## Introduction

The Spartan®-3AN FPGA family combines the best attributes of a leading edge, low cost FPGA with nonvolatile technology across a broad range of densities. The family combines all the features of the Spartan-3A FPGA family plus leading technology in-system Flash memory for configuration and nonvolatile data storage.

The Spartan-3AN FPGAs are part of the Extended Spartan-3A family, which also includes the Spartan-3A FPGAs and the higher density Spartan-3A DSP FPGAs. The Spartan-3AN FPGA family is excellent for space-constrained applications such as blade servers, medical devices, automotive infotainment, telematics, GPS, and other small consumer products. Combining FPGA and Flash technology minimizes chip count, PCB traces and overall size while increasing system reliability.

The Spartan-3AN FPGA internal configuration interface is completely self-contained, increasing design security. The family maintains full support for external configuration. The Spartan-3AN FPGA is the world's first nonvolatile FPGA with MultiBoot, supporting two or more configuration files in one device, allowing alternative configurations for field upgrades, test modes, or multiple system configurations.

## Features

- The new standard for low cost nonvolatile FPGA solutions
- Eliminates traditional nonvolatile FPGA limitations with the advanced 90 nm Spartan-3A device feature set
  - Memory, multipliers, DCMs, SelectIO, hot swap, power management, etc.
- Integrated robust configuration memory
  - Saves board space
  - Improves ease-of-use
  - Simplifies design
  - Reduces support issues
- Plentiful amounts of nonvolatile memory available to the user
  - Up to 11+ Mb available
  - MultiBoot support
  - Embedded processing and code shadowing
  - Scratchpad memory
- Robust 100K Flash memory program/erase cycles
- 20 years Flash memory data retention
- Security features provide bitstream anti-cloning protection
- Buried configuration interface
- Unique Device DNA serial number in each device for design Authentication to prevent unauthorized copying
- Flash memory sector protection and lockdown
- Configuration watchdog timer automatically recovers from configuration errors
- Suspend mode reduces system power consumption
  - Retains all design state and FPGA configuration data
  - Fast response time, typically less than 100 μs
- Full hot-swap compliance
- Multi-voltage, multi-standard SelectIO™ interface pins
  - Up to 502 I/O pins or 227 differential signal pairs
  - LVCMOS, LVTTTL, HSTL, and SSTL single-ended signal standards
  - 3.3V, 2.5V, 1.8V, 1.5V, and 1.2V signaling
  - Up to 24 mA output drive
  - 3.3V ±10% compatibility and hot swap compliance
  - 622+ Mb/s data transfer rate per I/O
  - DDR/DDR2 SDRAM support up to 400 Mb/s
  - LVDS, RSDS, mini-LVDS, PPDS, and HSTL/SSTL differential I/O
- Abundant, flexible logic resources
  - Densities up to 25,344 logic cells
  - Optional shift register or distributed RAM support
  - Enhanced 18 x 18 multipliers with optional pipeline
- Hierarchical SelectRAM™ memory architecture
  - Up to 576 Kbits of dedicated block RAM
  - Up to 176 Kbits of efficient distributed RAM
- Up to eight Digital Clock Managers (DCMs)
- Eight global clocks and eight additional clocks per each half of device, plus abundant low-skew routing
- Complete Xilinx® ISE® and WebPACK™ software development system support
- MicroBlaze™ and PicoBlaze™ embedded processor cores
- Fully compliant 32-/64-bit 33 MHz PCI™ technology support
- Low-cost QFP and BGA Pb-free (RoHS) packaging options
  - Pin-compatible with the same packages in the Spartan-3A FPGA family

### Notes:

1. By convention, one Kb is equivalent to 1,024 bits and one Mb is equivalent to 1,024 Kb.
2. Maximum supported by Xilinx tools. See the customer notice [XCN14003: Flash Wafer Fabrication Change and Gold \(Au\) To Copper \(Cu\) Transition for Spartan-3AN FPGA Devices](#).

## Architectural Overview

The Spartan-3AN FPGA architecture is compatible with that of the Spartan-3A FPGA. The architecture consists of five fundamental programmable functional elements:

- **Configurable Logic Blocks (CLBs)** contain flexible Look-Up Tables (LUTs) that implement logic plus storage elements used as flip-flops or latches.
- **Input/Output Blocks (IOBs)** control the flow of data between the I/O pins and the internal logic of the device. IOBs support bidirectional data flow plus 3-state operation. They support a variety of signal standards, including several high-performance differential standards. Double Data-Rate (DDR) registers are included.
- **Block RAM** provides data storage in the form of 18-Kbit dual-port blocks.
- **Multiplier Blocks** accept two 18-bit binary numbers as inputs and calculate the product.

- **Digital Clock Manager (DCM) Blocks** provide self-calibrating, fully digital solutions for distributing, delaying, multiplying, dividing, and phase-shifting clock signals.

These elements are organized as shown in Figure 1. A dual ring of staggered IOBs surrounds a regular array of CLBs. Each device has two columns of block RAM except for the XC3S50AN, which has one column. Each RAM column consists of several 18-Kbit RAM blocks. Each block RAM is associated with a dedicated multiplier. The DCMs are positioned in the center with two at the top and two at the bottom of the device. The XC3S50AN has DCMs only at the top, while the XC3S700AN and XC3S1400AN add two DCMs in the middle of the two columns of block RAM and multipliers.

The Spartan-3AN FPGA features a rich network of traces that interconnect all five functional elements, transmitting signals among them. Each functional element has an associated switch matrix that permits multiple connections to the routing.

DS557-1\_01\_122006

**Notes:**

1. The XC3S700AN and XC3S1400AN have two additional DCMs on both the left and right sides as indicated by the dashed lines. The XC3S50AN has only two DCMs at the top and only one Block RAM/Multiplier column.

Figure 2: Spartan-3AN FPGA Configuration Interface from Internal SPI Flash Memory

## Configuration

Spartan-3AN FPGAs are programmed by loading configuration data into robust, reprogrammable, static CMOS configuration latches (CCLs) that collectively control all functional elements and routing resources. The FPGA’s configuration data is stored on-chip in nonvolatile Flash memory, or externally in a PROM or some other nonvolatile medium, either on or off the board. After applying power, the configuration data is written to the FPGA using any of seven different modes:

- Configure from internal SPI Flash memory (Figure 2)
  - Completely self-contained
  - Reduced board space
  - Easy-to-use configuration interface
- Master Serial from a Xilinx Platform Flash PROM
- Serial Peripheral Interface (SPI) from an external industry-standard SPI serial Flash
- Byte Peripheral Interface (BPI) Up from an industry-standard x8 or x8/x16 parallel NOR Flash
- Slave Serial, typically downloaded from a processor
- Slave Parallel, typically downloaded from a processor
- Boundary-Scan (JTAG), typically downloaded from a processor or system tester

The MultiBoot feature stores multiple configuration files in the on-chip Flash, providing extended life with field upgrades. MultiBoot also supports multiple system solutions with a single board to minimize inventory and simplify the addition of new features, even in the field. Flexibility is maintained to do additional MultiBoot configurations via the external configuration method.

The Spartan-3AN device authentication protocol prevents cloning. Design cloning, unauthorized overbuilding, and complete reverse engineering have driven device security requirements to higher and higher levels. Authentication moves the security from bitstream protection to the next generation of design-level security protecting both the design and embedded microcode. The authentication algorithm is entirely user defined, implemented using FPGA logic. Every product, generation, or design can have a different algorithm and functionality to enhance security.

## In-System Flash Memory

Each Spartan-3AN FPGA contains abundant integrated SPI serial Flash memory, shown in Table 3, used primarily to store the FPGA’s configuration bitstream. However, the Flash memory array is large enough to store at least two MultiBoot FPGA configuration bitstreams or nonvolatile data required by the FPGA application, such as code-shadowed MicroBlaze processor applications.

Table 3: Spartan-3AN Device In-System Flash Memory

### Notes:

1. Aligned to next available page location.
2. Maximum supported by Xilinx tools.

After configuration, the FPGA design has full access to the in-system Flash memory via an internal SPI interface; the control logic is implemented with FPGA logic. Additionally, the FPGA application itself can store nonvolatile data or provide live, in-system Flash updates.

The Spartan-3AN device in-system Flash memory supports leading-edge serial Flash features.

- Small page size (264 or 528 bytes) simplifies nonvolatile data storage
- Randomly accessible, byte addressable
- Up to 66 MHz serial data transfers
- SRAM page buffers
  - Read Flash data while programming another Flash page
  - EEPROM-like byte write functionality
  - Two buffers in most devices, one in XC3S50AN
- Page, Block, and Sector Erase

- Sector-based data protection and security features
  - Sector Protect: Write- and erase-protect a sector (changeable)
  - Sector Lockdown: Sector data is unchangeable (permanent)
- 128-byte Security Register
  - Separate from FPGA's unique Device DNA identifier
  - 64-byte factory-programmed identifier unique to the in-system Flash memory
  - 64-byte one-time programmable, user-programmable field
- 100,000 Program/Erase cycles
- 20-year data retention
- Comprehensive programming support
  - In-system prototype programming via JTAG using Xilinx [Platform Cable USB](#) and iMPACT software
  - Product programming support using BPM Microsystems programmers with appropriate programming adapter
  - Design examples demonstrating in-system programming from a Spartan-3AN FPGA application

## I/O Capabilities

The Spartan-3AN FPGA SelectIO interface supports many popular single-ended and differential standards. [Table 4](#) shows the number of user I/Os as well as the number of differential I/O pairs available for each device/package combination. Some of the user I/Os are unidirectional, input-only pins as indicated in [Table 4](#).

Spartan-3AN FPGAs support the following single-ended standards:

- 3.3V low-voltage TTL (LVTTTL)
- Low-voltage CMOS (LVCMOS) at 3.3V, 2.5V, 1.8V, 1.5V, or 1.2V
- 3.3V PCI at 33 MHz or 66 MHz
- HSTL I, II, and III at 1.5V and 1.8V, commonly used in memory applications
- SSTL I and II at 1.8V, 2.5V, and 3.3V, commonly used for memory applications

Spartan-3AN FPGAs support the following differential standards:

- LVDS, mini-LVDS, RSDS, and PPDS I/O at 2.5V or 3.3V
- Bus LVDS I/O at 2.5V
- TMDS I/O at 3.3V
- Differential HSTL and SSTL I/O
- LVPECL inputs at 2.5V or 3.3V

**Notes:**

1. See [Pb and Pb-Free Packaging, page 7](#) for details on Pb and Pb-free packaging options.
2. The footprint for the TQ(G)144 (22 mm x 22 mm) package is larger than the package body.
3. Each Spartan-3AN FPGA has a pin-compatible Spartan-3A FPGA equivalent, although Spartan-3A FPGAs do not have internal SPI flash and offer more part/package combinations.
4. The number shown in **bold** indicates the maximum number of I/O and input-only pins. The number shown in *(italics)* indicates the number of input-only pins. The differential (Diff) input-only pin count includes both differential pairs on input-only pins and differential pairs on I/O pins within I/O banks that are restricted to differential inputs.
5. Xilinx has issued a discontinuation notice for these highlighted devices/packages. For more information see [XCN13016: Product Discontinuation Notice For Selected Spartan-3AN FPGA Products](#).

## Package Marking

Figure 3 provides a top marking example for Spartan-3AN FPGAs in the quad-flat packages. Figure 4 shows the top marking for Spartan-3AN FPGAs in BGA packages. The markings for the BGA packages are nearly identical to those for the quad-flat packages, except that the marking is rotated with respect to the ball A1 indicator.

