tooltip cascades to find out the conditions for editing the box.

---

## 6.1.4.2 Expanding user rights

### Counteracting restrictions due to user rights

Certain functions may not be available if you are not logged on to the operating system with adequate rights. You can counteract these restrictions in the following ways:

- Enabling of extended rights using Windows user account control
- Logging on to the operating system with administrator privileges
- Using temporary administrator rights

### Enabling extended rights using the Windows user account control

To be able to use a function indicated by the shield icon of the Windows user account control, follow these steps:

1. Click on the box or button with the shield icon.  
The security prompt of the Windows user account control opens.
2. Follow the instructions of the Windows user account control and, when prompted enter an administrator password, if possible.

The function can now be used once without restrictions.

### Logging on to the operating system with administrator privileges

To be able to use a function that is disabled due to lack of user rights, follow these steps:

1. Close the software.
2. Log off from the operating system.
3. Log on to the operating system with administrator privileges.
4. Restart the software.

### Using temporary administrator rights

To obtain administrator privileges temporarily, follow these steps:

1. Click the "Change settings" button. You will find this button in dialogs that allow the temporary assignment of administrator privileges.  
An operating system dialog box for entering an administrator password opens.
2. Enter an administrator password.

The settings can be temporarily changed. When you call the dialog again, the procedure must be repeated.

---

#### Note

This function is not supported by all operating systems. If no "Change settings" button is present or the button is grayed out, you will need to log on to the operating system with administrator privileges instead.

---

## 6.2 Help on the information system

### 6.2.1 General remarks on the information system

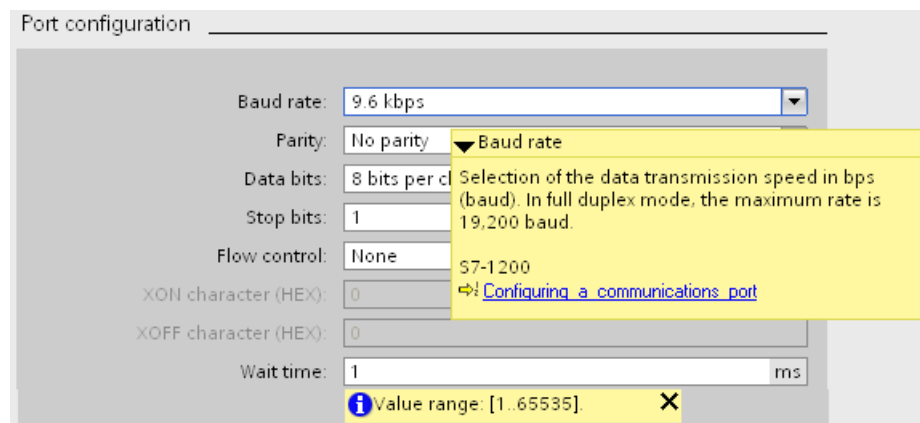

#### Quick answers to your questions

A comprehensive help system is supplied with the TIA Portal for solving your tasks. It describes basic concepts, instructions and functions. While working with the program, you also receive the following support:

- Roll-out for correct inputs in dialog boxes
- Tooltips for information on elements of the user interface, for example text boxes, buttons and icons. Some of the tooltips are supplemented by cascades containing more precise information.
- Help on the current context, on menu commands for example when you click on the keys <F1> or <Shift+F1>.

The following figure shows an example of a cascading tooltip (top) and a roll-out (bottom):

## Help

The supplied help system describes concepts, instructions and functions. It also contains reference information and examples. The help opens in a separate window.

A navigation pane appears on the left side of the help window. You can also hide the navigation pane to make room on the screen. The navigation pane provides you with the following functions:

- Table of contents
- Search in the index
- Full text search of the entire help
- Favorites

## Identification of the topics in the help according to the type of information

The help topics are identified by different symbols depending on the type of information they contain.

Symbol	Information type	Explanation
	Operating instructions	Describes the steps to follow in order to carry out a particular task.
	Example	Contains a concrete example to explain the task.
	Factual information	Contains background information that you need to know to carry out a task.
	Reference	Contains comprehensive reference information to refer back to.

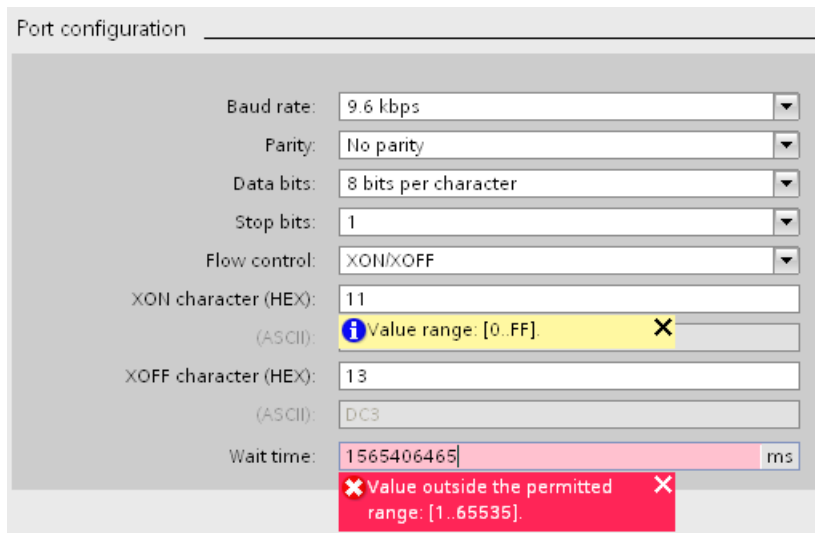

## Identification of the topics in the help according to the target system

Depending on the products that are installed, the help system may contain sections that apply to specific devices only. To be able to recognize such sections at first glance, you will find a note in brackets in the table of contents. The search results in the full text search and in the index are marked in the same way if they only apply to a specific device.

### Roll-out

Certain text boxes offer information that rolls out and helps you to enter valid parameters and values. The roll-out informs you about permitted value ranges and data types of the text boxes.

The following figure shows a roll-out (yellow) and a roll-out error message (red), which indicates an invalid value:

The roll-out is closed as soon as you exit the window or click on the "x" in the upper right-hand corner.

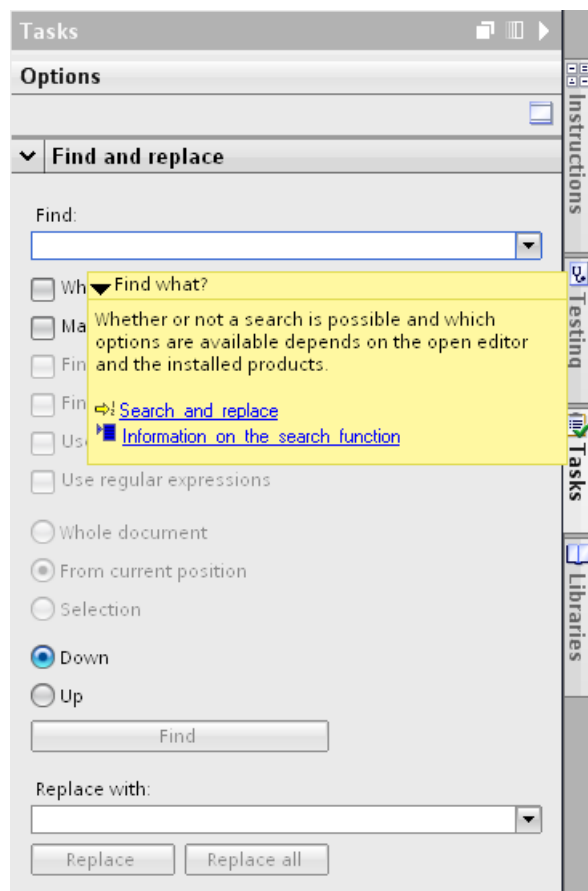

### Tooltip

Interface elements offer you a tooltip for easier identification.

Tooltips, which have an arrow icon on the left, contain additional information in tooltip cascades. If you position the mouse pointer briefly over the tooltip or click the arrow icon, this information is displayed. The automatic display of tooltip cascades can be disabled.

If additional information is contained in the help system, a link to the corresponding help topic appears in the cascade. If you click on the link, the corresponding topic opens in help.

The following figure shows a tooltip with opened cascade:

## See also

Configuring the display of tooltips and tooltip cascades (Page 295)

## 6.2.2 Opening the supplied Help system

You access the help via the menu, using links in the tooltip cascades, or with the <F1> key.

### Procedure

To open the supplied help system, follow these steps:

1. In the "Help" menu, select the "Show help" command or press <F1> to display the help matching the current context.

Or:

1. Click on the link in a tooltip cascade to go directly to a point in the help system that contains more detailed information.

### 6.2.3 Searching the Help system for keywords

#### Searching for keywords in the help text

To search the help topics for predefined keywords, follow these steps:

1. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.  
The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
2. Open the "Index" tab.
3. Enter the search term in the input box or select the search term from the list of key words.
4. Click "Display".

### 6.2.4 Full-text searches

#### Full-text searches

To search the entire text for specific words, follow these steps:

1. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.  
The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
2. Open the "Search" tab.
3. Type in your search term in the text box.
4. Refine your search if necessary using additional criteria:
  - Select "Search previous results" to start an additional search operation of your last search results only.
  - Select "Search for similar words" to find words that differ only slightly from your search term.
  - Select "Search titles only" to obtain only results that contain your search term in the title. The contents of the Help topics are ignored during the search.

5. Click on the arrow button to the right of the search field to use logic operations. The following logic operations are available:
  - Combine two or more search terms using the "AND" operator to find only Help topics that contain all the search terms in the text.
  - Combine two or more search terms using the "OR" operator to find only Help topics that contain one or more of the search terms in the text.
  - Combine two or more search terms using the "NEAR" operator to find only Help topics that contain terms in close proximity to each other (eight words).
  - Precede a word with the "NOT" operator to exclude Help topics from the search that contain this word.
6. Click on "List topics" to start the search.

The results are now listed with title, position and ranking. The "Position" column shows the section in which the Help topic found is located. Sorting according to ranking is based on the position of the Help topics found in the table of contents and based on the number of hits in the Help topics.

## 6.2.5 Using favorites

### Using favorites

You can save individual help topics as favorites. This saves you searching for the help topic a second time.

### Saving favorites:

To save a page as a favorite, follow these steps:

1. Open the help topic or the chapter you want to save as a favorite.
2. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.

The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
3. Open the "Favorites" tab.
4. Click the "Add" button.

The help topic or chapter is saved as a favorite and is available the next time you open the help system.

### Calling up favorites:

To call up a page from the favorites, follow these steps:

1. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.

The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
2. Open the "Favorites" tab.

3. Select the topic you want to open from the list.
4. Click the "Display" button.

### Deleting favorites

To delete an entry from the favorites, proceed as follows:

1. Click the "Show/hide table of contents" button in the help toolbar to display the table of contents.  
The table of contents is displayed and the "Index", "Search" and "Favorites" tabs are visible.
2. Open the "Favorites" tab.
3. Select the topic you want to remove from the list.
4. Click the "Remove" button.

## 6.2.6 Printing help topics

### Printing information

You can either print all the contents of the Help system or individual topics only.

### Procedure

To select the topics you would like to print, follow these steps:

1. Click the "Display printing dialog" button.  
The table of contents opens in a separate window.
2. Select the check boxes for the folders and help topics to be printed in the "Print help topics" dialog.
3. Click the "Print" button to print the selected information.  
The "Print" dialog opens.
4. Select the printer on which you want print the help topics.
5. Click "Properties" if you want to make additional printer settings.
6. Confirm your entries with "OK".  
The help topics are printed out on the selected printer.

## 6.2.7 Configuring the display of tooltips and tooltip cascades

### Configuration options for tooltips and tooltip cascade

You can customize the display of tooltips and tooltip cascades to suit your needs. You can make the following settings:

- **Display or hide truncated text**  
Sometimes texts may be too long for a text field. The texts are then fully displayed in a tooltip when you hover your mouse over the text field. You can enable or disable this function.
- **Enable or disable tooltips**  
Tooltips provide more detailed information about an element of the user interface. You can also have tooltips displayed in a cascade. If you disable the tooltips, the cascade with context-sensitive help is also no longer displayed. However, you have the option of manually displaying the tooltip for the currently active interface element by pressing <F1>.
- **Enable or disable automatic opening of tooltip cascades**  
By keeping the mouse pointer over a tooltip for a brief time, any available cascades are displayed automatically. You can enable or disable the automatic display of cascades. When automatic display is disabled, you must open the cascade manually if necessary. To do this, click on the arrow icon in the tooltip.

### Procedure

To configure the display of tooltips and tooltip cascades, follow these steps:

1. Select the "Settings" command in the "Options" menu.
2. Select the "General" group in the area navigation.
3. Select or clear the individual check boxes in the "Tooltips" area to suit your needs. The "Open cascade automatically in tooltips" check box is only available if you have enabled the display of tooltips.

## 6.2.8 Safety Guidelines

### Safety guidelines

This Help manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage

have no safety alert symbol. These notices shown below are graded according to the degree of danger.

 <b>DANGER</b>
indicates that death or severe personal injury will result if proper precautions are not taken.

 <b>WARNING</b>
indicates that death or severe personal injury may result if proper precautions are not taken.

 <b>CAUTION</b>
with a safety alert symbol, indicates that minor personal injury can result if proper precautions are not taken.

<b>NOTICE</b>
without a safety alert symbol, indicates that property damage can result if proper precautions are not taken.

---

**Note**

indicates that an unintended result or situation can occur if the corresponding information is not taken into account.

---

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The device/system may only be set up and used in conjunction with this documentation. Commissioning and operation of a device/system may only be performed by qualified personnel. Within the context of the safety notes in this documentation qualified persons are defined as persons who are authorized to commission, ground and label devices, systems and circuits in accordance with established safety practices and standards.

### Prescribed Usage

Note the following:

 <b>WARNING</b>
This device may only be used for the applications described in the catalog or the technical description and only in connection with devices or components from other manufacturers which have been approved or recommended by Siemens. Correct, reliable operation of the product requires proper transport, storage, positioning and assembly as well as careful operation and maintenance.

## Trademarks

All names identified by ® are registered trademarks of the Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

## Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

## 6.2.9 Assembling customized documentation

### Customized documentation

In the Siemens Industry Online Support, you can assemble customized documentation that is tailored to your needs. All configurable manuals and operating instructions of the Siemens Industry Online Support are available to you for this purpose. You can select the parts that are of interest to you and combine them into a library to form personal documentation. You can organize the documentation using folders in the library. The folders will later become the individual chapters of your custom documentation.

You can open your personal library here (<https://www.automation.siemens.com/mdm/?guiLanguage=en>).

### Requirements

- The manuals or operating instructions used must be configurable. You can recognize configurable manuals by the suffix "configurable" in their name.
- To use all the functions, you have to register in the Siemens Industry Online Support and log on.

### Documentation in different languages

You can change the language of the assembled documentation to German, French, Spanish, Italian and Chinese. This gives you the possibility, for example, to gather relevant information for a specific project and make it available to colleagues who speak other languages.

### Export function in the documentation

You can perform an export at any part of your library in various formats (PDF, XML, RTF).

### **Help on creating documentation**

You can find more help on creating and using custom documentation in the Siemens Industry Online Support ([https://www.automation.siemens.com/mdm/help/en/mdm\\_reference\\_manual\\_de-DE.htm](https://www.automation.siemens.com/mdm/help/en/mdm_reference_manual_de-DE.htm)).

# Editing projects

## 7.1 The basics of projects

### Introduction

Projects are used to organize the storage of data and programs resulting from the creation of an automation solution. The data that makes up a project includes the following:

- Configuration data on the hardware structure and parameter assignment data for modules
- Project engineering data for communication over networks
- Project engineering data for the devices
- Logs for important events in the life cycle of the project

### Project hierarchy

Data is stored in a project in the form of objects. Within the project, the objects are arranged in a tree structure (project hierarchy).

The project hierarchy is based on the devices and stations along with the configuration data and programs belonging to them.

Common data of the project and online access, for example, are also displayed in the project tree.

### See also

Creating a new project (Page 300)

Opening projects (Page 302)

Saving projects (Page 306)

Deleting projects (Page 307)

Using logs (Page 299)

## 7.2 Using logs

For some operations within the TIA Portal, logs are created automatically in the background. These logs document changes in the project. Logs are created automatically, for example, when you migrate projects and programs or when you update instances from the library.

Logs are displayed in the "Common data" folder in the project tree. They are stored together with the project in the project folder and can therefore be read independently of the programming device/PC used as soon as you have opened the project.

In addition to displaying them in the TIA Portal, logs can also be printed.

### **Opening logs**

To open a log, follow these steps:

1. Open the "Common data > Logs" folder in the project tree.
2. Double-click the desired log in the list.  
The contents of the log are displayed in the work area.

### **Deleting logs**

To delete a log, follow these steps:

1. Select the log in the project tree.
2. Press <Del>.  
The selected log is deleted from the project directory and removed from the project tree.

## **7.3 Creating and managing projects**

### **7.3.1 Creating a new project**

#### **Procedure**

To create a new project, follow these steps:

1. Select the "New" command in the "Project" menu.  
The "Create a new project" dialog opens.
2. Enter your project name and path or accept the proposed settings.
3. Click the "Create" button.

#### **Result**

The new project is created and displayed in the project tree.

#### **See also**

The basics of projects (Page 299)

Opening projects (Page 302)

Saving projects (Page 306)

Deleting projects (Page 307)

## 7.3.2 Compatibility of projects

You can use the TIA Portal to open projects that were created with an older version of the TIA Portal or with a different installation package. In the following, you will learn what to consider in this case.

### Opening projects from older product versions

The table below demonstrates the behavior of the TIA Portal when opening projects from older product versions:

Product version of the TIA Portal (file extension of the respective version)	Behavior when opening with TIA Portal V13
V10.5 (.ap10) V11.x (.ap11)	The project is automatically upgraded to the latest product version when opened, following your confirmation. The upgraded project is a copy of the original project. The original project is retained unchanged.
V12 (.ap12)	The project is upgraded when you open it. You can select if you want to upgrade the project to product version V12 SP1 or V13. The upgraded project is a copy of the original project in both cases. The original project is retained unchanged. When you upgrade the project to product version V12 SP1, the project is opened in compatibility mode.
V12 SP1 (.ap12)	When you open the project, you can decide if you want to open it in compatibility mode or upgrade it to the current product version. A copy of the original project is created when you upgrade the project. The original project is retained unchanged.

### Compatibility mode

When you open a project in the V12 SP1 project format and do not upgrade it, the project is in compatibility mode. The range of functions of the TIA Portal is limited to the range of functions of V12 SP1. The project remains backward compatible and can still be opened and edited with TIA Portal V12 SP1.

To projects in compatibility mode, components can be added that were supplied at a later date for version V12 SP1 as part of a Hardware Support Package (HSP). The project is still backward compatible with TIA Portal V12 SP1. To continue working with the project in TIA Portal V12 SP1, you merely have to also install the Hardware Support Package.

Global libraries are always created in the most recent format and are not backwards compatible, even if the project is opened in compatibility mode.

You need to upgrade the project to use the full range of functions of the current version. By upgrading the project you convert it to the current project format. The full range of functions of the current version becomes available.

### Backward compatibility with the current product version

Projects saved with the current version of the TIA Portal are not backward compatible with older versions due to their enhanced functionality. Projects saved with TIA Portal V13 can only be opened with TIA Portal V13 or later.

### Opening projects created with add-on products

The project you want to open may include data that were created with an optional software. The following cases may occur if you did not install these software components:

- Software components which are not absolutely required are missing:  
A dialog appears listing the missing software components. After the project is opened, its properties are displayed. You now have the opportunity to install missing components. All the devices contained in the project are available even if you do not install the missing components. However, you can only work with the devices that are supported by the currently installed software.  
Devices which are not supported because software components are missing are identified by the following symbol in the project tree:  

- Essential software packages are missing:  
A dialog appears listing the missing software components. The essential software components are marked. The project can only be opened if you install the missing software components.

### See also

- Opening projects (Page 302)
- Upgrading projects (Page 303)
- Compatibility of global libraries (Page 397)

### 7.3.3 Opening projects

You can open all projects from the current version and earlier versions in the TIA Portal.

Projects from earlier versions of the TIA Portal may first have to be upgraded to a more recent project format. You are prompted to upgrade the project when you open it.

You recognize projects of the TIA Portal by their file name extension ".ap[version number]". TIA Portal V13 projects have the file name extension ".ap13".

### Procedure

To open an existing project, follow these steps:

1. Select the "Open" command in the "Project" menu.  
The "Open project" dialog box opens and the list of most recently used projects is displayed.
2. Select a project from the list and click "Open".
3. If the project you require is not included in the list, click the "Browse" button. Navigate to the desired project folder, and open the project file.  
Projects in the current project format are opened in the project view. The "Upgrade project" dialog box opens if you have selected a project from an older version of the TIA Portal. More information on upgrading the project can be found in chapter "Upgrading projects (Page 303)".

**See also**

Creating a new project (Page 300)  
Saving projects (Page 306)  
Deleting projects (Page 307)

**7.3.4 Upgrading projects**

Projects from older versions of the TIA Portal can be edited with the current version of the TIA Portal. Depending on the product version that was used to create the project, you either upgrade the project or open the project in compatibility mode. To find out which options you have depending on the product version of the project, go to chapter "Compatibility of projects (Page 301)".

When you open projects from older product versions, you are prompted to upgrade the project. You can manually upgrade projects that are already open in compatibility mode. After upgrading the project to the current product version, it can no longer be opened in older versions of the TIA Portal. But the original project is still available. The upgraded project is saved as a copy.

**Upgrading projects from V11.x or lower**

Proceed as follows to upgrade a project from TIA Portal V11.x or lower:

1. Open the project.  
The "Upgrade project" dialog box opens.
2. Click "OK".  
A copy of the project is created and upgraded. The project copy receives the name extension "\_V13". The project is opened.
3. Compile the hardware and software of all devices in the project.

### Upgrading projects from V12

Proceed as follows to upgrade a project from TIA Portal V12:

1. Open the project.  
The "Upgrade project" dialog box opens.
2. Select the target version for the upgrade:
  - Click "Yes" to upgrade the project to product version V13.
  - Click "No" to upgrade the project to product version V12 SP1 and to work in compatibility mode.

A copy of the project is created and upgraded. The project copy receives the name extension "\_V13" or "\_V12SP1". The project is opened.

3. Compile the hardware and software of all devices in the project.

### Upgrading V12 SP1 projects or using them in compatibility mode

Proceed as follows to upgrade a project from TIA Portal V12 SP1 or to use it in compatibility mode:

1. Open the project.  
The "Upgrade project" dialog box opens.
2. Select how you want to proceed with the project:
  - Click "Yes" to upgrade the project to product version V13.
  - Click "No" to use the project in compatibility mode.
3. Optional: If you have upgraded the project to the current product version, compile the hardware and software of all devices in the project.

### Manually upgrading projects in compatibility mode to V13

To do this, the project must already be open in compatibility mode for the TIA Portal V12 SP1.

To manually upgrade a project in compatibility mode, follow these steps:

1. Select the "Upgrade" command in the "Project" menu.  
A security prompt appears.
2. Click "Yes" to confirm.  
A copy of the project is created and upgraded. The project copy receives the name extension "\_V13". The project is opened.
3. Compile the hardware and software of all devices in the project.

## Notes

Pay attention to the following notes after upgrading a project:

---

### Note

#### Upgrading global libraries

Because global libraries are independent of projects, they are not upgraded automatically together with the project. If you want to continue using libraries from older versions of the TIA Portal, you need to upgrade these global libraries as well. More information on upgrading global libraries can be found in the chapter "Compatibility of global libraries (Page 397)".

---

### Note

#### Upgrading know-how-protected blocks

The block is only upgraded and loaded after it has been opened once with the password. This means you should open know-how-protected blocks once after upgrading the project to also upgrade the blocks. If you have protected numerous know-how-protected blocks with the same password, you can select and open all of them at once.

---

Compiling project data (Page 322)

Compatibility of global libraries (Page 397)

## 7.3.5 Displaying properties of the project

You can display the properties of a project. Properties include the following:

- Metadata for the project  
This includes the following information: creation time, author, file path, project size, copyright, project languages, etc. Many of the properties can be changed.
- Project history  
The project history contains an overview with important events in the project life cycle. Here, for example, you can see the version of the TIA Portal used to create a project and whether it has been converted into another version in the meantime. If a project was created during a migration, for example, this is also indicated in the project history table with the date and time of the migration. If a log was created for an event, you can also call the log directly.

### 7.3 Creating and managing projects

- Support packages in the project  
An overview of the add-on software needed to work with all devices in the project is displayed. In addition, installed GSD files are listed (device description files for other devices in the hardware catalog).
- Software products in the project  
You can display an overview of all installed software products needed for the project.

#### Procedure

To display the project properties, follow these steps:

1. Select the open project in the project tree.
2. Select "Properties" in the shortcut menu of the project.  
The dialog with the properties of the project opens.
3. Select the project properties in the area navigation that you want to have displayed.

### 7.3.6 Saving projects

You can save the project at any time either under the same or a different name. You can even save a project when it still contains elements with errors.

#### Saving a project

To save a project, follow these steps:

1. Select the "Save" command in the "Project" menu.  
All changes to the project are saved under the current project name. If you are editing a project from an earlier version of the TIA Portal, the file extension of the project is also retained and you can continue to edit the project in the earlier version of the TIA Portal.

#### Project Save as

To save a project under another name, follow these steps:

1. Select the "Save as" command in the "Project" menu.  
The "Save current project as" dialog opens.
2. Select the project folder in the "Save in" box.
3. Enter the new project name in the "File name" box.
4. Confirm your entry with "Save".  
The project is saved under the new name and opened.

Creating a new project (Page 300)

Opening projects (Page 302)

Deleting projects (Page 307)

Upgrading projects (Page 303)

Compatibility of projects (Page 301)

### 7.3.7 Closing projects

#### Procedure

To close a project, follow these steps:

1. Select the "Close" command in the "Project" menu.  
If you have made changes to the project since the last time you saved it, a message is displayed.
2. Decide whether or not you want to save the changes.

### 7.3.8 Deleting projects

---

#### Note

When you delete a project, the entire project data is removed from the storage medium.

---

#### Requirement

The project you want to delete is not open.

#### Procedure

Follow the steps below to delete an existing project:

1. Select the "Delete project" command in the "Project" menu.  
The "Delete project" dialog opens and includes the list of most recently used projects.
2. Select a project from the list.  
If the project you require is not included in the list, click the "Browse" button. Navigate to the desired project folder, and open the project file.
3. Click the "Delete" button.
4. Click "Yes" to confirm. This starts the deletion of the project.

#### Result

The entire project folder is deleted from the file system.

## **See also**

The basics of projects (Page 299)

Opening projects (Page 302)

Saving projects (Page 306)

## **7.3.9 Working with multi-language projects**

### **7.3.9.1 Project text basics**

#### **Texts in different languages in the project**

When you enter texts while working on a project, you would normally do this in your own language. If you then pass on the project to someone else who does not know this language, this person will require a translation of the relevant texts to a language they know. This is why all texts can be translated. In this way, you can ensure that anyone who is subsequently confronted with the texts sees the texts in his/her language of choice.

#### **Project language**

Project languages are all languages in which a project will later be used. Based on the editing language, all the texts can be translated to the various project languages. You specify the languages that will be available in the project tree under "Languages & Resources > Project languages".

#### **Editing language**

Every project has an editing language. When you enter texts, these are always created in the editing language. You should therefore make sure that the editing language set is the language in which you enter the texts. This avoids problems if you translate the texts later.

The editing language does not depend on the language of the user interface. You could, for example, set English as the user interface language, but use Italian as the editing language. If you enter texts, these will be created in this case in the project language "Italian", although the user interface of the TIA Portal displays English.

You set the editing language in the project tree under "Languages & Resources > Project languages > Editing language".

#### **Reference language**

The reference language is used as a template for translation. The text is displayed in the reference language for each text box in the "Tasks > Languages and resources" task card. You therefore know which text that belongs in a text box, even when no text is entered in the currently selected editing language.

## User texts and system texts

For clarification purposes, a distinction is made between user texts and system texts:

- User texts are texts that the user created.
- System texts are texts that are created automatically according to the configuration in the project.

You manage the project texts in the project tree under "Languages & Resources > Project texts".

## Examples of multilingual project texts

You can, for example, manage the following project texts in more than one language:

- Block titles and block comments
- Network titles and network comments
- Comments in tables
- Alarm texts
- Operator-relevant texts
- Text lists
- Labels of buttons
- Display names of recipes

## Translating texts

The following procedures are available to translate texts.

- Translate all texts used in the project in tabular form  
You can enter the translations for the individual project languages directly in the "Project texts" table. You will find this in the project tree under "Languages & Resources > Project texts".
- Specify text assigned to individual objects in the Inspector window  
In the Inspector window, you can translate the texts that are assigned to the currently selected objects. Columns are displayed in a table for all available project languages. You can enter the translations for each text there.
- Translating texts using reference texts  
You can change the editing language for shorter texts. All the text cells are filled again with the default values and can be filled in the current language. As orientation, you can display what you last entered in the box in the reference language. To do this, select the "Tasks" task card and open the "Languages & resources".
- Exporting texts and translating them externally  
With larger volumes of text, you can export the texts to an Office Open XML file and translate them in a conventional table calculation program. You then import the translated texts again into the TIA Portal.

---

**Note**

**Using Asian project languages**

East Asian project languages are only displayed correctly in Windows XP, if the option "Install files for East Asian languages" is selected on the Languages tab of Regional and Language Options in the Control Panel of Windows XP Professional.

---

**See also**

Overview of the program settings (Page 241)

Changing the settings (Page 244)

Application examples for multilanguage projects (Page 315)

**7.3.9.2 Select project languages**

All the texts can be displayed within a project in the same language that you selected for your software user interface. This means that all project texts must exist in the corresponding language. You can select the available project languages yourself.

**Requirement**

- You are in the project view.
- A project is open.

**Procedure**

To select the project languages, follow these steps:

1. Click on the arrow symbol to the left of "Languages & Resources" in the project tree. The elements below this are displayed.
2. Double-click on "Project languages". In the work area, you will see a list of languages that you can select.
3. Select the required languages.

**Result**

All texts can be displayed in the activated languages if there is already a translation for these languages.

**7.3.9.3 Setting the editing language**

All the texts in the project are created in the editing language when they are entered. If you change the editing language, all future text input will be stored in the new editing language.

## Requirement

- You are in the project view.
- A project is open.

## Procedure

To change the editing language, follow these steps:

1. Click on the arrow symbol to the left of "Languages & Resources" in the project tree. The lower-level elements are displayed.
2. Double-click on "Project languages". The possible settings for the project languages are displayed in the work area.
3. Select the editing language in "General > Editing language".

### 7.3.9.4 Translating all project texts in tabular form

You can display and edit all project text used in the currently open project in a list. User and system texts are separated into two different lists for clarity. Both lists contain a separate column for each project language in which you can enter the translations for text.

## Requirement

- You are in the project view.
- You have selected at least one further project language.

## Procedure

To translate text in the project-wide list, follow these steps:

1. Click on the arrow symbol to the left of "Languages & Resources" in the project tree. The elements below this are displayed.
2. Double-click "Project texts". A list with the user texts in the project is displayed in the work area.
3. Click on "System texts" if you want to edit the list of system texts rather than the user texts.
4. You can improve the clarity of the lists if you have a lot of texts.
  - To group identical texts and to translate them all at once, click the "Switch on/off grouping" button in the toolbar.
  - To hide texts that do not have a translation, click the "Filter for empty texts on/off" button in the toolbar.
  - To further limit the displayed project texts to certain devices, select the devices for which you want to display project texts in the drop-down list.
5. Enter the translation of the project texts in the relevant column.

### 7.3.9.5 Translating text associated with individual objects

If you want to edit the text of individual objects, it would be too difficult to locate the matching text in the table with all project texts. For this reason, there is a table in the Inspector window in which only the texts assigned to the currently selected objects are displayed. In the table, you can add missing translations for individual project languages or change existing texts.

#### Requirement

Text must be entered in at least one project language for the texts to be translated.

#### Procedure

To edit the text of the currently selected object, follow these steps:

1. Select the object whose text you want to edit.
2. Open the "Properties" tab in the Inspector window.
3. Open the lower-level "Texts" tab in the inspector window.  
A table with all the texts that belong to the selected objects is displayed. It contains one column for the currently selected editing language and the reference language, as well as additional columns for the other project languages.
4. Add or change the entries in the table for each project language.

#### See also

Application examples for multilanguage projects (Page 315)

### 7.3.9.6 Translating texts using reference texts

#### Introduction

After changing the editing language, all texts are shown in input boxes in the new editing language. If there is not yet a translation available for the newly set language, the input boxes are empty or filled with default values.

If you enter text in an input box, this is saved in the current editing language. Following this, the texts exist in two project languages for this input field, in the previous editing language and in the current editing language. This makes it possible to create texts in several project languages.

You can display existing translations for an input box in other project languages. These serve as a comparison for text input in the current editing language and they are known as the reference language.

---

#### Note

The display of reference texts depends on the installed products and is not supported by every editor.

---

**Requirement**

There is at least one translation into a different project language for an input field.

**Procedure**

To display the translation of an input cell in a reference language, follow these steps:

1. In the "Tasks" task card, select the "Languages & Resources" pane.
2. Select a reference language from the "Reference language" drop-down list.

**Result**

The reference language is preset. If you click in a text box, translations that already exist in other project languages are shown in the "Tasks > Languages & Resources" task card.

**7.3.9.7 Exporting and importing project texts**

You can export project texts for translation and then reimport them. The texts are exported to an Office Open XML file with the extension ".xlsx". This can be edited in Microsoft Excel or a number of other spreadsheet programs.

The following export options are available:

- Exporting individual project texts
- Exporting all user texts or system texts at once  
In this case, the export can be additionally limited by categories.

---

**Note****Row limit in Microsoft Excel**

Note that spreadsheet programs may be able to process only a certain number of rows. Microsoft Excel 2003 supports a maximum of 65536 rows, for example. Later versions of Microsoft Excel support significantly more rows.

---

**Exporting individual project texts**

To export individual project texts, follow these steps:

1. Open the "Languages & Resources" folder in the project tree.  
The lower-level elements are displayed.
2. Double-click "Project texts".  
The project texts editor opens.
3. Choose the "User texts" or "System texts" tab in the editor, depending on which texts you want to export.
4. Select the project texts you want to export.
5. Click "Export project texts" on the editor toolbar.  
The "Export" dialog box opens.

6. Choose the language you want to translate from in the "Source language" drop-down list.
7. Choose the language you want to translate to in the "Target language" drop-down list. The drop-down list contains the project languages you specified previously. If the required language is missing, you must first specify it in the project languages editor.
8. Specify a file path and a file name for the export file in the "Select file for export" input box.
9. Click "Export".

### Exporting all system or user texts

To export all project texts, follow these steps:

1. Select the "Export project texts" command in the "Tools" menu.  
The "Export" dialog box opens.
2. Choose the language you want to translate from in the "Source language" drop-down list.
3. Choose the language you want to translate to in the "Target language" drop-down list. The drop-down list contains the project languages you specified previously. If the required language is missing, you must first specify it in the project languages editor.
4. In "Select content", select the check box "User texts" to export user texts. To export system texts, select "System texts". To export both user texts and system texts, select both check boxes.
5. In "Select content", select the required text categories for the user texts or the system texts.
6. In the "Export file" input field, specify a file name for the export file.
7. In the "Path" input field, select a path in the data system to which the export file is to be saved.
8. Click "Export".

### Importing project texts

To import a file containing project texts, follow these steps:

1. Select the "Import project texts" command in the "Tools" menu.  
The "Import" dialog box opens.
2. Select the path and the file name of the import file from the "Select file for import" field.
3. Select the "Import base language" check box if you have made changes to the base language in the export file and you want to overwrite the entries in the project with the changes.
4. Click "Import".

Application examples for multilanguage projects (Page 315)

### 7.3.9.8 Application examples for multilanguage projects

#### Introduction

Let us assume you are working in a team with colleagues some of whom speak English, some French and some German. You have created a project with the TIA Portal and have already created a functioning configuration.

To allow your other colleagues to be able to keep track of the project, you would like all devices being used to have comments in English and German. First, you would like to enter the comments in German. Following this, to save time and costs, you want to have the texts translated into English in a spreadsheet program by an external translation office.

In addition to this, you also want a single comment for a particular device in French so that your French-speaking colleague can continue working on this device.

The section below describes an example of how you can achieve this with the tools of the TIA Portal.

#### Translating the project into English

To enter the comments in German and to have them translated into English later, follow these steps:

1. Set the editing language to "German" and fill all the comment boxes with the relevant texts in German.  
On the device selected from the French-speaking colleague, enter, for example "Unser neues Gerät" in German first.  
All the comments are now stored in German.
2. Export all user texts to an Office Open XML file with the extension ".xlsx".
3. Have the user texts contained in the file translated into English in a spreadsheet program such as Microsoft Excel.
4. Import the file into the TIA Portal after it has been translated.  
All texts are now available in German and English.

#### Translating a single comment field to French

To translate an individual comment field to French, follow these steps:

1. Open the comment box for the device on which the French-speaking colleague will be working.
2. Open the "Languages & Resources" pane in the "Tasks" task card.
3. Set "French" as the editing language in the "Languages & Resources" pane. As the reference language, set, for example, "English".  
Since no translation has yet been installed in French, the comment box is empty. In the "Languages & Resources" pane, the English translation "Our new device" is displayed as a reference.
4. Orientating yourself on the English reference text enter "Notre nouvel appareil" in the comment box.  
The comment for this device is now available in the languages German, English and French.

Translating text associated with individual objects (Page 312)

## 7.3.10 Archiving and retrieving projects

### 7.3.10.1 Working with project archives

#### Archiving and transferring projects

If you work for a long time with a project, large files may result, especially with extensive hardware configurations. Therefore, you may want to reduce the size of the project, for example, when you archive it to an external hard drive, or when you send it via e-mail and require a smaller file size.

#### Options for reducing the size of the project

There are two ways to reduce the size of the project:

- **Creating a project archive**  
TIA Portal project archives are compressed files, each containing an entire project, including the entire folder structure of the project. Before the project directory is compressed into the archive file, all files are reduced to their essential components to further decrease the size of the project. Project archives are therefore well suited for sending via e-mail. Project archives have the file extension ".zap[version number of the TIA Portal]". Projects created with TIA Portal V13 have the file extension ". zap13".  
To open a project archive, retrieve the project archive. By retrieving it, the archive file with the included project files is extracted to a previously selected location in the original project directory structure.
- **Minimizing a project**  
You can skip additional compression in an archive file, and instead create a copy of the project directory. The included files are reduced to the essential elements of the project. This minimizes the required storage space. The full functionality of the project is maintained and you can open the project as usual.  
A minimized project is especially well suited for archiving, for example, on an external medium.

**See also**

Retrieving projects (Page 318)

Archiving projects (Page 317)

### 7.3.10.2 Archiving projects

You can reduce the storage space required for the currently open project by compressing the project into a file, or by reducing the project files to their essential components. You can do both of these with the archiving function of the TIA Portal.

---

**Note**

The most recently saved state of the project is used for archiving. Therefore, save the project before using the archiving function. This will ensure that your most recent changes are included in the archived project.

---

#### Procedure

To archive a project, follow these steps:

1. Select the "Archive" command in the "Project" menu.  
The "Archive current project as..." dialog opens.
2. Select the directory where you want to save the archive file or the new project directory.
3. Select the file type from the "File type" drop-down list:
  - TIA Portal project archive, if you want to create a compressed file of the project.
  - Minimized TIA Portal project, if you only want to create a copy of the project directory with minimal storage space.
4. Enter a file name in the "File name" field if you are creating an archive file. If you are creating a minimized project directory instead, enter the name of the new project directory to be created in the "File name" box.
5. Click "Save".

#### Result

When you have created a project archive, a compressed file with the extension ".zap13" is generated. Project archives of projects in compatibility mode for product version V12 SP1 receive the file extension ".zap12" and are backward compatible with TIA Portal V12 SP1. The archive file contains the complete project directory. The individual files of the project are also reduced to the essential components in order to save space.

If you have created a minimized TIA Portal project, only a copy of the original project directory is created at the desired location. The files contained within it are reduced to their essential components in order to save space.

#### See also

Working with project archives (Page 316)

Retrieving projects (Page 318)

### 7.3.10.3 Retrieving projects

You extract project archives of the TIA Portal with the "Restore from archive" function. This restores the project directory structure including all project files.

#### Requirement

No project should be open.

#### Procedure

To unpack a project archive, follow these steps:

1. Select the "Restore from archive" command in the "Project" menu.  
The "Retrieve archived project" dialog opens.
2. Select the project archive.
3. Click "Open".
4. The "Find folder" dialog opens.
5. Select the target directory to which the archived project should be extracted.
6. Click "OK".

#### Result

The project is extracted to the selected directory and opened immediately. If you extract a project archive that includes a project from a product version lower than V12 SP1, you may have to upgrade the project. You will automatically receive the corresponding prompt as soon as you open the project. The same rules apply that are described in the chapter "Compatibility of projects (Page 301)".

Working with project archives (Page 316)

Opening projects (Page 302)

Compatibility of projects (Page 301)

Upgrading projects (Page 303)

## 7.4 Using reference projects

### 7.4.1 Basics of reference projects

#### Introduction

You can open other projects as a reference in addition to the current project. You can use these reference projects as follows:

- You can drag individual objects from a reference project into the current project and then edit them.
- You can open specific objects, for example, code blocks from a reference project as read-only. But this is not possible for all elements.
- You can use an offline/offline comparison to compare devices of the reference project to devices from the current project.

Note that reference projects are read-only. You cannot change the objects of a reference project.

Projects that were created with an older version of the TIA Portal or with a different installation package can also be opened as reference projects. The same compatibility rules as those for the normal opening of a project from an older version of the TIA Portal apply here.

See also: Compatibility of projects (Page 301)

#### See also

Comparing reference projects (Page 320)

Opening and closing a reference project (Page 319)

Reference projects (Page 265)

### 7.4.2 Opening and closing a reference project

#### Opening a reference project

To open a reference project, follow these steps:

1. In the "Reference projects" palette of the project tree, click on "Open reference project" in the toolbar.  
The "Open reference project" dialog box opens.
2. Navigate to the desired project folder, and open the project file. TIA Portal V13.x projects have the extension ".ap13". Older projects of the TIA Portal have the extension ".ap[version number]".
3. Click "Open".  
The selected project is opened as a read-only reference project.

### Closing a reference project

To close a reference project, follow these steps:

1. In the "Reference projects" palette of the project tree, select the reference project you want to close.
2. Click on "Close reference project" in the toolbar.  
The selected reference project is closed.

### See also

Basics of reference projects (Page 319)

Comparing reference projects (Page 320)

Reference projects (Page 265)

## 7.4.3 Comparing reference projects

### Introduction

You can compare devices from reference projects with devices from both the current project as well as from the same or another reference project or from a library.

---

#### Note

Please note the following:

- You cannot specify actions for the comparison objects, since the reference projects are write-protected.
  - You can perform a detailed comparison for the comparison objects, if the type of comparison object generally allows a detailed comparison.
  - When comparing reference projects, you can always switch between automatic and manual comparison.
- 

### Procedure

To compare the objects of a reference project to the device data of the current project, follow these steps:

1. In the project tree, select the device whose data you want to compare to the data of a reference project and which allows offline/offline comparison.
2. Select "Compare > Offline/Offline" from the shortcut menu.  
The compare editor opens with the selected device displayed in the left area.
3. Open the "Reference projects" palette in the project tree.

4. Select the device of a reference project that you want to compare to the device data from the current project.
5. Drag the device from the reference project into the right drop area of the compare editor. You can identify the status of the objects based on the symbols in the status and action area. When you select an object, the object's properties and the corresponding object of the associated device is clearly shown in the properties comparison. You can drag a library or other devices from a reference project from the current project into drop areas at any time and thus start a new comparison. It does not matter which device you drag into the drop area.

## 7.5 Editing project data

### 7.5.1 Compiling and loading project data

#### 7.5.1.1 Compiling project data

#### General information on compiling project data

#### Compiling project data

During compilation, project data is converted so that it can be read by the device. Hardware configuration data and program data can be compiled separately or together. You can compile the project data for one or more target systems at the same time.

The following project data must be compiled prior to loading:

- Hardware project data, for example, configuration data of the devices or networks and connections
- Software project data, for example, program blocks or process screens

---

**Note**

While a device is being compiled, no additional compiling process can be started. Note in this regard that you can not only perform a compiling process manually, but you can also trigger it automatically for HMI devices.

---

**Scope of the compilation**

When you compile project data, you have the following options depending on the device involved:

- Hardware and software (only changes)
- Hardware (only changes)
- Hardware (rebuild completely)
- Software (only changes)
- Software (rebuild all blocks)
- Software (reset memory reserve)

**See also**

Compiling project data (Page 322)

**Compiling project data**

The following section describes the general procedure for compiling project data in the project tree. You will find details of how certain objects are compiled and any special points to note in the online help of the product.

**Procedure**

To compile project data, follow these steps:

1. In the project tree, select the devices whose project data you want to compile.
2. Select the option you require in "Compile" submenu of the shortcut menu.

---

**Note**

Note that the options available to you depend on the selected device.

---

The project data is compiled. You can check whether or not the compilation was successful in the Inspector window with "Info > Compile".

**See also**

General information on compiling project data (Page 321)

### 7.5.1.2 Loading project data

#### General information on loading

##### Introduction

In order to set up your automation system, you need to load the project data you generated offline on the connected devices. This project data is generated, for example when configuring hardware, networks, and connections or when programming the user program or when creating recipes.

The first time you download, the entire project data is downloaded. During later loading operations, only changes are downloaded.

You can download the project data to devices and memory cards.

---

**Note**

While a device is being compiled, no additional download process can be started. Note in this regard that you can not only perform a compiling process manually, but you can also trigger it automatically for HMI devices.

---

#### Possible options for downloading

Depending on the object you want to download, you have the following options:

- **Hardware and software (only changes)**  
Both the hardware configuration and software are downloaded to the destination if differences exist between the online and offline versions.
- **Hardware configuration**  
Only the hardware configuration is downloaded to the destination.
- **Software (only changes)**  
Only the objects that differ online and offline are downloaded to the destination.
- **Load PLC program to device and reset**  
All the blocks are loaded to the destination and all values are reset to their initial state. Be aware that this also applies to retentive values.

You can also upload project data already contained in a device back to your project. You have the following options:

- **Upload entire device as new station**  
The hardware configuration of the device and the software on the device is uploaded to the project.  
All relevant data of the device is uploaded to the project.
- **Upload software of a device**  
Only the blocks and parameters from the device are uploaded to an existing CPU in the project.

In both cases, during loading all instances of library types are connected again with the corresponding version of the type in the project library. If no suitable type is yet available for

a loaded instance or the correct version of the type does not exist in the project library, the type or the version is added to the project library.

**Downloading with synchronization**

In team engineering, it is possible for several users to work on one project with several engineering systems at the same time and to access one S7-1500 CPU. To ensure consistency within the shared project, it is necessary to synchronize the changed data prior to loading so that nothing gets overwritten unintentionally.

If differences are detected between the online and offline data management within the shared project that were caused by a different engineering system, automatic synchronization of the data to be loaded is offered when loading.

In this case, the "Synchronization" dialog displays the data to be synchronized with the current status (online-offline comparison) and the possible actions.

Use case	Recommendation	Synchronization
One or more blocks on the CPU (online) are more recent than in the engineering system (offline).	These blocks should be uploaded from the CPU to the engineering system before downloading.	Automatic synchronization is possible: The blocks in the engineering system are updated prior to loading.
One or more new blocks have been created and exist only on the CPU (online).	These blocks should be uploaded from the CPU to the engineering system before downloading.	Automatic synchronization is possible: The new blocks are added to the engineering system prior to the download.
One or more blocks on the CPU have been deleted.	The blocks should also be deleted prior to the download in the engineering system.	Automatic synchronization is not possible. The blocks deleted on the CPU should be manually deleted in the offline project in the engineering system.

Use case	Recommendation	Synchronization
One or more blocks on the CPU and in the engineering system are different. This is the case when a different user has changed blocks to which you have also made corrections and has already downloaded them to the CPU.	These blocks with competing changes must be adapted manually. You decide in this case which changes you are going to accept. If the blocks on the CPU are to be retained, you should adopt these blocks from the CPU in your engineering system before downloading to the CPU. If the blocks that you have changed are to be applied, you can continue with the download without synchronization.	Automatic synchronization is not possible: The affected blocks on the CPU or in the engineering system must be adapted manually. One of the existing block versions (online or offline) will be overwritten in the process.
There are differences in the hardware configuration on the CPU (online) and in the engineering system (offline).	Differences in the hardware configuration must be adapted manually. You decide in this case which hardware configuration you are going to accept. If the existing hardware configuration on the CPU is to be retained, you should adopt this in your engineering system prior to downloading. If you want to apply the hardware configuration you changed, you can continue downloading without synchronization.	Automatic synchronization is not possible: The hardware configuration must be adapted manually. One of the existing hardware configurations (online or offline) will be overwritten.

If required, you can use the "Force download to device" command to download blocks without synchronization.

**See also**

Downloading project data to a device (Page 325)

Downloading project data to a memory card (Page 327)

Uploading project data from a device (Page 328)

**Downloading project data to a device**

The following section describes the general procedure for downloading project data to a device. You will find details of how certain objects are downloaded and any special points to note in the online help of the product.

**Requirement**

- The project data is consistent.
- Each device to which you want to download is accessible via an online access.

## Procedure

To download the project data to the selected devices, follow these steps:

1. Select one or more devices systems in the project tree.
2. Right-click on a selected element.  
The shortcut menu opens.
3. Select the option you require in the shortcut menu of the "Download to device" submenu.

---

### Note

Note that the options available to you depend on the selected device.

---

When necessary, the project data is compiled.

- If you had previously established an online connection, the "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for downloading.
  - If you had not previously established an online connection, the "Extended download to device" dialog opens, and you must first select the interfaces via which you want to establish the online connection to the device. You have the option of showing all compatible devices by selecting the corresponding option and clicking the "Start search" command.  
See also: Auto-Hotspot
4. Check the messages in the "Load preview" dialog, and select the actions in the "Action" column, if necessary.

### WARNING

#### Preventing personal injury and material damage

Performing the proposed actions while the plant is in operation can cause serious bodily injury and property damage in the event of malfunctions or program errors.

Make sure that no dangerous situations can arise before you start the actions!

As soon as loading becomes possible, the "Load" button is enabled.

5. Click the "Load" button.  
The loading operation is performed. If there is a need for synchronization, the system automatically displays the "Synchronization" dialog. This dialog displays messages and suggests actions that are required for the synchronization. You have the option of performing these actions or forcing the download without synchronization by clicking "Force download to device". If you have performed the suggested actions, you will be asked whether you want to continue with the download. The "Load results" dialog then opens. In this dialog, you can check whether or not the loading operation was successful and take any further action that may be necessary.
6. Click the "Finish" button.

## Result

The selected project data was downloaded to the devices.

**See also**

General information on loading (Page 323)

Downloading project data to a memory card (Page 327)

Uploading project data from a device (Page 328)

**Downloading project data to a memory card**

You can drag-and-drop project data to load it to a memory card. For CPUs of the S7-300/400 series you can also explicitly download the user program to a memory card inserted in the CPU.

**Requirement**

A memory card is displayed.

See also: Accessing memory cards (Page 382)

**Dragging project data to a memory card**

To download project data to a memory card, follow these steps:

1. In the project tree, drag the project data you want to load to the memory card.  
The "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for downloading.
2. Check the messages, and select the actions in the "Action" column, if necessary.  
As soon as loading becomes possible, the "Load" button is enabled.
3. Click the "Load" button.  
The loading operation is performed. The "Load results" dialog then opens. In this dialog, you can check whether or not the loading operation was successful and take any further action that may be necessary.
4. Click the "Finish" button.

**Download the user program to a memory card in the CPU (S7-300/400 only)**

To download the user program to a memory card in a CPU of the S7-300/400 series, follow the steps below:

1. Select a CPU of the S7-300/400 series in the project tree.
2. Select the "Download user program to memory card" command in the "Online" menu.  
The "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for downloading.
3. Check the messages, and select the actions in the "Action" column, if necessary.  
As soon as loading becomes possible, the "Load" button is enabled.
4. Click the "Load" button.  
The download is made and the "Load results" dialog is displayed. This dialog displays messages and suggests possible actions.

5. Check the messages, and select the actions in the "Action" column, if necessary.
6. Click the "Finish" button.

### See also

General information on loading (Page 323)

Downloading project data to a device (Page 325)

Uploading project data from a device (Page 328)

### Uploading project data from a device

The following section describes the general procedure for uploading project data from a device. Which project data you can upload from a device depends on the products installed.

You have the following options for uploading project data from a device to your project:

- Upload as new station  
With this option you upload existing project data of a device to your project as a new station.
- Uploading project data of a device  
With this option you upload project data from the device to an existing CPU in the project. You will find the project data that can be loaded in the online help of the product.

In both cases, all instances of library types are connected again with the corresponding version of the type in the project library during loading. If no suitable type is yet available for a loaded instance or the correct version of the type does not exist in the project library, the type or the version is added to the project library.

### Requirement

- A project is open.
- The hardware configuration and software to be downloaded have to be compatible with the TIA Portal. If the data on the device was created with a previous program version or with a different configuration software, please make sure they are compatible.

### Upload as new station

To upload the complete device to your project, follow these steps:

1. Select the project name in the project tree.
2. Select "Upload device as new station (hardware and software)" in the "Online" menu. The "Upload device to PG/PC" dialog opens.
3. Select the type of interface you want to use for the load operation in the "Type of the PG/PC interface" drop-down list.
4. Select the interface to be used from the "PG/PC interface" drop-down list.
5. Click the "Configure interface" button to the right of the "PG/PC interface" drop-down list to adapt the settings for the selected interface.  
See also: Auto-Hotspot

6. Display all compatible devices by selecting the relevant option and clicking the "Start search" command. In the accessible devices table, select the device from which you want to upload project data.
7. Click on "Load".  
Depending on the selected device, a dialog appears in which you have to enter additional information, such as the position of the module rack.  
The project data of the device is uploaded to the project. You can edit it offline and then download it to the device again.

### Uploading project data of a device

To upload only project data from one device to your project, follow these steps:

1. Establish an online connection to the device from which you want to download the project data.  
See also: Auto-Hotspot
2. Select the device in the project tree.  
The "Upload from device (software)" command in the "Online" menu is enabled.
3. Select the "Upload from device (software)" command in the "Online" menu.  
The "Upload preview" dialog box opens.
4. Check the messages in the "Upload preview" dialog, and select the necessary actions in the "Action" column.  
As soon as uploading becomes possible, the "Upload from device" button is enabled.
5. Click the "Upload from device" button.  
The loading operation is performed.

### See also

General information on loading (Page 323)

Downloading project data to a device (Page 325)

Downloading project data to a memory card (Page 327)

### Loading project data from a memory card

You have the following options for uploading project data from a memory card to your project:

- Upload project data of the memory card as a new station  
With this option you upload the project data of a memory card to your project as a new station.
- Upload project data of the memory card to an existing device  
With this option you upload project data of a memory card to an existing device in your project. You will find the project data that can be loaded in the online help of the product.

In both cases, all instances of library types are connected again with the corresponding version of the type in the project library during loading. If no suitable type is yet available for a loaded instance or the correct version of the type does not exist in the project library, the type or the version is added to the project library.

## Requirement

- A project is open.
- The memory card is displayed.  
See also: Accessing memory cards (Page 382)
- The hardware configuration and software to be downloaded have to be compatible with the TIA Portal. If the data on the memory card was created with a previous program version or with different configuration software, please make sure they are compatible.

## Upload project data as a new station

To upload project data from a memory card to your project, follow these steps:

1. In the project tree, select the project data you want to upload.
2. Select "Upload device as new station (hardware and software)" in the "Online" menu.

Or:

1. In the project tree, drag the memory card folder to the project.

Or:

1. Right-click on the memory card.
2. Select "Copy" in the shortcut menu.
3. Right-click on the project.
4. Select the "Paste" command in the shortcut menu.

## Uploading project data to an existing device

To upload the project data of a memory card to an existing device, follow these steps:

1. In the project tree, drag the folder of the memory card to a device in the project or copy the memory card and paste the data into a device.  
The "Upload preview" dialog box opens.
2. Check the messages in the "Upload preview" dialog, and select the necessary actions in the "Action" column.  
As soon as uploading becomes possible, the "Upload from device" button is enabled.
3. Click the "Upload from device" button.  
The loading operation is performed.

## 7.5.2 Comparing project data

### 7.5.2.1 Basics of project data comparison

#### Function

You can compare project data of the same type in order to determine possible differences. In principle, the following comparison methods are available:

- **Online/offline comparison**  
With this comparison method you can compare the software of objects of a device with the objects of a project. This is only possible when you establish an online connection to the device.
- **Offline/offline comparison**  
With this comparison method you can either compare the software or the hardware. When you compare the software, you can compare objects from projects or libraries. The hardware comparison is available for devices from the currently open project or from reference projects. You can decide for the software as well as the hardware comparison whether the comparison should be performed automatically for all objects or whether you want to compare individual objects manually.
- **Detailed comparison**  
For some objects, for example, blocks, you can also perform a detailed comparison in addition to the online/offline and offline/offline comparison. This involves opening the blocks to be compared beside each other and highlighting the differences.

A simple online/offline comparison is performed as soon as you establish an online connection. During this process, comparable objects in the project tree are marked with icons that represent the result of the comparison.

The normal online/offline and offline/offline comparison is performed in the compare editor. With the software comparison, you can also select actions for non-identical objects in the compare editor.

---

#### Note

- Not all objects allow all types of comparison. Which comparison method you can use for which project data depends on the products installed.
  - Compile your user program before you start a comparison or detailed comparison. After each change of the program during a comparison, repeat this step before you update the result of the comparison. This ensures that the comparison shows the current status.
- 

#### See also

Carrying out an online/offline comparison (Page 332)

Carrying out offline/offline comparisons (Page 332)

Using the compare editor (Page 333)

Running a detailed comparison (Page 341)

### 7.5.2.2 Carrying out an online/offline comparison

The online/offline comparison lets you compare objects of a device with objects of a project.

#### Requirement

The project tree is open.

#### Procedure

To perform an online/offline comparison, follow these steps:

1. Select a device in the project tree that allows online/offline comparison.
2. Select the "Compare > Offline/online" command in the shortcut menu.
3. If you have not already established an online connection to this device, the "Go online" dialog opens. In this case, set all the necessary parameters for the connection and click "Connect".

The online connection is established and compare editor opens.

#### Result

All objects that exist online and offline are displayed. The symbols in the compare editor and in the project tree show you the status of the objects. In the compare editor, you can now define certain actions for the objects, depending on their status.

#### See also

Basics of project data comparison (Page 331)

Using the compare editor (Page 333)

Running a detailed comparison (Page 341)

### 7.5.2.3 Carrying out offline/offline comparisons

With offline/offline comparison you have the option to compare the project data of two devices. You can carry out a software as well as a hardware comparison. When you compare the software, you can compare objects from projects or libraries. The hardware comparison is available for devices from the currently open project or from reference projects. You can decide whether the comparison should be performed automatically for all objects or whether you want to compare individual objects manually.

You can drag any other device to the drop area at any time to perform further comparisons.

#### Requirement

The project tree is open.

## Procedure

To perform an offline/offline comparison, follow these steps:

1. Select a device in the project tree that allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.  
The compare editor opens and the selected device is displayed in the left area.
3. Drag-and-drop an additional device to the drop area of the right pane.  
All existing objects of the selected devices are displayed depending on the settings of the compare editor in the "Software" tab and an automatic comparison is carried out. You can identify the status of the objects based on the symbols in the compare editor. You can define certain actions depending on the status of the objects.
4. If you want to carry out a manual comparison, click on the button for switching between automatic and manual comparison in the status and action area. Then select the objects that you want to compare.  
The properties comparison is displayed. You can identify the status of the objects based on the symbols. You can define certain actions depending on the status of the objects.
5. If you want to carry out a hardware comparison, open the "Hardware" tab. You can once again carry out a manual comparison, if necessary. But you cannot specify any action.

Using the compare editor (Page 333)

Running a detailed comparison (Page 341)

### 7.5.2.4 Using the compare editor

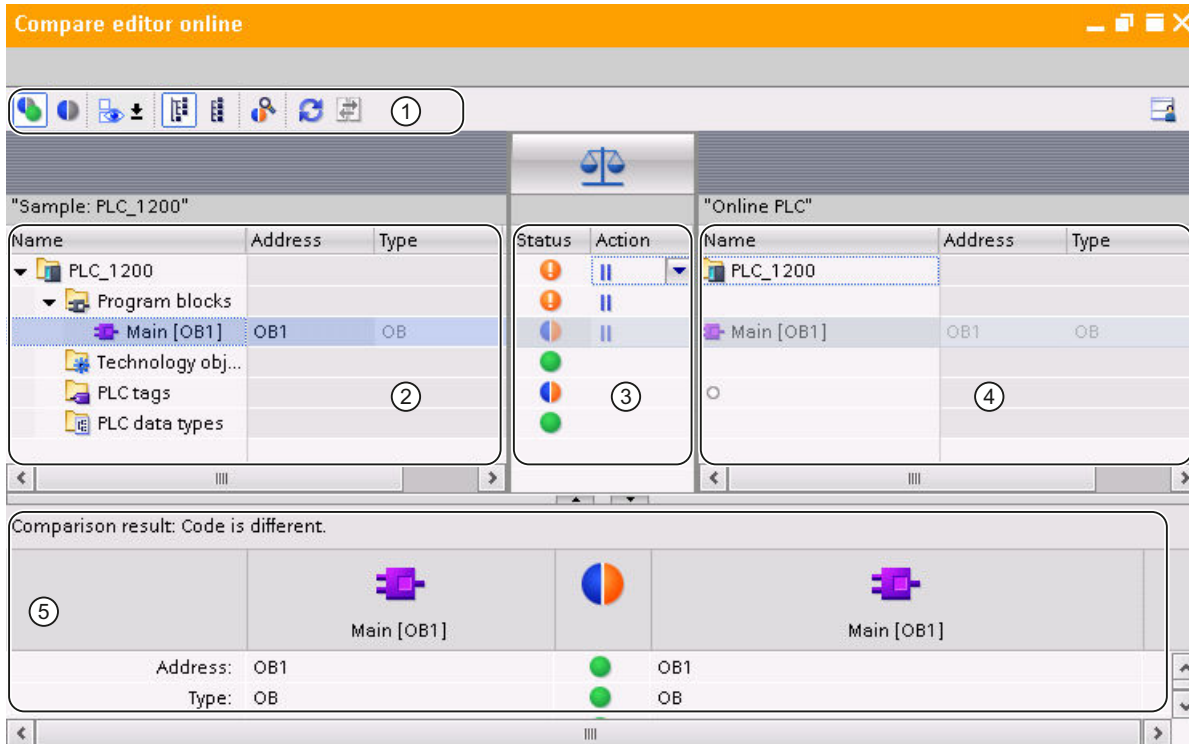

#### Overview of the compare editor

#### Function

The compare editor gives an overview of the results of a comparison in a table. The appearance varies slightly depending on whether it is an online/offline comparison or a hardware/software comparison.

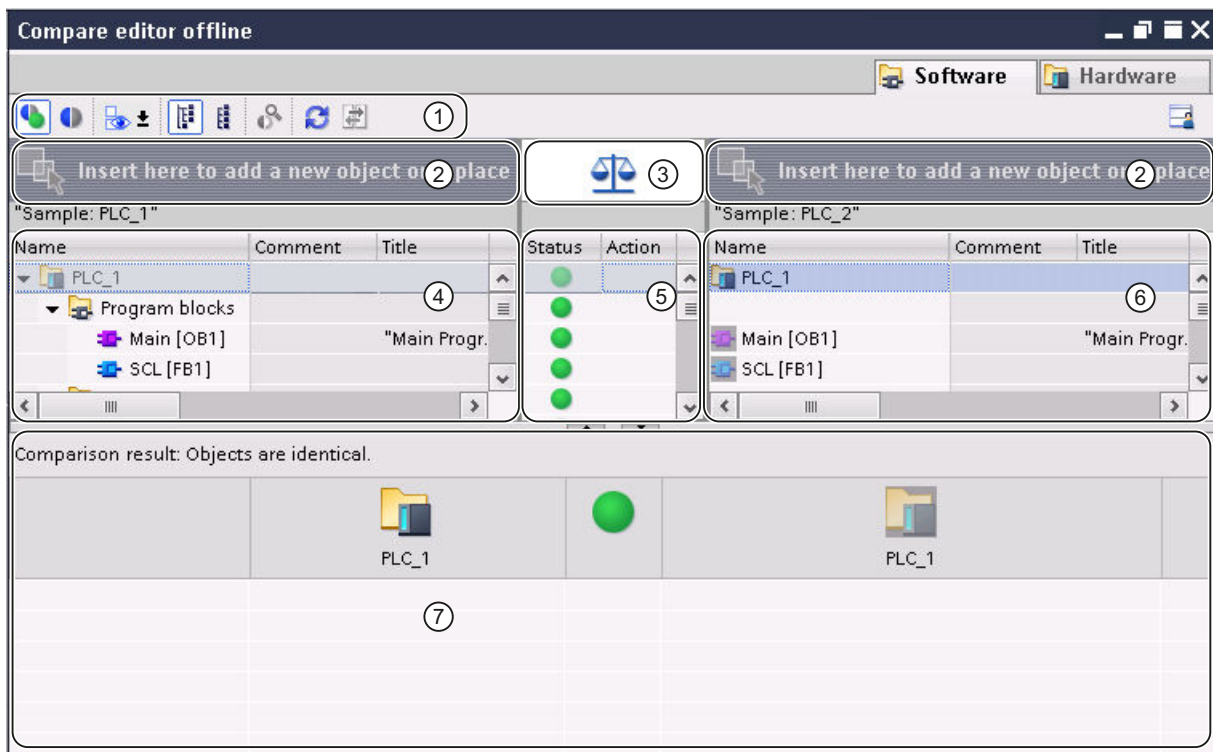

### Layout of the compare editor

The following figure shows the layout of the compare editor for an online/offline comparison:

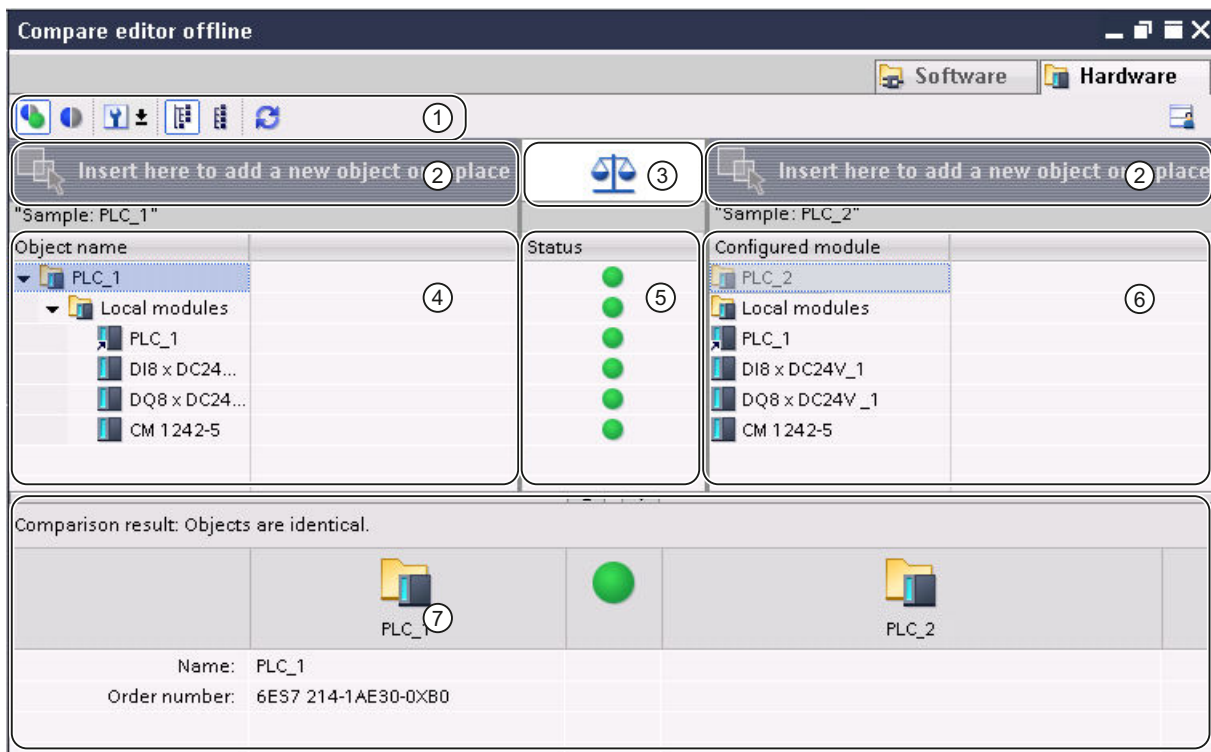

- ① Compare editor toolbar
- ③ Left comparison table
- ③ Status and action area
- ④ Right comparison table
- ⑤ Properties comparison

The following figure shows the layout of the compare editor for an offline/offline comparison (software):

- ① Compare editor toolbar
- ② Drop areas
- ③ Button to toggle between automatic and manual comparison
- ④ Left comparison table
- ⑤ Status and action area
- ④ Right comparison table
- ⑦ Properties comparison

The following figure shows the layout of the compare editor for an offline/offline comparison (hardware):

- ① Compare editor toolbar
- ② Drop areas
- ③ Button to toggle between automatic and manual comparison
- ④ Left comparison table
- ⑤ Status area
- ④ Right comparison table
- ⑦ Properties comparison

### Compare editor toolbar

With the toolbar, you can access the following compare editor functions:

- Only show different objects  
You can hide identical objects to make the comparison easier to follow.
- Show identical and different objects  
You can show identical objects if you want to view the comparison in full.
- Scope of the comparison (only online/offline comparison and offline/offline comparison for software)  
You can define which objects are to be compared.
- Select assignment criterion (only offline/offline comparison for hardware)  
You can specify the criterion according to which the modules are to be assigned to each other for the comparison.

- **Changing the view**  
You can choose between a hierarchical and a flat view. In the hierarchical view, the devices are shown in their structure; in the flat view, the objects of the devices are listed without structure.
- **Start detail comparison (only online/offline comparison and offline/offline comparison for software)**  
You can start a detailed comparison for objects to show the individual differences. This function is, however, not available for every object.
- **Updating comparison results**  
After you have modified objects, you can update the comparison results using this function.
- **Synchronize non-identical objects (only online/offline comparison and offline/offline comparison for software)**  
You can synchronize non-identical objects using specific actions.

## Drop areas

In the case of an offline/offline comparison, you can drag the devices you want to compare into the drop areas. In the case of a software comparison, the devices to be compared can originate from the opened project, from reference projects, from the project library or from global libraries. However, note that you can only drop complete libraries into the right drop area. In the case of a hardware comparison, you can compare devices from the opened project or from reference projects.

## Button to toggle between automatic and manual comparison

With an offline/offline comparison, you can switch between automatic and manual comparison. In the case of automatic comparison, the objects to be compared are assigned automatically to each other. In the case of a manual comparison, you can select the objects that are to be compared.

## Comparison tables

Comparison tables show the objects of the devices being compared to one another.

The following table shows the meaning of the columns of the comparison table:

Column	Description
Name	Name of the compare object
Comment	Comment on the compare object
Title	Title of the compare object
Address	Address of the compare object
Numbering	Type of numbering for the comparison object
Type	Type of compare object
Language	Programming language set for the compare object.
Time stamp interface	Time of the last modification to the block interface
Time stamp code	Time of the last modification to the source code
Author	Name of the author of the compare object

Column	Description
Version	Version of the compare object
Family	Name of the object family
Load memory	Memory usage of the load memory of the compare object
Work memory	Memory usage of the work memory of the compare object
Modified on	Time of last modification
Signature	Signature of the compare object (SIMATIC Safety)
Interface signature	Signature of the block interface of the compare object (SIMATIC Safety)

Not all columns are shown in the default setting. However, as in all table editors, you can show or hide the columns as required and sort according to individual columns. In the case of a hardware comparison, the comparison tables only contain the "Name" column.

### Status and action area

The status and action area offers the following options:

- You can view the results of automatic comparison. The results are displayed with symbols.
- In an online/offline comparison and an offline/offline comparison for software, you can specify actions for non-identical objects.

### Status and action symbol

The following table shows the comparison results symbols for an online/offline comparison:

Symbol	Description
	Folder contains objects whose online and offline versions differ
	Comparison results are not known
	Online and offline versions of the object are identical
	Online and offline versions of the object are different
	Object only exists offline
	Object only exists online

The following table shows the comparison results symbols for an offline/offline comparison:

Symbol	Description
	Reference program
	Version compared
	Folder contains objects of which the versions compared differ
	Results of the offline/offline comparison are not known

Symbol	Description
	The versions of the object compared are identical
	The versions of the object compared differ
	Object only exists in the reference program
	Object only exists in the version compared
	Hardware comparison only: Although the lower-level objects of the container are identical, there are differences between the containers themselves. Such a container may be a rack, for example.
	Hardware comparison only: The lower-level objects of the container are different. There are also differences between the containers. Such a container may be a rack, for example.

The following table shows the symbols for possible actions in a software comparison:

Symbol	Description
	No action
	Overwrite the object of the compared version with the object from the reference program
	Overwrite the object of the output program with the object from the compared version
	Different actions for the compare objects in the folder

## Properties comparison

The properties comparison compares the properties of the selected compare objects. The result is displayed with symbols. Only the properties comparison is made with a manual comparison so that the status and action area remains empty. With automatic comparison, you can perform the property comparison in addition to the comparison in the comparison tables.

- Filtering the compare editor view (Page 340)
- Updating the comparison results (Page 342)
- Synchronizing non-identical objects (Page 343)

## Show and hide table columns

In a software comparison, you can show or hide the columns of comparison tables as required.

### Procedure

To show or hide table columns, follow these steps:

1. Click a column header.
2. Select the "Show/Hide" command in the shortcut menu.  
The selection of available columns is displayed.
3. To show a column, select the column's check box.
4. To hide a column, clear the column's check box.

The change affects both the left and the right comparison table.

### Result

The columns in both the left and the right comparison table are shown or hidden.

### See also

Running a detailed comparison (Page 341)

Updating the comparison results (Page 342)

Synchronizing non-identical objects (Page 343)

Changing the view (Page 345)

## Filtering the compare editor view

You can improve the clarity of the compare editor using the following filters:

- **Hiding identical comparison objects**  
You can hide comparison objects which have identical online/offline or offline/offline versions. Any such comparison objects you have hidden can also be shown again at any time.
- **Displayed objects**  
In an online/offline comparison or an offline/offline comparison for software, you can specify the objects for which the comparison results are to be shown.

## Requirement

The compare editor is open.

## Hiding identical comparison objects

To hide identical objects, follow these steps:

1. Click on the "Show only objects with differences" button in the toolbar.  
Only the elements that differ online and offline are displayed.

## Showing identical comparison objects

To show identical objects again, follow these steps:

1. Click on the "Show identical and different objects" button in the toolbar.  
All elements will be displayed.

## Selecting displayed objects

To select the objects for which comparison results should be displayed, follow these steps:

1. Perform an online/offline or an offline/offline comparison for software.
2. Click the arrow of the button "Show additional available filters" in the toolbar.
3. Select the required filter.

## See also

Show and hide table columns (Page 340)

Running a detailed comparison (Page 341)

Updating the comparison results (Page 342)

Synchronizing non-identical objects (Page 343)

## Running a detailed comparison

---

### Note

Not all objects allow a detailed comparison. The project data for which you can perform a detailed comparison depends on the products installed. A detailed comparison of the hardware components is not available for hardware comparison.

---

## Procedure

Proceed as follows to perform a detailed comparison:

1. First, perform an online/offline or an offline/offline comparison for software.  
The compare editor opens.

---

### Note

You can only perform a detailed comparison for objects that are listed in the left as well as the right comparison table.

---

2. In the compare editor, select the object for which you want to perform a detailed comparison.
3. Click the "Start detailed comparison" button in the toolbar.

## See also

Changing the view (Page 345)

Filtering the compare editor view (Page 340)

Updating the comparison results (Page 342)

Synchronizing non-identical objects (Page 343)

## Updating the comparison results

As soon as you change an object, the comparison results are no longer valid and must be updated.

---

### Note

For online/offline comparisons, you should note that changes in the device may result in the system automatically updating the comparison editor if objects in the comparison are affected by the change. This can have the following results:

- Some of the actions you have defined may become invalid, for example if the device no longer contains the object in question. Objects with such invalid actions will be highlighted so you can define new, valid actions.
  - The selection you made before the automatic update may also be cancelled.
- 

## Requirement

The comparison editor is open.

## Procedure

To update the comparison results, follow these steps:

1. Click the "Refresh view" button in the toolbar.  
The comparison results are updated.

---

### Note

Please note that the "Refresh view" button will not be available while the comparison editor is loading or synchronizing content.

---

- Filtering the compare editor view (Page 340)
- Running a detailed comparison (Page 341)
- Synchronizing non-identical objects (Page 343)

## Synchronizing non-identical objects

### Specifying actions

If you have performed a comparison, you can specify the actions to be performed for non-identical objects in the compare editor. You cannot select any actions for identical objects. Note that you cannot execute any actions during hardware comparison.

In the case of an online/offline comparison, only synchronization actions in one direction are permitted, in order to retain program consistency. Thus, for example, you can load multiple blocks to a device or from a device, but you cannot perform a combination of loading actions in one synchronization action. In this case, the first action you set in the compare editor determines the synchronization direction. For example, if you specify for a block that the offline block is to be loaded to the device, then the other objects can also only be loaded to the device via a synchronization action. To load objects from the device again, first select the "No action"

option. You can then specify the action settings again as required. Or, you can perform a new comparison.

---

**Note**

Please note the following CPU-specific aspects when defining actions:

- S7-300/400:
    - You can define actions for the "Program blocks" folder, for folders you have created yourself or for individual blocks.
    - Neither SCL nor GRAPH blocks can be loaded from the device to the offline project.
  - S7-1200/1500:
    - You can define actions for the "Program blocks" folder, for folders you have created yourself or for individual blocks. If you have performed an online/offline comparison and select download to the device as action, a consistent download is executed. If you upload the object from the device to the project, however, you can also upload individual blocks.
    - SCL blocks cannot be loaded from the device to the offline project.
- 

**Requirement**

The compare editor is open.

**Procedure**

To select an action for a non-identical object, follow these steps:

1. In the status and action area, double-click in the "Action" column on the cell of the object for which you want to define an action.  
The cell changes to a drop-down list.
2. Click on the drop-down list.
3. Select the action you want.  
The action set will be carried out for the object in question the next time synchronization is performed.  
If you have accidentally changed the action you had selected, you can undo the change before the next synchronization.
4. To restore the previous action selected, right-click on the object or folder.
5. Select the "Restore previous selection" command in the shortcut menu.

Filtering the compare editor view (Page 340)

Updating the comparison results (Page 342)

Synchronizing objects (Page 345)

## Synchronizing objects

Synchronization executes the actions you have specified for non-identical objects. Note, however, that in the case of an online/offline comparison you can only perform actions in one direction in one synchronization action.

### Requirement

- The compare editor is open.
- The desired actions have been selected.

### Procedure

To synchronize objects, follow these steps:

1. Click the "Execute actions" button in the toolbar.

### Result

The actions you specified for the objects are performed.

### See also

Updating the comparison results (Page 342)

Specifying actions (Page 343)

## Changing the view

You can choose between a hierarchical and a flat view for the left comparison table. In the hierarchical view, the devices are shown in their structure; in the flat view, the objects of the devices are listed without structure. In the right comparison table, the objects are always displayed flat.

### Setting the hierarchical view

To set the hierarchical view, follow these steps:

1. Click the "Display in hierarchical view" button in the toolbar of the compare editor.

### Setting the flat view

To set the flat view, follow these steps:

1. Click the "Display in flat view" button in the toolbar of the compare editor.

## 7.5.3 Protecting project data

### 7.5.3.1 Protection concept for project data

#### Introduction

You can protect your project data from unauthorized access. These include, for example:

- Access protection for devices
- Copy and display protection of objects
- Restrictions for printouts of know-how-protected objects

For objects with know-how protection, this protection is also retained after the object is pasted into a library. Note that every protection mechanism is not available for all objects. How to protect specific objects is described in the online help of the product.

#### Revoking access rights for devices

If you want to execute a function that is password-protected by means of the device protection level, you are prompted to enter a password. When the password is entered correctly, you can

execute the required function. You continue to have access rights on the device until you close the TIA Portal.

If you want to reactivate password protection while the TIA Portal is open, you can explicitly revoke the access rights for a device. As a result, certain functions for the protected device cannot be executed until the correct password is entered again. You specify the functions for which a password must be entered when you assign the device protection level.

### See also

Printing project data (Page 365)

## 7.5.3.2 Revoking access rights for devices

### Requirement

- A protection level has been set for the device.
- A protected function for the device has been enabled by entering the password.

### Procedure

To revoke the access rights for the device, follow these steps:

1. Select the device for which you want to revoke access rights in the project tree.
2. Select the "Delete access rights" command in the "Online" menu.

### Result

The access rights are revoked, and starting from now the user will be prompted to enter the password again to execute a password-protected function on the device. The function can only be executed if the correct password is entered.

If the device has an online connection, it will be disconnected.

### See also

Protection concept for project data (Page 346)

## 7.5.4 Printing project contents

### 7.5.4.1 Printing project documentation

#### Documentation settings

##### Introduction

Once a project is created, the contents can be printed in an easy-to-read format. You may print the entire project or individual objects within the project. A well-structured printout is helpful when editing the project or performing service work. The printout can also be used for your customer presentations or as full system documentation.

You can prepare the project in the form of standardized circuit manuals and print it in a uniform layout. You can limit the scope of the printout. You have the option to print to the entire project, individual objects along with their properties, or a compact overview of the project. In addition, you can print the contents of an open editor.

##### Improving the printout with frames and cover pages

You can design the appearance of the printed pages according to your own requirements, for example, to add your own company logo or the corporate design of your company in the project documentation. You can create any number of design variants as frames and cover pages. The frames and cover pages are stored in the project tree under the item "Documentation settings" and are part of the project. You can insert placeholders for data from previously entered document information within the frames and cover pages. These will be filled automatically with the appropriate metadata during printing.

If you want to avoid designing your own template, there are ready-made frames and covers pages available. These include templates complying with the ISO standard for technical documentation.

##### Modular structure of a printout

An printout generally consists of the following components:

- Cover page (only when printing from the project tree)
- Table of contents (only when printing from the project tree)
- Name and path of an object within the project tree
- Object data

Printout of the cover page or the table of contents can be deactivated in the "Print" dialog.

##### See also

Creating frames (Page 354)

Creating a cover page (Page 354)

Editing cover pages and frames (Page 356)

Entering document information (Page 352)

Print function for module labels (Page 367)

## Printout of project contents

### Availability of print function

The following contents can be printed:

- An entire project in the project tree
- One or more project-related objects in the project tree
- Contents of an editor
- Tables
- Libraries
- Diagnostics view of the Inspector window

It is not possible to print in the following areas:

- Portal view
- Detailed view
- Overview window
- Compare editor
- All tabs of the Inspector window, except the diagnostics view
- All task cards, except the libraries
- Most of the dialogs
- Properties and devices of the programming device/PC not related to the project, for example online portals and connected card readers.

### Scope of printout

To be able to print, at least one printable element has to be selected.

If a selected object is printed, all subordinate objects are also printed. For example, if a device is selected in the project tree, all of its data is also printed. If you select the entire project in the project tree for printing, all project contents are printed with the exception of the graphical views. These have to be printed separately. Items in the project tree that are not part of the project cannot be printed. For example, this includes online portals and connected card readers and USB memory devices.

When table contents are printed, all lines in the table in which a cell is selected are printed. In order to print one or more table columns, the desired columns must be selected. If no individual cells or columns are selected, the entire table is printed.

### Limitations when printing

In general, it is possible to print all objects that can be visualized on the user interface. Conversely, this means that you cannot print objects that you do not have access to. If a printout fails, possible reasons may include the following:

- A valid license does not exist for displaying an object.
- There is no device description for an object.
- A software component needed to display an object is not installed.

### See also

Printing project data (Page 365)

### Changing the print settings

### Changing the print settings

You can specify general print settings that are retained even after the TIA Portal is closed and re-opened. Some settings are dependent on the products installed. The following settings are possible in every case:

### Always print table data as pairs of values

If this option is selected, tables are not printed in tabular format but rather as a pairs of key and value.

Example:

Object name	Property 1	Property 2
Object A	Value A1	Value A2
Object B	Value B1	Value B2

In this case, the printout has the following appearance:

#### Object A

Property 1: Value A1

Property 2: Value A2

#### Object B

Property 1: Value B1

Property 2: Value B2

## Printing mask editors

- Always print data in tables  
All parameters of technology objects are printed in tabular format.
- Print mask graphics if possible  
If the utilized editor supports this function, the contents of the editor are not printed as a table but rather as a complete graphic as it appears on the screen.

## Procedure

To change the print settings, follow these steps:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. Select the "General" group.
3. Select the desired default settings in the "Print settings" area.  
The changes are applied immediately and are retained for all projects, even after the TIA Portal is closed.

## See also

Overview of the print settings (Page 244)

## Specifying the print layout

### Specifying the print layout

If you do not want to rely on ready-made print templates, you can specify your own cover page or your own layout for the individual pages. Your designs are saved together with the respective project.

Your designs for the cover page and your templates for the page layout can be found in the project tree under the "Documentation information" group. You will also find metadata on the project there under the entry "Document information". For subsequent print operations, you can customize the appearance of the printout in the "Print" dialog using the saved cover pages and page layout templates and the available metadata.

### Designing the cover page

The cover page can be customized. You can insert a background graphic and provide placeholders for text on the page. The placeholders are automatically filled with data from a documentation information during printing.

Cover pages are located in the project tree under the "Documentation information > Cover pages" group.

## Designing the content page

The regular pages of a printout can contain the following elements:

- Frame with static content, such as a company logo
- Placeholders for text, such as the name of the project, the page number, and the time the printout was started  
Several different values for the individual placeholders can be specified in the document information. Other values, such as the project name, are preassigned and are inserted automatically during printing.
- Footnote  
The footnote is always output below the content area.
- Content area  
You can specify an area where the printed content is to be embedded.

The design of the content pages is saved in Frames. The individual frames are located in the project tree under the "Documentation information > Frames" group.

## Entering document information

You can enter metadata in the document information for every project. In addition, a print frame and a cover page are specified in the document information. You can create different information, if required, to enable you to quickly switch between different document information containing different information, frames, cover pages, page sizes, and page orientations when printing. For example, this is useful if you want to generate printouts in different languages and different document information is provided for each language.

In the documentation editor, you can specify placeholders on the cover page or in the frame of the regular pages. These placeholders can be automatically replaced with metadata from the documentation information during printing.

The various document information are therefore part of the printing function and specify the print layout and print content.

## Procedure

To add metadata, follow these steps:

1. To create new document information, double-click "Add new document information" under "Documentation information > Document information" in the project tree.  
The new document information is created and opened immediately.
2. Enter a name for the set in the "Name" field.
3. Fill in the individual fields with the metadata for the project.

## Managing cover pages and frames

### Using cover pages and frames

#### Uses for cover pages

You can give your plant documentation printouts a professional appearance by adding a cover page. You can design your own cover page or use ready-made cover pages. Ready-made cover pages can be adapted and stored again as a template.

Cover pages can be saved in global libraries where they are available for use across projects.

Cover pages are designed for use as a right printed page only.

#### Uses of frames

You can embed the regular pages of your plant documentation inside a consistently uniform page frame. The frame can contain placeholders for project metadata, which is stored in the document information. It can also contain graphic elements that you design yourself.

You can create your own frames or rely on ready-made page frames. You can adapt a ready-made page frame and then store it again as a new frame.

Like cover pages, frames can be saved in global libraries where they are available for use across projects.

Frames are designed for use on right printed pages only.

## Cover pages and templates in the project tree

Cover pages and frames associated with the project are stored in the project tree under the entry "Documentation information". There are separate folders here for frames and cover pages.

The following actions are available in the project tree for cover pages and frames.

- Creating your own subfolders
- Copying and pasting
- Inserting cover pages and frames from the "Documentation templates" system library
- Copying cover pages and templates to a global library

## Cover pages and templates in libraries

The "Documentation templates" system library contains a few cover pages and templates that are available in every project. The cover pages and templates can be moved from there to the project tree using a drag-and-drop operation. You can then adapt the cover pages and templates in the project tree according to the requirements of your project.

Cover pages and templates can be moved from the project tree to a global library. Afterwards, these are available in every project.

## See also

- Library basics (Page 383)
- Overview of the "Libraries" task card (Page 385)
- Designing cover pages and frames (Page 356)
- Using ready-made frames and cover pages (Page 355)

## Creating frames

You can create any number of frames for each project. The frames are stored in the project tree below the "Documentation information > Frames" group. You can assign a frame to all document information. When you select document information for printing, its associated frame is used.

## Procedure

To create a new frame, follow these steps:

1. Double-click the entry "Add new frame" below the "Documentation information > Frames" group in the project tree.  
The "Creating frames" dialog opens.
2. Enter a name for the frame in the "Name" field.
3. Choose the paper size from the "Paper type" drop-down list.
4. Choose whether the page is to be created in portrait or landscape format in the "Orientation" drop-down list.

Click the "Add" button.

## Result

A new frame is created. The frame is then opened automatically in the documentation editor where it can be edited.

## See also

- Editing cover pages and frames (Page 356)
- Creating a cover page (Page 354)

## Creating a cover page

You can create any number of cover pages for the printout for each project. The cover pages are stored in the project tree below the the "Documentation information > Cover pages" group. You can assign a cover page to all document information. When you select specific document information for printing, its associated cover page is used.

## Procedure

To create a new cover page, follow these steps:

1. Double-click the entry "Add new cover page" below the "Documentation information > Cover pages" group in the project tree.  
The "Add new cover page" dialog box opens.
2. Enter a name for the cover page in the "Name" field.
3. Choose the paper size from the "Paper type" drop-down list.
4. Choose whether the page is to be created in portrait or landscape format in the "Orientation" drop-down list.

Click the "Add" button.

## Result

A new cover page is created. The cover page is then opened automatically in the documentation editor where it can be edited.

## See also

Editing cover pages and frames (Page 356)

Creating frames (Page 354)

## Using ready-made frames and cover pages

The TIA Portal comes with some ready-made frames and cover pages. These can change according to your wishes.

## Procedure

To create and edit the ready-made frames and cover pages, follow these steps:

1. Open the "Global libraries" pane in the "Libraries" task card.
2. In the "Templates" folder, open the "Cover Pages" or "Frames" folder.
3. Drag a cover page or a frame from one of the folders into the project tree and drop it into one of the following folders:
  - For frames: "Document information > Frames"
  - For cover pages: "Document information > Cover pages".

The ready-made frame or cover page can now be used in the project.

4. Double-click on the new entry in the project tree click to edit the frame or the cover page.

## See also

Using cover pages and frames (Page 353)

Editing cover pages and frames (Page 356)

## **Designing cover pages and frames**

### **Editing cover pages and frames**

The documentation editor is a graphical editor which allows you to design frames and cover pages for your plant documentation. You can place images or text elements on the frame and the cover pages in the document editor. The text elements are either static or they are automatically filled during printing with the data from the document information that you have selected in the print dialog.

### **Procedure**

To edit a cover page or a frame in the documentation editor, follow these steps:

1. In the project tree, double-click on the entry for an existing cover page or frame under the "Documentation information > Frames " or "Documentation information > Cover pages" group.  
The documentation editor opens.
2. Design the cover page or frame as desired.
3. Close the documentation editor.  
The changes to the cover page or frame are applied automatically.

### **See also**

Creating a cover page (Page 354)

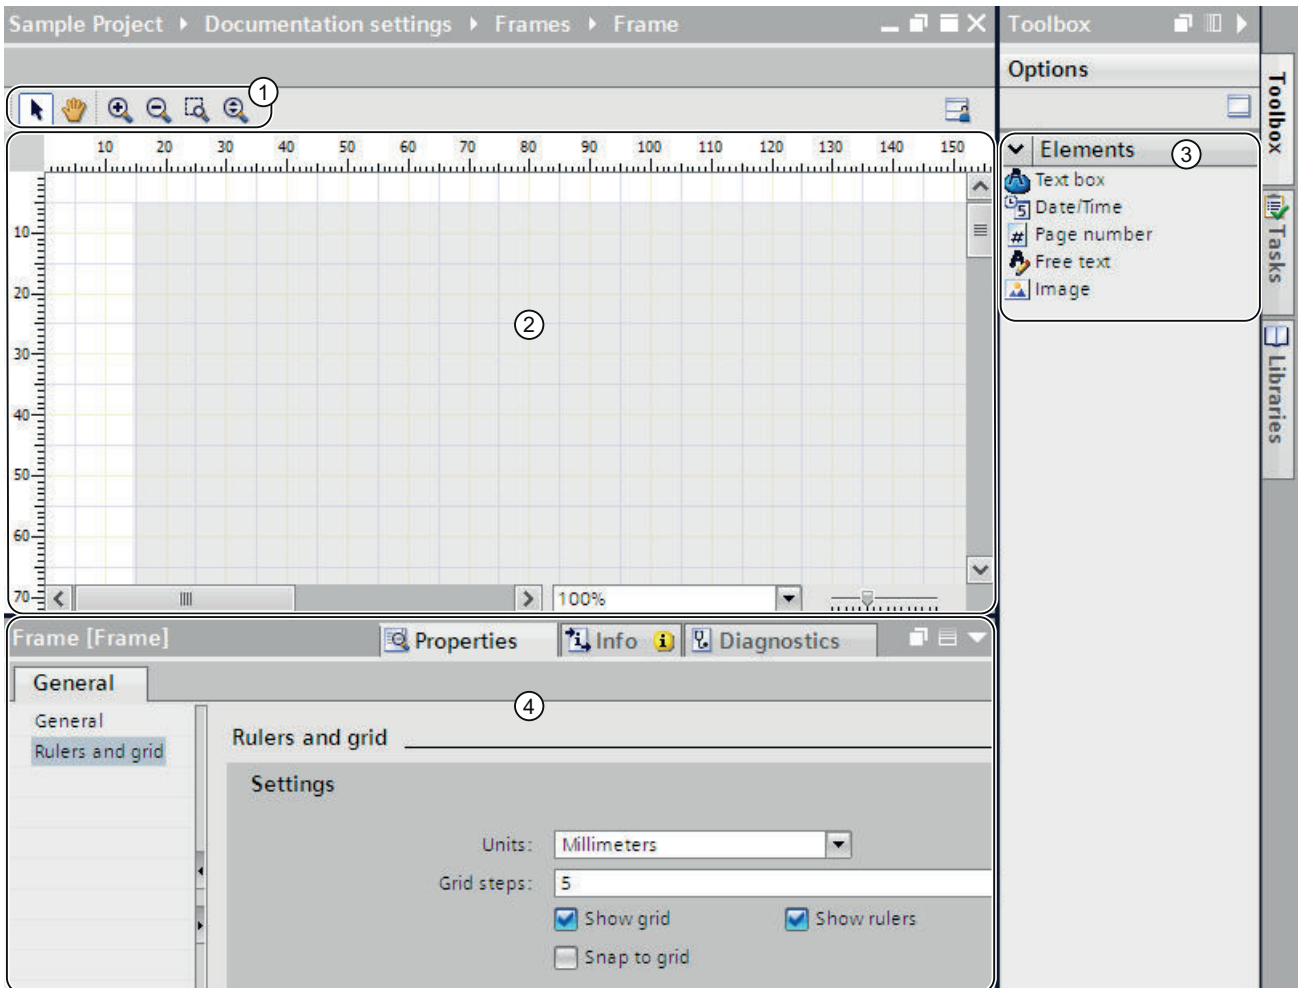

Creating frames (Page 354)

General operation of the documentation editor (Page 357)

## General operation of the documentation editor

### Components of the documentation editor

The following figure provides an overview of the components of the documentation editor:

- ① **Toolbar**

The toolbar provides the following tools (from left to right):

  - **Arrow tool**  
Enables object selection.
  - **Navigation tool**  
Allows shifting of the partial page.
  - **Zoom-in button**  
Magnifies the page display incrementally.
  - **Zoom-out button**  
Reduces the page display incrementally.
  - **Zoom with selection**  
Adapts the page size to a selected work area.
  - **Dynamic zoom**  
Adapts the page width to the work area.
- ② **Work area**

You can design the cover page or frame in the work area.
- ③ **"Toolbox" task card**

The "Toolbox" task card contains various types of placeholders that you can use on the cover sheet or frame. The placeholders can be placed in the work place using a drag-and-drop operation.
- ④ **Properties in the Inspector window**

You can display and modify the properties of the currently selected object in the "Properties" tab of the Inspector window. For example, you can modify the properties of the page, format text, specify the position of objects on the page, etc.

## Operation in the documentation editor

The following basic functions are available in the documentation editor:

- **Drag-and-drop functionality**  
The documentation editor is a graphic editor, which means you can place objects anywhere with the mouse. An image of the page is displayed in the work area. This image corresponds to the ultimate print layout.  
If you want to select objects on the page in order to move them or modify their properties, the arrow tool must be activated in the toolbar.
- **Zoom function**  
You can use the zoom function to change the size of the page display. You have two options for changing the page size:
  - **Via the buttons in the toolbar**  
Select the "Zoom in" or "Zoom out" magnifying glass button in the toolbar of the documentation editor. Then click on the page in order to magnify (zoom in) or reduce (zoom out) the page incrementally.  
To zoom in on a particular area, select the "Zoom with selection" tool and use the mouse to drag an outline around the area you want to focus on.  
To continuously zoom in or zoom out of the work area, use the "Dynamic zoom" tool.  
To magnify the page display, click anywhere on the work area, and then hold down the mouse button while dragging the mouse toward the top of the page. To reduce the page display, drag the mouse toward the bottom of the page.
  - **Via the zoom bar**  
You can also use the zoom bar (located in the bottom right corner of the work area) to change the display size. Choose a percentage value from the drop-down list or enter a percentage value. Alternatively, you control the display size using the slider.
- **Navigation over the page**  
In addition to scrolling, you have the option of changing the partial page with the navigation tool. To change the partial page with the navigation tool, select the Hand button in the toolbar. Then, click anywhere on the page and hold the mouse button down while moving the page to the desired position.

## Using and adapting the positioning aids

You have various aids at your disposal to help you position elements on the page:

- **Rulers**  
Rulers are affixed to the page margins in the work area.
- **Page grid**  
A grid is placed underneath the page in the work area.

You can display, hide or adapt the positioning aids in the Inspector window under "Properties > Rulers and grid". You can make the following settings:

- **Units:**  
Specify the unit of measurement for the grid and the rulers.
- **Grid steps:**  
Specify the width of the grid.
- **Show grid:**  
Specify whether the grid is to be displayed or hidden.

- Snap to grid:  
Specify whether objects are to be aligned automatically to the grid. If the option is selected, the grid lines function like a "magnet".
- Show rulers:  
Specify whether the rulers are to be displayed.

### See also

Editing cover pages and frames (Page 356)

Specifying the print area (Page 360)

Inserting placeholders for metadata (Page 360)

### Specifying the print area

An area within the frame is provided for the actual printed contents. The project data is then always inserted inside this defined and uniformly consistent area within the frame. You can adjust the size of the print area.

### Requirement

A frame is open in the documentation editor.

### Procedure

To define an area for the printed contents, follow these steps:

1. Click on the slightly darker area within the page display in the documentation editor to select the area for the print content.  
This opens the properties of the area to be printed in the Inspector window.
2. Enter the position of the print area on the X and Y axes in the Inspector window.
3. Specify the width and height of the print area in cm in the Inspector window.

Alternatively, you can change the width and position of the print area in the graphic display of the page. To do so, use the mouse to drag the margins of the print area until the desired size and position are achieved.

### See also

Creating frames (Page 354)

General operation of the documentation editor (Page 357)

### Inserting placeholders for metadata

You can provide placeholders on the cover page and in a frame. The placeholders are automatically filled with metadata from documentation information during printing, if they are placeholders for text. Alternatively, you can add non-modifiable data, such as free text or an image.

All elements are arranged in numbered Z-Orders. If objects overlap, you can determine in which sequence these are to be arranged.

## Types of placeholders

The following types of placeholders are available to you:

- **Text field**  
The text field stands as a placeholder for a text element from a document information. In the properties of the text field, you set which text from a document information should be automatically inserted during printing.
- **Field for date and time**  
A date and time is inserted instead of the placeholder when printing. This can be the date of creation or the point in time when the last change was made to the project. In the properties of the Inspector window, you specify which date or time is printed.
- **Page number**  
The correct page number is automatically applied when printing.
- **Free text**  
You can enter freely selectable text in the properties of the text field. The text is static and is not influenced by the document information selected at the time of printing.
- **Image**  
Select the image file in the properties of the placeholder in the Inspector window. Images in the formats BMP, JPEG, PNG, EMF or GIF are possible.

## Requirement

An cover page or frame is open in the documentation editor.

## Procedure

To insert placeholders for metadata on the cover sheet or in a frame, follow these steps:

1. Drag a field from the "Toolbox > Elements" task card to the work area of the documentation editor.  
The placeholder is inserted. The placeholder properties are shown in the Inspector window and can be edited there.
2. Select the metadata to be inserted during printing from the "Text" drop-down list in the Inspector window under "Properties > General > Text box". Alternatively, you have the option of entering free text or selecting an image depending on the type of placeholder.
3. In the Inspector window under "Properties > General > Position and size", specify the position of the placeholder on the X and Y axis and enter the width and height of the text box in cm. You specify the sequence of the objects in the "Z-Order" field, if these overlap. The smaller the value, the further down an object is located.
4. In the Inspector window, go to "Properties > View" and select the font formatting and the orientation of the text as well as the alignment of the text. You cannot make this setting for images.

## Displaying print preview

## Creating a print preview

## Creating a print preview

You can create a preview of the printout. Document information can be chosen for this, in the same way as for the actual printout. In this way, you preview the selected frame and, if applicable, the cover sheet. The settings are retained for later printing.

## Procedure

To create a print preview and to set the scope of the later printout, follow these steps:

1. Select the "Print preview" command in the "Project" menu.  
The "Print preview" dialog opens.
2. Select the frame layout you want to use for the printout.
  - In the "Document information" drop-down list, select the documentation information you want to use later for the printout.
  - Select the "Print cover page" check box to print the cover page, which is specified in the selected document information.
  - Select the "Print table of contents" check box to add a table of contents to the printout.

The check boxes for printing the cover page and the table of contents can only be selected if you have started the printout in the project tree.
3. Under "Print objects/area", select what is to be printed. The selection is only possible if you have started the printout from an editor that supports this function.
  - Choose "All" to print out the entire content of the editor.
  - Choose "Selection" to print only the objects currently selected in the editor.

4. Select the print scope under "Properties".
    - Choose "All" to print all configuration data of the selected objects.
    - Choose "Visible" to print the information of an editor that is currently visible on the screen. This option can only be chosen if you have started the printout from an editor that supports this function.
    - Choose "Compact" to print out an abbreviated version of the project data.
  5. Click "Preview" to generate the preview.  
A print preview is created in the work area.
- 

**Note**

**Wait time for extensive documents**

It can take several minutes to generate the print preview in the case of very extensive projects. You can continue working normally in the meantime on systems with adequate resources. The progress of the print preview is shown in the status bar.

---

**See also**

Operation within the print preview (Page 364)

## Operation within the print preview

### Functions within the print preview

The print preview shows an exact image of the subsequent printout. You can use the buttons in the toolbar to modify the print preview display. The following functions are available (from left to right):

- Navigation mode  
Allows shifting of the partial page.  
To change the partial page with the navigation tool, select the arrow button in the toolbar. Then, click anywhere on the page and hold the mouse button down while moving the page to the desired position.
- Zoom function
  - "Zoom in" and "Zoom out"  
Magnifies or reduces the page display.  
To zoom in or zoom out the display incrementally, select the corresponding button. Then click on the page in order to magnify (zoom in) or reduce (zoom out) the page incrementally.  
To zoom in on a particular area, enable the "Zoom with selection" icon and use the mouse to drag an outline around the area you want to focus on.  
To zoom dynamically through the page, select the button "Zoom in / zoom out dynamically". With pressed mouse button, scroll down over the page to zoom in. Scroll up to zoom out.
  - Percentage value in the drop-down list  
Specifies the display size of the page in percent.  
Enter a percentage value or select a percentage value from the drop-down list.  
Alternatively, choose the "Fit to page" option from the drop-down list to adapt the page size to the work area. Or, choose "Fit to width" to adapt the page width to the work area.
- "Forward" and "Backward"  
Each change in the partial page, the page count, or the display size is saved in a history in the background. You can use the "Forward" or "Backward" button to return to the previous view or the next view.
- Page navigation
  - "First page"  
Jumps to the first page
  - "Previous page"  
Goes to the previous page.
  - "Page number" input field  
Shows the current page. To jump directly to a page, enter the page number of the page you want to view.
  - "Next page"  
Goes to the next page.
  - "Last page"  
Jumps to the last page.

Creating a print preview (Page 362)

## Printing project data

You have two options for printing out project data:

- Print immediately using default settings by means of the "Print" button in the toolbar. The button is only active if a printable object is selected.
- Printout with additional setting options with the "Project > Print" menu command. For example, you can choose a different printer or specific documentation information or you can specify whether a cover page and table of contents are to be printed. In addition, you can specify the print scope or display a print preview prior to printing.

## Requirement

- At least one printer is configured.
- The objects to be printed are not protected. The print scope for protected objects is limited. Disable the know-how protection to print the objects in full.

## Printing project data

To print out data from the current project or the entire project with additional setting options, follow these steps:

1. Select the entire project in the project tree in order to print out the entire project. To print only individual elements within a project, select them in the project tree.
2. Select the "Print" command in the "Project" menu. The "Print" dialog opens.
3. Select the printer in the "Name" box.
4. Click "Advanced" to modify the Windows printer settings.
5. Select the frame layout you want to use for the printout.
  - Select the documentation information in the "Document information" drop-down list. The frame stored in the document information is used for the printout. All placeholders within the chosen frame are filled with the metadata from the selected document information.
  - Select the "Print cover page" check box to print the cover page, which is stored in the selected document information.
  - Select the "Print table of contents" check box to add a table of contents to the printout.

The check boxes for printing the cover page and the table of contents can only be selected if you have started the printout in the project tree.

6. Under "Print objects/area", select what is to be printed. The selection is only possible if you have started the printout from an editor that supports this function.
  - Choose "All" to print out the entire content of the editor.
  - Choose "Selection" to print only the objects currently selected in the editor.
7. Select the print scope under "Properties".
  - Choose "All" to print all configuration data of the selected objects.
  - Choose "Visible" to print the information of an editor that is currently visible on the screen. This option can only be chosen if you have started the printout from an editor.
  - Choose "Compact" to print out an abbreviated version of the project data.
8. Click "Preview" to generate a print preview in advance.  
A print preview is created in the work area.
9. Click "Print" to start the printout.

---

**Note**

**Scope of the "Print" dialog**

The options available in the "Print" dialog vary depending on the elements to be printed.

---

## Result

The project data is prepared in the background for printing and then printed on the selected printer. The status bar shows the progress of the print operation. You can continue working normally while data is being prepared for printing.

The print results and any errors or warnings are listed in the Inspector window under "Info" at the conclusion of the print job.

## Canceling a print job

To cancel an active print job, follow these steps:

1. Click the blue cross in the status bar next to the progress display for the printout.  
The printout is cancelled promptly.

## 7.5.4.2 Printing module labels

### Print function for module labels

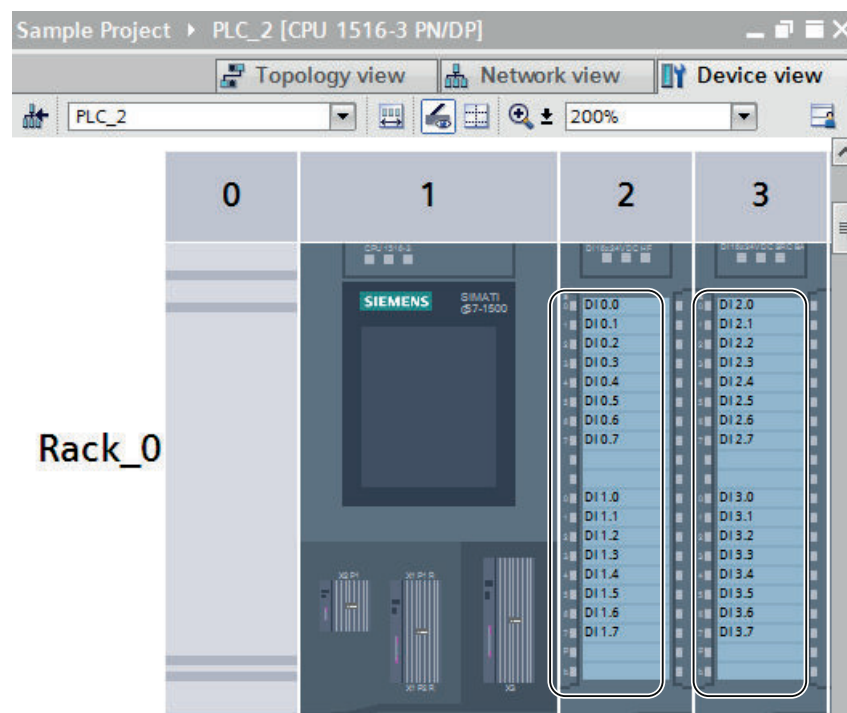

#### Printing of module labels for hardware modules

You can print labels for the modules in your project with the help of the TIA Portal. The labels are custom-fit to each module and can contain the following printed information:

- Symbolic name of the input or output
- Absolute address of the input or output
- Symbolic name and additionally the absolute address of the input or output. The order of the information can be specified.

The modules are displayed graphically in the device view. If you set the zoom level in the device view to at least 200%, the labels for the individual modules will be visible. The printout on the labels corresponds to the representation of the labeling in the device view.

The following figure shows an example of two modules in the device view on which the labeling of the inputs and outputs is visible:

#### Export and further editing as Microsoft Word file

Before you can print them, the labels are first exported as a Microsoft Word file (.docx). This file can be further edited with commonly available word processing programs such as Microsoft

Word 2010. The individual labels are represented as a table in the .docx file. You can format the text or the backgrounds of the individual cells as desired.

The character spacing of the text within the table is adapted by default, so that texts are not truncated. If you want to prevent this from stretching or compressing the text too much, change the character spacing of the text in the table cell properties.

## Print media

You can print the labels either on ready-made print sheets or on standard DIN A4 paper. You can separate the individual labels from the ready-made print sheets and insert them in the designated labeling areas of your modules. If you print on standard paper, the individual labels must be cut out. Cut marks are automatically included on the printout and serve as aids.

Because the paper feeds of different printers differ slightly, the printout may be slightly offset on the paper. When the labels are printed on ready-made print sheets, printing that is accurate to the millimeter is important, because otherwise the text will not be custom-fit inside the stamped area. In addition, if the printing is imprecise, the labeling of an input or output may no longer be congruent with the channel status displays of the module. For this reason, you can enter an offset value for your printer in the TIA Portal to ensure precise printing. For information on how to determine the proper offset value for your printer, refer to Chapter "Determining the print area offset (Page 370)".

## See also

Printing labels (Page 368)

Determining the print area offset (Page 370)

Documentation settings (Page 348)

## Printing labels

You can print labels for the modules in your project if provision has been made for attaching labels to the utilized modules. The labels are first exported to a Microsoft Word file (.docx). A separate .docx file is created for each module family (for example, for all selected S7-1500 modules). You can then modify the labels according to your wishes. The labels are always printed from the word processing program.

If no provision has been made for printing labels, the corresponding shortcut menu command is inactive. If you have selected multiple modules for printing of labels and at least one of the modules does not support this, a message is shown on the "Info > General" tab of the Inspector window. The message lists all unsupported modules, and the export of the print file is continued for the supported modules.

## Requirement

- The chosen modules must support the printing of labels.
- A word processing program that supports Microsoft Word .docx files must be installed, e.g., Microsoft Word 2010.
- You need the ready-made labels for your modules or commercially available DIN A4 paper.

## Procedure

To print labels for hardware modules, follow these steps:

1. In the project tree, select the modules for which you want to print labels.
  - You can select one or more stations in order to print out labels for all modules plugged into these stations.
  - Or, select the desired modules below the stations in the "Local modules" folder.
2. Right-click on one of the devices, and select the "Export labels" command from the shortcut menu.  
The "Export labels" dialog box opens.
3. In the "Content of label" area, select which data are to be printed on the label:
  - Choose "Symbolic name" in order to print the symbolic name of the input or output (corresponds to the contents of the "Name" column in the IO tag table).
  - Choose "Absolute address" in order to print the absolute address of the input or output (corresponds to the contents of the "Address" column in the IO tag table).
  - Choose "Absolute and symbolic address" or "Symbolic and absolute address" in order to print both addresses. The print order corresponds to the indicated order.
4. Select which paper you plan to print on in the "Paper type" area.
  - Choose "Print on SIEMENS label sheet" if you want to print on a ready-made label sheet for your modules.
  - Choose "Print on standard paper" if you want to print on standard DIN A4 paper.
5. In the "Offset print area" select correction values for your printer, if required, for proper orientation of the print area. This is only necessary if you are printing on ready-made labels.
  - Enter a correction value, in millimeters, in the "Vertical offset" field. A negative value shifts the print area upward. A positive value shifts the print area downward.
  - Enter a correction value, in millimeters, in the "Horizontal offset" field. A negative value shifts the print area to the left. A positive value shifts the print area to the right.
6. In the "Path" field, select the path to which the exported .docx files should be stored.
7. Click the "Export" button to start the export to a .docx file.  
The .docx files are created.
8. Open the .docx files with a conventional word processing program, such as Microsoft Word 2010, and change the design of the labels if necessary.
9. Print out the labels from your word processing program. To do so, use the paper that you specified in the Export dialog box.
10. If you are using ready-made sheets, separate the labels at the stamped lines provided for that purpose. When standard DIN A4 paper is used, you must cut out the labels.

## See also

Determining the print area offset (Page 370)

### Determining the print area offset

If you are using a ready-made label sheet, the printing on it must be applied precisely so that the text is properly oriented on the prestamped labels and will have the proper fit relative to the channel status displays of the module. However, the paper feeds vary slightly from one printer to another. For this reason, you must enter a suitable correction value for your printer in the TIA Portal, if necessary. The print area is then shifted in the exported .docx file in such a way that the printing fits precisely on the ready-made label sheet.

The settings for shifting the print area are stored for the specific Windows user. If you log on to Windows using a different user name, you have to enter the correction values again.

The procedure for determining the correction value for your printer is described below.

### Requirement

- You require a ready-made label sheet.
- You must have access to the actual printer that you will use subsequently for the printout. The printer must be made ready for printing on standard DIN A4 paper.

### Procedure

To determine the correction value for your printer, follow these steps:

1. Print out a label sheet on standard DIN A4 paper, as described in Chapter "Printing labels (Page 368)".
2. Compare the printout on the DIN A4 paper with the ready-made label sheet.
3. If the print area is offset, you must use correction values.
  - Using a ruler, measure the horizontal offset relative to the ready-made label sheet. This will be entered later in the "Horizontal offset" field of the Export dialog box for the printing. If the print area is offset to the right, a negative correction value must be entered. If the print area is offset to the left, a positive correction value must be entered.
  - Using a ruler, measure the vertical offset relative to the ready-made label sheet. This will be entered later in the "Vertical offset" field of the Export dialog box for the printing. If the print area is offset downward, a negative correction value must be entered. If the print area is offset upward, a positive correction value must be entered.

## 7.6 Undoing and redoing actions

### 7.6.1 Basics of undoing and redoing actions

#### Function

You can undo performed actions at any time. For this purpose, every action you perform is saved in an action stack. When undoing actions, the stack is processed from top to bottom. In

other words, if you undo an action that lies further down in the stack, all actions located above it in the stack will also be undone automatically.

You can redo previously undone actions until you execute a new action. Once you execute a new action, it is no longer possible to redo previously undone actions.

### Particularities for undoing

There are a few actions that empty the action stack. You cannot undo these actions or the actions performed before these actions. The following actions empty the action stack:

- Saving
- Project management (creating a new project, opening project, closing a project, deleting a project)
- Compiling
- Restoring blocks
- Establishing an online connection
- Loading
- Writing to memory cards

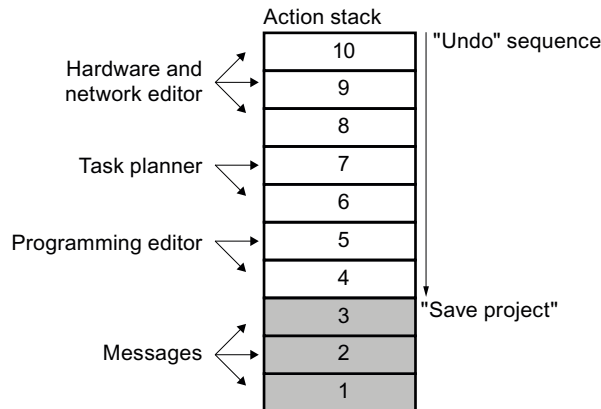

### Displaying the action stack

The "Undo" button in the toolbar is enabled as soon as you perform an action that can be undone. This button is split; you can use the arrow down portion to open a drop-down list containing all actions of the action stack that you can undo. If you had performed actions in an editor other than the currently displayed editor, the corresponding editor is also displayed as a subheading. This allows you to always identify the point at which the undo operation will be applied. The subheadings are removed from the list when the editor responsible can no longer undo actions.

Actions you have undone are entered in the action stack from where they can be redone. Here, you can redo actions you have undone. The display of actions you can redo it is analogous to the display of the actions that you can undo.

### Example of undoing actions

The figure below shows how actions performed in various editors and tables are undone:

In this example, you cannot undo actions 1 to 3 because the project was saved. You can undo actions 4 to 10 in the order indicated by the direction of the arrow. In other words, you must undo action 10 first. Once you have undone action 8, you cannot then undo action 5. You must first undo actions 7 and 6. As the final step in the sequence, you can then undo action 4. You also have the option of undoing several actions in a single step by undoing an action located further down in the action stack. All actions located above it in the stack will be undone automatically.

The same principle also applies to redoing of actions.

### See also

Undoing an action (Page 372)

Redoing an action (Page 373)

## 7.6.2 Undoing an action

The following options are available for undoing actions:

- Undoing the last action only  
Only the last action performed is undone.
- Undoing as many actions as required  
Multiple actions in the action stack are undone in a single step.

### Undoing the last action only

To undo the last action performed, follow the steps below:

1. Click the "Undo" button in the toolbar.
  - If the action was not performed in the currently displayed editor, a confirmation prompt appears.
  - If the undo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
2. Click "Yes" to confirm.
3. Enter the password, if necessary.

The editor in which the action was performed is displayed and the action is undone.

### Undoing as many actions as required

To undo multiple actions in the action stack in a single step, follow these steps:

1. Click the Down arrow next to the "Undo" button in the toolbar.

This opens a drop-down list containing all actions you can undo. Actions performed in other editors are identified by the editor name in the subheading.
2. Click the action you want to undo.

The chosen action and all actions in the stack located above the chosen action are undone. If the undo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
3. Enter the required passwords, if necessary.

The editors in which the actions were performed are displayed and the actions are undone.

### See also

Basics of undoing and redoing actions (Page 370)

Redoing an action (Page 373)

### 7.6.3 Redoing an action

You have the option of redoing an action that has been undone, so that you can return to the status present before "Undo" was performed. However, this is only possible until you perform a new action. The following options are available for redoing actions:

- Redoing the last undone action only  
Only the last undone action is redone.
- Redoing as many undone actions as required  
Multiple undone actions in the action stack are redone in a single step.

### Redoing the last undone action only

To redo the last undone action, follow the steps below:

1. Click the "Redo" button in the toolbar.
  - If the action is not being redone in the currently displayed editor, a confirmation prompt appears.
  - If the redo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
2. Click "Yes" to confirm.
3. Enter the password, if necessary.  
The editor in which the action was undone is displayed and the action is redone.

### Redoing as many undone actions as required

To redo multiple undone actions in the action stack in a single step, follow these steps:

1. Click the Down arrow next to the "Redo" button in the toolbar.  
This opens a drop-down list containing all actions you can redo. Actions performed in other editors are identified by the editor name in the subheading.
2. Click the action you want to redo.  
The chosen action and all actions in the stack located above the chosen action are redone. If the redo operation requires an editor containing a protected object to be opened, you must enter the password for the object.
3. Enter the required passwords, if necessary.  
The editors in which the actions were undone are displayed and the actions are redone.

## 7.7 Finding and replacing in projects

### 7.7.1 Information on the search function

#### Find and replace

You can search for texts in the editors. The search function finds all texts containing the search key in the currently opened editor. The results are selected in sequence in the opened editor.

You also have the following options:

- Narrowing down the search with additional options
- Replacing found texts

The additional options and the type of texts for which you can search depend on the installed products and the currently open editor.

## See also

Search and replace (Page 375)

## 7.7.2 Search and replace

### Using Find

The "Find and replace" function enables you to search for or replace texts in an editor.

### Additional options for searching

You can narrow down your search by selecting one of the following additional options:

- **Whole words only**  
Only whole words are found. Words that contain the search key as part of the word are ignored.
- **Match case**  
Upper- and lowercase letters are taken into account in the search.
- **Find in substructures**  
The search also includes texts contained in another object.
- **Find in hidden texts**  
Texts that are assigned to another text but that are currently hidden are also included in the search.
- **Use wildcards**  
Enter an asterisk as the wildcard for any number of characters. Example: You want to search for all words starting with "Device". Type in "Device\*" in the search key box. Enter a question mark as the wildcard, however, if you only want to leave out a single character.
- **Use regular expressions (for searching in scripts only)**  
A regular expression is a character string used to describe sets of values and for filtering. This allows you to create complex search patterns.

The additional options available depend on the installed products and the editor opened.

## Start search

Follow these steps to start the "Find and replace" function:

1. Select the "Find and replace" command in the "Edit" menu or open the "Find and replace" pane in the "Tasks" task card.  
The "Find and replace" pane opens.
2. Enter a term in the "Find" drop-down list.  
As an alternative, you can select the most recent search key from the drop-down list.
3. Select the options desired for the search.
4. Using the option buttons, select the starting point for the search and the search direction.
  - Select "Whole document" if you want to search through the entire editor regardless of the current selection,
  - Select "From current position" if you want to start the search at the current selection.
  - Select "Selection" if you only want to search within the current selection.
  - Select "Down" to search through the editor from top to bottom or from left to right.
  - Select "Up" to search through the editor from bottom to top or from right to left.
5. Click "Find".  
The first hit is marked in the editor.
6. Click "Find" again to display the next hit.  
The next hit is marked in the editor. Repeat this process, as necessary, until you reach the last hit.

## Replacing the search key

You have the option of replacing hits individually or automatically replacing all the found texts, if the respective editor supports this function. Follow these steps to replace terms:

1. Enter a term in the "Find" drop-down list.  
As an alternative, you can select the most recent search key from the drop-down list.
2. Select the options desired for the search.
3. Click the "Find" button to start a search for the specified search key.  
The first hit is displayed in the editor.
4. In the "Replace" drop-down list, enter the text you wish to use to replace the search key.  
As an alternative, you can select the most recently text specified from the drop-down list.
5. Click the "Replace" button to replace the selected hit with the specified text.  
The found text is replaced and the next hit is marked in the editor.  
Repeat this process until you have replaced all the hits as wanted. To skip to the next hit without replacing the marked word, click the "Find" button instead of "Replace".
6. Click "Replace all" to automatically replace all hits at once.

## 7.8 Working with text lists

### 7.8.1 Text lists

#### Introduction

You can manage texts to be referenced in alarms centrally. All the texts are stored in text lists. Each text list has a unique name with which you can call up its content. A range of values is assigned to each text in a text list. If a value from a range of values occurs, the corresponding text is called up.

All the texts can be translated to all project languages. Here, you have two options available:

- You can enter the translation of the texts in a list. You will find the list in the project tree under "Languages & Resources > Project texts".
- You can export all texts to a file in Office Open XML format and enter the translation in a spreadsheet program. The translations can then be imported again.

The texts are translated into the other project languages within the framework of the project texts. In the text lists editor, you only have to manage the assignment of individual texts to a text list.

Each device in the project has its own text lists. For this reason, these lists are arranged under the devices in the project tree. In addition, there are text lists that apply to all devices. These can be found in the project tree under "Common data > Text lists".

#### User-defined and system-defined text lists

There are two types of text lists:

- **User-defined text lists**  
You can create user-defined text lists yourself and fill them with texts; in other words, you can specify value ranges and the corresponding texts yourself. With user-defined text lists, the name of the text list begins with "USER" as default. You can change this name to any suitable name.
- **System-defined text lists**  
System-defined text lists are created by the system. These always involve texts relating to devices. They are automatically created as soon as you insert a device in the project. With system alarms, the name of the text list begins with "SYSTEM". The name of the text list and the ranges of values it contains cannot be modified. You can only edit texts assigned to individual value ranges.

User-defined text lists	System-defined text lists
A user-defined text list can only be assigned to one device.	System-defined text lists can be assigned both to a device as well as to the entire project.
You can create new text lists and delete existing text lists.	You cannot create new text lists or delete text lists.

User-defined text lists	System-defined text lists
You can add and delete value ranges in the text lists.	You cannot add or delete value ranges in the text lists.
You can specify both the value ranges as well as the associated texts.	You can only edit the text associated with one value range.

### Device-specific and cross-device text lists

Device-specific text lists relate to only one device in the project and are therefore only valid for this device. For this reason, they are arranged under a device in the project tree. Device-specific text lists can be user-defined or created by the system.

If system-defined text lists are generally valid for several devices or not intended uniquely for one device, these are grouped together in the project tree under "Common data". These text lists are available for all devices. Cross-device text lists are always created by the system and are used solely for system diagnostics alarms. For this reason, you cannot store any user-defined text lists under "Common data".

### See also

Exporting and importing project texts (Page 313)

## 7.8.2 Creating user-defined text lists

### Creating text lists

You can create user-defined text lists for individual devices.

### Requirement

- You are in the project view.
- A project is open.
- The project includes at least one device.

### Procedure

To create user-defined text lists, follow these steps:

1. Click on the arrow to the left of a device in the project tree.  
The elements arranged below the device are displayed.
2. Double-click on "Text lists".  
All the text lists assigned to the device are displayed in the work area listed in a table.
3. Double-click on the first free row in the table.  
A new user-defined text list is created.
4. Enter a name for your new text list in the "Name" column.

5. From the drop-down list in the "Selection" column, select whether you want to specify the value ranges in decimal, binary or in bits. Depending on the device, there may be further options available at this point.
6. Enter a comment in the "Comment" column.  
A new user-defined text list has been created and you can now enter the value ranges and texts.

### 7.8.3 Editing user-defined text lists

#### Editing user-defined text lists

You can enter value ranges and the corresponding texts in user-defined text lists. User-defined text lists are always located below a device in the project tree.

#### Requirement

- You are in the project view.
- A project is open.
- The project includes a least one device.

#### Adding to user-defined text lists with value ranges and texts

To add to user-defined text lists with value ranges and texts, follow these steps:

1. Click on the arrow to the left of a device in the project tree.  
The elements arranged below are displayed.
2. Double-click on "Text lists".  
All the text lists assigned to the device are displayed in the work area listed in a table.
3. Select a text list in the table.  
The contents of the selected text list are displayed in the work area. There, you can enter a value range and assign texts to the individual value ranges.
4. Enter the value ranges you require in the "Range from" and "Range to" columns. The entry must be made in the numeric format selected for the text list.
5. Enter a text for each value range in the "Entry" column.

### 7.8.4 Editing system-defined text lists

#### Editing system-defined text lists

In system-defined text lists, you can only modify the individual texts assigned to a value range.

System-defined text lists are located in the project tree either below a device or under "Common data".

## Requirement

- You are in the project view.
- A project is open.
- The project includes a least one device.

## Modifying texts in system-defined text lists

To edit texts in system-defined text lists that are assigned to a value range, follow these steps:

1. Click on the arrow to the left of a device in the project tree or the "Common data" element. The elements arranged below are displayed.
2. Double-click on "Text lists".  
All the text lists assigned to the device or used in common are displayed in the work area listed in a table.
3. Select a text list in the table.  
The contents of the selected text list are displayed in the work area. Here, you can add to or edit the texts assigned to a value range.
4. Enter a text for each value range in the "Entry" column.

## 7.9 Using memory cards

### 7.9.1 Basics about memory cards

#### Introduction

Memory cards are plug-in cards that come in a variety of types and can be used for a variety of purposes. Depending on the device type or device family, memory cards can be used for purposes, such as:

- Load memory of a CPU
- Storage medium for projects, firmware backups, or any other files
- Storage medium for performing a firmware update
- Storage medium for the PROFINET device name

For information regarding the technical variants of the respective memory cards and general information on their handling, refer to the respective documentation for the device. For

information on handling memory cards in the TIA Portal, refer to the online help under keyword "Memory Card".

**NOTICE**

Do not use memory cards for non-SIMATIC-related purposes, and do not use third-party devices or Windows tools to format them. This will irrevocably overwrite the internal structure of the memory card, rendering it unusable for SIMATIC devices!

**See also**

Adding a user-defined card reader (Page 381)

Accessing memory cards (Page 382)

Displaying properties of memory cards (Page 382)

## 7.9.2 Adding a user-defined card reader

**Introduction**

If your card reader is not detected automatically, you can add it manually.

**Requirement**

The project view is open.

**Procedure**

To add a card reader, follow these steps:

1. Open the project tree.
2. Select the "Card Reader / USB memory > Add user-defined Card Reader" command in the "Project" menu.  
The "Add user-defined Card Reader" dialog opens.
3. In the drop-down list box, select the path for the card reader.
4. Confirm your entries with "OK".

**See also**

Basics about memory cards (Page 380)

Accessing memory cards (Page 382)

Displaying properties of memory cards (Page 382)

### 7.9.3 Accessing memory cards

#### Requirement

- A memory card is inserted in the card reader.
- The project view is open.

#### Procedure

To access memory cards, follow these steps:

1. Open the project tree.
2. Select the "Card Reader / USB memory > Card Reader / Show USB memory" command in the "Project" menu.  
The "Card reader / USB memory" folder is displayed in the project tree.
3. Open the "Card Reader / USB memory" folder.  
You can now access the memory card.

---

#### Note

If data from a non-installed product is stored on the memory card, the folders that contain these data are shown in gray. You receive an error message when you attempt to access such a folder. Install the corresponding product if needed.

---

#### See also

Basics about memory cards (Page 380)

Adding a user-defined card reader (Page 381)

Displaying properties of memory cards (Page 382)

### 7.9.4 Displaying properties of memory cards

You can display the properties for the utilized memory cards. Note that different memory cards with different properties must be used, depending on the device.

#### Requirement

- A memory card is inserted in the card reader.
- The project view is open.

## Procedure

To display the properties of a memory card, follow these steps:

1. Right-click on the memory card for which you want to display the properties.
2. Select the "Properties" command in the shortcut menu.  
The "Memory Card <name of the memory card>" dialog opens. The properties are displayed in this dialog.

- Basics about memory cards (Page 380)
- Adding a user-defined card reader (Page 381)
- Accessing memory cards (Page 382)

## 7.10 Using libraries

### 7.10.1 Library basics

#### Introduction

You can store objects you want to reuse in libraries. For each project there is a project library that is connected to the project. In addition to the project library, you can create any number of global libraries that can be used over several projects. Since the libraries are compatible with each other, library elements can be copied and moved from one library to another. Libraries are used, for example, to create templates for blocks that you first paste into the project library and then further develop there. Finally, you copy the blocks from the project library to a global library. You make the global libraries available to other employees working on your project. They use the blocks and further adapt them to their individual requirements, where necessary.

Both the project library and global libraries distinguish between two different types of objects:

- **Master copies**  
Almost every object can be saved as a master copy and pasted into the project again later. You can, for example, save entire devices with their contents or cover sheets for plant documentation as master copies.
- **Types**  
Elements that are required to run user programs, for example, blocks, PLC data types, user-defined data types or faceplates are suitable as types. Types can be versioned and therefore support professional further development. Projects using the types can be updated as soon as new versions of the types are available.

## Project library

Each project has its own library, the project library. Here, you store the objects you want to use more than once in the project. This project library is always opened, saved, and closed together with the current project.

## Global libraries

In addition to the project library, you use global libraries if you want to use libraries over several projects. Global libraries exist in three versions:

- **System libraries**  
Siemens supplies global libraries for its own software products. These include off-the-peg functions and function blocks that you can use within your project. The supplied libraries cannot be changed. The supplied libraries are loaded automatically matching the project. If you are working in V12 SP1 compatibility mode, the matching libraries for product version V12 SP1 are loaded. For all other projects the supplied libraries of the latest TIA Portal version are loaded.
- **Corporate libraries**  
Corporate libraries are made available centrally by your organization, for example, in a central folder on a network drive. The TIA Portal manages the corporate libraries automatically. As soon as a more recent version of an existing corporate library becomes available, you receive a prompt to update the corresponding corporate library to the more recent version.
- **User libraries**  
Global user libraries are independent of a specific project and can therefore be passed on to other users. Shared access to global user libraries is also possible, for example on a network drive, if all users open the global user library with write protection.  
Global user libraries you have created yourself from older versions of the TIA Portal can still be used. To continue using global user libraries from older versions of the TIA Portal, they must first be upgraded.

## Comparing library objects

You can compare blocks and PLC data types with the objects of a device. This allows you to determine, for example, whether certain blocks or PLC data types have been used in a project and whether they have been modified.

## 7.10.2 Using the "Libraries" task card

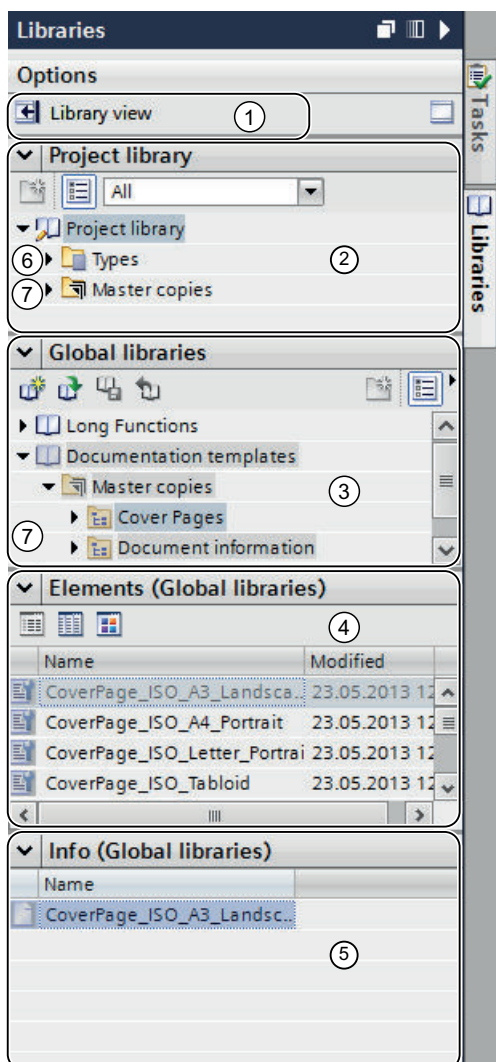

### 7.10.2.1 Overview of the "Libraries" task card

#### Function of the "Libraries" task card

The "Libraries" task card enables you to work efficiently with the project library and the global libraries.

#### Layout of the "Libraries" task card

The "Libraries" task card consists of the following components:

- ① "Library view" button
- ② "Project library" pane
- ③ "Global libraries" pane
- ④ "Elements" pane
- ⑤ "Info" pane
- ⑥ "Types" folder
- ⑦ "Master copies" folder

### "Library view" button

The "Library view" button is used to change to the library view. The "Libraries" task card and the project tree are hidden with this action.

See also: Using the library view (Page 388)

### "Project library" pane

In the "Project library" pane, you can store the objects that you want to use more than once in the project.

### "Global libraries" pane

In the "Global libraries" pane, you manage the global libraries whose elements you want to reuse over several projects.

The "Global libraries" pane also lists libraries that were shipped together with the products you purchased. These libraries provide you with ready-made functions and function blocks, for example. The supplied global libraries cannot be edited.

### "Elements" pane

In this pane, you can display the contents of folders in the library. The "Elements" pane is not displayed by default. If you want to display the "Elements" pane, you have to enable it first. Three view modes are available in the "Elements" palette:

- Details mode  
The properties of folders, master copies and types are shown in table form in details mode.
- List mode  
In list mode, the contents of folders are listed.
- Overview mode  
In overview mode, the contents of folders are displayed with large symbols.

See also: Using the element view (Page 387)

### "Info" pane

You can display the contents of the library elements in the "Info" pane. The individual versions of types and the last revision date of the version are also displayed.

### "Types" folder

In the "Types" directories, you can manage types and type versions of objects that you use as instances in the project.

See also: Using types (Page 412)

### "Master copies" folder

In the "Master copies" directories, you can manage master copies of objects that you can use as copies in the project.

See also: Using master copies (Page 409)

### See also

Library basics (Page 383)

Comparing library elements (Page 439)

## 7.10.2.2 Using the element view

### Introduction

When you open the "Libraries" task card the first time, the "Project library" and "Global libraries" palettes are opened and the "Info" palette is closed. You can display the "Elements" palette if needed.

The elements view shows the elements of the selected library. Three view modes are available in the elements view:

- **Details**  
The properties of folders, master copies and types are shown in table form in details mode.
- **List**  
In list mode, the contents of folders are listed.
- **Overview**  
In overview mode, the contents of folders are displayed with large symbols.

The "Info" palette shows the contents of the selected library element. If you select a type in the elements view, for example, the type versions are displayed in the "Info" palette.

### Requirement

The "Libraries" task card is displayed.

## **Procedure**

To use the element view, follow these steps:

1. Click "Open or close the element view" in the "Project library" or "Global libraries" pane.
2. To change the view mode from the details view to the list mode or overview mode, click the corresponding icon on the toolbar.

## **See also**

Library basics (Page 383)

Overview of the "Libraries" task card (Page 385)

Using global libraries (Page 396)

Comparing library elements (Page 439)

## **7.10.3 Using the library view**

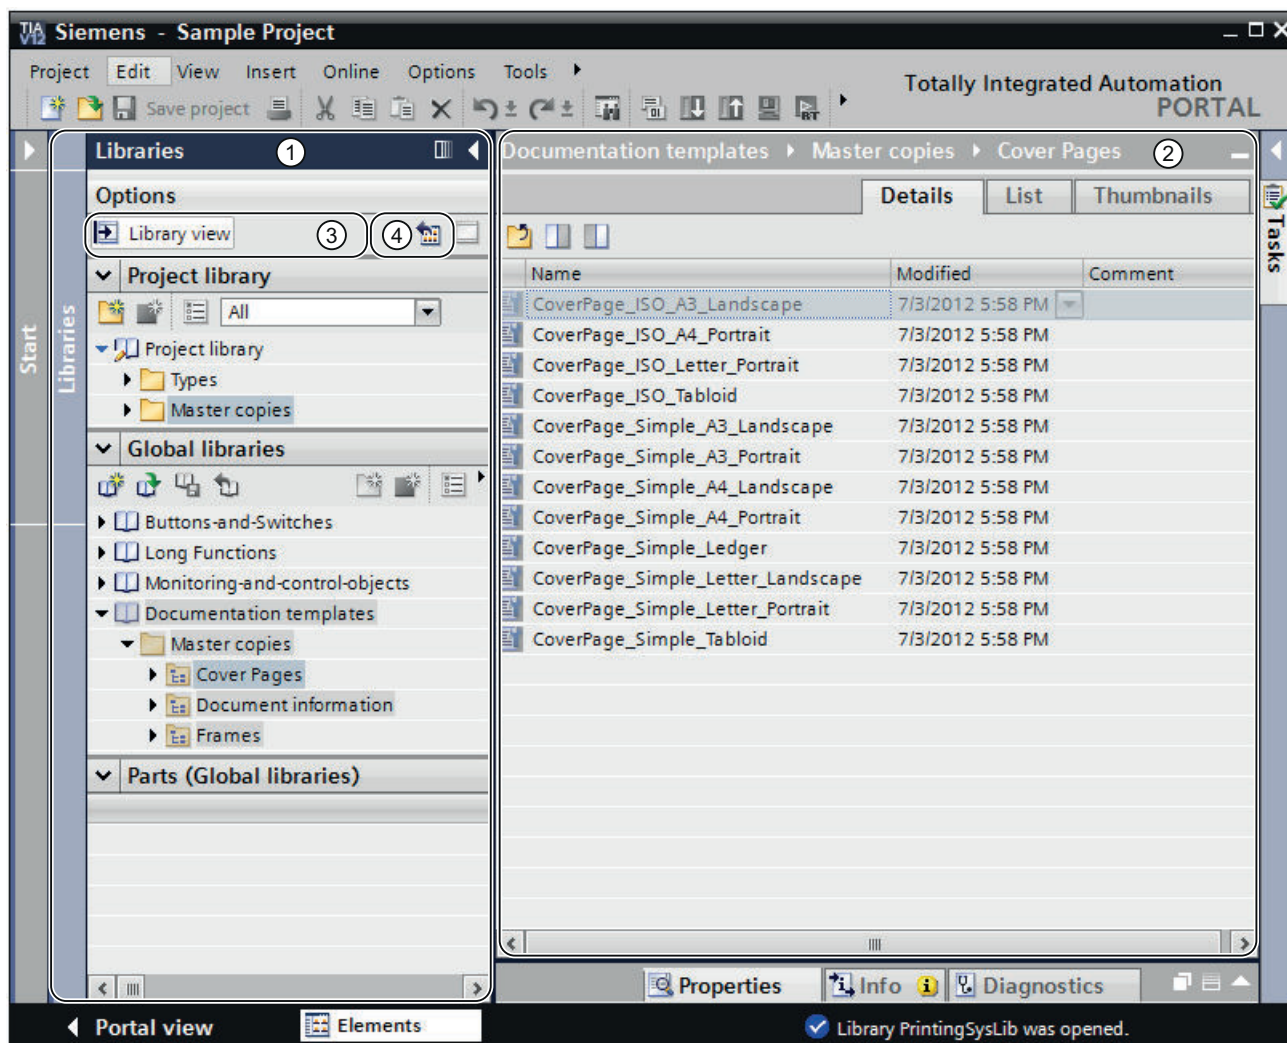

### **7.10.3.1 Overview of the library view**

#### **Function of the library view**

The library view combines the functionality of the "Libraries" task card and the overview window. In the library view, the elements of a library are displayed in various views. In the details view, for example, you see additional properties of the individual elements. You can also edit and version the types in the library view.

## Layout of the library view

The following figure shows the components of the library view:

- ① Library tree
- ② Library overview
- ③ "Library view" button
- ④ "Open or close library overview" button

## Library tree

The library tree is similar to the "Libraries" task card, apart from a few minor differences. In contrast to the task card, there is no "Elements" palette, because the elements are displayed in the library overview. In addition, you can close the library view in the library tree, or open and close the library overview.

See also: "Libraries" task card (Page 385)

## Library overview

The library overview corresponds to the overview window and displays the elements of the currently selected object in the library tree. You can display the elements in three different views:

- **Details view**  
The objects are displayed in a list with additional information, such as the date of the last change.
- **List view**  
The objects are displayed in a simple list.
- **Icon view**  
The objects are displayed as icons according to category.

In addition, you can perform the following actions in the library overview:

- Renaming elements
- Deleting elements
- Copying elements
- Moving elements
- Editing type instances
- Versioning types
- WinCC only: Editing faceplates and HMI user data types

See also: Overview window (Page 268)

## See also

Basics on master copies (Page 409)

Basics on types (Page 412)

Opening and closing the library view (Page 390)

Library basics (Page 383)

Comparing library elements (Page 439)

### 7.10.3.2 Opening and closing the library view

The library view is opened automatically in some cases, for example, when you edit the test instance of a type or when you edit faceplates and HMI user data types. You can also open the library view manually.

## Opening the library view

To open the library view manually, follow these steps:

1. Open the "Libraries" task card.
2. Click the "Open library view" button in the "Libraries" task card.  
The library tree opens. The "Library" task card and the project tree are closed.
3. If the library overview is not displayed, click "Open/close library overview" button in the library tree.  
The library overview opens.

## Exit library view

To exit the library view, follow these steps:

1. Click the "Close library view" button in the library tree.  
The library tree closes. The "Libraries" task card and the project tree are opened.

## See also

- Overview of the library view (Page 388)
- Library basics (Page 383)
- Using the "Libraries" task card (Page 385)
- Using global libraries (Page 396)
- Comparing library elements (Page 439)

## 7.10.4 Using library management

### 7.10.4.1 Overview of the library management

#### Function of the library management

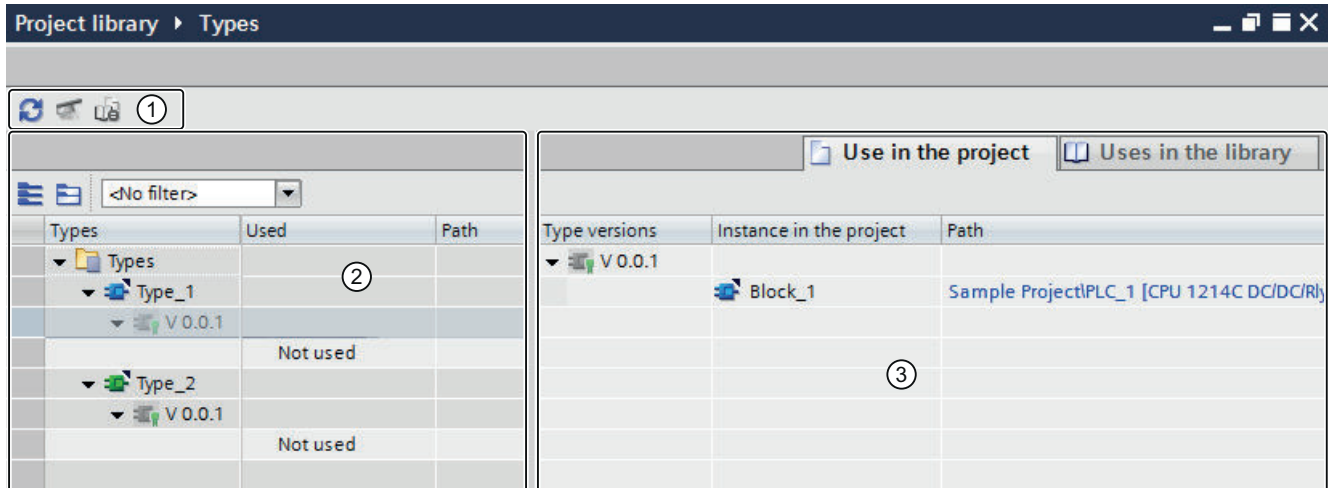

Master copies and types with dependencies to other library elements are subject to some functional restrictions. They can, for example, not be deleted as long as dependencies still exist. This prevents other library elements from becoming useless. The library management is used to identify the dependencies and to create an overview of the work progress.

The library management offers the following functions:

- Display of the correlations of types and master copies  
If a type is referenced in other types or master copies, the correlations are displayed in the library management. You will also be able to see which library elements reference a type or a master copy.
- Display of points of use of types in the project
- Use of filters to narrow down the displayed types

### Layout of the library management

The following figure shows the components of the library management:

- ① Toolbar of the library management
- ② "Types" area
- ③ "Uses" area

### Toolbar of the library management

You can perform the following tasks in the toolbar of the library management:

- Update view  
If the project was changed, you can update the view of the library management.
- Clean up library  
You can clean up the project library and global libraries. By cleaning up a library, you delete all types and type versions that are not linked to an instance in the project.
- Harmonize project  
By harmonizing a project, you adapt the names and the path structures of type uses in the project to the corresponding names and path structures of the types within a library.

### "Types" area

The "Types" area displays the contents of the folder that you have selected in the library view. For each type, the types that it references are displayed. You can expand or collapse all type nodes by using the buttons in the toolbar of the "Types" area. You can also filter the view with the "Filter" drop-down list.

## **"Uses" area**

The "Uses" area gives you an overview of the points of use of the selected types and master copies. The "Uses" area is divided into two tabs:

- "Uses in the project" tab  
The "Uses in the project" tab is used to show the instances of type versions and their respective point of use in the project. When you select an instance, you can show the cross references of the instance in the project in the Inspector window.
- "Uses in the library" tab  
The "Uses in the library" tab is used to show all points within the library at which a type or a master copy is used.

## **See also**

Displaying relations to other library objects (Page 395)  
Library basics (Page 383)  
Basics on master copies (Page 409)  
Basics on types (Page 412)

### **7.10.4.2 Opening library management**

#### **Procedure**

To open the library management, follow these steps:

1. Open the library view.
2. Select a type or any folder that contains types.
3. Select the "Library management" command from the shortcut menu.

#### **Result**

The library management opens and the types are displayed with their versions.

#### **See also**

Overview of the library management (Page 391)

### 7.10.4.3 Filtering the display of types

Use filters to obtain a better overview of types in extensive libraries. A filter provides you with the option of limiting the displayed types. The following filters are available:

- Display all types that include a version with the "In test" or "In progress" status
- Display all released types
- Display all types that have no instances in the project
- Display all types that have more than one version

#### Requirement

The library management is open.

#### Procedure

To filter the displayed types, follow these steps:

1. In the "Types" area, select the folder whose contents you want to filter.
2. Select the required filter in the "Filter" drop-down list.  
In the "Types" area, types are displayed that correspond to the selected filter criteria.

#### See also

State of type versions (Page 414)

Creating a test version of a type (Page 419)

Editing a test version of a type (Page 420)

Creating an editing version of a type (Page 421)

### 7.10.4.4 Displaying instances in the project

In the library management, you can have the instances of all versions of a type or an individual type version displayed. You can jump directly to each instance in the project.

#### Requirement

The library management is open.

## Procedure

To display the instances of a type or its versions, follow these steps:

1. Select a type or one of its versions in the "Types" area.
2. Open the "Uses in the project" tab in the "Uses" area.  
The instances in the project are displayed for each type version. The "Path" column shows the path at which the respective instance is located in the project.
3. Optional: Click the path to jump directly to the respective instance in the project tree.  
The library management is hidden and the instance is selected in the project tree.

## See also

Displaying cross references of an instance (Page 395)

Using types (Page 418)

Overview of the library management (Page 391)

Displaying relations to other library objects (Page 395)

### 7.10.4.5 Displaying cross references of an instance

You can display the cross references of an instance without exiting the library management.

## Requirement

The library management is open.

## Procedure

To display the cross references of an instance in the project, follow these steps:

1. In the "Types" area, select a type version whose instances you want to display.
2. Select the instance of the required type version in the "Uses > Uses in the project" area.
3. Open the "Info > Cross-references" tab in the inspector window.  
The cross reference of the instance are displayed in the project.

## See also

Using cross-references (Page 440)

Overview of the library management (Page 391)

Displaying instances in the project (Page 394)

### 7.10.4.6 Displaying relations to other library objects

You can display relations between individual library objects in the library management. The references of the individual type versions to the other library objects are automatically

displayed in the "Types" area. In the "Uses" area, you can also view the other library objects in which the respective type version is referenced.

### Requirement

The library management is open.

### Procedure

To display the other library objects from which a type version is referenced, follow these steps:

1. Select a folder, an individual type or an individual version in the "Types" area.
2. Open the "Uses in the library" tab in the "Uses" area.  
In the "Uses" area, you can now see which other library objects are referenced by the individual type versions.
3. Optional: To jump to the referenced library object, click on the respective path in the "Path" column.

### See also

Displaying instances in the project (Page 394)

Overview of the library management (Page 391)

## 7.10.5 Using global libraries

### 7.10.5.1 Creating a global library

#### Requirement

The "Libraries" task card is displayed or the library view is open.

#### Procedure

To create a new global library, follow these steps:

1. Click the "Create new global library" icon in the toolbar of the "Global libraries" palette or select the command "Global libraries > Create new library" in the "Options" menu.  
The "Create new global library" dialog opens.
2. Specify the name and the storage location for the new global library.
3. Confirm your entries with "Create".

## Result

The new global library is generated and pasted into the "Global libraries" palette. A folder with the name of the global library is created in the file system at the storage location of the global library. This actual library file is given the file name extension ".al12".

## See also

- Library basics (Page 383)
- Opening a global library (Page 398)
- Displaying properties of global libraries (Page 401)
- Saving a global library (Page 402)
- Closing a global library (Page 403)
- Deleting a global library (Page 404)

### 7.10.5.2 Compatibility of global libraries

You can use the TIA Portal to open global libraries that were created with an older version of the TIA Portal. However, the product version of global libraries must correspond to the product version of the opened project if you want to use objects from the global library in the project. Consequently, you may need to upgrade the global libraries.

### Opening global libraries from older product versions

The table below illustrates the behavior of the TIA Portal when global libraries from older product versions are opened:

Product version of the TIA Portal (file extension of the respective global library)	Behavior when a global library is opened
V10.5 (.al10) V11.x (.al11)	The global library is automatically upgraded to the latest library version when opened, following your confirmation. The upgraded global library is a copy of the original library. The original global library is retained unchanged.
V12 (.al12)	The global library is upgraded when opened. You can choose whether you want to upgrade the global library to the library version V12 SP1 or V13. In both cases, the upgraded library is a copy of the original global library. The original global library is retained unchanged. When you upgrade the global library to library version V12 SP1, the library is opened in compatibility mode.
V12 SP1 (.al12)	When you open the global library, you can decide whether you want to open it in compatibility mode or upgrade it to the current library version. If you upgrade the global library, a copy of the original global library is created. The original global library is retained unchanged.

### Compatibility mode

If a project is open in compatibility mode for product version V12 SP1 of the TIA Portal, the global library must also be in compatibility mode. You can use objects from the global library

in the project opened in compatibility mode. You can also save new objects in the global library if the objects originate from a project in compatibility mode. A global library in compatibility mode can still be opened and edited with TIA Portal V12 SP1.

### Backward compatibility of the current library version

Global libraries saved with the library format of the TIA Portal V13 are not backward compatible with older versions due to their enhanced functionality. Global libraries in TIA Portal V13 library format can only be used in connection with TIA Portal V13 projects.

### See also

- Compatibility of projects (Page 301)
- Opening a global library (Page 398)
- Upgrading global libraries (Page 399)
- Upgrading projects (Page 303)

#### 7.10.5.3 Opening a global library

Global libraries can be further developed centrally and used over several projects. Several persons can open a global library simultaneously from a central storage location, provided all users open the global library in write-protected mode.

### Requirement

The "Libraries" task card is displayed or the library view is open.

### Procedure

To open a global library, follow these steps:

1. Click the "Open global library" icon in the toolbar of the "Global libraries" pane or select the command "Global libraries > Open library" in the "Options" menu.  
The "Open global library" dialog box is displayed.
2. Select the global library you want to open. Library files are identified by the file name extension ".al[version number]". This means global libraries that were saved with TIA Portal V13 have the file name extension ".al13".
3. Write protection is activated for the library. If you want to modify the global library, disable the "Open as read-only".
4. Click "Open".  
The global library is opened and pasted into the "Global libraries" pane if the library version matches the project version. The "Upgrade global library" dialog box opens if you have selected a global library from an older version of the TIA Portal. More information on upgrading the global library can be found in the chapter "Upgrading global libraries (Page 399)".

## See also

### 7.10.5.4 Upgrading global libraries

If you want to use objects from a global library in a project, the library version must match the product version of the project. Global libraries must be present in the library version of the TIA Portal V12 SP1 if you want to edit a project in V12 SP1 compatibility mode. Global libraries must be present in the library version of the TIA Portal V13 if you want to edit a project of the product version V13.

Depending on the library version, the following options are available:

- **Upgrading the global library to the product version V13**  
You can upgrade each global library from an older product version to the current product version. You are prompted accordingly when you open the global library. You can manually upgrade global libraries projects that are already open in compatibility mode to product version V13.
- **Upgrading the global library to the product version V12 SP1 (compatibility mode)**  
If you open a global library from version V12 of the TIA Portal, you also have the option of upgrading the global library to the library version V12 SP1. In this case, however, the global library can only be used in connection with projects from the TIA Portal V12 SP1.

### Upgrading global libraries from V11.x or lower

Proceed as follows to upgrade a global library from TIA Portal V11.x or lower:

1. Open the global library.  
The "Upgrade global library" dialog box opens.
2. Click "OK".  
A copy of the global library is created and upgraded. The copy of the global library receives the name extension "\_V13". The global library is opened.

### Upgrading global libraries from V12

Proceed as follows to upgrade a global library from TIA Portal V12:

1. Open the global library.  
The "Upgrade global library" dialog box opens.
2. Select the target version for the upgrade:
  - Click "Yes" to upgrade the global library to product version V13.
  - Click "No" to upgrade the global library to product version V12 SP1 and to work in compatibility mode.

A copy of the global library is created and upgraded. The copy of the global library receives the name extension "\_V13" or "\_V12SP1". The global library is opened.

### Upgrading V12 SP1 libraries or using them in compatibility mode

Proceed as follows to upgrade a global library from TIA Portal V12 SP1 or to use it in compatibility mode:

1. Open the global library.  
The "Upgrade global library" dialog box opens.
2. Select how you want to proceed with the global library:
  - Click "Yes" to upgrade the global library to product version V13.
  - Click "No" to use the global library in compatibility mode.

A copy of the global library is created and upgraded or the library is opened changed. The copy of the global library receives the name extension "\_V13".

### Manually upgrading libraries in compatibility mode to V13

To do this, a global library must already be open in compatibility mode for the TIA Portal V12 SP1.

Proceed as follows to manually upgrade global libraries to the library version V13:

1. Right-click on the global library you want to upgrade.
2. Select the "Upgrade library" command in the shortcut menu.  
The "Upgrade" dialog opens.
3. Confirm with "Yes".

A copy of the global library is created and upgraded. The copy of the global library receives the name extension "\_V13". The upgraded global library is opened. The original global library is closed.

### See also

Opening a global library (Page 398)

Compatibility of global libraries (Page 397)

Upgrading projects (Page 303)

### 7.10.5.5 Displaying properties of global libraries

Global libraries contain properties for describing the respective library in more detail. Properties include the following:

- General information about the library  
This includes the following information: creation time, author, file path, file size, copyright, etc. Many of the attributes can be changed.
- Library history  
The library history contains an overview of the migrations performed. Here you can also call the log file for the migrations. The library history also contains information on updates of the global library.
- Support packages in the library  
You can display an overview of the additional software needed to work with all devices in the project.
- Software products in the library  
You can display an overview of all installed software products needed for the project.

#### Requirement

The "Libraries" task card is displayed or the library view is open.

#### Procedure

To display the properties of a global library, follow these steps:

1. Right-click the global library whose properties you want to display.
2. Select the "Properties" command in the shortcut menu.  
A dialog containing the properties of the global libraries opens.
3. Select the properties in the area navigation that you want to have displayed.

#### See also

Creating a global library (Page 396)

Saving a global library (Page 402)

Closing a global library (Page 403)

Deleting a global library (Page 404)

### 7.10.5.6 Displaying logs of global libraries

Logs are created when you update or clean up global libraries or assign a shared version to several types. The logs list all changes you have made to the global library. The logs are stored

together with the global library and are always available once you have opened the global library.

## Procedure

To open the logs of a global library, follow these steps:

1. Open the global library in the "Libraries" task card or in the library view.
2. Open "Common data > Logs" in the lower-level folder.
3. Double-click the required log.  
The log opens in the work area.

## See also

Updating a library with the contents of another library (Page 435)

### 7.10.5.7 Saving a global library

After you have changed a global library, you need to save it. You can save a global library under another name using the "Save library as" command.