The “5C” and “4I” Speed Grade/Temperature Range part combinations may be dual marked as “5C/4I”. Devices with the dual mark can be used as either -5C or -4I devices. Devices with a single mark are only guaranteed for the marked speed grade and temperature range.

Figure 3: Spartan-3AN FPGA QFP Package Marking Example

Figure 4: Spartan-3AN FPGA BGA Package Marking Example

## Pb and Pb-Free Packaging

Spartan-3AN FPGAs are available in both leaded (Pb) and Pb-free packaging options (see [Table 5](#)). The Pb-free packages are available for all devices and include a 'G' character in the ordering code. Leaded (non-Pb-free) packages are available for selected devices. The ordering code for the leaded devices does not have an extra 'G'. Leaded and Pb-free devices have the same pin-out.

## Revision History

The following table shows the revision history for this document.

Date	Version	Revision
02/26/2007	1.0	Initial release.
08/16/2007	2.0	Updated for Production release of initial device.
09/12/2007	2.0.1	Minor updates to text.
09/24/2007	2.1	Added note that In-System Flash commands were not supported by simulation until ISE 10.1 software.
12/12/2007	3.0	Updated to Production status with Production release of final family member, XC3S50AN. Noted that SPI_ACCESS simulation is supported in ISE 10.1 software. Updated links.
06/02/2008	3.1	Minor updates.
11/19/2009	3.2	In the <a href="#">Spartan-3AN FPGA Design Documentation</a> section, added link to <a href="#">DS706</a> , <i>Extended Spartan-3A Family Overview</i> and removed references to older software versions.
12/02/2010	4.0	Updated link to sign up for Alerts and updated <a href="#">Notice of Disclaimer</a> .
04/01/2011	4.1	Added the FT(G)256 package selection for the XC3S50AN and XC3S400AN devices and the FG(G)484 package selection for the XC3S1400AN device throughout this data sheet.
06/11/2014	4.2	Xilinx has issued a discontinuation notice for the XC3S50AN in the FT(G)256 package and the XC3S1400AN in the FG(G)484 package. See <a href="#">XCN13016: Product Discontinuation Notice For Selected Spartan-3AN FPGA Products</a> . Updated <a href="#">Notice of Disclaimer</a> .
01/09/2019	4.3	Updated for <i>Lead-Frame Plating Composition Change For Legacy Eutectic Products</i> ( <a href="#">XCN18024</a> ).

### AUTOMOTIVE APPLICATIONS DISCLAIMER

AUTOMOTIVE PRODUCTS (IDENTIFIED AS "XA" IN THE PART NUMBER) ARE NOT WARRANTED FOR USE IN THE DEPLOYMENT OF AIRBAGS OR FOR USE IN APPLICATIONS THAT AFFECT CONTROL OF A VEHICLE ("SAFETY APPLICATION") UNLESS THERE IS A SAFETY CONCEPT OR REDUNDANCY FEATURE CONSISTENT WITH THE ISO 26262 AUTOMOTIVE SAFETY STANDARD ("SAFETY DESIGN"). CUSTOMER SHALL, PRIOR TO USING OR DISTRIBUTING ANY SYSTEMS THAT INCORPORATE PRODUCTS, THOROUGHLY TEST SUCH SYSTEMS FOR SAFETY PURPOSES. USE OF PRODUCTS IN A SAFETY APPLICATION WITHOUT A SAFETY DESIGN IS FULLY AT THE RISK OF CUSTOMER, SUBJECT ONLY TO APPLICABLE LAWS AND REGULATIONS GOVERNING LIMITATIONS ON PRODUCT LIABILITY.

## DC Electrical Characteristics

In this section, specifications can be designated as Advance, Preliminary, or Production. These terms are defined as follows:

**Advance:** Initial estimates are based on simulation, early characterization, and/or extrapolation from the characteristics of other families. Values are subject to change. Use as estimates, not for production.

**Preliminary:** Based on characterization. Further changes are not expected.

**Production:** These specifications are approved once the silicon has been characterized over numerous production lots. Parameter values are considered stable with no future changes expected.

All parameter limits are representative of worst-case supply voltage and junction temperature conditions. **Unless otherwise noted, the published parameter values apply to all Spartan<sup>®</sup>-3AN devices. AC and DC characteristics are specified using the same numbers for both commercial and industrial grades.**

### Absolute Maximum Ratings

Stresses beyond those listed under [Table 6: Absolute Maximum Ratings](#) might cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions is not implied. Exposure to absolute maximum conditions for extended periods of time adversely affects device reliability.

**Table 6: Absolute Maximum Ratings**

Symbol	Description	Conditions	Min	Max	Units
V <sub>CCINT</sub>	Internal supply voltage		-0.5	1.32	V
V <sub>CCAUX</sub>	Auxiliary supply voltage		-0.5	3.75	V
V <sub>CCO</sub>	Output driver supply voltage		-0.5	3.75	V
V <sub>REF</sub>	Input reference voltage		-0.5	V <sub>CCO</sub> + 0.5	V
V <sub>IN</sub>	Voltage applied to all User I/O pins and dual-purpose pins	Driver in a high-impedance state	-0.95	4.6	V
	Voltage applied to all Dedicated pins		-0.5	4.6	V
I <sub>IK</sub>	Input clamp current per I/O pin	-0.5V < V <sub>IN</sub> < (V <sub>CCO</sub> + 0.5V) <sup>(1)</sup>	-	±100	mA

## Power Supply Specifications

**Table 7: Supply Voltage Thresholds for Power-On Reset**

Symbol	Description	Min	Max	Units
$V_{CCINTT}$	Threshold for the $V_{CCINT}$ supply	0.4	1.0	V
$V_{CCAUXT}$	Threshold for the $V_{CCAUX}$ supply	1.0	2.0	V
$V_{CCO2T}$	Threshold for the $V_{CCO}$ Bank 2 supply	1.0	2.0	V

**Notes:**

- When configuring from the In-System Flash,  $V_{CCAUX}$  must be in the recommended operating range; on power-up make sure  $V_{CCAUX}$  reaches at least 3.0V before INIT\_B goes High to indicate the start of configuration.  $V_{CCINT}$ ,  $V_{CCAUX}$ , and  $V_{CCO}$  supplies to the FPGA can be applied in any order if this requirement is met. However, an external configuration source might have specific requirements. Check the data sheet for the attached configuration source. Apply  $V_{CCINT}$  last for lowest overall power consumption (see the chapter called “Powering Spartan-3 Generation FPGAs” in [UG331](#) for more information).
- To ensure successful power-on,  $V_{CCINT}$ ,  $V_{CCO}$  Bank 2, and  $V_{CCAUX}$  supplies must rise through their respective threshold-voltage ranges with no dips at any point.

**Table 8: Supply Voltage Ramp Rate**

Symbol	Description	Min	Max	Units
$V_{CCINTR}$	Ramp rate from GND to valid $V_{CCINT}$ supply level	0.2	100	ms
$V_{CCAUXR}$	Ramp rate from GND to valid $V_{CCAUX}$ supply level	0.2	100	ms
$V_{CCO2R}$	Ramp rate from GND to valid $V_{CCO}$ Bank 2 supply level	0.2	100	ms

**Notes:**

- When configuring from the In-System Flash,  $V_{CCAUX}$  must be in the recommended operating range; on power-up make sure  $V_{CCAUX}$  reaches at least 3.0V before INIT\_B goes High to indicate the start of configuration.  $V_{CCINT}$ ,  $V_{CCAUX}$ , and  $V_{CCO}$  supplies to the FPGA can be applied in any order if this requirement is met. However, an external configuration source might have specific requirements. Check the data sheet for the attached configuration source. Apply  $V_{CCINT}$  last for lowest overall power consumption (see the chapter called “Powering Spartan-3 Generation FPGAs” in [UG331](#) for more information).
- To ensure successful power-on,  $V_{CCINT}$ ,  $V_{CCO}$  Bank 2, and  $V_{CCAUX}$  supplies must rise through their respective threshold-voltage ranges with no dips at any point.

**Table 9: Supply Voltage Levels Necessary for Preserving CMOS Configuration Latch (CCL) Contents and RAM Data**

Symbol	Description	Min	Units
$V_{DRINT}$	$V_{CCINT}$ level required to retain CMOS Configuration Latch (CCL) and RAM data	1.0	V
$V_{DRAUX}$	$V_{CCAUX}$ level required to retain CMOS Configuration Latch (CCL) and RAM data	2.0	V

## General Recommended Operating Conditions

Table 10: General Recommended Operating Conditions

Symbol	Description		Min	Nominal	Max	Units	
$T_J$	Junction temperature	Commercial	0	–	85	°C	
		Industrial	–40	–	100	°C	
$V_{CCINT}$	Internal supply voltage		1.14	1.20	1.26	V	
$V_{CCO}^{(1)}$	Output driver supply voltage		1.10	–	3.60	V	
$V_{CCAUX}$	Auxiliary supply voltage	$V_{CCAUX} = 3.3V$	3.00	3.30	3.60	V	
$V_{IN}^{(2)}$	Input voltage	PCI IOSTANDARD	–0.5	–	$V_{CCO} + 0.5$	V	
		All other IOSTANDARDS	IP or IO_#	–0.5	–	4.10	V
			IO_Lxxy_# <sup>(3)</sup>	–0.5	–	4.10	V
$T_{IN}$	Input signal transition time <sup>(4)</sup>		–	–	500	ns	

### Notes:

1. This  $V_{CCO}$  range spans the lowest and highest operating voltages for all supported I/O standards. [Table 13](#) lists the recommended  $V_{CCO}$  range specific to each of the single-ended I/O standards, and [Table 15](#) lists that specific to the differential standards.
2. See [XAPP459](#), *Eliminating I/O Coupling Effects when Interfacing Large-Swing Single-Ended Signals to User I/O Pins on Spartan-3 Families*.
3. For single-ended signals that are placed on a differential-capable I/O,  $V_{IN}$  of –0.2V to –0.5V is supported but can cause increased leakage between the two pins. See *Parasitic Leakage* in [UG331](#), *Spartan-3 Generation FPGA User Guide*.
4. Measured between 10% and 90%  $V_{CCO}$ . Follow [Signal Integrity](#) recommendations.

## General DC Characteristics for I/O Pins

Table 11: General DC Characteristics of User I/O, Dual-Purpose, and Dedicated Pins

Symbol	Description	Test Conditions		Min	Typ	Max	Units
$I_L^{(2)}$	Leakage current at User I/O, Input-only, Dual-Purpose, and Dedicated pins, FPGA powered	Driver is in a high-impedance state, $V_{IN} = 0V$ or $V_{CCO}$ max, sample-tested		-10	-	+10	$\mu A$
$I_{HS}$	Leakage current on pins during hot socketing, FPGA unpowered	All pins except INIT_B, PROG_B, DONE, and JTAG pins when PUDC_B = 1.		-10	-	+10	$\mu A$
		INIT_B, PROG_B, DONE, and JTAG pins or other pins when PUDC_B = 0.		Add $I_{HS} + I_{RPU}$			$\mu A$
$I_{RPU}^{(3)}$	Current through pull-up resistor at User I/O, Dual-Purpose, Input-only, and Dedicated pins. Dedicated pins are powered by $V_{CCAUX}^{(4)}$	$V_{IN} = GND$	$V_{CCO}$ or $V_{CCAUX} = 3.0V$ to $3.6V$	-151	-315	-710	$\mu A$
			$V_{CCO} = 2.3V$ to $2.7V$	-82	-182	-437	$\mu A$
			$V_{CCO} = 1.7V$ to $1.9V$	-36	-88	-226	$\mu A$
			$V_{CCO} = 1.4V$ to $1.6V$	-22	-56	-148	$\mu A$
			$V_{CCO} = 1.14V$ to $1.26V$	-11	-31	-83	$\mu A$
$R_{PU}^{(3)}$	Equivalent pull-up resistor value at User I/O, Dual-Purpose, Input-only, and Dedicated pins (based on $I_{RPU}$ per Note 3)	$V_{IN} = GND$	$V_{CCO} = 3.0V$ to $3.6V$	5.1	11.4	23.9	$k\Omega$
			$V_{CCO} = 2.3V$ to $2.7V$	6.2	14.8	33.1	$k\Omega$
			$V_{CCO} = 1.7V$ to $1.9V$	8.4	21.6	52.6	$k\Omega$
			$V_{CCO} = 1.4V$ to $1.6V$	10.8	28.4	74.0	$k\Omega$
			$V_{CCO} = 1.14V$ to $1.26V$	15.3	41.1	119.4	$k\Omega$
$I_{RPD}^{(3)}$	Current through pull-down resistor at User I/O, Dual-Purpose, Input-only, and Dedicated pins	$V_{IN} = V_{CCO}$	$V_{CCAUX} = 3.0V$ to $3.6V$	167	346	659	$\mu A$
$R_{PD}^{(3)}$	Equivalent pull-down resistor value at User I/O, Dual-Purpose, Input-only, and Dedicated pins (based on $I_{RPD}$ per Note 3)	$V_{CCAUX} = 3.0V$ to $3.6V$	$V_{IN} = 3.0V$ to $3.6V$	5.5	10.4	20.8	$k\Omega$
			$V_{IN} = 2.3V$ to $2.7V$	4.1	7.8	15.7	$k\Omega$
			$V_{IN} = 1.7V$ to $1.9V$	3.0	5.7	11.1	$k\Omega$
			$V_{IN} = 1.4V$ to $1.6V$	2.7	5.1	9.6	$k\Omega$
			$V_{IN} = 1.14V$ to $1.26V$	2.4	4.5	8.1	$k\Omega$
$I_{REF}$	$V_{REF}$ current per pin	All $V_{CCO}$ levels		-10	-	+10	$\mu A$
$C_{IN}$	Input capacitance	-		-	-	10	pF
$R_{DT}$	Resistance of optional differential termination circuit within a differential I/O pair. Not available on Input-only pairs.	$V_{CCO} = 3.3V \pm 10\%$	LVDS_33, MINI_LVDS_33, RSDS_33	90	100	115	$\Omega$
		$V_{CCO} = 2.5V \pm 10\%$	LVDS_25, MINI_LVDS_25, RSDS_25	90	110	-	$\Omega$

**Notes:**

- The numbers in this table are based on the conditions set forth in Table 10.
- For single-ended signals that are placed on a differential-capable I/O,  $V_{IN}$  of  $-0.2V$  to  $-0.5V$  is supported but can cause increased leakage between the two pins. See *Parasitic Leakage* in UG331, *Spartan-3 Generation FPGA User Guide*.
- This parameter is based on characterization. The pull-up resistance  $R_{PU} = V_{CCO} / I_{RPU}$ . The pull-down resistance  $R_{PD} = V_{IN} / I_{RPD}$ .
- $V_{CCAUX}$  must be 3.3V on Spartan-3AN FPGAs.  $V_{CCAUX}$  for Spartan-3A FPGAs can be either 3.3V or 2.5V.

## Quiescent Current Requirements

		XC3S200AN	5.1	12.1	15.1	mA
		XC3S400AN	5.1	18.1	24.1	mA
		XC3S700AN	6.1	28.1	34.1	mA
		XC3S1400AN	10.1	50.1	58.1	mA

### Notes:

- The numbers in this table are based on the conditions set forth in [Table 10](#).
- Quiescent supply current is measured with all I/O drivers in a high-impedance state and with all pull-up/pull-down resistors at the I/O pads disabled. The internal SPI Flash is deselected (CSB = High); the internal SPI Flash current is consumed on the V<sub>CCAUX</sub> supply rail. Typical values are characterized using typical devices at room temperature (T<sub>J</sub> of 25°C at V<sub>CCINT</sub> = 1.2V, V<sub>CCO</sub> = 3.3V, and V<sub>CCAUX</sub> = 3.3V). The maximum limits are tested for each device at the respective maximum specified junction temperature and at maximum voltage limits with V<sub>CCINT</sub> = 1.26V, V<sub>CCO</sub> = 3.6V, and V<sub>CCAUX</sub> = 3.6V. The FPGA is programmed with a “blank” configuration data file (that is, a design with no functional elements instantiated). For conditions other than those described above (for example, a design including functional elements), measured quiescent current levels will be different than the values in the table.
- There are two recommended ways to estimate the total power consumption (quiescent plus dynamic) for a specific design:
  - The [Spartan-3AN FPGA Xilinx Power Estimator](#) provides quick, approximate, typical estimates, and does not require a netlist of the design.
  - Xilinx Power Analyzer uses a netlist as input to provide maximum estimates as well as more accurate typical estimates. For more information on power for the In-System Flash memory, see the Power Management chapter of [UG333](#).
- The maximum numbers in this table indicate the minimum current each power rail requires in order for the FPGA to power-on successfully.
- For information on the power-saving Suspend mode, see [XAPP480: Using Suspend Mode in Spartan-3 Generation FPGAs](#). Suspend mode typically saves 40% total power consumption compared to quiescent current.

SSTL3_II	3.0	3.3	3.6	1.3	1.5	1.7	V <sub>REF</sub> – 0.2	V <sub>REF</sub> + 0.2

**Notes:**

- Descriptions of the symbols used in this table are as follows:  
V<sub>CCO</sub> – the supply voltage for output drivers  
V<sub>REF</sub> – the reference voltage for setting the input switching threshold  
V<sub>IL</sub> – the input voltage that indicates a Low logic level  
V<sub>IH</sub> – the input voltage that indicates a High logic level
- In general, the V<sub>CCO</sub> rails supply only output drivers, not input circuits. The exceptions are for LVCMOS25 inputs and for PCI™ I/O standards.
- For device operation, the maximum signal voltage (V<sub>IH</sub> max) can be as high as V<sub>IN</sub> max. See Table 6.
- There is approximately 100 mV of hysteresis on inputs using LVCMOS33 and LVCMOS25 I/O standards.
- All Dedicated pins (PROG\_B, DONE, SUSPEND, TCK, TDI, TDO, and TMS) draw power from the V<sub>CCAUX</sub> rail and use the LVCMOS33 standard. The Dual-Purpose configuration pins use the LVCMOS standard before the User mode. When using these pins as part of a standard 2.5V configuration interface, apply 2.5V to the V<sub>CCO</sub> lines of Banks 0, 1, and 2 at power-on as well as throughout configuration.
- For information on PCI IP solutions, see [www.xilinx.com/pci](http://www.xilinx.com/pci). The PCI IOSTANDARD is not supported on input-only pins. The PCIX IOSTANDARD is available and has equivalent characteristics but no PCI-X IP is supported.

Notes:

- The numbers in this table are based on the conditions set forth in Table 10 and Table 13.
- Descriptions of the symbols used in this table are as follows:  
 I<sub>OL</sub> — the output current condition under which V<sub>OL</sub> is tested  
 I<sub>OH</sub> — the output current condition under which V<sub>OH</sub> is tested  
 V<sub>OL</sub> — the output voltage that indicates a Low logic level  
 V<sub>OH</sub> — the output voltage that indicates a High logic level  
 V<sub>CCO</sub> — the supply voltage for output drivers  
 V<sub>TT</sub> — the voltage applied to a resistor termination
- For the LVCMOS and LVTTL standards: the same V<sub>OL</sub> and V<sub>OH</sub> limits apply for the Fast, Slow and QUIETIO slew attributes.
- Tested according to the relevant PCI specifications. For information on PCI IP solutions, see [www.xilinx.com/products/design\\_resources/conn\\_central/protocols/pci\\_pcix.htm](http://www.xilinx.com/products/design_resources/conn_central/protocols/pci_pcix.htm). The PCIX IOSTANDARD is available and has equivalent characteristics but no PCI-X IP is supported.
- These higher-drive output standards are supported only on FPGA banks 1 and 3. Inputs are unrestricted. See the chapter "Using I/O Resources" in UG331.

## Differential I/O Standards

### Differential Input Pairs

$$V_{ICM} = \text{Input common mode voltage} = \frac{V_{INP} + V_{INN}}{2}$$

$$V_{ID} = \text{Differential input voltage} = |V_{INP} - V_{INN}|$$

1. The V<sub>CCO</sub> rails supply only differential output drivers, not input circuits.
2. V<sub>ICM</sub> must be less than V<sub>CCAUX</sub>.
3. These true differential output standards are supported only on FPGA banks 0 and 2. Inputs are unrestricted. See the “Using I/O Resources” chapter in [UG331](#).
4. See [External Termination Requirements for Differential I/O, page 22](#).
5. LVPECL is supported on inputs only, not outputs. Requires V<sub>CCAUX</sub> = 3.3V ± 10%.
6. LVPECL\_33 maximum V<sub>ICM</sub> = V<sub>CCAUX</sub> - (V<sub>ID</sub> / 2)
7. Requires V<sub>CCAUX</sub> = 3.3V ± 10% for inputs. (V<sub>CCAUX</sub> - 300 mV) ≤ V<sub>ICM</sub> ≤ (V<sub>CCAUX</sub> - 37 mV)
8. V<sub>REF</sub> inputs are used for the DIFF\_SSTL and DIFF\_HSTL standards. The V<sub>REF</sub> settings are the same as for the single-ended versions in [Table 13](#). Other differential standards do not use V<sub>REF</sub>.
9. These higher-drive output standards are supported only on FPGA banks 1 and 3. Inputs are unrestricted. See the “Using I/O Resources” chapter in [UG331](#).

ISF_SEC_CYCLES	Number of program cycles for Sector Lockdown Register per sector, user-programmable field in Security Register, and Power-of-2 Page Size	1	Cycle

**Notes:**

1. Minimum value at which functionality is still guaranteed. Do not exceed these values.

## Switching Characteristics

All Spartan-3AN FPGAs ship in two speed grades: -4 and the higher performance -5. Switching characteristics in this document are designated as Preview, Advance, Preliminary, or Production, as shown in Table 19. Each category is defined as follows:

**Preview:** These specifications are based on estimates only and should not be used for timing analysis.

**Advance:** These specifications are based on simulations only and are typically available soon after establishing FPGA specifications. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur.

**Preliminary:** These specifications are based on complete early silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting preliminary delays is greatly reduced compared to Advance data.

**Production:** These specifications are approved once enough production silicon of a particular device family member has been characterized to provide full correlation between speed files and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Production before faster speed grades.

## Software Version Requirements

Production-quality systems must use FPGA designs compiled using a speed file designated as PRODUCTION status. FPGA designs using a less mature speed file designation should only be used during system prototyping or pre-production qualification. FPGA designs with speed files designated as Preview, Advance, or Preliminary should not be used in a production-quality system.