---

#### Note

#### Backward compatibility to older versions of the TIA Portal

Note that global libraries can no longer be opened in older versions of the TIA Portal once they have been saved in the newer version.

---

## Requirement

The "Libraries" task card is displayed or the library view is open.

## Saving changes

To save a global library, follow these steps:

1. Right-click on the global library you want to save.
2. Select the "Save library" command in the shortcut menu.

## Saving a global library under another name

To save a global library under another name, follow these steps:

1. Right-click the global library that you want to save under a different name.
2. Select the "Save library as" command in the shortcut menu.  
The "Save global library as" dialog opens.

3. Select the storage location and enter the file name.
4. Confirm your entries with "Save".  
The library is saved in the specified location under the new name. The original library is retained.

Closing a global library (Page 403)

Deleting a global library (Page 404)

**7.10.5.8 Closing a global library**

Global libraries are independent of projects. This means that global libraries are not closed together with your project. You must therefore close global libraries explicitly.

**Requirement**

The "Libraries" task card is displayed or the library view is open.

**Procedure**

To close a global library, follow these steps:

1. Right-click on the global library you want to close.
2. Select the "Close library" command in the shortcut menu.  
If you have made changes to the global library, select whether or not you want to save the changes.  
The global library is closed.

Deleting a global library (Page 404)

### **7.10.5.9 Deleting a global library**

If you no longer require a global library, you can delete it. Libraries supplied by Siemens cannot be deleted.

#### **Requirement**

The "Libraries" task card is displayed or the library view is open.

#### **Procedure**

To delete a global library, follow these steps:

1. Right-click the global library you want to delete.
2. Select the "Delete" command in the shortcut menu.
3. Click "Yes" to confirm.

#### **Result**

The global library is removed from the "Global libraries" palette. The entire library for the global library is deleted from the file system.

- Closing a global library (Page 403)

### **7.10.5.10 Archiving and disabling global libraries**

#### **Working with archives of global libraries**

If you want to back up global libraries on an external hard drive or send them via e-mail, for example, use the archiving function to reduce the storage space of the library.

## Options for reducing the size of the project

There are two ways to reduce the storage space of global libraries:

- **Creating a compressed archive of global libraries**  
Archives of global libraries are compressed files, each containing an entire global library, including the entire folder structure of the library. Before the directory with the global library is compressed into the archive file, all files are reduced to their essential components to further decrease the storage space. Compressed archives of global libraries are therefore well suited for sending via e-mail.  
Compressed archives of global libraries of TIA Portal V13 have the file extension ".zal13". Archives from TIA Portal V12.x have the file extension ".zal12".  
To open a compressed archive of a global library, retrieve the archive. The archive file is extracted to a location you have selected with the entire folder structure and all files.
- **Minimizing global libraries**  
You can skip additional compression in an archive file, and instead create a copy of the global library directory. The included files can be reduced to the essential elements. This minimizes the required storage space. The full functionality of the global library is retained and the global library can be loaded as usual.  
Minimized global libraries are especially well suited for archiving, for example, on an external medium.

## See also

Archiving global libraries (Page 405)

Retrieving global libraries (Page 406)

## Archiving global libraries

You reduce the storage space of a global library by packing it into a compressed file. You can also reduce the storage space by saving the global library reduced to the essential elements. You can do both of these with the archiving function for global libraries. When you archive a library, the original library version is retained. This means libraries in compatibility mode for TIA Portal V12 SP1 are still compatible with TIA Portal V12 SP1.

## Requirement

The global library is loaded.

## Procedure

To archive a global library, follow these steps:

1. Select the global library that you want to archive.
2. Right-click the global library and select the "Archive" command from the shortcut menu. The "Archive global library as..." dialog opens.
3. Select the directory where you want to save the archive file or the new directory of the global library.  
The directory may not be located in a project directory or within the directory of a global library.

4. Select the file type from the "File type" drop-down list:
  - Global libraries archive, if you want to create a compressed file of the library.
  - Minimized global library, if you only want to create a copy of the library directory with minimal storage requirement.
5. Enter a file name in the "File name" field if you are creating an archive file. If you are creating a minimized global library, enter the name of the new library directory to be created in the "File name" box.
6. Click "Save".

## Result

A compressed file with the extension ".zal13" or ".zal12" is generated. The file extension depends on whether you have archived a library in V12 SP1 compatibility mode or in the library format of TIA Portal V13

The file includes the complete directory of the global library. The individual files of the global library are also reduced to the essential components in order to save space.

If you have minimized the global library, only a copy of the original directory of the global library is created at the required location. The files contained within it were reduced to their essential components in order to save space.

## See also

Working with archives of global libraries (Page 404)

Retrieving global libraries (Page 406)

## Retrieving global libraries

Before you can use an archived global library, you have to retrieve it. The global library is extracted and then opened in the TIA Portal.

## Procedure

To extract the archive of a global library, follow these steps:

1. Select the "Global libraries > Retrieve library" command in the "Options" menu.  
The "Retrieve archived global library" dialog opens.
2. Select the archive file.
3. Select the check box "Open read-only" if you want to load the global library write-protected.
4. Click "Open".
5. The "Find folder" dialog opens.
6. Select the target directory to which the archived global library should be extracted.
7. Click "OK".

## Result

The global library is extracted to the selected directory and opened immediately.

If the archive file contained a global library from TIA Portal V12 SP1, the global library is opened in compatibility mode. Manually upgrade the library to the library version of TIA Portal V13, if necessary.

### 7.10.5.11 Using global corporate libraries

#### Basics of corporate libraries

##### Introduction

Corporate libraries are global libraries made available by an administrator and assigned to the TIA Portal. The administrator can assign new libraries or change libraries at any time. New libraries are automatically uploaded in the TIA Portal following your confirmation. As soon as more recent versions of corporate libraries are available, the existing corporate libraries are automatically updated to the more recent version, also following your confirmation.

The corporate libraries are located just like normal global libraries in the "Global libraries" palette of the "Libraries" task card.

##### Providing corporate libraries

Corporate libraries can be saved in any directory on the hard drive of the computer or on a network drive. Use an XML file to assign corporate libraries to the TIA Portal. The XML file includes the directories and names of the assigned corporate libraries. The XML file must be saved in the following directory on the hard drive of the computer:

```
C:\ProgramData\Siemens\Automation\Portal V13\CorporateSettings\
```

The XML file must be named "CorporateSettings.xml".

You either copy the configuration file yourself to the corresponding directory or the configuration file is assigned to you through the company network. The valid configuration is automatically applied when the TIA Portal is started. When the TIA Portal is started, it continuously monitors the directory for configuration files. If the configuration file has changed, you receive a prompt to apply the new configuration. You can reject this prompt twice. You will always receive the next prompt three hours later. You must apply the new configuration at the third prompt. You receive a changed configuration file from the project administrator, for example, if corporate libraries have been added or deleted.

## Options as project administrator

You can automatically assign the configuration file or the corporate libraries to the computers of the team members or distribute updates to the team members. This function is not part of the TIA Portal and requires a corresponding IT infrastructure in your company. If you want to administer the configuration file centrally, discuss this approach with the IT managers at your company.

## Creating a configuration file

Use a configuration file in XML format to make the corporate libraries available in the TIA Portal. The configuration file includes the directories and file names of the libraries to be loaded. Below you will learn how you create the XML configuration file and where to save it.

## Procedure

To provide a configuration file for corporate libraries, follow these steps:

1. Create an XML configuration file with the content listed below. Use the coding "UTF-8".
2. Save the XML file under the name "CorporateSettings.xml".
3. Save the file in the following directory on your computer:  
C:\ProgramData\Siemens\Automation\Portal V13\CorporateSettings\

## Content of the XML configuration file

The XML configuration file must have the following content:

### XML

```
<?xml version="1.0" encoding="utf-8"?>
<Document>
  <Settings.Settings ID="0">
    <ObjectList>
      <Settings.General ID="1" AggregationName="General">
        <AttributeList>
          <CorporateLibraryPaths>
            <!-- Example of an entry -->
            <Item>D:\CorporateLibraries\Corporate_Library_1.all3</Item>
            <!-- Here you enter additional global libraries, if any. -->
          </CorporateLibraryPaths>
        </AttributeList>
      </Settings.General>
    </ObjectList>
  </Settings.Settings>
</Document>
```

## Result

As soon as you have saved the XML configuration file in the respective directory, you will receive the prompt (in the TIA portal) to download the corporate libraries in the TIA Portal.

## 7.10.6 Creating folders in a library

The library elements are stored in the libraries according to their type in the "Types" and "Master copies" folders. Create additional folders below "Types" and "Master copies" to further organize master copies and types.

### Requirements

- The "Libraries" task card is displayed or the library view is open.
- If you want to create new folders within a global library, you have to open the global library with write permission.

### Procedure

To create a new folder, follow these steps:

1. Right-click any folder within the library.
2. Select "Add folder" from the shortcut menu.  
A new folder is created.
3. Enter a name for the new folder.

### See also

Working with types in the project library (Page 417)

Filtering master copies (Page 411)

## 7.10.7 Using master copies

### 7.10.7.1 Basics on master copies

Master copies are used to create standardized copies of frequently used elements. You can create as many elements as needed and insert them into the project based on a master copy. The elements inherit the properties of the master copy.

You store master copies either in the project library or in a global library. Master copies in the project library can only be used within the project. When you create the master copy in a global library, it can be used in different projects.

The following elements can be created as master copies in the library, for example:

- Devices with their device configuration
- Tag tables
- Instruction profiles
- Monitoring tables
- Elements from the documentation settings, for example, cover sheets and frames

- Blocks and groups containing multiple blocks
- PLC data types and groups containing multiple PLC data types
- Text lists
- Alarm classes
- Technology objects

In many cases, the objects you add as master copy contain additional elements. A CPU, for example, can contain blocks. If the included elements are uses of a type version, the used versions of the types are automatically created in the library. The elements contained therein are then used as an instance and linked to the type.

### See also

Adding master copies (Page 410)

Using master copies (Page 412)

Basics on types (Page 412)

Filtering master copies (Page 411)

### 7.10.7.2 Adding master copies

If you want to use objects multiple times, copy them as master copies in the project library or in a global library. You can choose from the following methods for creating master copies:

- You can select one or more elements and generate a master copy from it
- You can select multiple elements and generate a master copy from each element

### Requirement

- The "Libraries" task card is displayed.
- If you add a device as a master copy, this device meets the following requirements:
  - The device is compiled and consistent.
  - The device contains no test instance of a type.
- If you add the master copy to a global library, the global library is opened with write permission.

### Creating a master copy from one or more elements

To create a master copy for one or more elements, follow these steps:

1. Open the library in the "Libraries" task card.
2. Drag one or more elements and drop them into the "Master copies" folder or any subfolder of "Master copies".  
Alternative: Copy the elements to the clipboard and paste them at the required location.  
The element is pasted into the library as a single master copy.

### Creating a master copy for each element among multiple elements

To create a master copy for each element among multiple elements, follow these steps:

1. Open the library in the "Libraries" task card.
2. Copy to the clipboard the elements that you want to create as master copies.
3. Right-click on the "Master copies" folder or any of its subfolders in the library.
4. In the shortcut menu, select "Paste as separate master copies".  
The elements are pasted into the library as separate master copies. In each case, a separate type is created automatically for any objects contained.

### See also

Basics on master copies (Page 409)  
Using master copies (Page 412)  
Library basics (Page 383)  
Adding types to the project library (Page 417)

#### 7.10.7.3 Filtering master copies

To make it easier to keep track of a large number of master copies, you can filter the display according to the type of master copy.

### Requirement

The "Libraries" task card is displayed or the library view is open.

### Procedure

To filter the view, follow these steps:

1. Open the "Master copies" folder in the project library or a global library.
2. In the drop-down list of the toolbar, select the type of objects you want to display under "Master copies".

### Result

Only the selected type of master copies is displayed. You can set the filter to "All" to return to an unfiltered view.

### See also

Library basics (Page 383)  
Creating folders in a library (Page 409)  
Basics on master copies (Page 409)

Using master copies (Page 412)

Using the element view (Page 387)

#### 7.10.7.4 Using master copies

Master copies are contained either in the project library or in a global library.

#### Requirement

The "Libraries" task card is displayed.

#### Procedure

To paste a master copy into the project, follow these steps:

1. Open the "Master copies" folder or any subfolder of "Master copies" in a library.
2. Drag-and-drop one or more master copies to the desired point of use.  
A copy of the master copy is inserted.

Or:

1. Open the element view.
2. Drag the master copy from the "Elements" palette and drop it at the location where you want to use it.  
A copy of the master copy is inserted.

#### See also

Basics on master copies (Page 409)

Adding master copies (Page 410)

Filtering master copies (Page 411)

Library basics (Page 383)

Using the element view (Page 387)

### 7.10.8 Using types and their versions

#### 7.10.8.1 Basics on types

#### Using types

Types are elements that are required for the execution of user programs. Types can be versioned and further developed from a central location.

The following elements can be stored as type in the project library or the global library:

- Functions (FCs)
- Function blocks (FBs)
- PLC data types
- User data types
- Faceplates
- Figures
- User-defined functions

Any number of instances can be derived from the versions of types in the project. The instances are then linked to the version of the type. If you are using types from a global library, the type is also created in the project library. If the type already exists in the project library, any missing type versions are added if necessary. The instance is then linked only to the respective type version in the project library.

Types and their instances are marked with a black triangle. The following figure shows an instance, marked with a black triangle, and an ordinary program block:

## Basics on versioning types

Type versioning provides you with the means to develop types centrally and then roll out the most recent version to the individual projects as an update. In this way, error corrections and added functions can be easily integrated into existing projects. If you have created a new version of a global library, you can update existing projects in an automatic process. This minimizes errors and reduces the amount of maintenance work for large automation solutions that contain numerous individual projects.

Versioning allows you to trace the development process of individual types. Before you release a version, you can try it out in a test environment to determine whether changes made to a type integrate smoothly into an existing project. You only release a version for productive use after you have made sure that everything operates without errors. You can view the history of individual instances in the project at any time and determine the version from which the instance was derived.

The TIA Portal also checks automatically if there are associated objects with individual versions of a type. Associated objects can be, for example, PLC data types or other blocks referenced in a block. All associated objects are already taken into consideration during the creation of a type or during copying between libraries. Before being released, versions of types are checked for their consistency to ensure that no inconsistencies arise in the project.

## Versions of types

Versions are assigned to each type. The version number is displayed in both the "Libraries" task card as well as the library view next to the respective type. The version number is also displayed in the project tree next to instances of types. This allows you to see at all times which version of an instance is used in the project.

The version number consists of three numbers separated by periods. You can randomly assign the first two digits. Numbers from 1 to 999 are permitted as the first two numbers. The third digit is the build number. It is automatically incremented by one when you edit an instance related to the version. The build number is reset to 1 when you release the version.

The versions of types can have three states:

- In progress (faceplates and HMI user data types)
- In test (all sorts of types except faceplates and HMI user data types)
- Released

The following figure shows a type with two versions. One version is "in test" and one version is released:

## See also

State of type versions (Page 414)

Basics on master copies (Page 409)

Adding types to the project library (Page 417)

Using types (Page 418)

### 7.10.8.2 State of type versions

The versions of types can be in three different states. The states can be determined from the instance or in the library.

#### "In progress" status

Only versions of faceplates and HMI user data types have the "in progress" state. If a version is in progress, "in progress" appears next to the version in the library.

When you create a new type or a new version of a released type, the type is assigned the status "in progress".

Types with the status "in progress" can be edited in the library view. A reference to an instance in the project does not have to exist. Upon release, the compatibility of the type is tested by a consistency check.

#### "In test" status

All types except for faceplates and HMI user data types can have the "in test" status. If a version is in test, "in test" appears next to the instance and in the library. A version in the test state is linked to a test instance in the project. This allows you try out the effects of your changes in a test environment including all online functions before you release a type for use in actual operations.

## "Released" status

The "released" status is available for all types, regardless of the point of use. If a version has been released, the symbol of the version is marked with a seal in the library:

Released versions can be opened with write protection in their instance. If you want to edit a released version, you must first create a new "in progress" or "in test" version.

## See also

- Basics on types (Page 412)
- Using types (Page 418)
- Creating a test version of a type (Page 419)
- Editing a test version of a type (Page 420)
- Creating an editing version of a type (Page 421)
- Performing a consistency check for a version (Page 421)
- Discarding versions (Page 422)
- Release versions (Page 423)
- Assigning a version (Page 431)
- Updating the project to the latest versions (Page 426)
- Remove the link between instance and type (Page 427)
- Filtering the display of types (Page 394)

### 7.10.8.3 Displaying a released type version

If you display a released version but do not want to edit it, open the instance with write protection. All types except faceplates and HMI user data types can be opened directly at the instance. Faceplates and HMI user data types can only be opened in the "Libraries" task card or in the library view.

## Requirement

The released version has an instance in the project; except with types, this is a faceplate or an HMI user data type.

### Opening a type version at an instance

To open a released version of a type with write protection starting from an instance, follow these steps:

1. Select the released version at the instance in the project tree.
2. To do this, right-click the instance and select the "Open" command from the shortcut menu. The instance is opened with write protection.

### Opening a type version in the "Libraries" task card or library view

To open a released version of a type in the "Libraries" task card or in the library view, follow these steps:

1. Select the version.
2. To do this, right-click the version and select the "Open" command from the shortcut menu. If it is a faceplate or HMI user data type, it is opened directly in the library view. In this case, skip the remaining steps. If it is any other type, the "Open type" dialog opens.
3. Select the instance with the version that you want to display from the list of instances.
4. Click "OK" to confirm. The instance is opened with write protection.

#### 7.10.8.4 Displaying properties of a type or version

The following properties can be viewed and changed in the properties of a type or its versions, if needed:

- Name of the type
- Version number (only visible in the case of a version)
- Data and time of the last change to the version (only visible in the case of a version)
- Author who created the version (only visible if there is a version)
- Comments on the type or the version of the type  
The comment on the type can be changed.
- Original library (only visible in the case of a version)  
Displayed is the project and the library from which the current version of the type was generated. This information is important, for example, for finding the original of the type after it has been copied from another library.
- ID of the type or the version of the type  
This ID is used to uniquely identify the type or the version of the type, even if, for example, there are types or versions with an identical name within the project library or the global library. The ID cannot be changed and is assigned automatically.

## Procedure

To display the properties of a type or a version and to enter a comment, follow these steps:

1. Select a type or the version of a type in the "Libraries" task card or in the library view.
2. To do this, right-click on the type or one of its versions and select the "Properties" command from the shortcut menu.  
The "Properties" dialog box opens.
3. If needed, enter a comment on the type in the "Comment" field or edit an existing comment.

### 7.10.8.5 Working with types in the project library

#### Adding types to the project library

Types for reuse in the project can be created in the project library for various elements. You can create the following elements as types, for example:

- Program blocks
- Faceplates
- PLC data types
- HMI user data type

If you add an element as a type to the project library and this element has dependencies to other elements, the dependent elements are automatically created as a type as well.

After a type has been added to the project library, the type is linked to the added element from the project.

#### Requirement

- The "Libraries" task card is displayed.
- The elements that you want to add as type are compiled.
- The elements are consistent.

## Procedure

To add an existing element to the project library as a type, follow these steps:

1. Open the project library in the "Libraries" task card.
2. Drag-and-drop one or more elements into the "Types" folder or any subfolder of "Types".  
Alternative: Copy the elements in the project tree to the clipboard and add the elements in the desired project library folder.  
The "Generate type" dialog opens.

3. Enter the properties of the new type:
  - Enter a name for the new type in the "Name of the type" field.
  - Enter a version number for the new type in the "Version" field.
  - Enter the name of the editor who is responsible for the type in the "Author" field.
  - Enter a comment on the type in the "Comment" field.
4. Click "OK" to confirm.  
The new type is generated with a released version. The version is linked to the element that has been added.

### See also

Basics on types (Page 412)

Library basics (Page 383)

Adding master copies (Page 410)

### Using types

To use the version of a type, create an instance of the version at a suitable location in the project tree. You can also position faceplates and HMI user data types directly in the editor. The instance is then linked to the version of the respective type. If the type contains dependent elements such as a PLC data types referenced in a block, these are also created as instance at a suitable location. You can only assign a version of the same type to a device.

If necessary, you can create instances of several types at the same time.

### Requirement

- The "Libraries" task card is displayed.
- The desired versions have been released.
- A device which supports the sort of desired type is already available in the project
- The device is not yet assigned any further instance of the same type.

### Procedure

To create instances of type versions, follow these steps:

1. In the project library, navigate to the versions of the types that you want to use.
2. Select the versions of which you want to create instances.
3. Drag the required type versions from the project library and drop them at the location where you want to use them.  
Alternative: To automatically use the most recent version, drag the types from the project library and drop them at the location where you want to use them.

## Result

Instances of the types and their dependent elements are generated and pasted at the location where you want to use them. The instances are connected to the respective version of the type in the project library.

## See also

State of type versions (Page 414)

Library basics (Page 383)

Using master copies (Page 412)

## Creating a test version of a type

Before you release a type for productive use, you need to test the type within a project and on the automation system. The test is conducted in a specific test environment. This test environment can be a CPU, for example.

Create a version with "in testing" status for the test. The creation of a version "in testing" is suitable for all sorts of types except for faceplates and HMI user data types. On the other hand, versions "in progress" can be created from faceplates and HMI user data types.

There are two ways to create a test version of a type and define the test environment:

- In the "Libraries" task card or library view  
Generate the new version with "in testing" status in the "Libraries" task card or in the library view. You can generate the new version either directly from the type or from a specific version of the type.
- At an instance in the project tree  
You can also create the test version directly at the instance in the project tree. Since the instance is always used in a specific version in the project, a new version of the type is generated from the version used at the instance.

You can also create test versions from several types at the same time.

The following rules apply to a version "in testing":

- You can set only one version to "in testing" for each type at a given time.
- A version in testing may only be linked to a single instance in the project. Therefore, it is not possible to copy an instance to the clipboard, to duplicate it or to create an additional type from the instance as long as it has "in testing" status.

## Requirement

- There is at least one instance of the type within the project in a given version.
- If you want to create the new version from a particular version of the type, the instance must be used in this version in the project.

## Procedure

To generate a new test version of a type or the version of a type, follow these steps:

1. Select the type, a version of the type, or the instance.  
When you create the test version directly at the instance, you can select several elements or folders with multiple selection. You can skip steps 3 and 4 because the test environment is already defined by the selected instance.
2. Right-click the selected element and select the "Edit type" command from the shortcut menu.  
If you have started the editing in the "Libraries" task card or in the library view, the "Edit type" dialog opens. If you have started the editing at the instance in the project tree, the test instance is immediately opened for editing in the library view.
3. Select an instance of the type from the list in the project.  
If you have started editing at the type itself, the following applies:
  - The location at which the instance is used (for example, the CPU) is also used as test environment for the subsequent editing of the type.
  - Selecting the test instance also defines the version to be edited.The following applies to editing a specific version:  
If your starting point is a specific version, you can only select from the list instances that are used in the same version.
4. Click "OK" to confirm.

## Result

A new version of the type is created. The new version is "in testing" and is identified as such in the user interface.

## See also

Basics on types (Page 412)

State of type versions (Page 414)

Library basics (Page 383)

## Editing a test version of a type

When you edit a version "in testing", a new version is not created. You can start the editing of the test version at the instance in the project tree, in the "Libraries" task card" or in the library view.

---

### Note

#### Deleting and renaming interface parameters

You can add new parameters. However, if you rename or delete existing parameters, these parameters will not be supplied when the block is called.

---

## Procedure

To edit the test version of a type, follow these steps:

1. Right-click the test version or the instance.
2. Select the "Edit type" command from the shortcut menu.  
The test instance is opened in the library view and can be edited.

## See also

Basics on types (Page 412)

State of type versions (Page 414)

Library basics (Page 383)

Performing a consistency check for a version (Page 421)

Discarding versions (Page 422)

Release versions (Page 423)

## Creating an editing version of a type

If you want to edit a type with faceplates or HMI user data types, create a new "in progress" version of the type. The new version is edited in the library view. To check the compatibility of the changes, a consistency check is automatically performed for the type prior to the release.

## Requirement

The project library is opened in the "Libraries" task card or in the library view.

## Procedure

To create a new version of a type in progress, follow these steps:

1. Right-click the type or the version of the type.
2. Select the "Edit type" command from the shortcut menu.  
A new "in progress" version is created and opened for editing in the library view.

## See also

Basics on types (Page 412)

State of type versions (Page 414)

Library basics (Page 383)

## Performing a consistency check for a version

A type version can unintentionally obtain an inconsistent state during editing. To notice errors in the development process in good time, you can regularly perform a consistency check.

However, the consistency check always takes place automatically as soon as you release a version.

Details of how to start the consistency check manually for the version of a type are provided below.

### **Requirement**

- The project library is opened in the "Libraries" task card or in the library view.
- The version is "in progress" or "in test".

### **Procedure**

To perform a consistency check for the version of a type, follow these steps:

1. Right-click on the version that you want to check for consistency.
2. Select the "Consistency check" command in the shortcut menu.  
The consistency check is carried out. You receive a message with the result of the consistency check.

### **See also**

Release versions (Page 423)

Discarding versions (Page 422)

Editing a test version of a type (Page 420)

Basics on types (Page 412)

State of type versions (Page 414)

Library basics (Page 383)

### **Discarding versions**

Discard versions of a type "in test" or "in progress" when you no longer need the version. You can also select several types or folders and discard all test or editing versions contained therein. All uses of the deleted versions are reset to the last released status.

### **Requirement**

- The versions that you want to discard are in the "In test" or "In progress" status.
- Your are in the library view of the "Libraries" task card is open.

## Procedure

To discard one version, follow these steps:

1. Right-click the version that you want to discard.
2. Select the "Discard changes and delete version" command from the shortcut menu.  
The version is deleted.

Alternative:

1. Click the "Discard changes and delete version" button in the toolbar while a version is opened for editing.  
The version is deleted.

## See also

Basics on types (Page 412)

State of type versions (Page 414)

Library basics (Page 383)

Performing a consistency check for a version (Page 421)

## Discarding all versions within a folder

You can discard all versions with the "In test" or "In progress" status at the same time within a folder. All uses of the deleted version are reset to the last released status.

## Requirement

Your are in the library view of the "Libraries" task card is open.

## Discarding a version of a single type

To discard all versions within a folder, follow these steps:

1. Right-click the folder.
2. Select the "Discard all" command from the shortcut menu.  
All "In test" or "In progress" versions are deleted.

## Release versions

When you are finished editing a type version, release the version for productive use. Assign a version number for the release. You can also select to release several type versions at the same time.

## Requirement

- The "Libraries" task card is open or you are in the library view.
- The versions that you want to release are "in test" or "in progress" status.
- The versions are consistent.  
A consistency check is performed as soon as you start the release. If errors that prevent a release occur during the consistency check, a message is displayed indicating how you can correct the errors.

## Procedure

To release type versions, follow these steps:

1. Select the versions you want to release.
2. Right-click your selection.
3. Select the "Release version" command from the shortcut menu.  
The "Release type version" dialog box opens.
4. If necessary, change the properties of the version:
  - Enter a name for the type in the "Name" field. If you have selected several versions for release, the "Name" field cannot be changed.
  - In the "Version" field, define a main and an intermediate version number for the version to be released. If you have selected several versions for release, the "Version" field cannot be changed and the last version number is used for the release.
  - In the "Author" field, enter the editor of the version to be released.
  - In the "Comment" field, enter a comment on the version to be released.
5. Optional: Select the "Delete all unused type versions from the library" check box to delete all versions from the library that are not connected to any instance in the project. Versions with dependencies on other types or master copies are not deleted.
6. Click "OK" to confirm.

Alternative:

1. Click the "Release version" icon in the toolbar while a version is opened for editing.
2. Continue with steps 3 to 5 of the description above.

## Result

The selected versions are released.

The properties are applied for the types themselves, the versions to be released, and for all future versions. Versions already released remain unaffected by the changes.

If needed, all instances with the same original version are updated to the most recent version and the unused versions of the type are deleted.

## See also

- Releasing all versions within a folder (Page 425)

- Performing a consistency check for a version (Page 421)
- Assigning a version (Page 431)
- Adding types to a global library (Page 428)
- Updating the project to the latest versions (Page 426)

## Releasing all versions within a folder

When you are finished editing all types within a folder, release all versions simultaneously.

## Requirement

- You are in the "Libraries" task card or in the library view.
- The folder includes versions "in test" or "in progress" status.
- All versions "in test" or "in progress" are consistent.  
A consistency check is performed as soon as you start the release. If errors that prevent release occur during the consistency check, a message is displayed indicating how to correct the errors.

## Procedure

To release all type versions within a folder, follow these steps:

1. Right-click the required folder.
2. Select the "Release all" command from the shortcut menu.  
The "Release type version" dialog box opens.
3. If necessary, change the properties of the version:
  - In the "Author" field, enter the editor of the versions to be released.
  - In the "Comment" field, enter a comment on the versions to be released.
4. Select the "Delete all unused type versions from the library" check box to delete all versions from the library that are not connected to any instance in the project. Versions with dependencies on other types or master copies are not deleted.
5. Click "OK" to confirm.

## Result

All type versions "in test" or "in progress" status within the selected folder are released.

The properties are applied for the versions to be released and for all future versions. Versions already released remain unaffected by the changes.

Versions of types not used in the project may be deleted.

### See also

Release versions (Page 423)

### Updating the project to the latest versions

After you have updated several types in the project library, update all instances in the project to the most recent version of the types from the project library. If you do not want to apply the changes to the entire project, restrict the update to individual devices in the project.

Each of the following elements can be selected as source for the update:

- The entire project library
- Individual folders within the project library
- Individual types  
You can select multiple types.

### Requirement

You are in the "Libraries" task card or in the library view.

### Procedure

To update instances in a project with the contents from the project library, follow these steps:

1. Select the entire project library or elements from it.
2. Right-click the required elements and select the "Update > Project" command from the shortcut menu.  
The "Update project" dialog box opens.
3. Select either the entire project or individual devices for the update.
4. Select the options for the update process:
  - The "Update all instances of the affected types" check box is always selected during this process.
  - Select the "Delete all unused versions of affected types" check box to delete all older versions of the updated types from the project library.
5. Click "OK" to confirm.  
The update is performed.

## Result

The following changes were made to the project:

- All older versions were deleted from the project library as needed.
- All instances within the selected devices were updated to the most recent version of the linked types.
- You can find a log of the update process in the projection tree under "Common data".

## See also

Updating the project to the latest type versions (Page 430)

Using logs (Page 299)

Updating a library with the contents of another library (Page 435)

Basics on types (Page 412)

Library basics (Page 383)

State of type versions (Page 414)

## Remove the link between instance and type

Instances of types are always connected to the version of the corresponding types. They cannot be edited like an ordinary object. If you edit the instance, a new version of the type is created automatically in the library and the changes therefore affect the entire project.

If you remove the link between the instance and its type, you then edit the object like an ordinary object in the project tree.

## Requirement

The instance may not be "in test".

## Procedure

To remove the link between instances and their type versions, follow these steps:

1. Select one or more instances in the project tree.
2. Right-click the selection and select the "Terminate connection to type" command from the shortcut menu.
3. The link to the corresponding type versions is removed.

Basics on types (Page 412)

Library basics (Page 383)

State of type versions (Page 414)

### 7.10.8.6 Working with types in global libraries

#### Adding types to a global library

Global libraries are used as a central resource when working on multiple projects. Among the types, only the types in the project library can be edited directly. Therefore, use the project library if you want to work on types. When you are finished editing a type in the project library, you can add the type to a global library. Adding types from the project library corresponds to a normal copy process from the project library.

#### Requirement

- The "Libraries" task card is displayed or the library view is open.
- The global library to which you want to add types is opened and can be written to.

#### Procedure

To add types to a global library, follow these steps:

1. Open the required folder in the global library in the "Libraries" task card or in the library view.
2. Drag one or more types from the project library to the "Types" folder or any subfolder of the global library.

Alternative:

1. Copy the required types from the project library to the clipboard.
2. Open the required global library in the "Global library" palette of the "Libraries" task card.
3. Right-click the "Types" folder or any of its subfolders.
4. Select the "Paste" command in the shortcut menu.

#### Result

The types are inserted in the global library. Dependent types, such as types of HMI user data types or tags, are also copied to the global library, provided they do not already exist there. This ensures that all necessary elements for generating an instance are present in the global library.

If a type already exists in the global library, the described action corresponds to an update of the global library. In this case, the most recent released versions of the types are added to the global library.

#### See also

Basics on types (Page 412)

Release versions (Page 423)

Assigning a version (Page 431)

Updating the project to the latest type versions (Page 430)

Library basics (Page 383)

## Using types

To use the version of a type from the global library, create an instance of the version at a suitable location in the project tree. You can also position faceplates and HMI user data types directly in the editor.

In the project, instances of types from a global library are not linked to the type in the global library. Instead, a copy of the type and its dependent elements is generated in the project library when an instance is pasted into the project. Dependent elements, for example, can be PLC data types that are referenced in a block. In each case, the copy of the type and the dependent elements in the project library contain the version that you link to the instance. If the type or a dependent element already exists in the project library, only the missing version is added when necessary to the type in the project library.

The instance is linked to the type in the project library. You can only assign a type to a device once irrespective of the version.

## Requirement

- The "Libraries" task card is displayed.
- A device which supports the sort of desired type is available in the project.
- The device is not assigned to any further instances of the same type.

## Procedure

To generate and use an instance from a type, follow these steps:

1. In the global library, navigate to the version of the type that you want to use.
2. Drag the required version of the type and drop it at the location where you want to use it.  
Alternative: To automatically use the most recent version, drag the type to the location where you want to use it.

## Result

Missing elements are added to the project library. An instance is generated from the type and its dependent elements and pasted at the location where you want to use it. The instances are connected to the respective version of the type in the project library.

Basics on types (Page 412)

Updating the project to the latest type versions (Page 430)

Library basics (Page 383)

Using the element view (Page 387)

### Updating the project to the latest type versions

In large enterprises with numerous automation projects, the global libraries are frequently edited from a central location. The updated global libraries of the individual projects are made available after the completion of a new version. If you have received a more recent version of a global library, replace the outdated instances in your project with the most recent version. If you do not want to apply the changes to the entire project, restrict the update to individual devices in the project.

The project library is also updated with the new versions of the types in the global library during the updating of the project or individual devices.

The following elements can be selected as source for the updating:

- A global library
- Individual folders within a global library
- Individual types  
You can select multiple types.

### Requirement

- You are in the "Libraries" task card or in the library view.
- The updated global library is open.

### Procedure

To update instances in a project with the contents from a global library, follow these steps:

1. Select the updated global library or the individual elements from it.
2. Right-click the global library or the required elements and select the "Update > Project" command from the shortcut menu.  
The "Update project" dialog box opens.
3. Select either the entire project or individual devices for the update.
4. Select the options for the update process:
  - The "Update all instances of the affected types" check box is always selected during this process.
  - Select the "Delete all unused versions of affected types" check box to delete all older versions of the updated types from the project library.
5. Click "OK" to confirm.  
The update is performed.

## Result

The following changes were made to the project:

- The most recent version of the select types is present in the project library. All older versions were deleted if necessary.
- All instances within the selected devices were updated to the most recent version of the linked types.
- You can find a log of the update process in the projection tree under "Common data".

Updating the project to the latest versions (Page 426)

Using logs (Page 299)

Updating a library with the contents of another library (Page 435)

Basics on types (Page 412)

Library basics (Page 383)

Adding types to a global library (Page 428)

### 7.10.8.7 Assigning a version

A library is more clearly structured if types related by content have the same version number. The identical version number reflects the work progress. When you have completed the work on multiple associated types, you can assign the same version number to these types.

You have the following options to assign a common version to types:

- The entire project library or a complete global library
- One or more folders in a library
- One or more types

## Requirement

- The "Libraries" task card or the library view is open.
- Your selection must not contain types with "in test" or "in progress" status.

## Procedure

To assign several types the same version, follow these steps:

1. Select the types to which you want to assign a common version.
2. Select the "Assign version" command from the shortcut menu.  
The "Assign version" dialog box opens.

3. If necessary, change the properties of the version:
  - In the "Version" field, determine the new version number. The version number must be higher than the highest version number of all selected types.
  - In the "Author" field, enter the person responsible for the version to be released.
  - In the "Comment" field, enter a comment on the version to be released.
4. If you have started the operation within the project library, select the options for the release. The following options cannot be selected in a global library.
  - Select the "Update all instances" check box to update all instances in the project to the new version. Types used in master copies are not updated.
  - Select the "Delete all unused versions from the library" check box to delete all older versions of the types from the project library. The versions are only deleted if they are not assigned to an instance in the project and if they have no dependencies to other types.
5. Click "OK" to confirm.

## Result

The selected type versions are changed as follows:

- A new version of all selected types is created with the specified version number.
- The properties are applied to all selected types, the new version and to all future versions. Lower versions remain unaffected by the changes. If you make no changes to the properties, the properties of the last released version of each type are applied.
- If needed, all instances are updated to the most recent version and the unused versions of all types are deleted from the project library.
- The build number of dependent types is incremented to the next free build number as long as the dependent types were not in your selection. If you had selected a dependent type as well, the version number you specified will be assigned.

A log of the changes is created. If you have versioned the types in the project library, you find the log in the project tree under "Common data > Logs". If you have versioned types in a global library, you find the log in the "Common data > Logs" folder in the level below the global library.

State of type versions (Page 414)

Library basics (Page 383)

Release versions (Page 423)

Adding types to a global library (Page 428)

Using logs (Page 299)

Displaying logs of global libraries (Page 401)

### 7.10.9 Editing library elements

Types, master copies and folder can be cut, copied, pasted, moved, renamed or deleted in the usual way within the "Libraries" task card or the library view. Global libraries must be opened with write permission for each of the above-described processes.

---

**Note****User help for types and master copies**

User help is not affected by any of the operations within the library. When you move a master copy or a type to a different location, you are also moving the associated user help in the file system to the corresponding location.

Additional help on using the user help can be found in the chapter "Conventions for creating user help".

---

#### Copying types

The following rules apply when you copy types to the clipboard:

- Types are always copied to the clipboard with all associated versions. However, only versions that have previously been released are copied.
- Types are always copied to the clipboard with all dependent elements.
- Master copies are always copied to the clipboard with all type versions used in them.

#### Copying and pasting type versions

When you copy type versions to another library, the types must already exist in the target library.

#### Cutting elements

You can only paste previously cut library elements into the same library. In so doing, you can only paste master copies into the "Master copies" folder or any of its subfolders. Likewise, you can only paste types into the "Types" folder or any of its subfolders.

#### Pasting types

Pasting types in a different library corresponds to updating the target library.

The following rules apply when you have pasted a type into a different library:

- A type is always pasted with all its versions.
- If the type already exists in the target library, all versions that are more recent than the existing versions are added to the corresponding types in the target library.
- If there is already a version with released status in the target library, this version is not pasted again.

- If the same version exists with in test or in progress status in the target library, it is replaced by the released version.
- If a type needs other types, these are also added at the respective location.

### Pasting master copies

When you paste master copies, all type versions contained in these copies are also pasted. If the corresponding types already exist in the library, only the missing versions are added to the individual types. If one of the types used does not yet exist, it is pasted at the highest level in the library. The type includes the type version that was used in the master copy.

### Moving elements

When you move an element from one library to another, the element is copied and not moved. The same rules apply as described under "Pasting types" and "Pasting master copies".

### Deleting of types and type versions

Note the following when you delete types or type versions:

- A type or a type version can only be deleted if there are no dependencies to other types.
- When you delete a type, all versions of the type are deleted.
- If you delete all versions of a type, the type is also deleted.
- If you delete a version that has instances in the project, the instances are also deleted from the project.
- If you delete a type that is also stored at the same time as a master copy, the master copy is also deleted.

### Deleting instances

If you delete an instance that has dependencies to other instances, this instance is restored during the next compilation. The instance is then linked again to the original type version. This restores the consistency of the project.

### See also

Library basics (Page 383)

Remove the link between instance and type (Page 427)

Updating a library with the contents of another library (Page 435)

### 7.10.10 Updating a library with the contents of another library

An existing library can be updated with the contents of another library. The following options are available for updating libraries:

- Updating a global library with types from another global library or from the project library
- Updating the project library with types from a global library

Each of the following elements can be selected as source for the update:

- An entire library
- Individual folders within a library
- Individual types

You can select multiple types.

During the update, new versions are added to the types that already exist in the target library. Types that do not yet exist in the target library are copied together with all their versions to the target library.

---

**Note****User help for copying types**

User help is not copied together with a type to another library. You need to copy the user help for types to the corresponding directory.

Additional help on using the user help can be found in the chapter "Conventions for creating user help".

---

**Requirement**

If you want to update a global library, you have to open it with write permission.

**Procedure**

To update a library with the contents of a different library, follow these steps:

1. Select a library or individual elements from a library as source for the update.
2. Right-click the source and select the "Update > Library" command from the shortcut menu. The "Update library" dialog box opens.
3. Select the type of library you want to update:
  - Select "Update the project library" to update the project library with types from a global library.
  - Select "Update a global library" if you want to update a global library.
4. Optional: In the drop-down list, select the global library that you want to update, if you want to update a global library.

5. Select the options for the update:
  - The "Update all instances of the affected types" option is always disabled during this process.
  - Select the "Delete all unused versions of the affected types" check box to delete all older versions of types from the project library if these are not assigned to any instance in the project and if there are no dependencies to other types. This option cannot be selected for the update of a global library, since types of a global library never have a point of use in the project.
6. Click "OK" to confirm.  
The update is performed.

## Result

The following changes were made to the target library:

- Types not yet available in the target library were copied together with all their versions. More recent versions were added to the types that already exist in the target library. If a more recent version of a type already existed in the target library, the latest version was nevertheless copied and automatically assigned a newer version number.
- If needed, all versions of types were deleted from the project library if these were not used in any instance in the project.
- A log listing all performed changes to the target library was created for the update process. If you have updated the project library, you can find the log in the project tree under "Common data > Logs".  
If you have updated a global library, you can find the log in the "Common data > Logs" folder in the level below the global library.

### 7.10.11 Harmonizing names and path structure

You can harmonize the project with a library. This helps you correct the following items:

- Names of the instances:  
Instances can be created during the development phase of a library, the names of which are appended by "\_1", "\_2", etc. due to an automatic correction. This extension is used to prevent duplicate names in the project. During harmonization, the instances once again receive the names of their associated types.
- Path structure:  
The original path structure can be lost due to parallel development or copying of dependent instances. This affects the clarity of the project. During harmonization, the path structure within the project is adapted to the path structure of the library.

#### Procedure

To harmonize the names and the path structure, follow these steps:

1. Open the library management.
2. Click "Harmonize project" in the toolbar.  
The "Harmonize project" dialog box opens.
3. Select the device with which you wish to harmonize the library.
4. Select the "Harmonize paths between project and library" check box if you want to restore the path structure.
5. Select the "Harmonize names between project and library" check box if you want to have the names corrected.
6. Confirm your entries with "OK".

#### Result

Depending on your settings, the names and the path structure in the project are harmonized with the library.

The changes to the project are logged. The log is available under "Common data > Logs" in the project navigation.

#### See also

Library basics (Page 383)

### 7.10.12 Clean up library

You can clean up the project library or global libraries to remove types or versions that are not connected to any instance in the project. This step provides more clarity within the libraries and decreases the size of the library.

#### Cleaning up the project library

To clean up the project library, follow these steps:

1. Open the library management.
2. Click on "Clean up library" in the toolbar.  
The "Clean up project library" dialog box opens.
3. Select the scope in which types or versions are to be deleted:
  - to retain the version with the highest version number, even if this has no instance, select the option "Delete old type versions and retain the newest type version".
  - Select the option "Delete complete types" to delete the complete type if no version is connected to an instance.
4. Confirm your entry with "OK".  
Depending on your selection, either unused type versions or types are removed from the project library.  
The changes are logged. The log is available under "Common data > Logs" in the project navigation.

#### Clean up global library

To clean up a global library, follow these steps:

1. Open the library management.
2. Click on "Clean up library" in the toolbar.  
The "Clean up global library" dialog box opens.
3. Click "Continue".  
Unused type versions are deleted. The latest version of a type is always retained.  
The changes are logged. The log is available in the "Common data > Logs" folder in the level below the global library.

#### See also

- Library basics (Page 383)

## 7.10.13 Comparing library elements

### Introduction

You can compare devices from libraries with devices from both the current project as well as from the same or another libraries or reference projects. Note, however, that reference projects are write-protected. You can also compare instances in a device with their type version in a library. Not all actions are available for the comparison with types. You cannot, for example, overwrite an instance of a newer version with an older type version from the library.

When comparing library elements, you can always switch between automatic and manual comparison.

### Procedure

To compare library elements with the device data of a project, follow these steps:

1. In the project tree, select the device whose data you want to compare to a library element and which allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.  
The compare editor opens and the selected device is displayed in the left area.
3. Open the "Libraries" task card.
4. Select the library element that you want to compare to the device data.
5. Drag the library element into the right drop area of the compare editor.  
You can identify the status of the objects based on the symbols in the status and action area. When you select an object, the object properties and the corresponding object of the assigned device are clearly shown in the property comparison.  
You can drag other devices into the drop areas from the current project, a library or from a reference point at any time to start a new comparison. It does not matter which device you drag into the drop area.

## 7.11 Using cross-references

### 7.11.1 Using cross-references

#### Introduction to cross-references

The cross-reference list provides an overview of the use of objects within the project. You can see which objects are interdependent and where the individual objects are located. Cross-references are therefore part of the project documentation.

You can also jump directly to the point of use of an object.

Which objects you can display and localize in the cross-reference list depends on the installed products.

#### See also

Displaying cross references of an instance (Page 395)

## 7.12 Simulating devices

### 7.12.1 Simulation of devices

#### Introduction

You can use the TIA Portal to run and test the hardware and software of the project in a simulated environment. The simulation is performed directly on the programming device or PC. No additional hardware is required.

The simulation software provides a graphical user interface for monitoring and changing the configuration. It differs according to the currently selected device.

#### Integration in the TIA Portal

The simulation software is fully integrated in the TIA Portal but is only supported by certain devices. Therefore, the button for calling the simulation software is only active if the selected device supports simulation.

The simulation software for some devices requires its own virtual interface to communicate with the simulated devices. The virtual interface can be found in the project tree under the "Online access" entry next to the physical interfaces of the programming device/PC.

Once you have opened the software, additional help on the simulation software is available via a separate link.

**See also**

Starting the simulation (Page 441)

**7.12.2 Starting the simulation**

Some devices can be simulated with additional software. You therefore do not have to have the actual devices to perform comprehensive testing of your project.

**Procedure**

To start the simulation software, follow these steps:

1. Select the device you want to simulate, for example, in the project tree.
2. Select the "Simulation > Start" command in the "Online" menu.  
This calls the simulation software.

Simulation of devices (Page 440)

# Editing devices and networks

## 8.1 Configuring devices and networks

### 8.1.1 Hardware and network editor

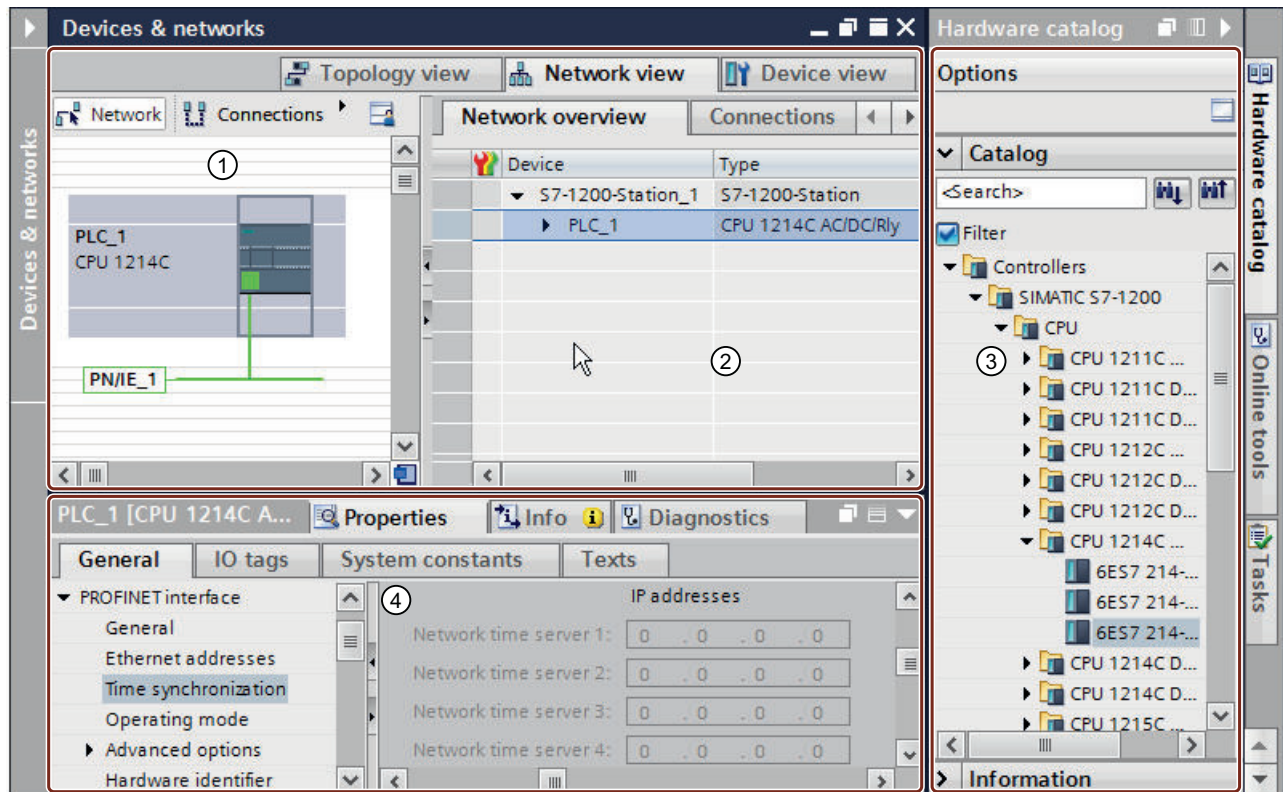

#### 8.1.1.1 Overview of hardware and network editor

#### Function of the hardware and network editor

The hardware and network editor opens when you double-click on the "Devices and Networks" entry in the project tree. The hardware and network editor is the integrated development environment for configuring, networking and assigning parameters to devices and modules. It provides maximum support for the realization of the automation project.

### Structure of the hardware and network editor

The hardware and network editor consists of the following components:

- ① Device view (Page 447), Network view (Page 445), Topology view (Page 450): Graphic area
- ② Device view (Page 447), Network view (Page 445), Topology view (Page 450): Table area
- ③ Hardware catalog (Page 456)
- ④ Inspector window (Page 455)

The hardware and network editor provides you with three views of your project. You can switch between these three views at any time depending on whether you want to produce and edit individual devices and modules, entire networks and device configurations or the topological structure of your project.

Drag the devices and modules you need for your automation system from the hardware catalog to the network, device or topology view.

The inspector window contains information on the object currently marked. Here you can change the settings for the object marked.

### 8.1.1.2 Network view

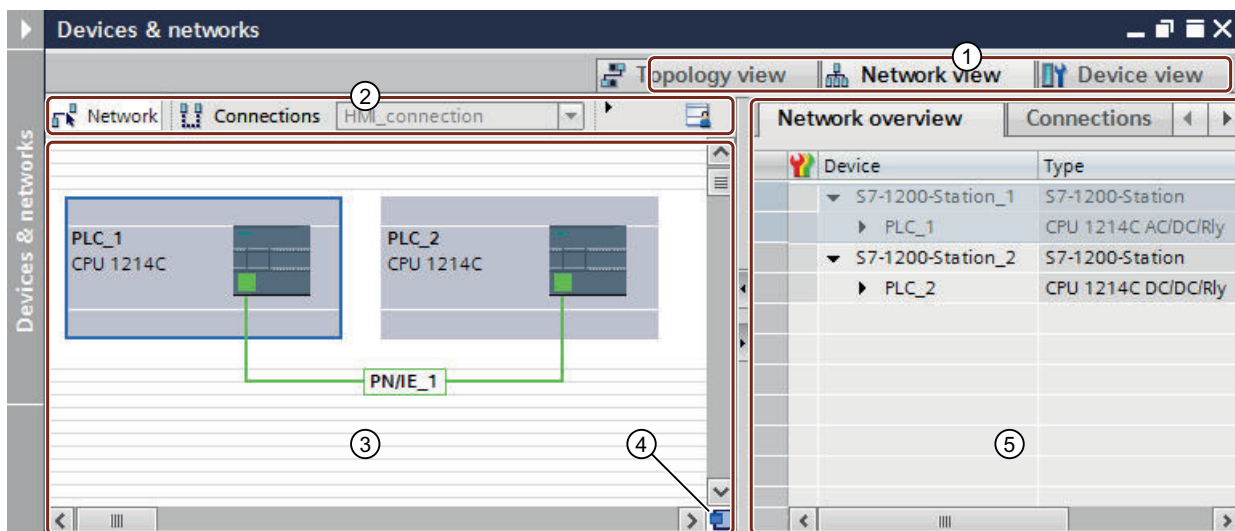

#### Introduction

The network view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Configuring and assign device parameters
- Networking devices with one another

#### Structure

The following diagram shows the components of the network view:

- ① Changeover switch: device view / network view / topology view
- ② Toolbar of network view
- ③ Graphic area of network view
- ④ Overview navigation
- ⑤ Table area of network view

You can use your mouse to change the spacing between the graphic and table areas of the network view. To do this, click between the graphic and the table areas and change the spacing by moving the divider to the left or right while keeping the mouse button pressed. The Speedy Splitter (the two small arrow keys) allows you to use a single click to minimize the table view, maximize the table view or restore the last selected split.

## Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Mode to network devices.
	Mode to create connections. You can use the adjacent drop-down list to set the connection type.
	Mode to create relations.
	Show interface addresses.
	Adjust the zoom setting. You can use the adjacent drop-down list to select or directly enter the zoom setting. You can also zoom in or zoom out the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
	Show page breaks Enables page break preview. Dotted lines are displayed at the positions where the pages break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

## Graphic area

The graphic area of the network view displays any network-related devices, networks, connections and relations. In this area, you add devices from the hardware catalog, connect them with each other via their interfaces and configure the communication settings.

## Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

## Table area

The table area of the network view includes various tables for the devices, connections and communication settings present:

- Network overview
- Connections
- Relations
- I/O communication
- VPN

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

## **See also**

### **8.1.1.3 Device view**

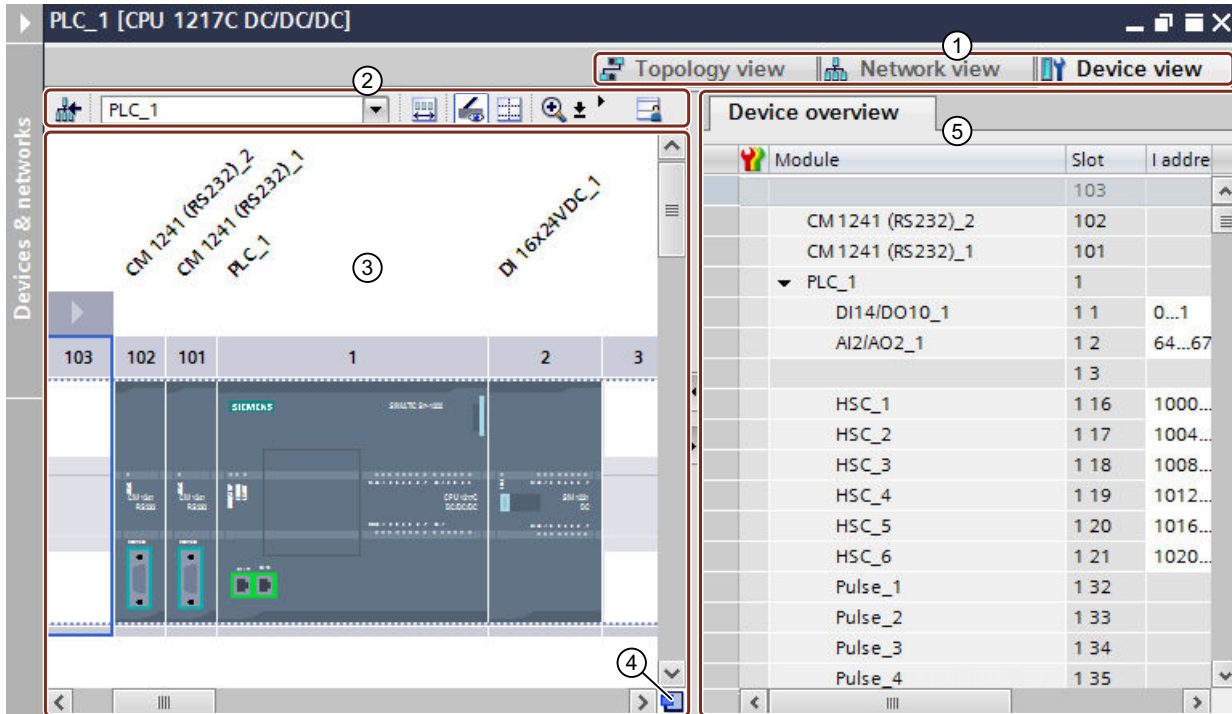

#### **Introduction**

The device view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Configuring and assign device parameters
- Configuring and assign module parameters

### Structure

The following diagram shows the components of the device view:

- ① Changeover switch: device view / network view / topology view
- ② Toolbar of device view
- ③ Graphic area of the device view
- ④ Overview navigation
- ⑤ Table area of device view

You can use your mouse to change the spacing between the graphic and table areas of the device view. To do this, click between the graphic and the table areas and change the spacing by moving the divider to the left or right while keeping the mouse button pressed. The Speedy Splitter (the two small arrow keys) allows you to use a single click to minimize the table view, maximize the table view or restore the last selected split.

### Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Switches to the network view. Note: The device view can switch between the existing devices using the drop-down list.
	Show the area of unplugged modules.
	Show module labels.

Icon	Meaning
	Adjust the zoom setting. You can use the adjacent drop-down list to select or directly enter the zoom setting. You can use the Zoom icon to zoom in or out incrementally or to drag a frame around an area to be enlarged. With signal modules, you can recognize the address labels from a zoom level of 200% or higher.
	Show page breaks Enables page break preview. Dotted lines are displayed at the positions where the pages break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

## Graphic area

The graphic area of the device view displays hardware components and if necessary the associated modules that are assigned to each other via one or more racks. In the case of devices with racks, you have the option of installing additional hardware objects from the hardware catalog into the slots on the racks.

## Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

## Table area

The table area of the device view gives you an overview of the modules used and the most important technical and organizational data.

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

## See also

Layout of the user interface (Page 245)

Displaying diagnostics status and comparison status using icons (Page 1145)

### 8.1.1.4 Topology view

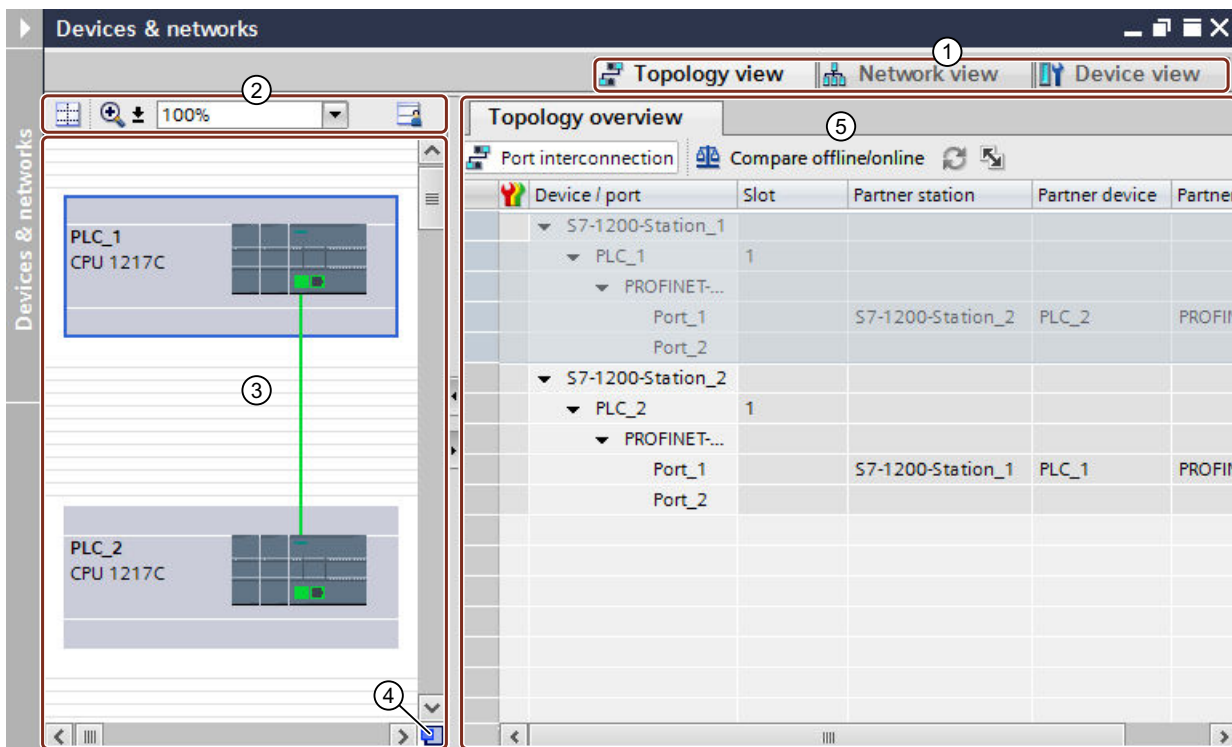

#### Introduction

The topology view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Displaying the Ethernet topology
- Configuring the Ethernet topology
- Identifying and minimizing differences between the desired and actual topology

#### Structure

The following figure provides an overview of the topology view.

- ① Changeover switch: device view / network view / topology view
- ② Topology view toolbar
- ③ Graphic area of the topology view
- ④ Overview navigation
- ⑤ Table area of the topology view

You can use your mouse to change the spacing between the graphic and table areas of the topology view. To do this, click between the graphic and the table areas and change the spacing by moving the divider to the left or right while keeping the mouse button pressed. The Speedy Splitter (the two small arrow keys) allows you to use a single click to minimize the table view, maximize the table view or restore the last selected split.

## Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Adjusting the zoom setting. You can use the adjacent drop-down list to select or directly enter the zoom setting. You can also zoom in or zoom out the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
	Show page breaks Enables page break preview. Dotted lines are displayed at the positions where the pages break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

## Graphic area

The graphic area of the topology view displays Ethernet modules with their appropriate ports and port interconnections. Here you can add additional hardware objects with Ethernet interfaces. See: Adding a device to the hardware configuration (Page 473)

## Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

## Table area

This displays the Ethernet or PROFINET modules with their appropriate ports and port interconnections in a table. This table corresponds to the network overview table in the network view.

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

## See also

Layout of the user interface (Page 245)

Displaying diagnostics status and comparison status using icons (Page 1145)

### 8.1.1.5 Overview of settings for hardware configuration

You can make some settings for the hardware configuration in the settings of the TIA Portal.

## Overview

The following table provides an overview of the settings for the hardware configuration:

Group	Setting	Description
Information on product support	Deactivated	Prevents access to the Siemens Industry Online Support
	Via Internet	Enables access to product information about individual devices in the hardware catalog via the Internet.
Topological overview	Temporarily assigning an IP address	Assigns a temporary IP address for topology discovery if a device does not have a valid IP address. Topology information (LLDP) cannot be read from a device without valid IP address.
	Show a warning if the option is activated	Shows a warning when a temporary IP address is assigned to a device during topology discovery.
Compiling	Download module comment	Transfers any existing comments in addition to the hardware configuration when loading the hardware configuration to the device. The comment is available after the device is loaded to a programming device.

**See also**

Changing the settings (Page 244)

**8.1.1.6 Printing hardware and network configurations**

**Printout of hardware and network configurations**

You can print out the following elements of the hardware and network view as part of the project documentation:

- Graphic network view
- Network overview table
- Graphic device view
- The device overview table
- The parameters of the object currently selected in the editor

**Printout of editor content**

If you start a printout within an opened editor and no module is selected, the content of the editor is always printed. This includes a graphic representation of the editor as well as the table for the editor. You can adapt the scope of the printout. You can specify whether only the graphic view, the table or both together are to be printed. Read section "Changing the print options (Page 454)" for more on this.

If the graphic is larger than the page layout you have selected, the printout is continued on the next page. No content is lost this way. Alternatively, you can change the zoom level of the graphic representation to fit the printout on one page. The printout is always made in the currently selected zoom setting.

To check that all content fits on one page, you can either use the print preview or activate the page break preview. When page break preview is activated, dashed lines are displayed within the graphic editor at the location where the page break is later made.

### Printing very large tables

If a table is larger than the print area and therefore cannot be fully printed, the content of the table is not printed as a table, but instead as pairs between value and key.

Example:

Object name	Property 1	Property 2
Object A	Value A1	Value A2
Object B	Value B1	Value B2

In this case, the printout has the following appearance:

#### Object A

Property 1: Value A1

Property 2: Value A2

#### Object B

Property 1: Value B1

Property 2: Value B2

You can also preset this as a template so that tables are always printed as pairs between the key and the value. Read section "Changing the print settings (Page 350)" for more on this.

### Printing module parameters

Parameters of selected modules are printed out along with the current value settings in text form. All parameters from corresponding modules are also printed. For example, if you have selected a CPU, the parameters of an inserted signal board, if present, are printed as well.

You can determine the scope of the module parameters to be printed. In the "Print" dialog, select whether all properties and parameters of a module are to be printed or whether to use the compact printout. If you select the compact form, only the entries in the "General" area of the module properties are printed. Comments on modules, as well as the author and module description, are excluded. In compact mode, the following module parameters are therefore printed, for example:

- Module specifications  
Name, module slot, short description, order number, firmware version
- Name of the PROFINET interface
- Subnet specifications  
Name of the subnet, ID of the S7 subnet

## See also

- Changing the print options (Page 454)
- Documentation settings (Page 348)
- Creating a print preview (Page 362)
- Printing project data (Page 365)
- Activating the page break preview for printout (Page 454)

### 8.1.1.7 Activating the page break preview for printout

You can activate the page break preview for the printout in the graphic editor. If this option is activated, dashed lines are shown within the graphic editor at the locations where page breaks are later made during printout.

#### Procedure

Proceed as follows to activate the page break preview:

1. Select the graphic area of the corresponding view.
2. Click on the "Show page break" symbol in the toolbar of the graphic editor.  
Dashed lines are displayed within the graphic editor at the location a page break is later made.
3. To modify the frame layout, select the "Print" command in the "Project" menu.
4. To disable page break preview, click again on the "Show page break" symbol in the toolbar of the graphic editor.

### 8.1.1.8 Changing the print options

#### Changing the scope of the printout

When printing from an editor, you can specify whether both graphics and tables are to be printed or just one of the two. Both are printed by default.

#### Procedure

To change the scope of the printout, proceed as follows:

1. In the "Options" menu, select the "Settings" command.
2. In the area navigation, open the "Print settings" parameter group under "General".
3. Scroll to the "Hardware configuration" group.
4. Select or clear the "Active graphic view" check box, depending on whether you want to print the graphics of the network and device view as well.
5. Select or clear the "Active table" check box, depending on whether you want to print the table for the editor as well.

## See also

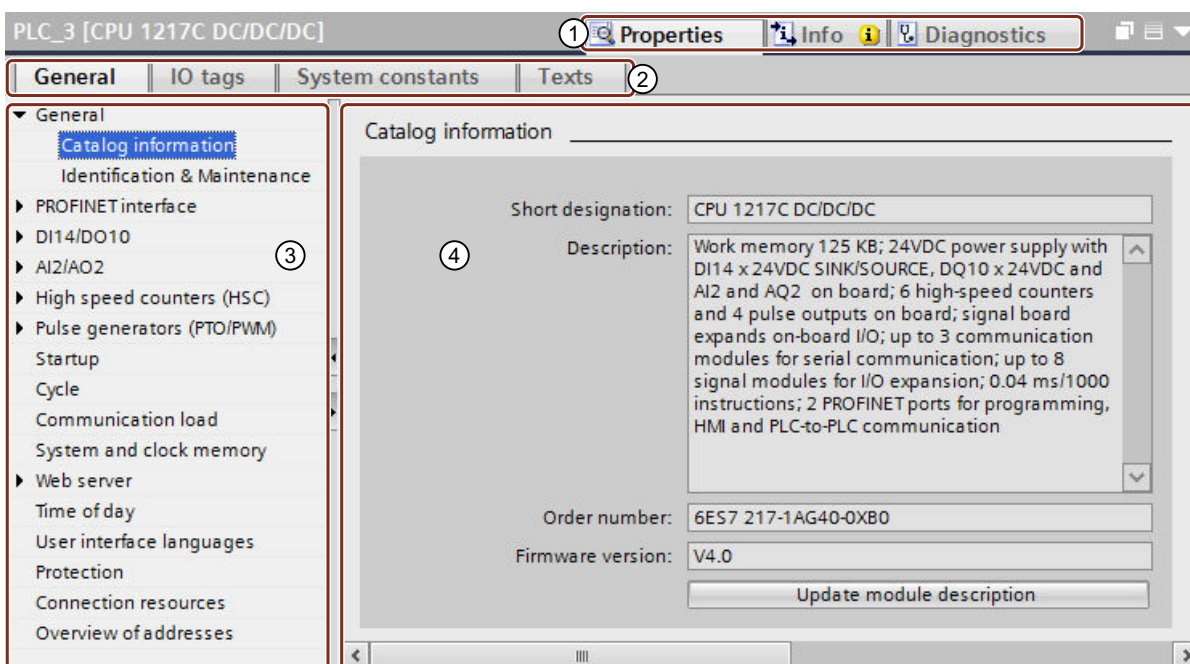

Printing hardware and network configurations (Page 452)

### 8.1.1.9 Inspector window

The properties and parameters shown for the object selected can be edited in the Inspector window.

## Structure

The Inspector window consists of the following components:

- ① Switch between various information and work areas
- ② Switch between various tabs of the information and work areas
- ③ Navigation between various pieces of information and parameters
- ④ Display showing the selected information and parameters

## Function

The information and parameters in the Inspector window are split into different types of information:

- Properties
- Info
- Diagnostics

To display the corresponding information and parameters, click in the relevant area. The "Properties" area is the most important one for configuring an automation system. This area is displayed by default and contains various tabs:

- **General:** Display the properties and settings of the device or module. Here you can edit the settings and parameters. The left pane of the Inspector window is used for area navigation. Information and parameters are arranged there in groups. If you click on the arrow symbol to the left of the group name, you can expand the group if sub-groups are available. If you select a group or sub-group, the corresponding information and parameters are displayed in the right pane of the Inspector window and can be edited there too.
- **IO tags:** Display the IO tags of the PLC. You can assign names for the tags, assign the tags to the user-defined tag tables via a drop-down list, and enter comments for the tags. The IO tags are also shown in the PLC tag table.
- **System constants:** Display the constants required by the system with the HW IDs of the modules. The system constants are also shown in the PLC tag table.
- **Texts:** Display the reference language and specify the text source for the project texts.

## **See also**

Editing properties and parameters (Page 481)

Overview of hardware and network editor (Page 443)

Translating text associated with individual objects (Page 312)

Project text basics (Page 308)

Addressing modules (Page 723)

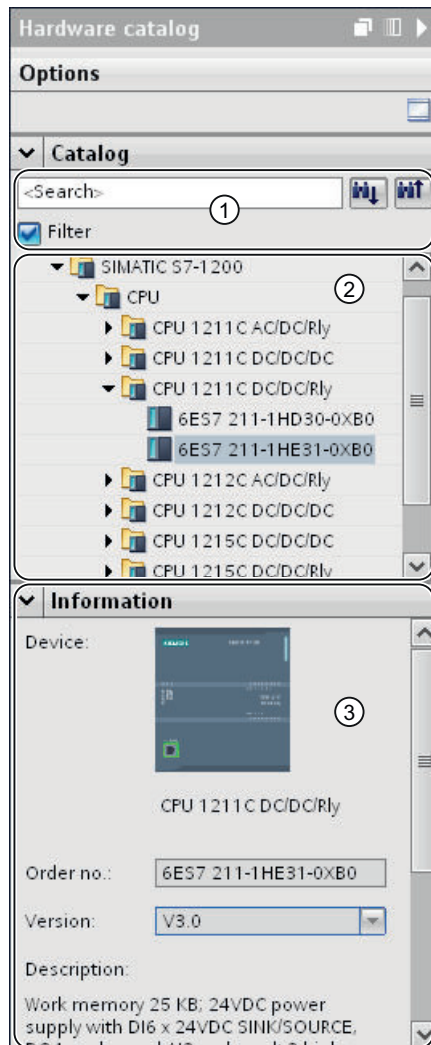

### **8.1.1.10 Hardware catalog**

The "Hardware catalog" task card gives you easy access to a wide range of hardware components.

## Structure

The "Hardware catalog" task card consists of the following panes:

- ① "Catalog" pane, search and filter function
- ② "Catalog" pane, component selection
- ③ "Information" pane

## Search and filter function

The search and filter functions of the "Catalog" pane make it easy to search for particular hardware components. You can limit the display of the hardware components to certain criteria using the filter function. For example, you can limit the display to objects that you can also place within the current context or which contain certain functions.

Objects that can be used in the current context include, for example, interconnectable objects in the network view or only modules compatible with the device in the device view.

## **Component selection**

The component selection in the "Catalog" pane contains the installed hardware components in a tree structure. You can move the devices or modules you want from the catalog to the graphic work area of the device or network view.

Installed hardware components without a license are grayed out. You cannot use non-licensed hardware components.

Hardware components belonging to various components groups thematically are partially implemented as linked objects. When you click on such linked hardware components, a catalog tree opens in which you can find the appropriate hardware components.

## **Information**

The "Information" pane contains detailed information on the object selected from the catalog:

- Schematic representation
- Name
- Order number
- Version number
- Description

## **See also**

Browsing the hardware catalog (Page 465)

Overview of hardware and network editor (Page 443)

### **8.1.1.11 Enabling product support**

For each device in the hardware catalog, you have the option of displaying additional information that is stored in the Siemens Industry Online Support. By default, the function is disabled. Instructions for enabling the function are given below.

## **Requirement**

The TIA Portal has access to the Internet.

## **Procedure**

To enable access to Siemens Industry Online Support, follow these steps:

1. In the "Options" menu, select the "Settings" command.
2. Open the "Hardware configuration" group in the area navigation.
3. Select the "Via Internet" check box.

## Result

You can access product support, FAQs and manuals in the hardware catalog via the shortcut menu for the module.

## See also

Displaying product support for hardware components (Page 459)

### 8.1.1.12 Displaying product support for hardware components

In the hardware catalog, you have direct access to information that is stored for each module in Siemens Industry Online Support. You can jump directly to the following pages in Siemens Industry Online Support:

- Information on product support
- FAQs
- Manuals

## Requirement

- You have access to the Internet.
- Access to product support is enabled in the settings of the TIA Portal.  
For information on how to enable the function, refer to section "Enabling product support (Page 458)".

## Procedure

To display the information for a particular module in Siemens Industry Online Support, follow these steps:

1. Navigate to the required module in the hardware catalog.
2. Right-click the module.
3. Select one of the following entries in the shortcut menu:
  - Information on product support
  - FAQs
  - Manuals

## Result

The default browser set in the operating system is opened and the relevant page in the Siemens Industry Online Support is loaded.

## See also

Enabling product support (Page 458)

### 8.1.1.13 Keyboard operation: Navigation in the editor

You can use shortcut keys in the network and device view to navigate between the components of the hardware and network editor and its objects.

#### Navigating between elements and functions

Function	Shortcut keys
Switch to the next lower selection level You can for example, use <Return> to switch from a selected rack to the lower selection level of the devices and modules that are snapped onto it. If a device is selected, you can use <Return> to switch to the lower selection level of the interfaces that are displayed on the device.	<Return>
Switch to the next higher selection level You can use <Esc>, for example, to switch from a selected interface to the higher selection level of the devices and modules. If a device is selected, you can use <Esc> to switch to the higher selection level of the rack.	<Esc>
Navigation between objects in the current selection level You can use the arrow keys to switch between the objects within a current selection level. To change the selection level, use the <Return> or <Esc> keys.	<Up arrow> <Down arrow> <Right arrow> <Left arrow>
Switches to the device view	<Ctrl+Shift+D>
Switches to the network view	<Ctrl+Shift+N>
Switches to the topology view	<Ctrl+Shift+T>
Switch between editor elements Use the <Tab> key to switch from one editor element to the next element. Use <Shift+Tab> to switch to the previous element. You can switch, for example, between the graphical view, Speedy Splitter, table view or underlying tabs.	<Tab> <Shift+Tab>
Switch between tabs Use the <Ctrl+Tab> keys to switch from one tab to the next tab on the right. Use <Ctrl+Shift+Tab> to switch to the next tab to the left. You can use these keys, for example, to switch between the device view, the network view and the topology view.	<Ctrl+Tab> <Ctrl+Shift+Tab>

#### Opening elements and functions

Function	Shortcut keys
Opening the online and diagnostics view When a device is selected, <Ctrl+D> opens the online and diagnostics view for the selected device.	<Ctrl+D>
Opening the download to device dialog When a device is selected, <Ctrl+L> opens the advanced download dialog.	<Ctrl+L>
Add new device <Ctrl+N> opens the dialog for adding a new device.	<Ctrl+N>
Opens the "Hardware catalog" task card	<Ctrl+Shift+C>
Opens "Online Tools" task card	<Ctrl+Shift+O>

**See also**

Keyboard operation in the TIA Portal (Page 276)

**8.1.1.14 Keyboard operation: Editing objects**

You can execute some of the functions of the network and device view directly with a combination of keyboard and mouse in the hardware and network editor. The keyboard operation in tables (Page 276) corresponds to standard characteristics. Here you find the keyboard operation for the graphic work area of the network and device view.

**General keyboard operation**

<b>Function</b>	<b>Shortcut keys</b>
Zoom in on view in frame Drag a frame in the graphical view in order to correspondingly change the size of the view.	<Ctrl+Space> + pressed mouse button
Move view Move the mouse pointer in order to move the view.	<Space> + pressed mouse button
Cancel current operation	<Esc>
Separate connection Use <Esc> or a double-click to exit connection mode when dragging a connection.	<Esc> or double-click
Zoom in graphic view The enlargement or reduction depends on the direction of rotation.	<Ctrl> + turn mouse wheel

**Selected objects**

<b>Function</b>	<b>Shortcut keys</b>
Select object	Mouse click
Cut an object The selected object is copied to the clipboard and deleted from the graphical view.	<Ctrl+X>
Copy object The selected object is copied to the clipboard.	<Ctrl+C>
Paste object The object from the clipboard is inserted into the selection.	<Ctrl+V>
Delete selected object	<Del>
Select several objects 1 You can add several objects to the selected objects by clicking on them individually. Alternatively, you can use <Shift> + pressed mouse key to drag a frame around the objects that are to be selected.	<Shift> + click
Select several objects 2 You can add several objects to the selected objects by clicking on them individually. Alternatively, you can use <Shift> + pressed mouse key to drag a frame around the objects that are to be selected. When holding down the <Ctrl> key, you can use a mouse click to deselect selected objects.	<Ctrl> + click

Function	Shortcut keys
Move selection When the mouse button is pressed, you can drag devices or modules to allowed slots on a rack.	Mouse button pressed
Copy selection Using <Ctrl> + pressed mouse button you can drag devices and modules to allowed slots on a rack. This copies the devices or modules.	<Ctrl> + pressed mouse button

## 8.1.2 Configuring devices

### 8.1.2.1 Basics

#### Introduction to configuring hardware

To set up an automation system, you will need to configure, assign parameters and interlink the individual hardware components. The work needed for this is undertaken in the device and network view.

#### Configuring

"Configuring" is understood to mean arranging, positioning, and networking devices and modules within the device or network view. Racks are represented symbolically. Just like "real" racks, they allow you to plug in a defined number of modules.

An address is automatically assigned to each module. The addresses can be subsequently modified.

When the automation system is started, the CPU compares the configuration that is preset by the software with the actual configuration of the system. Possible errors can be detected and reported straight away.

#### Assigning parameters

"Assigning parameters" is understood to mean the setting of properties of the components used. Parameter assignment is carried out for hardware components and for data exchange settings:

- Properties of modules with assignable parameters
- Settings for data exchange between components

The parameters are loaded to the CPU and transferred to the corresponding modules when the CPU starts up. Modules can be replaced with ease since the assigned parameters are automatically loaded into the new module during startup.

## **Adjusting the hardware to the project requirements**

You need to configure hardware if you want to set up, expand or change an automation project. To do this, add hardware components to your configuration, connect them to existing components, and adapt the hardware properties to the tasks.

The properties of the automation systems and modules are preset in such a way that in many cases there is no need for additional parameter assignment. Parameter assignment is however needed in the following cases:

- You want to change the default parameter settings of a module.
- You want to use special functions.
- You want to configure communication connections.

## **See also**

Changing properties of the modules (Page 1028)

## **Using existing configurations**

### **Open existing projects**

When opening existing projects, an automatic check is made to determine if the appropriate software is installed for all modules used within the project. If you try to open a project with modules that are not supported by the current scope of the installation of the TIA portal, a message appears on opening the project informing you of the missing software components. If the software components are not absolutely required to open the project, the project can still be opened.

## Reaction to missing software components

Projects that contain modules not supported by the current scope of the installation react as follows:

- Display the modules on the GUI
  - The non-supported modules are displayed in the project navigation with all of their nested objects. However, the modules themselves cannot be processed in editors or in inspector windows. When possible, a replacement module is used that best matches the original module. Replacement modules are indicated by an exclamation mark.
  - Display of properties in tables is limited. This applies in particular to the display of network parameters, such as the IP address.
- Functional limitations
  - Non-supported modules cannot be printed out or compiled.
  - An online connection cannot be established to the module. It is therefore also impossible to download.
  - To change the device type, the device must first be deleted and then re-inserted. The "Change device type" function is not supported.
  - Copying and inserting nested objects, such as modules, is possible although the device itself cannot be copied and inserted.
  - The network configuration cannot be changed with replacement modules within the network view.
  - Cross-references can be displayed. However, the cross-references only reflect the state last saved within the project because an online comparison to the original module cannot be made.

## See also

Opening projects (Page 302)

## General slot rules

### Introduction

Specific slot rules apply to each automation system and module.

If you select a module from the hardware catalog in the device view, all possible slots for the module selected are marked in the rack. You can only drag modules to marked slots.

If you insert, move or swap a module, the slot rules are also applied.

### Consistency

Some slot rules depend on how the environment is configured. This means that you can sometimes plug modules into the rack although this would result in inconsistencies at the current time. If you change the configuration, for example by selecting different modules or module parameter settings, you can make the configuration consistent again.

In cases where inserting a module results in an inconsistency that can be corrected, this will be permitted. A consistency check is run when the configuration is compiled. Inconsistencies are displayed as alarms in the Inspector window under "Info". Based on the result of the consistency check, you can revise your configuration and make it consistent again.

## Rules for arranging modules

The following rules apply generally to modules in racks:

- You can only plug modules into a rack.
- You can only plug interface modules into a module.
- You can only use modules of the same product or system family in one rack.

There are also other special rules for some modules:

- Can only be inserted in certain slots
- Insertion depends on other modules, CPUs or settings
- Limited number of uses in a rack

## Browsing the hardware catalog

### Introduction

Use the "Hardware catalog" task card to select the hardware components you want for a hardware configuration. Use the hardware catalog to select the interconnectable hardware components in the network and topology view and to select the modules you want in the device view.

### Context filter

You can use the "Filter" option of the hardware catalog to restrict the number of displayed hardware components and the number of hardware components that can be found by searching.

If you select the filter, only those components are displayed that can be selected currently in the hardware catalog. If the do not select the filter, the entire hardware catalog is displayed.

If you switch between the various views, the view of the filter objects is adapted to the current context.

### Search options

You can use the search function to search for specific entries in the hardware catalog. Note the following rules when entering search terms:

- No distinction is made between upper and lower case text.
- Dashes and blanks are ignored during the search.
- The search function considers parts of a search term.
- Several search terms must be separated by a space

You start the search from an object highlighted in the hardware catalog and either search upwards or downwards.

Symbol	Meaning
	Downwards search
	Upwards search

### Browsing the hardware catalog

If you want to browse the hardware catalog, proceed as follows:

1. Click in the entry field of the search function
2. Enter a search term. The search includes the following elements:
  - Name of device or module
  - Order number (MLFB)
  - Description in "Information" pane
3. Click on either the "Downwards search" or "Upwards search" buttons.

---

#### Note

To ensure the right search direction, note which point you have marked in the hardware catalog. To browse the entire catalog, click on the topmost object of the hardware catalog and start the search once you have entered the search term by clicking "Downwards search".

The first match with the search term found is displayed as the result. For more search results, again click on the "Downwards search" or "Upwards search" button.

Observe the context filter of the hardware catalog. If this is selected, the search in the hardware catalog is restricted to the displayed inserted hardware components.

---

### See also

Hardware catalog (Page 456)

### Working with racks

#### Introduction

To assign modules to a device, you need a rack, for example a mounting rail. Secure the modules on the rack and connect these via the backplane bus with the CPU, a power supply or other modules.

## Creating a rack

If you insert a device in the network view, a station and a rack suitable for the device selected are created automatically. The rack and slots available are displayed in the device view. The number of slots available again depends on the type of device used.

## Rack structure

A rack always contains the device that has been inserted in the network view. The device is permanently assigned a slot which will depend on the type of device in question. There are additional slots on the right of the device and, if necessary, on left of the device; slot numbers are located above slots in which devices are plugged.

A corresponding short description is displayed above the plugged devices and modules. You show or hide this short description via the toolbar under "View" with the command "Display module titles" or the corresponding symbol in the toolbar of the device view (Page 447).

Symbol	Meaning
	Show module titles

When modules are selected in the hardware catalog, all the slots permitted for this module are marked. This allows you to see immediately the slot into which the selected module can be inserted.

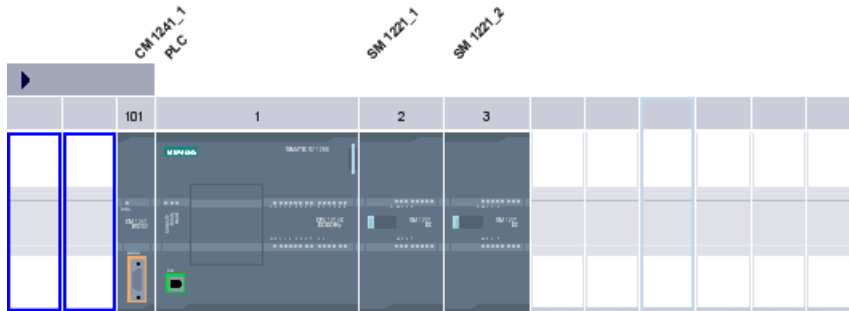

In the following screenshot, a signal module has been selected in the hardware catalog for a partially filled S7-1200 rack:

Since slots 101-103 are reserved for communications modules, only the other free slots are shown as available slots.

You can expand and collapse the front group of slots using an arrow symbol above the expandable slot. When the group of slots is collapsed, the first and last of the group's slot numbers are displayed.

The following figure shows the expanded slot group:

Groups of slots into which modules have already been plugged cannot be collapsed.

### Multiple selection of modules and slots

There are various ways of selecting several modules or slots:

- By pressing <Shift> or <Ctrl>, you can select several modules or slots at the same time.
- Click outside the rack and then hold the mouse button and drag a frame to include the modules or slots you want to select.

### Objects in the device view

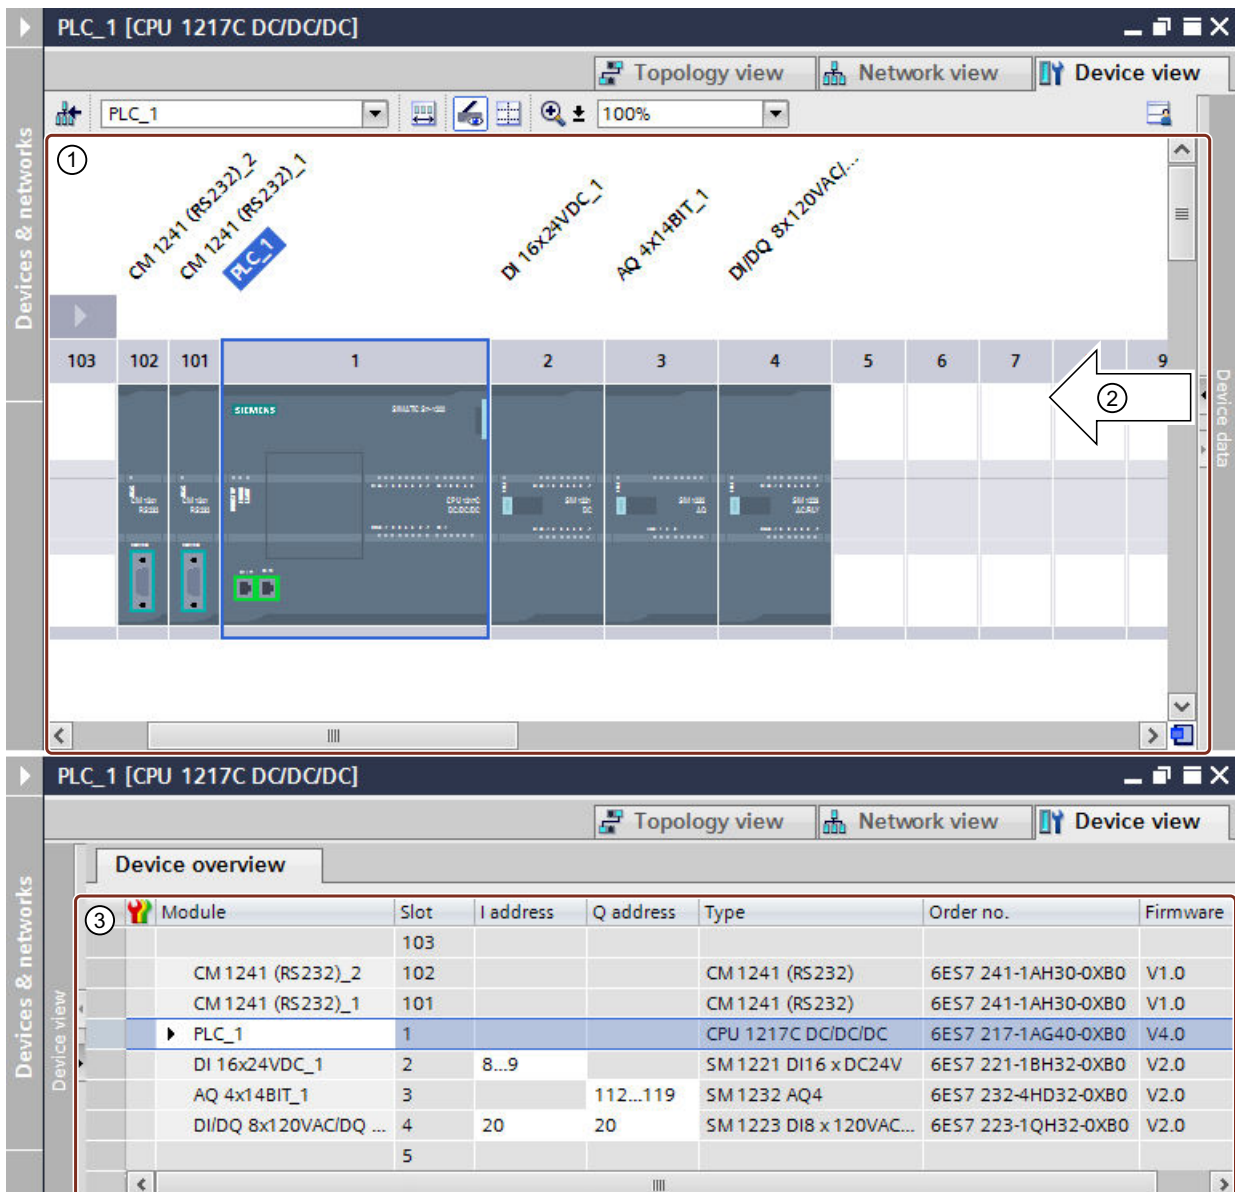

A graphic display of the rack and the devices plugged into it is shown in the left area of the device view. You can see the device overview in the right area of the device view. The device overview is a table showing you the most important information about the modules inserted in the rack. Both areas are displayed in a window. The size of both areas is adjusted using a divider. You can also use it to display one or the other area in full or to hide them.

### Structure and content of device view

The offline configuration of the devices in the rack are displayed in the graphic device view. This is a symbolic representation of the configuration on the real rack.

The rack configuration is displayed as a table in the device view. Each line in the table contains the information for assigning a slot.

The following screenshot shows the device view with the configuration of a SIMATIC S7-1200 CPU.

- ① Graphic view of the allocation of the rack by the CPU and various modules in slots 1 to 4, as well as 101 and 102.
- ② You can use the divider to adjust the proportion of the device view between the left area (graphic view) and the right area (device overview). If you click on the arrows, you can quickly switch the division of the separate areas.
- ③ Device overview with a tabular representation of the slots of the rack and the plugged components.

Each line in the device overview represents one slot. The key information for each slot is displayed in the various columns:

Column	Meaning
Module	Name of module, can be edited in any way
Slot	Slot number
I address	Input address area, can be edited in any way
Q address	Output address area, can be edited in any way

Column	Meaning
Type	Catalog name of module
Order no.	Module order number
Firmware	Firmware version of module
Comments	Optional comments

**See also**

Device view (Page 447)

**Area for unplugged modules**

In some cases, the modules for a hardware configuration are not assigned a slot for short periods. Such unplugged modules are moved to the area of unplugged modules, a special area in the device view.

**Adding modules to the storage area**

The modules that, for example, should be assigned to a device using a copy action but for which the corresponding rack does not have a free compatible slot, are moved automatically into the area of unplugged modules.

Under the following conditions, modules are automatically added to the area of unplugged modules:

- In the network view, a module is moved to a device but the rack does not have a compatible free slot.
- In the device view, a module is moved or copied from the rack, the hardware catalog or the project tree straight into the storage area.

CPs and FMs that occupy a network resource can be moved into the area of unplugged modules but will lose the network resources they have been assigned.

You can add modules to the area of unplugged modules by means of drag-and-drop, for example. To do this, the area must be opened.

**Using the area of unplugged modules**

Use the corresponding button to open the area of unplugged modules.

You can find the area of unplugged modules in the device view.

You open the area of unplugged modules with the respective icon in the toolbar of the device view (Page 447).

Icon	Meaning
	Open area of unplugged modules

---

**Note**

To free up slots, move modules from your configuration into the storage area and plug the modules you want from the storage area into the freed up slots.

You can use this approach to temporarily move modules whose parameters have already been assigned out of the configuration without deleting them.

---

### Treatment of modules in the storage area

The following rules apply to modules in the storage area:

- The modules appear in the project tree under the corresponding device in the "Local modules" folder.
- The modules retain all settings and parameters previously assigned.
- The modules are not taken into account during loading to a target system. This means that a consistency check is not undertaken for modules in the area of unplugged modules.
- Using the context menu, the modules can be copied, cut, or deleted, for example.

### 8.1.2.2 Configuring individual devices

#### Selecting a CPU

##### Introduction

Select a CPU from the hardware catalog and place it, together with a rack, in the network view. On this device drag the desired modules from the hardware catalog; they are arranged automatically on the rack.

##### Selecting the components in the hardware catalog

Each hardware component is displayed as a folder in the hardware catalog. When you open this folder you will see the different versions of the selected hardware component with its respective order numbers.

There will be an example of how to set up a CPU with a rack in network view.

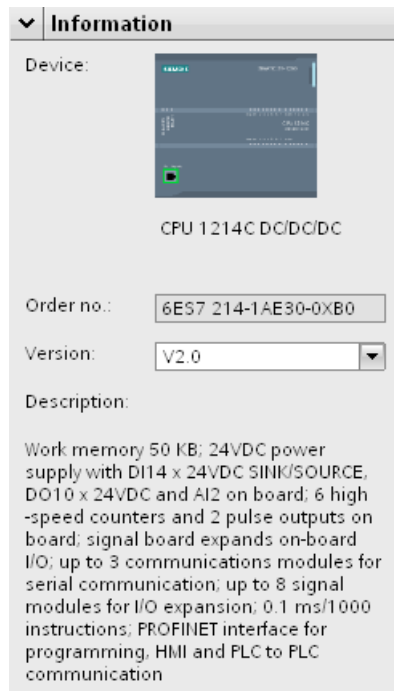

##### Requirement

- The hardware catalog is open.
- You must be in the network view.

## Procedure

To select a CPU from the hardware catalog, proceed as follows:

1. In the hardware catalog navigate to the folder with the desired CPUs.
2. Open the folder with the desired CPU type; you will see all order numbers for the selected CPU type.
3. Click on a CPU order number to get information about the selected CPU under "Information" pane.

4. Set up the CPU and a rack. You have the following options:
  - Use drag-and-drop to drag the CPU from the hardware catalog into network view.
  - Use Copy & Paste to copy the CPU to the network view.
  - Double-click the CPU entry in the hardware catalog.

## See also

Browsing the hardware catalog (Page 465)

Adding a device to the hardware configuration (Page 473)

Inserting a module into a rack (Page 475)

Working with racks (Page 466)

Creating an unspecified CPU (Page 474)

## Adding a device to the hardware configuration

### Introduction

There are various ways of adding a connectable device from the hardware configuration in the network view and the topology view:

- Command "Add new device" in the project tree
- Double-click device in hardware catalog
- Drag-and-drop from the hardware catalog in network view or in topology view:
  - Text entry from the "Catalog" pane
  - Preview graphic from the "Information" pane
- "Add > Device" command from menu bar in network view or topology view
- Shortcut menu of a device in the hardware catalog for copying and pasting

A suitable rack is created along with the new device. The selected device is inserted at the first permitted slot of the rack.

Regardless of the method selected, the added device is visible in the project tree and the network view of the hardware and network editor.

### Adding device using the project tree

To use the project tree to add a device to the hardware configuration, proceed as follows:

1. Click on the command "Add new device" in the project tree.  
The "Add new device" dialog box opens.
2. Display the required device in the tree structure:
  - Go to required device in the tree structure.
  - Enter a device name in the entry field.
3. Select the required device from the tree.  
More information about the device presently selected is displayed on the right-side of the dialog box.
4. If necessary, set the firmware version using the drop-down list in the dialog box.
5. Select the "Open device view" check box if you want to change to the device view immediately after adding the device.  
There you can immediately continue with device configuration and equipping the rack.
6. Click on "OK" to add the device selected.  
The dialog box closes.

### Adding device from the hardware catalog

To add a device to the hardware configuration using the hardware catalog, proceed as follows:

1. Open the network view or the topology view.
2. Open the hardware catalog.

3. Go to the required device in the hardware catalog.
4. Click on the chosen device to select it.
5. If necessary, set the firmware version using the drop-down list in the hardware catalog.
6. Drag the device to the network view or the topology view.

You have now placed the device in the network view or in the topology view. The displayed rectangle (in other words "Station") symbolizes the plugged device together with its rack and any lower-level modules. Double-click on the device or station to open the device view and view the new rack and inserted device. In the next steps, you can configure the device in the device view and equip the rack with modules.

## See also

- Network view (Page 445)
- Creating an unspecified CPU (Page 474)
- Topology view (Page 450)

## Creating an unspecified CPU

### Introduction

If you have not yet selected a CPU but have already started programming or want to use an existing program, you have the option of using an unspecified CPU. You can also adjust some settings with unspecified CPUs. The setting options are restricted to parameters that all CPUs of the same CPU family have in common.

### Creating an unspecified CPU in the portal view

To create an unspecified CPU in the portal view, follow these steps:

1. Now, click one of the following options:
  - "Devices & networks > Add new device"
  - "PLC programming" > "Device" button
2. For a device family, select an unspecified CPU from the tree structure of the "Add new device" dialog.
3. Click on "Add".

An unspecified CPU is created and the device view for this CPU appears.

## Further options for creating unspecified CPUs

In the project view, you can create unspecified CPUs like specified CPUs:

- Using the "Add new device" button in the project tree
- In the "Hardware catalog" task card

You can also use these methods to create multiple unspecified CPUs.

## Specifying unspecified CPUs

You have two options for specifying unspecified CPUs:

- Use drag-and-drop to assign an existing CPU from the hardware catalog to an unspecified CPU by means of module replacement (Page 481).
- Select a selected, unspecified CPU and then the menu command "Online > Hardware detection" and assign a CPU identified online. For this purpose, you assign an IP address using the "Add address for PG/PC" button.

---

### Note

If you want to go online after the hardware detection, you have to first download the detected configuration to your project; otherwise, an error may occur due to inconsistent configurations. After hardware detection, the order numbers of the CPU in the project and the actually existing CPU are identical, but their parameters are not. The parameters of the CPU in the project have the default values; the parameters of the actually existing CPU have the values set by you.

---

## See also

Selecting a CPU (Page 471)

Adding a device to the hardware configuration (Page 473)

## Inserting a module into a rack

### Introduction

Once you have added devices from the hardware catalog to your configuration in network view, you can add modules to the devices. There are various ways of adding a module to a rack in the device view:

- If there is an available valid slot, double-click a module in the hardware catalog.
- Use drag-and-drop to move the module from the hardware catalog to an available valid slot in the graphic or table area:
  - Text entry from the "Catalog" pane
  - Preview graphic from the "Information" pane
- Select "Copy" in the shortcut menu for a module in the hardware catalog and then select "Paste" in the shortcut menu on an available valid slot in the graphic or table area.

To access the device view from the network view, double-click a device or station in the network view or select the Device view tab. The device view contains an illustration of the device selected within a rack. The graphic illustration of the rack in the software corresponds to the real structure, i.e. you can see the same number of slots as exist in the real structure.

---

**Note**

You can also move a module to a rack in the network view. The filter function for the hardware catalog must be deactivated in this instance. The module is automatically plugged into a free and permitted slot. If there are no slots available, the module will be moved to the area of unplugged modules (Page 470).

---

## Equipping a rack

Arrange the modules on a rack according to the applicable slot rules.

After a module has been inserted in a rack with an already inserted CPU, the address areas are checked automatically so that addresses are not assigned twice. After it has been inserted, each module then has one valid address range. To do so, DP slaves and IO devices must be networked with a CPU via the corresponding DP master or IO system.

## Requirements

- You are in the device view.
- The hardware catalog is open.

## Adding module from the hardware catalog

How to insert a module from the hardware catalog into a rack is illustrated based on the example of a signal module. To do this, follow these steps:

1. Go to the required module board in the hardware catalog.

---

**Note**

If you activate the filter function of the hardware catalog, only those modules which match the selected device type will be displayed.

---

2. Select the chosen module.

3. If necessary, set the firmware version using the drop-down list in the hardware catalog.
4. Drag the signal module to a free slot in the rack.

You have now inserted the digital signal module in a slot in the rack. Repeat these steps with the other modules.

The name of the module is displayed above the inserted modules. You can activate or deactivate module labeling in the menu bar with "View > Show module labels".

## Inserting module

You can also drag modules and drop them between modules that have already been inserted. To do this, drag a module above and between the two existing modules while holding down the mouse button.

A mouse pointer appears. When you release the mouse button, all modules plugged to the right of the pointer are moved one slot to the right. Any redundant modules are moved to the area of unplugged modules. The new module is plugged at the point of the freed up slot.

## See also

- Device view (Page 447)
- Area for unplugged modules (Page 470)
- General slot rules (Page 464)

## Deleting a hardware component

There are various ways of deleting hardware components. Deleted hardware components are removed from the system and assigned addresses made available again.

## Rules

- CPUs or modules from the rack and from the area of unplugged modules can be deleted.
- When a rack is deleted in the device view, the plugged hardware components are moved to the area of unplugged modules.

## Procedure

Proceed as follows to delete a hardware component:

1. Select the hardware components you want to delete.
  - Network view: Select devices or network relevant hardware components in the graphic view or in the network view.
  - Device view: In the graphic view or device overview, select racks or modules in racks or in the area of unplugged components.
  - Topology view: Select devices or hardware components with Ethernet interfaces in the graphic view or in the topology view.
  - Project tree: Select devices or individual hardware components from the tree structure.
2. Select "Delete" from the shortcut menu or press <Del>. If the "Delete" menu item is unavailable, your selection contains at least one component that cannot be deleted.

The selected hardware components are deleted.

---

### Note

Deleting hardware components may result in inconsistencies in the project, such as violation of slot rules. Inconsistencies are reported during the consistency check. Correct the inconsistencies by taking appropriate action, for example, ensuring compliance with the slot rules.

---

## See also

Keyboard operation: Editing objects (Page 461)

## Copying a hardware component

You can copy hardware components in the device or network view. Copied hardware components are stored on a clipboard and can be pasted at another point from this clipboard. Copied stations are pasted as new stations in the network view. Copied devices and modules can be pasted into existing racks in the network and device view.

## Rules

- Single objects as well as several objects can be copied at the same time.
- Modules inserted in the rack and in the area of unplugged modules can be copied.

- You can only copy devices and modules to free and valid slots in keeping with the slot rules.
- Racks with a CPU inserted cannot be copied individually, but only as complete units along with all inserted hardware components.

## Procedure

Proceed as follows to copy a hardware component:

1. Select the hardware components you want to copy.
  - Device view: Select the module in a rack or put it in the area of unplugged modules.
  - Network view: Select the station or the relevant hardware component from the network view.
  - Project tree: Select the station or module.
2. Select "Copy" from the shortcut menu or press <Ctrl+C>.  
If the "Copy" menu item is unavailable, your selection contains at least one component that cannot be copied.
3. Select the location at which the content of the clipboard is to be pasted.
  - Device view: Select a free slot in the rack or area of unplugged modules.
  - Network view: Select a station where you want to insert devices or modules or move the mouse pointer to a free location in the network view to paste a copied station or a hardware component relevant to the network view.
4. Select "Paste" from the shortcut menu or press <Ctrl+V>.  
If the "Paste" menu item is unavailable, the clipboard is empty or contains at least one component that cannot be pasted at this point.

The selected object is pasted at the chosen point.

Once you have selected a station where you want to insert a module in the network view, the module is inserted in the first free and valid slot. If no free, valid slots are available, the object is inserted in the area of unplugged modules.

---

### Note

You can also copy a module from one device to another:

To do so, copy a module in the hardware and network editor, select a different device in the network view or the drop down list of the device view and insert the module.

You can insert the copied object directly in a slot or place it in the area of unplugged modules in the device view. If you add the copied object in the network view of a device or a station, it will be inserted in the first available slot.

If there is no slot available for the object, it is automatically placed in the area of unplugged modules (Page 470).

---

### Note

You can use <Ctrl> and drag-and-drop to directly copy a selected hardware component.

---

Keyboard operation: Editing objects (Page 461)

## Moving a hardware component

You can move hardware components in the device or network view.

## Rules

- You can move devices and modules from the rack and the area for unplugged modules taking the slot rules into consideration.
- CPs can be moved in the network view. The CP is plugged in a free and valid slot in the target device. If there are no free slots available, the CP to be inserted is moved to the area for unplugged modules.
- In the network view, CPU and slave head modules can be moved between the devices; depending on CPU type also within the rack.

---

### Note

Moved CPs are disconnected from their network but keep their network parameters and address. If you reconnect the CP to the network and its address has been assigned, use a dialog to assign a new unique address to the CP.

---

## Procedure

Proceed as follows to move a hardware component:

1. Select the hardware component you want to move.
  - Device view: Select the module in a rack or put it in the area of unplugged modules.
  - Network view: Select the hardware component of relevance to the network view.
2. Select "Cut" from the shortcut menu or press <Ctrl+X>.  
If the "Cut" menu item is unavailable, your selection contains at least one component that cannot be cut.
3. Select the location to which the cut object is to be moved.
  - Device view: Select a free slot in the rack or area of unplugged modules.
  - Network view: Select a station where you want to insert devices or modules.
4. Select "Paste" from the shortcut menu or press <Ctrl+V>.  
If the "Paste" menu item is unavailable, the clipboard is empty or contains at least one component that cannot be pasted at this point.

The selected hardware component is moved to the target. If the hardware component being moved is a networked object, it is disconnected from the network.

---

**Note**

You can use drag-and-drop to directly move a selected hardware component.

---

**See also**

Keyboard operation: Editing objects (Page 461)

**Replacing a hardware component**

You can replace hardware components with others. This, for example, allows you to replace unspecified CPUs (Page 474) with available CPUs from the hardware catalog.

**Rules**

You can only replace hardware components if they support module replacement and if the two components are compatible.

**Procedure**

To replace one module with another, proceed as follows:

1. Select the module you want to replace.
2. Open the shortcut menu:
  - If the "Replace device" entry is enabled, the module can be replaced.
  - If the "Replace device" entry is disabled, a module cannot be replaced.
3. Click on "Replace device" in the shortcut menu. The "Replace device" dialog box appears.
4. Under "New device" in the tree structure, select the module with which you want to replace your current module.
5. Click "OK".

The existing module is replaced by the new one.

As an alternative, you can take a module by dragging it from the hardware catalog to the module you are replacing. If the module can be replaced by the selected module, this is indicated by the mouse pointer symbol.

**Editing properties and parameters**

Once you have inserted hardware components in your rack, you can edit their default properties, for example parameters or addresses in the network or device view.

## **Requirement**

You are in the device view.

---

### **Note**

You can also edit properties and parameters in the network view. In the graphic network view, you have access to the network-related hardware components and the station. You can access modules and hardware components not displayed in the graphic network view using the table network view.

---

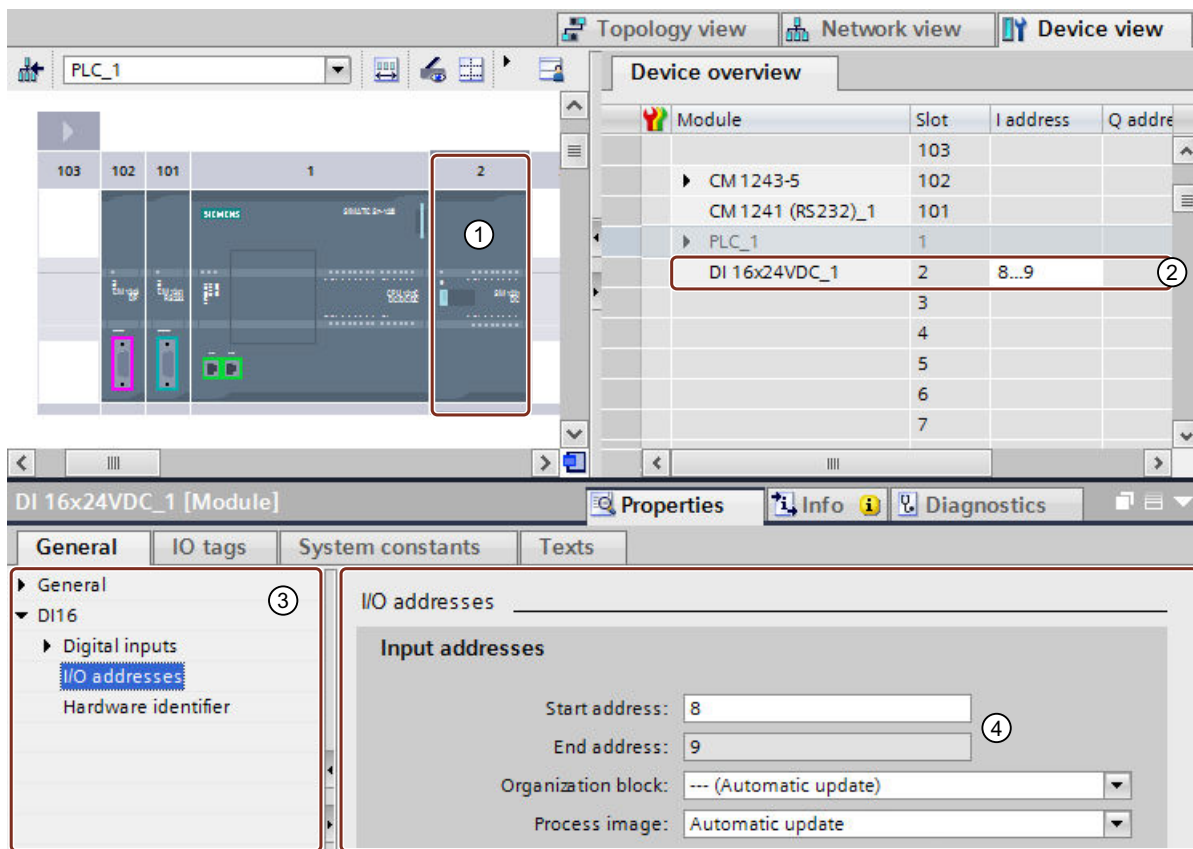

## **Procedure**

To change the properties and parameters of the hardware components, proceed as follows:

1. In the graphic view, select the CPU, module, rack or interface you want to edit.
2. Edit the settings for the selected object:
  - Use the table view to edit addresses and names, for example.
  - In the Inspector window additional setting possibilities are available in "Properties".

Note that modules can only be fully parameterized if they are assigned to a CPU. Therefore, PROFIBUS or PROFINET interfaces modules must first be networked with the CPU or a centrally inserted communication module so that they form a master system or IO system. Only then is it possible, for example, to edit the addresses of the distributed components that are inserted.

## Example of changing settings

- ① Selection of a module
- ② Editing option for addresses in the device overview
- ③ Selection options in the inspector window
- ④ Editing option for addresses in the inspector window

## See also

Inspector window (Page 455)

## Input and output addresses in the address overview

### Introduction

The currently used input and output addresses can be displayed in the address overview in a table form. The address overview can be found in the Inspector window under "Properties" of the CPU.

### Design of the address overview

With the different check boxes, you can set which objects should be displayed in the address overview:

- Inputs: Display of the input addresses
- Outputs: Display of the output addresses
- Address gaps: Display of open address spaces
- Slot: Display of the slot number

The following information is typically shown in the address overview:

Table header	Meaning
Type	Indicates whether the area is an input address area or an output address area.
Addr. from	Start address of the address range.
Addr. to	End address in the address range.
Module	Module using the address area.
PIP	Number of the process image partition. Shows whether the cyclic OB is within the process image partition.
OB	Organization block that is assigned to the process image. This column is not available for every CPU.
DP	Number of the master system. You can use the number to determine which slaves are assigned to a master. The value in brackets specifies the PROFIBUS address of the hardware component.
PN	Number of the IO system. The value in brackets stands for the device number of the hardware component.
Rack	Number of the rack on which the hardware component is inserted.
Slot	Number of the slot in the rack in which the hardware component is inserted.

Specifying input and output addresses (Page 724)

### Update module version

#### Explanation of terms

The terms "Module version" and "Firmware version" are explained in more detail in the following section.

- Module version: The specific version of the configuration software from which the module description stems.  
Example: V11.0.0.0
- Firmware version: The version of the firmware of the module whose parameters are assigned offline  
Example: V2.0

## Requirement

- You have created a device configuration.
- You have installed an update or an optional package at a later date. As a result of this installation, the module version of at least one module type was updated in the hardware catalog, whereby the new version is incompatible with the previous version.
- You have used such modules in your device configuration and want to use the modified or added properties.

## Procedure

Perform the following step for each affected module type.

1. Select the affected module in the device view.
2. In the Inspector window, go to "Properties > General > Catalog Information". Click the "Update module version" button there.
3. In the query that then appears, specify whether you want to update the module version only for the selected module or for all modules of this type in the current project.

## Result

The selected modules are replaced by the same modules with updated module version in the the current project.

## In which cases is it unnecessary to update the module version?

An updating of the module version is not necessary in the following cases:

- You do not want to use the modified or added properties of the modules.
- You open an existing project with a version of the configuration software that is more recent than the version with which you created the project, and the system automatically performs a project conversion, for example, from TIA Portal V12 to V13. In this case, all older module versions are automatically adapted.

### 8.1.2.3 Comparing devices

#### Basics of device comparison

#### Function

You have the option of comparing the hardware components of two devices allowing you to identify any differences. You can perform an offline/offline comparison for this purpose. The devices to be compared can be from one project or different projects.

You can compare the central as well as the distributed I/O. The devices to be compared can be assigned either automatically or manually. The automatic assignment of central I/O is based

on the slot number. With the distributed I/O, the automatic assignment can be made according to the following criteria:

- Assignment using the address/ID: The assignment is made using the addresses or IDs of the devices. This criterion is suitable for comparing devices within a project.
- Assignment using the name: The assignment is made based on the device names. This criterion is suitable for comparing devices in different projects.

You can either specify the assignment yourself or let the system decide. In the latter case, the system selects the assignment itself depending on the context.

### **See also**

Basics of project data comparison (Page 331)

Overview of the compare editor (Page 333)

Making a device comparison (Page 486)

## **Making a device comparison**

### **Procedure**

Follow the steps below to compare devices:

1. Select a device in the project tree that allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.  
The comparison editor opens and the selected device is displayed in the left area.
3. Open the "Hardware" tab.
4. Drag an additional device to the drop area in the right-hand pane.  
All existing objects of the selected devices are displayed depending on the settings of the comparison editor in the "Hardware" tab and an automatic comparison is made. You can identify the status of the objects based on the symbols in the comparison editor.
5. If you want to change the matching criterion, click on the arrow of the "Available matching criteria" button in the toolbar. Then, select the matching criterion you want to use.
6. If you want to make a manual comparison, click the button for switching between automatic and manual comparison above the status area. Then select the objects you want to compare.  
The properties comparison is displayed. You can see the status of the objects based on the symbols.

## **8.1.3 Configure networks**

### **8.1.3.1 Networking devices**

#### **Communication and networks**

##### **Communication between devices**

The basis of all types of communication is always a previously configured network. The network configuration provides the necessary requirements for communication:

- All the devices in a network are provided with a unique address
- Communication of the devices with consistent transmission properties

##### **Network configuration**

The following steps are necessary when configuring networks:

- Connect devices to subnet
- Specify the properties/parameters for each subnet
- Specify the device properties for every networked module
- Download configuration data to the devices to supply interfaces with the settings resulting from the network configuration
- Document the network configuration

For Open User Communication, creating and configuring a subnet is supported by the assignment of connection parameters.

##### **Relation between network configuration and project**

Within a project, subnets and their properties are managed. Properties result mainly from adjustable network parameters and the quantity and communication properties of the connected devices.

The devices to be networked must be in the same project.

##### **Subnet name and subnet ID**

Within the project, subnets are clearly identified by a subnet name and ID. The subnet ID is saved in all components along with interconnectable interfaces. Components can then be clearly assigned to a subnet even after uploading into a project.

## Networking options

In the project, you can create and network devices with components capable of communication. The following basic options are available for networking the devices:

- You link the interfaces of the components capable of communication with one another. A new subnet is created suitable for the type of interface.
- You connect the interface of the devices capable of communication with a new or existing subnet.
- You create an Open User Communication connection. When you assign parameters to the connection for Open User Communication, a subnet is created automatically between the communication partners.
- You use the graphic connection configuration to configure connections; missing networks are hereby recognized and are created either automatically or via dialog.

Due to the different tasks of the devices or the span of the plant, you may need to use several subnets. These subnets are managed in a project.

## Networking devices in the network view

### Options

In the graphic network view, you have an overview of the subnets of the entire system in the project. You can use the tabular network overview for additional support.

Depending on the starting situation, there are various ways of undertaking configuration to network the interface for a component capable of communication. The procedures are described in the following section:

- Creating an individual subnet
- Creating several subnets at one time
- Connecting two target devices via a new subnet
- Connecting devices to existing subnet
- Selecting an existing subnet from a list
- Automatic networking during the configuration of the connection;  
See also: Auto-Hotspot

Possible starting situations are:

- A suitable subnet is not yet available.
- The subnet with which you want to connect the component already exists.

### Procedure - creating a single subnet

To create a subnet and to connect it to an interface, proceed as follows:

1. Select the interface of a CPU / a CP.
2. Select the "Create subnet" command in the shortcut menu of the interface.

The selected interface is connected to a new subnet. Consistent address parameters are set automatically for the interface.

The following schematic shows an interface with outgoing line connecting to a subnet:

### Procedure - creating several subnets at one time

To create several subnets at one time, proceed as follows:

1. Select several interfaces by clicking on them while pressing the <Ctrl> button.
2. Select the "Create subnet" command in the shortcut menu of the interface.

Each selected interface is connected to a new subnet. Consistent address parameters are set automatically for the interface.

The following figure shows multiple subnets created by selecting multiple interfaces:

### Procedure – Connecting two target devices via a new subnet

To connect an interface with another device via a subnet that does not yet exist, proceed as follows:

1. Position the mouse pointer over the interface for a component capable of communication requiring networking.
2. Click with the left mouse button and hold the button down.
3. Move the mouse pointer.  
The pointer now uses the networking symbol to indicate "Networking" mode. At the same time, the mouse pointer shows the lock symbol that will only disappear when the pointer is on a valid target.

8.1 Configuring devices and networks

4. Now move the pointer onto the interface of the target device. You can either keep the mouse button pressed or release it.
5. Now release the left mouse button or press it again (depending on previous action).

A new subnet is created. The interfaces are now connected via the new subnet. Consistent address parameters are set automatically for the interface.

The following schematic shows two networked devices:

Procedure - Connecting devices to existing subnet

To connect an interface to an existing subnet, proceed as follows:

1. Position the mouse pointer on the interface of a communications-compliant component you want to network or on the existing subnet.
2. Click with the left mouse button and hold the button down.
3. Move the mouse pointer.  
The pointer now uses the networking symbol to indicate "Networking" mode. At the same time, the mouse pointer shows the lock symbol that will only disappear once the pointer is moved to a valid target.
4. Now move the mouse pointer to the existing subnet or to the interface to be networked. You can either keep the mouse button pressed or release it.

5. Now release the left mouse button or press it again (depending on previous action).

Result:

The interface and selected subnet are now connected. Consistent address parameters are set automatically for the interface.

### **Procedure - selecting an existing subnet from a list**

To link an interface with a subnet that has already been created, proceed as follows:

1. Select the interface of a CPU.
2. Select the "Assign to new subnet" command in the shortcut menu of the interface.  
A list box containing the available subnets appears.
3. Select a subnet from the list.

The interface and selected subnet are now connected. Consistent address parameters are set automatically for the interface.

### **Tabular network overview**

#### **Meaning**

The tabular network overview adds the following functions to the graphic network view:

- You obtain detailed information on the structure and parameter settings of the devices.
- Using the "Subnet" column, you can connect components capable of communication with created subnets.

#### **Basic functions for tables**

The network overview supports the following basic functions for editing a table:

- Displaying and hiding table columns  
Note: The columns of relevance to configuration cannot be hidden.
- Optimizing column width
- Sorting table
- Displaying the meaning of a column, a row or cell using tooltips.

### **Networking devices in the device view**

#### **Networking in the device view**

In the device view, you can check and set all the parameters of the components belonging to a device and the interfaces in detail. Here you can also assign the interfaces to the subnets created in the project.

#### **Requirements**

- The subnet with which you want to connect an interface has already been created.
- If the subnet has not yet been created, change to the network view and make the settings required for networking.

### Procedure - connecting to an existing subnet

To connect an interface to an existing subnet, proceed in the device view as follows:

1. Select the entire communications-compliant component or the interface to be networked. The properties of the selected interface or component are displayed in the Inspector window.
2. In the Inspector window, select the parameter group for the selected interface; for example, the "Ethernet addresses" parameter group for a PROFINET interface.
3. Select the subnet to be connected from the "Interface connected with" drop-down list.

The interface and selected subnet are now connected. Consistent address parameters are set automatically for the interface.

### Procedure - creating a new subnet

To create a subnet and to connect it to the interface, proceed as follows in the device view:

1. Select the entire communications-compliant component or the interface to be networked. The properties of the selected interface or component are displayed in the Inspector window.
2. In the Inspector window, select the parameter group for the selected interface; for example, the "Ethernet addresses" parameter group for a PROFINET interface.
3. In "Interface connected with", click the "Add new subnet" button.

The interface is connected to a new subnet of the appropriate subnet type. Consistent address parameters are set automatically for the interface.

## Checking or changing network parameters and interface parameters

### Introduction

Communication between networked devices requires the following parameters to be configured:

- Network parameters  
Network parameters identify the network within the system configuration, for example, using a name.
- Interface parameters  
Interface parameters define specific properties of a component capable of communication. Addresses and transmission characteristics are set automatically and are consistent with the network parameters.

---

#### Note

Network parameters and interface parameters are usually set during networking such that communication can take place for numerous applications without the parameters having to be changed.

---

### **Procedure - checking or changing network parameters**

Proceed as follows to check or change network parameters:

1. Enter the network view.
2. Select the subnet from the network view.  
You can see the network parameters in the "Properties" tab in the inspector window.
3. If necessary, check or modify the network parameters in the relevant group of parameters.

### **Procedure - checking or changing interface parameters**

You can check and modify interface parameters in the network and device view.

Proceed as follows to check or change interface parameters:

1. Enter the network view or device view.
2. Select the interface.  
You can see the interface parameters in the "Properties" tab in the inspector window.
3. If necessary, check or modify the interface parameters in the relevant group of parameters.

## **Changing networkings**

### **Introduction**

You can cancel an interface's network connection or assign it to another subnet of the same subnet type.

### **Consequences**

Depending on the version, a distinction should be made between:

- Canceling a network connection for an interface  
The configured parameters for the interface remain unchanged.
- Assigning a network connection to another subnet  
If the addresses in the assigned subnet are not unique, in other words, they already exist, they will be changed automatically to make them unique.

### Procedure - disconnecting from a network

Proceed as follows to cancel the network connection for an interface:

1. Select the networked interface.

2. Select the "Disconnect from subnet" command in the shortcut menu of the interface.

The network connection is deleted, the interface addresses are, however, not changed.

Configured connections are retained; however these connections are marked red in the connection table because they are not networked. Specified connections remain specified.

### See also

Networking devices in the network view (Page 488)

### Copying, cutting or deleting subnets

#### Introduction

You can copy subnets as individual objects or copy them along with networked devices or other networks.

For example, you can create complex configurations to be used more than once in different variants within the project with no additional effort.

#### Effects on the copied subnet

Properties that have to be assigned explicitly within a project are re-assigned appropriately when the copied objects are copied.

For subnets, this means: The subnet ID and name are re-assigned to the copied subnet.

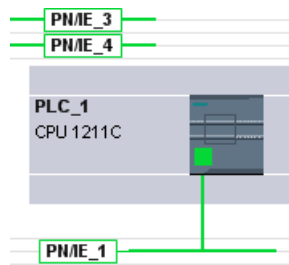

The configured properties are adopted in the copied subnet.

### Procedure - copying a subnet

Proceed as follows to copy one or more subnets:

1. Select one or more subnets.
2. In the shortcut menu, select the "Copy" command.
3. Select the "Paste" command in the shortcut menu.

The copied subnets are shown as "orphaned" subnets in the top part of the network view.

### Procedure - copying a subnet with connected devices

To copy one or more subnets with networked devices, proceed as follows:

1. Select one or more subnets with the connected devices, for example by drawing a lasso around them.
2. In the shortcut menu, select the "Copy" command.
3. Select the "Paste" command in the shortcut menu.

Complete copies of the subnets and connected devices are created.

Configured connections are adopted and remain within the copied devices. Connections to devices that have not been copied are interrupted and become unspecified.

### MPI network configuration

#### Allocating MPI addresses

Note the following for devices with an MPI interface: All devices of a subnet must have different device addresses.

CPUs with MPI address ship with the default MPI address 2. Since you can only use this address once in the MPI subnet, you will have to change the default address in all other CPUs.

The following applies to devices with the order no. 6ES7 3xx-xxxxx-0AB0:

When planning the MPI addresses for several CPUs, you have to fill "MPI address gaps" for FMs and CPs with separate MPI addresses to prevent addresses being assigned twice.

Only when all the modules in a subnet have different addresses and your actual structure matches that of the network configuration produced, should you load the settings across the network.

#### Rules for assigning the MPI address

- Allocate the MPI addresses in ascending order.
- Reserve MPI address 0 for a programming device.
- You can link up to 126 (addressable) devices with one another in an MPI subnet; up to 8 devices at a transfer speed of 19.2 KB/s.
- All MPI addresses in an MPI subnet must be different.

You will find other rules relating to the structure of a network in the manuals for setting up automation systems.

## **PROFIBUS network configuration**

### **PROFIBUS addresses**

#### **Rules for the network configuration**

All the devices in a subnet must have a different PROFIBUS address.

Only when all the modules in a subnet have different addresses and your actual structure matches that of the network configuration produced, should you load the settings across the network.

You can connect devices to the PROFIBUS subnet that communicate via configured connections or that belong to a PROFIBUS DP master system.

You can find more information on configuring a DP master system in the following sections.

#### **Requirements**

The 121xC CPU is PROFIBUS compatible as of firmware version 2.0.

#### **Rules for assigning PROFIBUS addresses**

- Allocate the PROFIBUS addresses in ascending order.
- Reserve the PROFIBUS address "0" for a programming device.
- Allocate a unique PROFIBUS address between 0 and 126 for each device on the PROFIBUS network and/or for each DP master and each DP slave in the PROFIBUS network.
- There are modules with which the smallest address that can be set has to be greater than 1.
- All PROFIBUS addresses of a PROFIBUS subnet must be different.

You will find additional rules relating to the structure of a network in the manuals for setting up automation systems, for example SIMATIC S7-1200.

---

#### **Note**

##### **PROFIBUS address "0"**

Reserve PROFIBUS address "0" for a programming device that you will briefly connect up to the PROFIBUS network at a later date for servicing.

---

#### **See also**

What you need to know about PROFIBUS bus parameters (Page 497)

## What you need to know about PROFIBUS bus parameters

### Matching parameters to one another

The PROFIBUS subnet will only function without problem if the parameters for the bus profile are matched to one another. You should therefore only change the default values if you are familiar with how to configure the bus profile for PROFIBUS.

---

#### Note

It may be possible for the bus parameters to be adjusted depending on the bus profile. If the bus parameters cannot be adjusted, they are grayed out. The offline values of the bus parameters are always shown even if you are online and linked to the target system.

---

The parameters shown apply to the entire PROFIBUS subnet and are briefly explained below.

### Activating cyclic distribution of the bus parameters

If the "Enable cyclic distribution of the bus parameters" check box is selected under "Bus parameters" while PROFIBUS subnet is selected in the Inspector window, the bus parameters are transferred cyclically during operation by the modules that support this function. This allows a programming device, for example, to be easily connected to the PROFIBUS in runtime.

You should deactivate this function:

- For a heterogeneous PROFIBUS subnet (or more accurately: when external devices are connected whose protocol uses the DSAP 63 for Multicast)
- When in constant bus cycle time mode (minimize bus cycle)

### Bus parameters for the bus profile of PROFIBUS subnets

Bus parameter	Adjustable?	Limit values
Tslot_Init	Yes	$\text{Max. Tsdr} + 15 \leq \text{Tslot\_init} \leq 16.383 \text{ t\_bit}$
Max. Tsdr	Yes	$35 + 2 * \text{Tset} + \text{Tqui} \leq \text{Max. Tsdr} \leq 1.023 \text{ t\_bit}$
Min. Tsdr	Yes	$11 \text{ t\_bit} \leq \text{Min. Tsdr} \leq \text{MIN}(255 \text{ t\_bit}, \dots \dots \text{Max. Tsdr} - 1, 34 + 2 * \text{Tset} + \text{Tqui})$
Tset	Yes	$1 \text{ t\_bit} \leq \text{Tset} \leq 494 \text{ t\_bit}$
Tqui	Yes	$0 \text{ t\_bit} \leq \text{Tqui} \leq \text{MIN}(31 \text{ t\_bit}, \text{Min. Tsdr} - 1)$
GAP factor	Yes	$1 \leq \text{GAP factor} \leq 100$
Retry limit	Yes	$1 \leq \text{Retry limit} \leq 15$
Tslot	No	---
Tid2	No	$\text{Tid2} = \text{Max. Tsdr}$
Trdy	No	$\text{Trdy} = \text{Min. Tsdr}$
Tid1	No	$\text{Tid1} = 35 + 2 * \text{Tset} + \text{Tqui}$
Ttr	Yes	$256 \text{ t\_bit} \leq \text{Ttr} \leq 16.777.960 \text{ t\_bit}$

Bus parameter	Adjustable?	Limit values
Ttr typical	No	This time is provided for information only and is not transferred to the nodes.
Response monitoring		10 ms <= response monitoring (watchdog) <= 650 s

If you want to create a customized bus profile, we recommend the following settings:

- Minimum target rotation time (Ttr) = 5000 x HSA (highest PROFIBUS address)
- Minimum response monitoring (watchdog) = 6250 x HSA

### Recalculating

You can use the "Recalculate" button to recalculate the parameters.

### See also

PROFIBUS addresses (Page 496)

Description of the bus parameters (Page 498)

### Description of the bus parameters

#### Detailed description of PROFIBUS bus parameters

Bus parameter	Meaning
Tslot_Init	The wait-for-reception (slot time) defines the maximum time the sender will wait to receive a response from the addressed partner. If the influence of the line components on message frame run times is entered in the "Cable Configuration" parameter group, these components must also be taken into account. The component is added to the specified Tslot_Init and the total used as Tslot.
Max. Tsdr	The maximum protocol processing time defines the latest time by which the responding node should have replied.
Min. Tsdr	The minimum protocol processing time defines the earliest time by which the responding node may reply.
Tset	The trigger time is the time which may lapse between the reception of a data message frame and the response to it in the node.
Tqui	The modulator quiet time is the time which a sending node needs after the end of the message frame to switch from sending to receiving.
GAP factor	The GAP update factor defines the number of token rotations after which a newly added, active node can be added to the logical token ring.
Retry limit	This parameter defines the maximum number of attempts (message frame repeats) made to reach a node.
Tslot	The wait-for-reception time (slot time) defines the maximum time the sender will wait to receive a response from the addressed partner.  If the influence of the bus design components on message frame run times is entered in the "Cable Configuration" parameter group, these components must also be taken into account. The component is added to the specified Tslot_Init and the total used as Tslot.

Bus parameter	Meaning
Tid2	Idle time 2 defines the earliest time by which a sending node may send the next message frame after sending a message frame that has not been acknowledged.
Trdy	The ready time specifies the earliest time by which a sending node may receive a response message frame.
Tid1	Idle time 1 defines the earliest time by which a sending node may send the next message frame after receiving a response.
Ttr	The target rotation time is the maximum time made available for a token rotation. During this time, all active nodes (DP masters etc.) have the right to send (token) once. The difference between the target rotation time and the actual token holding time of a node determines how much time is left over for the other active nodes (programming device, other DP masters etc.) to send message frames.
Ttr typical	The typical data cycle time is the average response time on the bus if all configured slaves are exchanging data with the DP master. None of the slaves report diagnostics and there is no extra message frame traffic with programming devices or other active nodes etc. on the bus.
Response monitoring	The response monitoring time is only needed for PROFIBUS-DP bus systems. It defines the latest time by which a DP slave has to be addressed by its DP master with a new data message frame. If this does not happen, the DP slave assumes that the DP master has failed and resets its outputs to a secure mode.

What you need to know about PROFIBUS bus parameters (Page 497)

## Bus profiles with PROFIBUS

### Introduction

Depending on the device types connected and protocols used on the PROFIBUS, different profiles are available. The profiles differ in terms of the setting options and calculation of bus parameters. The profiles are explained below.

### Devices with different profiles on the same PROFIBUS subnet

The PROFIBUS subnet only functions without problem if the bus parameters of all devices have the same values. For example, if both DP and FMS services are being used on a subnet, the "slower" sets of bus parameters must always be set for all devices, i.e. even the "Universal (DP/FMS)" profile for DP devices.

### Profiles and transmission rates

Profiles	Supported transmission speeds in Kbits/s
DP	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000
Standard	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000
Universal (DP-FMS)	9.6 19.2 93.75 187.5 500 1500
Customized	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000

Meaning of profiles

Profile	Meaning
DP	<p>Select the "DP" bus profile when the only devices connected to the PROFIBUS subnet are those which satisfy the requirements of standard EN 50170 Volume 2/3, Part 8-2 PROFIBUS. The bus parameter setting is optimized on these devices.</p> <p>This includes devices with DP master and DP slave interfaces of the SIMATIC S7 and distributed I/Os of other manufacturers.</p>
Standard	<p>Compared to the "DP" profile, the "Standard" profile also offers scope for devices of another project or devices which have not been configured here to be taken into account when calculating the bus parameters. The bus parameters are then calculated following a simple, non-optimized algorithm.</p>
Universal (DP/FMS)	<p>Select the "Universal (DP/FMS)" bus profile when individual devices on the PROFIBUS subnet use the PROFIBUS-FMS service.</p> <p>This includes the following devices for example:</p> <ul style="list-style-type: none"> <li>• CP 343-5 (SIMATIC S7)</li> <li>• PROFIBUS-FMS devices of other manufacturers</li> </ul> <p>As with the "Standard" profile, this profile allows you to take other devices into account when calculating the bus parameters.</p>
Customized	<p>The PROFIBUS subnet will only function without problem if the parameters for the bus profile are matched to one another. Select the "Customized" profile when none of the usual profiles "match" a PROFIBUS device and you need to adapt the bus parameters to your special structure. Information on this can be found in the documentation for the PROFIBUS device.</p> <p>You should only change the default values if you are familiar with how to configure the bus profile for PROFIBUS.</p> <p>Not all combinations that can be theoretically set can be used even with this bus profile. The PROFIBUS standard specifies several parameter limits that depend on other parameters. For example, a responder must not respond (Min TsdR) before the initiator can receive the message frame (Trdy). These standard specifications are also checked in the "Customized" profile.</p> <p>Tip: The bus parameters last valid on the PROFIBUS subnet are always automatically set as customized. For example, if the "DP" bus profile was valid for the subnet, then the bus parameters for "DP" are set in the "Customized" bus profile. The parameters can be modified on this basis.</p> <p>The monitoring times are not automatically recalculated so that you do not put at risk the consistency of set values, for example with configurations in other configuration tools without realizing that you have done so.</p> <p>You can also have the Ttr monitoring times and target rotation time calculated on the basis of parameters you have set: Click here on the "Recalculate" button.</p>

**Note**

Both mono-master mode and multi-master mode are possible with all PROFIBUS profiles.

## What you need to know about PROFIBUS line configuration

### Cable configuration and bus parameters

Information regarding the cable configuration can be taken into consideration when calculating the bus parameters. For this purpose, you must select the "Consider cable configuration" check box in the properties for the PROFIBUS subnet.

The remaining information then depends on the type of cable used; the following settings are available:

- Copper cable
- Fiber-optic cable/optical ring

### PROFIBUS line configuration, optical ring

The calculation depends on the OLM types used. The selection is made by activating the check box (multiple activation is possible, at least one OLM type must be selected):

- OLM/P12
- OLM/G12
- OLM/G12-EEC
- OLM/G12-1300

The following bus parameter adjustments are made:

- Configuration of a node not present

---

#### Note

**The following restrictions apply to optical rings, even for passive nodes (DP slaves for example):**

A maximum of HSA-1 nodes may be connected to the PROFIBUS network. With an HSA of 126, addresses 126 and 125 must not be used. A maximum of 125 nodes are possible on the bus (No. 0 to 124).

If an HSA is less than or equal to 125, the addresses HSA and greater may not be used. The address HSA-1 may not be used.

---

- Increase the retry value to 3
- Setting of minimum slot time needed for ring mode

---

#### Note

Short slot time values are needed for OLM/P12, average ones for OLM/G12 and OLM/G12-EEC and long ones for OLM/G12-1300. This results in high performance for small network lengths and average to low performance for average to large network lengths.

---

## PROFIBUS communication load

### Communication load - allowing for additional network stations

The bus parameters depend on the volume of communication between the active network nodes. There are differences between cyclic communication (DP) and connection-based, acyclic communication (S7 communication, Send/Receive (FDL), FMS). Unlike DP, the volume and size of communication tasks (communication load) depends on the user program. For this reason, the communication load cannot always be calculated automatically.

To calculate the bus times you can define a network configuration in the "Additional network stations" parameter group that differs from the network configuration.

### Taking the profile into account

The network configuration can be defined for the "Standard", "Universal (DP/FMS)", and "User-defined" profiles. Parameters cannot be entered in the "Additional network stations" parameter group for the "DP" profile.

### Quantification of the communication load

The following settings are available in order to make allowance for the communication load.

- Information regarding the number of unconfigured network stations;
- Information on the communication load resulting from the user programs for FDL or S7 communication. Here you can selected from the following settings:
  - Low  
Typically used for DP, no great data communication apart from DP.
  - Medium  
Typically used for mixed operations featuring DP and other communication services (such as for S7 communication), when DP has strict time requirements and for average acyclic volumes of communication.
  - High  
For mixed operations featuring DP and other communication services (such as for S7 communication), when DP has loose time requirements and for high acyclic volumes of communication.

## Configuring Industrial Ethernet

### Rules for the network configuration

The Ethernet interfaces of the devices have a default IP address that you can change.

## IP address

The IP parameters are visible if the module capable of communication supports the TCP/IP protocol. This is usually the case for all Ethernet modules.

The IP address consists of 4 decimal figures in the range of 0 to 255. The decimal figures are separated from one another by a dot.

Example: 140.80.0.2

The IP address consists of:

- Address of IP subnet
- Address of the device (generally also called host or network node)

## Subnet mask

The subnet mask splits these two addresses. It determines which part of the IP address addresses the network and which part of the IP address addresses the device.

The set bits of the subnet mask determine the network part of the IP address.

Example:

Subnet mask: 255.255.0.0 = 11111111.11111111.00000000.00000000

In the example given for the above IP address, the subnet mask shown here has the following meaning:

The first 2 bytes of the IP address identify the subnet - i.e. 140.80. The last two bytes address the device, i.e. 0.2.

It is generally true that:

- The network address results from AND logic operation of the IP address and subnet mask.
- The device address results from the AND NOT logic operation of the IP address and subnet mask.

## Relation between IP address and default subnet mask

An agreement exists relating to the assignment of IP address ranges and so-called "Default subnet masks". The first decimal number (from the left) in the IP address determines the structure of the default subnet mask. It determines the number of "1" values (binary) as follows:

IP address (decimal)	IP address (binary)	Address class	Default subnet mask
0 to 126	0xxxxxxx.xxxxxxxx...	A	255.0.0.0
128 to 191	10xxxxxx.xxxxxxxx...	B	255.255.0.0
192 to 223	110xxxxx.xxxxxxxx...	C	255.255.255.0

---

**Note**

**Range of values for the first decimal point**

A value of between 224 and 255 is also possible for the first decimal number of the IP address (address class D, etc). This is not recommended, however, because there is no address check for these values.

---

**Masking other subnets**

You can use the subnet mask to add further structures and form "private" subnets for a subnet that is assigned one of the address classes A, B or C. This is done by setting other lower points of the subnet mask to "1". For each bit set to "1", the number of "private" networks doubles and the number of devices they contain is halved. Externally, the network functions like an individual network as it did previously.

Example:

You have a subnet of address class B (for example IP address 129.80.xxx.xxx) and change the default subnet mask as follows:

Masks	Decimal	Binary
Default subnet mask	255.255.0.0	11111111.11111111.00000000.00000000
Subnet mask	255.255.128.0	11111111.11111111.10000000.00000000

Result:

All devices with addresses between 129.80.001.xxx and 129.80.127.xxx are on one IP subnet, all devices with addresses between 129.80.128.xxx and 129.80.255.xxx are on another IP subnet.

**Router**

The task of the routers is to connect the IP subnets. If an IP datagram is to be sent to another network, it first has to be conveyed to a router. To make this possible, you have to enter the address of the router for each device in the IP subnet.

The IP address of a device in the subnet and the IP address of the router can only differ at the points at which there is a "0" in the subnet mask.

**See also**

Settings for interconnecting Ethernet devices (Page 504)

**Settings for interconnecting Ethernet devices**

The following paragraph describes the behavior of STEP 7 during interconnection of PROFINET devices and the effects of the port interconnection on the network view.

## Relation between port interconnection and network view

### **Topology view:**

In the topology view, you specify the physical interconnection of Ethernet ports.

You specifically determine which Ethernet port of a device is to be connected with a specific Ethernet port of another device by means of an Ethernet cable (preset topology).

Example:

You specify that port 1 of the PROFINET interface of the CPU is to be connected to port 2 of the PROFINET interface of device A by means of an Ethernet cable.

You also specify the interface for devices with several PROFINET interfaces.

Example:

You specify that port 1 of PROFINET interface X2 of the CPU is to be connected to port 2 of the PROFINET interface of device A by means of an Ethernet cable.

The Ethernet ports can be interconnected in a table or graphically.

### **Network view:**

In the network view, you specify which devices are to be connected with each other via an Ethernet subnet. You do not specify the Ethernet ports by which the devices are interconnected with each other (that is the task of the port interconnection).

The port interconnection has effects on the network view:

When you interconnect Ethernet ports of devices with each other in the topology view, STEP 7 connects the interconnected PROFINET interfaces of the devices in the network view with an Ethernet subnet (green line).

However, the course of the green line does not reflect the actual cable routing. You specify the actual wiring in the topology view.

An Ethernet subnet always has a name and an S7 subnet ID. You can set these two values in the subnet properties.

## **Which Ethernet subnet is used to link interconnected devices?**

STEP 7 distinguishes between the following cases:

- Ethernet subnet specified (default subnet).
- No Ethernet subnet specified (no default subnet).

### **Ethernet subnet specified (default subnet)**

The option "Connect devices that are not linked with this subnet in case of port connection" is activated in the properties of an Ethernet subnet (default).

This option can be activated for exactly one Ethernet subnet.

Activate the option, if necessary, for the Ethernet subnet that is to be continued when interconnecting devices that are not linked. This subnet is referred to as "default subnet" below.

Response of STEP 7:

When you interconnect the ports of two devices that are not linked in the topology view, STEP 7 links these devices with the default subnet.

**Example:**

Step 1: Create a subnet in the network view at PLC\_4, "Connect devices that are not linked with this subnet in case of port connection" option is **enabled**.

Step 2: Interconnect PLC\_1 with PLC\_2 (topology view).

**Result:** All PLCs are now connected to the same default subnet (network view).

**No Ethernet subnet specified (no default subnet).**

This is the case when the following conditions are fulfilled:

- A subnet has been added to a PROFINET interface (this interface is referred to as "Interface A" below).
- The option "Connect devices that are not linked with this subnet in case of port connection" is deactivated in the properties of this subnet (no default subnet).
- There is no other Ethernet subnet for which this option is activated.

Response of STEP 7:

- The Ethernet subnet of interface A is only continued when you interconnect a port of interface A with a port of another device.
- When you interconnect ports of other devices that are not linked with each other, STEP 7 creates a new Ethernet subnet.

**Example:**

Step 1: Create a subnet in the network view at PLC\_4, "Connect devices that are not linked with this subnet in case of port connection" option is **disabled**.

Step 2: Interconnect PLC\_1 with PLC\_2 (topology view).

**Result:** PLC\_1 and PLC\_2 are connected to a new subnet (network view).

### Manual adaptation of the IP addresses

It can occur that STEP 7 does not adapt the IP addresses of the interconnected devices in such a way that the resulting network can be correctly compiled, for example, for devices with multiple PROFINET interfaces.

In these situations, you need to adapt the IP addresses of the devices manually.

The following rules apply:

- Devices that are to communicate with each other without a router cannot belong to different IP subnets.
- For devices with multiple PROFINET interfaces, the interfaces must be in different IP subnets.

To change the IP address of a PROFINET interface, perform the following steps:

1. Change to the network view (if not selected already).
2. Left-click on the icon of the PROFINET interface that is not to be part of the IP subnet.
3. Change the subnet part of the IP address in the properties of the PROFINET interface (in the "Ethernet addresses" area).

**Example: Manual conversion of the IP subnet part for devices with multiple PROFINET interfaces in a subnet**

The IP address is: "192.168.0.1".

The subnet mask is "255.255.255.0".

The first three numbers "192.168.0" form the IP subnet part of the IP address "192.168.0.1".

Change the IP subnet part, for example, to "192.168.1"

Interconnecting ports in the graphic view (Page 577)

Interconnecting ports in the table view (Page 578)

Configuring Industrial Ethernet (Page 502)

**Network configuration of AS interface**

AS-Interface consists of an AS-i master and AS-i slaves connected to each other over an AS-i subnet.

**Rules for AS interface network configuration**

All the nodes in an AS-i subnet must have a different AS-i node address.

You should only load the settings over the network when all the modules in a subnet have different addresses and when the actual structure matches that of the network configuration you have created.

One AS-i master and up to 31 AS-i slaves can be operated on one AS-i subnet.

For more information on configuring an AS-Interface with an AS-i master and AS-i slaves, refer to the section on AS-Interface and the documentation of the AS-i master modules.

### 8.1.3.2 Communication via connections

#### Working with connections

#### S7 connection

#### Introduction to configuring connections

#### Definition

A connection defines a logical assignment of two communication partners in order to undertake communication services. A connection defines the following:

- Communication partner involved
- Type of connection (for example, S7 connection)
- Special properties (e.g., whether a connection is established permanently or whether it is established and terminated dynamically in the user program, and whether status messages are to be sent)
- Connection path

#### What you need to know about connection configuration

During connection configuration, a local connection name is assigned for an S7 connection as a unique local identification.

In the network view, a "Connections" tab is displayed in addition to the "Network overview" tab. This tab contains the connection table. A row in this connection table represents a configured connection from the viewpoint of the local communication partner with its properties, for example, between two S7-1200 CPUs.

#### What you need to know about using connection resources

#### Introduction

Each connection requires connection resources for the end point and/or transition point on the devices involved. The number of connection resources is device-specific.

If all the connection resources of a communication partner are assigned, no new connections can be established. This situation is apparent when a newly created connection in the connection table has a red background. The configuration is then inconsistent and cannot be compiled.

## **S7 connections**

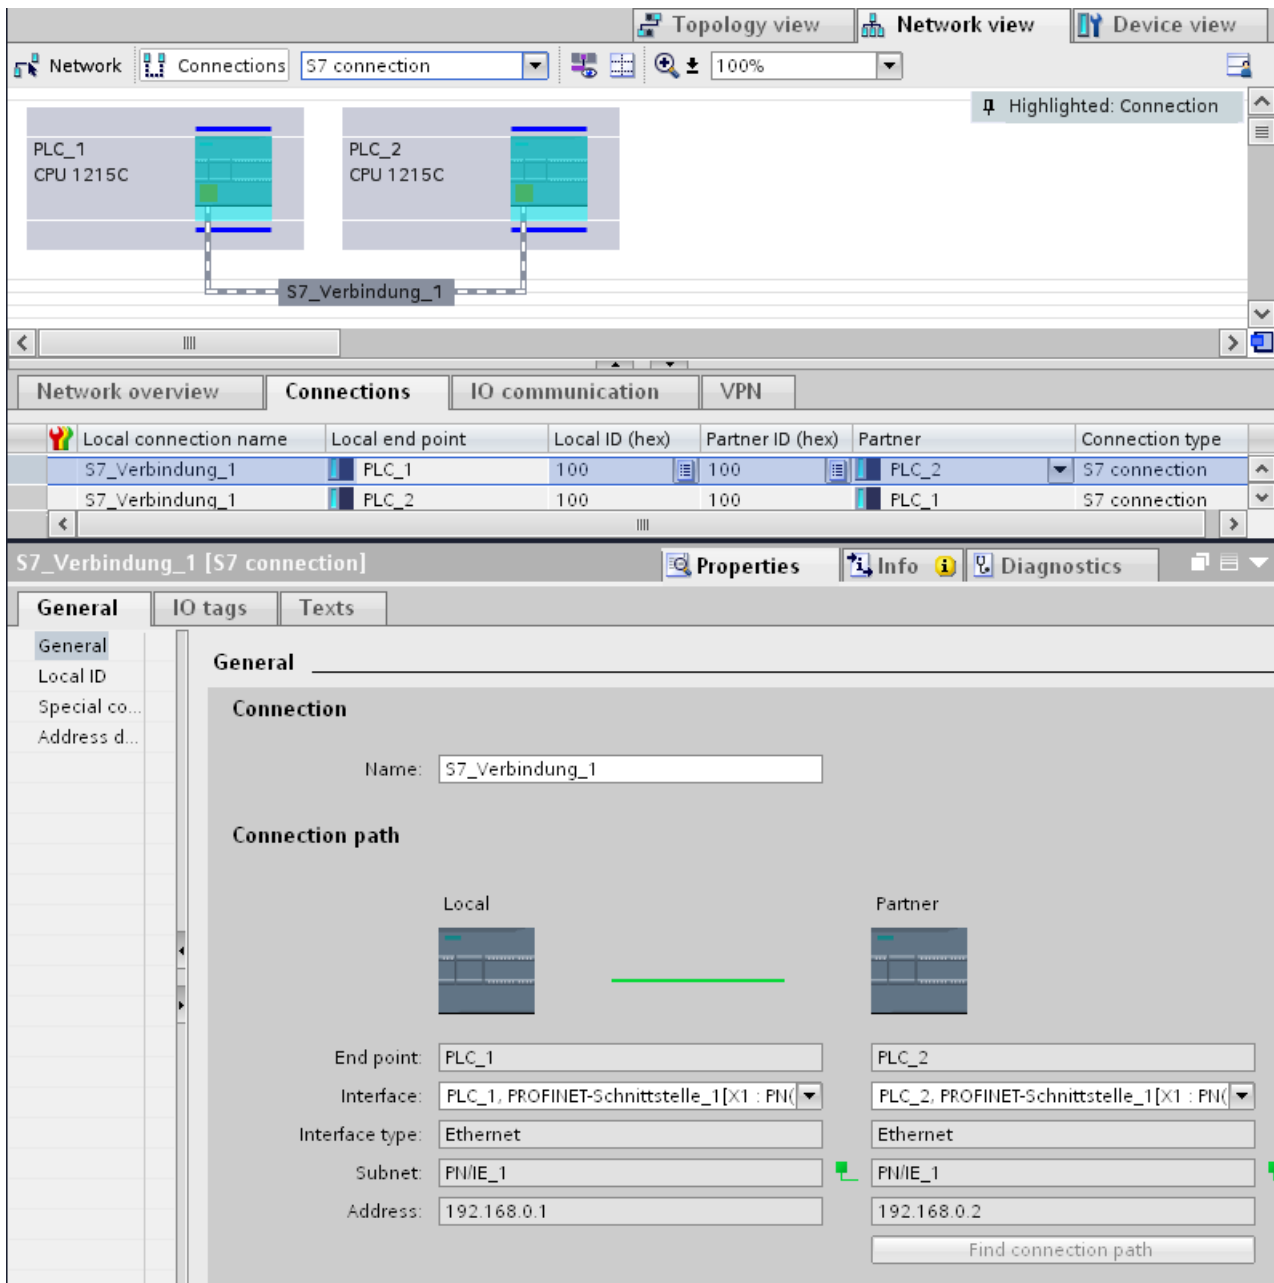

In the case of S7 connections via the PN interface, one connection resource per S7 connection is assigned for the endpoint for the S7-1200 CPU. One connection resource is also required for the connection partner.

You can find an overview of available and assigned connection resources for selected S7-1200 CPU in the Inspector window at "Properties > Connection Resources"

### Views containing information about the configured connections

The views described below will provide you with comprehensive access to all the information and functions regarding configuring and checking communication connections.

- Connection display in the network view
- Connection table
- "Properties" tab for a connection in the inspector window

## **Benefits**

The information shown in these views are always up-to-date in terms of the current user actions. This means:

- The connection table displays all connections created.
- If you have selected a connection in the connection table:
  - When connection mode is enabled, the connection path is highlighted in the network view.
  - The "Properties" tab in the Inspector window displays the parameters of this connection.

## **The connection table**

The connection table offers the following functions:

- List of all connections in the project
- Selection of a connection and display of connections associated with it in the network view (when connection mode is enabled)
- Changing of connection partners
- Display showing status information

## **"Properties" tab for a connection in the inspector window**

The properties dialog has the following meaning:

- Display for connection parameters
- Display of connection path
- Subsequent specification of connections using the "Find connection path" button

## **Creating a new connection**

### **Creating a connection - alternatives**

You have the following options for creating a connection in the network view:

- Graphic connection configuration
- Interactive connection configuration

You'll find the individual steps for this in the following chapters.

## **Requirement and result**

In the network view, you have add devices between which the connections should be configured.

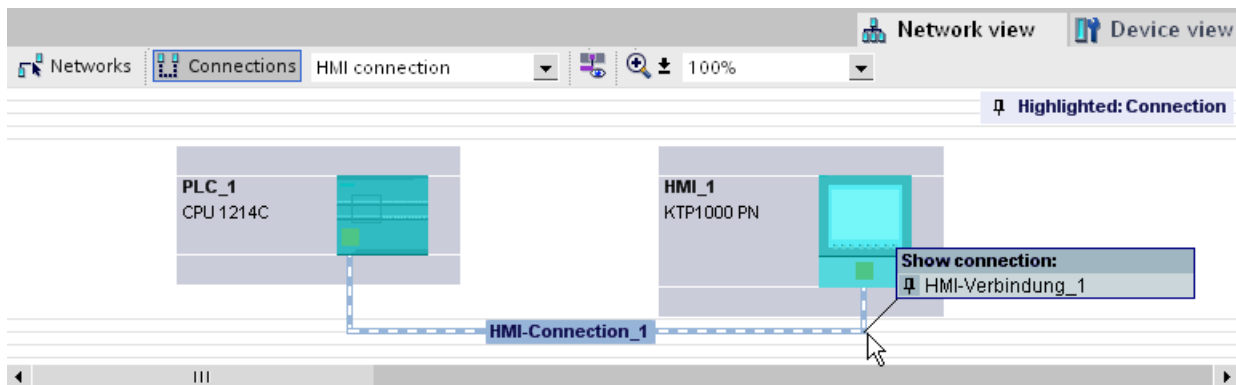

## Specifying a connection

If both partners for the connection type selected are networked on the same network, use the graphic or interactive selection of both communication partners to create a fully specified connection.

This connection is entered automatically in the connection table of the S7-1200 CPU. A local connection name is assigned for this connection.

The following schematic shows a configured connection with a networked device:

## Creating a new connection graphically

### Graphically configuring connections

In the case of graphic connection configuration, the connection path is automatically specified provided interfaces and resources are available. Select the devices to be connected in the current configuration.

### Automatically determining connection path

To create a connection graphically, follow these steps:

1. Click the "Connections" button.

This step activates the connection mode: You can now select the connection type you want. You will see this from the following:  
The devices that can be used for the connection type selected in your project are color-highlighted in the network view.

2. Hold down the mouse button and drag the mouse pointer from the device from which the connection will originate to the device at which the connection ends.

3. Release the mouse button over the destination device to create the connection between the two devices.

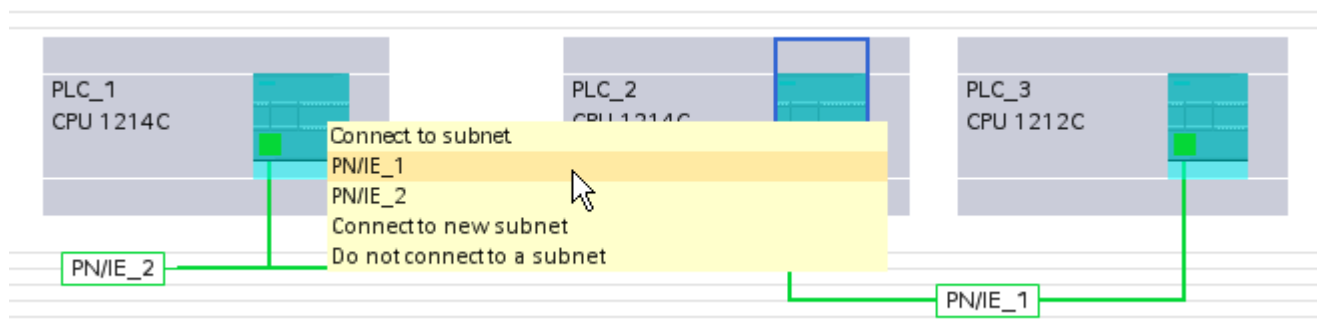

### Result

- A specified connection is created.
- The connection path is highlighted.
- The connection is entered in the connection table.