Whenever a speed file designation changes, as a device matures toward Production status, rerun the latest Xilinx® ISE® software on the FPGA design to ensure that the FPGA design incorporates the latest timing information and software updates.

In some cases, a particular family member (and speed grade) is released to Production at a different time than when the speed file is released with the Production label. Any labeling discrepancies are corrected in subsequent speed file releases. See Table 19 for devices that can be considered to have the Production label.

All parameter limits are representative of worst-case supply voltage and junction temperature conditions. **Unless otherwise noted, the published parameter values apply to all Spartan-3AN devices. AC and DC characteristics are specified using the same numbers for both commercial and industrial grades.**

Timing parameters and their representative values are selected for inclusion either because they are important as general design requirements or they indicate fundamental device performance characteristics. The Spartan-3AN speed files (v1.41), part of the Xilinx Development Software, are the original source for many but not all of the values. The speed grade designations for these files are shown in Table 19. For more complete, more precise, and worst-case data, use the values reported by the Xilinx static timing analyzer (TRACE in the Xilinx development software) and back-annotated to the simulation netlist.

			XC3S700AN	4.97	5.34	ns
			XC3S1400AN	5.06	5.69	ns

**Notes:**

1. The numbers in this table are tested using the methodology presented in Table 30 and are based on the operating conditions set forth in Table 10 and Table 13.
2. This clock-to-output time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the Global Clock Input or a standard other than LVCMOS25 with 12 mA drive and Fast slew rate is assigned to the data Output. If the former is true, add the appropriate Input adjustment from Table 26. If the latter is true, add the appropriate Output adjustment from Table 29.
3. DCM output jitter is included in all measurements.

			XC3S700AN	-0.80	-0.75	ns
			XC3S1400AN	-0.69	-0.69	ns

Notes:

1. The numbers in this table are tested using the methodology presented in Table 30 and are based on the operating conditions set forth in Table 10 and Table 13.
2. This setup time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the Global Clock Input or the data Input. If this is true of the Global Clock Input, subtract the appropriate adjustment from Table 26. If this is true of the data Input, add the appropriate Input adjustment from the same table.
3. This hold time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the Global Clock Input or the data Input. If this is true of the Global Clock Input, add the appropriate Input adjustment from Table 26. If this is true of the data Input, subtract the appropriate Input adjustment from the same table. When the hold time is negative, it is possible to change the data before the clock's active edge.
4. DCM output jitter is included in all measurements.

**Notes:**

1. The numbers in this table are tested using the methodology presented in Table 30 and are based on the operating conditions set forth in Table 10 and Table 13.
2. This setup time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the data Input. If this is true, add the appropriate Input adjustment from Table 26.
3. These hold times require adjustment whenever a signal standard other than LVCMOS25 is assigned to the data Input. If this is true, subtract the appropriate Input adjustment from Table 26. When the hold time is negative, it is possible to change the data before the clock's active edge.

**Notes:**

1. The numbers in this table are tested using the methodology presented in Table 30 and are based on the operating conditions set forth in Table 10, Table 13, and Table 15.
2. These adjustments are used to convert output- and three-state-path times originally specified for the LVCMOS25 standard with 12 mA drive and Fast slew rate to times that correspond to other signal standards. Do not adjust times that measure when outputs go into a high-impedance state.
3. Note that 16 mA drive is faster than 24 mA drive for the Slow slew rate.

## Timing Measurement Methodology

When measuring timing parameters at the programmable I/Os, different signal standards call for different test conditions. Table 30 lists the conditions to use for each standard.

The method for measuring Input timing is as follows: A signal that swings between a Low logic level of  $V_L$  and a High logic level of  $V_H$  is applied to the Input under test. Some standards also require the application of a bias voltage to the  $V_{REF}$  pins of a given bank to properly set the input-switching threshold. The measurement point of the Input signal ( $V_M$ ) is commonly located halfway between  $V_L$  and  $V_H$ .

The Output test setup is shown in Figure 11. A termination voltage  $V_T$  is applied to the termination resistor  $R_T$ , the other end of which is connected to the Output. For each standard,  $R_T$  and  $V_T$  generally take on the standard values recommended for minimizing signal reflections. If the standard does not ordinarily use terminations (for example,

LVC MOS, LVTTTL), then  $R_T$  is set to  $1M\Omega$  to indicate an open connection, and  $V_T$  is set to zero. The same measurement point ( $V_M$ ) that was used at the Input is also used at the Output.

**Notes:**

1. The names shown in parentheses are used in the IBIS file.

**Notes:**

- Descriptions of the relevant symbols are as follows:  
V<sub>REF</sub> – The reference voltage for setting the input switching threshold  
V<sub>ICM</sub> – The common mode input voltage  
V<sub>M</sub> – Voltage of measurement point on signal transition  
V<sub>L</sub> – Low-level test voltage at Input pin  
V<sub>H</sub> – High-level test voltage at Input pin  
R<sub>T</sub> – Effective termination resistance, which takes on a value of 1 MΩ when no parallel termination is required  
V<sub>T</sub> – Termination voltage
- The load capacitance (C<sub>L</sub>) at the Output pin is 0 pF for all signal standards.
- According to the PCI specification. For information on PCI IP solutions, see [www.xilinx.com/products/design\\_resources/conn\\_central/protocols/pci\\_pcix.htm](http://www.xilinx.com/products/design_resources/conn_central/protocols/pci_pcix.htm). The PCIX IOSTANDARD is available and has equivalent characteristics but no PCI-X IP is supported.

The capacitive load (C<sub>L</sub>) is connected between the output and GND. *The Output timing for all standards, as published in the speed files and the data sheet, is always based on a C<sub>L</sub> value of zero.* High-impedance probes (less than 1 pF) are used for all measurements. Any delay that the test fixture might contribute to test measurements is subtracted from those measurements to produce the final timing numbers as published in the speed files and data sheet.

## Using IBIS Models to Simulate Load Conditions in Application

IBIS models permit the most accurate prediction of timing delays for a given application. The parameters found in the IBIS model ( $V_{REF}$ ,  $R_{REF}$ , and  $V_{MEAS}$ ) correspond directly with the parameters used in Table 30 ( $V_T$ ,  $R_T$ , and  $V_M$ ). Do not confuse  $V_{REF}$  (the termination voltage) from the IBIS model with  $V_{REF}$  (the input-switching threshold) from the table. A fourth parameter,  $C_{REF}$ , is always zero. The four parameters describe all relevant output test conditions. IBIS models are found in the Xilinx development software as well as at the following link:

[www.xilinx.com/support/download/index.htm](http://www.xilinx.com/support/download/index.htm)

Delays for a given application are simulated according to its specific load conditions as follows:

1. Simulate the desired signal standard with the output driver connected to the test setup shown in Figure 11. Use parameter values  $V_T$ ,  $R_T$ , and  $V_M$  from Table 30.  $C_{REF}$  is zero.
2. Record the time to  $V_M$ .
3. Simulate the same signal standard with the output driver connected to the PCB trace with load. Use the appropriate IBIS model (including  $V_{REF}$ ,  $R_{REF}$ ,  $C_{REF}$ , and  $V_{MEAS}$  values) or capacitive value to represent the load.
4. Record the time to  $V_{MEAS}$ .
5. Compare the results of steps 2 and 4. Add (or subtract) the increase (or decrease) in delay to (or from) the appropriate Output standard adjustment (Table 29) to yield the worst-case delay of the PCB trace.

## Simultaneously Switching Output Guidelines

This section provides guidelines for the recommended maximum allowable number of Simultaneous Switching Outputs (SSOs). These guidelines describe the maximum number of user I/O pins of a given output signal standard that should simultaneously switch in the same direction, while maintaining a safe level of switching noise. Meeting these guidelines for the stated test conditions ensures that the FPGA operates free from the adverse effects of ground and power bounce.

Ground or power bounce occurs when a large number of outputs simultaneously switch in the same direction. The output drive transistors all conduct current to a common voltage rail. Low-to-High transitions conduct to the  $V_{CCO}$  rail; High-to-Low transitions conduct to the GND rail. The resulting cumulative current transient induces a voltage difference across the inductance that exists between the die pad and the power supply or ground return. The inductance is associated with bonding wires, the package lead frame,

and any other signal routing inside the package. Other variables contribute to SSO noise levels, including stray inductance on the PCB as well as capacitive loading at receivers. Any SSO-induced voltage consequently affects internal switching noise margins and ultimately signal quality.

Table 31 and Table 32 provide the essential SSO guidelines. For each device/package combination, Table 31 provides the number of equivalent  $V_{CCO}/GND$  pairs. The equivalent number of pairs is based on characterization and may not match the physical number of pairs. For each output signal standard and drive strength, Table 32 recommends the maximum number of SSOs, switching in the same direction, allowed per  $V_{CCO}/GND$  pair within an I/O bank. The guidelines in Table 32 are categorized by package style, slew rate, and output drive current. Furthermore, the number of SSOs is specified by I/O bank. Generally, the left and right I/O banks (Banks 1 and 3) support higher output drive current.

Multiply the appropriate numbers from Table 31 and Table 32 to calculate the maximum number of SSOs allowed within an I/O bank. Exceeding these SSO guidelines might result in increased power or ground bounce, degraded signal integrity, or increased system jitter.

$$SSO_{MAX}/IO \text{ Bank} = \text{Table 31} \times \text{Table 32}$$

The recommended maximum SSO values assumes that the FPGA is soldered on the printed circuit board and that the board uses sound design practices. The SSO values do not apply for FPGAs mounted in sockets, due to the lead inductance introduced by the socket.

The number of SSOs allowed for quad-flat packages (TQ) is lower than for ball grid array packages (FG) due to the larger lead inductance of the quad-flat packages. Ball grid array packages are recommended for applications with a large number of simultaneously switching outputs.

**Notes:**

- Not all I/O standards are supported on all I/O banks. The left and right banks (I/O banks 1 and 3) support higher output drive current than the top and bottom banks (I/O banks 0 and 2). Similarly, true differential output standards, such as LVDS, RSDS, PPDS, miniLVDS, and TMDS, are only supported in top or bottom banks (I/O banks 0 and 2). Refer to [UG331: Spartan-3 Generation FPGA User Guide](#) for additional information.
- The numbers in this table are recommendations that assume sound board lay out practice. Test limits are the V<sub>IL</sub>/V<sub>IH</sub> voltage limits for the respective I/O standard.
- If more than one signal standard is assigned to the I/Os of a given bank, refer to [XAPP689: Managing Ground Bounce in Large FPGAs](#) for information on how to perform weighted average SSO calculations.

$T_{MSCKD\_A}$	Data hold time at the A input after the active transition at the CLK when using the AREG input register <sup>(4)</sup>	0.35	–	0.45	–	ns
$T_{MSCKD\_B}$	Data hold time at the B input after the active transition at the CLK when using the BREG input register <sup>(4)</sup>	0.35	–	0.45	–	ns
<b>Clock Frequency</b>						
$F_{MULT}$	Internal operating frequency for a two-stage 18x18 multiplier using the AREG and BREG input registers and the PREG output register <sup>(5)</sup>	0	280	0	250	MHz

**Notes:**

1. The numbers in this table are based on the operating conditions set forth in Table 10.
2. The PREG register is typically used in both single-stage and two-stage pipelined multiplier implementations.
3. The PREG register is typically used when inferring a single-stage multiplier.
4. Input registers AREG or BREG are typically used when inferring a two-stage multiplier.
5. Combinational delay is less and pipelined performance is higher when multiplying input data with less than 18 bits.

## Block RAM Timing

$T_{RCKC\_WEB}$	Hold time on the WE input after the active transition at the CLK input	0	–	0	–	ns
<b>Clock Timing</b>						
$T_{BPWH}$	High pulse width of the CLK signal	1.56	–	1.79	–	ns
$T_{BPWL}$	Low pulse width of the CLK signal	1.56	–	1.79	–	ns
<b>Clock Frequency</b>						
$F_{BRAM}$	Block RAM clock frequency	0	320	0	280	MHz

**Notes:**

1. The numbers in this table are based on the operating conditions set forth in [Table 10](#).

## Digital Clock Manager (DCM) Timing

For specification purposes, the DCM consists of three key components: the Delay-Locked Loop (DLL), the Digital Frequency Synthesizer (DFS), and the Phase Shifter (PS).

Aspects of DLL operation play a role in all DCM applications. All such applications inevitably use the CLKIN and the CLKFB inputs connected to either the CLK0 or the CLK2X feedback, respectively. Thus, specifications in the DLL tables (Table 39 and Table 40) apply to any application that only employs the DLL component. When the DFS and/or the PS components are used together with the DLL, then the specifications listed in the DFS and PS tables (Table 41 through Table 44) supersede any corresponding ones in the DLL tables. DLL specifications that do not change with the addition of DFS or PS functions are presented in Table 39 and Table 40.

Period jitter and cycle-cycle jitter are two of many different ways of specifying clock jitter. Both specifications describe statistical variation from a mean value.

### Delay-Locked Loop (DLL)

Table 39: Recommended Operating Conditions for the DLL

Symbol	Description	Speed Grade				Units		
		-5		-4				
		Min	Max	Min	Max			
<b>Input Frequency Ranges</b>								
F <sub>CLKIN</sub>	CLKIN_FREQ_DLL	Frequency of the CLKIN clock input		5 <sup>(2)</sup>	280 <sup>(3)</sup>	5 <sup>(2)</sup>	250 <sup>(3)</sup>	MHz
<b>Input Pulse Requirements</b>								
CLKIN_PULSE	CLKIN pulse width as a percentage of the CLKIN period	F <sub>CLKIN</sub> ≤ 150 MHz	40%	60%	40%	60%	%	
		F <sub>CLKIN</sub> > 150 MHz	45%	55%	45%	55%	%	
<b>Input Clock Jitter Tolerance and Delay Path Variation<sup>(4)</sup></b>								
CLKIN_CYC_JITT_DLL_LF	Cycle-to-cycle jitter at the CLKIN input	F <sub>CLKIN</sub> ≤ 150 MHz	–	±300	–	±300	ps	
CLKIN_CYC_JITT_DLL_HF		F <sub>CLKIN</sub> > 150 MHz	–	±150	–	±150	ps	
CLKIN_PER_JITT_DLL	Period jitter at the CLKIN input		–	±1	–	±1	ns	
CLKFB_DELAY_VAR_EXT	Allowable variation of off-chip feedback delay from the DCM output to the CLKFB input		–	±1	–	±1	ns	

**Notes:**

1. DLL specifications apply when any of the DLL outputs (CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, or CLKDV) are in use.
2. The DFS, when operating independently of the DLL, supports lower F<sub>CLKIN</sub> frequencies. See Table 41.
3. The CLKIN\_DIVIDE\_BY\_2 attribute can be used to increase the effective input frequency range up to F<sub>BUFG</sub>. When set to TRUE, CLKIN\_DIVIDE\_BY\_2 divides the incoming clock frequency by two as it enters the DCM.
4. CLKIN input jitter beyond these limits might cause the DCM to lose lock.
5. The DCM specifications are guaranteed when both adjacent DCMs are locked.

Period jitter is the worst-case deviation from the ideal clock period over a collection of millions of samples. In a histogram of period jitter, the mean value is the clock period.

Cycle-cycle jitter is the worst-case difference in clock period between adjacent clock cycles in the collection of clock periods sampled. In a histogram of cycle-cycle jitter, the mean value is zero.

### Spread Spectrum

DCMs accept typical spread spectrum clocks as long as they meet the input requirements. The DLL will track the frequency changes created by the spread spectrum clock to drive the global clocks to the FPGA logic. See XAPP469: *Spread-Spectrum Clocking Reception for Displays* for details.

Symbol	Description	Device	Speed Grade				Units
			-5		-4		
			Min	Max	Min	Max	
<b>Delay Lines</b>							
DCM_DELAY_STEP <sup>(5)</sup>	Finest delay resolution, average over all taps	All	15	35	15	35	ps

**Notes:**

1. The numbers in this table are based on the operating conditions set forth in Table 10 and Table 39.
2. Indicates the maximum amount of output jitter that the DCM adds to the jitter on the CLKIN input.
3. For optimal jitter tolerance and faster lock time, use the CLKIN\_PERIOD attribute.
4. Some jitter and duty-cycle specifications include 1% of input clock period or 0.01 UI. For example, the data sheet specifies a maximum jitter of “±[1% of CLKIN period + 150]”. Assume the CLKIN frequency is 100 MHz. The equivalent CLKIN period is 10 ns and 1% of 10 ns is 0.1 ns or 100 ps. According to the data sheet, the maximum jitter is ±[100 ps + 150 ps] = ±250 ps.
5. The typical delay step size is 23 ps.

**Digital Frequency Synthesizer (DFS)**

Table 41: Recommended Operating Conditions for the DFS

Symbol	Description	Device	Speed Grade				Units
			-5		-4		
			Min	Max	Min	Max	
<b>Input Frequency Ranges<sup>(2)</sup></b>

<b>Input Clock Jitter Tolerance<sup>(4)</sup></b>							
CLKIN_CYC_JITT_FX_LF	Cycle-to-cycle jitter at the CLKIN input, based on CLKFX output frequency	F <sub>CLKFX</sub> ≤ 150 MHz	–	±300	–	±300	ps
CLKIN_CYC_JITT_FX_HF		F <sub>CLKFX</sub> > 150 MHz	–	±150	–	±150	ps
CLKIN_PER_JITT_FX	Period jitter at the CLKIN input		–	±1	–	±1	ns

**Notes:**

1. DFS specifications apply when either of the DFS outputs (CLKFX or CLKFX180) are used.
2. If both DFS and DLL outputs are used on the same DCM, follow the more restrictive CLKIN\_FREQ\_DLL specifications in Table 39.
3. To support double the maximum effective FCLKIN limit, set the CLKIN\_DIVIDE\_BY\_2 attribute to TRUE. This attribute divides the incoming clock frequency by two as it enters the DCM.
4. CLKIN input jitter beyond these limits may cause the DCM to lose lock.

<b>Phase Alignment<sup>(5)</sup></b>								
CLKOUT_PHASE_FX	Phase offset between the DFS CLKFX output and the DLL CLK0 output when both the DFS and DLL are used	All	–	±200	–	±200	ps	
CLKOUT_PHASE_FX180	Phase offset between the DFS CLKFX180 output and the DLL CLK0 output when both the DFS and DLL are used	All	–	±[1% of CLKFX period + 200]	–	±[1% of CLKFX period + 200]	ps	
<b>Lock Time</b>								
LOCK_FX <sup>(2)</sup>	The time from deassertion at the DCM's Reset input to the rising transition at its LOCKED output. The DFS asserts LOCKED when the CLKFX and CLKFX180 signals are valid. If using both the DLL and the DFS, use the longer locking time.	$5\text{ MHz} \leq F_{\text{CLKIN}} \leq 15\text{ MHz}$	All	–	5	–	5	ms
		$F_{\text{CLKIN}} > 15\text{ MHz}$		–	450	–	450	µs

**Notes:**

1. The numbers in this table are based on the operating conditions set forth in Table 10 and Table 41.
2. For optimal jitter tolerance and faster lock time, use the CLKIN\_PERIOD attribute.
3. Maximum output jitter is characterized within a reasonable noise environment (40 SSOs and 25% CLB switching) on an XC3S1400A FPGA. Output jitter strongly depends on the environment, including the number of SSOs, the output drive strength, CLB utilization, CLB switching activities, switching frequency, power supply and PCB design. The actual maximum output jitter depends on the system application.
4. The CLKFX and CLKFX180 outputs always have an approximate 50% duty cycle.
5. Some duty-cycle and alignment specifications include a percentage of the CLKFX output period. For example, the data sheet specifies a maximum CLKFX jitter of “±[1% of CLKFX period + 200]”. Assume the CLKFX output frequency is 100 MHz. The equivalent CLKFX period is 10 ns and 1% of 10 ns is 0.1 ns or 100 ps. According to the data sheet, the maximum jitter is ±[100 ps + 200 ps] = ±300 ps.

FINE_SHIFT_RANGE_MAX	Maximum guaranteed delay for variable phase shifting	±[MAX_STEPS • DCM_DELAY_STEP_MAX]	ns	

Notes:

1. The numbers in this table are based on the operating conditions set forth in Table 10 and Table 43.
2. The maximum variable phase shift range, MAX\_STEPS, is only valid when the DCM is has no initial fixed phase shifting, that is, the PHASE\_SHIFT attribute is set to 0.
3. The DCM\_DELAY\_STEP values are provided at the bottom of Table 40.

Symbol	Description	Min	Max	Units
DCM_RST_PW_MIN	Minimum duration of a RST pulse width	3	–	CLKIN cycles
DCM_RST_PW_MAX <sup>(2)</sup>	Maximum duration of a RST pulse width	N/A	N/A	seconds
		N/A	N/A	seconds
DCM_CONFIG_LAG_TIME <sup>(3)</sup>	Maximum duration from V <sub>CCINT</sub> applied to FPGA configuration successfully completed (DONE pin goes High) and clocks applied to DCM DLL	N/A	N/A	minutes
		N/A	N/A	minutes

Notes:

1. This limit only applies to applications that use the DCM DLL outputs (CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, and CLKDV). The DCM DFS outputs (CLKFX, CLKFX180) are unaffected.
2. This specification is equivalent to the Virtex™-4 FPGA DCM\_RESET specification. This specification does not apply for Spartan-3AN FPGAs.
3. This specification is equivalent to the Virtex-4 FPGA T<sub>CONFIG</sub> specification. This specification does not apply for Spartan-3AN FPGAs.

## DNA Port Timing

## Configuration and JTAG Timing

### General Configuration Power-On/Reconfigure Timing

**Notes:**

1. When configuring from the In-System Flash, VCCAUX must be in the recommended operating range; on power-up make sure VCCAUX reaches at least 3.0V before INIT\_B goes High to indicate the start of configuration. VCCINT, VCCAUX, and VCCO supplies to the FPGA can be applied in any order if this requirement is met.
2. The Low-going pulse on PROG\_B is optional after power-on but necessary for reconfiguration without a power cycle.
3. The rising edge of INIT\_B samples the voltage levels applied to the mode pins (M0 - M2).