### Configuring a connection when there is no or no clear network assignment

Any networking not in place will if possible be created automatically when a connection is created. A query will be made upon completion of connection configuration if unique network assignment is not possible. You will be able to choose from the existing subnets.

Example below: A query is made upon creation of a connection between stations PLC\_1 and PLC\_2, which are not yet networked.

## Interactively creating a new connection

### Interactively configuring connections

Define the local device and its connection partners.

### Procedure

Proceed as follows to interactively create a connection:

1. Select the "Add new connection" command in the shortcut menu of a connection partner for which you want to create a connection.  
The "Create new connection" dialog appears.
2. Select the partner endpoint.  
In the right pane of the dialog, a possible connection path fitting the selected endpoint is displayed, if available. Incomplete paths, for example, for a non-specified CPU, are marked by an exclamation mark on a red background.
3. To accept the configured connection and to configure additional connections to other endpoints, click "Add".  
To close the dialog, click "OK".

## Working in the network view

### Highlighting connection path and partner in the network view

To display the connection partners for all or certain connection types in the network view, proceed as follows:

1. Click the "Connections" button.

2. Select the S7-CPU for which you want to display the connection partners in the network view and then select the "Highlight connection partners" command in the shortcut menu.
3. Select "All connection partners" in the following menu.  
The local device and the CPUs of the target devices are selected. The local connection partner shows an arrow pointing right and the remote connection partners show an arrow pointing left.
4. To open a list with information on the target devices, click the arrow of the local device.  
This additional function is useful in complex network configurations in which some devices are not visible.

---

**Note**

You can display one of the connection partners which cannot be seen in the current display range of the network view. Click on the communication partner in the list that appears. Result: The display is moved such that the connection partner becomes visible.

---

## Working with the connection table

### Basic functions for tables

The connection table supports the following basic functions for editing a table:

- Changing column width
- Displaying the meaning of a column, a row or cell using tooltips.

### Changing column width

To adjust the width of a column to the content so that all texts in the lines are legible, follow these steps:

1. Position the cursor in the header of the connection table to the right of the column that you want to optimize until the cursor changes its shape to two parallel lines (as if you wanted to change the width of the column by dragging it with the cursor).
2. Double click on this point.

or

1. Open the shortcut menu on the header of the table.
2. Click on
  - "Optimize column width" or
  - "Optimize width of all columns".

For columns that are too narrow, the complete content of specific fields is shown when you pause with the cursor on the respective field.

### Show / hide columns

You can use the shortcut menu of the header of the connection table to control the display of the various table columns. The shortcut menu entry "Show/hide columns" provides you with an overview of the available columns. Use the check box to control whether columns are shown or hidden.

If you want to store the layout, width and visibility of the table columns, click on the "Remember layout" function in the top right-hand of the network view.

Symbol	Meaning
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

### Using cursor keys to move within the connection table

You can use the UP and DOWN cursor keys to select a connection from the connection table; the selected connection is marked and is shown highlighted in the network view.

### Changing properties of connection

You can directly edit some of the parameters displayed in the connection table. The name of the connection can, for example, only be changed in the connection table.

### Changing connection partners

You can change the connection partner of a connection as follows:

1. Select the connection.
2. Select the new connection partner from the open drop-down list in the "Partner" column.

### Deleting connections

You can delete configured connections using the network view or the connection table.

In the network view you can delete one highlighted connection per action. In the connection table you can delete one or several connections per action.

### Procedure

To delete a connection, follow these steps:

1. Select the connection to be deleted:
  - In the network view: Select the connection to be deleted.
  - In the connection table: Select the rows of the connections to be deleted (multiple selection possible).
2. Open the shortcut menu with a right mouse click.
3. Select the "Delete" command.

### Result

The selected connection is removed completely.

## Copying connections

### Introduction

Connections are not copied singly but always in context along with the project or the device.

You can copy:

- Entire projects
- One or more devices within a project or from one project to another

### Copying a project

When you copy a project all configured connections will also be copied. No settings whatsoever are required for the copied connections because the connections remain consistent.

### Copying devices

If you copy devices for which connections have been configured, the connections are copied as well. To complete the connection path, you must still finalize the networking.

An S7-1200 CPU with a V.10 firmware is merely a server for connections and has no connection configuration itself. Consequently, no connections are copied along with it when an S7-1200 CPU with a V1.0 firmware is copied.

### Inconsistent connections - connections without assignment

With an inconsistent connection the structure of the connection data is destroyed or the connection is not functional in the project context.

Inconsistent connections cannot be compiled and loaded - operation is not possible with such a connection.

In the connection table inconsistent connections are marked in red.

### Possible causes for inconsistent connections

- Deletion or change of the hardware configuration.
- Missing interface network links in the project, which are necessary for a connection.
- Connection resources are exceeded
- Connections to an unspecified connection partner without partner address information.

Detailed information regarding the reasons for the inconsistency can be found in the "Compile" tab following compilation (Edit > Compile).

### Remedies

To assign a closed connection path to an existing open connection path, expand the device configuration in such a way that the interfaces required for the connection type are available

for both partners. At "Properties > General > Interface" in the Inspector window, you can use the "Find connection path" button to create a connection to an existing partner.

## **S7 connection - general settings**

### **General connection parameters**

General connection parameters are displayed in the "General" parameter group under the properties of the connection; these connection parameters identify the local connection end point.

Here, you can assign the connection path and specify all aspects of the connection partner.

### **Local ID**

The local ID of the module from which the connection is viewed is displayed here (local partner). You can change the local ID. You may need to do this if you have already programmed communication function blocks, and you want to use the local ID specified in those function blocks for the connection.

### **Special connection properties**

Display of connection properties (can be modified depending on the components used):

- One-way  
One-way means that the connection partner functions as a server on this connection and cannot send or receive actively.
- Active connection establishment  
In the case of one-way connection, for example with a S7-1200 CPU (firmware version V1.0), a connection partner can only be provided for the active connection establishment. In the case of a two-way connection you can set which connection partner will assume the active role.
- Sending operating mode messages  
Indicates whether or not the local partner sends operating mode messages to the connection partner.

### **Address details**

Displaying address details of the S7 connection. With an unspecified partner, the values for the rack and slot can be changed. All other values are obtained from the current configuration and cannot be changed.

## **S7 connection - address details**

### **Meaning**

The address details show the end points of the connection and can localize these via the specification of rack and slot.

When a connection is established, the connection-specific resources of a module are assigned specifically to this connection. This assignment requires that the connection resource can be addressed. The TSAP (Transport Service Access Point) is, as it were, the address of the resource that is formed with the help of the connection resource or, in the case of S7-1200 CPUs (firmware V2.0 or higher) with the SIMATIC-ACC (SIMATIC Application Controlled Communication).

### Configuration of TSAP for S7-1200

- For S7-1200 CPU (firmware V2.0 or higher):  
"SIMATIC-ACC"<nnn><mm>  
nnn = Local ID  
mm = any value
- For S7-1200 CPU (firmware V1.0):  
<xx>.<yz>  
xx = Number of the connection resource  
y = Rack number  
z = Slot number

### TSAP structure, dependent on partner

The configuration of the TSAP for S7-1200 CPUs is dependent on the respective firmware and on the remote connection partner. When a S7-1200 CPU is connected with a S7-300/400 CPU, a S7-1200 CPU also uses a TSAP configuration that includes the connection resource.

See the following examples for TSAPs of various connection configurations

- Connection between two S7-1200 CPUs (both with firmware V2.0):
  - S7-1200 CPU "A" with firmware V2.0 and local ID 100:  
TSAP: SIMATIC-ACC10001
  - S7-1200 CPU "B" with firmware V2.0 and local ID 5AE:  
TSAP: SIMATIC-ACC5AE01
- Connection between two S7-1200 CPUs (firmware V2.0 and V1.0):
  - S7-1200 CPU with firmware V2.0 and local ID 1FF:  
TSAP: SIMATIC-ACC1FF01
  - S7-1200 CPU with firmware V1.0 (rack 0, slot 1, connection resource 03):  
TSAP: 03.01
- Connection between S7-1200 CPUs (firmware V2.0) and S7-300/400 CPU:
  - S7-1200 CPU with firmware V2.0 (rack 0, slot 1, connection resource 12):  
TSAP: 12.01
  - S7-300/400 CPU (rack 0, slot 2, connection resource 11):  
TSAP: 11.02

## S7 connections via CM/CP

### Introduction

S7-1200 CPUs with a firmware version of V2.0 or higher support one-way and two-way S7 connections via CM/CP interfaces. This increases the number of Ethernet ports and networks that can be used for S7 connections. Even though the connection is then guided via the CM/CP, the associated S7-1200 CPU is an end point of the connection. The other end point can be any other device in the case of two-way connections. This other device must also support S7 connections.

### Data volumes and configuration limit

The number of communication connections which are supported by CM/CP can be found in the manual accompanying every CM/CP. The number of connections per device can be further increased by adding other CM/CPs.

If several CM/CPs are fitted in a device, an automatic switch is made to the next CM/CP when this limit is exceeded. Specifically assign the connections using the path selection as required.

---

**Note**

Data transfer > 240 byte transfer is supported by the current CPs.

CPs with an older product version support the transfer of data with a data length of up to 240 bytes.

For more information, refer to the details provided in the Ethernet CP equipment manual.

---

### Tasks of the Ethernet CM/CP in online mode

During data transfer via a connection, the Ethernet CM/CP takes on the following tasks:

- Receiving  
Receiving data from the Ethernet and forwarding to the user data area in the CPU
- Sending  
Transferring data from the user data area of the CPU and sending data via the Ethernet

The connection is established automatically as soon as the partner can be reached.

## HMI connection

### Introduction to configuring connections

#### Definition

A connection defines a logical assignment of two communication partners in order to undertake communication services. A connection defines the following:

- Communication partner involved
- Type of connection (e.g., HMI connection)
- Special properties (e.g., whether a connection is established permanently or whether it is established and terminated dynamically in the user program, and whether status messages are to be sent)
- Connection path

#### What you need to know about connection configuration

During connection configuration, a local connection name is assigned for an HMI connection as a unique local identification.

In the network view, a "Connections" tab is displayed in addition to the "Network overview" tab. This tab contains the connection table. A line in this connection table represents a configured connection, e.g., between an HMI device and PLC, along with its properties.

#### What you need to know about using connection resources

##### Introduction

Each connection requires connection resources for the end point and/or transition point on the devices involved. The number of connection resources is device-specific.

If all the connection resources of a communication partner are assigned, no new connections can be established. This situation is apparent when a newly created connection in the connection table has a red background. The configuration is then inconsistent and cannot be compiled.

##### HMI connections

For HMI connections via the **integrated** PN interface, one connection resource for the endpoint per HMI connection is occupied for the HMI device.

One connection resource is also required for the connection partner (PLC).

## Views containing information about the configured connections

The views described below will provide you with comprehensive access to all the information and functions regarding configuring and checking communication connections.

- Connection display in the network view
- Connection table
- "Properties" tab for a connection in the inspector window

The screenshot displays the WinCC interface for configuring connections. At the top, there are tabs for 'Topology view', 'Network view', and 'Device view'. The 'Network view' is active, showing a network diagram with two devices: 'PLC\_1 CPU 1214C' and 'HMI\_1 KTP1000 PN'. A dashed blue line connects them, labeled 'HMI connection\_1'. Below the diagram is a table of connections:

Local end po	Local connection name	Local ID	Partner ID	Partner	Connection type	One-way	Connection
HMI_1	HMI connection_1			PLC_1	HMI connection	✓	✓

Below the table is the 'Properties' window for 'HMI connection\_1'. It has tabs for 'General', 'IO tags', and 'Texts'. The 'General' tab is active, showing the following configuration:

**Connection**  
Offline status:

**Connection path**

Local	Partner
End point: HMI_1	PLC_1
Subnet: PN/IE_1	PN/IE_1
Address: 192.168.0.2	192.168.0.1

Additional settings include 'Scl Interface: ETHERNET, HMI IE SUBMODULE' and a 'Find connection path' button.

## **Benefits**

The information shown in these views are always up-to-date in terms of the current user actions. This means:

- The connection table displays all connections created.
- If you have selected a connection in the connection table:
  - You will graphically see the connection path in the network view.
  - The "Properties" tab in the Inspector window displays the parameters of this connection.

## **The connection table**

The connection table offers the following functions:

- List of all connections in the project
- Selection of a connection and display of connections associated with it in the network view
- Changing of connection partners
- Display showing status information

## **"Properties" tab for a connection in the inspector window**

The properties dialog has the following meaning:

- Display for connection parameters
- Display of connection path
- Subsequent specification of connections using the "Find connection path" button

## **Creating a new connection**

### **Creating a connection - alternatives**

You have the following options for creating a connection in the network view:

- Graphic connection configuration
- Interactive connection configuration

You'll find the individual steps for this in the following chapters.

## **Requirement and result**

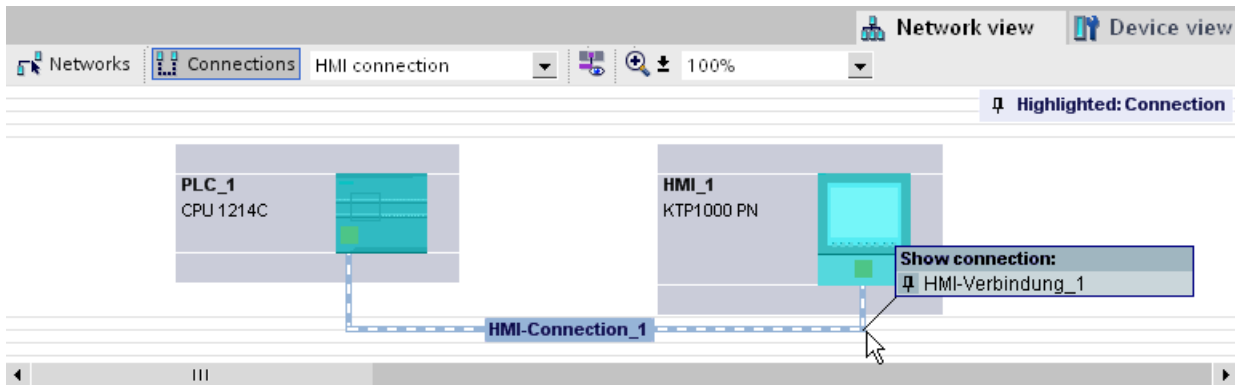

You have created the devices with CPUs and HMI devices between which you want to configure connections in the network view.

## Specifying a connection

If both partners for the connection type selected are networked on the same network, use the graphic or interactive selection of both communication partners to create a fully specified connection.

This connection is entered automatically into the connection table of the HMI device. A local connection name is assigned for this connection.

The following schematic shows a configured connection with a networked device:

## Creating a new connection graphically

### Graphically configuring connections

When using the graphic connection configuration, if necessary the system asks you to define the connection path. Select the devices to be connected in the current configuration.

### Automatically determining connection path

To create a connection graphically, follow these steps:

1. Click the "Connections" button.

The connection mode for the connection type you have selected is then activated.

You will see this from the following:

The devices that can be used for the connection type selected in your project are color-highlighted in the network view.

2. Hold down the mouse button and drag the mouse pointer from the device from which the connection will originate to the device at which the connection ends.

3. Release the mouse button over the destination device to create the connection between the two devices.

### Result

- A specified connection is created.
- The connection path is highlighted.
- The connection is entered in the connection table.

### Interactively creating a new connection

### Interactively configuring connections

Define the local device and its connection partners.

## Procedure

Proceed as follows to interactively create a connection:

1. Select the "Create new connection" command in the shortcut menu of a connection partner for which you want to create a connection.  
The "Create new connection" dialog is opened.
2. Select the partner endpoint.  
In the right pane of the dialog, a possible connection path fitting the selected endpoint is displayed, if available. Incomplete paths, for example, for a non-specified CPU, are marked by an exclamation mark on a red background.
3. To close the dialog, click "OK".  
To accept the configured connection and to configure additional connections to other endpoints, click "Apply".

## Working in the network view

### Highlighting connection path and partner in the network view

To display the connection partners for all or certain connection types in the network view, proceed as follows:

1. Click the "Connections" button.

2. Select the "Highlight connection partners" command in the shortcut menu for the HMI device whose connection partners you want to display in the network view.
3. Select "All connection partners" in the following menu.  
The local device and the CPUs of the target devices are selected. The local connection partner shows an arrow pointing right and the remote connection partners show an arrow pointing left.
4. To open a list with information on the target devices, click the arrow of the local device.  
This additional function is useful in complex network configurations in which some devices are not visible.

### Note

You can display one of the connection partners which cannot be seen in the current display range of the network view. Click on the communication partner in the list that appears. Result: The display is moved such that the connection partner becomes visible.

## See also

Creating a new connection graphically (Page 525)

## Working with the connection table

### Basic functions for tables

The connection table supports the following basic functions for editing a table:

- Changing column width
- Displaying the meaning of a column, a row or cell using tooltips.

### Changing column width

To adjust the width of a column to the content so that all texts in the lines are legible, follow these steps:

1. Position the cursor in the header of the connection table to the right of the column that you want to optimize until the cursor changes its shape to two parallel lines (as if you wanted to change the width of the column by dragging it with the cursor).

2. Double click on this point.

or

1. Open the shortcut menu on the header of the table.
2. Click on
  - "Optimize column width" or
  - "Optimize width of all columns".

For columns that are too narrow, the complete content of specific fields is shown when you pause with the cursor on the respective field.

### Show / hide columns

You can use the shortcut menu of the header of the connection table to control the display of the various table columns. The shortcut menu entry "Show/hide columns" provides you with an overview of the available columns. Use the check box to control whether columns are shown or hidden.

### Using cursor keys to move within the connection table

You can use the UP and DOWN cursor keys to select a connection from the connection table; the selected connection is marked and is shown highlighted in the network view.

### Changing properties of connection

You can directly edit the parameters displayed in the connection table in some cases. To change the name of a connection, you do not have to navigate to the Inspector window.

## Changing connection partners

You can change the connection partner of a connection as follows:

1. Select the connection.
2. Select the new connection partner from the open drop-down list in the "Partner" column.

## Deleting connections

You can delete configured connections using the network view or the connection table.

In the network view you can delete one highlighted connection per action. In the connection table you can delete one or several connections per action.

## Procedure

To delete a connection, follow these steps:

1. Select the connection to be deleted:
  - In the network view: Select the connection to be deleted.
  - In the connection table: Select the rows of the connections to be deleted (multiple selection possible).
2. Open the shortcut menu with a right mouse click.
3. Select the "Delete" command.

## Result

The selected connection is removed completely.

## Copying connections

### Introduction

Connections are not copied singly but always in context along with the project or the device.

You can copy:

- Entire projects
- One or more devices within a project or from one project to another

### Copying a project

When you copy a project all configured connections will also be copied. No settings whatsoever are required for the copied connections because the connections remain consistent.

## **Copying devices**

If you copy devices for which connections have been configured (HMI devices), the connections are copied as well. To complete the connection path, you must still finalize the networking.

An S7-1200 CPU with a V.10 firmware is only a server for connections and has no connection configuration itself. Consequently, no connections are copied along with it when an S7-1200 CPU with a V1.0 firmware is copied.

## **Inconsistent connections - connections without assignment**

With an inconsistent connection the structure of the connection data is destroyed or the connection is not functional in the project context.

Inconsistent connections cannot be compiled and loaded - operation is not possible with such a connection.

In the connection table inconsistent connections are marked in red.

## **Possible causes for inconsistent connections**

- Deletion or change of the hardware configuration.
- Missing interface network links in the project, which are necessary for a connection.
- Connection resources are exceeded
- Errors when backing up data due to insufficient memory
- Connections to an unspecified connection partner without partner address information.

Detailed information regarding the reasons for the inconsistency can be found in the "Compile" tab following compilation (Edit > Compile).

## **Remedies**

If the connection cannot be repaired by opening the connection properties, changing them or undoing them in the configuration, then it may be necessary to delete the connection and re-create it.

## **HMI connection general settings**

### **General connection parameters**

General connection parameters are displayed in the "General" parameter group under the properties of the connection; these connection parameters identify the local connection end point.

Here, you can also assign the connection path and specify all aspects of the connection partner.

## Special connection properties

Display of the connection properties (cannot be changed):

- Active connection establishment  
The connection establishment always starts from the HMI device. This option is selected by default if the address of the partner is specified.
- One-way  
One-way means that the connection partner functions as a server on this connection and cannot send or receive actively.
- Sending operating mode messages  
Not relevant for HMI devices.

## Address details

Displaying address details of the HMI connection. With an unspecified partner, the values for the rack and slot can be changed. All other values are obtained from the current configuration and cannot be changed.

## Miscellaneous

Display of the access points for the online connection between HMI device and connection partner.

## Using Open User Communication

### Basics of Open User Communication

#### Introduction

Open User Communication is the name given to a program-controlled communication process for communicating via the integrated PN/IE interface of the S7-1200/1500 and S7-300/400 CPUs. Different connection types are available for this communication process.

The main feature of Open User Communication is its high degree of flexibility in terms of the data structures transferred. This allows open data exchange with any communicating devices providing they support the connection types available here. Since this communication is controlled solely by instructions in the user program, event-driven connection establishment and termination is possible. Connections can also be modified by the user program during runtime.

For CPUs with an integrated PN/IE interface, the TCP, UDP, and ISO-on-TCP connection types are available for Open User Communication. The communication partners can be two SIMATIC PLCs or a SIMATIC PLC and a suitable third-party device.

## Instructions for Open User Communication

To create the connections, you have various instructions available after opening in the program editor in the "Instructions > Communication > Open User Communication" task card:

- Compact instructions for sending or receiving data via the integrated functions for establishing and terminating the connection (S7-1200/1500 only):
  - TSEND\_C (connection establishment/termination, sending)
  - TRCV\_C (connection establishment/termination, receiving)
- Individual instructions for sending and receiving data or for establishing or terminating connections:
  - TCON (connection establishment)
  - TDISCON (connection termination)
  - TSEND (TCP or ISO-on-TCP: Sending)
  - TRCV (TCP or ISO-on-TCP: Receiving)
  - TUSEND (UDP: Sending)
  - TURCV (UDP: Receiving)

## Connection establishment

For Open User Communication, instructions for establishing and terminating the connection must exist for both communication partners. One communication partner sends its data using TSEND, TUSEND or TSEND\_C while the other communication partner receives the data using TRCV, TURCV or TRCV\_C.

One of the communication partners starts the connection establishment as the active partner. The other communication partner reacts by starting its connection establishment as the passive partner. If both communication partners have initiated their connection establishment, the communication connection is fully established.

## Connection configuration

You can specify establishment of the connection via a connection description DB with the TCON\_Param, TCON\_IP\_v4, or TCON\_IP\_RFC structure by means of parameter assignment as follows:

- Manually create, assign parameters and write directly to the instruction.
- Supported by connection configuration.

Connection configuration supports the establishment of the connection and should, therefore, be given preference over the other methods.

You specify the following in the connection configuration:

- Connection partner
- Connection type
- Connection ID

- Connection description DB
- Address details according to selected connection type

In addition, you specify here which communication partner activates the connection establishment and which partner establishes a connection passively in response to a request from its communication partner.

## **See also**

Principle of operation of connection-oriented protocols (Page 545)

## **Connection configuration**

### **Overview of connection configuration**

#### **Introduction**

You can find the connection configuration in the inspector window of the program editor if you want to program Open User Communication with the communication instructions TSEND\_C, TRCV\_C or TCON.

Connection configuration supports the flexible functionality of communication programming: The parameters entered for the connection configuration are stored in an automatically generated global DB derived from the TCON\_Param, TCON\_IP\_v4 or TCON\_IP\_RFC structure. You can modify the connection parameters in this connection description DB.

## **Structure of the connection configuration**

The connection configuration is made up of the following components:

The screenshot displays the WinCC interface for configuring a TCON block. The top window shows a ladder logic diagram with a TCON block (labeled 1) connected to a data base (%DB3 "TCON\_DB"). The block's EN input is set to False, and its ID is set to 1. The CONNECT input is linked to the data base %DB2 "PLC\_1\_Send\_DB".

The bottom window shows the Properties dialog box for the TCON block, with the Configuration tab selected (labeled 2). The Connection parameter section (labeled 3) is expanded, showing the following settings:

- General:**
  - End point: Local (PLC\_1) and Partner (PLC\_2) (labeled 4)
  - Interface: CPU 1215C DC/DC/Rly, PF
  - Subnet: PN/IE\_1
  - Address: Local (192.168.0.2) and Partner (192.168.0.1)
  - Connection type: TCP
  - Connection ID (dec): 1
  - Connection data: Local (PLC\_1\_Send\_DB) and Partner (PLC\_2\_Receive\_DB)
  - Establish active connection: Local (checked), Partner (unchecked)
- Address details:**
  - Port (decimal): Local (empty), Partner (2000) (labeled 5)

### *8.1 Configuring devices and networks*

- ① Communication instruction for TCON, TSEND\_C or TRCV\_C
- ② "Configuration" tab in the "Properties" tab
- ③ Area navigation of the "Configuration" tab
- ④ General properties of the connection parameters
- ⑤ Address details of the connection parameters (for selected connection DBs)

#### **"Configuration" tab**

Enter the desired connection parameters in the "Configuration" tab. The area navigation of the "Configuration" tab includes the "Connection parameters" group. This group contains the connection configuration. Here, you can enter the parameters for the connections and the address details with system support. Here, you also connect the CONNECT (TCON, TSEND\_C, TRCV\_C) or ID (TCON, TSEND, TRCV, TUSEND, TURCV) block parameters of the selected communication instructions.

When all the required parameters are assigned, a check mark is set in front of the "Connection parameters" group in the area navigation.

---

#### **Note**

The connection parameter assignment does not check whether the connection IDs and port numbers (TCP, UDP) or TSAPs (ISO-on-TCP, ISO) are unique. When you configure Open User Communication, you should, therefore, make sure that the parameter settings are unique within a device.

---

Connection parameters with structure according to TCON\_IP\_RFC (Page 551)

## Description of the connection parameters

### Overview

The following table shows the general connection parameters:

Parameter	Description
End point	<p>The names of the local end point and the partner end point are shown.</p> <p>The local end point is the CPU for which TCON, TSEND_C or TRCV_C is programmed. The local end point is, therefore, always known.</p> <p>The partner end point is selected from the drop-down list. The drop-down list shows all available possible connection partners including unspecified connection partners for devices whose data is unknown in the project.</p> <p>For S7-1500, broadcast can be selected as the partner end point (message to all subnet devices). For S7-1500 CPs/CMs, multicast can also be selected as the partner end point (message to a group within the subnet). The connection type is converted automatically to UDP in this case.</p> <p>As long as no connection partner is set, all other parameters in the mask are disabled.</p>
Interface	<p>The interface of the local end point is displayed. If multiple interfaces are available, e.g., by means of CPs or CMs, the interface can be selected from the drop-down list. To display or select the partner interface, a specified partner end point must first be selected.</p>
Subnet	<p>The subnet of the local end point is displayed, provided this exists. The partner subnet is displayed only after the partner end point has been selected.</p> <p>If at least one of the two connection partners is not connected with a subnet, the two connection partners are connected with each other.</p> <p>A connection between partners in different subnets is only possible with IP routing. The IP routing settings can be edited in the properties of the relevant Ethernet interfaces.</p>
Address	<p>The IP address of the local end point is displayed. The IP address of the partner is displayed only after the partner end point has been selected.</p> <p>If you have selected an unspecified connection partner, the input box is empty and has a red background. In this case, you need to specify a valid IP address.</p> <p>Broadcast (S7-1500 only): If "Broadcast" is set as the partner end point, a non-editable IP address with host address 255 is entered automatically for the connection partner. The network allocation corresponds to that of the sender. Example: Local IP address 192.168.0.1, partner IP address 192.168.0.255.</p> <p>Multicast (S7-1500 CPs/CMs only): If "Multicast" is set as the partner end point, the editable IP address 224.0.1.0 is entered automatically for the connection partner.</p>
Connection type	<p>Select the connection type you want to use from the "Connection type" drop-down list:</p> <ul style="list-style-type: none"> <li>• TCP</li> <li>• ISO-on-TCP</li> <li>• UDP</li> </ul> <p>With the S7-1500, you can also select the ISO connection type at the configuration type of the configured connections for TSEND_C and TRCV_C or TCON.</p> <p>The connection types can only be used for partners that support the corresponding protocol.</p>

8.1 Configuring devices and networks

Parameter	Description
Connection type (for S7-1500 only)	<p>With the S7-1500, two different configuration types can be set for TSEND_C and TRCV_C:</p> <ul style="list-style-type: none"> <li>• Programmed connections use program blocks for the connection description.</li> <li>• Configured connections are saved for the configuration and are only created after download to the device in runtime. You can also use the configured connection to select the connection type ISO.</li> </ul> <p>The specified configuration method depends on the selected connection type. If both configuration methods are possible, the programmed connection is preset.</p> <p>The same configuration method must be set for both connection partners.</p>
Connection ID	<p>Enter the connection ID in the input box. You can change the connection ID in the input boxes or enter it directly in TCON.</p> <p>Ensure that the connection ID assigned is unique within the device.</p>
Connection data	<p>The names of the connection description DBs for the connection description structured according to TCON_IP_v4, TCON_IP_RFC or TCON_Param are displayed in the drop-down lists.</p> <p>The drop-down list is still empty after selection of a connection partner. You can use the drop-down list to generate a new data block or to select an existing data block. This data block is filled automatically with the values from the connection configuration. The name of the selected data blocks is entered automatically in the CONNECT block parameter of the selected TSEND_C, TRCV_C or TCON instruction.</p> <p>From the drop-down list, you can also reference another valid data block. If a DB is referenced using the CONNECT input parameter of the TSEND_C, TRCV_C or TCON extended instructions and this does not correspond to the structure of a TCON_IP_v4, TCON_IP_RFC or TCON_Param, the drop-down list is shown with no content on a red background.</p>
Connection name (for S7-1500 only)	<p>If the connection type of the configured connections is set for TSEND_C and TRCV_C for the S7-1500, the "Connection data" parameter is replaced with the "Connection name" parameter. The name of the configured connection serves here as the connection data.</p> <p>The drop-down list is still empty after selection of a connection partner. You can use the drop-down list to generate a new connection or to select an existing connection. If needed, a data block is created and automatically filled with the values from the connection configuration. The name of the data block is entered automatically in the CONNECT block parameter of the TSEND_C or TRCV_C instruction.</p> <p>You can also reference an existing connection from the drop-down list.</p>
Active connection establishment	<p>Use the "Active connection establishment" check box to specify the active partner of the Open User Communication (only with TCP and ISO-on-TCP).</p>
Port (only with TCP and UDP)	<p>Address component for a TCP or UDP connection. The default after creating a new TCP connection is 2000.</p> <p>You can change the port numbers.</p> <p>The port numbers must be unique on the device!</p>
TSAP (ISO-on-TCP only)	<p>Address component for an ISO-on-TCP connection. The default value after creating a new ISO-on-TCP connection is E0.01.49.53.4F.6F.6E.54.43.50.2D.31 (S7-1200/1500) or E0.02.49.53.4F.6F.6E.54.43.50.2D.31 (S7-300/400).</p> <p>You can enter the TSAP-ID with an extension or as an ASCII TSAP.</p> <p>The TSAPs must be unique on the device!</p>

**Note****UDP connection for the "Broadcast" setting (S7-300/400/1200)**

The parameters of the UDP connection for the "Broadcast" setting for the partner end point are stored in a connection description DB TCON\_IP\_v4 : With respect to UDP communication with TCON and TUSEND/TURCV , the TCON\_IP\_v4 is not filled with any partner parameters (value=0). However, the partner address and the partner port are necessary for sending the data and must be entered by the user in the TADDR\_Param . The TADDR\_Param for UDP communication is referenced by the TUSEND-/TURCV block parameter ADDR . The values for both parameters can be taken from the connection configuration.

The configuration must also be adapted for the other recipients of UDP communication. In order to receive broadcast frames, the partner port must be configured at the receiver end. For this purpose, the RemotePort parameter of the TADDR\_Param must be filled at the ADDR block.

---

**Note****Communication via TSEND\_C and TRCV\_C (S7-1500)**

When TSEND\_C and TRCV\_C are used, a separate TSEND\_C and TRCV\_C block pair with a configured connection is required for each communication. Multiple TSEND\_C and TRCV\_C block pairs cannot simultaneously use the same configured connection for communication.

Additional connections for a TSEND\_C or TRCV\_C instruction can be created in the inspector window for the connection parameters using the appropriate button next to the connection data.

The connections configured using TSEND\_C and TRCV\_C are displayed in a connection table in the inspector window under "Properties > Configuration > Overview of configured connections" when the TSEND\_C or TRCV\_C block is selected.

## Starting connection parameter assignment

The connection configuration for Open User Communication is enabled as soon as a TCON, TSEND\_C or TRCV\_C instruction for communication is selected in a program block.

### Requirement

- Your project must contain at least one S7-CPU.
- The program editor is open.
- A network is available.

### Procedure

To insert the extended instructions for Open User Communication, proceed as follows:

1. Open the task card, pane and folder "Instructions > Communication > Open User Communication".
2. Drag one of the following instructions to a network:
  - TSEND\_C
  - TRCV\_C
  - TCON

The "Call options" dialog opens.

3. Edit the properties of the instance DB in the "Call properties" dialog. You have the following options:
  - Change the default name.
  - Select the "Manual" check box to assign your own number.
  - You can also execute the DB as a multi-instance for function blocks.
4. Click "OK" to complete your entry.

### Result

A corresponding instance DB is created at a single instance for the inserted instruction TSEND\_C, TRCV\_C or TCON. In the case of a multi-instance, the instance DB of the function block is used.

With TSEND\_C, TRCV\_C or TCON selected, you will see the "Configuration" tab under "Properties" in the Inspector window. The "Connection parameters" group in area navigation contains the connection parameter assignment that you can now make.

### See also

Creating and assigning parameters to connections (Page 541)

## Creating and assigning parameters to connections

In the connection configuration for Open User Communication, you can create and configure connections of the TCP, UDP or ISO-on-TCP type.

### Requirement

A CPU exists with a TCON, TSEND\_C or TRCV\_C communication instruction.

### Procedure

To create a connection for Open User Communication, follow these steps:

1. Select a TCON, TSEND\_C or TRCV\_C block of Open User Communication in the program editor.
2. Open the "Properties > Configuration" tab in the inspector window.
3. Select the "Connection parameters" group. Until you select a connection partner, only the empty drop-down list for the partner end point is enabled. All other input options are disabled.

The connection parameters already known are displayed:

- Name of the local end point
- Interface of the local end point
- IP address of the local end point

4. In the drop-down list box of the partner end point, select a connection partner. You can select an unspecified device or a CPU in the project as the communication partner. Certain connection parameters are then entered automatically.

The following parameters are set:

- Name of the partner end point
- Interface of the partner end point
- IP address of the partner end point

If the connection partners are networked, the name of the subnet is displayed.

5. With the S7-1500, in the "Configuration type" drop-down list, you choose between using program blocks or configured connections.

6. Select an existing connection description DB in the "Connection data" drop-down list or for configured connections select an existing connection under "Connection name". You can also create a new connection description DB or a new configured connection. Later, you can still select other connection description DBs or configured connections or change the names of the connection description DBs in order to create new data blocks:
  - You can also see the selected data block at the interconnection of the CONNECT input parameter of the selected TCON, TSEND\_C or TRCV\_C instruction.
  - If you have already specified a connection description DB for the connection partner using the CONNECT parameter of the TCON, TSEND\_C or TRCV\_C instruction, you can either use this DB or create a new DB.
  - If you edit the name of the displayed data block in the drop-down list, a new data block with the changed name but with the same structure and content is generated and used for the connection.
  - Changed names of a data block must be unique in the context of the communication partner.
  - A connection description DB must have the structure TCON\_Param, TCON\_IP\_v4 or TCON\_IP\_RFC, depending on CPU type and connection.
  - A data block cannot be selected for an unspecified partner.

Additional values are determined and entered after the selection or creation of the connection description DB or configured connection.

The following is valid for specified connection partners:

- ISO-on-TCP connection type
- Connection ID with default of 1
- Active connection establishment by local partner
- TSAP ID
  - for S7-1200/1500: E0.01.49.53.4F.6F.6E.54.43.50.2D.31
  - for S7-300/400: E0.02.49.53.4F.6F.6E.54.43.50.2D.31

The following is valid for unspecified connection partners:

- TCP connection type
- Partner port 2000

The following applies for a configured connection with a specified connection partner:

- TCP connection type
- Connection ID with default of 257
- Active connection establishment by local partner
- Partner port 2000

The following applies for a configured connection with an unspecified connection partner:

- TCP connection type
- Local port 2000

7. Enter a connection ID as needed for the connection partner. No connection ID can be assigned to an unspecified partner.

---

**Note**

You must enter a unique value for the connection ID at a known connection partner. The uniqueness of the connection ID is not checked by the connection parameter settings and there is no default value entered for the connection ID when you create a new connection.

---

8. Select the desired connection type in the relevant drop-down list. Default values are set for the address details depending on the connection type. You can choose between the following:
  - TCP
  - ISO-on-TCP
  - UDP

For configured connections with S7-1500, ISO applies in addition.

9. You can edit the input boxes in the address details. Depending on the selected protocol, you can edit the ports (for TCP and UDP) or the TSAPs (for ISO-on-TCP and ISO).
10. Use the "Active connection establishment" check box to set the connection establishment characteristics for TCP, ISO and ISO-on-TCP. You can decide which communication partner establishes the connection actively.

Changed values are checked immediately for input errors by the connection configuration and entered in the data block for the connection description.

---

**Note**

Open User Communication between two communication partners can only work when the program section for the partner end point has been downloaded to the hardware. To achieve fully functional communication, make sure that you load not only the connection description of the local CPU on the device but also that of the partner CPU as well.

## Deleting connections

### Introduction

The data of a created connection for Open User Communication is stored in a connection description DB. You can delete the connection by deleting the data block containing the connection description.

### Requirement

You have created an Open User Communication connection.

### Procedure

To delete a connection, follow these steps:

1. Select a communication partner for Open User Communication in the project tree.
2. Open the "Program blocks > System blocks > Program resources" folder below the selected communication partner.
3. Select the "Delete" command from the shortcut menu of the data block with the connection parameter assignment.

---

#### Note

If you are not certain which block to delete, open the extended instruction TCON, TSEND\_C or TRCV\_C. You will find the name of the data block as the CONNECT input parameter or in the connection parameter assignment as the "Connection data" parameter.

If you only delete the instance DBs of the extended instructions TCON, TSEND\_C or TRCV\_C, the assigned connections are not deleted as well.

---

#### Note

If the connection DB is still being used by other blocks of the extended instructions, then the corresponding calls, their instance DBs, and, if present, the combination blocks TSEND\_C and TRCV\_C must also be deleted from the block folder, provided they are not used elsewhere.

This action prevents the program from being inconsistent.

---

## Result

You have deleted the connection.

---

### Note

Insert an extended instruction TCON, TSEND\_C, or TRCV\_C again in order to reference an existing connection description with the TCON\_Param, TCON\_IP\_v4, or TCON\_IP\_RFC structure again via the "Connection data" parameter.

---

## How protocols work

### Principle of operation of connection-oriented protocols

#### Introduction

Connection-oriented protocols establish a logical connection to the communication partner before data transmission is started. After the data transmission is complete, they then terminate the connection, if necessary. Connection-oriented protocols are used especially when reliable data transmission is important. Several logical connections can exist over one physical line.

Open User Communication supports the following connection types:

- TCP
- ISO-on-TCP
- ISO (S7-1500 only)
- UDP

Both communication partners must support the same connection type for a connection. If a communication partner does not support a connection of the type ISO-on-TCP, for example, use the connection type TCP instead, if it is supported.

For communication partners that cannot be configured in the TIA Portal, such as third-party devices or PCs, enter "unspecified" for the partner end point during connection parameter assignment. The required connection type for unspecified devices is listed in the respective documentation.

---

### Note

#### Connections with ISO

For S7-1500 CPUs, configured connections of the type ISO can be created using the TSEND\_C and TRCV\_C instructions. For additional information on these connection types, refer to the general connection descriptions.

---

## Characteristics of TCP

TCP is a streaming protocol in which the length of the data stream is transmitted to the receiver so that it can receive the data stream as individual TCP segments. This means no information about the start and end of a message is transmitted during data transmission via a TCP connection. The receiver cannot determine by the received segments of the data stream where one message in the data stream ends and the next one begins. It is therefore recommended that the number bytes to be received (parameter LEN, instruction TRCV/TRCV\_C) be assigned the same value as the number of bytes to be sent (parameter LEN, instruction TSEND/TSEND\_C).

If the length of the sent data and the length of the expected data do not match, the following occurs:

- Length of data to be received (parameter LEN, instruction TRCV/TRCV\_C) greater than length of data to be sent (parameter LEN, instruction TSEND/TSEND\_C):  
TRCV/TRCV\_C copies the received data to the specified receive area (parameter DATA) only after the assigned length is reached. When the assigned length is reached, data of the subsequent job are already being received. As a result, the receive area contains data from two different send jobs. If you do not know the exact length of the first message, you are unable to recognize the end of the first message and the start of the second message.
- Length of data to be received (parameter LEN, instruction TRCV/TRCV\_C) less than length of data to be sent (parameter LEN, instruction TSEND/TSEND\_C):  
TRCV/TRCV\_C copies the number of bytes you specified in the LEN parameter to the receive data area (parameter DATA). Then, it sets the NDR status parameter to TRUE (job completed successfully) and assigns RCVD\_LEN (amount of data actually received) the value of LEN. With each subsequent call, you receive a further block of the sent data.

A receive area with fixed data length can be specified in the TRCV/TRCV\_C instructions with the protocol version of the Ad-hoc mode.

## Characteristics of ISO-on-TCP

ISO-on-TCP is a message-oriented protocol which detects the end of the message at the receiver end and indicates the data that belongs to the message to the user. This does not depend on the specified reception length of the message. This means that information regarding the length and the end of a message is included during data transmission via an ISO-on-TCP connection.

If the length of the sent data and the length of the expected data do not match, the following occurs:

- Length of data to be received (parameter LEN, instruction TRCV/TRCV\_C) greater than length of data to be sent (parameter LEN, instruction TSEND/TSEND\_C):  
TRCV/TRCV\_C copies all the sent data to the receive data area (parameter DATA). Then, it sets the NDR status parameter to TRUE (job completed successfully) and assigns RCVD\_LEN (amount of data actually received) the length of the data sent.
- Length of data to be received (parameter LEN, instruction TRCV/TRCV\_C) less than length of data to be sent (parameter LEN, instruction TSEND/TSEND\_C):  
TRCV/TRCV\_C does not copy any data to the receive data area (parameter DATA), but instead supplies the following error information: ERROR=1, STATUS=W#16#8088 (destination buffer too small).

## Characteristics of UDP

UDP is a message-oriented protocol which detects the end of the message at the receiver end and indicates the data that belongs to the message to the user. This does not depend on the specified reception length of the message. This means that information on the length and the end of a message is included during data transmission via a UDP connection.

If the length of the sent data and the length of the expected data do not match, the following occurs:

- Length of data to be received (parameter LEN, instruction TRCV/TRCV\_C) greater than length of data to be sent (parameter LEN, instruction TUSEND/TSEND\_C):  
TUSEND/TSEND\_C copies all the sent data to the receive data area (DATA parameter). Then, it sets the NDR status parameter to TRUE (job completed successfully) and assigns RCVD\_LEN (amount of data actually received) the length of the data sent.
- Length of data to be received (parameter LEN, instruction TRCV/TRCV\_C) less than length of data to be sent (parameter LEN, instruction TUSEND/TSEND\_C):  
TRCV/TRCV\_C copies as much data to the receive data area (parameter DATA) as the LEN parameter requests. No further error message is generated. In this case, the user has to call a T\_URCV again in order to receive the remaining bytes.

## Connection parameters with structure according to TCON\_Param

### Data block for connection description

A connection description DB with a structure according to TCON\_Param is used for some S7-1200 CPUs when it comes to the assignment of parameters for TCP, UDP and ISO-on-TCP communication connections. The fixed data structure of the TCON\_Param contains all the parameters that are needed to establish the connection. The connection description DB is automatically created for a new connection by the connection configuration for Open User Communication when the TSEND\_C, TRCV\_C or TCON instruction is used.

The CONNECT connection parameter of the instance DBs for TSEND\_C, TRCV\_C or TCON contains a reference to the data block used.

### Structure of the connection description according to TCON\_Param

Byte	Parameter	Data type	Start value	Description
0 ... 1	block_length	UINT	64	Length: 64 bytes (fixed)
2 ... 3	id	CONN_OUC	1	Reference to this connection (value range: 1 to 4095). You must specify the value of this parameter for the TSEND_C, TRCV_C or TCON instruction under ID.

8.1 Configuring devices and networks

Byte	Parameter	Data type	Start value	Description
4	connection_type	USINT	17	Connection type: <ul style="list-style-type: none"> <li>• 17: TCP</li> <li>• 18: ISO-on-TCP</li> <li>• 19: UDP</li> </ul>
5	active_est	BOOL	TRUE	Identifier for the type of connection establishment: FALSE always applies to UDP, since data can be sent and received via local ID. The following is valid for TCP and ISO-on-TCP: <ul style="list-style-type: none"> <li>• FALSE: Passive connection establishment</li> <li>• TRUE: Active connection establishment</li> </ul>
6	local_device_id	USINT	1	ID for the local PN/IE interface.
7	local_tsap_id_len	USINT	0	Length of parameter local_tsap_id used, in bytes; possible values: <ul style="list-style-type: none"> <li>• 0 or 2, if connection type = 17 (TCP) Only the value 0 is permissible for the active side.</li> <li>• 2 to 16, if connection type = 18 (ISO-on-TCP)</li> <li>• 2, if connection type = 19 (UDP)</li> </ul>
8	rem_subnet_id_len	USINT	0	This parameter is not used.
9	rem_staddr_len	USINT	4	Length of address of partner end point, in bytes: <ul style="list-style-type: none"> <li>• 0: unspecified, in other words, parameter rem_staddr is irrelevant.</li> <li>• 4: valid IP address in the parameter rem_staddr (TCP and ISO-on-TCP only)</li> </ul>
10	rem_tsap_id_len	USINT	2	Length of parameter rem_tsap_id used, in bytes; possible values: <ul style="list-style-type: none"> <li>• 0 or 2, if connection type = 17 (TCP) Only the value 0 is permissible for the passive side.</li> <li>• 2 to 16, if connection type = 18 (ISO-on-TCP)</li> <li>• 0, if connection type = 19 (UDP)</li> </ul>
11	next_staddr_len	USINT	0	This parameter is not used.
12 ... 27	local_tsap_id	ARRAY [1..16] of BYTE	-	Local address component of connection: <ul style="list-style-type: none"> <li>• TCP and UDP: local port no. (possible values: 1...49151; recommended values: 2000...5000); local_tsap_id[1] = high byte of port no. in hexadecimal notation; local_tsap_id[2] = low byte of port no. in hexadecimal notation; local_tsap_id[3-16] = irrelevant</li> <li>• ISO-on-TCP: local TSAP-ID: local_tsap_id[1] = B#16#E0; local_tsap_id[2] = rack and slot of local end points (bits 0 to 4: Slot number, bits 5 to 7: rack number);  local_tsap_id[3-16] = TSAP extension, optional</li> </ul> Note: Make sure that every value of local_tsap_id is unique within the CPU.

Byte	Parameter	Data type	Start value	Description
28 ... 33	rem_subnet_id	ARRAY [1..6] of USINT	-	This parameter is not used.
34 ... 39	rem_staddr	ARRAY [1..6] of USINT	-	TCP and ISO-on-TCP only: IP address of the partner end point, for example, for 192.168.002.003: <ul style="list-style-type: none"> <li>• rem_staddr[1] = 192</li> <li>• rem_staddr[2] = 168</li> <li>• rem_staddr[3] = 002</li> <li>• rem_staddr[4] = 003</li> <li>• rem_staddr[5-6]= irrelevant</li> </ul>
40 ... 55	rem_tsap_id	ARRAY [1..16] of BYTE	-	Partner address component of connection <ul style="list-style-type: none"> <li>• TCP: partner port no. (possible values: 1...49151; recommended values: 2000...5000); rem_tsap_id[1] = high byte of port no. in hexadecimal notation; rem_tsap_id[2] = low byte of port no. in hexadecimal notation; rem_tsap_id[3-16] = irrelevant</li> <li>• ISO-on-TCP: partner TSAP-ID: rem_tsap_id[1] = B#16#E0; rem_tsap_id[2] = rack and slot of partner end point (bits 0 to 4: Slot number, bits 5 to 7: rack number); rem_tsap_id[3-16] = TSAP extension, optional</li> <li>• UDP: This parameter is not used.</li> </ul>
56 ... 61	next_staddr	ARRAY [1..6] of BYTE	-	This parameter is not used.
62 ... 63	spare	WORD	W#16#0000	Reserved.

**Note****TCON\_Param for S7-1500 CPU**

The connection description DB with the structure according to TCON\_Param is also supported by S7-1500 CPUs for migration reasons. However, we recommend that you use the new structures TCON\_IP\_v4 and TCON\_IP\_RFC.

### Connection parameters with structure according to TCON\_IP\_v4

#### Data block for connection description

A connection description DB with a structure according to TCON\_IP\_v4 is used for CPUs of S7-1200 V4.0 and higher and S7-1500 to assign parameters for TCP and UDP communication connections. The fixed data structure of the TCON\_IP\_v4 contains all parameters that are required to establish the connection. The connection description DB is automatically created for a new connection by the connection configuration for Open User Communication when the TSEND\_C, TRCV\_C or TCON instruction is used.

The CONNECT connection parameter of the instance DBs for TSEND\_C, TRCV\_C or TCON contains a reference to the data block used.

#### Structure of the connection description according to TCON\_IP\_v4

Byte	Parameter	Data type	Start value	Description
0 ... 1	interface_id	HW_ANY	64	Hardware identifier of the local interface (value range: 0 to 65535).
2 ... 3	id	CONN_OUC	1	Reference to this connection (value range: 1 to 4095). You must specify the value of this parameter for the TSEND_C, TRCV_C or TCON instruction under ID.
4	connection_type	BYTE	11	Connection type: <ul style="list-style-type: none"> <li>• 11: TCP</li> <li>• 13: UDP</li> </ul>
5	active_established	BOOL	TRUE	Identifier for the type of connection establishment: <ul style="list-style-type: none"> <li>• FALSE: Passive connection establishment</li> <li>• TRUE: Active connection establishment</li> </ul>
6 ... 9	remote_address	ARRAY [1..4] of BYTE	-	IP address of the partner end point, for example, for 192.168.0.1: <ul style="list-style-type: none"> <li>• addr[1] = 192</li> <li>• addr[2] = 168</li> <li>• addr[3] = 0</li> <li>• addr[4] = 1</li> </ul>
10 ... 11	remote_port	UINT	2000	Port address of the remote connection partner (value range: 1 to 49151).
12 ... 13	local_port	UINT	2000	Port address of the local connection partner (value range: 1 to 49151).

**Connection parameters with structure according to TCON\_IP\_RFC****Data block for connection description**

A connection description DB with a structure according to TCON\_IP\_RFC is used for CPUs of S7-1200 V4.0 and higher and S7-1500 to assign parameters to ISO-on-TCP communication connections. The fixed data structure of the TCON\_IP\_RFC contains all parameters that are required to establish the connection. The connection description DB is automatically created for a new connection by the connection configuration for Open User Communication when the TSEND\_C, TRCV\_C or TCON instruction is used.

The CONNECT connection parameter of the instance DBs for TSEND\_C, TRCV\_C or TCON contains a reference to the data block used.

**Structure of the connection description according to TCON\_IP\_RFC**

Byte	Parameter	Data type	Start value	Description
0 ... 1	interface_id	HW_ANY	64	Hardware identifier of the local interface (value range: 0 to 65535).
2 ... 3	id	CONN_OUC	1	Reference to this connection (value range: 1 to 4095). You must specify the value of this parameter for the TSEND_C, TRCV_C or TCON instruction under ID.
4	connection_type	BYTE	12	Connection type: ISO-on-TCP
5	active_established	BOOL	TRUE	Identifier for the type of connection establishment: <ul style="list-style-type: none"> <li>• FALSE: Passive connection establishment</li> <li>• TRUE: Active connection establishment</li> </ul>
8 ... 11	remote_address	ARRAY [1..4] of BYTE	-	IP address of the partner end point, for example, for 192.168.0.1: <ul style="list-style-type: none"> <li>• addr[1] = 192</li> <li>• addr[2] = 168</li> <li>• addr[3] = 0</li> <li>• addr[4] = 1</li> </ul>

Byte	Parameter	Data type	Start value	Description
12 ... 45	remote_tselector	TSelector	-	TSelector of the remote connection partner: <ul style="list-style-type: none"> <li>• TSelLength = Value range 0 to 32 as UINT</li> <li>• TSel[1-32] = Value range each 0 to 255 in bytes</li> </ul>
46 ... 79	local_tselector	TSelector	-	TSelector of the local connection partner: <ul style="list-style-type: none"> <li>• TSelLength = Value range 0 to 32 as UINT</li> <li>• TSel[1-32] = Value range each 0 to 255 in bytes</li> </ul>

**See also**

Principle of operation of connection-oriented protocols (Page 545)

Ability to read back connection description parameters (Page 553)

Overview of connection configuration (Page 533)

TSAP structure (Page 555)

**Assignment of port numbers**

**Introduction**

When an Open User Communication is created, the value 2000 is automatically assigned as the port number.

Permissible values for port numbers are 1 to 49151. You can assign any port number within this range. However, because some ports may already be used depending on the system, port numbers within the range from 2000 to 5000 are recommended.

**Note**

Port numbers must be unique. The connection configuration or a corresponding block call is rejected with an error if the port numbers are assigned twice.

**Overview of port numbers**

The following table summarizes the system reactions to various port numbers.

Port no.	Description	System reaction
2000 ... 5000	Recommended range	No warning, no error message on entry Port number is permitted and accepted
1 ... 1999, 5001 ... 49151	Can be used, but is outside the recommended range	Warning message on entry Port number is permitted and accepted

Port no.	Description	System reaction
0, 20, 21, 25, 80, 102, 135, 161, 34962 ... 34964	Can be used conditionally*	
53, 80, 102, 135, 161, 162, 443, 520, 9001, 34962 ... 34964	Can be used conditionally**	

\* Ports defined for specific functions:

0: ANY - Port number is automatically assigned by S7-1500 CPU as value (>49151)

20: FTP data transmission

21: FTP control

25: TMAIL\_C (Simple Mail transfer protocol)

80: Web server

102: ISO-on-TCP (RFC1006)

135: DCE Endpoint Mapper for PROFINET

161: SNMP (Simple Network Management Protocol)

34962 ... 34964: PROFINET

#### Note

The user usually specifies the value 0 for the local port on the active connection end point for UDP/TCP. In this case, the CPU operating system selects the next available port above 49151. The partner port usually has the default 0 with the passive connection end point. The corresponding parameter is disabled in the connection configuration.

\*\* These ports are disabled depending on the function scope of the CPU in use. The documentation of the respective CPUs provides the assignment of these ports.

#### See also

Description of the connection parameters (Page 537)

Creating and assigning parameters to connections (Page 541)

#### Ability to read back connection description parameters

#### Changing parameter values in the connection description

The connection description for exactly one connection of the Open User Communication is entered from the connection configuration in the connection description DB.

You can change the parameter values of the connection description DB outside of the connection configuration in the user program. Connection description DBs containing values you changed subsequently can be read back from the connection configuration. Under

"Properties > Configuration > Connection parameters", the inspector window displays only the connection parameters stored in the connection description DB.

---

**Note**

You can only change the values in the running user program if the instructions TCON, TSEND\_C or TRCV\_C are not being processed and the referenced connection is not established.

---

The connection configuration does not support nested entries of connection descriptions in DB types that can only be found via offset referencing (for example, Global-DB).

The structure of the connection description cannot be changed.

### Ability to read back individual connection parameters

For the "Address" parameter of the communication partner in a TCP or ISO-on-TCP connection, its IP address is displayed from the "rem\_staddr" parameter of the connection description.

The following values can also be reloaded from the connection description:

- Connection type
- Local connection ID
- Active/passive connection establishment (only with UDP)
- Local TSAP (ISO-on-TCP only)
- Partner TSAP (ISO-on-TCP only)
- Local port (only with TCP and UDP)
- Partner port (only with TCP)

The values of the connection ID parameters of the communication partner, the connection data, as well as the connection establishment, are not included in the connection description in the local connection description DB. Consequently, these parameters cannot be displayed when the connection configuration is reopened. The connection establishment of the partner results from the local connection establishment and is therefore also displayed.

A new communication partner can be selected at any time in the "Partners" drop-down list box.

When a CPU recognized in the project is selected as a specified communication partner, the entry options for the connection ID and the connection data are shown again.

Description of the connection parameters (Page 537)

## TSAP structure

### Introduction

For an ISO-on-TCP connection, Transport Service Access Points (TSAPs) must be assigned for both communication partners. TSAP IDs are assigned automatically after an ISO-on-TCP connection is created. To ensure the uniqueness of TSAP IDs within a device, you can change the preassigned TSAPs in the connection parameter assignment.

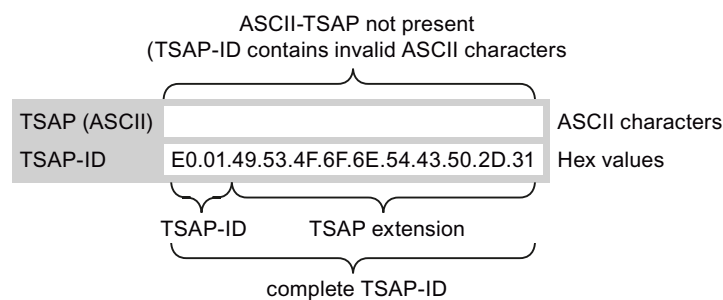

### Structure of TSAPs

You must comply with certain rules when assigning TSAPs. A TSAP must contain a certain number of bytes, which are able to be displayed and entered as hexadecimal values (TSAP-ID) or as ASCII characters (ASCII-TSAP):

Entries or changes of the TSAP-ID or the ASCII-TSAP in the corresponding entry fields always take effect in the other display format as well.

If a TSAP contains no valid ASCII characters, the TSAP is displayed only as TSAP-ID and not as ASCII-TSAP. This is the case after a connection is created. The first two hex characters as TSAP-ID identify the communication type and the rack/slot. Because these characters are not valid ASCII characters for a CPU, the ASCII-TSAP is not displayed in this case.

In addition to the rules for length and structure of TSAPs, you must also ensure the uniqueness of the TSAP-ID. The assigned TSAPs are not automatically unique.

### Length and content of TSAPs

A TSAP is structured as follows:

- TSAP-ID with TSAP extension  
 Length = 2 to 16 bytes  
 x\_tsap\_id[0] = 0xE0 (Open User Communication)  
 x\_tsap\_id[1] (bits 0 to 4) = slot number of CPU  
 x\_tsap\_id[1] (bits 5 to 7) = rack number of CPU  
 x\_tsap\_id[2...15] = any characters (TSAP extension, optional)  
 (x = loc (local) or x = rem (partner))
- TSAP-ID as ASCII-TSAP  
 Length = 3 to 16 bytes  
 x\_tsap\_id[0 to 2] = 3 ASCII characters (0x20 to 0x7E)  
 x\_tsap\_id[3...15] = any characters (optional)  
 (x = loc (local) or x = rem (partner))

The following table shows the schematic structure of a TSAP-ID:

TSAP-ID	tsap_id_len	tsap_id[0]	tsap_id[1]	tsap_id[2..15]	tsap_id[3..15]
...with extension	2...16 bytes	0xE0	0x01 or 0x02 or 0x00*	Extension (optional)	Extension (optional)
...as ASCII-TSAP	3...16 bytes	0x20...0x7E	0x20...0x7E	0x20...0x7	Any (optional)

\*An S7-1200/1500 CPU is normally inserted on rack 0 and slot 1, and an S7-300/400 CPU on rack 0 and slot 2. For this reason, hex value 01 or 02 is valid for the second position of the TSAP-ID with extension. If the connection partner is an unspecified CPU, for example, a third-party device, the hex value 00 is also permissible for the slot address.

#### Note

For unspecified communication partners, the local TSAP-ID and the partner TSAP-ID can have a length of 0 to 16 bytes, in which all hex values from 00 to FF are permitted.

### ASCII code table for entry of ASCII TSAPs

For entry of an ASCII-TSAP in the connection parameter assignment, only hexadecimal values from 20 to 7E are permitted:

Code	..0	..1	..2	..3	..4	..5	..6	..7	..8	..9	..A	..B	..C	..D	..E	..F
2..		!	"	#	\$	%	&	'	(	)	*	+	,	-	.	/
3..	0	1	2	3	4	5	6	7	8	9	:	;	<	=	>	?
4..	@	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O
5..	P	Q	R	S	T	U	V	W	X	Y	Z	[	\	]	^	_
6..	`	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o
7..	p	q	r	s	t	u	v	w	x	y	z	{		}	~

## Examples of TSAP assignment

The following examples show the processing of the TSAPs for CPUs of the S7-1200/1500 (CPU on slot 1) under various points of view:

- Example 1: Creating a new connection for PLC-PLC communication
- Example 2: Entry of a local ASCII-TSAP
- Example 3: Entry of a TSAP extension in the TSAP-ID
- Example 4: Incorrect editing of the TSAP-ID
- Example 5: Entry of an ASCII-TSAP via the "TSAP-ID" entry field

### Example 1: Creating a new connection for PLC-PLC communication

Once you have created a new connection with two PLCs for the Open User Communication, the TSAP extension "ISOonTCP-1" is assigned automatically.

This TSAP extension produces the TSAP-ID E0.01.49.53.4F.6F.6E.54.43.50.2D.31, which is entered automatically in the connection description DB and in the entry fields of the local and the partner TSAP. The entry fields of the ASCII-TSAPs remain empty:

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	E0.01.49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

You can change the values in the entry fields of the TSAP-ID and the ASCII-TSAP at any time.

The entry field of the TSAP-ID shows the complete TSAP stored in the data block of the connection description. The TSAP-ID with TSAP extension, which is limited to 16 characters, is not displayed in the "TSAP (ASCII)" entry field because the character E0 does not represent a valid character for the ASCII-TSAP.

If the displayed TSAP-ID is a valid ASCII-TSAP, it is displayed in the "TSAP (ASCII)" entry field.

Changes in the entry fields for TSAP-ID and ASCII-TSAP affect the other field.

### Example 2: Entry of a local ASCII-TSAP

If you have created a new connection and assigned an ASCII value for the local TSAP in the "TSAP (ASCII)" entry field, for example, "ISOonTCP-1", the resulting TSAP-ID is created automatically.

When you exit the "TSAP (ASCII)" entry field, the number of ASCII characters is checked automatically for compliance with the limit (3 to 16 characters) and the resulting TSAP-ID is entered into the corresponding entry field:

	Local TSAP	Partner TSAP
TSAP (ASCII)	ISOonTCP-1	
TSAP-ID	49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

**Example 3: Entry of a TSAP extension in the TSAP-ID**

If, following creation of a connection and entry of an ASCII-TSAP (see examples 1 and 2) in the entry field of the local TSAP-ID, you add the prefix "E0.01" to the TSAP value, the ASCII-TSAP will no longer be displayed when the entry field is exited.

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	E0.01.49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

Once you have exited the entry field of the TSAP-ID, a check is performed automatically to determine whether the first character of the TSAP-ID is a valid ASCII character. Since the character "E0" now present in the TSAP-ID is not a valid character for the ASCII-TSAP, the "TSAP (ASCII)" entry field no longer displays an ASCII-TSAP.

If a valid ASCII character is used, the check for compliance with the length specification of 2 to 16 characters follows.

**Example 4: Incorrect editing of the TSAP-ID**

If you remove the hex value "E0" from a TSAP-ID beginning with "E0.01", the TSAP-ID now begins with "01" and therefore no longer complies with the rules and is invalid:

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	01.49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

After the entry field is exited, a message is output because the TSAP-ID is neither a valid ASCII-TSAP (this would have to have a hex value in the range from 20 to 7E as the first value) or a valid TSAP-ID (this would have to have the identifier "E0" as the first value).

**Example 5: Entry of an ASCII-TSAP via the "TSAP-ID" entry field**

If you remove the value "01" in addition to the value "E0" from the incorrect TSAP-ID in example 4, the TSAP-ID begins with the hex value 49. This value is within the permissible range for ASCII-TSAPs:

	Local TSAP	Partner TSAP
TSAP (ASCII)		
TSAP-ID	49.53.4F.6F.6E.54.43.50.2D.31	E0.01.49.53.4F.6F.6E.54.43.50.2D.31

When you exit the entry field, the TSAP-ID is recognized as a valid ASCII-TSAP and the resulting ASCII-TSAP "ISOonTCP-1" is written to the "TSAP (ASCII)" entry field.

## Communication via PUT and GET instructions

### Basic information on communication via the PUT/GET instruction

#### Basic information on PUT/GET instructions

Use PUT and GET instructions to exchange data between two CPUs via an S7 connection.

The GET instruction is used to read data from a partner CPU. The PUT instruction is used to control the writing of tags by the communication partner via the user program. Apart from the PUT and GET instructions, no additional communication functions are provided for reading and writing tags.

To simplify the use of the two instructions, specify all required parameters for the connection and all block parameters in the Inspector window of the program editor.

#### Requirement

To be able to use the PUT and GET instructions, the following requirements must be satisfied:

- At least one S7-1200/1500 CPU or S7-300/400 CPU must be created in the project. Firmware 2.0 or higher must be installed on an S7-1200 CPU. If you have not yet created a second CPU in the project, you can initially establish the connection to an unspecified partner.
- An S7 connection must exist between the two CPUs. If you have not yet established a connection between two CPUs, a connection is automatically established during the configuration of the instructions.
- For both instructions, an instance data block is required in which all data used by the instruction is stored. The instance data block is created automatically as soon as you drag a PUT or GET instruction to a network in the program editor. For the correct execution of the program, it is essential that the instance data blocks are not changed; consequently, these data blocks are know-how protected. You only have read access to the instance data blocks.

## See also

- Overview of connection configuration (Page 560)

- PUT: Set parameters for write and send area (Page 566)
- GET: Set parameters for read and memory area (Page 567)

## **Connection configuration**

### **Overview of connection configuration**

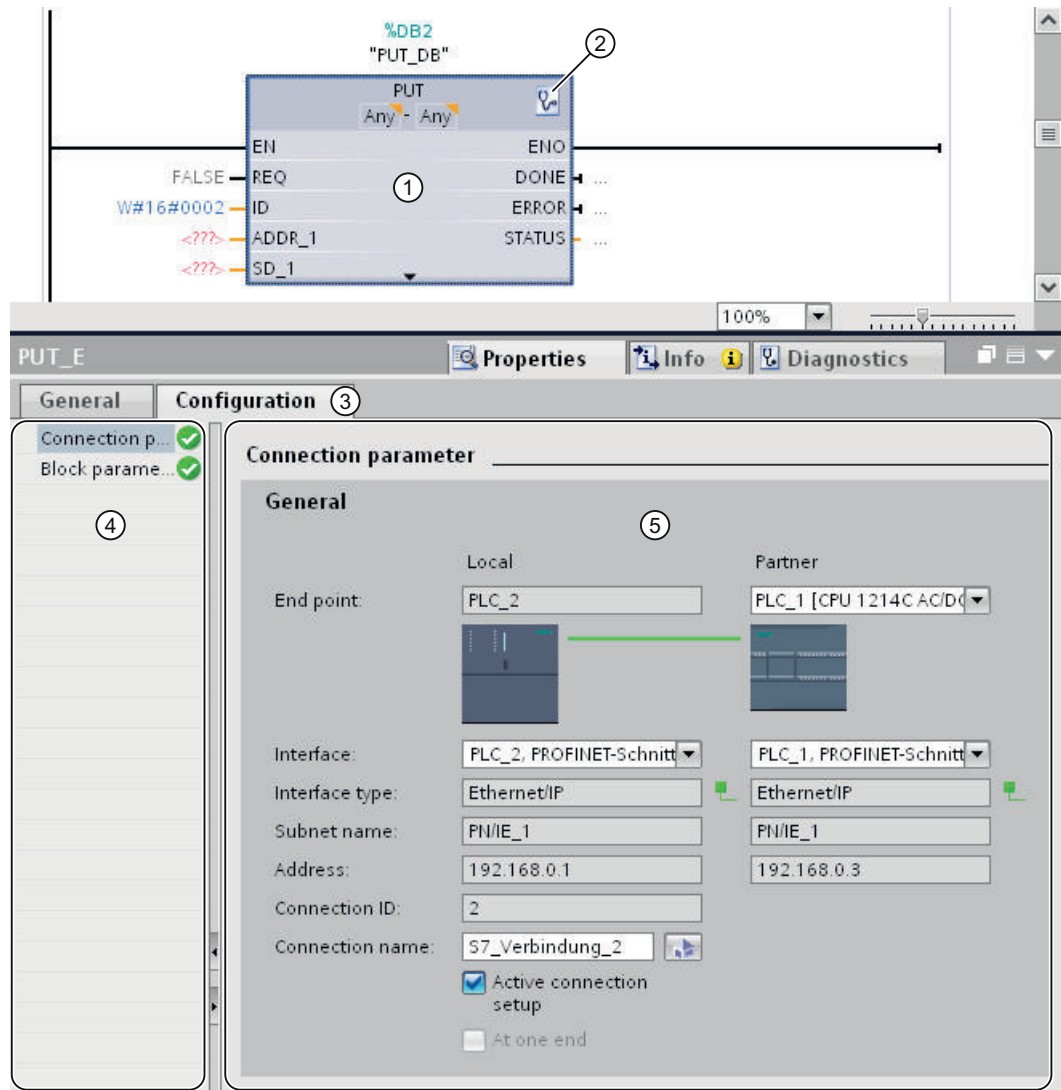

#### **Introduction**

The connection parameters for the PUT and GET instructions are assigned in the inspector window of the program editor. All parameters are saved in the corresponding instance data block.

## Structure of the connection configuration

The connection configuration is made up of the following components:

- ① Communication instruction for PUT or GET
- ② Call of online and diagnostic functions
- ③ "Configuration" tab in the "Properties" tab
- ④ Area navigation of the "Configuration" tab
- ⑤ General properties of the connection parameters

## Display of online and diagnostic functions

If you click the icon for starting the online and diagnostic functions, the associated CPU goes online automatically. The connection table in the network view is opened. In addition, the "Diagnostics" tab and the connection information are displayed in the inspector window.

### Entering the connection parameters

Enter the desired connection parameters in the "Configuration" tab. The area navigation of the "Configuration" tab includes the "Connection parameters" group. This group contains the connection configuration. Here, you can enter the parameters for the connections using system functions. When all the required parameters are assigned, a check mark is set behind the "Connection parameters" group in the area navigation.

### See also

Assigning parameters to start request (Page 565)

PUT: Set parameters for write and send area (Page 566)

GET: Set parameters for read and memory area (Page 567)

### Description of the connection parameters

#### Overview

The following table shows the general connection parameters:

Parameter	Description
End point	<p>The names of the local end point and the partner end point are shown.</p> <ul style="list-style-type: none"> <li>• Local end point The local end point is the CPU in which the PUT or GET instruction is programmed.</li> <li>• Partner end point The partner end point is selected from the drop-down list. The drop-down list shows all available possible connection partners including unspecified connection partners for devices whose data is unknown in the project. As long as no connection partner is set, all other parameters in the mask are disabled.</li> </ul>
Interface	<p>The interface of the partner CPU is displayed. The partner interface is not displayed until a specified partner CPU has been selected.</p>
Interface type	<p>The type of interface via which communication is handled is displayed.</p>
Subnet name	<p>The subnet of the local end point is displayed, provided this exists. The partner subnet is displayed only after the partner end point has been selected.</p> <p>If at least one of the two connection partners is not connected with a subnet, the two connection partners are automatically connected with each other. The partner which is not connected to a network is hereby connected to the same subnet via which the other partner is already connected to a network.</p> <p>A connection of connection partners to different subnets is only possible with IP or S7 routing. The IP routing settings can be edited in the properties of the relevant Ethernet interfaces.</p>
Address	<p>The IP address of the local end point is displayed. The IP address of the partner is displayed only after the partner end point has been selected.</p> <p>If you have selected an unspecified connection partner, the input box is empty and has a red background. In this case, you will need to specify a valid IP address for the connection partner.</p>
Connection ID	<p>The currently set connection ID is displayed. You can change the connection ID in the connection table in the network view. You can also directly access the connection table while you are setting the connection parameters. To do this, click the "Create new connection" icon.</p>

Parameter	Description
Connection name	The name of the connection which was automatically created when the PUT/GET instruction was inserted is displayed. You can change the name of the connection by entered a different name in the field. You can also create a new connection or edit existing connections by clicking the "Create new connection" icon.
Active connection establishment	Use the "Active connection establishment" option button to specify which partner starts the communication. When the connection is created, the local partner is initially specified by default for the establishment of the connection. If a device does not support active connection establishment, you have to activate active connection establishment on the other partner.
Configured at one end	If this check box is selected, the connection partner is the server for this connection. It cannot actively send or receive. This corresponds to the behavior of the PUT/GET instructions. In this case, other instructions are not possible. If the check box is not selected, other instructions can also be used for the communication.

### Starting connection parameter assignment

You can assign the connection parameters for PUT and GET in the inspector window as soon as you have inserted and selected a PUT or GET instruction in a program block.

### Procedure

To insert PUT/GET instructions, follow these steps:

1. Open the "Instructions" task card in the "Communication > S7 Communication" folder.
2. Drag a PUT or GET instruction to a network.  
The "Call options" dialog opens.
3. Optional: Edit the properties of the instance DB in the "Call properties" dialog. You have the following options:
  - Change the default name.
  - Select the "Manual" check box to assign your own number.
4. Click "OK".

### Result

A corresponding instance data block is created for the inserted PUT or GET instruction. For S7-300 CPUs, a function block is also created in the program resources.

When PUT or GET instruction is selected, you will see the "Configuration" tab under "Properties" in the inspector window. The "Connection parameters" group in area navigation contains the connection parameter assignment that you can now make.

### See also

Creating and assigning parameters to connections (Page 564)

Deleting connections (Page 565)

## Creating and assigning parameters to connections

You can create S7 connections and assign the parameters for these in the connection parameter assignment of the PUT/GET instructions. Changed values are checked immediately by the connection parameter assignment for input errors.

### Requirement

A CPU exists with a PUT or GET communication instruction.

### Procedure

To configure an S7 connection using PUT/GET instructions, follow these steps:

1. In the program editor, select the call of the PUT or GET instruction.
2. Open the "Properties > Configuration" tab in the inspector window.
3. Select the "Connection parameters" group. Until you select a connection partner, only the empty drop-down list for the partner end point is enabled. All other input options are disabled.  
The connection parameters already known are displayed:
  - Name of the local end point
  - Interface of the local end point
  - IP address of the local end point
4. In the drop-down list box of the partner end point, select a connection partner. You can select an unspecified device or a CPU in the project as the communications partner. The following parameters are automatically entered as soon as you have selected the connection partner:
  - Interface of the partner end point
  - Interface of the partner end point. If several interfaces are available, you can change the interface as required.
  - Interface type of the partner end point
  - Subnet name of both end points
  - IP address of the partner end point
  - Name of the connection which is used for the communication. If no connection exists yet, it is automatically established.
5. If required, change the connection name in the "Connection name" input box. If you want to create a new connection or edit an existing connection, click on the "Create new connection" icon.

---

### Note

The PUT and GET instructions between two communication partners can only run if both the hardware configuration and the program part for the partner end point have been loaded into the hardware. To achieve fully functional communication, make sure that you load not only the connection description of the local CPU on the device but also that of the partner CPU as well.

---

## Deleting connections

A connection which was automatically created during the insertion of a PUT or GET instruction appears in the connection table of the network view like every standard connection. As a result, it can be deleted in the connection table.

## Procedure

To delete a connection, follow these steps:

1. Open the connection table in the network view.
2. In the connection table, select the connection that you want to delete.
3. To do this, right-click the connection and select the "Delete" command from the shortcut menu.

## Result

The connection is deleted. The PUT or GET instruction and the associated instance data blocks are retained and must be manually deleted if necessary.

To continue using the PUT or GET instruction, you must configure the connection again in the inspector window of the program editor, since all connection parameters were also deleted when the connection was deleted. In this case, specify a new communication partner and a suitable connection.

## Block parameter assignment

### Assigning parameters to start request

To start communication via the PUT or GET instruction, you have to specify an event which activates the instruction. This event is referred to as control parameter (REQ). The communication job is activated as soon as there is a positive edge at the control parameter REQ.

Please note that the control parameter REQ is assigned the default FALSE at first call.

## Requirement

- The program editor is open.
- You have already inserted a PUT or GET instruction.
- A connection has been established between two communication partners.

## Procedure

To define the REQ control parameter, follow these steps:

1. Select the PUT or GET instruction in the program editor.
2. Open the "Configuration" tab in the inspector window.

3. Select the "Block parameter assignment" entry in the area navigation.
4. In the "REQ" field, select a tag of the "BOOL" data type to initialize the execution of the instruction. Alternatively, you can also interconnect a previous instruction in the program editor.

### See also

PUT: Set parameters for write and send area (Page 566)

GET: Set parameters for read and memory area (Page 567)

### PUT: Set parameters for write and send area

For communication via the PUT instruction, you must specify the memory area of the partner CPU to which the data should be written. In addition, you must specify the memory area of the local CPU from which the data is to be read.

### Requirement

- The program editor is open.
- You have already inserted a PUT instruction.
- A connection has been established between two communication partners.

### Procedure

To specify the read and the memory area for the instruction, follow these steps:

1. Select the PUT instruction in the program editor.
2. Open the "Configuration" tab in the inspector window.
3. Select the "Block parameter assignment" entry in the area navigation.
4. In the "In/Outputs > Write area (ADDR\_1) > Start" field, select a "REMOTE" data type pointer to the area of the partner CPU which is to be written.  
Only absolute addressing is permitted.  
Example: P#DB10.DBX5.0 Byte 10
5. In the "Length" field, enter the length of the write area and select the data type of the memory area from the drop-down list.
6. In the "In/Outputs > Send area (SD\_1) > Start" field, select a pointer to the area in the local CPU which contains the data to be sent.
7. In the Length field, enter the length of the memory area to be read and select the data type from the drop-down list.  
Only the data types BOOL (for a bit array, "0" must be used as address and an integer multiple of byte must be used as length), BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, COUNTER, TIMER are permitted.  
If the VARIANT pointer accesses a DB, the DB must always be specified (for example: P#DB10.DBX5.0 Byte 10).

## See also

GET: Set parameters for read and memory area (Page 567)

## GET: Set parameters for read and memory area

For communication via the GET instruction, you must specify the memory area of the local CPU to which the data should be written. In addition, you must specify the memory area of the partner CPU from which the data is to be read.

## Requirement

- The program editor is open.
- You have already inserted a GET instruction.
- A connection has been established between two communication partners.

## Procedure

To specify the read and the memory area for the instruction, follow these steps:

1. Select the GET instruction in the program editor.
2. Open the "Configuration" tab in the inspector window.
3. Select the "Block parameter assignment" entry in the area navigation.
4. In the "In/Outputs > Read area (ADDR\_1) > Start" field, select a "REMOTE" data type pointer to the area of the partner CPU which is to be read.  
Only absolute addressing is permitted.  
Example: P#DB10.DBX5.0 Byte 10
5. In the "Length" field, enter the length of the read area and select the data type of the memory area from the drop-down list.
6. In the "In/Outputs > Memory area (RD\_1) > Start" field, select a pointer to the area in the local CPU in which the read data is to be stored.
7. In the Length field, enter the length of the memory area and select the data type from the drop-down list.  
Only the data types BOOL (for a bit array, "0" must be used as address and an integer multiple of byte must be used as length), BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, COUNTER, TIMER are permitted.

### 8.1.3.3 Displaying and configuring topology

#### Overview of the topology view

#### Functions of the topology view

The topology view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

- Displaying the Ethernet topology
  - Displaying all the PROFINET devices and passive Ethernet components of the project along with their ports
  - Displaying interconnections between the ports
  - Displaying corresponding logical networks
  - Display diagnostic information of all ports
- Configuring the Ethernet topology
  - Creating, modifying and deleting interconnections of the ports
  - Renaming stations, devices, interfaces or ports
  - Adding PROFINET devices and passive Ethernet components to the project from the hardware catalog
- Identifying and minimizing differences between the desired and actual topology
  - Running an offline/online comparison of Ethernet modules, ports and port interconnections
  - Adopting existing online topology information in the offline project

---

#### Note

##### Devices without valid IP address

Topology information (LLDP) cannot be read from a device without valid IP address.

To prevent devices from having an invalid IP address, specify in the settings of the TIA Portal for hardware configuration that devices without valid IP address are temporarily assigned an IP address.

---

### Differences between network view and topology view

- The network view shows all the logical subnets of the project. The topology view shows all Ethernet components of the project. These include passive components such as switches, media converters and cables.

---

**Note**

Stations with non-Ethernet components are also displayed if the station has a least one Ethernet component.

---

- The position of a device in the network view and its position in the topology view are not dependent on each other; in other words, the same device generally appears at different locations in the two views.
- If you open the hardware catalog in the topology view, you only see devices with an Ethernet interface.

### Structure of the topology view

The topology view (Page 450) essentially consists of a graphic area (called the graphic view below) and a table area (called the table view below).

### Which functions are there in the graphic view and which functions are there in the table view?

- Displaying the Ethernet topology

Function	Graphic view	Table view
Displaying all the PROFINET devices and passive Ethernet components of the project along with their ports	yes	yes
Display interconnections between the ports (including type of medium)	yes	yes
Displaying corresponding logical networks	no	yes
Displaying properties of the cables between the ports	no	yes
Display diagnostic information of all ports	yes	yes

- Configuring the Ethernet topology

Function	Graphic view	Table view
Creating, modifying and deleting interconnections of the ports	<ul style="list-style-type: none"> <li>• Create: yes</li> <li>• Modify: no</li> <li>• Delete: yes</li> </ul>	<ul style="list-style-type: none"> <li>• Create: yes</li> <li>• Modify: yes</li> <li>• Delete: yes</li> </ul>
Renaming stations, devices, interfaces or ports	no	yes
Adding PROFINET devices and passive Ethernet components to the project from the hardware catalog	yes	no

- Identifying and minimizing differences between the desired and actual topology

Function	Graphic view	Table view
Running an offline/online comparison of Ethernet modules, ports and port interconnections	no	yes
Adopting existing online topology information in the offline project	no	yes

### See also

Overview of settings for hardware configuration (Page 451)

### Starting the topology view

#### Requirement

The device or network view is open in the hardware and network editor.

#### Procedure

To start the topology view of your project, follow these steps:

1. Click on the "Topology view" tab.

Or:

1. Open the network view of the hardware editor.
2. Select a PROFINET device or a PROFINET module.
3. Select the "Go to topology view" command in the shortcut menu.

#### Result

The graphic view of the topology view is started. If you opened the topology view using the shortcut menu, the selected component remains selected after the change of view.

### Displaying topology

### Displaying the graphic view of the configured topology

#### What is shown?

The graphic view of the configured topology shows the following:

- Configured PROFINET devices and passive Ethernet components along with their ports
- Configured stations with non-Ethernet components if there is at least one Ethernet component in the station
- Configured interconnections between the ports

## Type of display

The way in which the graphic view of the topology view and the network view are displayed is very similar:

- Compared with the device view, components are shown in a simplified form.
- The interconnections between ports are shown as horizontal and vertical lines. These are dashed when an interconnection between a tool changer port and its possible partner ports is involved.

## Displaying the table view of the configured topology

### What is shown?

The table view of the configured topology shows exactly the same content as the graphic view except for the logical PROFINET subnets.

- All the configured PROFINET devices and passive Ethernet components along with their ports
- All the configured stations with non-Ethernet components if there is at least one Ethernet component in the station
- Configured interconnections between the ports  
For each port with the "Alternating partner port" property, there are as many completed rows as there are potential partner ports plus one empty row.

## Type of display

As the name implies, the table view of the topology view consists of a table, the topology overview table. It is structured like the network overview table. It consists of the following columns:

- Device / port  
This is the most important column of the table. The entries in this column have a hierarchical structure with the PROFINET ports being the last element in the hierarchy. You can expand and collapse the hierarchical entries. For a CPU, for example, an entry consists of the following elements:
  - Station name
  - Device name
  - Name of the PROFINET interface
  - Names of the ports

Note: All the other columns only have entries in the rows containing the port names.
- Type (as default, this column is not displayed)  
Shows what type of station, device or interface the table row relates to or whether it belongs to a port.
- Order no. (as default, this column is not displayed)  
Order no. of device

### *8.1 Configuring devices and networks*

- Subnet (as default, this column is not displayed)  
Configured subnet to which the interface belongs
- Master / IO system (as default, this column is not displayed)  
Shows whether or not the interface belongs to a PROFIBUS DP master system or a PROFINET IO system.
- Device address (as default, this column is not displayed)  
Configured address of the interface in the subnet
- Partner station  
Name of the station that contains the partner port
- Partner device  
Name of the device that contains the partner port
- Partner interface  
Interface to which the partner port belongs
- Partner port
- Cable data  
Contains the cable length and the signal delay of the cable connecting the ports

#### **Basic functions for tables**

The topology overview table supports the following basic functions for editing a table:

- Displaying and hiding table columns  
Note: The columns that define the configuration cannot be hidden.
- Optimizing column width
- Displaying the meaning of a column, a row or cell using tooltips.

#### **Displaying the diagnostics status of ports and cables in the graphic view**

##### **Requirements**

The graphic view of the topology view is open.

## Procedure

To determine the diagnostics status of the port, follow these steps:

1. Go online with the required component or components.

## Result

The following icons are displayed:

- The corresponding diagnostics icon is displayed for each device.
- If there is an error in at least one lower-level component, the diagnostics icon "Error in lower-level component" is also displayed in the left-hand lower corner of the diagnostics icon.
- The corresponding diagnostics icon is displayed for each port.
- Every cable between two ports that are online has the color that matches its diagnostics status.

You will find the possible diagnostics icons for ports and the color coding of Ethernet cables in the description of hardware diagnostics. See: Displaying diagnostics status and comparison status using icons (Page 1145)

## Showing the diagnostics status of hardware components in the table view

### Requirement

The table view of the topology view is open.

### Procedure

To obtain the diagnostics status of hardware components of the topology overview table, follow these steps:

1. Go online with the required components.

### Result

The following icons are displayed at the left-hand edge of the topology overview table in each row that belongs to the component involved:

- The diagnostics icon belonging to the hardware component is displayed.
- If the hardware component has lower-level components and if there is an error in at least one of the lower-level components, the diagnostics icon "Error in lower-level component" is also displayed in the left-hand lower corner of the diagnostics icon of the hardware component.

For the possible diagnostics icons for hardware components, refer to the description of hardware diagnostics. See: Displaying diagnostics status and comparison status using icons (Page 1145)

---

**Note**

The display of the diagnostics status of hardware components in the topology overview table and the network overview table is identical.

---

## Running an offline/online comparison and displaying the results

### Requirement

The topology view is open. There may be an online connection to one or more devices, but this is not actually necessary.

### Procedure

To find the differences between the configured and the actual topology, follow these steps:

1. Click the "Offline/online comparison" button in the toolbar of the topology overview.

### Result

The "Partner station", "Partner interface" and "Cable data" columns in the topology overview table are removed.

Two additional groups of columns are added to the right-hand side of the table and these are initially empty:

- On the far right, columns for the topology to be identified online are added.
- Between the columns for the offline and the online topology, the "Status", "Action" and "Description" columns are added to show the result of the offline/online comparison.

---

**Note**

As default, the "Description" column is not displayed.

---

The following buttons are enabled in the toolbar of the table:

Button	Name	Meaning
	Update	The detection of the existing online topology is started again.
	Synchronize	<ul style="list-style-type: none"><li>• Adopting the port interconnections identified online in the project (Page 583)</li><li>• Adopt the devices identified online in the project (Page 584)</li></ul>

After the actual topology has been identified, the added columns are filled. These steps are described in more detail in the following section.

**Note**

A difference between offline and online view is displayed for that port connected with the PG/PC which is only available online. This is because the PG/PC cannot be configured offline.

**Columns for the topology identified online**

The following columns are displayed:

- "Device / port"
- "Type" (as default, this column is not displayed)
- "Order no." (as default, this column is not displayed)
- "IP address" (as default, this column is not displayed)
- "Partner device"
- "Partner port"
- "Cable data"

**Columns for the result of the offline/online comparison**

The following columns are displayed:

- "Status"  
The result of the offline/online comparison is shown here in the form of diagnostics icons.  
The following icons are possible:

Diagnostics icon	Meaning
	Differing topology information in at least one lower-level component
	Identical topology information
	Topology information only available offline or device is disabled.
	Topology information only exists online
	Differing topology information
	If a device does not support topology functions, the "Status" column remains empty.

- "Action"  
The possible actions are shown here in the form of icons. The following icons are possible:

Icon	Meaning
=	No action possible
←	Adopt the interconnection found online

- "Description"  
This column describes the selected action in words.

## Configuring topology

### Interconnecting ports

#### Overview

#### Interconnecting ports in the topology view

In the topology view, you have the following options for interconnecting ports:

- in the graphic view (Page 577)
- in the graphic view of a tool changer (Page 579)
- in the table view (Page 578)
- in the table view of a tool changer (Page 579)
- by adopting port interconnections identified online (Page 583)

#### What effects does the interconnection of ports have on the network view?

---

##### Note

In the properties of a subnet in the network view, you can specify that this subnet is used when a port interconnection is created between two devices that are not networked.

---

When you create an interconnection between two ports, the following effects are possible in the network view:

- If the corresponding interfaces are not networked: If you have specified a default subnet, this is used. Otherwise a new subnet is created to connect the two interfaces.
- If one (and only one) of the two interfaces involved is networked: The non-networked interface is connected to the same subnet as the already networked interface.
- In all other cases: The corresponding interfaces are not connected to a logical subnet.

## See also

Interconnecting ports (Page 978)

Settings for interconnecting Ethernet devices (Page 504)

## Interconnecting ports in the graphic view

### Requirement

You are in the graphic view of the topology view.

### Procedure – Creating a new interconnection between two ports

To interconnect a port of a device with a port of another device, follow these steps:

1. Place the mouse cursor on the port you want to interconnect.
2. Click with the left mouse button and hold it down.
3. Move the mouse pointer.  
The pointer now shows the networking symbol to indicate "Interconnect" mode. At the same time, the mouse pointer shows the lock symbol that will only disappear when the pointer is on a valid target.
4. Now drag the mouse cursor to the target port. You can do this while holding down or after releasing the mouse button.
5. Now release the left mouse button or press it again (depending on your previous action).

Result: A new port interconnection is created.

---

#### Note

##### **Creating a ring for S7-300, S7-400, and S7-1500 CPUs**

If you create a ring using port interconnections for S7-300, S7-400, or S7-1500 CPUs, an MRP domain is created automatically.

---

### Procedure – Changing an existing port interconnection without deleting it first

To do this, follow these steps:

1. Place the mouse cursor on the port of an existing interconnection that is to receive a new partner port.
2. Drag the port to the new partner port.

Result: The existing port interconnection is deleted. The new port interconnection is created.

Alternative procedure:

1. Place the mouse cursor on a port without an interconnection that is to be connected with an already interconnected port.
2. Drag the port to the already interconnected port.

Result: The existing port interconnection is deleted. The new port interconnection is created.

### **Procedure – Interconnecting two interconnected ports with each other without first deleting the two existing port interconnections**

To do this, follow these steps:

1. Place the mouse cursor on the interconnected port that is to receive a new partner port.
2. Drag the port to the new partner port that is also interconnected already.

Result: The two existing port interconnections are deleted. The new port interconnection is created.

### **Interconnecting ports in the table view**

#### **Which actions are possible with port interconnections in the table view?**

The following actions are possible with port interconnections in the table view:

- Creating a new port interconnection
- Changing an existing port interconnection
- Deleting an existing port interconnection

#### **Requirement**

The row with the port whose interconnection you want to create, modify or delete is visible in the topology overview.

#### **Procedure**

To create the interconnection of a port for the first time, to modify it or delete it, follow these steps:

1. Move the mouse pointer to the "Partner port" column in the row of the source port.
2. Click the drop-down list there.
3. Select the required partner port (when creating or changing a port interconnection) or the "Not interconnected" entry (when deleting a port interconnection).

#### **Result**

The required action is performed. The new partner port (after creating or modifying a port interconnection) or the "Select port" entry (after deleting a port interconnection) is displayed in the "Partner port" column.

## Interconnecting a port with more than one partner port in the graphic view

### Requirement

- You have configured a port of a PROFINET device with the "Alternative partners" property and have specified its possible partner ports.
- The graphic view of the topology view is open.

### Procedure

1. Interconnect this port (referred to hereafter as source port) with one of the partner ports you have specified (referred to hereafter as target port).
2. Interconnect the source port with an additional target port.  
You can do this in several ways:
  - Drag the mouse pointer from a partner port that is already interconnected to a target port.
  - Drag the mouse pointer from an interconnection that has already been created to a target port.
  - Drag the mouse pointer from a target port to a partner port that is already interconnected.
  - Drag the mouse pointer from a target port to an already created interconnection.
3. If necessary, repeat the step above one or more times.

### Result

An interconnection is created between the source port and the alternative partner ports. This is indicated by a dashed line.

## Interconnecting a port with more than one partner port in the table view

### Which actions are possible with port interconnections to several partner ports in the table view?

When working with a tool changer, the following actions can be performed with port interconnections to multiple partner ports in the table view:

- Creating a new port interconnection
- Changing an existing port interconnection
- Deleting an existing port interconnection

### Requirement

- You have configured a port of a PROFINET device with the "Alternative partners" property and have specified its possible partner ports.
- The row with the port whose interconnection you want to create, modify or delete is visible in the topology overview.

## Procedure

To create the interconnection of a port to one or more partner ports for the first time, to modify it, or to delete it, follow these steps:

1. Move the mouse pointer to the "Partner port" column in the row of the source port.
2. Click the drop-down list there.
3. Select the required partner port (when creating or changing a port interconnection) or the "Not interconnected" entry (when deleting a port interconnection).

## Result

The required action is performed:

- If you are creating an interconnection, a new row is inserted in the topology overview table. The new partner port is displayed there in the "Partner port" column.
- If you change an interconnection, the new partner port is displayed in the "Partner port" column.
- If you delete an interconnection, the row with the previous port interconnection is deleted.

---

### Note

With a tool changer, there are normally several rows for a port with port interconnections to more than one partner port. The last row is always an empty row. The first row can be edited, all other rows are read-only.

---

## Renaming stations, devices, interfaces or ports

### Rename a station, a device, an interface or a port

#### Requirement

The table view of the configured topology is open.

#### Procedure

To rename a station, a device, an interface or a port, proceed as follows:

1. Click twice in the relevant field of the topology overview table (the second click starts the editing mode).
2. Enter the new name and then press the ENTER key (this closes editing mode).

#### Result

The object is renamed.

## Offline/online comparison

### Automatic assignment of devices by offline/online comparison

#### Overview

During the offline/online comparison, the configured topology is compared with the actual existing topology. Devices identified online are automatically assigned to configured devices as far as this is possible.

#### Start of availability detection

You start the availability detection the first time by clicking the "Compare offline/online" button in the toolbar of the topology overview.

You restart availability detection by clicking the "Update" button.

---

#### Note

The availability detection can take several seconds. During this time, no user input is possible.

---

#### Automatic assignment

A device identified online is automatically assigned to a configured device if the following properties of the two devices match up:

- Device name
- Order number
- Number of ports

The following section describes the situations that can occur and what action you can take:

8.1 Configuring devices and networks

- Identical port interconnections  
This is the ideal situation. No action is necessary here.

"Action" column	Meaning
	No action

- There are interconnections for the identified and configured device, there are however differences.  
The following actions are possible:

- If it is possible to adopt the online configuration

"Action" column	Meaning
	Adopt online interconnection (Page 583)
	No action

- If it is not possible to adopt the configuration

"Action" column	Meaning
	No action

- The interconnection only exists online.  
The following actions are possible:

- If it is possible to adopt the online configuration

"Action" column	Meaning
	Adopt online interconnection (Page 583)
	No action

- If it is not possible to adopt the configuration

"Action" column	Meaning
	No action

- The interconnection only exists in the configuration.  
The following actions are possible:

"Action" column	Meaning
	Adopt the online interconnection (Page 583), in other words, the interconnection in the configuration will be deleted
	No action

## No automatic assignment

In the following situations, no automatic assignment is possible:

- No device can be identified online to match a configured device. In this case the corresponding columns in the "Online topology" area of the topology overview table are empty.  
In this case, you should add the already configured device to your system or delete the configured device from the configuration.
- A device identified online cannot be assigned to any configured device. In this case the corresponding columns in the "Offline topology" area of the topology overview table are empty.  
In this case, you can adopt the device identified online in the project (Page 584).

## Adopting the port interconnections identified online in the project

### Requirement

You have run an offline/online comparison in the topology view. The result of this is that at least one device identified online was automatically assigned to a configured device, but that there are differences relating to the interconnection.

### Procedure

To adopt one more port interconnections identified online in the project manually, follow these steps:

1. Select the value "Adopt" in the "Action" column for a port of a configured device to which a device identified online was assigned.
2. Repeat the step if necessary for other ports of the same configured device.
3. Repeat the steps up to now if necessary for other configured devices to which devices identified online were assigned and for which there are differences relating to the interconnection.
4. Click the "Synchronize" button.

### Result

The port interconnections identified online and the cable information for the corresponding devices are adopted in the project. Successful adoption is indicated by the diagnostics icon "Identical topology information" for each port.

---

#### Note

If other port interconnections are recognized for a device identified online and these differ from those that exist in the project, adopting these in the project means that the port interconnections that were previously in the project are replaced by those identified online. If no port interconnections are detected for a device identified online, adopting in the project means that all the port interconnections of this device are deleted in the project.

---

## **Adopt the devices identified online in the project**

### **Requirements**

You have run an offline/online comparison in the topology view. The result of this is that at least one device identified online could not be assigned to any configured device.

### **Procedure**

To adopt one more devices identified online in the project manually, follow these steps:

1. For a configured device without an online partner, move the mouse pointer to the "Device/port" column of the online topology.
2. Select the device you want to assign to the configured device from the drop-down list of this box.
3. Repeat the previous steps if necessary for other configured devices without an online partner.

### **Result**

The selected device that was identified online is moved up from the end of the table. Following this, it is in the row of the configured device to which you have just assigned it.

## **8.1.3.4 Industrial Ethernet Security**

### **Configuring security**

#### **General**

#### **Supported devices**

#### **Supported devices**

Security functions can be configured for the following products:

- SCALANCE S:
  - S602 V2/V3/V4
  - S612 V2/V3/V4
  - S613 V2
  - S623 V3/V4
  - S627-2M V4
- SOFTNET Security Client:
  - SOFTNET Security Client V4

- S7-CPs: CP 343-1 GX31 Advanced, CP 443-1 GX30 Advanced, CP 1543-1
- PC CP: CP 1628
- Mobile wireless router: SCALANCE M875

### **General terminology "security module"**

In this section of the information system, the following products are grouped together under the term "security module": SCALANCE S602 / SCALANCE S612 / SCALANCE S613 / SCALANCE S623 / SCALANCE S627-2M, CP 343-1 GX31 Advanced, CP 443-1 GX30 Advanced, CP 1543-1, CP 1628, SCALANCE M875.

### **Use of the terms "interface" and "port"**

In this documentation, the following terms are used for the ports of SCALANCE S modules:

- "External interface": The external port of the SCALANCE S602 / S612 / S623 or an external port of the SCALANCE S627-2M (marked red)
- "Internal interface": The internal port of the SCALANCE S602 / S612 / S623 or an internal port of the SCALANCE S627-2M (marked green)
- "DMZ interface": The DMZ port of the SCALANCE S623 / S627-2M (marked yellow)

The term "port" itself is used when the focus of interest is a special port of an interface.

### **General use of the term "CP x43-1 Adv."**

In this documentation, the term "CP x43-1 Adv." includes the following products: CP 343-1 GX31 Advanced / CP 443-1 GX30 Advanced.

### **Structure of this section of the help system**

Topics that are relevant to all security modules can be found in the "General" section. Information that is only relevant to certain module types can be found in the sections relating specifically to these modules.

### **Overview - Scope of performance and method of operation**

### **General use of the term "STEP 7"**

Configuration of security functions is supported as of STEP 7 V12. For this reason, in this section of the information system, the name "STEP 7" will be used for all versions of STEP 7 V12 or higher.

## **Scope of performance**

You can use the following security functions in STEP 7:

- Configuration of the security modules
- Creating VPN configuration data for SOFTNET Security Client V4
- Creating VPN configuration data for SCALANCE M875
- Test and diagnostics functions, status displays

## **Offline configuration view and online diagnostics view**

The security functions are configured in two views:

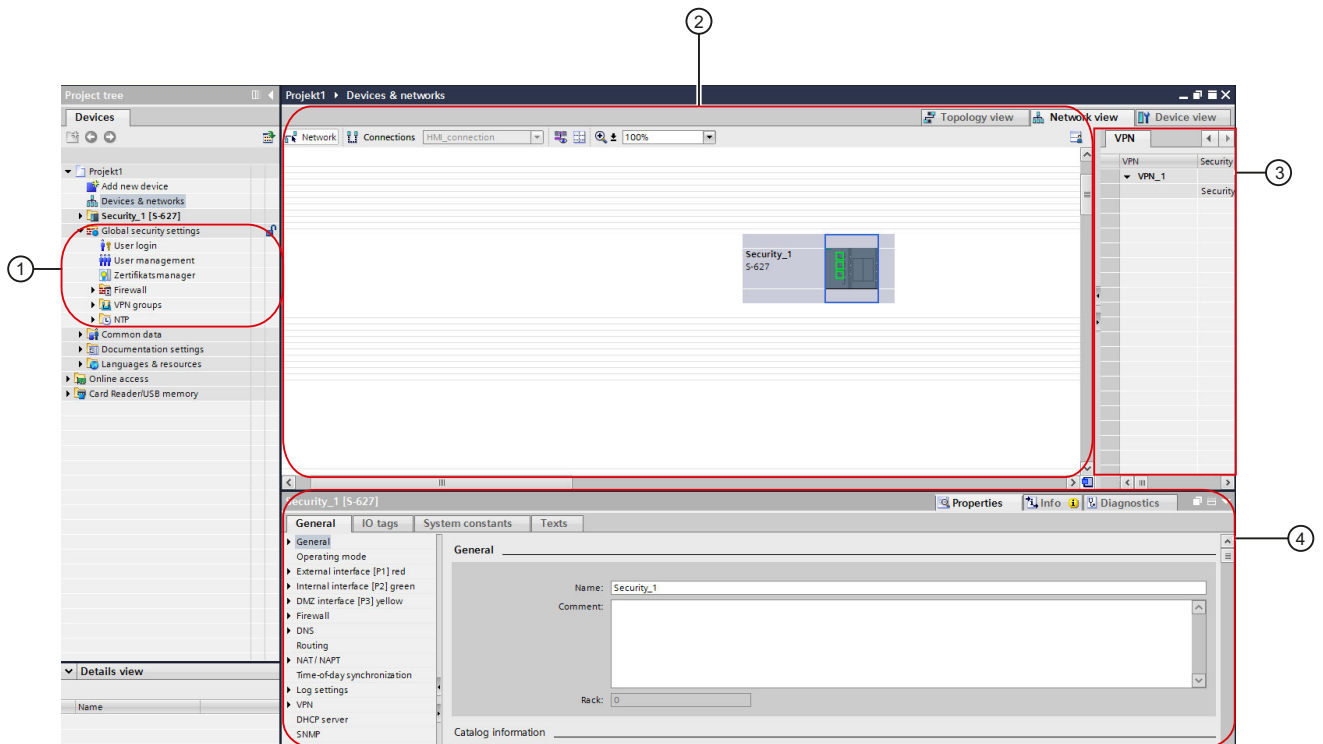

- **Offline configuration view**  
In the offline configuration view, you create the configuration data for the security modules and the SOFTNET Security Client. Prior to downloading, there must already be a connection to the security modules.
- **Online diagnostics view**  
The online diagnostics view is used for diagnostics of the security module and, among other things, allows you to run firmware updates.

## **How it works - security and consistency**

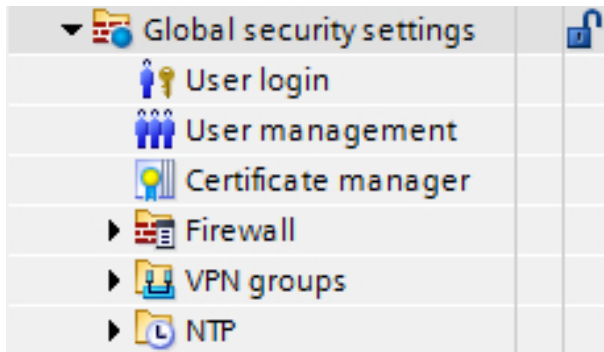

- **Access only for authorized users**  
The security functions of every project are protected from unauthorized access by assigning user names and passwords.
- **Consistent project data**  
Consistency checks are running even while you make the entries in the dialogs. In addition, cross-dialog, project-wide consistency checks are carried out.  
Only consistent project data can be downloaded to the security modules.
- **Protecting project data by encryption**  
The project and configuration data relevant to security are protected by encryption.  
Depending on the security module, data can be stored in the project and/or on the C-PLUG.

## User interface - layout and menu commands

### User interface for security functions in STEP 7

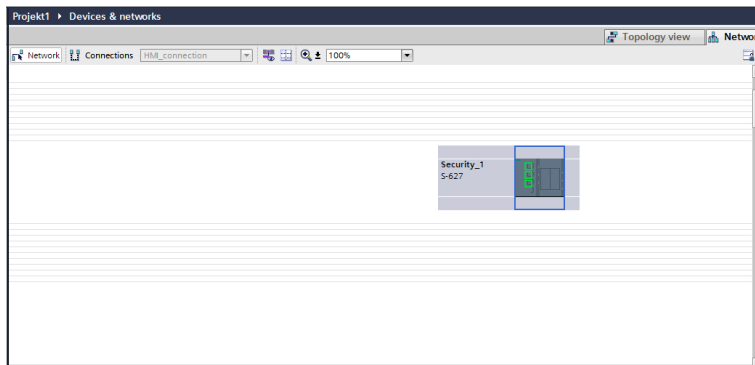

① Global security settings

The global security settings are located in the project navigation. These security settings can be configured independently of the module and subsequently assigned to individual security modules as required. If the first security module to be configured is a CP, the global security settings are only displayed when the security functions have been enabled in the local security settings of the CP. If the first security module to be configured is a SCALANCE S module, the global security settings are displayed after logging in to the security project. The following main folders and entries are available in the global security settings:

- **User login**  
For the security configuration within a project, there is a separate user management. Log in to the security configuration using the "User login" entry. The first time that there is a login to the security configuration, a user with the system-defined role "Administrator" is created automatically. You can create further users in the security configuration in the user management.
- **User administration**  
In user administration, you can create users, define rights for roles and assign these roles to users.
- **Certificate manager**  
In the certificate manager, you see an overview of all the certificates used in the project. You can, for example, import new certificates as well as export, modify or replace existing certificates.
- **Firewall**  
Under the "Firewall" entry, you can define global IP and MAC firewall rule sets and user-specific IP rule sets (SCALANCE S modules only) and assign security modules. IP and MAC service definitions are used to define the IP and MAC firewall rules compactly and clearly.
- **VPN groups**  
All created VPN groups are contained in this folder. You can create new VPN groups here and assign security modules to these VPN groups. You can also adapt VPN group properties of VPN groups that have already been created.
- **NTP**  
Here, you can create NTP servers and assign them to one or more security modules. This ensures that time synchronization is performed through the assigned NTP server. Unsecured NTP servers can only be configured in the local security settings.

② Working area with security module

Once you have selected a security module in the work area, you can configure its local security settings in "Properties" > "General". If the selected security module is in a VPN group, related information is displayed in the VPN tab.

③ VPN tab

A screenshot of the 'VPN' tab in the WinCC configuration interface. The tab is titled 'I/O communication' and 'VPN'. It displays a table with the following data:

VPN	Security module	Authentication
▼ VPN_1	Security_1	Certificate

This tab displays information about all the VPN groups to which the security module that was selected in the working area belongs. Information about the respective participants of a VPN group can be displayed and hidden.

④ Local security settings

Local security settings are configured for a specific security module. After a security module has been selected in the working area, its local security settings are available in the inspector window under "Properties" > "General".

**Note for CPs:**

Before security settings can be configured for CPs, the local security settings must be enabled. To do this, log in to your security project and then in the Inspector window, select the "Activate security features" check box under "Properties" > General" > "Security". The local security settings are then displayed below the "Security" entry. When the check box is selected, the following settings (assuming they were enabled) are migrated automatically to the local security settings.

CP x43-1 Advanced:

- SNMP
- FTP configuration
- Time-of-day synchronization
- Web server
- Entries of IP access lists

CP 1543-1:

- SNMP
- FTP configuration
- Time-of-day synchronization

CP 1628:

- SNMP
- Time-of-day synchronization

In addition, firewall rules that enable a connection to be established are created automatically for configured connections. Log settings are available to record blocked packets.

**Secure and non-secure configuration areas**

The user interface can be divided into secure and non-secure configuration areas.

The secure areas are areas in which configuration is possible only after logging in to the security configuration. These areas are encrypted and therefore only accessible to persons authorized in the user management even if the project is accessible to a wider circle of people.

Functions from the non-secure areas, on the other hand, can be configured without logging in to the security configuration. The correctness of the settings must be checked before downloading the project to the plant components if a wider circle of people can make modifications to the project.

Below, you will find a list of the configuration areas of the user interface showing which areas are secure and which are non-secure. To some extent, this depends on the security module for which the configuration is created.

- All settings from the global security settings are secure.
- Secure and non-secure configuration areas for SCALANCE S modules:
  - All the settings for the interfaces and ports, in particular IP addresses, are non-secure.
  - The settings under the entry "General" in the local security settings are non-secure.
  - Higher-level settings (e.g. MRP settings such as MRP manager etc.) that are not configured on the security module itself but may affect the security module are non-secure. This does not relate to the global security settings.
  - The other settings are protected.
- Secure and non-secure configuration areas for CP 343-1 GX31 Advanced, CP 443-1 GX30 Advanced, CP 1628, CP 1543-1:
  - All settings outside the "Security" entry are non-secure.
  - Higher-level settings (e.g. MRP settings such as MRP manager, PROFINET settings, connections etc.) that are not configured on the security module itself but may affect the security module are non-secure. This does not relate to the global security settings.
  - All the settings for the interfaces and ports, in particular IP addresses, are non-secure.
  - All settings below the "Security" entry are secure.

## Running a consistency check

### Overview

The following consistency checks are available:

- Local consistency checks
- Project-wide consistency checks

In the individual dialog descriptions in this help system, the rules you need to take into account for your entries are listed under the keyword "Consistency check".

### Local consistency checks

A consistency check is local when it can be performed directly within a dialog. With the following actions, local consistency checks are made:

- After exiting a box
- After exiting a row in a table
- When you confirm a dialog with OK.

## Project-wide consistency checks

Project-wide consistency checks provide you with information indicating whether or not project data is correctly configured. With the following actions, there is a consistency check through the entire project:

- When compiling a configuration
- When downloading a configuration

---

### Note

You can only download configured data to a security module when the entire project is consistent.

---

## Managing certificates

### Overview of certificates

#### How do you manage certificates?

In the certificate manager, you have an overview of all the certificates, for example, CA certificates used in the project with information about the applicant, issuer, validity, use and the existence of a private key.

The CA certificate is issued by a certificate authority from which the device certificates are derived. These include the SSL certificates and if the security module is a member of a VPN group the VPN group certificates. The SSL certificates are required for authentication during secure communication between a network node and a security module. Certificate authorities can be:

- STEP 7 itself. If the "applicant" and "issuer" are the same, this is a self-signed certificate; in other words, issued by STEP 7.
- A higher ranking (commercial) certificate authority. These third-party certificates are external to the project and are imported and stored in the certificate store of STEP 7.

Certificates created by one of the two certificate authorities always have a private key so that the device certificates can be derived from them.

The following functions are also available in the certificate manager:

- Modification of existing certificates (for example, duration of validity).
- Import of new certificates and certificate authorities.
- Import of SSL certificates (CP x43-1 Adv. only), e.g. for FTP communication.
- Export of the certificates and certificate authorities used in the project.
- Renewal of expired certificates and certificate authorities.
- Replacement of existing certificate authorities with others.

- Addition of trusted certificates and certificate authorities.
- Deleting manually imported certificates.

---

**Note**

**Downloading the configuration**

After replacing or renewing certificates, the configuration must be downloaded to the relevant security modules.

After replacing or renewing CA certificates, the configuration must be downloaded to all security modules.

---

---

**Note**

**Current date and current time of day on the security modules**

When using secure communication (for example, HTTPS, VPN...), make sure that the security modules involved have the current time of day and the current date. Otherwise the certificates used are not evaluated as valid and the secure communication does not work.

---

**How to access this function**

Double-click on the "Certificate manager" entry in the global security settings.

In the individual tabs, you have the following commands available in the shortcut menu:

Command	Meaning
Import / Export	Import / export of device certificates or CA certificates. The certificates are transferred to the security module. The following formats are permitted: *.cer (certificate only) *.crt (certificate only) *.pem (certificate only) *.p12 (certificate and corresponding private key)
Displays	Opens the certificate dialog of Windows where you see an overview of all certificate data.
Renew (only in the "CA" and "Device certificates" tabs)	Opens the "Create new certificate" dialog in which you can import a certificate or have a new certificate created by STEP 7 when necessary, for example with compromised certificates.
Replace (only in the "CA" tab)	Opens the "Change certificate authority (CA)" dialog in which you can replace an existing certificate authority with a new one.
Delete (only with manually imported certificates)	Deletes a certificate in the "Trusted certificates and root certification authorities" tab.

## Certificate authorities

### "CA" tab

The certificates displayed here are created by a certificate authority.

- CA certificates of a project: When you create a new project, a CA certificate is generated for the project. The SSL certificates for the individual security modules are derived from this certificate.
- CA group certificates: When you create a new VPN group, a CA certificate is generated for the VPN group. The VPN group certificates of security modules located in the VPN group are derived from this certificate.

## Device certificates

### "Device certificates" tab

Display of the device-specific certificates generated by STEP 7 for a security module. These include:

- SSL certificate of a security module: An SSL certificate that is derived from a CA certificate of the project is generated for each security module that you create. SSL certificates are used for authentication during secure communication between PG/PC and security module when downloading the configuration.
- VPN group certificate of a security module: A VPN group certificate is also generated for each security module for each VPN group in which it is located.

## Trusted certificates and root certification authorities

### "Trusted root certification authorities" tab

Display of the third-party certificates imported into STEP 7. For example, server certificates can be imported from external FTPS servers or project certificates from other projects that were created with STEP 7.

With CPs, the imported third-party certificate is transferred to all the CPs managed in the project and these check the certificate. If you classify the certificate sent to the security modules as trusted, a connection can be established, for example, to an FTPS server. The imported certificate is not used at any other point in STEP 7.

With SCALANCE S modules, the certificate authorities required for verifying the security modules using external services such as dyn. DNS are displayed in this tab.

## Renewing certificates

### Meaning

In this dialog, you renew CA certificates and device certificates. If necessary, for example with compromised certificates, you can import a certificate or have a new certificate generated by STEP 7.

### How to access this function

1. Right-click on a list entry in the certificate manager.
2. Select the "Renew" entry in the shortcut menu.
3. Decide whether or not the new certificate will be self-signed or signed by a certificate authority.
4. If the certificate is to be signed by a certificate authority, select the certificate authority to be used with the "Select" button. Only certificate authorities stored in the certificate store of the current project can be selected.
5. Depending on the certificate, enter the following values in the "Applicant" or "Alternative applicant name" input box:

Certificate to be renewed	Parameter	
	Applicant	Alternative applicant name
CA certificates of the project	Name of the CA certificate	-
CA group certificate	Name of the CA group certificate	-
SSL certificate for S7 CP	Name of the security module	Comma-separated IP addresses of the Gigabit and PROFINET interface
SSL certificate for PC CP	Name of the security module	IP address of the security module
SSL certificate for SCALANCE S, SCALANCE M, SOFTNET Security Client	Name of the security module	For SCALANCE S: External IP address, internal IP address and, if applicable, IP address of the DMZ interface For SCALANCE M: External IP address, internal IP address For SOFTNET Security Client: DNS name
VPN group certificate of the security module	Name of the VPN group certificate	Derived from the CA group certificate.

6. Select a period during which the certificate is valid. As default the current time is entered in the "Valid from:" box and the value of the current certificate is entered in the "Valid to:".

## Replacing certificates

### Meaning

Open the "Change certification authority (CA)" to replace the existing CA certificate of the project or the CA group certificate with a new one.

### How to access this function

1. Right-click a list entry in the "CA" tab.
2. Select the "Replace" entry in the shortcut menu.
3. The "Change certification authority (CA)" dialog opens.

All certificates listed in the "Certificates involved" table are derived once again. This means that the CA group certificate of an already configured VPN group can be replaced in the project by the CA group certificate of a different project. The VPN group certificates for the VPN group members are therefore derived from the same CA group certificate in both projects.

After making changes in the certificate manager, download the configuration to all security modules affected.

### Which format can the certificate have?

Other certificates are derived from the imported certificate authority in STEP 7. For this reason, you can only select certificates with a private key.

- \*.p12

## Managing users and roles

### Rules for user names, roles and passwords

#### Which rules apply to user names, role names and passwords?

When creating or modifying a user, a role or a password, remember the following rules:

Table 8-1 Rules for user management

Permitted characters	The following characters from the US-ASCII character set are permitted: 0123456789 A...Z a...z !#\$%&()*+,-./:;<=>?@[ \_{}~ ^
Characters not allowed	" ' ,
Length of the user name	1 ... 32 characters
Length of the password	8 ... 32 characters
Length of the role name	1 ... 32 characters

Maximum number of users per project	128
Maximum number of users on one security module	32 + 1 administrator when creating the project
Maximum number of roles per project	124 (120 user-defined + 4 system-defined)
Maximum number of roles on one security module	33 (29 user-defined + 4 system-defined)

**Note****User names and passwords**

As vital measure under the aspect of maximizing security, always make sure that user names and passwords have a minimum length of 8 characters and that these contain special characters, uppercase/lowercase letters, number, etc..

**Create users****Meaning**

The security functions configured in STEP 7 are protected from unauthorized access by a separate user management. Before you can access the global and local security settings of security modules, you need to log in to the security configuration as a user.

**Creating the first user in the project**

After creating the first security module in the project, you first need to create a user. To do this, in the local security settings of the created security module, click the "User login" button under the "Security properties" entry and enter the login data of the user you want to create. You will then be logged in as the created user and the user is assigned the system-defined "Administrator" role. This role includes all configuration and module rights.

**Creating users in the user management**

When you are logged in as a user in the security configuration, you can create further users or delete users with the "User management" entry in the global security settings.

**Note****Users with the "Administrator" role**

There must always be at least one user with full configuration rights within a project. The administrator that is created automatically when you first enable the security functions in the project can only be deleted if at least one other user exists with the system-defined role "Administrator".

The following parameters are available in user management in the "User" tab:

Table 8-2 Information in the "User" tab

Parameter	Meaning
User name	Name of the user to be created. Click on the "Add new user" entry in the "User name" column to create a new user.
Password	Password with which a user authenticates him/herself when logging on.
Role	Selecting a system-defined or user-defined role.
Maximum time of the session (only for SCALANCE S V3 or higher)	Entry of the time after which a user logged on to the Web page for user-specific IP rule sets of SCALANCE S modules is automatically logged off. The time entered here starts after the logon and after renewing the session on the Web page of the security module. <ul style="list-style-type: none"> <li>• Default setting: 30 minutes</li> <li>• Minimum value: 5 minutes</li> <li>• Maximum value: 480 minutes</li> </ul>
Comment	Entry of optional comments.

## Creating roles

### Overview

You can assign a system-defined or a user-defined role to a user. Specify the module rights of a user-defined role for each security module.

### System-defined roles

The system-defined roles listed below are predefined. Certain rights are assigned to the roles that are the same on all modules and that the administrator can neither change nor delete.

- **Administrator**  
Default role when creating a security configuration.  
Unlimited access rights to all configuration data and all security modules.
- **Standard**  
Role with restricted access rights.
- **Diagnose**  
Default role when creating new user.
  - Read access to configurations.
  - Read access to the security module in the "Online" mode for testing and diagnostics.
- **Remote-Access**  
Can be used as a template when creating user-defined roles.

You will find a detailed list of the configuration and module rights assigned to the system-defined roles "Administrator", "Standard" and "Diagnostics" in tables 1-3 to 1-7 of the section Managing rights (Page 599).

## User-defined role

In addition to the system-defined roles, you can create user-defined roles. For a user-defined role, select the configuration or module rights and specify the appropriate module rights for every security module used in the project. You manually assign the user-defined roles to the relevant user.

## How to access this function

1. Double-click on the "User management" entry in the global security settings.
2. Select the "Roles" tab in User management.

Table 8-3 Information in the "Roles" tab

Parameter	Meaning
Role	Freely selectable role name. Double-click on the "Add new role" entry to create a new user-defined role. You can then set the rights for the created role.
Description	Specifying the system-defined role With user-defined roles, the "User-defined role" character string is displayed.
Maximum time of the session (only for SCALANCE S V3 or higher)	Entry of the time after which a user with the assigned role is automatically logged off from the Web page for user-specific IP rule sets of SCALANCE S modules. The time entered here starts after the logon and after renewing the session on the Web page of the security module. <ul style="list-style-type: none"> <li>• Default setting: 30 minutes</li> <li>• Minimum value: 5 minutes</li> <li>• Maximum value: 480 minutes</li> </ul>
Comment	Entry of additional, optional comments.

### Note

#### Deleting roles

A user-defined role can only be deleted when it is no longer assigned to any user. If necessary, assign the user a different role.

System-defined roles cannot be deleted.

## Managing rights

### How to access this function

1. Double-click on the "User management" entry in the global security settings.
2. Select the "Roles" tab in User management.

### Creating and assigning a user-defined role

1. Double-click on the "Add new role" entry.
2. Enter a role name.
3. If necessary, select the system-defined role whose rights will be used as the template for the user-defined role from the drop-down list labeled "<Copy rights from>". User-defined roles cannot be selected from the drop-down list.  
Result: In the list of rights of the user roles, the rights are selected that are assigned to the selected system-defined role.
4. For each security module, enable or disable the rights to be assigned to the user-defined role.
5. Assign the role to a user in the "User" tab.

### Configuration rights

Configuration rights are not module dependent and control the rights for configuration in STEP 7.

Depending on the user type, the following configuration rights are available for selection:

Table 8-4 Configuration rights

Configuration right	Administrator	Standard	Diagnose
Diagnose security	x	x	x
Configure security	x	x	-
Managing users and roles	x	-	-

### Module rights

Module rights are configured per module. The "Service" column shows the service to which the particular right relates. With the "Copy rights" and "Paste rights" commands in the shortcut menu, you can transfer the rights from one module to another.

Depending on the user type, the following module rights are available for selection:

Table 8-5 Module rights CP x43-1 Advanced

Right within the service	Administrator	Standard	Diagnose	Service
Web: Format CP file system *	x	-	-	File system
FTP: Read files from the CP file system	x	x	x

FTP: Read files (DBs) from the S7 CPU **	x	x	x	PLC
FTP: Write files (DBs) to the S7 CPU ***	x	x	-	

- \* To be able to use the function, the module right "Web: Access Web diagnostics and CP file system" must be enabled as well.
- \*\* To be able to use the function, the module right "FTP: Read files from CP file system" must be enabled as well.
- \*\*\* To be able to use the function, the module right "FTP: Write files to CP file system" must be enabled as well.
- \*\*\*\* To use the function, the configuration right "Security diagnostics" must also be enabled.

### Setting module rights before and after creating the security modules

Within a user-defined role, the module rights for each security module are defined separately. If a security module was created before this role was added and module rights within a role need to be set, STEP 7 presets the module rights for the security module according to the selected rights template. The preset module rights can then be adapted when adding the role. If a security module was created after adding a role, no rights are preset for this security module. In this case, you will need to edit an existing role and set all the module rights yourself for the security module.

You can also transfer existing module rights to another module by copying and, if necessary, adapting them there. To do this, select a module in the shortcut menu in the module rights and select the "Copy rights" or "Paste rights" menu command.

### Generating configuration data for SCALANCE M modules

#### Context

You can generate the VPN information for the assignment of parameters to a SCALANCE M using STEP 7. For this to be possible, the module must be in at least one VPN group with a security module or a SOFTNET Security Client. With the generated files, you can then configure the SCALANCE M using the Web Based Management of the device.

## Generated files

The following file types are generated:

- Export file with the configuration data
  - File type: \*.txt file in ASCII format
  - Contains the exported configuration information for the SCALANCE M including information on the additionally generated certificates.
- VPN group certificates of the module
  - File type of the private key: \*.p12 file
  - The file contains the module certificate and the key material.
  - Access is password protected.
- CA certificates of VPN groups
  - File type: \*.cer file

```

  DPD-timeout: 60 seconds
  DPD-maximum failures: 5
}
```

Figure 8-1 SCALANCE M configuration file

### Note

#### No transfer to the security module

Configuration files are not transferred to the security module. An ASCII file is generated with which you can configure the SCALANCE M. To allow this, the SCALANCE M must be located in at least one VPN group with another security module.

## Follow the steps below

1. Select the module of the type "SCALANCE M".
2. In the local security settings, select the entry "SCALANCE M configuration".

3. Select the "Generate SCALANCE M files" check box and select a storage location for the configuration files.
4. Compile the configuration of the SCALANCE M module.
5. In the dialog that follows, choose whether you want to create your own password for the created .p12 file.  
If you select "Cancel", the project name is assigned as the password, not the project password.

Result: The files (.txt file and certificates) are stored in the folder you specify.

## Configuring interfaces for SCALANCE S modules

### Overview

You will find information on configuration interfaces of SCALANCE S modules in Auto-Hotspot of the section "SCALANCE S". The information contained here deals with the following configuration options:

- Mode (bridge mode / routing mode): Setting the operating mode (Page 671)
- IP address parameters: Configuring IP address parameters (Page 671)
- Port settings (only for SCALANCE S ≥ V3): Configuring port mode (Page 673)
- Settings for the Internet Service Provider (ISP) if one of the interfaces is operated using PPPoE (only for SCALANCE S ≥ V3): Configuring an Internet connection (Page 673)
- Dynamic DNS (only for SCALANCE S ≥ V3): Configuring dynamic DNS (Page 674)
- LLDP (only for SCALANCE S ≥ V4 in routing mode): Configuring LLDP (Page 677)
- Media redundancy in ring topologies (MRP client), (only for SCALANCE S ≥ V4 in routing mode): Auto-Hotspot

The configuration of the interfaces of CPs is described in the sections dealing with the CPs.

## Setting up a firewall

### Overview of the firewall

#### Meaning

The firewall functionality of the security modules is intended to protect networks and stations from third-party influence and interference. This means that only certain, previously specified communications relations are permitted. The firewall discards invalid frames without sending a response.

To filter the data traffic, IP addresses, IP subnets, port numbers or MAC addresses can be used. You can also set a bandwidth limitation.

The firewall functionality can be configured for the following protocol levels:

- IP firewall with stateful packet inspection (layer 3 and 4)
- Firewall also for Ethernet "non-IP" frames according to IEEE 802.3 (layer 2)

With security modules capable of VPN, the firewall can also be used for the encrypted data traffic (IPsec tunnel). With the SCALANCE S602 Security module, the firewall can only be used for unencrypted data traffic.

## Firewall rules

Firewall rules describe which packets in which direction are permitted or forbidden.

### Types of firewall rules

- Global firewall rule sets: Global firewall rule sets can be assigned to several security modules at the same time. Global firewall rule sets are configured in the global security settings.
- Local firewall rules: Local firewall rules are configured in the local security settings of a security module.
- User-specific IP rule sets (only for SCALANCE S  $\geq$  V3): User-specific IP rule sets can be assigned to individual or several security modules at the same time. User-specific IP rule sets are configured in the global security settings and assigned there to one or more users. You will find information on configuring user-specific IP rule sets for SCALANCE S V3 modules in the following section:  
Auto-Hotspot

### Service definitions

With the aid of service definitions, you can also define firewall rules clearly in a compact form. Service definitions are configured in the global security settings and can be used in the global, local and user-specific firewall rules.

### Adapting standard rules for IP services

For SCALANCE S modules V3 or higher, you can adapt service-specific firewall rules that are set as default for the interfaces of the security modules. You will find information on configuring these firewall rules in Adapting standard rules for IP services (Page 686) of the section "SCALANCE S".

### Automatically generated firewall rules for CP connections

For connections that were configured using CPs, STEP 7 automatically creates firewall rules that allow communication with the partner of the CP in the specified direction (CP active/passive). The connection establishment directions are taken into account. To display these firewall rules, if the advanced firewall mode is enabled, the "Update connection rules" button needs to be clicked. The firewall rules are then displayed in advanced firewall mode.

Which firewall rules are generated automatically is described in the following sections.

- For S7-300 CPs/S7-400 CPs/PC CPs: Connection-related automatic firewall rules (Page 710) in the section "Security for S7-300 / S7-400 / PC CPs".
- For S7-1500 CPs: Connection-related automatic firewall rules (Page 719) in the section "Security for S7-1500 CPs".

### Enabling the firewall

Firewall functionality for a specific security module is controlled in the local security settings using the "Enable firewall" check box. If the check box is enabled, the firewall can be configured and is effective following the download. For a security module that is a member of a VPN group, the "Enable firewall" check box is activated by default and cannot be deactivated. After switching to advanced firewall mode, it is not possible to switch back to standard mode. For more information about the standard and advanced firewall modes, refer to the section:

Overview of local firewall rules (Page 614).

### Global firewall rule sets

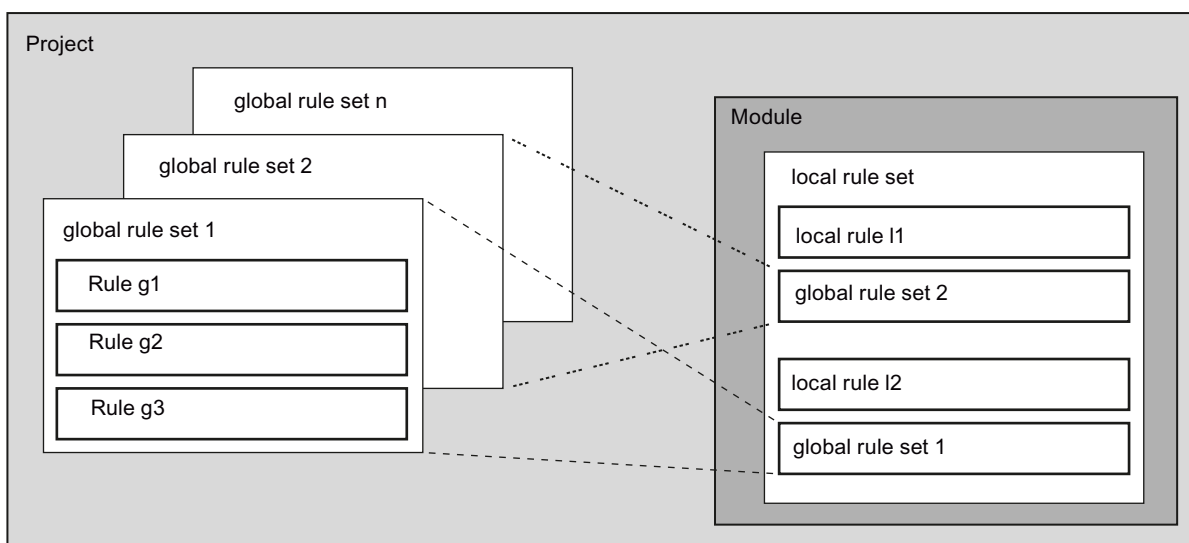

#### Application

Regardless of the module, global firewall rule sets are configured in the global security settings. A firewall rule set consists of one or more firewall rules and is assigned to the individual security modules.

In the global firewall rule sets, a distinction is made between the following:

- IP rule sets
- MAC rule sets

The following schematic illustrates the relationship between globally defined rule sets and locally used rule sets.

## Configuring

When configuring global firewall rules, you can make detailed firewall settings. You can allow individual services for a single node or all services for the node for access to the station or network.

### When are global IP and MAC firewall rules useful?

Global firewall rules are useful if you want to define identical filter criteria for communication with several security modules.

---

#### Note

##### Assigning firewall rule sets with incompatible firewall rules

For a security module, only the firewall rules from firewall rule sets are adopted correctly if the security module supports them. A firewall rule with the direction "From external" or "To any" in a global firewall rule set is not assigned to a CP 1628. The other firewall rules of the global firewall rule set are adopted if the CP supports them.

---

## Global firewall rule sets - conventions

### Global firewall rule sets are used locally

The following conventions apply when creating a global set of firewall rules and when assigning it to a module:

- Configuration view  
Global firewall rule sets are configured in the global security settings.
- Priority  
As default, locally defined rules have a higher priority than the global IP and MAC firewall rule sets. Newly assigned global IP and MAC firewall rule sets are therefore initially entered at the bottom of the local rule list.  
The priority can be changed by changing the position in the rule list.
- Entering, changing or deleting rule sets  
Global firewall rule sets cannot be edited in the local rule list of the firewall rules in the module properties. They can only be displayed there and positioned according to the required priority.  
It is not possible to delete a single rule from an assigned rule set in the local security settings. Only the entire rule set can be removed from the local list of rules. The firewall rule sets in the global security settings remain unaffected.

## Creating global firewall rule sets

### How to access this function

1. In the global security settings, select the entry "Firewall" > "Global firewall rule sets" > "IP rule sets" or "MAC rule sets".  
Result: The previously created IP rule sets or MAC rule sets are displayed under the selected entry.
2. Double-click on the entry "Add new IP rule set" or "Add new MAC rule set".
3. Enter the following data:
  - Name: Project-wide, unique name of the rule set. The name appears in the local rule list of the security module after the rule set is assigned.
  - Description (optional): Enter a description of the global rule set.
4. Enter the firewall rules one by one in the list.  
Note the parameter description in the following sections:  
For IP rule sets: Defining IP packet filter rules (Page 615)  
For MAC rule sets: Defining MAC packet filter rules (Page 618)

### Result

You have created the global firewall rule set and can now assign this to the required security modules.

Note the descriptions in the following section:

Assigning global firewall rule sets (Page 608)

## Assigning global firewall rule sets

### Requirement

You have enabled the advanced firewall mode for the security modules you want to assign to a firewall rule set.

### Procedure

1. In the global security settings, select the entry "Firewall" > "Global firewall rule sets" > "Assign module to a firewall rule set".
2. From the "Rule set" drop-down list, select the rule set to which you want to assign the security module.  
In the right-hand table, you will see the security modules that you can assign to the selected firewall rule set. In the left-hand table, you will see the security modules already assigned to the selected firewall rule set.
3. In the "Available modules" area, select the security modules you want to assign to the selected rule set.
4. Click the  button to assign the selected modules to the selected rule set.

## Result

The global rule set is used by the assigned security modules as a local rule set and appears automatically at the end of the list of firewall rules in the local security settings.

## IP services

### Defining IP services

### How to access this function

In the global security settings, select the entry "Firewall" > "Services" > "Define services for IP rules".

## Procedure

Using the definition of IP services, you can define succinct and clear firewall rules for specific services. You select a name and assign the service parameters to it.

These services defined in this way can also be grouped together under a group name.

When you configure the packet filter rules, you then use this name.

## Parameters for IP services

You define the IP services using the following parameters:

Table 8-9 IP services: Parameter

Parameter	Meaning/comment	Available options / ranges of values
Name	Name for the service that is used as identification in the rule definition or in the group. The names of predefined services cannot be changed.	<ul style="list-style-type: none"> <li>• Name must start with a letter.</li> <li>• Name must not contain any special characters.</li> <li>• Name must not be redundant.</li> </ul>
Protocol	Selection of the protocol type	<ul style="list-style-type: none"> <li>• TCP</li> <li>• UDP</li> <li>• All</li> </ul>
Source port	The filtering is based on the specified port number; this defines the service access at the frame sender.	Examples: *: Port is not checked 20 or 21: FTP service
Destination port	The filtering is based on the specified port number; this defines the service access at the frame recipient.	Examples: *: Port is not checked TCP 80: Web HTTP service TCP 102: S7 protocol

## Defining ICMP services

### How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for IP rules".
2. Select the "ICMP" tab.

### Procedure

Using the definition of ICMP services, you can define succinct and clear firewall rules for specific services. You select a name and assign the service parameters to it.

These services defined in this way can be grouped together under a group name.

When you configure the packet filter rules, you then use this name.

### Parameters for ICMP services

Parameter	Meaning/comment	Available options / ranges of values
Name	User-definable name for the service that is used as identification in the rule definition or in the group. The names of predefined ICMPv6 services cannot be modified.	<ul style="list-style-type: none"> <li>• Name must start with a letter.</li> <li>• Name must not contain any special characters.</li> <li>• Name must not contain more than 20 characters.</li> <li>• Name must not occur more than once</li> </ul>
ICMPv6	If you enable this check box, the ICMP service is declared as an ICMPv6 service and you can select an ICMPv6-specific type and code for the service. An ICMPv6 service can only be used in the firewall rule of a security module that supports IPv6.	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>
Type	Type of the ICMPv4 or ICMPv6 message.	If the "ICMPv6" check box is deselected, ICMPv4-specific types can be selected. If the check box is selected, ICMPv6-specific types can be selected.
Code	Code of the ICMP type.	Values depend on the selected type.

## Creating service groups

### How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for IP rules".
2. Select the "Service groups" tab.

### Forming service groups

You can put several services together by creating service groups. This allows you set up more complex services that you can then use in the packet filter rules simply by selecting the name. IPv4 and IPv6 services can be collected in the same service group.

Create groups in the open "Service groups" tab. You can then assign services to a group in the "Group management" tab.

### Follow the steps below

1. First, create groups in this tab with names to suit your requirements and add a description if required.
2. Select the "Group management" tab. You can assign the previously specified IP services to the groups defined in this tab.

## Managing service groups

### How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for IP rules".
2. Select the "Group management" tab.

### Forming service groups

You can put several services together by creating service groups. This allows you set up more complex services that you can then use in the packet filter rules simply by selecting the name. IPv4 and IPv6 services can be collected in the same service group.

Use the "Group management" tab to assign services to a selected group you created previously in the "Service groups" tab.

### Follow the steps below

1. Select a group created previously in the "Service groups" tab from the "Service groups" drop-down list in this tab.
2. Then assign the required services from the right-hand "Available services" list box to the group.

## MAC services

### Define MAC services

#### How to access this function

In the global security settings, select the entry "Firewall" > "Services" > "Define services for MAC rules".

#### Meaning

Using the definition of MAC services, you can define succinct and clear firewall rules for specific services. You select a name and assign the service parameters to it.

These services defined in this way can be grouped together under a group name.

When you configure the global or local packet filter rules, you use this name.

#### Parameters for MAC services

A MAC service definition is formed using protocol-specific MAC parameters:

Table 8-10 MAC services - parameters

Parameter	Meaning/comment	Available options / ranges of values
Name	User-definable name for the service that is used as identification in the rule definition or in the group.	<ul style="list-style-type: none"> <li>Name must start with a letter.</li> <li>Name must not contain any special characters.</li> <li>Name must not be redundant.</li> </ul>
Protocol	Name of the protocol type: <ul style="list-style-type: none"> <li>ISO ISO identifies frames with the following properties: Lengthfield &lt;= 05DC (hex), DSAP= userdefined SSAP= userdefined CTRL= userdefined</li> <li>SNAP SNAP identifies frames with the following properties: Lengthfield &lt;= 05DC (hex), DSAP=AA (hex), SSAP=AA (hex), CTRL=03 (hex), OUI=userdefined, OUI-Type=userdefined</li> <li>PROFINET IO</li> <li>As an alternative, a protocol number can be entered.</li> </ul> The protocol entries 0800 (hex) and 0806 (hex) are not accepted since these values apply to IP or ARP frames.	<ul style="list-style-type: none"> <li>ISO</li> <li>SNAP</li> <li>PROFINET IO</li> <li>0x (code entry)</li> </ul>
DSAP	Destination Service Access Point: LLC recipient address	
SSAP	Source Service Access Point: LLC sender address	

Parameter	Meaning/comment	Available options / ranges of values
CTRL	LLC control field	
OUI	Organizationally Unique Identifier (the first 3 bytes of the MAC address = vendor ID)	
OUI type	Protocol type/identification	

**Note****Processing for S7-CPs**

Only settings for ISO frames with DSAP=SSAP=FE (hex) are processed. Other frame types are not relevant for S7 CPs and are therefore discarded even before processing by the firewall.

**Special settings for SIMATIC NET services**

To filter special SIMATIC NET services, please use the following protocol settings:

- DCP (Primary Setup Tool):  
PROFINET
- SiClock :  
OUI= 08 00 06 (hex) , OUI-Type= 01 00 (hex)

**Creating service groups****How to access this function**

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for MAC rules".
2. Select the "Service groups" tab.

**Forming service groups**

You can put several services together by creating service groups. This allows you set up more complex services that you can then use in the packet filter rules simply by selecting the name.

Create groups in the open "Service groups" tab. You can then assign services to a group in the "Group management" tab.

**Follow the steps below**

1. First, create groups in this tab with names to suit your requirements and add a description if required.
2. Select the "Group management" tab. You can assign the previously specified MAC services to the groups defined in this tab.

## Managing service groups

### How to access this function

1. In the global security settings, select the entry "Firewall" > "Services" > "Define services for MAC rules".
2. Select the "Group management" tab.

### Forming service groups

You can put several services together by creating service groups. This allows you set up more complex services that you can then use in the packet filter rules simply by selecting the name.

Use the "Group management" tab to assign services to a selected group you created previously in the "Service groups" tab.

### Follow the steps below

1. Select a group created previously in the "Service groups" tab from the "Service groups" drop-down list in this tab.
2. Then assign the required services from the right-hand "Available services" list box to the group.

## Overview of local firewall rules

### Meaning

Local firewall rules are configured in the local security settings of a security module and apply only to this security module. After enabling the firewall functionality you can either use predefined firewall rules or define firewall rules in the advanced firewall mode.

### Using predefined firewall rules

Here, you use simple, predefined rules. You can only enable service-specific rules. The enabled services are allowed for all nodes in the specified direction. You can find detailed information on the definition of firewall rules in this dialog in the following module-specific sections:

- For SCALANCE S: Auto-Hotspot
- For S7-300 CPs/S7-400 CPs/PC CPs: Auto-Hotspot
- For S7-1500 CPs: Auto-Hotspot

### Defining firewall rules in advanced firewall mode

In advanced firewall mode, you can make detailed firewall settings. You can allow individual services for a single node or all services for the node for access to the station or network. You enable the advanced firewall mode using the "Activate firewall in advanced mode" check box.

In the local security settings, the firewall rules can then be configured in "Firewall" > "IP rules" or "MAC rules". The configuration options available here are described individually in the following section:

For IP packet filter rules: Defining IP packet filter rules (Page 615)

For MAC packet filter rules: Defining MAC packet filter rules (Page 618)

---

**Note**

**Deactivating the advanced firewall mode not possible**

Once you have activated the advanced firewall mode, you can no longer deactivate it.

---

**Quantity structure**

Number of firewall rules (advanced firewall mode)	
SCALANCE S	Maximum of 256
S7 CPs	Maximum of 256
CP 1628	Maximum of 256

**Defining IP packet filter rules**

**Meaning**

With IP packet filter rules, you filter according to IP frames, such as TCP, UDP and ICMP.

Within a packet filter rule, you can also fall back on the definitions of the IP services.

**Entering IP packet filter rules**

Enter the firewall rules one by one in the list. Note the following parameter description.

Table 8-11 IP rules: Parameter

Parameter	Meaning/comment	Available options / ranges of values
Action	Allow/disallow (enable/block)	<ul style="list-style-type: none"> <li>• Allow Allow frames according to definition.</li> <li>• Drop Block frames according to definition.</li> </ul> <p>For firewall rules generated automatically as result of configuring a connection and subsequently adapted manually:</p> <ul style="list-style-type: none"> <li>• Allow*</li> <li>• Drop*</li> </ul> <p>If you change automatically created connection rules, when the "*" option is selected they are not recreated and overwritten by STEP 7.</p>
From / To	Selection of the communications directions for which the rule will apply.	<p>Described in separate sections.</p> <ul style="list-style-type: none"> <li>• For SCALANCE S modules: IP packet filter directions SCALANCE S (Page 685)</li> <li>• For S7-300 CPs/S7-400 CPs/PC CPs: IP packet filter directions S7-300-/S7-400-/PC-CPs (Page 708)</li> <li>• For S7-1500 CPs: IP packet filter directions S7-1500 CPs (Page 718)</li> </ul>
IPv6 (for the CP 1543-1 only)	If this check box is selected, you can use a previously defined ICMPv6 service in the firewall rule. For the CP 1543-1 V1.1, after selecting the check box you can enter additional IPv6 addresses in the "Source IP address" and "Destination IP address" input boxes. For the CP 1543-1 V1.0, after enabling the check box you cannot enter any source IP address or any destination IP address for the firewall rule.	<p>The check box can only be selected and deselected if there are no entries in the "Source IP address" and "Destination IP address" input boxes.</p> <p>If IPv6 is disabled in the local settings of the CP 1543-1, you cannot select the "IPv6" check box in the local security settings of the CP and therefore cannot use ICMPv6 services or IPv6 addresses in firewall rules. Existing firewall rules that use IPv6 are shown grayed out if IPv6 is disabled.</p>
Source IP address	The firewall rule is applied to the frames whose sender has the IP address specified here. If you do not specify an IP address, the firewall rule applies to all nodes in the communications direction you selected in the "From" column.	You can find additional information about IP addresses in the IP addresses in IP packet filter rules (Page 619) section.
Destination IP address	The firewall rule is applied to the frames whose recipient has the IP address specified here. If you do not specify an IP address, the firewall rules applies to all nodes in the communications direction you selected in the "To" column.	

Parameter	Meaning/comment	Available options / ranges of values
Service	Name of the IP/ICMP service or service group used. Here, you select one of the services you defined in the "IP services" dialog: <ul style="list-style-type: none"> <li>• IP services</li> </ul> or <ul style="list-style-type: none"> <li>• ICMP services</li> </ul> Before you select an ICMPv6 service, you need to select the "IPv6" check box.	The drop-down list box displays the services and service groups configured in the global security settings and you can select them.
Bandwidth (Mbps)	Option for setting a bandwidth limitation Can only be entered if the "Allow" action is selected. A packet passes through the firewall if the allow rule matches and the permitted bandwidth for this rule has not yet been exceeded.	CP x43-1, CP 1543-1 and SCALANCE S < V3.0: 0.001 ... 100 Mbps CP 1628 and SCALANCE S ≥ V3.0: 0.001 ... 1000 Mbps For global and user-specific rules: 0.001 ... 100 Mbps Note: If the direction "From tunnel to station" is configured in a firewall rule for the CP 1543-1, no bandwidth limitation can be specified.
Logging	Enable and disable logging for this rule. If logging is enabled, the settings for the packet filter logging configured in the local security settings apply.	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>
Number	Automatically assigned number for the rule	
Comment	Space for your own explanation of the rule	If a comment is marked with "AUTO", it was created for an automatic connection rule. For rules you have created, entry of a comment is optional.

Table 8-12 Meaning of the entries in the shortcut menu

Entry in the shortcut menu	Meaning
Delete	This deletes the selected rule or the selected rule set. Notes on removing a globally defined and locally assigned rule set: if you delete a rule set here, this only cancels the assignment to the security module.
Save as global rule set (only for local firewall rules)	Copies the selected firewall rule(s) and inserts it as a global firewall rule set in the global security settings. The firewall configuration currently configured for the security module remains unaffected by this procedure.
Move up	Use this button to move the selected rule or selected rule set up one position in the list. The rule / rule set you moved is therefore handled with higher priority.
Move down	Use this button to move the selected rule or selected rule set down one position in the list. The rule / rule set you moved is therefore handled with lower priority.
Define service for IP rules	This opens the dialog in which you can manage the IP services and service groups.

## Defining MAC packet filter rules

### Meaning

With the MAC packet filter rules, you filter according to MAC frames.

Within a packet filter rule, you can also fall back on the definitions of the MAC services.

### Entering MAC packet filter rules

Enter the firewall rules one by one in the list. Note the following parameter description.

Table 8-13 MAC rules: Parameter

Parameter	Meaning/comment	Available options / ranges of values
Action	Allow/disallow (enable/block)	<ul style="list-style-type: none"> <li>Allow Allow frames according to definition.</li> <li>Drop Block frames according to definition.</li> </ul>
From / To	Selection of the communications directions for which the rule will apply.	Described in separate sections. <ul style="list-style-type: none"> <li>For SCALANCE S modules: MAC packet filter directions SCALANCE S (Page 686)</li> <li>For S7-300 CPs/S7-400 CPs/PC CPs: MAC packet filter directions S7-300-/S7-400-/PC-CPs (Page 709)</li> <li>For S7-1500 CPs: MAC packet filter directions S7-1500 CPs (Page 719)</li> </ul>
Source MAC address	The firewall rule is applied to the frames whose sender has the MAC address specified here. If you do not specify a MAC address, the firewall rule applies to all nodes in the communications direction you selected in the "From" column.	MAC address in the correct format
Destination MAC address	The firewall rule is applied to the frames whose recipient has the MAC address specified here. If you do not specify a MAC address, the firewall rule applies to all nodes in the communications direction you selected in the "To" column.	
Service	Name of the MAC service or service group used	The drop-down list box displays the configured services and service groups you can select.
Bandwidth (Mbps)	Option for setting a bandwidth limitation. Can only be entered if the "Allow" action is selected.  A packet passes through the firewall if the allow rule matches and the permitted bandwidth for this rule has not yet been exceeded.	CP x43-1, CP 1543-1 and SCALANCE S < V3.0: 0.001 ... 100 Mbps CP 1628 and SCALANCE S ≥ V3.0: 0.001 ... 1000 Mbps For global rules: 0.001 ... 100 Mbps Note: If the direction "From tunnel to station" is configured in a firewall rule for the CP 1543-1, no bandwidth limitation can be specified.

Parameter	Meaning/comment	Available options / ranges of values
Logging	Enable and disable logging for this rule. If logging is enabled, the settings for the packet filter logging configured in the local security settings apply.	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled (default)</li> </ul>
Number	Automatically assigned number for the rule	
Comment	Space for your own explanation of the rule	If a comment is marked with "AUTO", it was created for an automatic connection rule. For rules you have created, entry of a comment is optional.

Table 8-14 Meaning of the menu commands

Button	Meaning
Delete	This deletes the selected rule or the selected global rule set. Notes on removing a globally defined and locally assigned rule set: if you delete a rule set here, this only cancels the assignment to the security module.
Save as global rule set (only for local firewall rules)	Copies the selected firewall rule(s) and inserts it as a global firewall rule set in the global security settings. The firewall configuration currently configured for the security module remains unaffected by this procedure.
Move up	Use this button to move the selected rule or selected global rule set up one position in the list. The rule / rule set you moved is therefore handled with higher priority.
Move down	Use this button to move the selected rule or selected global rule set down one position in the list. The rule / rule set you moved is therefore handled with lower priority.
Define service for MAC rules	This opens the dialog in which you can manage the MAC services and service groups.

## IP addresses in IP packet filter rules

### Entering IP addresses in IP packet filter rules

In IP packet filter rules, you have the following options for entering IP addresses:

- Nothing specified  
The rule applies to all IP addresses.
- An IP address  
The rule applies specifically to the specified address.

8.1 Configuring devices and networks

- Address range  
 The rule applies to all the IP addresses covered by the address range.  
 An address range is defined by specifying the number of valid bit places in the IP address in the format: [IP address]/[number of bits to be included]
  - [IP address]/24 therefore means that only the most significant 24 bits of the IP address are included in the filter rule. These are the first three octets of the IP address.
  - [IP address ]/25 means that only the first three octets and the highest bit of the fourth octet of the IP address are included in the filter rule.
- Address area  
 For the source IP address, an address range can be entered in the following format: [Start IP address]-[End IP address]

**IPv4 addresses**

An IPv4 address consists of 4 decimal numbers in the range from 0 to 255 separated from each other by a dot.

Table 8-15 Examples of address ranges in IPv4 addresses

Source IP address or destination IP address	Address range		Number of addresses*)
	from	to	
192.168.0.0/16	192.168.0.0	192.168.255.255	65.536
192.168.10.0/24	192.168.10.0	192.168.10.255	256
192.168.10.0/25	192.168.10.0	192.168.10.127	128
192.168.10.0/26	192.168.10.0	192.168.10.63	64
192.168.10.0/27	192.168.10.0	192.168.10.31	32
192.168.10.0/28	192.168.10.0	192.168.10.15	16
192.168.10.0/29	192.168.10.0	192.168.10.7	8
192.168.10.0/30	192.168.10.0	192.168.10.3	4

\*) Note: Note that the network address and the broadcast address are not available as IP addresses of network nodes in an address range.

**IPv6 addresses**

IPv6 addresses consist of 8 fields each with four hexadecimal numbers (128 bits in total). The fields are separated by a colon. IPv6 addresses can only be entered in IP packet filter rules for the CP 1543-1 V1.1.

Example: fd00:ffff:ffff:ffff:ffff:ffff:2f33:8f21

Rules / simplifications:

- Leading zeros within a field can be omitted.  
Example: Instead of 2001:0db8:2426:08d3:1457:8a2e:0070:7344 it is also possible to use the notation 2001:db8:2426:8d3:1457:8a2e:70:7344.
- If one or more fields have the value 0 (or 0000), a shortened notation is possible.  
Example: Instead of 2001:0db8:0:0:0:0:1428:57ab it is also possible to use the notation 2001:db8::1428:57ab.  
To ensure uniqueness, this shortened form can only be used once within the entire address.
- Decimal notation with periods  
The last 2 fields or 4 bytes can be written in the normal decimal notation with periods.  
Example: The IPv6 address fd00::ffff.125.1.0.1 is equivalent to fd00::ffff:7d01:1.
- Address range notation in IP packet filter rules: In the same way as IPv4 addresses, IPv6 addresses can also be noted in the form of address ranges.  
Example: The entry "2001:0db8:85a3:08d3:1319:8a2e:0:0/96" covers all IPv6 addresses from 2001:0db8:85a3:08d3:1319:8a2e:0:0 to 2001:0db8:85a3:08d3:1319:8a2e:ffff:ffff.

## Carrying out module-specific log settings

### Log settings - overview

#### Log settings in the configuration

The log settings made here are loaded on the module with the configuration and take effect when the security module starts up.

You can restrict the configured packet filter log settings in the online functions if necessary. For example, you can use the online functions to specify that merely IP logging is displayed if you have configured IP and MAC logging.

#### Logging procedures and event classes

Here, you can specify which data should be logged. As a result, you enable logging as soon as you download the configuration to the security module.

During configuration, you also select one or both of the possible logging procedures:

- Local logging
- Network Syslog

In both logging procedures, the security module recognizes the three following types of events:

- Packet filter events
- Audit events
- System events

## **Configuring local logging**

### **How to access this function**

1. Select the module to be edited.
2. Select the "Log settings" > "Local log memory" entry in the local security settings.

## Configuring local logging

Table 8-16 Local logging - settings for log events

Log event	Meaning	Comments
Packet filter log (firewall)	<p>The packet filter log records certain packets of the data traffic. Only those data packets for which a configured packet filter rule (firewall) applies or to which the basic protection reacts (corrupt or invalid packets) are logged. This is only possible when logging is enabled for the packet filter rule.</p> <p>In the "Packets to be logged" drop-down list, you can specify the data packets to be logged:</p> <ul style="list-style-type: none"> <li>• "All packets": The data packets that are logged are those to which a configured firewall rule applies. In addition to this, all the response packets to such packets are recorded that have passed the firewall according to a configured allow rule.</li> <li>• "Status generating packets": The only data packets that are logged are those to which a configured firewall rule (standard mode or advanced mode) applies and that initially generate a status in the firewall. Data packets that pass through the firewall by using this firewall status are not logged.</li> </ul>	<p>Packet filter log data is not retentive</p> <p>The data is stored in volatile memory on the security module and is therefore no longer available after the power supply has been turned off. For retentive storage, you can also save the log data displayed in the "Online &amp; diagnostics" dialog in a file.</p>
Audit log	<p>The logging of audit events is always enabled.</p> <p>The logged information is always stored in the ring buffer.</p> <p>The audit log automatically records security-relevant events, for example user actions such as activating or deactivating packet logging or downloading configurations to the security module.</p>	<p>Audit log data is retentive</p> <p>The data is stored in a retentive memory of the security module and is therefore still available after turning off the power supply.</p> <p><b>Note for CPs:</b></p> <p>The audit log files are not retentive on CPs. You should therefore use a Syslog server to backup this data.</p>
System log	<p>The system log automatically logs successive system events, for example the start of a process or the failed login attempt of a user.</p> <p>Select the "Log settings" &gt; "Configure system events" entry to configure the event filter and cable diagnostics functions.</p>	<p>System log data is not retentive</p> <p>The data is stored in volatile memory on the security module and is therefore no longer available after the power supply has been turned off. For retentive storage, you can also save the log data displayed in the "Online &amp; diagnostics" dialog in a file.</p>

Table 8-17 Local logging - storage of recorded data

Storage	Meaning
Ring buffer	At the end of the buffer, the recording continues at the start of the buffer and overwrites the oldest entries.
One-shot buffer	Recording stops when the buffer is full.

## Configuring system events

### How to access this function

1. Select the module to be edited.
2. Select the "Log settings" > "Configure system events" entry in the local security settings.

### Filtering of the system events

In this dialog, you set a filter level for the system events. As default, the following values are set:

- SCALANCE S: Level 3 (Error)
- CP: Level 3 (Error)

The priority of the selected filter level must be the same or lower than the severity set for the cable diagnostics; see the "Setting parameters for line diagnostics" table (not for CPs).

Recommendation: Select "Error" as the filter level or a higher value to exclude logging of general, uncritical events.

### Note for CP

For CPs, select only level 3 or level 6 since only events of these levels are generated for CPs.

- Level 0 to level 3 error messages are output if level 3 is selected.
- If you select level 6, the error messages of levels 0 to 6 are output.

### Properties of the system events - line diagnostics (not for CPs)

Line diagnostics generates a special system event. A system event is generated when a selectable percentage of bad frames is reached. This system event is assigned the severity and facility set in this dialog.

Table 8-18 Setting parameters for line diagnostics

Function / option / parameter	Meaning
Enable	Enabling and disabling logging
Limit	Selectable percentage of faulty frames representing the limit at which a system event is triggered.

Function / option / parameter	Meaning
Facility	Select a facility from the drop-down list that identifies the system event to be logged.
Severity	Using the severity, you weight the system events of line diagnostics relative to the severity of the other system events.

**Note****Severity of the system events of line diagnostics**

Make sure that you do not assign a lower severity to the system events of line diagnostics than for the filter. At a lower severity, these events will not pass through the filter and will not be logged.