Figure 13: Waveforms for Power-On and the Beginning of Configuration

Table 50: Power-On Timing and the Beginning of Configuration

Symbol	Description	Device	All Speed Grades		Units
			Min	Max	
T <sub>POR</sub> <sup>(2)</sup>	The time from the application of VCCINT, VCCAUX, and VCCO Bank 2 supply voltage ramps (whichever occurs last) to the rising transition of the INIT_B pin	All	–	18	ms
T <sub>PROG</sub>	The width of the low-going pulse on the PROG_B pin	All	0.5	–	µs
T <sub>PL</sub> <sup>(2)</sup>	The time from the rising edge of the PROG_B pin to the rising transition on the INIT_B pin	XC3S50AN	–	0.5	ms
		XC3S200AN	–	0.5	ms
		XC3S400AN	–	1	ms
		XC3S700AN	–	2	ms
		XC3S1400AN	–	2	ms
T <sub>INIT</sub>	Minimum Low pulse width on INIT_B output	All	250	–	ns
T <sub>ICCK</sub> <sup>(3)</sup>	The time from the rising edge of the INIT_B pin to the generation of the configuration clock signal at the CCLK output pin	All	0.5	4	µs

**Notes:**

1. The numbers in this table are based on the operating conditions set forth in Table 10. This means power must be applied to all VCCINT, VCCO, and VCCAUX lines.
2. Power-on reset and the clearing of configuration memory occurs during this period.
3. This specification applies only to the Master Serial, SPI, and BPI modes.
4. For details on configuration, see UG332 Spartan-3 Generation Configuration User Guide.

$F_{CCSER}$	Frequency of the clock signal at the CCLK input pin <sup>(2)</sup>	Slave	No bitstream compression	0	100	MHz
			With bitstream compression	0	100	MHz

Notes:

1. The numbers in this table are based on the operating conditions set forth in Table 10.
2. For serial configuration with a daisy-chain of multiple FPGAs, the maximum limit is 25 MHz.

Slave Parallel Mode Timing

Notes:

1. It is possible to abort configuration by pulling CSI\_B Low in a given CCLK cycle, then switching RDWR\_B Low or High in any subsequent cycle for which CSI\_B remains Low. The RDWR\_B pin asynchronously controls the driver impedance of the D0–D7 bus. When RDWR\_B switches High, be careful to avoid contention on the D0–D7 bus.
2. To pause configuration, pause CCLK instead of de-asserting CSI\_B. See [UG332](#), Chapter 7, section “Non-Continuous SelectMAP Data”

Figure 16: Waveforms for External Serial Peripheral Interface (SPI) Configuration

Table 57: Timing for External Serial Peripheral Interface (SPI) Configuration Mode

Symbol	Description	Minimum	Maximum	Units
$T_{CCLK1}$	Initial CCLK clock period	See Table 51		
$T_{CCLKn}$	CCLK clock period after FPGA loads <b>ConfigRate</b> bitstream option setting	See Table 51		
$T_{MINIT}$	Setup time on VS[2:0] variant-select pins and M[2:0] mode pins before the rising edge of INIT_B	50	–	ns
$T_{INITM}$	Hold time on VS[2:0] variant-select pins and M[2:0] mode pins after the rising edge of INIT_B	0	–	ns
$T_{CCO}$	MOSI output valid delay after CCLK falling clock edge	See Table 55		
$T_{DCC}$	Setup time on the DIN data input before CCLK rising clock edge	See Table 55		
$T_{CCD}$	Hold time on the DIN data input after CCLK rising clock edge	See Table 55		

Table 58: Configuration Timing Requirements for Attached SPI Serial Flash

Symbol	Description	Requirement	Units
$T_{CCS}$	SPI serial Flash PROM chip-select time	$T_{CCS} \leq T_{MCCL1} - T_{CCO}$	ns
$T_{DSU}$	SPI serial Flash PROM data input setup time	$T_{DSU} \leq T_{MCCL1} - T_{CCO}$	ns
$T_{DH}$	SPI serial Flash PROM data input hold time	$T_{DH} \leq T_{MCCH1}$	ns
$T_V$	SPI serial Flash PROM data clock-to-output time	$T_V \leq T_{MCCLn} - T_{DCC}$	ns
$f_C$ or $f_R$	Maximum SPI serial Flash PROM clock frequency (also depends on specific read command used)	$f_C \geq \frac{1}{T_{CCLKn(min)}}$	MHz

Notes:

1. These requirements are for successful FPGA configuration in SPI mode, where the FPGA generates the CCLK signal. The post-configuration timing can be different to support the specific needs of the application loaded into the FPGA.
2. Subtract additional printed circuit board routing delay as required by the application.

Byte Peripheral Interface (BPI) Configuration Timing

Symbol	Description	Minimum	Maximum	Units
$T_{CCLK1}$	Initial CCLK clock period	See Table 51		
$T_{CCLKn}$	CCLK clock period after FPGA loads ConfigRate setting	See Table 51		
$T_{MINIT}$	Setup time on M[2:0] mode pins before the rising edge of INIT_B	50	–	ns
$T_{INITM}$	Hold time on M[2:0] mode pins after the rising edge of INIT_B	0	–	ns
$T_{INITADDR}$	Minimum period of initial A[25:0] address cycle; LDC[2:0] and HDC are asserted and valid	5	5	$T_{CCLK1}$ cycles
$T_{CCO}$	Address A[25:0] outputs valid after CCLK falling edge	See Table 55		
$T_{DCC}$	Setup time on D[7:0] data inputs before CCLK rising edge	See $T_{SMDCC}$ in Table 56		
$T_{CCD}$	Hold time on D[7:0] data inputs after CCLK rising edge	0	–	ns

Table 60: Configuration Timing Requirements for Attached Parallel NOR Flash

Symbol	Description	Requirement	Units
$T_{CE}$ ( $t_{ELQV}$ )	Parallel NOR Flash PROM chip-select time	$T_{CE} \leq T_{INITADDR}$	ns
$T_{OE}$ ( $t_{GLQV}$ )	Parallel NOR Flash PROM output-enable time	$T_{OE} \leq T_{INITADDR}$	ns
$T_{ACC}$ ( $t_{AVQV}$ )	Parallel NOR Flash PROM read access time	$T_{ACC} \leq 0.5T_{CCLKn(min)} - T_{CCO} - T_{DCC} - PCB$	ns
$T_{BYTE}$ ( $t_{FLQV}, t_{FHQV}$ )	For x8/x16 PROMs only: BYTE# to output valid time <sup>(3)</sup>	$T_{BYTE} \leq T_{INITADDR}$	ns

**Notes:**

1. These requirements are for successful FPGA configuration in BPI mode, where the FPGA generates the CCLK signal. The post-configuration timing can be different to support the specific needs of the application loaded into the FPGA.
2. Subtract additional printed circuit board routing delay as required by the application.
3. The initial BYTE# timing can be extended using an external, appropriately sized pull-down resistor on the FPGA's LDC2 pin. The resistor value also depends on whether the FPGA's PUDC\_B pin is High or Low.

## Revision History

The following table shows the revision history for this document.

Date	Version	Revision
02/26/2007	1.0	Initial release.
08/16/2007	2.0	Updated for Production release of initial device (XC3S200AN). Timing specifications updated for v1.38 speed files. DC specifications updated with production values. Other changes throughout.
08/31/2007	2.0.1	Updated for Production release of XC3S1400AN. Improved $t_{PEP}$ for XC3S700AN in <a href="#">Table 48</a> .
09/12/2007	2.0.2	Updated for Production release of XC3S700AN.
09/24/2007	2.1	Updated for Production release of XC3S400AN. Updated <a href="#">Software Version Requirements</a> to note that Production speed files are available as of Service Pack 3. Removed PCIX IOSTANDARD due to limited PCIX interface support. Added note that SPI_ACCESS (In-System Flash) is not currently supported in simulation.
12/12/2007	3.0	Updated to Production status with Production release of final family member, XC3S50AN. Noted that SPI_ACCESS simulation is supported in ISE 10.1 software. Removed DNA_RETENTION limit of 10 years in <a href="#">Table 17</a> since number of Read cycles is the only unique limit. Updated Setup, Hold, and Propagation Times for the IOB Input Path to show values by device in <a href="#">Table 23</a> and <a href="#">Table 25</a> . Increased SSO recommendation for SSTL18_II in <a href="#">Table 32</a> . Updated <a href="#">Figure 17</a> and <a href="#">Table 59</a> to show BPI data synchronous to CCLK rising edge. Updated links.
06/02/2008	3.1	Improved $V_{CCAUXT}$ and $V_{CCO2T}$ POR minimum in <a href="#">Table 7</a> and updated $V_{CCO}$ POR levels in <a href="#">Figure 13</a> . Clarified power sequencing in Note 1 of <a href="#">Table 7</a> , <a href="#">Table 8</a> , and <a href="#">Figure 13</a> . Added $V_{IN}$ to Recommended Operating Conditions in <a href="#">Table 10</a> and added reference to <a href="#">XAPP459</a> , "Eliminating I/O Coupling Effects when Interfacing Large-Swing Single-Ended Signals to User I/O Pins." Reduced typical $I_{CCINTQ}$ and $I_{CCAUXQ}$ quiescent current values by 12%-58% in <a href="#">Table 12</a> . Noted latest speed file v1.39 in ISE 10.1 software in <a href="#">Table 19</a> . Added reference to Sample Window in <a href="#">Table 24</a> . Changed Internal SPI interface max frequency to 50 MHz and updated other Internal SPI timing parameters to match names and values from speed file in <a href="#">Table 47</a> . Restored Units column to <a href="#">Table 49</a> . Updated CCLK output maximum period in <a href="#">Table 51</a> to match minimum frequency in <a href="#">Table 52</a> . Added references to User Guides.
11/19/2009	3.2	Updated selected I/O standard DC characteristics. Changed typical quiescent current temperature from ambient to junction. Removed references to older software versions. Updated column 3 header of <a href="#">Table 17</a> and <a href="#">Table 18</a> . Added table note to <a href="#">Table 18</a> . Added $T_{IOPI}$ and $T_{IOPID}$ propagation times in <a href="#">Table 25</a> . Updated $T_{IOCKHZ}$ and $T_{IOCKON}$ synchronous output enable/disable times in <a href="#">Table 28</a> . Removed $V_{REF}$ requirements for differential HSTL and differential SSTL in <a href="#">Table 30</a> . Improved DIFF_SSTL18_II SSO limits in <a href="#">Table 32</a> . Updated table note 3 in <a href="#">Table 39</a> . Removed references to old software versions from <a href="#">Table 47</a> and <a href="#">Table 48</a> . Added description of spread spectrum in <a href="#">Spread Spectrum</a> section. Updated BPI configuration waveforms in <a href="#">Figure 17</a> . Updated $T_{ACC}$ equation in <a href="#">Table 60</a> .
12/02/2010	4.0	Added $I_{IK}$ to <a href="#">Table 6</a> . Updated $V_{IN}$ in <a href="#">Table 10</a> and added a footnote to $I_L$ in <a href="#">Table 11</a> to note potential leakage between pins of a differential pair. Added note 6 to <a href="#">Table 13</a> . Corrected CLK High and Low Time symbol in <a href="#">Table 46</a> . Corrected symbols for $T_{SUSPEND\_GTS}$ and $T_{SUSPEND\_GWE}$ in <a href="#">Table 49</a> . Updated link to sign up for Alerts and updated <a href="#">Notice of Disclaimer</a> .
04/01/2011	4.1	In <a href="#">Table 31</a> , added the equivalent pairs per bank for the XC3S50AN and XC3S400AN in the FT(G)256 package and the XC3S1400AN in the FG(G)484 package.
06/11/2014	4.2	Clarified and updated the maximum description in <a href="#">Table 24</a> . Added <a href="#">Note 1</a> , <a href="#">Note 2</a> , and <a href="#">Note 3</a> to <a href="#">Table 48</a> . These changes are outlined in the customer notice <a href="#">XCN14003: Flash Wafer Fabrication Change and Gold (Au) To Copper (Cu) Transition for Spartan-3AN FPGA Devices</a> . Xilinx has issued a discontinuation notice for the XC3S50AN in the FT(G)256 package and the XC3S1400AN in the FG(G)484 package. See <a href="#">XCN13016: Product Discontinuation Notice For Selected Spartan-3AN FPGA Products</a> . Updated <a href="#">Notice of Disclaimer</a> .
01/09/2019	4.3	Updated for <a href="#">Lead-Frame Plating Composition Change For Legacy Eutectic Products (XCN18024)</a> .

## Introduction

This section describes how the various pins on a Spartan®-3AN FPGA connect within the supported component packages, and provides device-specific thermal characteristics. For general information on the pin functions and the package characteristics, see the Packaging section of UG331:

- UG331: Spartan-3 Generation FPGA User Guide**  
[http://www.xilinx.com/support/documentation/user\\_guides/ug331.pdf](http://www.xilinx.com/support/documentation/user_guides/ug331.pdf)

Spartan-3AN FPGAs are available in Pb-free, RoHS packages, indicated by a “G” in the middle of the package code. Leaded (Pb) packages are available for selected devices, with the same pinout and without the “G” in the ordering code (see [Table 5, page 7](#)). The Pb-free package code can be selected in the software for the Pb packages since the pinouts are identical. References to the Pb-free package code in this document apply also to the Pb package.

## Pin Types

Most pins on a Spartan-3AN FPGA are general-purpose, user-defined I/O pins. There are, however, up to 12 different functional types of pins on Spartan-3AN FPGA packages, as outlined in [Table 62](#). In the package footprint drawings that follow, the individual pins are color-coded according to pin type as in the table.

Table 62: Types of Pins on Spartan-3AN FPGAs

Type with Color Code	Description	Pin Name(s) in Type <sup>(1)</sup>
I/O	Unrestricted, general-purpose user-I/O pin. Most pins can be paired together to form differential I/Os.	IO_# IO_Lxxy_#
INPUT	Unrestricted, general-purpose input-only pin. This pin does not have an output structure, differential termination resistor, or PCI™ clamp diode.	IP_# IP_Lxxy_#
DUAL	Dual-purpose pin used in some configuration modes during the configuration process and then usually available as a user I/O after configuration. If the pin is not used during configuration, this pin behaves as an I/O-type pin. See <a href="#">UG332: Spartan-3 Generation Configuration User Guide</a> for additional information on these signals.	M[2:0] PUDC_B CCLK MOSI/CSI_B D[7:1] D0/DIN DOUT CSO_B RDWR_B INIT_B A[25:0] VS[2:0] LDC[2:0] HDC
VREF	Dual-purpose pin that is either a user-I/O pin or Input-only pin, or, along with all other VREF pins in the same bank, provides a reference voltage input for certain I/O standards. If used for a reference voltage within a bank, all VREF pins within the bank must be connected.	IP/VREF_# IP_Lxx_#/VREF_# IO/VREF_# IO_Lxx_#/VREF_#
CLK	Either a user-I/O pin or an input to a specific clock buffer driver. Most packages have 16 global clock inputs that optionally clock the entire device. The exceptions are all devices in the TQG144 package and the XC3S50AN in the FTG256 package. The RHCLK inputs optionally clock the right half of the device. The LHCLK inputs optionally clock the left half of the device. See the Using Global Clock Resources chapter in <a href="#">UG331: Spartan-3 Generation FPGA User Guide</a> for additional information on these signals.	IO_Lxx_#/GCLK[15:0], IO_Lxx_#/LHCLK[7:0], IO_Lxx_#/RHCLK[7:0]

Table 62: Types of Pins on Spartan-3AN FPGAs (Cont'd)

Type with Color Code	Description	Pin Name(s) in Type <sup>(1)</sup>
CONFIG	Dedicated configuration pin, two per device. Not available as a user-I/O pin. Every package has two dedicated configuration pins. These pins are powered by VCCAUX. See <a href="#">UG332: Spartan-3 Generation Configuration User Guide</a> for additional information on the DONE and PROG_B signals.	DONE, PROG_B
PWR MGMT	Control and status pins for the power-saving Suspend mode. SUSPEND is a dedicated pin and is powered by VCCAUX. AWAKE is a dual-purpose pin. Unless Suspend mode is enabled in the application, AWAKE is available as a user-I/O pin.	SUSPEND, AWAKE
JTAG	Dedicated JTAG pin - 4 per device. Not available as a user-I/O pin. Every package has four dedicated JTAG pins. These pins are powered by VCCAUX.	TDI, TMS, TCK, TDO
GND	Dedicated ground pin. The number of GND pins depends on the package used. All must be connected.	GND
VCCAUX	Dedicated auxiliary power supply pin. The number of VCCAUX pins depends on the package used. The In-System Flash memory is powered by VCCAUX. All must be connected to +3.3V.	VCCAUX
VCCINT	Dedicated internal core logic power supply pin. The number of VCCINT pins depends on the package used. All must be connected to +1.2V.	VCCINT
VCCO	Along with all the other VCCO pins in the same bank, this pin supplies power to the output buffers within the I/O bank and sets the input threshold voltage for some I/O standards. All must be connected.	VCCO_#
N.C.	This package pin is not connected in this specific device/package combination.	N.C.

**Notes:**

- # = I/O bank number, an integer between 0 and 3.

### Package Pins by Type

Each package has three separate voltage supply inputs—VCCINT, VCCAUX, and VCCO—and a common ground return, GND. The numbers of pins dedicated to these functions vary by package, as shown in [Table 63](#).

Table 63: Power and Ground Supply Pins by Package

Package	VCCINT	VCCAUX	VCCO	GND
TQG144	4	4	8	13
FTG256	6	4	16	28
FGG400	9	8	22	43
FGG484	15	10	24	53
FGG676	23	14	36	77

A majority of package pins are user-defined I/O or input pins. However, the numbers and characteristics of these I/Os depend on the device type and the package in which it is available, as shown in [Table 64](#). The table shows the maximum number of single-ended I/O pins available, assuming that all I/O-, INPUT-, DUAL-, VREF-, and CLK-type pins are used as general-purpose I/O. AWAKE is counted here as a dual-purpose I/O pin. Likewise, the table shows the maximum number of differential pin-pairs available on the package. Finally, the table shows how the total maximum user-I/Os are distributed by pin type, including the number of unconnected—N.C.—pins on the device.

Not all I/O standards are supported on all I/O banks. The left and right banks (I/O banks 1 and 3) support higher output drive current than the top and bottom banks (I/O banks 0 and 2). Similarly, true differential output standards, such as LVDS, RSDS, PPDS, miniLVDS, and TMDS, are only supported in the top or bottom banks (I/O banks 0 and 2). Inputs are unrestricted. For more details, see the “Using I/O Resources” chapter in [UG331](#).

	FGG676	502	94	227	313	67	52	38	32	17

**Notes:**

1. Some VREFs are on INPUT pins. See pinout tables for details.
2. Xilinx has issued a discontinuation notice for these highlighted devices/packages. For more information see [XCN13016: Product Discontinuation Notice For Selected Spartan-3AN FPGA Products](#).

Electronic versions of the package pinout tables and foot-prints are available for download from the Xilinx website at:

[http://www.xilinx.com/support/documentation/data\\_sheets/s3a\\_pin.zip](http://www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip)

Using a spreadsheet program, the data can be sorted and reformatted according to any specific needs. Similarly, the ASCII-text file is easily parsed by most scripting programs.

## Package Overview

Table 65 shows the five low-cost, space-saving production package styles for the Spartan-3AN family.

Table 65: Spartan-3AN Family Package Options<sup>(1)</sup>

Package	Leads	Type	Maximum I/Os	Lead Pitch (mm)	Body Area (mm)	Height (mm)
TQ144/TQG144	144	Thin Quad Flat Pack (TQFP)	108	0.5	20 x 20	1.60
FT256/FTG256	256	Fine-pitch Thin Ball Grid Array (FBGA)	195	1.0	17 x 17	1.55
FG400/FGG400	400	Fine-pitch Ball Grid Array (FBGA)	311	1.0	21 x 21	2.43
FG484/FGG484	484	Fine-pitch Ball Grid Array (FBGA)	375	1.0	23 x 23	2.60
FG676/FGG676	676	Fine-pitch Ball Grid Array (FBGA)	502	1.0	27 x 27	2.60

**Notes:**

1. See the package material declaration data sheet for package mass.

Each package style is available in an environmentally friendly lead-free (Pb-free) option. The Pb-free packages include an extra “G” in the package style name. For example, the standard “CS484” package becomes “CSG484” when ordered as the Pb-free option. Leaded (Pb) packages are available for selected devices, with the same pinout and without the “G” in the ordering code; See [Table 5, page 7](#) for more information. The mechanical dimensions of the Pb and Pb-free packages are similar. Package drawings and package material declaration data sheets (MDDS) are available on [www.xilinx.com](http://www.xilinx.com).

For additional package information, see [UG112: Device Package User Guide](#).

## Mechanical Drawings

Package drawings and package material declaration data sheets (MDDS) are available on [www.xilinx.com](http://www.xilinx.com).

## Package Thermal Characteristics

The power dissipated by an FPGA application has implications on package selection and system design. The power consumed by a Spartan-3AN FPGA is reported using either the [Xilinx Power Estimator](#) or the [Xilinx Power Analyzer](#) calculator integrated in the Xilinx® ISE® development software. [Table 66](#) provides the thermal characteristics for the various Spartan-3AN FPGA packages. This information is also available using the Thermal Query tool at <http://www.xilinx.com/cgi-bin/thermal/thermal.pl>.

The junction-to-case thermal resistance ( $\theta_{JC}$ ) indicates the difference between the temperature measured on the package body (case) and the junction temperature per watt of power consumption. The junction-to-board ( $\theta_{JB}$ ) value similarly reports the difference between the board and junction temperature. The junction-to-ambient ( $\theta_{JA}$ ) value reports the temperature difference between the ambient environment and the junction temperature. The  $\theta_{JA}$  value is reported at different air velocities, measured in linear feet per minute (LFM). The “Still Air (0 LFM)” column shows the  $\theta_{JA}$  value in a system without a fan. The thermal resistance drops with increasing air flow.

Table 66: Spartan-3AN FPGA Package Thermal Characteristics

Device	Package <sup>(1)</sup>	Junction-to-Case ( $\theta_{JC}$ )	Junction-to-Board ( $\theta_{JB}$ )	Junction-to-Ambient ( $\theta_{JA}$ ) at Different Air Flows				Units
				Still Air (0 LFM)	250 LFM	500 LFM	750 LFM	
XC3S50AN	TQG144	13.4	32.8	38.9	32.8	32.5	31.7	°C/Watt

XC3S200AN	FTG256	7.4	23.3	29.0	23.8	23.0	22.3	°C/Watt
XC3S400AN	FTG256	5.9	13.6	25.9	21.7	20.2	19.3	°C/Watt
	FGG400	6.2	12.9	22.5	16.7	15.6	15.0	°C/Watt
XC3S700AN	FGG484	5.3	11.5	19.4	15.0	13.9	13.4	°C/Watt
XC3S1400AN	FGG484 <sup>(3)</sup>							°C/Watt
	FGG676	4.3	10.9	17.7	13.7	12.6	12.1	°C/Watt

**Notes:**

1. Thermal characteristics are similar for leaded (non-Pb-free) packages.
2. Use the Thermal Query tool at <http://www.xilinx.com/cgi-bin/thermal/thermal.pl> for specific device information.
3. Xilinx has issued a discontinuation notice for these highlighted devices/packages. For more information see [XCN13016: Product Discontinuation Notice For Selected Spartan-3AN FPGA Products](#).