**Configuring the network Syslog****How to access this function**

1. Select the module to be edited.
2. Select the "Log settings" > "Network Syslog" entry in the local security settings.

**Configuring the network Syslog**

Table 8-19 Network Syslog - basic settings

Option / parameter	
Enable network Syslog	Enables and disables the transfer of logging events to the Syslog server.
Syslog server	Here, enter the IP address of the Syslog server. As an alternative, an FQDN can be entered for SCALANCE S V4 modules.  The Syslog server must be accessible from the security module at the specified address and, if applicable, using the router configuration under the "Routing" entry of the local security settings. If the Syslog server cannot be accessed no Syslog messages are sent. You can recognize this operating state on the basis of corresponding system alarms. To activate the sending of the Syslog information again, you may have to update the routing information and initiate a restart of the security module.
Module name	The module name is displayed and cannot be changed at this point.

Table 8-20 Network Syslog - settings for log events

Log event	Configuring	Comments
Packet filter events (firewall)	The packet filter log records certain packets of the data traffic. Only those data packets for which a configured packet filter rule (firewall) applies or to which the basic protection reacts (corrupt or invalid packets) are logged. This is only possible if logging is activated for the packet filter rule.  Syslog alarms can be classified according to their origin and their severity level by setting Facility and Severity. This assignment is carried out with drop-down lists. The severity and facility that you set here is assigned to every event.	The value you select here depends on the evaluation in the Syslog server.  If you retain the "default" value setting, the security module specifies the combination of facility and severity with which the event is displayed.
Audit events	The audit log automatically records security-relevant events, for example user actions such as activating or deactivating packet logging or downloading configurations to the security module.  Assignment of the severity and facility is carried out with drop-down lists. The severity and facility that you set here is assigned to every event.	The value you select here for the severity and facility depends on the evaluation in the Syslog server.  If you retain the "default" value setting, the security module specifies the combination of facility and severity with which the event is displayed.
System events	The system log automatically logs successive system events, for example the start of a process or the failed login attempt of a user.	Select the "Log settings" > "Configure system events" entry in the local security settings to configure the event filter and cable diagnostics functions.

## Security module as router

### Overview of the routing settings

#### Meaning

If you operate the security module in routing mode, the networks connected to the internal and external interface are transformed into separate subnets. The DMZ interface (SCALANCE S623/S627-2M only) is connected in routing mode regardless of the mode. In routing mode, the frames intended for an existing IP address in the subnet are forwarded. The firewall rules for the direction of transmission also apply.

You have the following additional options:

- Setting specific routes - can be set in the local security settings under "Routing" (SCALANCE S only), see Specifying routes (Page 688) in the section "SCALANCE S".
- Use standard router - can be set in the local security settings with "External interface [P1] red", "Internal interface [P2] green" or "DMZ interface [P3] yellow" (SCALANCE S623/S627-2M only) see Configuring IP address parameters (Page 671) in the section "SCALANCE S".  
Only one standard router can be used per interface.
- NAT/NAPT routing - can be set with "NAT / NAPT" (not for CP 1628 and CP 1543-1) in the local security settings. To be able to use NAT/NAPT, the security module must be in routing mode.

### Enabling routing mode (required for SCALANCE S modules only)

For this mode, you configure an internal IP address and an internal subnet mask for addressing the router in the internal subnet in the local security settings. All network requests that do not belong to a subnet are forwarded by the security module to a different subnet.

Note: In contrast to the bridge mode of the security module, VLAN tags are lost in routing mode. VLAN is not supported by SCALANCE S modules. Frames with a VLAN tag are therefore discarded by SCALANCE S modules.

1. Select the "Routing mode" option under "Mode" in the local security settings.
2. In the local security settings, enter an internal IP address and an internal subnet mask for addressing the router on the internal subnet in the input boxes under "Internal interface [P2] green" > Ethernet addresses".

### Overview of NAT/NAPT

#### Module-specific function

This function is not available for the CP 1628 and CP 1543-1.

#### Requirement

The security module is in routing mode or the DMZ interface is activated (SCALANCE S623 / S627-2M only).

#### How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "NAT / NAPT".
3. When required, enable address translation according to NAT(Network Address Translation) or NAPT (Network Address Port Translation).

### Address translation with NAT (Network Address Translation)

NAT is a procedure for address translation between two address spaces.

The main task is to translate private addresses into public addresses; in other words into IP addresses that are used and even routed on the Internet. As a result, the IP addresses of the internal network are not known to the outside in the external network. The internal nodes are only visible to the external network by means of external IP address that is specified in the address translation list (NAT table). If the external IP address is not the address of the security module and if the internal IP address is unique, this is known as 1:1 NAT. With 1:1 NAT, the internal address is translated to this external address without port translation. Otherwise, n:1 NAT is being used.

### Address translation with NAPT (Network Address Port Translation)

The address translation with NAPT changes the target address and the target port to a communication relation (port forwarding).

Frames coming from the external network or DMZ network and intended for the IP address of the security module are translated. If the destination port of the frame is identical to one of the values specified in the "Source port" column, the security module replaces the destination IP address and the destination port as specified in the corresponding row of the NAPT table. With the reply, the security module uses the values for the destination IP address and destination port as contained in the initial frame as the source IP address and the source port.

The difference to NAT is that with this protocol ports can also be translated. There is no 1:1 translation of the IP address. There is now only a public IP address that is translated to a series of private IP addresses with the addition of port numbers.

### Consistency check - these rules must be adhered to

When assigning addresses, remember the following rules to obtain consistent entries:

Check / rule	Check made	
	locally	project-wide
The internal IP addresses must not be identical to the IP addresses of the module.		x
Use the part specified by the subnet mask for the IP addresses: <ul style="list-style-type: none"> <li>IP addresses that you specify for the direction "external" must be in the same subnet range as the external IP address of the security module under the entry "External interface [P1] red".</li> <li>IP addresses that you specify for the direction "internal" must be in the same subnet range as the internal IP address of the security module under the entry "Internal interface [P2] green".</li> <li>IP addresses that you specify for the direction "DMZ" must be in the same subnet range as the DMZ IP address of the security module under the entry "DMZ interface [P3] yellow".</li> </ul>		x
An IP address used in the NAT/NAPT address conversion list must not be a multicast or broadcast address.		x

Check / rule	Check made	
	locally	project-wide
The external ports assigned for the NAPT translation are in the range > 0 and ≤ 65535. Port 123 (NTP), 443 (HTTPS), 514 (Syslog), 161 (SNMP), 67+68 (DHCP), 500+4500 (IPsec) and 161 (SNMP) are excluded if the relevant services are activated on the security module.	x	
The external IP address of the security module or the IP address of the DMZ interface may only be used in the NAT table for the action "Source NAT".	x	
Checking for duplicates in the NAT table An external IP address or an IP address in the DMZ network used in the direction "Destination NAT", "Source NAT +Destination NAT" or "Double NAT" may only be used once in each specified direction.	x	
Checking for duplicates in the NAPT table: A source port number may only be entered once for each interface.	x	
Internal NAPT ports can be in the range > 0 and ≤ 65535.	x	

**See also**

Overview of the routing settings (Page 626)

**NAT/NAPT routing****Enabling NAT**

The input boxes for NAT are enabled. NAT address translations only take effect with the entries in the address translation list described below. After creating NAT rules, the corresponding firewall rules are generated and displayed in advanced firewall mode, see section:

Relationship between NAT/NAPT router and firewall (Page 634)

If PPPoE is activated for the external interface or the DMZ interface, the action "Destination NAT" cannot be configured. When configuring the action "Source NAT", the IP address cannot be entered in the "Source translation" input box because this is obtained dynamically during runtime.

**Possible address translations for NAT**

The following tables show the input options for address translation with NAT.

**Action "Destination NAT" - "Redirect"**

The action "Destination NAT" can be performed in the following direction:

- External to internal

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the action "Destination NAT" can also be performed in the following directions:

8.1 Configuring devices and networks

- External to DMZ
- DMZ to internal
- DMZ to external

The following applies, for example for the direction "external to internal": The destination IP address of a frame coming from the external network is checked to see whether it matches the IP address specified in the "Destination IP address" input box. If it matches, the frame is forwarded into the internal network by replacing the destination IP address of the frame with the IP address specified in the "Destination translation" input box. Access from external to internal using the external address is possible.

The following table shows the input required for the action "Destination NAT".

Box	Possible entries	Meaning
Source IP address	Not relevant for this action.	-
Source translation	Not relevant for this action.	-
Destination IP address	IP address in the source network	Destination IP address in the source network with which an IP address in the destination network will be accessed.  If the destination IP address in a frame matches the address entered, the address is replaced by the corresponding IP address in the destination network.  If the IP address entered here is not the IP address of the security module, this becomes an alias address. This means that the specified IP address is also registered as an IP address on the selected interface. Make sure that the alias address does not cause an IP address conflict in the network.
Destination translation	IP address in the destination network	The destination IP address is replaced by the IP address specified here.
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rule generated by STEP 7 for the NAT rule.

**Action "Source NAT" - "Masquerading"**

The action "Source NAT" can be performed in the following direction:

- Internal to external

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the action "Source NAT" can also be performed in the following directions:

- Internal to DMZ
- External to DMZ
- DMZ to external

The following applies, for example for the direction "internal to external": The source IP address of a frame coming from the internal network is checked to see whether it matches the IP address specified in the "Source IP address" input box. If it matches, the frame with the external IP address specified in the "Source translation" input box is forwarded to the external network as a new source IP address. In the external network, the external IP address is effective.

The following table shows the input required for the action "Source NAT".

Box	Possible entries	Meaning
Source IP address	IP address in the source network	The source IP address of the specified node is replaced by the IP address specified in the "Source translation" input box.
	IP address range in the source network	The IP address range is replaced by the IP address specified in the "Source translation" input box.
	*	The IP addresses of all nodes in the source network are replaced by the IP address specified in the "Source translation" input box.
Source translation	IP address in the destination network	Entry of the IP address that will be used as the new source IP address.  If the IP address entered here is not the IP address of the security module, this becomes an alias address. This means that the specified address is also registered as an IP address on the selected interface. Make sure that the alias address does not cause an IP address conflict in the network.
Destination IP address	Not relevant for this action.	Not relevant for this action.
Destination translation	Not relevant for this action.	Not relevant for this action.
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rule generated by STEP 7 for the NAT rule.

You can configure an address translation to the module IP address in the destination network for all frames going from a source network to a destination network. The security module also assigns a port number for each frame. This is an n:1 NAT address translation in which multiple IP addresses of the source network are translated to one IP address of the destination network.

Enter, for example, the following parameters for the direction "internal to external":

- Action: "Source NAT"
- From: "Internal"
- To "External"
- Source IP address: "\*"
- Source translation: External IP address of the security module

### Action "Source NAT + Destination NAT" - "1:1-NAT"

The action "Source NAT + Destination NAT" can be performed in the following direction:

- Internal to external

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the action "Source NAT + Destination" can also be performed in the following directions:

- Internal to DMZ
- External to DMZ
- DMZ to external

The following applies, for example for the direction "internal to external": When accessing from internal to external, the action "Source NAT" is performed. When accessing from external to internal, the action "Destination NAT" is performed.

The following table shows the input required for the action "Source NAT + Destination NAT":

Box	Possible entries	Meaning
Source IP address	IP address in the source network	The configuration is always specified in the source NAT direction. The IP addresses of the destination NAT direction are then inserted automatically by STEP 7.
Source translation	IP address in the destination network	
Destination IP address	Not relevant for this action.	
Destination translation	Not relevant for this action.	
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rules generated by STEP 7 for the NAT rule.

### Action "Double NAT"

The action "Double NAT" can be performed in the following directions:

- Internal to external
- External to internal

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the action "Double NAT" can also be performed in the following directions:

- Internal to DMZ
- External to DMZ
- DMZ to internal
- DMZ to external

In every direction, Source and Destination NAT always take place at the same time.

The following applies, for example for the direction "external to internal": When accessing from external to internal, the source IP address of the external node is replaced (Source NAT). Access to the internal network also uses the external IP address specified in the "Destination IP address" input box (Destination NAT).

You can, for example, use this action if a standard router other than the security module is entered for a device to be accessed using Destination NAT. Response frames from this device are then not sent to the entered standard router but to the corresponding interface of the security module.

The following table shows the input required for the action "Double NAT":

Box	Possible entries	Meaning
Source IP address	IP address in the source network	IP address of the node in the source network
Source translation	-	The Source NAT address translation is always to the IP address of the security module in the destination network. For this reason, the "Source translation" input box cannot be configured.
Destination IP address	IP address in the source network	Destination IP address in the source network with which an IP address in the destination network will be accessed.  If the destination IP address in a frame matches the IP address entered, the IP address is replaced by the IP address specified in the "Destination translation" input box.  If the IP address entered here is not the IP address of the security module, this becomes an alias address. This means that the specified address is also registered as an IP address on the selected interface. Make sure that the alias address does not cause an IP address conflict in the network.
Destination translation	IP address in the destination network	The destination IP address is replaced by the IP address specified here.
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rule generated by STEP 7 for the NAT rule.

## Enabling NAPT

The input boxes for NAPT are enabled. NAPT translations only take effect with the entries in the list described below. After creating NAPT rules, the corresponding firewall rules are generated and displayed in advanced firewall mode, see section: Relationship between NAT/NAPT router and firewall (Page 634)

The IP address translation with NAPT can be performed in the following direction:

- External to internal

If the DMZ interface of the security module (SCALANCE S623/S627-2M only) is activated, the IP address translation with NAPT can also be performed in the following directions:

- External to DMZ
- DMZ to internal
- DMZ to external

The following applies, for example for the direction "external to internal": Frames intended for the external IP address of the security module and for the port entered in the "Source port"

8.1 Configuring devices and networks

column are forwarded to the specified destination IP address in the internal network and to the specified destination port.

The following table shows the input required for address translation with NAT:

Box	Possible entries	Meaning
Source port	TCP/UDP port or port range Example of entering a port range: 78:99	A node in the source network can send a frame to a node in the destination network by using this port number.
Destination IP address	IP address in the destination network	Frames intended for the IP address of the security module in the source network and the TCP/UDP port specified in the "Source port" box are forwarded to the IP address specified here.
Destination port	TCP/UDP port	Port number to which the frames coming from the source network are forwarded.
Protocol	<ul style="list-style-type: none"> <li>• TCP+UDP</li> <li>• TCP</li> <li>• UDP</li> </ul>	Selection of the protocol family for the specified port numbers
No.	-	Consecutive number assigned by STEP 7 used to reference the firewall rule generated by STEP 7 for the NAT rule.

Relationship between NAT/NAPT router and firewall

Meaning

After creating NAT/NAPT rules, STEP 7 automatically generates firewall rules that enable communication in the configured address translation direction. The generated firewall rules are visible in advanced firewall mode and can, if necessary, be moved and expanded (additional IP address, services, bandwidth). In addition to this, the generated firewall rules should be checked in terms of their priority and their position. If necessary, the generated firewall rules can be moved. Firewall parameters generated by STEP 7 cannot be adapted. After deactivating NAT/NAPT, the firewall rules generated by 7 are disabled.

To clarify the relationship between the NAT/NAPT rules and the corresponding firewall rules, they are identified by corresponding, consecutive numbers.

The following table shows the system behind the firewall rules generated for NAT rules.

Table 8-21 NAT address translation and corresponding firewall rules

NAT action	Created firewall rule				
	Action	From	To	Source IP address	Destination IP address
Source NAT	Allow	Source network	Destination network	IP address of the node specified in the "Source IP address" input box	-
Destination NAT	Allow	Source network	Destination network	-	IP address of the node specified in the "Destination translation" input box

NAT action	Created firewall rule				
	Action	From	To	Source IP address	Destination IP address
Source NAT + Destination NAT	Allow	Source network	Destination network	IP address of the node specified in the "Source IP address" input box	-
	Allow	Destination network	Source network	-	IP address of the node that was inserted in the "Destination translation" input box by STEP 7
Double NAT	Allow	Source network	Destination network	IP address of the node specified in the "Source IP address" input box	IP address of the node specified in the "Destination translation" input box

The following table shows the system behind the firewall rules generated for NAT rules.

Table 8-22 NAPT translations and created firewall rules

Created firewall rule					
Action	From	To	Source IP address	Destination IP address	Service
Allow	Source network	Destination network	-	IP address of the node specified in the "Destination IP address" input box	[Portnumber_protocol]

## Configuring time-of-day synchronization

### Overview of time-of-day synchronization

#### Meaning

The date and time are maintained on the security module to verify the validity (time) of a certificate and for time stamping log entries. For CPs, time-of-day synchronization is active as default.

The following alternatives can be configured:

- Set time of day when loading (only for SCALANCE S): The module time is set automatically to the PC time when a configuration is downloaded.
- SIMATIC (for CPs only): If the security module receives MMS time-of-day messages, its local time is synchronized provided the NTP procedure was not configured (MMS = Manufacturing Message Specification).
- NTP: Automatic setting and cyclic synchronization of the time-of-day by means of Network Time Protocol server.

---

**Note**

Time-of-day synchronization relates solely to the security module and cannot be used to synchronize devices in the internal network of the security module. S7 CPs can forward the time of day to other modules of the station.

---

**Note**

**Configuring the firewall for communication with NTP servers**

If the NTP server cannot be reached by the security module, you will need to allow the frames from the NTP server explicitly in the firewall (UDP, port 123).

---

## Defining an NTP server

### Creating NTP servers in the global security settings

In the global security settings only NTP servers of the type "NTP (secure)" can be created and assigned CPs or SCALANCE S V4 modules. Non-secure NTP servers for SCALANCE S modules < V4 and CPs therefore need to be created in the local security settings.

1. Double-click the "NTP" entry in the global security settings.
2. Double-click on the "Add new NTP server" entry.
3. Enter a name for the NTP server (secure).
4. Enter the IP address of the NTP server (secure). If the NTP server will only be assigned SCALANCE S V4 modules, an FQDN can be specified as an alternative.
5. Specify the encryption parameters for the NTP server (secure).

Property	Meaning
Key ID	Numeric value between 1 and 65534.
Authentication	Select the authentication algorithm.
Hex/ASCII	Select the format for the NTP key.
Key	Enter the NTP key with the following lengths: Hex: 22 ... 40 characters ASCII: 11 ... 20 characters

6. Assign a the required security module to the NTP server (secure) you have created, see section:  
Assigning the security module to an NTP server (secure) (Page 640).

## Creating NTP servers in the local security settings

1. Select the module to be edited.
2. Select the "Time-of-day synchronization" entry in the local security settings.
3. Select the required synchronization mode.
4. Enter a name and the IP address of the NTP server. If you have selected the "NTP (secure)" synchronization mode, you can select an NTP server (secure) that you created in the global security settings in the "Name" column.

## Configuration limits for NTP servers

The following rules apply when creating NTP servers:

- You can create 32 NTP servers throughout the project.
- You can assign a maximum of 4 NTP servers to one security module.

## Importing/exporting NTP servers (secure)

Using the "Import" or "Export" commands in the shortcut menu, you can export the key list of the currently selected NTP server (secure) and import the file into an NTP server (secure) or vice versa.

## Configuring time-of-day synchronization for a security module

### How to access this function

1. Select the module to be edited.
2. Select the "Time-of-day synchronization" entry in the local security settings.
3. Select the "Activate time-of-day synchronization" check box.

## Alternatives for time-of-day synchronization

The following alternatives can be configured:

Table 8-23 Time synchronization for CP and SCALANCE S

Possible selection	Meaning / effect
Set time of day when loading (only for SCALANCE S)	The module time is set automatically to the PC time when a configuration is downloaded.
SIMATIC (not for SCALANCE S)	If the security module receives MMS time-of-day messages, its local time is synchronized provided the NTP procedure was not configured (MMS = Manufacturing Message Specification).
NTP (not for SCALANCE S $\geq$ V3)	Automatic setting and periodic synchronization of the time using an NTP server.
NTP (secure) (not for SCALANCE S < V4)	Automatic setting and periodic synchronization of the time using an NTP server (secure).

### **Selecting the mode of time-of-day synchronization**

Follow these steps:

1. Select the synchronization mode.
2. The following configuration options are available to you depending on the selected mode:

- **Set time of day when loading:** When a configuration is downloaded to a SCALANCE S module, the module time of day is set with the PC time of day.
- **SIMATIC:** For the CP x43-1 select whether the CP is to adopt or forward the time of day. The CP 1628 always forwards the time of day. For CPs you also the set direction for forwarding the time.  
Available directions:
  - Automatic (only for CP x43-1): The CP receives the time from the station or from the LAN and forwards it to the station or to the LAN. If multiple CPs are being operated in the station, this automatic setting can cause collisions. To avoid this, you can specifically define the forwarding direction.
  - From station (for CP x43-1 only).
  - From LAN.If forwarding of the time of day is enabled, you can use the "Use corrected time" check box to specify whether or not a correction factor included in the time-of-day frame is used. For the CP 1628, this option is enabled as default and cannot be disabled.
- **NTP:**
  - Time zone: In NTP mode, generally UTC (Universal Time Coordinated) is transmitted. This corresponds to GMT (Greenwich Mean Time). The time offset from UTC can be set by configuring the local time zone.
  - Update interval in seconds: Defines the interval between the time queries in seconds. For SCALANCE S  $\geq$  V3, the time interval for querying the NTP server is specified automatically.

---

**Note****Setting the update interval for CPs**

If the "Enable security functions" check box is enabled in the local security settings of a CP, the setting for the update interval is transferred from the CP's local settings into the CP's local security settings.

---

- Time-of-day synchronization on the full minute (for CP x43-1/CP 1628 only): With this option, you can decide whether or not the time of day is forwarded to the communications bus on the full minute. This option is required for certain special applications.
- Accept time of non-synchronized NTP servers (only for CP x43-1/CP 1628/CP 1543-1): Here you can specify whether the security module also accepts the time-of-day from non-synchronized NTP servers.
- Forward time of day to station (only for CP x43-1/CP 1628): Disable this option if the CPU requests the time separately from an NTP server. This prevents the time on the CPU obtained directly from the NTP server from being overwritten by the time detected in the CP. The accuracy may be reduced slightly due to forwarding via the CP.
- NTP server: Creating NTP servers in the local security settings is described in the section Defining an NTP server (Page 636).

## Assigning the security module to an NTP server (secure)

### Requirement

- You have defined an NTP server (secure) in the global security settings.
- "NTP" or "NTP (secure)" is selected as the time-of-day synchronization mode in the local security settings of the security module that you want to assign to an NTP server (secure).

### Procedure

1. Double-click the "NTP" entry in the global security settings.
2. Double-click the entry "Assign module to an NTP server".
3. From the "NTP Server" drop-down list, select the NTP server (secure) to which you want to assign a security module.
4. In the "Available modules" section, select the security module that you want to assign to the selected NTP server (secure).
5. Click the  button to assign the selected security module to the selected NTP server (secure).

### Result

You have assigned the security module to the NTP server (secure). The NTP server (secure) is displayed automatically in the local security settings in the list of NTP servers.

## Security module as DHCP server

### Module-specific function

The use of the security module as a DHCP server is only possible with SCALANCE S modules, see subsection:  
Auto-Hotspot in the section "SCALANCE S".

## Configuring SNMP

### Overview of SNMP

#### What is SNMP?

The security module supports the transfer of management information using the Simple Network Management Protocol (SNMP). For this purpose, an SNMP agent that receives and responds to SNMP requests is installed on the security module. The information on the properties of SNMP-compliant devices is entered in MIB files (MIB = Management Information Base) for which the user must have the required rights.

In SNMPv1, the "community string" is also sent. The "community string" is like a password that is transmitted along with the SNMP request. If the community string is correct, the security module replies with the required information. If the string is incorrect, the security module discards the query and does not reply. The community string is transmitted via SNMPv1 without encryption.

SNMPv3 lets you transmit encrypted data.

## Configuring SNMP - "SNMP" entry

### Module-specific function

The configuration of SNMP is possible only for SCALANCE S V3 or higher, S7 CPs and the CP 1628.

### How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "SNMP".
3. Activate the "Activate SNMP" check box.
4. Select one of the following SNMP protocol versions:

---

#### Note

##### Encrypted data transmission with SNMPv3

You should use SNMPv3 to transmit data in encrypted form in order to enhance security.

---

- SNMPv1  
The security module uses the following default values for the community strings to control the access rights in the SNMP agent. These default values should be adapted to increase security.  
For read access: public  
For read and write access: private  
To enable write access using SNMP, select the "Allow write access" option.
- SNMPv3  
Select either only an authentication algorithm or an authentication algorithm and an encryption algorithm.  
Authentication algorithm: none, MD5, SHA-1  
Encryption algorithm: none, AES-128, DES

---

#### Note

##### Preventing the use of DES

DES is an insecure encryption algorithm. Therefore, it should only be used for reasons of down compatibility.

---

5. If SNMPv3 is to be used, assign a user a role with corresponding activated SNMP rights to enable access to the module via SNMP. An overview of SNMP rights is available in the section *Managing rights (Page 599)*.
6. In the "Advanced settings" area, configure module-specific information about the author, location and e-mail address overwriting the information from the project properties. The following applies to values written to the security module by an SNMP tool using an SNMP-SET command:  
If you select the "Keep values written by SNMP set" check box, the values are not overwritten when there is another download of an SCT configuration to the security module.

## **Configuring proxy ARP**

### **Module-specific function**

This function is available only for SCALANCE S V3 modules or higher, see section *Configuring proxy ARP (Page 692)*

## **Activate Web server on security module**

### **Module-specific function**

This function is only available for CP x43-1 Advanced, see subsection: *Activating the Web server on CP x43-1 Advanced (Page 713)* in the section "Security for S7-300 / S7-400 / PC CPs".

## **IPsec tunnel: Creating and assigning VPN groups**

### **How to create an IPsec tunnel with VPN groups**

### **Module-specific function**

This function is not available for SCALANCE S602 and CP 1543-1 V1.0. CP 1543-1 supports this function only as of firmware V1.1.

## **Requirement**

---

### **Note**

#### **Current date and current time of day on the security modules**

When using secure communication (for example, HTTPS, VPN...), make sure that the security modules involved have the current time of day and the current date. Otherwise the certificates used are not evaluated as valid and the secure communication does not work.

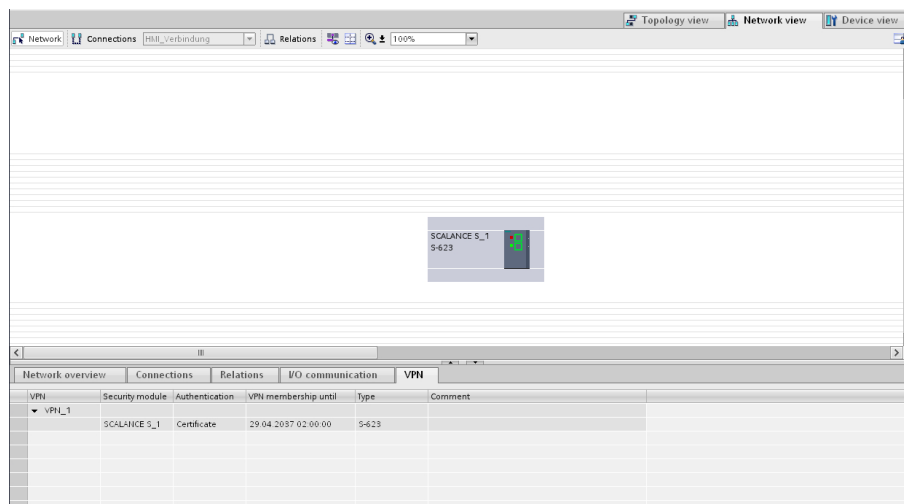

---

## How to access this function

1. Double-click on the entry "VPN groups" > "Add new VPN group" in the global security settings to create a VPN group.
2. Double-click on the entry "VPN groups" > "Assign module to a VPN group" in the global security settings and assign the security modules and SOFTNET security client modules to the VPN group between which VPN tunnels will be established. Here, note the rules for forming VPN groups. You will also find these rules in the section: Modes of VPN groups (Page 647).

## Display of the VPN groups with their properties

If you select a security module that is in one or more VPN group(s), the properties of the VPN group(s) of which the security module is a member are shown in the "Network data" area.

The following properties of the VPN groups are displayed in columns in the "VPN" tab of the "Network data" area:

Property/column	Meaning
VPN	Names of the VPN groups of which the selected security module is member
Security module	Names of the assigned security modules
Authentication	Type of authentication: Preshared key or certificate
Group membership until	Date and time up to which the VPN group certificate of the security module is valid
Type	Model numbers of the assigned security modules
Comment	Comment

### Setting the life of certificates

Open the dialog in which you can set the expiry date of the certificate as follows:

1. Select the VPN group you want to edit in the "VPN" tab.
2. In the "Properties" > "General" tab of the Inspector window, select the entry "Authentication".

---

**Note****Expiry of a certificate**

Communication through the VPN tunnel continues after the certificate has expired until the tunnel is terminated or the SA lifetime expires. For more information on certificates, refer to section:  
Auto-Hotspot.

---

### Quantity structure

Number of IPSec tunnels	
SCALANCE S612 V2	Maximum of 64
SCALANCE S612 V3/V4	Maximum of 128
SCALANCE S613	Maximum of 128
SCALANCE S623 V3/V4	Maximum of 128
SCALANCE S627-2M V4	Maximum of 128
CP x43-1 Advanced	Maximum of 32
CP 1628	Maximum of 64
CP 1543-1 V1.1	Maximum of 16

### Authentication methods

#### The following methods are available:

The authentication method is specified per VPN group and decides the type of authentication used.

The following key-based or certificate-based authentication methods are supported:

- **Preshared key**  
Authentication is achieved using a previously specified character string that is distributed to all modules in the group.  
Enter a preshared key in the "Key" field under "Authentication" > "General" in the VPN group properties dialog.
- **Certificate**  
Certificate-based authentication "Certificate" is the default setting. The procedure is as follows:
  - When a group is created, a CA certificate is generated as a root certificate.
  - Each security module that is a member of the VPN group also receives a group certificate signed with the key of the CA certificate.

All certificates are based on the ITU standard X.509v3 (ITU, International Telecommunications Union).

The certificates are generated by a certificate authority contained in STEP 7.

---

**Note****Restriction in VLAN operation**

No VLAN tagging is transmitted in IP frames via the VPN tunnel of the security module. The VLAN tags included in IP frames are lost when they pass through the security modules because IPsec is used to transfer the IP frames.

As default, no IP broadcast or IP multicast frames can be transferred with IPsec through a layer 3 VPN tunnel. Through a layer 2 VPN tunnel of the security module, IP broadcast or IP multicast frames are packaged just like MAC packets including the Ethernet header in UDP and transferred. With these packets, the VLAN tagging is therefore retained.

---

## Group properties for selected VPN group

### VPN group properties

---

**Note****Knowledge of IPsec necessary**

To be able to set these parameters, you require IPsec experience. If you do not make or modify any settings, the defaults apply.

---

The following settings can be configured in the properties of a VPN group:

- Authentication method (entry: "General")
- IKE settings (entry: "Advanced settings phase 1")
- IPsec settings (entry: "Advanced settings phase 2")

**How to access this function**

1. In the global security settings select the VPN group whose properties you want to configure under the entry "VPN groups".
2. Select "Open" in the shortcut menu of this entry.  
Result: The VPN group properties appear in the area of the local security settings.
3. In the "Authentication" entry, select whether to use a preshared key or certificate for authentication. For more detailed information, refer to section: Authentication methods (Page 644).

**Parameters for advanced settings phase 1 - IKE settings**

Phase 1: Key exchange (IKE = Internet Key Exchange):

Here, you set the parameters for the protocol of the IPsec key management. Key exchange is handled by means of the standardized IKEv1 method for which you can set the following protocol parameters:

Parameter	Description
IKE mode	Key exchange method: <ul style="list-style-type: none"> <li>• Main mode</li> <li>• Aggressive mode</li> </ul> The difference between the main and aggressive mode is the "identity protection" used in the main mode. The identity is transferred encrypted in main mode but not in aggressive mode.
DH group phase 1	Diffie-Hellman key agreement: <ul style="list-style-type: none"> <li>• Group 1</li> <li>• Group 2</li> <li>• Group 5</li> <li>• Group 14</li> </ul> Diffie-Hellman groups (selectable cryptographic algorithms in the Oakley key exchange protocol).
SA lifetime type	Phase 1 Security Association (SA): <ul style="list-style-type: none"> <li>• Time: Time limit in minutes</li> </ul> The lifetime of the current key material is limited in time. When the time expires, the key material is renegotiated.
SA lifetime	Numeric value: Range of values for time: 1440 ... 2500000 minutes (default: 2500000)
Encryption phase 1	Encryption algorithm: <ul style="list-style-type: none"> <li>• DES*: Data Encryption Standard (56 bit key length, mode CBC)</li> <li>• 3DES-168: Triple DES (168-bit key length, mode CBC)</li> <li>• AES-128, 192, 256: Advanced Encryption Standard (128 bit, 192 bit or 256 bit key length, mode CBC)</li> </ul>
Authentication phase 1	Authentication algorithm: <ul style="list-style-type: none"> <li>• MD5: Message Digest Algorithm 5</li> <li>• SHA1: Secure Hash Algorithm 1</li> </ul>

\*DES is an insecure encryption algorithm. It should only be used for reasons of down compatibility. DES is not supported by the CP 1543-1 V1.1.

## Parameters for advanced settings phase 2 - IPsec settings

Phase 2: Data exchange (ESP = Encapsulating Security Payload)

Here, you set the parameters for the protocol of the IPsec data exchange. The data exchange is in "quick mode". The entire communication during this phase is encrypted using the standardized security protocol ESP for which you can set the following protocol parameters:

Parameter	Description
SA lifetime type	Phase 2 Security Association (SA): <ul style="list-style-type: none"> <li>• Time: Time limit in minutes. The lifetime of the current key material is limited in time. When the time expires, the key material is renegotiated.</li> <li>• Limit: Limitation of the data volume in MB</li> </ul>
SA lifetime	Numeric value: <ul style="list-style-type: none"> <li>• Range of values for time: 60 ... 16666666 minutes (default: 2880)</li> <li>• Range of values for limit: 2000 ... 500000 MB (default: 4000)</li> </ul>
Encryption phase 2	Encryption algorithm: <ul style="list-style-type: none"> <li>• DES*: Data Encryption Standard (56 bit key length, mode CBC)</li> <li>• 3DES-168: Triple DES (168-bit key length, mode CBC)</li> <li>• AES-128: Advanced Encryption Standard (128-bit key length, mode CBC)</li> </ul>
Authentication phase 2	Authentication algorithm: <ul style="list-style-type: none"> <li>• MD5: Message Digest Algorithm 5</li> <li>• SHA1: Secure Hash Algorithm 1</li> </ul>
Perfect Forward Secrecy	Select whether or not before each time an IPsec-SA is renegotiated, the key is negotiated again using the Diffie-Hellman method. Perfect Forward Secrecy safely prevents the new key from being derived from keys generated previously.

\*DES is an insecure encryption algorithm. It should only be used for reasons of down compatibility. DES is not supported by the CP 1543-1 V1.1.

## Modes of VPN groups

### VPN modes

Depending on the mode of the security modules that were added to a VPN group, different modes of VPN groups are distinguished. The mode of a VPN group provides information about the security modules and their modes that can be added to the VPN group.

### Rules for forming groups

Remember the following rules if you want to create VPN groups:

- For SCALANCE S612 / S613 / S623 / S627-2M / SCALANCE M  
 The first module assigned in a VPN group decides which other modules can be added to it.  
 If the first SCALANCE S module to be added is in routing mode or if the first security module is a SCALANCE M module, only additional SCALANCE S modules with routing activated or SCALANCE M modules can be added because SCALANCE M modules always operate in routing mode. If the first SCALANCE S module added is in bridge mode, you can only add other SCALANCE S modules in bridge mode. If you want to change the mode of a VPN group, you have to remove all the modules contained in the group and add them again. A CP and an SSC can be added to a group with a SCALANCE S in bridge or routing mode.
- For CP / SSC  
 If a CP / SSC is the first module in a VPN group, security modules can be added in any mode. The next security module that decides the mode then also decides the mode of the VPN group. A CP / SSC can be assigned to several VPN groups at the same time and use different modes. The CP / SSC is then operated in mixed mode.
- It is not possible to add a SCALANCE M module to a VPN group that contains a module in bridge mode.

Refer to the following table to see which modules can grouped together in a VPN group:

Table 8-24 Security modules and VPN modes

Module	Can be included in a VPN group in...	
	Bridge mode	Routing mode
SCALANCE S612 / S613 / S623 / S627-2M in bridge mode	x	-*
SCALANCE S612 / S613 / S623 / S627-2M in routing mode	-	x
CP x43-1 Adv.	x	x
CP 1543-1 V1.1	x	x
CP 1628	x	x
SOFTNET Security Client V4.0	x	x
SCALANCE M875	-	x

\* SCALANCE S623/S627-2M modules in bridge mode can be inserted in a VPN group in routing mode if their DMZ interface is activated (not at the same time).

### Including security module in configured VPN group

The configured VPN group properties are adopted for security modules added to in an existing VPN group.

### Procedure after including a security module in a configured VPN group

Depending on whether or not you have changed the VPN group properties since the last download, you must make a distinction between the following:

- **Case a:** If you have not changed the VPN group properties and the module to be added actively establishes the connection to the configured modules:
  1. Add the new security module to the VPN group.
  2. Download the configuration to the new module.
- **Case b:** If you have changed the VPN group properties or the module being added does not actively establish the connection to the already configured modules:
  1. Add the new security module to the VPN group.
  2. Download the configuration to all modules that belong to the VPN group.

In case a, it is not necessary to reconfigure and load the already commissioned security modules. Active communication is not influenced or interrupted.

### Settings for nodes with an unknown IP address

Nodes whose IP address is unknown at the time of configuration (unknown peers) can be inserted in an existing VPN group. Since the nodes are usually mobile and obtain their IP addresses dynamically (for example a SOFTNET security client or SCALANCE M), the VPN tunnel can only be established if you set the parameters for Phase 1 according to one of the following tables ("Encryption parameter 1 to Encryption parameter 4). If you use other settings, you cannot establish a VPN tunnel to the end device.

Table 8-25 Encryption parameter 1

Parameter	Setting
Authentication method	Certificate
DH group phase 1	Group 2
SA lifetime	1440 ... 2500000 minutes
Encryption phase 1	AES-256
Authentication phase 1	SHA-1

Table 8-26 Encryption parameter 2

Parameter	Setting
Authentication method	Certificate
DH group phase 1	Group 2
SA lifetime	1440 ... 2500000 minutes
Encryption phase 1	3DES-168
Authentication phase 1	SHA-1

8.1 Configuring devices and networks

Table 8-27 Encryption parameter 3

Parameter	Setting
Authentication method	Certificate
DH group phase 1	Group 2
SA lifetime	1440 ... 2500000 minutes
Encryption phase 1	DES
Authentication phase 1	MD5

Table 8-28 Encryption parameter 4

Parameter	Setting
Authentication method	Preshared key
DH group phase 1	Group 2
SA lifetime	1440 ... 2500000 minutes
Encryption phase 1	3DES-168
Authentication phase 1	SHA1

**Additional restrictions for the SOFTNET Security Client**

For the SOFTNET security client, the following restrictions also apply:

Table 8-29 Encryption parameters for the SOFTNET Security Client

Parameter	Setting / special feature
Encryption phase 1	AES-256 possible only with Windows 7
SA lifetime phase 1	1440 to 2879 minutes
SA lifetime type	Must be selected identical for both phases
Encryption phase 2	No AES 128 possible
SA lifetime phase 2	60 to 2879 minutes
Authentication phase 2	No MD5 possible

**Procedure after removing an active member from a VPN group**

If you remove an active node from an existing VPN group, this can still establish a connection to the group members even if you have downloaded the project to all members of the VPN group again.

If you do not want the removed active node to be able to establish the connection any longer, renew the CA group certificate and download the project again to the members of the VPN group. The certificate can be renewed in the group properties of the VPN group or in the "CA" tab of Certificate Manager.

## Configuring internal network nodes

### Overview of configuring internal network nodes

#### Configuring internal network nodes

Each security module must know the network nodes in the entire internal network to be able to recognize the authenticity of a frame.

The security module must know both its own internal nodes as well as the internal nodes of the security modules in the same VPN group. This information is used on a security module to decide which data packet will be transferred in which tunnel.

By adding a security module to a VPN group, the local internal nodes/subnets of the security module are automatically made known to the security module. To allow communication via the VPN tunnel with other subnets or nodes of another subnet, these subnets or nodes need to be enabled for VPN tunnel communication in the configuration.

SCALANCE S modules allow network nodes to be learned automatically or configured statically. The mode of the security module also decides the options available for learning internal network nodes.

#### SCALANCE S in bridge mode

In bridge mode, you can configure the internal IP/MAC nodes and the internal subnets or alternatively can allow automatic learning of internal nodes by the SCALANCE S.

#### SCALANCE S in routing mode

In routing mode there is no automatic learning mode available. Instead, enter entire subnets here that need to be released for tunnel communication.

#### CP x43-1 Advanced and CP 1628

- CP x43-1 Adv.  
Decide whether or not tunnel communication to the CP (Gbit interface) and/or to the internal subnet (PROFINET subnet) is permitted for VPN connection partners in routing mode (SCALANCE S / M).
- CP 1628  
Enter the NDIS nodes you want to be reachable through the tunnel of VPN connection partners in routing mode (SCALANCE S / M).

## Automatic learning of internal network nodes

### Module-specific function

SCALANCE S modules in bridge mode provide a learning mode with which the internal network nodes can be learned automatically during operation. For more detailed information, refer to

subsection:

Using the learning mode to learn internal nodes (Page 692) in the section "SCALANCE S".

### **Configuring IP network nodes manually for SCALANCE S**

#### **Module-specific function**

How to configure IP network nodes for SCALANCE S modules manually is explained in:  
Configuring IP network nodes manually (Page 694) in the section "SCALANCE S".

### **Configuring MAC network nodes manually for SCALANCE S**

#### **Module-specific function**

How to configure MAC network nodes for SCALANCE S modules manually is explained in  
Configuring MAC network nodes manually (Page 694) in the section "SCALANCE S".

### **Configuring internal subnets for SCALANCE S manually**

#### **Module-specific function**

How to configure the internal subnets for SCALANCE S modules is explained in  
Configuring internal subnets manually (Page 695) in the section "SCALANCE S".

### **Allow access to S7-300 / S7-400 CPs for VPN connection partners**

#### **Module-specific function**

How to allow access to S7-300 / S7-400 CPs for VPN connection partners is explained in  
Allow access to S7-300 / S7-400 CPs for VPN connection partners (Page 713) in the section  
"Security for S7-300 /S7-400 /PC CPs".

### **Configuring NDIS nodes for PC CPs that can be reached through the tunnel**

#### **Module-specific function**

How you configure NDIS nodes for PC CPs that can be reached through the tunnel is explained  
in  
Configuring NDIS nodes manually for PC CPs that can be reached through the tunnel  
(Page 713) in the section "Security for S7-300 / S7-400 / PC CPs".

## Configuring module- and connection-specific VPN settings

### Requirement

The module is a member of a VPN group.

### Module- and connection-specific settings

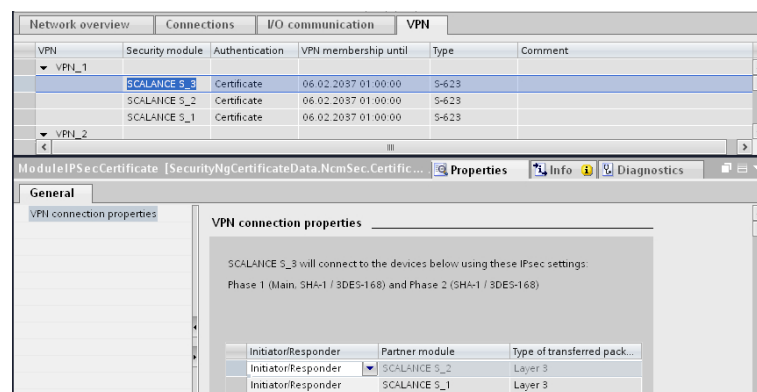

With module- and connection-specific settings, you can configure specific VPN settings. Module-specific settings are configured specifically for a security module while connection-specific settings are configured specifically for a security module in a certain VPN group.

You can configure the following **module-specific** properties in the local security settings with the "VPN" entry:

- Dead peer detection
- Permission to initiate connection establishment
- Public address (IP address / FQDN) for communication via Internet gateways
- Nodes that need to be enabled for tunnel communication

If you select a security module in the list of VPN groups in the "Network data" area, the following **connection-specific** VPN settings can be seen and can be configured:

- Permission to initiate connection establishment
- Partner modules to which tunnel connections exist
- Type of transferred packets
- Selection of the local interface of the selected security module that will serve as the tunnel endpoint
- Selection of the partner interface that will serve as the tunnel endpoint

### Dead peer detection (DPD)

As default, DPD is enabled.

When DPD is enabled, the modules exchange additional messages at selectable intervals if no communication occurs at these points in time. This means that it is possible to recognize

whether the IPsec connection is still valid or possibly needs to be re-established. If there is no longer a connection, the security associations (SA) of phase 2 are terminated prematurely. If DPD is disabled, the SA is ended only after the SA lifetime has expired. For information on setting the SA lifetime, see section Group properties for selected VPN group (Page 645).

### Permission to initiate connection establishment

You can restrict the permission for initiating the VPN connection establishment to certain modules in the VPN.

The decisive factor the setting of the parameter described is the assignment of the IP address for the gateway of the module you are configuring. If a static IP address is assigned, the module can be found by the partner. If the IP address is assigned dynamically and therefore changes constantly, the partner cannot establish a connection as things stand.

Mode	Meaning
Start connection to partner (initiator/responder) (default)	<p>If this option is selected, the module is "active", in other words, it attempts to establish a connection to the partner with a fixed IP address.</p> <p>This option is recommended when you obtain a dynamic IP address from the provider for the gateway of the security module you are configuring.</p> <p>The partner is addressed over its external module IP address or its configured WAP IP address.</p>
Wait for partner (responder)	<p>If this option is selected, the module is "passive", in other words, it waits for the partner to initiate the connection.</p> <p>This option is recommended when you have been assigned a static IP address by the provider for the gateway of the security module you are configuring. It means attempts to establish a connection can only be initiated by the partner. This partner can, for example, have a dynamic WAN IP address.</p>

#### Note

Make sure that you do not set all the modules in a VPN group to "Wait for connection from remote VPN gateway" otherwise no connection is established.

### WAN IP address / FQDN - IP addresses of the modules and gateways in a VPN over Internet

When operating a VPN with IPsec tunnel over the Internet, additional IP addresses are generally required for the Internet gateways such as DSL routers. The individual security or

SCALANCE M modules must know the external IP addresses of the partner modules in the VPN.

---

**Note**

To use a WAN as an external public network, enter the IP address that you received from the provider as the external IP address, through which the security module is then reachable in the WAN (Internet). To allow the security module to send packets via the WAN, you need to enter your DSL router as "Standard router".

If you use a DSL router as Internet gateway, the following ports (at least) must be opened on it:

- Port 500 (ISAKMP)
  - Port 4500 (NAT-T)
- 

To allow this, when you configure the module, you have the option of assigning an external IP address as a "WAN IP address". When you download the module configuration, the group members are then informed of the WAN IP addresses of the partner modules. As an alternative to a WAN IP address, you can also enter an FQDN. If you have configured dynamic DNS on the security module at the same time, this FQDN must match the FQDN from the dyn. DNS configuration tab that is registered with a provider for dynamic DNS.

Whether the external IP address, the IP address of the DMZ interface (only SCALANCE S623 / S627-2M) or the WAN IP address / the FQDN will be used can be specified in the module-specific VPN settings of the security module. In these settings, you can also specify the interface to be used for communication by the nodes of a VPN group and the security module that is authorized to set up connections.

If you do not enter an access point here, the external IP address or the IP address of the DMZ interface (SCALANCE S623/S627-2M only) will be used as the VPN endpoint.

8.1 Configuring devices and networks

- ① Internal IP address - of a module
- ② External IP address - of a module
- ③ IP address of an Internet gateway (for example, GPRS gateway)
- ④ IP address (WAN IP address) of an Internet gateway (for example, DSL router)

Configuring internal network nodes

The configuration of internal network nodes is described in the following section:  
Auto-Hotspot

See also

How to create an IPsec tunnel with VPN groups (Page 642)

Online functions - test / diagnostics and logging

Overview of diagnostics and logging in

For test and monitoring purposes, the security module has diagnostic and logging functions.

- Diagnostic functions  
These include various system and status functions that you can use for an existing network connection to the security module.
- Logging functions  
This involves the logging of system and security events and data packets.

## Recording events with logging functions

You select the events to be logged in the log settings for the relevant security module.

You can configure the following variants for logging:

- **Local logging**  
In this variant, you log events in the local buffer of the security module. You can then access these logs, display them and archive them on the service station in the "Online & diagnostics" dialog. The evaluation of the buffer areas of the security module is only possible if there is a network connection to the selected security module.
- **Network Syslog**  
With Network Syslog, you use a Syslog server that exists in the network. This logs the events according to the configuration in the log settings for the relevant security module.

## Archiving log data and reading in from a file

You can save the logged events for archiving in a log file and open this later even without a network connection to the security module. For more detailed information, refer to section Auto-Hotspot.

## Function overview online dialog

### Functions of the "Online & diagnostics" dialog

In STEP 7, the security module provides the following functions in the "Online & diagnostics" dialog:

Entry in the online dialog	Function
Status	Display of status information about the selected security module, such as the current IP addresses of the interfaces and the current time and date.
Interface settings (only for SCALANCE S V3 or higher)	Overview of the settings of the individual interfaces.
Dyn DNS (only for SCALANCE S V3 or higher)	Overview of the settings for dynamic DNS.
System log	Display of logged system events, starting and stopping logging (only if there is an online connection to SCALANCE S modules) and starting and stopping the reading out of log data from the local buffer of the security module.
Audit log	Display of logged security events, starting and stopping reading out of log data from the local buffer of the security module.
Packet filter log	Display of logged data packets, starting and stopping logging (only if there is an online connection to SCALANCE S modules) and starting and stopping the reading out of log data from the local buffer of the security module.
ARP table (only for SCALANCE S V3 or higher)	Display of the ARP table of the security module.
Logged in users (only for SCALANCE S V3 or higher)	Shows the users logged in to the Internet page for user-specific IP rule sets.
Communication status (not for SCALANCE S602 and CP 1543-1 V1.0)	Display of status information about VPN tunnel connections and members of VPN groups to which the selected security module belongs.

Entry in the online dialog	Function
Internal nodes (not for SCALANCE S602, CP 1543-1 V1.0 and PC CPs)	Display of the learned or configured internal network nodes of the security module.
Log files (offline view)	
<ul style="list-style-type: none"> <li>System log</li> </ul>	Display of logged system events as well as starting and stopping the display.
<ul style="list-style-type: none"> <li>Audit log</li> </ul>	Display of logged security events as well as starting and stopping the display.
<ul style="list-style-type: none"> <li>Packet filter log</li> </ul>	Display of logged data packets as well as starting and stopping the display.
Dynamically updated firewall rules (only for S7 CPs)	Display of the IP addresses that were released dynamically over HTTP or HTTPS, or loaded by a user.
Date and time (only for SCALANCE S)	Date and time setting.

### Requirements for access

The following requirements must be met to use the online functions of a security module:

- There is a network connection to the selected module
- The project with which the module was configured is open
- a user with the required rights must be logged in to the project

### How to access this function

1. Right-click on the module to process.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. If there is no online connection established to the security module, click the "Connect online" button in the "Diagnostics" entry.

### Online settings are not saved in the configuration

Settings that you make in online mode (for example settings for the logging memory) are not stored in the configuration on the security module. This is why the configuration settings are always applied at the restart of the module.

### Functions of the online diagnostics

#### Status information of the security module - "Status" entry

#### Meaning

Display of the status of the security module selected in the project.

Table 8-30 Online & diagnostics: - "Status" entry

System and status functions	Meaning
<b>Overview</b>	
Hardware type	The type of the security module.

<b>System and status functions</b>	<b>Meaning</b>
External IP address	The external IP address of the security module. For CP 1628: The IP address of the Industrial Ethernet interface. For S7 CPs: The IP address of the Gbit interface.
Internal IP address	The internal IP address of the security module. For CP 1628: The IP address of the NDIS interface. If there is more than one NDIS address, only one is displayed. For S7 CPs: The IP address of the PROFINET interface.
DMZ IP address (SCALANCE S623 / S627-2M only)	The DMZ IP address of the security module.
Serial number	The serial number of the security module.
Order number	The MLFB identifier of the security module that is used when ordering.
Firmware version	The firmware version of the security module.
Operating mode	Mode of the security module (bridge mode / routing mode)
External MAC address	The external MAC address of the security module. For CP 1628: The MAC address of the Industrial Ethernet interface. For S7 CPs: The MAC address of the Gbit interface.
Internal MAC address	The internal MAC address of the security module. For CP 1628: The MAC address of the NDIS interface. For S7 CPs: The MAC address of the PROFINET interface.
DMZ MAC address (SCALANCE S623 / S627-2M only)	The DMZ MAC address of the security module
Hardware release	The hardware product version of the security module.
C-PLUG	Shows whether or not a C-PLUG is inserted.
<b>Local time</b>	

System and status functions	Meaning
Current time	<p>Date and time that is displayed on the security module.</p> <p>Format for "German" user interface language: dd.mm.yyyy (date) hh:mm:ss (time)</p> <p>Format for "English" user interface language: mm/dd/yyyy (date) hh:mm:ss AM/PM (time)</p> <p>Format for "French" user interface language: dd/mm/yyyy (date) hh:mm:ss (time)</p> <p>Format for "Italian" user interface language: dd/mm/yyyy (date) hh:mm:ss (time)</p> <p>Format for "Spanish" user interface language: dd/mm/yyyy (date) hh:mm:ss (time)</p> <p><b>Note (not for CPs)</b></p> <p>You set the local time on the SCALANCE S module in "Functions" &gt; "Date and time".</p>
Operating time	<p>Time since the last restart of the security module.</p> <p>Format for "German" user interface language: dddd.hh:mm:ss</p> <p>Format for "English" user interface language: dddd.hh:mm:ss</p> <p>Format for "French" user interface language: dddd.hh:mm:ss</p> <p>Format for "Italian" user interface language: dddd.hh.mm.ss</p> <p>Format for "Spanish" user interface language: dddd.hh:mm:ss</p>
Time-of-day source	<p>The source from which the date and time are obtained.</p>
<b>Configuration</b>	
Created	<p>Date and time when the project was first created.</p> <p>Format for "German" user interface language: dddd.hh:mm:ss hh:mm:ss (time)</p> <p>Format for "English" user interface language: dddd.hh:mm:ss hh:mm:ss AM/PM (time)</p> <p>Format for "French" user interface language: dddd.hh:mm:ss hh:mm:ss (time)</p> <p>Format for "Italian" user interface language: dddd.hh.mm.ss hh.mm.ss (time)</p> <p>Format for "Spanish" user interface language: dddd.hh:mm:ss hh:mm:ss (time)</p>
Name	<p>File name under which the project was last saved. The name is set by default by STEP 7 and is changed when you rename the project.</p>
Author	<p>Name of the user who created the project. Is adopted from the project properties.</p>

System and status functions	Meaning
Loaded	Date and time when the project was last loaded on the security module. Format for "German" user interface language: dddd.hh:mm:ss hh:mm:ss (time) Format for "English" user interface language: dddd.hh:mm:ss hh:mm:ss AM/PM (time) Format for "French" user interface language: dddd.hh:mm:ss hh:mm:ss (time) Format for "Italian" user interface language: dddd.hh.mm.ss hh.mm.ss (time) Format for "Spanish" user interface language: dddd.hh:mm:ss hh:mm:ss (time)
Storage location	Specifies the location (e.g. town) to be set using an SNMP tool. For SCALANCE S modules, the storage location can be configured as an alternative in the advanced SNMP settings.
<b>File system (not for CPs)</b>	
RAM	Indicates how much RAM and flash is occupied in the file system.
Flash	

## Overview of the individual interfaces - "Interface settings" entry

### Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Overview of the individual interfaces - "Interface settings" entry (Page 696)

## Overview of the DDNS settings - "Dynamic DNS" entry

### Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Overview of the DDNS settings - "Dynamic DNS" entry (Page 697)

## Display of the ARP table - "ARP table" entry

### Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Display of the ARP table - "ARP table" entry (Page 699)

## Users logged in to the Web page - "Logged in users" entry

### Module-specific function

This function is available only for SCALANCE S V3 modules or higher, see section Users logged in to the Web page - "Logged in users" entry (Page 700)

## VPN connections of the security module - "Communication status" entry

### Module-specific function

This function is not available for SCALANCE S 602 modules.

### Meaning

Display of the communication status of the following network components:

- Other security modules of the VPN group to which the selected security module belongs
- Internal network nodes of these security modules

Table 8-31 Online & diagnostics: "Communication Status" entry

System and status functions	Meaning
Known security devices or modules	Display of the nodes with which the selected security module is in a VPN group. This also shows whether the tunnel status is active or passive. To obtain additional information on one of the nodes, select this in the list. <b>Note:</b> Configured, inactive tunnels are indicated for CPs only.
Endpoints	Display of information on the internal network nodes of the security module that you selected in the "Known security devices or modules" table. For each internal network node, this shows whether it was learned or configured. It also shows the subnet in which the internal network node is located. With SCALANCE S modules, the subnet of network nodes is only displayed in bridge mode.
Tunnel properties	Display of properties of the VPN tunnel established to the security module that you selected in the "Known security devices or modules" table.

## **Found internal network nodes - "Internal nodes" entry**

### **Module-specific function**

This function is not available for SCALANCE S602 modules and the CP 1543-1.

### **Meaning**

Display of all learned and configured network nodes. This also displays whether or not the learning mode of the security module is enabled.

## **Updated firewall rules - "Dynamically updated firewall rules" entry**

### **Module-specific function**

This function is only available for CP x43-1, see subsection:  
Updated firewall rules - "Dynamically updated firewall rules" entry (Page 714) in the section  
"Security for S7-300 / S7-400 / PC CPs".

## **Display of the firewall blacklist - "Firewall blacklist" entry**

### **Module-specific function**

This function is available only for SCALANCE S V4 modules or higher, see section  
Display of the firewall blacklist - "Firewall blacklist" entry (Page 700).

## **Setting the date and time - "Date and Time" entry**

### **Module-specific function**

This function is available only for SCALANCE S modules, see section  
Setting the date and time - "Date and time" entry (Page 701).

## **Logging functions**

### **Logging system events - "System log" entry**

#### **Meaning**

Display of logged system events and starting and stopping reading system events from the local memory of the security module.

The system log automatically logs successive system events, for example the start of a process. The logging can be scaled based on event classes.

System and status functions	Meaning
Start/stop logging (not for CPs)	Starts/stops recording of system events. The method and the event classes that are logged are configured in the local security settings.
Start/stop reading	Starts/stops reading of system events from the local memory of the security module. If you select the "Save log file" check box, the recorded log data is also saved as file. Select the storage location and enter a file name.  <b>Note</b> If you select the "Save log file" check box after starting reading, the data read out up to then can no longer be saved in a log file.
Clear display	Deletes the log data shown in the table.

For more information on opening saved system events in log files, refer to section Evaluating system events in offline mode - "System log" entry (offline view) (Page 665).

### Logging security events - "Audit log" entry

#### Meaning

Display of logged security events and starting and stopping reading of security events from the local memory of the security module.

The audit log automatically logs successive security-relevant events. This includes, for example, user actions such as enabling and disabling packet logging.

System and status functions	Meaning
Start/stop reading	Starts/stops reading of security events from the local memory of the security module. If you select the "Save log file" check box, the recorded log data is also saved as file. Select the storage location and enter a file name.  <b>Note</b> If you select the "Save log file" check box after starting reading, the data read out up to then can no longer be saved in a log file.
Clear display	Deletes the log data shown in the table.

For more information on opening security events stored in log files, refer to section Evaluating security events in offline mode - "Audit log" entry (offline view) (Page 666).

### Logging data packets - "Packet filter log" entry

#### Meaning

Display of logged data packets and starting and stopping reading of packet filter events.

The packet filter log records certain packets of the data traffic. Data packets are only logged if they match a configured packet filter rule (firewall) or to which the basic protection reacts (corrupt or invalid packets). This is only possible when logging is enabled for the packet filter rule.

For information about activation of the logging, refer to section Auto-Hotspot.

As well as reading the log data from the buffer and transferring it to the display, it can also be saved in a file for archiving.

System and status functions	Meaning
Start/stop logging (not for CPs)	Starts/stops logging of data packets. The method with which the data is logged is configured in the local security settings.
Start/stop reading	Starts/stops reading out of logged data packets from the local memory of the security module. If you select the "Save log file" check box, the recorded log data is also saved as file. Select the storage location and enter a file name. <b>Note</b> If you select the "Save log file" check box after starting reading, the data read out up to then can no longer be saved in a log file.
Clear display	Deletes the log data shown in the table.
Log category	Select the data packets for which the logging will be displayed. The selection depends on the settings you configured offline in the local security settings. Only the data packets for which logging was enabled are logged. If you select a category for which logging was not enabled, no data will be logged for this category.

For information on opening the stored packet filter log data, refer to section Evaluating packet filter events in offline mode - "Packet filter log" entry (offline view) (Page 666).

## Evaluating log files in offline mode

### Evaluating system events in offline mode - "System log" entry (offline view)

#### How to access this function

1. Right-click on the module to process.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. Select "Diagnostics" > "Log files (offline view)" > "System log".

### **Meaning**

Opens logged system events that you saved as a file in the online view.

For more information, refer to chapter Logging system events - "System log" entry (Page 663).

### **Evaluating security events in offline mode - "Audit log" entry (offline view)**

#### **How to access this function**

1. Right-click on the module to process.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. Select "Diagnostics" > "Log files (offline view)" > "Audit log".

### **Meaning**

Opens logged security events that you saved as a file in the online view.

For more detailed information, refer to section Logging security events - "Audit log" entry (Page 664).

### **Evaluating packet filter events in offline mode - "Packet filter log" entry (offline view)**

#### **How to access this function**

1. Right-click on the module to process.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. Select "Diagnostics" > "Log files (offline view)" > "Packet filter log".

### **Meaning**

Opens logged data packets that you saved as a file in the online view.

For more detailed information, refer to section Logging data packets - "Packet filter log" entry (Page 664).

### **Download functions**

#### **Special features when downloading security configurations**

Security configurations can influence the reachability of the security module for the configuration PC. This, for example, is the case if there is a tunnel connection configured for one security module to another security module in a configuration and this configuration is downloaded from the configuration PC to the security module. After the download by the configuration PC, the security module can no longer be reached and the reachability test performed as default by STEP 7 following the download of the configuration fails. The error message output by STEP 7 relates solely to the reachability test; the actual download of the

configuration is ensured if the project data is consistent and the IP address relationship between the security module and the configuration PC is correct.

Special features when downloading configurations and firmware to SCALANCE S modules are described in the following subsection of the section "SCALANCE S":

Auto-Hotspot

### **Uploading configurations to the engineering station**

Uploading a configuration from a SCALANCE S module or from the CP 1628 to an engineering station is not possible.

Uploading a configuration from an S7 CP that supports security to an engineering station is also possible if security features were included in the configuration. Configured security functions are not, however, transferred to the engineering station. In the transferred configuration on the engineering station, the "Activate security features" check box is also deselected.

## **SOFTNET Security Client**

### **Using the SOFTNET Security Client**

#### **Area of application - access over VPN**

With the SOFTNET Security Client (SSC) PC software, secure remote access is possible from PGs/PCs to automation systems protected by a security module via public networks. You require SOFTNET Security Client V4.0 HF1 for S7-300/S7-400 CPs and for the PC CP 1628. These CPs are not approved for operation with SOFTNET Security Client  $\leq$  V4.0. The SOFTNET Security Client has not been released for the CP 1543-1.

With the SOFTNET Security Client, a PG/PC is configured automatically so that it can establish a secure IPsec tunnel communication in the VPN (Virtual Private Network) with one or more security modules.

This IPsec tunnel communication makes it possible for PG/PC applications such as NCM diagnostics to securely access devices or networks that are located in an internal network protected by SCALANCE S.

### **How does the SOFTNET Security Client work?**

The SOFTNET Security Client reads the configuration that was created by STEP 7 and determines from the file which certificates are to be imported.

The CA certificate and, when applicable, the private key are imported and stored on the local PG/PC.

Following this, security settings are made based on the data from the configuration so that applications can access IP addresses downstream from the security modules.

If the learning mode is enabled for the internal nodes or programmable controllers, a security policy is first set for secure access to security modules. Then, the SOFTNET Security Client

addresses the security modules in order to obtain the IP addresses of the relevant internal nodes.

The SOFTNET Security Client enters these IP addresses in special filter lists belonging to this security policy. Applications can then communicate with the programmable controllers via VPN.

### Creating a configuration file in STEP 7

#### Configuring a SOFTNET Security Client module in the project

The SOFTNET security client is created as a module in the project. In contrast to the other security modules, you do not need to configure any further properties.

Assign the SSC module to the VPN group or groups at which an IPsec tunnel to the PG/PC is to be set up.

---

**Note**

Refer to the information on parameters in section Including security module in configured VPN group (Page 648).

---

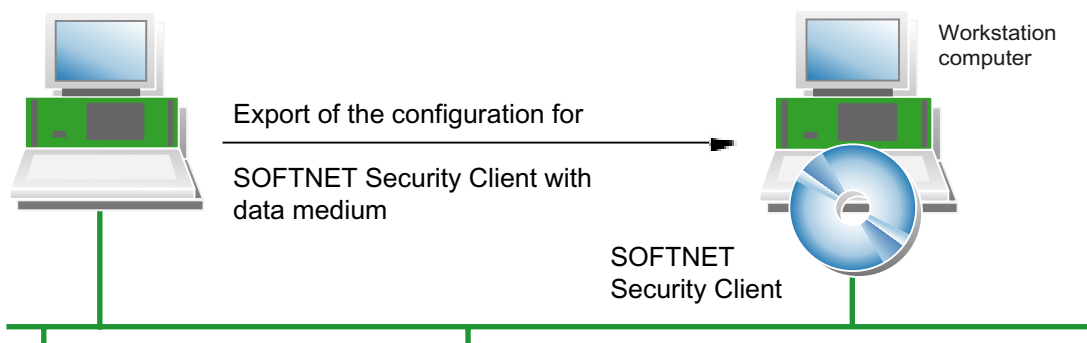

**Note**

If you create several SOFTNET Security Clients within a group, no tunnels are set up between these clients but only from the relevant client to the security modules.

---

#### Configuration files for the SOFTNET Security Client

The interface between STEP 7 as configuration tool and the SOFTNET Security Client is controlled by configuration files.

The configuration is stored in the following file types:

- \*.dat
- \*.p12
- \*.cer

## Procedure

To generate the configuration files, perform the following steps in STEP 7:

1. In the "Devices & networks" view, select the "Topology view" or the "Network view" tab.
2. Insert a PC system of the type "SOFTNET Security Client" in the selected tab from the hardware catalog.
3. Assign the SOFTNET Security Client to the VPN groups in which the PG/PC will communicate over IPsec tunnels.
4. Make sure that the "Generate SSC files" check box is selected under the "Configuration of the SOFTNET Security Client" entry in the local security settings of the SOFTNET Security Client.
5. Select the storage location for the configuration files.
6. Compile the configuration of the SOFTNET Security client to export the configuration file.
7. If you selected certificate as the authentication method, specify a password for the certificate of the VPN configuration. If you do not assign a password, the project name (not the project password) is used as the password.  
Result: Export of the configuration files is completed.
8. Adopt the files of the type \*.dat, \*.p12, \*.cer on the PG/PC on which you want to operate the SOFTNET Security Client.

## SCALANCE S

### Configuring interfaces for SCALANCE S modules

#### Overview

#### Configuring the mode

With the mode you specify how interface routing is handled (external/internal). The DMZ interface of the security module (SCALANCE S623/S627-2M only) is always connected in routing mode. For more detailed information, refer to the section [Configuring IP address parameters \(Page 671\)](#)

#### Configuring the interfaces

If the external interface or the DMZ interface (SCALANCE S623/S627-2M only) of a security module needs to be configured, it must be activated using the "Activate interface" check box. Set the IP address information for each interface and settings for the individual ports. The

following options are available with which you can assign an IP address for the external interface and for the DMZ interface in the "General" entry (SCALANCE S623/S627-2M only):

- Static IP address with subnet mask. For more detailed information, refer to the section Configuring IP address parameters (Page 671)
- Address assignment using PPPoE. For more detailed information, refer to the section Configuring an Internet connection (Page 673)  
The internal interface can only be configured using a static IP address.

---

**Note**

**External interface and DMZ interface as Internet access**

The simultaneous operation of PPPoE on the external interface and on the DMZ interface (dual ISP) is not possible.

---

### Point to Point Protocol over Ethernet (PPPoE)

To allow Internet/WAN access directly via a DSL modem, the IP address on the external interface or on the DMZ interface is assigned using PPPoE. PPPoE is a dial-in protocol for obtaining IP addresses from an Internet service provider (ISP). SCALANCE S is operated here in routing mode.

To use this IP address assignment mode, specify the ISP in the "PPPoE" entry. The IP address, the subnet mask, the standard router and the DNS server of the interface are specified by the ISP.

---

**Note**

A configured standard router is not taken into account when using PPPoE. This is assigned dynamically to the module by the ISP.

---

**Note**

**No network components between SCALANCE S and DSL modem**

If the interface of a SCALANCE S module is operated using PPPoE, there must be no other network components between this interface and the connected DSL modem, otherwise the dial-in data of the Internet Service Provider will be transferred unencrypted over this link due to the protocol being used.

---

### Configuring media modules

In addition to the functions of the SCALANCE S623, the S627-2M has two media module slots in which an electrical or optical media module with two ports can be inserted. This expands both the external and internal interface by up to two ports. In routing mode, the additional ports of the security module can be used to link the external and internal interface to ring topologies.

To integrate media modules in the SCALANCE S627-2M, select the security module and change to the device view. Then select the required media modules from the hardware catalog.

For ports with the port type "Copper", you can set the transmission speed and the duplex method manually using the port mode. For ports with the port type "Optical", the port mode is fixed by the media module used or by the SFP transceiver used and cannot be adapted.

You will find information on connecting the media module ports to MRP rings in the following section:

Auto-Hotspot

## See also

Setting the operating mode (Page 671)

## Setting the operating mode

### How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Mode".

### Operating mode - possible selections

You can change the operating mode in this dialog if the security module is not included in a VPN group. If the security module is in a VPN group, the mode cannot be changed.

The selection applies to interface routing between the external and internal interface. The DMZ interface (SCALANCE S623 and S627-2M only) is always connected in routing mode.

Bridge mode	For operation in flat networks. External and internal interface are in the same IP subnet. For S623 / S627-2M: External and internal interface are in the same IP subnet, the DMZ interface is in a different IP subnet or is deactivated.
Routing mode	All interfaces are in different IP subnets. If you have activated the routing mode, you must configure an internal IP address and subnet mask for the internal interface of the security module. <b>Note</b> If you have enabled the routing mode for the SCALANCE S module, no MAC firewall rules can be defined.

## Configuring IP address parameters

### Meaning

Specify network parameters such as the IP address and subnet mask for the interface(s) of the security module.

**How to access this function**

1. Select the module to be edited.
2. Select "External interface [P1] red" or "DMZ interface [P3] yellow" in the local security settings.

---

**Note**

**Configuration of the internal interface in routing mode**

If you have selected the "Routing" mode for the security module, you must also configure an internal IP address and subnet mask for the internal interface of the security module. You can access this function in the local security settings under "Internal interface [P2] green" > "Ethernet addresses".

---

3. If applicable, enable the interface using the "Activate interface" check box.
4. Select the "Ethernet addresses" entry.
5. Complete the settings specified in the following table.

Parameter	Meaning
IP address	IP address for the external interface. The IP address consists of four decimal numbers from 0 to 255, with each number being separated by a period, for example, 141.80.0.16.
Subnet mask	The subnet mask consists of four decimal numbers that are separated by period, for example, 255.255.0.0
Use router	Select this check box if you want to use a standard router and enter its address in the "Router address" input box.

---

**Note**

**Networking the interfaces**

Network the individual interfaces of the security module with suitable subnets to avoid IP address conflicts.

---

**Special features with a standard router**

- If the IP assignment configured is via "PPPoE", no standard router needs to be configured because the standard route is always automatically via the PPPoE interface.
- If the address assignment configured is with "Static address" and if the security module is connected to the Internet via a DSL (NAPT) router, the DSL router must be entered as the standard router.

## Configuring port mode

### Meaning

The port mode specifies the transmission speed and the duplex method. For SCALANCE S V2 modules, the port mode is set to "Autonegotiation" as default. This means the transmission speed and the duplex setting are selected automatically. Moreover, the auto-crossing function is supported.

### Configurable port modes

For SCALANCE S V3 and higher, the following port modes can be configured:

Port mode	Meaning
Autonegotiation	The transmission speed and the duplex setting are selected automatically. <b>Note</b> A transmission speed of 1000 Mbps and the autocrossing function are supported only if autonegotiation is selected.
10 Mbps, half and full duplex	Transmission speed of 10 Mbps
100 Mbps, half and full duplex	Transmission speed of 100 Mbps

## Configuring an Internet connection

### Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

### Requirement

The "PPPoE" entry is only displayed in the local security settings if the IP assignment method "PPPoE" is configured for one of the interfaces.

### How to access this function

1. Select the security module to be edited
2. In the local security settings, select the entry "PPPoE".

**Meaning**

In this entry, you make settings related to the Internet Service Provider (ISP) if a connection using PPPoE is set for one of the interfaces of the security module.

Table 8-32 Settings for the ISP account

Function	Description
Authentication	Select none or one of the following authentication protocols: <ul style="list-style-type: none"> <li>• PAP (Password Authentication Protocol)</li> <li>• CHAP (Challenge Handshake Authentication Protocol)</li> </ul> <b>Note</b> Both communications partners have to use the same authentication method otherwise no connection can be established.
User name	Enter the name for logging in with the ISP account.
Password	Enter the password for logging in with the ISP account.
Repeat password	Enter the password for logging in with the ISP account again.

Table 8-33 Settings for the connection

Function	Description
Permanent connection	Permanent Internet connection. After the connection has been terminated by the provider, the connection is automatically restored even if there are currently no packets to be sent.
On-demand connection	The Internet connection is established automatically if packets need to be sent to the Internet. In this setting, delays in the sending of packets are possible.
Maximum idle time (only with the setting "on-demand connection")	If no packets are sent during a certain time, the Internet connection is automatically terminated. In the "Maximum idle time" box, enter the time in seconds after which the connection will be terminated. Permitted values: 10 ... 3600.
Forced disconnection (only with the "Permanent connection" setting)	Select the check box to be able to adapt the time of the forced disconnection by the security module.
Forced disconnection time (only with the "Permanent connection" setting)	The provider terminates the Internet connection automatically after a certain period. If you enter a time of day in this box, the security module terminates the Internet connection itself at this time. This allows disconnection of the Internet connection by the provider to be delayed under certain circumstances. A self-initiated forced disconnection is only possible with an existing permanent connection. Permitted entries: 00:00 ... 23:59

**Configuring dynamic DNS**

**Module-specific function**

FQDNs can be configured for SCALANCE S V3 or higher. The resolution of FQDNs by SCALANCE S modules is possible as of SCALANCE S V4.

## Meaning

With dynamic DNS, you can access a constantly changing IP address with a permanently defined name (FQDN). This is necessary, for example, if you want to access a server that can be reached via a public IP address that changes.

## How it works

The security module signals the current WAN IP address via which the security module can be reached to a provider for dynamic DNS (for example DynDNS.org, no-ip.com). The provider makes sure that DNS queries sent to the FQDN of the security module are replied to with the current WAN IP address of the security module.

Dynamic DNS is permitted on the following interfaces:

- External interface
- DMZ interface

## Setting up dynamic DNS - Requirements

Requirement:

- An account has been created with a provider of dynamic DNS and an FQDN has been registered.

## Setting up dynamic DNS - Follow the steps below:

1. Select the security module to be edited.
2. In the local security settings, select the entry "DNS".
3. If the security module is downstream from a DSL router or DSL modem, you specify a valid DNS server address. To do this, two options are available:

Option	Meaning
Obtain DNS server address automatically	The address of the DNS server can be obtained automatically using PPPoE if the security module is connected to the Internet via a DSL modem. Can only be set for the external interface and the DMZ interface.
Use the following DNS server address:	Enter the address of the preferred and of the alternative DNS server manually.

4. Activate the "Activate service" check box in the "Primary dynamic DNS service" area and make the following settings:

Setting	Meaning
Provider	Choose the provider with which you have set up an account for dynamic DNS.
User account with the provider	Enter the user name that you specified when you created the account.
Password with the provider	Enter the password that you specified when you created the account.
FQDN	Enter the host name (e.g. mysecuritymodule) and the domain name (e.g. dyndns.org) that is registered with the provider separated by a period. If an FQDN is also entered in the "VPN" entry, both must match.
Monitor IP address change on DSL router	If the security module is connected to the Internet via a DSL router, enabling this function activates the function of the Check IP service. The security module periodically sends queries to determine the current IP address of the DSL router and to detect an IP address change on the DSL router. The IP address specified in this way is sent to the provider with each change ID.
Period	Specify the interval at which the Check IP service is called. Permitted values: 10 to 1440 minutes

5. In case the primary provider fails, create a second provider in the "Secondary dynamic DNS service" area (optional setting).

**Setting up a user-defined provider - follow the steps below:**

Select the "User-defined" entry in the "Provider" drop-down list and make the following entries:

Setting	Meaning
Ignore errors when checking the server certificate	To ensure that the authentication data is protected, the certificate of the update server is checked as default. If the certificate check fails, the HTTPS connection is terminated and the account data is not transferred. If you select the check box, the function is disabled, for example if the server certificate of the dynamic DNS service is invalid (for example expired). It is advisable not to ignore the check and not to select the check box.
Provider update URL	With the predefined providers (DynDNS.org and No-IP.com), the URL is already populated.
Check IP service URL	With the predefined providers (DynDNS.org and No-IP.com), the URL is already populated.

## Configuring LLDP

### Module-specific function

This function is available only for SCALANCE S V4 modules or higher.

### Requirement

The security module is in routing mode.

### Meaning

LLDP (Link Layer Discovery Protocol) is a protocol used to discover network topologies. A device capable of LLDP can send information about itself to neighboring devices at regular intervals and at the same time receive information from neighboring devices. The received information is stored on every device with LLDP capability in an LLDP MIB file. Network management systems can access these LLDP MIB files using SNMP and therefore recreate the existing network topology.

### Configurable parameters

The degree of activity of the security module in terms of LLDP can be configured under the "LLDP mode" entry of the relevant interface.

Parameter	Description
Name	Name of the port for which the setting is configured.
LLDP mode	Configured LLDP mode: <ul style="list-style-type: none"> <li>• RxTx: LLDP frames can be sent and received</li> <li>• Off: No LLDP frames can be sent or received</li> </ul>

## Media redundancy in ring topologies

### Media redundancy with MRP

### Module-specific function

This function is available only for SCALANCE S627-2M modules.

### Meaning

The term "media redundancy" groups together various methods for increasing availability in Industrial Ethernet networks in which devices can be reached over different paths. This might be achieved by meshing networks, arranging parallel transmission paths or by closing a linear bus topology to form a ring.

### Media redundancy method MRP

Media redundancy within a ring topology is available with SIMATIC NET products among other things with the MRP method (Media Redundancy Protocol).

With this method, one of the nodes is configured as the redundancy manager. The other nodes are redundancy clients. SCALANCE S627-2M modules can only adopt the role of an MRP client. Using test frames, the redundancy manager checks the ring to make sure it is not interrupted. The redundancy clients forward the test frames. If the test frames of the redundancy manager no longer arrive at the other ring port of the redundancy manager due to an interruption, the redundancy manager switches through its two ring ports and informs the redundancy clients of the change immediately.

The time the SCALANCE X switches need to switch through their ring ports as redundancy manager is 200 ms.

#### Note on the use of MRP

- MRP is supported in ring topologies with up to 50 devices. Exceeding this number of devices can lead to a loss of data traffic.
- It is recommended that you set the ring ports involved to full duplex and 100 Mbps. Otherwise there may be a loss of data traffic.

#### Possible uses of MRP on media module ports

MRP is supported only on the media module ports of the SCALANCE S627-2M. The following table shows the possible uses of MRP on the media module ports of a SCALANCE S627-2M:

Ring ports	Media module 1		Media module 2	
	P4	P5	P6	P7
MRP Client	-	-	-	-
	Ring 1	Ring 1	-	-
	-	-	Ring 2	Ring 2
	Ring 1	Ring 1	Ring 2	Ring 2

With two lower-layer rings per SCALANCE S module, layer 3 communication is possible between the rings.

#### Configuring MRP for the security module

##### Requirement

- The security module is in routing mode.
- The interfaces of the security module to be connected to MRP rings are networked with the relevant ring managers.

## How to access this function

1. Select the security module to be edited.
2. In the settings of the required interface, select the "Media redundancy" entry.

## Configurable parameters

Parameter	Meaning	Possible selections
MRP domain (only if the "MRP client" media redundancy role is selected)	The members of an MRP ring are specified with the help of MRP domains. The same MRP domain must be selected for the interfaces of all modules to be connected to the same MRP ring.	Display of the MRP domain used for the interface.
Media redundancy role	Selection of the media redundancy protocol or disabling of media redundancy for the interface.	<ul style="list-style-type: none"> <li>• Not a node in the ring</li> <li>• MRP Client</li> </ul>
Ring port 1 (only when the media redundancy role "MRP client" is selected)	Name of the first ring port of the selected interface if the media redundancy role "MRP client" was selected for it.	-
Ring port 2 (only when the media redundancy role "MRP client" is selected)	Name of the second ring port of the selected interface if the media redundancy role "MRP client" was selected for it.	-
Domain settings	Using the domain settings, you can add new MRP domains, edit the names of existing MRP domains and delete existing MRP domains.	-
Alternative media redundancy protocol	Select this check box to enable the interface of the security module for other media redundancy protocols.	<ul style="list-style-type: none"> <li>• Enable interface for other media redundancy protocols</li> <li>• Disable interface for other media redundancy protocols (default setting)</li> </ul>
Passive listening	Enable this check box if the selected interface will be connected to third-party networks in which STP/RSTP (Spanning Tree Protocol/ Rapid Spanning Tree Protocol) is used.	<ul style="list-style-type: none"> <li>• Activate passive listening</li> <li>• Deactivate passive listening (default)</li> </ul>

## Setting up a firewall

### Local firewall rules for SCALANCE S modules

#### Configuring a firewall with predefined firewall rules

#### Configuring a firewall using predefined firewall rules

#### How to access this function

1. Select the module to be edited.
2. Select the "Firewall" entry in the local security settings.

#### Firewall enabled as default

The "Enable firewall" check box is enabled by default. The firewall is therefore activated automatically and all access from external to the security module is blocked. By clicking the relevant check box, enable the firewall rules for the specific direction.

---

#### Note

##### Detailed firewall settings in advanced firewall mode

In advanced firewall mode, you can restrict firewall rules to individual nodes. To change to advanced firewall mode, select the "Enable firewall in advanced mode" check box. For more detailed information about the advanced firewall mode, refer to the section [Overview of local firewall rules \(Page 614\)](#)

---

#### Firewall configuration with VPN

If the security module is in a VPN group, the "Tunnel communication only" check box is enabled as default. This means that only encrypted IPsec data transfer is permitted via the external interface or via the DMZ interface.

If you deselect the check box, tunneled communication and also the types of communication selected in the other boxes are permitted.

Table 8-34 Available firewall rules and directions

Service	From internal to external	From external to internal	From internal to DMZ (only for S623 / S627-2M)	From DMZ to internal (only for S623 / S627-2M)	Enabled ports	Meaning
Allow IP communication	x	x	x	x	-	IP communication for the selected communication directions is allowed.
Allow S7 protocol	x	x	x	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/FTPS (explicit mode)	x	x	x	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow HTTP	x	x	x	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	x	x	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow DNS	x	x	x	x	TCP port 53 UDP port 53	Communication connection to a DNS server is allowed.
Allow SNMP	x	x	x	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow SMTP	x	x	x	x	TCP port 25	For sending e-mails via an SMTP server.
Allow NTP	x	x	x	x	UDP port 123	For synchronization of the time of day.
Allow DHCP	x	x	x	x	UDP port 67 UDP port 68	Only in bridge mode Communication connection with a DHCP server is permitted.

Table 8-35 Logging

Option	Action when activated
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.
Log blocked incoming packets	All incoming IP packets that are discarded are logged.
Log blocked outgoing packets	All outgoing IP packets that are discarded are logged.

You can view the logged packets at the "Packet filter log" entry in the "Online & Diagnostics" dialog. For more detailed information, refer to the section Logging data packets - "Packet filter log" entry (Page 664).

## Configuring a firewall with predefined MAC rules

### How to access this function

1. Select the module to be edited.
2. Select the "Firewall" entry in the local security settings.

### Firewall enabled as default

The "Enable firewall" check box is enabled by default. The firewall is therefore activated automatically and all access from external to the security module is blocked. By clicking the relevant check box, enable the firewall rules for the specific direction.

---

#### Note

##### Detailed firewall settings in advanced firewall mode

In advanced firewall mode, you can restrict firewall rules to individual nodes. To change to advanced firewall mode, select the "Enable firewall in advanced mode" check box. For more detailed information about the advanced firewall mode, refer to the section Overview of local firewall rules (Page 614).

---

### Firewall configuration with VPN

If the security module is in a VPN group, the "Tunnel communication only" check box is enabled as default. This means that only encrypted IPsec data transfer is permitted via the external interface or via the DMZ interface.

If you deselect the check box, tunneled communication and also the types of communication selected in the other boxes are permitted.

### Available MAC rules and directions

Service	From internal to external	From external to internal	Meaning
Allow MAC communication	x	x	The MAC traffic from internal to external and vice versa is allowed.
Allow ISO protocol	x	x	The ISO traffic from internal to external and vice versa is allowed.
Allow SiClock	x	x	SiClock time frames from internal to external nodes and vice versa are permitted.
Allow DCP	x	x	Internal to external or external to internal DCP traffic for IP address assignment is permitted.

Table 8-36 Logging

Option	Action when activated
Log tunneled packets	Only active if the security module is a member of a VPN group. All MAC packets transferred via the tunnel are logged.
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.

## User-specific IP rule sets

### Overview

#### Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

#### Meaning

Initially, individual or multiple users are assigned to user-specific IP rule sets. The user-specific IP rule sets are then assigned to individual or multiple security modules. This makes it possible, to allow user-specific access. If, for example all access to the networks downstream from a security module is blocked, certain nodes can be allowed for a user based on their IP addresses. This means that access is allowed for this user but access remains blocked for other users.

#### User logon via the Internet

The user can log in to the external interface or the DMZ interface of the security module via a Web page. If authentication is successful, the predefined IP rule set for this user is enabled. The connection of the security module is via HTTPS using the IP address of the connected port and taking into account the valid routing rules:

Example:

External interface: 192.168.10.1

Call up of the login page with: <https://192.168.10.1/>

Users can log on with every role as long as the user is assigned to a user-specific firewall rule set.

#### User-specific IP rule sets are used locally - conventions

The same conventions as described in the following section apply:  
Global firewall rule sets - conventions (Page 607)

## Creating and assigning user-specific IP rule sets

### Creating user-specific IP rule sets

1. In the global security settings, select the entry "Firewall" > "User-specific IP rule sets" > "IP rule sets".  
Result: The previously created user-specific IP rule sets are displayed under the selected entry.
2. Double-click on the "Add new IP rule set" entry.
3. Enter the following data:
  - Name: Project-wide, unique name of the rule set. The name appears in the local rule list of the security module after the rule set is assigned.
  - Description (optional): Enter a description of the user-specific IP rule set.
4. Enter the firewall rules one by one in the list.  
Note the parameter description in the following sections:  
Defining IP packet filter rules (Page 615)

### Assigning user-specific IP rule sets

1. Within the created user-specific IP rule set, change to the "User" tab.
2. In the "Available users" area, select the users you want to assign to the user-specific rule set.
3. Click the  button to assign the selected users to the user-specific rule set.

---

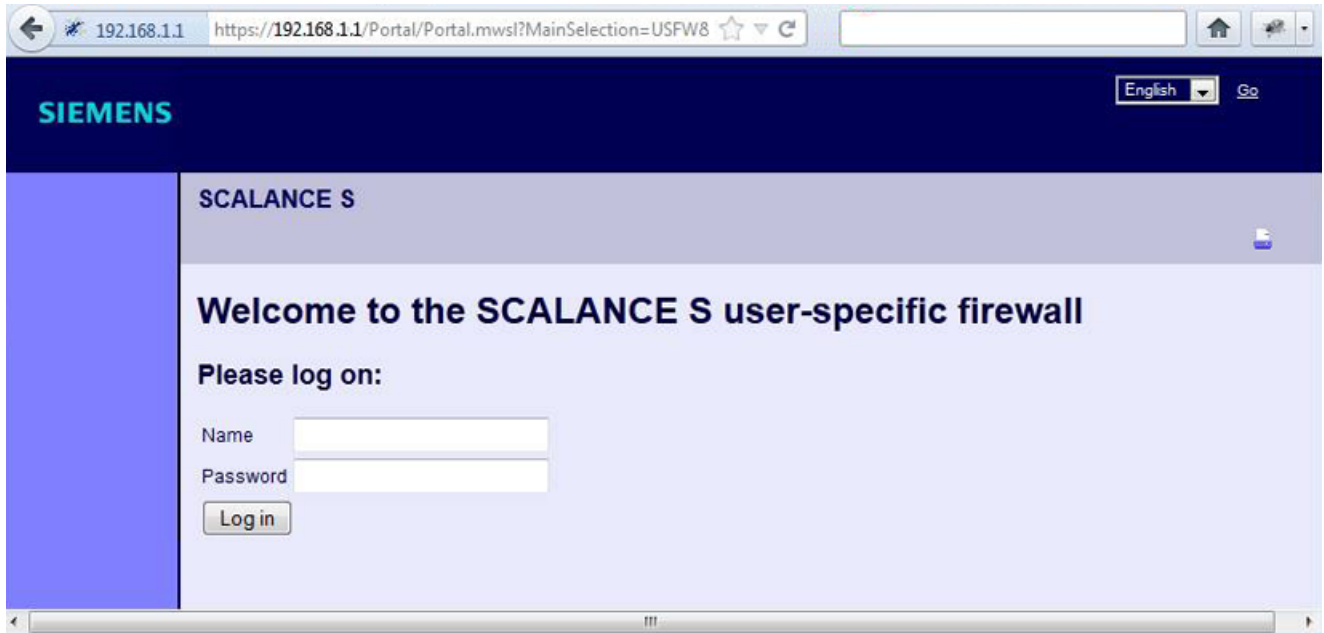

#### Note

##### Assignment of user-specific IP rule sets

- A security module can only be assigned one user-specific rule set per user.
  - Due to the assignment, the right to log in to the security module is activated implicitly for all users assigned to the IP rule set.
-

## Result

- The user-specific rule set is used by the assigned security modules as a local rule set and automatically appears in the local list of firewall rules.
- The user can log on with the security module.

## IP packet filter directions SCALANCE S

### Meaning

Possible selections for the communication directions "From" and "To" in the IP rules of the advanced firewall mode.

### The following directions are available

Available options / ranges of values		Security module		
From	To	S602	S61x	S623 / S627-2M
Internal	External	x	x	x
	Tunnel	-	x	x
	Any	-	x	x
	DMZ	-	-	x
	Internal	x	x	x
External	Internal	x	x	x
	Any	-	-	x
	Tunnel	-	-	x
	DMZ	-	-	x
Tunnel	Internal	-	x	x

Available options / ranges of values		Security module		
Any	External	-	x	x
	DMZ	-	-	x
	Internal	-	x	x
	External	-	-	x
	DMZ	-	-	x
DMZ	Internal	-	-	x
	External	-	-	x
	Any	-	-	x
	Tunnel	-	-	x

x = communication direction is configurable  
 - = communication direction is not configurable

### MAC packet filter directions SCALANCE S

#### Meaning

Possible selections for the communication directions "From" and "To" in the MAC rules of the advanced firewall mode.

#### The following directions are available

Available options / ranges of values		Security module		
From	To	S602	S61x	S623 / S627-2M
Internal	External	x	x	x
	Tunnel	-	x	x
	Any	-	x	x
External	Internal	x	x	x
	Any	-	-	x
	Tunnel	-	-	x
Tunnel	Internal	-	x	x
	External	-	x	x
Any	Internal	-	x	x
	External	-	-	x

x = communication direction is configurable  
 - = communication direction is not configurable

### Adapting standard rules for IP services

#### Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

**Requirement**

This function is available only in advanced firewall mode.

**How to access this function**

1. Select the security module to be edited.
2. In the local security settings, select the entry "Firewall" > "Standard rules for IP services".

**Meaning of the advanced settings**

Parameter	Meaning when activated
Use advanced status options	The permitted number of connections and firewall statuses per time unit is limited. If a network node exceeds this limit, its IP address is entered in the IP blacklist of the security module. The IP blacklist of the security module can be viewed in online mode.
Log all activated rules	Packets that are allowed according to the default rules for IP services are logged.
Enable ICMP test for interfaces	Ping queries coming in on an interface of the security module can be forwarded to other interfaces. This means that, for example, ping queries can be made from the external network to the internal interface of the security module.

**Default firewall rules for SCALANCE S**

The following table lists the default firewall rules for SCALANCE S modules. In some cases, the firewall rules are only set if the relevant service is used by the security module (e.g. SNMP).

Service	Direction	X1 interface (red)	Interface X2 (green)	Interface X3 (yellow) (only for S623, S627-2M)	Tunnel interface (not for S602)
Interface rerouting	outgoing	-	x	-	-
HTTPS		x	x*	x	x*
ICMP	incoming	-	x	-	x
SNMP	incoming	x	x	x	x
Syslog	outgoing	x	x	x	x
NTP	outgoing	x	x	x	x
DNS	outgoing	x	x	x	x
HTTP	outgoing	x	-	x	-
VPN (IKE)		x	-	x	-
VPN (NAT Traversal)		x	-	x	-
BootP Server	incoming	-	x	x	-
BootP Client	outgoing	-	x	x	-

- x enabled as default
- disabled as default
- \* cannot be adapted

### Specifying routes

#### Meaning

Specify routes for addressing subnets that cannot be reached directly via the security module.

#### How to access this function

1. Select the module to be edited.
2. In the local security settings, select the "Routing" entry.
3. Double-click "Add new" in the table to add a route.
4. Enter the following values:

Parameter	Function	Example of a value
Network ID	Requests to nodes of the subnet with the network ID and the subnet mask specified here are forwarded to the subnet via the specified router IP address. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet. The specified network ID must not be located in the same subnet as the IP address of the security module.	192.168.11.0
Subnet mask	The subnet mask determines the network structure. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet.	255.255.255.0
Router IP address	IP address of the router that connects to the subnet. As an alternative, an FQDN can be entered for SCALANCE S V4 modules. The specified router IP address must be in the same subnet as the IP address of the security module.	192.168.10.2
Activate rerouting (only for SCALANCE S V3/V4 modules)	Select this check box if the frames of the entered route will enter and leave on the same interface of the security module (rerouting). Rerouting is only supported on the internal interface of the security module.	

## Security module as DHCP server

### Overview DHCP server

#### Overview

You can operate the SCALANCE S module on the internal network and on the DMZ network as DHCP server (DHCP = Dynamic Host Configuration Protocol). This allows IP addresses to be assigned automatically to the devices connected to the internal network.

Simultaneous DHCP server operation on both interfaces is possible (SCALANCE S623/S627-2M only).

The IP addresses are either distributed dynamically from an address range you have specified or you can select a specific IP address and assign it to a particular device. If devices on the internal interface or on the DMZ interface should always be assigned the same IP address for firewall configuration, the address assignment must only be static based on the MAC address or based on the client ID.

#### Requirements

You configure the devices on the internal network or on the DMZ network so that they obtain the IP address from a DHCP server.

Depending on the mode, the security module sends an IP address of the standard router to the nodes in the relevant subnet or you need to inform the nodes in the subnet of a router IP address.

- Router IP address will be transferred  
In the following situations, the DHCP protocol of the security module will inform the nodes of the router IP address:
  - The node is connected to the DMZ interface (SCALANCE S623/S627-2M only)  
In this case, the security module sends its own IP address as the router IP address.
  - The node is connected to the internal interface and the security module is configured for router mode  
In this case, the security module sends its own IP address as the router IP address.
  - The node is connected to the internal interface and the security module is not configured for router mode, there is, however, a standard router specified in the configuration of the security module.  
In this case, the security module transfers the IP address of the standard router as the router IP address.
- Router IP address will not be transferred  
In the following situations, enter the router IP address manually on the node:
  - The node is connected to the internal interface and the security module is not configured for router mode. There is also no standard router specified in the configuration of the security module.

## See also

Configuring a DHCP server (Page 690)

## Configuring a DHCP server

### How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "DHCP server".
3. Select the interface for which you want to make the DHCP settings.
4. Make the address assignment. You have the following configuration options:
  - Static address assignment  
Devices with a specific MAC address or client ID are assigned the specified IP addresses. You specify these addresses by entering the devices in the address list in the "Static address assignment" group box.
  - Dynamic address assignment  
Devices whose MAC address or whose client ID was not specified specifically, are assigned a random IP address from a specified address range. For this purpose, activate the "Dynamic IP address pool" check box. Set the address range in the "Dynamic IP address pool" input area.

---

### Note

#### Dynamic address assignment - reaction after interrupting the power supply

Please note that dynamically assigned IP addresses are not saved if the power supply is interrupted. On return of the power, you must therefore make sure that the nodes request an IP address again.

You should therefore only use dynamic address assignment for the following nodes:

- Nodes that are used temporarily in the subnet (such as service devices).
- Nodes that have been assigned an IP address and send this as the "preferred address" the next time they request an address from the DHCP server (for example PC stations).

For permanent nodes you should preferably use static address assignment by specifying a client ID or the MAC address.

---

**Consistency check - these rules must be adhered to**

Remember the following rules when making the entries.

Check / rule	Check made <sup>1)</sup>	
	locally	Project-wide/ module-wide
The IP addresses assigned in the address list in the "Static address assignments" group box must not be in the range of the dynamic IP addresses.		x
IP addresses, MAC addresses and client IDs may only occur once in the "Static address assignment" table (related to the security module).		x
For the statically assigned IP addresses, you must specify either the MAC address or the client ID (computer name).	x	
The client ID is a string with a maximum of 63 characters. Only the following characters may be used: a-z, A-Z, 0-9 and - (dash). <b>Note</b> In SIMATIC S7, a client ID can be assigned to the devices on the Ethernet interface to allow them to obtain an IP address using DHCP. With PCs, the procedure depends on the operating system being used; it is advisable to use the MAC address here for the assignment.	x	
For the statically assigned IP addresses, you must specify the IP address.	x	
The following IP addresses must not be in the range of the free IP address range (dynamic IP addresses): <ul style="list-style-type: none"> <li>• All router IP addresses in the "Routing" entry</li> <li>• Syslog server</li> <li>• Standard router</li> <li>• Security module address(es)</li> </ul>		x
DHCP is supported by the security module on the interface to the internal subnet and on the interface to the DMZ network. The following additional requirements for IP addresses in the range of the dynamic address assignments result from this operational behavior of the security module: <ul style="list-style-type: none"> <li>• Bridge mode The range must be within the network defined by the security module.</li> <li>• Routing mode The range must be within the internal subnet defined by the security module.</li> </ul> <b>Note</b> The DMZ network always represents a separate subnet. When using DHCP on the DMZ interface, make sure that the free IP address range (dynamic IP addresses) is within the DMZ subnet.		x
The free IP address range must be fully specified by entering the start address and the end address. This end address must be higher than the start address.	x	
The IP addresses you enter in the address list in the "Static address assignments" input area must be in the address range of the internal subnet or in the DMZ subnet of the security module.		x

**Legend:**

<sup>1)</sup> Note the explanations in the section  
Running a consistency check (Page 591).

## Configuring proxy ARP

### Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

### Overview

Proxy ARP allows routers to respond to ARP queries for hosts. The hosts are in networks separated by routers but use the same IP address range.

If PC1 sends an ARP request to PC2, it receives an ARP response and the hardware address of the interface (MAC address of the port of the security module) on which the query was received from the security module located in between and not from PC2. The querying PC1 then sends its data to the security module that then forwards it to PC2.

### How to access this function

This function is only available for the internal interface of a security module that is a member of a VPN group and is in bridge mode.

1. Select the security module to be edited.
2. In the local security settings, select the entry "Proxy ARP".
3. If the security module is to respond to an ARP query from its own LAN as a substitute for the specific connection partner, enter the corresponding IP address.

## IPsec tunnel: Creating and assigning groups

### Configuring internal network nodes

### Using the learning mode to learn internal nodes

### Finding nodes for tunnel communication automatically

One great advantage when configuring and operating tunnel communication is that SCALANCE S modules in bridge mode can find the nodes on the internal interface automatically. New nodes are detected by the security module during operation. The detected nodes are signaled to the security modules belonging to the same group. This allows data exchange within the tunnels of a group in both directions at any time.

## Detectable nodes

The following nodes are detected:

- Network nodes with IP capability  
Network nodes with IP capability are found when they transmit an ICMP response to the ICMP subnet broadcast.  
IP nodes downstream from routers can be found if the routers pass on ICMP broadcasts.
- ISO network nodes  
You can also teach-in network nodes without IP capability that can be addressed by means of ISO protocols.  
This is only possible if they reply to XID or TEST packets. TEST and XID (Exchange Identification) are auxiliary protocols for exchanging information on layer 2. By sending these packets with a broadcast address, these network nodes can be located.
- PROFINET nodes  
Using DCP (Discovery and basic Configuration Protocol), it is possible to find PROFINET nodes.

Network nodes that do not meet these conditions must be configured manually.

Subnets located on the other side of internal routers also need to be configured manually.

## How to access the function

1. Select the module.
2. In the local security settings, select the entry "VPN" > "Nodes".

## Enabling/disabling the learning mode

The learning function is enabled in the configuration as default for every security module.

Learning can also be disabled completely for SCALANCE S. In this case, you will need to configure all internal network nodes participating in the tunnel communication manually.

## When is it useful to disable the automatic learning mode?

The default settings for the security module assume that internal networks are always secure; in other words, in a normal situation, no network node is connected to the internal network if it is not trustworthy.

Disabling the learning mode can be useful if the internal network is static; in other words, when the number of internal nodes and their addresses do not change.

If the learning mode is disabled, this reduces the load on the medium and the nodes in the internal network resulting from the learning packets. The performance of the security module is also slightly improved since it does not need to process the learning packets.

Note: In the learning mode, all nodes in the internal network are detected. The information relating to VPN configuration limits relates only to nodes that communicate over VPN in the internal network.

---

**Note**

If more than 128 internal nodes are being operated, the permitted configuration limits are exceeded and an illegal operating status results. Due to the dynamics in the network traffic, this causes internal nodes that have already been learned to be replaced by new previously unknown internal nodes.

---

**See also**

Configuring internal subnets manually (Page 695)

**Configuring IP network nodes manually**

**Meaning**

As an alternative to the learning mode that you enable using the "Enable learning of internal nodes" check box and that allows the security module to learn the internal network nodes dynamically, you can enter the network nodes to be learned manually in the "Internal IP nodes" entry and in doing so enable them for VPN tunnel communication. The MAC address of a network node can be specified as an option.

**Requirement**

- The security module is in bridge mode.
- The security module is a member of a VPN group.

**How to access this function**

1. Select the module to be edited.
2. In the local security settings, select the entry "VPN" > "Nodes" > "Internal IP nodes".

**Configuring MAC network nodes manually**

**Meaning**

As an alternative to the learning mode that you enable using the "Enable learning of internal nodes" check box and that allows the security module to learn the internal network nodes dynamically, you can enter the network nodes to be learned manually in the "Internal MAC nodes" entry and in doing so enable them for VPN tunnel communication.

## Requirement

- The security module is in bridge mode.
- The security module is a member of a VPN group.

## How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "VPN" > "Nodes" > "Internal MAC nodes".

## Configuring internal subnets manually

### Requirement

- The security module is a member of a VPN group.

### How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "VPN" > "Nodes" > "Internal subnets".

### Security module in bridge mode - "Internal subnets" entry

To be able to enable internal subnets for VPN tunnel communication manually, you need to enter the following address parameters:

Parameter	Function	Example of a value
Network ID	Network ID of the subnet to be enabled for VPN tunnel communication. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet. Must not be located in the same subnet as the IP address of the security module.	192.168.11.0
Subnet mask	The subnet mask determines the network structure. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet.	255.255.255.0
Router IP address	IP address of the router via which the subnet you are allowing is reached. Must be located in the same subnet as the IP address of the security module.	192.168.10.2

**Security module in routing mode - "Subnets reachable through tunnel" entry**

In routing mode, entire subnets are always tunneled. To be able to enable internal subnets for VPN tunnel communication manually, you need to enter the following address parameters:

Parameter	Function	Example of a value
Network ID	Network ID of the subnet to be enabled for VPN tunnel communication. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet. Must not be located in the same subnet as the IP address of the security module.	192.168.11.0
Subnet mask	The subnet mask determines the network structure. Based on the network ID, the router recognizes whether a destination address is inside or outside the subnet.	255.255.255.0
Comment	Entry of additional, optional comments.	

**Online functions - testing / diagnostics and logging**

**Overview of the individual interfaces - "Interface settings" entry**

**Module-specific function**

This function is available only for SCALANCE S V3 modules or higher.

## Meaning

Table 8-37 Online diagnostics: "Interface settings" entry

System and status functions	Meaning
Interfaces	<p>Table above: General overview of the interfaces of the security module.</p> <p>Table below: Information on the interface operated via PPPoE.</p> <ul style="list-style-type: none"> <li>• Status: Indicates whether or not a connection was established to the Internet Service Provider (ISP).</li> <li>• Current IP address: Current IP address of the interface</li> <li>• Gateway: IP address of the gateway</li> <li>• Primary dynamic DNS service: Primary service for dynamic DNS</li> <li>• Secondary dynamic DNS service: Secondary service for dynamic DNS</li> <li>• Error code (numeric): Error information if no connection could be established to the ISP.</li> </ul>
Media redundancy (SCALANCE S627-2M only)	<ul style="list-style-type: none"> <li>• Interface: Interface connected to the MRP ring</li> <li>• Protocol: Protocol used (MRP)</li> <li>• Ring port 1: Name of the first media module port of the interface connected to the MRP ring</li> <li>• Ring port 2: Name of the second media module port of the interface connected to the MRP ring</li> <li>• Domain name: Name of the MRP domain</li> <li>• Discrepancy: Displays whether or not there is an error in the MRP configuration</li> <li>• Domain UUID: UUID of the MRP domain</li> </ul>
Media modules (SCALANCE S627-2M only)	<ul style="list-style-type: none"> <li>• Port: Port ID(s) of the media module port(s)</li> <li>• Name: Name of the media module</li> <li>• MLFB: MLFB of the media module</li> <li>• Revision: Version of the media module</li> <li>• Discrepancy: Displays whether or not there is an error in the configuration of the media module</li> </ul>

## Overview of the DDNS settings - "Dynamic DNS" entry

### Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

**Meaning**

Table 8-38 Online diagnostics: "Dynamic DNS"

System and status functions	Meaning
Client status	Indicates whether or not a connection was established to a dyn. DNS server.
Current IP address	Own (in other words logged on to dyn. DNS provider) IP address.
Defined IP address	IP address assigned via PPPoE.
Current time	The current time-of-day.
Force update	The security module obtains the current IP address of its Internet access and sends an update query to the configured update server(s). This publishes the current IP address on the Internet. The status is displayed in the primary or secondary dynamic DNS service fields. This means, for example that it is possible to check whether configured data such as the user name and password of the dynamic DNS account are correct.
Cancel suspension	Cancels the suspension (blocking of IP address updates from the dynamic DNS provider on the security module), for example after the dynamic DNS provider password has been corrected or an error has been eliminated.
<b>Primary and secondary dynamic DNS service</b>	
FQDN	Fully Qualified Domain Name registered with the provider.
Server IP Address	IP address of the update server used.
Successful update	Successful update in the dynamic DNS update service.
Last update attempt	Last update attempt for DynDNS update service.
Last failed update	Last update error in the dynamic DNS update service.
Error code	Error status of the last unsuccessful update attempt during a dynamic DNS update.

**What is the meaning of the messages?**

The messages of the last DDNS update attempt have the following meaning:

Message	Meaning
<b>Success</b>	
DDNS_OK	The update query was successful.
<b>Connection-related status messages</b>	
DDNS_E_CON_UPD_SRV_RESOLV_ERR	DNS name of the update server unknown, FQDN cannot be resolved using the known DNS server.
DDNS_E_CONUPD_SRV_UNREACHABLE	Update server unreachable ("Timeout").
<b>Security-related status messages (errors)</b>	
DDNS_E_CERT_SUBJECT_INVALID	The common name of the subject in the certificate does not match the domain name of the update server or its IP address.
DDNS_E_CERT_UNABLE_TO_GET_ISSUER_CERT	Issuer certificate not found. The certificate chain could not be followed back to the root CA because an issuer certificate was not found. The trust chain is incomplete.
DDNS_E_CERT_SIGNATURE_INVALID	The signature of a certificate could not be read or is invalid.

Message	Meaning
DDNS_E_CERT_NO_TRUST	A certificate in the trust chain is invalid, in other words: <ul style="list-style-type: none"> <li>• Not yet valid or ready expired</li> <li>• V3 extensions invalid</li> <li>• Critical V3 extension is not supported</li> </ul>
DDNS_E_CERT_DEPTH_ZERO_SELFSIGNED_CERT	The update server has supplied a self-signed certificate and the certificate is not in the certificate store for trustworthy root CA certificates.
DDNS_E_CERT_SELF_SIGNED_CERT_IN_CHAIN	The certificate chain could be established using non trustworthy certificates but no suitable root CA certificate was found in the certificate store for trustworthy certificates.
DDNS_E_CERT_CHAIN_TOO_LONG	The certificate chain exceeds the maximum supported verification depth.
DDNS_E_CERT_INVALID_CA	A CA certificate is invalid, in other words expired, not yet valid or the V3 extensions are not suitable for the intended purpose (for example CA not set to TRUE for CA certificates).
DDNS_E_CERT_KEYUSAGE_UNSUITED	The V3 extensions key usage or extended key usage set in a certificate of the trust chain are not suitable for the use of the certificate.
DDNS_E_CERT_EXTENSION_UNSUPPORTED	A certificate in the trust chain used an extension marked as critical that is not supported.
<b>Agent-related status messages (errors)</b>	
DDNS_E_AGT_BAD_AGENT	<ul style="list-style-type: none"> <li>• The update request does not correspond to the structure required by cRSP, for example URL parameters missing.</li> <li>• The update request was sent to an illegal URL on the update server.</li> <li>• The configured update string contains errors.</li> </ul>

## Display of the ARP table - "ARP table" entry

### Module-specific function

This function is available only for SCALANCE S V3 modules or higher.

**Meaning**

Display of the ARP table of the security module.

Table 8-39 Online diagnostics: "ARP table" tab

System and status functions	Meaning
ARP table	Display of the static (proxy ARP) and dynamic entries of the ARP table on the security module. The "Publication type" tab specifies whether the entry is configured statically or learnt.

**Users logged in to the Web page - "Logged in users" entry**

**Module-specific function**

This function is available only for SCALANCE S V3 modules or higher.

**Meaning**

Shows the users logged in to the Internet page for user-specific IP rule sets.

System and status functions	Meaning
User name	Name of the logged on user.
Source IP address	IP address with which the user logged on.
Time remaining	Remaining time before the user is automatically logged off.
Maximum time of the session	Configured total time of the session.
Log off	If you click the button, the selected user is logged off.

**Display of the firewall blacklist - "Firewall blacklist" entry**

**Meaning**

Displays the IP addresses of nodes that have exceeded the permitted number of connections and firewall statuses per time unit. These nodes are entered in the IP blacklist of the firewall.

The number of connections and firewall statuses per time unit is only limited if the "Use extended status options" check box is selected in the "Standard rules for IP services" entry in the local security settings.

If you click the "Delete all" button, the displayed IP addresses are removed from the firewall blacklist of the security module. The IP addresses are also no longer displayed.

## **Setting the date and time - "Date and time" entry**

### **How to access this function**

1. Select the security module whose time and date you want to check or set.
2. Select the "Online & diagnostics" command from the shortcut menu.
3. In online diagnostics, select the "Functions" > "Date and time" entry.

### **Setting the local time on the security module**

In this area, you can read out and set the time and date of the security module. When you click the "Apply" button, the security module is assigned the time and date currently entered in the "Date" and "Time" input boxes.

### **Setting the local time on PC**

This area shows the current time and current date of the PC on which STEP 7 is installed. If you click the "Adopt for module" button, the security module is assigned the current time and current date of the PC.

## Download functions

### Downloading a configuration

#### This needs to be taken into consideration before downloading a configuration

- IP address used for downloading configurations  
Configurations are always downloaded to the security module using the IP address configured in the local security settings for the internal or external port. This IP address must match that of the security module.
- Ports  
You can download the configuration data to the security module both via the external and the internal interface.  
Ideally, you should configure the modules of a VPN group via the common external network of these modules (device port 1). If the configuration computer is located on an internal network, you must enable the IP addresses of the other modules of the group explicitly in the firewall of this SCALANCE S module and first load this module.

---

#### Note

##### Selecting a network adapter

If you are using more than one network adapter in your PC/PG, first select the network adapter via which you can reach the SCALANCE S module in the "PG/PC Interface" drop-down list of the "Extended download to device" dialog.

---

- Operating mode  
Configurations can be downloaded while the SCALANCE S devices are operating. Restart the SCALANCE S module to activate your configuration changes.

---

#### Note

##### Special characteristics

- As long as a module has not yet set IP parameters (in other words, prior to the first configuration), there must be no router between the module and the configuration computer.
  - If you swap a PC from the internal to the external interface of the SCALANCE S, access from this PC to the SCALANCE S is blocked for approximately 20 minutes.
- 

## Transferring firmware

#### This needs to be taken into consideration before transferring new firmware

To transfer new firmware to a security module, the following conditions must be met:

- You have the rights required to transfer firmware; refer to section Auto-Hotspot.
- The security module is configured with an IP address.

### **The transfer is secure**

The firmware is transferred over a secure connection and can therefore also be transferred from the unprotected network.

The firmware itself is signed and encrypted. This ensures that only authentic firmware can be downloaded to the SCALANCE S module.

### **The transfer can take place during operation**

The firmware can be transferred while a SCALANCE S module is in operation. Newly downloaded firmware only becomes active after the SCALANCE S module has been restarted. If the transfer is disturbed and aborted, the module starts up again with the old firmware version.

## **Security for S7-300 /S7-400 / PC CPs**

### **Setting up a firewall**

#### **Local firewall rules for S7-300 /S7-400 / PC CPs**

#### **Overview S7-300 CPs / S7-400 CPs /PC CPs**

### **Enabling packet filter rules**

If you enable the security function for the CPs in the local security settings, initially all access to and via the CP is permitted. To enable individual packet filter rules, select the "Activate firewall" check box. Then enable the required services. Firewall rules created automatically due to a connection configuration have priority over rules set manually.

---

#### **Note**

##### **Detailed firewall settings in advanced firewall mode**

In advanced firewall mode, you can restrict firewall rules to individual nodes. To change to advanced firewall mode, select the "Activate firewall in advanced mode" check box.

---

### **Firewall configuration with VPN**

If the security module is added to a VPN group, the firewall is enabled by default. In addition, the "Tunnel communication only" check box is enabled. This means that only encrypted IPsec data transfer is permitted via the external interface. External data traffic is blocked.

If you deselect the check box, tunneled communication and also the types of communication selected in the other boxes are permitted.

### Updating connection rules

Changes to the connection configuration of CPs also change the connection-related firewall rules. To display the modified firewall rules, click the "Update connection rules" button. The modified firewall rules are then displayed in advanced firewall mode.

### Configuring a firewall with predefined firewall rules - CP x43-1 Advanced

### Configuring a firewall with predefined IP rules - CP x43-1 Advanced

#### How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Firewall" > "Predefined IP rules".

Table 8-40 Available services and directions

Service	From station/ internal to external	External to internal	From external to station	Enabled ports	Meaning
Allow IP communication	x	x	x	All	IP traffic for the selected communication directions is allowed.
Allow S7 protocol	x	x	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/FTPS (explicit mode)	x	x	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow HTTP	x	x	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	x	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow DNS	x	x	-	TCP port 53 UDP port 53	Communication connection to a DNS server is allowed.
Allow SNMP	x	x	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow SMTP	x	x	-	TCP port 25	For sending e-mails via an SMTP server.
Allow NTP	x	x	-	UDP port 123	For synchronization of the time of day.

Table 8-41 Logging

Option	Action when activated	Relevant firewall rule		
		Action	From	To
<b>IP log settings</b>				
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

**Note**

**Relationship between log settings in default mode and firewall rules**

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

**Configuring a firewall with predefined MAC rules - CP x43-1 Advanced**

**How to access this function**

1. Select the module to be edited.
2. Select the entry "Firewall" > "Predefined MAC rules".

Table 8-42 Available services and directions

Service	From station to external	From external to station	Meaning
Allow MAC communication	x	x	The MAC traffic from station to external and vice versa is allowed.
Allow ISO protocol	x	x	The ISO traffic from station to external and vice versa is allowed.

Table 8-43 Logging

Option	Action when activated	Relevant firewall rule		
		Action	From	To
<b>MAC log settings</b>				
Log tunneled packets	Only active if the security module is a member of a VPN group. All MAC packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station

Option	Action when activated	Relevant firewall rule		
MAC log settings		Action	From	To
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.	Drop	External	Station
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.	Drop	Station	External

**Note**

**Relationship between log settings in default mode and firewall rules**

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

**Configuring a firewall with predefined firewall rules - CP 1628**

**Configuring a firewall with predefined IP rules - CP 1628**

**How to access this function**

1. Select the module to be edited.
2. Select the "Security" > "Firewall" > "Predefined IP rules" entry.

Table 8-44 Available services and directions

Service	From external to station	Enabled ports	Meaning
Allow IP communication	x	All	IP traffic from external to station is allowed.
Allow S7 protocol	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/FTPS (explicit mode)	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow HTTP	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow DNS	x	TCP port 53 UDP port 53	Communication connection to a DNS server is allowed.

Service	From external to station	Enabled ports	Meaning
Allow SNMP	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow SMTP	x	TCP port 25	For sending e-mails via an SMTP server.
Allow NTP	x	UDP port 123	For synchronization of the time of day.

Table 8-45 Logging

Option	Action when activated	Relevant firewall rule		
		Action	From	To
<b>IP log settings</b>				
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

**Note**

**Relationship between log settings in default mode and firewall rules**

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

**Configuring a firewall with predefined MAC rules - CP 1628**

**How to access this function**

1. Select the module to be edited.
2. Select the entry "Security" > "Firewall" > "MAC rules".

Table 8-46 Available services and directions

Service	From station to external	From external to station	Meaning
Allow MAC level communication	x	x	The MAC traffic from external to the station and vice versa is allowed.
Allow ISO communication	x	x	ISO traffic from external to the station and vice versa is allowed.
Allow SiClock	x	x	SiClock time-of-day frames from external to the station and vice versa are allowed.

Table 8-47 Logging

Option	Action when activated	Relevant firewall rule		
MAC log settings		Action	From	To
Log tunneled packets	Only active if the security module is a member of a VPN group. All MAC packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.	Drop	External	Station
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.	Drop	Station	External

**Note**

**Relationship between log settings in default mode and firewall rules**

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

**IP packet filter directions S7-300-/S7-400-/PC-CPs**

**Meaning**

Possible selections for the communication directions "From" and "To" in the IP rules of the advanced firewall mode.

**The following directions are available**

Available options / ranges of values		Security module		Meaning
From	To	CP x43-1 Adv.	CP 1628	
Internal	Station	x	-	Access from the internal network to the station.
	Any	x	-	Access from internal to the external network, VPN tunnel partner and the station.
External	Station	x	x	Access from the external network to the station.
	Any	x	-	Access from external to the internal network and the station.
Station	Internal	x	-	Access from the station to the internal network.
	External	x	x	Access from the station to the external network.
	Tunnel	x	x	Access from the station to the VPN tunnel partner.
Tunnel	Station	x	x	Access via the VPN tunnel partner to the station.

Available options / ranges of values		Security module		Meaning
	Any	x	-	Access from VPN tunnel partners to the internal network and the station.
Any	External	x	-	Access from the internal network and the station to the external network.

### MAC packet filter directions S7-300-/S7-400-/PC-CPs

#### Context

Possible selections for the communication directions "From" and "To" in the MAC rules of the advanced firewall mode.

#### The following directions are available

Available options / ranges of values		Security module		Meaning
From	To	CP x43-1 Adv.	CP 1628	
External	Station	x	x	Access from the external network to the station.
Station	External	x	x	Access from the station to the external network.
	Tunnel	x	x	Access from the station to the VPN tunnel partner.
Tunnel	Station	x	x	Access via the VPN tunnel partner to the station.

#### Configuring the access list

#### Module-specific function

This function is not available for the CP 1628.

## Meaning

You set access protection for certain IP addresses using the IP access lists. List entries that have already been created and the corresponding rights are displayed in the local settings of the CP in the entry "Firewall" > "IP rules" (advanced firewall mode).

---

### Note

#### Changed behavior after activation of security

- Once you have activated the security function for a CP, access protection will only apply to the external interface. You can apply access protection to the internal interface as well, by configuring suitable firewall rules in advanced firewall mode.
  - The CP also responds to ARP requests from IP addresses that have not been released (layer 2).
  - If the IP access list of a CP contains no entries and you activate security for the CP, the firewall will be activated and prevent access to the CP from external locations. Configure the corresponding firewall rules in advanced firewall mode so that the CP can be reached.
- 

## Effect of IP access list entries at activation of security

If security is enabled in the local settings of a CP, the corresponding rules are created in the advanced firewall mode. A firewall rule "Allow" > "External" > "Station" is created for an IP address you specified in the address list. The IP address from the IP access list is used accordingly as source IP address. IP addresses from a defined IP address range are also integrated into corresponding firewall rules.

## Requirements for editing

Before you can edit created firewall rules, the following condition must be met:

- for editing using STEP 7: "Configure security" configuration right
- for editing using a Web server: Module right "Web: Expand IP access control list"

The requirements for editing the IP access lists outside the local security settings are described in the sections on the specific CPs.

## Connection-related automatic firewall rules

### Meaning

For connections that were configured using CPs, STEP 7 automatically creates firewall rules that allow communication with the partner of the CP in the specified direction (CP active/passive). The connection establishment directions are taken into account. To display these

firewall rules, if the advanced firewall mode is enabled, the "Update connection rules" button needs to be clicked. The firewall rules are then displayed in advanced firewall mode.

**Note**

**Enabling UDP multicast and UDP broadcast connections manually**

No automatic firewall rules are created for UDP multicast and UDP broadcast connections. To enable the connections, add the relevant firewall rules manually in advanced firewall mode.

Depending on how the connection establishment is configured, the following level 3 firewall rules are created. If the security module is in a VPN group, the direction "External" changes to "Tunnel". This applies only to CPs that support VPN.

The IP address of the connection partner is entered in the "Source IP address" or "Destination IP address" column of these firewall rules.

CP->external	Action	From	To
active	Allow	Station	External
	Drop	External	Station
passive	Drop	Station	External
	Allow	External	Station
active and passive	Allow	External	Station
	Allow	Station	External

CP->internal	Action	From	To
active	Allow	Station	Internal
	Drop	Internal	Station
passive	Drop	Station	Internal
	Allow	Internal	Station
active and passive	Allow	Internal	Station
	Allow	Station	Internal

For level 2 connections, "Allow" rules are created for both directions. If the security module is in a VPN group, the direction "External" changes to "Tunnel". This applies only to CPs that support VPN.

The MAC address of the connection partner is entered in the "Source MAC address" or "Destination MAC address" column of these firewall rules.

CP->external	Action	From	To
active, passive, active and passive	Allow	Station	External
	Allow	External	Station

---

**Note**

**Changing the connection configuration**

Changes to the connection configuration of CPs also change the connection-related firewall rules. To display the modified firewall rules, click the "Update connection rules" button.

---

**Conventions for automatically created firewall rules**

- **Priority**  
The rules have highest priority and are therefore inserted at the top in the local rule list.
- **Deleting rules**  
The rules cannot be deleted. Logging can be enabled and services can be assigned. Moreover, you may insert a bandwidth and a comment.
- **Changing the action**  
If you set the action from "Allow" to "Drop" or vice versa, this is overwritten again during renewed system synchronization. Select "Allow\*" or "Drop\*" to retain your changes. In this case, only the IP address is synchronized and the action and direction remain as set. Settings for logging, service, bandwidth and comment are also retained after a renewed system synchronization even without changing the action to "Allow\*" or "Drop\*". If the configured connection is deleted, the corresponding rules are removed from the list.

**Security module in VPN group**

As default, the "Tunnel communication only" check box is enabled. If you deselect the check box, in addition to tunnel communication between tunnel partners, communication is also possible with network nodes to which there is no tunnel.

- Communication is untunneled if the partner address belongs to a station known in STEP 7 for which no VPN tunnel is configured.
- Communication is through the tunnel if the partner address is a VPN endpoint.
- If it is not clear whether connection should bypass or run through the VPN tunnel, the connection is assigned to the VPN tunnel and a message to this effect is displayed. The assignment can be adapted in advanced firewall mode, for example, by changing the "From" direction "Tunnel" to "External". To avoid this adaptation being overwritten by the next system synchronization, the "Allow\*" or "Drop\*" action must be selected.

---

**Note**

If you want to ensure that only communication through the tunnel is possible, you will need to create suitable firewall rules in advanced firewall mode, for example, for internal nodes or NDIS addresses.

To allow only tunneled communication for a CP, add a "Drop" > "Any" > "External" rule. For the CP 1628, add a "Drop" > "Station" > "External" rule. In addition to this, you need to remove existing firewall rules that allow untunneled communication.

---

## Activating the Web server on CP x43-1 Advanced

### Module-specific function

This function is only available for CP x43-1.

### Meaning

After activating the Web server, you have access to the Web pages of the module. In the local security settings, you can restrict access to these Web pages using the HTTPS protocol. This access is controlled using the "Allow access only using HTTPS" check box. In addition, you must configure the firewall accordingly.

## IPsec tunnel: Creating and assigning groups

### Configuring internal network nodes - "Nodes" entry

#### Allow access to S7-300 / S7-400 CPs for VPN connection partners

### Possible selections

Decide whether or not the VPN connection partner can have access to the CP and/or the internal subnet of the CP in routing mode (SCALANCE S / M).

### How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Node".
3. Configure access for the VPN connection partner of the CP in routing mode (SCALANCE S / M):
  - Allow connection to the CP (Gbit interface)
  - Allow connection to the internal subnet (PROFINET subnet)

## Configuring NDIS nodes manually for PC CPs that can be reached through the tunnel

### Configuring NDIS nodes that can be reached through the tunnel

The internal nodes are learned and assigned to the routes dynamically. This concerns the NDIS IP addresses of the Windows PC.

### **Follow the steps below**

1. Select the module to be edited.
2. In the local security settings, select the entry "Nodes" > "NDIS nodes reachable via tunnel".
3. Enter the NDIS IP addresses.

### **Online functions - Debug / Diagnostics and Logging**

### **Updated firewall rules - "Dynamically updated firewall rules" entry**

#### **Meaning**

Display of the IP addresses or IP address ranges that were enabled dynamically using HTTP or HTTPS, or loaded by a user. The rights assigned for accessing the S7 CP are displayed for the enabled IP addresses. An update of the IP addresses in this tab can only be triggered by the following events:

- Extension/modification of the IP access control list
- Update of firewall rules
- Dynamic extensions transmitted to the CP at runtime, for example, PROFINET IO devices

Since only the dynamically updated firewall rules are displayed here, you also need to take into account the firewall rules that were configured offline and downloaded to the station for a full picture of the current firewall status of the module.

### **Security for S7-1500 CPs**

#### **Setting up a firewall**

#### **Local firewall rules for S7-1500 CPs**

#### **Overview of local firewall rules**

#### **Enabling packet filter rules**

If you enable the security function for the CPs in the local security settings, initially all access to and via the CP is permitted. To enable individual packet filter rules, select the "Activate

firewall" check box. Then enable the required services. Firewall rules created automatically due to a connection configuration have priority over rules set manually.

---

#### Note

##### Detailed firewall settings in advanced firewall mode

In advanced firewall mode, you can restrict firewall rules to individual nodes. To change to advanced firewall mode, select the "Activate firewall in advanced mode" check box.

---

## Updating connection rules

Changes to the connection configuration of CPs also change the connection-related firewall rules. To display the modified firewall rules, click the "Update connection rules" button. The modified firewall rules are then displayed in advanced firewall mode.

## Configuring a firewall with predefined firewall rules - CP 1543-1

## Configuring a firewall with predefined IP rules - CP 1543-1

### How to access this function

1. Select the module to be edited.
2. In the local security settings, select the entry "Firewall" > "Predefined IP rules".

Table 8-48 Available services and directions

Service	From external to station	Enabled ports	Meaning
Allow IP communication	x	All	IP traffic from external to station is allowed.
Allow S7 protocol	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/FTPS (explicit mode)	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow HTTP	x	TCP port 80	For communication with a Web server.
Allow HTTPS	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow SNMP	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow SMTP	x	TCP port 25	For sending e-mails via an SMTP server.
Allow security diagnostics	x	TCP port 8448	Allow/do not allow security diagnostics.

Table 8-49 Logging

Option	Action when activated	Relevant firewall rule		
		Action	From	To
<b>IP log settings</b>				
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

**Note**

**Relationship between log settings in default mode and firewall rules**

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

**Configuring a firewall with predefined IPv6 rules - CP 1543-1**

**Meaning**

With the predefined IPv6 rules, you have the option of configuring the firewall for services in which IPv6 is used. By enabling a predefined IPv6 rule in the local security settings of the CP 1543-1 V1.1, the system-defined ICMPv6 services that can be seen in the global security settings in the "ICMP" tab in "Firewall" > "Services" > "Define services for IP rules" are also enabled in the firewall. The firewall of the CP 1543-1 V1.0 allows ICMPv6 packets through even without enabling a predefined IPv6 rule.

**How to access this function**

1. Select the module to be edited.
2. Select the "Firewall" > "Pre-defined IPv6 rules" item in the local security settings.

Table 8-50 Available services and directions

Service	From external to station	Enabled ports	Meaning
Allow IP traffic	x	All	IP traffic from external to station is allowed.
Allow S7 protocol	x	TCP port 102	Communication of the nodes using the S7 protocol is allowed.
Allow FTP/FTPS (explicit mode)	x	TCP port 20 TCP port 21	For file management and file access between server and client.
Allow HTTP	x	TCP port 80	For communication with a Web server.

Service	From external to station	Enabled ports	Meaning
Allow HTTPS	x	TCP port 443	For secure communication with a Web server, for example, for Web diagnostics.
Allow SNMP	x	TCP port 161/162 UDP port 161/162	For monitoring nodes capable of SNMP.
Allow SMTP	x	TCP port 25	For sending e-mails via an SMTP server.
Allow security diagnostics	x	TCP port 8448	Allow/do not allow security diagnostics via IPv6.

Table 8-51 Logging

Option	Action when activated	Relevant firewall rule		
IP log settings		Action	From	To
Log tunneled packets	Only active if the security module is a member of a VPN group. All IP packets transferred via the tunnel are logged.	Allow	Station	Tunnel
		Allow	Tunnel	Station
Log blocked incoming packets	All incoming IP packets that are discarded are logged.	Drop	External	Station

**Note****Relationship between log settings in default mode and firewall rules**

Log settings made in "Predefined IPv6 rules" have no effect on firewall rules that were automatically generated as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

**Configuring a firewall with predefined MAC rules - CP 1543-1****How to access this function**

1. Select the module to be edited.
2. Select the entry "Firewall" > "Predefined MAC rules".

Table 8-52 Available services and directions

Service	From station to external	From external to station	Enabled ports	Meaning
Allow MAC communication	x	x	-	The MAC traffic from external to the station and vice versa is allowed.
Allow ISO protocol	x	x	-	ISO traffic from external to the station and vice versa is allowed.
Allow SiCLOCK	x	x	-	SiCLOCK traffic from external to the station and vice versa is allowed.

Table 8-53 Logging

Option	Action when activated	Relevant firewall rule		
		Action	From	To
MAC log settings				
Log blocked incoming packets	All incoming MAC packets that are discarded are logged.	Drop	External	Station
Log blocked outgoing packets	All outgoing MAC packets that are discarded are logged.	Drop	Station	External

**Note**

**Relationship between log settings in default mode and firewall rules**

Log settings that are made in "Predefined IP rules" and "Predefined MAC rules" have no effect on firewall rules that were automatically created as a result of configuring a connection. This means, for example, that tunneled frames belonging to a configured connection cannot be logged. In advanced firewall mode, logging can be extended to the automatically generated firewall rules of connections.

**IP packet filter directions S7-1500 CPs**

**Meaning**

Possible selections for the communication directions "From" and "To" in the IP rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Meaning
From	To	
External	Station	Access from the external network to the station.
Station	External	Access from the station to the external network.
	Tunnel	Access from the station to VPN tunnel partners.*
Tunnel	Station	Access by VPN tunnel partners to the station.*

\* Not for the CP 1543-1 V1.0.

### MAC packet filter directions S7-1500 CPs

#### Meaning

Possible selections for the communication directions "From" and "To" in the MAC rules of the advanced firewall mode.

The following directions are available

Available options / ranges of values		Meaning
From	To	
External	Station	Access from the external network to the station.
Station	External	Access from the station to the external network.
	Tunnel	Access from the station to VPN tunnel partners.*
Tunnel	Station	Access by VPN tunnel partners to the station.*

\* Not for the CP 1543-1 V1.0.

### Connection-related automatic firewall rules

#### Meaning

For connections that were configured using CPs, STEP 7 automatically creates firewall rules that allow communication with the partner of the CP in the specified direction (CP active/passive). The connection establishment directions are taken into account. To display these firewall rules, if the advanced firewall mode is enabled, the "Update connection rules" button needs to be clicked. The firewall rules are then displayed in advanced firewall mode.

---

#### Note

##### Enabling UDP multicast and UDP broadcast connections manually

No automatic firewall rules are created for UDP multicast and UDP broadcast connections. To enable the connections, add the relevant firewall rules manually in advanced firewall mode.

---

8.1 Configuring devices and networks

Depending on how the connection establishment is configured, the following level 3 firewall rules are created. If the CP 1543-1 V1.1 is in a VPN group, the direction "External" changes to "Tunnel".

The IP address of the connection partner is entered in the "Source IP address" or "Destination IP address" column of these firewall rules.

CP->external	Action	From	To
active	Drop	External	Station
	Allow	Station	External
passive	Drop	Station	External
	Allow	External	Station
active and passive	Allow	External	Station
	Allow	Station	External

For level 2 connections, "Allow" rules are created for both directions. If the CP 1543-1 V1.1 is in a VPN group, the direction "External" changes to "Tunnel".

The MAC address of the connection partner is entered in the "Source MAC address" or "Destination MAC address" column of these firewall rules.

CP->external	Action	From	To
active, passive, active and passive	Allow	Station	External
	Allow	External	Station

**Note**

**Changing the connection configuration**

Changes to the connection configuration of CPs also change the connection-related firewall rules. To display the modified firewall rules, click the "Update connection rules" button.

**Conventions for automatically created firewall rules**

- **Priority**  
The rules have highest priority and are therefore inserted at the top in the local rule list.
- **Deleting rules**  
The rules cannot be deleted. Logging can be enabled and services can be assigned. Moreover, you may insert a bandwidth and a comment.
- **Changing the action**  
If you set the action from "Allow" to "Drop" or vice versa, this is overwritten again during renewed system synchronization. Select "Allow\*" or "Drop\*" to retain your changes. In this case, only the IP address is synchronized and the action and direction remain as set. Settings for logging, service, bandwidth and comment are also retained after a renewed system synchronization even without changing the action to "Allow\*" or "Drop\*". If the configured connection is deleted, the corresponding rules are removed from the list.

## Security module in VPN group

As default, the "Tunnel communication only" check box is enabled. If you deselect the check box, in addition to tunnel communication between tunnel partners, communication is also possible with devices to which there is no tunnel.

- Communication is untunneled if the partner address belongs to a station known in STEP 7 for which no VPN tunnel is configured.
- Communication is through the tunnel if the partner address is a VPN endpoint.
- If it is not clear whether connection should bypass or run through the VPN tunnel, the connection is assigned to the VPN tunnel and a message to this effect is displayed. The assignment can be adapted in advanced firewall mode, for example, by changing the "From" direction "Tunnel" to "External". To avoid this adaptation being overwritten by the next system synchronization, the "Allow\*" or "Drop\*" action must be selected.

---

### Note

If you want to ensure that only communication through the tunnel is possible, you will need to create suitable firewall rules in advanced firewall mode.

To allow only tunneled communication for a CP, add a "Drop" > "Any" > "External" rule. In addition to this, you need to remove existing firewall rules that allow untunneled communication.

---

## 8.1.4 Creating configurations

### 8.1.4.1 Information about the web server

#### Introduction

The web server lets you monitor and administer the CPU through authorized users by means of a network. This permits evaluation and diagnostics over long distances. All you need is a web browser.

Alarms and status information are visualized on HTML pages.

#### Web browser

You need a web browser to access the HTML pages of the CPU.

The following web browsers have been tested for communication with the CPU:

- Internet Explorer (Version 8)
- Mozilla Firefox (Version 21)
- mobileSafari (iOS5)

## Web access to the CPU via PG/PC

Proceed as follows to access the web server:

1. Connect the client (PG/PC) to the CPU via the PROFINET interface.
2. Open the web browser.  
Enter the IP address of the CPU in the "Address" field of the web browser in the format `http://ww.xx.yy.zz` (example: `http://192.168.3.141`).  
The start page of the CPU opens. From the start page, you can navigate to further information.

## Additional information

Additional information about the web server of the various CPU families is available under the key word "Web server" in the information system.

Information on creating your own web pages for access to the CPU is available under the keyword "User-defined web pages" in the information system.

## 8.1.4.2 Things you should know about PROFIBUS DP operating modes

### Introduction

DP master systems that consist of a DP master and DP slaves which are connected via a bus and communicate with one another via the PROFIBUS DP protocol are referred to as distributed I/O.

Below, we refer to communication-capable modules with DP interface that can take on the role of DP master or DP slave.

### "DP master" and "DP slave" option

Communication-capable modules, such as CPUs with DP interface and CPs or CMs with DP interface, have the area "Mode" in their module properties.

For S7-300 CPUs with integrated DP interface, for example, you can set the mode "DP master" and "DP slave". A CPU or a CP that is configured as DP slave is also referred to as intelligent DP slave (I-slave).

For S7-1500 CPUs with integrated DP interface, only the "DP master" mode is possible. To operate S7-1500 CPUs as I-slave, you have to insert the communication module CM 1542-5 and configure it as DP slave.

S7-1200 CPUs do not have integrated DP interfaces. To operate an S7-1200 as DP master or DP slave, you must insert a communication module CM 1243-5 (DP master only) or a communication module CM 1242-5 (DP slave only; I-slave).

### **Additional information**

Additional information on distributed I/O is available under the key word "Distributed I/O" and "I-slave" in the information system.

### **8.1.4.3 Configuring automation systems**

#### **Addressing modules**

#### **Addressing modules**

#### **Introduction**

In the device overview, you see the addresses or address ranges of the modules in the I address and Q address columns. There are other addresses as well, which are explained below.

#### **I/O address**

I/O addresses (input/output addresses) are required to read inputs and set outputs in the user program.

Input and output addresses are assigned automatically when modules are inserted in the rack. The address of the first channel is the start address of a module. The addresses of the other channels are derived from this start address. The address end is obtained from the module-specific address length.

#### **Device address (e.g., Ethernet address)**

Device addresses are addresses of programmable modules (Industrial Ethernet addresses). They are required to address the different stations of a subnet, for example, to download a user program to a CPU.

#### **Hardware identifier for identifying modules and submodules**

In addition to the I addresses and Q addresses, a hardware identifier (HW ID) is assigned automatically and is used to address and identify the module. Submodules (units of a module), such as an integrated counter, also receive such a hardware identifier.

The hardware identifier consists of an integer and is output by the system with diagnostics alarms to allow the faulty module or the faulty submodule to be localized.

In addition, the hardware identifier is used for a number of instructions to address the corresponding module.

The hardware identifier cannot be changed.

Example: Identifying high-speed counters of the S7-1200 CPU

The hardware identifier is assigned automatically when components are inserted in the device or network view and in the PLC tags. A name is also assigned automatically for the hardware identifier. The system constants of the PLC tags cannot be changed either.

Specifying input and output addresses (Page 724)

Assigning addresses to a location in the program (Page 725)

Introduction to loading a configuration (Page 991)

Inspector window (Page 455)

### Specifying input and output addresses

Default input and output addresses are set automatically. You can, however, change the address assignment later.

All addresses of modules are located in the process image area. The process image is automatically updated cyclically.

### Requirement

You are in the device view.

### Procedure

To change the preset address range proceed as follows:

1. In the device view, click on the module for which you want to set the start address.
2. Go to "I/O addresses" in "Properties" in the inspector window.
3. Under "Start address" enter the required start address.
4. Press <Return> or click on any object to accept a modified value.

If you have entered an invalid address, a message indicating the next available address is displayed.

---

**Note**

You can also change the addresses directly in the device overview.

---

**See also**

Editing properties and parameters (Page 481)

Input and output addresses in the address overview (Page 483)

**Assigning addresses to a location in the program**

You can assign addresses of the I/O channels of modules directly to the points of use in the program or to a tag table.

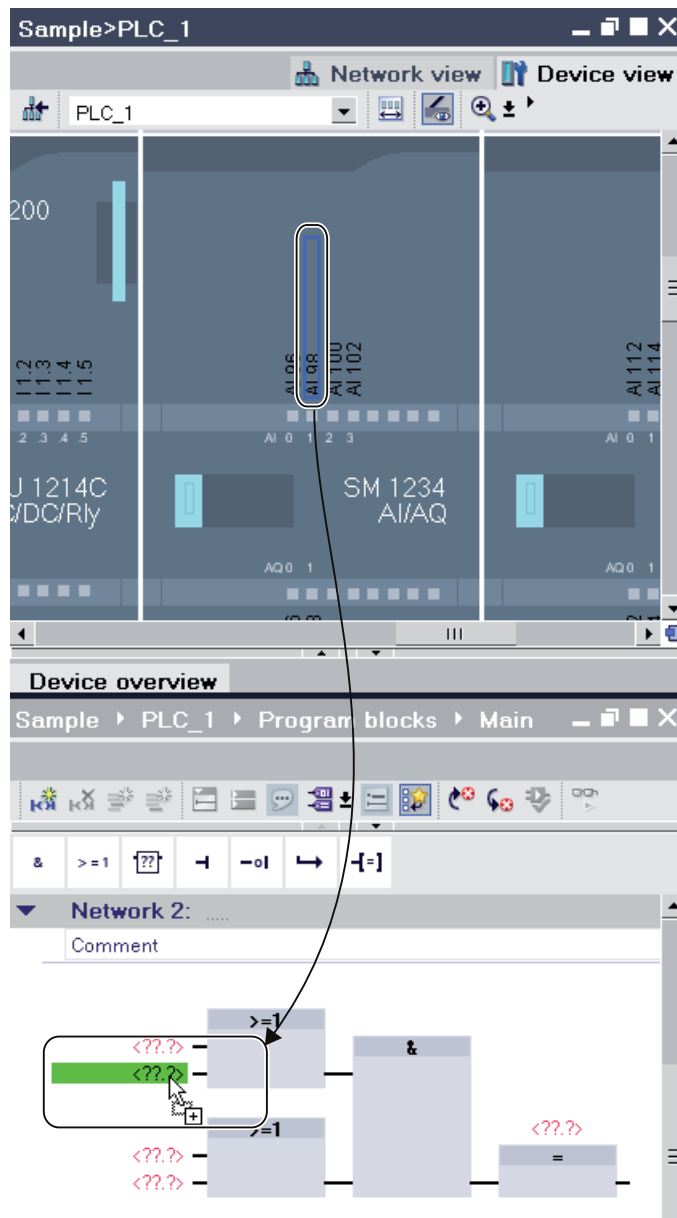

**Requirement**

- The device view of the hardware and network editor is open.
- The zoom level in the device view must be set to at least 200% to allow you to see the individual I/O channels.
- The instruction window of the programming editor or a tag table is open.

Procedure

To assign I/O channels of modules to the points of use in the program or to a tag table, follow these steps:

1. In the device view, navigate to the module with the desired I/O channel.
2. Click and hold down the mouse button to drag the desired I/O address to the corresponding point of use of the block or to the tag table.

The address of the module is assigned to the point of use in the program or entered as a tag in the tag table.

---

**Note**

The tag for an input or output of a block can also be dragged to the input or output of a module in order to link the tag to the I/O channel of the module.

---

## Signal board

### Inserting a signal board in a CPU

#### Introduction

Signal boards allow you to increase the number of the S7-1200 CPU's own inputs and outputs. Just like all other hardware components, you will find signal boards in the hardware catalog. However, you do not insert signal boards in the rack like other modules but directly in a slot of the CPU itself.

Note the following points when using a signal board:

- Each CPU can have only one signal board inserted in it.
- A signal board can only be inserted when the slot in the CPU is free.

There are various ways of inserting a signal board in a CPU:

- Double click on a signal board in the hardware catalog when there is a free slot in the CPU
- Drag from the hardware catalog to a free slot in the CPU
- Shortcut menu of a signal board in the hardware catalog for copying and pasting

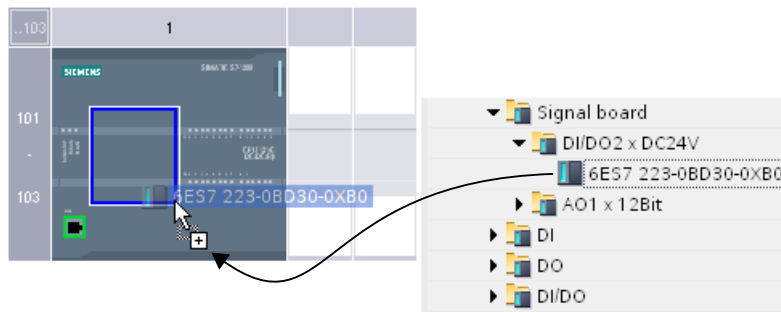

#### Requirement

- The hardware catalog is open.
- The S7-1200 CPU has a free slot for the signal board.

### Inserting a signal board in a CPU

To insert a signal board in a CPU, proceed as follows:

1. Go to the required signal board in the hardware catalog.
2. Select the signal board you want to use.
3. Drag the signal board to the free slot in the CPU.

You have now inserted a signal board in the slot of the CPU.

If you are in the network view, you can also drag a signal board to a device. If the CPU has an empty slot for a signal board, the signal board is inserted automatically into this slot.

### Configurations for Web server

#### Information about the web server

##### Introduction

The web server allows you to monitor the CPU via the Internet or the intranet of your company. This permits evaluation and diagnostics over long distances.

Alarms and status information are visualized on HTML pages.

##### Web browser

You need a web browser to access the HTML pages of the CPU.

The following PC web browsers, for example, are suitable for communication with the CPU:

- Internet Explorer (Version 8.0, 9.0)
- Mozilla Firefox (Version 17.0.1 and higher)
- Google Chrome 23.0
- Apple Safari 5.1.7 (Windows)
- Apple Safari 6.0.2 (Mac)

The following Web browsers of mobile devices are also suitable:

- Internet Explorer 6.0 for HMI Panels
- Mobile Safari (iOS 5.0.1)

- Mobile Android Browser 2.3.4
- Mobile Google Chrome 23.0

### Reading information via the web server

The following information can be read from the CPU. The availability of the respective web pages depends on the CPU and its firmware version.

As of firmware version 4, the web pages are also available in several languages.

Page/information	Description
Intro/Introduction	Entry page for the standard web pages
Start Page Start page with general CPU information	The start page provides an overview of general information on the CPU, the name of the CPU, the type of CPU and basic information on the current operating state.
Identification Identification information	Displays the static identification information such as serial number, order number and version numbers.
Diagnostic Buffer Diagnostic information	Displays the content of the diagnostics buffer with the most recent entries first.
Module Information Module information	Displays whether the centrally inserted components of a station are OK, whether there are maintenance requirements or components cannot be reached, for example.  As of firmware version 4 a firmware update is possible via this Web page.
Communication Communication	Displays the communication connections during open communication (OUC); displays resources and address parameters.
Variable Status Tags	Displays the status of operands of the user program to monitor and change the values.
Data Logs (File Browser as of firmware version 4)	Data logs in CSV format to transfer to the hard disk of the programming device. The data logs are created with data log instructions in the user program and filled with data.  As of firmware version 4 you have access to files of the internal load memory and of the external load memory (Memory Card), for example to the content of the directory "DataLogs" and "Recipes" via the Web page "File Browser".
User Pages User pages (if user-defined web pages have been configured and loaded)	The user web pages deliver a list of web pages with customer-specific web applications.

## Web access to the CPU via PG/PC

Proceed as follows to access the web server:

1. Connect the client (PG/PC) to the CPU via the PROFINET interface.
2. Open the web browser.  
Enter the IP address of the CPU in the "Address" field of the web browser in the format `http://ww.xx.yy.zz` (example: `http://192.168.3.141`).  
The start page of the CPU opens. From the start page, you can navigate to further information.

## See also

S7-1200 web server (<http://support.automation.siemens.com/WW/view/en/36932465>)

## Standard web pages

### Requirements for web access

The requirements for access to standard CPU web pages are explained in the following, as well as the effects of missing or existing configuration information.

### Requirement

The web server must be started.

The web server only starts when it has been activated in the properties of the CPU in the "Web server" section.

Note the following:

The web pages are normally transmitted via an non-secure connection and are not secured against hacker attacks. If you want to transfer the web pages in encrypted form to the browser, use the URL `https://`, followed by the IP address of the CPU.

### Logon

No logon is required to access the standard web pages read-only. A user must be logged on to execute certain actions like changing the operating mode of the CPU or for write access.

#### For S7-1200 CPUs up to FW version V3:

You must be logged on as "admin" for the actions listed above. The logon input boxes are on the top left of each standard web page.

The image shows a small rectangular logon form with a light blue background. It contains two input fields: the top one is labeled "Name" and the bottom one is labeled "Password". To the right of the "Password" field is a blue button with the text "Log in" in white.

If you log on as "admin", you must enter the user name and password there.

Name: admin.

Password: configured CPU password (for password-protected CPU).

**For S7-1200 CPUs as of FW version 4:**

You can freely select the names of users and the passwords (CPU parameter "Web server", area "User management").

You assign rights to the users, for example the right to query diagnostics or to update the firmware.

### **JavaScript and cookies**

The standard web pages use JavaScript and cookies. You must enable both in your web browser.

If JavaScript is not enabled, the following limitations apply:

- Data from standard web pages is not automatically updated.
- You cannot log on as user.
- Fields cannot be sorted (module information)

If cookies are not enabled, you cannot log on.

### **See also**

Access for HTTPS (Page 732)

### **Settings for operation**

#### **Settings for operation**

To be able to use the web server of an S7-1200-CPU, you must select the CPU in the network view or the device view and make the following settings in the inspector window under "Properties > General > Web server":

- Enable the web server
- Restricting access to the CPU to HTTPS transmission protocol (encrypted transmission)  
Access via port 80 is then blocked. Communication is only possible via port 443.

- Enabling automatic update of web pages  
The update interval is set by default and cannot be changed. The CPU updates web pages with changing content (for example, status information or diagnostics information) at regular intervals.
- Creating and managing users  
Users are exclusively entitled to options that are assigned to the access rights. Depending on the CPU and firmware used, you can assign different user rights. Rights that your CPU does not support cannot be activated. A user called "Everybody" with minimal access rights, that you can, however, extend, is set by default in the user list. A user who uses the Web server without entering a password has "Everybody" user rights. You have the possibility of configuring further users with different access rights. These users have to log on with the configured user name and password.

**WARNING**

**Unauthorized access to the CPU by means of the Web server**

Unauthorized access to the CPU or the changing of PLC variables to invalid values can result in interruptions of the processes controlled by the CPU and cause death, serious bodily harm or material damage!

Since the activation of the Web server allows authorized persons for example to change operating modes, to write-access CPU data or to update the firmware, we recommend that the following security measures be taken:

- If possible limit access to the HTTPS protocol.
- Create users with secure passwords. An example of a secure password is one which is only used for a single application, is more than 8 characters long, and consists of lower- and upper-case letters as well as symbols and numbers (?!+%\$1234...). In addition, passwords based on common keyboard sequences or words from the dictionary should be avoided.  
Change the password at regular intervals.
- Do not extend the rights of the "Everybody" user.
- Check the PLC variables in the user program and limit the range of values to permissible ranges since users can set invalid values via the Web server.

## Access for HTTPS

### Access via HTTPS

HTTPS is used for encrypting and authentication of communication between the browser and web server.

To transfer data between the browser and the CPU using the HTTPS protocol, enter the URL as `https://ww.xx.yy.zz` in the address line of your browser, whereby `ww.xx.yy.zz` stands for the IP address of the CPU.

You require a valid, installed certificate for error-free HTTPS access to the CPU.

If no certificate is installed a warning is displayed with a recommendation not to use this page. To view the page you must explicitly "Add exception".

You can receive a valid certificate (Certification Authority) "SIMATIC CONTROLLER" as a download from the "Intro" web page under "Download certificate". The help function for your respective web browser provides information on how to install a certificate.

### Accessing data of the CPU memory

You can access data in the internal or external CPU load memory by means of a standard web page.

- Use the web page "Data logs" for S7-1200 CPUs up to and including FW version 3. From this web page, you transfer the data logs from the CPU to a drive on your PC.
- Use the web page "File Browser" for S7-1200 CPUs as of FW version 4. From this web page, you transfer data from the folders "Data logs" or "Recipes", for example, to a drive on your PC.

Depending on the file type and the access permissions you have configured for the web server user, you can download, delete, rename or upload the files. The actual directories can only be created, deleted or renamed.

### Example: Data logs

To open a data log, click on the link of the desired data log. You can then open the file (.csv), for example, in Microsoft Excel or in another program you choose or you can save the file.

Special note: Data logs are saved in U.S. American CSV format. You can only open the file directly using the U.S. version of Microsoft Excel. If you are using another national version of Microsoft Excel, you must import the file, selecting "comma" in the import assistant as the delimiter.

### Downloading a data log

To download a data log, click on the download icon of the desired data log. You can then open the file (.csv), for example, in Microsoft Excel or in another program you choose or you can save the file.

### Downloading and clearing or deleting a data log

For a CPU with FW version up to V3.0:

To download and delete the current entries of the data log, you must be logged on. To do this, click on the "Download and delete" icon of the required data log. You can then open the file (.csv), for example, in Microsoft Excel or in another program you choose or you can save the file.

For a CPU as of FW version V4.0:

To reset the data log, follow these steps:

1. Open the CSV file, for example with Excel.
2. Delete the rows between the headline and the row with the entry "//END", if this row exists.

3. Save the file to a drive on your PC.
4. On the web page "File Browser", delete the data log (which means the CSV file) and load the prepared CSV file to the CPU with the "Upload file" button of the "File Browser" web page.

Additional information is available in the S7-1500 CPU system manual.

## Create and download user-defined websites

### What you need to know about user-defined web pages

#### Concept

The concept of user-defined web pages allows you to access freely-designed web pages of the CPU from a web browser. The web server of the CPU provides this function.

You are not dependent on special tools for the design and functionality of the user-defined web pages. You can adapt the pages in the layout with CSS, provide dynamic content with JavaScript or use any framework to produce web pages.

The totality of files processed by the web server is also referred to as the "web application".

#### Web application and user program

Using HTML code in user-defined web pages, you can also transmit data via a web browser to the user program of the CPU for further processing and can display data from the operand area of the CPU in the web browser.

You can use script instructions (such as Javascript) to optimize your web pages, for example to dynamically change contents or validate user entries.

To synchronize between the user program and the web server, but also to initialize, you must call the WWW (SFC 99) instruction in the user program.

- If no interaction is required between the web application and the user program, for example, if a web page only provides static information, only initialization in the user program is required.
- If a simple data exchange is necessary between PLC tags and tags in web applications, to display the contents of PLC tags or write a value in a PLC tag for example, the syntax for reading and writing tags has to be observed. In this case only an initialization is required in the user program, for example in the startup OB.
- If a further interaction is required between the web application and the user program, you must handle status and control information from the Web Control DB in addition to the synchronization between Web server and user program. This is the case, for example, when user entries are transmitted via the web browser to the web server for evaluation by the CPU. Unlike simple data exchange, the user program directly influences the time at which the requested web page is relayed back to the web browser. In this case, you must be acquainted with the concept of manual fragments and the structure of the Web Control DB.

## Initialization

User-defined web pages are "packaged" in data blocks for processing by the CPU. You must generate appropriate data blocks from the source data (HTML files, images, JavaScript files, etc.) during configuration to be able to download the web application into the CPU. The Web Control DB takes on a special role (default: DB 333). It contains status and control information as well as links to additional data blocks with coded web pages. Data blocks that contain coded web pages are termed "Fragment DBs".

When the data block is downloaded into the CPU, the CPU does not "know" that user-defined web pages are coded inside it. The "WWW" (SFC 99) instruction, for example, in the Startup OB informs the CPU which DB is the Web Control DB. The user-defined web pages can be accessed via a web browser after this initialization.

## Synchronization

If the user program is to exchange data with the user-defined web pages, the WWW (SFC 99) instruction must be used in the cyclic program section.

Examples of interaction between user program and web page:

- Check received data
- Compiling and returning data for web browser making request

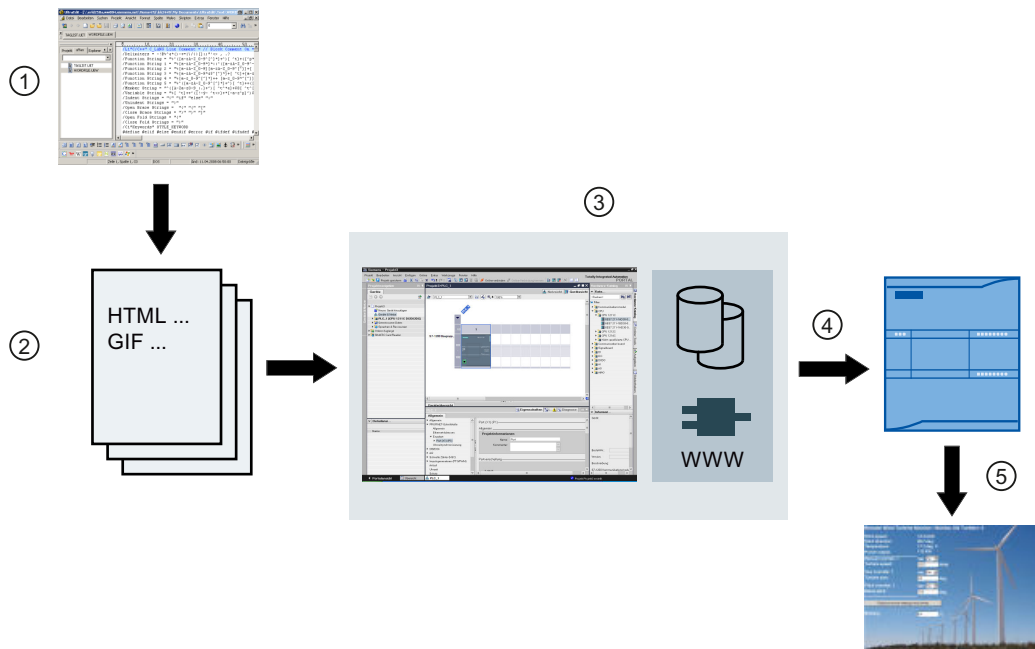

In this case, the status information must be able to be evaluated and control information must be transmitted to the web server, for example, to release a requested web page.