## TQG144: 144-lead Thin Quad Flat Package

The XC3S50AN is available in the 144-lead thin quad flat package, TQG144.

Table 67 lists all the package pins. They are sorted by bank number and then by pin name. Pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type (as defined in Table 62). The XC3S50AN does not support the address output pins for the Byte-wide Peripheral Interface (BPI) configuration mode.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at: [www.xilinx.com/support/documentation/data\\_sheets/s3a\\_pin.zip](http://www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip).

## User I/Os by Bank

Table 68 indicates how the 108 available user-I/O pins are distributed between the four I/O banks on the TQG144 package. The AWAKE pin is counted as a dual-purpose I/O.

Table 68: User I/Os Per Bank for the XC3S50AN in the TQG144 Package

## Footprint Migration Differences

The XC3S50AN FPGA is the only Spartan-3AN device offered in the TQG144 package. The XC3S50AN FPGA is pin compatible with the Spartan-3A XC3S50A FPGA in the TQ(G)144 package, although the Spartan-3A FPGA requires an external configuration source.

### TQG144 Footprint

## FTG256: 256-Ball Fine-Pitch, Thin Ball Grid Array

Xilinx has issued a discontinuation notice for the XC3S50AN in the FT(G)256 package. See [XCN13016: Product Discontinuation Notice For Selected Spartan-3AN FPGA Products](#).

The 256-ball fine-pitch, thin ball grid array package, FTG256, supports the XC3S200AN and XC3S400AN devices. [Table 69](#) lists all the package pins for these devices including the discontinued XC3S50AN. They are sorted by bank number and then by the pin name of the largest device. Pins that form a differential I/O pair appear together in the table. The differential I/O pairs that have different assignments between the XC3S50AN and the XC3S200AN or XC3S400AN are highlighted in light blue in [Table 69](#). See [Footprint Migration Differences, page 87](#) for additional information. The table also shows the pin number for each pin and the pin type (as defined in [Table 62](#)).

The footprints for the XC3S200AN and XC3S400AN in the FTG256 are identical. [Figure 21](#) shows the common footprint for the XC3S200AN and XC3S400AN. The discontinued XC3S50AN footprint is compatible with the XC3S200AN and XC3S400AN, however, there are 51 unconnected balls (indicated as N.C. in [Table 69](#)).

[Table 72](#) summarizes the discontinued XC3S50AN FPGA footprint migration differences for the FTG256 package.

The XC3S50AN does not support the address output pins for the byte-wide peripheral interface (BPI) configuration mode.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at: [www.xilinx.com/support/documentation/data\\_sheets/s3a\\_pin.zip](http://www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip).

## User I/Os by Bank

Table 70 and Table 71 indicate how the available user-I/O pins are distributed between the four I/O banks on the FTG256 package. The AWAKE pin is counted as a dual-purpose I/O. The XC3S50AN FPGA (which is discontinued in the FTG256 package) has 51 unconnected balls, labeled with an N.C. type. These pins are also indicated in Figure 20.

## Footprint Migration Differences

### Unconnected Balls on XC3S50AN (Discontinued in the FTG256 Package)

Table 72 summarizes any footprint and functionality differences between the XC3S50AN and the XC3S200AN or XC3S400AN devices for migration between these devices in the FTG256 package. The XC3S200AN and XC3S400AN have identical pinouts. The XC3S50AN pinout is compatible with the XC3S200AN and XC3S400AN, however, there are 51 unconnected balls and one functionally different ball. Generally, designs migrate upward from the XC3S50AN to either the XC3S200AN or XC3S400AN. If using differential I/O, see Table 73. If using the BPI configuration mode (parallel Flash), see Table 74.

In Table 72, the arrow (→) indicates that this pin can unconditionally migrate from the device on the left to the device on the right. Migration in the other direction is possible depending on how the pin is configured for the device on the right.

### XC3S50AN Differential I/O Alignment Differences

Also, some differential I/O pairs on the discontinued XC3S50AN FPGA are aligned differently than the corresponding pairs on the XC3S200AN or XC3S400AN FPGAs, as shown in [Table 73](#). All the mismatched pairs are in I/O Bank 2. The N side of each pair is shaded.

### XC3S50AN Does Not Have BPI Mode Address Outputs

The XC3S50AN FPGA does not generate the BPI-mode address pins during configuration. [Table 74](#) summarizes these differences.

**Notes:**

1. Xilinx has issued a discontinuation notice for the XC3S50AN in the FT(G)256 package. See [XCN13016: Product Discontinuation Notice For Selected Spartan-3AN FPGA Products](#).

The Spartan-3AN FPGAs are pin compatible with the same density Spartan-3A FPGAs in the FT(G)256 package, although the Spartan-3A FPGAs require an external configuration source.

### FTG256 Footprint (XC3S50AN)

Xilinx has issued a discontinuation notice for the XC3S50AN in the FT(G)256 package. See [XCN13016: Product Discontinuation Notice For Selected Spartan-3AN FPGA Products](#).

## FGG400: 400-Ball Fine-Pitch Ball Grid Array

The 400-ball fine-pitch ball grid array, FGG400, supports the XC3S400AN FPGA as shown in [Table 75](#) and [Figure 22](#).

[Table 75](#) lists all the FGG400 package pins. They are sorted by bank number and then by pin name. Pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type (as defined in [Table 62](#)).

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at: [www.xilinx.com/support/documentation/data\\_sheets/s3a\\_pin.zip](http://www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip).

## User I/Os by Bank

Table 76 indicates how the 311 available user-I/O pins are distributed between the four I/O banks on the FGG400 package. The AWAKE pin is counted as a dual-purpose I/O.

## Footprint Migration Differences

The XC3S400AN is the only Spartan-3AN FPGA offered in the FGG400 package.

The XC3S400AN FPGA is pin compatible with the Spartan-3A XC3S400A FPGA in the FG(G)400 package, although the Spartan-3A FPGA requires an external configuration source.

## FGG484: 484-Ball Fine-Pitch Ball Grid Array

Xilinx has issued a discontinuation notice for the XC3S1400AN in the FG(G)484 package. See [XCN13016: Product Discontinuation Notice For Selected Spartan-3AN FPGA Products](#).

The 484-ball fine-pitch ball grid array, FGG484, supports the XC3S700AN and the discontinued XC3S1400AN FPGAs. There are three pinout differences, as described in [Table 80](#).

[Table 77](#) lists all the FGG484 package pins. They are sorted by bank number and then by pin name. Pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type (as defined in [Table 62](#)).

The shaded rows indicate pinout differences between the XC3S700AN and the XC3S1400AN FPGAs. The XC3S700AN has three unconnected balls, indicated as N.C. and with a black diamond (◆) in [Table 77](#) and [Figure 23](#).

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at: [www.xilinx.com/support/documentation/data\\_sheets/s3a\\_pin.zip](http://www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip).

## User I/Os by Bank

Table 78 and Table 79 indicate how the user-I/O pins are distributed between the four I/O banks on the FGG484 package. The AWAKE pin is counted as a dual-purpose I/O.

Table 78: User I/Os Per Bank for the XC3S700AN in the FGG484 Package

**Notes:**

1. Xilinx has issued a discontinuation notice for the XC3S1400AN in the FG(G)484 package. See [XCN13016: Product Discontinuation Notice For Selected Spartan-3AN FPGA Products](#).

## Footprint Migration Differences

Table 80 summarizes the three footprint and functionality differences between the XC3S700AN and the XC3S1400AN FPGAs that can affect migration between devices available in the FGG484 package. All other pins unconditionally migrate between the Spartan-3AN devices available in the FGG484 package.

Spartan-3AN FPGAs are pin compatible with the same density Spartan-3A FPGAs in the FG(G)484 package, although the Spartan-3A FPGAs require an external configuration source.

In Table 80, the arrow (→) indicates that this pin can unconditionally migrate from the device on the left to the device on the right. Migration in the other direction is possible depending on how the pin is configured for the device on the right.

Table 80: FGG484 XC3S700AN to XC3S1400AN<sup>(1)</sup> Footprint Migration/Differences

## FGG676: 676-Ball Fine-Pitch Ball Grid Array

The 676-ball fine-pitch ball grid array, FGG676, supports the XC3S1400AN FPGA.

Table 81 lists all the FGG676 package pins. They are sorted by bank number and then by pin name. Pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type (as defined in Table 62).

The XC3S1400AN has 17 unconnected balls, indicated as N.C. in Table 81 and Figure 24.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at: [www.xilinx.com/support/documentation/data\\_sheets/s3a\\_pin.zip](http://www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip).

## User I/Os by Bank

Table 82 indicates how the 502 available user-I/O pins are distributed between the four I/O banks on the FGG676 package. The AWAKE pin is counted as a dual-purpose I/O.

Table 82: User I/Os Per Bank for the XC3S1400AN in the FGG676 Package

## Footprint Migration Differences

The XC3S1400AN is the only Spartan-3AN FPGA offered in the FGG676 package. The XC3S1400AN FPGA is pin compatible with the Spartan-3A XC3S1400A FPGA in the FG(G)676 package, although the Spartan-3A FPGA requires an external configuration source.

## Revision History

The following table shows the revision history for this document.

Date	Version	Revision
02/26/2007	1.0	Initial release.
08/16/2007	2.0	Updated for Production release of initial device. Noted that family is available in Pb-free packages only.
09/12/2007	2.0.1	Minor updates to text.
09/24/2007	2.1	Update thermal characteristics in <a href="#">Table 66</a> .
12/12/2007	3.0	Updated to Production status with Production release of final family member, XC3S50AN. Noted that non-Pb-free packages may be available for selected devices. Updated thermal characteristics in <a href="#">Table 66</a> . Updated links.
06/02/2008	3.1	Add <a href="#">Package Overview</a> section. Removed VREF and INPUT designations and diamond symbols on unconnected N.C. pins for XC3S700AN FGG484 in <a href="#">Table 77</a> and <a href="#">Figure 22</a> and for XC3S1400AN FGG676 in <a href="#">Table 81</a> and <a href="#">Figure 23</a> .
11/19/2009	3.2	Renamed package 'Footprint Area' to 'Body Area' throughout document. Noted in <a href="#">Introduction</a> that references to Pb-free package code also apply to the Pb package. Added Pb packages to <a href="#">Table 65</a> and <a href="#">Table 66</a> . Changed Body Area of TQ144/TQG144 packages in 0. Corrected bank designation for SUSPEND to VCCAUX. Noted that non-Pb-free (Pb) packages are available for selected devices. Updated <a href="#">Table 78</a> and <a href="#">Figure 22</a> for I/O vs. Input pin counts.
12/02/2010	4.0	Upgraded <a href="#">Notice of Disclaimer</a> .
04/01/2011	4.1	Updated the CLK description in <a href="#">Table 62</a> . In <a href="#">Table 64</a> , added device/package combinations for the XC3S50AN and XC3S400AN in the FT(G)256 package and the XC3S1400AN in the FG(G)484 package. In <a href="#">Table 65</a> , updated the maximum I/Os for the FG484/FGG484 packages, removed the Mass column, and updated Note 1.