## Procedural overview

### Basic information

This section provides a step-by-step explanation of the basic procedure used to create and download custom web pages and to use them in the operating phase.

The following graphic provides a simplified representation of the process used in creating and displaying custom web pages:

- ① Programming a web application (using suitable tools when required and AWP commands for dynamic pages when applicable).
- ② The web application is comprised of single source files, for example, \*.html, \*.gif, \*.js, etc.
- ③ Using STEP 7:
  - Generate the data blocks (Web Control DB and fragment DBs) from source files. The DBs contain meta information and the complete web application, including the images and the dynamic and static parts of the web application. The DBs are stored under "System blocks" in the project tree.
  - Call the "WWW" instruction in the user program. This instruction initializes the web server of the CPU for a web application.
  - If required, complete final programming for interaction between the web server and user program
- ④ Downloading the blocks to the CPU.
- ⑤ Call the web page in the browser. The web pages of the CPU are called by entering the IP address of the CPU.

### Additional information

You can find additional information and examples relating to the S7-1200 web server on the Internet (<http://support.automation.siemens.com/WW/view/en/36932465>).

### Creating web pages

Web design tools from various companies can be used to create user-defined web pages. As a rule, the web pages should be programmed and designed compliant to the conventions of the W3C (World Wide Web Consortium). No check is made for compliance to W3C criteria in the web server of the CPU.

## Rules

- The tool must be able to directly edit the HTML code so that the AWP command can be inserted into the HTML page.  
Only the AWP commands are parsed in the CPU and, for example, replaced by values from the user program/process image of the CPU.
- Files containing AWP commands must be coded in UTF-8. In the metadata of the HTML page, therefore, set the attribute charset to UTF-8 and save the file UTF-8 coded.
- Files containing AWP commands must not contain the following sequence: `]]`
- Files containing AWP commands must not contain the following sequence outside of the "Tag read ranges" (`:=<Tag name>:`): `:=`  
Tip: Replace the first character of a prohibited sequence with its character coding; for the colon, for example, `&#58;`.

A small example for a custom web page should make clear the basic design.

## Requirement

- The CPU must have a web server and the web server of the CPU must be activated.
- To be able to access PLC tags with write access as a user, you must be logged on as "admin".
- For the example below, PLC tags must be defined for those PLC tags that are to be shown on the web page. This is shown here for the first tab used, "Tank\_below\_max".

	Name	Data type	Address
1	 Tank_below_max	Bool	%I0.0

## Creating user-defined web pages

The following code for an example web page reads values from the process image and provides them in a table.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01//EN" "http://www.w3.org/TR/html4/strict.dtd">
<html>
  <head>
    <meta http-equiv="Content-Type" content="text/html; charset=utf-8">
    <title>Mix</title>
  </head>
  <body>
    <h1>Mix</h1>
    <h2> Actual State </h2>
    <table border="1">
      <tr>
        <th>Variable</th>
        <th>State</th>
      </tr>
      <tr>
        <td>Tank below max</td>
        <td>:="Tank_below_max":</td>
      </tr>
    </table>
  </body>
</html>
```

```
</tr>
<tr>
  <td>Tank above min</td>
  <td>:="Tank_above_min":</td>
</tr>
</table>
</body>
</html>
```

## AWP commands

The interface between a freely-programmable web application for a CPU that has a web server and the CPU data is declared by the AWP command (Automation Web Programming).

To develop web applications you are only subject to the restrictions of the web browser. In one of the programming languages of STEP 7, control with the user program which CPU data is displayed at what time in the web browser of the viewer. Use AWP commands, which you comment within the HTML files, to declare data to be used for intentional interaction between the web application and the user program.

AWP commands are inserted as HTML comments with a special syntax into HTML files; they declare the following features:

- Read PLC tags
- Write PLC tag
- Read special tags
- Write special tags
- Define enum types
- Assign tags to enum types
- Defining fragments
- Import fragments

## Syntax of AWP commands

An AWP command begins with "`<! --AWP_`" and ends with "`-->`". In JavaScript files, the commands should also be enclosed by JavaScript comments ("`/* . . . */`").

## Notation rules for PLC tag names within an AWP command

The AWP commands "AWP\_In\_Variable" and "AWP\_Out\_Variable" contain a name attribute and optionally a use attribute. A PLC tag name is assigned to these attributes, by means of which the PLC tags in the browser are written or read. The following rules apply to handling PLC tag names in HTML code:

- PLC tags must be enclosed in quotation marks ("`...` ").
- PLC tags used in AWP commands must also be enclosed by single quotation marks ("`'...` ") or with quotation marks masked by a backslash ("`\"... \`").

- If the PLC tag name contains the character \ (backslash), this character must be designated with the escape sequence \\ as standard character of the PLC tag name.
- If the PLC tag name in the AWP command is also enclosed by single quotation marks and the single quotation mark (') occurs within the name, it must also be designated as normal character by the escape sequence \'.
- If an absolute address (input, output, bit memory) is used in AWP command, it is enclosed by single quotation marks.

PLC tag	PLC tag in HTML code
"Velocity"	<!-- AWP_In_Variable Name="Velocity" -->
"Velocity\""	<!-- AWP_In_Variable Name="\"Velocity\"" -->
"abc\de"	<!-- AWP_In_Variable Name="abc\\de" -->
"abc'de"	<!-- AWP_In_Variable Name="abc\'de" -->
"abc'de"	<!-- AWP_In_Variable Name="abcde" Use="abc\'de" -->
"DB name".tag	<!-- AWP_In_Variable Name="DB name".tag' -->
"DB name"."tag"	<!-- AWP_In_Variable Name="DB name"."tag" -->
-	<!-- AWP_Out_Variable Name='flag1' Use='M0.0' -->

## See also

Reading tags (Page 739)

Writing tags (Page 741)

Special tags (Page 742)

## Reading tags

User-defined web pages can read PLC tags.

The PLC tag must be specified by a PLC tag name.

These OUT variables (direction of output as viewed from the controller) are inserted at any location within the HTML text with the syntax described in the following.

## Syntax

```
:=<varname>:
```

These references are replaced when the web server is in operation by the current values of the PLC tag in each case.

<varname> can be a simple, global PLC tag but also a complete tag path to a structural element.

### Notation rules for PLC tag names

- PLC tags in HTML code are enclosed by quotation marks ("), if they are defined in the tag table. In the case of data block tags, the name of the data block is enclosed by quotation marks. If special characters are used in the structure elements of the data block, for example the dot (.) or blank, this part must also be enclosed by quotation marks.
- Quotation marks are not used for absolute addresses of inputs, outputs or bit memories.

PLC tag	PLC tag in HTML code
"DB_name".var_name	:= "DB_name".var_name:
"DB_name"."var.name"	:= "DB_name"."var.name":
"memory"	:= "memory":
-	:= I0.0:
	:= Q0.0:
	:= MW100:
	:= %MW100:
"My_Data_Block".flag1	<!-- AWP_Out_Variable Name='flag1' Use="My_Data_Block".flag1' -->
	...
	:= flag1:

- If the PLC tag name contains the character : (colon) or \ (backslash), this character must be designated with the escape sequence \: or \\ as standard character of the PLC tag name.

PLC tag	PLC tag in HTML code
"abc:de"	:= "abc\:de":
"abc\de"	:= "abc\\de":

- Special characters "<, &, >"  
Display problems can occur if these characters are contained in the tag name (for example, "a<b").  
Avoid expressions such as := "a<b": in the HTML page.  
To prevent display problems from occurring, use e.g. an AWP command with a use expression according to the pattern depicted below. The use attribute defines the PLC tag with the problematic character, the name attribute defines the name without problematic character, as it is used in the HTML page.

PLC tag	PLC tag in HTML code
"a<b"	<!-- AWP_Out_Variable Name='simplename' Use="a<b" ' -->
	...
	:= simplename:

### See also

AWP commands (Page 738)

## Writing tags

Custom web pages can write data into the CPU.

This requires an AWP command that identifies the PLC tag to be written.

The PLC tag must also be specified by a PLC tag name.

The IN tags (direction of input as viewed from the controller) are placed on the browser page. This can be done, for example, in a form.

The tags are either set in the HTTP header (by cookie or POST method) or in the URL (GET method) by the browser and are then written by the web server into the respective PLC tag.

## Syntax

To allow the IN tags to be written to the CPU, the tags must first be defined by an explicit AWP instruction:

```
<!-- AWP_In_Variable Name='<PLC_Varname1>' Name='<PLC_Varname2>'
Name='<PLC_Varname3>' -->
```

Several tags can be defined in an instruction - such as that shown above.

The specific PLC tag name is hereby written in double quotation marks; for example  
<PLC\_Varname1> = "myVar".

In cases where the name of the tag that you use for the web application is not identical to the name of the PLC tag, the "Use" parameter can be used to assign to a PLC tag.

```
<!-- AWP_In_Variable Name='<Webapp_Varname>' Use='<PLC_Varname>'
```

## Example

The "AWP\_In\_Variable" AWP command is indispensable when handling forms.

```
<form method='post' action='/awp/appl/x.html'>
  <p>
    <input name='"var1"' type='text'>
    <input value='set' name='Button1' type='submit'>
  </p>
</form>
```

In the form defined above, the HTTP request method "post" is used to transfer the tag "var1" to the web server. The user places the "var1" tag in the form field. The tag 'Button1' has the value 'set', but is not required for the CPU. To allow the "var1" tag to be written to the CPU, the following instruction must be included in the same fragment:

```
<!-- AWP_In_Variable Name='"var1"' -->
```

Since PLC tags are enclosed in double quotation marks ("), the name in the AWP command must be enclosed in single quotation marks (') or in masked quotation marks (\"). To avoid the numerous escape sequences, we recommend the use of single quotation marks.

```
<!-- AWP_In_Variable Name=' "Info".par1' -->
<!-- AWP_In_Variable Name="\ "Info".par1\"" -->
```

### Conditions for write access during operation

The following requirements have to be met in order for a user to be able to write to PLC tags from a user-defined web page.

- The CPU is password protected.
- The user is logged in as "admin".

This rule applies to all writing access to web pages on a CPU.

### See also

Requirements for web access (Page 730)

AWP commands (Page 738)

### Special tags

Special tags are mainly HTTP tags set in the definition of the World Wide Web Consortium (W3C). Special tags are also used for cookies and server tags.

The AWP command to read and write special tags differ only in that they have additional parameters than the AWP command used to read and write normal tags.

### Reading a special tag

The Web server can read PLC tags and transfer these to special tags in the HTTP Response Header. You can, for example, read a URL for a diversion to another web page and transfer to the special tag HEADER:Location using the special tag HEADER:Location.

The following special tags can be read:

Name	Description
COOKIE_VALUE:name	Value of cookie with name: "name"
COOKIE_EXPIRES:name	Execution time of cookie with name: "name" in seconds (must be set beforehand).
HEADER:Status	HTTP status code (if no other value has been set, status code 302 is returned).
HEADER:Location	Path for forwarding to another page. Status code 302 must be set.
HEADER:Retry-After	Anticipated time in which the service is not available. Status code 503 must be set.
HEADER: ...	All other header tags can also be forwarded in this way.

Use the AWP command "AWP\_Out\_Variable" to specify which PLC tags are to be transferred in the HTTP header to the web browser.

Basic structure:

```
<!-- AWP_Out_Variable Name="<Typ>:<Name>" [Use="<Varname>"] -->
```

### Parameter description

- Name: Type and name of special tag
- Use (optional parameter): In cases where the name of the special tag is not identical to the name of the PLC tag, parameter "Use" can be used to assign to a PLC tag.

Example:

```
<!-- AWP_Out_Variable Name="COOKIE_VALUE:siemens" Use="'info'.language' -->
```

### Writing a special tag

In principle, all HTTP tags written in the HTTP header by the web browser can be evaluated by the user program of the CPU. Examples of tag types:

Name	Description
HEADER:Accept-Language	Accepted or preferred language
HEADER:Authorization	Proof of authorization for a requested resource
HEADER:Host	Host and port of the requested resource
HEADER:User-Agent	Information on the browser
HEADER: ...	All other header tags can also be forwarded in this way
SERVER:current_user_id	Indicates whether a user is logged on (current_user_id=0: no user logged on)
SERVER:current_user_name	User name of the user logged on
SERVER:GET	Request method is GET
SERVER:POST	Request method is POST
COOKIE_VALUE:name	Value of cookie with name: "name"

The AWP command "AWP\_In\_Variable" is used to define which special tags are to be evaluated in the user program of the CPU.

Basic structure:

```
<!-- AWP_In_Variable Name="<Typ>:<Name>" [Use="<Varname>"] -->
```

Parameter description:

Name: Type and name of special tag

Use (optional parameter): In cases where the name of the special tag is not identical to the name of the PLC tag, the parameter Use can be used to assign to a PLC tag.

## Examples:

```
<!-- AWP_In_Variable Name="COOKIE_VALUE:siemens" Use='"info".language' -->
```

The tag name in the HTTP header is replaced by the PLC tag name specified by Use . The cookie is written to the PLC tag "info".language .

```
<!-- AWP_In_Variable Name='COOKIE_VALUE:siemens' Use='"info".language' -->
```

The tag name in the HTTP header is replaced by the PLC tag name specified by Use. The cookie is written to the PLC tag "info".language .

```
<!-- AWP_In_Variable Name='"COOKIE_VALUE:siemens"' -->
```

The HTTP-header variable is written in the same-name PLC variable.

AWP commands (Page 738)

## Enumeration types

### Enumeration types (enums)

Numerical values from the PLC program can be converted into text and vice versa using enums. The numerical values can also be assigned for several languages.

### Creating enums

Enter an AWP command using the following syntax at the start of the HTML file:

```
<!-- AWP_Enum_Def Name="<Name of the enum type>"  
Values='0:"<Text_1>", 1:"<Text_2>", ... , x:"<Text_x>"' -->
```

For example, for German values to be saved as an HTML file in the "de" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"an", 1:"aus", 2:"Störung"' -->
```

For example, for English values, to be saved as an HTML file in the "en" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"on", 1:"off", 2:"error"' -->
```

## Assigning enums

Tags are assigned from the user program to the individual enum texts using a special AWP command:

```
<!-- AWP_Enum_Ref Name="<VarName>" Enum="<EnumTypeName>" -->
```

<VarName> is thereby the symbolic name from the user program and <EnumTypeName> is the previously set name of the enum type.

---

### Note

In each fragment in which enum texts are referenced by a PLC tag, this PLC tag must be assigned by the appropriate AWP command of the enum type name.

Ensure that no AWP command for importing fragments is positioned between an enum assignment and enum usage because this import can result in the enum assignment lying in a different fragment than the enum usage.

---

## Example

Enum type "state" is defined with values "0" and "1". "0" means "off", "1" means "on":

```
<!-- AWP_Enum_Def Name="state" Values='0:"off", 1:"on"' -->
```

The following code is contained in the HTML code of the web page to be output:

```
<!-- AWP_Enum_Ref Name="operating state" Enum="state" -->  
:=operating state:
```

Depending on the value of the "operating state" tag, the result displayed is no longer "0" or "1", but "off" or "on".

## Simplified use of enumeration types

At S7-1200 CPUs as of firmware version 4 it is possible to use enumerations directly in AWP commands to read and write PLC variables.

You create enums as described in the previous section, and you can then utilize the values with user program read and write commands.

### Creating enums

```
<!-- AWP_Enum_Def Name="<Name des Enum Typs>" Values='0:"<Text_1>",&br/>1:"<Text_2>",&br/>... , x:"<Text_x>"' -->
```

### Utilizing enums in the user program read and write commands

```
<!-- AWP_In_Variable Name='<Varname>' Enum="<EnumType>" -->  
<!-- AWP_Out_Variable Name='<Varname>' Enum="<EnumType>" -->
```

### Example of reading PLC tags

```
<!-- AWP_Enum_Def Name='AlarmEnum' Values='0:"No alarms", 1:"Tank is  
full", 2:"Tank is empty"' --><!-- AWP_Out_Variable Name=' "Alarm" '  
Enum="AlarmEnum" -->...<p>The current value of "Alarm"  
is := "Alarm":</p>
```

If the value of "Alarm" in the CPU is "2", the following text will be displayed on the HTML page:

'The current value of "Alarm" is Tank is empty' because the enum definition assigns the string "Tank is empty" to the numerical value 2.

### Example of writing PLC tags

```
<!-- AWP_Enum_Def Name='AlarmEnum' Values='0:"No alarms", 1:"Tank is  
full", 2:"Tank is empty"' --><!-- AWP_In_Variable Name=' "Alarm" '  
Enum='AlarmEnum' -->...  
<form method="POST">  
<p><input type="hidden" name=' "Alarm" ' value="Tank is full" /></p>  
<p><input type="submit" value='Set Tank is full' /></p>  
</form>
```

Because the enum definition assigns the string "Tank is full" to the numerical value "1", the value "1" is written to the PLC tag "Alarm".

## Definition of fragments

### Fragments

Fragments are "logical sections" of a web page to be processed by the CPU individually.

Fragments are usually complete pages but can also be individual elements such as files (for example, images) or complete documents.

## Defining fragments

```
<!-- AWP_Start_Fragment Name="<Name>" [Type="<Type>"] [ID="<Id>"]  
[Mode="<Mode>"]-->
```

The start of a fragment is specified by this command. A fragment runs to the start of the next fragment or to the end of the file.

- **<Name>** Indicates the name of the fragment.  
The name must start with a letter [a-zA-Z] or an underscore ( \_ ). Letters, underscores or numbers [0-9] can follow after this first character.
- **<Type>** Indicates the type of the fragment.
  - "manual" The user program is informed of the request for a fragment; the web page to be returned can be changed by the user program.
  - "automatic" The page is automatically processed (default).
- **<id>** A numeric ID can be stipulated for the fragment. If no ID is assigned, the fragment is automatically assigned an ID. For manual pages (<Type>=manual) , the fragment can be addressed in the user program of the CPU by this ID.

---

### Note

Keep the ID low because the highest ID influences the size of the Web Control DB.

---

- **<Mode>** Fragments support the visible and hidden modes.
  - "visible" The fragment is a part of the web page. This mode is preset and can also be omitted.
  - "hidden" The fragment is not part of the web page. However, the fragment will be saved in the Web DB and is available to the user program for inserting in a requested web page. You use an exchange of the fragment ID (Web-Control-DB.fragment\_index tag) to insert a "hidden" fragment in the requested web page.

The input document is completely divided into fragments by the "AWP\_Start\_Fragment" command. "AWP\_End\_Fragment" is therefore unnecessary.

Without a start fragment command, a file is mapped as a fragment; the fragment name is derived from the file name. If a file is divided into several fragments (by "AWP\_Start\_Fragment"), the file must begin with the "AWP\_Start\_Fragment" command.

## Importing fragments

You can declare a fragment in an HTML page and import this fragment into other web pages.

## Example

A company logo is to be displayed on all web pages of a web application.

There is only one instance of the HTML code for the fragment that displays the company logo. You can import the fragment as often and into as many HTML files as required.

## Syntax

```
<!-- AWP_Import_Fragment Name = "<name>"-->
```

- <name> is the name of the fragment to be imported.

## Example

HTML code within a web page that declares a fragment:

```
<!-- AWP_Start_Fragment Name = "My_Company_Logo"-->  
<p><img src = "compay_logo.jpg"></p>
```

## Example

HTML code within another web page that imports the declared fragment:

```
<!-- AWP_Import_Fragment Name = "My_Company_Logo"-->
```

## Creating and loading a data block

### Requirement

- All source files required for the web application (\*.html, \*.js, \*.png, ...) have been created.
- The source files are located in one folder, but only those source files that are required for the web application. No other files may be located in this folder.

---

### Note

#### Length of file names and tag names

If you have a comprehensive web application with many files and directories, the generation of the web data blocks may possibly fail. If this happens, the generation is aborted with the message "Text list overflow...". The cause is system-internal size limitations for management information saved in the web data block.

Remedy: Use short file names and short tag names.

---

## Procedure

To create data blocks from the source files for user-defined web pages in STEP 7, proceed as follows:

1. Select the CPU, for example, in the device configuration.
2. Select the properties for user-defined web pages in the inspector window under "Properties > General > Web server".
3. As "HTML source", select the folder that contains the source files for the web application.
4. Enter the HTML page to be opened on starting the web application as the start HTML page.
5. Enter a name for the application if required.
6. You can supplement a range of file name extensions as "Files with dynamic content" if necessary. Only enter those file name extensions that also contain AWP commands.
7. The number for the Web Control DB and for the fragment DB start number can be kept as long as they are not already being used by your user program.
8. Click on the "Generate" button to create DBs from the source files.  
The generated data blocks are saved in the project navigation in the "System block" folder (in the "Web server" subfolder).
9. In the CPU, select the network view to be loaded and then select the "Download to device" command in the "Online" menu to download the blocks. Compilation of the blocks is implicitly initiated before downloading.  
If errors are reported during this process, you must correct these errors before you can download the configuration.

## Structure of the PLC program

Your user program must call the "WWW" instruction to even allow the web application, for example, the user-defined web pages, to be available to the CPU on the standard web pages and to allow them to be called up there.

The Web Control DB you have created from the source files is the input parameter (CTRL\_DB) for the "WWW" instruction. The Web Control DB references the content of the user-defined web pages coded in the fragment DB and then receives status and control information.

## Calling the "WWW" instruction in the startup program

If you do not want the user program to influence requested web pages, it is sufficient to only call the "WWW" instruction once in a startup OB. This instruction initializes communication between the web server and the CPU.

## Calling the "WWW" instruction in the cyclic program

The "WWW" instruction can also be called in an OB processed in cycles (for example, OB 1). This has the advantage of being able to respond to web server requests from within the user program. Manual fragments must be used for this.

In this case, you must evaluate information from the Web Control DB in order to identify the requested web page or the requested fragment. On the other hand, you must set a bit in the

user program in order to explicitly release the web page to be returned by the web server after processing the web page request.

The structure of the Web Control DB is described in the following section.

### Web Control DB

The Web Control DB (DB 333 by default) is created by STEP 7 and contains information on the structure of user pages, the status of communication and any errors that occur.

Additional fragment DBs are also created as well as the Web Control DB. These fragment DBs (there may also only be one fragment DB) are referenced in the Web Control DB. The fragment DBs contain the web pages and media data coded in fragments, for example, images. The content of the fragment DB cannot be changed by the user program. It is created automatically and is only for data management.

The status and control tags of the Web Control DB are accessed via symbols.

The following lists the tags of the Web Control DB required for status evaluation and to control interaction.

The Web Control DB provides two types of information:

- Global status information: Not bound to a concrete web page request.
- Request status and control information: Information about queued requests.

### Global status information

"WEB-Control_DB".commandstate.init	Activates and initializes the web application.
"WEB-Control_DB".commandstate.deactivate	Deactivates the web application.
"WEB-Control_DB".commandstate.initializing	The web application is initialized (read Web Control DB, etc.).
"WEB-Control_DB".commandstate.error	Web application could not be initialized. The reason is coded in "WEB-Control_DB".commandstate.last_error .
"WEB-Control_DB".commandstate.deactivating	The web application is closed.
"WEB-Control_DB".commandstate.initialized	The web application has been initialized and is ready.
"WEB-Control_DB".commandstate.last_error	Refer to the next table for a value table of possible errors.

Last_error	Description
1	Fragment DB is inconsistent (does not match the Web Control DB).
2	A web application already exists with this name.
3	Memory problem initializing in the web server.
4	Inconsistent data in the Web Control DB.
5	A fragment DB is not available (not loaded).
6	No AWP ID for a fragment DB.

Last_error	Description
7	The enum fragment is not available (contains the texts and information on the enum types).
8	An action requested via the command flag in the Web Control DB is prohibited in the current state.
9	Web application is not initialized (if there is no reinitializing after disabling).
10	Web server is disabled.
...	Last_error is reset once the web application has been successfully initialized.

### Request status information

Request status information is bound to one of four possible requests,  $x = [1 \dots 4]$ .

"WEB-Control_DB".requesttab[x].idle	Nothing need be done.
"WEB-Control_DB".requesttab[x].waiting	The user program must react to a request from a manual fragment and explicitly initiate further processing in the web browser.
"WEB-Control_DB".requesttab[x].sending	The web server is occupied with processing the request/fragment.
"WEB-Control_DB".requesttab[x].aborting	The TCP connection is closed by the web server.

### Request control information

Request control information is bound to one of four possible requests,  $x = [1 \dots 4]$ .

"WEB-Control_DB".requesttab[x].continue	Releases the fragment being processed for transmission. Processing of the next fragment is initiated.
"WEB-Control_DB".requesttab[x].repeat	Releases the fragment being processed for transmission. The fragment is then processed again.
"WEB-Control_DB".requesttab[x].abort	Closes the TCP connection.
"WEB-Control_DB".requesttab[x].finish	Releases the fragment being processed for transmission. Stops further processing of requests (terminates the request).

### Example:

The tag for the DB is: "WEB-Control\_DB". Whether errors have occurred during initialization of the web application can be determined by requesting bit "WEB-Control\_DB".commandstate.error in the user program.

If an error has occurred you can analyze it using the "WEB-Control\_DB".commandstate.last\_error value.

### Interaction with the user program

Using manual fragments ensures that the user program reacts synchronously to the user program, thereby allowing the responding web page to be processed by the user program.

### Fragment type

To react to the received data in the user program the "manual" fragment type must be used for the fragment writing the data (for "manual pages"):

```
<!-- AWP_Start_Fragment Name="testfrag" ID="1" Type="manual" -->
```

The values are always transferred to the web server of the CPU for automatic and manual pages in the same way:

Example:

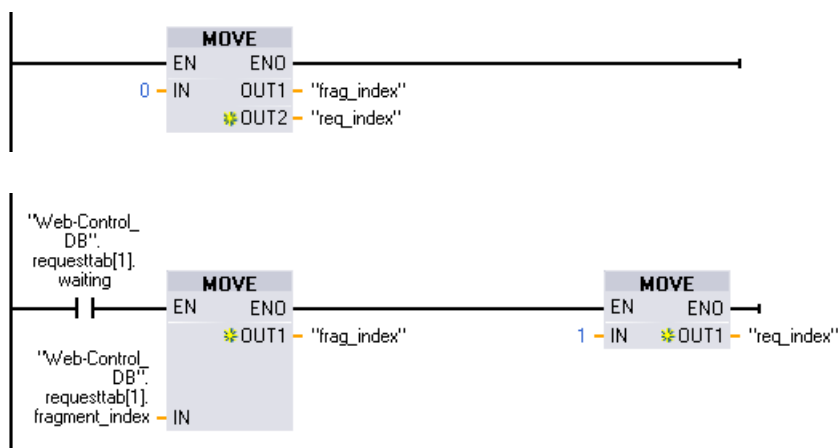

```
<form method="POST" action="">
<p>
<input type="submit" value="Set new value">
<input type="text" name="Velocity" size="20">
</p>
</form>
```

### User program for manual fragments

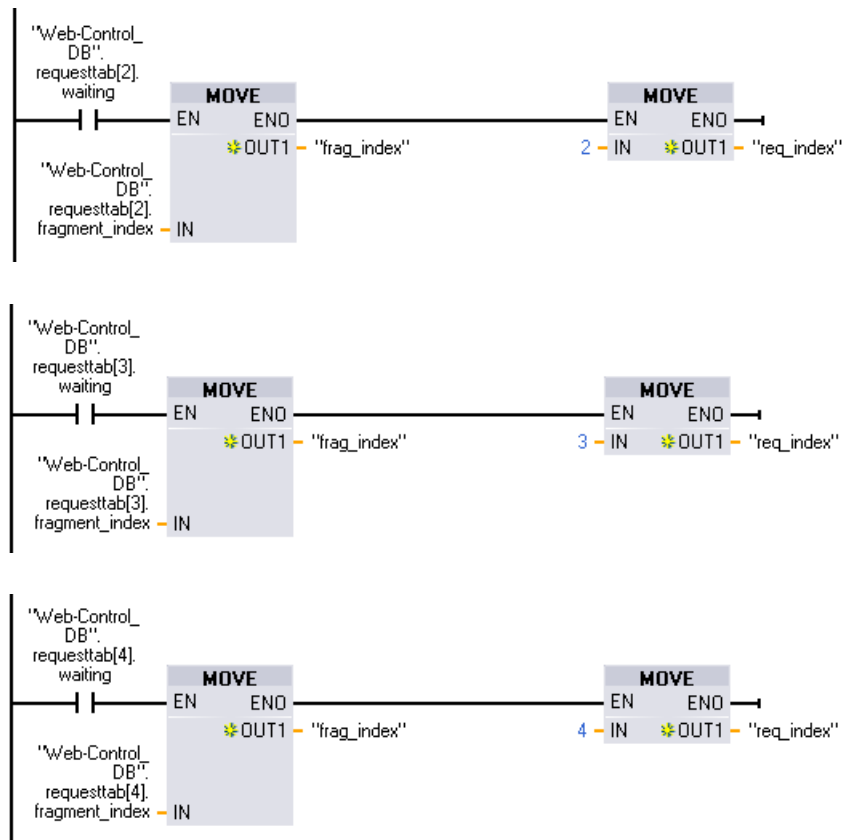

When using manual pages, the "WWW" instruction must be called in cycles in the user program of the CPU.

To react to values entered in the browser, the request - which is made by the manual page to the web server - must first be evaluated in the user program. To do this, the Web Control DB (for example, DB 333) must be examined in cycles for queued requests. The array that manages four requests is contained in the "requesttab" section of the Web Control DB. Each element of the array thereby contains information on the respective request within a structure.

A simple programming example shows how queued requests are checked based on the tags of the Web Control DB.

In cases where a request has been made, this program section writes the fragment ID in the #frag\_index tag and the request no. (value range 1-4) in the #req\_index tag.

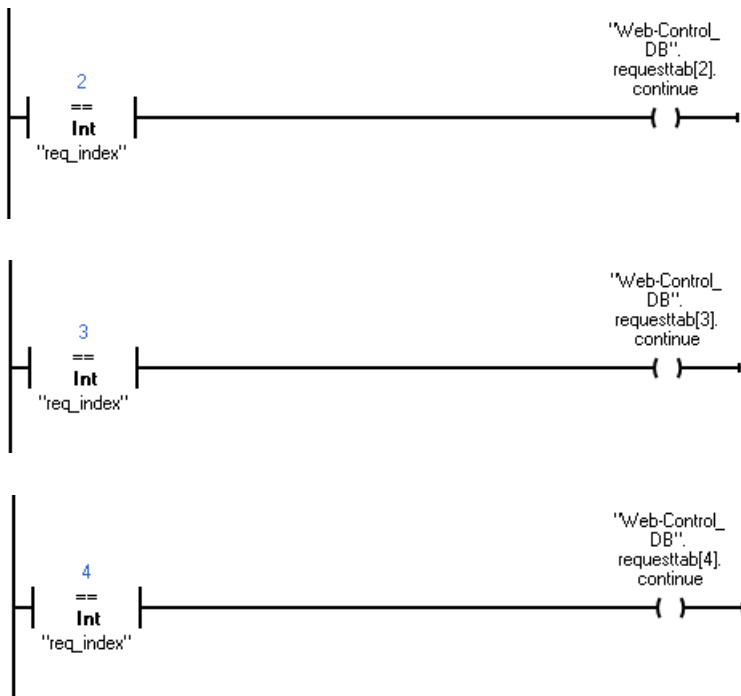

Using the information from this, the information transferred in the request can now be processed separately for each fragment ID in the program (for example, plausibility check).

Once processing of the request has been completed by the program, the request must be answered and the appropriate entry is once more reset under "requesttab" of the Web Control DB (for example, DB 333).

A simple programming example for replying to requests:

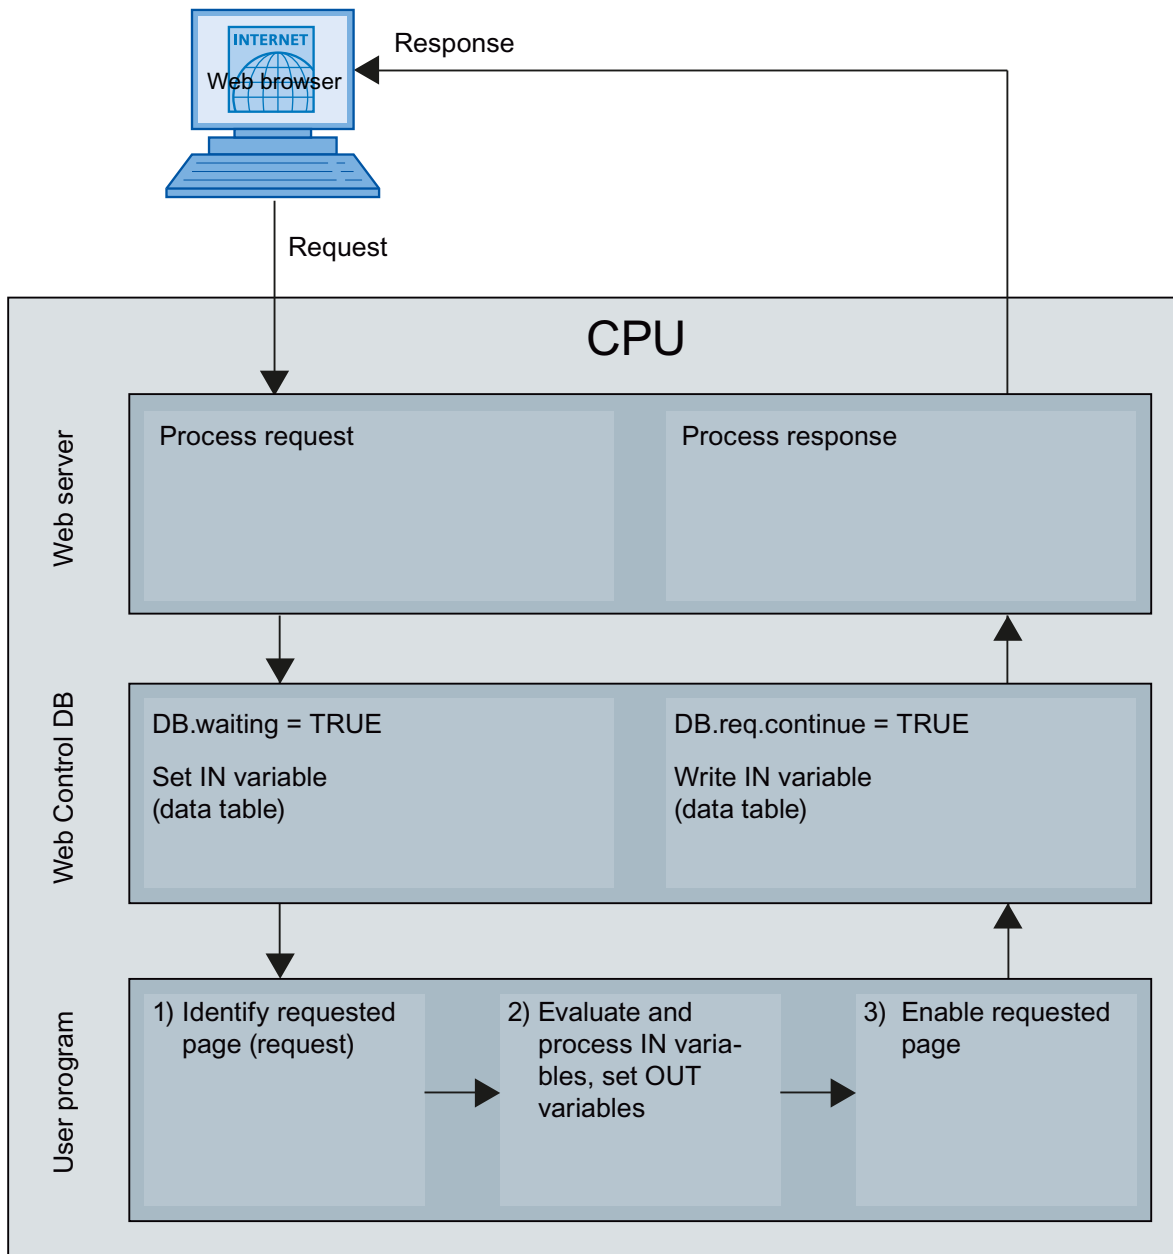

8.1 Configuring devices and networks

**Principle sequence of a browser request with interaction from the user program**

The following figure shows the simplified, principle sequence of the web browser request on the effects of Web Control DB content and the actions required from the user program until the processed web page is returned (response).

**Displaying custom web pages in the browser**

**Display web pages in browser**

Web pages are called from the standard web pages of the web browser.

In addition to the other links in the navigation bar, the standard web pages also have a link to "user pages".

Click on the "user pages" link to open the web browser you have configured as the default HTML page.

## Creating custom web pages in several languages

You can make each of your custom web pages available in various languages.

### Requirements

The language-dependent HTML; pages must be stored in a folder structure containing folders with the respective language abbreviations:

### Specified language abbreviations

Language abbreviations "de", "en", "fr", "es", "it" and "zh" are fixed. Additional language folders or other designated language folders are not supported.

Additional folders within the same folder hierarchy for other files can be created as required; for example, an "img" folder for images and a "script" folder for JavaScript files.

## Language switching for custom web pages

### Requirements

The HTML pages are contained in the predefined language folders, for example, HTML pages with German text are in the "de" folder, HTML pages with English text are in the "en" folder.

### Language switching concept

Language switching is based on a predefined cookie named "siemens\_automation\_language". If the cookie is set to value "de", at the next web page request or web page update, the web server switches to the web page from the "de" folder.

Similarly, the web server switches to the web page from the "en" folder when the cookie is set to "en".

## Example of language switching

The example is structured as follows:

- The language-dependent HTML files with the same name, for example, "langswitch.html" are located in both language folders "de" and "en". The text to be displayed within the two files are German or English, corresponding to the name of the folder.
- There is an additional "script" folder in the folder structure containing the JavaScript file "lang.js". Functions required for language switching are stored in this file .

## Structure of the "langswitch.html" file ("de" folder)

Meta data "content language", charset and path to JavaScript file are set in the file header.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN">
<html>
<head>
<meta http-equiv="Content-Language" content="de">
<meta http-equiv="Content-Type" content="text/html; charset=utf-8">
<title>Switch language to German page</title>
<script type="text/javascript" src="script/lang.js" ></script>
</head>
```

Language selection is implemented in the body of the file by the "select" HTML element. The select element initiates a list box and contains the "de" option, labeled as "German" and "en", labeled as "English"; "de" is the default.

The "DoLocalLanguageChange(this)" function is called using the "onchange" event handler. The "this" parameter transmits the select object with the selected option to this function. "onchange" calls the function each time the option is changed.

```
<!-- Language Selection -->
<table>
  <tr>
    <td align="right" valign="top" nowrap>
      <!-- change language immediately on change of the selection
-->
      <select name="Language"
onchange="DoLocalLanguageChange(this)" size="1">
        <option value="de" selected >Deutsch</option>
        <option value="en" >English</option>
      </select>
    </td>
  </tr>
</table>
<!-- Language Selection End-->
```

## Structure of the "langswitch.html" file ("en" folder)

The header of the HTML file with English text is structured similarly to the HTML file with German text.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN">
<html>
<head>
<meta http-equiv="Content-Language" content="en">
```

```
<meta http-equiv="Content-Type" content="text/html; charset=utf-8">
<title>Language switching english page</title>
<script type="text/javascript" src="script/lang.js" ></script>
```

Language selection is also implemented in the body of the file by the "select" HTML element. In contrast to the German HTML file, the English option is already selected as a default and the text or the labels are in English.

```
<!-- Language Selection -->
<table>
  <tr>
    <td align="right" valign="top" nowrap>
      <!-- change language immediately on change of the selection
-->
      <select name="Language"
onchange="DoLocalLanguageChange(this)" size="1">
        <option value="de" >German</option>
        <option value="en" selected >English</option>
      </select>
    </td>
  </tr>
</table>
<!-- Language Selection End-->
```

### Structure of "lang.js" file (in the "script" folder)

The " DoLocalLanguageChange" function is defined in the Java script file and calls the "SetLangCookie" function with the language selection value. SetLangCookie combines the cookie name and cookie value and then sets the cookie by means of the corresponding document.cookie property. The web page must then be reloaded (top.window.location.reload) to allow the web server to react to the setting of the cookie by displaying the required language.

```
function DoLocalLanguageChange(oSelect) {
  SetLangCookie(oSelect.value);
  top.window.location.reload();
}

function SetLangCookie(value) {
  var strval = "siemens_automation_language=";
  // this is the cookie by which the web server
  // detects the desired language
  // this name is required by the web server
  strval = strval + value;
  strval = strval + "; path=/ ;";
  // set path to the application, since otherwise
  // path would be set to the requesting page
  // would not get the cookie.
  // The path for user defined applications follows this
sample:
  // path=/awp/<application name>/<pagename>
  // example: path=/awp/myapp/myappstartpage.htm
  //(where myapp is the name of the web application
  // entered in the web server properties of the cpu)
```

```
        /*
        use expiration if this cookie should live longer
        than the current browser session
        var now      = new Date();
        var endttime = new Date(now.getTime() + expiration);
        strval = strval + "; expires=" + endttime.toGMTString()
+ ";";
        */
        document.cookie = strval;
    }
```

## Additional configurations

### Configuring additional functions

The S7-1200 automation system has numerous additional functions that are useful as integrated CPU functions or available via plug-in modules (for example, communication modules). You can find the description via the following links.

#### 8.1.4.4 S7-1200 CM/CP

##### S7-1200 CM/CP

##### Telecontrol S7-1200

##### CP 1242-7

### Copying the CP 1242-7 into another project

If you copy a CP 1242-7 from one project into another project, the following parameters in the parameter group "CP identification" are changed on the target station:

- Project number of the CP
- Station number of the CP

### **Download to device**

Only use the "Download to device" function with the CP 1242-7 via a TeleService connection as follows:

1. Select the CP in STEP 7.
2. Select the "Online" > "Download to device" menu.
3. In the "Extended download" dialog that appears, select the TeleService interface.
4. Download the project data from the "Extended download" dialog.

### **Upload from device**

The function "Upload from device" is not supported by the CP 1242-7.

## CP 1242-7 configuration

### Modes of the GPRS-CP

#### Modes of the CP

The CP 1242-7 allows an S7-1200 to communicate as a GPRS station with a central station or other remote networks via the GSM network. For communication using GPRS, the CP is set to one of the following operating modes:

- **Telecontrol**

This operating mode of the CP allows the GPRS station to exchange data with the following partners:

  - Communication with the Telecontrol server  
This CP mode allows the GPRS station to exchange data with a telecontrol server. The Telecontrol server is a PC connected to the Internet with the "TELECONTROL SERVER BASIC" application. It is generally located in the master station and serves to monitor and control the remote GPRS stations. Data can be exchanged with the OPC client of a central control system via the integrated OPC interface. The Telecontrol server PC is not configured in STEP 7. The "TELECONTROL SERVER BASIC" application has its own configuration user interface.
  - Communication with another remote GPRS station  
The message frames are transmitted via the Telecontrol server.
  - Communication with an engineering station (for TeleService)

Communication with the Telecontrol server is performed via the GSM network and the Internet.

This operating mode requires a SIM card with GPRS service enabled and a Telecontrol server that can be reached by the CP.

- **GPRS direct**

This operating mode of the CP is used for direct communication between remote stations via the GSM network. No Telecontrol server is required.

To allow network nodes in public wireless networks to be directly accessible, these need to be addressed using a fixed address. Here, SIM cards with a fixed IP address are used that allow the stations to address each other directly.

The possible communications services and security functions (for example VPN) depend on what is offered by the network provider.

Possible communications partners of the GPRS station with a CP 1242--7 in "GPRS direct" mode are:

  - A subscriber that can be reached by the CP via an IP address (GPRS station with CP 1242-7)
  - An engineering station (for TeleService)

## Establishing a connection using GPRS communication

### Connection modes

- "GPRS direct" mode  
There are no different connection modes in the "GPRS direct" mode.
- "Telecontrol" mode  
The CP can be configured for the following connection modes.
  - "Permanent" connection mode  
There is a permanent TCP connection to the telecontrol server. Following connection establishment, there is a permanent TCP connection to the telecontrol server even if data is not transferred permanently.
  - "Temporary" connection mode  
A connection is only established to the telecontrol server when required.

If a TCP connection is established, process data is sent as soon as the telecontrol instructions are called on the CPU.

A connection is always established by the CP. If a connection established by the CP is interrupted, the CP automatically attempts to re-establish the connection.

### Triggering connection establishment for permanent stations ("Telecontrol" mode)

In the "Telecontrol" mode, the permanent connection to the telecontrol server is established when the station starts up. If there is an interruption on the connection, the establishment of the connection can be triggered by a wake-up SMS (see below).

### Triggering connection establishment for temporary stations ("Telecontrol" mode)

With "temporary" stations, connection establishment can be triggered by the following events:

- Event on the local CPU that needs to be evaluated by the program.  
In terms of the program, two situations need to be distinguished:
  - Events that lead to a single connection establishment (for example alarms or commands from the operator).
  - Expiry of an interval that leads to cyclic connection establishment (for example once daily for data transmission)
- Request by a communications partner (OPC client or S7 station)  
The request from the communications partner leads to the connection being established.
- Request for TeleService by an engineering station  
The request switched by the telecontrol server or TeleService gateway does not need to be evaluated in the program.
- Wake-up SMS of the telecontrol server  
The wake-up SMS can be triggered spontaneously on the telecontrol server. It is also possible to configure cyclic sending on the telecontrol server.

- Telephone wake-up call  
The wake-up call can be sent from a telephone that has a phone number authorized in the STEP 7 project. The telephone must support the CLIP function (transfer of its own call number).  
The connection establishment with the (main) telecontrol server is triggered.
- Telephone wake-up SMS  
The wake-up SMS can be sent from a telephone that has a phone number authorized in the STEP 7 project. The telephone must support the CLIP function (transmission of its own number) and sending of SMS.  
The connection establishment with the telecontrol server specified in the SMS is triggered.

When a temporary station is woken up, all the data is transferred if this has changed since the last data transfer.

### Triggering connection establishment in "GPRS direct" mode

In "GPRS direct" mode, a connection establishment is triggered by the following events:

- Event on the local CPU that is evaluated by the program.
- Request by a communications partner (not an engineering station)  
The request in the frame received from the communications partner is evaluated in the program by calling the telecontrol instructions.
- Request for TeleService by an engineering station  
The request switched by the telecontrol server or TeleService gateway does not need to be evaluated in the program.

### Right to wake-up by "authorized phone numbers"

The CP only accepts an SMS if the sending communication partner is authorized based on its phone number. These numbers are in configured for the CP in STEP 7 in the "authorized phone numbers" list.

---

#### Note

##### "Authorized phone numbers" in the STEP 7 project

- A phone number entered here gives the sender who transfers this phone number the right to trigger connection establishment.
  - If an asterisk (\*) is entered in the list, the CP accepts SMS messages from all senders.
  - If the list is empty, the CP cannot be woken up for connection establishment.
-

## Wake-up SMS

Depending on the connection type and the triggering server or intermediary TeleService server, the following text must be transferred in the wake-up SMS:

- For telecontrol connections:
  - Text for the wake-up SMS message for establishing a connection to the telecontrol server:  
TELECONTROL
  - Text for the wake-up SMS message for establishing a connection to the main telecontrol server:  
TELECONTROL MAIN
  - Text for the wake-up SMS message for establishing a connection to the substitute telecontrol server:  
TELECONTROL BACKUP

The configuration of the telecontrol server for the GPRS CP is set in STEP 7 in "Telecontrol interface > Operating mode > main or substitute telecontrol server".

---

### Note

#### Wake-up with a mobile phone

- One of the texts listed above can be used in a wake-up SMS message.
  - With a wake-up call, the station always connects to the main telecontrol server.
- 

- For TeleService connections:
  - Text for the wake-up SMS message for establishing a connection to the first configured TeleService server:  
TELESERVICE  
or  
TELESERVICE 1
  - Text for the wake-up SMS message for establishing a connection to the second configured TeleService server:  
TELESERVICE 2

The configuration of the TeleService server for the GPRS CP is set in STEP 7 in "Telecontrol interface > TeleService authorization > 1st or 2nd TeleService server".

## Preferred GSM networks

### Selection of preferred GSM networks

The following options are provided to select the GSM networks that the CP 1242-7 should preferably dial up:

- **Automatic dialup**  
The CP dials with highest priority into the GSM network of the contracted network operator set on the SIM card. If a connection cannot be made within the contracted network, the CP dials up another GSM network with which the network operator has a roaming contract and whose access data is stored on the SIM card.
- **Contract network only**  
The CP only dials up the GSM network of the contracted network operations whose SIM card is plugged into the CP. No roaming.
- **Contracted network and alternative network**  
The CP dials up the contracted network with the highest priority. If dialup to the contracted network is unsuccessful, the CP dials up an alternative GSM network, in decreasing priority, as entered in the list of preferred network operators.  
The alternative networks are entered in the list as "Public Land Mobile Network" (PLMN). PLMN is a construct of Mobile Country Code (MCC) and Mobile Network Code (MNC).  
Example: 26276  
This is the PLMN for the test network of Siemens AG with MCC = 262 and MNC = 76.

### Time-of-day synchronization in NTP mode - parameter assignment

#### NTP mode (NTP: Network Time Protocol)

In NTP mode, the CP sends time-of-day queries at regular intervals to one or more NTP servers. From the responses of the servers, the CP selects the most accurate time of day.

The advantage of this mode is that it allows the time to be synchronized across subnets.

In NTP mode, it is generally UTC (Universal Time Coordinated) that is transferred. This corresponds to GMT (Greenwich Mean Time).

## CP 1242-7 TeleService

### TeleService via GPRS

#### Communication path for TeleService via GPRS

With TeleService for remote S7 stations with the CP 1242-7 via GPRS, the connection is always established via an intermediary between the engineering station and remote S7 station.

This intermediary can be either:

## *8.1 Configuring devices and networks*

- A telecontrol server (and possibly a substitute telecontrol server)  
The telecontrol server can be a separate PC or installed on the engineering station in the form of the "TELECONTROL SERVER BASIC" application.
- A TeleService server  
A TeleService server is used when no telecontrol server is available; in other words, when the CP operates in "GPRS direct" mode.

The telecontrol server or TeleService server can be connected to the engineering station via LAN or Internet and the TeleService function can be called from there.

### **Requirements for TeleService via GPRS**

- A telecontrol server or a TeleService server
- The STEP 7 project with the required data for GPRS communication

### **Note on project engineering**

The telecontrol server and TeleService server are not configured in STEP 7.

### **See also**

Establishing a connection using GPRS communication (Page 762)

Modes of the GPRS-CP (Page 761)

### **Establishing a TeleService connection via GPRS**

#### **Establishing a connection for TeleService via GPRS**

The request to establish a connection is triggered by the engineering station and transmitted by a wake-up SMS to the station. The CP 1242-7 in the S7-1200 station establishes a connection to the engineering station via the GSM network and the Internet.

#### **Starting the TeleService via GPRS**

Start the TeleService via GPRS as follows:

1. In the project on the authorized engineering station, select the remote S7 station with which you want to establish a TeleService connection via GPRS.
2. Alternatively, open the "Connect online" dialog box as follows:
  - "Connect online" button
  - "Connect online" shortcut menu (right mouse button)
  - "Online" > "Connect online" menu

The "Connect online" dialog box opens.

3. Choose interface type "TeleService GPRS" in the "Type of PG/PC interface" drop-down list.

4. In the "PG/PC interface" drop-down list, select the "GPRS TeleService board" option if it is not automatically displayed.
5. Click on the "Connect" icon next to the "PG/PC interface" drop-down list. The "Establish remote connection" dialog box opens.
6. Make the necessary settings in the "Establish remote connection" dialog. Details of this are contained in the tooltip cascade of STEP 7.

The following details are required to successfully establish a connection:

### Details required to establish a connection with the GPRS station

The following information is necessary in the "Establish remote connection" dialog:

- IP address or DNS name of the telecontrol server
- TCP port number of the telecontrol server or the DSL router via which the connection between the engineering station and the remote GPRS station is running.
- Server password of the ES to authenticate the engineering station at the telecontrol server  
Only required if a group-specific password has been configured in the "TELECONTROL SERVER BASIC" application.
- TeleService user name  
See CP configuration in STEP 7.
- TeleService password  
See CP configuration in STEP 7.
- Access ID of the CP  
Only required when there are several CP 1242-7s in the station. See CP configuration in STEP 7.

### Status

#### Connection statuses of TeleService via GPRS

The following connection statuses can be displayed in the "Establish remote connection" dialog box:

- Not connected  
There is no connection to the remote GPRS station. Connection establishment has not yet started.

If connection establishment was started by clicking the "Connect" button, the following statuses are displayed one after the other after the connection has been established:

- Connect to telecontrol server  
The engineering station connects to the telecontrol server.
- Wait for S7 station  
The wake-up SMS has been sent to the remote station. Wait for reply from station.

*8.1 Configuring devices and networks*

- Authentication at S7 station  
The S7 station has established an IP connection with the engineering station via GPRS and Internet and is checking the received logon and authentication data.
- Connected  
The station has successfully established the connection to the engineering station.

The following states may be displayed if the connection cannot be successfully established:

- Telecontrol server not accessible  
Possible causes:
  - The connection between the engineering station and the telecontrol server has been interrupted.
  - The telecontrol server is switched off.
- Wrong server password  
Cause: The wrong server password for logging on and authentication was entered at the telecontrol server.
- S7 station not responding  
Possible causes:
  - Faulty GSM communication between the telecontrol server and the station.
  - Faulty connection between the GSM network and the Internet.
  - Faulty Internet connection.
  - The telecontrol server could not send a wake-up SMS.
  - The CP has not received a wake-up SMS.
  - The sender of the SMS was not configured in the list of authorized wake-up call numbers.
- Wrong TeleService user name or TeleService password  
Possible causes:
  - An incorrect TeleService user name or incorrect TeleService password was entered in the authentication dialog for the CP 1242-7.
  - The TeleService user name or TeleService password was not configured in STEP 7.
- All TeleService access points are in use.
- The CP is not known to the telecontrol server.  
Cause: The CP originates from a STEP 7 project that does not match the project of the telecontrol server.
- No resources available for TeleService on the CP: Please contact the hotline.
- Protocol error  
Cause: Wrong frame or frame from wrong subscriber. Please contact the hotline.

## CP 1243-1

### CPU scan cycle

#### Structure of the CPU scan cycle

The cycle (including the pause) with which the CP scans the memory area of the CPU is made up of the following phases:

- **High-priority read jobs**  
For data points of the type "Input", which are configured with the "High priority" setting in the data point configuration in "General > Priority in the scan cycle", the PLC tags are all read in one scan cycle.
- **Write jobs**  
In every cycle, the values of a certain number of unsolicited write jobs are written to the CPU. The number of tags written per cycle is specified for the CP in the "Communication with the CPU" parameter group with the "Max. number of write jobs" parameter. The tags whose number exceeds this value are then written in the next or one of the following cycles.
- **Low-priority read jobs - proportion**  
For data points of the type "Input", which are configured with the "Low priority" setting in the data point configuration in "General > Priority in the scan cycle", the values of a part of the PLC tags are read in every scan cycle.  
The number of tags read per cycle is specified for the CP in the "Communication with the CPU" parameter group with the "Max. number of read jobs" parameter. The tags that exceed this value and can therefore not be read in one cycle are then read in the next or one of the following cycles.
- **Cycle pause time**  
This is the waiting time between two scan cycles. It is used to reserve adequate time for other processes that access the CPU via the backplane bus of the station.

#### Duration of the CPU scan cycle

Since no fixed time can be configured for the cycle and since the individual phases cannot be assigned a fixed number of objects, the duration of the scan cycle is variable and can change dynamically.

#### Datapoint types

During the configuration of the user data to be transferred by the CP, each data point is assigned a protocol-specific data point type. The data point types supported by the CP along with the compatible S7 data types are listed below. They are grouped according to format (memory requirements).

The direction relates to the direction of transfer (monitoring direction = "in", control direction = "out").

**CP 1243-1 DNP3: Supported data point types**

Table 8-54 Supported data point types, DNP3 object groups, variants and compatible S7 data types

Format (memory requirements)	Data point type	DNP3 object group [variations]	Direction	S7 data types	Address area
<b>Bit</b>	Binary Input	1 [1, 2]	in	BOOL	I, Q, M
	Binary Input Event	2 [1, 2]	in	BOOL	I, Q, M
	Binary Output <sup>1)</sup>	10 [2]	out		
	Binary Output Event <sup>1)</sup>	11 [1, 2]	out		
	Binary Command	12 [1]	out	BOOL	I, Q, M
<b>Integer (16 bits)</b>	Counter Static	20 [2]	in	UINT, WORD	I, Q, M
	Frozen Counter <sup>2)</sup>	21 [2, 6]	in		
	Counter Event	22 [2, 6]	in	UINT, WORD	I, Q, M
	Frozen Counter Event <sup>3)</sup>	23 [2, 6]	in		
	Analog Input	30 [1]	in	INT	I, Q, M
	Analog Input Event	32 [2, 4]	in	INT	I, Q, M
	Analog Output Status <sup>4)</sup>	40 [2]	out		
	Analog Output <sup>4)</sup>	41 [2]	out	INT	I, Q, M
<b>Integer (32 bits)</b>	Counter Static	20 [1]	in	UDINT, DWORD	I, Q, M
	Frozen Counter <sup>2)</sup>	21 [1, 5]	in		
	Counter Event	22 [1, 5]	in	UDINT, DWORD	I, Q, M
	Frozen Counter Event <sup>3)</sup>	23 [1, 5]	in		
	Analog Input	30 [2]	in	DINT	I, Q, M
	Analog Input Event	32 [1, 3]	in	DINT	I, Q, M
	Analog Output Status <sup>4)</sup>	40 [1, 3]	out		
	Analog Output <sup>4)</sup>	41 [1]	out	DINT	I, Q, M
<b>Floating-point number (32 bits)</b>	Analog Input	30 [5]	in	REAL	Q, M
	Analog Input Event	32 [5, 7]	in	REAL	Q, M
	Analog Output Status <sup>4)</sup>	40 [3]	out		
	Analog Output	41 [3]	out	REAL	Q, M
	Analog Output Event <sup>4)</sup>	42 [5, 7]	out		
<b>Floating-point number (64 bits)</b>	Analog Input	30 [6]	in	LREAL	Q, M
	Analog Input Event	32 [6, 8]	in	LREAL	Q, M
	Analog Output	41 [4]	out	LREAL	Q, M
	Analog Output Event <sup>4)</sup>	42 [6, 8]	out		
<b>Block of data (1...64 bytes) <sup>5)</sup></b>	Octet String	110 [-]	in	<sup>5)</sup>	I, Q, M
	Octet String Event <sup>5)</sup>	111 [-]	in	<sup>5)</sup>	I, Q, M

<sup>1)</sup> This object group can be configured in the Data point editor of STEP 7 using object group 12.

<sup>2)</sup> This object group can be configured in the Data point editor of STEP 7 using object group 20.

<sup>3)</sup> This object group can be configured in the Data point editor of STEP 7 using object group 22.

4) This object group can be configured in the Data point editor of STEP 7 using object group 41.

5) With these data point types, contiguous memory areas up to a size of 64 bytes can be transferred. All S7 data types with a size between 1 and 64 bytes are compatible. If the array is modified later, the data point must be recreated.

### Configuration and feedback of binary and analog values

- **Binary values**

You configure binary values (inputs) using object groups 1 and 2.

The object groups 10 and 11 are used to feed back the current values in the process image of the CPU to the control system.

- **Analog values**

You configure analog values using the object groups 30, 32 and 41 depending on the transfer direction.

The object groups 40 and 42 are used to feed back current values in the process image of the CPU to the control system.

## CP 1243-1 IEC: Supported data point types

Table 8-55 Supported data point types, IEC types and compatible S7 data types

Format (memory requirements)	Data point type	IEC type	Direction	S7 data types	Address area
<b>Bit</b>	Single point information	<1>	in	BOOL	I, Q, M
	Single point information with time tag	<30>	in	BOOL	I, Q, M
	Single command	<45>	out	BOOL	I, Q, M
<b>Byte</b>	Step position information	<5>	in	BYTE	I, Q, M
	Step position information with time tag	<32>	in	BYTE	I, Q, M
	Regulating step command	<47>	out	BYTE	I, Q, M
<b>Integer (16 bits)</b>	Measured value, normalized value	<9>	in	INT	I, Q, M
	Measured value, normalized value with time tag	<34>	in	INT	I, Q, M
	Measured value, scaled value	<11>	in	INT	I, Q, M
	Measured value, scaled value with time tag	<35>	in	INT	I, Q, M
	Set point command, normalised value	<48>	out	INT	I, Q, M
	Set point command, scaled value	<49>	out	INT	I, Q, M
<b>Integer (32 bits)</b>	Bitstring of 32 bits	<7>	in	DWORD, UDINT	I, Q, M
	Bitstring of 32 bits with time tag	<33>	in	DWORD, UDINT	I, Q, M
	Integrated totals	<15>	in	DWORD, UDINT	I, Q, M
	Integrated totals with time tag	<37>	in	DWORD, UDINT	I, Q, M
<b>Floating-point number (32 bits)</b>	Measured value, short floating point number	<13>	in	REAL	Q, M
	Measured value, short floating point number with time tag	<36>	in	REAL	Q, M

Format (memory requirements)	Data point type	IEC type	Direction	S7 data types	Address area
	Set point command, short floating point number	<50>	out	REAL	Q, M
<b>Block of data (1...32 Bit)</b> <sup>1)</sup>	Bitstring of 32 bits <sup>1)</sup>	<7>	in	<sup>1)</sup>	I, Q, M
	Bitstring of 32 bits with time tag <sup>1)</sup>	<33>	in	<sup>1)</sup>	I, Q, M
	Bitstring of 32 bits <sup>1)</sup>	<51>	out	<sup>1)</sup>	I, Q, M

<sup>1)</sup> With these data point types, contiguous memory areas up to a size of 32 bits can be transferred. All S7 data types with a size between 1 and 32 bits are compatible. If the array is modified later, the data point must be recreated.

## Types of transmission and event classes

### Storing and transferring values

The values of data points can be assigned to different memory areas on the CP and therefore to different types of transfer:

- **Static values**

Static values are entered in the process image of the CP.

The value of a static data point is sent after being requested by the communications partner.

- **Events**

The values of data points configured as an event are also entered in the process image of the CP.

The values of events are also entered in the send buffer of the CP.

The value of a data point that was configured as an event is sent unsolicited to the communications partner if this function is enabled by the master.

The send buffer has the following size:

- With DNP3: Max. 64000 events
- With IEC: Max. 65535 events

The capacity of the send buffer is divided up equally for all enabled partners.

### Types of transmission

Depending on your CP type, you have the following transmission types available:

- **Transfer after call**

The current value of the data point is entered in the image memory of the CP. A new value overwrites the older value in the image memory.

After being called by the communications partner, the current value at the time is transferred.

- **Every value triggered**

Whenever the trigger condition is met, the individual value of the data point is entered separately in the send buffer and transferred to the communications partner.

- **Event class ...**  
The value is transferred to the send buffer triggered as a class 1, 2 or 3 event. If unsolicited transfer is enabled by the master, the value is transferred unsolicited.  
You will find details of the event classes in the following sections.
- **Current value triggered**  
Only the current value of a data point at the time of the trigger is entered in the send buffer and transferred to the communications partner.

### Event classes for the DNP3 protocol

The process data of the various event classes is handled as follows:

- **Event class 1 / event class 2**  
Classes according to the DNP3 protocol: Event, class 1 / class 2  
Each value change is entered in the send buffer in chronological order.  
The evaluation of the classification (1 or 2) must be handled by the master.
- **Event class 3**  
Class according to the DNP3 protocol: Static event, class 3  
Only the current value at the time the trigger condition was met is entered in the send buffer and overwrites the last value stored there.

### Event classes for the IEC protocol

The process data of the various event classes is handled as follows:

- **Event class 1**  
Classes according to the IEC protocol: Event, class 1  
Each value change is entered in the send buffer in chronological order.
- **Event class 3**  
Class according to the IEC protocol: Static event, class 3  
Only the current value at the time the trigger condition was met is entered in the send buffer and overwrites the last value stored there.

### Analog value preprocessing

Some CPs have analog value preprocessing that, among other things, supports the functions described below.

### Smoothing factor

Analog values that fluctuate quickly can be evened out using the smoothing function.

The smoothing factors are calculated according to the following formula as with S7 analog input modules.

$$y_n = \frac{x_n + (k - 1)y_{n-1}}{k}$$

where

$y_n$  = smoothed value in the current cycle

$x_n$  = value acquired in the current cycle  $n$

$k$  = smoothing factor

The following values can be configured for the module as the smoothing factor.

- 1 = No smoothing
- 4 = Weak smoothing
- 32 = Medium smoothing
- 64 = Strong smoothing

### Fault suppression time

An analog value in the overflow range ( $32767 / 7FFF_n$ ) or underflow range ( $-32768 / 8000_n$ ) is not transferred for the duration of the fault suppression time. This also applies to live zero inputs. The value in the overflow/underflow range is only sent after the fault suppression time has elapsed, if it is still pending.

If the value returns to the measuring range before the fault suppression time elapses, the current value is transferred immediately.

A typical use case for this parameter is the suppression of peak current values when starting up powerful motors that would otherwise be signaled to the control center as a disruption.

The suppression is adjusted to analog values that are acquired by the S7 analog input modules as raw values. These modules return the specified values for the overflow or underflow range for all input ranges (also for live zero inputs).

If the CPU makes preprocessed finished values available in the bit memory area or in a data block, fault suppression is only possible or useful if these values have the values listed above ( $32767 / 7FFF_n$ ) or ( $-32768 / 8000_n$ ) in the overflow or underflow range. If this is not the case, the parameter should not be enabled for preprocessed values.

### Mean value generation

With this parameter, acquired analog values are transferred as mean values.

The current values of an analog datapoint are acquired cyclically and totaled. The number of acquired values per time unit depends on the read cycle of the CPU and the CPU scan cycle of the CP. The mean value is calculated from the accumulated values as soon as the transfer is triggered by a time trigger. Following this, the accumulation starts again so that the next mean value can be calculated.

The mean value can also be calculated if the transmission of the analog value message is triggered by a request from the communications partner. The duration of the mean value calculation period is then the time from the last transmission (for example triggered by the trigger) to the time of the request. Once again, the accumulation restarts so that the next mean value can be calculated.

If the acquired analog value in the overflow range ( $32767 / 7FFF_n$ ) or underflow range ( $-32768 / 8000_n$ ), this value can either be taken into account immediately in the calculation of the mean value or it can be suppressed for a specific period for the calculation of the mean value. The required response can be decided with the Fault suppression time parameter:

- **Fault suppression time = 0**  
Acquisition of a value in the overflow or underflow range results in the mean calculation being stopped immediately. The value 32767 / 7FFF<sub>h</sub> or -32768 / 8000<sub>h</sub> is saved as an invalid mean value for the current mean value calculation period and sent when the next analog value message is triggered. The calculation of a new mean value is then started. If the analog value remains in the overflow or underflow range, this new value is again saved immediately as an invalid mean value and sent when the next frame is triggered.
- **Fault suppression time > 0**  
If the acquired analog value is in the overflow or underflow range, the bad values are excluded from the calculation of the mean value for a maximum time as defined by the Fault suppression time. If this time is exceeded, the value 32767 / 7FFF<sub>h</sub> or -32768 / 8000<sub>h</sub> is saved as an invalid mean value and sent when the next analog value frame is triggered. The procedure is identical in each new averaging period; in other words, bad values are again suppressed for the duration of the fault suppression time.

The duration of the fault suppression time also indirectly decides the proportion of invalid values per averaging period. If the mean value is formed, for example in a cycle of 15 minutes, and the fault suppression time is set to 5 minutes, this means that the mean value is only transferred as invalid if more than 33% of the acquired analog values are in the overflow or underflow range in the current averaging period.

#### 8.1.4.5 SCALANCE X, W and M

### SCALANCE X

#### Useful information

### VLAN

#### Network definition regardless of the spatial location of the nodes

VLAN (Virtual Local Area Network) divides a physical network into several logical networks that are shielded from each other. Here, devices are grouped together to form logical groups. Only nodes of the same VLAN can address each other. Since multicast and broadcast frames are only forwarded within the particular VLAN, they are also known as broadcast domains.

The particular advantage of VLANs is the reduced network load for the nodes and network segments of other VLANs.

To identify which packet belongs to which VLAN, the frame is expanded by 4 bytes (VLAN tagging (Page 777)). This expansion includes not only the VLAN ID but also priority information.

## Options for the VLAN assignment

There are various options for the assignment to VLANs:

- Port-based VLAN  
Each port of a device is assigned a VLAN ID. You configure port-based VLAN in "Layer 2 > VLAN > Port-based VLAN".
- Protocol-based VLAN  
Each port of a device is assigned a protocol group. You can configure protocol-based VLAN in "Layer 2 > VLAN > Protocol Based VLAN Port".
- Subnet-based VLAN  
The IP address of the device is assigned a VLAN ID. You configure subnet-based VLAN in "Layer 2 > VLAN > Ipv4 Subnet Based VLAN".

## processing the VLAN assignment

If more than one VLAN assignment is created on the device, the assignments are processed in the following order:

1. Subnet-based VLAN
2. Protocol-based VLAN
3. Port-based VLAN

The frame is first examined for the IP address. If a rule on the "Ipv4 Subnet Based VLAN" tab applies, the frame is sent to the corresponding VLAN. If no rule applies, the protocol type of the frame is examined. If a rule on the "Protocol Based VLAN Port" tab applies, the frame is sent to the corresponding VLAN. If no rule applies, the frame is sent via the port-based VLAN. The rules for the port-based VLAN are specified on the "Port Based VLAN" tab.

## See also

General (Page 861)

GVRP (Page 863)

Port-based VLAN (Page 864)

Protocol-based VLAN group (Page 865)

Protocol-based VLAN port (Page 866)

IPv4 subnet-based VLAN (Page 866)

The tagged frame has 3 bits for the priority that is also known as Class of Service (CoS). The priority according to IEEE 802.1p is as follows:

CoS bits	Type of data
000	Non time-critical data traffic (less then best effort [basic setting])
001	Normal data traffic (best effort [background])
010	Reserved (standard)
011	Reserved ( excellent effort )
100	Data transfer with max. 100 ms delay
101	Guaranteed service, interactive multimedia
110	Guaranteed service, interactive voice transmission
111	Reserved

The prioritization of the data packets is possible only if there is a queue in the components in which they can buffer data packets with lower priority.

The device has eight parallel queues in which the frames with different priorities can be processed. First, the frames with the highest priority ("Strict Priority" method) are processed. This method ensures that the frames with the highest priority are sent even if there is heavy data traffic.

**Canonical Format Identifier (CFI)**

The CFI is responsible for compatibility between Ethernet and the token Ring. The values have the following meaning:

Value	Meaning
0	The format of the MAC address is canonical. In the canonical representation of the MAC address, the least significant bit is transferred first. Standard-setting for Ethernet switches.
1	The format of the MAC address is not canonical.

**VLAN ID**

In the 12-bit data field, up to 4095 VLAN IDs can be formed. The following conventions apply:

VLAN ID	Meaning
0	The frame contains only priority information (priority tagged frames) and no valid VLAN identifier.
1 - 4094	Valid VLAN identifier, the frame is assigned to a VLAN and can also include priority information.
4095	Reserved

**SNMP**

**Introduction**

With the aid of the Simple Network Management Protocol (SNMP), you monitor and control network elements from a central station, for example routers, switches. SNMP controls the communication between the monitored devices and the monitoring station.

Tasks of SNMP:

- Monitoring of network components
- Remote control and remote parameter assignment of network components
- Error detection and error notification

In versions v1 and v2c, SNMP has no security mechanisms. Each user in the network can access data and also change parameter assignments using suitable software.

For the simple control of access rights without security aspects, community strings are used.

The community string is transferred along with the query. If the community string is correct, the SNMP agent responds and sends the requested data. If the community string is not correct, the SNMP agent discards the query. Define different community strings for read and write permissions. The community strings are transferred in plain text.

Standard values of the community strings:

- public  
has only read permissions
- private  
has read and write permissions

---

**Note**

For security reasons, do not use the standard values "public" or "private". Change the values following the initial installation.

---

Further simple protection mechanisms at the device level:

- Allowed Host  
The IP addresses of the monitoring systems are known to the monitored system.
- Read Only  
If you assign "Read Only" to a monitored device, monitoring stations can only read out data but cannot modify it.

SNMP data packets are not encrypted and can easily be read by others.

The central station is also known as the management station. An SNMP agent is installed on the devices to be monitored with which the management station exchanges data.

The management station sends data packets of the following type:

- GET  
Request for a data record from the agent
- GETNEXT  
Calls up the next data record.
- GETBULK (available as of SNMPv2)  
Requests multiple data records at one time, for example several rows of a table.
- SET  
Contains parameter assignment data for the relevant device.

The SNMP agent sends data packets of the following type:

- **RESPONSE**  
The agent returns the data requested by the manager.
- **TRAP**  
If a certain event occurs, the SNMP agent sends traps.

SNMPv1 and SNMPv2 and SNMPv3 use UDP (User Datagram Protocol). The data is described in a Management Information Base (MIB).

## **SNMP v3**

Compared with the previous versions SNMP v1 and SNMP v2, SNMP v3 introduces a comprehensive security concept.

SNMP v3 supports:

- Fully encrypted user authentication
- Encryption of the entire data traffic
- Access control of the MIB objects at the user/group level

## **Spanning Tree**

### **Avoiding loops on redundant connections**

The spanning tree algorithm allows network structures to be created in which there are several connections between two stations. Spanning tree prevents loops being formed in the network by allowing only one path and disabling the other (redundant) ports for data traffic. If there is an interruption, the data can be sent over an alternative path. The functionality of the spanning tree algorithm is based on the exchange of configuration and topology change frames.

### **Definition of the network topology using the configuration frames**

The devices exchange configuration frames known as BPDUs (Bridge Protocol Data Unit) with each other to calculate the topology. The root bridge is selected and the network topology created using these frames. BPDUs also bring about the status change of the root ports.

The root bridge is the bridge that controls the spanning tree algorithm for all involved components.

Once the root bridge has been specified, each device sets a root port. The root port is the port with the lowest path costs to the root bridge.

### **Response to changes in the network topology**

If nodes are added to a network or drop out of the network, this can affect the optimum path selection for data packets. To be able to respond to such changes, the root bridge sends configuration messages at regular intervals. The interval between two configuration messages can be set with the "Hello Time" parameter.

## Keeping configuration information up to date

With the "Max Age" parameter, you set the maximum age of configuration information. If a bridge has information that is older than the time set in Max Age, it discards the message and initiates recalculation of the paths.

New configuration data is not used immediately by a bridge but only after the period specified in the "Forward Delay" parameter. This ensures that operation is only started with the new topology after all the bridges have the required information.

## RSTP, MSTP, CIST

### Rapid Spanning Tree Protocol (RSTP)

One disadvantage of STP is that if there is a disruption or a device fails, the network needs to reconfigure itself: The devices start to negotiate new paths only when the interruption occurs. This can take up to 30 seconds. For this reason, STP was expanded to create the "Rapid Spanning Tree Protocol" (RSTP, IEEE 802.1w). This differs from STP essentially in that the devices are already collecting information about alternative routes during normal operation and do not need to gather this information after a disruption has occurred. This means that the reconfiguration time for an RSTP controlled network can be reduced to a few seconds. This is achieved by using the following functions:

- Edge ports (end node port)

Edge ports are ports connected to an end device.

A port that is defined as an edge port is activated immediately after connection establishment. If a spanning tree BPDU is received at an edge port, the port loses its role as edge port and it takes part in (R)STP again. If no further BPDU is received after a certain time has elapsed (3 x hello time), the port returns to the edge port status.

- Point-to-point (direct communication between two neighboring devices)

By directly linking the devices, a status change (reconfiguration of the ports) can be made without any delays.

- Alternate port (substitute for the root port)

A substitute for the root port is configured. If the connection to the root bridge is lost, the device can establish a connection over the alternate port without any delay due to reconfiguration.

- Reaction to events

Rapid spanning tree reacts to events, for example an aborted connection, without delay. There is no waiting for timers as in spanning tree.

- Counter for the maximum bridge hops

The number of bridge hops a package is allowed to make before it automatically becomes invalid.

In principle, therefore with rapid spanning tree, alternatives for many parameters are preconfigured and certain properties of the network structure taken into account to reduce the reconfiguration time.

## Multiple Spanning Tree Protocol (MSTP)

The Multiple Spanning Tree Protocol (MSTP) is a further development of the Rapid Spanning Tree Protocol. Among other things, it provides the option of operating several RSTP instances within different VLANs or VLAN groups and, for example, making paths available within the individual VLANs that the single Rapid Spanning Tree Protocol would globally block.

## Common and internal Spanning Tree (CIST)

CIST is a term from the multiple spanning tree. CIST identifies the internal instance used by the switch that is comparable in principle with an internal RSTP instance.

## Routing function

### Introduction

The term routing describes the specification of routes for communication between different networks; in other words, how does a data packet from subnet A get to subnet B.

SCALANCE X supports the following routing functions:

- Static routing  
With static routing, the routes are entered manually in the routing table.
- Router redundancy  
With standardized VRRP (Virtual Router Redundancy Protocol), the availability of important gateways is increased by redundant routers.
- Dynamic routing  
The entries in the routing table are dynamic and are updated continuously. The entries are created by the routing protocol.
  - OSPF v2 (Open Shortest Path First)

### Static routing

The route is entered manually in the routing table. Enter the route in the routing table on the WBM page "Routes".

### Router redundancy with VRRP

With the Virtual Router Redundancy Protocol (VRRP), the failure of a router in a network can be countered.

Several VRRP routers in a network segment are put together as a logical group that forms a virtual router (VR). The group is defined using the virtual ID (VRID). Within the group, the VRID must be the same. The VRID can no longer be used for other groups.

The virtual router is assigned a virtual IP address and a virtual MAC address. One of the VRRP routers within the group is specified as the master router. The master router has priority 255. The other VRRP routers are backup routers. The master router assigns the virtual IP address and the virtual MAC address to its network interface. The master router sends VRRP packets

(advertisements) to the backup routers at specific intervals. With the VRRP packets, the master router signals that it is still alive. The master router also replies to the ARP queries.

If the virtual master router fails, a backup router takes over the role of the master router. The backup router with the highest priority becomes the master router. If the priority of the backup routers is the same, the higher MAC address decides. The backup router becomes the new virtual master router.

The new virtual master router adopts the virtual MAC and IP address. This means that no routing tables or ARP tables need to be updated. The consequences of a device failure are therefore minimized.

You configure VRRP in "Layer 3 > VRRP".

## OSPFv2

### Dynamic routing with OSPF v2

OSPF (Open Shortest Path First) is a cost-based routing protocol. To calculate the shortest and most cost-effective route, the Short Path First algorithm by Dijkstra is used. OSPF was developed by the IETF (Internet Engineering Task Force).

You configure OSPFv2 in "Layer 3 > OSPFv2".

OSPF v2 divides an autonomous system (AS) into different areas.

### Areas in OSPF

The following areas exist:

- **Backbone**  
The backbone area is area 0.0.0.0. All other areas are connected to this area. The backbone area is connected either directly or via virtual connections with other areas.  
All routing information is available in the backbone area. As a result, the backbone area is responsible for forwarding information between different areas.
- **Stub Area**  
This area contains the routes within its area within the autonomous system and the standard route out of the autonomous system. The destinations outside this autonomous system are assigned to the standard route.
- **Totally Stubby Area**  
This area knows only the routes within its area and the standard route out of the area.
- **Not So Stubby Area (NSSA)**  
This area can forward (redistribute) packets from other autonomous systems into the areas of its own autonomous system. The packets are further distributed by the NSSA router.

## Routers of OSPF

OSPF distinguishes the following router types:

- Internal router (IR)  
All OSPF interfaces of the router are assigned to the same area.
- Area Border Router (ABR)  
The OSPF interfaces of the router are assigned to different areas. One OSPF interface is assigned to the backbone area. Where possible, routes are grouped together.
- Backbone Router (BR)  
At least one of the OSPF interfaces is assigned to the backbone area.
- Autonomous System Area Border Router (ASBR)  
One interface of the router is connected to a different AS, for example an AS that uses the routing protocol RIP.

## Virtual connection

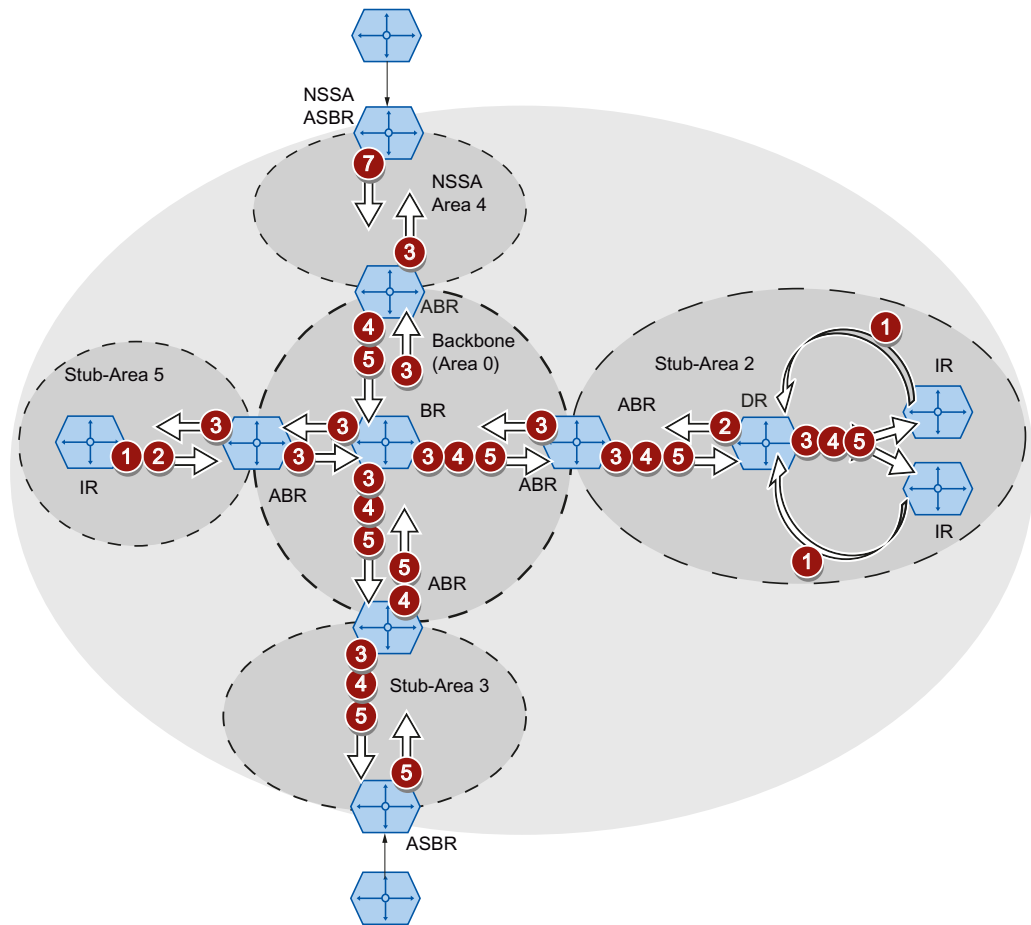

Each area must be physically connected to the backbone area. In some situations a physical connection is not possible. The remote router is connected to a backbone router via a virtual connection. In the area through which the virtual connection runs, there is no designated router or designated backup router.

## LSA types

Within the autonomous system, packets are exchanged that contain information about the connections of a router and the connection status message. The packets are also known as LSAs (Link State Advertisements). The LSAs are always sent from the router to the neighbor router.

If there are changes in the network, LSAs are sent to all routers in the network. The information depends on the LSA type.

- 1 Router LSA (LSA Type 1)**  
The LSA Type 1 is only sent within an area. For each active connection of the router that belongs to the area in consideration, an LSA Type 1 is generated. The LSA Type 1 contains information about the status and the costs of the connection, for example IP address, network mask, network type
- 2 Network LSA (LSA Type 2)**  
The LSA Type 2 is sent only within an area. For each network that belongs to the relevant area, the router generates an LSA Type 2. If several routers are interconnected in a network, the LSA Type 2 is sent by the designated router (DR). The LSA Type 2 includes the network address, the network mask and a list of routers that are connected to the network

- 3 Summary LSA (LSA Type 3 / LSA Type 4)**

The Summary LSA is generated by the area border router and sent into the area. The
- 4 Summary LSA contains information about routes outside the area but inside the AS.**

Where possible, the routes are grouped together.

  - Summary LSA (LSA Type 3)  
The LSA Type 3 describes the routes to the networks and advertises the standard route to the areas.
  - AS Summary LSA (LSA Type 4)  
The LSA Type 4 describes the routes to the ASBR.
- 5 External LSA (LSA Type 5 / LSA Type 7)**

The External LSA is generated by the ASBR. The LSA type depends on the area.
- 7**
  - AS External LSA (LSA Type 5)  
The LSA Type 5 is sent by the AS border router into the areas of the autonomous system except the Stub and NSSA areas. The LSA contains information about routes to a network in another AS. The routes are either created manually or learned externally. The ASBR uses LSA Type 5 to distribute standard routes to the backbone area.
  - NSSA External LSA (LSA Type 7)  
The LSA Type 7 is generated by the AS border router of an NSSA. The router is also known as the NSSA ASBR. The LSA Type 7 is sent only within the NSSA. If the P bit in LSA Type 7 = 1, these LSAs are converted to LSA Type 5 by the ABR and sent to the backbone area.

## Establishing the neighborhood

The router runs through the following statuses to establish a connection to the neighbor router.

1. Attempt state / Init state  
The router activates OSPF and begins to send and receive Hello packets. Based on the received Hello packets, the router learns which OSPF routers are in its vicinity. The router checks the content of the Hello packet. The Hello packet also contains the list of the neighbor routers (neighbor table) of the "sender".
2. Two way state  
If, for example, the ID of the area, the area type and the settings for the times match, a connection (adjacency) can be established to the neighbor. In a point-to-point network, the connection is established directly. If several neighbor routers can be reached in a network, the designated router (DR) and the designated backup router (DBR) are identified based on Hello packets. The router with the highest router priority becomes the designated router. If two routers have the same router priority, the router with the lower router ID becomes the designated router. The router establishes a connection to the designated router.
3. Exchangestart state  
The neighbor routers decide which router starts communication. The router with the higher router ID becomes master.
4. Exchange state  
The neighbor routers send packets that describe the content of their neighborhood database. The neighborhood database (link state database - LSDB) contains information on the topology of the network.

#### 5. Loading state

The router completes the received information. If the router still has questions relating to the status of a specific connection, it sends a link state request. The neighbor router sends a response (link state update). The response contains a suitable LSA. The router confirms receipt of the response (link state acknowledge).

#### 6. Full State

The information exchange with the neighbor router is completed. The neighborhood database of the neighbor router is the same. Based on the Short Path First algorithm, the router calculates a route to every destination. The route is entered in the routing table.

### Check the neighborhood

The Hello packets are only used to establish the neighborhood relations. Hello packets are used to check the connection to the neighbor router by sending them cyclically. If no Hello packet is received within a certain interval (dead interval), the connection to the neighbor is marked as "down". The relevant entries are deleted.

### Updating the neighborhood database

Once the neighborhood database is established, LSAs are sent to all routers in the network if there are changes in the topology.

## RIPv2

### Dynamic routing with RIPv2

The Routing Information Protocol (RIPv2) is used to create routing tables automatically. RIPv2 is used in autonomous systems (AS) with a maximum of 15 routers. It is based on the Distance-Vector algorithm.

RIPv2 was developed by the IETF (Internet Engineering Task Force) and is described in RFC 2453.

You configure RIPv2 in "Layer 3 > RIPv2".

### Setting up a routing table

Since a router initially only knows its directly connected networks, it sends a request to its direct neighbor routers. As the reply, it receives the routing tables of the neighbor routers. Based on the information it receives, the router set up its own routing table.

The routing table contains entries for all possible destinations. Each entry includes the distance to the destination and the first router on the route.

The distance is also known as the metric. This indicates the number of routers to be passed through on the route to the destination (hop count). The maximum distance is 15 routers (hops).

### Updating the routing table

Once the routing table is set up, the router sends its routing table to each direct neighbor router at intervals of 30 seconds.

The router compares new routing information with its existing routing table. If the new information includes shorter routes, the existing routes are overwritten. The router only keeps the shortest route to a destination.

### **Checking neighbor routers**

If a router does not receive messages from a neighbor router for longer than 180 seconds, it marks the router as being invalid. The router assigns the metric 16 for the neighbor router.

### **Link aggregation**

#### **Link aggregation**

With link aggregation, several parallel physical connections with the same transmission speed are grouped together to form a logical connection with a higher transmission speed. This method based on IEEE 802.3ad is also known as port trunking or channel bundling.

Link aggregation works only with full duplex connections with the same transmission speed in point-to-point mode. This achieves multiplication of the bandwidth or transmission speed. If part of the connection fails, the data traffic is handled via the remaining parts of the connection.

To control and monitor, the Link Aggregation Control Layer (LACL) and the Link Aggregation Control Protocol (LACP) are used.

### **Authentication**

#### **Authentication method**

You can configure the authentication methods "802.1x" and "MAC Authentication" as well as the "Guest VLAN" option separately for each port.

The functions have a hierarchical order. If all three functions are enabled, an attempt is made initially to authenticate the end device using "802.1x". If this authentication is unsuccessful, "MAC Authentication" is started. If this authentication is also unsuccessful, the end device is enabled for communication in the "Guest VLAN". "Guest VLAN" can only be used if at least one authentication method is active.

The two authentication methods depend on the end device. If the end device supports EAP (Extensible Authentication Protocol), it can be authenticated using the "802.1x" method. If the end device does not support EAP, it can be authenticated using "MAC Authentication". In this case, the IE switch adopts the role of the end device and uses the MAC address of the device as the authentication parameter.

#### **802.1x**

The "802.1x" authentication method works as follows:

An end device that supports EAP sends authentication information to the IE switch. The IE switch forwards the information to the authentication server. The authentication server checks the information and allows or denies the end device access to the network.

## MAC Authentication

The "MAC Authentication" authentication method works as follows:

As soon as the IE switch receives a frame from the end device, the IE switch sends a query to the RADIUS server to allow or deny the end device access to the network.

## Editing properties and parameters

### Editing options

You have the following options for editing properties and parameters:

- **Hardware and network editor**  
Once you have inserted the network component, you can edit the properties and parameters, for example the device name. You will find more detailed information in "Hardware and network editor".
- **Web Based Management (WBM)**  
The parameters and properties are accessible using the supplied HTML pages (WBM pages). Each WBM page has its own help page that describes the properties and parameters. For further information, refer to the configuration manual "SCALANCE XM400/X-500 Web Based Management". You will find the MIB at Siemens Industry Automation and Drives Service & Support on the Internet under the entry ID 67428305 (<http://support.automation.siemens.com/WW/view/en/67428305>).
- **Command Line Interface**  
All the configuration settings for the device can be made using the CLI. The CLI provides the same options as Web Based Management (WBM). For further information, refer to the configuration manual "SCALANCE XM400/X-500 Command Line Interface". You will find the MIB at Siemens Industry Automation and Drives Service & Support on the Internet under the entry ID 67430663 (<http://support.automation.siemens.com/WW/view/en/67430663>).

## Availability

The availability of the settings depends

- on the port type
- on the configuration mode

SCALANCE X distinguishes the following port types:

- Switch port
- Router port

The following configuration modes are available:

## 8.1 Configuring devices and networks

- **Offline configuration**  
You can configure a PC station the first time offline. In this mode only the settings that require no connection to the device are available.
- **Online configuration mode**  
If there is a connection to the device, there are additional pages available in the Inspector window. These pages include the note "This page is only available if there is an online connection to the device". With some settings, the additional information "only available online" is included.

### Creating and deleting an entry

As an example, an entry will be created and deleted on the Syslog client. The procedure is valid on all pages.

#### Creating a new entry

1. Select the device in the network or device view.
2. Open the properties of the device in the Inspector window.
3. In the Inspector window go to System > Syslog client.
4. Enter the IP address for the Syslog server.
5. Click in the table.
6. Select the entry "New entry" in the shortcut menu.  
A new entry is created in the table.

#### Deleting an entry

1. Select the required entry in the table.
2. Select the "Delete" entry in the shortcut menu.

### Buttons you require often

- **Refresh the display with "Refresh"**  
Pages that display current parameters have a "Refresh" button at the lower edge of the page. Click this button to request up-to-date information from the device for the current page.
- **Save settings for all ports with "Transfer to table"**  
Pages on which you can configure several ports have 2 tables. In the first table, you can make the settings for all ports and transfer these to the second table. In the last column of the first table, there is the "Transfer to table" button. Click this button to save the settings you have made for all ports.

### IP address assignment

#### Configuration options

When shipped and after restoring to the factory settings, the device does not have an IP address.

The following options are available to assign an IP address to the device:

- DHCP (default setting)
- Primary Setup Tool  
For further information, refer to the configuration manual "Primary Setup Tool". You will find the MIB at Siemens Industry Automation and Drives Service & Support on the Internet under the entry ID 19440762 (<http://support.automation.siemens.com/WW/view/en/19440762>).
- STEP 7
- CLI via the serial interface  
For further information, refer to the configuration manual "SCALANCE X500 Command Line Interface". You will find the MIB at Siemens Industry Automation and Drives Service & Support on the Internet under the entry ID 67430663 (<http://support.automation.siemens.com/WW/view/en/67430663>).

### Requirement

- "Set IP address on device" is enabled in the properties of the device. You will find more detailed information in "Addressing PROFINET devices".

### SCALANCE XR500 as IO device: "Compile" and "Download to device"

With a SCALANCE XR500 configured as a PROFINET IO device and assigned to an IO controller, the functions "Compile" and "Download to device" only download the data to the switch that can also be configured in Web Based Management (WBM) (layer 2, layer 3, system, security).

If you want to use the "Compile" or "Download to device" functions for the PROFINET IO device data of the XR500, first select the assigned IO controller.

### Information

### Versions

---

**Note**

The page is only available if there is an online connection to the device.

---

This page shows the versions of the hardware and software of the device.

### Description

Table 1 has the following columns:

- **Hardware**  
Shows the device being used.
- **Name**  
Shows the name of the device or module.

- **Revision**  
Shows the hardware version of the device.
- **Order ID**  
Shows the order number of the device or module.

Table 2 has the following columns:

- **Software**
  - Firmware  
Shows the current firmware version. If a new firmware file was downloaded and the device has not yet restarted, the firmware version of the downloaded firmware file is displayed here. After the next restart, the downloaded firmware is activated and used.
  - Bootloader  
Shows the version of the boot software stored on the device.
- **Description**  
Shows the short description of the software.
- **Version**  
Shows the version number of the software version.
- **Date**  
Shows the date on which the software version was created.

## I&M

---

### Note

The page is only available if there is an online connection to the device.

---

This page contains information about device-specific vendor and maintenance data such as the order number, serial number, version number etc. You cannot configure anything on this page.

## Description of the displayed values

The table has the following rows:

- **Manufacturer ID**  
Shows the manufacturer ID.
- **Order number**  
Shows the order number.
- **Serial number**  
Shows the serial number.
- **Hardware revision**  
Shows the hardware version.
- **Software version**  
Shows the software version.

- **Revision counter**  
Shows the revision counter: Counter for revisions since the initial commissioning
- **Revision Date**  
Date and time of the last revision
- **Function tag**  
Shows the function tag (plant designation) of the device. The plant designation (HID) is created during configuration of the device with HW Config of STEP 7.
- **Location tag**  
Shows the location tag of the device. The location identifier (LID) is created during configuration of the device with HW Config of STEP 7.

## ARP table

---

### Note

The page is only available if there is an online connection to the device.

---

## Assignment of MAC address and IP address

With the Address Resolution Protocol (ARP), there is a unique assignment of MAC address to IPv4 addresses. This assignment is kept by each network node in its own separate ARP table. The page shows the ARP table of the device.

## Displayed values

The table has the following columns:

- **Interface**  
Shows the interface via which the row entry was learnt.
- **MAC address**  
Shows the MAC address of the target device.
- **IP address**  
Shows the IP address of the target device.
- **Media Type**  
Shows the type of connection.
  - Dynamic  
The device recognized the address data automatically.
  - Static  
The addresses were entered as static addresses

## Log table

### Logging events

---

#### Note

The page is only available if there is an online connection to the device.

---

The device allows you to log events that occur, some of which you can specify in " System > Events". This, for example, allows you to record when an authentication attempt failed or when the connection status of a port has changed. The content of the events log table is retained even when the device is turned off.

### Settings

- **Severity Filters**  
You can filter the entries in the table according to severity. To display all the entries, enable or disable all settings.
  - Info  
Information (6)
  - Warning  
Warnings (4)
  - Critical  
Critical (2)

### Displayed values

The table has the following columns:

- **Restart**  
Counts the number of restarts since you last reset to factory settings and shows the device restart after which the corresponding event occurred.
- **System up time**  
Shows the time the device has been running since the last restart when the described event occurred.  
If the system time is set, the time is also displayed at which the event occurred.
- **System Time**  
Shows the date and time of the device.
- **Severity**  
Shows the severity.
- **Log Message**  
Displays a brief description of the event that has occurred.

## Buttons

- **Delete**  
Click this button to delete the content of the event log file. The display is also cleared. The restart counter is only reset after you have restored the device to the factory settings and restarted the device.

---

### Note

The number of entries in this table is restricted to 400. When this number is reached, the oldest entries are overwritten. The table remains permanently in memory.

---

## Fault

### Error status

---

#### Note

The page is only available if there is an online connection to the device.

---

This page displays any errors that occur. If there are no more unanswered error/fault messages, the fault LED goes off.

The time calculation always begins after the last system start. When the system is restarted, a new entry with the type of restart is created in the fault memory.

### Description of the displayed values

- **No. of Signaled Faults**  
Shows the number of reported faults.  
The table contains the following columns:
- **Fault Time**  
Shows the time the device has been running since the last restart when the described error/fault occurred.
- **Fault description**  
Display of the fault state for the device.
- **Clear Fault State**  
When you can delete faults, the "Clear Fault State" button is enabled.

## Redundancy

## Spanning Tree

---

### Note

The page is only available if there is an online connection to the device.

---

The page shows the current information about the Spanning Tree and the settings of the root bridge.

- If Spanning Tree is turned off, only the basic information about this device is displayed.
- If Spanning Tree is activated, the following is displayed:
  - Parameters of the selected instance
  - Parameters for the ports of the selected instance

The information depends on the selected Spanning Tree mode.

## Displayed values

- **Spanning Tree Mode**  
Shows the set mode. You specify the mode in "Layer 2 > MSTP > General".  
The following values are possible:
  - ' '
  - STP
  - RSTP
  - MSTP
- **Instance ID**  
Shows the number of the instance. The parameter depends on the configured mode.
- **Bridge Priority / Root Priority**  
Which device becomes the root bridge is decided by the bridge priority. The bridge with the highest priority (in other words, with the lowest value for this parameter) becomes the root bridge. If several devices in a network have the same priority, the device whose MAC address has the lowest numeric value will become the root bridge. Both parameters, bridge priority and MAC address together form the bridge identifier. Since the root bridge manages all path changes, it should be located as centrally as possible due to the delay of the frames. The value for the bridge priority is a whole multiple of 4096.
- **Bridge address / root address**  
The bridge address shows the MAC address of the device and the root address shows the MAC address of the root bridge.
- **Root Cost**  
Shows the path costs from the device to the root bridge.  
In MSTP mode, the path costs as far as the root bridge of the CIST are displayed.
- **Bridge Status**  
Shows the status of the bridge, e.g. whether or not the device is the root bridge.

- **Regional root priority** (available only with MSTP)  
For a description, see Bridge priority / Root priority.
- **Regional root address** (available only with MSTP)  
Shows the MAC address of the device.
- **Regional root costs** (only available with MSTP)  
The path costs from this device to the regional root bridge.

The table has the following columns:

- **Port**  
Shows the port via which the device communicates.
- **Role**  
Shows the status of the port. The following values are possible:
  - Disabled  
The port was removed manually from the spanning tree and will no longer be taken into account by the spanning tree.
  - Designated  
The ports leading away from the root bridge.
  - Alternate  
The port with an alternative route to a network segment
  - Backup  
If a switch has several ports to the same network segment, the "poorer" port becomes the backup port.
  - Root  
The port that provides the best route to the root bridge.
  - Master  
This port points to a root bridge located outside the MST region.
- **Status**  
Displays the current status of the port. The values are only displayed. The parameter depends on the configured protocol. The following statuses are possible:
  - Discarding  
The port receives BPDU frames. Other incoming or outgoing frames are discarded.
  - Listening  
The port receives and sends BPDU frames. The port is involved in the spanning tree algorithm. Other outgoing and incoming frames are discarded.
  - Learning  
The port actively learns the topology; in other words, the node addresses. Other outgoing and incoming frames are discarded.
  - Forwarding  
Following the reconfiguration time, the port is active in the network. The port receives and sends data frames.
- **Oper. Version**  
Describes the type of spanning tree in which the port operates

- **Priority**

If the path calculated by the spanning tree is possible over several ports of a device, the port with the highest priority (in other words the lowest value for this parameter) is selected. A value between 0 and 240 can be entered for the priority in steps of 16. If you enter a value that cannot be divided by 16, the value is automatically adapted.
- **Path costs**

This parameter is used to calculate the path that will be selected. The path with the lowest value is selected. If several ports of a device have the same value, the port with the lowest port number will be selected.

If the value "Cost Calc." is "0", the automatically calculated value is displayed. Otherwise, the value of "Cost Calc." is displayed.

The calculation of the path costs is largely based on the transmission speed. The higher the achievable transmission speed is, the lower the value of the path costs.

Typical values for path costs with rapid spanning tree:

  - 10,000 Mbps = 2,000
  - 1000 Mbps = 20,000
  - 100 Mbps = 200,000
  - 10 Mbps = 2,000,000.
- **Edge type**

Shows the type of the connection. The following values are possible:

  - Edge Port  

An edge port is connected to this port.
  - No Edge Port  

There is a spanning tree or rapid spanning tree device at this port.
- **P.t.P. Type**

Shows the type of point-to-point link. The following values are possible:

  - P.t.P.  

With half duplex, a point-to-point link is assumed.
  - Shared Media  

With a full duplex connection, a point-to-point link is not assumed.

## VRRP statistics

### Introduction

---

#### Note

The page is only available if there is an online connection to the device.

---

This page shows the statistics of the VRRP protocol and all configured virtual routers.

## Description of the displayed values

The following fields are displayed:

- **VRID errors**  
Shows how many VRRP frames containing an unsupported VRID were received.
- **Version errors**  
Shows how many VRRP frames containing an invalid version number were received.
- **Checksum errors**  
Shows how many VRRP frames containing an invalid checksum were received.

The table has the following columns:

- **Interfaces**  
Interface to which the settings relate.
- **VRID**  
Shows the ID of the virtual router.  
Valid values are 1 to 255.
- **Change to master status**  
Shows how often this virtual router changed to the "Master" role.
- **Advertisements recd.**  
Shows how often a VRRP frame was received that contained a bad address list.
- **Advertisement Interval Errors**  
Shows how many bad VRRP packets were received whose interval does not match the value set locally.
- **IP TTL errors**  
Shows how many bad VRRP packets were received whose TTL (Time to live) value in the IP header is incorrect.
- **Prio 0 received**  
Shows how many VRRP packets with priority 0 were received. VRRP packets with priority 0 are sent when a master router is shut down. These packets allow a fast handover to the relevant backup router.
- **Prio 0 sent**  
Shows how many VRRP packets with priority 0 were sent. Packets with priority 0 are sent when a master router is shut down. These packets allow a fast handover to the relevant backup router.
- **Invalid Type**  
Shows how often a VRRP packet was received that had the wrong type.
- **Address List Errors**  
Shows the number of errors in the address list.
- **Invalid Auth. Type**  
Shows how many bad VRRP packets were received whose authentication type was not type 0. Type 0 means "no authentication".

- **Auth. Type Mismatch**  
Shows how many bad VRRP frames were received whose authentication type does not match.
- **Frame length error**  
Shows how many bad VRRP frames were received whose length is not correct.

## Ring Redundancy

---

### Note

The page is only available if there is an online connection to the device.

---

Automatic Redundancy Detection (ARD) is the default when the device ships. If you want to use the previous High Speed Redundancy Protocol (HRP), HRP must be configured.

- Reconfiguration time of the frame traffic following a failover in MRP: 200 ms
- Reconfiguration time of the frame traffic following a failover in HRP: 300 ms

This page informs you about the values currently set for the device.

## Description

The following fields are displayed:

- **Redundancy Function**

The following values are shown:

- Disabled  
Ring redundancy is disabled on the device.
- MRP Manager  
The device is operating as MRP manager.
- MRP Client  
The device is operating as MRP client.
- HRP Client  
The device is operating as HRP client.
- HRP Manager  
The device is operating as HRP manager.

- **RM Status**

The "RM Status" column shows whether or not the IE switch is operating as redundancy manager and whether it has opened or closed the ring in this role.

- Passive  
The IE switch is operating as redundancy manager and has opened the ring; in other words, the line of switches connected to the ring ports is operating problem free. The passive status is also displayed if the IE switch is not operating as the redundancy manager (RM Function Disabled).
- Active  
The IE switch is operating as redundancy manager and has closed the ring; in other words, the line of switches connected to the ring ports is interrupted (problem). The redundancy manager connects its ring ports through and restores an uninterrupted linear topology.
- If media redundancy in ring topologies is completely disabled, ring ports configured last are displayed and the text "Ring Redundancy disabled" is displayed.

- **Observer Status**

Shows the current status of the observer.

- **Ring ports**

Ring ports 1 and ring port 2 show the ports used for redundancy.

- **No. of Changes to RM Active State**

Shows how often the device as redundancy manager switched to the active status, i.e. closed the ring.

If the redundancy function is disabled or the device is not the HRP/MRP manager, the text "Redundancy manager disabled" appears.

- **Max. delay of the RM test frames [ms]**

Shows the maximum delay for test frames of the redundancy manager.

If the redundancy function is disabled or the device is not the HRP/MRP manager, the text "Redundancy manager disabled" appears.

## Standby

---

### Note

The page is only available if there is an online connection to the device.

---

This page shows the standby status of the device.

For more information on Ethernet cabling and the topological location of master and slave, refer to the "Industrial Ethernet Network Manual".

## Description

The following fields are displayed:

- **Standby ports**  
Shows the ports being used.
- **Standby name**  
Shows the name for the standby connection. The master/slave device pair is defined by this name (both must be in the same ring). This is achieved by entering the same name on two devices in the ring. You can select any name to suit your purposes, however, you can only use the name for one pair of devices in the entire network.
- **Standby Function**  
Shows whether the standby connection is activated or deactivated.
  - Master  
The device has a connection to the partner device and is operating as master. In normal operation, the standby port of this device is active.
  - Slave  
The device has a connection to the partner device and is operating as slave. In normal operation, the standby port of this device is inactive.
  - Disabled  
The standby link is disabled. The device is operating neither as master nor slave. The standby port is working as a normal port without standby function.
  - Waiting for Connection...  
No connection has yet been established to the partner device. The standby port is inactive. In this case, either the configuration on the partner device is inconsistent (for example incorrect connection name, standby link disabled) or there is a physical fault (for example device failure, link down).
  - Connection Lost  
The existing connection to the partner device has been lost. In this case there is either a physical fault (for example, device failure, link down) or the configuration on the partner device was modified (for example different connection name, standby link disabled).

- **Standby status**  
Shows the status of the standby port:
  - Active  
The standby port of this device is active; in other words is enabled for frame traffic.
  - Passive  
The standby port of this device is inactive; in other words is blocked for frame traffic.
- **No. of Changes to Standby Active State**  
Shows the number of changes from the inactive to the active status.

## Ethernet Statistics

### Interface statistics

### Interface statistics

The page shows the statistics from the interface table of the Management Information Base (MIB).

---

#### Note

The page is only available if there is an online connection to the device.

---

## Displayed values

The table has the following columns:

- **Received bytes**  
Shows the number of received bytes.
- **Sent bytes**  
Shows the number of sent bytes.
- **Received unicast frames**  
Shows the number of received unicast frames.
- **Received non-unicast frames**  
Shows the number of received frames that are not of the type unicast.
- **Sent unicast frames**  
Shows the number of sent unicast frames.
- **Sent non-unicast frames**  
Shows the number of sent frames that are not of the type unicast.

## Frame length

### Frames sorted by length

This page displays how many frames of which size were sent and received at each port.

---

#### Note

The page is only available if there is an online connection to the device.

---

### Displayed values

The table has the following columns:

- **Port**  
Shows the available ports and link aggregations.

---

#### Note

##### Display of frame statistics

In the statistics relating to frame lengths, note that both incoming and outgoing frames are counted.

---

- **Frame lengths**  
The other columns after the port number contain the absolute numbers of incoming frames according to their frame length.  
The following frame lengths are distinguished:
  - 64 bytes
  - 65 - 127 bytes
  - 128 - 255 bytes
  - 256 - 511 bytes
  - 512 - 1023 bytes
  - 1024 - max.

### Button

#### Reset Counter

Click "Reset Counter" to reset all counters. The counters are also reset by a restart.

## Frame type

### Received frames sorted by type

This page displays how many frames of the type "unicast", "multicast", and "broadcast" were received at each port.

---

**Note**

The page is only available if there is an online connection to the device.

---

### Displayed values

The table has the following columns:

- **Port**  
Shows the available ports and link aggregations.
- **Unicast/Multicast /Broadcast**  
The other columns after the port number contain the absolute numbers of the incoming frames according to their frame type "unicast", "multicast" and "broadcast".

## Button

### Reset Counter

Click "Reset Counter" to reset all counters. The counters are also reset by a restart.

## Packet Errors

### Received bad frames

This page shows how many bad frames were received per port.

---

**Note**

The page is only available if there is an online connection to the device.

---

## Displayed values

The table has the following columns:

- **Port**  
Shows the available ports and link aggregations.
- **Error types**  
The other columns after the port number contain the absolute numbers of the incoming frames according to their error type.  
In the columns of the table, a distinction is made according to the following error types:
  - CRC  
Frames whose content does not match the CRC checksum.
  - Undersize  
Frames with a length less than 64 bytes.
  - Oversize  
Frames discarded because they were too long.
  - Fragments  
Frames with a length less than 64 bytes and a bad CRC checksum.
  - Jabbers  
VLAN-tagged frames with an incorrect CRC checksum that were discarded because they were too long.
  - Collisions  
Collisions that were detected.

## Button

### Reset Counter

Click "Reset Counter" to reset all counters. The counters are also reset by a restart.

## History

## Samples of the statistics

The page shows samples from each port with information from the statistics.

---

### Note

The page is only available if there is an online connection to the device.

---

## Settings

- **Port**  
Select the port for which the history will be displayed.

## Displayed values

- **Entries**  
Maximum number of samples that can be saved at the same time.
- **Interval [s]**  
Interval after which the current status of the statistics will be saved as a sample.

The table has the following columns:

- **Sample**  
Number of the sample
- **Time for the Sample**  
System up time at which the sample was taken.
- **Unicast**  
Number of received unicast frames.
- **Multicast**  
Number of received multicast frames.
- **Broadcast**  
Number of received broadcast frames.
- **CRC**  
Number of frames with a bad CRC checksum.
- **Undersize**  
Number of frames that are shorter than 64 bytes.
- **Oversize**  
Number of frames discarded because they were too long.
- **Fragments**  
Number of frames that are shorter than 64 bytes and have a bad CRC checksum.
- **Jabbers**  
Number of frames with a VLAN tag that have a bad CRC checksum and will be discarded because they are too long.
- **Collisions**  
Number of collisions of received frames.
- **Utilization**  
Utilization of the port during a sample.

## Unicast

This page shows the learnt and static unicast MAC addresses.

## Description

- **VLAN ID**  
Shows the VLAN-ID assigned to this MAC address.
- **MAC Address**  
Shows the MAC address of the node that the device has learned or the user has configured.
- **Status**  
Shows the status of each address entry:
  - Learnt  
The specified address was learned by receiving a frame from this node and will be deleted when the aging time expires if no further packets are received from this node.
  - Static  
Configured by the user. Static addresses are stored permanently; in other words, they are not deleted when the aging time expires or when the switch is restarted.
- **Port**  
Shows the port via which the node with the specified address can be reached. Frames received by the device whose destination address matches this address will be forwarded to this port.

## Multicast

This page shows the learnt and static multicast MAC addresses.

## Description

- **VLAN ID**  
Shows VLAN ID of the VLAN to which the MAC multicast address is assigned.
- **MAC Address**  
Shows the MAC multicast address that the device has learned or the user has configured.
- **Status**  
Shows the status of each address entry. The following information is possible:
  - static  
The address was entered statically by the user. Static addresses are stored permanently; in other words, they are not deleted when the aging time expires or when the device is restarted. These must be deleted by the user.
  - IGMP  
The destination port for this address was obtained by IGMP configuration.
  - GMRP  
The destination port for this address was registered by a received GMRP frame.

## Routing

### Routing table

This page shows the routing table of the device.

## Description

The table has the following columns:

- **Destination network**  
Shows the destination address of this route.
- **Subnet mask**  
Shows the subnet mask of this route.
- **Gateway**  
Shows the gateway for this route.
- **Interface**  
Shows the interface for this route.
- **Metric**  
Shows the metric of the route. The higher value, the longer the packets require to their destination.
- **Routing protocol**  
Shows the routing protocol from which the entry in the routing table originates. The following entries are possible:
  - Connected: Connected routes
  - Static: Static routes
  - RIP: Routes using RIP
  - OSPF: Routes using OSPF
  - other: Other routes

## OSPFv2 interfaces

### Overview

---

#### Note

The page is only available if there is an online connection to the device.

---

This page shows the configuration of the OSPF interface.

### Description of the displayed values

The table has the following columns:

- **IP address**  
Shows the IP address of the OSPF interface
- **Area ID**  
Shows the Area ID to which the OSPF interface belongs.

- **Interface Status**  
Shows the status of the WLAN interface:
  - Down  
The interface is not available.
  - Loopback  
Loopback interface
  - Waiting  
Startup and negotiation of the interface.
  - Point to Point  
Point-to-point connection
  - Designated Router  
The router is a designated router and generates a network LSA.
  - Backup D. Router  
The router is backup for the designated router.
  - Other D. Router  
The interface is started up. The router is neither a designated router nor a backup designated router.
- **OSPF status**  
Shows the status of OSPF.
  - Enabled: OSPF is enabled on the interface.
  - Disabled: OSPF is disabled on the interface.
- **Designated Router**  
Shows the IP address of the designated router for this OSPF interface.
- **Backup Designated Router**  
Shows the IP address of the designated backup router for this OSPF interface.
- **Events**  
Shows the number of status changes of OSPF.

## OSPFv2 neighbors

---

### Note

The page is only available if there is an online connection to the device.

---

This page shows the dynamically detected neighbor routers in the relevant networks.

## Description of the displayed values

The table has the following columns:

- **IP address**  
Shows the IP address of the neighbor router in this network.
- **Router ID**  
Shows the ID of the neighbor router. The two addresses can match.

- **Status**  
Shows the status of the neighbor router. The status can adopt the following values:
  - unknown  
Status of the neighbor router is unknown.
  - down  
The neighbor router cannot be reached.
  - attempt and init  
Short-lived statuses during initialization
  - two-way  
Two-way receipt of Hello packets. Specification of the designated router and the designated backup router.
  - exchangestart, exchange and loading  
Status during exchange of the LSAs
  - full  
The database is complete and synchronized within the area. The routes can now be detected.

---

**Note****Normal status**

If the partner router is a designated router or a designated backup router, the status is "full". Otherwise the status is "two-way".

---

- **Assoc. Area Type**  
Shows the area type via which the neighbor-neighbor relation is maintained. The following area types exist:
  - Normal
  - Stub
  - NSSA
  - Backbone
- **Priority**  
Shows the priority of the neighbor router. This is only significant when selecting the designated router on a network. For virtual neighbor routers, this information is irrelevant.
- **Hello Suppr.**  
Shows whether there are suppressed Hello packets to the virtual neighbor router.
  - no: There are no suppressed Hello packets (default).
  - yes: There are suppressed Hello packets.
- **Hello Queue**  
Shows the length of the queue with Hello packets still to be transmitted.
- **Events**  
Shows the number of status changes.

## OSPFv2 virtual neighbors

---

### Note

The page is only available if there is an online connection to the device.

---

This page shows the configured virtual neighbor routers.

## Overview

The table has the following columns:

- **IP address**  
Shows the IP address of the virtual neighbor router in this network.
- **Router ID**  
Shows the router ID of the virtual neighbor router.
- **Status**  
Shows the status of the neighbor router. The status can adopt the following values:
  - unknown  
Status of the neighbor router is unknown.
  - down  
The neighbor router cannot be reached.
  - attempt and init  
Short-lived statuses during initialization
  - two-way  
Two-way receipt of Hello packets. Specification of the designated router and the designated backup router.
  - exchangestart, exchange and loading  
Status during exchange of the LSAs
  - full  
The database is complete and synchronized within the area. The routes can now be detected.

---

### Note

#### Normal status

If the partner router is a designated router or a designated backup router, the status is "full". Otherwise the status is "two-way".

---

- **Trans. Area ID**  
Shows the ID of the area via which the virtual neighborhood relation exists.
- **Hello Suppr.**  
Shows whether there are suppressed Hello packets to the virtual neighbor router.
  - no: There are no suppressed Hello packets (default)
  - yes: There are suppressed Hello packets.

- **Hello Queue**  
Shows the length of the queue with Hello packets still to be transmitted.
- **Events**  
Shows the number of status changes.

## OSPFv2 LSDB

### Overview

---

**Note**

The page is only available if there is an online connection to the device.

---

The link state database is the central database for managing all links within an area. It consists of the link state advertisements (LSAs). The most important data of these LSAs is shown on the this WBM page.

## Description of the displayed boxes

The table has the following columns:

- **Area ID**  
Shows the ID of the area to which the LSA belongs. If the LSA is an external connection, '-' is displayed.
- **LSA type**  
Shows the LSA type. The following values are possible:
  - unknown  
LSA type is unknown.
  - Router  
The router LSA (Type 1) is sent by the OSPF router within an area. The LSA contains information about the status of all router interfaces.
  - Network  
The network LSA (Type 2) is sent by the designated router within an area. The LSA contains a list of routers connected to the network.
  - NSSA External  
The NSSA external LSA (Type 7) is sent by the NSSA-ASBR within an NSSA. The NSSA-ASBR receives LSAs of Type 5 and converts the information to LSAs of Type 7. The NSSA router can forward these LSAs within an NSSA.
  - Summary  
The summary LSA (Type 3) is sent by the ABR within an area. The LSA contains information about routes to other networks.
  - AS Summary  
The AS summary LSA (Type 4) is sent by the area border router within an area. The LSA contains information about routes to other autonomous systems.
  - AS External  
The AS external LSA (Type 5) is sent by the AS border router within an autonomous system. The LSA contains information about routes from one network to another.
- **Link State ID**  
Shows the ID of the LSA.
- **Router ID**  
Shows the ID of the router that sent this LSA.
- **Sequence number**  
Shows the sequence number of the LSA. Each time an LSA is renewed, this sequence number is incremented by one.

## RIPv2 statistics

### Overview

---

#### Note

The page is only available if there is an online connection to the device.

---

This page shows the statistics of the RIP interface.

### Description of the displayed values

The table has the following columns:

- **IP address**  
Shows the IP address of the RIPv2 interface
- **Bad packets**  
Number of received RIP packets that were deleted and therefore ignored.
- **Bad Routes**  
Number of routes of valid RIP packets that could not be taken into consideration.
- **Updates Sent**  
Shows how often the router has sent its routing table to its neighbor routers.

### System

### Configuration

On this page, you specify the services with which the device can be accessed. With some services, there are further configuration pages on which more detailed settings can be made.

### Settings

- **Telnet Server**  
Enable or disable the "Telnet Server" service for unencrypted access to the CLI.
- **SSH server**  
Enable or disable the "SSH Server" service for encrypted access to the CLI.
- **HTTPS server only**  
Enable or disable access using HTTP.
- **DNS client**  
Enable or disable depending on whether the IE switch should operate as a DNS client. You can configure other settings in "System > DNS Client".
- **SMTP Client**  
Enable or disable the SMTP client. You can configure other settings in "System > SMTP Client".
- **Syslog Client**  
Enable or disable the system event client. You can configure other settings in "System > Syslog client".

- **DCP Server**

Specify whether or not the device can be accessed with DCP (Discovery and Configuration Protocol):

  - "-" (disabled)  
DCP is disabled. Device parameters can neither be read nor modified.
  - Read/write access  
With DCP, device parameters can be both read and modified.
  - Read-Only  
With DCP, device parameters can be read but cannot be modified.
- **Time**

Select the required setting. The following settings are possible:

  - Manual  
The system time is set manually.
  - SNTP Client  
The system time is set via an SNTP server. You can configure other settings in "System > System time > SNTP client".
  - NTP Client  
The system time is set via an NTP server. You can configure other settings in "System > System time > NTP client".
  - SIMATIC Time  
The system time is set using a SIMATIC time transmitter. You can configure other settings in "System > System Time SIMATIC Time Client".
  - PTP Client  
The system time is set via a PTP server. You can configure other settings in "System > System Time > PTP Client".  
This function is only available for SCALANCE X500.
- **SNMP**

Select the required protocol. The following settings are possible:

  - "-" (SNMP disabled)  
Access to device parameters using SNMP is not possible.
  - SNMPv1/v2c/v3  
Access to device parameters is possible with SNMP versions 1, 2c or 3. You can configure other settings in "System > SNMP > General".
  - SNMPv3  
Access to device parameters is possible with SNMP version 3. You can configure other settings in "System > SNMP > General".
- **SNMPv1/v2 Read-Only**

Enable or disable write access to SNMP variables with SNMPv1/v2c.
- **SNMPv1 traps**

Enable or disable the sending of SNMP traps (alarm frames). You can configure other settings in "System > SNMP > Traps".

- **NFC (Near Field Communication)**  
Enable or disable the "NFC" function.  
This function is only available for SCALANCE XM400.
- **Configuration mode**  
Select the required mode. The following modes are possible:
  - Automatic save  
Automatic save mode. Approximately 1 minute after the last parameter change or when you restart the device, the configuration is automatically saved.
  - Trial  
In the "Trial" configuration mode, although changes are adopted, they are not saved in the configuration file (startup configuration).  
To save changes in the configuration file, use the "Write startup config" button. The button is displayed when you set this configuration mode. The display area also shows the message "Trial mode active - Press "Write Startup Config" button to make your settings persistent" as soon as there are unsaved modifications. This message can be seen on every page until the changes made have either been saved or the device has been restarted.

## General

### Device

This page contains the general device information.

### Settings

- **Current System Time**(Only available online)  
Shows the current system time. The system time is either set by the user or by a time-of-day frame: either SINEC H1 time-of-day frame, NTP or SNTP. (readonly)
- **System Up Time**(only available online)  
Shows the operating time of the device since the last restart. (readonly)
- **Device Type**(only available online)  
Shows the type designation of the device. (readonly)
- **System Name**  
You can enter the name of the device. The entered name is displayed in the selection area. A maximum of 255 characters are possible. The system name is also displayed in the CLI input prompt. The number of characters in the CLI input prompt is limited. The system name is truncated after 16 characters.

- **System Contact**  
You can enter the name of a contact person responsible for managing the device.
- **Location**  
You can enter the location of the device. The entered installation location is displayed in the selection area.

---

**Note**

The ASCII characters 0x20 to 0x7e are used in the input boxes.

At the start and end of the input boxes "System Name", "System Contact" and "System Location", the characters "<", ">" and "space" are not permitted.

---

## Coordinates

On this page, you configure the geographic coordinates (latitude, longitude and the height above the ellipsoid according to WGS84). These boxes are purely for information with a maximum length of 32 characters.

### Getting the coordinates

Use suitable maps for obtaining the geographic coordinates of the device.

The geographic coordinates can also be obtained using a GPS receiver. The geographic coordinates of these devices are normally displayed directly and only need to be entered in the input boxes of this page.

## Settings

- **Latitude**  
Enter the north or south latitude for the location of the device.  
For example, +49° 1' 31.67" means that the device is located at 49 degrees, 1 arc minute and 31.67 arc seconds north latitude.  
A south latitude is shown by a preceding minus character.  
You can also append the letters N (north latitude) or S (south latitude) to the numeric information (49° 1' 31.67" N).
- **Longitude**  
Enter the value of the eastern or western longitude of the location of the device.  
For example, +8° 20' 58.73" means that the device is located at 8 degrees, 20 minutes and 58.73 seconds east.  
A western longitude is indicated by a preceding minus sign.  
You can also add the letter E (eastern longitude) or W (western longitude) to the numeric information (8° 20' 58.73" E).
- **Height**  
Enter the value of the height above sea level in meters.  
For example, 158 m means that the device is located at a height of 158 m above sea level. Heights below sea level (for example the Dead Sea) are indicated by a preceding minus sign.

## Agent IP

### Configuration of the IP addresses

---

**Note**

The page is only available if there is an online connection to the device.

---

On this page, you set the IP configuration for the device.

With devices with more than one IP interface, this call references the "Subnets > Configuration" menu item in the "Layer 3" menu and the configuration of the TIA interface there.

---

**Note**

The IP address of the in-band port and the out-band port must belong to different subnets.

---

### Settings

- **IP Address**  
In the input boxes under "In band", enter the IP address, subnet mask and the default gateway. In the input boxes under "Out band", enter the IP address, subnet mask and the default gateway.  
If you change the IP address, the Web browser should automatically set itself to the new address. If this does not happen, enter the new address in the Web browser manually.
- **Subnet mask**  
Here, in "In-band", you enter the subnet mask of the in-band port and in "Out-band" the subnet mask of the out-of-band port.
- **Default Gateway**  
If the device is required to communicate with devices (diagnostics stations, e-mail servers etc.) in another subnet, enter the IP address of the default gateway here. The out-of-band port it is not accessible from a different subnet.
- **Agent VLAN ID**  
From the drop-down list, select the VLAN ID for the in-band management. You can only select VLANs that have already been configured.

---

**Note****Changing the agent VLAN ID**

If the configuration PC is connected directly to the device via Ethernet and you change the agent VLAN ID, the device is no longer reachable via Ethernet following the change.

---

- **MAC Address**  
Shows the MAC address of the device. The MAC address is linked to the hardware and cannot be modified.

## DNS client

The DNS () server (Domain Name System) assigns a domain name to an IP address so that a device can be uniquely identified.

If this function is enabled, the IE switch can communicate with a DNS server as a DNS client.

---

### Note

The DNS client function can only be used if there is a DNS server in the network.

---

## Description

The page contains the following boxes:

- **DNS Client**  
Enable or disable depending on whether the IE switch should operate as a DNS client.
- **DNS Server IP Address**  
Enter the IP address of the DNS server.

## Restart

On this page, there is a button with which you can restart the device and various options for resetting to the device defaults.

---

### Note

The page is only available if there is an online connection to the device.

---

### Note

Note the following points about restarting a device:

- You can only restart the device with administrator privileges.
  - A device should only be restarted with the buttons of this page or with the appropriate CLI commands and not by a power cycle on the device.
  - Any modifications you have made only become active on the device after clicking the "Set Values" button on the relevant page. If the device is in "Trial Mode", configuration modifications must be saved manually before a restart. In "Automatic Save" mode, the last changes are saved automatically before a restart.
-

## Settings

The following options are available for restarting:

- **Restart**  
Click this button to restart the system. You must confirm the restart in a dialog box. During a restart, the device is reinitialized, the internal firmware is reloaded, and the device runs a self-test. The learned entries in the address table are deleted. You can leave the browser window open while the device restarts. You then need to log in again:
- **Restore Factory Defaults and Restart**  
Click this button to restart the system. You must confirm the restart in a dialog box. During a restart, the device is reinitialized, the internal firmware is reloaded, and the device runs a self-test. The learned entries in the address table are deleted. You can leave the browser window open while the device restarts. You then need to log in again.

---

### Note

By resetting all the defaults to the factory settings, the IP address and the passwords are also lost. Following this, the device can only be accessed using the Primary Setup Tool or using DHCP.

With the appropriate attachment, a previously correctly configured device can cause circulating frames and therefore the failure of the data traffic.

---

## Load & save

### Uploading and saving using HTTP

### Loading and saving data via HTTP

On this page, you store device data in an external file on your client PC or load such data from an external file from the PC to the devices. This means, for example, that you can also load new firmware from a file located on your client PC.

---

### Note

#### Incompatibility with predecessor versions

During the installation of a previous version, the configuration data can be lost. In this case, the device starts up with the factory settings after the firmware has been installed.

#### Incompatibility with previous versions with PLUG inserted

During the installation of a previous version, the configuration data can be lost. In this case, the device starts up with the factory settings after the firmware has been installed. In this situation, if a PLUG is inserted in the device, following the restart, this has the status "Not Accepted" since the PLUG still has the configuration data of the previous more up-to-date firmware. This allows you to return to the previous, more up-to-date firmware without any loss of configuration data. If the original configuration on the PLUG is no longer required, the PLUG can be deleted or rewritten manually using System > PLUG.

---

**Note**

**Configuration files and Trial mode/Automatic Save**

In "Automatic Save" mode, the data is saved automatically before the configuration files (ConfigPack and Config) are transferred.

In Trial mode, although the changes are adopted, they are not saved in the configuration files (ConfigPack and Config). Use the "Write Startup Config" button on the "System > Configuration" WBM page to save changes in the configuration file.

---

**Settings**

The table has the following columns:

- **Type**  
Shows the file type.
- **Description**  
Shows the short description of the file type.
- **Load**  
With this button, you can upload files to the device. The button can be enabled, if this function is supported by the file type.
- **Save**  
With this button, you can save files from the device. The button can only be enabled if this function is supported by the file type and the file exists on the device.
- **Delete**  
With this button, you can delete files from the device. The button can only be enabled if this function is supported by the file type and the file exists on the device.

**Loading new firmware**

After successfully downloading the firmware, you will be requested to restart the device.

Restart the device and continue to configure the newly started firmware.

**Procedure**

**Loading files using HTTP**

1. Start the upload function by clicking the one of the "Load" buttons.  
The dialog for uploading a file opens.
2. Go to the file you want to upload.
3. Click the "Open" button in the dialog.  
The file is now uploaded.
4. When the message "Restart required" appears, click the "Yes" button to trigger the restart.  
If you click the "No" button, there is no device restart. The changes only take effect after a restart.

**Saving files using HTTP**

1. Start the save function by clicking the one of the "Save" buttons.
2. You will be prompted to select a storage location and a name for the file. Or you accept the proposed file name. To make the selection, use the dialog in your browser. After making your selection, click the "Save" button.

**Deleting files using HTTP**

1. Start the delete function by clicking the one of the "Delete" buttons.  
The file will be deleted.

**Reusing configuration data**

If several devices are to receive the same configuration and the IP addresses are assigned using DHCP, the effort for configuration can be reduced by saving and reading in the configuration data.

Follow the steps below to reuse configuration data:

1. Save the configuration data of a configured device on your PC.
2. Download this configuration file to all other devices you want to configure in this way.
3. If individual settings are necessary for specific devices, these must be made online on the relevant device.

Note that the configuration data is coded when it is saved. This means that you cannot edit the files with a text editor.

**Uploading and saving using TFTP****Loading and saving data via a TFTP server**

On this page, you can configure the TFTP server and the file names. You can also store device data in an external file on your client PC or load such data from an external file from the PC to the devices. This means, for example, that you can also load new firmware from a file located on your client PC.

---

**Note****Incompatibility with predecessor versions**

During the installation of a previous version, the configuration data can be lost. In this case, the device starts up with the factory settings after the firmware has been installed.

**Incompatibility with predecessor versions with inserted PLUG**

During the installation of a previous version, the configuration data can be lost. In this case, the device starts up with the factory settings after the firmware has been installed. In this situation, if a PLUG is inserted in the device, following the restart, this has the status "Not Accepted" since the PLUG still has the configuration data of the previous more up-to-date firmware. This allows you to return to the previous, more up-to-date firmware without any loss of configuration data. If the original configuration on the PLUG is no longer required, the PLUG can be deleted or rewritten manually on the "System > PLUG page."

---

**Note**

**Configuration files and Trial mode/Automatic Save**

In "Automatic Save" configuration mode, the data is saved automatically before the configuration files (ConfigPack and Config) are transferred.

In the "Trial" configuration mode, although the changes are adopted, they are not saved in the configuration files (ConfigPack and Config). Use the "Write Startup Config" button on the "System > Configuration" WBM page to save changes in the configuration files.

---

**Settings**

- **TFTP Server IP Address**  
Here, enter the IP address of the TFTP server with which you exchange data.
- **TFTP Server Port**  
Here, enter the port of the TFTP server via which data exchange will be handled. If necessary, you can change the default value 69 to your own requirements.

The table has the following columns:

- **File type**  
Shows the file type.
- **Description**  
Shows the short description of the file type.
- **File name**  
Enter a file name.
- **Select action** (only available online)  
Select the action from the drop-down list. The selection depends on the selected file type, for example the log file can only be saved.  
The following actions are possible:
  - Save file  
With this selection, you save a file on the TFTP server.
  - Load file  
With this selection, you load a file from the TFTP server.

**Events**

**Configuration**

On this page, you specify how the device reacts to events.

## Settings

- **Signaling Contact Response**

Select the behavior of the signaling contact. The following reactions are possible:

- conventional  
Default setting for the signaling contact. An error/fault is displayed by the fault LED and the signaling contact is opened. When the error/fault state no longer exists, the fault LED goes off and the signaling contact is closed.
- User-defined  
The way the signaling contact works does not depend on the error/fault that has occurred. The signaling contact can be opened or closed as required by user actions.

- **Signaling Contact Status**

Select the status of the signaling contact. The following statuses are possible:

- close  
Signaling contact is closed.
- open  
Signaling contact is opened.

Table 1 has the following columns:

- **1st column**

Shows that the settings are valid for all ports of table 2.

- **E-mail/Trap/Log table/Syslog/Errors**

Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.

- **Transfer to table**

If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Event**  
The "Event" column contains the following values:
  - Cold/Warm Start  
The device was turned on or restarted by the user.
  - Link Change  
This event occurs only when the port status is monitored and has changed, see "System > Fault Monitoring > Link Change".
  - Authentication Failure  
This event occurs when attempting access with a bad password.
  - RMON Alarm  
An alarm or event has occurred relating to the remote monitoring of the system.
  - Power Supply Switchover  
This event occurs only when power supply lines 1 and 2 are monitored. It indicates that there was a change to line 1 or line 2, see System > Fault monitoring > Power supply".
  - RM status change  
The status of the redundancy manager has changed
  - Spanning Tree Topology Change  
The STP or RSTP or MSTP topology has changed.
  - Fault State Change  
The fault state has changed. The fault state can relate to the activated port monitoring, the response of the signaling contact or the power supply monitoring.
  - VRRP State Change (only with routing using VRRP)  
The status of the virtual router has changed
  - Loop Detection  
A loop was detected in the network segment.
  - OSPF State Change (only with routing using OSPF)  
The status of OSPF has changed
- **E-mail**  
The device sends an e-mail. This is only possible if the SMTP server is set up and the "SMTP client" function is enabled.
- **Trap**  
The device sends an SNMP trap. This is only possible if "SNMPv1 traps" is enabled in "System > Configuration".
- **Log table**  
The device writes an entry in the log table.
- **Syslog**  
The device writes an entry to the system log server. This is only possible if the system log server is set up and the "Syslog client" function is enabled.
- **Fault**  
The device triggers a fault. The error LED lights up

## Severity filter

On this page, set the threshold levels for sending system event notifications.

## Settings

The table has the following columns:

- **Client Type**  
Select the client type for which you want to make settings:
  - E-mail  
Sending system event messages by e-mail
  - Log table  
Entry of system events in the log table.
  - Syslog  
Entering system events in the Syslog file
- **Severity**  
Select the required level. The following settings are possible:
  - Info  
System events are processed as of the severity level "Info".
  - Warning  
System events are processed as of the severity level "Warning".
  - Critical  
System events are processed as of the severity level "Critical".

## SMTP client

The device provides the option of automatically sending an e-mail if an alarm event occurs (for example to the network administrator). The e-mail contains the identification of the sending device, a description of the cause of the alarm in plain language, and a time stamp. This allows centralized network monitoring to be set up for networks with few nodes based on an E-mail system. When an e-mail event message is received, the WBM can be started by the browser using the identification of the sender to read out further diagnostics information.

On this page, you can configure up to three SMTP servers and the corresponding e-mail addresses.

---

### Note

Depending on the properties and configuration of the SMTP server, it may be necessary to adapt the "From" input box for the e-mails. Check with the administrator of the SMTP server.

---

## Settings

- **SMTP Client**  
Enable or disable the SMTP client.
- **Email address of the sender**  
Enter the name of the sender that will be included in the e-mail, for example the device name.

- **SMTP Port**  
Change the port if the SMTP server is not obtainable via port 25.
- **SMTP Server IP Address**  
Enter the IP address of the SMTP server.

This table contains the following columns:

- **SMTP Server IP Address**  
Shows the SMTP server IP address.
- **Email address of the recipient**  
Enter the e-mail address to which the device sends an e-mail if a fault occurs. The e-mail address can be the address of a single person or a distribution list.

### Syntax of email addresses

The following conditions apply to e-mail addresses:

- Alphanumeric characters are permitted.
- The following special characters are permitted:
  - @
  - \_ (underscore)
  - - (hyphen)
  - . (period)
- A @ character must be included.
- Only one @ may be used.
- The characters "@" and the "." must not be the first or last character.

### DHCP client

If the DHCP mode is activated, the DHCP client starts a DHCP request to a configured DHCP server and is assigned an IP address as the response. The server manages an address range from which it assigns IP addresses. It is also possible to configure the server so that the client always receives the same IP address in response to its request.

## Settings

- **DHCP client configuration request (opt. 66, 67)**  
Select this option if you want the DHCP client to use options 66 and 67 to download and then enable a configuration file.
- **DHCP Mode**  
Select the DHCP mode. The following modes are possible:
  - via MAC Address  
Identification is based on the MAC address.
  - via DHCP Client ID  
Identification is based on a freely defined DHCP client ID.
  - via System Name  
Identification is based on the device name. If the device name is 255 characters long, the last character is not used for identification.

This table contains the following columns:

- **Interface**  
Shows the available interfaces.
- **DHCP**  
Enable or disable the DHCP client.

## SNMP

### General

On this page, you make the basic settings for SNMP. Enable the functions you want to use.

### Settings

- **SNMP**  
Select the SNMP protocol. The following settings are possible:
  - "-" (disabled)  
SNMP is disabled.
  - SNMPv1/v2c/v3  
SNMPv1/v2c/v3 is supported.
  - SNMPv3  
Only SNMPv3 is supported.
- **SNMPv1/v2 Read-Only**  
If you enable this option, SNMPv1/v2c can only read the SNMP variables.

---

**Note****Community String**

For security reasons, do not use the standard values "public" or "private". Change the community strings following the initial installation.

---

- **SNMPv1/v2c Read Community String**  
Enter the community string for access of the SNMP protocol.
- **SNMPv1/v2c Read/Write Community String**  
Enter the community string for read and write access of the SNMP protocol.
- **SNMPv1 Traps**  
Enable or disable the sending of SNMP traps (alarm frames). On the "Trap" tab, specify the IP addresses of the devices to which SNMP traps will be sent.
- **SNMPv1/v2c Trap Community String**  
Enter the community string for sending SNMPv1/v2 messages.

## Traps

If an alarm event occurs, a device can send SNMP traps (alarm frames) to up to ten different management stations at the same time. Traps are only sent if events specified in "Events > Configuration" occur.

---

### Note

SNMP traps are sent only when the "SNMPv1 Traps" setting was selected in "SNMP > General".

---

## Settings

- **IP Address**  
Enter the IP address of the stations to which the device sends SNMP traps

The table has the following columns:

- **IP Address**  
Shows the IP addresses of the stations to which the device sends SNMP traps.
- **Trap**  
Enable or disable the sending of SNMP traps. Stations that are entered but not selected do not receive SNMP traps.

## v3 Groups

### Security settings and assigning permissions

SNMP version 3 allows permissions to be assigned, authentication, and encryption at protocol level. The security levels and read/write permissions are assigned according to groups. The settings automatically apply to every member of a group.

## Settings

- **Group Name**  
Enter the name of the group. This name must have at least two characters, the maximum length is 32 characters.
- **Security Level**  
Select the security level (authentication, encryption) valid for the selected group. You have the following options for the security levels:
  - no Auth/no Priv  
No authentication enabled / no encryption enabled.
  - Auth/no Priv  
Authentication enabled / no encryption enabled.
  - Auth/Priv  
Authentication enabled / encryption enabled.

The table has the following columns:

- **Group Name**  
Shows the defined group names.

---

### Note

Once a group name and the security level have been specified, they can no longer be modified after the group is created. If you want to change the group name or the security level, you will need to delete the group and recreate it and reconfigure it with the new name.

---

- **Security Level**  
Shows the configured security level.
- **Read**  
Enable or disable read access.
- **Write**  
Enable or disable write access.
- **Persistence**  
Shows whether or not the group is assigned to an SNMPv3 user. If the group is not assigned to an SNMPv3 user, no automatic saving is triggered and the configured group disappears again after restarting the device.
  - Yes  
The group is assigned to an SNMPV3 user.
  - No  
The group is not assigned to an SNMPV3 user.

## v3 users

### User-specific security settings

On the WBM page, you can create new SNMPv3 users and modify or delete existing users. The user-based security model works with the concept of the user name; in other words, a

user ID is added to every frame. This user name and the applicable security settings are checked by both the sender and recipient.

## Settings

- **User name**  
Enter a freely selectable user name. After you have entered the data, you can no longer modify the name.

The table has the following columns:

- **User name**  
Shows the created users.
- **Group Name**  
Select the group to which the user will be assigned.
- **Authentication Protocol**  
Select the authentication protocol. Can only be enabled, if this group supports the function. The following settings are available:
  - None
  - MD5
  - SHA
- **Encryption Protocol**  
Specify whether or not the user uses the DES algorithm. Can only be enabled, if the group supports this function.
- **Authentication Password**  
Enter the authentication password in the first input box.
- **Confirm authentication password**  
Confirm the password by repeating the entry.
- **Encryption Password**  
Enter your encryption password.
- **Confirm Encryption Password**  
Confirm the encryption password by repeating the entry.
- **Persistence**  
Shows whether or not the user is assigned to an SNMPv3 group. If the user is not assigned to an SNMPv3 group, no automatic saving is triggered and the configured user disappears again after restarting the device.
  - Yes  
The user is assigned to an SNMPv3 group.
  - No  
The user is not assigned to an SNMPv3 group.

## System time

### Manual time setting

On this page, you set the date and time of the system. For this setting to be used, enable "Manual time setting".

---

#### Note

The page is only available if there is an online connection to the device.

---

## Settings

- **Time Manually**  
Enable or disable the manual time setting.
- **System Time**  
Enter the date and time in the format "MM/DD/YYYY HH:MM:SS". Can only be edited, if manual time setting is enabled.  
After a restart, the time of day begins at 01/01/2000 00:00:00
- **Use PC Time**  
Click the button to use the time setting of the PC.
- **Last Synchronization Time**  
This box is read-only and shows when the last time-of-day synchronization took place. If no time-of-day synchronization was possible, the box displays "Date/time not set".
- **Last Synchronization Mechanism**  
This box displays how the last time-of-day synchronization was performed.
  - Not set  
The time was not set.
  - Manual  
Manual time setting
  - SNTP  
Automatic time-of-day synchronization using SNTP
  - NTP  
Automatic time-of-day synchronization using NTP
  - SIMATIC  
Automatic time-of-day synchronization using the SIMATIC time frame.
  - PTP  
Automatic time-of-day synchronization with PTP

## DST overview

On this page, you can create new entries for the daylight saving time changeover.

The table provides an overview of the existing entries.

## Settings

- **DST No.**  
Shows the number of the entry.  
If you create a new entry, a new line with a unique number is created.
- **Name**  
Shows the name of the entry.
- **Year**  
Shows the year for which the entry was created.
- **Start Date**  
Shows the month, day and time for the start of daylight saving time.
- **End Date**  
Shows the month, day and time for the end of daylight saving time.
- **Type**  
Shows how the daylight saving time changeover is made:
  - Date  
A fixed date is entered for the daylight saving time changeover.
  - Recurring  
A rule was defined for the daylight saving time changeover.

## DST configuration

On this page, you can configure the entries for the daylight saving time changeover. As result of the changeover to daylight saving or standard time, the system time for the local time zone is correctly set.

You can define a rule for the daylight saving time changeover or specify a fixed date.

## Settings

---

### Note

The content of this page depends on the selection in the "Type" box.

The boxes "DST No.", "Type" and "Name" are always shown.

---

- **DST No.**  
Select the type of the entry.
- **Type**  
Select how the daylight saving time changeover is made:
  - **Date**  
You can set a fixed date for the daylight saving time changeover.  
This setting is suitable for regions in which the daylight saving time changeover is not governed by rules.
  - **Recurring**  
You can define a rule for the daylight saving time changeover.  
This setting is suitable for regions in which the daylight saving time always begins or ends on a certain weekday.
- **Name**  
Enter a name for the entry.

#### Settings with "Date" selected

You can set a fixed date for the start and end of daylight saving time.

- **Year**  
Enter the year for the daylight saving time changeover.
- **Start Date**  
Enter the following values for the start of daylight saving time:
  - Day
  - Hour
  - Month
- **End Date**  
Enter the following values for the end of daylight saving time:
  - Day
  - Hour
  - Month

#### Settings with "Recurring" selected

You can create a rule for the daylight saving time changeover.

- **Start Date**  
Enter the following values for the start of daylight saving time:
  - Hour
  - Month
  - Week  
You can select the 1st to 5th or the last week of the month.
  - Weekday
- **End Date**  
Enter the following values for the end of daylight saving time:
  - Hour
  - Month
  - Week  
You can select the 1st to 5th or the last week of the month.
  - Weekday

## SNTP client

SNTP (Simple Network Time Protocol) is used for synchronizing the time in the network. The appropriate frames are sent by an SNTP server in the network.

## Settings

- **SNTP Client**  
Enable or disable automatic time-of-day synchronization using SNTP.
- **Current System Time** (only available online)  
Shows the values currently set in the system for date and time.
- **Last Synchronization Time** (only available online)  
This box is read-only and shows when the last time-of-day synchronization took place. If no time-of-day synchronization was possible, the box displays "Date/time not set".

- **Last Synchronization Mechanism** (only available online)  
This box displays how the last time-of-day synchronization was performed.
  - Not set  
The time was not set.
  - Manual  
Manual time setting
  - SNTP  
Automatic time-of-day synchronization using SNTP
  - NTP  
Automatic time-of-day synchronization using NTP
  - SIMATIC  
Automatic time-of-day synchronization using the SIMATIC time frame
  - PTP  
Automatic time-of-day synchronization with PTP
- **Time Zone**  
Enter the time zone you are using in the format "+/- HH:MM". The time zone relates to UTC standard world time. Settings for daylight-saving and standard time are taken into account in this box by specifying the time offset.
- **SNTP Mode**  
Select the synchronization mode. The following types of synchronization are possible:
  - Poll  
If you select this protocol type, the input boxes "SNTP Server IP Address", "SNTP Server Port" and "Poll Interval" are displayed for further configuration. With this type of synchronization, the device is active and sends a time query to the SNTP server.
  - Listen  
With this type of synchronization, the device is passive and "listens" for SNTP frames that deliver the time of day.
- **SNTP Server IP Address**  
Enter the IP address of the SNTP server.
- **SNTP Server Port**  
Enter the port of the SNTP server.
- **Poll Interval [s]**  
Enter the interval in seconds between two time polls.

## NTP client

If you require time-of-day synchronization using NTP, you can make the relevant settings here.

## Settings

- **NTP Client**  
Enable or disable automatic time-of-day synchronization using NTP.
- **Current System Time** (only available online)  
Shows the values currently set in the system for date and time.

- **Last Synchronization Time** (only available online)  
This box is read-only and shows when the last time-of-day synchronization took place. If no time-of-day synchronization was possible, the box displays "Date/time not set".
- **Last Synchronization Mechanism** (only available online)  
This box displays how the last time-of-day synchronization was performed.
  - Not set  
The time was not set.
  - Manual  
Manual time setting
  - SNTP  
Automatic time-of-day synchronization using SNTP
  - NTP  
Automatic time-of-day synchronization using NTP
  - SIMATIC  
Automatic time-of-day synchronization using the SIMATIC time frame
  - PTP  
Automatic time-of-day synchronization with PTP
- **Time Zone**  
Enter the time zone you are using in the format "+/- HH:MM". The time zone relates to UTC standard world time. Settings for daylight-saving and standard time are taken into account in this box by specifying the time offset.
- **NTP Server IP Address**  
Enter the IP address of the NTP server.
- **NTP Server Port**  
Enter the port of the NTP server.
- **Poll Interval [s]**  
Enter the interval in seconds between two time polls.

## SIMATIC Time Client

On this page, you configure time synchronization with the SIMATIC Time Client.

### Settings

- **SIMATIC Time Client**  
Enable or disable loop the SIMATIC Time Client.
- **Current System Time** (only available online)  
Shows the values currently set in the system for date and time.

- **Last Synchronization Time** (only available online)  
This box is read-only and shows when the last time-of-day synchronization took place. If no time-of-day synchronization was possible, the box displays "Date/time not set".
- **Last Synchronization Mechanism** (only available online)  
This box displays how the last time-of-day synchronization was performed.
  - Not set  
The time was not set.
  - Manual  
Manual time setting
  - SNTP  
Automatic time-of-day synchronization using SNTP
  - NTP  
Automatic time-of-day synchronization using NTP
  - SIMATIC  
Automatic time-of-day synchronization using the SIMATIC time frame
  - PTP  
Automatic time-of-day synchronization with PTP

## PTP Client

On this page, you configure time synchronization with PTP (Precision Time Protocol).

This function is only available for SCALANCE X500.

## Settings

- **PTP Client**  
Enable or disable time synchronization using PTP. You can configure other settings in "Layer 2 > PTP".
- **Current System Time** (only available online)  
This box is read-only and displays the current system time.
- **Last Synchronization Time** (only available online)  
This box is read-only and shows when the last time-of-day synchronization took place. If no time-of-day synchronization was possible, the box displays "Date/time not set".

- **Last Synchronization Mechanism** (only available online)  
This box displays how the last time-of-day synchronization was performed.
  - Not set  
The time was not set.
  - Manual  
Manual time setting
  - SNTP  
Automatic time-of-day synchronization using SNTP
  - NTP  
Automatic time-of-day synchronization using NTP
  - SIMATIC  
Automatic time-of-day synchronization using the SIMATIC time frame
  - PTP  
Automatic time-of-day synchronization with PTP
- **Time Zone**  
Enter the time zone you are using in the format "+/- HH:MM". The time zone relates to UTC standard world time.

## Auto logout

On this page, set the times after which there is an automatic logout from WBM or the CLI following user in activity.

---

### Note

#### No automatic logout from the CLI

If the connection is not terminated after the set time, check the setting of the "keepalive" mechanism on the Telnet client.

If the interval is shorter than the configured time, the connection is kept alive although no user data is transferred. Example: you selected 300 seconds for the automatic logout and 120 seconds is set for the keepalive function. In this case, a packet is sent every 120 seconds that keeps the connection up.

- Disable the keepalive mechanism (interval time = 0)  
or
  - Set the interval high enough so that the underlying connection is terminated when there is inactivity.
- 

## Settings

- **Web Based Management [s]**  
Enter the time in seconds for the automatic logout from WBM. If you enter the value 0, the automatic logout is disabled.
- **CLI (TELNET, SSH, Serial) [s]**  
Enter the time in seconds for the automatic logout from the CLI. If you enter the value 0, the automatic logout is disabled.

## Button

The "Select/Set" button has the following functions:

- Change display mode
- Enable redundancy manager
- Restore to factory defaults
- Fault mask and LED display

You will find a detailed description of the individual functions available with the buttons in the operating instructions of the specific device.

## Settings

- **Restore Factory Defaults**  
Enables or disables the "Restore Factory Defaults" function for the Select/Set button.

 **CAUTION**

**Button function "Restore Factory Defaults" active during startup**

If you have disabled this function in your configuration, disabling is only valid during operation. When restarting, for example after power down, the function is active until the configuration is loaded so that the device can inadvertently be reset to the factory settings. This may cause unwanted disruption in network operation since the device needs to be reconfigured if this occurs. An inserted PLUG is also deleted and returned to the status as shipped

- **Redundancy Manager**  
Enables or disables the redundancy manager function for the Select/Set button.
- **Set Fault Mask**  
Enable or disable the function "Define fault mask via the LED display" with the Select/set button. This function only works in display mode D.

## Syslog client

Syslog according to RFC 3164 is used for transferring short, unencrypted text messages over UDP in the IP network. This requires a system log server.

### Requirements for sending log entries:

- The system log function is enabled on the device.
- The system log function is enabled for the relevant event.
- There is a system log server in your network that receives the log entries. Since this is a UDP connection, there is no acknowledgment to the sender.
- The IP address of the system log server is entered on the device.

## Settings

- **Syslog Client**  
Enable or disable the system log function.
- **Syslog Server IP Address**  
Enter the IP address of the system log server.

This table contains the following columns

- **Syslog Server IP Address**  
Shows the IP address of the system log server.
- **Server Port**  
Enter the port of the Syslog server being used.

## Ports

### Port overview

The page shows the configuration for the data transfer for all ports of the device.

## Settings

- **Port**  
Shows the configurable ports.
- **Port name**  
Shows the name of the port.
- **MAC Address** (only available online)  
Shows the MAC address of the port.
- **Mode** (only available online)  
Shows the transfer parameters of the port
- **Negotiation**  
Shows whether the automatic configuration is enabled or disabled.
- **Flow Ctrl. Type**  
Shows whether flow control is enabled or disabled for the port.
- **Flow Ctrl.**  
Shows whether or not flow control is working on this port.
- **MTU**  
Shows the maximum packet size.
- **Port Type** (only with routing)  
Shows the type of the port. The following types are possible:
  - Router Port
  - Switch Port VLAN Hybrid
  - Switch-Port VLAN Trunk
- **Status**  
Shows whether the port is on or off. Data traffic is possible only over an enabled port.

- **Combo Port Media Type**(SCALANCE XM400 only)  
Shows the mode of the combo port:
  - auto
  - rj45
  - sfp
- **Link** (only available online)  
Shows the connection status to the network. With the connection status, the following is possible:
  - Up  
The port has a valid link to the network, a link integrity signal is being received.
  - Down  
The link is down, for example because the connected device is turned off.

## Configuration

On this page, you configure the ports of the device

## Settings

- **Port**  
Select the port to be configured. The port is made up of the port number and the slot number, for example port 0.1 is slot 0, port 1.
- **Status**  
Specify whether the port is enabled or disabled.
  - enabled  
The port is enabled. Data traffic is possible only over an enabled port.
  - disabled  
The port is disabled but the connection remains.
  - Link down  
The port is disabled and the connection to the partner device is terminated.
- **Port name**  
Enter a name for the port.
- **MAC Address** (only available online)  
Shows the MAC address of the port.
- **Mode Type**  
Shows the transmission speed and the transmission method of the port. You make the settings for "Autonegotiation" and "Transmission rate" in the port options.

---

### Note

Before the port and partner port can communicate with each other, the settings must match at both ends.

---

- **Mode** (only available online)  
Shows which transmission speed and which transmission mode is currently being used.

- **Negotiation**  
Shows whether the automatic configuration of the connection to the partner port is enabled or disabled.
  - **Flow Ctrl. Type**  
Shows whether or not flow control is working on this port.
- 

**Note**

**Turning flow control on/off with autonegotiation**

Flow control can only be enabled or disabled if the "autonegotiation" function is turned off. The function cannot be enabled again afterwards.

---

- **Flow Ctrl.**  
Shows whether or not flow control is working on this port.
- **MTU**  
Enter the packet size.
- **Port Type** (only with routing)  
Select the type of the port:
  - Router Port  
The port is an IP interface. It does not support layer 2 functions.
  - Switch Port VLAN Hybrid  
The port sends tagged and untagged frames. It is not automatically a member of a VLAN.
  - Switch-Port VLAN Trunk  
The port only sends tagged frames and is automatically a member of all VLANs.
- **Combo Port Media Type**(SCALANCE XM400 only)  
Specify the mode for the combo port:
  - auto  
If you select this mode, the SFP transceiver port has priority. As soon as an SFP transceiver is plugged in, an existing connection at the fixed RJ-45 port is terminated. If no SFP transceiver is plugged in, a connection can be established via the fixed RJ-45 port.
  - rj45  
If you select this mode, the fixed RJ-45 port is used regardless of the SFP transceiver port.
  - sfp  
If you select this mode, the SFP transceiver port is used regardless of the built-in RJ-45 port.

The factory setting is auto mode.
- **Link** (only available online)  
Shows the connection status to the network. With the connection status, the following is possible:
  - Up  
The port has a valid link to the network, a link integrity signal is being received.
  - Down  
The link is down, for example because the connected device is turned off.

## Changing the port configuration

---

### Note

Optical ports only work with the full duplex mode and at maximum transmission rate. As a result, the following settings cannot be made for optical ports:

- Automatic configuration
  - Transmission speed
  - Transmission technique
- 

### Note

With various automatic functions, the device prevents or reduces the effect on other ports and priority classes (Class of Service) if a port is overloaded. This can mean that frames are discarded even when flow control is enabled.

Port overload occurs when the device receives more frames than it can send, for example as the result of different transmission speeds.

---

## Fault monitoring

### Power supply

Configure whether or not the power supply should be monitored by the messaging system. Depending on the hardware variant, there are one or two power connectors (Supply 1 / Supply 2). With a redundant power supply, configure the monitoring separately for each individual feed-in line.

If there is no power on one of the monitored lines (Supply 1 or Supply 2) or when the voltage is too low, a fault is signaled by the signaling system.

---

### Note

You will find the permitted operating voltage limits in the compact operating instructions of the device.

---

An error causes the fault LED to light up on the device. Depending on the configuration, the error may trigger a trap, an e-mail or an entry in the event log table.

## Settings

- **Line 1**  
Enable or disable the monitoring of power connector 1.
- **Line 2**  
Enable or disable the monitoring of power connector 2.

## Link Change

On this page, you configure whether or not an error message is triggered if there is a status change on a network connection.

If connection monitoring is enabled, an error is signaled

- when there should be a link on a port and this is missing.
- or when there should not be a link on a port and a link is detected.

An error causes the signaling contact to trigger and the fault LED to light up on the device. Depending on the configuration, the error may trigger a trap, an e-mail or an entry in the event log table.

## Settings

Table 1 has the following columns:

- **1st column**  
Shows that the settings are valid for all ports.
- **Setting**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns

- **Port**  
Shows the available ports.
- **Setting**  
Select the setting. You have the following options:
  - Up  
Error handling is triggered when the port changes to the active status.  
(From "Link down" to "Link up")
  - Down  
Error handling is triggered when the port changes to the inactive status.  
(From "Link up" to "Link down")
  - "-" (disabled)  
The error handling is not triggered.

## Redundancy

On this page, you configure whether or not an error message is triggered if there is a status change on a network connection.

## Setting

- **Redundancy loss (HRP only)**  
Enable or disable connection monitoring. If the redundancy of the connection is lost, an error is signaled.

## PNIO

On this page, you configure the device response to PROFINET input and output.

## Description

The page contains the following boxes:

- **PNIO runtime mode**  
Shows the status of the PNIO operation.
- **PNIO runtime mode for next startup**  
Select the runtime mode that will be active the next time the device starts up.
- **PNIO AR status**  
This box shows the PROFINET IO application relation status; in other words, whether or not the IE switch is connected "online" or "offline" with a PROFINET controller. In this context, online means that a connection to a PROFINET IO controller exists, that the controller has downloaded its configuration data to the IE switch and that the device can send status data to the PROFINET IO controller. In this status known as "in data exchange", the parameters set with the PROFINET IO controller cannot be configured on the IE switch.
- **PNIO Device Name**  
Enter the PROFINET IO device name.
- **Allow PNIO Data Exchange**  
Enable or disable PNIO data exchange
- **Simulate PNIO Data Exchange**  
Enable or disable the simulation of PNIO data exchange.

## PLUG

### PLUG configuration

---

#### Note

The page is only available if there is an online connection to the device.

---

**NOTICE**

**Do not remove or insert a C-PLUG / KEY-PLUG during operation!**

A PLUG may only be removed or inserted when the device is turned off. The device checks whether or not a PLUG is present at one second intervals. If it is detected that the PLUG was removed, there is a restart. If a valid KEY-PLUG was inserted in the device, the device changes to a defined error state following the restart.

**Information about the configuration of the C-PLUG / KEY-PLUG**

This page provides detailed information about the configuration stored on the C-PLUG or KEY-PLUG. It is also possible to reset the PLUG to "factory defaults" or to load it with new contents.

**Note**

The action is only executed after you click the "Set Values" button.

The action cannot be undone.

If you decide against executing the function after making your selection, click the "Refresh" button. As a result the data of this page is read from the device again and the selection is canceled.

**Note**

**Incompatibility with previous versions with PLUG inserted**

During the installation of a previous version, the configuration data can be lost. In this case, the device starts up with the factory settings after the firmware has been installed. In this situation, if a PLUG is inserted in the device, following the restart, this has the status "NOT ACCEPTED" since the PLUG still has the configuration data of the previous more up-to-date firmware. This allows you to return to the previous, more up-to-date firmware without any loss of configuration data.

If the original configuration on the PLUG is no longer required, the PLUG can be deleted or rewritten manually using "System > PLUG".

## Settings

The table has the following rows:

- **Status**  
Shows the status of the PLUG. The following are possible:
  - ACCEPTED  
There is a PLUG with a valid and suitable configuration in the device.
  - NOT ACCEPTED  
Invalid or incompatible configuration on the inserted PLUG.
  - NOT PRESENT  
There is no C-PLUG or KEY-PLUG inserted in the device.
  - FACTORY  
PLUG is inserted and does not contain a configuration. This status is also displayed when the PLUG was formatted during operation.
  - MISSING  
There is no PLUG inserted. Functions are configured on the device for which a license is required.
- **Device Family**  
Shows the SIMATIC NET product line that used the C-PLUG or KEY-PLUG previously.
- **Device Type**  
Shows the device type within the product line that used the C-PLUG or KEY-PLUG previously.
- **Configuration Revision**  
The version of the configuration structure. This information relates to the configuration options supported by the device and has nothing to do with the concrete hardware configuration. This revision information does not therefore change if you add or remove additional components (modules or extenders), it can, however, change if you update the firmware.
- **File System**  
Displays the type of file system on the PLUG.

### NOTICE

#### New file system UBI

As of firmware version 3.0, UBI is the standard file system for the C-PLUG or KEY-PLUG. If a C-PLUG with the previous file system IECP is detected in such a device, this C-PLUG will be formatted for the UBI file system and the data will be rewritten to the C-PLUG.

The file system is also changed following a firmware update to V3.0. A downgrade to the previous version of the corresponding software is then a problem. The firmware can neither read nor write the C-PLUG or KEY-PLUG and it is not even possible to "Erase PLUG to factory default".

- **File System Size [bytes]**  
Shows the maximum storage capacity of the file system on the C-PLUG.
- **File System Usage**  
Displays the storage space in use in the file system of the C-PLUG.

- **Info String**  
Shows additional information about the device that used the PLUG previously, for example, order number, type designation, and the versions of the hardware and software. The displayed software version corresponds to the version in which the configuration was last changed. With the "NOT ACCEPTED" status, further information on the cause of the problem is displayed.
- **Modify PLUG**  
Select the required setting.
  - Write current configuration to PLUG  
This option is available only if the status of the PLUG is "NOT ACCEPTED" or FACTORY. The configuration in the internal flash memory of the device is copied to the PLUG.
  - Erase PLUG to factory default  
Deletes all data from the C-PLUG and triggers low-level formatting.

## PLUG license

---

### Note

The page is only available if there is an online connection to the device.

---

<b>NOTICE</b>
---------------

<b>Do not remove or insert a C-PLUG / KEY-PLUG during operation!</b>
--

A PLUG may only be removed or inserted when the device is turned off. The device checks whether or not a PLUG is present at one second intervals. If it is detected that the PLUG was removed, there is a restart. If a valid KEY-PLUG was inserted in the device, the device changes to a defined error state following the restart.
---

If the device was configured at some time with a PLUG, the device can no longer be used without this PLUG. To be able to use the device again, reset the device to the factory settings.
--

---

### Note

#### Incompatibility with previous versions with PLUG inserted

During the installation of a previous version, the configuration data can be lost. In this case, the device starts up with the factory settings after the firmware has been installed. In this situation, if a PLUG is inserted in the device, following the restart, this has the status "NOT ACCEPTED" since the PLUG still has the configuration data of the previous more up-to-date firmware. This allows you to return to the previous, more up-to-date firmware without any loss of configuration data.

If the original configuration on the PLUG is no longer required, the PLUG can be deleted or rewritten manually using "System > PLUG".

---

## Information about the license of the KEY-PLUG

A C-PLUG can only store the configuration of a device. In addition to the configuration, a KEY-PLUG also contains a license that enables certain functions of your SIMATIC NET device.

This page provides detailed information about the license on the KEY-PLUG. In this example, the KEY-PLUG contains the data for enabling the layer 3 functions of the device.

## Displayed values

- **Status**  
Shows the status of the KEY-PLUG. The following are possible:
  - ACCEPTED  
The KEY-PLUG in the device contains a suitable and valid license.
  - NOT ACCEPTED  
The license of the inserted KEY-PLUG is not valid.
  - NOT PRESENT  
No KEY-PLUG is inserted in the device.
  - MISSING  
There is no KEY-PLUG or a C-PLUG with the status "FACTORY" inserted in the device. Functions are configured on the device for which a license is required.
  - WRONG  
The inserted KEY-PLUG is not suitable for the device.
  - UNKNOWN  
Unknown content of the KEY-PLUG.
  - DEFECTIVE  
The content of the KEY-PLUG contains errors.
- **Order ID**  
Shows the order number of the KEY-PLUG. The KEY-PLUG is available for various functional enhancements and for various target systems.
- **Serial Number**  
Shows the serial number of the KEY-PLUG.
- **Info String**  
Shows additional information about the device that used the KEY-PLUG previously, for example, order number, type designation, and the versions of the hardware and software. The displayed software version corresponds to the version in which the configuration was last changed. With the "NOT ACCEPTED" status, further information on the cause of the problem is displayed.

---

### Note

When you save the configuration, the information about whether or not a KEY-PLUG was inserted in the device at the time is also saved. This configuration can then only work if a KEY-PLUG with the same order number / license is inserted.

---

## Ping

### Reachability of an address in an IP network

---

#### Note

The page is only available if there is an online connection to the device.

---

With the ping function, you can check whether a certain IP address is reachable in the network.

## Settings

The table has the following columns:

- **IP Address**  
Enter the IP address of the device.
- **Repeat**  
Enter the number of ping requests.
- **Ping**  
Click this button to start the ping function.
- **Ping Output**  
This box shows the output of the ping function.

## PoE

### General

On this page, you specify the maximum power for the power sourcing equipment (PSE).

### PSE (power sourcing equipment)

The SCALANCE X-500 represents a PSE (Power Sourcing Equipment).

With a SCALANCE XM400, you can use the "Power over Ethernet" function via the port extender PE408PoE. Each group of four ports with PoE capability is known as a PSE. The numbering of the PSEs is fixed and does not change with the number of plugged-in PoE port extenders or the slot. A maximum of 4 PSEs are possible.

### Setting

- **PSE**  
Shows the number of the PoE power supply.
- **Maximum Power**  
Maximum power that a PSE provides to supply PoE devices.
- **Allocated Power**  
Sum of the power reserved by the PoE devices according to the "Classification".

- **Used power**  
Sum of the power used by the end devices.
- **Usage Threshold [%]**  
When the power being used by the end devices exceeds the percentage shown here, an event is triggered.

## Port

### Settings for the ports

For each individual PoE port, you can specify whether or not the power will be supplied via Ethernet. You can also set a priority for each connected powered device (PD). Devices for which a high priority was set, take preference over other devices for the power supply.

### Settings

The table has the following columns:

- **Port**  
Shows the configurable PoE ports.  
The port is made up of the port number and the slot number, for example port 0.1 is slot 0, port 1.
- **Setting**  
Enable the PoE power supply for this port or interrupt it.
- **Priority**  
Select which priority this port will have for the power supply.  
The following settings are possible, in ascending order of relevance:
  - low  
low priority
  - high  
medium priority
  - critical  
high priority

If the same priority is set for two ports, the port with the lower port number will be preferred when necessary.

- **Type**  
Here, you can enter a string to describe the connected device in greater detail.
- **Classification**  
The classification specifies the class of the device. From this, it is possible to recognize the maximum power of the device.

- **Status**  
Shows the current status of the port.  
The following states are possible:
  - disabled  
The PoE power supply is deactivated for this port.
  - delivering  
The PoE power supply is activated for this port and a device is connected.
  - searching  
The PoE power supply is activated for this port but there is no device connected.

---

**Note**

If a device is connected to a port with PoE capability, a check is made to determine whether the power of the port is adequate for the connected device. If the power of the port is inadequate, although PoE is enabled in "Setting", the port nevertheless has the status "disabled". This means that the port was disabled by the PoE power management.

---

- **Power [mW]**  
Shows the power that the SCALANCE provides at this port.
- **Voltage [V]**  
Shows the voltage applied to this port.
- **Current [mA]**  
Shows the current with which a device connected to this port is supplied.

## Port diagnostics

### Cable tester

---

**Note**

The page is only available if there is an online connection to the device.

---

With this page, each individual Ethernet port can run independent fault diagnostics on the cable. This test is performed without needing to remove the cable, connect a cable tester and install a loopback module at the other end. Short-circuits and cable breaks can be localized to within a few meters.

---

**Note**

Please note that this test is permitted only when no data connection is established on the port to be tested.

---

## Settings

- **Port**  
Select the required port from the drop-down list.
- **Run Test**  
Activates error diagnostics. The result is shown in the table.

This table contains the following columns:

- **Pair**  
Shows the wire pair in the cable.

---

### Note

#### Wire pairs

Wire pairs 4-5 and 7-8 of 10/100 Mbps network cables are not used.

In 1000 Mbps or gigabit Ethernet, all 4 wire pairs are used.

The wire pair assignment - pin assignment is as follows (DIN 50173):

Pair 1 = pin 4-5

Pair 2 = pin 1-2

Pair 3 = pin 3-6

Pair 4 = pin 7-8

---

- **Status**  
Displays the status of the cable.
- **Distance [m]**  
Displays the distance to the cable end, cable break, or short-circuit.

## SFP diagnostics

On this page, you run independent error diagnostics for each individual SFP port. This test is performed without needing to remove the cable, connect a cable tester or install a loopback module at the other end.

---

### Note

Please note that this test is permitted only when no data connection is established on the port to be tested.

If, however, there is a data connection to the port to be tested, this is briefly interrupted.

Automatic re-establishment of the connection can fail and then needs to be done manually.

---

## Description

The page contains the following boxes:

- **Port**  
Select the required port from the drop-down list.

The values are shown in the following boxes:

- **Name**  
Shows the name of the interface.
- **Model**  
Shows the type of interface.
- **Revision**  
Shows the hardware version of the SFP.
- **Serial**  
Shows the serial number of the SFP.
- **Nominal Bit Rate [Mbps]**  
Shows the nominal bit rate of the interface.
- **Max. Link (50.0/125um) [m]**  
Shows the maximum distance in meters that is possible with this medium.
- **Max. Link (62.5/125um) [m]**  
Shows the maximum distance in meters that is possible with this medium.

The following table shows the values of the SFP transceiver used in this port:

- **Temperature [°C]**  
Shows the temperature of the interface.
- **Voltage [V]**  
Shows the voltage applied to the interface [V].
- **Current [mA]**  
Shows the current consumption of the interface [mA].
- **RX Power [mW]**  
Shows the receive power of the interface [mW].
- **Tx Power [mW]**  
Shows the transmit power of the interface [mW].
- **Current**  
Shows the current value.
- **Low**  
Shows the lowest value.
- **High**  
Shows the highest value.

## Layer 2

### Configuration

The functions of layer 2 are configured on this page. With some functions, there are further configuration pages on which more detailed settings can be made. You can also check the settings on the configuration pages.

### Settings

- **Protocol Based VLAN**  
Enable or disable protocol-based VLAN. You can configure other settings in "Layer 2 > VLAN".
- **Subnet Based VLAN**  
Enable or disable subnet-based VLAN. You can configure other settings in "Layer 2 > VLAN".
- **Dynamic MAC Aging**  
Enable or disable the "Aging" mechanism. You can configure other settings in "Layer 2 > Dynamic MAC Aging".
- **Redundancy Type**  
The following settings are available:
  - **"-" (disabled)**  
The redundancy function is disabled.
  - **Ring**  
Enables ring redundancy. You can configure other settings in "Layer 2 > Ring Redundancy > Ring".
  - **Spanning Tree**  
If you select this option, you specify the required redundancy mode in "Redundancy Mode".

- **Redundancy Mode**

If you select "Spanning Tree" for the "Redundancy Type", the following options are then available:

- **STP**  
Enables the Spanning Tree Protocol (STP). Typical reconfiguration times with spanning tree are between 20 and 30 seconds. You can configure other settings in "Layer 2 > Spanning Tree".
- **RSTP**  
Enables the Rapid Spanning Tree Protocol (RSTP). If a spanning tree frame is detected at a port, this port reverts from RSTP to spanning tree. You can configure other settings in "Layer 2 > Spanning Tree".

---

**Note**

When using RSTP (Rapid Spanning Tree Protocol), loops involving duplication of frames or frames being overtaken may occur briefly. If this is not acceptable in your particular application, use the slower standard spanning tree mechanism.

---

- **MSTP**  
Enables the Multiple Spanning Tree Protocol (MSTP). You can configure other settings in "Layer 2 > Spanning Tree".

If you select "Ring" for the "Redundancy Type", the following options are then available:

- **Automatic Redundancy Detection**  
Select this setting to create an automatic configuration of the redundancy mode. In this mode, the device automatically detects whether or not there is a device with the "HRP Manager" role in the ring. If this is the case, the device adopts the role of "HRP Client". If no HRP manager is found, all devices with the "Automatic Redundancy Detection" or "MRP Auto Manager" setting negotiate among themselves to establish which device adopts the role of "MRP Manager". The device with the lowest MAC address will always become "MRP Manager". The other devices automatically set themselves to redundancy type "MRP Client".
- **MRP Auto-Manager**  
Automatic media redundancy manager
- **MRP Client**  
Media redundancy client
- **HRP Client**  
High Speed Redundancy Protocol client
- **HRP Manager**  
High Speed Redundancy Protocol manager
- **Standby**  
Enable or disable the "Standby redundancy" function. You can configure other settings in "Layer 2 > Ring Redundancy > Standby".
- **Passive Listening**  
Enable or disable the "passive listening" function.

- **RMON**  
If you select this check box, Remote Monitoring (RMON) allows diagnostics data to be collected on the device, prepared and read out using SNMP by a network management station that also supports RMON. This diagnostic data, for example port-related load trends, allow problems in the network to be detected early and eliminated.
- **Dynamic Multicast**  
The following settings are possible:
  - **"-" (disabled)**
  - **IGMP Snooping**  
Enables IGMP (Internet Group Management Protocol). You can configure other settings in "Layer 2 > Multicast > IGMP".
  - **GMRP**  
Enables GMRP (GARP Multicast Registration Protocol). You can configure other settings in "Layer 2 > Multicast > GMRP".

---

**Note**

GMRP and IGMP cannot operate at the same time.

---

- **GVRP**  
Enable or disable "GVRP" (GARP VLAN Registration Protocol). You can configure other settings in "Layer 2 > VLAN > GVRP".
- **Mirroring**  
Enable or disable port mirroring. You can configure other settings in "Layer 2 > Mirroring > Port".
- **Loop Detection**  
Enable or disable loop detection. You can configure other settings in "Layer 2 > Loop Detection".
- **PTP**  
Specify how the device will process PTP messages. You can configure other settings in "Layer 2 > PTP".
  - **Off**  
The device does not process any PTP messages. PTP messages are, however, forwarded according to the rules of the switch.
  - **transparent**  
The device adopts the function of a transparent clock and forwards PTP messages to other nodes while at the same time making entries in the correction field of the PTP message.

## QoS

### CoS map

On this page, CoS priorities are assigned to certain queues (traffic queues).

## Settings

- **CoS**  
Shows the CoS priority of the incoming packets.
- **Queue**  
Select the forwarding queue (send priority) that is assigned the CoS priority.  
The higher the number of the queue, the higher the send priority.

## DSCP map

On this page, DSCP settings are assigned to various queues (traffic queues).

## Settings

- **DSCP**  
Shows the DSCP priority of the incoming packets.
- **Queue**  
Select the forwarding queue (send priority) that is assigned the DSCP value. The higher the queue number, the higher the send priority.

## Load limitation

### Limiting the transfer rate of incoming and outgoing data

On this page, you configure the load limitation (maximum number of data packets per second) for the individual ports. You can specify the category of frame for which these limit values will apply.

## Settings

Table 1 has the following columns:

- **1st column**  
Shows that the settings are valid for all ports.
- **Limit Ingress Unicast (DLF) / Limit Ingress Broadcast / Limit Ingress Multicast**  
Select the required setting.
  - enabled: Enables the function.
  - disabled: Disables the function
  - No Change: The setting in table 2 remains unchanged
- **Total Ingress Rate [pkts/s]**  
Specify the maximum number of incoming packets processed by the device. If "No Change" is entered, the entry in table 2 remains unchanged.

- **Egress Rate [Kb/s]**  
Specify the data rate for all outgoing frames. If "No Change" is entered, the entry in table 2 remains unchanged
- **Transfer to table**  
If you click the button, the settings are adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Shows the port to which the settings relate.
- **Limit Ingress Unicast (DLF)**  
Enable or disable the data rate for limiting incoming unicast frames with an unresolvable address (Destination lookup failure).
- **Limit Ingress Broadcast**  
Enable or disable the data rate for limiting incoming broadcast frames.
- **Limit Ingress Multicast**  
Enable or disable the data rate for limiting incoming multicast frames.
- **Total Ingress Rate [pkts/s]**  
Specify the maximum number of incoming packets processed by the device.
- **Egress Rate [Kb/s]**  
Specify the data rate for all outgoing frames.

---

**Note****Rounding of the values, deviation from desired value**

When you enter the values for transmission rates, note that the WBM rounds to correct values.

If values are configured for total ingress transmission rate and egress transmission rate, the actual values in operation can exceed or fall below the set values by 10%.

---

## VLAN

### General

On this page, you define the VLAN and specify the use of the ports.

---

**Note****Changing the "Agent VLAN ID"**

If the configuration PC is connected directly to the device via Ethernet and you change the "agent VLAN ID", the device is no longer reachable via Ethernet following the change.

---

### Important rules for VLANs

Make sure you keep to the following rules when configuring and operating your VLANs:

- Frames with the VLAN ID "0" are handled as untagged frames but retain their priority value.
- As default, all ports on the device send frames without a VLAN tag to ensure that the end node can receive these frames.
- With SCALANCE X devices, the VLAN ID "1" is the default on all ports.
- If an end node is connected to a port, outgoing frames should be sent without a tag (static access port). If, however, there is a further switch at this port, the frame should have a tag added (trunk port).
- With a trunk port, the VLAN assignment is dynamic. Static configurations can only be created if, in addition to the trunk port property, the port is also entered statically as a member in the VLANs involved. An example of a static configuration is the assignment of the multicast groups in certain VLANs.

### Settings

- **VLAN ID**  
Enter the VLAN ID.

The table has the following columns:

- **VLAN ID**  
Shows the VLAN ID. The VLAN ID is assigned once when you create a new data record and can then no longer be changed. To make a change, the entire data record must be deleted and created again.
- **Name**  
Enter a name for the VLAN. The name only provides information and has no effect on the configuration.  
The VLAN name can be a maximum of 32 characters long.

- **Status**  
Shows the status of the entry. Here, static means that the address was entered as a static address by the user. The entry GVRP means that the configuration was registered by a GVRP frame. This is, however, only possible if GVRP was enabled for the device.
- **List of ports**  
Specify the use of the port. The following options are available:
  - "-"  
The port is not a member of the specified VLAN.  
With a new definition, all ports have the identifier "-".
  - M  
The port is a member of the VLAN. Frames sent in this VLAN are forwarded with the corresponding VLAN tag.
  - R  
The port is a member of the VLAN. A GVRP frame is used for the registration.
  - U (upper case)  
The port is an untagged member of the VLAN. Frames sent in this VLAN are forwarded without the VLAN tag. Frames without a VLAN tag are sent from this port.
  - u (lower case)  
The port is an untagged member of the VLAN, but the VLAN is not configured as a port VLAN. Frames sent in this VLAN are forwarded without the VLAN tag.
  - F  
The port is not a member of the specified VLAN and it is not possible for the VLAN to be registered dynamically at this port using GVRP. You can configure other settings in "Layer 2 > VLAN > Port-based VLAN".

## GVRP

### Configuration of GVRP functionality

Using GVRP frame, a different device can register at the port of the device for a specific VID. A different device, can, for example be an end device or a switch. The device can also send GVRP frames via this port.

### Settings

- **GVRP**  
Enable or disable the "GVRP" function.

Table 1 has the following columns:

- **1st column**  
Shows that the settings are valid for all ports of table 2.
- **Setting**  
Select the setting. You have the following setting options:
  - enabled  
Enables the sending of GVRP frames.
  - disabled  
Disables the sending of GVRP frames.
  - No Change  
No change in table 2.
- **Transfer to table**  
If you click the button, the setting is adopted for all ports of table 2. If you have selected "No Change", the content of table 2 will not be changed.

Table 2 has the following columns:

- **Port**  
Shows the available ports.
- **Setting**  
Enable or disable the sending GVRP frames.

## Port-based VLAN

### Processing received frames

On this page, you specify the configuration of the port properties for receiving frames.

### Settings

Table 1 has the following columns:

- **1st column**  
Shows that the settings are valid for all ports.
- **Priority / Port VID / Acceptable Frames / Ingress Filtering**  
Select the setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Shows the available ports and link aggregations.
- **Priority**  
Select the priority assigned to untagged frames.  
The CoS priority (Class of Service) used in the VLAN tag. If a frame is received without a tag, it will be assigned this priority. This priority specifies how the frame is further processed compared with other frames.  
There are a total of eight priorities with values 0 to 7, where 7 represents the highest priority (IEEE 802.1p Port Priority).
- **Port VID**  
Select the VLAN ID. Only VLAN IDs defined on the "VLAN > General" page can be selected.  
If a received frame does not have a VLAN tag, it has a tag with the VLAN ID specified here added to it and is sent according to the rules at the port.
- **Acceptable Frames**  
Specify which types of frames will be accepted. The following alternatives are possible:
  - Tagged Frames Only  
The device discards all untagged frames. Otherwise, the forwarding rules apply according to the configuration.
  - All  
The device forwards all frames
- **Ingress Filtering**  
Specify whether the VID of received frames is evaluated.  
The following options are available:
  - enabled  
The VLAN ID of received frames decides whether they are forwarded: To forward a VLAN tagged frame, the receiving port must be a member in the same VLAN. Frames from unknown VLANs are discarded at the receiving port.
  - disabled  
All frames are forwarded.

### Protocol-based VLAN group

On this page, you specify groups to which a protocol will be assigned.

## Settings

- **Protocol Based VLAN**  
Enable or disable the protocol-based VLAN assignment.
- **Protocol Value**  
Enter the hexadecimal protocol value.  
A few examples are shown below:
  - PROFINET: 88:92
  - IP: 08:00
  - Novell: 81:37
  - netbios: f0:f0
  - appletalk: 80:9b
- **Group ID**  
Enter the ID of the group.

The table has the following columns:

- **Protocol Value**  
Shows the file value.
- **Group ID**  
Shows the group ID.

## Protocol-based VLAN port

On this page, you specify which protocol and which VLAN is assigned to the individual port.

## Settings

- **Port**  
Select the required port. All available ports and the link aggregations can be selected.
- **Group ID**  
Select the group ID from the drop-down list. Specify the ID in "Layer 2 > VLAN > Protocol Based VLAN Group".

The table has the following columns:

- **Port**  
All available ports and the link aggregations are shown.
- **Group ID**  
Shows the group ID assigned to the port.
- **VLAN ID**  
Select the required VLAN ID to be assigned to the port.

## IPv4 subnet-based VLAN

On this page, you specify which VLAN ID is assigned to the subnet.

## Settings

- **Subnet Based VLAN**  
Enable or disable the subnet-based VLAN assignment
- **Port**  
Select the port. All available ports and the link aggregations can be selected.
- **Subnet Address**  
Enter the IP address of the subnet.  
Example: 192.168.10.0 for the network 192.168.10.x with nodes 192.168.10.1 to 192.168.10.254.
- **Subnet Mask**  
Enter the subnet mask.

The table has the following columns:

- **Port**  
All available ports and the link aggregations are shown.
- **Subnet Address**  
Shows the subnet assigned to the port.
- **Subnet Mask**  
Shows the subnet mask.
- **VLAN ID**  
Select the VLAN ID you want to assign to the port or the subnet.

## Mirroring

### Basics

## Mirroring

The device provides the option of simultaneously channeling incoming or outgoing data streams via other interfaces for analysis or monitoring. This has no effect on the monitored data streams. This procedure is known as mirroring. In this menu section, you enable or disable mirroring and set the parameters.

### Mirroring ports

Mirroring a port means that the data traffic at a port (mirrored port) of the IE switch is copied to another port (monitor port). You can mirror one or more ports to a monitor port.

If a protocol analyzer is connected to the monitor port, the data traffic at the mirrored port can be recorded without interrupting the connection. This means that the data traffic can be investigated without being affected. This is possible only if a free port is available on the device as the monitor port.

## General

On this page, you can enable or disable the mirroring function and make the basic settings.

---

### Note

If the maximum data rate of the mirrored port is higher than that of the monitor port, data may be lost and the monitor port no longer reflects the data traffic at the mirrored port. Several ports can be mirrored to one monitor port at the same time.

Mirroring a port does not work beyond switch core boundaries.

Disable port mirroring if you want to connect a normal end device to the monitor port.

---

## Settings

- **Mirroring**  
Enable or disable mirroring of the data traffic.
- **Monitor Barrier**  
Enable or disable the option to restrict communication via the monitor port.

---

### Note

#### Monitor Barrier

If you enable the monitor barrier, the data traffic on the destination port is automatically blocked (broadcast, multicast, unicast, DCP forwarding, LLDP) so that only the mirrored traffic is present. To be able to allow other data traffic again, you need to configure this. The previous statuses of these options are not restored after stopping the monitor barrier and must be reconfigured.

---

- enabled  
The monitor port is taken out of normal frame switching.
- disabled  
Communication via the monitor port is unrestricted.

This table has the following columns:

- **Session ID**  
Enable or disable listening in on incoming packets at the required port.
- **Session Type**  
Specify which data traffic is mirrored. The following options are available:
  - None
  - Port Based  
Port-based mirroring You can configure other settings in "Layer 2 > Mirroring > Port".
  - VLAN  
VLAN-based mirroring. You can configure other settings in "Layer 2 > Mirroring > VLAN".
  - MAC ACL  
Mirroring of the MAC Access Control List. You can configure other settings in "Layer 2 > Mirroring > MAC Flow".
  - IP ACL  
Mirroring of the IP Access Control List. You can configure other settings in "Layer 2 > Mirroring > IP Flow".
- **Status**  
Shows whether or not mirroring is active.
- **Dest. Port**  
Select the destination port to be mirrored to in this session.

## Port

### Mirroring ports

You can only configure the settings on this page if you have already generated a session ID with the session type "Port Based" on the "General" tab.

### Settings

- **Session ID**  
Select the session ID. Only session IDs of the session type "Port Based" are available.

The table has the following columns:

- **Port**  
Shows the port to be monitored.
- **Ingress Mirroring**  
Enable or disable mirroring of incoming packets at the required port.
- **Egress Mirroring**  
Enable or disable mirroring of outgoing packets at the required port.

## VLAN

### VLAN sources of the port mirroring function

You can only configure the settings on this page if you have already generated a session ID with the session type "VLAN" on the "General" tab.

On this page, you specify the VLAN whose incoming data traffic will be mirrored to the monitor port.

#### Settings

- **Session ID**  
Select the session ID. Only session IDs of the session type "VLAN" are available.
- **VLAN ID**  
Enter a VLAN ID. The VLAN ID can only be assigned once when you create a new data record and can then no longer be changed. To make a change, the entire data record must be deleted and created again.

The table has the following columns:

- **VLAN ID**  
Shows the VLAN ID.

## MAC Flow

You can only configure the settings on this page if you have already generated a session ID with the session type "MAC ACL" on the "General" tab.

The MAC ACL filter decides which data is available at the monitor port.

#### Settings

- **Session ID**  
Select the session ID. Only session IDs of the session type "MAC ACL" are available.

The table has the following columns:

- **ACL Filter Number**  
Shows the number of the ACL filter. You configure the MAC ACL filter in "SecurityPort ACL MAC".
- **Ingress Mirroring**  
Shows whether incoming packets are mirrored.

---

#### Note

#### Rules

A rule selected for ingress mirroring only becomes active if it was configured as a port ingress rule on at least one port. You configure the port ingress rules in "Security> Port MAC IP > Port Ingress Rules".

---

- **Source MAC**  
Shows the MAC address of the sender.
- **Dest. MAC**  
Shows the MAC address of the recipient.
- **Ingress Port**  
Shows a list of all ports to which this rule applies.
- **Egress Port**  
Shows a list of all ports to which this rule applies.

## IP Flow

You can only configure the settings on this page if you have already generated a session ID with the session type "IP ACL" on the "General" tab.

The IP ACL filter decides which data is mirrored to the monitor port.

## Settings

- **Session ID**  
Select the session ID. Only session IDs of the session type "IP ACL" are available.

The table has the following columns:

- **ACL Filter Number**  
Shows the number of the ACL filter. You configure the IP ACL filter in "Security > Port ACL IP".
- **Ingress Mirroring**  
Shows whether incoming packets are mirrored.

---

### Note

#### Rules

A rule selected for ingress mirroring only becomes active if it was configured as a port ingress rule on at least one port. You configure the port ingress rules in "Security> Port ACL IP > Port Ingress Rules".

---

- **Source IP**  
Shows the IP address of the sender.
- **Source Subnet Mask**  
Shows the subnet mask of the sender.
- **Dest. IP**  
Shows the IP address of the recipient.
- **Dest. Subnet Mask**  
Shows the subnet mask of the recipient.
- **Ingress Port**  
Shows a list of all ingress ports to which this rule applies.
- **Egress Port**  
Shows a list of all egress ports to which this rule applies.

## Dynamic MAC Aging

The device automatically learns the source addresses of the connected nodes.

This information is used to forward data frames to the nodes specifically involved. The network load for the other nodes is reduced.

If a device does not receive a frame whose source address matches a learnt address within a certain time, the learnt address is deleted. This mechanism is known as aging. Aging prevents frames being forwarded incorrectly, for example when an end device (for example a programming device) is connected to a different port. If the check box is not enabled, a device does not delete learned addresses automatically.

## Settings

- **Dynamic MAC Aging**  
Enable or disable the function for automatic aging of learned MAC addresses:
- **Aging Time [s]**  
Enter the time in seconds. After this time, a learned address is deleted if the device does not receive any further frames from this sender address.

## Ring Redundancy

### Ring

On this page, you can select the required mode for fast ring redundancy. The "Automatic Redundancy Detection" ring redundancy mode is the default when the device ships.

---

#### Note

The ring redundancy cannot be enabled if Spanning Tree is still enabled on the device.

---

## Settings

- **Ring Redundancy**  
Enable or disable ring redundancy.
- **Ring redundancy mode**  
Specify the ring redundancy mode. The following options are available:
  - **"-" (disabled)**  
The redundancy function is disabled.
  - **Automatic Redundancy Detection**  
Select this setting to create an automatic configuration of the redundancy mode. In this mode, the device automatically detects whether or not there is a device with the "HRP Manager" role in the ring. If this is the case, the device adopts the role of "HRP Client". If no HRP manager is found, all devices with the "Automatic Redundancy Detection" or "MRP Auto Manager" setting negotiate among themselves to establish which device adopts the role of "MRP Manager". The device with the lowest MAC address will always become "MRP Manager". The other devices automatically set themselves to redundancy mode "MRP Client".
  - **MRP Auto Manager**  
Devices with the setting "Automatic Redundancy Detection" or "MRP Auto Manager" negotiate among themselves which device will adopt the "MRP Manager" role. The device with the lowest MAC address will always become "MRP Manager". In contrast to the setting "Automatic Redundancy Detection", the devices are not capable of detecting whether or not an HRP manager is in the ring. This means that they never adopt the role of HRP client.
  - **MRP Client**  
In a ring whose devices are configured with MRP, at least one device must be set to the "Automatic Redundancy Detection" or "MRP Auto Manager" mode. You can set the "MRP Client" role for all other devices. If all devices except one are configured as "MRP Client", this one device automatically adopts the role of "MRP Manager".  
Select "MRP Client" mode if you want to operate the device along with components that do not originate from Siemens in the ring.
  - **HRP Client**  
Here, you can select the role "HRP Client".
  - **HRP Manager**  
When you configure an HRP ring, one device must be set as HRP manager. All other devices must be configured as HRP clients.
- **Ring ports**  
Specify the ports to be used as ring ports in media redundancy in ring topologies.  
The ring port you select in the upper drop-down menu is the "Isolated Port" in HRP.

---

### Note

If you restore the factory defaults, the default redundancy mode "Automatic Redundancy Detection" becomes active.

The ring port configuration is also reset to the factory default ports. If other ports were used previously as ring ports, with the appropriate attachment, a previously correctly configured device can cause circulating frames and therefore the failure of the data traffic.

---

- **Observer**  
Enable or disable the observer. The "Observer" function is only available in HRP rings. The ring port selected in the upper drop-down menu is connected to the "Isolated Port" of an HRP manager.  
The observer monitors malfunctions of the redundancy manager or incorrect configurations of an HRP ring.  
If the observer is enabled, it can interrupt the connected ring if errors are detected. To do this, the observer switches a ring port to the "blocking" status. When the error is resolved, the observer enables the port again.
- **Restart Observer** (only available online)  
If numerous errors occur in quick succession, the observer no longer enables its port automatically. The ring port remains permanently in the "blocking" status. This is signaled by the error LED and a message text.  
After the errors have been eliminated, you can enable the port again using the "Restart Observer" button.

## Standby

### Standby manager

The standby manager allows the redundant linking of two HRP rings. To do this, two neighboring devices within a ring must be configured as standby partners. Enable the standby manager for both standby partners and select the port via which the device is connected to the ring you want to link to. For the "Standby Connection Name", a name unique within the ring must be assigned for both partners. This identifies the two modules as standby partners that belong together.

---

#### Note

To be able to use the function, HRP must be activated.

---

## Settings

- **Standby**  
Enable or disable the standby manager.

---

**Note**

If two devices are linked by the standby function, the "Standby" function must be enabled on both devices.

---

**Note**

The standby manager always requires an activated HRP client.

- **Standby Connection Name**  
Enter the name for the standby connection. This name defines the master/slave device pair. Both must be located in the same ring. This is achieved by entering the same name on two devices in the ring.

---

**Note**

Make sure that the standby name (for one pair of devices) is used only once in the network.

- **Force device to standby master**  
When selected, the device is configured as standby master regardless of its MAC address.
  - If the setting is enabled for neither of the two devices for which the standby function is enabled, then assuming that no error has occurred, the device with the higher MAC address adopts the role of standby master.
  - If the setting is enabled for both devices or if the setting is only supported by one device, the standby master is also selected based on the MAC address.

This type of assignment is important in particular when a device is replaced. Depending on the MAC addresses, the previous device with the slave function can take over the role of the standby master.

This table has the following columns:

- **Port**  
Shows the port to which the setting relates.
- **Setting**  
Here, you specify which ports are standby ports. The standby ports are involved in the redirection of data traffic.  
If there are no problems, only the standby ports of the master are enabled and handle to the data traffic into the connected HRP rings (buses). If the master or the Ethernet connection (link) of one of the standby ports of the master fails, all standby ports of the master will be disabled and the standby ports of the slave enabled. As a result, a functioning Ethernet connection to the connected network segments (HRP rings/linear buses) is restored.

## Spanning Tree

### General

#### General settings of MSTP

On this page, you configure the settings for MSTP. As default, Rapid Spanning Tree is enabled that can be set to the MSTP, RSTP or STP compatible mode with a switch.

On the configuration pages of these functions, you can make detailed settings.

Depending on the compatibility mode, you can configure the corresponding function on the relevant configuration page.

### Settings

- **Spanning Tree**  
Enable or disable Spanning Tree.
- **Protocol Compatibility**  
Select the compatibility mode of Spanning Tree. If, for example, you select RSTP, Spanning Tree behaves like RSTP.  
The following settings are available:
  - STP
  - RSTP
  - MSTP

#### Using a link aggregation in an MSTP instance

If you want to use a link aggregation in an MSTP instance, follow the steps below during configuration:

1. Create a link aggregation in "Layer 2" > "Link aggregation (Page 886)".
2. Create an MSTP instance in "Layer 2" > "Spanning Tree" > "MST General (Page 881)".
3. Configure the link aggregation in "Layer 2" > "Spanning Tree" > "MST port (Page 882)".

#### Automatic activation of MRP in redundant topologies

If you connect SCALANCE X switches with redundant network structures in the topology view, MRP is activated automatically on the switches involved.

If there is an existing configuration with other redundancy mechanisms, such as MSTP, this is automatically deactivated.

### CIST general

On this page, you configure CIST.

## Settings

- **Bridge Priority / Root Priority** (only available online)  
Which device becomes the root bridge is decided based on the bridge priority. The bridge with the highest priority becomes the root bridge. The lower the value, the higher the priority. If several devices in a network have the same priority, the device whose MAC address has the lowest numeric value will become the root bridge. Both parameters, bridge priority and MAC address together form the bridge identifier. Since the root bridge manages all path changes, it should be located as centrally as possible due to the delay of the frames.
- **Bridge Address / Root Address**(only available online)  
The bridge address shows the MAC address of the device and the root address shows the MAC address of the root bridge.
- **Root Port** (only available online)  
Shows the port via which the switch communicates with the root bridge.
- **Root Cost** (only available online)  
The path costs from this device to the root bridge.  
In MSTP mode, path costs up to the root bridge are shown.
- **Topology Changes / Last Topology Change** (only available online)  
The entry for the device shows the number of reconfigurations due to the spanning tree mechanism since the last startup. For the root bridge, the time since the last reconfiguration is displayed as follows:
  - Seconds: sec unit after the number
  - Minutes: min unit after the number
  - Hour: hr unit after the number
- **Bridge Hello Time / Root Hello Time** (only available online)  
Each bridge regularly sends configuration frames (BPDUs). The interval between two such frames is the Hello time. The default for this parameter is 2 seconds.
- **Bridge Forward Delay / Root Forward Delay**  
New configuration data is not used immediately by a bridge but only after the period specified in the parameter. This ensures that operation is only started with the new topology after all the bridges have the required information.
- **Bridge Max Age / Root Max Age** (only available online)  
Bridge Max Age defines the maximum "age" of a received BPDU for it to be accepted as valid by the switch.
- **Bridge Max Hop Count**  
This parameter specifies how many MSTP nodes a BPDU may pass through. If an MSTP BPDU is received and has a "Bridge Max Hop Count" that exceeds the value configured here, it is discarded.
- **Regional root priority** (only available online)  
For a description, see Bridge Priority / Root Priority
- **Regional root address** (only available online)  
The MAC address of the device.
- **Regional root costs** (only available online)  
Shows the path costs from this device to the regional root bridge.

- **Region Name**  
Enter the name of the MSTP region to which this device belongs. As default, the MAC address of the device is entered here. This value must be the same on all devices that belong to the same MSTP region.
- **Region Version**  
Enter the version number of the MSTP region in which the device is located. This value must be the same on all devices that belong to the same MSTP region.
- **Reset Counter** (only available online)  
Click this button to reset the counters on this page to zero.

## CIST port

### MSTP-CIST port configuration

When the page is called, the table displays the current status of the configuration of the port parameters.

To configure them, click the relevant cells in the port table.

## Settings

Table 1 has the following columns:

- **1st column**  
Shows that the setting is valid for all ports of table 2.
- **MSTP Status**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Shows the available ports.
- **MSTP Status**  
Specify whether or not the port is integrated in the spanning tree.

---

### Note

If you disable the "MSTP Status" option for a port, this may cause the formation of loops. The topology must be kept in mind.

---

- **Priority**  
Enter the priority of the port. The priority is only evaluated when the path costs are the same. The value must be divisible by 16. If the value that cannot be divided by 16, the value is automatically adapted.
- **Cost Calc.**  
Enter the path cost calculation. If you enter the value "0" here, the automatically calculated value is displayed in the "Path Costs" box.

- **Path Costs** (only available online)

This parameter is used to calculate the path that will be selected. The path with the lowest value is selected as the path. If several ports of a device have the same value for the path costs, the port with the lowest port number is selected.

If the value for "Cost Calc." is "0", the automatically calculated value is displayed. Otherwise, the value of the "Cost Calc." box is displayed. The calculation of the path costs is largely based on the transmission speed. The higher the achievable transmission speed is, the lower the value of the path costs.

Typical values for path costs with rapid spanning tree:

  - 10,000 Mbps = 2,000
  - 1000 Mbps = 20,000
  - 100 Mbps = 200,000
  - 10 Mbps = 2,000,000

The values can, however, also be set individually.
- **Status** (only available online)

Displays the current status of the port. The values are only displayed and cannot be configured. The "Status" parameter depends on the configured protocol. The following is possible for status:

  - Disabled

The port only receives and is not involved in STP, MSTP and RSTP.
  - Discarding

In the "Discarding" mode, BPDU frames are received. Other incoming or outgoing frames are discarded.
  - Listening

In this status, BPDUs are both received and sent. The port is involved in the spanning tree algorithm.
  - Learning

Stage prior to the forwarding status, the port is actively learning the topology (in other words, the node addresses).
  - Forwarding

Following the reconfiguration time, the port is active in the network; it receives and forwards data frames.

- **Fwd. Trans** (only available online)  
Specifies the number of changes from the "Discarding" status to the "Forwarding" status
- **Edge type**  
Specify the type of edge port. You have the following options:
  - "-"  
Edge port is disabled. The port is treated as a "no edge port".
  - Admin  
Select this option when there is always an end device on this port. Otherwise a reconfiguration of the network will be triggered each time a connection is changed.
  - Auto  
Select this option if you want a connected end device to be detected automatically at this port. When the connection is established the first time, the port is treated as a "no Edge Port".
  - Admin/Auto  
Select these options if you operate a combination of both on this port. When the connection is established the first time, the port is treated as an Edge Port.
- **Edge** (only available online)  
Shows the status of the port.
  - Enabled  
  
An edge port is connected to this port.
  - Disabled  
There is a spanning tree or rapid spanning tree device at this port.

With an end device, a switch can change over the port faster without taking into account spanning tree frames. If a spanning tree frame is received despite this setting, the port automatically changes to the "Disabled" setting for switches.

- **P.t.P. Type**  
Select the required option. The selection depends on the port that is set.
  - "-"  
Point to point is calculated automatically. If the port is set to half duplex, a point-to-point link is not assumed.
  - P.t.P.  
  
Even with half duplex, a point-to-point link is assumed.
  - Shared Media  
  
Even with a full duplex connection, a point-to-point link is not assumed.

---

**Note**

Point-to-point connection means a direct connection between two devices. A shared media connection is, for example, a connection to a hub.

---

- **Hello Time**  
Enter the interval after which the bridge sends configuration BPDUs

---

**Note**

The port-specific setting of the Hello time is only possible in MSTP compatible mode.

---

## MST General

### Multiple Spanning Tree configuration

With MSTP, in addition to RSTP, several VLANs can be managed in a LAN with separate RSTP trees.

### Settings

- **MSTP Instance ID**  
Enter the number of the MSTP instance.  
  
The table has the following columns:
- **MSTP Instance ID**  
Shows the number of the MSTP instance.
- **Root Address**  
Shows the MAC address of the root bridge
- **Root Priority**  
Shows the priority of the root bridge.

- **Bridge Priority**  
Enter the bridge priority. The value for the bridge priority is a whole multiple of 4096.
- **VLAN ID**  
Enter the VLAN ID. Here, you can also specify ranges with Start ID, "-", End ID. Several ranges or IDs are separated by ",".

## MST port

### Configuration of the Multiple Spanning Tree port parameters

On this page, you set the parameters for the ports of the configured multiple spanning tree instances.

## Settings

- **MSTP Instance ID**  
Select the ID of the MSTP instance.

Table 1 has the following columns

- **1st column**  
Shows that the setting is valid for all ports.
- **MSTP Status**  
Select the setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the setting is adopted for all ports of table 2

The table has the following columns:

- **Port**  
Shows all available ports and link aggregations.
- **MSTP Instance ID**  
ID of the MSTP instance.
- **MSTP Status**  
Enable or disable MSTP for this port.
- **Priority**  
Enter the priority of the port. The priority is only evaluated when the path costs are the same. The value must be divisible by 16. If the value that cannot be divided by 16, the value is automatically adapted.
- **Cost Calc.**  
Enter the path cost calculation in the input box. If you enter the value "0" here, the automatically calculated value is displayed in the next box "Path Costs".

- **Path Costs** (only available online)

This parameter is used to calculate the path that will be selected. The path with the lowest value is selected as the path. If several ports of a device have the same value for the path costs, the port with the lowest port number is selected.

If the value for "Cost Calc." is "0", the automatically calculated value is displayed. Otherwise, the value of the "Cost Calc." box is displayed. The calculation of the path costs is largely based on the transmission speed. The higher the achievable transmission speed is, the lower the value of the path costs.

Typical values for path costs with rapid spanning tree:

  - 10,000 Mbps = 2,000
  - 1000 Mbps = 20,000
  - 100 Mbps = 200,000
  - 10 Mbps = 2,000,000

The values can, however, also be set individually.
- **Status** (only available online)

Displays the current status of the port. The values are only displayed and cannot be configured. The "Status" parameter depends on the configured protocol. The following is possible for status:

  - Disabled

The port only receives and is not involved in STP, MSTP and RSTP.
  - Discarding

In the "Discarding" mode, BPDU frames are received. Other incoming or outgoing frames are discarded.
  - Listening

In this status, BPDUs are both received and sent. The port is involved in the spanning tree algorithm.
  - Learning

Stage prior to the forwarding status, the port is actively learning the topology (in other words, the node addresses).
  - Forwarding

Following the reconfiguration time, the port is active in the network; it receives and forwards data frames.
- **Fwd. Trans** (only available online)

Specifies the number of changes from the "Discarding" status to the "Forwarding" status

## Enhanced Passive Listening Compatibility

### Enabling the function

On this page, you enable the expanded compatibility for passive listening.

## Settings

- **Enhanced Passive Listening Compatibility**  
Enable or disable this function for the entire device.

Table 1 has the following columns:

- **1st column**  
Shows that the settings are valid for all ports of table 2.
- **Setting**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Displays the port of the device.
- **Setting**
  - enabled  
Enables the function for all ports of the device.
  - disabled  
Disables the function for all ports of the device.

## Loop detection

With the "Loop Detection" function, you specify the ports for which loop detection will be activated. The ports involved send special test frames - the loop detection frames. If these frames are sent back to the device, there is a loop.

A "local loop" involving this device means that the frames are received again at a different port of the same device. If the sent frames are received again at the same port, there is a "remote loop" involving other network components.

---

### Note

A loop is an error in the network structure that needs to be eliminated. The loop detection can help to find the errors more quickly but does not eliminate them. The loop detection is not suitable for increasing network availability by deliberately including loops.

---

### Note

Note that loop detection is only possible at ports that were not configured as ring ports or standby ports.

---

## Settings

- **Loop Detection**  
Enable or disable loop detection.
- **VLAN Loop Detection**  
Enable or disable loop detection in a VLAN.

Table 1 has the following columns:

- **1st column**  
Shows that the settings are valid for all ports of table 2
- **Threshold / Remote Reaction / Local Reaction**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Shows the available ports.
- **Setting**  
Specify how the port handles loop detection frames.

---

### Note

Test frames create additional network load. We recommend that you only configure individual switches, for example at branch points of the ring, as "sender" and the others as "forwarder".

---

- sender  
Loop detection frames are sent out and forwarded.
  - forwarder  
Loop detection frames from other devices are forwarded.
  - blocked  
The forwarding of loop detection frames is blocked.
- **Threshold**  
Specify the number of received loop detection frames as of which a loop is assumed.
  - **Remote Reaction**  
Specify how the port will react if a remote loop occurs. Select one of the two options from the drop-down list:
    - no action  
A loop has no effect on the port.
    - disable  
The port is blocked.

- **Local Reaction**  
Specify how the port will react if a local loop occurs. Select one of the two options from the drop-down list:
  - no action  
A loop has no effect on the port.
  - disable  
The port is blocked
- **Status** (only available online)  
This box shows whether loop detection is enabled or disabled for this port.
- **Source Port** (only available online)  
Shows the output port of the loop detection frame that triggered the last reaction
- **Source VLAN** (only available online)  
Shows the VLAN ID of the loop detection frame that triggered the last reaction.  
This is only possible if "VLAN Support Enabled" was selected earlier on the "Loop Detection Configuration" page.
- **Reset** (only available online)  
After a loop in the network has been eliminated, click this button to reset the port again

## Link aggregation

### Bundling network connections for redundancy and higher bandwidth

A link aggregation according to IEEE 802.3ad allows several connections between neighboring devices to be bundled to achieve higher bandwidths and to protect against failure.

Ports on both partner devices are included in link aggregations and the devices are then connected via these ports. To assign ports (in other words links) correctly to a partner device, the Link Aggregation Control Protocol (LACP) from the IEEE 802.3ad standard is used.

Up to 8 link aggregations can be defined. A maximum of 8 ports can be assigned to each link aggregation.

You can also use link aggregations within an MSTP instance, see "Layer 2" > "Spanning Tree" > "General (Page 876)".

## Settings

The table has the following columns:

- **Port**  
Shows the virtual port number of this link aggregation. This identifier is assigned internally by the firmware.
- **Link Aggregation Name**  
Enter the name for the link aggregation. This name can be specified by the user during configuration. The name is not absolutely necessary but can be useful to distinguish between the various link aggregations.
- **MAC Address**  
Shows the MAC address.

- **Status**  
Enable or disable link aggregation.
- **MTU**  
Specify the packet size.
- **LACP**
  - on  
Enables the sending of LACP frames.
  - off  
Disables the sending of LACP frames.
- **Frame Distribution**  
Set the type of distribution of packets on the individual links of an aggregation.
  - Destination&Source Mac  
The distribution is based on a combination of the destination and source MAC address.
  - Destination&Source IP-MAC  
The distribution is based on a combination of the destination and source IP address and MAC address.
- **VLAN Mode**  
Specify how the link aggregation is entered in a VLAN:
  - Hybrid  
The link aggregation sends tagged and untagged frames. It is not automatically a member of a VLAN.
  - Trunk  
The link aggregation only sends tagged frames and is automatically a member of all VLANs.
- **Port**  
Shows the ports that belong to this link aggregation. The following values can be selected from the drop-down list:
  - "-" (disabled)  
Link aggregation is disabled.
  - "a" (active)  
The port sends LACP frames and is only involved in the link aggregation when LACP frames are received.
  - "p" (passive)  
The port is only involved in the link aggregation when LACP frames are received.
  - "o" (on)  
The port is involved in the link aggregation and does not send any LACP frames.

---

**Note**

Within a "link aggregation", only ports with the following configuration are possible:

- all ports with "o"
  - all ports with "a" or "p".
-

## DCP forwarding

### Applications

The DCP protocol is used by STEP 7 and the PST Tool for configuration and diagnostics. When shipped, DCP is enabled on all ports; in other words, DCP frames are forwarded at all ports. With this option, you can disable the sending of these frames for individual ports, for example to prevent individual parts of the network from being configured with the PST Tool or to divide the full network into smaller parts for configuration and diagnostics.

### Settings

Table 1 has the following columns:

- **1st column**  
Shows that the setting is valid for all ports of table 2.
- **Setting**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Shows the available ports.
- **Setting**  
Specify whether the port should block or forward outgoing DCP frames. The following options are available:
  - forward  
DCP frames are forwarded via this port.
  - block  
No outgoing DCP frames are forwarded via this port. It is nevertheless still possible to receive via this port.

## LLDP

### Applications

PROFINET uses the LLDP protocol for topology diagnostics. In the default setting, LLDP is enabled for all ports; in other words, LLDP frames are sent and received on all ports. With this function, you have the option of enabling or disabling sending and/or receiving per port.

## Settings

Table 1 has the following columns:

- **1st column**  
Shows that the setting is valid for all ports of table 2.
- **Setting**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Shows the port.
- **Setting**  
Specify the LLDP functionality. The following options are available:
  - Rx  
This port can only receive LLDP frames.
  - Tx  
This port can only send LLDP frames.
  - Rx & Tx  
This port can receive and send LLDP frames.
  - "-" (disabled)  
This port can neither receive nor send LLDP frames.

## Unicast

### Filter

#### Address filtering

This page shows the current content of the unicast filter table. This table lists the source addresses of unicast address frames. The displayed entries were made statically, in other words, the user set them.

On this page, you also define the static unicast filters.

## Settings

- **VLAN ID**  
Select the VLAN ID in which you configure a new static MAC address. If nothing is set, "VLAN1" is set as the basic setting.
- **MAC Address**  
Enter the MAC address here.

This table contains the following columns:

- **VLAN ID**  
Shows the VLAN-ID assigned to this MAC address.
- **MAC Address**  
Shows the MAC address of the node that the device has learned or the user has configured.
- **Status**  
Shows the status of each address entry:
  - static  
Configured by the user. Static addresses are stored permanently; in other words, they are not deleted when the aging time expires or when the switch is restarted.
- **Port**  
Shows the port via which the node with the specified address can be reached. Frames received by the device whose destination address matches this address will be forwarded to this port.

---

**Note**

You can only specify **one** port for unicast addresses.

---

## Learning

### Starting/stopping learning

---

**Note**

The page is only available if there is an online connection to the device.

---

With the automatic learning function, all connected devices are automatically entered in the unicast filter table. As long as the "Start learning" function is enabled, all learned unicast addresses are created immediately as static unicast entries. The learning process is ended only after clicking the "Stop learning" button. With this method, learning can take a few minutes or several hours in larger networks before all nodes have really been learned. Only nodes that send packets during the learning phase are found. By subsequently enabling the Port Lock function, only packets from the nodes known after the end of the learning phase (static unicast entries) will be accepted at the relevant ports.

---

**Note**

If the Port Lock function was already active on individual ports prior to the automatic learning phase, no addresses will be learned on these ports. This makes it possible to restrict learning to certain ports. To do this, first enable the Port Lock function of the ports that are not intended to learn addresses.

---

## Settings

- **Start learning**  
Click the "Start learning" button to start the learning phase.  
The device now enters the addresses of connected devices until you stop the function.
- **Stop learning**  
Click the "Stop Learning" button to stop the learning phase.  
The learned entries are stored.
- **Deleting all static unicast addresses**  
Click the "Clear all static unicast addresses" button to delete all static entries.  
In large networks with numerous nodes, automatic learning may lead to a lot of undesired static entries. To avoid having to delete these individually, this button can be used to delete all static entries. This function is disabled during automatic learning.

---

**Note**

Depending on the number of entries involved, deleting may take some time.

---

## Locked ports

### Activating the access control

On this page, you can block individual ports for unknown nodes.

If the Port Lock function is enabled, packets arriving at this port from unknown MAC addresses are discarded immediately. Packets from known nodes are accepted by the port. Since ports with the port lock function enabled cannot learn any MAC addresses, learned addresses on these ports are automatically deleted after the port lock function is enabled.

## Settings

Table 1 has the following columns:

- **1st column**  
Shows that the setting is valid for all ports of table 2.
- **Setting**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Shows the available ports.
- **Setting**  
Enable or disable access the port lock function for the port.

## Blocking

### Blocking the forwarding of unknown unicast frames

On this page, you can block the forwarding of unknown unicast frames for individual ports.

## Settings

Table 1 has the following columns:

- **1st column**  
Shows that the setting is valid for all ports of table 2.
- **Setting**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Shows the available ports.
- **Setting**  
Enable or disable the blocking of unicast frames

---

#### Note

#### Ring redundancy / standby

If ring redundancy or standby is enabled, the ports configured for this are not included in the blocking.

---

## Multicast

### Groups

### Multicast applications

In the majority of cases, a frame is sent with a unicast address to a particular recipient. If an application sends the same data to several recipients, the amount of data can be reduced by sending the data using one multicast address. For some applications, there are fixed multicast addresses (NTP, IETF1 Audio, IETF1 Video etc.).

## Reducing network load

In contrast to unicast frames, multicast frames represent a higher load for the device. Generally, multicast frames are sent to all ports. There are three ways of reducing the load caused by multicast frames:

- Static entry of the addresses in the multicast filter table.
- Dynamic entry of the addresses by listening in on IGMP parameter assignment frames (IGMP Configuration).
- Active dynamic assignment of addresses by GMRP frames.

The result of all these methods is that multicast frames are sent only to ports for which an appropriate address is entered.

"Multicast" shows the multicast frames currently entered in the filter table and their destination ports. The displayed entries were made statically, in other words, the user set them.

## Settings

- **VLAN ID**  
Select the VLAN ID to be assigned to the MAC multicast address.
- **MAC Address**  
Here you enter a new MAC multicast address you want to configure.

The table has the following columns:

- **VLAN ID**  
Shows VLAN ID of the VLAN to which the MAC multicast address is assigned.
- **MAC Address**  
Shows the MAC multicast address that the device has learned or the user has configured.
- **Status**  
Shows the status of each address entry. The following information is possible:
  - static  
The address was entered statically by the user. Static addresses are stored permanently; in other words, they are not deleted when the aging time expires or when the device is restarted. These must be deleted by the user.

## IGMP

### Function

IE switches support "IGMP snooping" and the IGMP querier function. If "IGMP snooping" is enabled, IGMP frames are evaluated and the multicast filter table is updated with this information. If "IGMP Querier" is also enabled, IE switches also send IGMP queries that trigger responses from IGMP-compliant nodes.

## IGMP Snooping Aging Time

In this menu, you can configure the aging time for IGMP Configuration. When the time elapses, entries created by IGMP are deleted from the address table if they are not updated by a new IGMP frame.

This applies to all ports; a port-specific configuration is not possible.

## IGMP Snooping Aging Time depending on the querier

### SCALANCE XR500 as IGMP querier:

If a SCALANCE XR500 is used as an IGMP querier, the query interval is 125 seconds. For the "IGMP Snooping Aging Time", set at least 250 seconds.

### Other IGMP queriers

If a different IGMP querier is used, the value of the "IGMP Snooping Aging Time" should be at least twice as long as the query interval.

## Settings

- **IGMP Snooping**  
Enable or disable IGMP (Internet Group Management Protocol). The function allows the assignment of IP addresses to multicast groups. If the check box is selected, IGMP entries are included in the table and IGMP frames are forwarded.
- **IGMP Snooping Aging Time**  
Enter the value for the aging time in seconds in this box.
- **IGMP Querier**  
Enable or disable "IGMP Querier". The device sends IGMP queries.

## GMRP

### Enabling GMRP

By selecting the check box, you specify whether or not GMRP is used for each individual port. If "GMRP" is disabled for a port, no registrations are made for it and it cannot send GMRP frames.

## Settings

- **GMRP**  
Enable or disable the GMRP function.

Table 1 has the following columns:

- **1st column**  
Shows that the setting is valid for all ports of table 2.
- **Setting**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the settings are adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Shows the available ports and the link aggregations.
- **Setting**
- Enable or disable GMRP for the port or for the link aggregation.

## Blocking

On this page, you can block the forwarding of unknown multicast frames for individual ports.

## Settings

Table 1 has the following columns:

- **1st column**  
Shows that the setting is valid for all ports of table 2.
- **Setting**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged
- **Transfer to table**  
If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Shows the available ports.
- **Setting**  
Enable or disable the blocking of multicast frames.

## Broadcast

### Blocking the forwarding of broadcast frames

On this page, you can block the forwarding of broadcast frames for individual ports.

---

#### Note

Some communication protocols work only with the support of broadcast. In these cases, blocking can lead to loss of data communication. Block broadcast only when you are sure that you do not need it.

---

## Settings

Table 1 has the following columns:

- **1st column**  
Shows that the setting is valid for all ports of table 2.
- **Setting**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the setting is adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
All available ports and the link aggregations are shown.
- **Setting**  
Enable or disable the blocking of broadcast frames.

## PTP

### General

---

#### Note

PTP is only available with SCALANCE X500.

---

The Precision Time Protocol (PTP) complying with IEEE 1588v2 allows the time-of-day synchronization of devices connected to the ports of a device. These devices forward the synchronization frames through the network using the "Transparent Clock" (TC) mechanism. The connection mechanisms "end-to-end" and "peer-to-peer" are supported.

To use IEEE 1588v2, enable this function and configure every port that is on the synchronization path as well as ports that are blocked due to redundancy mechanisms. IEEE 1588v2 can also be used with redundancy mechanisms in the ring such as HRP, standby linking of rings, MRP and RSTP.

## Setting

- **1588 Mode**  
You can make the following settings:
  - **off**  
The device does not process any PTP messages. PTP messages are, however, forwarded according to the rules of the device.
  - **transparent**  
The device adopts the function of a transparent clock and forwards PTP messages to other nodes while at the same time making entries in the correction field of the PTP message.

## TC general

### 1588 Transparent Clock

On this page, you specify the general settings for PTP.

## Settings

- **Delay Mechanism**  
Specify the delay mechanism the device will work with:
  - End-to-end(delay request response mechanism will be used)
  - Peer-to-peer (peer delay mechanism will be used)
- **Domain Number**  
Enter the identification number for the time domain. Synchronization is only for the devices within the domain. The device ignores PTP messages with a different domain number. A SCALANCE device can only be assigned to one synchronization domain.

## TC port

On this page, you specify the ports that can process PTP messages.

## Settings

Table 1 has the following columns:

- **1st column**  
Shows that the settings are valid for all ports of table 2.
- **Setting / Transport Mechanism**  
Select the setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the settings are adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Shows the available ports.
- **Setting**  
Enable or disable PTP. When enabled, the port processes PTP messages.
- **Faulty Flag**  
Shows error status relating to PTP.
  - **true**  
An error occurred.
  - **false**  
No error has occurred on this port.
- **Transport Mechanism**  
Specifies the protocol for transferring the PTP messages. This protocol must also be supported by the communications partner of the port
  - Ethernet
  - UDP IPv4

## RMON

### Statistics

### Statistics

On this page you can specify the ports for which statistics are displayed.

### Settings

- **RMON**  
If you select this check box, Remote Monitoring (RMON) allows diagnostics data to be collected on the device, prepared and read out using SNMP by a network management station that also supports RMON. This diagnostic data, for example port-related load trends, allow problems in the network to be detected early and eliminated.
- **Port**  
Select the ports for which statistics will be displayed.  
The table has the following columns:
  - **1st column**  
Select the check box of the ports for which no more statistics will be displayed.
  - **Port**  
Shows the ports for which statistics will be displayed.

## History

### Samples of the statistics

On this page, you can specify whether or not samples of the statistics are saved for a port. You can specify how many entries should be saved and at which intervals samples should be taken.

### Settings

Table 1 has the following columns:

- **1st column**  
Shows that the settings are valid for all ports.
- **Setting**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Entries**  
Enter the maximum number of samples to be stored at the same time. If "No Change" is entered, the entry in table 2 remains unchanged.
- **Interval [s]**  
Enter the interval after which the current status of the statistics will be saved as a sample. If "No Change" is entered, the entry in table 2 remains unchanged.
- **Transfer to table**  
If you click the button, the settings are adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Shows the port to which the settings relate.
- **Setting**  
Enable the port for which the history will be displayed.
- **Entries**  
Enter the maximum number of samples to be stored at the same time.
- **Interval [s]**  
Enter the interval after which the current status of the statistics will be saved as a sample.

## Layer 3

### Configuration

The page contains the overview of the layer 3 functions of the device. To use the "Routing", "VRRP", "OSPF" and "RIP" functions, the device requires a KEY-PLUG.

## Settings

- **Routing** (only available on layer 3)  
Enable or disable the "Routing" function.
- **DHCP Relay Agent**  
Enable or disable the DHCP relay agent. You can configure other settings in "Layer 3 > DHCP Relay Agent".
- **VRRP** (only available on layer 3)  
Enable or disable routing using VRRP. To use VRRP, first enable the "Routing" function. You can configure other settings in "Layer 3 > VRRP".
- **OSPF** (only available on layer 3)  
Enable or disable routing using OSPF. To use OSPF, first enable the "Routing" function. You can configure other settings in "Layer 3 > OSPFv2".
- **RIP** (only available on layer 3)  
Enable or disable routing using RIP. To use RIP, first enable the "Routing" function. You can configure other settings in "Layer 3 > RIPv2".

## Subnets

### Overview

### Subnet

The page shows the subnets for the selected interface. If more than one subnet is available on an interface, the first entry of this interface is of the address type "Primary". All other subnets have the address type "Secondary".

On this page, you can create further subnets "Layer 3 > Subnets > Overview". In "Layer 3 > Subnets > Configuration", you configure the settings of the created subnets.

## Settings

The following settings are possible for subnets of the "Secondary" address type:

- **Interface**  
Select the interface on which you want to configure another subnet.

The table has the following columns:

- **Interface**  
Shows the interface.
- **TIA Interface**  
Shows whether or not the entry is a TIA interface.
- **Interface Name**  
Shows the name of the interface.
- **MAC Address**  
Shows the MAC address.

- **IP Address**  
Shows the IP address of the subnet.
- **Subnet Mask**  
Shows the subnet mask.
- **Address Type**  
Shows the address type. The following values are possible:
  - Primary  
The first IP address that was configured on an IP interface.
  - Secondary  
All other IP addresses that were configured on an interface.
- **IP Assignment Method**  
Shows how the IP address is assigned.
  - Static  
The IP address is static. You enter the IP settings in "IP Address" and "Subnet Mask".
  - Automatic (DHCP)  
The device obtains a dynamic IP address from a DHCP server.
- **Address Collision Detection Status**  
Shows the status of the "Detection of address collisions" function.
  - Idle  
The interface is not enabled and does not have an IP address.
  - Starting  
This status indicates the start-up phase. In this phase, the device initially sends a query as to whether the planned IP address already exists. If the address is not yet been assigned, the device sends the message that it is using this IP address as of now.
  - Conflict  
The interface is not enabled. The interface is attempting to use an IP address that is already been assigned.
  - Defending  
The interface uses a unique IP address. Another interface is attempting to use the same IP address.
  - Active  
The interface uses a unique IP address. There are no collisions.
  - Not supported  
The function for detection of address collisions is not supported.

## Configuration

On this page, you configure the subnet. You create the subnet in "Layer 3 > Subnets > Overview".

## Settings

- **Interface (Name)**  
Select the required interface.
- **Interface Name**  
Enter the name of the interface, e.g. eth0; P3.
- **MAC Address** (only available online)  
Shows the MAC address of the selected interface
- **DHCP**  
Enable or disable the DHCP client for this interface.
- **IP Address**  
Enter the IP address of the subnet. The IP address must not be used more than once.
- **Subnet Mask**  
Enter the subnet mask of the subnet you are creating. Subnets on different interfaces must not overlap.
- **Address Type**  
Shows the address type. The following values are possible:
  - Primary  
The first subnet of the interface.
  - Secondary  
All other subnets of the interface.
- **Address Collision Detection**  
Enable or disable the function.  
If new IP addresses become active in the network, this function checks whether this can result in address collisions.  
With this function, IP addresses that will be assigned twice can be detected.

---

### Note

The function does not run a cyclic check.

---

- **TIA Interface**  
Enable or disable the setting.  
The following conditions apply to the TIA interface:
  - Only interfaces with the address type "Primary" can be enabled as the TIA interface.
  - There must only ever be one TIA interface.
  - There can only be one TIA interface.
  - A TIA interface is always a VLAN interface.

## TIA interface and PROFINET interface

The IP address of the TIA interface is linked to the IP address located in the parameter group "Properties > General > PROFINET interface > Ethernet addresses".

Both IP addresses always have the same value. If you change the value of one IP address, the other IP address changes accordingly.

### **TIA Interface**

The TIA interface is the interface via which all PROFINET functions of the IE switch are handled. TIA interface is the name of the IP address for PROFINET from the perspective of the IE switch.

### **PROFINET interface**

You make the IP setting of the PROFINET device in TIA under PROFINET interface.

PROFINET interface is the name of the IP address for PROFINET from the perspective of the TIA Portal.

## **Routes**

### **Static route**

On this page, you create the static routes. During automatic adaptations, static routes are not taken into account and need to be adapted manually.

## **Settings**

- **Destination Network**  
Enter the network address of the destination.
- **Subnet Mask**  
Enter the corresponding subnet mask.
- **Gateway**  
Enter the IP address of the next gateway.
- **Metric**  
Enter the metric for the route. The metric corresponds to the quality of a connection, for example speed, costs.

The table has the following columns:

- **Destination Network**  
Shows the network address of the destination.
- **Subnet mask**  
Shows the corresponding subnet mask.
- **Gateway**  
Shows the IP address of the next gateway.
- **Interface** (only available online)  
Shows the interface of the route.
- **Metric**  
Enter the metric for the route. When creating the route, "not used" is entered automatically. The metric corresponds to the quality of a connection, for example speed, costs. If there are several equal routes, the route with the lowest metric value is used.
- **Status** (only available online)  
Shows the status of the route.

## Route maps

### General

## Route maps

With route maps, you control how routing information is further processed. You can filter routing information and specify whether the information is further processed, modified or discarded.

Route maps operate according to the following principle:

- Routing information is compared with the filters of the route maps.
- The comparison is continued until the filters of a route map match the properties of an item of information.
- The information is then processed according to the route map settings:
  - The routing information is discarded.
  - The properties of the routing information are changed.

## Settings

- **Name**  
Enter the name for the route map.
- **Sequence No**  
Enter a number for the route map.  
The numbers specify the order in which the route maps are processed.

The table has the following columns:

- **Name**  
Shows the name of the route map.
- **Sequence No**  
Shows the sequence number of the route map.
- **Action**  
Specify what happens to the routing information that matches the settings of the route map:
  - permit  
The routing information is further processed according to the settings you make in the "Settings" tab.
  - deny  
The routing information is discarded.

## Interface and metric match

On this page, you specify whether or not the routing information for a route map is filtered according to interfaces or metric.

## Settings

- **Route Map (name/seq. no.)**  
Select a route map.  
The created route maps are available to you.
- **Type**  
Select the basis for the filtering:
  - Interface
  - Metric
- **Interface**  
Select an interface.  
This box is active only if you have selected the "Interface" entry in the "Type" drop-down list.
- **Metric**  
Enter a value for the metric.  
This box is active only if you have selected the "Metric" entry in the "Type" drop-down list.

The table has the following columns:

- **Type**  
Shows the selected type:
  - Interface
  - Metric
- **Value**  
Shows the selected interface or the value of the metric.

## Source match

On this page, you specify whether or not the routing information for a route map is filtered based on the source IP address.

## Settings

- **Route Map (name/seq. no.)**  
Select a route map.
- **IP Address**  
Enter the IP address of the source on which the filtering is based.
- **Subnet Mask**  
Enter the subnet mask of the source on which the filtering is based.

The table has the following columns:

- **IP Address**  
Shows the IP address of the source.
- **Subnet Mask**  
Shows the subnet mask of the source.

### Destination match

On this page, you specify whether or not the routing information for a route map is filtered based on the destination IP address.

#### Settings

- **Route Map (name/seq. no.)**  
Select a route map.
- **IP Address**  
Enter the IP address of the destination on which the filtering is based.
- **Subnet Mask**  
Enter the subnet mask of the destination on which the filtering is based.

The table has the following columns:

- **IP Address**  
Shows the IP address of the destination.
- **Subnet Mask**  
Shows the subnet mask of the destination.

### Next hop match

On this page, you specify whether or not the filtering for a route map will be based on the router to which the routing information is sent next.

#### Settings

- **Route Map (name/seq. no.)**  
Select a route map.
- **IP Address**  
Enter the IP address of the router to which the routing information will be sent next.

The table has the following columns:

- **IP Address**  
Shows the IP address of the next router.

### Settings

On this page, you specify whether or not the routing information for a route map will be changed.

If, for example, you have filtered based on a certain metric, you can change the value of the metric here. The routing information is then forwarded with the new value.

#### Settings

- **Route Map (name/seq. no.)**  
Select a route map.

The table has the following columns:

- **Name**  
Shows the name of the route map.
- **Sequence No**  
Shows the sequence number of the route map.
- **Interface**  
Enter the new interface via which the routing information will be forwarded.
- **Metric**  
Enter the new value for the metric with which the routing information will be forwarded.
- **Next Hop IP Address**  
Enter the IP address of the router to which the routing information will be sent next.

## DHCP Relay Agent

### General

If the DHCP server is in a different network, the device cannot reach the DHCP server. The DHCP relay agent intercedes between a DHCP server and the device. The DHCP relay agent forwards the port number of the device with the DHCP query to the DHCP server. If a DHCP server is unreachable, the device can switch to a different DHCP server.

### Settings

- **DHCP Relay Agent (Opt. 82)**  
Enable or disable the DHCP relay agent.
- **Server IP Address**  
Enter the IP address of the DHCP server.

The table has the following columns:

- **Server IP address**  
Shows the IP address of the DHCP server.

### Option

#### Parameters of the DHCP relay agent

On this page, you can specify parameters for the DHCP server, for example the circuit ID. The circuit ID describes the origin of the DHCP query, for example which port received the DHCP query.

You specify the DHCP server on the "General" tab.

## Settings

### Global configuration

- **Circuit ID router index**  
When enabled, the router index is added to the generated circuit ID.
  - **Circuit ID recipient VLAN ID**  
When enabled, the VLAN ID is added to the generated circuit ID.
  - **Circuit ID receiving port**  
When enabled, the receiving port is added to the generated circuit ID.
- 

#### Note

You need to select a least one option.

---

- **Remote ID**  
Shows the device ID.

### Interface-specific configuration

- **Interface**  
Select the required interface.

The table has the following columns:

- **Interface**  
Shows the selected interface.
  - **Remote ID type**  
Select the type of the device ID. You have the following options:
    - IP Address  
The current IP address of the interface will be used as the device identifier and copied to the "Remote ID" box.
- 

#### Note

##### No automatic updating

There is no link between the "Remote ID" box and the currently set IP address.

If the IP address is changed, the new IP address is not entered in the "Remote ID" box automatically. Only the value of the "Remote ID Type" box changes to "Free Text". To use the current IP address again, select "IP Address" again in the "Remote ID Type" box.

---

- MAC Address  
The MAC address of the device is used as the device ID.
- Free Text  
If you use "Free Text", you can enter the device name as the device identifier in the "Remote ID" box.
- **Remote ID**  
The box can only be edited if you select the entry "Free Text" for "Remote ID Type".  
The remote IP must be unique.

- **Circuit ID Type**  
Select the type of circuit ID from the drop-down list. You have the following options:
  - Predefined  
The circuit ID is created automatically based on the router index, VLAN ID or port.
  - Free Number  
If you use "Free Number", you can enter the ID for "Circuit ID".
- **Circuit ID**  
Enter the circuit ID.  
The box can only be edited if you select the "Free Number" entry for the "Circuit ID Type".

## VRRP

### Router

On this page, you create virtual routers. You can configure other parameters in "Layer 3 > VRRP > Configuration".

---

#### Note

- VRRP is available only on layer 3.
  - VRRP can only be used in conjunction with VLAN interfaces. Router ports are not supported.
  - Select "VRRP" to configure VRRP
- 

## Settings

The following settings are available:

- **VRRP**  
Enable or disable routing using VRRP.
- **React to pings on virtual interfaces**  
When enabled, the virtual IP addresses also reply to the ping.
- **Interface**  
Select the interface operating as virtual router.
- **VRID**  
Enter the ID of the virtual router in the input box. This ID defines the group of routers that form a virtual router (VR). In the group, this is the same. it can no longer be used for other groups.

The table has the following columns:

- **Interface**  
Shows the Interface that functions as the virtual router.
- **VRID**  
Shows the ID of the virtual router.

- **Virtual MAC Address**  
Shows the virtual MAC address of the virtual router.
- **Primary IP Address**  
Shows the primary IP address in this VLAN. The entry 0.0.0.0 means that the "Primary" address on this VLAN is used. Otherwise all IP addresses configured in this VLAN in "Layer 3 > Subnets" are valid values.
- **Router Status**  
Shows the current status of the virtual router. Possible values are as follows:
  - Master  
The router is the master router and handles the routing functionality for all assigned IP addresses.
  - Backup  
The router is the backup router. If the master router fails, the backup router takes over the tasks of the master router.
  - Initialize  
The virtual router has just been turned on. It will soon change to the "Master" or "Backup" status.
- **Master IP Address** (only available online)  
Shows the IP address of the master router.
- **Priority**  
Shows the priority of the virtual router.  
The current master router is automatically given 255. All other priorities can be distributed freely among the VRRP routers. The higher the priority, the earlier the VRRP router becomes "Master".
- **Advert. Internal**  
Shows the interval at which the master router sends VRRP packets.
- **Preempt**  
Shows the precedence of a router when changing roles between backup and master.
  - yes  
This router has precedence when changing roles.
  - no  
This router does not have precedence when changing roles.

## Configuration

### Introduction

On this page, you configure the virtual router.

---

#### Note

VRRP is available only on layer 3.

---

## Description of the displayed values

The page contains the following boxes:

- **Interface / VRID**  
Select the ID of the virtual router to be configured.
- **Primary IP Address**  
Select the primary IP address. If the router becomes master router, the router uses this IP address.

---

### Note

If you only configure one subnet on this VLAN, no entry is necessary. The entry is 0.0.0.0. If you configure more than one subnet on the VLAN and you want a specific IP address to be used as the source address for VRRP packets, select the IP address from the drop-down list. Otherwise, the IP address with priority will be used.

---

- **Master**  
If this option is enabled, the primary IP address is entered for "Associated IP Address". This means that the highest priority IP address of the VRRP router is used as the virtual IP address of the virtual master router. The option must be disabled for the backup routers in this group and the IP address of the router in "Assigned IP address" must be used.
- **Priority**  
Enter the priority of this virtual router.  
The current master router is always given 255. All other priorities can be distributed freely among the redundant routers. The higher the priority, the earlier the router becomes "Master".
- **Advertisement Interval [s]**  
Enter the interval in seconds after which a master router sends a VRRP packet again.
- **Preempt lower priority master**  
Allow the precedence when changing roles between Backup and Master based on the selection process.

## Address overview

### Overview

This page shows which IP addresses the virtual router monitors.

---

### Note

VRRP is available only on layer 3.

---

## Settings

The table has the following columns:

- **Interface**  
Shows the Interface that functions as the virtual router.
- **VRID**  
Shows the ID of this virtual router.
- **Number of Addresses**  
Shows the number of IP addresses.
- **Associated IP Address (1) ... Associated IP Address (4)**  
Shows the router IP addresses monitored by this virtual router. If a router takes over the role of master, the routing function is taken over by this router for all these IP addresses.

## Address configuration

---

### Note

VRRP is available only on layer 3.

---

## Settings

The following settings are possible:

- **Interface / VRID**  
Select the required virtual router.
- **Associated IP Address**  
Enter the IP address that the virtual router will monitor.

The table has the following columns:

- **Associated IP Address**  
Shows the IP addresses that the virtual router monitors.

## OSPFv2

## Configuration

## Introduction

On this page, you configure routing with OSPF.

---

### Note

OSPF is available only on layer 3.

---

## Settings

- **OSPFv2**  
Enable or disable routing using OSPF.
- **Router ID**  
Enter the name of one of the OSPF interfaces. The name is entered in the IP address format and does not need to match the local IP address.
- **OSPFv2 RFC1583 Compatibility**  
Enable the option if you still have old OSPF routers in operation that are not compatible with RFC 2328.
- **Border Router**  
Shows the status of the OSPF router. If the local system is an active member in at least 2 areas, this is an area border router.
- **AS Border Router**  
Specify whether the router is an AS border router. An AS border router intercedes between multiple autonomous systems, for example if you have an additional RIP network. An AS border router is also necessary to add and to distribute static routes.
- **New LSA Received** (only available online)  
Shows the number of received LSAs.  
Updates and local LSAs are not counted.
- **New LSA Configured** (only available online)  
Number of different LSAs sent by this local system.
- **External LSA Maximum**  
To limit the number of entries of external LSAs in the database, enter the maximum number of external LSAs.
- **Exit Interval [s]**  
Enter the interval after which the OSPF router once again attempts to come out of the overflow status. A 0 means that the OSPF router attempts to exit the overflow status only following a restart.
- **Inbound Filter**  
Select a route map that filters inbound routes.

8.1 Configuring devices and networks

- **Redistribute Routes**  
Specify which known routes are distributed using OSPF.  
The following types of route exist:
  - Default
  - Connected
  - Static
  - RIPv2

---

**Note**

The settings can only be enabled on an AS border router. Enabling "Default" and "Static", in particular, can cause problems if they are enabled at too many points in the network, for example, forwarding loops.

---

- **Route Map**  
Select a route map that filters which routes are forwarded using OSPF.

## Areas

### Overview

An autonomous system can be divided into smaller areas.

On this page, you can view, create, modify or delete the areas of the router.

---

**Note**

OSPF is available only on layer 3.

---

### Settings

- **Area ID**  
Enter the ID of the area. The database is synchronized for all routers of an area.  
Input format: x.x.x.x  
x = 0 ... 255

This table contains the following columns:

- **Area ID**  
Shows the ID of the area.
- **Area Type**  
Select the area type from the drop-down list.
  - Normal
  - Stub
  - NSSA
  - Backbone
- **Summary**  
Specify whether summary LSAs are generated for this area.
  - Summary: Summary LSAs are sent to the area.
  - No Summary: Summary LSAs are not sent to the area.
- **Metric**  
Displays the costs for the OSPF interface.
- **Updates**  
Shows the number of recalculations of the routing tables.
- **LSA Count**  
Shows the number of LSAs in the database.
- **Area BR**  
Shows the number of reachable area border routers (ABR) within this area.
- **AS BR**  
Shows the number of reachable autonomous system border routers (ASBR) in this area.

## Area range

### Creating a new OSPFv2 area range

On this page, networks can be grouped together under one area ID. The method is used only with area border routers. This means that an area border router only propagates one route for each address area to the outside.

---

#### Note

OSPF is available only on layer 3.

---

## Settings

- **Area ID**  
Select the area ID. You configure the ID in "Layer 3 > OSPFv2 > Areas".
- **Subnet Address**  
Enter the address of the network that will be grouped.
- **Subnet Mask**  
Enter the subnet mask of the network that will be grouped.

This table contains the following columns:

- **Area ID**  
Shows the ID of the area.
- **Subnet Address**  
Shows the address of the network that will be grouped with other networks.
- **Subnet Mask**  
Shows the subnet mask of the network that will be grouped with other networks.
- **Advertise**  
Enable this option to advertise the grouped network.

## Interfaces

### Overview

On this page, you can configure OSPF interfaces.

---

#### Note

OSPF is available only on layer 3.

---

## Settings

- **IP Address**  
Select the IP address of the OSPF interface.
- **Area ID**  
Select the area ID of the area with which the OSPF interface is connected.

---

#### Note

For secondary address types, select the same Area ID as for the corresponding primary address type.

The information whether an address type is primary or secondary can be found in the "Address Type" column on the "Subnets > Overview" page.

---

This table contains the following columns:

- **IP Address**  
Displays the IP address of the OSPF interface.
- **Area ID**  
Select the area ID with which the OSPF interface is connected.
- **OSPF Status**  
Specify whether or not OSPF is active on the interface.
  - Enabled: OSPF is enabled on the interface.
  - Disabled: OSPF is disabled on the interface
- **Metric**  
Enter the costs for the OSPF interface.
- **Priority**  
Enter the router priority. The priority is only relevant for selecting the designated router. This parameter can be selected differently on routers within the same subnet.
- **Trans. Delay**  
Enter the required delay when sending a connection update.
- **Retrans. Delay**  
Enter the time after which an OSPF packet is transferred again if no confirmation was received.
- **Hello Interval**  
Enter the interval between two Hello packets.
- **Dead Interval**  
Enter the interval after which the neighbor router is marked as "failed" if no more Hello packets are received from it during this time.

## Interface authentication

### Configuring the interface login

On this page, you define the authentication of the interface.

---

#### Note

OSPF is available only on layer 3.

---

## Settings

- **OSPF Interface**  
Select the OSPF interface for which you want to configure authentication.
- **Authentication type**  
Select the authentication method of the OSPF interface. You have the following options:
  - None: No authentication
  - simple: Authentication using an unencrypted password
  - MD5: Authentication using MD5

### Simple authentication

- **Password**  
For "Simple authentication, enter the password if you have selected this type of authentication.
- **Confirmation**  
Confirm the entered password.

### MD5 authentication

- **Authentication Key ID**  
If you have selected this type of authentication, enter the ID for the MD5 authentication under which the password is used as the key. Since the key ID is transferred with the protocol, the same key must be stored under the same key ID on all neighboring routers.

The table has the following columns:

- **Authentication Key ID**  
Can only be edited if you set the MD5 authentication method. It is only possible to use several keys there.
- **MD5 Key**  
Enter the MD5 key.
- **Confirm MD5 Key**  
Confirm the entered key.
- **Youngest Key ID (only available online)**  
Shows whether or not the MD5 key is the latest key ID.

## Virtual links

### Overview

Due to the protocol, each area border router must have access to the backbone area. If a router is not connected directly to the backbone area, a virtual link to it is created.

---

#### Note

OSPF is available only on layer 3.

---

**Note**

Note that when creating a virtual link both the transit area and the backbone area must already be configured.

the virtual link must be configured identically at both ends.

---

**Note**

- **Virtual links are not effective unless the device is an ABR.** (only available online)  
This is displayed when at least one virtual link entry is configured and the device is not an area border router.

**Settings**

- **Neighbor Router ID**  
Enter the ID of the neighbor router at the other end of the virtual connection.
- **Transit Area ID**  
Select the ID of the area that connects the two routers.

This table contains the following columns:

- **Transit Area ID**  
Shows the ID via which the two routers are connected.
- **Neighbor Router ID**  
Shows the ID of the neighbor router at the other end of the virtual connection.
- **Virt. Link Status**  
Specify the status of the virtual link. The following statuses are possible:
  - down: The virtual link is inactive.
  - point-to-point: The virtual link is active.
- **Trans. Delay**  
Enter the required delay when sending a link update packet (in seconds).
- **Retrans. Delay**  
Enter the time after which a packet is transferred again if no confirmation was received (in seconds).
- **Hello Interval**  
Enter the interval between two Hello packets (in seconds).
- **Dead Interval**  
Enter the interval after which the neighbor router counts as "failed" if no more Hello packets are received from it during this time (in seconds).

## Virtual Link Authentication

### Configuring the virtual link login

On this page, you define the authentication for the virtual link.

---

**Note**

OSPF is available only on layer 3.

---

### Settings

- **Virtual link (area/neighbor)**  
Select the virtual link for which you want to configure authentication.
- **Authentication type**  
Select the authentication method of the OSPF interface. You have the following options:
  - None: No authentication
  - simple: Authentication using an unencrypted password.
  - MD5: Authentication using MD5

#### Simple authentication

- **Password**  
Enter the password for "simple authentication".
- **Confirmation**  
Confirm the entered password.

#### MD5 authentication

- **Authentication Key ID**  
Enter the ID for MD5 authentication with which the password will be used as a key. Since the key ID is transferred with the protocol, the same key must be stored under the same key ID on all neighboring routers.

The table has the following columns:

- **Authentication Key ID**  
Can only be edited if you set the MD5 authentication method. It is only possible to use several keys there.
- **MD5 Key**  
Enter the MD5 key.
- **Confirm MD5 Key**  
Confirm the entered key.
- **Youngest Key ID**  
Shows whether or not the MD5 key is the latest key ID.

## RIPv2

### Configuration

On this page, you configure routing with RIP.

---

**Note**

RIPv2 is available only on layer 3.

---

### Settings

- **RIPv2**  
Enable or disable routing using RIPv2.
- **Inbound Filter**  
Select a route map that filters inbound routes.
- **Redistribute Routes**  
Specify which known routes are distributed using RIPv2.  
The following types of route exist:
  - Static Default
  - Connected
  - Static
  - OSPF
- **Route Map**  
Select a route map that filters which routes are forwarded using RIPv2.

### Interfaces

### Overview

On this page, you can configure RIPv2 interfaces.

---

**Note**

RIPv2 is available only on layer 3.

---

### Settings

- **IP Address**  
Select the IP address of the RIPv2 interface.

This table contains the following columns:

- **IP Address**  
Displays the IP address of the RIPv2 interface.
- **Send Updates**  
Select the way in which updates are sent:
  - no send  
No updates are sent.
  - RIPv1  
Updates for RIPv1 are sent.
  - RIPv1-compatible  
RIPv2 updates are sent as broadcasts according to the rules of RIPv1.
  - RIPv2  
Updates for RIPv2 are sent as multicasts.
  - RIPv1 demand/RIPv2 demand  
RIP packets are sent only as a response to an explicit query.
- **Receive Updates**  
Select the form in which received updates are accepted:
  - no receive  
No updates are received.
  - RIPv1  
Only updates of RIPv1 are received.
  - RIPv2  
Only updates of RIPv2 are received.
  - RIPv1/v2  
Updates of RIPv1 and RIPv2 are received.
- **Default Metric**  
Enter the costs for the RIPv2 interface.

## Security

### Passwords

---

#### Note

The page is only available if there is an online connection to the device.

---

Only the administrator can change the device passwords for administrator and users.

The factory settings for the passwords when the devices ship are as follows:

- Administrator: admin
- User: user

---

**Note**

If you log on the first time or log on after a "Reset to factory defaults and restart", you will be prompted to change the password.

---

**Note**

**Changing the password in "Trial" configuration mode**

Even if you change the password in "Trial" configuration mode, this change is saved immediately.

---

## Settings

- **Current Admin Password**  
Enter the valid administrator password.
- **User name**  
Select the required user. The following options are available:
  - Administrator: admin
  - User: user
- **New Password**  
Enter the new password.
- **Password Confirmation**  
Confirm the new password.

## AAA

### General

The term "AAA" used in the menu stands for "Authentication, Authorization, Accounting" and is used to identify and allow network nodes, to provide them with the appropriate services and to determine the amount of use.

On this page, you configure the login.

## Settings

- **Login Authentication**  
Specify how the login is made:
  - Local  
Login with local user name and password.
  - RADIUS  
Login using a RADIUS server.

## RADIUS client

The term "AAA" used in the menu stands for "Authentication, Authorization, Accounting" and is used to identify and allow network nodes, to provide them with the appropriate services and to determine the amount of use.

## Authentication over an external server

The concept of RADIUS is based on an external authentication server. An end device can only access the network after the device has verified the logon data of the device with the authentication server. Both the end device and the authentication server must support the EAP protocol (Extensive Authentication Protocol).

Each column of the table contains access data for one server. In the search order, the primary server is queried first. If the primary server cannot be reached, secondary servers are queried in the order in which they are entered.

If no server responds, there is no authentication. The client has no access to the network although a link is indicated at the port.

## Settings

The table has the following columns:

- **Server IP Address**  
Enter the IP address of the RADIUS server.
- **Server Port**  
Here, enter the input port on the RADIUS server. As default, input port 1812 is set.
- **Shared Secret**  
Enter your access ID.
- **Confirm Shared Secret**  
Enter your access ID again as confirmation.
- **Max. Retrans**  
Enter the maximum number of query attempts before another configured RADIUS server is queried or the login counts as having failed. As default, 3 is set.

- **Primary Server**  
Specify whether or not this server is the primary server. You can select one of the options "yes" or "no".
- **Status**  
Enable or disable the RADIUS server.

---

**Note**

You can configure a maximum of two servers on this page.

---

## 802.1x authenticator

The term "AAA" used in the menu stands for "Authentication, Authorization, Accounting" and is used to identify and allow network nodes, to provide them with the appropriate services and to determine the amount of use.

## Enabling authentication for individual ports

By selecting the check box, you specify whether or not network access protection according to IEEE 802.1x is enabled on this port.

## Settings

- **MAC Authentication**  
Enable or disable MAC authentication for the device.
- **Guest VLAN**  
Enable or disable the "Guest VLAN" function for the device.

Table 1 has the following columns:

- **1st column**  
Shows that the settings are valid for all ports of table 2.
- **802.1x Auth. Control**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **802.1x Re-authentication**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **MAC Authentication**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Adopt RADIUS VLAN Assignment**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **MAC Auth. Max Permitted Addresses**  
Enter how many end devices are allowed to be connected to the port at the same time. If "No Change" is entered, the entry in table 2 remains unchanged.

- **Guest VLAN**  
Select the required setting. If "No Change" is selected, the entry in table 2 remains unchanged.
- **Guest VLAN ID**  
Enter the VLAN ID of the port. If "No Change" is entered, the entry in table 2 remains unchanged.
- **Guest VLAN max. Permitted Addresses**  
Enter how many end devices are allowed in the guest VLAN at the same time.
- **Transfer to table**  
If you click the button, the settings are adopted for all ports of table 2.

Table 2 has the following columns:

- **Port**  
Shows the port to which the setting relates.  
If a configuration is not possible for a port, it is displayed grayed out and you cannot modify the settings.
- **802.1x Auth. Control**  
Specify the authentication of the port:
  - Force Unauthorized  
Data traffic via the port is blocked.
  - Force Authorized  
Data traffic via the port is allowed without any restrictions.  
Default setting
  - Auto  
End devices are authenticated on the port with the "802.1x" method.  
The data traffic via the port is permitted or blocked depending on the authentication result.
- **802.1x Re-authentication**  
Enable this option if you want reauthentication of an already authenticated end device to be repeated cyclically.
- **MAC Authentication**  
Enable this option if you want end devices to be authenticated with the "MAC Authentication" method.
- **Adopt RADIUS VLAN Assignment**  
The RADIUS server informs the IE switch of the VLAN to which the port belongs.  
Enable this option if you want the information of the server to be taken into account. The port then belongs to the corresponding VLAN.  
If the option is disabled, the VLAN information is discarded.
- **MAC Auth. Max Permitted Addresses**  
Enter how many end devices are allowed to be connected to the port at the same time.
- **Guest VLAN**  
Enable this option if you want the end device to be permitted in the guest VLAN if authentication fails.
- **Guest VLAN ID**  
Enter the VLAN ID of the port.

- **Guest VLAN max. Permitted Addresses**  
Enter how many end devices are allowed in the guest VLAN at the same time.
- **MAC Auth. Currently Permitted Addresses**  
Shows the number of currently connected end devices.
- **MAC Auth. Currently Blocked Addresses**  
Shows the number of currently blocked end devices.
- **Guest VLAN Currently Permitted Addresses**  
Shows how many end devices are currently allowed in the guest VLAN.

## Port ACL MAC

### Rule configuration

On this page, you specify the ACL rules for the MAC-based ACL.

### Settings

The table has the following columns:

- **Rule Number**  
Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.
- **Source MAC**  
Enter the unicast MAC address of the source.  
**Dest. MAC**  
Enter the unicast MAC address of the destination.
- **Action**  
Select the action. The following is possible:
  - Forward  
If the frame complies with the ACL rule, the frame is forwarded.
  - Discard  
If the frame complies with the ACL rule, the frame is not forwarded.
- **Ingress Port**  
Shows a list of all ingress ports to which this rule applies.
- **Egress Port**  
Shows a list of all egress ports to which this rule applies.

---

#### Note

If you enter the address "00:00:00:00:00:00" for the source and/or destination MAC address, the rule created in this way applies to all source or destination MAC addresses.

---

## Port ingress rules

On this page, you specify the ACL rule according to which incoming frames are handled by the port.

## Settings

- **Ports**  
Select the required port.
- **Add Rule**  
Select the ACL rule to be assigned to the port. You specify the ACL rule on the "Rules Configuration" page.
- **Add**  
To permanently assign the ACL rule to the port, click the "Add" button. The configuration is shown in the table.
- **Remove Rule**  
Select the ACL rule to be deleted.
- **Remove**  
To remove the ACL rule from the port, click the "Remove" button.

The table has the following columns:

- **Rule Order**  
Shows the order of the ACL rules.
- **Rule Number**  
Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.
- **Source MAC**  
Shows the unicast MAC address of the source.
- **Dest. MAC**  
Shows the unicast MAC address of the destination.
- **Action**  
Select the action. The following is possible:
  - Forward  
If the frame complies with the ACL rule, the frame is forwarded.
  - Discard  
If the frame complies with the ACL rule, the frame is not forwarded.

## Port egress rules

On this page, you specify the ACL rule according to which outgoing frames are handled by the port.

## Description

- **Ports**  
Select the required port.
- **Add Rule**  
Select the ACL rule to be assigned to the port. You specify the ACL rule on the "Rules Configuration" page.
- **Add**  
To permanently assign the ACL rule to the port, click the "Add" button. The configuration is shown in the table.
- **Remove Rule**  
Select the ACL rule to be deleted.
- **Remove**  
To remove the ACL rule from the port, click the "Remove" button.

The table has the following columns:

- **Rule Order**  
Shows the order of the ACL rules.
- **Rule Number**  
Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.
- **Source MAC**  
Shows the unicast MAC address of the source.
- **Dest. MAC**  
Shows the unicast MAC address of the destination.
- **Action**  
Select the action. The following is possible:
  - Forward  
If the frame complies with the ACL rule, the frame is forwarded.
  - Discard  
If the frame complies with the ACL rule, the frame is not forwarded.

## Port ACL IP

### Rule configuration

On this page, you specify the rules for the IP-based ACL.

## Settings

The table has the following columns:

- **Rule Number**  
Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.
- **Source IP**  
Enter the IP address of the source.
- **Source Subnet Mask**  
Enter the subnet mask in which the source is located.
- **Dest. IP**  
Enter the IP address of the destination.
- **Dest. Subnet Mask**  
Enter the subnet mask in which the destination is located.
- **Action**  
Select the action from the drop-down list. The following is possible:
  - Forward  
If the frame complies with the ACL rule, the frame is forwarded.
  - Discard  
If the frame complies with the ACL rule, the frame is not forwarded.
- **Ingress Port**  
Shows a list of all ingress ports to which this rule applies.
- **Egress Port**  
Shows a list of all egress ports to which this rule applies.

## Protocol configuration

On this page, you specify the rules for protocols.

## Settings

The table has the following columns:

- **Rule Number**  
Shows the number of the protocol rule. When you create a rule, a new row with a unique number is created.
- **Protocol**  
Select the protocol for which this rule is valid.
- **Protocol Number**  
Enter a protocol number to define further protocols.  
This box can only be edited if you have set "Other Protocol" for the protocol.
- **Source Port Min.**  
Enter the lowest possible port number of the source port.  
This box can only be edited if you have set "TCP" or "UDP" for the protocol.

- **Source Port Max.**  
Enter the highest possible port number of the source port.  
This box can only be edited if you have set "TCP" or "UDP" for the protocol.
- **Dest. Port Min.**  
Enter the lowest possible port number of the destination port.  
This box can only be edited if you have set "TCP" or "UDP" for the protocol.
- **Dest. Port Max.**  
Enter the highest possible port number of the destination port.  
This box can only be edited if you have set "TCP" or "UDP" for the protocol.
- **Message Type**  
Enter a message type to decide the format of the message.  
This box can only be edited if you have set "ICMP" for the protocol.
- **Message Code**  
Enter a message code to specify the function of the message.  
This box can only be edited if you have set "ICMP" for the protocol.
- **DSCP**  
Enter a value for classifying the priority.  
This box cannot be edited if you have set "ICMP" for the protocol.

## Port ingress rules

On this page, you specify the ACL rule according to which incoming frames are handled by the port.

## Settings

- **Ports**  
Select the required port.
- **Add Rule**  
Select the ACL rule to be assigned to the port. You specify the ACL rule on the "Rules Configuration" page.
- **Add**  
To permanently assign the ACL rule to the port, click the "Add" button. The configuration is shown in the table.
- **Remove Rule**  
Select the ACL rule to be deleted.
- **Remove**  
To remove the ACL rule from the port, click the "Remove" button.

The table has the following columns:

- **Rule Order**  
Shows the order of the ACL rules.
- **Rule Number**  
Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.

- **Protocol**  
Shows the protocol for which this rule is valid.
- **Protocol Number**  
Shows the protocol number.
- **Source IP**  
Shows the IP address of the source.
- **Source Subnet Mask**  
Shows the subnet mask in which the source is located.
- **Dest. IP**  
Enter the IP address of the destination.
- **Dest. Subnet Mask**  
Enter the subnet mask in which the destination is located.
- **Action**  
Select the action. The following is possible:
  - Forward  
If the frame complies with the ACL rule, the frame is forwarded.
  - Discard  
If the frame complies with the ACL rule, the frame is not forwarded.
- **Source Port Min.**  
Shows the lowest possible port number of the source port.
- **Source Port Max.**  
Shows the highest possible port number of the source port.
- **Dest. Port Min.**  
Shows the lowest possible port number of the destination port.
- **Dest. Port Max.**  
Shows the highest possible port number of the destination port.
- **Message Type**  
Shows the message type.
- **Message Code**  
Shows the message code.
- **DSCP**  
Shows the value for classifying the priority.

### Port egress rules

On this page, you specify the ACL rule according to which outgoing frames are handled by the port.

## Settings

- **Ports**  
Select the required port.
- **Add Rule**  
Select the ACL rule to be assigned to the port. You specify the ACL rule on the "Rules Configuration" page.
- **Add**  
To permanently assign the ACL rule to the port, click the "Add" button. The configuration is shown in the table.
- **Remove Rule**  
Select the ACL rule to be deleted.
- **Remove**  
To remove the ACL rule from the port, click the "Remove" button.

The table has the following columns:

- **Rule Order**  
Shows the order of the ACL rules.
- **Rule Number**  
Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.
- **Protocol**  
Shows the protocol for which this rule is valid.
- **Protocol Number**  
Shows the protocol number.
- **Source IP**  
Shows the IP address of the source.
- **Source Subnet Mask**  
Shows the subnet mask in which the source is located.
- **Dest. IP**  
Enter the IP address of the destination.
- **Dest. Subnet Mask**  
Enter the subnet mask in which the destination is located.
- **Action**  
Select the action from the drop-down list. The following is possible:
  - Forward  
If the frame complies with the ACL rule, the frame is forwarded.
  - Discard  
If the frame complies with the ACL rule, the frame is not forwarded.
- **Source Port Min.**  
Shows the lowest possible port number of the source port.
- **Source Port Max.**  
Shows the highest possible port number of the source port.

- **Dest. Port Min.**  
Shows the lowest possible port number of the destination port.
- **Dest. Port Max.**  
Shows the highest possible port number of the destination port.
- **Message Type**  
Shows the message type.
- **Message Code**  
Shows the message code.
- **DSCP**  
Shows the value for classifying the priority.

## Management ACL

On this page, you can increase the security of your device. To specify which station with which IP address is allowed to access your device, configure the IP address or an entire address range.

You can select the protocols and the ports of the station with which it is allowed to access the device. You define the VLAN in which the station may be located. This ensures that only certain stations within a VLAN have access to the device.

---

### Note

Note that a bad configuration may mean that you can no longer access the device.

---

## Settings

- **Management ACL**  
Enable or disable the function.
- **IP Address**  
Enter the IP address or the network address to which the rule will apply. If you use the IP address 0.0.0.0, the settings apply to all IP addresses.
- **Subnet Mask**  
Enter the subnet mask. The subnet mask 255.255.255.255 is for a specific IP address. If you want to allow a subnet, for example a C subnet, enter 255.255.255.0. The subnet mask 0.0.0.0 applies to all subnets.

The table has the following columns:

- **Rule Order**  
Shows the number of the ACL rule. When you create a rule, a new row with a unique number is created.
- **IP Address**  
Shows the IP address.
- **Subnet Mask**  
Shows the subnet mask.

- **VLANs Allowed**  
Enter the number of the VLAN from which access is allowed.  
Only stations located in these VLANs can access the device. If this input box remains empty, there is no restriction.  
You can enter several individual VLANs and VLAN ranges separated by commas, for example 1,5,10-12.
- **SNMP**  
Specify whether the station or the IP address can access the device using the SNMP protocol.
- **TELNET**  
Specify whether the station or the IP address can access the device using the TELNET protocol.
- **HTTP**  
Specify whether the station or the IP address can access the device using the HTTP protocol.
- **HTTPS**  
Specify whether the station or the IP address can access the device using the HTTPS protocol.
- **SSH**  
Specify whether the station or the IP address can access the device using the SSH protocol.
- **Px.y**  
Specify whether the station or the IP address can access this device via this port.

#### 8.1.4.6 Configuring PROFIBUS DP

##### The basics of configuring a DP master system

##### Distributed I/O

DP master systems that consist of a DP master and DP slaves which are connected via a bus and communicate with one another via the PROFIBUS DP protocol are referred to as distributed I/O.

##### Firmware version of the S7-1200 CPU

Use of the PROFIBUS functions with the S7-1200, requires CPUs with firmware version 2.0 or higher.

##### Configuring distributed I/O

Since DP masters and DP slaves are different devices, these instructions only provide a basic configuration procedure. However, the process for configuring distributed I/O is practically identical to that of non-distributed configuration.

### Creating the DP master system in the network view

After you have used dragged a DP master and a DP slave (for example, a CM 1243-5 and a CM 1243-5) from the hardware catalog to the network view, connect them both to a PROFIBUS subnet.

### Additional information

Observe additional information on the scope of functions in the manuals of the respective device.

### DP slaves within the hardware catalog

#### DP slaves within the hardware catalog

You will find the DP slaves in the "Distributed I/O" folder of the hardware catalog. Compact and modular DP slaves are located there:

- Compact DP slaves  
Modules with integrated digital/analog inputs and outputs, for example, ET 200L
- Modular DP slaves  
(Interface modules with S7 modules assigned, for example, ET 200M)

The available DP master and the desired functionality will determine which DP slaves can be used.

#### I slaves within the hardware catalog

The CM 1242-5 is, for example, an DP slave that can be configured as intelligent DP slave. You can find it in the hardware catalog at:

- CM 1242-5  
"PLC > SIMATIC S7 1200 > Communication module > PROFIBUS"

### DP/DP coupler in the hardware catalog

#### Introduction

A DP/DP coupler connects two PROFIBUS DP networks as a gateway so that the DP master from one network can transfer data to the DP master of the other network.

The maximum amount of data that can be transferred is 244 bytes input data and 244 bytes output data.

#### DP/DP coupler in the hardware catalog

Details of a DP/DP coupler as gateway between two DM master systems are contained in the hardware catalog in the folder "Other field devices > PROFIBUS-DP > Gateways".

## Configuring the DP/DP coupler

DP/DP couplers are configured in both PROFIBUS networks, each in their own master systems.

The input and output areas of both networks must thereby be matched to one another. The output data from one end of the DP/DP coupler are accepted as input data at the other respective end and vice versa.

## Configurations involving PROFIBUS DP

### Configurations involving basic DP slaves

### Communication between DP master and DP slave

In the case of a configuration involving simple DP slaves, data is exchanged between the DP master and simple DP slaves, i.e. with I/O modules via the DP master. The DP master sequentially polls each DP slave configured within the DP master system and contained in its polling list. In doing so, it transfers the output data to the slaves and receives their input data in return.

### Mono-master system

The configuration with only one DP master is also described as mono-master system. A single DP master with its associated DP slaves is connected to a physical PROFIBUS DP subnet.

## Configurations involving intelligent DP slaves

### Definition

DP slaves that feature their own preprocessing program are referred to as intelligent DP slaves (I-slaves).

CM 1242-5 is an intelligent DP slave.

### I-slave <> DP master data exchange

A higher-level automation system processes the automation task, which is broken down into sub-tasks. The sub-tasks are processed in the lower-level automation systems. The necessary control tasks are processed separately and efficiently in the CPUs as preprocessing programs.

In the case of configurations involving intelligent DP slaves, the DP master only accesses the operand area of the I-slave's CPU, and not the I/O modules of the intelligent DP slave. The operand area must not be assigned to any actual I/O modules in the I-slave. The assignment must be made during I-slave configuration.

The addresses of the data to be exchanged between the master and slave are configured in the transfer area of the I-slave.

## Configuring distributed I/O systems

### Hint: Quick configuration of master systems

If the DP master system has several DP slaves, use drag-and-drop operation to assign to the master in one step all DP slaves that were placed.

## Requirements

DP master and DP slaves are placed in the network view.

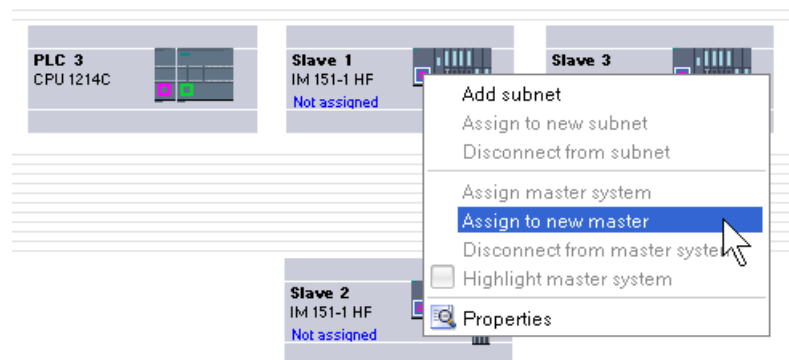

## Assigning DP slaves to a DP master system

To do this, follow these steps:

1. Select an appropriate zoom factor so that you can see as many DP slaves as possible in the network view.
2. Arrange the DP slaves in a maximum of two rows.
3. Select all DP interfaces with the mouse cursor (not all devices!). This only works if you begin to drag the mouse cursor outside of the first DP slave and release the mouse button at the last DP slave (selection with the lasso).

4. Select the shortcut menu "Assign to new master" and select the corresponding DP interface for the DP master in the subsequent dialog.

5. The DP slaves are automatically networked with the DP master and combine with it to form a DP master system.

### Note

When a DP master system is highlighted, you can double-click on a DP slave in the hardware catalog and thereby quickly add additional DP slaves. This will result in the DP slave being added to the highlighted DP master system automatically.

## **Creating a DP master system**

### **Introduction**

To create a DP master system, you need to have one DP master and at least one DP slave. As soon as you connect a DP master to a DP slave, a master-slave link is established.

### **DP master**

You can use any of the following devices as a DP master:

- CM 1243-5

### **Requirement**

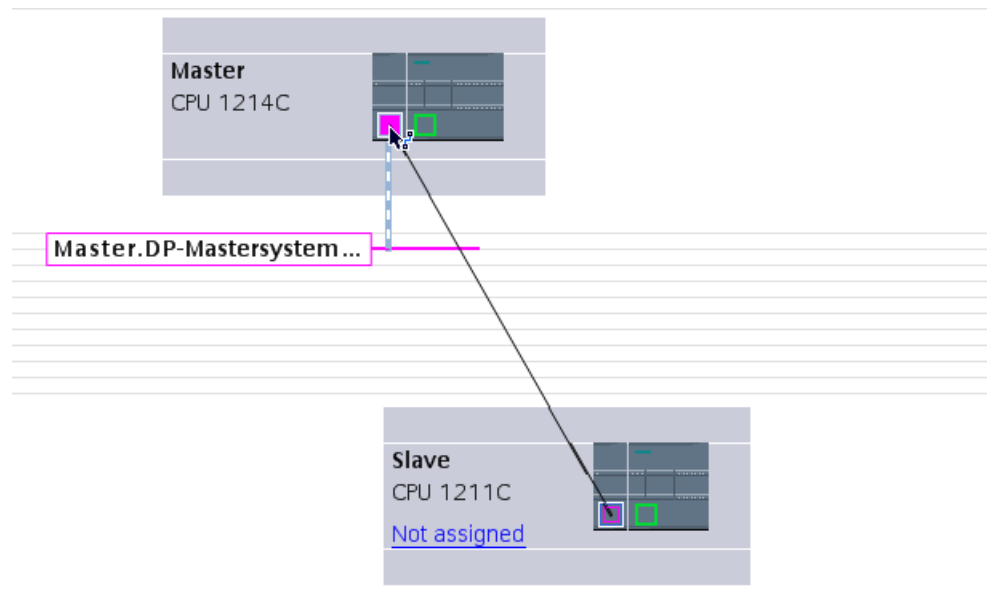

- You must be in the network view.
- The hardware catalog is open.

### **Procedure**

To create a DP master system, follow these steps:

1. Select a DP master from the hardware catalog.
2. Pull the DP master onto the free area within the network view.
3. Right-click on the DP master's DP interface.
4. Select "Create master system" from the shortcut menu.  
A DP master system with one DP master will be created as a single node.

If you connect a DP slave's DP interface to that of the DP master, the DP slave will be added to the master system.

Assuming that you have already placed both a DP master and a DP slave within the network view, you can drag-and-drop to connect the two and thereby create a DP master system. To do so, follow these steps:

1. Click on the DP interface of either the DP master or DP slave.
2. Hold down the mouse button and draw a connecting line between this DP interface and that of the desired communication partner.

This will create a subnet with one DP master system between the DP master and DP slave.

### DP master display on the DP slave

When you connect a DP slave to a DP master, the name of the DP master is displayed on the DP slave as a hyperlink. Click the hyperlink to select the associated DP master.

### Highlighting applied to the DP master system

When you create a new DP master system, highlighting will be applied to it. This enables you to identify quickly which devices belong to the DP master system. You can also highlight a DP master system yourself by moving the mouse pointer over a subnet. This will result in the names of the available DP master systems being displayed. Click the required DP master system to highlight it.

There are various ways of removing the highlighting from a DP master system:

- Highlight a different master system.
- Click on the drawing pin with the name of the master system in the top right-hand corner of the network view.

## Editing DP master systems and interfaces

### Introduction

Once you have created a DP master system, you also have the option of disconnecting the DP master system from its components. This can result in subnets with DP slaves but without DP master.

Generally, there is no need to edit the interfaces of a DP master.

You can change the name and number on the DP master system.

### Disconnection of master or slaves from the DP master system

If you have configured a PROFIBUS CP as a DP master with master system, you can then disconnect the DP master system from the DP master. After this, the device will no longer be connected to the DP master system.

Disconnecting the subnet from a DP master effectively eliminates the master system in the sense that it is no longer assigned to a DP master. However, the individual DP slaves are still interconnected via the subnet.

If you delete the DP slaves or disconnect them from the master system, the master system is then retained on the DP master.

### Requirement

- You must be in the network view.
- There has to be a DP master system with one DP master and at least one DP slave.

### Disconnecting the DP master from the DP master system

To disconnect the DP master system, proceed as follows:

1. Right-click on the DP master's DP interface.
2. Select "Disconnect from master system" from the shortcut menu.

The selected DP master will be disconnected from the DP master system. A subnet with the DP slaves will be retained.

### Adding a DP master to the DP master system

To reassign a DP master to a subnet, proceed as follows:

1. Right-click on the DP master's DP interface.
2. Select "Create master system" from the shortcut menu.
3. Draw connecting lines between the new DP master system and the DP interfaces of the DP slaves.

The DP master combines with the DP slaves to recreate a DP master system.

### Editing the properties of a DP master system

To edit the properties of a DP master system, proceed as follows:

1. Move the mouse pointer over a subnet with a DP master system.
2. A message will appear displaying the available DP master systems. Click the one you want to edit. The DP master system will now be color-highlighted.
3. Click on the highlighted DP master system.
4. In the inspector window, edit the DP master system attributes under "Properties > General".

---

#### Note

If you click a subnet when no DP master system is highlighted, you will be able to edit the properties of the entire subnet under "Properties" in the inspector window.

---

### Adding DP slaves to the master system and configuring them

In the network view, you can add various DP slaves from the hardware catalog directly by using the drag-and-drop function or by double-clicking.

### DP slaves

For configuration purposes, DP slaves are broken down into the following categories:

- Compact DP slaves  
(Modules with integrated digital/analog inputs and outputs, for example, ET 200L)
- Modular DP slaves  
(interface modules with S5 or S7 modules assigned, for example ET 200M)
- Intelligent DP slaves (I slaves)  
(CM 1242-5 or ET 200S with IM 151-7 CPU)

### Rules

- Your DP master system should only contain one DP master, but it may contain one or more DP slaves.
- You may only configure as many DP slaves in a DP master system as are permitted for the specific DP master.

---

#### Note

When configuring the DP master system, remember to observe the DP master technical data (max. number of nodes, max. number of slots, max. quantity of user data). User data restrictions may possibly prevent you from being able to use the maximum number of nodes that is theoretically possible.

---

## Requirements

- You must be in the network view.
- A DP master system must have been created.

## Adding a DP slave to the DP master system

To add a DP slave from the hardware catalog to the DP master system, follow these steps:

1. Select a DP slave from the hardware catalog.
2. Drag-and-drop the DP slave from the hardware catalog into the network view.
3. Draw a connecting line between the DP master's DP interface or a highlighted DP master system and the DP interface of the new DP slave.

A DP master system will be created and the DP slave will be connected to the DP master automatically.

---

### Note

When a DP master system is highlighted, you can double-click the required DP slave in the hardware catalog. This will result in the DP slave being added to the highlighted DP master system automatically.

---

## Disconnecting a DP slave from the DP master system

To disconnect a DP slave from the DP master system, follow these steps:

1. In the network view, right-click on the DP slave's DP interface.
2. From the shortcut menu, select the method for disconnecting from the DP master system:
  - "Disconnect from subnet": The PROFIBUS connection is broken and the device is no longer connected to the DP master system or a subnet.
  - "Disconnect from master system": The DP slave remains connected to the subnet, but is no longer assigned to the DP master system as a DP slave.

The selected DP slave will be disconnected from the DP master system.

## Assigning a DP slave to a new DP master system

To assign an existing DP slave to a new DP master system, follow these steps:

1. Right-click on the DP slave's DP interface.
2. From the shortcut menu, select "Assign to new master".  
It does not matter whether the DP slave concerned is already assigned to another DP master system.
3. From the selection list, select the DP master whose DP master system is to have the DP slave connected to it.  
The selected DP slave is now assigned to a new DP master system.

The "Assign to new subnet" function works in a similar way in that it allows you to connect a DP slave to a new subnet. However, in this case, the DP slave will not be connected to an existing DP master system.

### Configuring a DP slave

To configure a DP slave, follow these steps:

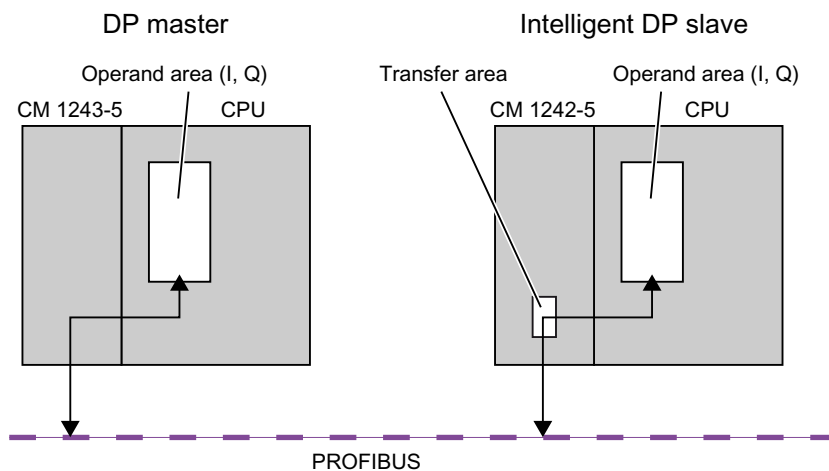

1. Switch to the DP slave's device view.
2. Select the module you want.
3. Configure the DP slave in the Inspector window.

### Configuring intelligent DP slaves

#### Adding an I-slave to a DP master system

#### Introduction

One of the characteristics of an intelligent DP slave (I-slave) is that the DP master is not provided with I/O data directly by a real I/O, but by a preprocessing CPU. Together with the CP, this preprocessing CPU forms the I-slave.

#### Difference: DP slave v. intelligent DP slave

In the case of a DP slave, the DP master accesses the distributed I/O directly.

In the case of an intelligent DP slave, the DP master actually accesses a transfer area in the I/O address space of the preprocessing CPU instead of accessing the connected I/O of the

intelligent DP slave. The user program running on the preprocessing CPU is responsible for ensuring data exchange between the address area and I/O.

#### Note

The I/O areas configured for data exchange between the DP master and DP slaves must not be used by I/O modules.

## Applications

Configurations involving intelligent DP slaves: I-slave <> DP master data exchange

## Procedure

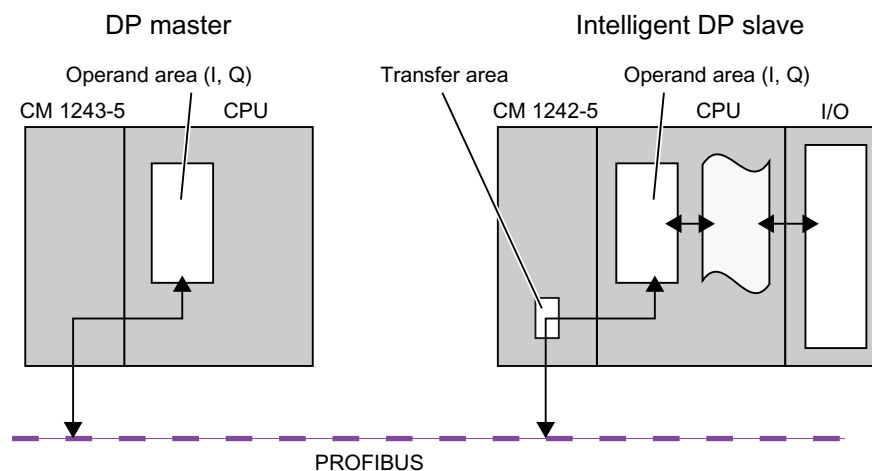

To add an I-slave to a DP master system, follow these steps:

1. In the network view, drag from the hardware catalog to a station one CM 1242-5 as an I-slave and one CM 1243-5 as a DP master.
2. Draw a connecting line between the DP interfaces of both devices.  
This way you connect the I-slave with a DP master in a DP master system.  
Result: You have now set up a DP master system with one DP master and one I-slave.

## Configuring access to I slave data

## Data access

The following applies to the CP 1242-5 in its function as I-slave: The addresses for the data transfer area and the address for the I/O modules in the I-slave differ. This means that the start address occupied by an I/O module can no longer be used for the transfer memory. If the higher-level DP master is to access the data of an I/O module in the I-slave, you must configure this data exchange between the I/O module and transfer area in the I-slave user program.

### **Configuration of the transfer area for the CM 1242-5 (transfer area)**

With CM 1242-5, the transfer area for the cyclic PROFIBUS data exchange is configured as transfer area in the parameter group "PROFIBUS interface > Mode > I Slave Communication".

### **Direct data access from CPU to CPU**

Direct data access from CPU to CPU via PROFIBUS is supported by the S7-1200 PROFIBUS CMs only via the PUT/GET services.

### **Configuring DP slaves as distributed I/O devices**

#### **Configuring an ET 200S**

##### **Slot rules for configuring an ET 200S**

The following rules apply when configuring an ET 200S:

- Do not leave any gaps when inserting the ET 200S modules.
- Slot 1: only for PM-E or PM-D Power Modules.
- To the left of an Electronics Module (EM): an EM or a Power Module (PM-E or PM-D) only.
- To the left of Motor Starter (MS): an MS, a PM-D, PM-D Fx (1..x..4) Power Module or a PM-X Power Module only.
- To the left of a PM-X: a motor starter or a PM-D only
- Up to 63 modules and one IM Interface Module are permitted

---

##### **Note**

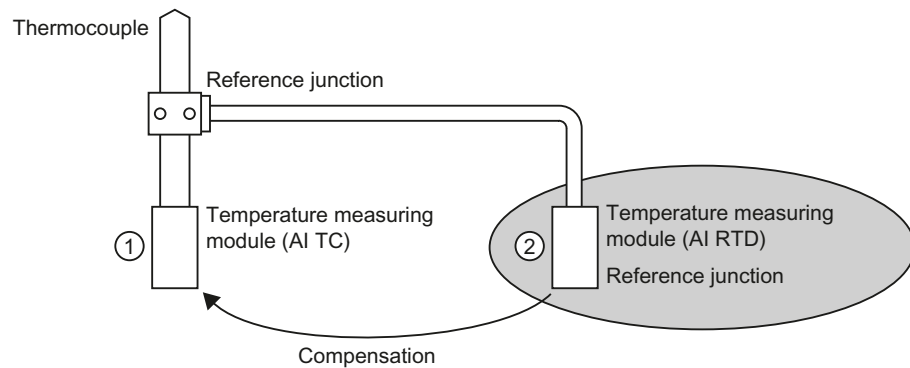

Remember to ensure that the correct PM-E and EM voltage ranges are assigned.

---

### **Configuring reference junctions**

A reference junction is the connection of a thermocouple to a supply line (generally in the terminal box). The voltage that occurs due to the effects of temperature falsifies the temperature value measured by the module.

On the ET 200S, one channel of the AI RTD module can be programmed as a reference junction. Other AI TC modules can correct their measured values using the temperature at the reference junction as measured by this module.

- ① Configuring the AI TC:
  - Selection of the reference junction used
- ② Configuring of the AI RTD:
  - Activation of the reference junction
  - Specifying the slot and channel of the AI RTD

### Special characteristics to be noted when assigning parameters for reference junctions

The process of assigning parameters for reference junctions will be explained based on the example of a resistance thermometer with a Pt 100 climatic range that is used for measuring the reference junction temperature.

To assign parameters for the reference junction, follow these steps:

1. In the ET 200S device view, insert an analog electronics module, for example a 2AI RTD HF.
2. Select the module on the rack.
3. Under "Properties > Inputs" in the inspector window, set a channel for the reference junctions function to the "RTD-4L Pt 100 climatic range" measuring range.
4. Select the ET 200S.
5. Under "Properties > Module parameters > Reference junctions" in the inspector window, select the "Reference junction" check box and specify the slot and channel number of the relevant RTD module.
6. Insert the analog electronics module for measuring the temperature using a thermocouple (TC module) and parameterize it with the reference junction number of the RTD module.

### Additional information

For additional information on the various types and uses of ET 200S modules, please refer to the operating instructions and the manual titled "ET 200S Distributed I/O System".

For additional information on analog value processing, please see the documentation for the ET 200S distributed I/O system.

## Packing addresses

### Introduction

DP slaves and I/O devices from the ET 200S family are configured in the same way as other modular DP slaves and I/O devices. As well as supporting all the standard modular DP slave and I/O device functions, the ET 200S also offers the "Pack addresses" function:

When digital electronics modules requiring an address space of 2 or 4 bits are inserted into the device view, they will initially be spread over a total area of 1 byte. However, the address area actually occupied can be compressed after configuration using the "Pack addresses" function.

	Initial state	After "Pack addresses"
Module	I address	I address
2DI (2-bit)	Byte 10	10.0...10.1
4DI (4-bit)	Byte 11	10.2...10.5

### Requirements

- You are in the device view.
- An ET 200S, for example an IM 151-1, must be present.
- A pair of digital electronics modules, for example 2DI AC120V ST, must be inserted into the slots.

### Packing addresses

To pack addressed, follow these steps:

1. Select the electronics modules whose addresses are to be packed. The following options are available for selecting multiple electronics modules:
  - Press and hold down <Shift> or <Ctrl> while clicking the relevant electronics modules.
  - Click off the rack and select the required electronics modules by drawing round them with the mouse.
2. Click "Pack addresses" in the shortcut menu for the selected electronics modules.

The address areas for inputs, outputs and motor starters are packed separately. The packed addresses will be displayed in the I address and Q address columns of the device overview.

## How packed addresses are generated and structured

If you make use of the "Pack addresses" function, the addresses of the selected electronics modules will be packed in accordance with the following rules:

- The start of the address area is determined by the lowest address of the selected electronics modules: X.0
- If the bit address is not "0", then the next (free) byte address as of which the selected area can be compacted will be selected automatically: (X+n).0
- If no coherent area exists, the addresses will be automatically packed into any available address gaps.

Electronics modules with packed addresses and the same byte address form a packing group.

## Unpacking addresses

To unpack addressed, follow these steps:

1. Select one or more electronics modules with packed addresses.
2. Click "Unpack addresses" in the shortcut menu for the selected electronics modules.

The packing groups of the selected electronics modules will be disbanded and the packed addresses for the relevant electronics modules unpacked.

The packing group will also be disbanded and the packed addresses unpacked in the following cases: if you delete electronics modules from a packing group, move electronics modules out of a packing group or insert electronics modules on a free slot within a packing group.

The start addresses of the unpacked electronics modules will be assigned to the next available byte addresses in each case.

## Special characteristics of electronics modules with packed addresses

The following special characteristics apply to electronics modules with packed addresses:

- As far as the CPU is concerned, there is no way of assigning a slot for the electronics module. Consequently, the instruction GADR\_LGC (SFC 5) outputs error information W#16#8099 "Slot not configured" for the actual slot of the electronic module.
- The instruction LGC\_GADR (SFC 49) and SZL-ID W#16#xy91 "module status information" cannot be evaluated for an electronics module.
- The electronics module receives an additional diagnostics address via the DPV1 function, because otherwise the packed addresses would prevent interrupts from being assigned as far as the CPU is concerned.
- The "Insert/remove interrupt" is not possible. This is because the "Pack addresses" and "Insert/remove interrupt" functions are mutually exclusive.

## Configuring option handling with standby modules

You can use the option handling function to prepare the ET 200S with PROFIBUS interface for future expansions (options). This section describes option handling with standby modules.

## 8.1 Configuring devices and networks

You do this by assembling, wiring, configuring, and programming the maximum configuration envisaged for the ET 200S and by using cost-effective standby modules (138-4AA00 or 138-4AA10) during assembly until it becomes time to replace them with the necessary electronics modules.

---

### Note

The ET 200S can be completely factory-wired with the master cabling, as no connection exists between a standby module and the terminals of the terminal module (and, in turn, to the process).

---

### Requirement

- ET 200S interface module
  - IM 151-1 STANDARD (6ES7 151-1AA03-0AB0 or higher)
  - IM 151-1 FO STANDARD (6ES7 151-1AB02-0AB0 or higher)
- Power module with option handling
  - PM-E DC24..48V
  - PM-E DC24..48V/AC24..230V

### Procedure

To activate option handling, follow these steps:

1. Select the IM 151-1 in the device view and enable it in "Option handling" check box under "Properties > General > Option handling" in the inspector window.
2. Select the numbered check boxes for the slots that are initially to accommodate the standby modules prior to the future electronics modules.
3. Select the power module in the device view and enable it in the "Option handling" check box under "Properties > Addresses" in the inspector window. Reserve the necessary address space for the control and check-back interface in the process image output (PIQ) and process image input (PII).

The assembled standby modules can be replaced with the configured modules at a later date without having to modify the configuration.

---

### Note

The addresses for these interfaces are reserved as soon as you activate option handling on the power module. The "Option handling" function must also be activated on the DP slave (IM 151-1 STANDARD Interface Module). If it is not activated, the addresses reserved for the control and check-back interface will be released again.

Note that activating and deactivating the option handling function repeatedly can change the address of the control and check-back interface.

Option handling may be activated for one PM-E DC24..48V or one PM-E DC24..48V/AC24..230V Power Module only.

---

## Additional information

For additional information on the assignment and significance of bytes within the process image, option handling with PROFIBUS and the use of standby modules, please refer to the documentation for the ET 200S distributed I/O system.

## How option handling works during startup

If "Startup when expected/actual config. differ" is not available, the ET 200S will still start up if a standby module is inserted instead of the configured electronics module and option handling has been activated for the slot concerned.

## How option handling works during operation

During operation, the option handling mode varies in accordance with the following:

- Option handling enabled for a slot:  
Either the standby module (option) or the configured electronics module can be plugged into this slot. If any other kind of module is present on this slot, diagnostics will be signaled (no module/incorrect module).
- Option handling disabled for a slot:  
Only the configured electronics module can be plugged into this slot. If any other kind of module is present, diagnostics will be signaled (no module/incorrect module).

## Standby module substitute values

- Substitute value for digital inputs: 0
- Substitute value for analog inputs: 0x7FFF

## Control and evaluation in the user program

The ET 200S is equipped with a control and feedback interface for the "Option handling" function.

The control interface is located in the process image output (PIQ). Each bit in this address area controls one of the slots from 2 to 63:

- Bit value = 0: Option handling parameterized. Standby modules are permitted.
- Bit value = 1: Option handling canceled. Standby modules are not permitted on this slot.

The check-back interface is located in the process image input (PII). Each bit in this address area provides information about the modules that are actually plugged into slots 1 to 63:

- Bit value = 0: This slot has the standby module, an incorrect module or no module plugged into it.
- Bit value = 1: The configured module is plugged into this slot.

## See also

Which modules support option handling? (<http://support.automation.siemens.com/WW/view/en/22564754>)

## **Configuring option handling without standby modules**

You can use the option handling function to prepare the ET 200S for future expansions (options) without installing standby modules. This section describes option handling without standby modules.

---

### **Note**

#### **ET 200S with PROFINET interface**

This description refers to the ET 200S with PROFIBUS interface. In principle, option handling for ET 200S with PROFINET interface functions as described here without standby modules. PN interface modules are to be used instead of the DP interface modules listed here. You can find additional information about option handling for ET 200S with PROFINET interface in the corresponding manuals.

---

## **Requirement**

- ET 200S interface module
  - IM 151-1 HIGH FEATURE (6ES7151-1BA02 or higher)
  - IM 151-1 STANDARD (6ES7 151-1AA05-0AB0 or higher)
- Power module with option handling
  - PM-E DC24..48V
  - PM-E DC24..48V/AC24..230V

## Procedure

To activate option handling, follow these steps:

1. Select the IM 151-1 in the device view and enable it in "Option handling" check box under "Properties > General > Option handling" in the inspector window.
2. Select the power module in the device view and enable it in the "Option handling" check box under "Properties > Addresses" in the inspector window. Reserve the necessary address space for the control and check-back interface in the process image output (PIQ) and process image input (PII).
3. Configure the slave's maximum configuration. The selection/clearing of options is controlled via the user program.

---

### Note

The addresses for these interfaces are reserved as soon as you activate option handling on the power module. The "Option handling" function must also be activated on the DP slave (IM 151-1 interface module). If it is not activated, the addresses reserved for the control and check-back interface will be released again.

Note that activating and deactivating the option handling function repeatedly can change the address of the control and check-back interface.

Option handling may be activated for one PM-E DC24..48V or one PM-E DC24..48V/AC24..230V Power Module only.

---

## Additional information

For additional information on the assignment and significance of bytes within the process image, option handling with PROFIBUS and the use of standby modules, please refer to the documentation for the ET 200S distributed I/O system.

## Control and evaluation in the user program

The ET 200S is equipped with a control and feedback interface for the "Option handling" function.

The control interface is located in the process image output (PIQ). Each bit in this address area controls one of the slots from 1 to 63:

- Bit value = 0: Slot is not available in the actual configuration.
- Bit value = 1: Slot is available in the actual configuration.

The check-back interface is located in the process image input (PII). Each bit in this address area provides information about the modules that are actually plugged into slots 1 to 63:

- Bit value = 0: Slot belongs to an option that is not available or module status is faulty.
- Bit value = 1: The configured module is plugged into this slot.

## See also

Sample applications for ET 200S, option handling without standby module (<http://support.automation.siemens.com/WW/view/en/29430270>)

### Configuring the ET 200S in DPV1 mode

PROFIBUS DPV1 enables you to access extended PROFIBUS functions.

#### Requirement

- You must be in network view.
- A DP master with DPV1 functionality must be available.
- A master-slave connection must be established with PROFIBUS.

#### Procedure

To switch the DP slave over to DPV1, follow these steps:

1. Select the DP slave.
2. Under "Properties > Module parameters" in the Inspector window, select "DPV1" mode from the "DP interrupt mode" drop-down list.

or

1. Select the DP master.
2. In the I/O communications table, select the row with the connection between the DP master and the desired DP slave.
3. Under "Properties > Module parameters" in the Inspector window, select "DPV1" mode from the "DP interrupt mode" drop-down list.

#### Special characteristics

The parameters are subject to interdependencies, which are outlined below:

Parameter	DPV0 mode	DPV1 mode
Operation when target configuration does not match actual configuration	Fully available	Fully available
Diagnostics interrupt (OB 82)	Not available, not set	Fully available
Hardware interrupt (OB 40 to 47)	Not available, not set	Fully available
Insert/remove interrupt (OB 83)	Not available, not set	Only available when addresses are not packed. "Startup when target configuration does not match actual configuration" is activated automatically along with an insert/remove interrupt.

#### Interrupts in the case of modules with packed addresses

If the module is capable of triggering interrupts and the bit address is not equal to 0 because of packed addresses, you will need to assign a diagnostics address in the ET 200S address dialog.

The diagnostics address is required for the purpose of assigning a DPV1 interrupt to the module as an interrupt trigger. The CPU will only be able to assign an interrupt correctly and store information on the interrupt in the interrupt OB start information/in the diagnostics buffer if the module concerned has this "unpacked" address. In this context, the CPU cannot make use of "packed" addresses.

From the point of view of interrupt processing (interrupt OB), this means the module will have the assigned diagnostics address, but from the point of view of processing the input and output data in the user program, the module will have the packed addresses.

---

**Note**

When the module addresses are packed, the insert/remove interrupt for the ET 200S is unavailable.

---

## Using GSD files

### GSD revisions

#### What you need to know about GSD revisions

The properties of DP slaves are made available to configuration tools by means of GSD files.

Functional enhancements in the area of the distributed I/O will have an effect on the GSD specification, for example, they will require the definition of new keywords.

This results in the versioning of the specification. In the case of GSD files, the version of the specification on which a GSD file is based is called a "GSD revision".

From GSD revision 1, the GSD revision must be included as a keyword "GSD\_revision" in GSD files. GSD files without this keyword will therefore be interpreted by configuration tools as GSD revision "0".

GSD files can be interpreted up to GSD revision 5. This means that DP slaves that support the following functions, for example, will be supported:

- Diagnostic alarms for interrupt blocks
- Isochronous mode and constant bus cycle time
- SYNC/FREEZE
- Clock synchronization for DP slaves

## Installing the GSD file

### Introduction

A GSD file (device data file) contains all the DP slave properties. If you want to configure a DP slave that does not appear in the hardware catalog, you must install the GSD file provided by the manufacturer. DP slaves installed via GSD files are displayed in the hardware catalog and can then be selected and configured.

## Requirement

- The hardware and network editor is closed.
- You have access to the required GSD files in a directory on the hard disk.

## Procedure

To install a GSD file, proceed as follows:

1. In the "Options" menu, select the "Install device master data files" command.
2. In the "Install device master data files" dialog box, choose the folder in which you want to save the GSD files.
3. Choose one or more files from the list of displayed GSD files.
4. Click on the "Install" button.
5. To create a log file for the installation, click on the "Save log file" button.  
Any problems during the installation can be tracked down using the log file.

You will find the new DP slave installed by means of the GSD file in a new folder in the hardware catalog.

---

### Note

Installation of GSD file cannot be undone.

---

## Configuring GSD-based DP slave

DP slaves that you have inserted through installation of a GSD file can be selected as usual via the hardware catalog and inserted in the network view. If you want to insert the modules of the GSD-based DP slaves, you must take into account some particular details.

## Requirement

- You have installed a DP slave using a GSD file.
- You have inserted the head module in the network view in the usual manner.
- The device overview opens in the device view.
- The hardware catalog is open.

## Procedure

To add the modules of a GSD-based DP slave, proceed as follows:

1. In the hardware catalog, navigate to the modules of the GSD-based DP slave.  
GSD-based DP slaves, also referred to as DP standard slaves, can be found in the "Other field devices" folder of the hardware catalog.
2. Select the desired module.

3. Use drag-and-drop to move the module to a free space in the device overview.
4. Select the module in the device overview to edit parameters.

You have now inserted the module in a free slot of the GSD-based DP slave and can edit its parameters.

---

**Note**

You can see only the GSD-based DP slave in the graphic area of the device view. The added modules of GSD-based DP slaves are only found in the device overview.

---

### Preset configuration

For modules with an adjustable preset configuration, you can change this configuration in the inspector window under "Properties > Preset configuration".

#### 8.1.4.7 Configurations for PROFINET IO

### What you need to know about PROFINET IO

#### What is PROFINET IO?

#### PROFINET IO

PROFINET is an Ethernet-based automation standard of PROFIBUS Nutzerorganisation e.V. (PNO) which defines a manufacturer-neutral communication, automation and engineering model.

#### Objective

The objective of PROFINET is:

- Integrated communication via field bus and Ethernet
- Open, distributed automation
- Use of open standards

#### Architecture

The PROFIBUS User Organisation e.V. (PNO) has designated the following aspects for PROFINET architecture:

- Communication between controllers as components within distributed systems.
- Communication between field devices, such as I/O devices and drives.

## Implementation by Siemens

The demand for "Communication between controllers as components within distributed systems" is implemented by "Component Based Automation" (CBA). Component Based Automation is used to create a distributed automation solution based on prefabricated components and partial solutions.

The demand for "Communication between field devices" is implemented by Siemens with "PROFINET IO". Just as with PROFIBUS DP, the complete configuration and programming of the components involved is possible using the Totally Integrated Automation Portal.

The following sections deal with the configuration of communication between field devices using PROFINET IO.

## Overview of RT classes

### RT classes in PROFINET IO

PROFINET IO is a scalable, real-time communication system based on Ethernet technology. The scalable approach is reflected in several real-time classes:

- **RT:** Transmission of data in prioritized, non-isochronous Ethernet frames. The required bandwidth is within the free bandwidth area for TCP/IP communication.
- **IRT:** Isochronous transmission of data with high stability for time-critical applications (for example, motion control). The required bandwidth is from the area of bandwidth reserved for cyclic data.

Depending on the device, not all real-time classes are supported.

## Connecting existing bus systems

### Connection of PROFINET and PROFIBUS

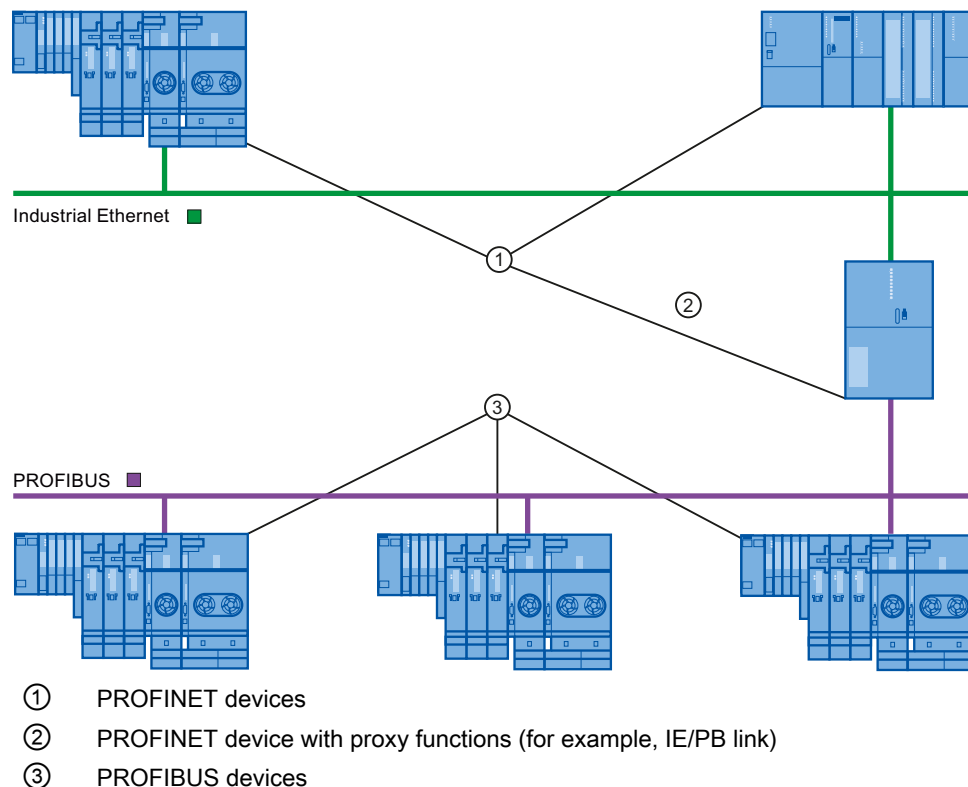

PROFINET IO and PROFIBUS DP can be connected with each other as follows:

- via Industrial Ethernet:  
To connect the two network types, Industrial Ethernet (plant control level) and PROFIBUS (cell level/field level), use the IE/PB link, for example.
- via Industrial Wireless LAN:  
PROFIBUS devices, for example, can be connected to PROFINET IO via a wireless LAN/PB link. This allows existing PROFIBUS configurations to be integrated into PROFINET.

AS interface devices can be connected by an IE/AS-i link PN IO to the interface of a PROFINET device. This allows the existing AS-i network to be integrated into PROFINET.

The following figure shows the connection of a PROFIBUS subnet via a PROFINET device with proxy functions.

### PROFINET device with proxy functions used as proxy for a PROFIBUS device

The PROFINET device with proxy functions is the proxy for a PROFIBUS device on the Ethernet. The proxy functionality enables a PROFIBUS device to communicate with all devices on the PROFINET and not just with its master.

Existing PROFIBUS systems can easily be integrated into PROFINET communication using the proxy functions.

If, for instance, you connect a PROFIBUS device via an IE/PB link to PROFINET, the IE/PB link acts as a proxy for the PROFIBUS components for communicating via PROFINET.

### Configuration using IE/PB link PN IO

#### Configuration using IE/PB Link PN IO

You can use the IE/PB Link PN IO to connect PROFIBUS DP configurations to PROFINET IO.

From the CPU perspective, the PROFIBUS DP slaves are connected to the same network as the IE/PB Link PN IO. These slaves have the same device name and IP address as the IE/PB Link PN IO, but different device numbers. Furthermore, each also has a specific PROFIBUS address.

In the properties of the IE/PB link, the PROFIBUS addresses of the connected DP slaves are displayed in addition to the PROFINET device numbers, as this device has two addressing schemes.

## Handling device numbers and PROFIBUS addresses on the master system

During placement, the same number is assigned for the PROFINET device number and the PROFIBUS address.

In the Inspector window under "General Properties > PROFINET device number", you can find an overview of the device numbers used and the PROFIBUS addresses of an IE/PB link. The device number can also be changed here. You can also set that the device number and the PROFIBUS address should or should not always be identical. If the "PROFINET device number=PROFIBUS address" option is activated, you do not have to update the device number when the PROFIBUS address changes.

The PROFIBUS address can be changed in the properties of the PROFIBUS device.

## Restrictions

The following restrictions apply to DP slaves configured as described above on the PROFIBUS subnet of an IE/PB link:

- No pluggable IE/PB link
- No pluggable DP/PA link
- No pluggable Y link
- Not CiR-compliant
- No pluggable redundant slaves
- No isochronous transmission / constant bus cycle time can be configured
- SYNC/FREEZE instructions ("DPSYC\_FR") of a CPU on the the Ethernet subnet for DP slaves behind the IE/PB-Link are not supported.

## Configuration using IWLAN/PN link

### Maximum number of devices in a IWLAN segment

If an Ethernet subnet is set up as wireless network (IWLAN = Industrial Wireless LAN), cyclic data exchange between IO controllers and IO devices is possible via a wireless route.

On one side of the wireless route there are fixed installed access points (for example, SCALANCE W 788) and on the other side mobile stations (with, for example IWLAN/PB links with PROFIBUS devices).

If the action radius of the mobile stations is large, it may be necessary to install several access points (SCALANCE W 788). Since each access point forms a segment with its wireless range, the IWLAN is made up of a series of segments.

The mobile devices "on the one side" of the wireless link with their IWLAN/PB links can move along the segments.

### Special feature

If several IWLAN/PB links are located within a segment, they have to share the bandwidth that is available for wireless transmission. This leads to a lengthening of the update time for these devices.

### Example

In the following example there are two IO devices (IWLAN/PB link) with a segment.

If no more than a maximum of two IWLAN/PB links are present in a IWLAN segment at the same time, enter a "2".

## Configure PROFINET IO

### Addressing PROFINET devices

#### Assigning addresses and names to PROFINET devices

In this chapter you will learn which address and naming conventions are valid for the PROFINET devices.

#### IP addresses

All PROFINET devices work with the TCP/IP protocol and therefore require an IP address for Ethernet operation.

You can set the IP addresses in the module properties. If the network is part of an existing company Ethernet network, ask your network administrator for this data.

The IP addresses of the IO devices are assigned automatically, usually at CPU startup. The IP addresses of the IO devices always have the same subnet mask as the IO controller and are assigned in ascending order, starting at the IP address of the IO controller.

#### Device names

Before an IO device can be addressed by an IO controller, it must have a device name. This procedure was chosen for PROFINET because names are easier to administer than complex IP addresses.

Both the IO controller as well as IO devices have a device name. When the "Generate PROFINET device name automatically" option is activated, the device name is automatically derived from the name configured for the device (CPU, CP or IM):

- The PROFINET device name is made up of the name of the device (for example, the CPU), the name of the interface (only with multiple PROFINET interfaces) and optionally the name of the IO system:  
<CPU name>.<Name of the interface>.<IO system name>  
You cannot change this name directly. You change the PROFINET device name indirectly, by changing the name of the affected CPU, CP or IM in the general properties of the module. This PROFINET device name is also displayed, for example, in the list of accessible devices. If you want to set the PROFINET device name independently of the module name, you have to deactivate the "Generate PROFINET device name automatically" option.
- A "converted name" is generated from the PROFINET device name. This is the device name that is actually loaded into the device.  
The PROFINET device name is only converted if it does not comply to the rules of IEC 61158-6-10. You cannot change this name directly either.

## Rules for the converted name

The rules for the converted name are listed in the following section. If the converted name is **not** different from the name of the module, the name of the module must comply with this rule.

- The name consists of one or more labels , which are separated by a dot [.]
- Restricted to a total of 240 characters (lower case letters, numbers, dash, or dot)
- A name component within the device name, which means a character string between two dots, must not exceed 63 characters.
- A name component consists of the characters [a-z, 0-9].
- The device name must not begin or end with the "-" character.
- The device name must not begin with a number.
- The device name form n.n.n.n (n = 0, ... 999) is not permitted.
- The device name must not begin with the string "port-xyz" or "port-xyz-abcde" (a, b, c, d, e, x, y, z = 0, ... 9).

## Example of device names

```
device-1.machine-1.plant-1.vendor
```

If you assign this name to a CPU, for example, STEP 7 will not convert it since it conforms to the rules described above.

## Device number

In addition to the device name, a device number is also automatically assigned when an IO device is plugged in. You can change this number.

## Devices in the PROFINET subnet

In a PROFINET subnet the maximum allowable number of devices is monitored during configuration.

## See also

Assigning the device name and IP address (Page 965)

Retentivity of IP address parameters and device names (Page 973)

## Assigning the device name and IP address

### Assigning an IP address and subnet mask for an IO controller the first time

There are various options for this.

During parameter assignment of the PROFINET interface you must specify if the IP address is set in the project (which means in the hardware configuration) or if the IP address is to be set on the device.

Assignment of an IP address	Comments
<p>Option "IP address is set in the project":</p> <p>The IO controller receives the IP address by loading the hardware configuration, for example, via one of the PROFINET interfaces, by means of the PROFIBUS interface or via the MPI interface.</p>	<p>When the hardware configuration is loaded to the IO controller (e.g. CPU), the IP address and the device name, if set, are also loaded.</p> <p>Example PROFINET interface:</p> <ol style="list-style-type: none"> <li>1. Connect your programming device/PC to the same network as the relevant PROFINET device. The interface of the PG/PC must be set to TCP/IP (Auto) mode.</li> <li>2. Have a list of accessible devices displayed.</li> <li>3. Select the target device by using its MAC address and load the hardware configuration including the configured IP address (IP address is then saved retentively).</li> </ol> <p>If your PROFINET device has an MPI or PROFIBUS DP interface, connect your programming device/PC directly to the PROFINET device via the MPI or PROFIBUS DP interface. The configured IP address is applied when the hardware configuration is loaded.</p>
<p>Option "IP address is set directly at the device":</p> <ul style="list-style-type: none"> <li>• Assign online</li> <li>• Assignment by user program (instruction IP_CONFIG for S7-300/400, T_CONFIG for S7-1200/1500)</li> <li>• Assign via CPU display (S7-1500)</li> <li>• Higher-level IO controller makes assignment (only with I-devices)</li> </ul>	<p>If you have selected this option in the properties of the PROFINET interface, the IP address can be assigned by the online and diagnostics editor, by the primary setup tool, or by the user program ("IP_CONFIG" instruction).</p> <p>This option is set automatically if the option "Multiple use IO system" has been enabled in the properties of the PROFINET IO system (standard machine project).</p> <p>In case of an S7-1200-CPU, make sure that access to the CPU is not protected by a password. If the CPU is write-protected, no IP address and no device name can be assigned directly on the device.</p>

### Commissioning a PROFINET interface

Further details of how to commission a PROFINET interface can also be found in the operating instructions for the PROFINET devices of the SIMATIC family.

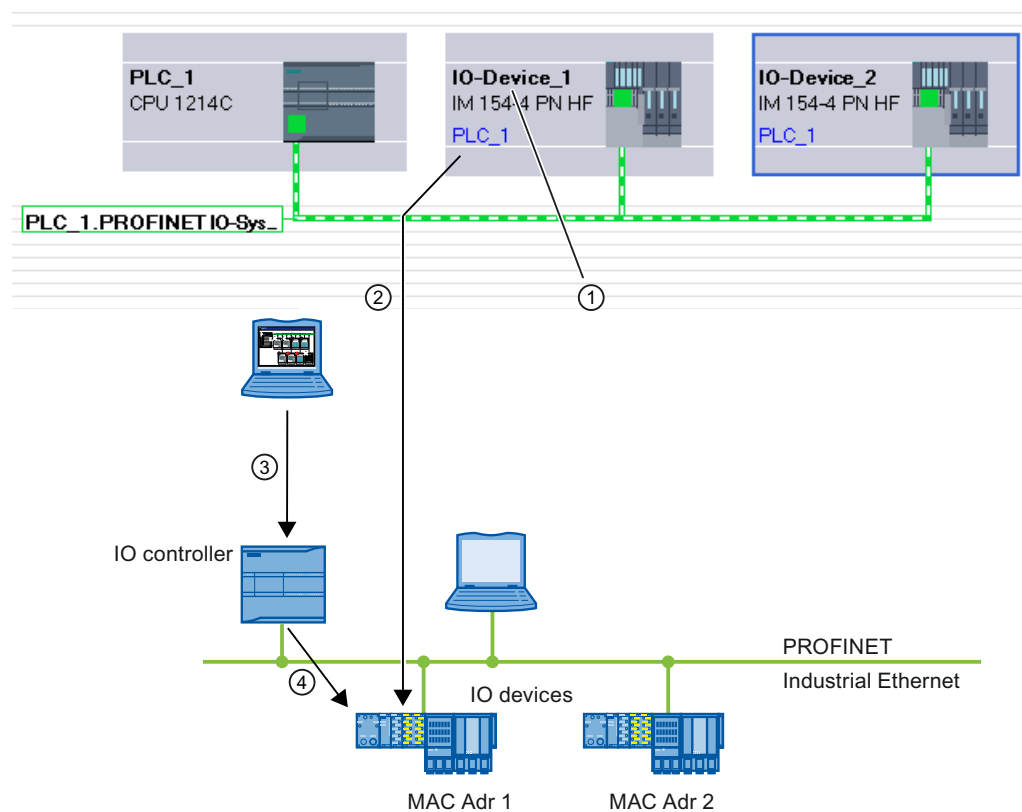

### Assignment of device name for IO devices when the "Support device replacement without exchangeable medium" option is selected

For IO controllers with the "Support device replacement without exchangeable medium" option selected, you do not have to assign device names to the IO devices locally, for example in the event of device replacement. Another application is automatic commissioning, in which the CPU automatically assigns the device name and IP address parameters to the IO devices during startup.

Requirement: The ports of the devices are interconnected, and the devices involved support LLDP. The devices have been put into delivery state or - for S7-1500 CPUs version V1.5 and higher - the "Permit overwriting device names of all assigned IO devices" option is selected for the IO controller ("Ethernet addresses" area, "PROFINET" section of the properties of the PROFINET interface).

### Assignment of device name and address for an IO device

The following graphic illustrates the process for assigning the device name and address. This process does not apply when the "Support device replacement without exchangeable medium" option is selected.

- ① Each device receives a name; STEP 7 automatically assigns an IP address.
- ② From the name, STEP 7 generates a PROFINET device name that you assign to an IO device online (MAC address) and that is written to the device.
- ③ You load the configuration to the IO controller.
- ④ The IO controller assigns the appropriate IP address to the IO device with the assigned PROFINET device name during startup.

## Changing the device name and IP address

You can change the name and IP address manually. The device name must first be changed in the configuration in order to subsequently assign it to the IO device via the memory card or online with programming device/PC.

Offline with memory card:

1. Place the configured data (device name: for example, turbo-3) for the IO device on the MMC in the PG/PC. Use the command "SIMATIC Card Reader > Save Device Name to Memory Card" in the "Project" menu for this.
2. Then insert the MMC into the IO device. The IO device automatically adopts the configured device name.

Online with programming device/PC:

1. Connect the programming device/PC directly to the Ethernet subnetwork via the PROFINET interface.
2. Select the subnet in the network view and then select the "Assign device name" shortcut command.
3. In the "Assign PROFINET device name" dialog box, select the suitable PG/PC interface to connect to the Ethernet subnet. All configured PROFINET device names are in the top drop-down list. Select a PROFINET device name from it and select the IO device to receive this device name from the table at the bottom. You can filter the display of devices in the table according to various criteria.
4. You can easily identify the device using the "Flash LED" button.
5. Click "Assign name".

The IO controller recognizes the IO device by its device name and automatically assigns the configured IP address to it.

## IP address assignment for special IO devices

Special IO devices, for example, SCALANCE X, S7-300 CPs, support the option of assigning the IP addresses not from the IO controller during startup. In this case, the IP address is assigned in a different way. The option is called "IP address is set directly at the device". For additional information, refer to the manual of the respective PROFINET device of the SIMATIC device family.

Another special case is the option "IP address is set by the IO controller during runtime" in the "IP protocol" area of the Ethernet address properties of an IO device. This option is set automatically when the option "Multiple use IO system" is selected for a standard machine project in the associated PROFINET IO system. In this case, an adapted IP address is not assigned by the IO controller until the IO controller itself has received a local IP address.

### **Requirement for additional procedures when assigning IP address and device name**

If the IO device, as described above, should not obtain the IP address or device name from the IO controller, proceed as follows:

1. Select device or network view.
2. Open the properties of the respective PROFINET device and select the area "PROFINET interface [X1]" > "Ethernet addresses".
3. Select the option "IP address is set directly at the device" under "IP parameters" or the option "Permit setting of PROFINET device name directly on the device" under "PROFINET".

### **Rules**

If the "IP address/device name is set directly at the device" option is used for a PROFINET device, note the following:

- The subnet part of the IP address of the IO device must match the subnet part of the IP address of the IO controller.
- The corresponding PROFINET device cannot be used as a gateway.

### **See also**

Assigning a name in the online and diagnostics view opened via "Accessible devices"  
(Page 1181)

Enabling device replacement without exchangeable medium (Page 984)

### **Example of the assignment of the device name**

In this example you assign device names to a PROFINET IO controller and a PROFINET IO device. To make assignment easier, the device names should also contain the names of the PROFINET IO system.

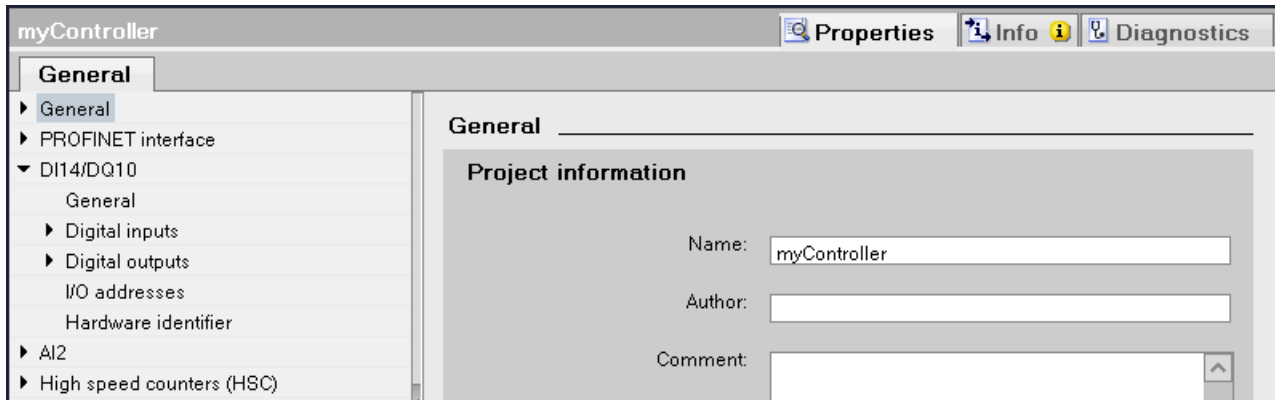

### **Requirement**

- You must be in the network view.
- A CPU 1214C (V2.0 or higher) must be available in the network view.
- An interface module IM 151-3PN exists.
- The PROFINET interfaces of both modules are networked.

### Procedure

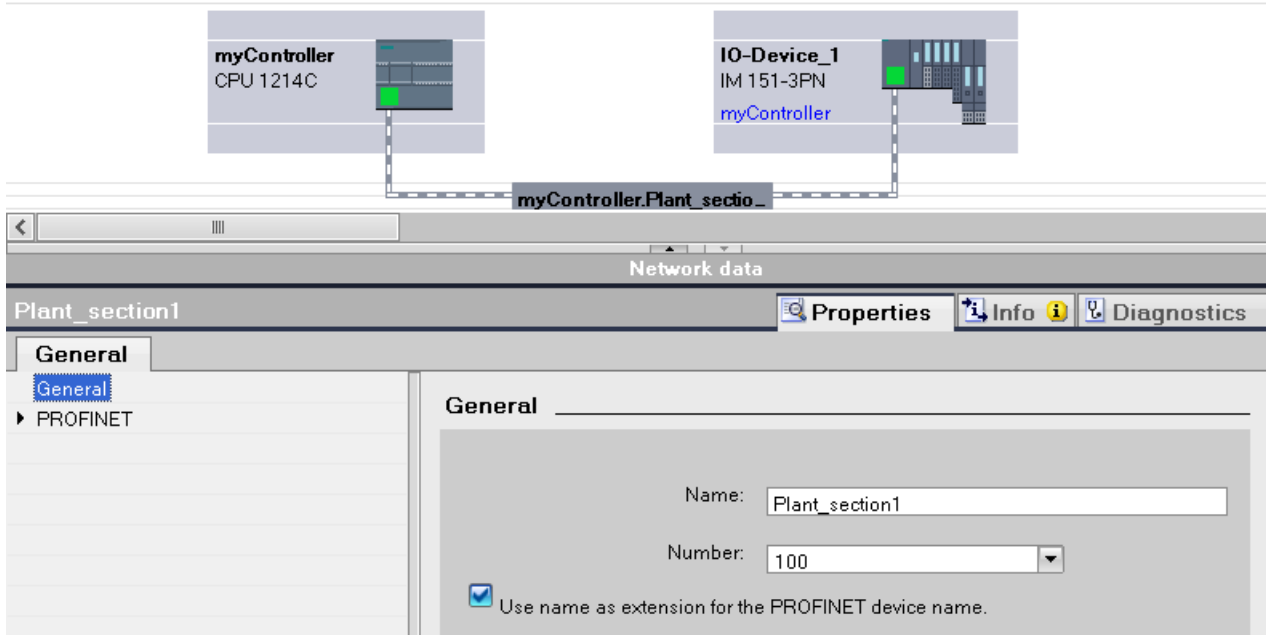

To assign the names, follow these steps:

1. Select the CPU.  
Make sure that you have selected only the CPU and not the complete device!
2. Assign the name "myController" in the Inspector window, under "General".

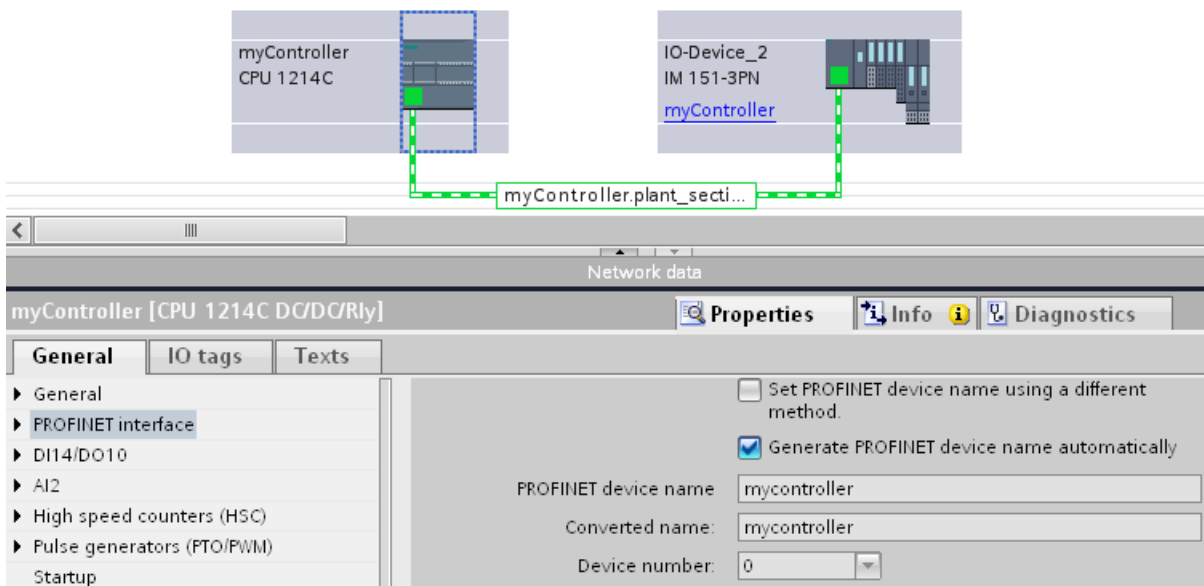

3. Select the interface module.  
Ensure that you have selected only the interface module and not the complete ET 200S device.
4. Assign the name "Device\_1" in the Inspector window, under "General".
5. Right-click on the PROFINET IO system and select the "Properties" command.

- Assign the name "Plant\_section1" to the IO system and select the check box "Use name as extension for PROFINET device names".

- You can find the automatically generated PROFINET device names at the selected device in the Inspector window, at "PROFINET interface".

The PROFINET device name corresponds to the name of the module (with the name of the IO system as extension) with the difference that only lower case text is used. Background: No distinction is made between upper and lower case ("case insensitive") for the storing of the name.

If you want to specify the device name independently of the module name, you have to deactivate the "Generate PROFINET device name automatically" option. The PROFINET device name can be edited in this case.

The converted name is displayed below. This is the name that is automatically generated from the PROFINET device name and satisfies the DNS conventions. If you work with STEP 7, you do not require this name. This name is displayed here as a check and corresponds to the name that is stored in the device. If you work with other tools that are able to record the data exchange and read the actual device names, then you find the converted names.

### **Other special features**

For PROFINET devices with multiple PROFINET interfaces, the name of the interface is attached to the name of the module, separated by a dot.

Example:

- Name of the module: myController
- Name of the interface: Interface\_1
- PROFINET device name: mycontroller.interface\_1

### **Assign device name via memory card**

#### **Introduction**

You can configure the device names of PROFINET IO devices offline. To do this, store a configured device name on a memory card and then insert the card into the appropriate IO device.

If an IO device has to be completely replaced due to a device defect, the IO controller automatically reconfigures the new device. Using the memory card, a device can be replaced without a programming device.

#### **Requirements**

- The programming device has a card reader for memory cards.
- The IO device must support the assignment of the device name via memory card.
- The station and its PROFINET IO system is configured.

#### **Procedure**

To store a device name on a memory card, follow these steps:

1. Insert the memory card into the card reader.
2. Select the IO device whose device name is to be assigned by the memory card.
3. Select the "Card reader > Save Device Name to Memory Card" command in the "Project" menu.

If the memory card is not empty, a message will be issued informing you of this and you will have the option to delete the card.

## Retentivity of IP address parameters and device names

The retentivity of IP address parameters (IP address, subnet mask, router setting) and device name depends on how the address is assigned.

The non-retentive, temporary assignment means:

- IP address parameters and device name remain valid for the following time period:
  - Until the next POWER OFF
  - Until the next memory reset
  - Until termination of the online connection (for example, after loading the program)  
After POWER OFF / POWER ON or a memory reset, the CPU can only be accessed via the MAC address.

If the IP address parameters are not retentive, communication based on the IP protocol can no longer take place after the above described events (for example, after POWER OFF/ POWER ON).

The assignment of a temporary IP address also deletes retentively saved IP address parameters.

## Assigning IP address parameters and device name non-retentively

IP address parameters and device name are not retentive in the following cases:

- A temporary IP address that is not retentive is implicitly assigned with the "Accessible devices" function, if the device (e.g. CPU) does not yet have an IP address.
- The device is a "normal" IO controller (i.e., not an I-device), and it is specified in the user program ("IP\_Conf" instruction) that the IP address parameters/device name are not to be retentive.

## Assigning IP address parameters and device name retentively

IP address parameters and device name are retentive in the following cases:

- In the properties of the PROFINET interface, it is specified that the IP address parameters are set in the project ("Set IP address in the project" option).
- In the properties of the PROFINET interface, it is specified that the IP address is to be set on the device.
  - Once the configuration is loaded, the IP address parameters and the device name are assigned via STEP 7 or a setup tool such as PST (STEP 7: online and diagnostic function "Assign IP address"). The assigned IP address parameters are retentive.
  - The device is a "normal" IO controller (i.e., not an I-device), and it is specified in the user program ("IP\_Conf" instruction) that the IP address parameters/device name are to be retentive.

### Special features of the I-device

In the properties of the PROFINET interface of the I-device, it is specified that the IP address parameters are to be set on the device. The IP address parameters for the I-device are assigned by the higher-level IO controller.

- If prioritized startup is set, the IP address parameters are retentive.
- If **no** prioritized startup is set, the IP address parameters are not retentive.

### Recommendation

If possible, use the "Set IP address in project" option and specify an appropriate IP address. In this case, the IP address is assigned retentively.

### Resetting of retentive IP address parameters and device names

Retentive IP address parameters and device names are reset via the online and diagnostic function "Reset to factory settings".

---

#### Note

##### Consequences of reassignment of IP address parameters on top of existing IP parameters

- The temporary assignment of IP address parameters/device names results in a reset of any retentively saved IP address parameters/device names.
- With a fixed assignment of IP address parameters/device names, previously retentively-saved parameters are replaced by the newly assigned parameters.

---

#### Note

##### Reuse of devices

Execute the "Reset to factory settings" before you install a device with retentive IP address parameters and device name in another subnet or system or before you place it in storage.

---

### Creating a PROFINET IO system

A PROFINET IO system is comprised of a PROFINET IO controller and its assigned PROFINET IO devices.

To create a PROFINET IO system you require an IO controller (for example, CPU 1214C) and one or more IO devices (for example, a head module from the distributed I/O family ET 200S).

As soon as you connect an IO controller to an IO device, a controller-device link is established.

## Procedure

To create a PROFINET IO system, proceed as follows:

1. Use drag-and-drop to pull an IO controller from the hardware catalog (for example, CPU 1214C) into the free area of the network view.  
The IO controller is created in the project.
2. Use drag-and-drop to move an IO device from the hardware catalog (for example, ET 200S) into the free area of the network view.
3. Click on the PROFINET interface of the IO controller or the IO device.
4. Hold down the mouse button and draw a connecting line between this selected interface and that of the partner device.  
A subnet with an IO system between the IO controller and the IO device is created.
5. If required, adapt the properties of the Ethernet subnet or the IO controller (for example, IP address) under "Properties" in the inspector window.

## Handling PROFINET IO systems

Using shortcut menu commands, you can delete PROFINET IO systems, create new ones or even connect the interface to another subnet from within the network view.

An existing PROFINET configuration can thereby be corrected in the network view.

## Create new PROFINET IO system for IO controller

To create a new PROFINET IO for an IO controller, proceed as follows:

1. Make sure that no IO system is already assigned to the IO controller. If an IO system is already assigned to the IO controller, the "Assign IO system" shortcut menu command is disabled.
2. Select the PROFINET interface and then select the "Assign IO system" shortcut menu command.

A new PROFINET IO system is created at the IO controller and you can assign IO devices to this IO system.

### Disconnecting PROFINET IO devices from PROFINET IO system

To disconnect an already networked PROFINET IO device from its PROFINET IO system, follow these steps:

1. Click on the PROFINET interface of an IO device.

2. Select the "Disconnect from IO system" shortcut menu command.  
The IO device that was assigned to this IO system is then no longer assigned to it.

You can create a new IO systems and can assign each of the non-assigned IO devices to an IO controller.

### Assign PROFINET IO devices to other IO controllers

Existing PROFINET IO systems can be easily reconfigured in the network view:

1. Select the interface of an IO device and then select the shortcut menu. You have the following options here:
  - Assign a new subnet to the IO device or disconnect it from the existing subnet
  - Assign a new IO controller to the IO device
  - Assign a new IO system to the IO device or disconnect it from the existing subnet
2. To assign another IO controller to the IO device, select the "Assign to new IO controller" shortcut menu command.  
If there is no connection, a subnet is automatically created and the IO device is assigned to the IO system of the new IO controller.

#### Tip: Quick configuration of IO systems

If the IO system has a lot of IO devices, assign all IO devices placed by drag-and-drop operation to an IO controller on one step.

### Requirements

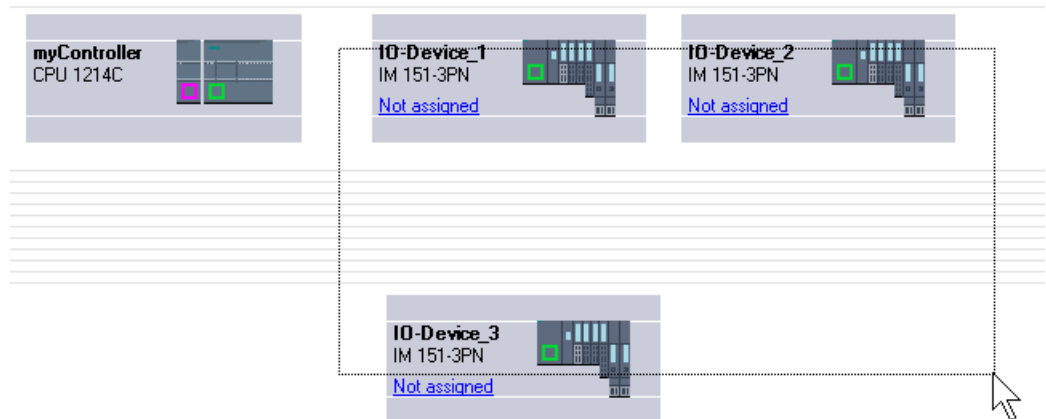

IO controller and IO devices are placed in the network view.

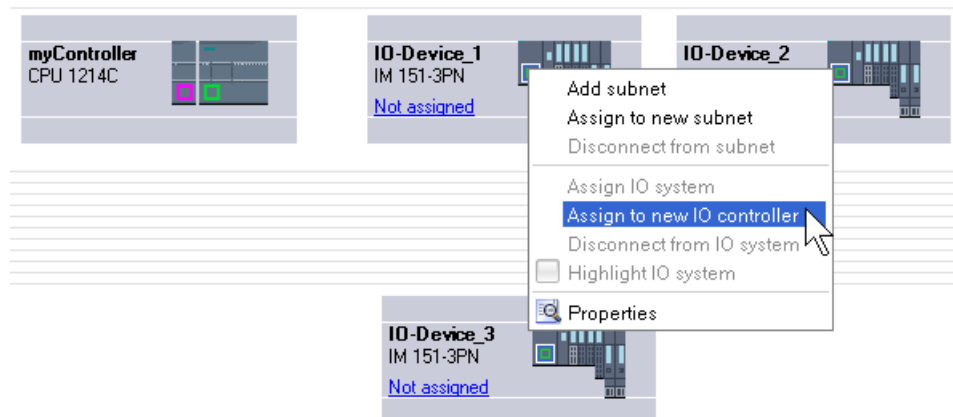

## Assign IO devices to an IO system

To do this, follow these steps:

1. Select an appropriate zoom factor so that you can see as many IO devices as possible in the network view.
2. Arrange the IO devices in not more than of two rows.
3. Select all IO interfaces (not all devices) with the mouse cursor. This only works if you begin to drag the mouse cursor outside of the first IO device and release the mouse button at the last IO device (selection with the lasso).

4. Select the shortcut menu "Assign new IO controller" and select the corresponding IO interface of the IO controller in the subsequent dialog.

5. The IO devices are automatically networked with the IO controller and combine with it to form an IO system.

### Note

When an IO system is highlighted, you can double-click on an IO device in the hardware catalog and thereby quickly add additional IO devices. Result: The IO device is automatically added to the highlighted IO system.

## Interconnecting ports

If an IO device is assigned to an IO controller, this does not yet specify how the ports are connected to each other.

Although a port interconnection is not required to make use of the Ethernet/PROFINET functions, it does offer the following advantages:

- A target topology is specified with the port interconnection. Based on an online-offline comparison, it is possible to conduct a target-actual comparison with all devices that support this function.
- Only with IRT communication: If a port interconnection is configured, STEP 7 can determine the required bandwidth more precisely. As a rule, this leads to a higher performance.

Make sure that no invalid ring structures occur through the interconnection of ports.

Port interconnection is only advisable for devices that support the topology configuration.

## Interconnecting ports in the Inspector window

To interconnect ports, follow these steps:

1. Select the Ethernet/PROFINET device or the Ethernet/PROFINET interface.
2. Navigate to the port property "Port interconnection".  
When the Ethernet/PROFINET interface is selected, you can find this setting in the Inspector window as follows: Properties > General > Advanced Options > Port [...] > Port Interconnection.
3. In the "Local port" section, you can find the settings at the local port. In the case of fiber-optic cable you can, for example, set the cable names here.  
In the "Partner port" section, click on the black triangle in the "Partner port" box to display and select the available partner ports.
4. If the port interconnection is a port interconnection with copper as medium and the devices support IRT communication, you can also set cable length and signal transit time.

If the Ethernet/PROFINET interface was not networked, it is automatically networked by this action. In the properties of the subnet you can set whether this subnet should or should not be used for the networking.

## See also

Overview (Page 576)

## Setting the send clock

### Requirements to change the send clock at the PROFINET device

No IRT (Isochronous Realtime) should be configured. In detail, this means:

- No device must be configured at the IO system as a sync slave or sync master.
- All devices at the IO system must be unsynchronized.

If IRT is configured (in other words, if the IO controller is configured as sync master), the send clock can only be configured in the sync domain.

## Procedure

To set the send clock on the PROFINET device, follow these steps:

1. Select the PROFINET IO controller in the device or network view.
2. Change the value for the shortest possible update interval in the properties of the PROFINET interface under "PROFINET Interface > Advanced options > Real-time settings > IO communication > Send clock".

The send clock is valid for all PROFINET devices at the IO system. If the synchronization role is set to a value other than "Unsynchronized", you can only set the send clock in the sync domain, in other words, centrally at the PROFINET IO system.

## Setting the update time

### Update time

An IO device / IO controller in the PROFINET IO system is supplied with new data from the IO controller / IO device within this time period. The update time can be separately configured for each IO device and determines the time interval in which data is transmitted from the IO controller to the IO device (outputs) as well as data from the IO device to the IO controller (inputs).

STEP 7 calculates the update time automatically in the default setting for each IO device of the PROFINET IO system, taking into account the volume of data to be exchanged as well as the set send clock.

## Setting the update time

If you do not want to have the update time calculated automatically, you can change the setting.

To change the update time, proceed as follows:

1. Select the PROFINET interface of the IO device in the network or device view.
2. Change the update time in the interface properties under "Advanced options > Realtime settings > IO cycle".
  - To have a suitable update time calculated automatically, select "Automatic".
  - To set the update yourself, select "Can be set" and enter the required update time in ms.
3. To ensure consistency between the send clock and the update time, activate the "Adapt update time when send clock changes" option.

This option ensures that the update time is not set to less than the send clock.

Non-automatic setting of the send clock may result in errors if the available bandwidth is insufficient or if other limits are exceeded (for example, too many devices are configured).

## Setting the watchdog time

### Watchdog time

You can configure the watchdog time for PROFINET IO devices.

If the IO device is not supplied with input or output data (IO data) by the IO controller within the watchdog time, it switches to the safe state.

Do not enter the watchdog time directly, but as "Accepted number of update cycles when IO data is missing". This makes setting easier because the update time can be shorter or longer, depending on the power of the IO device or the setting.

The resulting watchdog time is automatically calculated from the "Accepted number of update cycles when IO data is missing".

### Configuring the watchdog time

To specify the watchdog time, follow these steps:

1. Select the PROFINET interface of the IO device in the network or device view.
2. In the properties of the interface, navigate to "Advanced options > Realtime settings > IO cycle".
3. Select the required number of cycles from the drop-down list "Trigger watchdog after # cycles with missing IO data".

The watchdog time is subsequently calculated automatically based on the preset factor. It must not be more than 1.92 seconds.

---

#### Note

The default setting should only be changed in exceptional cases, for example, during the commissioning phase.

---

## Calculated bandwidth for cyclic IO data

### Calculated bandwidth for cyclic IO data

Adherence to the maximum available bandwidth for cyclic IO data is monitored by the system. The maximum bandwidth depends on the send clock cycle. If the send clock cycle is greater than or equal to 1 ms, the maximum bandwidth is 0.5 ms. If the send clock cycle is shorter, the maximum available bandwidth is also reduced.

The bandwidth actually required for cyclic IO data is determined by the system based on the number of configured IO devices and IO modules. Furthermore, the required bandwidth depends on the update time that is used.

In general, the calculated bandwidth increases in the following cases:

- There is a greater number of IO devices
- There is a greater number of IO modules
- The update times are shorter.

### Maximum bandwidth for cyclic IO data depending on the send clock

The following table shows how the maximum available bandwidth for cyclic IO data reacts based on the send clock:

Send clock cycle	Maximum bandwidth for cyclic IO data
250 $\mu$ s – 468.75 $\mu$ s	<< 125 $\mu$ s
500 $\mu$ s – 968.75 $\mu$ s	= send clock / 2
1 – 4 ms	= 500 $\mu$ s

## Setting port options

### Setting the port options

### Changing connection settings for the PROFINET IO port

You can change the network settings for the PROFINET IO port as required. By default, the settings are made automatically. In normal situations, this guarantees problem-free communication.

### Possible settings for transmission medium/duplex

Depending on the selected device, you can make the following settings for "Transmission medium/duplex":

- Automatic setting  
Recommended default setting of the port. The transmission settings are automatically "negotiated" with the partner port. The "Enable autonegotiation" option is automatically selected by default.
- TP/ITP at x Mbps full duplex (half duplex)  
Setting of the transmission rate and the full duplex/half duplex mode. The effectiveness depends on the "Enable autonegotiation" setting:
  - Autonegotiation enabled  
You can use both cross cable and patch cable.
  - Autonegotiation disabled  
Make sure that you use the correct cable (patch cable or cross cable)! The port is also monitored with this setting.
- Deactivated  
Depending on the module type, the drop down list box can contain the "- Disabled -" option. This option, for example, allows you to prevent access to an unused port for security reasons. With this setting, diagnostic events are not generated.

### "Monitor" option

This option is used to activate or deactivate the port diagnostics. Examples of port diagnostics: The link status is monitored, in other words, the diagnostics are generated during link-down and the system reserve is monitored in the case of fiber optic ports.

### Option "Enable autonegotiation "

The autonegotiation setting can only be changed if a concrete medium (for example, TP 100 Mbps full duplex) is selected. Whether or not a concrete medium can be set depends on the properties of the module.

If autonegotiation is disabled, this causes the port to be permanently specified, as for example, is necessary for a prioritized startup of the IO device.

You must make sure the partner port has the same settings because, with this option, the operating parameters of the connected network are not detected and the data transmission rate and transmission mode can therefore not be optimally set.

---

#### Note

When a local port is interconnected, STEP 7 makes the setting for the partner port if the partner port supports the setting. If the partner port does not support the setting, an error message is generated.

---

### See also

Wiring rules for disabled autonegotiation (Page 982)

Boundaries at the port (Page 983)

### Wiring rules for disabled autonegotiation

#### Requirement

You have made the following settings for the port in question, for example, to accelerate the startup time of the IO device:

- Fixed transmission speed
- Autonegotiation incl. autocrossing disabled

This saves you the time required to negotiate the transmission rate during startup.

If you have disabled autonegotiation, you must observe the wiring rules.

## Wiring rules for disabled autonegotiation

PROFINET devices have the following two types of ports:

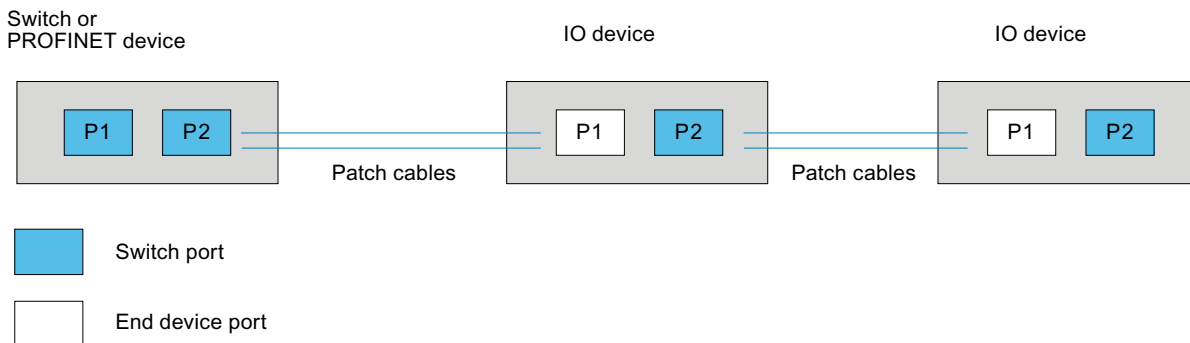

Type of port	PROFINET devices	Note
Switch port with crossed pin assignment	For IO devices: Port 2 For S7 CPUs with 2 ports: Ports 1 and 2	Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is exchanged internally.
End device port with uncrossed pin assignment	For IO devices: Port 1 For S7 CPUs with one port: Port 1	-

## Validity of the wiring rules

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting.

## Rules for cabling

You can connect several IO devices in a line using a patch cable (one-to-one wiring of both connectors). To do this, you connect port 2 (P2) of the IO device to port 1 (P1) of the next IO device. The following graphic gives an example with two IO devices.

## Boundaries at the port

### Requirement

To use boundaries, the respective device must have more than one port. If the device for PROFINET does not support boundary settings, the corresponding parameters are disabled.

## Enable boundaries

"Boundaries" are limits for transmission of certain Ethernet frames. The following boundaries can be set at a port:

- "End of detection of accessible devices"  
DCP frames for detection of accessible devices are not forwarded. Devices located behind this port are no longer displayed in the project tree under "Accessible devices". Devices located behind this port can no longer be reached by the CPU.
- "End of topology discovery"  
LLDP frames (Link Layer Discovery Protocol) for topology detection are not forwarded.
- "End of sync domain"  
Sync frames transmitted for synchronization of devices within a sync domain are not forwarded.  
For example, if you operate a PROFINET device with more than two ports in a ring, you should prevent the sync frames from being fed into the ring by setting a sync boundary (at the ports not inside the ring).  
Additional example: If you want to use several sync domains, configure a sync domain boundary for the port connected to a PROFINET device of the other sync domain.

## Restrictions

The following restrictions must be observed:

- The individual check boxes can only be used if the port supports the function in question.
- If a partner port has been defined for the port, the following check boxes cannot be used:
  - "End of detection of accessible devices"
  - "End of topology discovery"
- If autonegotiation is disabled, none of the check boxes can be used.

## Enabling device replacement without exchangeable medium

### Replacing an IO device without exchangeable medium

It is often necessary to replace IO devices in automation systems. The IO devices are generally assigned a device name by either inserting an exchangeable medium or via the programming device. The IO controller uses this device name to identify the IO device.

Subject to certain conditions, IO devices can also receive their device names without the insertion of an exchangeable medium (e.g., memory card) or without a programming device. For this purpose, the IO controller uses Ethernet mechanisms (LLDP protocol; Link Layer Discovery Protocol) to analyze the relationships between the individual IO devices and the IO controller. From these relationships, the IO controller detects which IO device was replaced and assigns the configured device name to it.

## Requirements

- A port interconnection is already configured.
- The affected IO devices in the automation system must support device replacement without exchangeable medium (LLDP protocol).  
If the individual IO devices in the automation system do not support device replacement without exchangeable medium, a corresponding alarm is output for the IO device.

---

### Note

Use only new IO devices as replacement devices, or restore IO devices with an existing parameter assignment to delivery state prior to commissioning.

For S7-1500 CPUs with firmware version V1.5 or higher, it is not necessary to reset IO devices with an existing parameter assignment to delivery state. The condition for this is that the "Permit overwriting of device name" option is enabled for the IO controller ("Ethernet addresses" area, "PROFINET" section of the properties of the PROFINET interface).

---

## Procedure

In order to enable the replacement of an IO device without exchangeable medium, proceed as follows:

1. In the device or network view, select the PROFINET interface of the corresponding IO controller.
2. In the interface properties under "Advanced settings > Interface options", select the "Support device replacement without exchangeable medium" check box.

The option "Support device replacement without exchangeable medium" also permits automatic commissioning, which means you can commission the IO system with the IO devices without assigning their device names in advance.

## See also

Assigning the device name and IP address (Page 965)

Components with the the device replacement without exchangeable medium function (<http://support.automation.siemens.com/WW/view/en/36752540>)

## Using GSD files

### GSD files for IO devices

#### Basic information on GSD files of IO devices

The properties of PROFINET IO devices are not stored in a keyword-based text file (as for PROFIBUS DP slaves), but in an XML file whose structure and rules are determined by a GSDML schema.

8.1 Configuring devices and networks

The language used to describe the GSD files is GSDML (Generic Station Description Markup Language). It is defined by the GSDML schema.

A GSDML schema contains validation rules that allow it, for example, to check the syntax of a GSD file. GSDML schemas (as schema files) are acquired by IO device manufacturers from PROFIBUS International.

Functional enhancements in the area of PROFINET IO will have an effect on the GSDML specification and the corresponding schema. A new version of the specification and of the schema is created by the functional enhancement.

**Names of GSD files for IO devices**

One possible example of a GSD file name for IO devices is:

"GSDML-V1.0-Siemens-ET200S-20030616.xml"

Name component	Explanation
GSDML	String at the start of each GSD file for IO devices
V1.0	Version of the GSDML schema
Siemens	Manufacturer
ET200S	Name of the device
20030616	Version code (date)
.xml	File extension

**Versioning of GSD files for IO devices**

The version information of GSD files is two-fold:

First, the version of the GSDML schema is indicated. This determines the language scope used by a GSD file.

This is followed by the version, listed as an issue date. The version number of GSD files is incremented, for example, after elimination of an error or introduction of a functional enhancement.

Functional enhancements may result in a new version of the GSDML schema. A new version of a GSDML schema might only be supported with restrictions.

**Installing the GSD file**

**Introduction**

A GSD file (generic station description file) contains all properties of an IO device. If you want to configure an IO device that is not available in the hardware catalog, you must install the GSD file provided by the manufacturer. IO devices installed via GSD files are displayed in the hardware catalog and can then be selected and configured.

## Requirement

- The hardware and network editor is closed.
- You have access to the required GSD files in a directory on the hard disk.

## Procedure

To install a GSD file, follow these steps:

1. In the "Options" menu, select the "Install generic station description files" command.
2. In the "Install generic station description files" dialog box, select the folder in which the GSD files are stored.
3. Choose one or more files from the list of displayed GSD files.
4. Click on the "Install" button.
5. To create a log file for the installation, click on the "Save log file" button.  
Any problems during the installation can be tracked down using the log file.

You will find the new IO devices installed by means of GSD files in the hardware catalog under "Additional field devices > PROFINET".

---

### Note

Installation of a GSD file cannot be undone.

---

## Changing the revision of a GSD file

### Changing the revision of a GSD file

You can change the revision of a GSD file for an IO device:

- Only for the current IO device
- All suitable IO devices within the IO system
- All suitable IO devices within the complete project

First, all existing GSD files for the current IO device are shown. The only difference between the GSD files shown is their revision status. The currently used GSD file is highlighted.

## Requirement

- The I/O data is the same for all IO devices whose revision is to be changed.
- The order number has not changed.
- The number of submodules is identical.
- The configuration data has not changed.
- There must be no module or submodule in a slot that is invalid after the new GSD file has been created.

### Procedure

To change the revision of one or more IO devices, proceed as follows:

1. Select the IO device whose GSD file revision is to be changed.
2. Click on the "Change revision" button under "General> Catalog information" in the properties of the IO device.  
The "Change revision" dialog box opens.
3. Select the GSD revision you want to use in the "Available revisions" table.
4. Under "Use selected revision for", select the devices whose version are to be changed:
  - Only for the current IO device
  - For all suitable IO devices in the IO system
  - For all suitable IO devices in the project
5. Click the "Apply" button.

#### 8.1.4.8 Bus coupling with PN/PN coupler

### Application and function

### Application

The PN/PN coupler is used to link two Ethernet subnets with one another and to exchange data. That way use data about input or output address areas or datasets can be used. The maximum size of the transferable input and output data is 1024 bytes. The division into input and output data is preferable, so that e.g. 800 byte input data and 200 byte output data can be configured.

As a device, the PN/PN coupler has two PROFINET interfaces, each of which is linked to one subnet.

In the configuration, two IO Devices are produced from this one PN/PN coupler which means that there is one IO Device for each station with its own subnet. The other part of PN/PN coupler in each case is known as the bus node. Once configuring is complete, the two parts are joined.

Figure 8-3 Coupling two PROFINET IO subnets with one PN/PN coupler

## Additional information

For additional information on "PN/PN couplers", refer to Service & Support on the Internet (<http://support.automation.siemens.com/WW/view/en/44319532>).

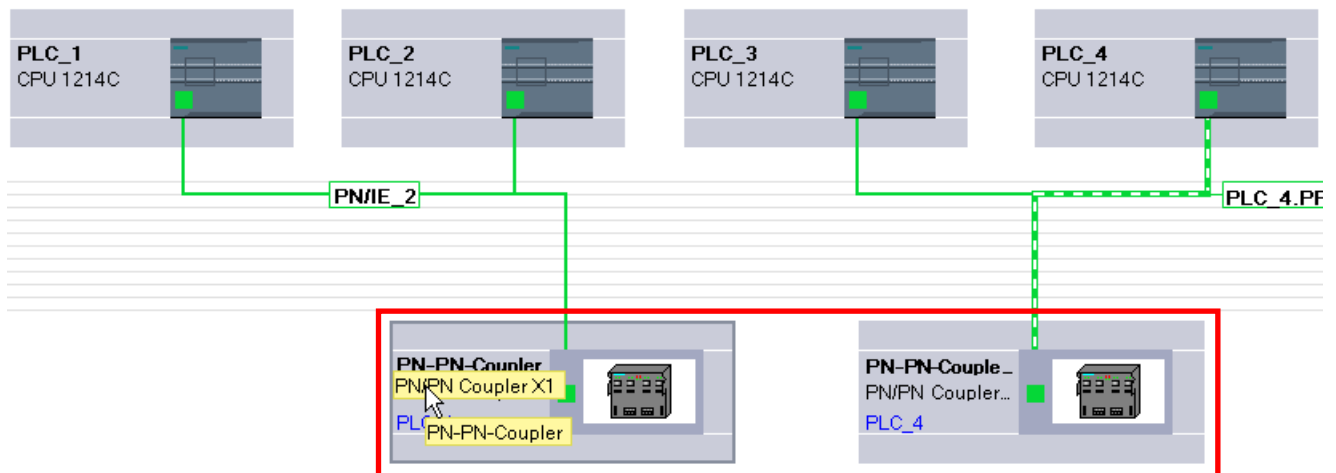

## Linking Ethernet subnets

### Linking Ethernet subnets with a PN/PN coupler

You can link Ethernet subnets with the standard device PN/PN coupler.

To link Ethernet subnets, follow these steps:

1. Create your Ethernet subnets.
2. Select the standard field devices in the hardware catalog. Find the PN/PN coupler as head module in the "PROFINET IO" folder.
3. In the network view, drag the two components X1 and X2 to the required version of the PN/PN coupler per drag-and-drop operation. The components form a device, but are shown separately to make handling easier.
4. Connect the Ethernet interface of the PN/PN coupler X1 to the first Ethernet subnet.
5. Connect the Ethernet interface of the PN/PN coupler X2 to the second Ethernet subnet.  
The Ethernet subnets are now linked through the two components of the PN/PN coupler.

### 8.1.4.9 Integrating external tools

#### Integrating S7-external tools

#### Introduction

Tools external to STEP 7 ("Device Tools") with a special call interface (Tool Calling Interface) can be used to configure distributed devices. Such devices are also referred to as "TCI capable".

The performance range of these tools exceeds the possibilities provided within GSD configuration, for example, they can provide expanded graphical input options.

Distributed devices can be as follows:

- PROFIBUS DP slaves
- Modules within a DP slave
- PROFINET IO devices
- Modules within an IO device

---

**Note**

**Warranty and liability**

Siemens accepts no liability for third-party software (device tools) called with the TCI (Tool Calling Interface) or for proper interaction with the associated devices.

---

## Requirement

The call interface of the tool complies with the TCI specification. Parameters and commands are forwarded to the distributed device via this call interface.

Such tools have to be installed using a setup provided by the manufacturer. The "S7-PCT" (Port Configuration Tool) device tool for IO-Link master modules and IO-Link devices is an exception; this is supplied with STEP 7. Special note: After the installation, the tool is not shown in the list of installed software or in the list of software products in the project.

The GSD file of the distributed device that is to be configured with the Device Tool must be installed.

## Starting the device tool

The command for starting the device tool is available in the shortcut menu of the TCI-capable device in the shortcut menu of the graphical and tabular device view: "Start device tool".

## See also

Starting the SIMATIC S7-PCT (Page 990)

## Starting the SIMATIC S7-PCT

### Introduction

The "S7-PCT" (Port Configuration Tool) device tool is installed with STEP 7.

The tool is used to assign parameters to the ports of IO-Link modules such as 4SI IO-Link (S7-1200, ET 200S) or 4IOL+8DI+4DO (ET 200eco PN).

## Requirement

You have configured the corresponding CPU, the DP slave or the IO device with an IO-Link module.

## Procedure

To start via the graphical device view, follow these steps:

1. Select the IO-Link module in the device view.
2. Select "Start device tool" from the shortcut menu.

OR, to start with the tabular device view, follow these steps:

1. Select the IO-Link module in the device view.
2. Arrange the areas in the work area in such a way that the tabular device overview is visible (it is located between the device view and the inspector window).
3. Select the row with the IO-Link module in the device overview.
4. Select "Start device tool" from the shortcut menu.

## Result

The tool starts and you can configure the ports.

## See also

Integrating S7-external tools (Page 989)

### 8.1.4.10 Loading a configuration

#### Introduction to loading a configuration

In order to commission a device, identical configurations must be stored on the programming device/PC and on the connected devices. To synchronize the configurations on the programming device/PC and the connected devices, you load a configuration. Configuration data can be loaded in two directions:

- From the programming device/PC to a device
- From the device to a PG/PC

## See also

Uploading project data from a device (Page 328)

General information on loading (Page 323)

Downloading a configuration to a device (Page 992)

Downloading project data to a device (Page 325)

General information on loading to PG/PC (Page 993)

Special features during startup (Page 1011)

## Downloading a configuration to a device

### Loading the hardware configuration

After you have inserted a new device in the project and configured it or if you have modified an existing hardware configuration, the next step is to load the current configuration to the device. This ensures that the same configuration is set on the programming device/PC and on the module that is physically present. Use the "Online > Download to device (Page 325)" menu command for this.

In the first download, the complete hardware configuration is downloaded. In subsequent downloads, only changes to the hardware configuration are downloaded.

You have the following options for loading the hardware configuration:

- Loading in the device or network view
- Loading in the project tree
- Loading to an accessible device

#### **WARNING**

##### **Perform load operation only in STOP mode**

Following loading, the machine or process may behave unexpectedly if the parameter assignment is incorrect. A CPU must be set to STOP mode for the load operation to rule out possible damage to equipment or personal injury.

### Special considerations for loading isochronous applications

Isochronous applications consist of a hardware configuration part and a software part.

Example: If you change the number of an IO system, the delay time, or the assignment of a process image partition of the isochronous I/O in the hardware configuration, this affects the parameters of the isochronous mode interrupt OB and thus also the software part.

With isochronous applications, you should always load the complete project (hardware and software). With partial loading (loading hardware and software separately at different times), inconsistencies can arise that, for example, can prevent CPU startup or isochronous operation of the application.

### See also

General information on loading (Page 323)

## Loading a configuration to PG/PC

### General information on loading to PG/PC

#### Introduction

If you bring your PG/PC to a plant and the STEP 7 project used to create the configuration of this plant is not available, load the configuration to a new project on your PG/PC, for example. Use the "Online > Loading the device as new station (hardware and software) (Page 328)" menu command for this.

The list of accessible devices in the project tree is always used when loading a device to your programming device. You can select multiple devices and load them to the project at the same time.

#### Requirements

- The hardware configuration in the device must be created in TIA Portal V12 or higher. A hardware configuration present in the device that was created with an older version cannot be loaded and must be upgraded (Page 303).
- Modules present in the device from GSD (ML), HSPs, or service packs must be installed in the TIA Portal on the PG/PC.
- A project must be open. This project can be a new (empty) project or an existing project.
- The opened project is in offline mode.

#### Scope of load operation

The following list shows an overview of the loadable components of a configuration:

- The device (e.g., a CPU) with all I/O modules and all parameter settings
- PROFIBUS master systems and all PROFIBUS-relevant settings
- PROFINET IO systems and all PROFINET-relevant settings
- I devices and I slaves
- Settings for direct data exchange

After loading a CPU, all other modules within the address area of the CPU are also loaded.

The following connections are also loaded when the configuration is loaded:

- S7 connections (including routed connections) in combined PB/IE networks, including via IE-CP or PB-CM interfaces. S7 connections are automatically accepted as configured at one end when a device configuration is loaded, even if the S7 connection was configured at both ends in the original project. When both connection partners are loaded, the connection is joined together again during the next compilation.
- TCP connections via CPU-internal Ethernet interface, UDP/ISOonTCP connections, and TCP, UDP, ISO, and ISOonTCP connections via IE-CP interface
- Connections via the OUC connection parameter assignment for projects from STEP 7 V13 and higher

---

**Note**

The hardware configuration loaded to PG/PC is not completely identical to the configuration originally loaded to the device. Note the additional information on loading, in particular with regard to partially loaded configuration data in the case of cross-device communication.

Loading PC systems, such as WinAC or PC-based automation, is not possible.

---

**See also**

General information on loading (Page 323)

**Loading specific device configurations**

**Information on loading**

When device configurations are loaded to the PG/PC, all assigned parameters are transferred from the device to the project. If the CPU is connected to a subnet, all parameters of the device are loaded and the CPU is displayed in the network view as networked.

---

**Note**

CPUs reset to their factory settings do not have any hardware configuration. Therefore, nothing is loaded in this case after "Load to PG/PC" is selected in the "Online" menu.

---

**Loading S7-300/400 configurations**

To avoid conflicts when loading a device to an existing project, the following rules must be followed:

- Device names for CPUs, PROFIBUS slaves (DP slaves, I-slaves) and PROFINET devices (IO devices, I devices) must be unique
- The combination of network name, subnet ID, and IP/DP address for modules must be unique

If conflicts occur, the load operation is canceled and an alarm provides information about the problems that occurred. You can then adapt the project correspondingly or install missing components and then repeat the load operation.

Alarm configurations are not loaded to PG/PC.

## Loading S7-1200/1500 configurations

Take the following into consideration when loading:

- CPUs of the S7-1200 series with firmware version V1.0 are not supported when loading.
- Device-specific diagnostic interrupts of the S7-1200 are not supported when loading. For device-specific diagnostic interrupts of the S7-1200 to be generated on the PG/PC once again, the hardware configuration must be compiled once again.
- Module comments of the S7-1200/1500 are loaded from the device to the PG/PC if the same project language is set that was used during loading to the device. You can deselect the loading of comments, if desired.

---

### Note

All types of PC systems, such as WinAC, Embedded Controller, CP 1616 or PC CPs, do not support loading to PG/PC.

---

## Loading distributed I/O

The following functionalities and settings of the distributed I/O are loaded:

- DP master systems/IO systems with associated DP masters/IO controllers (CPUs and CPs), DP slaves/IO devices, the utilized modules and their parameter assignment and properties, such as options handling, status bytes, or SYNC/FREEZE
- Connection of process image partitions (PIP) to organization blocks (OB). Applies to the module and OB properties
- Configured hardware interrupts with the associated properties
- DP master systems with I-slave
- CPs as PROFIBUS I-slave or PROFINET I-device
- Direct data exchange

Master-slave relationships between the I-slave/I-device and assigned DP master/IO controller are only established in the project if both the master as well as the I-slave are loaded to the PG. It does not matter whether you load the DP master/IO controller or the I-slave/I-device first. As soon as both devices are loaded, the master-slave/controller-device relationships will also be re-established.

## Loading subnets and devices with MPI, PROFIBUS, Ethernet, and PtP

The following special considerations apply to loading subnets and end points of connections for MPI, PROFIBUS, Ethernet, and PtP with their respective connection properties:

- If a device with PROFIBUS interface is loaded, the bus parameters of the device will initially be different from the settings in the original project. The bus parameters will only match those of the original project after all devices involved are loaded and no additional devices are on the same bus.
- Passive communication devices that are not connected as DP slaves or IO devices to a corresponding master system or IO system do not participate in the data exchange. They are therefore not loaded.
- All devices involved should therefore be loaded for cross-device configurations. A warning is output during compiling of the project for missing network stations. Missing routing information due to communication stations that are not loaded is displayed as warning during compilation. If the configuration is loaded from the PG/PC back to the device, different routing information results.

When you compile the project after loading devices to the PG/PC, STEP 7 checks if all devices to which communication relationships have been configured are available. If devices are missing, you receive an alarm with the number of missing communication stations.

### NOTICE

#### Cross-device communication

When you load a configuration with cross-device communication to the PG/PC, you must also load all corresponding network stations to the PG/PC. If required network stations are missing and the configuration is loaded back to the device, there is no guarantee that cross-device communication is working again.

## See also

Upgrading projects (Page 303)

## Loading configurations with web server

### Information on loading

The hardware configuration of a CPU also contains the web server settings. A number of restrictions apply to loading a web server configuration to the PG/PC:

- The assignment of the web server language and project language is not loaded for S7-300/400. The project texts are not loaded and an alarm is output that no project languages are assigned. The languages assigned in STEP 7 are loaded without restriction for S7-1200/1500 CPU.
- User administration data of the S7-1200/1500 can be loaded but not edited. You can use a check box to select whether you want to use the existing data as read-only data or discard these data and enter new data.
- Watch tables of the web server are not loaded.

The source files of the user-defined web pages (HTML pages, Java scripts, etc.) are not loaded. The program blocks generated during loading can only be edited if you enter the properties and the HTML page yourself.

## See also

Information about the web server (Page 728)

## Loading configurations with PROFIBUS

### Information on loading

A DP master is loaded to PG/PC. The DP master system and all connected DP slaves are inserted into the project. The respective settings remain unchanged. If a suitable PROFIBUS subnet has already been created, the loaded devices with PROFIBUS interface are connected to the existing subnet.

As a prerequisite for loading DP master systems with standard slaves, the corresponding GSD files must be installed in the TIA Portal and available in the hardware catalog. If a required GSD file is not available in the same version as in the device, differences are identified during the consistency check.

---

#### Note

Direct data exchange in a configuration is only loaded if all communication partners involved in the direct data exchange are loaded to the PG/PC. Missing communication partners are represented by a placeholder device. This means the configuration with direct data exchange can still be compiled.

---

## Isochronous mode

Note the following when loading DP master systems with activated PROFIBUS functionality "Isochronous mode":

- Bus parameters and the settings for isochronous mode are only identical after the device is loaded to the PG/PC if all devices relevant for calculation of isochronous mode are loaded.
- Only mono-master systems with isochronous mode are supported. Therefore, only configurations with just one DP master on the PROFIBUS subnet are loaded.

## Loading configurations with PROFINET

### Information on loading

If you have selected a CPU in the list of accessible devices and perform an load operation to PG/PC, all IO controllers and IO devices associated with this device along with their IO systems will be loaded. Settings for the topology are also transferred. If there is already a suitable Ethernet network in the project, the loaded devices are integrated into the existing network.

### *8.1 Configuring devices and networks*

Relationships between the IO controllers and IO devices are only established within the project if both the IO controller as well as the I-device are loaded to the PG. It does not matter whether you load the IO controller or the I-devices first.

#### **Supported functions**

The following functionalities and settings are loaded:

- PROFINET configurations (RT and IRT) in IO systems with the associated IO controllers (CPUs and CPs), IO devices, and the modules used
- Logical addresses and interface properties
- Port interconnections
- Isochronous mode
- Sync domains/MRP domains
- Redundancy role "Client" or "Manager" for MRP configurations

---

#### **Note**

Empty Sync domains and MRP domains are not included in the loading.

---

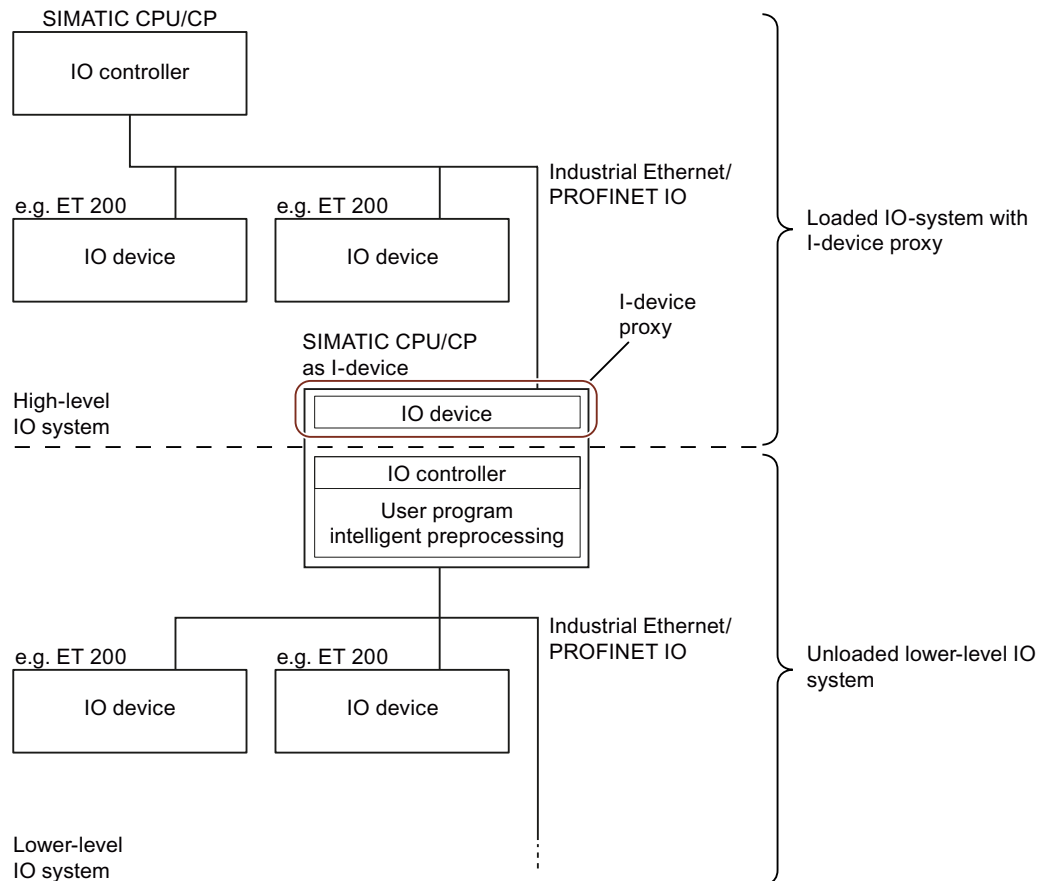

#### **GSD-based IO devices**

As a prerequisite for loading GSD based IO devices, the corresponding GSD files must be installed in the TIA Portal and available in the hardware catalog. If a required GSD file is not available in the same version as in the device, differences are identified during the consistency check.

#### **I-device**

If you load the IO controller from an IO system with connected I-device, the IO controller and its IO devices will be loaded. An involved I-device is loaded only as an I-device proxy. The CPU parameter assignment, including the parameter assignment of the CPU's "own"

(subordinate) IO system, is missing in the I-device proxy. Only the interface to the higher-level IO controller is loaded.

For I-device proxy devices:

- IO controller can be compiled and loaded
- Properties are displayed but cannot be changed
- Diagnostics in the project tree is not carried out

In the network view, placeholder devices are represented with a question mark:

In order to edit the I-device in the project, you must load the I-device from the device to the PG/PC. This replaces the I-device proxy with the complete I-device along with its subordinate IO devices.

It is possible to load an IO controller with connected I-device proxy from the PG/PC to the device.

---

**Note**

The replacement of I-device placeholders is only possible if the required I-device is available in the hardware catalog.

An I-device proxy representing a SIMOTION I-device cannot be loaded and replaced.

---

### Configurations with IE/PB link

If one of the following configurations with IE/PB Link PN IO as PROFINET IO device is present, the complete configuration with all subordinate PROFIBUS devices is loaded:

- CPU/CP of S7-300/400
- PC station and connected PROFIBUS master system

The complete configuration consists of the following:

- CPU
- CP configuration
- PROFINET IO system with connected IE/PB link
- PROFIBUS master system of the IE/PB link with connected DP slaves

An example configuration consists of an S7-300 CPU with a CP as PROFINET IO controller. An IE/PB link as IO device is connected to the IO controller. As the PROFIBUS DP master, the IE/PB link polls a PROFIBUS DP slave, e.g., ET 200L. If you load the CPU from the device to the PG/PC, the complete configuration is loaded.

---

**Note**

If the IE/PB link is not operated as a PROFINET IO proxy but rather as a gateway in standard mode, the IE/PB link functions as a CPU and can be loaded separately.

---

### Loading Shared Devices

The following applies to loading comments: If an input/output module with the Module-internal Shared Input (MSI) or Module-internal Shared Output (MSO) function consists of only one submodule, the submodule does not have its own comment. Instead, it uses the comment of the input/output module. The module must be subdivided into several submodules for the input/output module and all submodules to have their own comment fields.

## Loading HMI devices

### Information on loading

We distinguish between the following cases when loading HMI devices to PG/PC:

- HMI devices connected to a DP master as DP slave or to an IO controller as IO device are loaded as DP slave or IO device respectively (for example, PP 17-I PROFIsafe).
- HMI devices in a master system as I-slave or in an IO system as I-device are loaded as I-slave proxies or I-device proxies (Page 997) (for example, SIMATIC Comfort Panels). The settings of the device proxy are read-only.
- HMI devices are not loaded if they are connected to a subnet (PROFIBUS or PROFINET) but not to a master system or IO system (for example, KP600 Basic color DP).

### Going online with loaded configurations

You can go online with the loaded project or with loaded portions of the project.

### Requirement

The hardware configuration loaded from the device to the PG/PC has been compiled. The statuses of the central and distributed modules are only correctly displayed after compilation.

---

#### Note

If you go online before compiling, the diagnostics icon “?” is displayed (diagnostics not possible). A corresponding alarm is displayed under "Info > General" in the Inspector window.

---

### Dependencies

Depending on how completely the hardware configuration was loaded to the PG, restrictions apply to going online and to diagnostics:

- Completely loaded device with all associated central and distributed modules, such as DP slaves or IO devices:  
Going online and diagnostics are possible.
- Loaded device with connected I-devices/I-slaves:
  - I device/I slave is not loaded: Going online for the device and its modules is possible. For the dependent components of the configuration that are not loaded, device proxies are handled with only minimum diagnostics support. The online status is represented as an icon. The standard diagnostics is shown in the online and diagnostics view. I&M data are not loaded.
  - I device/I slave is also loaded: Going online is possible for all devices; diagnostics is fully supported.

## 8.1.5 Displaying alarms

### 8.1.5.1 Overview of the alarm display

The "Alarm display" function can be used to output asynchronous alarms of diagnostics events and user-defined diagnostics alarms as well as alarms from ALARM instructions.

From the alarm display, you can also start the alarm editor with the "Edit alarm" shortcut menu command and then create user diagnostic alarms.

#### Icons

The following table shows the icons and their functions:

Icon	Function
 Archive view	Shows the alarms located in the archive.
 Active alarms	Shows the currently active (pending) alarms. Alarms that must be acknowledged are shown in blue lettering.
 Ignore	Ignores the arrival of alarms, These alarms are neither shown in the window nor stored in the archive.
 Acknowledge	Confirms the selected alarm as read. Alarms requiring acknowledgment are shown in blue lettering.
 Clear archive	Deletes all alarms in the archive.
 Export archive	Exports the current alarm archive to a file in xml format.

### 8.1.5.2 Archive view

In the archive view, alarms are displayed and archived according to the time they appear. You can set the size of the archive (between 200 and 3000 alarms) with the menu command "Options > Settings > Online & Diagnostics". If the selected archive size is exceeded, the oldest alarm it contains is deleted.

Alarms that must be acknowledged are displayed in blue lettering and can be acknowledged with the shortcut menu command "Acknowledge alarm(s)".

The archive is constantly updated and does not need to be saved explicitly.

### 8.1.5.3 Layout of the alarms in the archive view

In the archive view, all events occurring on the selected CPUs are logged. A new entry is created for each individual event and shown as a further row in the table.

#### Table structure

All attributes of the alarms can be shown as columns. You can show or hide individual columns as well as modify the width and order of the columns. These settings are saved when the project is closed.

The alarms can be displayed in one or more rows. In the single row display, only the first row of the multiple-row alarm data is displayed.

The alarms either require acknowledgment or do not require acknowledgment. The alarms requiring acknowledgment that have not yet been acknowledged are highlighted in blue lettering and can be acknowledged either with the button in the toolbar for the particular context or with the shortcut menu command "Acknowledge alarm(s)".

### 8.1.5.4 Receiving alarms

To allow alarms to be displayed, you must first set the receipt of alarms for each CPU.

#### Procedure

To receive alarms, follow these steps:

1. Double-click on the "Online & Diagnostics" folder of the relevant CPU in project navigation.
2. Click the "Online access" group in the area navigation.
3. Select the option "Receive alarms".

---

**Note**

**If you select this procedure, alarms are only received after you have re-established an online connection to the device.**

---

Or:

1. Select the relevant CPU in the device, network, or topology view.
2. Select the command "Receive alarms" in the "Online" menu or in the shortcut menu.

Or:

1. Select the CPU in project navigation.
2. Select the command "Receive alarms" in the "Online" menu or in the shortcut menu.

---

**Note**

**If you select one of the two above-named procedures, you must have first established an online connection to the device.**

---

#### 8.1.5.5 Export archive

To archive alarms, you can export the archive. Follow these steps:

1. Go to the archive view.
2. Click the "Export archive" button.
3. In the dialog that opens, select the path to export the archive.

#### Result

The archive is saved as an xml file at the location you selected.

#### 8.1.5.6 Clear archive

The archive is organized as a ring buffer, in other words, when it is full, the oldest alarms are deleted from the archive. With the "Clear archive" button, you can delete the entire archive.

#### Procedure

To clear the archive, follow these steps:

1. Click the "Clear archive" button in the toolbar of the alarm display.

#### 8.1.5.7 "Active alarms" view

The "Active alarms" view is an image of the alarm acknowledgement memory of the selected CPU(s).

#### 8.1.5.8 Layout of the alarms in the "Active alarms" view

The "Active alarms" view represents an image of the alarm acknowledgment memory of the selected CPUs. One entry is shown in the table per active alarm. Events of an alarm ("incoming", "outgoing" and "acknowledged") are displayed in one row.

#### Table structure

All attributes of the alarms can be shown as columns. You can show or hide individual columns as well as modify the width and order of the columns. These settings are saved when the project is closed.

The alarms can be displayed in one or more rows. In the single row display, only the first row of the multiple-row alarm data is displayed.

The alarms either require acknowledgment or do not require acknowledgment. The alarms requiring acknowledgment that have not yet been acknowledged are highlighted in bold print and can be acknowledged either with the button in the toolbar for the specific context or with the shortcut menu command "Acknowledge alarm(s)".

### 8.1.5.9 Status of the alarms

Depending on whether you are in the "Active alarms" view or the archive view, the displayed alarms may have a different status.

#### Status of the alarms in the "Active alarms" view

- I: Alarm came
- IA: Alarm came and was acknowledged
- IO: Alarm has gone

If more signal changes occur than can be sent (signal overflow), OV is displayed as the status and the status is shown in red.

#### Status of the alarms in the archive view

- No information: only with alarms generated by the PG/PC and displayed in the "Archive" tab, for example logon status, connection abort, mode changes
- I: Alarm came
- A: Alarm came and was acknowledged
- O Alarm has gone
- D: The alarm was deleted.

If more signal changes occur than can be sent (signal overflow), OV is displayed as the status and the status is shown in red.

### 8.1.5.10 Acknowledging alarms

Alarms that must be acknowledged are shown in blue lettering.

#### Procedure

To acknowledge an alarm, follow these steps:

1. Select the required alarm or alarms from the table.
2. Click the "Acknowledge" button.

---

#### Note

You can select more than one alarm to acknowledge at the same time. To do this, hold down the <Ctrl> key and then select the alarms you want to acknowledge.

---

**Result**

The selected alarm was acknowledged and is then shown in normal characters.

---

**Note**

In the "Active alarms" view, acknowledged alarms that have already gone are no longer displayed.

---

**8.1.5.11 Ignoring alarms**

**Ignoring alarms**

To ignore alarms, follow these steps:

1. Click the "Ignore" button.  
The icon is shown on a gray background.

**Result**

From this point onwards, all alarms will be ignored. A message is created in the archive view indicating that the display of alarms and events is disabled.

**Canceling the ignoring of alarms**

To cancel the ignoring of alarms, follow these steps:

1. Click the "Ignore" button.  
The icon is shown on a white background.

**Result**

All alarms, in other words, even the alarms currently pending on the CPU while the "Ignore alarms" function was active, are displayed again from this point onwards. A message is created in the archive view indicating that the display of alarms and events is enabled again.

**8.1.5.12 Keyboard commands in the alarm display**

**Alarm display**

Function	Shortcut keys
Select all alarms	Ctrl+A
Acknowledge all selected alarms	Ctrl+Q

## 8.1.6 Additional information on configurations

### 8.1.6.1 Functional description of S7-1200 CPUs

#### Operating modes

#### Principles of the operating modes of S7-CPU

##### Introduction

Operating modes describe the behavior of the CPU. The following operating modes are possible:

- STARTUP
- RUN
- STOP

In these operating modes, the CPU can communicate via the PN/IE interface, for example.

##### Other operating modes

If the CPU is not ready for operation, it is in one of following two operating modes:

- Deenergized, i.e. the supply voltage is switched off.
- Defective, which means an internal error has occurred.  
If the "Defective" status is caused by a firmware error, this state is indicated by the status LEDs of the CPU (refer to the description of the CPU). To find out the cause, follow these steps:
  - Turn the power supply switch off and on again.
  - Read out the diagnostics buffer when the CPU starts up and send the data for analysis to Customer Support.

If the CPU does not start up, replace it.

##### See also

STOP mode (Page 1012)

RUN mode (Page 1012)

### Operating mode transitions

#### Overview

The following figure shows the operating modes and the operating mode transitions of S7-1200 CPUs:

The following table shows the conditions under which the operating modes will change:

No.	Operating mode transition	Conditions
①	POWER ON → STARTUP	After switching on, the CPU goes to "STARTUP" mode if: <ul style="list-style-type: none"> <li>• "Warm restart" startup type is set, and</li> <li>• the hardware configuration and the program blocks are consistent.</li> </ul> Non-retentive memory is cleared and the contents of non-retentive DBs are reset to the initial values of the load memory. Retentive memory and retentive DB contents are retained.
②	POWER ON → STOP	When startup type "No startup" is set, the CPU goes to "STOP" mode after the supply voltage is switched on. Non-retentive memory is cleared and the contents of non-retentive DBs are reset to the initial values of the load memory. Retentive memory and retentive DB contents are retained.
③	STOP → STARTUP	The CPU switches to "STARTUP" mode if: <ul style="list-style-type: none"> <li>• CPU is set to "RUN" from the programming device, and</li> <li>• the hardware configuration and the program blocks are consistent.</li> </ul>
④	STARTUP → STOP	The CPU returns to the "STOP" mode in the following situations: <ul style="list-style-type: none"> <li>• Error detected during startup.</li> <li>• The CPU is set to "STOP" from the programming device.</li> <li>• A STOP command is processed in the STARTUP OB.</li> </ul>
⑤	STARTUP → RUN	If the STARTUP is successful, the CPU switches to "RUN".
⑥	RUN → STOP	The CPU returns to the "STOP" mode in the following situations: <ul style="list-style-type: none"> <li>• An error is detected that prevents continued processing.</li> <li>• The CPU is set to "STOP" from the programming device.</li> <li>• A STOP command is processed in the user program.</li> </ul>

## "STARTUP" operating mode

### Principles of the STARTUP mode

#### Function

After turning on the CPU, it executes a startup program before starting to execute the cyclic user program.

By suitably programming startup OBs, you can specify certain initialization variables for your cyclic program in the startup program. There is no rule in terms of the number of startup OBs. That is, you can set up one or several startup OBs in your program, or none at all.

#### Parameter settings for startup characteristics

You can specify whether the CPU remains in STOP mode or whether a warm restart is run. Over and above this, you can set the response during startup (RUN or previous mode) in the "Startup" group of the CPU properties.

#### Special characteristics

Note the following points regarding the "STARTUP" mode:

- The startup OBs are executed. All startup OBs you have programmed are executed, regardless of the selected startup mode.
- No time-based program execution can be performed.
- Interrupt controlled program execution limited to:
  - OB 82 (diagnostics interrupt)
- The outputs on the modules are disabled.
- The process image is not updated; direct I/O access to inputs is possible.

#### See also

Editing properties and parameters (Page 481)

Principles of the operating modes of S7-CPU's (Page 1007)

Organization blocks for startup (Page 1057)

Warm restart (Page 1009)

#### Warm restart

#### Function

During a warm restart, all non-retentive bit memory is deleted and non-retentive DB contents are reset to the initial values from load memory. Retentive bit memory and retentive DB contents are retained.

Program execution begins at the call of the first startup OB.

### Triggering a warm restart

You can trigger a "Warm restart" using a corresponding menu command on your programming device in the following situations:

- The CPU must be in "STOP" mode.
- After a memory reset
- After downloading a consistent program and a consistent hardware configuration in the "STOP" mode of the CPU.

"POWER ON" triggers a "warm restart" if you have set the following parameters for the startup response:

- Startup type "warm restart - RUN" (regardless of the CPU operating mode prior to POWER OFF).
- "Warm restart - mode prior to POWER OFF" (depending on the CPU operating mode prior to POWER OFF. The CPU must have been in RUN mode prior to this.)

### See also

Retentive memory areas (Page 1017)

### Startup activities

#### Overview

The following table shows which activities the CPU performs at STARTUP:

Activities in execution sequence	At warm restart
Clear non-retentive bit memories	Yes
Clear all bit memories	No
Clear the process image output	Yes
Processing startup OBs	Yes
Update the process image input	Yes
Enable outputs after changing to "RUN" mode	Yes

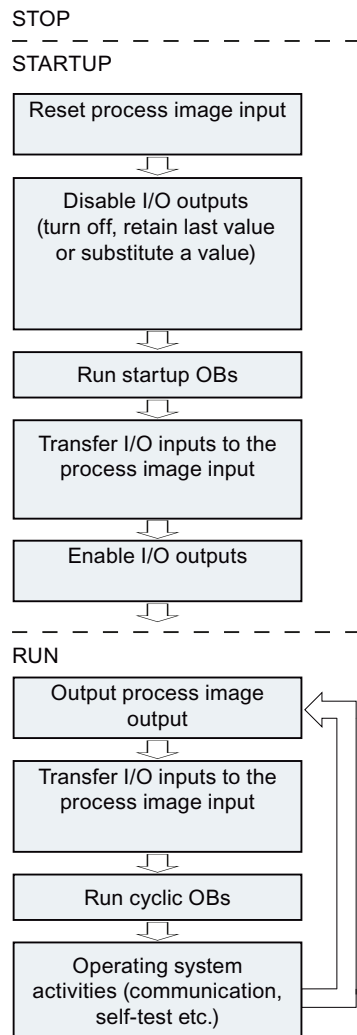

### Sequence

The following figure shows the activities of the CPU in "STOP", "STARTUP", and "RUN" modes.

You can use the following measures to specify the state of the I/O outputs in the first cycle of the user program:

- Use assignable output modules to be able to output substitute values or to retain the last value.
- Set default values for outputs in startup OBs.

During the startup, all interrupt events are entered in a queue so that they can be processed later during RUN mode. In RUN mode, hardware interrupts can be processed at any time.

### Special features during startup

#### Response when expected and actual configurations do not match

The expected configuration is represented by the engineering configuration loaded on the CPU. The actual configuration is the actual configuration of the automation system.

If the expected configuration and actual configuration differ, the CPU nevertheless initially changes to RUN.

#### Canceling a STARTUP

If errors occur during startup, the startup is canceled and the CPU remains in "STOP" mode.

Under the following conditions, a startup will not be performed or will be canceled:

- If an invalid SD card is inserted.
- If no hardware configuration has been downloaded.

### **See also**

Overview of the CPU properties (Page 1029)

### **RUN mode**

#### **Function**

In "RUN" mode the cyclic, time-driven, and interrupt-driven program sections execute:

- The process image output is read out.
- The process image input table is read.
- The user program is executed.

Active data exchange between S7-1200 CPUs by means of Open User Communication is only possible in "RUN" mode.

### **Running the user program**

Once the CPU has read the inputs, the cyclic program runs from the first to the last instruction.

If you have configured a minimum cycle time, the CPU will not end the cycle until this minimum cycle time is up even if the user program is completed sooner.

A maximum cycle time is set which you can adjust according to your requirements. This ensures that the cyclic program is completed within a specified time. The system will respond with a time error if the cyclic program is not completed within this time.

Other events such as hardware and diagnostic interrupts can interrupt the cyclic program flow and prolong the cycle time.

### **See also**

Principles of the operating modes of S7-CPU's (Page 1007)

Events and OBs (Page 1021)

### **STOP mode**

#### **Function**

In "STOP" mode, the user program is not executed. All outputs are disabled or react according to the parameter settings: They provide a substitute value as set in the parameters or retain the last value output and bring the controlled process to a safe status.

The CPU checks the following points:

- Hardware, for example whether all modules are available
- Whether the default settings for the CPU are applicable or parameter sets are present
- Whether the general conditions for the programmed startup behavior are correct

### **See also**

Principles of the operating modes of S7-CPU (Page 1007)

### **Basics of a memory reset**

#### **Function**

A memory reset on the CPU is possible only in STOP mode.

When memory is reset, the CPU is changed to an "initial status". This means:

- An existing online connection between your programming device/PC and the CPU is terminated.
- The content of the work memory and the retentive and non-retentive data are deleted.
- The diagnostic buffer, the time, the IP address, the hardware configuration, and active force jobs are retained.
- The load memory (code and data blocks) is then copied to work memory. As a result, the data blocks no longer have current values but their configured initial values.

### **Memory areas**

#### **Useful information on memory cards**

##### **How the memory card functions**

The SIMATIC Memory Card for a S7-1200 is an SD memory card preformatted by Siemens for the CPU user program.

You may only delete files and folders. If you format the memory card with Windows, for example with a commercially available card reader, you make the memory card unusable as a storage medium for an S7 CPU.

### Setting the card type

You can use the memory card as a transfer card, a program card or a firmware update card.

To set the card type, insert the memory card into the card reader of the programming device and select the "Card reader/USB memory" folder from the project tree. In the properties of the selected memory card, designate the card type:

- **Program**  
If it is used as a program card, you can load the user program on the memory card. In this case, the internal load memory of the device is replaced by the memory card and the internal load memory is erased. The user program is then fully executable from the memory card. If the memory card with the user program is removed, there is no longer a program available.
- **Transfer**  
If it is used as a transfer card, you can transfer the user program from the memory card to the internal load memory of the CPU. You can then remove the memory card again.
- **Firmware card**  
Firmware for the S7-1200 modules can be stored on a memory card. Therefore it is possible to perform a firmware update with the help of a specifically prepared memory card. Likewise, a backup copy of firmware for a module can be stored on a memory card.

### Transferring objects from the project to a memory card

When the memory card is inserted in the programming device or in an external card reader, you can transfer the following objects from the project tree to the memory card:

- **Individual blocks (multiple selection possible)**  
In this case a consistent transfer is available, as the dependencies of the blocks to each other is taken into account with block selection.
- **PLC**  
In this case, all objects relevant to processing are transferred, such as blocks and the hardware configuration on the memory card, just as with downloading.

To perform the transfer, you can move the objects with drag-and-drop or use the command "Card reader/USB memory > Write to memory card" in the "Project" menu.

### Transferring objects from the memory card to the project

You can transfer Individual blocks (multiple selection is possible) by dragging them to the project. A hardware configuration cannot be transferred from the memory card to the project.

## Updating firmware with a memory card

You can get the latest firmware data on the Internet from the Service & Support pages:

<http://support.automation.siemens.com> (<http://support.automation.siemens.com/WW/view/en/34143537>)

Save the firmware files on the hard disk and plug the SIMATIC Memory Card into the card reader of your programming device.

To store the file on the memory card, select the memory card in the "Card Reader/USB memory" folder in the project tree. Select the shortcut menu "Card Reader/USB memory > Create firmware update memory card".

Then follow the instructions in the Service & Support portal for performing a firmware update with your CPU.

Updating the firmware changes the CPU firmware status. If you have used the CPU in the project, you will have to update the CPU already configured to the CPU with the new firmware status by changing devices offline, and adapt and then load the program or configuration.

## See also

Replacing a hardware component (Page 481)

Useful information on CPU firmware versions and STEP 7 versions (Page 1079)

## Load memory

### Function

Each CPU has an internal load memory. The size of this internal load memory depends on the CPU used.

This internal load memory can be replaced by using external memory cards. If there is no memory card inserted, the CPU uses the internal load memory; if a memory card is inserted, the CPU uses the memory card as load memory.

The size of the usable external load memory cannot, however, be greater than the internal load memory even if the inserted SD card has more free space.

## See also

Using memory cards (Page 380)

## Work memory

### Function

Work memory is a non-retentive memory area for storing elements of the user program that are relevant for program execution. The user program is executed exclusively in work memory and system memory.

## System memory

### System memory areas

#### Function

System memory contains the memory elements that each CPU makes available to the user program, such as the process image and bit memory.

By using appropriate operations in your user program, you address the data directly in the relevant operand area.

The following table shows the operand areas of the system memory:

Operand area	Description	Access via units of the following size:	S7 notation
Process image output	The CPU writes the values from the process image output table to the output modules at the start of the cycle.	Output (bit)	Q
		Output byte	QB
		Output word	QW
		Output double word	QD
Process image input	The CPU reads the inputs from the input modules and saves the values to the process image input table at the start of the cycle.	Input (bit)	I
		Input byte	IB
		Input word	IW
		Input double word	ID
Bit memory	This area provides storage for intermediate results calculated in the program.	Bit memory (bit)	M
		Memory byte	MB
		Memory word	MW
		Memory double word	MD
Data block	Data blocks store information for the program. They can either be defined so that all code blocks can access them (global DBs) or assigned to a specific FB or SFB (instance DB). Requirement: The block attribute "Optimized block access" is not enabled.	Data bit	DBX
		Data byte	DBB
		Data word	DBW
		Data double word	DBD
Local data	This area contains the temporary data of a block while the block is being processed. Requirement: The block attribute "Optimized block access" is not enabled. Recommendation: Access local data (temp) symbolically.	Local data bit	L
		Local data byte	LB
		Local data word	LW
		Local data double word	LD
I/O input area	The I/O input and output areas permit direct access to	I/O input bit	<tag>:P

Operand area	Description	Access via units of the following size:	S7 notation
	central and distributed input and output modules.	I/O input byte	
		I/O input word	
		I/O input double word	
I/O output area		I/O output bit	
		I/O output byte	
		I/O output word	
		I/O output double word

Diagnostics buffer (Page 1019)

Basic principles of process images (Page 1018)

Access to the I/O addresses (Page 1020)

### Retentive memory areas

#### Retentive memory areas

Data loss after power failure can be avoided by marking certain data as retentive. This data is stored in a retentive memory area. A retentive memory area is an area that retains its content following a warm restart, in other words, after cycling the power when the CPU changes from STOP to RUN.

The following data can be assigned retentivity:

- Bit memory: The precise width of the memory can be defined for bit memory in the PLC tag table or in the assignment list.
- Tags of a function block (FB): You can define individual tags as retentive in the interface of an FB if you have enabled optimized block access. Retentivity settings can be defined only in the assigned instance data block if optimized block access has not been activated for the FB.
- Tags of a global data block: You can define retentivity either for individual or for all tags of a global data block depending on the settings for access.
  - Block with optimized access: retentivity can be set for each individual tag.
  - Block with standard access: The retentivity setting applies to all tags of the DB; either all tags are retentive or no tag is retentive.

Warm restart (Page 1009)

## process image input/output

### Basic principles of process images

#### Function

When the user program addresses the input (I) and output (O) operand areas, it does not query or change the signal states on the digital signal modules. Instead, it accesses a memory area in the system memory of the CPU. This memory area is referred to as the process image.

#### Advantages of the process image

Compared with direct access to input and output modules, the main advantage of accessing the process image is that the CPU has a consistent image of the process signals for the duration of one program cycle. If a signal state on an input module changes during program execution, the signal state in the process image is retained until the process image is updated again in the next cycle. The process of repeatedly scanning an input signal within a user program ensures that consistent input information is always available.

Access to the process image also requires far less time than direct access to the signal modules since the process image is located in the internal memory of the CPU.

#### Updating the process images

#### Sequence

The operating system updates the process images at cyclic intervals unless defined otherwise in your configuration. The process image input/output is updated in the following order:

1. The internal tasks of the operating system are performed.
2. The process image output (PIQ) table is written to the outputs of the module.
3. The status of inputs is read to the process image input (PII) table.
4. The user program is executed with all the blocks that are called in it.

The operating system automatically controls the writing of the process image output to the outputs of the modules and the reading of the process image input.

#### Special characteristics

You have the option of accessing inputs or outputs directly using direct I/O access.

- If an instruction accesses an output directly and the output address is located in the process image output, the process image of the relevant output is updated.
- If an instruction accesses an output directly and the output address is **not** located in the process image output, the process image of the relevant output is **not** updated.

### Example of normal I/O access by way of the process image

Update QW10 in the I/O output area with the value from MW0.

### I/O access error during process image updating

If an error occurs during process image updating (I/O access error), the CPU reacts with the default system reaction "Ignore".

### See also

- Start address of a module (Page 1020)
- Access to the I/O addresses (Page 1020)
- Startup activities (Page 1010)

### Diagnostics buffer

#### Function

The diagnostics buffer is part of the system memory of the CPU. It contains the errors detected by the CPU or modules with diagnostics capability. It includes the following events:

- Every mode change of the CPU (for example, POWER UP, change to STOP mode, change to RUN mode)
- Every diagnostics interrupt

The diagnostics buffer of the S7-1200-CPU has a capacity of 50 entries of which the last (most recent) 10 entries are retained following power cycling.

Those entries can only be cleared by restoring the CPU to factory defaults.

You can read the content of the diagnostics buffer with the help of the Online and Diagnostics view.

### See also

- Basic information on the diagnostics buffer (Page 1187)

## I/O data area

### Start address of a module

#### Definition

The start address is the lowest byte address of a module. It acts as the initial address of the module user data area.

#### Configuring module start addresses

The addresses used in the user program and the module start addresses are coordinated when the modules are configured.

In the module properties ("I/O addresses" group), you can change the start addresses that were assigned automatically after the modules were inserted.

You can also make a setting that decides whether or not the addresses are located in the process image.

#### Access to the I/O addresses

#### I/O addresses

If you insert a module in the device view, its user data is located in the process image of the S7-1200 CPU (default). The CPU handles the data exchange between the module and the process image area automatically during the update of the process images.

Append the suffix ":P" to the I/O address if you want the program to access the module directly instead of using the process image.

`%I0.0:P`

`"TAG_1":P`

This could be necessary, for example, during execution of a time-sensitive program which also has to control the outputs within the same cycle.

## Basics of program execution

### Events and OBs

#### Events and OBs

The operating system of S7-1200-CPU is based on events. There are two types of events:

- Events which can start an OB
- Events which cannot start an OB

An event which can start an OB triggers the following reaction:

- It calls the OB you possibly assigned to this event. The event is entered in a queue according to its priority if it is currently not possible to call this OB.
- The default system reaction is triggered if you did not assign an OB to this event.

An event which cannot start an OB triggers the default system reaction for the associated event class.

The user program cycle is therefore based on events, the assignment of OBs to those events, and on the code which is either contained in the OB, or called in the OB.

The following table provides an overview of the events which can start an OB, including the associated event classes and OBs. The table is sorted based on the default OB priority. Priority class 1 is the lowest.

Event class	OB no.	Number of OBs	Start event	OB priority (default)
Cyclic program	1, >= 123	>= 1	Starting or end of the last program cycle OB	1
Startup	100, >= 123	>=0	STOP to RUN transition	1
Time-of-day interrupt	>= 10	Max. 2	Start time has been reached	2
Time-delay interrupt	>= 20	Max. 4	Delay time expired	3
Cyclic interrupt	>= 30		Constant bus cycle time expired	8
Hardware interrupt	>= 40	Max. 50 (more can be used with DETACH and ATTACH)	• Positive edge (max. 16)	18
			• Negative edge (max. 16)	
			• HSC: Count value = reference value (max. 6)	18
			• HSC: Count direction changed (max. 6)	
• HSC: External reset (max. 6)				
Status interrupt	55	0 or 1	CPU has received status interrupt	4
Update interrupt	56	0 or 1	CPU has received update interrupt	4
Manufacturer- or profile-specific interrupt	57	0 or 1	CPU has received manufacturer-specific or profile-specific interrupt	4
Diagnostic error interrupt	82	0 or 1	Module has detected an error	5
Pull/plug interrupt	83	0 or 1	Removal/insertion of modules of distributed I/O	6

Event class	OB no.	Number of OBs	Start event	OB priority (default)
Rack error	86	0 or 1	Error in the I/O system of the distributed I/O	6
Time error	80	0 or 1	<ul style="list-style-type: none"> <li>• Maximum cycle time exceeded</li> <li>• Called OB is still being executed</li> <li>• Time-of-day interrupt missed</li> <li>• Time-of-day interrupt missed during STOP</li> <li>• Queue overflow</li> <li>• Interrupt loss due to high interrupt load</li> </ul>	22

The following table describes events which do not trigger an OB start, including the corresponding reaction of the operating system. The table is sorted based on event priority.

Event class	Event	Event priority	System reaction
Insert/remove central modules	Insert/remove a module	21	STOP
I/O access error during process image update	I/O access error during process image update	22	Ignore
Programming error	Programming error in a block for which you use system reactions provided by the operating system (note: the error handling routine in the block program is executed if you activated local error handling).	23	RUN
I/O access error	I/O access error in a block for which you use system reactions provided by the operating system (note: the error handling routine in the block program is executed if you activated local error handling).	24	RUN
Maximum cycle time exceeded twice	Maximum cycle time exceeded twice	27	STOP

### Assignment between OBs and events

With the exception of the cyclic program and startup program and event can only be assigned to one OB. However, in certain event classes such as hardware interrupts one and the same OB can be assigned to several events.

The assignment between OBs and events is defined in the hardware configuration. Defined assignments can be changed at runtime by means of ATTACH and DETACH instructions.

### OB priority and runtime behavior

S7-1200-CPU's support the priority classes 1 (lowest) to 27 (highest). An OB is assigned the priority of its start event.

OBs are always executed on a priority basis: The OBs with the highest priority are executed first. Events of the same priority are processed in order of occurrence.

As of firmware version V4.0 of the S7-1200 CPUs you can specify in the device configuration, under properties of the CPU, if the OBs are interruptible or not. This parameter assignment has an effect on all OBs with exception of the cycle OBs which are always interruptible.

The following applies to S7-1200 CPUs with firmware version < V4.0:

- Any OB with priority  $\geq 2$  will interrupt cyclic program execution.
- An OB of priority 2 to 25 cannot be interrupted by any event of priority group 2 to 25. This rule also applies to events of a priority higher than that of the currently active OB. Such events are processed later.
- A time error (priority 26) will interrupt any other OB.

The following applies to S7-1200 CPUs as of firmware version V4.0:

If you do not configure the OBs as interruptible, an OB is always processed completely even if an event of a higher priority occurs during its runtime. Specifically, this means:

- Any OB with priority  $\geq 2$  will interrupt cyclic program execution.
- An OB of priority 2 to 25 cannot be interrupted by any event. This rule also applies to events of a priority higher than that of the currently active OB, which also includes a time error. Such events are processed later.

If you do configure the OBs as interruptible and an event of a higher priority occurs during the runtime of an OB, the running OB is interrupted and the OB associated with the occurring event is processed. Once this OB has been completed, processing of the interrupted OB continues. Specifically, this means:

- Any OB with priority  $\geq 2$  will interrupt cyclic program execution.
- An OB of priority 2 to 25 can be interrupted by any event whose priority is higher than that of the running OB. This is also true for time errors: A time error (priority 26) will interrupt any OB.

## OB start information

Certain OBs have start information, while others do not. This is explained in greater detail in the description of the relevant OB.

## See also

Event-based program execution (Page 1023)

## Event-based program execution

## OB priority and runtime behavior

S7-1200-CPU support the priority classes 1 (lowest) to 27 (highest). An OB is assigned the priority of its start event.

Interrupt OBs can only be interrupted by time error interrupts. This rule also applies to events of a priority higher than that of the currently active OB. That is, only one interrupt OB can be active, with exception of the time error interrupt OB.

Any further event of generated while an interrupt OB is being executed is added to a queue in accordance with its priority. Start events within a queue are processed later based on the chronological order of their occurrence.

### **Program execution on the CPU**

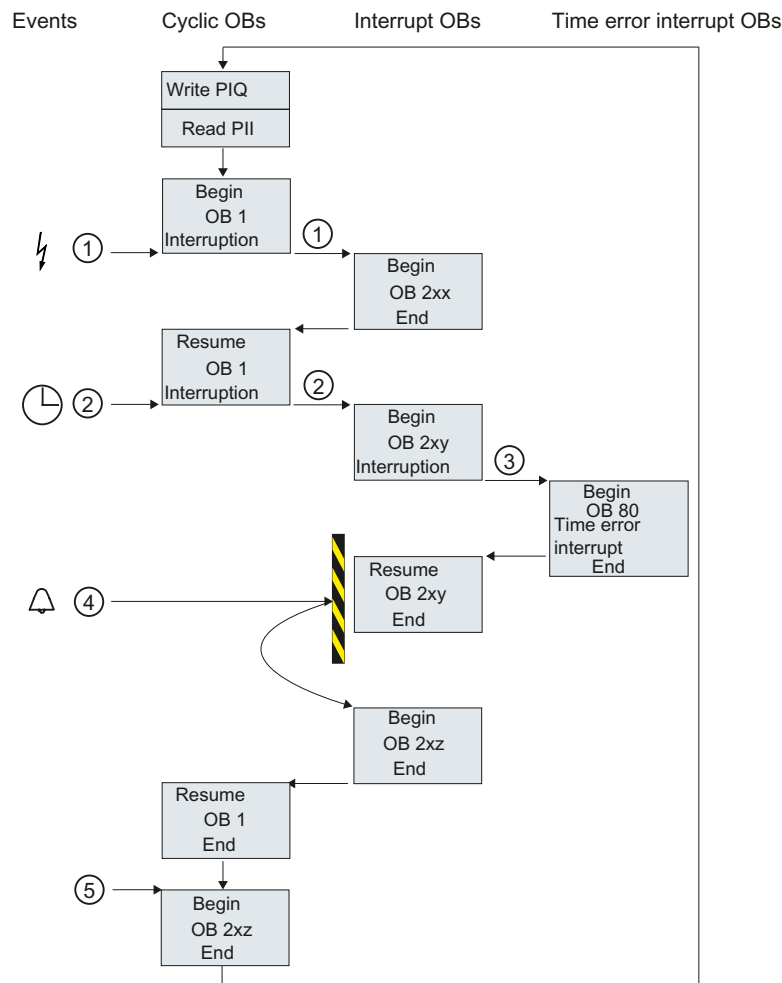

Cyclic OBs are interrupted by interrupt OBs.

Reactions to events which start an interrupt OB:

- For CPUs up to firmware version V3: Interrupt OBs can only be interrupted by time error interrupt OBs.
- For CPUs as of firmware version V4: Interrupt OBs can be interrupted by interrupt OBs of a higher priority.

The figure below shows the basic procedure in case interrupt OBs cannot be interrupted (behavior up to firmware version V3):

- ① and ② An event (e.g. a hardware interrupt) calls its associated OB.  
 ② A called OB is executed without interruption, including all of its nested blocks. Execution of the cyclic OB is resumed on completion of interrupt processing, provided the queue does not contain any events which trigger an OB start.  
 ③ An interrupt OB can only be interrupted by a time error interrupt OB (OB 80).  
 ④ An new alarm-triggering event occurs during interrupt processing.

**Reaction for CPUs up to and including firmware version V3:**

This new event is added to a queue. The queued events successively call their corresponding OBs only after execution of the current interrupt OBs was completed and according to the following rules:

- Events are processed in the order of their priority (starting at the highest priority).
- Events of the same priority are processed in chronological order.

**Reaction for CPUs as of firmware version V4:**

You use a CPU parameter to set the interruptibility for CPUs as of firmware version V4. Default behavior: OBs are interruptible. In this case: If the new event has a higher priority than the currently running OB, the OB started by the new event interrupts the currently running OB.

If you disable the option, the interrupt OBs cannot be interrupted.

- ⑤ The cyclic OBs are processed one after the other.

### Notes on queues

- Every priority class (OBs of the same priority to be called) is assigned a separate queue. The size of those queues is set by default.
- Any new event leading to the overflow of a queue is discarded and therefore lost. A "time error interrupt event" is generated simultaneously. Information identifying the OB that caused the error is included in the start information of the time error interrupt OB (OB 80). A corresponding reaction such as an alarm trigger can be programmed in the time error interrupt OB.

### Example of a hardware interrupt event

The function principle of event-oriented program execution in the S7-1200 CPU is described based on the example of a hardware interrupt-triggering module.

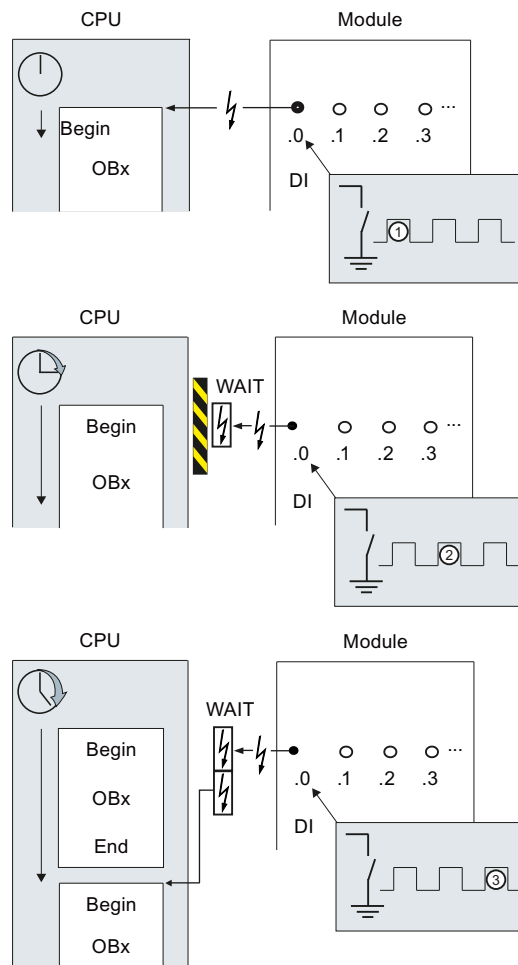

### Process events and their priority

Process events are triggered by the I/O (e.g. at a digital input) and initiate a call of the assigned OB in the S7-1200 CPU. OBs assigned to a process event are called hardware interrupt OBs.

Examples of process events and their priority:

- Process events "rising edge" or "falling edge" at an interrupt-triggering module: The hardware interrupt OB started by such an event is always assigned priority 5.
- Process events from a high-speed counter
  - Count value corresponds to the reference value
  - Change count direction
  - External reset of the high-speed counterThe hardware interrupt OB started by this event is always assigned priority 6.

The figure below shows the chronological sequence of hardware interrupt execution: In the case of two hardware interrupt events in immediate succession, the second hardware interrupt triggering event is held back in the queue until the first OBx has been processed. The next hardware interrupt triggering event can only start the associated OBx when the OBx has been processed. Additional hardware interrupt triggering events are lined up in the queue according to this principle.

## Hardware interrupt execution

- ① A hardware interrupt-triggering event such as a rising edge at the input calls the OB to which it is assigned.
- ② If a new event occurs that triggers a hardware interrupt while the OB is executing, this event is entered in a queue.
- ③ The new event that triggers a hardware interrupt starts the hardware interrupt OB assigned to the event.

## Assigning the interrupt-triggering event

The interrupt-triggering event is assigned to an OB in the input properties of the device view.

- An interrupt-triggering event can only be assigned to a single OB.
- OBs, however, can be assigned to several interrupt-triggering events. This means, for example, that you can assign both the rising and the falling edge to the same interrupt OB in order to trigger the same reaction to any change of the input signal.

- The started OB can interrupt a cycle OB at every instruction. Consistent data access is secured up to dword size.
- You can parameterize module-specific interrupt-triggering events such as a rising and the falling edge at the input.
- Assign the interrupt-triggering event and the OB to be started in the configuration of the interrupt-triggering module. However, within the started hardware interrupt OB you can override this assignment using the DETACH instruction, or assign the same event to a different OB using the ATTACH instruction. This functionality allows a flexible reaction to external process signals.

## **Setting the operating behavior**

## **Changing properties of the modules**

### **Default settings**

When they leave the factory, all hardware components with parameters have default settings suitable for standard applications. These default values allow the hardware components to be used immediately without making any additional settings.

You can, however, modify the behavior and the properties of the hardware components to suit the requirements and circumstances of your application. Hardware components with settable parameters include, for example, communications modules and several analog and digital modules.

### **Setting and loading parameters**

When you have selected a hardware component in the device or network view, you can set the properties in the Inspector window. When you save a device configuration with its parameters, data is generated that needs to be loaded on the CPU. This data is transferred to the relevant modules during startup.

### **Properties of the CPUs**

The properties of the CPUs have special significance for system behavior. For example for a CPU you can set:

- Interfaces
- Inputs and outputs
- High-speed counters
- Pulse generators
- Startup behavior
- Time-of-day
- Protection level
- Bit memory for system and clock

- Cycle time
- Communications load

The entry possibilities specify what is adjustable and in which value ranges. Fields that cannot be edited are disabled or are not shown in the properties window.

## Requirement

You have already arranged the hardware components for which you want to change properties on a rack.

## Procedure

To change the properties and parameters of the hardware components, follow these steps:

1. In the device or network view, select the hardware component or interface that you want to edit.
2. Edit the settings for the selected object:
  - For example in the device view you can edit addresses and names.
  - In the Inspector window additional setting possibilities are available.

You do not need to confirm your entries, the changed values will be applied immediately.

## CPU properties

### Overview of the CPU properties

#### Overview

The following table provides you with an overview of the CPU properties:

Group	Properties	Description
General	Project information	General information to describe the inserted CPU. Except for the slot number, you can change this information.
	Catalog information	Read-only information from the hardware catalog for this CPU.
PROFINET interface	General	Name and comment for this PROFINET interface. The name is limited to 110 characters.

8.1 Configuring devices and networks

Group	Properties	Description
	Ethernet addresses	Select whether the PROFINET interface is networked. If subnets have already been created in the project, they are available for selection in the drop-down list. If not, you can create a new subnet with the "Add new subnet" button.  Information on the IP address, subnet mask and IP router usage in the subnet is available in the IP protocol. If an IP router is used, the information about the IP address of the IP router is necessary.
	Advanced options	Name, comment and additional setting options of the Ethernet interface port.
	Time synchronization	Settings for time synchronization in the NTP time format.  The NTP (network time protocol) is a general mechanism for synchronizing system clocks in local and global area networks. In NTP mode, the interface of the CPU sends time queries (in client mode) at regular intervals to NTP servers on the subnet (LAN) and the addresses must be set in the parameters here. Based on the replies from the server, the most reliable and most accurate time is calculated and synchronized. The advantage of this mode is that it allows the time to be synchronized across subnets. The accuracy depends on the quality of the NTP server being used.
DI#/DO#	General	Name of and comment on the integrated digital inputs of the CPU.
	Digital inputs	Input delays can be set for digital inputs. The input delays can be set in groups (in each case for 4 inputs).  The detection of a positive and a negative edge can be enabled for each digital input. A name and a hardware interrupt can be assigned to this event.  Depending on the CPU, pulse catches can be activated at various inputs. When the pulse catch is activated, even pulse edges that are shorter than the cycle time of the program are detected.
	Digital outputs	The reaction to a mode change from RUN to STOP can be set for all digital outputs:  The state can either be frozen (corresponds to retain last value) or you set a substitute value ("0" or "1")
	I/O addresses	The address space of the input and output addresses is specified as is the process image.
	Hardware identifier	The hardware identifier of the device is displayed.
AI#	General	Name of and comment on the integrated analog inputs of the CPU.

Group	Properties	Description
	Analog inputs	<p>During noise reduction, the specified integration time suppresses interference frequencies at the specified frequency (in Hz).</p> <p>The channel address, measurement type, voltage range, smoothing and overflow diagnostics must be specified in the "Channel #" group. The measurement type and voltage range are set permanently to voltage, 0 to 10 V.</p> <p>Smoothing analog values provides a stable analog signal for further processing. Smoothing analog values can be useful with slow measured value changes, for example, in temperature measurement. The measured values are smoothed with digital filtering. Smoothing is achieved by the module forming mean values from a specified number of converted (digitalized) analog values. The selected level (slight, medium, strong) decides the number of analog signals used to create the mean value.</p> <p>If overflow diagnostics is enabled, a diagnostics event is generated if an overflow occurs.</p>
	I/O addresses	The address space of the input addresses is specified as is the process image.
	Hardware identifier	The hardware identifier of the device is displayed.
High-speed counter (HSC)	High-speed counter (HSC)#	<p>High-speed counters are typically used to drive counting mechanisms.</p> <p>See: Configuring high-speed counters (Page 1040)</p>
Pulse generators (PTO/PWM)	PTO#/PWM#	<p>A pulse generator is activated and can be initialized with project information.</p> <p>For the configuration of an activated pulse generator, specify the usage as PWM (Pulse Width Modulation) or as PTO (Pulse Train Output).</p> <p>Specify the output source, time base, pulse width format, cycle time and initial pulse width for PWM. A pulse output is specified as the hardware output. The PWM output is controlled by the CTRL_PWM instruction, see CTRL_PWM.</p> <p>Specify the output source for PTO. A pulse output and a direction output are specified as the hardware outputs. A PTO is operated together with a high-speed counter in the "axis of motion" count mode and controlled by the Motion Control technology object (see keyword "Motion Control S7-1200") .</p> <p>The hardware ID is displayed in the I/O-diagnostics addresses and, if the PWM function is selected, the address space of the output addresses and the process image can be selected.</p>
Startup	Startup after POWER ON	<p>Setting the startup characteristics after cycling power.</p> <p>See: Principles of the STARTUP mode (Page 1009)</p>
	Comparison of preset configuration and actual configuration	<p>Specifies whether modules (SM, SB, CM, CP or even the CPU) can be replaced:</p> <ul style="list-style-type: none"> <li>• Startup of the CPU only if compatible</li> <li>• Startup of the CPU even if there are differences</li> </ul> <p>Example: A signal module with 16 digital inputs and 16 digital outputs (DI16/DQ16) can be a compatible replacement for a signal module with 8 digital outputs (DQ8) or 4 digital inputs (DI4).</p>

8.1 Configuring devices and networks

Group	Properties	Description
	Parameter assignment time for distributed I/O	Specifies a maximum period (standard: 60000 ms) in which the distributed I/O must start up. (The CMs and CPs are supplied with voltage and communication parameters during the CPU startup. This configuration time provides a time period during which I/O modules connected to the CM or CP must start up.) The CPU switches to RUN as soon as the distributed I/O has started and is ready for operation, regardless of the "Parameter assignment time for distributed I/O" parameter. If the distributed I/O has not started up during this period, the CPU switches to RUN without the distributed I/O.
Cycle	Maximum cycle time and minimum cycle time.	Specification of a maximum cycle time or a fixed minimum cycle time. If the cycle time exceeds the maximum cycle time, the CPU goes to STOP mode. See: Cycle time and maximum cycle time (Page 1033)
Communication load	Maximum allocation of the cycle for communication (as a percentage)	Controls the duration of communication processes that always also extend the cycle time, within certain limits. Examples of communication processes include: Transferring data to another CPU or loading blocks (initiated via the PC). See: Cycle loading by communications (Page 1034)
System and clock memory	System memory bits and clock memory bits	You use system memory bits for the following scans: <ul style="list-style-type: none"> <li>• Is the current cycle the first since cycling power?</li> <li>• Have there been any diagnostics state changes compared with the previous cycle?</li> <li>• Scan for "1" (high)</li> <li>• Scan for "0" (low)</li> </ul> Clock memory bits change their values at specified periodic intervals. See: Enabling system memory (Page 1050) See: Using clock memory (Page 1051)
Web server	Automatic update	Sends the requested web page with current CPU data periodically to the web browser. Enter the period duration under "Update interval". Automatic update can only be activated if the web server is enabled. See: Auto-Hotspot
	User-defined web pages	Allows access to freely-designed web pages of the CPU via a web browser. See: Auto-Hotspot
Time	Local time and daylight saving time	Setting of the time zone in which the CPU is operated and setting of the daylight-saving/standard time changeover.
Protection	Protection and password for read/write access	Setting the read/write protection and the password for access to the CPU. See: Setting options for the protection level (FW V1 to V3) (Page 1052) See: Setting options for the protection (FW as of V4) (Page 1053)

Group	Properties	Description
Connection resources	-	Display of available, reserved and previously configured connection resources of the CPU.
Address overview	-	<p>Tabular representation of all addresses used by the CPU for integrated inputs/outputs as well as for the inserted modules. Addresses that are not used by any module are represented as gaps.</p> <p>The view can be filtered according to</p> <ul style="list-style-type: none"> <li>• Input addresses</li> <li>• Output addresses</li> <li>• Address gaps</li> </ul>

- Special features during startup (Page 1011)

### Cycle time and maximum cycle time

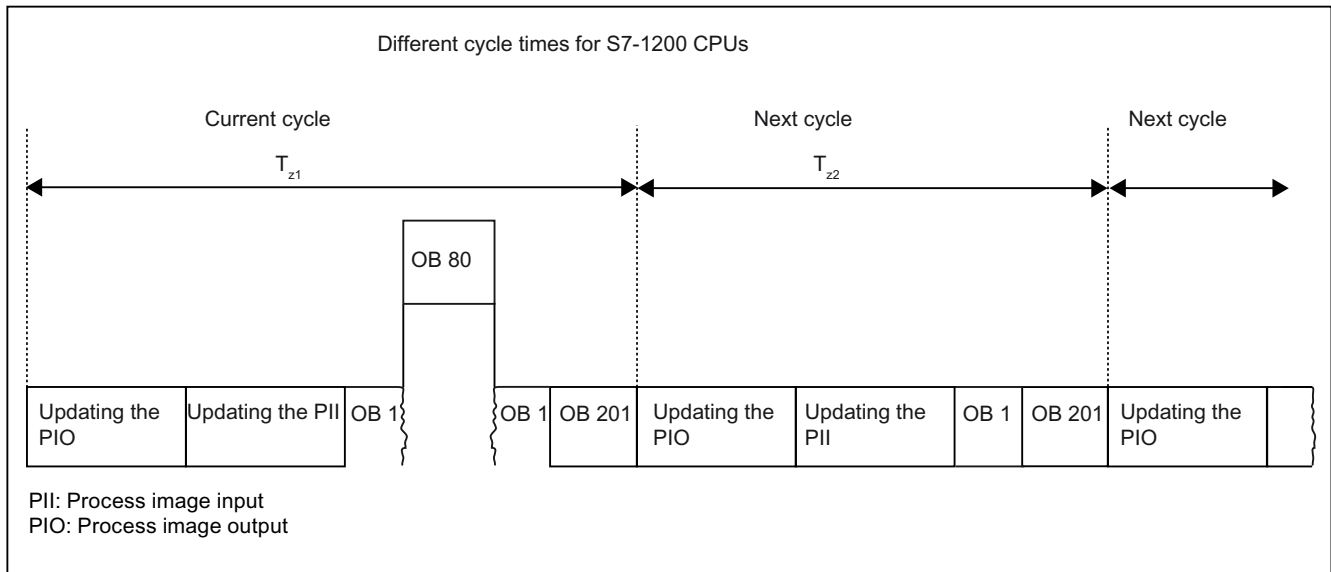

#### Function

The cycle time is the time that the operating system requires to execute the cyclic program and all the program sections that interrupt this cycle. The program execution can be interrupted by:

- Time errors and 2xMaxCycleTime errors
- System activities, e.g., process image updating

The cycle time (T<sub>cyc</sub>) is therefore not the same for every cycle.

The following schematic shows an example of different cycle times (TZ1 ≠ TZ2) for S7-1200 CPUs:

In the current cycle, the cyclic OB used here (e.g. OB 1) will be interrupted by a time error (e.g. OB 80). Following the cyclic OB, the next cycle OB 201 is processed.

### Maximum cycle time

The operating system monitors the execution time of the cyclic program for a configurable upper limit known as the maximum cycle time. You can restart this time monitoring at any point in your program by calling the RE\_TRIGR instruction.

If the cyclic program exceeds the maximum cycle time, the operating system will attempt to start the time error OB (OB 80). If the OB is not available, the CPU ignores the overshoot of the maximum cycle time.

In addition to monitoring the runtime for overshooting of the maximum cycle time, adherence to a minimum cycle time is guaranteed. To do this, the operating system delays the start of the new cycle until the minimum cycle time has been reached. During this waiting time, new events and operating system services are processed.

If the maximum cycle time is exceeded a second time, for example while the time error OB is being processed (2xMaxCycleTime error), the CPU changes to STOP mode.

### Cycle loading by communications

#### Function

The cycle time of the CPU can be extended due to communications processes. These communications processes include for example:

- Transferring data to another CPU
- Loading of blocks initiated by a programming device

You can control the duration of these communications processes to some extent using the CPU parameter "Cycle load due to communication".

In addition to communications processes, test functions also extend the cycle time. The "Cycle load due to communication" parameter can be used to influence the duration.

### How the parameter works

You use the "Cycle load due to communication" parameter to enter the percentage of the overall CPU processing capacity that can be available for communications processes. This CPU processing capacity is now available at all times for communication. This processing capacity can be used for program execution when not required for communication.

### Effect on the actual cycle time

The "Cycle load due to communication" parameter can be used to extend the cycle time of the cyclic organization block (e.g., OB 1) by a factor calculated according to the following formula:

$$\frac{100}{100 - \text{"Cycle load due to communication"}}$$

The formula does not take into account the effect of asynchronous events such as hardware interrupts or cyclic interrupts on the cycle time.

If the cycle time is extended due to communication processes, more asynchronous events may occur within the cycle time of the cyclic organization block. This extends the cycle still further. The extension depends on how many events occur and how long it takes to process them.

### Example 1 – no additional asynchronous events:

If the "Cycle load due to communication" parameter is set to 50%, this can cause the cycle time of the cyclic organization block to increase by up to a factor of 2.

### Example 2 – additional asynchronous events:

For a pure cycle time of 500 ms, a communication load of 50% can result in an actual cycle time of up to 1000 ms, provided that the CPU always has enough communications jobs to process. If, parallel to this, a cyclic interrupt with 20 ms processing time is executed every 100 ms, this cyclic interrupt would extend the cycle by a total of  $5 \times 20 \text{ ms} = 100 \text{ ms}$  without communication load. That is, the actual cycle time would be 600 ms. Because a cyclic interrupt also interrupts communications, it affects the cycle time by adding  $10 \times 20 \text{ ms}$  at 50 % communication load. That is, in this case, the actual cycle time amounts to 1200 ms instead of 1000 ms.

---

#### Note

Observe the following:

- Check the effects of changing the value of the "Cycle load due to communication" parameter while the system is running.
  - You must always consider the communication load when setting the minimum cycle time as time errors will otherwise occur.
-

## **Recommendations**

- Increase this value only if the CPU is used primarily for communication purposes and the user program is not time critical.
- In all other situations you should only reduce this value.

## **Time-of-day functions**

### **Basic principles of time of day functions**

All S7-1200 CPUs are equipped with an internal clock. The backup supports the display of the correct time for up to 10 hours if the power supply is interrupted.

### **Time-of-day format**

The clock always shows the time of day with a resolution of 1 millisecond and the date including the day of the week. The time adjustment for daylight-saving time is also taken into account.

### **Setting and reading the time of day**

#### **Setting and reading the time with instructions**

You can set, start and read the time-of-day and date on the CPU clock with the following instructions in the user program:

- Set the time-of-day: "WR\_SYS\_T"
- Read time of day "RD\_SYS\_T"
- Read local time "RD\_LOC\_T"
- Set time zone "SET\_TIMEZONE"

#### **Manual setting**

You can also read and set the time-of-day manually in the online and diagnostics view under "Functions > Set time-of-day".

## Assigning the clock parameters

### Clock parameters

The clock parameters allow you to make the following settings:

- Enable time synchronization via NTP server  
Select this check box if you want the internal clock to be synchronized using the NTP synchronization mode.
- Network time server  
The IP addresses of up to four NTP servers need to be configured.
- Update interval  
The update interval defines the interval between time queries.

### High-speed counters

#### General information on high-speed counters

##### Introduction

High-speed counters are typically used to drive counting mechanisms in which a shaft turning at a constant speed is equipped with an incremental step encoder. The incremental step encoder ensures a certain number of count values per rotation and a reset pulse once per rotation. The clock memory bit(s) and the reset pulse of the incremental step encoder supply the inputs for the high-speed counter.

The various S7-1200 CPUs have differing numbers of high-speed counters available:

S7-1200 CPU	Number of HSCs	HSC designation
CPU 1211C	3 (with digital signal board 4)*	HSC1...3 (and HSC5)*
CPU 1212C	4 (with digital signal board 5)*	HSC1...4 (and HSC5)*
CPU 1214C CPU 1215C CPU 1217C	6	HSC1...6

\* with DI2/DO2 signal board

##### How it works

The first of several default values is loaded on the high-speed counter. The required outputs are enabled for the time during which the current value of the counter is lower than the default value. The counter is set up so that an interrupt occurs if the current value of the counter is equal to the default value or when the counter is reset.

If the current value is equal to the default value and an interrupt event results, a new default value is loaded and the next signal state is set for the outputs. If an interrupt event occurs because the counter is reset, the first default value and the first signal states of the outputs are set and the cycle repeated.

Since the interrupts occur much less frequently than the high-speed counter counts, a precise control of the fast operations can be implemented with only a slight influence on the overall cycle of the automation system. Since you can assign specific interrupt programs to interrupts, each new default can be loaded in a separate interrupt program allowing simple control of the state.

---

**Note**

You can also process all interrupt events in a single interrupt program.

---

### Count algorithms of the various counters

All counters work in the same way, however some high-speed counters do not support all count algorithms. There are four basic count algorithms:

- Single-phase counter with internal direction control
- Single-phase counter with external direction control
- 2-phase counter with 2 clock inputs
- A/B counter

Each high-speed counter can be used with or without a reset input. If the reset input is activated, this resets the current value. The current value remains reset until the reset input is deactivated.

### See also

Configuring high-speed counters (Page 1040)

Interdependency of the counter mode and counter inputs (Page 1038)

### Interdependency of the counter mode and counter inputs

#### General information on counter mode and counter inputs

You can assign not only the counter modes and counter inputs to the high-speed counters but also functions such as clock pulse generator, direction control, and reset. The following rules apply:

- An input cannot be used for two different functions.
- If an input is not required by the current counter mode of the defined high-speed counter, it can be used other purposes.

If, for example, you set HSC1 to counter mode 1, in which inputs I0.0 and I0.3 are required, you can use I0.1 for edge interrupts or for HSC2.

If, for example, you set HSC1 and HSC5, inputs I0.0 (HSC1) and I1.0 (HSC5) are always used with the counting and frequency counter modes. As a result, these two inputs are not available for any other functions when counters are operated.

You have additional inputs available if you use a digital signal board.

**Overview of the interdependency of counter mode and counter inputs**

Counter mode	Description	Inputs		
	HSC1	I0.0 (CPU) I4.0 (signal board)	I0.1 (CPU) I4.1 (signal board)	I0.3 (CPU) I4.3 (signal board)
	HSC2	I0.2 (CPU) I4.2 (signal board)	I0.3 (CPU) I4.3 (signal board)	I0.1 (CPU) I4.1 (signal board)
	HSC3*	I0.4 (CPU)	I0.5 (CPU)	I0.7 (CPU)
	HSC4 (CPU 1212/14/15/17C only)	I0.6 (CPU)	I0.7 (CPU)	I0.5 (CPU)
	HSC5 (CPU 1214/15/17C only)**	I1.0 (CPU) I4.0 (signal board)	I1.1 (CPU) I4.1 (signal board)	I1.2 (CPU) I4.3 (signal board)
	HSC6 (CPU 1214/15/17C only)**	I1.3 (CPU)	I1.4 (CPU)	I1.5 (CPU)
Counting / frequency	Single-phase counter with internal direction control	Clock pulse generator	-	-
Counting				Resetting
Counting / frequency	Single-phase counter with external direction control	Clock pulse generator	Direction	-
Counting				Resetting
Counting / frequency	2-phase counter with 2 clock inputs	Clock pulse generator forwards	Clock pulse generator backwards	-
Counting				Resetting
Counting / frequency	A/B counter	Clock pulse generator A	Clock pulse generator B	-
Counting				Resetting
Motion axis	Pulse generators PWM/PTO	HSC1 and HSC2 support the motion axis count mode for the PTO1 and PTO2 pulse generators: <ul style="list-style-type: none"> <li>• For PTO1, HSC1 evaluates the Q0.0 outputs for the number of pulses.</li> <li>• For PTO2, HSC2 evaluates the Q0.2 outputs for the number of pulses.</li> </ul> Q0.1 is used as the output for the motion direction.		

\* HSC3 can only be used for CPU 1211 without a reset input

\*\* HSC5 can be also be used for CPU 1211/12 if a DI2/DO2 signal board is used

General information on high-speed counters (Page 1037)

Configuring high-speed counters (Page 1040)

## Configuring high-speed counters

### Requirement

An S7-1200 CPU has been inserted in the hardware configuration.

### Procedure

To configure a high-speed counter, follow these steps:

1. Select an S7-1200 CPU in the device or network view.
2. Click on the required high-speed counter under "Properties > High-speed counter" in the inspector window:
  - CPU 1211C: HSC1 to HSC3 (also HSC5 with a DI2/DO2 signal board)
  - CPU 1212C: HSC1 to HSC4 (also HSC5 with a DI2/DO2 signal board)
  - CPU 1214C / 1215C / 1217C: HSC1 to HSC6
3. Enable the high-speed counter in the "General" parameter group using the relevant check box.

---

#### Note

If you use a CPU 1211C or CPU 1212C with a DI2/DO2 signal board, you can also enable the high-speed counter HSC5.

---

#### Note

If you activate the pulse generators and operate them as PTO1 or PTO2, they use the associated high-speed counter HSC1 or HSC2 with "Motion axis" counting mode to evaluate the hardware outputs. If you configure high-speed counter HSC1 or HSC2 for other counting tasks, these cannot be used by pulse generator PTO1 or PTO2, respectively.

---

If required, you can enter a name and a comment for the high-speed counter here.

4. Define the functionality of the high-speed counter in the "Function" parameter group:
  - Count mode: Select what you want to be counted from the drop-down list.
  - Operating phase: Select the count algorithm from the drop-down list.
  - Input source: Select the on-board CPU inputs or the inputs of an optional digital signal board as the input source for the count pulses from the drop-down list.
  - Count direction is specified by: If you have selected a single-phase operating phase, open the drop-down list and select whether the count direction is set internally by an SFB parameter of the user program or externally via a digital input.
  - Initial count direction: If the user program is set as the internal direction control for the count direction, you can select the count direction at the start of counting from the drop-down list.
  - Frequency meter period: If frequency is set as the count mode, you can select the duration of the frequency meter periods in the drop-down list.

5. Specify the initial values and reset condition of the high-speed counter in the "Reset to initial values" parameter group:

- Initial counter value: Enter a start value for the high-speed counter.
- Initial reference value: Enter a maximum value for the high-speed counter.

Here, you can also specify whether the high-speed counter will use a reset input and the set the corresponding signal level for the reset input from the drop-down list.

6. Configure the reaction of the high-speed counter to certain events in the "Event configuration" parameter group. The following events can trigger an interrupt:

- The counter value matches the reference value.
- An external reset event was generated.
- A change of direction was triggered.

Enable an interrupt reaction using the check box, enter a name and select a hardware interrupt for the interrupt from the drop-down list.

7. Assign the start address for the high-speed counter in the "I/O/Diagnostics addresses" parameter group.

---

**Note**

In the "Hardware inputs" parameter group, you can only see which hardware inputs and values are being used for the clock, direction determination, reset pulse, and maximum count speed.

---

## Result

You have now adapted the parameters of the high-speed counter to the requirements of your project.

## Point-to-point communication

### Overview of point-to-point communication

PtP communication is communication via a serial interface that uses standardized UART data transmission (Universal Asynchronous Receiver/Transmitter). The S7-1200 uses communications modules with an RS-232 or RS-485 interface to establish PtP communication.

## Functions of point-to-point communication

Point-to-point communication (PtP) allows numerous applications:

- Direct transmission of information to an external device, for example a printer or a barcode reader
- Reception of information from external devices such as barcode readers, RFID readers, cameras and third-party optical systems as well as many other devices.
- Exchange of information with third-party devices, for example GPS devices, radio modems and many others

## The Freeport protocol

The S7-1200 supports the Freeport protocol for character-based serial communication. Using Freeport communication, the data transmission protocol can be configured entirely by the user program.

Siemens provides libraries with Freeport communication functions that you can use in your user program:

- USS Drive protocol
- Modbus RTU Master protocol
- Modbus RTU Slave protocol

Configuring a communications port (Page 1043)

## Using RS-232 and RS-485 communications modules

### Communications modules with RS-232 and RS-485 interfaces

In an S7-1200 CPU, you can use two different communications modules:

- RS-232 communications module
- RS-485 communications module

The communications modules can be connected to the S7-1200 CPU via the I/O channel on the left. You can plug in up to three different modules.

## Properties of the communications modules

The communications modules have the following features:

- Support of the Freeport protocol
- Configuration by the user program with the aid of expanded instructions and library functions

## Configuring a communications port

### Configuring a communications port

After you have inserted a communications module with an RS-232 or RS-485 interface, you then set the interface parameters. You set the parameters for the interface either in the properties of the interface or you control the interface parameters from the user program using the PORT\_CFG instruction. The following description relates to the graphic configuration.

---

#### **Note**

If you use the user program to change the port setting, the settings of the graphic configuration are overwritten.

You should also keep in mind that the settings made by the user program are not retained if there is a power down.

---

### Requirement

- A communications module is already plugged in.
- You are in the device view.

### Procedure

To configure the communications port, proceed as follows:

1. Select the interface in the graphic representation in the device view.  
The properties of the interface are displayed in the Inspector window.
2. Select the "Port configuration" group in the area navigation of the Inspector window.  
The settings of the port are displayed.
3. From the "Transmission speed" drop-down list, select the speed for the data transmission.  
With user-programmed communication, remember the influence of the transmission speed on the changeover time.
4. From the "Parity" drop-down list, select the type of detection of bad information words.
5. Using the "Data bits" drop-down list, decide whether a character consists of eight or seven bits.
6. From the "Stop bit" drop-down list, select how many bits will identify the end of a transmitted word.

## 8.1 Configuring devices and networks

7. From the "Flow control" drop-down list, select the method for ensuring a trouble-free data stream between sender and receiver. This parameter can only be set for the RS-232 interface.
  - Enter a HEX value in the "XON character" box that will cause the transmission of the message to be continued when it is detected. This parameter can only be set for software-controlled data flow control.
  - Enter a HEX value in the "XOFF character" box that will cause the transmission of the message to be suspended for the set wait time. This parameter can only be set for software-controlled data flow control.
8. In the "Wait time" box, enter a wait time in ms that must be kept to after the end of the message before the next transmission can start.

---

### Note

You can configure the interface in the network view as well. To do so, you must first select the communication module in the tabular network view and then select the interface in the Inspector window. Then you can continue as described above.

---

Setting data flow control (Page 1044)

### Setting data flow control

#### Data flow control

Data flow control is a method that ensures a balanced send and receive behavior. In the ideal situation, the intelligent control does not allow data to be lost. It ensures that a device does not send more information than the receiving partner can process.

There are two methods of data flow control:

- Hardware-controlled data flow control
- Software-controlled data flow control

With both methods, the DSR signals of the communications partners must be active at the beginning of transmission. If the DSR signals are inactive, the transmission is not started.

The RS-232 communications module can handle both methods. The RS-485 communications module does not support data flow control.

#### Hardware-controlled data flow control

Hardware-controlled data flow control uses the request to send (RTS) and clear to send (CTS) signals. With the RS-232 communications module, the RTS signal is transmitted via the output by pin 7. The CTS signal is received via pin 8.

If hardware-controlled data flow control is enabled, the RTS signal is then always set to activated when data is sent. At the same time, the CTS signal is monitored to check whether

the receiving device can accept data. If the CTS signal is active, the module can transfer data until the CTS signal becomes inactive. If the CTS signal is inactive, the data transfer must be suspended for the set wait time. If the CTS signal is still inactive after the set wait time, the data transfer is aborted and an error is signaled back to the user program.

### **Data flow control using hardware handshaking**

If data flow control is controlled by hardware handshaking, the sending device sets the RTS signal to active as default. A device such as a modem can then transfer data at any time. It does not wait for the CTS signal of the receiver. The sending device itself monitors its own transmission by sending only a limited number of frames (characters), for example to prevent overflow of the receive buffer. If there is nevertheless an overflow, the transferring device must hold back the message and signal an error back to the user program.

### **Software-controlled data flow control**

Software-controlled data flow control uses certain characters within the messages and these control the transfer. These characters are ASCII characters selected for XON and XOFF.

XOFF indicates when a transmission must be suspended. XON indicates when a transmission can be continued.

If the sending device receives the XOFF character, it must suspend sending for the selected wait time. If the XON character is sent after the selected wait time, the transfer is continued. If no XON character is received after the wait time, an error is signaled back to the user program.

Software data flow control requires full duplex communication because the receiving partner needs to send the XON character during the ongoing transfer.

### **See also**

Configuring a communications port (Page 1043)

### **Configuration of message transfer**

### **User-programmed communication**

You can control the data traffic between a communications module and a device connected externally via the serial interface using your own mechanisms. If you want to do this, you will need to define a communications protocol yourself. In freely programmable communication, ASCII and binary protocols are supported for message transfer.

Within the communications protocol, you will need to specify the criteria by which the start and end of a transferred message can be recognized in the data stream.

User-programmed communication can only be activated in RUN mode. If there is a change to STOP mode, the user-programmed communication is stopped.

## Specifying the communications protocol

You can specify the communications protocol as follows:

- With the user program
  - The behavior when sending data is controlled by the SEND\_CFG instruction.
  - The behavior when receiving data is controlled by the RCV\_CFG instruction.
- Using parameter settings set graphically in the Inspector window

---

### Note

If you change the communications protocol from the user program, the settings of the graphic configuration are overwritten.

You should keep in mind that the settings made by the user program are not retained if there is a power down.

---

Specifying the end of the message (Page 1049)

## User-programmed communication with RS-232 devices

### RS-232/PIP multi-master cable and user-programmed communication with RS-232 devices

Using the RS-232/PIP multi-master cable and user-programmed communication, you can connect a wide variety of RS-232-compliant devices to the communications modules of the S7-1200. The cable must, however, be set to the "PIP/user-programmed communication" mode.

## Settings on the cable

The switches on the cable must be set as follows:

- Switch 5 must be set to 0
- Switch 6 sets either the local mode (DCE) or the remote mode (DTE):
  - Switch set to 0 for the local mode
  - Switch set to 1 for the remote mode

## Changing over between send and receive mode

The RS-232/PIP multi-master cable is in send mode when data is sent from the RS-232 interface to the RS-485 interface. The cable is in receive mode when it is idle or when data is sent from the RS-485 interface to the RS-232 interface. The cable changes from receive to send mode immediately when it detects characters on the RS-232 send line.

## Supported transmission speeds

The RS-232/PIP multi-master cable supports transmission rates between 1200 baud and 115.2 kbaud. The RS-232/PIP multi-master cable can be set to the required transmission rate using the DIP switch on the PC/PIP cable.

The following table shows the switch settings for the various transmission speeds:

Transmission speed	Switchover time	Settings (1 = up)
115200 bps	0.15 ms	110
57600 bps	0.3 ms	111
38400 bps	0.5 ms	000
19200 bps	1.0 ms	001
9600 bps	2.0 ms	010
4800 bps	4.0 ms	011
2400 bps	7.0 ms	100
1200 bps	14.0 ms	101

The cable returns to receive mode when the RS-232 send line is idle for a certain time that is defined as the changeover time of the cable. The set transmission speed influences the changeover time as shown in the table.

## Influence of the changeover time

When working with an RS-232/PIP multi-master cable in a system in which user-programmed communication is used, the program must take into account the changeover time for the following reasons:

- The communications module reacts to messages sent by the RS-232 device. Once the communications module has received a request from the RS-232 device, it must delay the reaction message for a period that is equal to or longer than the changeover time of the cable.
- The RS-232 device reacts to messages sent by the communications module. Once the communications module has received a reaction message from the RS-232 device, it must delay the next request message for a period that is equal to or longer than the changeover time of the cable.

In both situations, the RS-232-PIP multi-master cable has enough time to change from send to receive mode so that the data can be sent from the RS-485 interface to the RS-232 interface.

**See also**

- Configuration of message transfer (Page 1045)
- Making the settings for sending (Page 1048)
- Specifying the start of the message (Page 1048)
- Specifying the end of the message (Page 1049)

**Making the settings for sending**

**Sending messages**

You can program pauses between individual messages.

The following table shows which pauses can be set:

Parameter	Definition
RTS ON delay	You can set the time that must elapse after the send request RTS (request to send) before the actual data transfer starts.
RTS OFF delay	You can set the time that must elapse after the complete transfer before RTS signal is deactivated.
Send pause at the start of the message	You can specify that a pause is sent at the start of every message transfer when the RTS ON delay has elapsed. The pause is specified in bit times.
Send Idle Line after a pause	You can make a setting so that following a selected pause at the start of the message, the "Idle Line" signal is output to signal that the line is not in use. To enable the parameter, "Send pause at message start" must be set. The duration of the "Idle Line" signal is specified in bit times.

**See also**

- Specifying the start of the message (Page 1048)
- Specifying the end of the message (Page 1049)
- User-programmed communication with RS-232 devices (Page 1046)

**Specifying the start of the message**

**Recognizing the start of the message**

To signal to the receiver when the transfer of a message is completed and when the next message transfer starts, criteria must be specified in the transmission protocol to identify the end and start of a message.

If a criterion is met that indicates the start of a message, the receiver starts searching the data stream for criteria that mean the end of the message.

There are two different methods for identifying the start of a message:

- Starting with any character:  
Any character can be defined as the start of a message. This is the default method.
- Starting with a specific condition:  
The start of a message is identified based on selected conditions.

### Conditions for detecting the start of a message

The following table shows the various options for defining the start of a message:

Parameter	Definition
Recognize start of message by line break	The receiver recognizes a line break when the received data stream is interrupted for longer than one character. If this is the case, the start of the message is identified by the line break.
Recognize start of message by idle line	The start of a message is recognized when the send transmission line is in the idle state for a certain time (specified in bit times) followed by an event such as reception of a character.
Recognize start of message with individual characters	The start of a message is recognized when a certain character occurs. You can enter the character as a HEX value.
Recognize start of message by a character string	The start of a message is detected when one of the specified character sequences arrives in the data stream. You can specify up to four character sequences each with up to five characters.

The individual conditions can be logically linked in any way.

### See also

Making the settings for sending (Page 1048)

User-programmed communication with RS-232 devices (Page 1046)

### Specifying the end of the message

#### Recognizing the end of the message

To signal to the receiver when the transfer of a message is completed and when the next message transfer starts, criteria must be specified in the transmission protocol to identify the end and start of a message.

In total, there are six different methods of recognizing the end of a message and these can all be logically linked in any way. The following table shows the various possible setting options:

Parameter	Definition
Recognize end of message by message timeout	The end of a message is recognized automatically when a selected maximum duration for a message is exceeded. Values from 0 to 65535 ms can be set.
Recognize end of message by reply timeout	The end of a message is recognized when there is no reply within a set time after transferring data. Values from 0 to 65535 ms can be set.

Parameter	Definition
Recognize end of message by timeout between characters	The end of a message is detected when the time between two characters specified in bit times is exceeded. Values from 0 to 2500 bit times can be set.  The S7-1200 CPU only accepts a maximum time of eight seconds even if the value that is set results in a duration of more than eight seconds.
Recognize end of message by maximum length	The end of a message is recognized when the maximum length of a message is exceeded. Values from 1 to 1023 characters can be set.
Read message length from message	The message itself contains information about the length of the message. The end of a message is reached when the value taken from the message is reached. Which characters are used for the evaluation of the message length is specified with the following parameters: <ul style="list-style-type: none"> <li>• Offset of the length field in the message The value decides the position of the character in the message that will be used to indicate the message length. Values from 1 to 1022 characters can be set.</li> <li>• Size of the length field This value specifies how many characters starting at the first evaluation position will be used to indicate the message length. Values of 0, 1, 2 and 4 characters can be set.</li> <li>• The data following the length field (does not belong to the message length) The value specifies the number of bytes after the length field that must be ignored in the evaluation of the message length. Values from 0 to 255 characters can be set.</li> </ul>
Recognize message end with a character sequence	The end of a message is detected when the specified character sequence arrives in the data stream. You can define up to five characters in the character string that are to be checked. If the specified characters appear at the correct location in the message, the message end is recognized. To recognize the message end when character 1 and character 3 have a certain value, for example, you have to activate the check box for character 1 and character 3 and enter a character value.

**See also**

Making the settings for sending (Page 1048)

User-programmed communication with RS-232 devices (Page 1046)

**Enabling system memory**

**System memory**

A system memory is a bit memory with defined values.

You decide which memory byte of the CPU will become the system memory byte when assigning the system memory parameters.

## Benefits

You can use system memory in the user program, for example to run program segments in only the first program cycle after start-up. Two system memory bits are constant 1 or constant 0.

## Bits of the system memory bytes

The following table shows the meaning of the system memory:

Bit of the system memory bytes	7	6	5	4	3	2	1	0
Meaning	Reserved (=0)	Reserved (=0)	Reserved (=0)	Reserved (=0)	=0	=1	=1 with change to the diagnosis status	=1 in first program cycle after startup, otherwise 0

### Note

The selected memory byte cannot be used for intermediate storage of data.

## Using clock memory

### Clock memory

A clock memory is a bit memory that changes its binary status periodically in the pulse-no-pulse ratio of 1:1.

You decide which memory byte of the CPU will become the clock memory byte when assigning the clock memory parameters.

## Benefits

You can use clock memory, for example, to activate flashing indicator lamps or to initiate periodically recurring operations such as recording of actual values.

## Available frequencies

Each bit of the clock bit memory byte is assigned a frequency. The following table shows the assignment:

Bit of the clock memory byte	7	6	5	4	3	2	1	0
Period (s)	2.0	1.6	1.0	0.8	0.5	0.4	0.2	0.1
Frequency (Hz)	0.5	0.625	1	1.25	2	2.5	5	10

---

**Note**

Clock memory runs asynchronously to the CPU cycle, i.e. the status of the clock memory can change several times during a long cycle.

The selected memory byte cannot be used for intermediate storage of data.

---

## Protection

### Setting options for the protection level (FW V1 to V3)

#### Protection level

The following section describes how to use the various protection levels of the S7-1200 CPUs V1 to V3.

#### Effects of the protection level setting

You can choose between the following protection levels:

- No protection: This corresponds to the default behavior. You cannot enter a password. Read and write access is always permitted.
- Write protection: Only read-only access is possible. You cannot change any data on the CPU and cannot load any blocks or a configuration. HMI access and communication between CPUs are excluded from the write protection. Assignment of a password is required to select this protection level.
- Write/read protection: No write or read access is possible in the "Accessible devices" area or in the project for devices that are switched online. Only the CPU type and the identification data can be displayed in the project tree under "Accessible devices". Display of online information or blocks under "Accessible devices", or in the project for devices interconnected online, is possible. HMI access and communication between CPUs are excluded from the write protection. Assignment of a password is required to select this protection level.

#### Behavior of a password-protected CPU during operation

The CPU protection takes effect after the settings are downloaded to the CPU.

Validity is checked before the online function is executed. If password protection is in place, you are prompted to enter a password.

Example: The module was assigned write protection and you want to execute the "Modify tags" function. This requires write access; therefore, the assigned password must be entered to execute the function.

The functions protected by a password can only be executed by one programming device/PC at any one time. Another programming device/PC cannot log on with a password.

Access authorization to the protected data is in effect for the duration of the online connection or until the access authorization is manually rescinded with "Online > Delete access rights". Access authorization will also expire when the project is closed.

---

**Note**

You can not restrict functions for process control, monitoring, and communications.

Some functions are still protected due to their use as online data. RUN/STOP in the "Online Tools" task card or "Set the time" in the diagnostics and online editor is therefore write-protected.

---

## Setting options for the protection (FW as of V4)

### Protection level

The following section describes how to use the various access levels of the S7-1200 CPUs as of V4.

S7-1200 CPUs provide various access levels to limit the access to specific functions.

The parameters for the access levels are assigned in a table. The green checkmarks in the columns to the right of the respective access level specify which operations are possible without knowing the password of this access level. If you want to use the functions of check boxes that are not selected, a password has to be entered.

<b>NOTICE</b>
<b>Configuring an access level does not replace know-how protection</b>
Configuring access levels prevents unauthorized changes to the CPU by restricting download privileges. However, blocks on the memory card are not write- or read-protected. Use know-how protection to protect the code of blocks on the memory card.

### Default characteristics

The default access level is "Full access (no protection)". Every user can read and change the hardware configuration and the blocks. A password is not set and is also not required for online access.

## The access levels in detail

With an S7-1200 CPU, you can configure the following access levels:

- Full access (no protection): The hardware configuration and the blocks can be read and changed by all users.
- Read access: With this access level, only read access to the hardware configuration and the blocks is possible without entering a password - meaning that you can load the hardware configuration and blocks into the programming device. In addition, HMI access and access to diagnostics data is possible.  
You cannot load blocks or a hardware configuration into the CPU without entering the password. Moreover, writing test functions and firmware updates are **not** possible without a password.
- HMI access: With this access level, only HMI access and access to diagnostics data is possible without entering the password.  
Without entering the password, you can neither load blocks and hardware configuration into the CPU, nor load blocks and hardware configuration from the CPU into the programming device. In addition, the following is **not** possible without a password: Writing test functions, changing the operating state (RUN/STOP) and firmware updates.
- No access (complete protection): When the CPU is completely protected, no read or write access to the hardware configuration and the blocks is possible. HMI access is also not possible. The server function for PUT/GET communication is disabled in this access level (cannot be changed).  
Authorization with the password again provides you full access to the CPU.

## Behavior of a password-protected module during operation

The CPU protection takes effect after the settings are downloaded to the CPU.

Validity is checked before the online function is executed. If password protection is in place, you are prompted to enter a password.

Example: The module was configured with read access and you want to execute the "Modify tags" function. This requires write access; therefore, the assigned password must be entered to execute the function.

The functions protected by a password can only be executed by one programming device/PC at any one time. Another programming device/PC cannot log on.

Access authorization to the protected data is in effect for the duration of the online connection or until the access authorization is manually rescinded with "Online > Delete access rights".

Each access level allows unrestricted access to certain functions without entering a password, for example, identification using the "Accessible devices" function.

## Configuring access levels

The following section describes how to configure an access level and enter passwords for an S7-1200 CPU as of V4.

For an S7-1200 CPU, you can enter multiple passwords and thereby set up different access rights for individual user groups.

The passwords are entered in a table in such a way that exactly one access level is assigned to each password.

The effect of the password is visualized in the "Access" column and explained in the text below the table.

### Example

You select the "No access (complete protection)" access level for a standard CPU (in other words, not an F-CPU) and enter a separate password for each of the access levels that lie above it in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the set passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (Full access (no protection)) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (read access) allows access as if the CPU were write-protected. Users who know this password have read-only access to the CPU.
- The password in row 3 (HMI access) allows access as if the CPU were write-protected and read-protected so that only HMI access is possible for users who know this password.

### Procedure

To configure the access levels of an S7-1200 CPU, follow these steps:

1. Open the properties of the module in the inspector window.
2. Open the "Protection" entry in the area navigation.  
A table with the possible access levels appears in the inspector window.

Protection level	Access			Access permission	
	HMI	Read	Write	Password	Confirmation
<input checked="" type="radio"/> Full access (no protection)	✓	✓	✓		
<input type="radio"/> Read access	✓	✓			
<input type="radio"/> HMI access	✓				
<input type="radio"/> No access (complete protection)					

Figure 8-4 Access protection

3. Activate the required access level in the first column of the table. The green checkmarks in the columns to the right of the respective protection level show you which operations are still available without entering the password.

## 8.1 Configuring devices and networks

4. In the "Password" column, specify a password for full access in the first row. In the "Confirmation" column, enter the selected password again to protect against incorrect entries.  
Ensure that the password is sufficiently secure, in other words, that it does not follow a machine-recognizable pattern!  
You must enter a password in the first row "Full access (no protection)". This enables unrestricted access to the CPU for those who know the password, regardless of the selected protection level.
5. Assign additional passwords as needed to other access levels if the selected protection level allows you to do so.
6. Download the hardware configuration so that the access level takes effect.

### Result

The hardware configuration and the blocks are protected against unauthorized access according to the set access level. If an operation cannot be executed without a password due to the set access level, a dialog for entering a password is displayed.

## Restriction of communication services

### Introduction

The CPU can be the server for a number of communication services. This means that other communication participants can access CPU data even if you have not configured and programmed connections for the CPU.

The local CPU as a server thus does not have the possibility to control communication to the clients.

The parameter "Connection mechanisms" in the "Protection" area of the CPU parameters is used to specify whether this type of communication is permitted or not for the local CPU during operation.

### Permit access with PUT/GET communication from remote partners

By default, the "Permit access with PUT/GET communication from remote partners (...)" option is disabled. In this case, read and write access to CPU data is only possible for communication connections that require configuration or programming both for the local CPU and for the communication partner. Access through BSEND/BRCV instructions is possible, for example.

Connections for which the local CPU is only a server (meaning that no configuration/programming of the communication with the communication partner exists at the local CPU), are therefore not possible during operation of the CPU, for example,

- For PUT/GET, FETCH/WRITE or FTP access via communication modules
- For PUT/GET access from other S7 CPUs
- For HMI access that is realized via PUT/GET communication

If you want to allow access to CPU data from the client side, meaning that you do not want to restrict the communication services of the CPU, activate the "Permit access with PUT/GET communication from remote partners" option.

## Organization blocks

### Organization blocks for startup

#### Description

You can determine the boundary conditions for the startup characteristics of your CPU, for example, the initialization values for "RUN". To do this, write a startup program. The startup program consists of one or more startup OBs (OB numbers 100 or  $\geq 123$ ).

The startup program is executed once during the transition from "STOP" mode to "RUN" mode. Current values from the process image of the inputs are not available for startup program, nor can these values be set.

After the complete execution of the startup OBs, the process image of the inputs is read in and the cyclic program is started.

There is no time limit for executing the startup routine. Therefore the scan cycle monitoring time is not active. Time-driven or interrupt-driven organization blocks cannot be used.

#### Start information

A startup OB has the following start information:

Tag	Data type	Description
LostRetentive	BOOL	= 1, if retentive data storage areas have been lost
LostRTC	BOOL	= 1, if realtime clock has been lost

#### See also

Events and OBs (Page 1021)

### Organization blocks for cyclic program execution

#### Introduction

For the program execution to start, at least one program cycle OB must be present in the project. The operating system calls this program cycle OB once in each cycle and thereby starts the execution of the user program. You can use multiple OBs (OB numbers  $\geq 123$ ). When multiple program cycle OBs are used, these are called in one after the other in the order of their OB numbers. The program cycle OB with the lowest OB number is called first.

The program cycle OBs have the priority class 1. This corresponds to the lowest priority of all OBs. The cyclic program can be interrupted by events of any other event class.

### Programming cyclic program execution

You program cyclic program execution by writing your user program in the cycle OBs and the blocks that they call.

The first cyclic program execution begins as soon as the startup program has ended without errors. The cycle restarts after the end of each cyclic program execution.

### Sequence of cyclic program execution

One cycle of the program execution encompasses the following steps:

1. The operating system starts the maximum cycle time.
2. The operating system writes the values from the process image output to the output modules.
3. The operating system reads out the state of the inputs of the input modules and updates the process image input.
4. The operating system processes the user program and executes the operations contained in the program.
5. At the end of a cycle, the operating system executes any tasks that are pending, for example, loading and deleting blocks or calling other cycle OBs.
6. Finally, the CPU returns to the start of the cycle and restarts the scan cycle monitoring time.

See also: Auto-Hotspot

### Options for interrupting

Cyclic program execution can be interrupted by the following events:

- Interrupt
- A STOP command, triggered by
  - Operation of the programming device
  - "STP" instruction
- Supply voltage failure
- Occurrence of a device fault or program error

### Start information

- None
- Optimized start information:

Name	Data type	Meaning
first_scan	BOOL	= TRUE in the first call of this OB: <ul style="list-style-type: none"><li>• Transition from STOP or HOLD to RUN</li><li>• After reloading</li></ul>
retentivity	BOOL	= TRUE, if retentive data are available

Events and OBs (Page 1021)

## Organization blocks for interrupt-driven program execution

## Organization blocks for time-of-day interrupt

### Function

Organization blocks for time-of-day interrupt (OB number  $\geq 123$ ) can be processed as follows:

- One time to a preset time (date with time of day)
- Periodically with preset start time and the following intervals:
  - Every minute
  - Hourly
  - Daily
  - Weekly
  - Monthly
  - Yearly
  - End of month

Time-of-day interrupt-OBs are therefore used to run parts of the user program on a time-controlled basis.

### Status for time-of-day interrupt

The following table contains the possible status of a time-of-day interrupt as well as its meaning.

Status	Meaning
Cancelled	The one-time processing has already taken place, or the start event of a not yet processed time-of-day interrupt has been deleted with the extended instruction CAN_TINT.
Set	You have scheduled the time or start time for processing.
Activated	You have scheduled whether processing takes place one time or periodically, and in the case of periodic processing, you have scheduled the interval.

### Rules for time-of-day interrupts

The following rules apply to the use of time-of-day interrupts:

- A time-of-day interrupt can only be processed if it is set and activated, and a corresponding organization block exists in the user program.
- The start times of periodic time-of-day interrupts must correspond to a real date. For example, it is not possible to repeat an organization block monthly which first occurs on January 31st. In this case, an OB will only be started in the months that have 31 days.

8.1 Configuring devices and networks

- A time-of-day interrupt activated during startup by extended instruction call ACT\_TINT will not be executed until the startup is complete.
- After each CPU startup, you must reactivate previously set time-of-day interrupts

**Setting and activating a time-of-day interrupt OB**

Before a time-of-day interrupt can be deleted and the corresponding time-of-day interrupt OB can be processed from the operating system, you must set and activate the interrupt. You have the following options:

Set time-of-day interrupt	Activate time-of-day interrupt
Means of configuring	Means of configuring
Means of configuring	By extended instruction call ACT_TINT
By extended instruction call SET_TINTL	By extended instruction call ACT_TINT

**Note**

If you configure a time-of-day interrupt in such a way that the corresponding OB is to be processed once, the start time must not be in the past (relative to the real-time clock of the CPU).

If you configure a time-of-day interrupt in such a way that the corresponding OB is to be processed periodically, but the start time is in the past, then the time-of-day interrupt will be processed the next time it is due.

**Time-of-day interrupt status query**

In order to query the status of the time-of-day interrupt, call the extended instruction QRY\_TINT.

**Cancelling a time-of-day interrupt**

You can cancel a time-of-day interrupt which has not yet been processed with the extended instruction CAN\_TINT.

You can reset cancelled time-of-day interrupts with the extended instruction SET\_TINTL and activate them with the extended instruction ACT\_TINT.

**Conditions that effect the time-of-day interrupt OBs**

Since a time-of-day interrupt occurs only at specific intervals, certain conditions can affect the function of the associated OBs during execution of your program. The following table shows

some of these conditions and describes how these affect the processing of a time-of-day interrupt OB.

Condition	Result
The extended instruction CAN_TINT is called in the user program.	The operating system deletes the start event (date and time) of the time-of-day interrupt. You must reset and reactivate the time-of-day interrupt if you are going to call the corresponding time-of-day interrupt OB again.
By synchronizing or correcting the CPU system clock, the time of day will be set ahead. With this, the start time for a time-of-day interrupt OB will be bypassed.	The operating system calls the time error interrupt OB (OB 80) and records the start event, the number, and the priority of the first bypassed time-of-day interrupt OB in its start information. After completion of the OB 80, the operating system processes the bypassed time-of-day interrupt OB only once.
By synchronizing or correcting the CPU system clock, the time of day will be set back. The corrected clock time is before the start time of an already processed time-of-day interrupt OB.	The time-of-day interrupt OB is repeated.
A time-of-day interrupt OB is still being processed when the start event for its next execution occurs.	The operating system then calls time error interrupt OB 80. The requested OB is processed only after the processing and further execution of the current time-of-day interrupt OB has completed.

### Start information

A time-of-day interrupt OB has the following start information:

Tag	Data type	Description
CaughtUp	BOOL	=1, if the OB call is executed because clock time is turned ahead.
SecondTime	BOOL	=1 if the OB is called a second time because clock time is turned back (more exactly, if the planned time of the current OB processing is earlier than or the same time as the planned time for the previous OB processing). Note: SecondTime is only set once.

### Organization block for status interrupts

#### Description

When it receives a status interrupt, the operating system of the S7-1200 CPU calls the status interrupt OB from a DP master or IO controller. This may be the case if a module of a slave changes its operating mode, for example, from "RUN" to "STOP". For more detailed information on events that trigger a status interrupt, refer to the documentation of the slave or device manufacturer.

### Structure of the start information

The status-interrupt OB has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware address of the component triggering the interrupt
Slot	UINT	Slot number of the component triggering the interrupt
Specifier	WORD	Interrupt specifier from the interrupt frame

### See also

Events and OBs (Page 1021)

### Organization block for update interrupts

#### Description

When it receives a status interrupt, the operating system of the S7-1200 CPU calls the update interrupt OB from a DP master or IO controller. This may be the case if you changed a parameter on a slot of a slave or device. For more detailed information on events that trigger an update interrupt, refer to the documentation of the slave or device manufacturer.

### Structure of the start information

The update interrupt OB has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware address of the component triggering the interrupt
Slot	UINT	Slot number of the component triggering the interrupt
Specifier	WORD	Interrupt specifier from the interrupt frame

### See also

Events and OBs (Page 1021)

### Organization block for manufacturer-specific or profile-specific interrupts

#### Description

When it receives a manufacturer-specific or profile-specific interrupt from a DP master or IO controller, the operating system of the S7-1200 CPU calls OB 57. For more detailed information on events that trigger this type of interrupt, refer to the documentation of the slave or device manufacturer.

## Structure of the start information

The OB for manufacturer-specific and profile-specific interrupts has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware address of the component triggering the interrupt
Slot	UINT	Slot number of the component triggering the interrupt
Specifier	WORD	Interrupt specifier from the interrupt frame

## See also

Events and OBs (Page 1021)

## Organization blocks for time-delay interrupts

### Description

A time-delay interrupt OB is started after a configurable time delay of the operating system. The delay time starts after the SRT\_DINT instruction is called.

You can use up to four time-delay interrupt OBs or cyclic OBs (OB numbers  $\geq 123$ ) in your program. If, for example, you are already using two cyclic interrupt OBs, you can insert a maximum of two further time-delay interrupt OBs in your program.

You can use the CAN\_DINT instruction to prevent the execution of a time-delay interrupt that has not yet started.

### Function of time-delay interrupt OBs

The operating system starts the corresponding OB after the delay time, which you have transferred with an OB number and an identifier to the SRT\_DINT instruction.

To use a time-delay interrupt OB, you must execute the following tasks:

- You must call the instruction SRT\_DINT.
- You must download the time-delay interrupt OB to the CPU as part of your program.

The delay time is measured with a precision of 1 ms. A delay time can immediately start again after it expires.

Time delay interrupt OBs are executed only when the CPU is in the "RUN" mode. A warm restart clears all start events of time-delay interrupt OBs.

The operating system calls the time-delay interrupt OB if one of the following events occurs:

- If the operating system attempts to start an OB that is not loaded and you specified its number when calling the SRT\_DINT instruction.
- If the next start event for a time-delay interrupt occurs before the time delay OB has completely executed.

You can disable and re-enable time-delay interrupts using the DIS\_AIRT and EN\_AIRT instructions.

---

**Note**

If you disable an interrupt with DIS\_AIRT after executing SRT\_DINT, this interrupt executes only after it has been enabled with EN\_AIRT. The delay time is extended accordingly.

---

**Start information**

- None
- Optimized start information:

Name	Data type	Meaning
sign	WORD	User ID: Input parameter SIGN from the call of the "SRT_DINT" instruction

**See also**

Events and OBs (Page 1021)

**Organization blocks for cyclic interrupts**

**Description**

Cyclic interrupt OBs serve to start program in periodic time intervals independently of the cyclic program execution. The start times of a cyclic interrupt OB are specified using the time base and the phase offset.

The time base defines the intervals at which the cyclic interrupt OB is started and is an integer multiple of the basic clock cycle of 1 ms. The phase offset is the time by which the start time is offset compared with the basic clock cycle. If several cyclic interrupt OBs are being used, you can use this offset to prevent a simultaneous start time if the time bases of the cyclic interrupt OBs have common multiples.

You can specify a time period between 1 ms and 60000 ms as the time base.

You can use up to four cyclic interrupt OBs or time-delay OBs (OB numbers  $\geq 123$ ) in your program. If, for example, you are already using two time-delay interrupt OBs, you can insert a maximum of two further cyclic interrupt OBs in your program.

---

**Note**

The execution time of each cyclic interrupt OB must be noticeably smaller than its time base. If a cyclic interrupt OB has not been completely executed but execution is again pending because the cycle clock has expired, the time error OB is started. The cyclic interrupt that caused the error is executed later or discarded.

---

### Example of the use of phase offset

You have inserted two cyclic interrupt OBs in your program:

- Cyclic interrupt OB1
- Cyclic interrupt OB2

For cyclic interrupt OB1, you have set a time base of 20 ms and for cyclic interrupt OB2 a time base of 100 ms. After expiration of the time base of 100 ms, the cyclic interrupt OB1 reaches the start time for the fifth time, cyclic interrupt OB2 for the first time. To nevertheless execute the cyclic interrupt OBs offset, enter a phase offset for one of the two cyclic interrupt OBs.

### Start information

- None
- Optimized start information:

Name	Data type	Meaning
first_scan	BOOL	= TRUE in the first call of this OB <ul style="list-style-type: none"><li>• At the transition from STOP or HOLD to RUN</li><li>• After reloading</li></ul>
event_count	INT	Number of lost start events since the last start of this OB

### See also

- Assigning parameters to cyclic interrupt OBs (Page 1073)
- Events and OBs (Page 1021)

### Organization blocks for hardware interrupts

#### Description

You can use hardware interrupt OBs to react to specific events. You can assign an event that triggers an alarm to precisely one hardware interrupt OB. A hardware interrupt OB in contrast can be assigned to several events.

Hardware interrupts can be triggered by high-speed counters and input channels. For each high-speed counter and input channel that should trigger a hardware interrupt, the following properties need to be configured:

- The process event that should trigger the hardware interrupt (for example, the change of a count direction of a high-speed counter)
- The number of the hardware interrupt OB which is assigned to this process event

You can use up to 50 hardware interrupt OBs (OB numbers  $\geq 123$ ) that are independent of each other in your program.

### Functionality of a hardware interrupt OB

After triggering a hardware interrupt, the operating system identifies the channel of the input or the high-speed counter and determines the assigned hardware interrupt OB.

If no other interrupt OB is active, the determined hardware interrupt OB is called. If a different interrupt OB is already being executed, the hardware interrupt is placed in the queue of its priority class. The hardware interrupt is acknowledged after the completion of the assigned hardware interrupt OB.

If another event that triggers a hardware interrupt occurs on the same module during the time between identification and acknowledgement of a hardware interrupt, the following applies:

- If the event occurs on the channel that previously triggered the hardware interrupt, then no additional hardware interrupt is triggered. Another hardware interrupt can only be triggered if the current hardware interrupt is acknowledged.
- If the event occurs on a different channel, a hardware interrupt is triggered.

Hardware interrupt OBs are called only in the CPU's "RUN" mode.

### Start information

- None
- Optimized start information:

Name	Data type	Meaning
Laddr	HW_IO	Hardware identifier of the module that triggers the hardware interrupt
USI	WORD	Identifier for future extensions (not user-relevant)
IChannel	USINT	Number of the channel that triggered the hardware interrupt
EventType	BYTE	Identifier for the event type associated with the event triggering the interrupt (e.g., positive edge) This identifier can be found in the description of the respective module.

### See also

- Assigning parameters to hardware interrupt OBs (Page 1074)
- Events and OBs (Page 1021)

### Organization block for time error

#### Description

The operating system calls the time error OB (OB 80) if one of the following events occurs:

- The cyclic program exceeds the maximum cycle time.
- The OB called is currently still being executed (possible for time-delay interrupt OBs and cyclic interrupt OBs).
- A time-of-day interrupt was missed because the clock time was set forward by more than 20 seconds.

- A time-of-day interrupt was missed during a STOP.
- An overflow has occurred in an interrupt OB queue.
- An interrupt was lost due to the excessive interrupt load.

If you have programmed no time error OB, the S7-1200 CPU reacts as follows:

- CPUs with firmware version V1.0: The CPU remains in RUN mode.
- CPUs with firmware version V2.0:
  - The CPUs goes to STOP mode when the maximum cycle time is exceeded.
  - With all other start events of the time error OB, the CPU remains in RUN mode.

With CPUs with firmware version V1.0, the two-time overshooting of the maximum cycle time does not lead to the calling of an OB, but to the STOP of the CPU. You can avoid the second violation by restarting the cycle monitoring of the CPU with the RE\_TRIGR instruction.

You can use only one time error OB in your program.

## Start information

The time error OB has the following start information:

Tag	Data type	Description
fault_id	BYTE	<ul style="list-style-type: none"> <li>• 0x01: Maximum cycle time exceeded</li> <li>• 0x02: Called OB is still being executed</li> <li>• 0x05: Expired time-of-day interrupt due to time jump</li> <li>• 0x06: Expired time-of-day interrupt on return to RUN mode</li> <li>• 0x07: Queue overflow</li> <li>• 0x09: Interrupt loss due to high interrupt load</li> </ul>
csg_OBnr	OB_ANY	Number of the OB being executed at the time of the error
csg_prio	UINT	Priority of the OB being executed at the time of the error

## See also

Events and OBs (Page 1021)

## Organization block for diagnostic interrupts

### Description

You can enable the diagnostic error interrupt for diagnostics-capable modules so that the module detects changes in the I/O status. As a result, the module triggers a diagnostic error interrupt in the following cases:

- A fault is present (incoming event)
- A fault is no longer present (outgoing event)

If no other interrupt OB is active, then the diagnostic interrupt OB (OB 82) is called. If another interrupt OB is already being executed, the diagnostic error interrupt is placed in the queue of its priority group.

You can use only one diagnostic interrupt OB in your program.

### Start information

The diagnostic interrupt OB has the following start information:

Tag	Data type	Description
IO_state	WORD	Contains the I/O status of the diagnostics-capable module.
laddr	HW_ANY	HW-ID
Channel	UINT	Channel number
multi_error	BOOL	= 1, if there is more than one error

### IO\_state tag

The following table shows the possible I/O states that the IO\_state tag can contain:

IO_state	Description
Bit 0	Configuration correct: = 1, if the configuration is correct = 0, if the configuration is no longer correct
Bit 4	Error: = 1, if an error is present, e.g., a wire break = 0, if the error is no longer present
Bit 5	Configuration not correct: = 1, if the configuration is not correct = 0, if the configuration is correct again
Bit 6	I/O cannot be accessed: = 1, if an I/O access error has occurred In this case, laddr contains the hardware identifier of the I/O with the access error. = 0, if the I/O can be accessed again

### See also

Events and OBs (Page 1021)

## Organization block for pulling and plugging

### Description

The S7-1200 CPU operating system calls the pull/plug interrupt OB (OB 83) if a configured and non-disabled distributed I/O module or submodule (PROFIBUS, PROFINET, AS-i) is removed or inserted.

#### Note

The removal or insertion of a central module leads to the STOP of the CPU.

### Start information

The pull/plug interrupt OB has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware identifier of the affected module or submodule
Event_Class	BYTE	<ul style="list-style-type: none"> <li>B#16#38: (Sub)module plugged</li> <li>B#16#39: (Sub)module pulled or not responding</li> </ul>
Fault_ID	BYTE	Error code (possible values: B#16#51, B#16#54, B#16#55, B#16#56, B#16#57, B#16#58)

The following table shows which event caused the start of the pull/plug interrupt OB.

ev_class (B#16# ...)	fault_id (B#16# ...)	Meaning
39	51	Module pulled
39	54	Submodule pulled
38	54	Submodule plugged, which conforms to the parameterized submodule
38	55	Submodule inserted, which does not conform to the submodule parameter assignment
38	56	Submodule inserted, but error in module parameter assignment
38	57	Submodule or module inserted, but with a fault or maintenance
38	58	Submodule access error remedied

### See also

Events and OBs (Page 1021)

## Organization block for rack fault

### Description

The S7-1200 CPU operating system calls the OB 86 in the following cases:

- The failure of a DP master system or of a PROFINET IO system is detected (in the case of either an incoming or an outgoing event).
- The failure of a DP slave or of an IO device is detected (in the case of either an incoming or an outgoing event).
- Failure of some of the submodules of a PROFINET I-device is detected.

### Structure of the start information

The rack fault OB has the following start information:

Name	Data type	Meaning
LADDR	HW_IO	Hardware identifier of the defective hardware object
Event_Class	BYTE	<ul style="list-style-type: none"> <li>• B#16#32: Activation of a DP slaves or an IO device</li> <li>• B#16#33: Deactivation of a DP slaves or an IO device</li> <li>• B#16#38: outgoing event</li> <li>• B#16#39: incoming event</li> </ul>
Fault_ID	BYTE	Error code (possible values: B#16#C3, B#16#C4, B#16#C5, B#16#C6, B#16#C7, B#16#C8, B#16#C9, B#16#CA, B#16#CB, B#16#CC, B#16#CD, B#16#CE, B#16#CF, B#16#F8, B#16#F9)

The following table shows which event caused the start of OB 86.

Ev_class B#16# ...	Fault_id B#16# ...	Meaning
39	C3	Failure of a DP master system
39/38	C4	Failure/return of a DP slave
38	C5	Return of a DP slave; however, slave is faulty
38	C6	Expansion unit return, but error in module parameter assignment
38	C7	Return of a DP device, but there is error in module configuration
38	C8	Return of a DP device, but discrepancy between preset/actual configuration
32/33	C9	Activation/deactivation of a DP slave with the "D_ACT_DP" instruction
39	CA	Failure of a PROFINET IO system
39/38	CB	Failure/return of a PROFINET IO device
38	CC	Return of a PROFINET IO device with fault or maintenance
38	CD	Return of a PROFINET IO device, deviation between preset/actual configuration
38	CE	Return of a PROFINET IO device, error in module configuration
32/33	CF	Activation/deactivation of an IO device with the "D_ACT_DP" instruction

Ev_class B#16# ...	Fault_id B#16# ...	Meaning
39/38	F8	Failure/return of some of the submodules of a PROFINET I-device
38	F9	Return of some of the submodules of a PROFINET I-device with a device configuration difference

Events and OBs (Page 1021)

## Block parameters of organization blocks

### Basics of block parameters

#### Introduction

Several organization blocks (OBs) have properties with which you can control their behavior or their assignment to specific events. You can influence these properties by assigning parameters.

#### Overview

You can assign parameters to the properties for the following organization blocks:

- Time-of-day interrupt OBs
- Cyclic interrupt OBs
- Hardware interrupt OBs

## See also

Assigning parameters to hardware interrupt OBs (Page 1074)

Assigning parameters to cyclic interrupt OBs (Page 1073)

## Parameter assignment for time-of-day interrupt OBs

### Procedure for setting the parameters

To set the parameters of a time-of-day interrupt OB, proceed as follows:

1. Open the "Properties" dialog belonging to the time-of-day interrupt OB in question.
2. Click the "Time-of-day interrupt" group in the area navigation.

## Overview of the parameters that can be set

You can set the following parameters:

- Execution
- Start date and time-of-day
- Option buttons "Local time" and "System time"

### "Execution" parameter

Use the drop-down list "Execution" to define the periods at which the time-of-day interrupt OB is to be executed. The time intervals relate to the settings for "Start date" and "Time-of-day".

The following values are possible for "Execution":

- Never
- Once
- Every minute
- Hourly
- Daily
- Weekly
- Monthly
- Yearly
- End of month

---

#### Note

With the value "End of month", the value specified under "Start date" is irrelevant.

---

### "Start date" and "Time-of-day" parameter

Here, you specify the time at which the time-of-day interrupt is to be executed for the first time.

Example: Start date = 07/05/2013, time =11:16

Depending on the value of the "Execution" parameter, the CPU generates additional time-of-day interrupts periodically. Depending on the setting, the start time relates either to the local time or to the coordinated universal timeUTC.

---

#### Note

If you set the "Execution" parameter to "Monthly", the start date cannot be set to the 29th, the 30th, or the 31st. If you want the time-of-day interrupt OB to start at the end of the month, you should set the parameter "Execution" to "End of month".

---

## "Local time" or "System time"

Here, you decide which time the start time of the time-of-day interrupt OB relates to:

- "Local time": The start time relates to the time zone set for the CPU.
- "System time": The start time relates to the coordinated universal time UTC (Universal Time Coordinated).

## Assigning parameters to cyclic interrupt OBs

### Introduction

You can use cyclic interrupt OBs to start programs at regular time intervals. To do so you must enter a scan time and a phase shift for each cyclic interrupt OB used.

You can use up to four cyclic interrupt OBs or time-delay OBs (OB numbers  $\geq 200$ ) in your program. If, for example, you are already using two time-delay interrupt OBs, you can insert a maximum of two further cyclic interrupt OBs in your program.

---

#### Note

If you assign multiple cyclic OBs, make sure that you assign a different cycle time or phase offset to each cyclic interrupt OB to avoid them executing at the same time or having to queue. When you create a cyclic interrupt OB, the cycle time 100 and the phase offset 0 are entered as start value.

---

### Procedure

To enter a scan time and a phase shift for a cyclic interrupt OB, proceed as follows:

1. Open the "Program blocks" folder in the project tree.
2. Right-click on an existing cyclic interrupt OB.
3. Select the "Properties" command in the shortcut menu.  
The "<Name of the cyclic interrupt OB>" dialog box opens.
4. Click the "Cyclic interrupt" group in the area navigation.  
The text boxes for the scan time and the phase shift are displayed.
5. Enter the scan time and the phase shift.
6. Confirm your entries with "OK".

### See also

Basics of block parameters (Page 1071)

Organization blocks for cyclic interrupts (Page 1064)

## Assigning parameters to hardware interrupt OBs

### Introduction

You must select the corresponding event and assign the following parameters for every input channel and high-speed counter that should trigger a hardware interrupt:

- Event name
- Number of the hardware interrupt OB that is assigned to this process event

The parameters of the hardware interrupt are assigned in the properties of the corresponding device. You can assign parameters for up to 50 hardware interrupt OBs.

You can create the hardware interrupt OB to be assigned parameters either before or during activation of an event.

### Procedure

To configure a hardware interrupt event, follow these steps:

1. Double-click the "Devices & Networks" command in the project tree. The hardware and network editor opens in the network view.
2. Change to the device view.
3. If the Inspector window closed in the device view, select the "Inspector window" check box in the "View" menu. The Inspector window opens.
4. Click the "Properties" tab.
5. In the device view, select the module for which you want to assign a hardware interrupt.
6. Select the corresponding event that will trigger a hardware interrupt, e.g., a positive edge.

The screenshot shows a configuration dialog box with the following elements:

- A checked checkbox labeled "Enable rising edge detection:".
- An "Event name:" label followed by a text input field containing "Rising edge0".
- A "Hardware interrupt:" label followed by a dropdown menu showing "Hardware interrupt".

7. Enter an event name.
8. Select an existing hardware interrupt OB from the "Hardware interrupt" drop-down list or create a new hardware interrupt OB. If you have not previously created any hardware interrupt OBs, you can click the "Add new block" button in the drop-down list. The start information of the corresponding hardware interrupt OB, including all specifications for the interrupt-triggering event, is updated.

The screenshot shows a table titled "Triggers" with the following content:

Configuration of events must be done in the properties of interrupt enabled modules

Source Module	Triggers	Event	Tag	Priority
DI14/DO10_1	I0.0	Rising edge0		5

9. If you want to assign further hardware interrupts, repeat steps 5 to 8.

A system constant of data type Event\_HwInt is created automatically for the event identified by the explicit event name. The system constants are displayed in the standard tag table.

## Symbolic and numerical names of instructions

### Description

The instructions from the task card are comprised of functions (FC), function blocks (FB), system functions (SFC) and system function blocks (SFB) that are identified internally by numbers.

The following tables show the assignment of numerical and symbolic names.

### Function blocks (FBs)

Numerical name	Symbolic name
FB 105	TC_CONFIG
FB 110	Port_Config
FB 111	Send_Config
FB 112	Receive_Config
FB 113	Send_P2P
FB 114	Receive_P2P
FB 115	Receive_Reset
FB 116	Signal_Get
FB 117	Get_Features
FB 118	Set_Features
FB 163	TC_SEND
FB 164	TC_RECV
FB 165	TC_CON
FB 166	TC_DISCON
FB 804	SET_TIMEZONE
FB 1030	TSEND_C
FB 1031	TRCV_S
FB 1071	USS_DRIVE
FB 1080	MB_COMM_LOAD
FB 1081	MB_MASTER

8.1 Configuring devices and networks

Numerical name	Symbolic name
FB 1082	MB_SLAVE
FB 1084	MB_CLIENT
FB 1085	MB_SERVER
FB 1100	MB_Halt
FB 1101	MC_Home
FB 1102	MC_MoveAbsolute
FB 1103	MC_MoveJog
FB 1104	MC_MoveRelative
FB 1105	MC_MoveVelocity
FB 1107	MC_Power

### Useful information on CPU firmware versions and STEP 7 versions

CPUs and engineering software for configuring the CPUs is constantly developed further to improve performance and security. New versions that have some special features with respect to the interaction of the components are created in this way. The sections below describe the special features of the S7-1200 CPUs with firmware version V4 as compared to firmware versions V1 to V3.

For a detailed comparison of the range of functions, read the S7-1200 System Manual (description of new instructions, new organization blocks and advanced configuration options).

### Required engineering software

S7-1200 CPUs V4 can be configured with STEP 7 as of V13.

### Compatibility between memory card content and firmware version of the CPU

Memory cards (transfer cards or program cards) with configuration and program for an S7-1200 CPU V1, V2 or V3 do not work with an S7-1200 CPU V4.

Memory cards with configuration and program for an S7-1200 CPU V4 do not work with an S7-1200 CPU V1, V2 or V3.

You must change an S7-1200 CPU V1 to V3 configuration to an S7-1200 CPU V4 configuration (device replacement) and then download it to the CPU. A gradual device replacement is required for an S7-1200 CPU V1-V2 (see below).

When you insert the memory card into a CPU with an incompatible firmware version, the CPU does not start up. When you insert a memory card for a CPU V1, V2 or V3 into an S7-1200 CPU V4, this CPU outputs a version error.

## Going online and loading

When you have configured an S7-1200 CPU with firmware version V1, V2 or V3 with STEP 7, the CPU to which you want to go online or which you want to download must have one of these firmware versions. You cannot go online to an S7-1200 CPU V4 with a configured S7-1200 CPU V1, V2 or V3.

On the other hand, you cannot go online to an S7-1200 CPU V1, V2 or V3 with a configured S7-1200 CPU V4 or download this CPU.

## Replacing an existing CPU

You can replace a configured S7-1200-CPU V1, V2 or V3 with a new CPU with a firmware version greater than or equal to 4. In case of an existing S7-1200 CPU V1 or V2, you must start by replacing the device with an S7-1200 CPU V3: It is not possible to directly replace it with an S7-1200 CPU V4.

1. S7-1200 CPU V1 (V2) > S7-1200 CPU V3
2. S7-1200 CPU V3 > S7-1200 CPU V4

As long as you do not download the configuration, you can undo the device replacement ("Undo" command in the "Edit" menu). When you download the configuration for the new CPU firmware version ("V4 configuration") to the CPU, you can no longer return to version V3.

This means you should save the existing project, for example, with a V3 configuration as project archive so that you can access it later.

Special notes for device replacement (V3 > V4):

- The interrupt behavior of interrupt OBs remains the same; they are not configured as interruptible. This is also the default behavior of S7-1200 CPUs V1-V3. The interrupt behavior of the interrupt OB can be configured for S7-1200 V4 CPUs. If you drag an S7-1200 CPU V4 directly from the hardware catalog into the network view, this option is activated (interrupt OBs are interruptible).
- The behavior for PUT/GET access of remote partners remains the same; access is permitted. This is also the default behavior of S7-1200 CPUs V1-V3. The access via PUT/GET communication by means of remote partners can be configured for S7-1200 V4 CPUs ("Protection" area of CPU parameters). If you drag an S7-1200 CPU V4 directly from the hardware catalog into the network view, access is not permitted and must be explicitly enabled.
- The wording for the protection levels changes but the effect of the settings remains the same. You can also select the access level "No access (complete protection)".
- The web server settings for activation of the web server and HTTP/HTTPS settings are applied. You also have the option to create users and assign them specific rights (Web server area > User management of CPU parameters). Web server users only have access to standard websites when you do not configure users. An S7-1200 CPU V4 no longer supports the user "admin" and his/her password.

## Communication with HMI devices

When you connect an HMI device to an S7-1200 CPU V4, make sure that you use the appropriate Runtime software version of the HMI device.

You may have to transfer the latest HMI Runtime version by means of the WinCC engineering software.

You must compile the HMI configuration once again and download it to the HMI device for the CPU-HMI communication to work.

## **8.1.6.2 Identification systems**

### **RFID systems**

#### **Communications module RF120C**

#### **Reader parameter group**

The "Reader" parameter group contains the following:

- **Diagnostics:** Setting to decide whether or not hardware diagnostics messages are output.
- **Reader System:** Selection of the connected RFID system. Depending on the selection you make, the "Reader System" parameter group is adapted.

#### **"Diagnostics" parameter**

Parameter assignment options:

- **None**  
Apart from standard diagnostics messages, no other diagnostics messages are generated.
- **Hard Errors**  
Extended diagnostics messages are generated if the following events occur.
  - Hardware error (memory test)
  - Firmware error (checksum)
  - Connection to reader lost
  - Short-circuit fault/interruption if supported by the hardware

#### **Further information**

For further information on diagnostics, refer the documentation for the RF120C communications module with application blocks for S7-1200 and S7-1500.

### Reader System parameter group

The parameters for the selected identification system are set in the "Reader system" parameter group.

The table shows the parameters that exist for all identification systems (RFID and code reader systems).

Table 8-56 Standard parameters for all identification systems

Parameter	Parameter value	Default value	Description
Baud rate reader	19.2 kBd 57.6 kBd 115.2 kBd	115.2 kBd	After changing the baud rate, the reader must be turned off and on again.
Presence Check	On Off (RF field off) Off (RF field on)	On	On = presence is reported as soon as there is a transponder in the antenna field of the reader Off (RF field on ) = the presence check in the FB is suppressed. The antenna on the reader is nevertheless turned on as long as it has not been turned off by a command. Off (RF field off) = the antenna is turned on only when a command is sent and it then turns itself off again (RF300 only)
Reset ERR-LED	On Off	Off	On = the flashing of the error LED on the RF120C is reset by each FB reset. Off = the error LED always indicates the last error. The display can only be reset by turning off the RF120C.

The following parameters are system specific according to the selection you made in the "Reader" parameter group.

### RF200

Table 8-57 RF200 general

Parameter	Parameter value	Default value	Description
-	-	-	Only the standard parameters are available.

Table 8-58 RF290R

Parameter	Parameter value	Default value	Description
RF power	0.50 - 5.00 W	1.00 W	Setting for the output power of the reader.

**RF300**

Table 8-59 RF300 general

Parameter	Parameter value	Default value	Description
Transponder type	RF300 ISO 15693	RF300	Selection of the transponders used.

Parameter	Parameter value	Default value	Description
RF power	0.50 - 2.00 W	1.25 W	Setting for the output power of the reader.
Transponder type	RF300 ISO 15693	RF300	Selection of the transponders used.

**RF600**

Table 8-61 Reader System: RF600

Parameter	Parameter value	Default value	Description
Max. no. of transponders	1 - 80	1	<p>Number of transponders expected in the antenna field.</p> <p>Permitted values:</p> <ul style="list-style-type: none"> <li>• 1 - 40 for RF620R</li> <li>• 1 - 80 for RF630R with 2 antennas</li> <li>• 1 - 40 for RF630R with 1 antenna</li> </ul> <p>The value stored in "multitag" defines the expected number of transponders to be read (EPC-ID) in the inventory.</p> <p>The value does not restrict the number of transponders to be processed in the antenna field.</p> <p>To ensure an efficient inventory of transponders in the antenna field, make sure that the values specified here do not deviate by more than approximately 10% from the maximum number of transponders to be expected in the antenna field.</p>
Reader type	RF620R ETSI RF620R FCC RF620R CMIIT RF630R ETSI RF630R FCC RF630R CMIIT	RF620R ETSI	<p>Selection of the reader used.</p> <p>By selecting a reader, you open the "Reader type" parameter group. The parameters are described in the following table.</p>

**Reader type (RF600 only)**

In the "Reader type" parameter group further specific parameters are set for the reader type selected in the "Reader system" parameter group.

Table 8-62 RF600 menu: Reader type

Parameter	Parameter value	Default value	Description
Wireless profile	-	-	Selection of the relevant wireless profile for ETSI, FCC or CMIIT.
Multitag mode	UID = EPC-ID (8 bytes) UID = Handle ID (4 bytes)	UID = EPC-ID (8 bytes)	<ul style="list-style-type: none"> <li>UID = EPC-ID (8 bytes) 8 byte UID of the bytes 5-12 of the 12 byte long EPC-ID</li> <li>UID = handle ID (4 bytes) 4 byte UID as handle ID for access to transponders with an EPC-ID of any length</li> </ul>
Intelligent Single Tag Mode (ISTM)	On Off	Off	Enable/disable the "Intelligent Single Tag Mode ISTM" algorithm <sup>1)</sup>
Black List	On Off	Off	Enable/disable the "Black list" <sup>1)</sup>
Radiated power internal antenna (RF620R)	0 - B	4	Setting the radiated power for the internal antenna <sup>1) 2)</sup>
Internal antenna (RF620R)	-	-	Enable/disable the internal antenna. With the RF620R, either only the internal or only the external antenna can be set.
Transmit power (external antenna RF620R)	0 - 9	4	Setting the transmit power for the external antenna <sup>1) 2)</sup>
External antenna (SetAnt block required) (RF620R)	-	-	Enable/disable the external antenna. With the RF620R, either only the internal or only the external antenna can be set.
Transmit power ANT 1 (RF630R)	0 - 9	4	Setting the transmit power for antenna 1 <sup>1) 2)</sup>
Transmit power ANT 2 (RF630R)	0 - 9	4	Setting the transmit power for the antenna 2 <sup>1) 2)</sup>
Communications speed	Reliable detection Fast detection	Reliable detection	<sup>1)</sup>
Tag hold	On Off	Off	Enable/disable "Tag hold" <sup>1)</sup>
Scanning mode	On Off	Off	Enable/disable the "Scanning mode" <sup>1)</sup>
Channel assignment (only with wireless profile ETSI)	-	-	Selection of the wireless channels to be used <sup>1)</sup>

<sup>1)</sup> You will find further information in the "Configuration manual RF620R/RF630R". \*

<sup>2)</sup> The values for the transmit/radiated power of the antennas can be found in the following table.

\* You will find the configuration manual RF620R/RF630R here (<http://support.automation.siemens.com/WW/view/en/10805817>).

Table 8-63 Transmit / radiated power of the antennas

Hex value	RF630R transmit power	RF620R radiated power (internal antenna)			RF620R transmit power
	dBm / (mW)	ETSI dBm / (mW) ERP	FCC dBm / (mW) EIRP	CMIIT dBm / (mW) ERP	dBm / (mW)
0	18 / (63)	18 / (63)	20 / (100)	18 / (65)	18 / (63)

B (...F)	27 / (501)	29 / (794)	31 / (1259)	29 / (794)	27 / (501)

## SLG D10S

Table 8-64 SLG D10S

Parameter	Parameter value	Default value	Description
RF power	0.50 - 10.00 W	1.00 W	Setting for the output power of the reader.
Transponder type	ISO I-Code (e.g. MDS D139)	ISO	Selection of the transponders used.

## SLG D11S/D12S

Table 8-65 SLG D11S/D12S

Parameter	Parameter value	Default value	Description
Transponder type	ISO I-Code (e.g. MDS D139)	ISO	Selection of the transponders used.

**MOBY U**

Table 8-66 MOBY U

Parameter	Parameter value	Default value	Description
Standby time	0 - 1400 ms	0 ms	Standby time (scanning_time) for the transponder. If the transponder receives a further command before the standby time has elapsed, this command can be executed immediately. If the transponder receives a command after standby time has elapsed, command execution is delayed by the "sleep_time" of the transponder.
Range limitation	0.2 m 0.5 m 1.0 m 1.5 m 2.0 m 2.5 m 3.0 m 3.5 m	1.5 m	-
Max. no. of transponders	1 - 12	1	Maximum number of transponders that can be processed at the same time in the antenna field.
BERO mode	Without BEROs 1 or 2 BEROs 1st BERO on, 2nd BERO off Synchronization by cable connection	Without BEROs	<ul style="list-style-type: none"> <li>Without BEROs No reader synchronization</li> <li>1 or 2 BEROs The BEROs are logically ORed. The antenna field is turned on during the actuation of a BERO.</li> <li>1st BERO on, 2nd BERO off 1st BERO turns on the antenna field and the 2nd BERO turns the antenna field off. If there are two BEROs present and "BERO time in s" is set, the antenna field is turned off automatically if the 2nd BERO does not switch within this BERO time. If no "BERO time in s" is set, the antenna field remains turned on until the 2nd BERO is activated.</li> <li>Synchronization by cable connection Enable reader synchronization via cable connection (see manual on configuration, installation and service for MOBY U).</li> </ul>
BERO time in s	0 - 255 s	0 s	Can only be set if the BERO mode is set to "1st BERO on, 2nd BERO off". <ul style="list-style-type: none"> <li>0 The time monitoring is disabled. To turn off the field, the 2nd BERO is required.</li> <li>1 ... 255 s Operating time for the reader field</li> </ul>

## General Reader

Table 8-67 General Reader

Parameter	Parameter value	Default value	Description
Input box for byte sequence (hexadecimal)	00000000	00000000	Expert mode With this function, you can specify the reset parameters directly in hexadecimal notation. This setting may only be selected if you have previously received the hexadecimal string for the setting from a member of the SIEMENS staff.

## Parameters via FB / code readers

Table 8-68 Parameters via FB / code readers

Parameter	Parameter value	Default value	Description
MOBY mode	RF200, RF300, RF600, MOBY D/U, MV	RF200, RF300, RF600, MOBY D/U, MV	Only the mode "RF200, RF300, RF600, MOBY D/U, MV" is supported. For further information on resetting a function block, refer to the documentation for the RF120C communications module with application blocks for S7-1200 and S7-1500. *

\* You will find information on the documentation here (<http://support.automation.siemens.com/WW/view/en/10805817>).

### 8.1.6.3 Distributed I/O

#### Distributed I/O systems

#### SIMATIC ET 200 - The right solution for all applications

SIMATIC ET 200 provides the most varied range of distributed I/O systems.

- Solutions for use in the control cabinet
- Solutions without control cabinet directly at the machine

Additionally, there are also components that can be used in explosive areas. SIMATIC ET 200 systems for construction without a control cabinet are contained in robust, glass-fibre reinforced plastic casing and are therefore shock-resistant, resistant to dirt and watertight.

Their modular design allows the ET 200 systems to be easily scaled and expanded in small steps. Fully-integrated auxiliary modules lower costs and also provide a wide range of possible applications. There are several combination possibilities available:

- Digital and analog I/OS
- Intelligent modules with CPU functions,

8.1 Configuring devices and networks

- Safety technology,
- Pneumatics,
- Frequency converters
- Various technology modules.

Communication via PROFIBUS and PROFINET, uniform engineering, clear diagnostic possibilities as well as optimal connection to SIMATIC controller and HMI devices vouch for the unique consistency provided by Totally Integrated Automation.

The following table provides an overview of I/O devices for use in the control cabinet:

I/O device	Properties
ET 200S	<ul style="list-style-type: none"> <li>• Highly modular design with multiple conductor connections</li> <li>• Multifunctional due to a wide range of modules</li> <li>• Use in explosive areas (Zone 2)</li> </ul>
ET 200S COMPACT	<ul style="list-style-type: none"> <li>• Highly modular design with multiple conductor connections</li> <li>• Multifunctional due to a wide range of modules</li> <li>• Use in explosive areas (Zone 2)</li> <li>• Integrated DE/DA</li> </ul>
ET 200L	<ul style="list-style-type: none"> <li>• Cost-effective digital block I/OS</li> <li>• Digital electronic blocks up to 32 channels</li> </ul>
ET 200M	<ul style="list-style-type: none"> <li>• Modular design with standard modules from SIMATIC-S7-300</li> <li>• Failsafe I/O modules</li> <li>• Use in explosive areas up to Zone 2, sensors and actuators up to Zone 1</li> <li>• High level of plant availability, for example by plugging and unplugging when in operation</li> </ul>
ET 200iSP	<ul style="list-style-type: none"> <li>• Modular design, also possible with redundancy</li> <li>• Robust and intrinsically safe design</li> <li>• Use in explosive areas up to Zone 1/21; sensors and actuators even up to Zone 0/20</li> <li>• High level of plant availability, for example by plugging and unplugging when in operation</li> </ul>

The following table provides an overview of I/O devices for use without a control cabinet:

I/O device	Properties
ET 200pro	<ul style="list-style-type: none"> <li>• Modular design with compact housing</li> <li>• Easy assembly</li> <li>• Multifunctional due to a wide range of modules</li> <li>• High level of availability due to plugging and unplugging in operation and permanent wiring</li> <li>• Comprehensive diagnostics</li> </ul>
ET 200eco PN	<ul style="list-style-type: none"> <li>• Cost-efficient, space-saving block I/Os</li> <li>• Digital modules up to 16 channels (also configurable)</li> <li>• Analog modules, IO-link master and load voltage distributor</li> <li>• PROFINET connection with 2-port switch in each module</li> <li>• Can be flexibly distributed via PROFINET in line or star shape directly within the plant</li> </ul>
ET 200eco	<ul style="list-style-type: none"> <li>• Cost-effective digital block I/Os</li> <li>• Flexible connection possibilities</li> <li>• Failsafe modules</li> <li>• High level of plant availability</li> </ul>
ET 200R	<ul style="list-style-type: none"> <li>• Specially for use on robots</li> <li>• Assembled directly on the chassis</li> <li>• Resistant to weld spatter due to robust metal housing</li> </ul>

## ET 200iSP

### ET 200iSP Distributed I/O Station

#### Definition

The ET 200iSP distributed I/O station is a highly modular and intrinsically safe DP slave with degree of protection IP 30.

#### Area of application

The ET 200iSP distributed I/O station can be operated in potentially explosive atmospheres characterized by gas and dust:

Approval	ET 200iSP Station*	Inputs and outputs
ATEX	Zone 1, Zone 21	up to Zone 0, Zone 20 **
IECEX	Zone 2, Zone 22	up to Zone 0, Zone 20 **
* In combination with an appropriate enclosure ** for electronic module 2 DO Relay UC60V/2A: up to Zone 1, Zone 21		

The ET 200iSP distributed I/O station can, of course, also be used in the safety area.

You can insert almost any combination of ET 200iSP I/O modules directly next to the interface module that transfers the data to the DP master. This means you can adapt the configuration to suit your on-site requirements.

Every ET 200iSP consists of a power supply module, an interface module and a maximum of 32 electronic modules (for example digital electronics modules). Remember not to exceed the maximum current consumption.

#### Terminal modules and electronic modules

In principle, the ET 200iSP distributed I/O station consists of various passive terminal modules onto which you plug the power supply and the electronic modules.

The ET 200iSP is connected to PROFIBUS RS 485-IS by means of a connector on terminal module TM-IM/EM. Every ET 200iSP is a DP slave on the PROFIBUS RS 485-IS.

#### DP master

All ET 200iSP modules support communication with DP masters that are compliant with *IEC 61784-1:2002 Ed1 CP 3/1* and operate with "DP" transmission protocol (DP stands for distributed peripherals or distributed I/O).

#### See also

## **Assigning the channel and IEEE tag**

### **Properties**

Analog electronic modules 4 AI | 2WIRE/HART, 4 AI | 4WIRE/ HART and 4 AO | HART support up to four IEEE tags.

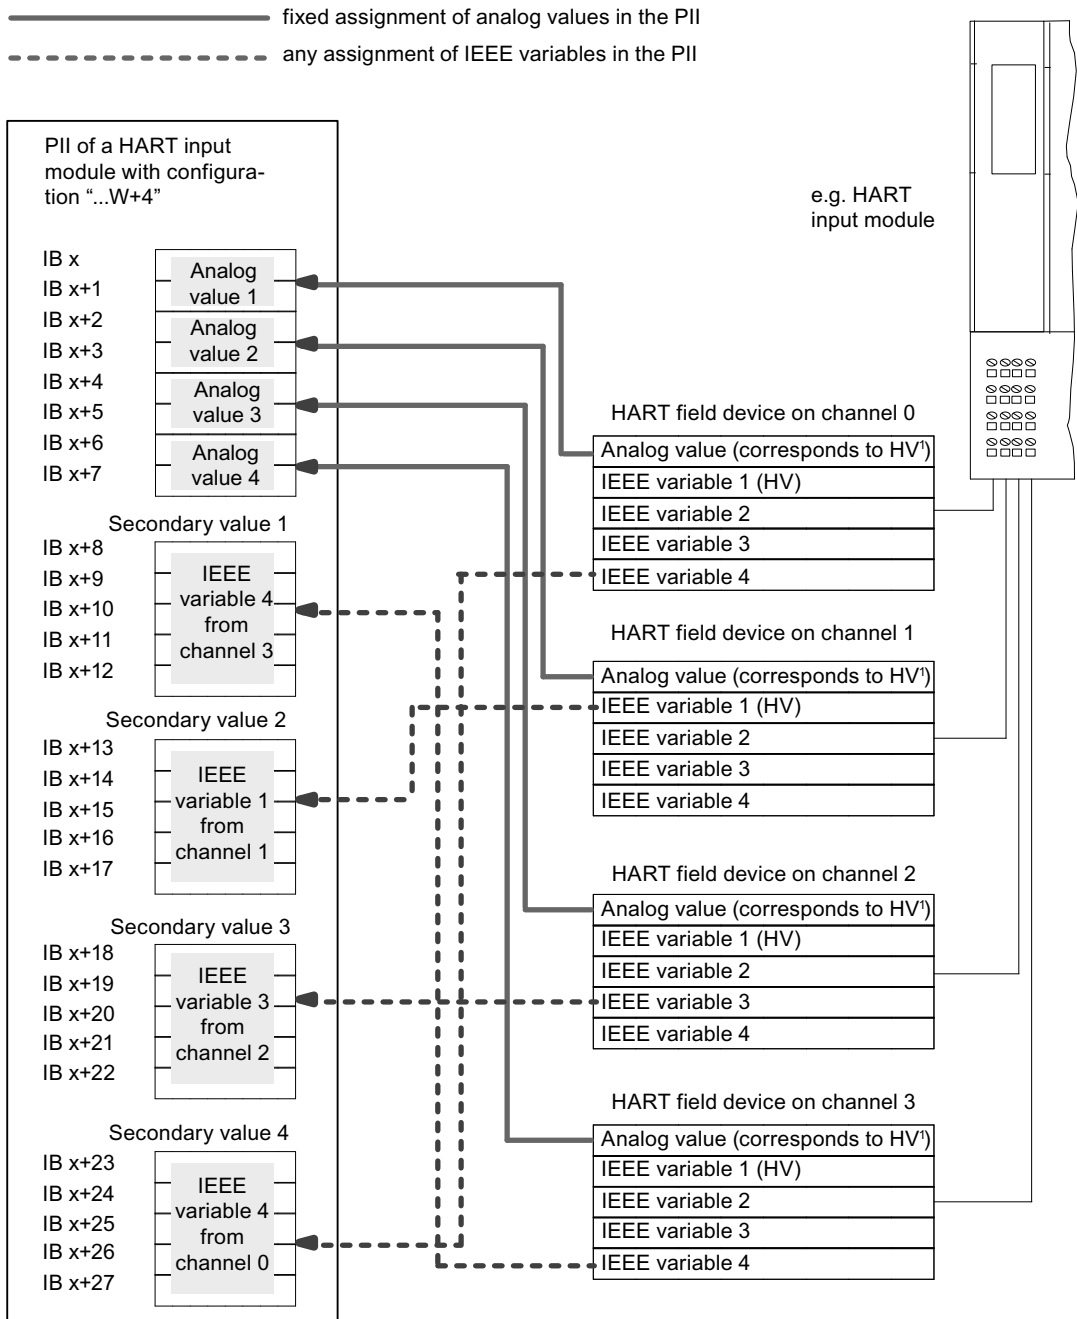

The process input image (PII) provides up to 20 bytes per module for the IEEE tags. Thus, four blocks of 5 bytes each are available for the four IEEE tags within the PII.

### **Requirements**

The HART field device must support the assigned number of IEEE tags.

### Assigning IEEE tags

You assign the IEEE tags of the field devices to any one of the four blocks in the PII.

<sup>1</sup> HV = main variable

## Assigning parameters to reference junctions for thermocouples

### Compensation of the reference junction temperature

There are various ways of obtaining the reference junction temperature in order to get an absolute temperature value from the temperature difference between the reference junction and the measuring point.

Table 8-69 Compensation of the reference junction temperature

Option	Explanation	Reference junction parameters
No compensation	You record not only the temperature of the measurement point. The temperature of the reference junction (transition from Cu line to thermocouple line) also affects the thermo-electromotive force. The measured value then includes an error.	None
Use of a Pt100 Climatic Range resistance thermometer to record the reference junction temperature (best method)	You can record the reference junction temperature using a resistance thermometer (Pt100 Climatic Range). If parameterized accordingly, this temperature value is distributed to the 4 AI TC modules in the ET 200iSP where it is offset against the temperature value obtained at the measuring location. Number of reference junctions: 2	The parameter assignment of the IM 152 and the 4 AI TC must be coordinated: <ul style="list-style-type: none"> <li>• 4 AI RTD assigned parameters for Pt100 climatic range in correct slot;</li> <li>• 4 AI TC: Reference junction : "yes"; select reference junction number "1" or "2"</li> <li>• IM 152-1:Assignment of the reference junction to a slot with 4 AI RTD; channel selection;</li> </ul>
Internal compensation 4 AI TC	The TC sensor module (temperature sensor) is mounted onto the terminals of terminal module EM 4 AI TC. The temperature sensor reports the temperature of the terminals to the 4 AI TC. This value is then calculated together with the measured value from the channel of the electronic module.	<ul style="list-style-type: none"> <li>• 4 AI TC: Reference junction number "internal"</li> </ul>

### Compensation by means of a resistance thermometer at the 4 AI RTD

If thermocouples that are connected to the inputs of the 4 AI RTD have the same reference junction, compensate by means of a 4 AI RTD.

For both channels of the 4 AI TC module, you can select "1", "2" or "internal" as the reference junction number. If you select "1" or "2", the same reference junction (RTD channel) is always used for all four channels.

### Setting parameters for the reference junction

You set the reference junctions for the 4 AI TC electronic modules by means of the following parameters:

Table 8-70 Reference junction parameters

Parameter	Module	Range of values	Explanation
Slot reference junction 1 to slot 2	IM 152	none, 4 to 35	With this parameter, you can assign up to 2 slots (none, 4 to 35), on which the channels for reference temperature measurement (calculating the compensation value) are located.
Input reference junction 1 to 4 input reference junction	IM 152	RTD on channel 0 RTD on channel 1 RTD on channel 2 RTD on channel 3	This parameter allows you to set the channel (0/1/2/3) for measuring the reference temperature (calculation of the compensation value) for the assigned slot.
Reference junction E0 to reference junction E3	4 AI TC	None yes	This parameter allows you to enable the use of the reference junction.
Reference junction number	4 AI TC	1 2 Internal	This parameter allows you to assign the reference junction (1, 2) that contains the reference temperature (compensation value).

### Fundamentals of Time Stamping

#### Properties

Time stamping is possible with the IM 152 in customer applications using FB 62 (FB TIMESTMP).

#### Principle of operation

A modified input signal is assigned a time stamp and stored in a buffer (data record). If time stamped signals exists or a data record is full, a hardware interrupt is generated to the DP master. The buffer is evaluated with "Read data record". Special messages are generated for events that influence the time stamping (communication with the DP master interrupted, frame failure of time master, ...).

## Parameter Assignment

With the parameter assignment you define which IM 152 user data will be monitored. For the time stamping these are digital inputs that are monitoring for signal changes.

Parameter	Setting	Description
Time stamping	<ul style="list-style-type: none"><li>• disabled</li><li>• enabled</li></ul>	Activate the time stamping for the channels of the electronics module 8 DI NAMUR.
Edge evaluation incoming event	<ul style="list-style-type: none"><li>• rising edge</li><li>• falling edge</li></ul>	Determine the type of signal change that will be time-stamped.

## Counting

### Count properties

### Counting functions

The 8 DI NAMUR electronics module has configurable counting functions:

- 2 x 16-bit up counters (standard counting function) or
- 2 x 16-bit down counters (standard counting function) or
- 1 x 32-bit down counter (cascading counter function)
- Setting a setpoint with the PIQ
- GATE function
- You can configure the control signals of the counters:
  - Configuration channel 0..1: "Counter", channel 2..7: "DI": Two counters are configured. The control signals of the counters are stored in the PIQ (process image output).
  - Configuration channel 0..1: "Counter", channel 2..7: "Control": Two counters are configured. The control signals of the counters are stored in the PIQ (process image output). They are also controlled by the digital inputs of the 8 DI NAMUR.

### See also

Principle of operation (Page 1095)

Configuring counters (Page 1098)

Assigning parameters to counters (Page 1101)

## Principle of operation

### 16-bit up counters (standard counting function)

The counting range is 0 to 65,535.

With each count pulse at the digital input, the count is incremented by 1. Once the count limit is reached, the counter is reset to 0 and it counts up again from this value.

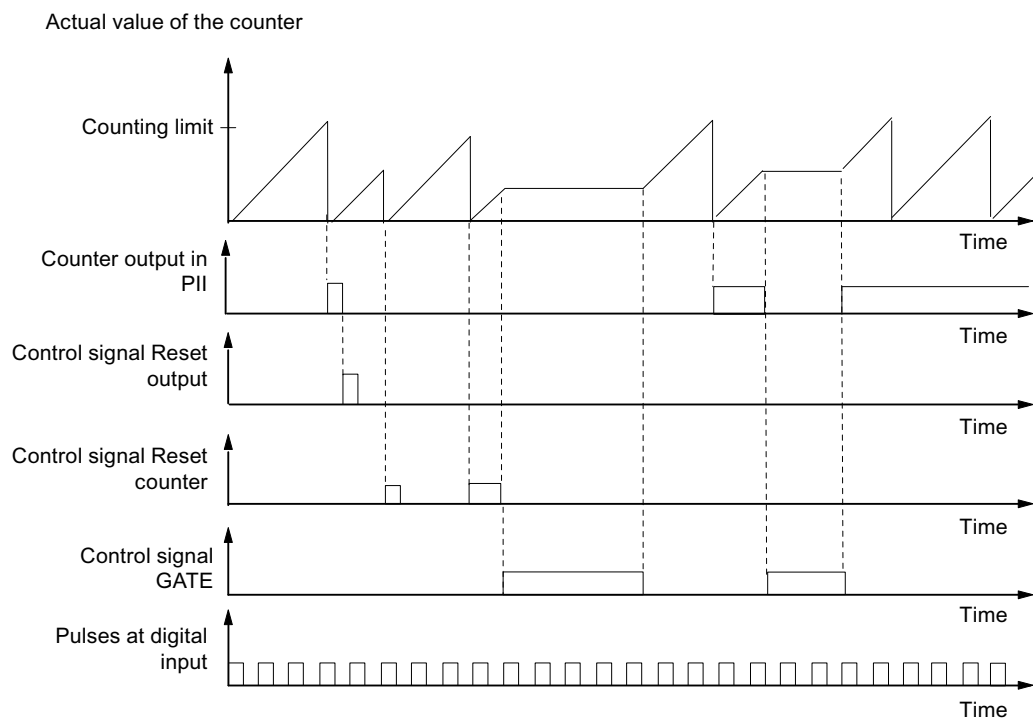

If there is counter overflow, the corresponding output is set in the PII.

A positive edge of the *Reset output* control signal resets the output in the PII. This does not affect the current count value.

In 16-bit up counting operations, the system does not set any outputs in the PIQ. These are always reset.

The positive edge of the *Reset counter* control signal sets the counter to 0 and resets the set counter output.

The *GATE* control signal pauses the counting on a positive edge. Count pulses are processed at the digital input again, but only at the negative edge. The *Reset counter* control signal is also effective when *GATE* is active.

### 16-bit down counters (periodic counting function)

The maximum counting range is always 65,535 to 0.

When the counter is started, the actual value is set to the selected setpoint. Each counted pulse reduced the actual value by 1. Once the actual value reaches 0, the corresponding output in the PII is turned on and the actual value is set to the selected setpoint. The counter then counts down from this value.

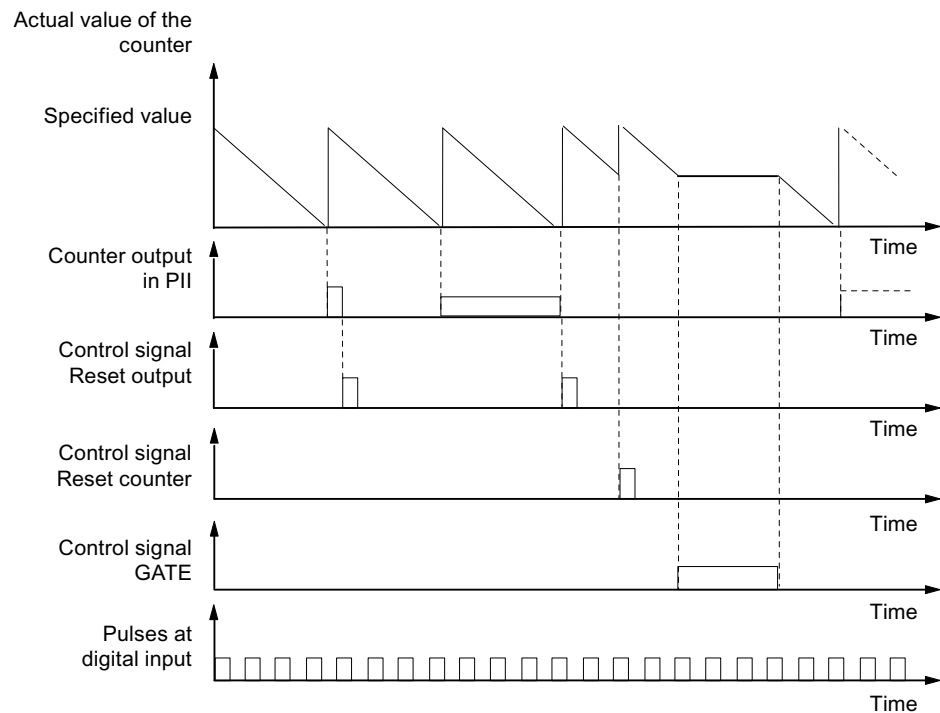

The positive edge of the *Reset counter* control signal resets the selected setpoint and the corresponding output in the PII.

A positive edge of the *Reset output* control signal resets the output in the PII. This does not affect the current count value.

The *GATE* control signal pauses the counting on a positive edge. At the same time, the assigned output in the PII is reset. Count pulses are processed at the digital input again, but only at the negative edge. The *Reset output* and *Reset counter* control signals are also effective when *GATE* is active.

The setpoint of the counter is set and changed using the PIQ. The setpoint is adopted on a positive edge of the *Reset counter* control signal or when the counter has reached zero.

### 32-bit down counter (cascading counter function)

The maximum counting range is always 4294967295 to 0.

The principle of operation is identical to that of the 16-bit down counter. Channel 1 has no function.

Count properties (Page 1095)

## Configuring counters

### Procedure

1. Using the mouse, pull module 8 DI Namur from the hardware catalog into distributed I/O station ET 200iSP.
2. Select the required configuration (channel 0..1: "Counter", channel 2..7: "DI" or "Control"). In the module properties (inspector window), you can find this setting under "Parameters > Inputs > Configuration".

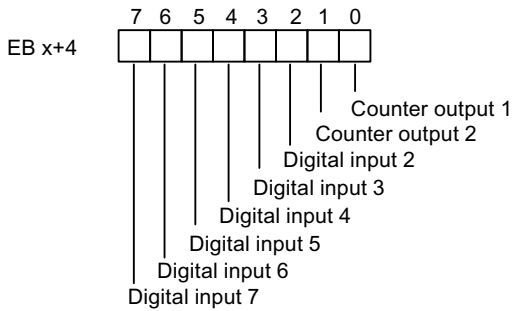

### Configuration channel 0..1: "Counter", channel 2..7: "DI"

- Assignment of the digital inputs on the electronic module 8 DI NAMUR

Table 8-71 Assignment of digital inputs for channel 0..1: "Counter", channel 2..7: "DI":

Digital input	Terminal	Assignment
Channel 0	1, 2	Counter 1
Channel 1	5, 6	Counter 2 (does not apply to 32-bit down counters)
Channel 2	9, 10	Digital input 2
Channel 3	13, 14	Digital input 3
Channel 4	3, 4	Digital input 4
Channel 5	7, 8	Digital input 5
Channel 6	11, 12	Digital input 6
Channel 7	15, 16	Digital input 7

• Assignment of the process image input (PII)

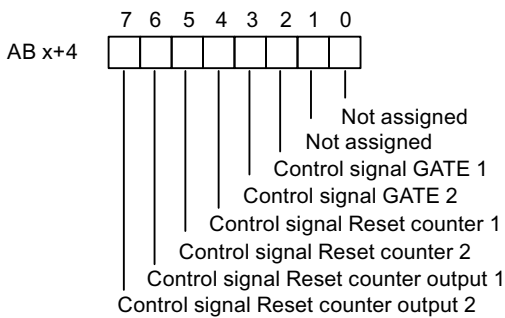

S7 format

Value status for channels 2 to 7:  
 1<sub>B</sub>: Input signal is valid  
 0<sub>B</sub>: Input signal is invalid

• Assignment of the process image output (PIQ)

**Configuration channel 0..1: "Counter", channel 2..7: "CONTROL"**

With this configuration, you can also control the counters over the digital inputs.

- Assignment of the digital inputs on electronic module 8 DI NAMUR  
For further information on input assignments, refer to the technical data for electronic module 8 DI NAMUR.

Table 8-72 Assignment of the digital inputs for 2 Count/ 6 Control

Digital input	Terminal	Assignment
Channel 0	1, 2	Counter 1
Channel 1	5, 6	Counter 2 (does not apply to 32-bit down counters)
Channel 2	9, 10	control signal <i>GATE 1</i>
Channel 3	13, 14	control signal <i>GATE 2</i>
Channel 4	3, 4	control signal <i>Reset counter 1</i>
Channel 5	7, 8	control signal <i>Reset counter 2</i>
Channel 6	11, 12	control signal <i>Reset counter output 1</i>
Channel 7	15, 16	control signal <i>Reset counter output 2</i>

- Assignment of the process image input (PII)  
Assignment is identical to configuration 0..1: "Counter", channel 2..7: "DI".
- Assignment of the process image output (PIQ)  
Assignment is identical to configuration 0..1: "Counter", channel 2..7: "DI".

## Assigning parameters to counters

### Parameters for the counting function

Only those parameters that are relevant for the counters are explained below. These belong to the parameters of electronic module 8 DI NAMUR and depend on the selected configuration:

Table 8-73 Parameters for the counters

Parameter	Setting	Description
Sensor type counter inputs	<ul style="list-style-type: none"> <li>• Channel disabled</li> <li>• NAMUR sensor</li> <li>• Single contact, no load resistance</li> </ul>	Select the sensor for the respective counter of channels 0 or 1.
Mode for counter 1	<ul style="list-style-type: none"> <li>• Standard counting function</li> <li>• Periodic counting function</li> <li>• Cascaded counting function</li> </ul>	Select the mode for counter 1.
Mode for counter 2	<ul style="list-style-type: none"> <li>• Standard counting function</li> <li>• Periodic counting function</li> <li>• Cascaded counting function</li> </ul>	Select the mode for counter 2. This parameter is not relevant if you have set the "Mode for counter 1" parameter to "Cascaded counter function".

## Frequency measurement

### Frequency measurement properties

### Properties

The electronic module 8 DI NAMUR allows the frequencies to be measured on channel 0 and 1:

- 2 frequency meters from 1 Hz to 5 kHz
- Configurable metering window (GATE)
- The signals of the frequency meter are read in by means of the digital inputs of the electronic module.

### See also

Principle of operation (Page 1102)

Configuring frequency meters (Page 1102)

Assigning parameters for the frequency meters (Page 1104)

## Principle of operation

### Frequency measurement

The signal frequencies are identified from the input signals of channel 0 or 1 of the electronic module. To calculate the frequency the signals are measured within a configurable gate.

The frequency is displayed as 16-bit value in fixed-point format and transferred to the PII.

The frequency meter calculates the frequency according to the follow formula:

$$\text{Frequency [Hz]} = \frac{\text{Number of rising edges at digital input}}{\text{Measuring window [s]}}$$

### Exceeding the input frequency

If the input frequency exceeds 5kHz, 7FFF<sub>H</sub> is reported as actual value. If the input frequency is above approx. 8 kHz it is no longer possible to display correct actual values.

### See also

Frequency measurement properties (Page 1101)

## Configuring frequency meters

### Procedure

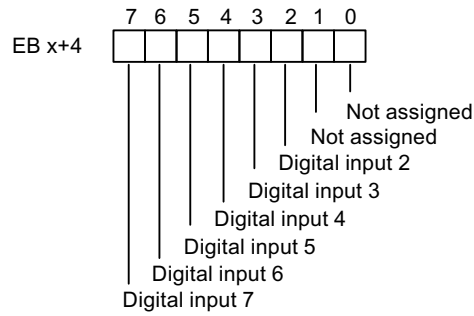

1. Using the mouse, pull module 8 DI Namur from the hardware catalog into distributed I/O station ET 200iSP.
2. Select the required configuration (channel 0..1: "Trace", channel 2..7: "DI"). In the module properties (inspector window), you can find this setting under "Parameters > Inputs > Configuration".

### Configuration 0..1: "Trace", channel 2..7: "DI"

Assignment of the digital inputs on electronic module 8 DI NAMUR

Digital input	Terminal	Assignment
Channel 0	1, 2	Frequency counter 1
Channel 1	5, 6	Frequency counter 2
Channel 2	9, 10	Digital input 2
Channel 3	13, 14	Digital input 3
Channel 4	3, 4	Digital input 4
Channel 5	7, 8	Digital input 5
Channel 6	11, 12	Digital input 6
Channel 7	15, 16	Digital input 7

Assignment of process image input (PII) for configuration of channel 0..1: "Trace", channel 2..7: "DI"

S7 format

Value status for channels 2 to 7:

1<sub>b</sub>: Input signal is valid

0<sub>b</sub>: Input signal is invalid

Assignment of the process image output (PIQ): The PIQ is not assigned.

## Assigning parameters for the frequency meters

### Parameters for frequency meter

Only those parameters that are relevant for the frequency meters are explained below. These are part of the parameters of electronic module 8 DI NAMUR.

Table 8-74 Parameters for the frequency meters

Parameter	Setting	Description
Sensor type frequency inputs	<ul style="list-style-type: none"><li>• Channel disabled</li><li>• NAMUR sensor</li><li>• Single contact, no load resistance</li></ul>	Select the sensor for the relevant frequency meter for channel 0 or 1.
Measuring window (GATE)	<ul style="list-style-type: none"><li>• 50 ms</li><li>• 200 ms</li><li>• 1 s</li></ul>	Select the required measuring window for channel 0 or 1. To achieve the highest possible accuracy when metering frequencies, remember the following rules: <ul style="list-style-type: none"><li>• High frequencies (&gt; 4 kHz): Set a low measuring window (50 ms)</li><li>• Variable/medium frequencies: set medium measuring window (200 ms)</li><li>• Low frequencies (&lt; 1 kHz): Set a high measuring window (1 s)</li></ul>

### ET 200eco PN

### ET 200eco PN Distributed I/O Device

### Definition

The ET 200eco PN distributed I/O device is a compact PROFINET IO device in degree of protection IP 65/66 or IP 67 and UL Enclosure Type 4x, Indoor use only.

## Field of application

The fields of application of the ET 200eco PN are derived from its special properties.

- A robust design and degree of protection IP 65/66 or IP 67 make the ET 200eco PN distributed I/O device suitable in particular for use in rugged industrial environments.
- The compact design of the ET 200eco PN is particularly favorable for applications in confined areas.
- The easy handling of ET 200eco PN facilitates efficient commissioning and maintenance.

## Properties

The ET 200eco PN has the following properties:

- Integrated switch with 2 ports
- Supported Ethernet services:
  - ping
  - arp
  - Network diagnostics (SNMP)
  - LLDP
- Interrupts
  - Diagnostics interrupts
  - Maintenance interrupts
- Port diagnostics
- Isochronous real-time communication
- Prioritized startup
- Device replacement without programming device
- Media redundancy
- Connection to intelligent sensors/actuators via IO link master interface module.

## IO Controller

The ET 200eco PN can communicate with all IO Controllers that conform to IEC 61158.

ET 200eco PN can be configured on a CPU with advanced diagnostics.

## See also

Documentation on ET 200eco PN (<http://support.automation.siemens.com/WW/view/en/29999018>)

## Parameter description analog input

### Group diagnostics

You can generally enable and disable the diagnostics function of the device with this parameter. The "Fault" and "Parameter assignment error" diagnostics functions are always independent of the group diagnostics.

### Diagnostics, missing 1L+

If you enable this parameter, the check for missing supply voltage is enabled.

### Diagnostics, sensor supply short circuit

If you enable this parameter, a diagnostics event is generated if a short-circuit of the sensor supply to ground is detected and the channel is enabled. The sensor supply is monitored for connectors X1, X3, X5 and X7. It is not possible to differentiate which connector has experienced the sensor short circuit.

### Interference frequency suppression

With this parameter, you set the integration time of the device, based on the selected interference frequency. Select the frequency of the supply voltage used. Interference frequency suppression **Off** means 500 Hz, which corresponds to an integration time of 2 ms for a measurement channel.

### Temperature unit

Specify the unit of the temperature measurement here.

### Measurement type (channel-wise)

With this parameter, you set the measurement type, for example, voltage. For any unused channels, you must select the **disabled** setting. For a disabled channel, the conversion time and integration time of the channel = 0 s and the cycle time is optimized.

### Measuring range

With this parameter, you set the measuring range of the selected measurement type.

### Temperature coefficient (for RTD, thermoresistor)

The correction factor for the temperature coefficients ( $\alpha$ -value) indicates by what extent the resistance of specific material changes relatively if the temperature increases by 1 °C.

The  $\alpha$ -values conform to EN 60751, GOST 6651, JIS C 1604 and ASTM E-1137.

The temperature coefficient depends on the chemical composition of the material.

## Smoothing

Smoothing of the analog values produces a stable analog signal for further processing. The smoothing of analog values is useful when handling wanted signals (measured values) with a slow rate of change, for example, temperature measurements.

The measured values are smoothed by digital filtering. To achieve smoothing, the device generates a mean value from a specified number of converted (digitized) analog values.

You assign a maximum of four levels for the smoothing (none, weak, medium, strong). The level determines the number of module cycles, from which the mean value is generated.

The stronger the smoothing, the more stable the smoothed analog value and the longer it takes until the smoothed analog value is applied following a signal change (see the example below).

The figure below shows the number of cycles a module requires to apply the smoothed analog value at almost 100% after a step response, based on the smoothing function settings. The figure applies to all signal changes at the analog input. The smoothing value defines the number of cycles a module requires to reach 63% of the end value of the changed signal.

- ① Smoothing, weak
- ② Smoothing, medium
- ③ Smoothing, strong

## Diagnostics, wire break

When this parameter is enabled, the **Wire break** diagnostics event is generated when a wire break is detected.

Observe the rules outlined below to handle a wire break in the 1 to 5 V and 4 to 20 mA measuring ranges:

Parameter	Event	Measured value	Explanation
Enable wire break <sup>1</sup>	Wire break	7FFF <sub>H</sub>	Diagnostics, <b>wire break</b>
Wire break disabled <sup>1</sup>  Underflow enabled	Wire break	8000 <sub>H</sub>	Measured value after leaving the underrange  Diagnostic message <b>Lower limit value undershot</b>
Wire break disabled <sup>1</sup>  Underflow disabled	Wire break	8000 <sub>H</sub>	Measured value after leaving the underrange
<sup>1</sup> Measuring range limits for wire break detection and measuring range undershoot detection: <ul style="list-style-type: none"> <li>• 1 to 5 V: At 0.296 V</li> <li>• 4 to 20 mA: At 1.185 mA</li> </ul>			

### Diagnostics, underflow

If you enable this parameter, the **Underflow** diagnostics event is generated when the measured value reaches the underflow range.

### Diagnostics, overflow

If you enable this parameter, the **Overflow** diagnostics event is generated when the measured value reaches the overflow range.

### Reference junction for thermoresistor (TC)

A difference in temperature between the measuring point and the free ends of the thermocouple (terminal point) generates a voltage between the free ends, namely the thermoelectric voltage. The value of this thermoelectric voltage is determined by the temperature difference between the measuring point and the free ends and by the type of material combination of the thermocouple. Since a thermocouple always measures a temperature difference, the free ends at the reference junction must be maintained at a known temperature in order to determine the temperature of the measuring point.

If you specify **Internal compensation**, the temperature of the measuring point in the housing of the I/O device is measured. With the **External compensation** setting, you can connect a compensation box in series in order to increase the accuracy of the temperature measurement.

### Parameter description analog output

#### Group diagnostics

You can generally enable and disable the diagnostics function of the device with this parameter.

The "Fault" and "Parameter assignment error" diagnostics functions are always independent of the group diagnostics.

### **Diagnostics, missing 1L+**

If you enable this parameter, the check for missing supply voltage is enabled.

### **Diagnostics, sensor supply short circuit**

When this parameter is enabled, the system generates a diagnostics event if it detects a short-circuit of the sensor supply to ground. This diagnostics function is activated when the group diagnostics function is enabled.

### **Response to CPU/Master STOP**

Select how the module's outputs will respond to a CPU STOP:

- Shut down  
The I/O device goes to the safe state. The process image output is deleted (=0).
- Keep last value  
The I/O device retains the last value to be output before STOP.
- Substitute value  
The I/O device outputs the value for the channel set beforehand.

---

#### **Note**

Make sure that the plant is always in a safe state if "Keep last value" is selected.

---

### **Type of output**

With this parameter, you set the output type, for example, voltage. For any unused channels, select the **disabled** setting. For a disabled channel, the conversion time and integration time of the channel = 0 s, and the cycle time is optimized.

### **Output range**

With this parameter, you set the output range of the selected output type.

### **Diagnostics, wire break (in current mode)**

When this parameter is enabled, the **Wire break** diagnostics event is generated when a wire break is detected. This diagnostics event cannot be detected in the zero range.

### **Diagnostics, short circuit (in voltage mode)**

If you enable this parameter, a diagnostics event is generated in the event of a short circuit in the output line. This diagnostics event cannot be detected in the zero range.

### **Diagnostics, overload**

If you enable this parameter, the diagnostics event is generated in the event of an overload.

### Substitute values

With this parameter, you enter a substitute value that the module is to output in CPU-STOP mode. The substitute value must be in the nominal range, overrange, or underrange.

### ET 200SP

#### ET 200SP distributed I/O system

#### Definition

The ET 200SP distributed I/O system is a scalable, highly flexible distributed I/O system for connection of process signals to a central controller via a field bus.

#### Application area

The ET 200SP is a multi-functional distributed I/O system for various fields of application. The scalable design allows you to configure the system exactly to the specific requirements on location.

The ET 200SP is approved for degree of protection IP 20 and for installation in a control cabinet.

#### Structure

The ET 200SP is mounted on a mounting rail and comprises:

- An interface module which can communicate with all IO controllers that conform to the PROFINET standard IEC 61158
- Up to 32 I/O modules which can be inserted on passive BaseUnits in any combination
- A server module that completes the design of the ET 200SP.

#### Interface module parameters

#### Status bytes

#### Status bytes

If you enable the "Status bytes" option, 4 bytes of input data are reserved for the status of the supply voltage of each I/O module.

	7	6	5	4	3	2	1	0	
Byte 0	8	7	6	5	4	3	2	1	I/O module slots
Byte 1	16	15	14	13	12	11	10	9	Bit = 0: Load voltage missing or I/O module not present
Byte 2	24	23	22	21	20	19	18	17	Bit = 1: Load voltage and I/O module present
Byte 3	32	31	30	29	28	27	26	25	

---

**Note**

An inserted or missing server module always reports for the slot bit = 0.

---

### Group diagnostics, missing supply voltage L+

#### Group diagnostics, missing supply voltage L+

This diagnostics is a group diagnostics that covers the supply voltage status of all I/O modules of a potential group which are defined by BaseUnits with incoming power supply (light-colored BaseUnit BU...D).

The group diagnostics is formed from the states of the supply voltage of the inserted I/O modules within the potential group.

The group diagnostics does not depend on the "Missing supply voltage L+" parameter of the I/O modules being enabled.

The server module does not influence the missing supply voltage L+ group diagnostics.

#### Requirements for the correct operation of the group diagnostics for missing supply voltage L+:

- I/O modules or BU covers must be inserted on the light-colored and dark-colored BaseUnits. If no I/O module is inserted on a light-colored BaseUnit, the start of this potential group will not be detected by the interface module; the I/O modules of this potential group will thus belong to the previous potential group. A supply voltage L+ group error will then be assigned to the wrong potential group. When an I/O module is inserted on the light-colored BaseUnit, the interface module detects the new potential group, re-evaluates the status, and reports a new group diagnostics in the case of an error.
- The server module must be inserted.  
The server module itself does not influence the missing supply voltage L+ group diagnostics.

### Configuration control

#### Operating principle

Configuration control allows you to operate various real configurations (options) with a single configuration of the distributed I/O device ET 200SP.

Configuration control provides you with the option of configuring the ET 200SP distributed I/O device with its maximum configuration and nevertheless operating it with missing modules. If missing modules are retrofitted later, no new configuration is required and the hardware configuration does not have to be reloaded either.

Using control data records, which are transferred to the interface module in the user program, you define a current preset configuration.

- The configured module is not present on a slot.
  - A base unit cover may be inserted on this slot instead of the configured I/O module. As there is no configured module on the slot, the term "Configuration control with empty slots" is also used.
  - The module that is configured to the right of the missing module can be inserted on this slot instead of the configured module. The missing module makes the actual configuration appear pushed together. As the configured module is missing but no gap arises in the configuration, this is also referred to as a "Configuration without empty slots".
- The configuration is extended by an already configured module.
  - In the case of configuration control with empty spaces, you extend the configuration by inserting the configured module on the corresponding empty slot.
  - In the case of configuration control without empty spaces, insert the configured module on the right-hand side next to the last module of the ET 200SP.

### Addressing the interface module using the hardware identifier

To transfer data record 196 with the instruction WRREC, you must enter the hardware identifier of the interface module as input parameter for the instruction. The system constant of this hardware identifier is, for example, "IO-Device\_2 [Head]". The system constants of a selected device are, for example, displayed in the network view in the "System constants" tab. Use the associated value for addressing.

### More information and examples

For information on the rules for configuration control, the structure of the control data record, and the behavior during operation as well as examples of the structure of the control data record for various configurations, refer to the IM 155-6 PN interface module manual (<http://support.automation.siemens.com/WW/view/en/59768173>).

### Output module parameters

#### Substitute value reaction

#### Substitute value reaction

In the ET 200SP, the substitute value reaction is executed by the IO controller per slot.

The respective output reacts according to its set substitute value reaction:

- "Turn off"
- "Output substitute value"
- "Keep last value"

This substitute value reaction is triggered in the following cases:

- IO controller in STOP
- Controller failure (connection interruption)
- Firmware update
- Reset to factory settings
- More than one I/O module withdrawn simultaneously
- Disable the IO device
- Station stop
  - Missing server module
  - More than one I/O module withdrawn simultaneously
  - At least one I/O module is inserted on the wrong BaseUnit

---

**Note**

**Reducing a configuration**

If you reduce the configuration of the ET 200SP and download the configuration to the CPU, the modules which are no longer configured but still present retain their original substitute value reaction. This applies until the supply voltage on the BaseUnit BU...D or on the interface module is turned off.

---

## **Input module parameters**

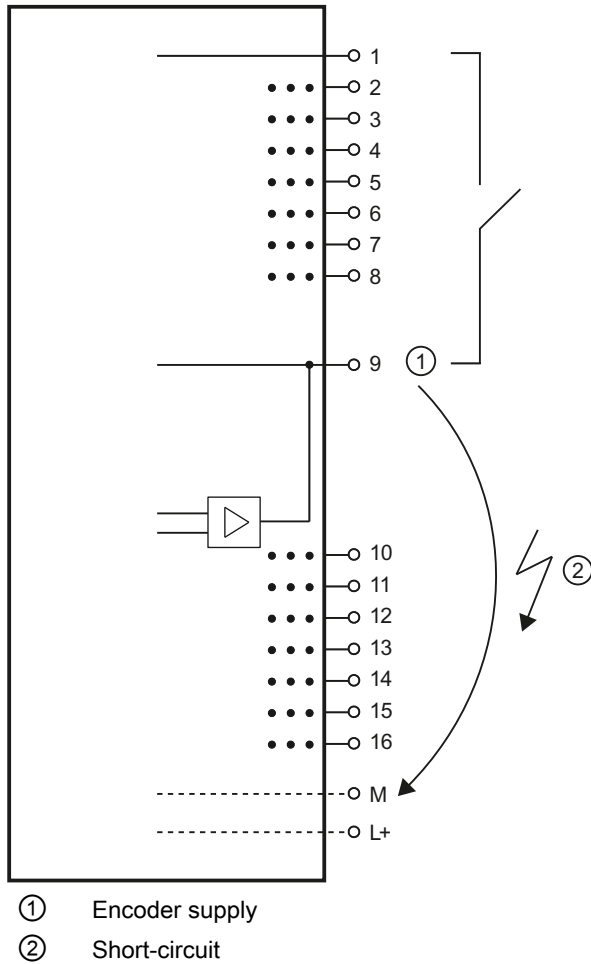

### **Parameters of the digital input modules**

#### **Diagnostics missing supply voltage L+**

Enabling of the diagnostics for missing or insufficient supply voltage L+.

### Diagnostics short-circuit to ground

Enabling of the diagnostics if a short-circuit of the actuator supply to ground occurs.

### Diagnostics short-circuit to L+

Enabling of the diagnostics if a short-circuit of the encoder supply to L+ occurs.

### Diagnostics wire break

Enabling diagnostics if the line to the encoder is interrupted.

### Operating mode

Determines whether a channel is enabled or disabled.

### Pulse extension (only High Feature modules)

Pulse extension is a function for changing a digital input signal. A pulse at a digital input is extended to at least the configured length. If the input pulse is already longer than the configured length, the pulse is not changed.

Pulse extension is started whenever the state of the input signal changes and no pulse extension is active for this channel.

**Potential group of the left module / new potential group**

Specifies whether the I/O module is located on a base unit with supply voltage feed (new potential group) or whether it is located on a base unit without supply voltage feed (in which case it belongs to the potential group of the left module).

**Parameters of the analog input modules**

**Missing supply voltage L+**

Enabling of the diagnostics, with missing or too little supply voltage L+.

**Reference junction (AI 4xRTD/TC 2-/3-/4-wire HF)**

A BaseUnit with internal temperature sensor (BU..T) or the channel 0 of the I/O module can be used as reference junction, provided this has been configured as "Thermal resistance Pt100 climatic range Celsius".

A possible configuration is shown below:

Table 8-75 RTD channel

Setting	Description
No reference channel operation	Temperature value at channel 0 can be used as module-wide reference value if the parameters of the other channels are assigned accordingly.
Reference channel of Group 0	The channel acts as sender for the reference junction temperature of Group 0. Distribution is performed via the interface module.

Table 8-76 TC channel

Setting	Description
Reference channel of the module	The corresponding TC channel uses the channel 0 of the same module as reference junction temperature. This must be set as "Thermal resistance Pt 100 climatic range Celsius" and "No reference channel operation"; otherwise, reference junction diagnostics is triggered.
Internal reference junction	The reference junction temperature is read by an internal temperature sensor on the BaseUnit. Reference junction diagnostics is triggered if there is a wrong BaseUnit type.
Reference channel of Group 0	With the setting "TC" (thermocouple...), the channel acts as receiver for the reference junction temperature of Group 0
Fixed reference temperature	No temperature compensation occurs. The linearization is executed with an assumed reference junction temperature of 0 °C.

**Overflow**

Enabling of the diagnostics if the measured value exceeds the overflow range.

## Underflow

Enabling of the diagnostics if the measured value falls below the underflow range.

## Wire break

Enabling of the diagnostics if the module has no current flow or too low a current flow for the measurement on the corresponding configured input.

## Smoothing

The individual measurements are smoothed using digital filtering. The smoothing can be set in 4 stages, whereby the smoothing factor  $k$  multiplied by the cycle time of the I/O module corresponds to the time constant of the smoothing filter. The larger the smoothing, the larger the time constant of the filter.

The following figure shows the step response for the various smoothing factors depending on the number of module cycles.

Figure 8-5 Smoothing with AI 4×RTD/TC 2-/3-/4-wire HF

## Interference frequency suppression

With analog input modules, suppresses the disturbance caused by the frequency of the AC network used.

The frequency of the AC network may interfere with measured values, particularly for measurements within low voltage ranges and when thermocouples are being used. This parameter is used to define the predominant power frequency of the system.

## Hardware interrupt limits

If the high limit 1/2 or the low limit 1/2 is violated, the module triggers a hardware interrupt.

Below are some examples for the selection of the limits 1 and 2.

### Low limit 1/2

Specify a threshold whose undershoot triggers a hardware interrupt.

### High limit 1/2

Specify a threshold whose overrange triggers a hardware interrupt.

### Potential group of the left module / new potential group

Specifies whether the I/O module is located on a base unit with supply voltage feed (new potential group) or whether it is located on a base unit without supply voltage feed (in which case it belongs to the potential group of the left module).

### Temperature coefficient (measuring type thermoresistor)

The correction factor for the temperature coefficient ( $\alpha$  value) defines the relative rate of change of the resistance of a specific material at a temperature rise of 1 °C.

The temperature coefficient depends on the chemical composition of the material. In Europe, only one value is used per sensor type (default value).

The further values facilitate a sensor-specific setting of the temperature coefficient and enhance accuracy.

Special features of AI 4xRTD/TC 2-/3-/4-wire HF (Page 1119)

## Special features of AI 4xRTD/TC 2-/3-/4-wire HF

### Use of Cu10 sensors

- Select "3-wire thermal resistor" and "Cu10" in the parameter assignment.
- Wire the Cu10 sensor using 3-wire connection technology.
- An automatic, internal compensation of the line resistance of the missing measuring line takes place during operation.

#### Note

To ensure optimum line compensation for Cu10, please note the following:

- The sum of cable resistance and measuring resistance must not exceed 31  $\Omega$ .
- Cable resistance should not exceed 8  $\Omega$  if you want to use the temperature range up to over 312  $^{\circ}\text{C}$ .

Example: A 200 m long copper cable with 0.5 mm<sup>2</sup> core cross-section has approx. 7  $\Omega$ . A lower cross-section reduces the permissible cable length accordingly.

### Use of PTC resistors

PTCs are suitable for temperature monitoring of or as thermal protective equipment for complex drives or transformer windings.

- Select "2-wire resistor" and "PTC" in the parameter assignment.
- Connect the PTC using 2-wire technology.
- Use type A PTC resistors (PTC thermistors) in accordance with DIN/VDE 0660, Part 302.
- If the "Over-/underflow" diagnostics is enabled, a "low limit violation" diagnostics which shows a short circuit is generated for resistance values < 18  $\Omega$ .
- Sensor data on PTC resistance:

Table 8-77 Use of PTC resistors

Property	Technical specifications	Note
Switching points	<b>Reaction to rising temperature</b>

- Assignment in the process image inputs (PII) with SIMATIC S7

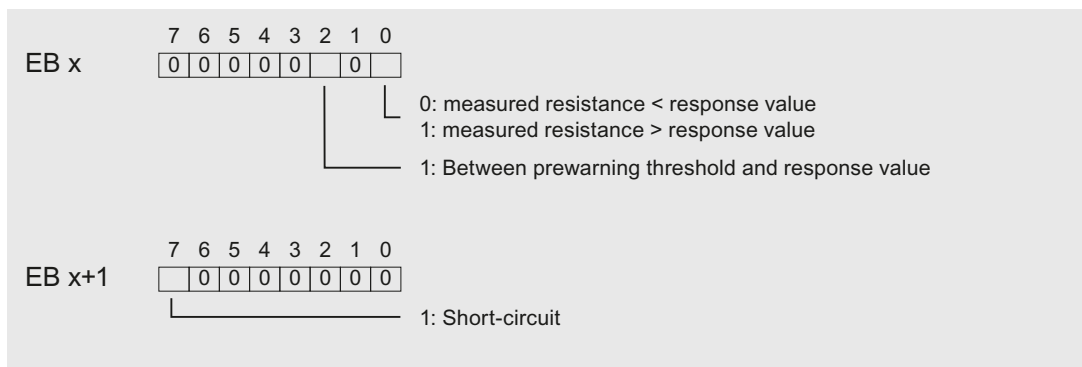

Figure 8-6 Assignment in the process image inputs (PII)

- Notes on programming

**Note**

Only the bits 0+2 are relevant for the evaluation in the process image inputs. You can use the bits 0+2 to monitor the temperature, for example, of a motor.

The bits 0+2 in the process image inputs have no latching function. When you are assigning parameters, take into consideration that a motor, for example, starts up in a controlled manner (via an acknowledgment).

Bits 0+2 can never be set simultaneously, but are instead set consecutively.

For safety reasons, always evaluate the diagnostic entries of the AI 4×RTD/TC 2-/3-/4-wire HF, as no measurement is possible if I/O modules are unplugged, if the supply voltage of the I/O module has failed, or if there is a wire break or short circuit of the measuring lines.

## Example

The following diagram shows the temperature variation and the associated switching points.

Parameters of the analog input modules (Page 1116)

## ET 200MP

### ET 200MP distributed I/O system

## Definition

The ET 200MP distributed I/O system is a scalable and flexible distributed I/O system for connection of process signals to a central controller via a field bus.

## Application area

The ET 200MP is a multi-functional distributed I/O system for various fields of application. The scalable design allows you to configure the system exactly to the specific requirements on location.

The ET 200MP complies with IP 20 degree of protection and is intended for installation in a control cabinet.

## Structure

The ET 200MP is installed on a mounting rail and comprises:

- An interface module that communicates with all IO controllers conforming to the PROFINET standard IEC 61158
- Up to 30 modules (power supply modules and I/O modules from the S7-1500 I/O range) can be inserted to the right of the interface module.
- If you insert a power supply module to the left of the interface module, this yields a possible maximum configuration of 32 modules in total.
- The number of insertable I/O modules is limited by their power requirements.

## Slot rules

- Slot 0: Power supply module (optional)
- Slot 1: Interface module
- Slot 2 to 31: I/O modules or power supply modules

## Interface module parameters

### Supply voltage L+ connected

#### Parameter "Supply voltage L+ connected"

This parameter influences the diagnostics and the checking of the power budget.

- Diagnostics of the ET 200MP:  
If the actual configuration does not conform to the setpoint configuration with regard to the supply voltage of the interface module, the interface module generates a diagnostic alarm.  
Example: You have deactivated the "Supply voltage L+ connected" option, but you have connected the supply voltage in the actual configuration.
- Power budget check during configuration:  
The power budget changes in accordance with the parameter setting: Either the interface module feeds power into the backplane bus or it draws power from the backplane bus.

The default ("Supply voltage L+ connected" option is **activated**) means that the front of the interface module is supplied with 24 V DC and the power is stored in the backplane bus.

If the "Supply voltage L+ connected" option is **deactivated**, the interface module may not be supplied with 24 V DC on the front.

In this case, insert a power supply unit (PS) on the left next to the interface module that supplies the interface module and the modules to the right of the interface module.

---

**Note**

We recommend that you always supply the interface module on the front side with 24 V DC. If a system power supply unit (PS) is inserted and connected additionally **before** or on the left next to the interface module, both the power from the system power supply unit (PS) as well as the power from the integrated power supply of the interface module are then available to the configuration.

In this case, you do not have to change the default setting of the parameter.

---

## Configuration control

### Operating principle

Configuration control allows you to operate various real configurations (options) with a single configuration of the ET 200MP distributed I/O device.

Configuration control provides you with the option of configuring the ET 200MP distributed I/O device with its maximum configuration and nevertheless operating it with missing modules. If missing modules are retrofitted later, no new configuration is required and the hardware configuration does not have to be reloaded either.

Using control data records, which are transferred to the interface module in the user program, you define a current preset configuration.

We distinguish between the following procedures:

- Configuring configuration control without empty slots (option handling)
- Expanding configuration (step-by-step commissioning)

### Requirement

Enable the "Configuration control" option of the interface module ("Configuration control" area). Control takes place with control data record 196 to specify the required configuration.

Configuration control is not ready for operation without a control data record. You transfer the control data record with the instruction WRREC in the user program.

### Addressing the interface module using the hardware identifier

To transfer data record 196 with the instruction WRREC, you must enter the hardware identifier of the interface module as input parameter for the instruction. The system constant of this hardware identifier is, for example, "IO-Device.\_V2 [Head]". The system constants of a selected device are, for example, displayed in the network view in the "System constants" tab. Use the associated value for addressing.

### More information and examples

For information on the rules for configuration control, the structure of the control data record and the behavior during operation, as well as examples of the structure of the control data record for various configurations, refer to the IM 155-5 PN ST interface module manual (<http://support.automation.siemens.com/WW/view/en/67295970>).

### Input module parameters

#### Parameters of the analog input modules

##### Missing supply voltage L+

Enabling of the diagnostics for missing or insufficient supply voltage L+.

##### Wire break

Enabling of the diagnostics if the module has no current flow or the current is too weak for the measurement at the corresponding configured input or the applied voltage is too low.

##### Current limit for wire break diagnostics

Threshold at which a wire break is reported. The value can be set to 1.185 mA or 3.6 mA, depending on the sensor used.

##### Overflow

Enabling of the diagnostics if the measured value exceeds the overrange.

##### Underflow

Enabling of the diagnostics if the measured value undershoots the underrange.

##### Common mode error

Enable diagnostics if the valid common mode voltage is exceeded.

##### Reference channel error (only for AI 8xU//RTD/TC ST)

- Enable diagnostics on error at the temperature compensation channel, e.g. wire break.
- Dynamic reference temperature compensation type is configured and no reference temperature has been transferred to the module yet.

## Temperature coefficient

The temperature coefficient depends on the chemical composition of the material. In Europe, only one value is used per sensor type (default value).

The correction factor for the temperature coefficient ( $\alpha$  value) specifies how much the resistance of a certain material changes when the temperature is raised by 1 °C.

The further values facilitate a sensor-specific setting of the temperature coefficient and enhance accuracy.

## Interference frequency suppression

At analog input modules, this suppresses interference caused by the frequency of AC mains.

The frequency of the AC network may interfere with measured values, particularly for measurements within low voltage ranges and when thermocouples are being used. With this parameter, you define the mains frequency in your system.

## Smoothing

The individual measured values are smoothed using filtering. Smoothing can be set in 4 stages for the analog input modules AI 8xU/I/RTD/TC ST and AI 8xU/I HS.

Smoothing time = number of module cycles (k) x cycle time of the module.

The figure below shows the number of module cycles after which the smoothed analog value is almost 100%, depending on the set smoothing. Is valid for each signal change at the analog input.

- ① None (k = 1)
- ② Weak (k = 4)
- ③ Medium (k = 16)
- ④ Strong (k = 32)

### Reference junction (only for AI 8xU/I/RTD/TC ST)

The following settings can be configured for the reference junction parameter:

Table 8-78 Possible parameter assignments for the reference junction parameter

Setting	Description
Fixed reference temperature	The reference junction temperature is configured and stored in the module as a fixed value.
Dynamic reference temperature	The reference junction temperature is transferred in the user program from the CPU to the module by data records 192 to 199 using the WRREC (SFB 53) instruction.
Internal reference junction	The reference junction temperature is determined using an integrated sensor of the module.
Reference channel of the module	The reference junction temperature is determined using an external resistance thermometer (RTD) at the reference channel (COMP) of the module.

**Note**

**Fixed reference temperature**

During parameter assignment of a thermocouple Type B, only the setting "Fixed reference temperature" with a temperature of 0 °C is possible.

### Enable hardware interrupt 1 or 2

Enable a hardware interrupt if high limit 1 or 2 is exceeded, or low limit 1 or 2 is violated.

### Low limit 1 or 2

Specifies the low limit threshold that triggers hardware interrupt 1 or 2.

### High limit 1 or 2

Specifies the high limit threshold that triggers hardware interrupt 1 or 2.

### Temperature compensation for thermocouples

#### Introduction

You have several options of measuring the reference junction temperature in order to obtain an absolute temperature value as a function of the temperature difference between the reference junction and the measuring point.

You can use various compensation options depending on the required location of the reference junction.

**Note**

During parameter assignment of a thermocouple Type B, only the setting "Fixed reference temperature" with a temperature of 0 °C is possible.

**Options of compensating for the reference junction temperature**

Compensation options	Explanation	Application case
Internal reference junction	<p>With this compensation, the reference junction temperature is determined using an integrated sensor of the module.</p> <p><b>Procedure</b> Connect the thermocouple to the I/O module directly or with compensating lines.</p>	<ul style="list-style-type: none"> <li>• For the connection, you use compensating lines matching the thermocouple material.</li> <li>• If the reference junction temperature and the module temperature are identical in your system, you may also use lines made from a different material.</li> </ul>
Reference channel of the module	<p>The reference junction temperature is determined using an external resistance thermometer (RTD).</p> <p><b>Procedure</b> Connect the thermocouple to the supply lines at the reference junction, either directly or with compensating lines. You connect the supply lines to the appropriate terminals of the module. Connect the resistance thermometer (RTD) to the reference channel of the module. The resistance thermometer (RTD) must be placed in the area of the reference junction.</p>	<ul style="list-style-type: none"> <li>• You want to measure the temperature directly at the reference junction.</li> <li>• The measured temperatures of all channels that you have configured for this compensation type is corrected automatically by the temperature value of the reference junction.</li> <li>• You can use inexpensive lines, e.g., copper lines, from the reference junction to the module.</li> </ul>

Compensation options	Explanation	Application case
Dynamic reference temperature	<p>The temperature of the reference junction is determined via a module. This temperature value is transferred to other modules via a data record in the user program.</p> <p><b>Procedure</b></p> <p>Connect the resistance thermometer (RTD) for the reference junction to any channel.</p> <p>The reference junction temperature is communicated from the CPU to the module by data records 192 to 199 using the WRREC instruction.</p>	<ul style="list-style-type: none"> <li>You use multiple modules at the reference junction and can therefore compensate all channels using a common temperature value.</li> <li>You require only one resistance thermometer (RTD) to acquire the temperature value.</li> <li>You can use inexpensive lines, e.g., copper lines, from the reference junction to the module.</li> </ul>
Fixed reference temperature	<p>The reference junction temperature is stored in the module as a fixed value.</p> <p><b>Procedure</b></p> <p>Connect the thermocouple to the supply lines at the reference junction, either directly or with compensating lines. You connect the supply lines to the appropriate terminals of the module.</p> <p>When configuring the module, specify a fixed temperature value for the reference junction (e.g. 20 °C).</p>	<ul style="list-style-type: none"> <li>You keep the reference junction temperature constant and know the temperature value.</li> <li>You can use inexpensive lines, e.g., copper lines, from the reference junction to the module.</li> </ul>

## Output module parameters

### Parameters of the analog output modules

#### Missing supply voltage L+

Enabling of the diagnostics, with missing or too little supply voltage L+.

#### Short-circuit to ground

Enabling of the diagnostics if a short-circuit of the actuator supply to ground occurs.

#### Wire break

Enabling diagnostics if the line to the encoder is interrupted.

#### Overflow

Enabling of the diagnostics if the measured value exceeds the overflow range.

#### Underflow

Enabling of the diagnostics if the measured value falls below the underflow range.

## **Reaction to CPU STOP**

Determines the reaction of the output to the CPU going into STOP state.

## **Substitute value**

The substitute values are values that the outputs (the output) issue in the event of a CPU STOP.

## **ET 200M**

### **Configuring an ET 200M**

#### **Introduction**

For the ET 200M series, you can find a wide range of modules in the hardware catalog under "Distributed I/O".

#### **Configuration and parameter assignment**

Information on configuration and parameter assignment can be found in the following sections.

#### **ET 200M configuration**

##### **Definition**

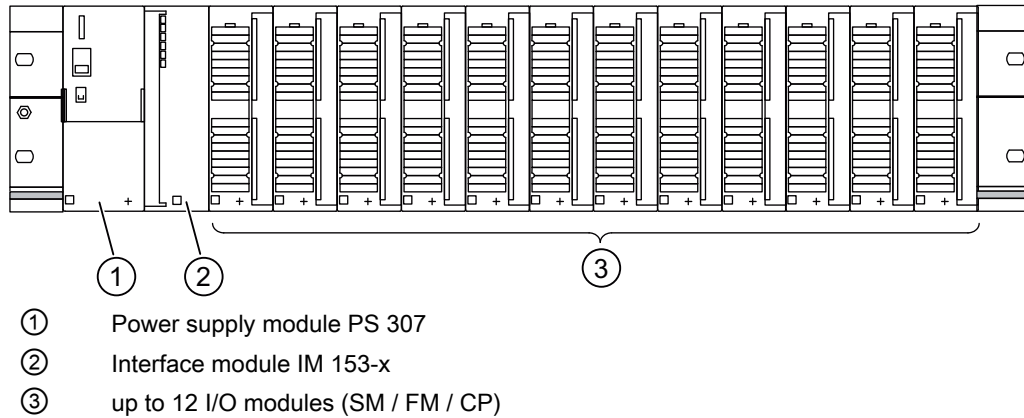

The distributed IO device, ET 200M, is a modular DP slave with an IP 20 degree of protection.

The ET 200M has the configuration technology of the S7-300 automation system and consists of an IM 153-x and I/O modules of the S7-300.

ET 200M supports communication with:

- all DP masters compliant with IEC 61784-1:2002 Ed1 CP 3/1
- all IO controllers compliant with IEC 61158

### Configuration of the ET 200M (example)

### Configuration of the 'Module replacement during operation' function

#### Introduction

The ET 200M supports the "Replace modules during operation" function and the associated pull/plug interrupt.

The "Replace modules during operation" function makes it possible for you to pull modules from or plug modules into the ET 200M rack during operation.

#### Requirement

You have configured an interface module that supports replacing modules during operation. (as of IM 153-1, order no. 153-1AA02-0XB0).

In addition, the configured CPU must also support the function, e.g. for PROFIBUS an S7-400 with DP interface.

You must use the active backplane bus (bus rail with slots) for the hardware configuration. The conventional profile rail with bus connectors between the modules does not support this function.

#### Configuring

If the configuration requirements have been met, the "Replace modules during operation" parameter is available for selection in the inspector window's "Module parameters" area. Below this parameter, a table for the configured modules is displayed, which shows the required active bus modules for the hardware configuration.

For a PROFIBUS configuration, the "Startup if preset configuration does not match actual configuration" option is displayed. This option is automatically enabled if "Replace modules during operation" is enabled.

## Configuring HART variables

### Introduction

Numerous HART field devices make available additional measured quantities (e.g. sensor temperature). These can be read if they are set accordingly in the field device configuration. Using the HART variables, it is possible to apply the set measured values directly from the field device into the I/O area of your automation system.

Regardless of the number of configured channels, a maximum of 8 HART variables can be assigned for HART modules and no more than 4 HART variables per channel. You assign the HART variables to a channel in the properties for the module ("HART variable settings" area).

### Requirement

The HART module is plugged into an ET 200 M (as of IM 153-2, 6ES7 153-2BA02-0AB0).

### Address assignment

The HART module occupies 16 input/output bytes. If you configure HART variables, the module occupies an additional 5 bytes for each HART variable.

If you use all 8 HART variables, the HART input module occupies a total of 56 input/output bytes (16 bytes + 8 x 5 bytes = 56 bytes).

The "None" configuration occupies no additional input bytes.

### Configuration of HART variables

You can configure up to 4 HART variables for a channel

- PV (Primary Variable)
- SV (Secondary Variable)
- TV (Tertiary Variable)
- QV (Quaternary)

CiR is a placeholder that reserves the address space for a HART variable. You must configure the HART variables you are not using with the "None" parameter.

### Configuration of HART variables

The HART variables are structured as follows:

4 bytes of HART data	1 byte QC
----------------------	-----------

### Structure of the "Quality-Code" byte

The Quality-Code (QC) can assume the following values:

Quality-Code (QC)	Meaning
0x4C or 0	Initialization: 0 value of IM and 4C of module
0x18	Communication cancelled / no communication
0x0C	Fault in HART device
0x47	HART device is busy
0x84	OK "Configuration changed"
0x80	OK

### See also

Documentation for HART analog modules (<http://support.automation.siemens.com/WW/view/en/22063748>)

## Signal modules for process automation

### Fundamentals

#### Introduction

Signal modules for the process automation are S7-300 models, such as SM 321; DI 16xNAMUR or SM 322; DO 16x24VDC/0.5A.

They are being operated in a DP slave (IM 153-2).

Unlike standard modules, they offer the following additional technical functions, such as pulse extension and chatter monitoring.

### See also

Changeover contact (Page 1132)

Technological parameters (Page 1133)

### Changeover contact

#### "Changeover contact" sensor type

If the digital inputs of a channel group are configured as "changeover contacts", the module runs diagnostics for the changeover contact sensor type for this channel group.

## Changeover contact

A changeover contact is an auxiliary switch with only one moving switch element with one close setting each for closed and open switching device.

Remember the following rule:

- Always connect a normally open contact to the "even" channel
- Always connect a normally closed contact to the "odd" channel.

The tolerated switchover time between the two channels is fixed at 300 ms.

If the result of the check is negative, then

- the module identifies the value status of the normally open channel as "invalid"
- the module generates a diagnostic entry for the normally open channel
- triggers a diagnostic interrupt (if diagnostic interrupts have been enabled)

The digital input signal and the value status are updated only for the normally open channel. For the normally closed channel, the digital input signal is set permanently to "zero" and the value status to "invalid" since this channel is used only to check the sensor.

Diagnostics depends on the "Selection" parameter (of the sensor). You should also note the special features of diagnostics with the changeover contact sensor type in the "Signal Modules for Process Automation" manual.

## See also

Documentation on modules for process automation (<http://support.automation.siemens.com/WW/view/de/7215812/0/en>)

## Technological parameters

### Pulse extension and flutter monitoring

Pulse extension is a function for changing a digital input signal. A pulse at a digital input is extended to at least the length set in the parameters. If the input pulse is already longer than the specified length, it is not changed.

If you want the pulse to be extended, click in the box to select the time. If you do not want the pulses to be extended, select the "---" entry.

Flutter monitoring is a process control function for digital input signals. It detects and reports signal changes that are unexpected in process control, for example when an input signal fluctuates too often between "0" and "1".

Flutter monitoring is possible only when group diagnostics has also been enabled for this input.

### Monitoring window and number of signal changes

Flutter monitoring works with aid of the two parameters Monitoring window and Number of signal changes.

The first time the signal changes, the time set as the monitoring window is started. If the signal changes more often during this time than allowed by the number of signal changes parameter, this is signaled as a flutter error. If no flutter error is detected during the monitoring window time, the monitoring window can be restarted at the next signal change.

---

**Note**

If you set pulse extension for an input channel, this also affects the flutter monitoring enabled for this channel. The "extended pulse" signal is the input signal for the flutter monitoring. You should therefore make sure that the values set for pulse extension and flutter monitoring are compatible with each other.

---

Documentation on modules for process automation (<http://support.automation.siemens.com/WW/view/de/7215812/0/en>)

**IQ Sense module**

**Properties of 8 IQ-SENSE**

**Properties**

The 8 IQ-SENSE module has the following properties:

- Connection of sensors with IQ-SENSE®, photoelectric proximity switches: for example, reflex sensors, diffuse sensors, and laser sensors.
- It can be used centrally in an S7-300 or distributed in an ET 200M.
- You can connect up to 8 sensors to every module. Each sensor requires a two-wire cable.
- Function reserve that can be assigned parameters.
- Time functions, switching hysteresis, synchronous mode that can be assigned parameters
- Sensitivity and distance values can be specified (*IntelliTeach* using the "IQ-SENSE Opto" FB)
- Teach-in
- Sensors can be removed and inserted during operation (automatic reassignment of parameters)

**Anti-interference group**

Only for optical IQ Sense devices (IQ profile ID 1).

For IQ Sense devices with IQ profile ID 128 (ultrasound), see "Multiplex/synchronous mode" under the channel-specific parameters.

Prevention of interference (e.g., scattered light) by assigning an anti-interference group. This means:

- Anti-interference group: None (= default)  
Optical sensors on one or more modules can mutually influence each other when unfavorably arranged.
- Anti-interference group: 3 or 4  
Optical sensors on the same module with anti-interference group 3 or 4 cannot mutually influence each other. Similarly, optical sensors on different modules with anti-interference group 3 or 4 cannot mutually influence each other. You need not maintain minimum clearance between the IQ Sense devices and can, for example, align two retroreflective sensors on a single reflector.

### Operating principle

The diagram below explains the functioning of the anti-interference group parameter:

Mutual interference is only possible between the optical sensors of the modules in slot 5, 6, 7 and 9 because they are in the same anti-interference group 3 or "None" is set.

#### Note

Sensors in the same anti-interference group must be installed to maintain the minimum clearance (see sensor package insert) and to prevent mutual interference.

### Encoder type

This parameter is used to set the sensor type per channel:

- Reflex sensor or
- Diffuse sensor or
- Disabled

### Diffuse sensor

Table 8-79 Diffuse sensor

Diffuse sensor	Object	
Transmitter Receiver		Circuit state 0: No object detected, which means the object is not in the beam. The receiver does not see any light.
Transmitter Receiver		Circuit state 1: Object detected, which means the object is in the beam. The receiver does not see any light.

### Reflex sensor

Table 8-80 Reflex sensor

Reflex sensor	Object	
Transmitter Receiver		Circuit state 0: No object detected, which means the object is not in the beam. The receiver sees light.
Transmitter Receiver		Circuit state 1: Object detected, which means the object is in the beam. The receiver does not see any light.

### Switching hysteresis

Faults with the diffuse sensor or in the production process can result in signal wobbles. The measured value then changes the switching threshold by 100 % (object detected - object not detected). You can prevent this switching threshold wobble using the switching hysteresis parameter. This will ensure a stable output signal on the sensor.

You can assigned parameters to 5 %/10 %/20 %/50 % for switching hysteresis.

### Requirements

You can only set the switching hysteresis parameter for diffuse sensors with background fadeout.

### Operating principle

Figure 8-7 Switching hysteresis parameter

### Time function,time value

These parameters can be used to set the electronic module for its specific application.

**Operating principle**

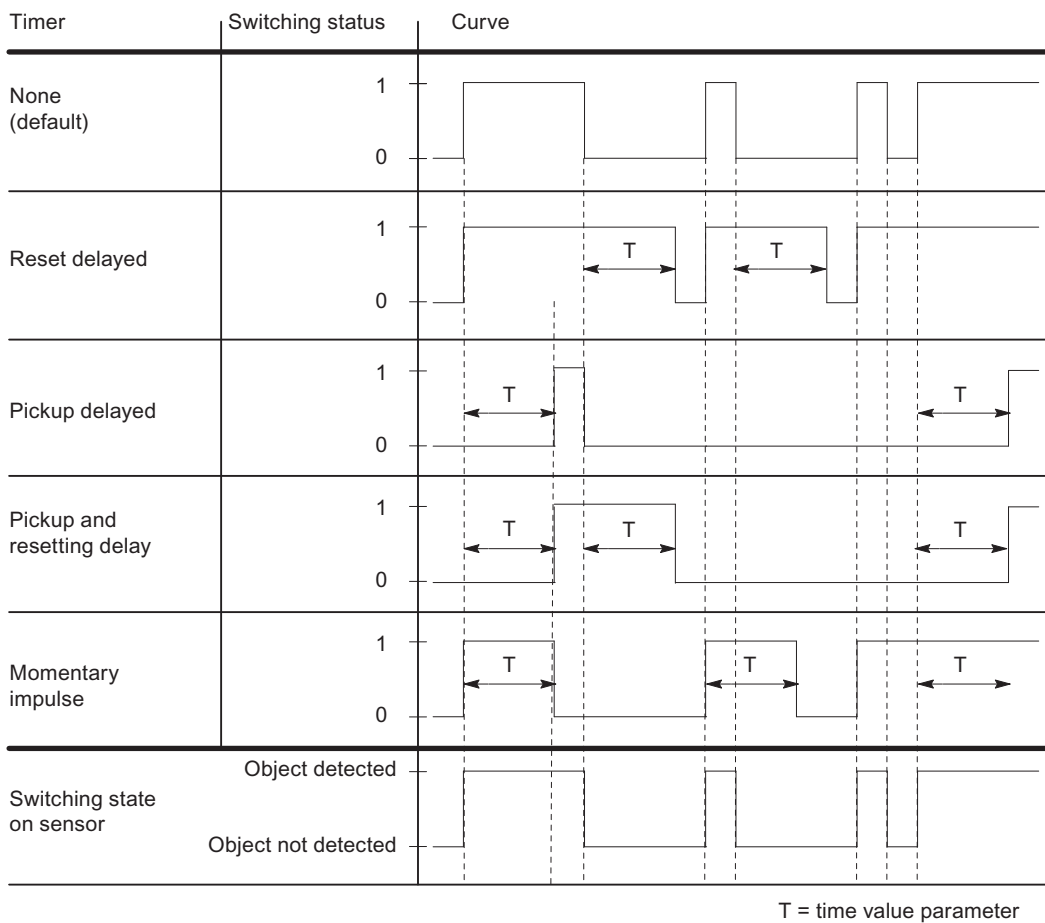

Figure 8-8 Time functions, time values parameters

**Multiplex/synchronous mode**

For the prevention of mutual influence between IQ Sense ultrasound devices in spatial proximity (devices with IQ profile ID 128), use the "Multiplex/synchronous operation" parameter.

**Settings for the multiplex/synchronous mode parameter**

Disabled: Mutual influence between IQ Sense ultrasound sensors in spatial proximity is possible (default). The cycle time is determined by the IQ Sense ultrasound sensor.

Multiplex: The IQ Sense ultrasound sensors determine the process value (distance) one after another, preventing them from affecting one another. The cycle time here is the sum of the configured synchronous cycle times of the IQ Sense ultrasound sensors that are to be multiplexed.

Synchronization: The IQ Sense ultrasound sensors determine the process value (distance) at exactly the same time, preventing them from affecting one another. The cycle time here

corresponds to the greatest configured synchronous cycle time from among the IQ Sense ultrasound sensors that are to be synchronized.

You can, for example, use synchronous operation for a curtain function in which several IQ Sense ultrasound sensors aligned in parallel share a single extended detection area. The sensors simultaneously emit an ultrasound impulse. When an object enters the detection area, the sensor nearest to the object receives the echo most quickly. The object can therefore not only be detected, it can be located as well.

### **AFI value**

Using the AFI value (application series identifier, as defined in the ISO 15693-3 international standard), transponders can be selected for different applications. Only transponders whose AFI value coincides with the value set on the sensor are processed. If a transponder has the AFI value "0", it can be identified and processed regardless of the AFI value of the sensor.

This parameter is only important if it is supported by the ident system, otherwise any value (normally "0") may be assigned.

### **Transponder type**

Depending on the type of the transponder, you must configure whether it is an ISO transponder or a vendor-specific type.

For transponders in accordance with international standard ISO 15693, the value "1" should be selected; for all other types "0" is set. Based on this setting, one of the two possible air interface drivers is selected in the sensor.

This parameter is only important if it is supported by the ID system, otherwise any value (normally "0") may be assigned.

## **ET 200S**

### **Configuring an ET 200S**

#### **Introduction**

For the ET 200S series, you can find a wide range of modules in the hardware catalog under "Distributed I/O".

#### **Assigning parameters**

For information on configuration and parameter assignment, refer to "See also".

## Frequency converters

### Use of the frequency converter

#### Frequency converters

The frequency converter ICU24 and ICU24F ( as fail-safe version) are modular design frequency converters that are completely embedded in the distributed I/O system ET 200S. For parameterization of both modules, please see the following.

#### Message frame

The message frame number and the operating mode of the module are only displayed and cannot be modified.

#### Application ID

You indicate the saved parameters in the frequency converter as a whole with the application ID. Enter an application ID from the value range 0 to 65535. During startup (or pull/plug), this ID is compared with the application ID stored on the converter.

Converters that work with identical applications are usually also identically parameterized and should be identified with the same application ID. Converters with the same application ID may be exchanged between each other. Copying of the complete parameterization of a converter to another converter, for example, via an MMC, is only accepted, if both have the same application ID.

Converters that work with different applications and are parameterized differently must be identified by different application IDs. This prevents a converter with unsuitable parameterization from starting on an incorrect slot, i.e. on the wrong application. This also prevents the parameterization that is saved in the converter from being accidentally overwritten with any parameterization that is stored on an MMC.

#### Enable diagnostic interrupt

You can enable the diagnostic interrupt for the frequency converter. If diagnostic interrupt is enabled, an OB 82 must be available in a CPU to process the diagnostic events.

#### See also

Documentation for the frequency converter (<http://support.automation.siemens.com/WW/view/en/26291825/0/en>)

## ET 200pro

### Use of the frequency converter

#### Frequency converters

The frequency converters ET 200pro FC and ET 200pro F-FC (as fail-safe version) are modularly design frequency converters that are completely embedded in the distributed I/O system ET 200pro. The following section describes how to configure the two modules.

#### Message frame

The message frame number and the operating mode of the module are only displayed and cannot be modified.

#### Application ID

You indicate the saved parameters in the frequency converter as a whole with the application ID. Enter an application ID from the value range 0 to 65535. During startup (or pull/plug), this ID is compared with the application ID stored on the converter.

Converters that work with identical applications are usually also identically configured and should be identified with the same application ID. Converters with the same application ID may be exchanged between each other. Copying of the complete configuration of a converter to another converter, for example, via an MMC, is only applied, if both have the same application ID.

Converters that work with different applications and are configured differently must be identified by different application IDs. This prevents a converter with unsuitable configuration from starting on an incorrect slot, in other words on the wrong application. This also prevents the configuration that is saved in the converter from being accidentally overwritten with any configuration that is stored on an MMC.

#### Enable diagnostic interrupt

You can enable the diagnostic interrupt for the frequency converter. If diagnostic interrupt is enabled, an OB 82 must be available in a CPU to process the diagnostic events.

### 8.1.6.4 IPv6 configuration

#### IPv6 protocol

The Internet Protocol version 6 - called IPv6 below - extends the Internet Protocol version 4 (IPv4) that is used predominantly at the current time.

### Address format IPv6: Notation

IPv6 addresses consist of 8 fields each with four-character hexadecimal numbers (128 bits in total). The fields are separated by a colon.

Example:

fd00:ffff:ffff:ffff:ffff:ffff:2f33:8f21

Rules / simplifications:

- Leading zeros within a field can be omitted.  
Example: fd01:0:ffff::2d12:7d23
- If one or more fields have the value 0, a shortened notation is possible.  
The address fd00:0:0:0:0:0:0:8f21 can also be shortened and written as follows:  
fd00::8f21  
To ensure uniqueness, this shortened form can only be used once within the entire address.
- Decimal notation with periods  
The last 2 fields or 4 bytes can be written in the normal decimal notation with periods.  
Example: The IPv6 address fd00::ffff.125.1.0.1 is equivalent to fd00::ffff:7d01:1

### Entry and appearance

The entry of IPv6 addresses is possible in the notations described above. IPv6 addresses are always shown in the same notation in which they were entered.

### See also

IPv6 with the CP 1543-1 (Page 1142)

### IPv6 with the CP 1543-1

#### Use of IPv6 with the CP 1543-1

The CP supports the Internet Protocol version 4 (IPv4) for all IP services

The additional specification of addresses in IPv6 format can be used with the CP for the following services and applications:

- **FETCH/WRITE**  
Direct write/read access by PC stations, SIMATIC S5 or third-party devices
- **FTP client**  
FTP access from the S7-1500 CPU to an FTP server with the program block FTP\_CMD
- **FTP server**  
FTP access from an FTP client to data areas of the S7-1500 CPU
- **SNMP**  
Data query using MIB objects according to SNMP
- **E-mail**  
Data transfer from the S7-1500 CPU using the program block T\_Mail

## 8.2 Device and network diagnostics

### 8.2.1 Hardware diagnostics

#### 8.2.1.1 Overview of hardware diagnostics

##### Principal methods of hardware diagnostics

##### Principal methods of hardware diagnostics

Hardware diagnostics can be performed as follows:

- Using the Online and Diagnostics view
- Using the "Online Tools" task card
- Using the "Diagnostics > Device Info" area of the Inspector window
- Using diagnostics icons, for example, in the device view and the project tree

##### Structure of the Online and Diagnostics view

The Online and Diagnostics view consists of two windows alongside each other:

- The left window shows a tree structure with folders and - when you open the folder - groups.
- The right window contains detailed information on the selected folder or selected group.

The "Online access" group and the "Diagnostics" and "Functions" folders are located here:

- "Online access" group: Displays whether or not there is currently an online connection with the associated target. In addition, you can establish or disconnect the online connection.
- "Diagnostics": Contains several diagnostics groups for the selected module.
- "Functions": Contains several groups, in which you can make settings for the selected module or issue commands to the module.

##### Function and structure of the "Online Tools" task card

For modules with their own operating mode (such as CPUs), the "Online tools" task card allows you to read current diagnostics information and commands to the module.

If you selected a module without its own operating mode or if you selected several modules before activation of the "Online Tools" task card, the task card relates to the relevant CPU.

The "Online Tools" task card consists of the following panes:

- CPU control panel
- Cycle time
- Memory

---

**Note**

A pane is filled with content only if the module controls the associated functions and an online connection exists.

If there is no online connection to the respective module, the display "No online connection" appears in blue. If an existing online connection was disconnected, then "This target is not available" will be displayed.

---

### Structure of the "Diagnostics" tab of the Inspector window

The "Diagnostics" tab of the Inspector window itself consists of several tabs: Of these tabs, the following is relevant for the hardware diagnostics.

- Device information  
This tab relates to all CPUs of the project to which the online connection is established. Alarms are reported here if one or more CPUs are defective or are not in RUN mode.

### See also

Basics on task cards (Page 263)

Inspector window (Page 261)

### Determination of which of the devices that are connected online are defective

#### Overview of the defective devices

In the "Diagnostics > Device Info" area of the Inspector window you will obtain an overview of the defective devices that are or were connected online.

The "Diagnostics> Device Info" area of the Inspector window consists of the following elements:

- Header line with the number of defective devices
- Table with detailed information on each defective device

If you originate the establishment of an online connection to a device which is not reachable or reports one or more faults or is not in RUN mode, it will rank as defective.

#### Structure of the table with detailed information on the defective devices

The table consists of the following columns:

- Online status: Contains the online status as a diagnostic symbol and in words
- Operating mode: Contains the operating mode as a symbol and in words
- Device / module: Name of the affected device or the affected module

- **Message:** explains the entry of the previous column
- **Details:** The link opens the online and diagnostics view for the device, and places it in the foreground. If an online connection does not exist any longer, the link will open the connection establishment dialog.
- **Help:** The link supplies further information on the defect that has occurred.

### **See also**

Displaying diagnostics status and comparison status using icons (Page 1145)

### **Displaying diagnostics status and comparison status using icons**

#### **Determining diagnostics status online and displaying using icons**

When the online connection to a device is established, the diagnostics status of the device and, if applicable, its lower-level components is determined. The operating state of the device is also determined, where applicable.

The following is a description of which icons are displayed in specific views.

- Device view
  - The associated diagnostic icon is displayed for every hardware component (except the signal board on the CPU).
  - For a hardware component with lower-level components, if there is a hardware error in at least one lower-level component, the diagnostic icon appears as follows: The hardware component's diagnostic icon has a pale appearance and the diagnostic icon "Hardware error in lower-level component" is also shown in the lower right corner.
  - For hardware components with their own operating state, the operating state icon is also displayed to the left of or above the diagnostic icon.
  - The following applies to modules or submodules of a shared device with an S7-1500 CPU: No diagnostic icons are displayed (due to the configuration as GSDML device).
- Device overview
  - The associated diagnostic icon is displayed for every hardware component.
  - For a hardware component with lower-level components, if there is a hardware error in at least one lower-level component, the diagnostic icon appears as follows: The hardware component's diagnostic icon has a pale appearance and the diagnostic icon "Hardware error in lower-level component" is also shown in the lower right corner.
  - The following applies to modules or submodules of a shared device with an S7-1500 CPU: For modules assigned to the CPU, the associated diagnostic icon is displayed (modules that are not assigned do not receive a diagnostic icon). The associated diagnostic icon is displayed for plug-in submodules of an assigned module (submodules that are not pluggable are not visible and therefore do not receive a diagnostic icon).
- Network view
  - The associated diagnostic icon is displayed for every device.
  - For a hardware component with lower-level components, if there is a hardware error in at least one lower-level component, the diagnostic icon appears as follows: The hardware component's diagnostic icon has a pale appearance and the diagnostic icon "Hardware error in lower-level component" is also shown in the lower right corner.
  - The following applies to modules or submodules of a shared device with an S7-1500 CPU: A diagnostic icon is displayed. It belongs to that part of the station that is assigned to the CPU.

- Network overview
  - The associated diagnostic icon is displayed for every hardware component.
  - For a hardware component with lower-level components, if there is a hardware error in at least one lower-level component, the diagnostic icon appears as follows: The hardware component's diagnostic icon has a pale appearance and the diagnostic icon "Hardware error in lower-level component" is also shown in the lower right corner.
  - The following applies to modules or submodules of a shared device with an S7-1500 CPU: A diagnostic icon is displayed. It belongs to that part of the station that is assigned to the CPU.
- Topology view
  - The associated diagnostic icon is displayed for every device.
  - For a hardware component with lower-level components, if there is a hardware error in at least one lower-level component, the diagnostic icon appears as follows: The hardware component's diagnostic icon has a pale appearance and the diagnostic icon "Hardware error in lower-level component" is also shown in the lower right corner.
  - The associated diagnostic icon is displayed for every port. The meaning of the individual colors is described further below.
  - Each cable between two online ports is assigned the color associated with its diagnostics status.  
The color of the cable between two ports depends on the status of the individual ports:

Color of the first port	Color of the second port	Color of the connecting cable
green	green	green
green	gray	gray
green	red	red
gray	red	red

- The following applies to modules or submodules of a shared device with an S7-1500 CPU: A diagnostic icon is displayed. It belongs to that part of the station that is assigned to the CPU.
- Topological overview
  - The associated diagnostic icon is displayed for every hardware component.
  - For a hardware component with lower-level components, if there is a hardware error in at least one lower-level component, the diagnostic icon appears as follows: The hardware component's diagnostic icon has a pale appearance and the diagnostic icon "Hardware error in lower-level component" is also shown in the lower right corner.
  - The following applies to modules or submodules of a shared device with an S7-1500 CPU: A diagnostic icon is displayed. It belongs to that part of the station that is assigned to the CPU.

- Project tree
  - The associated diagnostic icon is displayed behind every hardware component.
  - For a hardware component with lower-level components (e.g., distributed I/O, Slave\_1), if there is a hardware error in at least one lower-level component, the diagnostic icon appears as follows: The hardware component's diagnostic icon has a pale appearance and the diagnostic icon "Hardware error in lower-level component" is also shown in the lower right corner.
  - For hardware components with their own operating state, the operating state icon is also displayed in the top right corner of the diagnostic icon.
  - If forcing is active on a CPU, a red F is displayed at the left margin of the diagnostic icon.
  - The diagnostic icon "Hardware error in lower-level component" is displayed behind the "Local modules" folder when there is a hardware error in at least one of the associated modules.
  - The diagnostic icon "Hardware error in lower-level component" is displayed behind the "Distributed I/O" folder when there is a hardware error in at least one of the associated modules.
  - The diagnostic icon "Hardware error in lower-level component" is displayed behind the project folder when the "Hardware error in lower-level component" diagnostic icon is displayed behind at least one of the "Local modules" or "Distributed I/O" folders.
  - The following applies to modules or submodules of a shared device with an S7-1500 CPU: The associated diagnostic icon is displayed for modules assigned to the CPU (modules that are not assigned are grayed out and do not receive a diagnostic icon). The associated diagnostic icon is displayed for plug-in submodules of an assigned module (submodules that are not pluggable are not visible and therefore do not receive a diagnostic icon).

---

**Note**

If the diagnostic for a hardware component is "not reachable from the CPU", the diagnostic icon "Hardware error in lower-level component" is not additionally shown.

---

**Diagnostic icons for modules and devices**

The following table shows the available icons and their respective meaning.

Icon	Meaning
	The connection with a CPU is currently being established.
	The CPU is not reachable at the set address.
	The configured CPU and the CPU actually present are of incompatible types.
	On establishment of the online connection to a protected CPU, the password dialog was terminated without specification of the correct password.
	No fault

Icon	Meaning
	Maintenance required
	Maintenance demanded
	Error
	The module or device is deactivated.
	The module or the device cannot be reached from the CPU (valid for modules and devices below a CPU).
	Diagnostics data are not available because the current online configuration data differ from the offline configuration data.
	The configured module or device and the module or device actually present are incompatible (valid for modules or devices under a CPU).
	The configured module does not support display of the diagnostics status (valid for modules under a CPU).
	The connection is established, but the module status has not yet been determined or is unknown.
	The configured module does not support display of the diagnostics status.
	Hardware error in lower-level component: A hardware error is present in at least one lower-level hardware component. (occurs as a separate icon only in the project tree)

#### Note

Some modules, for example, the FM 450-1, are only indicated as having a problem in the case of an error if you have enabled the diagnostic interrupt when assigning the module property parameters.

### Icons for the comparison status

The diagnostic icons can be combined at the bottom right with additional smaller icons that indicate the result of the online/offline comparison. The following table shows the available comparison icons and their meaning.

Icon	Meaning
	Hardware error in lower-level component: The online and offline versions differ (only in the project tree) in at least one lower-level hardware component.
	Software error in lower-level component: The online and offline versions differ (only in the project tree) in at least one lower-level software component.
	Online and offline versions of the object are different
	Object only exists online
	Object only exists offline
	Online and offline versions of the object are the same

**Note**

If both a comparison icon and the "Error in lower-level component" diagnostic icon are to be displayed at the bottom right in the device view, the following rule applies: The diagnostic icon for the lower-level hardware component has a higher priority than the comparison icon. This means that a comparison icon is only displayed if the lower-level hardware components have no errors.

**Display of software errors in the project tree**

- The associated comparison icon is shown behind each block.
- Behind each folder, under which exclusively blocks are contained, the diagnostic icon "Software error in lower-level component" is displayed when there is a software error in at least one of the associated blocks.
- For a hardware component with lower-level software components, if there is no hardware error and there is an error in at least one lower-level software component, the diagnostic icon appears as follows: The hardware component's diagnostic icon has a pale appearance and the diagnostic icon "Software error in lower-level component" is also shown in the lower right corner.

**Combined diagnostics and comparison icons**

The following table shows examples of icons that are displayed in the diagnostics icon.

Icon	Meaning
	Folder contains objects whose online and offline versions differ (only in the project tree)
	Object only exists online

**Operating state icons for CPUs and CPs**

The following table shows the available icons and their respective operating states.

Icon	Operating state
	RUN
	STOP
	STARTUP
	HOLD
	DEFECTIVE

Icon	Operating state
	Unknown operating state
	The configured module does not support display of the operating state.

**Note**

If forcing is active on a CPU, a red F is displayed on a pink background at the bottom right of the operating state icon.

**Color marking of ports and Ethernet cables**

The following table shows the available colors and their respective meaning.

Color	Meaning
	No fault or maintenance required
	Maintenance demanded
	Communication error or topological error
	no diagnostic capability

**Start online and diagnostics view**

**Overview of possible ways of starting the Online and Diagnostics view**

You can start the Online and Diagnostics view of a module to be diagnosed at the following locations:

- Overview
- Project tree
- Device view
- Device overview
- Network view
- Network overview
- Topology view

In the following, examples are used to show how to proceed.

## Requirement

The project with the module to be diagnosed is open.

---

### Note

This requirement does not apply if you call the online and diagnostics view from the project tree after you have identified the accessible devices.

---

## Procedure

To start the online and diagnostics view of a module, follow these steps:

1. In the project tree, open the respective device folder.
2. Double click on "Online & Diagnostics".

Or:

1. In the project tree, select the respective device folder.
2. Select the "Online & Diagnostics" command in the shortcut menu or the "Online" main menu.

Or:

1. In the project tree, open the "Online access" folder.
2. Open the folder for the interface with which you want to establish the online connection.
3. Double click on "Show/Update accessible devices".
4. Select the module to be diagnosed.
5. Select the "Online & Diagnostics" command in the shortcut menu or the "Online" main menu.

Or:

1. In the project tree, open the "Local modules" folder.
2. Select the respective device or the module that is to be diagnosed.
3. Select the "Online & Diagnostics" command in the shortcut menu or the main menu.

Or:

1. Open the device view in the device configuration.
2. Select the module to be diagnosed.
3. Select the "Online & Diagnostics" command in the shortcut menu or the "Online" main menu.

Or:

1. Open the device view in the device configuration.
2. Establish an online connection to the module to be diagnosed.
3. Double-click on the diagnostics icon above the module.

Or:

1. Open the network view in the device configuration.
2. Select the station with the module to be diagnosed.
3. Select the "Online & Diagnostics" command in the shortcut menu or the "Online" main menu.

Or:

## **Result**

The online and diagnostics view of the module to be diagnosed will be started. If an online connection to the associated CPU had previously been created, the header bar of the Online and Diagnostics view will now have an orange background.

---

### **Note**

If no online connection exists when the online and diagnostics view is started, no online information is displayed and the display fields remain empty.

---

## **Activation of the "Online Tools" task card**

### **Activation of the "Online Tools" task card**

You can activate this task card as follows:

1. Start the online and diagnostics view.
2. Click on the "Online Tools" task card.

Or:

1. Start the device view.
2. Click on the "Online Tools" task card.

Or:

1. Start the network view.
2. Click on the "Online Tools" task card.

## **8.2.1.2 Showing non-editable and current values of configurable module properties**

### **Showing general properties and system-relevant information for a module**

#### **Where do I find the information I need?**

The general properties and system-relevant information for a module can be found in the "General" group in the "Diagnostics" folder in the online and diagnostics view of the module to be diagnosed.

### Structure of the "General" group

The "General" group consists of the following areas:

- Module
- Module information
- Vendor information

### "Module" area

This area shows the following data of the module:

- Short designation, for example, CPU 1214C DC/DC/DC
- Order no.
- Hardware
- Firmware
- Racks
- Slot

### "Module information" area

This area shows the following data of the module that you configured during hardware configuration:

- Module name
- Installation date (not displayed for all modules)
- Additional information (not displayed for all modules)

### "Manufacturer information" area

This area shows the following data of the module:

- Manufacturer
- Serial number
- Profile: Profile ID as hexadecimal number

---

#### Note

You will find the corresponding profile name in the profile ID table for PROFIBUS International (see "[www.profibus.com](http://www.profibus.com)").

---

- Profile details: Profile-specific type as hexadecimal number

---

#### Note

You will find the corresponding profile-specific type name in the profile-specific type table for PROFIBUS International (see "[www.profibus.com](http://www.profibus.com)").

---

## Display configured cycle times

### Where do I find the information I need?

The required information can be found in the following places:

- In the "Cycle time" group of the "Diagnostics" folder in the Online and Diagnostics view of the module to be diagnosed.
- In the "Cycle time" pane of the "Online Tools" task card

### Structure of the "Cycle time" group in the "Diagnostics" folder of the Online and Diagnostics view

The "Cycle time" group consists of the following areas:

- Cycle time diagram (graphical display of the assigned and measured cycle times)
- Cycle time configured (display of the assigned cycle times as absolute values)
- Cycle times measured (display of the measured cycle times as absolute values)

### Structure of the "Cycle time" pane of the "Online Tools" task card

The "Cycle time" pane displays the cycle time diagram and below it the measured cycle times as absolute values.

### Assigned cycle times

The following assigned cycle times are displayed in the cycle time diagram and in the "Cycle time configured" area.

- Minimum cycle time
- Maximum cycle time

In the cycle time diagram, the minimum cycle time and the maximum cycle time correspond to the two markings on the time axis.

In the "Cycle time configured" area, the assigned cycle times are displayed as absolute values.

## Show interfaces and interface properties of a module

### Where do I find the information I need?

The interfaces and interface properties of a module can be found in the "Diagnostics" folder in the online and diagnostics view of the module to be diagnosed in the following group:

- PROFINET interface

### "PROFINET interface" group

This group is divided into the following areas:

- "Ethernet address" with the "Network connection" and "IP Parameters" subareas
- "Ports"

### "Network connection" subarea of the "Ethernet address" area

This subarea shows the following data for the module:

- MAC Address:  
MAC address of the interface.  
The MAC address consists of two parts. The first part ("Basic MAC address") identifies the manufacturer (Siemens, 3COM, ...). The second part of the MAC address differentiates between the various Ethernet devices. Each Ethernet module is assigned a unique MAC address.

### "IP Parameters" subarea of the "Ethernet address" area

This subarea shows the following data for the module:

- IP address:  
Internet protocol address of the device on the bus (TCP/IP)
- Subnet mask:  
The subnet mask shows which part of the IP address determines the membership of a particular sub-network.
- Default router:  
If the subnet is connected via a router to other subnets, the IP address of the default router must be known. This is the only way a datagram can be forwarded with a non-matching subnet address.
- IP settings:  
Identifier for the path by which the device has obtained its IP settings (IP address, subnet mask, default router).

Identifier	Meaning
0	IP address is not initialized
1	By configuration (i.e., by the configuration loaded to the device from the device or network view)
2	Via the "Assign IP address" group of the online and diagnostics view

Identifier	Meaning
3	Via the DHCP server (i.e., the IP parameters are obtained by a special service from a DHCP server (Dynamic Host Configuration Protocol) and assigned for a limited time)
4	IP address is set by a user program
5	Source of IP address unknown

- IP setting time:  
Time stamp of the last change to the IP address directly through the Ethernet connection of the module

### "Ports" area

This area shows the following data for the module:

- Ethernet ports  
Physical properties of the PROFINET interface

Properties of the PROFINET interface	Meaning
Port no.	Port number The short description of interface (X + interface no.) and port (P + port no.) is specified in parentheses. An "R" in the short description of a port means that it is a ring port.
Status	Displays the status of the port LINK LED. <ul style="list-style-type: none"> <li>• Status "OK" means another device (such as a switch) is connected to the port and the physical connection is available.</li> <li>• Status "disconnected" means no other device is connected to the port.</li> <li>• Status "deactivated" means that access to the port is blocked.</li> </ul>
Settings	<ul style="list-style-type: none"> <li>• "Automatic" for automatic network settings of the device</li> <li>• Network settings for speed and transmission method for manual network settings of the device</li> </ul>
Operating mode	Network settings for speed and transmission method

If you select a line in the port table, additional help information will be provided for the corresponding port.

## Displaying IO controllers that access modules of a Shared Device

### Where do I find the information I need?

The display of those IO controllers that access the modules of a Shared Device can be found in the Online and Diagnostics view of the interface module of the Shared Device in the "Diagnostics" folder in the following area of the "PROFINET interface" group:

- IO controller

## Displaying sync domain properties of a PROFINET device

### Where do I find the information I need?

The sync domain properties of a PROFINET device can be found in the following area of the "PROFINET interface" group in the "Diagnostics" folder of the Online and Diagnostics view of the device to be diagnosed:

- Domain

### "Domain" area

This area is divided into the following subareas:

- Sync domain
- MRP domain

### What is a sync domain?

A sync domain is a group of PROFINET devices that are synchronized to a common clock. Exactly one device has the role of the sync master (clock generator); all other devices assume the role of a sync slave. The sync master is usually an IO controller or a switch.

Non-synchronized PROFINET devices are not part of a sync domain.

### "Sync domain" subarea of the "Domain" area

This subarea shows the following properties of the sync domain:

- Name:  
Name of sync domain
- Role:  
Role of the PROFINET device in the sync domain. The following roles are possible:
  - Sync master
  - Sync slave
- Synchronization interval:  
Interval at which the synchronization is performed

- Send clock  
Smallest possible send interval for the data exchange
- Jitter accuracy of the send clock
- Reserved bandwidth for cyclic communication

## Displaying MRP domain properties of a PROFINET device

### Where do I find the information I need?

The MRP domain properties of a PROFINET device can be found in the following area of the "PROFINET interface" group in the "Diagnostics" folder of the Online and Diagnostics view of the device to be diagnosed:

- Domain

### "Domain" area

This area is divided into the following subareas:

- Sync domain
- MRP domain

### What is an MRP domain?

The Media Redundancy Protocol (MRP) enables redundant networks to be structured. Redundant transmission paths (ring topology) ensure that, if one transmission path fails, an alternative communication path is available. The PROFINET devices that are part of this redundant network form an MRP domain.

### "MRP domain" subarea of the "Domain" area

This subarea shows the following properties of the MRP domain:

- Name:  
Name of MRP domain
- Role:  
Role of the PROFINET device in the MRP domain. The following roles are possible:
  - Manager
  - Manager (Auto)
  - Client
  - Not a device of the ring
- Ring port 1:  
The port of the PROFINET device that has the "Ring port 1" property

## 8.2 Device and network diagnostics

- Ring port 2:  
The port of the PROFINET device that has the "Ring port 2" property
- Status of the MRP ring:  
Indicates whether the ring is interrupted ("open" status) or not ("closed" status).

### Displaying current firmware of a module

#### Displaying firmware

You can display the currently installed firmware of a module.

#### Requirements

- The module supports a firmware update.
- The module is connected online.

#### Procedure

To display the current firmware, follow these steps:

1. Open the module in the Online and Diagnostics view.
2. Select the "Firmware update" group in the "Functions" folder.
3. You read off the current firmware in the "Online data" area under "Firmware".

### 8.2.1.3 Showing the current values of dynamic modules properties

#### Display measured cycle times

##### Where do I find the information I need?

The measured cycle times can be found at each of the following places:

- In the "Cycle time" group of the "Diagnostics" folder in the Online and Diagnostics view of the module to be diagnosed.
- In the "Cycle time" pane of the "Online Tools" task card

##### Structure of the "Cycle time" group in the "Diagnostics" folder of the Online and Diagnostics view

The "Cycle time" group consists of the following areas:

- Cycle time diagram (graphical display of the assigned and measured cycle times)
- Cycle time configured (display of the assigned cycle times as absolute values)
- Cycle times measured (display of the measured cycle times as absolute values)

## Structure of the "Cycle time" pane of the "Online Tools" task card

The "Cycle time" pane displays the cycle time diagram and below it the measured cycle times as absolute values.

### Graphical display of the measured cycle times

The following measured cycle times are displayed in the cycle time diagram:

- Shortest cycle time: Duration of the shortest cycle since the last transition from STOP to RUN  
This corresponds to the dashed gray arrow on the left in the diagram.
- Current / last cycle time: Duration of the last cycle  
This corresponds to the green arrow in the diagram. If the current / last cycle time exceeds the maximum cycle time, the arrow will turn red.

---

#### Note

If the duration of the last cycle comes close to the maximum cycle time, it may be possible that it will be exceeded. Depending on the CPU type, parameter assignment and your user program, the CPU can switch to STOP mode. If for instance you are monitoring the tags in your program, this will increase the cycle time.

If the cycle lasts longer than double the maximum cycle time, and you do not restart the maximum cycle time in the user program (by calling the extended RE\_TRIGR) instruction, the CPU will switch to STOP mode.

---

- Longest cycle time: Duration of the longest cycle since the last transition from STOP to RUN.  
This corresponds to the dashed blue arrow on the right in the diagram.

A blue band extends between the two dashed lines; this band corresponds to the entire range of the measured cycle times. If a measured cycle time is greater than the maximum cycle time, the portion of the band that lies outside the assigned limits will be colored red.

### Display of the measured cycle times as absolute values

The following measured times are displayed in the "Cycle times measured" area and in the "Cycle time" pane.

- Shortest cycle time since the last transition from STOP to RUN.
- Current/last cycle time:
- Longest cycle time since the last transition from STOP to RUN.

### Showing the current status of the LEDs of a CPU

#### Where do I find the information I need?

The current status of the LEDs of a CPU can be found in the display area of the "CPU control panel" pane of the "Online tools" task card.

### Display area of the "CPU control panel" pane of the "Online Tools" task card

This area contains the following displays:

- Station name and CPU type (short designation)
- RUN / STOP (corresponds to the "RUN / STOP" LED of the CPU)
- ERROR (corresponds to the "ERROR" LED on the CPU)
- MAINT (corresponds to the "MAINT" LED on the CPU)

### Showing fill levels of all types of memory on a CPU

#### Where do I find the information I need?

The fill levels of all types of memory on a CPU can be found on the following two pages:

- In the display area of the "Memory" group in the "Diagnostics" folder in the online and diagnostics view of the module to be diagnosed
- In the display area of the "Memory" pane on the "Online Tools" task card

### Display area of the "Memory" group in the "Diagnostics" folder of the online and diagnostics view

This area contains the current memory utilization of the associated module and details of the individual memory areas.

The memory utilization is shown both as a bar diagram and as a numerical value (percentage).

The following memory utilizations are shown:

- Load memory  
If no memory card is inserted, the internal load memory is displayed.  
If a memory card is inserted, the operating system only uses the inserted load memory as the load memory. This is displayed here.
- Work memory
- Retentive memory

### Display area of the "Memory" pane of the "Online Tools" task card

This area contains the current memory utilization of the associated module. The available memory is shown both as a bar diagram and as a numerical value (percentage). The numerical value is rounded to an integer value.

---

#### Note

If less than 1% of a memory area is utilized, the available portion of this memory area is shown as "99%".

---

The following memory utilizations are shown:

- Load memory  
If no memory card is inserted, the internal load memory is displayed.  
If a memory card is inserted, the operating system only uses the inserted load memory as the load memory. This is displayed here.
- Work memory
- Retentive memory

### See also

## Displaying fill level of all types of memory of an S7-1500 CPU

### Where do I find the information I need?

The fill levels of all types of memory of an S7-1500 CPU can be found at the following two places:

- In the display area of the "Memory" group in the "Diagnostics" folder in the online and diagnostics view of the module to be diagnosed
- In the display area of the "Memory" pane on the "Online Tools" task card

### Display area of the "Memory" group in the "Diagnostics" folder of the online and diagnostics view

This area contains the current memory utilization of the associated module and details of the individual memory areas.

The memory utilization is shown both as a bar diagram and as a numerical value (percentage).

The following memory utilizations are shown:

- Load memory

---

#### Note

The load memory is located on the SIMATIC memory card.

---

- Code work memory: work memory for program code
- Data work memory: work memory for data blocks
- Retentive memory

### Display area of the "Memory" pane of the "Online Tools" task card

This area contains the current memory utilization of the associated module. The available memory is shown both as a bar diagram and as a numerical value (percentage). The numerical value is rounded to an integer value.

---

#### Note

If less than 1% of a memory area is utilized, the available portion of this memory area is shown as "99%".

---

The following memory utilizations are shown:

- Load memory

---

#### Note

The load memory is located on the SIMATIC memory card.

---

- Code work memory: work memory for program code
- Data work memory: work memory for data blocks
- Retentive memory

### 8.2.1.4 Checking a module for defects

#### Determining the diagnostic status of a module

##### Where is the diagnostics status of a module displayed?

The diagnostic status of a module is displayed in the "Diagnostic status" group in the "Diagnostics" folder in the online and diagnostics view of the module to be diagnosed.

The "Diagnostics status" group consists of the following areas:

- Status
- Standard diagnostics (for S7-300 and S7-400 only for non-CPU modules)

## "Status" area

The following status information is displayed in this area:

- Status of the module as viewed by the CPU, for example:
  - Module available and OK.
  - Module defective.  
If the module experiences a fault and you have enabled the diagnostic error interrupt during configuration, the "Module defective" status is displayed.
  - Module configured, but not available.  
Example: Diagnostics data is not available because the current online configuration differs from the offline configuration.
- Detected differences between the configured and the inserted module. Provided it can be ascertained, the order number will be displayed for the set and actual type.

The scope of the displayed information depends on the selected module.

## "Standard diagnostics" area

The following diagnostics information for non-CPU modules is displayed in this area:

- Internal and external faults that relate to the overall module
- Associated diagnostics events

Examples of such diagnostics information are:

- Entire backup failed
- Module defective

---

### **Note**

#### **Diagnostic interrupts**

A diagnostic interrupt can be reported to the CPU only if the module has diagnostic interrupt capability and the diagnostic interrupt has been enabled.

The display of the diagnostic interrupt is a snapshot. Sporadic module defects can be identified in the diagnostics buffer of the respective CPU.

---

## Reading out the diagnostics buffer of a CPU

### Where do you read out the diagnostics buffer of a CPU?

You read out the diagnostics buffer of a CPU in the "Diagnostics buffer" group in the "Diagnostics" folder in the Online and Diagnostics view.

### Structure of the "Diagnostics buffer" group

The "Diagnostics buffer" group consists of the following areas:

- "Events"
- "Settings"

### Diagnostics buffer

The diagnostics buffer is used as a log file for the diagnostics events that occurred on the CPU and the modules assigned to it. These are entered in the order of their occurrence, with the latest event shown at the top.

### "Events" area

The "Events" area consists of the following elements:

- Check box "CPU time stamp takes into account local PG/PC time"
- Event table
- "Freeze display" or "Cancel freeze" button
- Details of the event: Event no., event ID, description, time stamp, incoming/outgoing information
- "Help on event", "Open in editor", "Save as ..." buttons

### Check box "CPU time stamp takes into account local PG/PC time"

If you have not activated the check box, the diagnostics buffer entries are shown with the module time.

If you have activated the check box, the diagnostics buffer entries are shown with the time given by the following formula:

Displayed time = module time + time zone offset on your programming device / PC

This requires the module time to be identical to UTC.

You should use this setting if you wish to see the times of the diagnostics buffer entries for the module expressed in the local time of your programming device / PC.

Selecting or clearing the check box immediately changes the times displayed for the diagnostics buffer entries.

---

#### Note

If you use the "WR\_SYS\_T" instruction in your program or if you set the real-time clock of the CPU using an HMI device instead of using UTC, we recommend that you clear the "CPU time stamp takes into account local PG/PC time" check box. In this case, the module time is the sole time of concern.

---

## Event table

The following information is displayed in the table for each diagnostics event:

- Sequential number of the entry  
The first entry contains the latest event.
- Date and time of the diagnostics event  
If no date and time are shown, the module has no integral clock.
- Short name of the event and, if applicable, the reaction of the CPU

---

### Note

If an individual parameter of a text cannot be determined, the character string "###" is shown in its place.

If no display text is yet available for new modules or new events, the numbers of the events and the individual parameters are stated as hexadecimal values.

---

- Icon for information related to incoming/outgoing status  
The following table shows the available icons and their respective meaning.

Icon	Meaning
	Incoming event
	Outgoing event
	Incoming event to which there is no independent outgoing event
	User-defined diagnostics event

- Only for S7-1200 and S7-1500 CPUs: Icon for the severity of the event  
The following table shows the available icons and their respective meaning.

Icon	Meaning
	No maintenance and/or no fault
	Maintenance required
	Maintenance demanded
	Error

You can change the order of the columns, adjust the column widths and remove and add individual columns in the event table. In addition, you can sort as follows: by sequential number, by "Date and time" and by "Event".

## "Freeze display" or "Cancel freeze" button

The "Freeze display" or "Cancel freeze" button is only enabled when there is an online connection to the CPU.

The default setting is "Freeze display".

The following happens when you click the "Freeze display" button:

- The current display of the diagnostics buffer entries is frozen.
- The labeling of the button changes to "Cancel freeze".

If an error has occurred in your system, diagnostics events can occur very quickly in succession. This produces a high update rate on the display. Freezing the display allows you to calmly examine the situation in more detail.

If the display is frozen and you click the "Cancel freeze" button, the following happens:

- The display of the diagnostics buffer entries is updated again.
- The labeling of the button changes to "Freeze display".

---

**Note**

If you freeze the diagnostics buffer display, the CPU continues to enter events in the diagnostics buffer.

---

### Details of the event

If you select a line in the list of events, you obtain detailed information on the respective event:

- Sequential number of the event in the diagnostics buffer
- Event ID
- Description of the event with event-dependent additional information. Examples of this additional information:
  - Command that caused the event
  - Operating mode switch caused by the diagnostics event
- Time stamp
- Only for S7-1200 and S7-1500 CPUs: Associated I&M data (module, rack/slot, plant designation, location designation)
- Priority of the event
- Information on whether the event is an incoming or outgoing event

### "Help on event" button

If you click on this button, the selected event is explained in more detail and any remedies given.

---

**Note**

For a small number of events, the "Help on event" button is grayed out.

---

### "Open in editor" button

The following table shows if the "Open block" button is active and which function it conceals.

When is the "Open in editor" button enabled?	What happens when you click this button?
If the diagnostics event references the relative address of a block. This is the address of the command that caused the event.	The "Open in editor" function opens the referenced block in the offline view at the programming instruction that causes the error. This allows you to check and, if necessary, change the source code of the block at the specified place and then download it again to the CPU.
If the diagnostics event was triggered by a module.	The "Open in editor" function opens the Device view of the module involved.

### "Save as ..." button

If you click this button, the content of the diagnostics buffer is saved in a text file. "Diagnostics", depending on the language, with the extension ".txt" is suggested as the file name. You can however change this name.

### "Settings" area

The "Settings" area consists of the following elements:

- "Display events" list
- "Apply settings as default" button
- "Output event information in hexadecimal format" check box

### "Display events:" list

There is a check box in this list for every event class (default setting: all check boxes are selected). If you clear a check box, the events of that event class are no longer displayed in the "Events" area. Reselecting the check box displays the associated events once again.

### "Apply settings as default" button

If you click this button, the settings are also applied to future occasions when the "Events" tab is opened.

### "Output event information in hexadecimal format" check box

If you select the check box, the event IDs in the Events list of the "Events" area are displayed in hexadecimal format. If you clear the check box, the event information is given in text form.

### See also

Basic information on the diagnostics buffer (Page 1187)

## **Saving service data**

### **Purpose**

In the event of servicing it may be possible that the SIEMENS Customer Support requires very special information about the state of a module of your system for diagnostic purposes.

If such a case occurs in your system, you will be asked by Customer Support to save the service data of the module and send the resulting file to them.

### **Where do you carry out the saving of service data of a module?**

You carry out the saving of service data of a module in its online and diagnostics view at the following points: In the "Functions" folder in the "Save service data" group"

The "Save service data" group consists of the following areas:

- Online data
- Saving service data

### **"Online data" area**

This area shows the following data for the module:

- Order number
- Firmware version
- Module name (you configured this while configuring the hardware.)
- Rack
- Slot

### **"Save service data" area**

Proceed as follows to create and save a file with special service data:

1. Select the point in the file system at which you want to save the file:
  - You use the path preset in the "Path" field.
  - Click the three-dot (browse) button. In the dialog that opens specify the desired path and enter the file name.
2. Click the "Save data" button.

### 8.2.1.5 Changing the properties of a module or the programming device/PC

#### Changing the mode of a CPU

##### Requirement

There is an online connection to the CPU whose mode you want to change.

##### Procedure

To change the mode of the CPU, follow these steps:

1. Enable the "Online tools" task card of the CPU.
2. Click the "RUN" button in the "CPU control panel" pane if you want to change the CPU to RUN mode or the "STOP" button if you want to change the CPU to STOP mode.

---

**Note**

The only button active is the one that can be selected in the current operating mode of the CPU.

---

3. Acknowledge the confirmation prompt with "OK".

Or:

1. Open the "Online" menu.
2. Choose the "Start CPU" menu command if you want to set the CPU to RUN mode and "Stop CPU" if you want to set the CPU to STOP mode.

---

**Note**

The only button that is active is the one that can be chosen in the current operating mode of the CPU.

---

3. Acknowledge the confirmation prompt with "OK".

Or:

1. Click the "Start CPU" button in the toolbar if you want to set the CPU to RUN mode and the "Stop CPU" button if you want to set the CPU to STOP mode.

---

**Note**

The only button that is active is the one that can be chosen in the current operating mode of the CPU.

---

2. Acknowledge the confirmation prompt with "OK".

##### Result

The CPU will be switched to the required operating mode.

## Performing a memory reset

### Requirement

- There is an online connection to the CPU on which the memory reset is to be performed.
- The CPU is in STOP mode.

---

#### Note

If the CPU is still in RUN mode and you start the memory reset, you can place it in STOP mode after acknowledging a confirmation prompt.

---

### Procedure

To perform a memory reset on a CPU, follow these steps:

1. Enable the "Online Tools" task card of the CPU.
2. Click the "MRES" button in the "CPU control panel" pane.
3. Acknowledge the confirmation prompt with "OK".

### Result

The CPU is switched to STOP mode, if necessary, and the memory reset is performed on the CPU.

### See also

Basics of a memory reset (Page 1013)

## Determining and setting the time of day on a CPU

### Where do I find the functions I need?

You determine and change the time of day on a CPU in the "Set time of day" group in the "Functions" folder of the Online and Diagnostics view. This requires an online connection.

### Structure of the "Set time of day" group

The "Set time of day" group consists of the following areas:

- Area for reading out and setting the time of day
- Time system (This area does not exist for S7-1200 and will not be examined here.)

## Structure of the area for reading out and setting the time of day

This area consists of the following parts:

- **Programming device / PC time**  
Here the time zone setting, the current date and the current time setting of your programming device / PC are displayed.
- **Module time**  
Here the date and time values currently read from the module (for example the CPU), are converted to local time and date and displayed.  
If the "Take from PG/PC" check box is selected, when you click the "Apply" button, the date and the PG/PC time converted to UTC are transferred to the module.  
If the "Take from PG/PC" check box is not selected, you can assign the date and time for the integrated clock of the module. After clicking the "Apply" button, the date and the time recalculated to UTC time are transferred to the module.

## Updating the firmware of a module

### Performing a firmware update

Using firmware files, you can update the firmware of a module.

### Requirements

- The module is connected online.
- The module supports a firmware update.
- For those modules that require a supply voltage to perform the firmware update correctly: The supply voltage of the module is secured. For details, see the documentation of the module.

### Procedure

To perform a firmware update, follow these steps:

1. Open the module in the Online and Diagnostics view.
2. Select the "Firmware update" group in the "Functions" folder.

---

**Note**

For S7-1500-CPU's, this group is subdivided into "PLC" and "Display".

---

3. Click the "Browse" button in the "Firmware update" area in order to select the path to the firmware update files.
4. Select one of these files. The table then lists all modules for which an update is possible with the selected firmware file.

5. Optional: Select the "Run firmware after update" check box to reset the module after the load operation and to start the new firmware.
6. Click the "Start update" button. If the selected file can be interpreted by the module, it is downloaded to the module. If the mode of the CPU needs to be changed, you will be prompted to do this in dialogs.

 **WARNING**

**Invalid plant states possible**

An S7-1500 CPU immediately goes to STOP mode when you start the firmware update, which can have an effect on the operation of an online process or a machine. Unexpected operation of a process or a machine can result in severe or fatal injuries and/or damage to property.

**Note**

After you have run a firmware update, you will need to replace the module involved with the same module with the current firmware version in the hardware configuration of your project. The engineering configuration then matches the actual physical configuration again.

**"Run firmware after update" check box**

If you have not selected the "Run firmware after update" check box, the previous firmware remains active until the module is reset (for example by cycling power). The new firmware only becomes active after the module has been reset.

If you have selected the check box, the module is automatically reset after the firmware has been downloaded and it then continues with the new firmware.

Activating the firmware following the update has the following consequences:

- A station executes a restart. This means that all modules in the station become unavailable.
- If the corresponding CPU is in RUN, activating the firmware can lead to access errors or other problems in the user program and might even mean that the CPU remains permanently in STOP.

**Note**

For some CPUs, the "Run firmware after update" check box is grayed out and deactivated. In this case, you must restart the CPU manually.

For S7-1500 CPUs, the "Run firmware after update" check box is grayed out and selected. In this case, the new firmware is activated immediately after the download operation.

**See also**

Replacing a hardware component (Page 481)

## Resetting an S7-1200 CPU to factory settings

### Requirement

- There is no memory card inserted in the CPU.
- There is an online connection to the CPU that you want to reset to the factory settings.
- The CPU is in STOP mode.

---

#### **Note**

If the CPU is still in RUN mode and you start the reset operation, you can place it in STOP mode by answering the security prompt with yes.

---

### Procedure

To reset an S7-1200 CPU to factory settings, follow these steps:

1. Open the Online and Diagnostics view of the CPU.
2. Select the "Reset to factory settings" group in the "Functions" folder.
3. Select the "Keep IP address" check box if you want to keep the IP address or the "Delete IP address" check box if you want to delete the IP address.

---

#### **Note**

The two check boxes mentioned are only available if the module to be reset is able to choose whether to retain or delete the IP address.

---

4. Click the "Reset" button.
5. Acknowledge the confirmation prompt with "OK".

### Result

The module is switched to STOP mode if necessary and the settings are then reset to factory settings. This means:

- The work memory and the internal load memory and all operand areas are cleared.
- All parameters are reset to their defaults.
- The diagnostic buffer is cleared.
- The time is reset.
- The IP address is kept or deleted depending on which setting you made.

## Resetting an S7-1500 CPU to factory settings

### Requirement

- If you start a reset to factory settings from the project context, an online connection to the relevant CPU must exist.
- The relevant CPU is in STOP mode.

---

#### Note

If the CPU is still in RUN mode and you start the reset operation, you can place it in STOP mode after acknowledging a confirmation prompt.

---

### Procedure

To reset an S7-1500 CPU to factory settings, follow these steps:

1. Open the Online and Diagnostics view of the CPU (either from the project context or via "Accessible devices").
2. Select the "Reset to factory settings" group in the "Functions" folder.
3. Select the "Keep IP address" check box if you want to keep the IP address or the "Delete IP address" check box if you want to delete the IP address.

---

#### Note

With "Delete IP address", all IP addresses are deleted. This applies regardless of how you created the online connection.

If a memory card is inserted, selecting the "Delete IP address" option causes the following: The IP addresses are deleted and the CPU is reset to factory settings. Then, the configuration (including IP addresses) that is stored on the memory card is transferred into the CPU (see below). If the memory card was formatted before resetting to factory settings or if it is empty, no IP address is transferred into the CPU.

---

4. Click the "Reset" button.
5. Acknowledge the confirmation prompt with "OK".

### Result

The module is switched to STOP mode if necessary and the settings are then reset to factory settings. This means:

- The work memory and the internal retentive system memory and all operand areas are cleared.
- All parameters are reset to their defaults.
- The diagnostic buffer is cleared.
- The time of day is reset.
- The I&M data are deleted except for I&M0 data.

- The runtime meters are reset.
- The IP address is kept or deleted depending on which setting you made.
- If a memory card was inserted prior to the reset to factory settings, the configuration contained on the memory card (hardware and software) is downloaded to the CPU.

## Formatting an S7-1500 memory card

### Requirement

- If you start the formatting of the memory card from the project context, an online connection to the relevant CPU must exist.
- The relevant CPU is in STOP mode.

---

#### Note

If the CPU is still in RUN mode and you start a formatting operation, you can place it in STOP mode after acknowledging a confirmation prompt.

---

### Procedure

To format an S7-1500 memory card, follow these steps:

1. Open the Online and Diagnostics view of the CPU (either from the project context or via "Accessible devices").
2. Select the "Format memory card" group in the "Functions" folder.
3. Click the "Format" button.
4. Answer the safety prompt with "Yes".

### Result

- The memory card is formatted.
- The CPU is temporarily unavailable.
- The project data on the CPU are deleted with the exception of the IP address.
- If you start the formatting of the memory card from the project context, the Online and Diagnostics view remains open. If formatting is started via "Accessible devices", the Online and Diagnostics view will close.

## Assigning an IP address to a PROFINET IO device

### Basic information on assigning an IP address to a PROFINET IO device

#### Overview

All PROFINET IO devices work with the TCP/IP protocol and therefore require an IP address for operation on Industrial Ethernet. Once an IP address has been assigned to an IO device, it can be accessed via this address. You can then download configuration data or perform diagnostics, for example.

#### Requirement

- The Ethernet LAN connection must already be established.
- The Ethernet interface of your programming device or PC must be accessible.
- The IO device that is to be assigned an IP address must be in the same IP band as the programming device or PC.

### Starting the address assignment via "Accessible devices"

#### Requirement

- You have opened the Online and Diagnostics view of the PROFINET IO device using "Update accessible devices" (in the project tree) or "Accessible devices..." ("Online" menu).

#### Procedure

1. Open the "Functions" folder and the "Assign IP address" group inside this folder. The "MAC address" field displays the MAC address of the PROFINET IO device. The "Accessible devices" button is grayed out.
2. Enter the desired IP address.
3. Enter the subnet mask.
4. If a router is to be used, select the "Use router" check box and enter its IP address.
5. Click the "Assign IP address" button.

## Result

The IP address is permanently assigned to the IO device or to the relevant PROFINET interface of the IO device. It is retained even through a startup or a power failure.

---

### Note

For an S7-1500 CPU, you can also use the above-described method to change the IP address of a PROFINET interface, if a project has already been downloaded to the CPU via this interface. This overwrites the IP address downloaded via the project.

---

## See also

Retentivity of IP address parameters and device names (Page 973)

## Starting the address assignment from the project context

### Requirement

- An online connection to the PROFINET IO device exists.
- You have opened the Online and Diagnostics view of the PROFINET IO device from the project context.
- The PROFINET IO device is not assigned to any IO controller.

### Procedure

1. Open the "Functions" folder and the "Assign IP address" group inside this folder.
2. Click the "Accessible devices" button in order to identify the devices that can be accessed.  
Note: For an S7-1500 CPU, there are two entries here because it has two PROFINET interfaces.
3. Select the IO device. The "IP address" field, "Subnet mask" field, "Use router" check box and "Router address" field are grayed out and contain the node properties you used to establish the current online access.
4. Click the "Assign IP address" button.

## Result

The IP address is permanently assigned to the IO device or to the relevant PROFINET interface of the IO device. It is retained even through a startup or a power failure.

## See also

Retentivity of IP address parameters and device names (Page 973)

## Assigning a PROFINET device name

### Basic information on assigning a name to a PROFINET IO device

#### Device name

Before an IO device can be addressed by an IO controller, it must have a device name. This procedure was chosen for PROFINET because names are easier to handle than complex IP addresses.

Assigning a device name to a PROFINET IO device is comparable to setting the PROFIBUS address for a DP slave.

An IO device has no device name in its delivery state. For an IO controller to address an IO device, it must first be assigned a device name using the programming device or PC. It is now ready to transfer the configuration information including the IP address during startup or exchange user data in cyclic operation.

#### Rules for the device name

The device name is subject to the following limitations:

- Restricted to a total of 240 characters (lower case letters, numbers, dash, or dot)
- A name component within the device name, which is a character string between two dots, must not exceed 63 characters.
- No special characters such as umlauts, brackets, underscore, slash, blank space, etc. The only special character permitted is the dash.
- The device name must not begin or end with the "-" character.
- The device name must not begin with a number.
- The device name form n.n.n.n (n = 0, ... 999) is not permitted.
- The device name must not begin with the string "port-xyz" or "port-xyz-abcde" (a, b, c, d, e, x, y, z = 0, ... 9).

#### Where do I find the function I am seeking?

You can assign the name of a PROFINET IO device at the following places:

- In the online and diagnostics view of the device in the "Assign name" group of the "Functions" folder. The user interface for this group differs depending on how you open the online and diagnostics view:
  - Open via "Accessible devices"
  - Open from the project context
- In the "Assign PROFINET device name" dialog

## See also

Assigning a name in the online and diagnostics view opened from the project context  
(Page 1181)

Assigning a name in the "Assign PROFINET device name" dialog (Page 1182)

## Assigning a name in the online and diagnostics view opened via "Accessible devices"

### Requirement

- You have opened the online and diagnostics view of the PROFINET IO device using "Update accessible devices" (in the project tree) or "Accessible devices..." ("Online" menu).

### Procedure

1. Open the "Functions" folder and the "Assign name" group inside this folder. The "Type" field displays the module type of the PROFINET IO device.
2. Enter the required device name in the "PROFINET device name" input box.
3. Optional: Select the "Flash LED" check box in order to run an LED flash test on the PROFINET IO device. In this way, you verify that you are naming the desired IO device.

---

#### Note

The LED flash test is not supported by all PROFINET IO devices.

---

The LED flash test runs until you cancel it. This is done, for example, by clearing the "Flash LED" check box or by closing the online and diagnostics view.

4. Click "Assign name".

### Result

The entered name is assigned to the PROFINET IO device.

## Assigning a name in the online and diagnostics view opened from the project context

### Requirement

- You have opened the online and diagnostics view of the PROFINET IO device from the project context.
- The PROFINET IO device can be accessed using at least one PG/PC interface.

## Procedure

1. Open the "Functions" folder and the "Assign name" group inside this folder. The "PROFINET device name" drop-down list displays the current name in the offline project, and the "Type" box shows the module type of the PROFINET IO device.

---

### Note

For CPUs with several PROFINET interfaces, the names of all existing PROFINET interfaces are displayed in the offline project.

---

2. Choose a different name from the drop-down list, if necessary.

---

### Note

In steps 3 to 5, you determine the IO devices that are present in the PROFINET subnet.

---

3. In the "PG/PC interface for assignment" drop-down list, select the PG/PC interface you want to use to establish the online connection.
4. Optional: Use the three check boxes to make a selection from all IO devices available online.
5. Click the icon for determining the IO devices present in the PROFINET subnet. The table is then updated.
6. Select the desired IO device in the table.
7. Optional: Select the "Flash LED" check box in order to run an LED flash test on the PROFINET IO device. In this way, you verify that you are naming the desired IO device.

---

### Note

The LED flash test is not supported by all PROFINET IO devices.

---

The LED flash test runs until you cancel it. This is done, for example, by clearing the "Flash LED" check box, by selecting another IO device in the table, or by closing the online and diagnostics view.

8. Click "Assign name".

## Result

The selected name is assigned to the PROFINET IO device or one of its PROFINET interfaces.

## Assigning a name in the "Assign PROFINET device name" dialog

### Requirement

- You have opened the "Assign PROFINET device name" dialog from the network view (from the shortcut menu of a PN/IE connection).
- The PROFINET IO device can be accessed using at least one PG/PC interface.

## Procedure

1. The following is displayed in the "PROFINET device name" drop-down list:
  - the name of the interface that was used to open the project in the current offline project
  - the names of those IO devices that are connected by means of this interface

The "Type" field displays the module type of the PROFINET IO device.  
Choose a different name from the drop-down list, if necessary.

---

### **Note**

In steps 2 to 4, you determine the IO devices that are present in the PROFINET subnet.

---

2. In the "PG/PC interface for assignment" drop-down list, select the PG/PC interface you want to use to establish the online connection.
3. Optional: Use the three check boxes to make a selection from all IO devices available online.
4. Click the icon for determining the IO devices present in the PROFINET subnet. The table is then updated.
5. Select the desired IO device in the table.
6. Optional: Select the "Flash LED" check box in order to run an LED flash test on the PROFINET IO device. In this way, you verify that you are naming the desired IO device.

---

### **Note**

The LED flash test is not supported by all PROFINET IO devices.

---

The LED flash test runs until you cancel it. This is done, for example, by clearing the "Flash LED" check box or by selecting another IO device in the table.

7. Click "Assign name".

## Result

The selected name is assigned to the PROFINET IO device or the interface that was used to open the dialog.

## Calibrating an S7-1500 analog module

### Calibrating an S7-1500 analog module - Overview

#### Where do you calibrate an S7-1500 analog module?

You calibrate an S7-1500 analog module in its Online and Diagnostics view in the "Calibrate" group of the "Functions" folder.

### Overview of the function scope of the calibrating function

You can perform the following functions for an S7-1500 analog module in the "Calibrate" group:

- Specifying the current calibration of all channels
- Calibrating a channel
- Canceling a running calibration
- Resetting the calibration of a channel to the factory settings

### Requirement for the calibrating function described below

The following is required for the calibrating function described below:

- You have opened the Online and Diagnostics view from the project context (thus not from the project tree or via the "Online" menu).
- There is an online connection to the analog module that is to be calibrated.
- Offline and online configuration are identical.

### Calibrating an S7-1500 analog module

#### Overview of the calibration of a channel of an S7-1500 analog module

The calibration of a channel of an S7-1500 analog module consists of the following steps:

1. Start calibration
2. Perform the second step up to the next to last step of the calibration
3. Complete calibration

These steps are described in more detail in the following section.

#### Requirement

- You have opened the Online and Diagnostic view of the S7-1500 analog module from the project context and are in the "Calibrate" group of the "Functions" folder.
- The associated CPU is online.
- No calibration is currently running on the analog module (if you want to start the calibration) or the last step initiated has been performed successfully (if you want to resume or complete the calibration).

#### Procedure for starting the calibration

To start the calibration, follow these steps:

1. In the overview table, select the line that belongs to the channel to be calibrated.
2. Click the "Start manual calibration" button.

The user interface then changes as follows:

- The overview table and the "Start manual calibration" button and "Set to factory settings" buttons become inactive.
- The step display is activated and displays the numbers of the current and last steps.
- The "Command" field becomes active and indicates what the user must do in the next calibration step.
- The "Status" field becomes active and shows the current status of the calibration, e.g., "Calibration successfully started".
- The "Measured value" field becomes active. For an input module a value is displayed here; you must enter a value here for an output module.
- The "Cancel" button becomes active.
- The "Next" button becomes active. This button can be used to advance to the next step of the calibration.

### **Procedure for the second to the next to last step of the calibration**

Follow these steps:

1. Click the "Next" button.

The fields of the user interface described above are then updated.

### **Procedure for the last step of the calibration**

Follow these steps:

1. Click the "Next" button.

The user interface then changes as follows:

- The overview table becomes active.
- The calibration display of the calibrated channel is updated.
- The "Start manual calibration" button and "Set to factory settings" buttons become active.
- The step display is deactivated and the numbers of the current step and last steps are empty.
- The "Command" field becomes inactive and is empty.
- The "Status" field becomes inactive and shows the last status of the calibration, e.g., "Calibration successfully finished".
- The "Measured value" field becomes inactive and is empty.
- The "Cancel" button becomes inactive.
- The "Next" button becomes inactive.

### **Error occurrence**

If an error occurs during the calibration, the module cancels the calibration. Afterwards, the channel that was to be calibrated has the same settings as before the start of the calibration.

Except for the "Status" field, the user interface appears the same after the occurrence of an error as before the calibration. The "Status" field displays the error that the module detected during the calibration.

### Canceling a running calibration of an S7-1500 analog module

#### Requirement

- You have opened the Online and Diagnostic view of the S7-1500 analog module from the project context and are in the "Calibrate" group of the "Functions" folder.
- The associated CPU is online.
- A calibration is currently running on the analog module.

#### Procedure

To cancel a running calibration, follow these steps:
